Intentionality and Rationality: An Analytic Perspective

Intentionality and rationality are the two primary excellences which human, and perhaps some other, minds are understood to have. Intentionality is that directedness which allows thoughts to be about other things, even about the world. Because the mind is an intentional system, it can represent how things are. Rationality is that excellence which is concerned with how that representation should work so as to be accurate, and with how one should behave given one's thoughts about the world, both those that are about how it is (beliefs) and those about how one wants it to be (desires). This article discusses the nature of

intentionality, the question of what the objects of thought actually are, what relationship if any it has with consciousness, and some modern naturalistic (broadly scientific) accounts of what makes something intentional. Under the heading of rationality, the various putative domains of rationality are discussed: belief, desire, and action. This article concludes with a brief discussion of whether we in fact are rational, and of how to justify the normative claim that we ought to be rational.

1. Intentionality

Intentionality is the term given to the mind's striking capacity to have states which are about features in the world. In addition to weighing three grams, or being comprised of ectoplasmic goo, or conforming to a certain neural networking diagram, a mental state might have the property of being *about* something: perhaps *panna cotta* flavored gelato. This property —this 'aboutness'—is an intentional one. It is sometimes thought of as a kind of directedness. The mind is directed on things; your fears are directed on their objects; your beliefs likewise.

The term itself is derived from a medieval Latin translation of an Arabic technical term. The medieval discussion was about a rather different topic than the contemporary issues that are discussed under the rubric of intentionality—perhaps slightly closer to the contemporary debate about the nature of concepts (Sorabji 1991; see also *Natural Concepts, Psychology of*).

1.1 The World or Intermediate Objects?

A straightforward and appealing account of intentionality is to claim that it consists of some kind of relation between a mental state and the object it represents. This claim is neutral between the view that the relation is inexplicable by the natural sciences, and reductive naturalistic programs that try to explain just what scientifically mandated properties this relation is constituted by.

There are difficulties: presumably it is possible to have beliefs about things that do not exist. In some cases this can be finessed away—my belief about the gelato in the fridge, should there turn out to be no gelato in the fridge, might be redescribed as a (false) belief about the fusion of all gelato, that part of it is instantiated in the fridge. But such finessing is pointless, because there are *types* of things that don't exist, as when I have beliefs about Bunyips. So if my (false) belief about the Bunyips does not gain its intentionality in virtue of a relation between a mental state and Bunyips, what does the relation hold between?

One solution is that it holds between a mental state and a special, intermediate, intentional object. The intentional object might be there even if the mental state does not succeed in directing itself onto the world. This requires that there are such intentional objects to do the representational work. Some philosophers, including Meinong and latterly Routley and Zalta (Zalta 1988) hold variations on the doctrine that there are such entities, but they do not have full fledged existence: the nonexistent (sometimes called Meinongian) objects have some other kind of being which is enough to do the work.

Some proponents of the Meinongian view can allow that intentionality is always relational, but that in the case of existing objects the relation is between the mental state and the existing object, and in the case of the nonexistent objects it is between the mental state and the nonexistent object. This requires them to say (in the case of a fear of a Yeti) that the nonexistent Yeti is the very same object as the thing you would be fearing if there really were Yeti.

Perhaps in favor of indirect objects is that it seems that the contents of our beliefs, desires and so on are more finely discriminated that the things in the world. This can be noticed in so-called referentially opaque conditions (a kind of intensional context: see *Intentionality and Rationality: A Continental-European Perspective*). If Bill desires a Rosa brand Gelato, and if it so happens that Rosa brand is the worst in Sydney, most do not think that it follows straightforwardly that Bill desires the worst gelato in Sydney, even though the gelato he desires is (unbeknown to him) the worst in Sydney. However if some indirect intentional object is taken to be the content, then there might be two distinct intentional objects, only one of which is the object of Bill's desire, but both of which are themselves directed. One of the disturbing things about this approach is that it does not seem to make the problem go away. How do the special intentional objects do the work of ensuring that our mental states, that are in relation to them, get to be about the world? If it is a relation to the object in the world, then there is a regress problem. If not and there is just a mysterious power, then the mysterious power may also be possessed by the mental state directly.

There is also difficulty for naturalists in seeing how mental states can bear relations to mysterious indirect objects. Finally a more basic complaint is that even where there are such indirect entities, it seems that our thoughts are surely at least sometimes directly about the things in the world: it is the gelato itself Bill desires, not some intermediate object.

1.2 Intentionality and Consciousness

Some have thought that intentionality is a special feature that marks off mental phenomena from nonmental phenomena: all and only mental systems display intentionality. Something like this was intended by Brentano in the slogan claiming that

intentionality is the 'mark of the mental.' This is not meant to be a nomenclatural claim which merely says that, by definition, if a system is complex enough to be intentional then it is complex enough to be mental. Instead it seems to proceed by some connection between consciousness and intentionality. Thus, John Searle (1983), for example, thinks that a physical system which could do whatever reductionists claim is enough for representation (see Sect. 2) could nonetheless lack genuine intentionality, because it wouldn't be *about* the thing it co-varied with. The reasoning is that either such systems might not have what it takes for consciousness, and thus lack intentionality, or else the reverse: that since they might lack genuine intentionality, they might lack consciousness.

1.3 Reductive Approaches to Intentionality

Most common among contemporary approaches to intentionality are reductive attempts to say what scientifically respectable property of our minds it is that accounts for the difference between intentionality and nonintentionality.

The first of these approaches is to deny that the phenomenon of intentionality exists. So-called eliminative materialists (e.g. Churchland 1981) agree that we can specify scientifically respectable properties which, if they were instantiated, would guarantee that there is intentionality. But they do not think such properties are instantiated, and thus think science will discover that there is no intentionality. Since their arguments depend on stringent principles for the existence of intentional entities, there are two ways for non-eliminativist reductionists to argue against them: by accepting the standards and making the empirical claim that there are things of this nature, or by rejecting the standards.

Among those who think there is in fact intentionality in the natural world, there are, very broadly, four basic approaches in the contemporary literature: informational semantics, teleo-biological theories, broadly functionalist theories, and instrumentalist theories.

Informational semantics is the view that intentionality occurs in the case of the mind only when there is co-variation is between mental states and things in the world. Caveats about complexity, inter-relatedness, or causal and logical dependence are often added to upgrade this condition to sufficiency. Versions of these theories can be found famously in pieces by Fred Dretske (Dretske 1983) and Jerry Fodor (Fodor 1990).

Objections to the view are legion, the most troubling being variations of the so-called misrepresentation problem. The problem is that in situations where there is obvious error, the theory denies that there is error. Suppose that we are trying to have a mental state about cats. It co-varies with cats (i.e., it appears exactly when the agent is in the presence of cats), but occasionally—say about 1 percent of the time—it misfires in the dark and the state appears in the mind when a large rat is seen in the darkness. For simplicity suppose nothing else causes this cat symbol in the head. Intuitively, it seems we should say the symbol is about cats, and occasionally we deploy that symbol to say false things of cats—as when we think that there is a cat there, but unbeknown to us it is in fact a rat which has misled us. Unfortunately, the theory notes that there is perfect co-variation: between the mental symbol on the one hand, and cats *or* rats. Thus it says the symbol is about cats or rats. And so thus we have in every case a *true* belief about cats or rats—that they are present. Various solutions to this problem can be found in the references cited above, but none uncontroversially works.

Another objection is that no purely correlational fact could account for the thought that intentional states do not just reliably indicate the state of the world, but rather such indication is what they are normatively *for*. Teleo-semantics purports to find a solution to this problem. This is the cluster of views around the work of Ruth Millikin (Millikan 1984) and Karen Neander (Neander 1991), according to which evolutionary biology plays a central role. The leading idea is that states are genuinely representational because something like co-variation is the *proper biological function* of the states (or is produced by states whose function is producing states of this sort). This in turn is cashed out evolutionarily: a state's proper biological function is whatever it did that caused it to be selected by natural selection. Thus a heart's function is to pump blood but not to make a noise, because while hearts have always made noises, these noises did not contribute to the fitness of those organisms with hearts, whereas pumping blood did. So, in the case of mental states, while there may be many mental states which correlate with external features of the world, only those that do so because it was advantageous during evolutionary history get to count as intentional states. Objections are of two kinds. The first kind is that the states discriminated in such ways may not turn out to be remotely about the sorts of things that we imagine our intentional states pick out. The second kind involves worries about the historical individuation of mental states. If Creationism is true, for example, states would not be intentional—because they would have no evolutionary history. Alternatively, if Creationism is true then intentionality is an entirely different thing from what it would be on the assumption that Creationism is false. This would raise questions about what is in common between what is called 'intentionality' on the Creationist assumption and what is called 'intentionality' on the standard assumption that would make it right to give them the same name.

Functionalist theories say that intentionality is a phenomenon which arises when systems are com-

plicated enough to interact with the environment in a complicated way. So what matters is not just how the things in the world affect the presence or absence of the state, but how the state interacts with other states to affect the world. A state gets to be a belief that icecream is around, and thus a belief, and thus intentional, not only because it is an indicator of icecream, but also because it potentially interacts with the world. Combined with desires for icecream it may cause icecream directed behavior. In most functionalist accounts, there are few constraints on what the internal nature of a mind has to be like to count as intentional, so long as that nature will cause the right interaction with the world (Armstrong 1968, Braddon-Mitchell and Jackson 1996, Lewis 1972).

The final major category is instrumentalism (see *Realisms and their Opponents: Philosophical Aspects*). An instrumentalist about intentionality sometimes thinks that there is no intentionality as such, but it is pragmatically useful to imagine there is, because it allows us to engage in intentional explanations of behavior, which are both quicker and more practical than the full neurophysical story. Strictly speaking such views are versions of eliminativism which do not seek to eliminate *talk* of the properties they hold not to exist. Other theorists who are sometimes called instrumentalists hold that there are indeed intentional states, but that all it takes for a system to have intentional states is to produce effects in the world best predicted or explained by intuitional talk (see e.g. Dennett 1991). On some construals, this kind of instrumentalism is close to functionalism, since like the functionalist the view is realist about intentional states, and like the functionalist it places few constraints on the intrinsic nature of the states insofar as that nature is not relevant to their causal or explanatory profile. The differences center around whether talk of states apt for prediction and explanation is a distinct way of typing the states from the functionalist's way of typing causally. The answers to these questions about the differences between functionalism and realist instrumentalism will depend in part on views about the relationships between causation and explanation.

2. *Rationality*

2.1 *Introduction*

If anything is common to various accounts of rationality, it is that rationality is a special excellence of the mind. Perhaps it is to have one's higher mental processes functioning well. It must be narrowed down by excluding certain kinds of functioning—functioning well just in terms of crude computational power can be excluded. More controversially moral well functioning is often excluded (see *Rationalism*).

It can be best thought of in terms of criticism: one can criticize various mental process as irrational. Many think that one can criticize as irrational someone who fails to draw obvious deductive inferences; one can criticize someone as irrational who has strange and bizarre patterns of change in desire (though this is controversial as we shall see later), and one can criticize as irrational someone who fails to act so as to bring about what she desires in the light of her beliefs. On the other hand, it is more controversial whether one can criticize as irrational behavior or thought on the grounds that it is immoral and virtually no one thinks that not being able to perform Herculean tasks of mental arithmetic is enough to count as irrationality.

This article will cover three domains: belief, desire, and practical reason, and the question of how much there is in common between what is called 'rationality' in these domains. There is also a question as to whether rationality is a feature of emotions: is it rationally required or prohibited to be in various emotional states in various circumstances?

Rationality with respect to these domains has characteristic goals. The rational believer aims at truth, the rational desirer aims at best desires (perhaps here is a connection with morality), and the rational actor aims to act in a way so as to satisfy her desire in the light of her beliefs. An unresolved issue is whether rationality is characterized as whatever processes bring about these goals, or whether rationality can be characterized by the nature of the processes themselves, and we are lucky enough to live in a world where these processes do in fact bring about the goals on average better than other processes.

2.2 *Rationality of Belief*

In the domain of beliefs, agents are held to be irrational if they form or revise beliefs in the wrong way. At least three kinds of belief forming mechanisms are at issue: the source of initial beliefs, the updating of beliefs on the basis of evidence, and the deduction of the implications of these beliefs in the absence of further evidence.

There is no clear consensus on how initial beliefs should be sourced. Bayesian probability theory holds that there is no way of assessing the rightness of the initial probabilities that agents give to various claims about the world. Instead, the method for revising beliefs in the light of evidence is something that the theory specifies. So on this tradition, an agent's beliefs are rational just if they are revised in the light of evidence the way the theory specifies (see e.g., Jeffrey 1983). There are competing systems for updating beliefs in the light of evidence.

Some philosophers, however, grant special epistemological status to some initial beliefs (or probability assignments) depending on where they come from. Initial beliefs might be held to be held rational insofar as they come from approved sources. These include the testimony of others (see *Expert Testimony*)

or claims about sense impressions (see *Logical Positivism and Logical Empiricism*).

The rational constraints on drawing inferences from existing beliefs unaided by further evidence is the domain of the various branches of deductive logic (see *Deductive Logic*). Of course there is a richer sense of rationality in this area: the capacity to draw the *important* conclusions and ignore the irrelevant ones.

Artificial intelligence researchers have long seen how irrational seeming a system will be that just sits and cranks out all the irrelevant consequences of what it believes.

2.3 Rationality of Desire

While most philosophers would allow that beliefs, or at least the process of change of belief, can be legitimately subject to criticism on the grounds of rationality, there is less consensus in the case of desires. Hume's famous dictum that it is not contrary to reason for him to prefer the destruction of the world to the scratching of his finger, is an illustration of his idea that foundational desires are not subject to constraints of reason. An agent simply has the basic desires she has; the job of reason is to modify beliefs with the goal of truth, which is turn serves the task of satisfying desires. A way of understanding the motivation for this is through considering the *point* of reason. If you think that reason has goals such as truth or the satisfaction of desire, then it is easy to see how belief formation can be irrational—it fails to track the truth—and how action can be irrational—it fails to satisfy desire in the light of belief. It is harder to see what goals basic desires have—though perhaps ease of satisfaction might accord with one of these desiderata, in which case a kind of quasi-Buddhist constraint might recommend itself, of desire minimization. It is here also that connections between rationality and ethics might be drawn, since one constraint might be that the goal of desire is to motivate oneself towards the good life, and rational desires are those which do this (see *Rationalism*; *Economics and Ethics*).

But even if there is no constraint on basic desires taken singly, there might be some constraints on combinations. In the same way that one can rationally criticize someone for inconsistent beliefs, on the grounds that not all can be true, one might criticize someone for incoherent desires, on the grounds that not all can be satisfied. But this will be a much messier business, for it is much less clear that there is anything wrong with a desire set, not all of which can be satisfied. For contingency purposes, it is never the case that all our desires are satisfied, and it is hard to see why it is worse if this is elevated to a logical truth in the case where they cannot all be satisfied because two desires are logically exclusive. Indeed one can imagine that there might be some inconsistent desire sets which lead to greater flourishing than some consistent desire sets—in which case this constraint is at odds with the ethical one above. But supposing that it is a desideratum to have consistent desires: is 'rational' the right word to describe such sets? This might be thought to be an essentially terminological issue. Certainly the situation is isomorphic with the case of consistent beliefs, but whether the differences are small enough to justify using the same term may be an unsettleable piece of semantics.

There is a further question about desire evolution. How should desires change over time? Most grant that along with changes in beliefs, there are rationally mandated changes in instrumental desires. If I desire to be cured of disease, and I learn that a certain berry contains the cure, then I have a reason to acquire a desire to eat the berries in the service of my desire to be. But what of desire change over time under the impact of experience which is not grounded instrumentally. Some think that greater general consistency across time and other coherence factors are rational constraints. On this view, someone whose desires change all the time in apparently senseless ways, wishing for world peace and bananas one day, and world war and fruitlessness the next, is irrational. Certainly such a person in practice would have inconsistent desires (most desire happiness, and fluctuating desires is a sure-fire killer of that state). In these cases the view that co-satisfiability is a requirement would be enough to claim that such a person is irrational. But what if the wildly fluctuating desires were always synchronically consistent? This would still be a very bad way to be, though the author thinks that it is again a borderline terminological matter whether there is enough in common between this malady and others to call it irrational rather than unfortunate.

2.4 Rationality of Action

Rationality of action is most commonly called practical rationality. It is the kind of rationality which concerns the relations between one's beliefs and desires on the one hand and one's actions on the other. If you desire ice-cream, if the ice-cream is in front of you, and if there are no conflicting desires or other impediments to eating it then it is a principle of practical rationality that you should pick it up and lick. The noneater is practically irrational.

Sometimes practical rationality is characterized as reasoning *about* action. Some interpreters of Aristotle and Kant see their work in this way. Similarly contemporary work on decision theory and game theory is often understood as what conclusions about what one *ought* to do should be drawn from premises about beliefs and desires. Another way of understanding practical rationality is the relationship between action itself and belief and desire. The difference is just that on the first way of understanding it one is

practically irrational if one holds wrong *opinions* about how one should act given one's beliefs and desires, and thus it is a special case of rationality about belief or theoretical reason. In the other way of understanding it, one is practically irrational if one actually acts in the wrong way given a set of beliefs and desires.

Much modern work on practical reason has focused on various calculi which either describe or prescribe how to act given one's beliefs and desires. Decision theory (see e.g. Skyrms 1986) (see *Decision Theory: Bayesian*; *Decision Theory: Classical*) is a family of theories which, on the assumption that features of the world relevant to one's decisions are themselves unaffected by those decisions, aims to give an precise account of how to choose Game theory (see *Game Theory*) is the calculus which has been developed to compare actions in situations where the situation itself depends on ones actions, as in many games, where one's own moves may determine the moves of others and thus affect one's assumptions about how the world is that are relevant to choice (see e.g., Elster 1979).

One central philosophical worry with these theories stems from an account of what desires are. Decision and game theory both aim, it seems, to prescribe how we should act. Thus we ought to be able to rationally criticize someone who has acted irrationally and flouted the favored theory. Yet the most popular account of desires (or preferences as they are usually called in the literature) is so-called revealed preference theory. According to revealed preference theory, one's desires are ascribed according to one's actions. In other words, you see what someone does, you make some assumptions about what they believe on the assumption that they are rational with respect to belief formation, and then assume that their desires are whatever it would take to produce the action. But then you can never criticize anyone's actions, for you can always attribute desires, however strange, that make sense of actions. According to revealed preference theory these are the desires that the person had.

In its most extreme version it is hard to use the theory to make recommendations about action as well. For it is hard to say what one's desires are until they are revealed in action, and in strong versions they are *constituted* by the actions (among other things) so there is no fact of the matter.

So if the theories are to have prescriptive content, then we need a substantive theory of desire internal to the workings of the mind, a theory that is not tied so closely to what one actually does.

One phenomenon, about which there has been a lot of philosophical discussion ever since Aristotle, and which is connected to these issues, is so-called weakness of the will. Sometimes it seems that we act against our own desires. You might overwhelmingly desire to loose weight, resolve to avoid icecream, but eat it nonetheless. It might seem impossible to act against your desires if desire is constituted by actions, for there is a desire posited to explain any action. Theories of weakness of will divide between those that accept this and posit sudden changes of desire or hidden desires to explain the behavior, and those that posit a nondesire-based mechanism that makes one sometimes behave against all the things considered desired one has at the time of the weak-willed act.

2.5 *Are We Rational?*

Recently there has been much focus on the question of whether, as a matter of fact, we are rational or not. Much of this has focused on theoretical reason or rationality about belief. Tests show that when examples of simple reasoning are given to even quite intelligent people, large proportions draw wrong inferences. Even simple *modus ponens* can be got wrong. Elementary statistical reason goes badly wrong, though how badly wrong depends on how the information that subjects are expected to use to draw their conclusions is presented (see e.g. Stich 1990, Chap 1).

There has sometimes seemed to be a debate about whether this view that irrationality is omnipresent conflicts with the views of some evolutionary psychologists who see the brain as a marvellously well-engineered machine with many modules for making calculations about the environments in which it evolved. But there is surely no conflict. For what is marvellously engineered for the environments we evolved in need not be so great for our current one, and modules that calculate quickly and efficiently in demanding real-time environments are unlikely to use the same algorithms as would be best for giving considered opinions when time is not an issue (see Stich and Samuels 2000).

2.6 *Ought We be Rational?*

What the question of whether we are rational or not does raise, though, is the issue of whether we ought to be. For if humans are in fact to a substantial extent not theoretically rational, then the claims that a theory of rationality has to be purely descriptive cannot be upheld. For it would be a false description. So perhaps this should be thought of as a purely normative, a theory of how we ought to think and act. And the question is why? If we lack of a foundational story about why one ought to adhere to some norms of thought, then either a scepticism about rationality or a relativism about rationality—the view that that there are many sets of norms competing in the same domains, and there is no fact of the matter about which ought generally to be adopted—become attractive. The latter view has acquired some prominence in recent years) (see *Relativism: Philosophical Aspects*).

One answer to the question of why we should adopt a set of rational norms is found in the pragmatic school: it will be somehow good for use or useful. But this is perilously subject to empirical refutation. For the evolutionary theories seem to suggest that aiming to achieve true beliefs at any cost is in fact not good for us. Perhaps quick and dirty solutions are more life preserving, even at the cost of falsehood. There is also speculation that optimism is a condition in which people systematically overestimate the likelihood of good outcomes and underestimate the likelihood of bad ones, while at the same time getting on better in life than the more accurate pessimists.

A more modest claim, but still unsatisfactory to many, is to make rationality itself a hypothetical imperative. Insofar as you care about truth, exhibit theoretical reason. Insofar as you care about coherent desires, make them coherent. Insofar as you care about satisfying your desires, act so as to make them most likely to be satisfied in the light of your beliefs. Of course even the modest claim, to have any force, requires a principle very like practical reason: insofar as you care about something, follow the rule that will give it to you.

2.7 Rationality and Reasoning

The fact that rationality is often thought of as a characteristic human excellence, and so is the power of conscious thought, has sometimes led to a confusion between rationality and conscious, deliberate reasoning. In fact it is very useful to distinguish between them. Much of what we do is not the result of conscious deliberate reasoning (sometimes called ratiocination). We make decisions, pursue our goals, and act in a way which can be praised as rational or criticized as irrational, despite the fact that it may not happen in a conscious way. If it were only conscious deliberate reason that was rational, then rationality would be even harder to find than it is. Of course, in showing that a piece of cognition is rational, it sometimes helps to provide an argument which shows how the process can be *rationalized*, i.e. described in a way that might look like a valid piece of deliberation or ratiocination. But this is not to say that this is what originally went on. Thus we might say of animals, even if we do not think they possess the power of conscious reasoning, that their mental processes are rational insofar as they process the information they receive about the world and respond in a rational way.

Interactionism and Personality

1. Personality

Personality is a central concept in psychological theorizing and empirical research. Much has been written about personality but there still seems to be no

commonly accepted and applied definition (van Heck 1997). One consequence is fragmentation of relevant knowledge, a situation that has been described as follows: 'Contemporary academic investigation of personality makes little attempt to sustain a consistent, generally applicable view of personality, preferring an eclectic use of heterogeneous data, which are then scrutinized for patterns' (*New Encyclopedia Britannica*, 1991, **9**: 312). As emphasized by researchers from different positions, the fragmentation is detrimental and an obstacle to scientific progress in personality research. Research in this area needs the formulation of a general, integrated theoretical perspective that can serve as the framework for planning, implementing, and interpreting empirical studies on specific issues.

Although diverse, most of the definitions have an element in common; implicitly or explicitly they regard the total individual, 'the undivided personality' (Allport 1924, p. 132), as the target of observation and generalization in theorizing and empirical research. Rather than trying to contribute another semantic definition of what personality 'really is,' the presentation here starts from the view that what can be the target of scientific analysis in personality research is an active and purposeful organism, functioning and developing as a total, integrated being in interaction with different aspects of the environment. With reference to this view, the task for personality research is to contribute knowledge about how and why individuals as a total, integrated organism, think, feel, act, and react in real life.

A full discussion of the implications of this task formulation requires a distinction between three perspectives: a current, a developmental, and an evolutionary perspective. The three perspectives are complimentary. However, most empirical personality research has a current perspective and this article is focused accordingly.

Models using a current perspective analyze and explain why individuals functions, in terms of their contemporaneous mental, behavioral, and biological states, independently of the developmental processes that might have led to the present state of affairs.

2. *Dynamic Interaction*

Dynamic interaction is a basic principle in the functioning of living organisms. Two concepts are central in dynamic interaction: process and reciprocity.

(a) A fundamental starting point for theoretical discussions and empirical research on individual functioning is its character of integrated, dynamic, complex, and adaptive processes. A basic feature of these processes is time. The processes at different levels of individual functioning cannot be properly understood by looking at snapshots of states; we need films. The importance of introducing time in empirical studies has been demonstrated in several ways. For example, access to advanced techniques for brain-imaging has made it possible to investigate the current functioning of the brain while an individual is performing a mental task. This has contributed to new understanding of the interaction of mental acts, biological structures and processes, behavior, and events in the environment.

(b) Reciprocity or bidirectionality in the functioning of operating elements is a characteristic feature of dynamic processes at all levels of the integrated person–environment system, both horizontally among elements and systems functioning at the same level of the organism and vertically between systems functioning at different levels. At the cellular level of the individual, the growth, functioning, and death of a particular cell is dependent on its continuous reciprocal exchange of information with neighboring cells. The effective functioning of any subsystem of the body, for example, the coronary system or the immune system, depends on its reciprocal interaction with other bodily systems. The way an individual functions socially in a specific situation is characterized by continuous reciprocal interaction with other individuals participating in the same situation. The individual's self-identity and world views are formed and develop in a process of reciprocal interaction with the environment.

3. *Classic Interactionism*

During the twentieth century a number of prominent researchers have argued, from very different viewpoints, for what might be designated classic interactionism: Kantor (1924, 1926) the behaviorist, Murray (1938) in his need-press theory, Murphy (1947) in his biosocial theory, Tolman (1951) focusing on purposive behavior, Sullivan (1953) discussing interpersonal relations, Rotter (1954) in his social learning approach, and Sells (1963) arguing explicitly for an interactionistic position, to mention the most influential in personality psychology. The central idea expressed by these theorists was summarized in Lewin's (1936) formula $B = f(P, E)$; behavior (B) is a function of the person (P) and the environment (E). The equation reflects three common elements of classic interactionism: (a) the focus is on person–environment relations, (b) behavior is regarded as an outcome variable, and (c) behavior cannot be understood and explained without considering the environment, particularly the situation in which behavior occurs. This focus on the interplay of individuals and environments in classic interactionism is also reflected in the different contextual models which have been presented and are influential in developmental psychology.

In spite of the very skillful analyses of central issues concerning the individual–environment relations,

there is a surprising lack of explicit discussions of interactional processes in the early contributions. The term interaction seldom appears in the writings of the theorists referred to above. Depending on theoretical preference, P and E in the B = f(P, E) equation were more readily addressed than the functional relations between them.

During the 1970s the discussion was enriched by the introduction of mediating cognitive and motivational aspects of individual functioning for understanding person–environment interactions. Summarizing the state of the art of classic interactionism, Endler and Magnusson (1976) emphasized the individual as an active agent in the person–situation interaction process, the role of cognitive and emotional factors in that process, and the importance of the subjective meaning of situations and environments in person–environment interactions (Magnusson 1976).

Empirical research using an interactionistic perspective was almost nonexistent before the 1960s. Such empirical studies as were presented mainly aimed at demonstrating the role of situations in the person–situation interaction. During the 1970s and 1980s, the explicit formulations of a classic interactionist view exerted a twofold impact on personality research. First, the issue of cross-situational consistency/inconsistency in individual functioning became a central topic for theoretical debate and empirical analyses (Magnusson and Endler 1977). Second, this debate led to an interest in theoretical taxonomies and empirical analyses of situational characteristics (Magnusson 1981, Forgas and Van Heck 1992).

4. *Modern Holistic Interactionism*

A modern interactionistic view considers the way an individual and the integrated person–environment system function in a holistic perspective. Within this framework, individual functioning can be described and analyzed in terms of complex, dynamic, and adaptive processes involving mental, biological, and behavioral aspects of the individual and different aspects of the environment (Magnusson 1999, Magnusson and Törestad 1993).

The two basic concepts of interactionism are central in this perspective: process, implying the time perspective, and reciprocity among operating elements and systems. At each level, the totality derives its characteristic features and properties from the interaction of the elements involved, not from the dynamic effect of each isolated part on the totality. Each aspect of the structures and processes that are operating in the individual (perceptions, plans, values, goals, motives, biological factors, conduct, etc.), as well as each aspect of the environment, takes on psychological meaning from its role in the total functioning of the individual. A certain element or system derives its significance, not from its structure, but from its role in the system of which it forms a part.

In three inter-related ways this view is an extension of classic interactionism. First, behavior is not regarded as an outcome variable, that is, as the result of the processes. It is a certain aspect of individual functioning and an integrated part of the total dynamic, adaptive interaction process. Second, interactional processes are not restricted to the interplay between the individual and the environment. Dynamic, adaptive interaction is also a basic principle for the processes within the individual, in which mental, biological, and behavioral factors are involved. Third, the character of these individual-bound processes is important in the individual's continuous interaction with the environment. Besides being influenced by characteristics of the environment, these processes have an impact on the person–environment interaction processes.

A heated issue for debate during the 1970s and 1980s was the 'existence' and role of personality traits. Much of the debate reflected a misunderstanding of the interactionistic view as in conflict with the trait concept. There is no contradiction between the analysis and description of individual functioning at the trait level and an interactionistic view: the essential argument concerns the trait concept's explanatory contribution to understanding individual functioning in specific situations and across situations. It is a matter of level of analysis. What Allport (1937) defined as 'bona fide structures in each personality that account for the consistency of its behavior' (p. 37) form an essential basis for understanding coherence in the individual's interaction with situations of different character and for coherent continuity in the individual's interaction with the environment over time. Mischel and Shoda (1995) recently contributed to the discussion on this issue by analyzing traits in terms of processing dispositions with reference to social, cognitive, and biological models.

A holistic view of individual functioning has ancient roots. Yet it is also very modern and in line with developments in other disciplines concerned with dynamic, complex processes. In recent decades it has derived substantive content from research on both cognitive and noncognitive factors and on structures and processes of the brain and the physiological system. In fact, a holistic view is inherent in the rapid development of research in the interface of mental, biological, and behavioral aspects of individual functioning. Cognitive neuroscience is one of the most dynamic areas of relevance for understanding the way individuals think, feel, act, and react in real life.

5. *Methodological Implications*

At a general theoretical level, the holistic–interactionistic perspective in personality research is

being increasingly accepted. However, little empirical research has been performed and interpreted with explicit reference to this perspective (Endler and Parker 1992). In their review of recent personality research, Endler and Speer (1998) concluded: '… the general research methodologies employed in the personality area have not changed a great deal since the 1960's' (p. 667). This tradition has been dominated by the application of statistical models and methods for the study of relations among variables across individuals at group level; the focus is on variables.

The formulation of a holistic interactionistic theoretical framework has led to the development and application of models and methods in which the individual is the organizational unit, a theoretical approach which is designated the person approach. In a person approach, individual functioning is studied empirically in terms of patterns of operating factors at the level that is relevant for the specific study. The development of adequate methods for the application of a person approach has been fostered by the presentation of modern models for dynamic, complex processes, particularly general systems theory. In other disciplines the formulation of such models has contributed to impressive progress.

6. *Modern Interactionism as a General Theoretical Framework*

As a result of the rapid development of research on mental and biological aspects of individual functioning and the contributions from modern models for dynamic, complex processes, the modern holistic, interactionistic view now offers a stable platform for further scientific progress, enabling personality research to fall into step with recent developments in other disciplines in the life sciences.

A holistic view serves two inter-related general purposes: (a) as a common conceptual space for effective communication among researchers concerned with very different problems, and (b) as a theoretical framework for the planning, implementation, and interpretation of specific empirical studies. No single researcher can be an expert on all problems at all levels of individual functioning and development. Researchers in cognition and antisocial behavior are concerned with different problems and may apply different methods for observation and data treatment. A common theoretical framework enables them to communicate and gain from each other's empirical work more effectively. Thus, the modern holistic interactionistic perspective forms the basis for a synthesis of knowledge, gained from empirical studies. At the same time the following implications of a modern interactionistic frame of reference should be kept in mind. First, it does not imply that specific mental, behavioral, and biological aspects of individual functioning cannot or should not be the object of empirical research. Second, it does not offer a hypothesis or an explanation for all problems. Within the holistic framework general principles for scientific investigation are applicable: the Newtonian model did not answer every question about the structure and functioning of the physical world but it did serve the two purposes summarized above.

Interactionism: Symbolic

Symbolic interactionism constitutes a longstanding and resilient theoretical perspective and research tradition in sociology and particularly within sociological social psychology, wherein it has been referred to as one of the three major faces of social psychology (House 1977). In contrast to perspectives that emphasize internal (biological or psychological) or external (structural or cultural) determinants of human social behavior, symbolic interactionism argues that most nonhabituated social actions take their particular form during the course of interpretive interaction in concrete social situations. Hence, the perspective's orienting premise is that an understanding of most human social action, be it individual or collective, requires an appreciation of its situated, interactive, and interpretive character. This article provides an overview of the perspective's historical roots and development, its central principles, and its criticisms and theoretical and research variations.

1. *Historical Roots and Development*

Although the phrase 'symbolic interactionism' was coined by Herbert Blumer in 1937, the various ideas and arguments associated with the perspective are clearly rooted in the philosophy of pragmatism, and particularly in the lectures and writings of one of its chief proponents, George Herbert Mead (see Miller 1973, for a comprehensive discussion of Mead's work and a complete listing of his writings, and Joas 1985, for a contemporary assessment). Mead, along with fellow pragmatists John Dewey, William James, and Charles Pierce, the social psychologist Charles Horton Cooley, and a group of sociologists at the University of Chicago, namely Robert Park and W. I. Thomas, provided the initial seedbed of ideas that eventually germinated, mutated in different but overlapping ways, and diffused among successive generations of sociologists. The two most prominent students among the first generation were Herbert Blumer and Everett Hughes, who taught and mentored, directly or indirectly, a wave of students who matriculated at the University of Chicago, mainly in the decade following World War II. Included among these students were Howard Becker, Elliot Freidson, Erving Goffman, Joseph Gusfield, Helena Lopata, Tamotsu Shibutani, Gregory Stone, Anselm Strauss, and Ralph Turner, all of whom became prominent sociologists defining and shaping a variety of subfields, such as collective behavior, deviance, organizations, social problems, the study of face-to-face interaction in public places, and social psychology, with an emphasis on roles, self, identity, and socialization processes. It is this set of scholars that played a major role in the diffusion of the evolving perspective as they spread out across the USA at various colleges and universities and who, along with their mentors and the initial seeded scholars, comprise what has been referred to as the 'Chicago School of Sociology,' or at least a major variant thereof (Fine 1995).

The interactionist perspective blossomed in a number of other sociology departments as well, with those at the universities of Iowa, Minnesota, California at San Diego, and Indiana becoming training centers, with somewhat different emphases, for successive but smaller cohorts of students. The Iowa program, founded and guided by Manford H. Kuhn and then sustained by Carl Couch, even became designated a 'school' of interactionism, largely because it had a different emphasis than the so-called Chicago School. But there has never been any significant debate about Chicago being at the core of the development and diffusion of the perspective.

2. *Central Principles*

Neither all of the aforementioned scholars nor all of their students would identify themselves as symbolic interactionists. However, if attention is focused on the character of their scholarly research and writings, it is clear that what most of them have done and continue to do reflects a number of pragmatist themes that congeal into what can be thought of as the core principles of symbolic interactionism. Herbert Blumer, who perhaps more than anyone else was associated with the articulation of the interactionist perspective, or at least a major variant of the perspective, contended that there are three such principles: that people act towards things, including each other, on the basis of the meanings they have for them; that these meanings are derived through social interaction with others; and that these meanings are managed and transformed through an interpretive process that people use to make sense of and handle the objects that constitute their social worlds (Blumer 1969, see Denzin

1989, for an expansive discussion of this interpretive process).

Embracing these three principles and reflected in most work today that falls under the interactionist umbrella are four broader and even more basic orienting principles:

(a) The principle of interactive determination, which holds that neither individual or society, nor self or other, are ontologically prior but exist only in relation to each other and therefore can be fully understood only in terms of their interaction;

(b) The principle of symbolization, which highlights the processes through which events and conditions, artifacts and edifices, people and aggregations, and other features of the ambient environment take on particular meanings, becoming objects of orientation that elicit specifiable feelings and actions;

(c) The principle of emergence, which focuses attention on the nonhabituated side of social life and its dynamic character and thus the potential for change, not only in the organization and texture of social life but in associated meanings and feelings as well; and

(d) The principle of human agency, which emphasizes the active, goal-seeking character of human actors.

The basic insight suggested by these principles is that the objects of analysis—be they crowds, face-to-face encounters in public places, social problems, organizations, work and occupations, illness, identities, self-concept and -esteem, or emotions—cannot be fully understood apart from the interactive web or context in which they are situated and the interpretive work of the actors involved. Because of this, interactionists generally have been highly critical of theoretical perspectives, analytical schemes, and research methodologies that neglect or gloss over interpretative, interactive processes. This does not mean that the perspective dismisses the influence of biological, psychological, historical, or structural factors in the determination and explanation of behavior; rather, it suggests that such factors may constitute predispositions to or constraints on action without necessarily determining the character of the action. Thus, from the standpoint of symbolic interactionism, social actors take into account the structural and cultural factors (e.g., role constraints, social expectations, norms, values) that impinge on the situations in which they find themselves in course of developing their respective lines of action.

Given the underlying view of the human being as an active rather than merely responsive organism, and the importance of interpretive interaction to the perspective, it is not surprising that 'the self' has been center stage in symbolic interactionist theorization and research. This is due in large measure to the self's reflexive character, as manifested in the ability to define, name, and act towards oneself just as one acts towards other objects. And it is this reflexive capacity that makes the self the central mechanism through which interpretation occurs and which, in turn, allows for the formulation of lines of action.

3. *Criticisms and Variations*

Because of the emphasis placed on situated, interpretative interaction, and thus human agency, critics of the perspective have argued that it ignores organization, power, and politics and is therefore astructural (see Reynolds 1993, Chap. 9, for a review of this and related criticisms). Like most critical characterizations, this one is only partly true. As previously noted, social actors, whether individual or collective, are said to take structural factors—such as role constraints, power differences, and organization—into account when anticipating or engaging in social behavior. Since empirical analyses of this process often focus on interactions that take place at the face-to-face, microscopic level of social life, as between people in public and quasi-public places (see Lofland 1989, for a summary of relevant research), it can be argued that macrostructural and mesostructural forces and processes are overlooked. Yet, it has been argued, as well, that social order, whatever the level, is constituted and reconstituted during the course of everyday interaction (see Goffman 1983), whether it is face-to-face or mediated.

Additionally, a good deal of interactionist research has occurred in and/or focused on organizational, mesostructural contexts (e.g., hospitals, shop floors, restaurants, orchestras, and spheres of industry like the automobile industry), and concepts that reference structural entities and forces (e.g., negotiated order, networks, and constraint) have increasingly found their way into interactionist research and analyses (see Fine 1993, Maines 1977, and Reynolds 1993, for literature reviews). Issues of political power, conflict, and organization also come into play in the constructionist perspective on social problems inspired by symbolic interactionism. Proponents of this work focus on the interpretive, claims-making activities of social problem entrepreneurs. Although there is considerable debate among adherents of this perspective as to the relative importance of putatitive objective social conditions in relation to the success of claims-making activities (Miller and Holstein 1993), it is recognized that these activities do not occur in a social vacuum but in a context of competing and conflicting claims in which some claimants or crusaders are advantaged over others for various organizational and political reasons. The medicalization of various forms of deviance and social problems is a telling case in point (Conrad and Schneider 1980).

Structural factors also figure in interactionist analyses of self-concept and identity, social roles, and emotions, but with varying degrees of emphasis. The

previously noted distinction between the Chicago and Iowa schools of symbolic interactionism reflect this different emphasis, with adherents of the former considering the self as a process that can be best studied through ethnographic fieldwork, and those associated with the latter conceptualizing the self primarily as an object that lends itself to study via survey research techniques and even laboratory experimentation (see Reynolds 1993, particularly Chap. 4). More recent research on the concept of identity parallels this distinction. Linked more closely to the Iowa school are approaches to identity that accent its structural locus, arguing that the source and relative salience of our identities resides primarily in the roles we play and the social relationships in which they are embedded (McCall and Simmons 1978, Stryker 1980). In contrast is work that approaches identity from a more processual, negotiated perspective (Goffman 1963, Snow and Anderson 1987, Strauss 1959). Both approaches acknowledge the influence of structural factors (e.g., roles and social relationships) in relation to identities and their relative salience, but the latter grants the actor greater latitude in negotiating and weighting the structural forces and impositions encountered. Similar differences in interpretive and structural weighting are also found in interactionist scholarship on roles (Stryker 1980, Turner 1962, 1978) and emotions (Ellis 1991, Hochschild 1979, Smith-Lovin and Heise 1988).

Taken together, these observations indicate that there is considerable variation in the range of work that falls under the interactionist umbrella, and that blanket criticisms, such as that the perspective is plagued by an astructural bias, are therefore likely to be off the mark. One final illustration of the extent of this internal variation is the recent methodological debate between those who take a radical, postmodern approach to research, seeing all data as biased and fictionalized, as a kind of second- or third-order reality, and those who regard careful research as a means for securing reasonable approximations of social reality (see Denzin 1992 and Fine 1993, for discussion of and references to this debate).

Given these debates and variations, which can be arrayed along an interpretive or constructionist continuum ranging from unconstrained interpretation or subjectivism at one extreme to highly constrained and contextualized interpretation at the other, it is reasonable to wonder what adherents of the perspective have in common. What ties them together, however loosely? The answer is found in the perspective's view of human beings as active rather than merely responsive organisms and in its contention that an understanding of much human social action requires consideration of its situated, interactive, and interpretive character. And it is also this combination of orienting principles that makes the perspective a useful sensitizing one within sociology in general, thereby accounting in part for its resilience and persistence.

D. A. Snow

Interdependence: Political

As used by political scientists, 'interdependence' has two meanings. First, a group of actors is considered interdependent if the behavior of each one is contingent on the behavior of the others. Second, a group of actors is considered interdependent if it would be costly for them to forego their relationship. Defined in both ways, interdependence is a concept that has been used quite widely to analyze various aspects of international relations. Particular attention, however, has been paid to economic interdependence among countries; and in this article, the definition, measurement, causes, and consequences of international economic interdependence are reviewed.

1. Interdependence as Sensitivity and as Vulnerability

In the field of international relations, it is common to distinguish between sensitivity interdependence—which corresponds to the first meaning described above—and vulnerability interdependence—which corresponds to the second meaning (Baldwin 1980). The key difference between sensitivity and vulnerability interdependence hinges on the costs that countries would bear if relations between them were disrupted. If, for example, changes in economic conditions in one country have a speedy and marked influence on another country, then there is a high degree of sensitivity interdependence between them. If these countries also would find it quite costly to sever their relationship, then the extent of vulnerability interdependence between them is high as well. But sensitivity and vulnerability interdependence often do not move in lockstep. Frequently, there are extensive economic connections between states, yielding a high level of sensitivity interdependence. However, they would not find it especially costly to replace these connections—either by expanding economic interactions with third parties or making domestic economic adjustments—so the level of vulnerability interdependence is relatively low.

2. The Measurement of Interdependence

Interdependence has been measured in various ways, most of which are linked to the volume of interstate transactions. Among these transactions are tourism and travel, mail, and immigration. Some of the earliest work on interdependence, for example, measured its growth by assessing whether domestic transactions and communications were rising at a more rapid pace than foreign transactions and communications (Deutsch and Eckstein 1961). More typically, however, the extent of interdependence is gauged by the volume of economic exchange between states.

One particularly popular measure of economic interdependence is the ratio of international trade flows to national income. Some studies have assessed the extent of interdependence throughout the international system using the ratio of total global trade to total global income. That the value of this ratio has increased dramatically since the conclusion of World War II is viewed widely as evidence that interdependence is on the rise. Studies of international relations, however, usually focus on interdependence between countries, rather than worldwide. Such analyses often measure interdependence by dividing the annual volume of trade between a pair of countries by the annual gross domestic product (GDP) of one state or the other.

Frequently it is argued that the ratio of bilateral trade to GDP is a good gauge of both sensitivity and vulnerability interdependence. This ratio does provide a useful measure of sensitivity interdependence, since it indicates the extent to which trade partners' economies are intertwined. The argument that this ratio also furnishes an accurate indication of vulnerability interdependence rests on the claim that as commerce between a pair of countries makes up a larger portion of each country's total economic output, it is increasingly costly for either partner to replace the trade conducted with its counterpart. But this claim has been the subject of heated debate, and some observers have pointed out that states that trade extensively may not find it very difficult to locate alternative markets in the event that economic relations between them deteriorate (see Baldwin 1980, Hirschman 1945/1980, Keohane and Nye 1977). As such, considerable care should be exercised in using the ratio of bilateral trade to GDP as a measure of vulnerability interdependence. Unfortunately, however, developing more precise measures of vulnerability interdependence requires data that are not available for many countries and periods of time.

3. Determinants of Interdependence

What accounts for the degree of interdependence between states? Economic and technological factors play important roles in this regard. A group of states

vested with similar factor endowments, for example, tends to realize fewer gains from economic exchange than a group of states with very different endowments. All else being equal, both the extent of and the cost of disrupting economic exchange (and, hence, the degree of interdependence) are likely to be lower in the former than the latter group. In addition, economic growth can contribute to heightened interdependence by spurring the demand for goods and services, including those produced abroad. Furthermore, technological improvements have increased the ability to ship goods safely and quickly, and have reduced the costs of doing so, thereby promoting international economic exchange. Such improvements have also increased the ease and speed of moving financial assets between countries, again spurring the growth of interdependence (see Cooper 1968).

However, the extent of economic interdependence also depends on political factors. Particularly important are the international institutions established to regulate economic exchange. The General Agreement on Tariffs and Trade and its successor, the World Trade Organization, have helped slash trade barriers and promote the flow of commerce among participating states. So have various preferential trading arrangements (PTAs), like the European Economic Community, that were designed to foster economic integration. Many of these institutions have contributed to rising interdependence among member-states (Jacobson 1984, Keohane and Nye 1977). In a related vein, some PTAs—including many of those formed by less developed countries during the 1960s and 1970s, and the Council for Mutual Economic Assistance—were established to reduce the economic and political dependence of members on third parties (Mansfield and Milner 1999).

Political–military relations also influence the extent of economic interdependence. Economic relations tend to be more open—and both sensitivity and vulnerability interdependence tend to be higher—between allies than between adversaries. The efficiency gains from open trade stimulate the growth of national income and rising income can be used to enhance states' political–military capacity. Countries cannot ignore these political–military implications of foreign commerce without jeopardizing their well-being; and they can address these security implications by trading more freely with their political–military allies than with other states (see Gowa 1994). Open trade, in turn, promotes sensitivity interdependence and can heighten vulnerability interdependence too.

Political–military relations affect political, as well as economic, interdependence among states. Sensitivity interdependence tends to be high between both allies and adversaries, since a state's political behavior is contingent on the behavior of both its closest friends and its foes. But whereas the level of vulnerability interdependence tends to be low between adversaries, it tends to be high between allies. Since allies typically rely on each other for military security, they face a high cost if their political relations deteriorate unless each of them can quickly and easily locate substitutes for the security furnished by the others.

4. *Implications of Interdependence*

Having discussed some factors affecting the extent of interdependence, this article concludes by addressing some of its domestic and international implications. From a domestic standpoint, heightened interdependence can erode the effectiveness of a country's economic policies and, hence, undermine its economic autonomy (see Cooper 1968). If, for example, private actors face relatively few impediments to shifting assets from one country to another and governments face substantial costs if these actors actually relocate assets, then governments are constrained in setting tax and regulatory policies that affect private actors. As such, various observers maintain that one implication of growing interdependence has been greater convergence in macroeconomic policies throughout the world.

Economic interdependence also influences international relations. In a pair of countries marked by substantial vulnerability interdependence, each country is vested with some power vis-à-vis the other, since each one has the capacity to damage the other by severing their economic relationship. Rarely, however, do such countries depend on their economic relationship to the same degree. The least dependent party is vested with a source of power vis-à-vis the more dependent party because the former can more easily bear the costs of disrupting or forgoing the relationship (Baldwin 1980, Hirschman 1945/1980).

Furthermore, it is argued widely that interdependence affects the likelihood of military conflict between states. Debated for centuries, at least three competing views can be identified on this topic. The first is that economic interdependence inhibits interstate hostilities, a claim that can be traced to biblical times, but that most frequently is associated with the nineteenth century Manchester liberals. Although there are various strands of this position, its advocates have stressed a number of core arguments. One is that by increasing contact and communication among individuals and governments, economic interdependence promotes cooperative political relations. Another is that economic exchange and conquest are substitute means of acquiring the resources needed to foster political security and economic growth. As economic interdependence rises, the incentives to obtain these resources through territorial expansion and foreign aggression decline. A third argument emphasizes that since war typically disrupts economic relations among the belligerents, heightened interdependence increases the costs associated with military conflict, thus deterring its onset.

However, the view that greater trade promotes peace has not gone unchallenged. Mercantilists and economic nationalists have long maintained that, as noted earlier, open commerce can undermine the national security of states by influencing interstate power relations. Because the gains from trade tend to be distributed asymmetrically and can be used to enhance states' political–military capacity, those countries benefiting less from a commercial relationship may find their security jeopardized. Similarly, if trading partners depend on sustaining a commercial relationship to very different degrees, trade may do little to deter belligerence on the part of the less dependent state. Even if a set of states depends heavily and uniformly on trade with each other, such dependence could contribute to commercial disputes and thereby stimulate political antagonism. Furthermore, various observers have argued that the anarchic structure of the international system compels states to limit their economic dependence. As dependence rises, countries may have reason to engage in foreign expansion to manage or reduce it.

Finally, a wide variety of studies have concluded that international economic relations have no systematic bearing on political conflict. Many such studies argue that hostilities stem largely from variations in the distribution of political–military capabilities and that power relations underlie any apparent effect of economic exchange on military antagonism. Despite enduring and heated debates about the nature and strength of the relationship between economic interdependence and political conflict, systematic analyses of these issues have been relatively scarce (for more detailed treatments of the relationship between interdependence and political conflict, see Blanchard et al. 2000, Gasiorowski 1986, Stein 1993).

Interest Groups

Among the requisites for democracy on a sustained basis are not only free and fair elections but also the rule of law, respect for dissent and freedom of expression, and the legitimation of the organized representation of citizen interests—often in opposition to those currently in power—through parties and interest groups. Interest groups, those myriad organizations—ranging from business and professional associations to labor unions to environmental and consumer groups to groups concerned about issues as diverse as abortion and nuclear power—that link the individual to public institutions and seek to influence public policy, are a feature of every functioning democracy. Although they may be present in nondemocratic systems as well, it is not an exaggeration to claim that democracy on a national scale is impossible without interest groups.

1. Problems of Definition

Differences of opinion arise in any discussion of how to categorize the various collectivities that mediate between the individual and the state in a democracy. Many of the institutions often described as interest groups—for example, corporations, foundations, or public bodies such as regional governments—are not groups at all, in that they do not have members in the ordinary sense. For this reason, some analysts prefer the term 'organized interests' to 'interest groups.' Interest groups have much in common with other social aggregates that represent citizen preferences to policy makers in a democracy. In fact, organized interests often have connections, formal or informal, with political parties or social movements. However, unlike political parties, they do not nominate candidates to campaign under their name for the purpose

of running the government. They contrast with social movements in their greater degree of formal organization.

2. Interest Groups and the Policy Process

Wherever they are, interest groups serve as intermediaries in a two-way process of communication linking a citizen constituency with policy makers. All interest groups perform certain functions: they provide information to public officials to assist in designing policy; they seek to persuade policy makers to pursue a preferred course of action, an activity that may be difficult to distinguish in practice from the attempt to inform; and they communicate with members—keeping them apprised as to what the government is doing, educating them about the political process, and cultivating support.

Within the context of these widely shared functions, organized interests vary substantially—in ways that reflect the degree of permeability of the political system to new interests, and the nature and relative importance of formal political institutions—with respect to the difficulty they face in gaining access, the techniques they use to influence policy, and the targets of their activities. Newly emergent groups have much more difficulty penetrating interest group politics in Israel, which has a strong, centralized state, than in the USA, with its tradition of voluntarism and a public domain that, because it is divided by federalism and separation of powers, provides many points of access. Within and across polities, there is tremendous variety in the kinds of techniques groups use to realize their objectives. France, for example, has a tradition of direct action by groups not present in, say, the UK. Within any single country, organized interests differ in the extent to which they function solely as insiders utilizing traditional, low-profile means of achieving political influence or operate as outsiders, adopting more public tactics of mobilization and protest—with unions and environmental groups more likely to engage in protest activities than, say, business associations.

In choosing where to direct their energies, organized interests inevitably gravitate to power. Hence, the primary focus of interest group activity in Japan is the bureaucracy, while in Italy it is parliament. In a system as fragmented as the US political system, interest groups often have choices, and may seek to locate a political controversy in the institutional arena in which they would have the greatest probability of success.

Political systems differ not only in terms of what interest groups do and where they channel their activities but also in terms of the structure of relations between interest groups and government. Some political scientists have suggested that there are two basic patterns of organized interest interaction with the state: neocorporatist and pluralist. According to the neocorporatist model, approximated most closely in Sweden and Austria, mechanisms providing for equal representation of individuals on a geographical basis are supplemented by mechanisms providing for functional representation of organized interests—ordinarily by a relatively limited number of peak associations. Such organizations are recognized and licensed by the state and attain a regularized role in policy making through delegations of administrative power or participation on public councils or committees. Important government decisions are made only after consultation with major economic interests, most notably workers, employers, and farmers.

In contrast, according to the pluralist model, interest groups are much more numerous—less highly aggregated and organized around multiple bases of political conflict—and much more autonomous. Pluralist interest-group politics, approximated most closely by the USA, is relatively permeable to the entry of new groups, and groups arise and get involved in politics at their own initiative, rather than at the behest of the state. In a politics of pluralism, interest groups have greater freedom in choosing which political battles to fight in which political arenas. Typically, those battles involve shifting, issue-specific coalitions taking sides on issues of narrower, more limited import.

It is essential to recognize that these alternative models, which have generated considerable scholarly discussion and some controversy, are ideal types. No polity actually conforms to either model, and many countries—for example, France where a strong, centralized state has meant comparative weakness for interest groups, or Japan where regular consultation between business and government more or less excludes labor—evidence a pattern that is neither pluralist nor corporatist. Furthermore, in most countries no single pattern obtains for the making of policy in all issue areas: the formulation of foreign policy, for example, is less likely to entail regularized bargaining with interest groups than the making of agricultural policy.

3. Interest Group Systems: Who is Represented?

Reflecting national differences in their political traditions and political culture, in the number and depth of politically relevant social cleavages, and in the number, strength, and ideological distinctiveness of the parties, there are also, across democracies, enormous differences in the nature of interest systems, the collective set of organized interests active in politics. Polities vary widely in both the number of groups and the proportion of citizens who are members of any group at all; in the Scandinavian countries, where most employees belong to some kind of union or professional association, membership is much higher

than in, for example, Italy or Greece. There are also differences in the nature and number of the axes of political cleavage encompassed in organized interest politics; the multiplicity of kinds of interests represented in the interest groups of a large and diverse country such as the USA contrasts with that in a relatively homogeneous country such as Norway.

In addition, interest group systems vary substantially in the degree to which interest representation is highly aggregated or fragmented functionally or geographically and in the extent to which interest groups have a monopoly on the organization of a particular constituency. For example, in contrast to the centralized interest group systems of Austria and Sweden are those of the Netherlands, where business associations are organized according to religious differences, or Belgium, where business associations are divided along regional lines but labor is pillarized into socialist, liberal, and Catholic national federations. Furthermore, there are marked differences in terms of the relative strength of organizations representing different kinds of interests—in particular, in the vigor of the opposition provided to traditionally powerful business organizations by organized labor and citizens' groups concerned about consumer and environmental issues.

There are, however, certain regularities in the kinds of interests represented by interest groups. It is difficult to think of a democracy with active interest group politics where producer interests are not well represented—whether by peak employer groups, sectorally based trade associations, or corporations acting individually. In contrast, with the exception of pensioners, the interests of those who benefit directly from welfare-state policies—for example, students or recipients of public assistance—rarely receive vigorous advocacy by interest groups although their causes may be championed by political parties.

4. *Interest Groups and Parties*

That the political parties in a democracy might represent interests not being championed by organized interests—and vice versa—makes clear that an overall assessment of the way in which citizen interests are represented in any particular democracy requires that its interest groups be considered in the context of its parties. Common wisdom holds that strong parties go hand in hand with weak organized interests and, conversely, weak parties with strong organized interests. In the USA, a plurality of groups broadens substantially the range of interests represented in politics by two relatively weak and ideologically moderate parties. However, strong parties do not necessarily preclude strong interest groups. Sweden has strong political parties, and interest groups are guaranteed a consultative role in corporatist policy making in the system of state commissions. And France has traditionally been characterized as having both weak parties and weak interest groups in the face of a strong state.

Democracies also differ in the extent to which interest groups have strong links to like-minded political parties. For example, at least until recently, UK trade unions have had a much closer relationship to the Labour Party than their US counterparts do to the Democrats.

5. *The Evolution of Interest Group Politics*

In spite of the substantial differences across democracies, there have been, over the past few decades, two related developments affecting interest group politics on a cross-national basis that suggest the possibility of convergence among democracies. First is the emergence of interest representation at the European Union (EU). Although group activity in Brussels often arises within individual EU nations, many of the groups involved are either individual corporations or European-level, rather than national, organizations.

The second important trend is an advocacy explosion in democracies everywhere with—in a fragmented, pluralist fashion—more concerns being represented by more groups, and a greater reliance on professional lobbyists. This fluid style of interest advocacy is especially characteristic of the EU but has appeared in the national capitals as well. With respect to the kinds of interests represented, a growing number of citizens' groups concerned about an array of issues including nuclear proliferation, the environment, immigration, and the rights of gays, women, and ethnic minorities supplement traditional economic groups representing business, farmers, and workers. How these developments will alter interest group politics is not yet clear. Nonetheless, private associational life will surely remain essential to the functioning of democracies around the world.

Interest Groups, History of

Organized interests and groups, their factions or parties fighting for influence and power in a given polity or beyond, go back a long way in history. In modern political theory the notion of 'interests' was first narrowed down by enlightened philosophers from Machiavelli to Montesquieu to material and rational interests, as opposed to and counteracting the 'passions' (Hirschman 1977). James Madison and the Federalists have considered both the passions and the different material interests, particularly of 'those who hold, and those who are without property,' to be the principal sources of factions in a society which could only be contained and controlled by building adequate institutions with a sufficient number of checks and balances (Hamilton et al. 1961, 'Federalist 10'). The concepts of interest groups, although under different labels, and of interest politics in a more specific sense, began to proliferate in the Western world from the beginning of the nineteenth century when, following the American and French revolutions, the world of political parties and factions started to dissociate from the universe of interests at large; and when the unequal progress of industrialization in different parts of Europe induced individuals, firms, and groups to articulate their interests in determined policies in order to improve economic or institutional prerequisites, or cope with the social consequences of industrialization.

So the modern interest group might be defined as a voluntary association of individuals, firms, or smaller groups uniting in order to defend or fight for a common interest, with the intention of influencing and intervening in the political process, but without ambition to form a political party (exceptions notwithstanding). A number of similar terms correspond to the same definition: pressure groups, organized interests, lobbies, power groups, the German *Verbände*, the French *syndicats*, US 'chambers,' and many 'institutes' or 'associations.' (Functional equivalents in the non-Western world are here excluded.) As the groups' activities are usually directed toward the political arena asking for specific legislation, allocation of benefits, and state intervention promoting their interests, the rise of state interventionism and of the modern social and welfare state since the last quarter of the nineteenth century has been closely intertwined with a secular proliferation of interest groups of different types which, on the one hand, usually reflected the characteristics of the (more or less democratic) political systems in which they originated. On the other hand, the groups' activities have often significantly contributed to modifying and modernizing the political systems, and to establishing new rules and patterns of interaction. Their recognition and legitimation have not only been products of their performance, but have also been dependent on the general theoretical and ideological orientations of the political consensus within a given polity, which could vary from authoritarian or Rousseauist views of single or 'particular' interests as being categorically detrimental to the common good to more pluralistic Anglo-Saxon approaches of accepting different interest articulations as expressions of a vital civil society (Tocqueville) and of taking factions for granted as vehicles of political agency (cf. Fraenkel 1964). In order to overcome some of the implied shortcomings of legitimation, interest groups have usually tended to develop ideological mechanisms of their own to demonstrate that their particular interests serve the common good or coincide with the interests of the community.

1. *Types*

Interest groups have developed into a wide variety of different types. They could organize individuals, firms, associations, or public corporations (cities, states, provinces, legislatures) at a local, translocal, national, or transnational level and develop different characteristics. With regard to the contents and quality of the interests involved it could be said that, with some simplification and not accounting for the various mixes and marginal or exceptional cases, most of the groups may belong to one of the following eight types: (a) professional associations; (b) groups of business, commerce, and industry; (c) labor unions; (d) agricultural organizations; (e) single interest groups; (f) ideological interest groups; (g) public interest groups; and (h) welfare associations.

(a) The most 'classical' case seems to be the one of the professional associations which have taken over many of the functions of the premodern guilds, estates, brotherhoods, or clubs, particularly in regulating the

requirements and mechanisms of cooptation and access to a number of key professions, be it as a privilege of professional self-government as in the USA (American Bar Association, American Medical Association) or as a task delegated by the state as in most of the German *Kammern* (of lawyers, doctors, artisans). The various medical associations have become particularly differentiated with the rise of compulsory health insurance or comprehensive national health services (cf. the German *Kassenärztliche Vereinigungen*). The organization of less professionalized groups such as teachers or employees in trade and commerce has often followed the lines of professional associations, if they did not unionize in the labor ranks as in most Latin countries.

(b), (c) The two predominant camps of interest groups of the industrial era, the associations of industry and the labor unions, have typologically developed out of earlier commercial guilds or professional associations of craftspeople and workers. The labor unions in industry have usually been able to acquire more strength and influence since they began to overcome their traditional fragmentation along the lines of professions and crafts, and started to form broader industrial unions—in Germany since the 1890s, in the UK after World War II, in most other industrial countries during the 1920s and 1930s. In industry and labor it also made a great difference whether there evolved a coordinating peak association or confederation, or whether there were two, as in German industry before 1919 or in Spanish labor before 1939 and after 1975, or a more fragmented variety, as in the USA. In case labor relations became institutionalized, the industrial sector and its associations occasionally created separate employers' associations with the specific objective of coordinating negotiations with the unions. Banking, insurance, and small business interests in most countries have also organized separately.

(d) Most agricultural interest groups, which came into existence from the last third of the nineteenth century on, besides voicing the interests of 'agriculture' against industry and the industrial world, have reflected the structures and divisions of the various crop sectors or regions in their nation's agricultural economies, with the interests of larger producers usually dominating those of the smaller ones, a high influence of specialized production interests notwithstanding. In less developed countries or regions with a greater number of dependent small peasants and landless laborers, agricultural interests have also been organized in labor unions and social movements. In some countries (such as France) and in determined historical periods and constellations in others (such as Italy, Spain, the USA during the Populist Era, Germany and the USA around 1930 during the Great Depression) the mode of agricultural interest articulation could oscillate between interest-group politics and social protest.

Two other 'classical' types are constituted by groups dedicated to voicing (e) a single nonprofessional, nonproducer, and nonpublic interest—for example, the National Rifle Association (NRA) in the USA, groups advocating or fighting particular forms of exclusive or commercialized sports or entertainment, automobile associations; and (f) by more ideologically inspired groups such as those advocating imperialism, temperance, or prohibition (Anti-Saloon League), or fighting abortion or the death penalty. A number of single interest groups claim to be contributing to the public good by improving people's health—for example, most large sports associations—or by promoting human progress and empowerment of the underprivileged—for example, many organizations of the minorities and of women in the USA (such as the National Association for the Advancement of Colored People, the Leadership Conference on Civil Rights, the National Organization for Women).

(g) Some of these groups might also be considered to belong, at least partly, to the type of public interest groups, the most common issues of which in the USA—following more than a century of honorable precursors such the Anti-Slavery Society (1833) and the American Civil Liberties Union (1920)—since the 1970s have been environmental and consumer interests (Common Cause, Public Citizen, Consumer Federation of America; cf. McFarland 1984). In Germany and some other Central and West European countries antinuclear and pacifist issues would have to be added. At the transnational level, groups such as Greenpeace or Amnesty International would belong to this category.

(h) The heterogeneous groups which might be labeled as welfare associations often combine professional interests, particularly those of social workers, with those of public entities, mostly cities and counties, and the single and ideological interests of churches, religious communities, and other private agents in the welfare arena, which in parts might also be considered as serving the public interest. Many organized themselves early on into coordinating central or national associations of associations or corporations, such as the National Conference of Charities and Correction (1874/84) in the USA (professional interests prevailing) or the *Deutsche Verein für Armenpflege und Wohltätigkeit* (1881) in Germany (corporate interests prevailing), long before sectoral peak associations were formed.

The various forms of intergovernmental lobbying will not be considered here because they are about influence and allocation of benefits within the public sphere only. Hence, neither the National Governors' Association or the US Conference of Mayors, nor the German *Kultusministerkonferenz* or the *Deutsche Städtetag* will be considered as interest groups. The same applies to the often well-organized lobbies of foreign governments in Washington, DC, or to the representation of state or regional interests vis-à-vis

the European Commission in Brussels, even if they seek to increase their influence by behaving like private interests. Likewise, the numerous Political Action Committees (PACs) of American interest groups, which have basically been founded for legal reasons with the specific purpose of influencing legislation, might not be considered as being a separate type of interest group, because the interests voiced by them are the same as those of their creators (cf. Cigler and Loomis 1995, Walker 1991).

Alternative typologies might differentiate between status quo defenders and agents of change, or according to whether the groups rely more on money or on numbers, on machines and bureaucrats, or on mobilization and agitation, whether they wish to influence legislators *en petit comité* or think they need a broad public forum (which also depends on the political system), or whether or not they need a high level of identification or have to provide a variety of services in order to secure their members' loyalty (such as automobile associations). Among the most basic and influential differences are those between big and small interest groups, and between big and small constituencies. Smaller constituencies (such as steel or farming interests) are usually much better organized and represented than broader constituencies (such as consumers), which tend to fall victim to the mechanisms of the 'free rider' effect (Olson 1965, Downs 1957).

2. *Constellations and Trajectories*

The shapes of interest groups and of the evolving national systems of interest intermediation have been significantly influenced by particular economic, social, and political constellations, by institutional sets, and by the distinct paths and trajectories of modernization in different countries and societies. Of particular importance here are the peculiar relations and mixes of developments in the three most important dimensions of the modernization processes, which, simplified, might be labeled as bureaucratization, industrialization, and democratization. In the UK industrialization has triggered democratization, and bureaucratization came late, basically in order to cope with the social consequences of industrialization. In the USA, which followed a similar pattern, the elements of democratization were stronger from the beginning, although moderated by federalism, and more checks and balances. On the European continent bureaucratization has been the legacy of early state building under absolutism, but here the French Revolution has made the great difference. In France the bureaucratic factors combined with the different lines of democratization (notable representation or Bonapartism, with its peculiar 'deliberative' mechanisms), whereas in most of the German states democratization was postponed, and the characteristic patterns of modernization were dominated, down to the mid-twentieth century, by factors combined from bureaucratization and industrialization.

These different constellations have influenced the emergence and performance of interest groups with regard to their social bases and opportunity structures, their strategies and addressees, organization, modes of operation, and achievements, and their relationship with governments, parliaments, and political parties. It is important to note that of the USA and Germany—two countries which have shaped the Gestalt of modern interest groups for the twentieth century more than any others since the breakthrough of organized mass politics between 1890 and 1910—one was not democratic. In Germany the government was not accountable to parliament, and the decades of Bismarckian authoritarianism had weakened the political parties and given the (supposedly less political) interest groups better conditions to flourish than anywhere else.

3. *Different Patterns of Organization*

In Germany the interest groups developed typologically in three waves:

(a) Most of the associations of the first wave, some of which dated back to the first decades of the nineteenth century, were by 1900 closely cooperating with the state bureaucracy, and had become part of privileged semiautonomous corporations, or 'chambers,' of agriculture, commerce, and the trades, which could no longer oppose government policies.

(b) The second wave was initiated by the protectionist groups of heavy industry (*Zentralverband Deutscher Industrieller*, 1876) and, though to a lesser degree, by heavy agriculture, in response to the great deflation of the 1870s whose principal addressees were bureaucrats and legislators. The same characteristics of interest representation vis-à-vis parliament and the executive, but not much mobilization, can be found in most groups of business and industry which were emerging during the same period in the industrial countries—usually divided into protectionists and free traders. In the USA from the 1880s on, a two-tiered system was emerging, with, at its peak, national associations such as the National Association of Manufacturers (1885) and the US Chamber of Commerce, and thousands of influential trade associations to represent the various branches of production. In US agriculture, however, populist protest preceded organized lobbying (see below).

(c) The groups of the third wave in Germany went beyond the previously established patterns of interest representation in that they started massive and permanent propaganda campaigns, and began to influence elections, political parties, and individual politicians. They entered the stage at a time, from the 1890s onward, when the progress of industrialization induced by new technologies combined with

the extension of the political mass market, modernization of party organization, the proliferation of social Darwinism, and imperialistic rhetoric to create an ambience favoring a new type of vigorous, aggressive, and well-organized interest group working the public. Among these groups were the protectionist and interventionist Farmers' League (*Bund der Landwirte*, 1893), various petty bourgeois groups of the 'old Mittelstand' (artisans, shopkeepers), and a number of imperialistic propaganda associations such as the Pan German and the Navy League. These groups were at the core of the politics of the New Right against liberalism and social democracy. They contributed much to the modernization and radicalization of conservative groups, which now turned ultranationalistic and racist, and to the irreconcilable right/left polarization of the social and political forces active at the end of the monarchy that was to continue during the Weimar Republic, which it helped to undermine (Puhle 1975, Ullmann 1988).

One of the models the German interest groups of the third wave decided to follow was that of 'social democracy,' meaning the party and the labor unions, which soon after their emergence from clandestinity under Bismarck's Anti-Socialist Law in 1890 created efficient bureaucratic machines and initiated wide-ranging activities in expanding and consolidating the movement—which went far beyond the scope of what the earlier traditional crafts unions and associations of mutual assistance had achieved since the 1850s. The 'General Commission' of the social democratic unions, from the late 1890s on, came close to what might be called a peak association of labor, despite the existence of some smaller Catholic and liberal unions. The powerful industrial unions, particularly those of the metal workers and miners, could claim to be the most modern in the world. Their position was further enhanced by the fact that industry and the new employers' associations, from around 1900 on, began to negotiate with them on a regular basis, usually at the regional level. Beside bureaucratic traditions, the modern unions contributed to the early emergence of institutionalized labor relations in Germany, and vice versa.

In the USA, both the organization of industrial unions, most visible in the Congress of Industrial Organization (CIO) and institutionalized labor relations, though much more fragmented than in Germany, were not achieved before the New Deal reforms of the mid-1930s (cf. Schönhoven 1987, Bok and Dunlop 1970). Most of the unions within and outside the American Federation of Labor (AFL, 1886) were organized for much longer along the lines of the traditional crafts, although not as long as the UK unions of the Trades Union Congress (TUC), which nevertheless managed to dominate the Labour Party for the first two thirds of the twentieth century. The AFL and the CIO were reunited in 1955. In France, Southern Europe, and in other parts of the world there has often been more competition between unions of different ideological and political 'colors,' which have close ties to their respective parties.

Many European interest groups of the third wave, particularly in agriculture, also saw a model in the American Populists. It is interesting to see, however, that the sequences of different modes of organization and political performance of the agricultural interests in Germany and the USA have somehow been inverse: In Germany before 1933 the prevailing patterns went from ordinary lobbying to protest and mobilization; in the USA it has been the other way round, some limited revivals of protest in the Great Depression notwithstanding. The Populist revolts were followed by extensive and efficient lobbying techniques, as established by the American Farm Bureau Federation (1919), now also taken up by the older National Grange (1867) and National Farmers' Union (1902). In the UK and Scandinavia, traditional sectoral lobbying has prevailed throughout. In France one could always find several different modes of operation simultaneously—lobbying in the channels of notable politics by the big producers, mostly in the north, which organized themselves in Catholic and radical groups; and protest and mobilization on the part of the smaller producers, notably the winegrowers, mostly in the south. Interest representation has hence been more fragmented, and a second tier of special product interests (*associations spécialisées*) has been influential. Since the 1950s the coordinating function of the *Fédération Nationale des Syndicats d'Exploitants Agricoles* has become stronger. Small peasants and laborers in the French South were eventually organized in socialist unions; in parts of Italy and Spain also in anarchist and anarchosyndicalist unions (cf. Hervieu and Lagrave 1992).

4. *Systems of Interest Intermediation*

The various interest groups interact with one another, and with the legislative and executive branches of the governments, in national (occasionally also regional) systems of interest intermediation, the organization of which follows distinct patterns. These patterns depend, among other things, on the respective intensities and traditions of democratic and parliamentary government, and state interventionism. They usually oscillate between the two poles of more liberal and market-oriented pluralism, and more regulated and institutionalized corporatism, be it in the authoritarian 'state-corporatist' tradition (mostly of fascist extraction) or in the democratic variant of 'societal corporatism' or 'neocorporatism.'

Modern corporatism was originally defined by Schmitter as:

> a system of interest representation in which the constituent units are organized into a limited number of singular,

> compulsory, noncompetitive, hierarchically ordered and functionally differentiated categories, recognized or licensed (if not created) by the state and granted a deliberate representational monopoly within their respective categories in exchange for observing certain controls on their selection of leaders and articulation of demands and supports. (Schmitter and Lehmbruch 1979, p. 13)

Among the essential prerequisites for the emergence of corporatist mechanisms or systems are usually counted the existence of peak associations, strong reformist labor movements, a propensity for state interventionism, and a readiness for interparty cooperation, if not consociationalism, in the political arena (cf. Puhle 1984, Lijphart 1984). In reality, however, this 'pure type' of corporatism has been as rare as its opposite, the nineteenth-century model of liberal pluralism.

The systems of interest intermediation of most developed countries seem to have evolved into one of the two most frequent 'mixed' patterns. One is an organized and more or less regulated pluralism, often with strong oligarchic tendencies, which usually begins with 'regulation by the regulated,' as in the USA during the Progressive Era. The other is a syndrome displaying corporatist mechanisms in a number of important sectors, not, however, adding up to a full-fledged corporatist system except in very few countries, such as Sweden, Austria, or The Netherlands in their 'classical' postwar periods. Occasionally the two patterns even seem to converge: The 'iron triangles,' observed in certain sectors until the late 1990s, of a pluralist pattern of interest intermediation such as the American, came close to the classical 'tripartite' arrangements between industry, labor (both ideally represented by peak associations), and the state in corporatist systems.

Corporatism as well as the quasicorporatist functions of the 'iron triangles'—since the economic crisis of the 1970s—seem to have been significantly weakened by the increased tendencies toward fragmentation and segmentation, of interests and politics, under the impact of decentralization and deregulation, loss of membership, 'new lobbyism,' and the emergence of new public interest groups. This is particularly the case in the USA, where in the late 1980s about 18,000 associations (and 7,000 lobbyists) were registered before Congress, in comparison with around 1,350 in Germany (cf. Petracca 1992).

The degree of institutionalization of the mechanisms of interest intermediation could also vary on a sliding scale of at least four different intensities. These range from almost none (lobbying in the open political market) to codified advisory or deliberative functions of interest representation—either *ad hoc*, as in parliamentary hearings, or on a permanent basis, as provided by some constitutions and in the economic, social, and regional councils of the European Union—to coordinating and regulating agencies jointly organized by the interests and the state after the model of the agencies and councils established in Germany and the USA during the First World War and revitalized by the New Deal or by the (moderately neocorporatist) *Konzertierte Aktion* of the early 1970s in Germany. A variety of corporatist arrangements in other countries would also fit into this category. The highest level of institutionalization with compulsory participation, binding decisions, and some general jurisdiction has been reached in sectoral interest representation in councils or chambers with delegated public powers, and in the different regimes of institutionalized labor relations with 'tripartite' participation, in many industrial countries. In addition, in the USA and in Europe some of the newly established legal programs for the empowerment of women or minorities, although they do not recognize interest groups, have given some of the respective groups a quasipublic monitoring function.

5. *Functions*

Together with political parties, interest groups are the core agents of structured intermediacy indispensable to the functioning of a free society and a democratic polity. They contribute essentially to the aggregation, articulation, and representation of interests, serve as vehicles for identification, mobilization, and participation, and also as transmission belts for support and legitimation. On the whole, most modern interest groups during the nineteenth and twentieth centuries have contributed to the extension and preservation of liberal democracy, and to social and political change. The existence of distinct and different organized interests has been a key prerequisite of the recognition of pluralism, for setting up channels and rules for the democratic game, and for checks and balances. Active and dynamic interest groups and nongovernmental organizations (the often idealized NGOs) have contributed to consolidating the mechanisms of civil society, and their participatory and mobilizing energies have helped to revitalize political systems in cases of crisis and stagnation.

Interest groups, however, cannot be considered to be democratic *per se* in their internal structure, or to defend and promote democracy under all circumstances. In many European countries during the first half of the twentieth century, interest groups, principally of industry, agriculture, and the mobilized, crisis-ridden middle classes, substantially contributed to the breakdown and destruction of democracies, and collaborated with the dictators (e.g., in Germany, Italy, and Spain), in particular by disputing the principle of parliamentary representation and the legitimacy of political parties. As, with regard to their primary political function, many tend to be somewhat ambiguous vis-à-vis the particular form of the political order, it is important that interest groups—like political parties—be held responsive and accountable to

the general rules of the democratic game, that their performance in the public arena be subject to adequate control, and that, wherever necessary, efforts are made to integrate the regime of interest intermediation into the texture of democratic institutions and traditions (which may be more problematic in the case of groups acting transnationally). In dictatorial regimes, in contrast, interest groups, despite their instrumental function of organizing and occasionally mobilizing the different social sectors around the regime party or movement, in many cases by virtue of their participatory impact, have also been serving as vehicles of incremental liberalization, which eventually produces elite splits, transfers loyalties from the regime, and contributes to its demise. Recent research into the transitions from authoritarian rule and the consolidation of democracy has also demonstrated that the character of interest groups and the constellations within the 'partial regime' of interest intermediation have an important function for the overall process of democratic consolidation (Schmitter 1995).

Interest: History of the Concept

While modern social science is inconceivable without some notion of interest, the actual concept has a long and complicated history of shifting meanings. In this relatively brief overview, these changes will be highlighted by following the main stages of this conceptual development.

As a central notion for the understanding of human behavior, the concept of interest emerged in early modern political theory. It was part of the sceptical view of human affairs which informed the secular approach to politics and government which arose anew in the Renaissance. In the course of the seventeenth century, the concept entered a variety of other discourses as well, and gained a strategic importance by becoming linked to a theory of civic exchange. This view was subsequently elaborated by political economists and utilitarian philosophers. From the early nineteenth century onwards the conceptual changes have occurred mainly in debates accompanying the formation and the development of academic disciplines. Interest became embedded primarily in economic theories, which have been emulated as well as vividly contested in other disciplines.

1. The Politics of Interest

The word interest, derived from the Latin *inter esse*, originally referred to procedures for compensation in Roman law. The expression *id quod interest* could be applied to a variety of claims in this respect. The meaning of taking rent on loans was directly related to the legal notion of compensation. Interest in this specific sense came into use in many European languages during the fifteenth century, commonly as a euphemism for usury (Fuchs 1976, Hirschman 1992).

The more general meaning of the term emerged in the beginning of the sixteenth century. Interest then referred to the more general sense of advantage and to the human propensity for seeking benefits. It was part of a sceptical anthropology and a nonmetaphysical approach to statecraft, appearing systematically for the first time in the work of Francesco Guicciardini. Guicciardini, one of the most perceptive political theorists of Renaissance Italy, frequently observes in his *Ricordi* (1512/30) that 'self-interest' prevails in nearly all human beings. This applies especially to successful leaders and others who do well in life: they always have their 'own interest in mind and measure all their actions accordingly.' Guicciardini adds, however, that 'true interest' does not necessarily reside in pecuniary advantage: it pertains, more often, to honor and to the art of knowing how to keep a good reputation.

The general meaning which Guicciardini gives to the term allows him to use it for matters of government as well. Where particular interests are in conflict with the 'public interest,' Guicciardini advocates the primacy of the latter. The conceptions of Guicciardini and his contemporary Machiavelli were developed more fully in the reason-of-state literature, which flourished in Europe around 1600. For one of the leading theorists, Giovanni Botero, 'reason of state' meant 'reason of interest,' and state interest had to be the supreme rule of conduct for princes and statesmen. In this view religious and constitutional matters were to be treated as merely instrumental issues. For the ruler, interest of state is the only legitimate principle of action, and this interest is defined in opposition to both the interests of other states and the passions of the ruler. Control over people demands self-control: passions and other disorderly appetites need to be replaced by a rational use of state interest.

Interests thus came to be seen as the principal motive of human behavior and as the only realistic rule of political conduct. From a predominantly critical concept, directed against ecclesiastic and humanistic virtues, it had gained a more positive meaning. While preserving its amoral connotations, interests appeared to be a more stable and more reliable motive than the passions (Hirschman 1977). The French Huguenot leader Henri de Rohan expressed this view in his influential *De l'Intérêt des Princes et des États de la Chrétienté* (1638) by stating that 'princes order their people around and interest orders princes around.' The prince can be deceived, his council can be corrupt, only 'interest does not lie.'

It was through the translation of Rohan's work that the term 'interest' became established in the political vocabulary in England. And it was from the political scene that the term was then transferred to the market place and came to be applied to private behavior (Gunn 1969).

In the early modern political literature interest was not merely an analytical term. Interests were indeed perceived as the predominant motive of human behavior, but political advisors stressed that interests had to be observed in a rational and calculating way. This was not because human beings were considered to be rational decision makers, but because of the strategic advantages of rational calculation. The prudential weighing of costs and benefits was a behavioral norm for political elites rather than a form of motivational reductionism (Holmes 1995).

2. Contours and Consequences of Exchange

From the political literature, written by counselors and diplomats, the notion of interest entered other intellectual genres in the course of the seventeenth century (Heilbron 1998, Lazzeri and Reynié 1998). Among these other discourses, natural law and moral philosophy stand out; in both cases interest-driven behavior came to be related to new conceptions of politics and society.

In modern natural law interest was part of a foundational argument. The anthropology of the sceptics had given a seemingly universal role to self-interest, and more in particular to self-preservation. Natural law theorists treated this factual observation as a natural right. On the basis of the fundamental right to assure one's self-preservation, they built a system of moral and political obligation which was intended to overcome the relativism of the sceptics.

For natural law theorists such as Thomas Hobbes and Samuel Pufendorf, people are motivated primarily by self-love. But the consequences of their view differed fundamentally. For Hobbes a strong state was the only alternative for permanent and violent conflict between selfish indivuals. Pufendorf constructed more of a historical argument. Human societies arise out of individual needs. Upon this assumption, he proposed a scheme of societal development, culminating in a form of sociability proper to 'commercial' society. Commerce at the time referred to exchange or traffic and not specifically to trade. The idea of a 'commercial' society designated a relatively pacified order within which various realms of exchange had been established. Contrary to Hobbes, Pufendorf thus envisioned a form of sociability based essentially on the ties of self-interested exchange (Hont 1987).

The very idea of a social order emerging out of the self-interested acts of individuals is found more ex-

plicitly in seventeenth-century French moral philosophy. In a number of remarkable essays of the 1670s, collected in his *Essais de morale* (1671–78), the Jansenist moralist Pierre Nicole explained how human society could be well ordered and prosperous without assuming religious duties or prescribing any secular virtues.

Jansenist theology made a strict distinction between the 'city of man' and the 'city of God.' The radically separated realms were founded on two mutually exclusive drives: self-love and love of God. Nicole and some other Jansenists sought somehow to adapt their uncompromising outlook to the demands of worldly life. Especially in his moral essays, Nicole tried to define a modus vivendi for Christians who were forced to live in a corrupt world. Looking for an intermediary route between pious retreat and worldly corruption, he proposed what is probably the first consistent model of commercial society.

The Hobbesian image of a war of all against all, Nicole argued, is valid only in the very beginning of humankind. Since each human being is a threat to the other and no one wants to be a victim, people unite with other people. To affirm their union, laws are established and punishment is instituted for those who violate the laws. Fear of death is therefore the first restraint on self-love. Once open violence is excluded, human beings are forced to use artificial means to satisfy their desires. These artificial means are all forms of exchange. The result of this process is a civil society, which—given the corrupt human nature after the Fall—could not be better organized, even if true religion is banned. Human traffic alone, established and regulated by self-love, had produced this result.

From the point of view of God human society meant corruption, but from the point of view of human beings themselves, the establishment of human civility is the best possible achievement. Given the fact that very few people are prepared to withdraw from society, Nicole added that 'enlightened self-love' was the most effective policy in human affairs.

For Nicole and his fellow Jansenists, human beings could not be credited with any virtue. As in the maxims of La Rochefoucauld, they depicted what seemed virtuous (courage, love, friendship) as being a refined expression of self-interest. Since human virtue is a kind of narcissistic illusion, self-interested exchange was the most realistic alternative for the threat of civil war and a sufficient basis for an orderly society.

3. *Political Economy and Utilitarianism*

Many of the economic and the utilitarian arguments advanced in the eighteenth century were derived from these seventeenth-century writings. Mandeville's tale about private vices and public benefits, for example, originated in the work of French moralists like Nicole. It was not disinterestedness or self-denial which produced civil society, but vanity, avarice, and ambition. Adam Smith's famous phrase that it is not from the benevolence of the butcher that we expect our dinner, but from his 'regard to his own interest' was poignant but historically hardly original. The same may be said of his affirmations that 'society may subsist among different men, as among merchants, from a sense of its utility, without any mutual love or affection.'

Classical political economists like Smith transformed the argument about self-interested exchange into an economic theory of self-regulating markets. When the general argument about exchange narrowed down to a mechanism of economic markets, the political questions implied in the doctrine of interest reemerged. Utilitarianism was one of the attempts to rethink the political issues involved.

Emerging in the eighteenth century and becoming an intellectual movement with Jeremy Bentham and James Mill, the utilitarian system was built on the principle that every human being seeks pleasure and avoids pain. Human conduct is universally guided by the ideas and feelings which are associated with either one of these emotions. This behavioral principle was applied not only to individuals, but extended to the polity as a whole. Like individuals, governments should promote the amount of happiness and reduce the amount of pain. Moral arithmetic, based on the principle of the greatest amount of happiness of the greatest number, thus provided the means for assessing the utility of public institutions and initiating political reform.

The rise of political economy and utilitarian philosophy provoked several intellectual countermovements in the decades around 1800. In their opposition to the French revolution and the ensuing waves of democratic reform, conservatives appealed to the lustre of tradition to counter the cold-blooded politics of interest. Romantics similarly found ways to reaffirm the power of the passions.

4. *Disciplinary Social Science and Interdisciplinarity*

When the social sciences during the nineteenth century gradually became university disciplines, theories of interest were associated specifically with economic theories which—with the exception of Marxism—were increasingly separated from other social concerns. John Stuart Mill redefined the status of political economy by arguing that while different causes operate in society, some of the more powerful causes need to be studied separately. Political economy was legitimately restricted to the phenomena based on the desire of wealth and the law that a greater gain is preferred to a smaller. In Mill's view political economists do not deny other motives, but merely abstract

from them; self-interest is more a methodological construct than a behavioral reality.

During the 'marginalist revolution' the plea for scientific abstraction was combined with the postulate of instrumental rationality (Demeulenaere 1996, Hausman 1992). Economic behavior was modeled as rational calculation aimed at maximizing utility. This approach, which formed the heart of the neoclassical program, allowed much of the formal and technical developments that have characterized mainstream economics ever since. The notion of interest turned into a mathematical technique of maximization under constraint. With Pareto the domain of economics was redefined as the study of choice or optimization, and in Lionel Robbins's definition economists study 'human behavior as a relationship between ends and scarce means that have alternative uses.'

While this definition is, in principle, applicable to all forms of human behavior, many economists during the beginning of the twentieth century were well aware of the limits of their approach. For Vilfredo Pareto neoclassical economics had a limited validity since many aspects of human behavior do not meet the conditions of rational calculation. Many other sociologists also reacted critically to the abstract and formal nature of *homo economicus*. Emile Durkheim and François Simiand argued against the 'unrealistic abstractions' of economic theory, advocating a positive and more empirical approach which was not unlike that of institutional economics. Max Weber proposed a broader understanding of interest and rationality and integrated these in a general typology of social action. Weber reintroduced what he called 'ideal interests' besides material interests, and distinguished instrumental rationality from value rationality. In addition to affective and traditional action, instrumental rationality refers to a means–end relationship, while value rationality pertains to choice as derived from values.

While the academic division of labor between the various social sciences became more strict during many decades, it has been increasingly contested since the 1960s. Economic theories and modeling procedures expanded into many areas which were previously seen as the territory of other disciplines. In political science and sociology economic approaches have become part of the mainstream. Game theory has provided a tool for modeling problems of interactive choice; and rational choice, more generally, became the common denominator for a broad area of interdisciplinary work (Heap et al. 1992).

The progressive expansion of economics was accompanied by a movement in the opposite direction: sociologists, psychologists, organization theorists, and anthropologists have gradually invaded the domain of economics, proposing alternative accounts of core issues of economic theory. Diverse and varied as these contributions may be, they have at least demonstrated that the technical sophistication of economics depends on assumptions which can reasonably be questioned on empirical as well as on theoretical grounds.

5. *Enduring Ambiguities*

Since its early uses in Renaissance political theory, the concept of interest and its terminological derivatives (self-interest, group interest, public interest) have been part of what may be called the materialist tradition in the social sciences. But this general, realistic and hard-nosed orientation is divided over a number of fundamental issues. The development of the notion of interest uncovers at least three enduring ambiguities.

First, the term interest can be used for interpretative purposes in accounting for observable behavior; it can also be used in a normative way for defining what rational behavior is. In the former sense interest generally refers to an explanatory principle; in the latter it merely designates a logically possible and perhaps desirable course of action. The ambiguity of serving both descriptive and prescriptive functions has persisted ever since the origins of the term in political theory. Second, interest refers to material advantages as well as to political, cultural, and symbolic benefits. If the broader understanding of interest is accepted, the idea of maximization becomes problematic, since it is unclear how costs and benefits in the various domains could be calculated and compared with one another. Third, actors may pursue their interests by relying on rational calculation, but they may also do so on the basis of a process of socialization in which choice is not 'rational' in the economists' sense, but bound up with habitualization leading to the practical mastery of a social game (Bourdieu 1990). In the former case interest is part a rational choice theory, in the latter it is not.

Interest, Psychology of

Interest has been conceptualized and studied as a habitual tendency, a motivational belief, a trait, a component of personality, a vocational choice, and a reader response elicited by text characteristics (Renninger et al. 1998). These various conceptualizations of interest can be grouped and defined as a psychological state and/or as an individual disposition (e.g., Krapp et al. 1992, Todt and Schreiber 1998).

Interest as a psychological state involves focused attention, increased cognitive functioning, persistence, and affective involvement. Although focusing attention and continuing cognitive engagements normally require increased effort, when interest is high these activities feel relatively effortless. Increased affect has also been associated with the experience of interest, and researchers generally consider mainly positive affect, such as enjoyment or liking, when they refer to the affective component of interest. Interest as a disposition may be central to how individuals attend, select, and persist in processing certain types of information in preference to others (Hidi 1990, 1995). It has been suggested that interest has evolutionary profit since it causes individuals to concentrate their cognitive, emotional, and motor processes on a certain part of their environment for continuous periods (Rheinberg 1998).

Common to most conceptualizations of interest is an interactive relationship between people and their environment. This feature goes back to Dewey (1913) who said that in interest 'self and world are engaged with each other in a developing situation' (p. 126). Thus, interest always refers to a person's interaction with a specific class of objects, events, or activities, and as such has been identified as having physiological, affective, and cognitive correlates. This strong focus on the specificity of the person and environment relation (as opposed to being localized in either the person, or in the task, topic, activity, etc.) distinguishes interest from other psychological constructs such as general curiosity and intrinsic motivation. Since interest develops over a history of interactions with a class of specific objects and/or activities that include both intrinsic and extrinsic aspects, it is inappropriate to describe interest as the outcome of either purely intrinsic or extrinsic factors (Hidi 2000).

1. *History*

The first theory of interest is often attributed to the German philosopher Herbart ([1806] 1965), who stated that cultivation of diversified interests was a prerequisite for learning and should be one of the primary goals of education. In the early part of the twentieth century many important thinkers were grappling with the relationship between interest and learning. In this period the many different ways in which academics looked at interest reflected the complexity of the concept. Dewey (1913) paved the way for future educational research by suggesting that interest-based learning was different from learning that lacked interest. Furthermore, Dewey argued that interest was necessary to maintain self-initiated, content-related activities that result in pleasure, satisfaction, and learning.

As the fields of education focused on concepts that could be operationalized and empirically tested, there was a noticeable decline in research devoted to the less precise concept of interest. Not until the last two decades of the twentieth century did researchers renew their focus on the concept of interest. Consequently, a renaissance of interest research occurred, with most of the work being produced in Germany and North America. In this period, researchers started to recognize that both emotional and cognitive factors can elicit interest (Kintsch 1980, Schank 1979) and to view interest as being domain and/or content-specific (e.g., Schiefele et al. 1979). The early conceptualizations were further developed into the more recent categorizations of interest.

2. *Various Categories of Interest*

Situational and individual interest are currently the two categories most commonly associated with experiencing the psychological state of interest.

2.1 Situational Interest

Situational interest is generated by particular conditions and/or objects in the environment. Such interest involves focused attention and an affective reaction that may or may not last (Hidi 1990). Although the affective reaction associated with situational interest tends to be positive, negative emotions may also be involved in experiencing interest (Hidi and Harackiewicz 2000). For example, a student who is not interested in science may watch a television show that demonstrates how sheep and cows may be cloned. The student reacts with surprise and a little concern. Her interest has been triggered and her attention has been focused. She experiences fascination mixed with some negative emotions driven by her apprehension over what might happen if humans are cloned. If the television show does not further sustain these reactions, the student will stop watching and move on to other activities. Thus, her situational interest has been linked only to that moment and proved to be short-lived. On the other hand, if the content of the show presents further images that engage her attention and she continues to watch it, her situational interest has been maintained. In this case, the student has continued to experience the psychological state of interest. She became fully engaged, and may even be riveted to the television program.

The above examples suggest that situational interest should be conceptualized as having two potential stages, one in which interest is triggered, and a subsequent stage in which interest is further maintained (Hidi and Baird 1986). Several experimental investigations have found empirical support for this two-stage model (e.g., Harackiewicz et al. 2000, Mitchell 1993).

2.2 Individual Interest

Individual interest has been described as an individual's relatively enduring predisposition to attend to certain objects, stimuli, and events, and to engage in certain activities (e.g., Krapp et al. 1992, Renninger and Wozniak 1985). Through repeated engagements over time, individuals build related knowledge structures, experience positive affects, and come to value highly the object of their individual interests. For example, a person with an individual interest in science values and seeks out opportunities to engage in scientific activities that he or she finds stimulating and enjoyable, works through difficulties that may involve negative emotions, continues to seek out opportunities to accumulate scientific knowledge, and experiences the psychological state of interest (Krapp and Fink 1992, Renninger 2000). Investigations that focused on individual interest have demonstrated that it influences learning and as such is an important component of academic motivation (e.g., Ainley 1998, Alexander et al. 1995, Prenzel 1992, Schiefele 1996).

2.3 The Relationship Between Situational and Individual Interest

Although situational interest and individual interests are distinct, they are not dichotomous phenomena, and they can be expected to influence each other's development. Situational interest, once maintained, may contribute to the development of a longer-term individual interest leading to increased knowledge, value, and positive feelings for the object of interest (Krapp 1998, Renninger 2000). For example, a student assigned a project on Freud starts reading his work only because it is required reading. As the student reads, his (situational) interest is triggered, and he becomes captivated with Freud's personality theory. He becomes excited, develops his own assumptions on how the behavior of significant others in his life could be best understood, and wants to learn more. From a cognitive point of view, a wide range of knowledge patterns have been activated. As the student continues to read about Freud's theory, makes connections, and develops new hypotheses, corresponding changes can be expected to occur across declarative, conceptual, and logical knowledge structures (Farnham-Diggory 1994). From a motivational point of view, although interest has been elicited through an externally triggered cognitive activity, it leads to continued and persistent engagement. As the activity proceeds, it is no longer externally imposed on the student, but becomes enjoyable, self-determined, and autonomous. The potential of situational interest to affect both cognitive and motivational functioning is an important consideration since environmental influences such as teachers and parents can contribute in this way to developing individual interest in students lacking such interest.

Individual interest can influence situational interest by moderating the impact of environmental factors on the psychological state of interest (Bergin 1999, Murphy and Alexander 2000, Pintrich 2000). For instance, having an individual interest in science would predispose a student to watch science television programs. If the program turns out to be a basic introduction to cloning and reiterates information the student knows well—even if the video is arresting for novices—the student will turn to something else.

2.4 Topic Interest

Another form of interest that has been investigated in the literature is topic interest. To date, the meaning ascribed to the term topic interest is ambiguous. Some researchers have considered topic interest to be a form of individual interest but others have treated it more like a form of situational interest. To demonstrate the ambiguity of the way the term has been used, consider what might happen when students are presented with a text entitled 'Cloning Sheep in the 21st Century.' For

students with a well-developed individual interest in biological science, the interest aroused by the text title (topic interest) would be closely linked to their individual interest. However, students who do not have a well-developed interest in the area might also report strong topic interest. In the latter case, this would most likely be due to situational factors such as the novelty or the uncertainty conveyed by the title. Thus, both individual and situational factors influence topic interest. Topic interest has also been investigated in the extensive literature that deals with vocational choice. However, reviewing this literature is outside the scope of this article.

3. Interest and Gender

Although parents and teachers have always been aware of gender difference in interest, only in the last decade of the twentieth century did researchers begin systematically to examine how gender influences individuals' interests. The results of a number of other investigations indicated that gender differences also play a role in the development and outcome of situational, individual, and topic interest (see Hoffmann et al. 1998, for a review of the literature) For example, boys have been found to be more interested in physics than girls, whereas interest in writing shows the opposite trend. In addition to the gender differences in interests, boys' and girls' performances are differently affected by the experience of interest. The literature suggests that it may be particularly important for boys to be interested in their school activities, since their task performance seems to be more adversely affected than that of girls by low levels of interest.

4. New Directions

4.1 Relation Between Interest and Other Motivational Concepts

Until the beginning of the twenty-first century, motivational research tended to be clustered around a few concepts such as interest, intrinsic motivation, self-efficacy, task value, and goal orientation. Whereas the considerable literature resulted in the clarification of these concepts, little understanding developed as to how they were interrelated. Many researchers argue that the time now seems ripe for investigating the interrelations among these motivational clusters (Murphy and Alexander 2000). Interest, intrinsic motivation, self-efficacy, and mastery goals seem to have similar behavioral outcomes such as focused attention, persistence, effort, and positive emotional reactions. It is incumbent upon future research to investigate and clarify how these motivational variables develop and influence each other.

4.2 Neuropsychological Aspects

It has been proposed that the psychological and physiological processes associated with interesting information have unique aspects not present in processing information without such interest (Hidi 1990). By elucidating how the brain works when engaged in interesting as opposed to uninteresting activities, current developments in neuropsychology may legitimize this claim. Thus, a multidisciplinary research agenda that coordinates the findings of the newer techniques of brain behavioral analysis with the longer tradition of educational psychological research on interest holds exciting promise for the future.

Interests, Sociological Analysis of

It is not an easy task to define the notion of interest. Throughout the tradition of sociological analysis, it is often referred to without further specification. In ordinary language, there are two general meanings of this particular idea: The first is that of an agent's special commitment toward some kind of object, or activity, like music. This meaning can be studied by sociology as far as it is concerned with tastes or cultural practices. But the second and more important meaning is the one that implies a certain selfishness. This is mainly the case with 'economic' interests, those concerned with the appropriation of scarce goods. But this idea can also be extended to noneconomical goods, like power or prestige.

1. Sociology and Economic Interests

1.1 Three Problems

Economics has been described as a science of human interests, when they are considered apart from any other motive. This definition is implicit in Adam Smith's analysis, while explicit in Pareto's general statement on the division of work inside social sciences. According to this description, what should the role of sociological analysis be regarding interests? Three major problems come to the forefront of the discussion.

The first one is that of social order. Any economic activity occurs within a social framework, made up of varied institutions, rules, and rights. There are two options here. The first one is to explain this framework in terms of interests, following the tradition of Hobbes and Hume. There is a trend, especially in contemporary sociology inspired by economics, to try to revive this kind of explanation of social norms in terms of interests. But the major part of sociological analysis has tried, on the contrary, to define a specific attitude toward social order that cannot be reduced to interests.

The second problem is that of economic attitudes themselves. In the economic tradition, these attitudes are generally considered from a nonhistorical point of view, in a constant way. For instance, in his description of economic equilibrium, Pareto makes no direct reference to any historical evolution of economic attitudes. For him there are only random distributions of different attitudes toward interest among different people (Pareto 1963). In most of the sociological tradition, this has been seen as irrelevant, since economic attitudes do vary historically. Therefore, various attempts to explain the logic of these changes can be found. Such is the aim, for instance, of Mauss's (1954) celebrated *Essai sur le don*. More generally, sociological analysis tries to relate interests to the background values that encourage or discourage them. In fact, there are two aspects to be stressed from this standpoint: The first is that the very notion of what is to be considered as an interest for an individual can vary socially. For instance, Mauss tries to show that in

archaic societies there is no real interest in personal consumption. The second level is that, any kind of interest being admitted as such, there are social values that reinforce it or restrict its expression.

Therefore, the third problem is that of the extension of the role of interests in social life. Economics mainly studies the exchange of scarce goods. But interests arise in other fields, such as political conflict, family attitudes, etc. The problem will be then to understand how far an analysis in terms of interests can go to explain social phenomena.

1.2 The Problem of Social Order

Three major sociologists have tried to describe the problem of social order as the main area, in social life, where it seems that interests alone cannot suffice to produce the norms that unify people into a society. Comte, first, in a radical attack against what appeared to him as an 'abstract' view, namely that of social contract and economic exchange, stressed the existence of a social consensus foreign to any calculation, and prior to any economic exchange. Following Comte, Durkheim built all his sociological theory on the assumption that individual interests cannot be seen as the root of social solidarity. In a Kantian fashion, he understood morality as a repressive force against individual interests. But, in opposition to Kant, he did not find the roots of such obligations in an individual rational sense of morality, but rather derived it from a specific social level that exerts coercion upon individuals. Parsons, in his attempt to build a general theory of society, continued this tradition. He stressed the existence of common shared values on which economic interests depend. The main point that these three authors made is that selfish interests cannot always lead to cooperation. These same interests can also lead sometimes to opposition among individuals. Hence, the social primacy of cooperation should not be based only on interest.

These three authors can fairly easily be grouped under the 'holist' tradition. But even in the tradition of methodological individualism, there has been a similar trend to refer interests to the values behind them that allow or restrict their development.

1.3 Economic Attitudes

Weber is famous for having, in his work on the Protestant ethic (Weber 1974), stressed the influence of religious attitudes on economic ones. He links the development of capitalism to a complex religious background. Demagicalization, universalization, and moralization of relations among people, commitment to an ascetic lifestyle, and interpretation of worldly success as a sign of eschatological salvation are the key religious elements that can contribute to explaining capitalism's rise in Western societies. These religious elements are joined to other values, namely the general importance of rationality, and its effects on other institutional contexts, like the extension of rational legal systems. The specific modern capitalist attitude cuts itself from its religious roots: It becomes an acquisitive trend in a society oriented towards constant increase of goods rather than satisfaction of stable needs (Weber 1981).

There is, however, another element important in the analysis of economic attitudes: the description of tastes which are behind interests. Parsons and Smelser (1956), for instance, in a general theorization of the relations between economics and sociology, insist upon the fact that the economic preferences that constitute interests are rooted in common social values. The analysis can apply also to the very constitution of economic markets and the value of profit making (Polanyi 1944)

1.4 The Scope of Interests

The article so far has stressed the importance of the social background that narrows or enlarges the field where interests play a role, and has also indicated that, from a sociological point of view, the very definition of interests depends on a social valuation of some kind of ends.

But to this description should be added the opposite trend, that insists on the role of typical standard interests in several aspects of social life. This move does not only refer economic exchange to selfish interests, nor does it try to explain social values or institutions in terms of interest, but it also considers that even beliefs can be referred to interests. That has been the general meaning of a Marxist analysis of ideologies. But the main point here is that a critical attitude towards social order is related to the revelation of hidden interests behind common moral or political beliefs. The main difficulty of such a conception is that it does not take into account the specifically cognitive side of any ideology that cannot be so easily reduced to noncognitive contents.

But the extension of the scope of interests can also intervene without any critical intention: It is only then an effort to show that attitudes in some areas apparently removed from any economic dimension, can be interpreted in terms of interests: not only social norms, but also attitudes towards marriage, children, voting etc. Becker's (1976) or Posner's (1981) work are representative of such ambitions.

2. A Methodological Divide

2.1 Altruism and Selfishness

There is a common assumption shared by the two traditions that try to explain social order in opposed fashions regarding interests: the selfishness of indi-

viduals. Individuals are considered to act according to their interests because they are selfish. This common assumption leads to two alternative results, as we have seen. The first is to consider that social order and social norms can be explained in terms of social interests. The second is that it is not possible to do so, but, since there is a social order as well as something like a morality, which leads individuals to act morally, in an unselfish manner, it has to be referred to something different from interests.

But why should individuals be considered selfish? There are basically two reasons for this. The first is empirical and arises from the evidence of the selfish attitudes that prevail in economic exchange, where there is a huge tendency to avoid systematically letting someone's else interest prevail over one's own.

The second element is methodological: Since commitment to social values is to be explained in a way that is not tautological, it seems convenient to try to show that these norms derive from a sense of interest, that should not, for its part, be explained.

Durkheim admits straightforwardly that individuals are selfish when they are taken alone, but he does not justify this assumption. This assumption is, however, at the core of his effort to describe a specific social coercive level that could explain why individuals act in an unselfish way on certain occasions. His argument could be worded as follows: Individuals are selfish; sometimes they devote themselves to others, but since others are just like me, I should have no reason to prefer them to myself; therefore, it is not to them that I show my respect, through my moral behavior, but to society, as a distinct entity from any individual (Durkheim 1996).

But this statement rests on the idea that such altruistic behavior is always strange. One gives another individual what one has denied oneself, despite the fact that this other being is just another version of oneself not worthy of such an attitude. But in fact, most often, this so-called altruistic behavior does not correspond to this description. Usually, it intervenes in three different scenarios. The first relates to symmetrical attitudes of reciprocity. In this case, there is an admission of the idea that different individuals should have the same rights, and therefore, be allowed to have the same opportunity to pursue their own interests within a common framework. The respect of the right of the other is not the seemingly absurd renunciation of one's self-interest for the other's benefit, with no reason to do so, since the other is just another self. It can be derived from the acknowledgement of the fact that both individuals can be granted the same rights since they have the same interests. It is not that one favors the other at the expense of oneself. It is that everyone can understand, precisely, that since someone's interest should not systematically prevail upon the other's, the solution to this problem is the adoption of norms of reciprocity. A related analysis can be find in Harsanyi (1969)

The second case for altruism occurs when a stronger or wealthier person helps a weaker or poorer one. But, in this case, it is obvious that if people renounce their own interests in favor of someone else, it is precisely because they are in a position to help someone else who does not have the same means. This indicates that it is not another equivalent self that is helped, but someone who is in a worse position.

Third, it is true that sometimes there is a 'sacrifice' of the self in favor of others. Durkheim insists strongly on this kind of situation. But it could be understood, also, by considering the specific position of the person: If the captain of a ship is legally considered to be responsible for a vessel's safety because of his or her specific competence, it is therefore consistent for the captain to remain on board until everyone has evacuated.

All this means that it does not seem absolutely necessary to assume that there is some global social force behind the individual restrictions to self-interest. It is possible to understand actors' self-limitations of interest by their ability to understand the logic of a situation and the need for social rules. Therefore, three positions can be described. The first one is an individualistic and utilitarian position, that interprets most of human actions in terms of selfish interests, as in the case of Coleman's sociology.

The second is a nonindividualistic and nonutilitarian position. As we have seen, it rests upon the idea that, as individuals are selfish, and naturally committed to their own interests, the fact that they sometimes act in an altruistic manner should lead to the recognition of a specific social (not individualistic) level that is responsible for such a change of attitude.

But since it is not obvious that individuals should definitely be considered selfish and only devoted to their own interests without the intervention of a superior force, it seems possible to introduce a third methodological position, individualistic but nonutilitarian. Actors would have then to choose to favor their interests, or instead to avoid satisfying them, because they would be able rationally to understand the appropriate course of action regarding different situations.

2.2 Rationality and Interests

It is important to introduce here the notion of rationality, which has a multisided relationship with that of interest. The classical notion of rationality that prevails in economics is an instrumental one. It designates the choice of adequate means towards ends. The important point is that ends are not integrated in this sense of rationality. They are arbitrary, given at random.

But the rational choice model, highly influential both in economics and sociology, is not entirely clear (Demeulenaere 1996). On the one hand, it is officially

maintained that ends, i.e., interests, are not rational by themselves, rationality being reserved to the choice of means. But on the other hand, the description of rational behavior seems to involve an attitude that does follow selfish interests, and denies respect to any kind of value or social norm that would go against them. There is also another ambiguity. On the one hand, interests are not considered to be substantial ones, as they depend on individuals' choice. But on the other hand, interests are described as substantial: money or wealth, power and prestige.

Thus it is not clear whether this rational choice model is strongly normative or not. It would be so if it stressed that individuals are rational only if they follow their interest, in the selfish sense. But this assumption is very costly for two reasons. The first is that it is not obvious that obeying one's own interests should be the only rational choice. The second is that individuals do not have the impression that they are not rational when submitting to a norm that cannot be referred to interests. On the contrary, they believe they have reasons for doing so.

2.3 Axiological Rationality

Therefore, it seems possible to introduce, in sociological analysis, a third point of view that maintains the principle of rationality, without restricting it to the pursuit of interests or to the limited choice of means towards ends. This principle of rationality should allow the actor to discriminate between interests that deserve to be followed and those that should be avoided.

How should we define this axiological rationality (Boudon 1997)? The main point is that it would show the reasons actors have to act in a specific way, the reasons being not necessarily their interest. Boudon, for instance, shows the importance, in the voter's attitudes, of normative aspects that should not be reduced to the actor's narrow scope of interest. Those normative aspects are not arbitrary as they can be related to a system of beliefs that seems acceptable to actors regarding their general aims. Voters know that, in a large-scale election, their individual votes have no influence on the result. But they know also that other voters are aware of the same fact. If they all abstain from voting, they will lose the benefit of the democratic system. Committed to that system, they understand the importance of voting, even if it is costly in the short run and seemingly inefficient.

Such a theoretical interpretation of the actor's behavior should thus expand the concept of rationality and depart from a narrow positivistic attitude where the ends (including interests) can never be interpreted in their own rationality.

Interference and Inhibition, Psychology of

The concepts of interference and inhibition have a long and diverse history (see Dempster 1995, Macmillan 1996, Smith 1992), and have benefited from a new thrust of energy in cognitive psychology (Dagenbach and Carr 1994, Dempster and Brainerd 1995, Dempster and Corkill 1999, Houdé 2000). These two concepts are directly interconnected, as suggested in the title of the book edited by F. N. Dempster and C. J. Brainerd (1995), *Interference and Inhibition in Cognition*. If interference causes an alteration in performance (triggered by prior learning, a distractor, etc.), then inhibition is the cognitive process that enables subjects to resist interference, as clearly stated by Dempster in the early 1990s (Dempster 1992, 1993). Two fields of cognitive psychology where focusing on

interference and inhibition has led to the newest and greatest insights are the study of selective attention processes, and the study of cognitive development.

1. Interference, Inhibition, and Selective Attention

Traditionally, selective attention has been thought to be a function of activation. That is, after initial automatic processing, relevant information is selected (early or late, depending on the locus of the 'selective filter') by an activation or facilitation mechanism (Broadbent 1958, Deutsch and Deutsch 1963, Norman 1968, etc.). From then on, irrelevant information is no longer processed, and its effect dissipates passively over time. An alternative conception, the attention-*inhibition* view (see Bruce and Tipper 1998, Houghton et al. 1996, Neill et al. 1995), has gradually taken over from classical attention-*activation* theory. In this new approach, the essential mechanism of selective attention is inhibition (or resistance to interference), i.e., the active blocking of irrelevant information. In this case, the cognitive processing of relevant information, after selection, is not seen as being due to specific activation-facilitation, but simply to the fact that processing is no longer adversely affected by interfering irrelevant information.

For psychologists, the question becomes how can these two possible modes of cognitive selection be distinguished experimentally. The paradigm designed to do this is negative priming. Using this paradigm has become the most popular way of measuring inhibition and its interconnection with interference. Take a situation where the subject has to respond first to S1 (the relevant or target stimulus) while ignoring S2 (the irrelevant or distractor stimulus, the one that interferes). Suppose that afterwards the subject unexpectedly has to respond to S2, or in another condition to S3 (a new stimulus). The first part of this procedure is called 'the prime' and the second part is called 'the probe.' The attention-*activation* view says that during the prime, S2 dissipates passively over time since it is not selectively activated. If the effect of S2 has not yet completely disappeared from memory when the probe appears, then S2 (now the relevant stimulus) should be easier and faster to process than S3. This is the classic priming effect (positive priming or facilitatory effect), which is measured using mental chronometry (reaction time in ms). Still in the activation view, if the initial effect of S2 has completely faded when the probe arrives, then S2 processing should not differ from S3 processing. Now in the alternative view, attention-*inhibition*, the prediction for this same prime–probe sequence is exactly the opposite. In this case, S2 is inhibited on the prime, i.e., it is actively blocked in resistance to interference, so it should be more difficult (slower) to process than S3 on the probe. This is the negative priming effect.

Under the impetus of S. P. Tipper (1985), who introduced the negative priming idea into cognitive psychology, a large number of experimental studies on adults have confirmed the existence of this phenomenon in a wide variety of situations, including identification tasks (picture naming, word naming, letter identification), categorization tasks (semantic categorization, lexical decision), matching tasks (letter matching, shape matching), counting tasks, localization tasks, and so on. In Tipper's (1985) influential study using picture-naming tasks, subjects were shown superimposed line drawings. One stimulus (S1), the relevant one (target), was drawn in red, and the other (S2), the irrelevant one (distractor), was drawn in green (e.g., S1 = a kite and S2 = a trumpet). So on the prime, interference came from the green stimulus (here, the trumpet). In the negative priming condition, the prime–probe sequence was such that the prime distractor became the probe target (the same trumpet now drawn in red ink). Naming latencies were significantly slower in this condition than when the prime and probe trials were unrelated (that is, when a new stimulus, S3, was introduced as the probe target). Note that the negative priming effect was also observed with a solely semantic relation (i.e., nonidentical) between the prime distractor and the probe target (e.g., a cat and a dog, respectively).

This first work by Tipper, and the many studies that followed (for reviews, see Bruce and Tipper 1998, Neill et al. 1995), have brought the inhibitory control of information into the foreground as an important mechanism of resistance to interference, with the negative priming (observed on the probe) being indicative of the existence and effectiveness of the inhibition (generated earlier on the prime). New and more precise questions then arose, such as: What is the exact nature of interference, and hence, what is in fact inhibited (the response, the perception, the representation)? Does inhibition depend on task requirements? How is episodic memory (retrieval) involved in negative priming? Is there a single inhibition mechanism or are there many? What parameters affect negative priming, knowing that in certain cases the expected effect is not observed? All of these theoretical and experimental questions are now under study in current research.

Initially, the negative priming paradigm was defined in terms of stimuli, with S1 as the target and S2 as the distractor (see the Tipper example above), but current research as illustrated in the following section also uses a variation applied directly to cognitive strategies.

2. Interference, Inhibition, and Cognitive Development

In the study of cognitive development, new experimental research has also been aimed specifically at

analyzing interference and inhibition (Bjorklund and Harnishfeger 1990, Dempster 1992, Dempster and Brainerd 1995, Houdé 2000, Houdé et al. 2000, Pascual-Leone 1988, Tipper et al. 1989). In this framework, the underlying assumption is that cognitive development cannot be reduced to the mere coordination-activation of structural units or scheme (as in Jean Piaget's 1984 structuralist theory and in the neo-Piagetian models, see Demetriou 1988) but that developing also means learning to inhibit a competing strategy (scheme). To illustrate this approach, two examples are given below in the areas of object construction in infancy and numerical abilities in childhood.

The question of the relationship between cognitive development, interference, and inhibition becomes a relevant one as soon as the basic unit of reality, the permanent object, is in place in the infant. Research on infant oculomotor activity, which uses the violation-of-expectancy paradigm, has shown that early object permanence already exists at the age of four or five months. How, then, can one explain the well-known A-not-B error, observed by Piaget (1954) at eight months and present until the age of one year? To demonstrate this error, the experimenter puts an infant in front of two covers that are equally easy to reach (A and B), and then puts an object under cover A. The infant has no trouble finding it. After a few repetitions (A-A-A- …), the object is conspicuously moved under cover B. The infant who continues to search under A makes the A-not-B error.

According to Piaget, this error is a testimony to the lack of object permanence, in the sense that infants should know that the object continues to exist under cover B because that is where they lost sight of it. But this explanation is no longer tenable today. As indicated above, new research has shown that the object permanence scheme (acquired by the early age of four or five months) clearly precedes the A-not-B error. (Certain authors (Smith et al. 1999) even indicate that there are circumstances in which older children and adults make a similar error.) An interference-and-inhibition-based analysis is better able to resolve this paradox. Situations where oculomotor reactions to unexpected events are observed (events where object permanence is violated) can indeed be considered as optimal contexts where the 'simple' activation of object permanence suffices. The Piagetian situation, on the other hand, where the object disappears under A-A-A- … and then under B, is a misleading situation which, according to neuropsychological analyses of the connection between frontal cortex maturation and the A-not-B error, requires the inhibition of a dominant motor tendency, i.e., the interfering preprogrammed gesture towards A (Diamond 1991, 1998). The A-not-B error is thus considered to be the outcome of an executive failure to inhibit a motor response—which leads to perseveration—and not the lack of the object permanence scheme. More exactly, Diamond (1991, 1998) defends a 'memory + inhibition' interpretation. Already in infancy, then, being intelligent (no longer making the A-not-B error) means inhibiting an interfering scheme. In agreement with Diamond (1991), 'Cognitive development can be conceived of, not only as the progressive acquisition of knowledge, but also as the enhanced inhibition of reactions that get in the way [interference] of demonstrating knowledge that is already present [here, object permanence]' (p. 67).

In the area of numerical development, new research has also revealed the existence of early abilities that were unknown to Piaget. By recording oculomotor behavior, recent studies have shown that four- and five-month-olds are capable of detecting the violation or conservation of number when presented with unexpected or expected numerical events. It has also been shown that these early numerical abilities undergo a cognitive-linguistic reorganization process and then re-emerge in preschoolers after a temporary drop in performance (Houdé 1997). So why, then, do children at this age answer incorrectly on Piaget's (1952) conservation of number task? When shown two rows of objects that contain an equal number of objects but differ in length (because the objects in one of the rows have been spread apart), these children think the longer one has more objects.

We know that Piaget's interpretation was that preschool children are still fundamentally intuitive, or as he called them, 'preoperational,' and hence limited to a global and holistic perceptual way of processing information (here, based on length or, in certain cases, on density). In this view, they have not yet integrated the number strategy that enables them to perform an analytic process involving an exact calculation. The new studies mentioned above cast doubt on this interpretation, suggesting that the conservation of number task is a number/length interference task more than anything else, one that reflects the ability to resist the visuospatial length-equals-number strategy (an often relevant quantification heuristic still used by adults). As Dempster (1995) said, 'Conservation and class inclusion have more to do with the ability to resist interference than they do with the child's ability to grasp their underlying logic' (p. 15).

Here again, as in the A-not-B error in object construction, being intelligent (resisting the visuospatial interference) is essentially being capable of inhibition. This interpretation was recently confirmed using a negative-priming adaptation of Piaget's numerical task (Houdé and Guichart 2001). A chronometric paradigm (adapted from Tipper 1985; see above) was used with nine-year-olds, who succeed in Piaget's conservation of number task, to test the role of cognitive inhibition in a priming version of this classical task. The experimental design was such that the misleading strategy 'length-equals-number' to be inhibited on the prime (a Piaget-like item with number/length interference) became a congruent strategy to be

activated on the probe (a subsequent item where number and length covaried). A negative priming effect, manifested by slower reaction times, was observed for the prime–probe sequence (compared to an unrelated condition). This result thus confirmed that, first and foremost, success on Piaget-like tasks requires an inhibitory process. In this light, the solution to the enigma of cognitive development could be found by looking mainly at the interference-and-inhibition side of cognition rather than searching solely on the scheme-coordination or coactivation side, as Piaget did.

Thus, whether it be in the study of cognitive development in infancy and childhood, or in the study of selective attention in adulthood, interference and inhibition are key concepts for new approaches in cognitive psychology (and also in the field of cognitive aging, following Dempster's 1992 theoretical input). One of the most exciting research trends for addressing these questions is neurofunctional imaging, a new field where the cerebral bases of cognitive interference and inhibition are beginning to be explored (Ghatan et al. 1998), particularly in the anterior cingulate cortex (Bush et al. 2000) and in its strong reciprocal interconnections with the lateral prefrontal cortex. Another exciting perspective is the current evolutionary framework (Bjorklund 1997, Bjorklund and Harnishfeger 1995, Cosmides and Tooby 1987), where inhibition is regarded as a possible 'Darwinian algorithm.'

Intergenerational Justice

Intergenerational justice refers to the negative and positive obligations one generation owes to another. The concept of a generation is essentially indeterminate as there is no point at which a single generation stops and another begins. Within any single population a number of generations will coexist. Intergenerational justice does not refer to relationships of right and duty between different generations within one temporally continuous population. The obligations of young to old or old to young are matters of distributive justice. Intergenerational justice refers to the relationships of obligation, right, or benevolence that ought to exist between groups of people who are not temporally continuous or to that set of issues which apply to noncontinuous populations, in the same way that international justice applies to populations that do not spatially overlap.

The fact of nontemporal continuity explains the problem of intergenerational justice. Many philosophers argue that the absence of temporal continuity casts doubt on the possibility of justifying claims of obligation or right between generations. Discussions of intergenerational justice focus on two sets of questions; first, how do we explain obligations between nontemporally continuous populations and second what obligations might we have to future generations. This article will examine the bases of these doubts about extending the idea of justice to apply to the relationship between nontemporally continuous populations and then conclude with an assessment of what we might owe to posterity.

1. *Contractualism and Asymmetry*

Contemporary discussions of distributive justice are synonymous with the resurgence of contractarian thinking under the influence of philosophers such as Rawls (1971) and Gauthier (1986). We can distinguish between 'mutual advantage' and 'impartialist' contractarianism (Barry 1989). The contract device is used for thinking about distributive questions in circumstances where the parties disagree about ultimate moral principles. If we cannot base our obligations to one another by appeal to a common standard such as utility maximization, we can use the idea of a rational bargain or reasonable agreement as the basis for distributive norms and obligations. The idea of a contract is a thought experiment that can be used to legitimize principles rather than an actual agreement process that groups of people have to collectively engage in. However, even as an hypothetical device the idea of a contract (in both versions of the theory) poses a major problem because of the asymmetrical relation between the participants in intergenerational cases.

The 'mutual advantage' theory argues that distributive principles can be derived from a rational bargain between participants in a cooperative venture, such as market society or political community. The issue of justice only arises when certain circumstances of justice obtain. If each individual could get everything they wanted without cooperation there would be no need for principles of justice. The circumstances of justice are threefold. First, (roughly) equal power among the parties. What one lacks in strength they can make up in guile so no one is guaranteed always getting their own way. Second, moderate scarcity of goods and motivations obtains, so that social cooperation is necessary or at least in the interest of all. Finally, while all benefit from the existence of social cooperation the participants are interested in the distribution of its benefits and burdens. As rational agents each has an interest to maximize their share of the benefits but minimize their share of the burdens of cooperation.

The problem for the 'mutual advantage' theorist is that the circumstances of justice do not unequivocally obtain between noncontinuous generations. If we use the idea of the contract within one generation we can make sense of the idea of rough equality of power and reciprocity as the key motivations for accepting the distribution of the benefits and burden of social cooperation (although we might still argue that this is a morally inappropriate way to think about justice). Yet when we extend this idea to noncontinuous generations the weakness of the method becomes apparent. In what way can we both speak of ourselves and future generations as part of the same 'cooperative' venture? If we just concentrate on the rough equality of power we can see how there is an asymmetrical relation between the generations. Take an issue such as energy policy. We can conceive of

examples where a present generation can unilaterally impose significant costs on future generations such as the management of toxic or nuclear wastes. It is clearly possible for a present generation to take such choices without any possible negative consequences from the future generation except perhaps disapproval and poor historical reputation. The present generation is able unilaterally to affect the interests of a future generation, whereas a future generation cannot unilaterally affect the interests of the present generation, hence the asymmetry. Without rough equality of bargaining power any contractual agreement will simply reflect the advantage of the stronger party, in this case the present generation. If this is so, the contract does nothing more than allow the present generation to pursue its own interests taking account of the future only when its own reputation is at stake and when this is of higher value than any other present interest such as standard of living. Because of the asymmetrical relationship underlying the bargain it is unclear how the present generation could be motivated to assume obligations to the future given the motivational assumptions of 'mutual advantage' contractarianism. The contract not only does not generate obligations to the future, but would appear to generate reasons for ignoring such claims.

The 'impartialist' theory departs from many of the key features of the 'mutual advantage' bargain just considered. Rawls's theory introduces the idea of a hypothetical original position in which the participants deciding which principles of justice should shape the basic structure of their society as a fair system of social co-operation, are shrouded by a 'veil of ignorance.' The point of the veil of ignorance is to filter out the possibility of exploiting 'positional' advantage or inequalities of bargaining power. By denying agents behind the veil of ignorance, information about their particular circumstances and goals, and allowing them only general knowledge about society, Rawls constructs an impartial choice situation. Rational self-interest plus ignorance delivers impartiality and fairness.

Rawls' theory is a thought experiment designed to test the fairness of candidate principles of justice. The contract with the veil of ignorance is designed to model a fair choice situation. However, once again the asymmetry problem arises. The agents behind the 'veil or ignorance' are denied information that will prevent them pursuing their own interests at the expense of each other. The agreement is effectively between members of a single generation. What is to stop the participants choosing principles in order to maximize the condition of the worst off currently in existence that will at the same time worsen the situation of those not yet born? In order to bring future generations into the agreement Rawls posits an additional motive for the participants. They are expected to reason as representatives of families who are assumed to have a concern for their descendants. Heads of families provide the intergenerational link that overcomes the asymmetrical relations between future generations. The problem with this strategy is that it merely concedes the problem of asymmetry and the inability of the contract device to generate adequate obligations to the future. At best the additional motivational assumption gives those in the present generation a reason to take account of future generations. It does not establish an obligation to future generations in the way that the contract does establish obligations within one generation. The addition of the extra motivational assumption provides a noncontractarian reason for taking account of future generations. In effect it assumes precisely what it is supposed to provide, namely a reason for taking account of the interests of future generations.

While contractarian arguments have been central to the development of current theories of distributive justice, they seem singularly ill-equipped to deal with issues of justice between generations because of the asymmetrical relationship between even hypothetical bargainers. This is a point acknowledged by Barry, one of the most significant defenders of a neo-Rawlsian contractarianism (in Dobson 1998b). The key relationship of reciprocity and the equal ability of the partners to affect the interests of each other do not apply in the case of noncontinuous generations. To overcome this the contractarian has to appeal to noncontractarian reasons.

2. *The Nonidentity Problem*

A further ground for skepticism which is related to the asymmetry objection, but which has implications beyond contractarian arguments is the nonidentity problem. This problem has been given its most forceful modern restatement by Parfit (1984). And it is as applicable to theories such as utilitarianism as it is to contractarian theories of justice.

The nonidentity problem draws on a paradoxical implication of the intuitive response to issues of intergenerational justice. Assume that policy makers are making decisions about technologies that deplete environmental resources or cause global warming. These decisions involve questions of intergenerational justice because they do not merely distribute the benefits and burdens of social cooperation within generations but also across generations. Any policy that unilaterally worsens the conditions of future generations by depleting nonrenewable resources without suitable compensations for the future might be deemed to involve an intergenerational injustice as it sacrifices the interests of future generations to serve our own temporary interests. In this case the injustice consists of harming the interests of future generations by denying them opportunities or by unilaterally imposing costs upon them. Against this a sceptic

might respond that our intuitive concern for the future does not withstand critical scrutiny and that we should discount the interests of future generations in determining between environmental policies.

The argument claims that only harms to assignable individuals constitute cases of injustice. An action becomes a case of injustice when it involves harm to the interests of an individual agent or groups of individuals. But if we turn to the issue of appraising environmental policies it is far from clear that they do distribute harms to assignable individuals.

Whichever environmental policy is chosen will have complex consequences for the future, many of which are indirect. One such consequence is on the procreation decisions of particular populations, that is, on who should come to mate with whom. The nonidentity problem depends upon the assumptions that any decision to procreate at one time rather than another will result in the birth of different people. The fact that I was born at the time I was and in the place I was in part made me the person I am now. If I was born either earlier of later my experiences would have been different and therefore I would have been a different person. If this claim is true then any policy which affects peoples behaviour will have implications for the identity of future generations. Thus, an environmental policy which forces me to use my car less and travel more on public transport may be responsible for me meeting my future partner and therefore albeit indirectly for any future persons who result from our relationship.

The important point is that whichever policy is chosen will result in different future populations and not simply different levels of welfare for the same potential population. But if different populations result from different policy choices then does it make sense to talk about obligations of intergenerational justice? We can argue that a policy of resource depletion does not involve any issue of intergenerational justice because it does not harm the interests of any assignable individual. After all whichever individuals do find themselves bearing the burdens of our choices only exist as the people they are because of choices made by us in the past. If we had chosen otherwise they would not have existed at all, but rather some other group of persons would have existed. For the contractarian the problem of showing how assignable individuals are harmed by our choices undermines the claim that we can do injustices to people in the future and this fact renders the whole idea of intergenerational justice deeply problematic. But the problem also applies to utilitarian theories that explain the idea of injustice in terms of worsening the welfare of individuals. We cannot, for example, argue that a future population would have a higher welfare if we had adopted a policy of conservation than if we had adopted one of resource depletion for either policy would result in different populations. The issue would then become one not of whether population X had a welfare level of a or b, but whether population X should exist or whether population Y should exist. The utilitarian can respond to this claim but only at the expense of opening themselves to certain repugnant conclusions.

3. *Utilitarianism and Repugnant Conclusions*

The idea behind the nonidentity problem is that intergenerational obligations must be person-regarding, that is because obligations are owed to assignable individuals. But as we have seen, as the identity of individuals in the future is itself dependent upon present actions, the idea of harming or benefiting future generations becomes problematic. Utilitarians—those philosophers who believe our most fundamental obligation is to promote, either total or average, welfare—often reject the person-regarding view of moral obligations by claiming that overall welfare is prior to questions of its distribution (see Stearns 1972). For the utilitarian we have an overriding obligation to promote utility or welfare and this avoids the nonidentity problem because we can assess overall outcomes irrespective of the identity of the recipients of utility or welfare. This strategy raises a number of important issues when applied to intergenerational questions, but its most striking consequences arise from its application to population policy.

If we have a primary obligation to promote or maximize welfare and this obligation is prior to any obligations to assignable individuals then we are inevitably faced with the question how many people should there be? This utilitarian obligation to promote welfare has direct implications for individual procreative decisions. Before considering whether to conceive a child or bring it into the world a couple will need to consider the impact of this decision on overall welfare. We can consider the impact of this procreative choice on either average or total welfare.

Let us first consider the case of average utility. Here we are required to consider the impact of our procreative choices on the average level of utility across the relevant population. If our society is a prosperous and happy one and the addition of further members who, though happy, would be slightly less happy than the average, then their impact would be negative. In such a case average utilitarianism would counsel against conceiving such a child. Such a way of conceiving procreative decisions might seem suspect but often we do apply such reasoning in thinking about population policy. Some utilitarians consider draconian population policies are justified by average utility. However, opponents of utilitarianism argue that such an approach to procreative questions is wholly inappropriate because social welfare is a morally irrelevant consideration.

Average utilitarianism does not merely have implications for whether we should allow the birth of happy children who are merely less happy than average, it also has implications for those who exist but are less happy than the average. Consider a population of 10 people two of whom are miserable while eight are happy. If we add to this consideration the fact that there is no hunger in the society so that the eight would not gain in utility if the two were removed, we could still increase the average utility by removing the two. However, we could then make similar judgments within the eight until we were left with a very small population perhaps numbering only two in which there was no difference in average utility. In existing populations there are always groups whose elimination would, other things being equal, increase average utility.

What happens when these arguments are applied across populations, as in the case of intergenerational justice? If we accept the premise of the nonidentity argument, namely that the policies we pursue will affect the identity and size of future generations then using the average utility argument we can engage in some interesting trade-offs. If we are concerned about a policy of conservation vs. one of depletion we can reason as follows. A depletion policy would have a large negative impact on a large population but a relatively low impact on a smaller future population. As long as the impact diminished the fewer people there were to be affected we would satisfy our utilitarian obligation. This could easily be achieved by coupling the depletion policy with a draconian population policy amongst our existing population, such that the average utility of the small population x is greater than the average utility of population y that would have resulted from the policy of conservation. The point here is that we can make one of the aspects of the nonidentity problem a policy objective, in order to justify our depletion of resources. As long as we can manipulate the size of future populations by regulating procreative decisions we can pursue almost any policy without harming the interests of future generations.

Average utility results in some questionable conclusions, does total utility fair any better? In the case of individual procreative decisions the issue becomes one of the duty to maximize happy people. As long as each child being born is happy to some degree they contribute to the total sum of happiness. It need not be the case that they are happier than their parents only that they are happier to exist than not to exist by however small a degree. If we grant this condition, which follows from the commitment to maximizing total utility, then we are faced with an obligation to bring as many happy people into the world as possible, however small the individual level of happiness of each person is. The most striking implication for intergenerational justice is that we act justly to the future when we make the size of future populations as big as they can be irrespective of how low the average utility of each member of those future generations might be. Whereas average utility suggests the imposition of particularly draconian population policies, total utility goes to the opposite extreme by encouraging population maximization. The full impact of this repugnant conclusion can be seen when we apply the total utility strategy to the choice between policies of depletion versus conservation. We need to be able to judge the relative utility or welfare of one population against another who would have lived if an alternative policy had been pursued. As long as the total utility of population a is greater than that of population b that might have existed as a result of a different policy choice, then we are justified in pursuing policy a over b. This can help us explain and justify some trade-offs between population size and level of utility such that we might prefer a policy which resulted in a larger population with a lower utility to a smaller population with a higher utility, for example population a with n members each having a utility of 10 as opposed to population b with $2n$ members each having a utility of eight. But this approach becomes counterintuitive and repugnant when we consider the case of a third population of $10{,}000n$ each having a utility of 0.01. In this latter case we face the repugnancy of the total utilitarian approach whereby as long as the population is large enough the utility of the individual members does not matter as long as it is above zero.

By rejecting the person-regarding aspect of justice arguments, utilitarianism can overcome the criticism that we only have obligations to assignable individuals (and therefore we cannot be said to have obligations to future generations) because of the nonidentity problem. They get around the problem only by exposing themselves to different problems resulting from their indifference to issues of distribution that are also at the heart of intergenerational justice arguments. Both forms of utilitarianism considered here address the issue of intergenerational justice by the artificial means of manipulating population size. This strategy either loads the dice in favor of existing generations as long as they are prepared to manipulate the size of future generations accordingly or to reduce our obligations to the simple duty to procreate as much as possible. Neither approach seems an adequate answer to the question of what if any obligations we have to future generations. The two main candidate theories for grounding claims of justice, contractualism, and utilitarianism have serious problems in making sense of the identity of future generations and the idea that we may have obligations to them. Does this mean that the sceptic is right and the idea of intergenerational justice is flawed?

4. *The Prospects for Intergenerational Justice*

The contemporary literature on intergenerational justice is largely focused on discussions of the paradoxical

consequences of applying existing theories of justice to intergenerational problems. Does this mean that the sceptic is correct in arguing that the idea of relationships of justice between generations is incoherent? Two contemporary political philosophers, De-Shalit (1995) and Barry (in Dobson 1998b) reject this sceptical position and suggest that there are ways we can overcome the sceptical position to make sense of intergenerational obligations. However, they do so from very different perspectives, De-Shalit is a communitarian whereas Barry is a universalist egalitarian.

4.1 Transgenerational Community

De-Shalit begins with the challenge posed by the inadequacy of contractarianism and the nonidentity problem. Faced with the problem of asymmetry in the original position, Rawls introduces an additional motivation linking the generations to justify a just savings principle as a constraint on contemporary consumption. This additional motive which requires the participants to think as heads of families is supposed to model the motive to be concerned about our posterity. De-Shalit takes this natural motive and generalises it across the idea of constitutive communities. Why should the family be the only repository of such a motive? His point is that it is not the particular institution that is the repository of this motive but the type of relationship. The contractarian and the non-identity argument posit a sharp break between generations that creates an unbridgeable moral gap between persons. De-Shalit challenges this individualization by arguing that our identities are shaped and constituted by membership of communities. Membership is itself obligation creating, in the same way that Rawls assumes that acting as head of families will provide the sufficient motive to assume obligations to the future. The motivation to be concerned about posterity is for De-Shalit a natural motivation and this is missed by the narrowly 'individualistic' approaches of contractarians and utilitarians. The task for the political philosopher is then not to construct the basis of the obligation to the future. We have this natural concern because our own identity and interests are tied up with the membership and existence of a certain type of community. The task is to expand the implications of that concern for posterity and the specific obligations that can be derived from it. Two important implications arise from De-Shalit's communitarian turn. First, he broadens the notion of those goods we have a duty to bequeath to posterity. Whereas much of the literature assumes merely that our obligations to the future concern material resources and the environment, De-Shalit's emphasis on constitutive communities entails that all those definitive aspects of such communities might be 'goods' that we have an obligation to preserve for posterity. Thus, we could have obligations to preserve languages and cultures or defining institutions such as constitutions, political rights, etc. The second implication is that De-Shalit changes the focus of intergenerational justice from a universal to a particular one. We have obligations to our posterity and not future generations as such. The British people might have obligations to preserve their constitution for future generations, or the Quebequois might have an obligation to pass on their 'distinct society' to future Quebequois, but not to future Nigerians or for the good of future Japanese. For De-Shalit it is not assignable individuals that we need worry about but only assignable groups. Obligations only extend as far into the future as it is reasonable to think a constitutive community will retain its identity.

One possible objection to De-Shalit's approach is that it makes group membership too important. If we only have obligations to our own posterity then we only have obligations to preserve the environment for our posterity. But this raises the counter intuition that it surely cannot be right that I have a duty to protect the environment for my own posterity but that if a policy of depletion falls not on my posterity but on another people then I have no obligation or responsibility. It is for this reason that other theorists are reluctant to abandon moral universalism, or the idea that from a moral point of view spatial and temporal location are not significant.

4.2 Universalism Defended

The key intuition underlying Barry's universalism is that place and time do not provide morally relevant bases on which to discriminate between the interests of those who fall under a principle. This assumption is morally basic, as such it must be defended indirectly by challenging the challenges to it and showing how it accords with our reflectively adjusted intuitions. We might, for example, show that it overcomes the narrow parochialism of De-Shalit's communitarianism. Alternatively, we might suggest that it is the intuition that underlies Rawls' additional motivation designed to supplement contractarianism. The universalist is also likely to reject the utilitarian variant because of the repugnant conclusions that follow from abandoning a person-respecting morality. A universalist might deny that we have an obligation to bring about maximal well-being if this results in the kinds of population policies that result in repugnant conclusions.

One simple way of avoiding this utilitarian paradox is to conceive of obligations of justice not in terms of promoting the good as maximal welfare but in terms of not harming the interests of the future generations. This negative obligation has implications for the redistribution of resources and benefits, it does not merely involve staying ones hand and refraining from

causing harm. In this way we can argue that we have an obligation to give weight to the interests of future generations when we make irreversible consumption decisions. We ought not merely discard future people because they are in the future. However, it is important to notice that the relationship of obligation is between those existing not to harm those in the future, it is in effect a matter of how we regard the future rather than a matter of how we and those in the future interact.

The major objection still facing this approach is the nonidentity problem. We can only have obligations to assignable individuals but the identities of these individuals are contingent on the choices we currently make such that we cannot be said to be harming them. Referring to 'future generations' does not mark out the identity of those being harmed. One way to overcome this problem is to contest the idea that only assignable individuals can be harmed. Thus, it might make sense to say that our decisions about resource depletion can harm future generations relative to the absence of that policy even though the existence of particular individuals might be dependent upon that policy. The nonidentity paradox will only work against such a view if it could be shown that the identities of all members of the relevant future generations owe their existence only to this environmental policy. We can also contest the idea implicit in the nonidentity problem that we cannot be said to harm the interests of members of a future generation as their interests will be a function of the circumstances in which they find themselves. While it is certainly true that any complex account of universal transtemporal interests will be hard to conceive of, there are certain things that it can be argued will be in any subsequent group's interest. It is clearly in no future group's interest to live in a world in which potable water is made scarce by pollution, or in which ozone damage raises levels of carbon dioxide in the atmosphere and levels of harmful radiation. Future generations are also likely to place some value on their environment and biodiversity. How much each of these things will matter is debatable, but that they will matter is uncontestable. Where this leaves the universalist is with the idea that we have obligations to take account of the 'general' interests of future generations not to be harmed in certain ways, whoever they happen to be and whatever else they happen to want. Thus, the burdens of intergenerational justice fall on contemporaries in the form of not harming those interests of future generations by over consumption, environmental depletion and unsustainable development without permanent advances to any future generation.

As subsequent generations extend far into the future our common intuitions suggest that our obligations become weaker in terms of just savings and the transfer of resources. In the case of private individuals the motive to save for offspring is strong but weakens across many generations until we reach a stage where most are indifferent to distant posterity. But the universalist approach is able to accommodate this intuition because it transforms the debate from one of just-savings and the intergenerational transfer of wealth into a present day concern for sustainable economic and political policies which do not worsen the position of those in the future. The idea of sustainable economic development has its own broad and complex literature but the idea of sustainablity gives content to how we might think about justice between generations. In this way the idea of justice between generations converges with the environmentalists' concern with respect for the environment as a common good. If we have obligations to future generations they are to respect the common resource that is the environment which we share. Where intergenerational justice differs from environmental ethics is that it regards the value of the environment as an aspect of human interests. This of course is not the only way we might regard it, but that is merely to recognise that even in the intergenerational case there is more to morality than justice.

Intergroup Relations, Social Psychology of

For purposes of this article, *intergroup relations* will be defined in accord with Sherif's (1962) classic definition of intergroup behavior, i.e., 'individuals belonging to one group interacting, collectively or individually, with another group or its members in terms of their group identification…' (p. 5). This definition highlights the subjective nature of intergroup situations in that it depends on the participants' cognitive representation of themselves as group members or as representatives of social groups or categories. Based on this conceptual definition, the operational definition of intergroup behavior is the presence of category-based discrimination—responding differentially to others depending on whether they belong to one's own social group ('ingroup') or to another group ('outgroup'). Such discrimination can range from preferential attitudes to group-based hostility and warfare. In this article, the study of intergroup discrimination is distinguished from the study of prejudice as intraindividual cognition (see *Stereotypes, Social Psychology of* and *Social Cognition and Affect, Psychology of*) or personality (see *Personality and Social Behavior*).

Within social psychology, theory and research on intergroup relations encompasses two major research traditions. One is the theory of social categorization and social identity which focuses on the processes underlying the formation of ingroup and outgroup differentiation and discrimination. The other is research on the 'contact hypothesis,' which focuses on understanding the conditions that promote or reduce intergroup bias and discrimination. In recent years, these two traditions have been merged into a more comprehensive perspective on the origins of intergroup discrimination and reduction of prejudice.

1. Social Categorization and the Ingroup–Outgroup Schema

One perspective on intergroup relations is provided by social identity theory, as articulated by Tajfel (1978) (see *Social Identity, Psychology of* and *Social Categorization, Psychology of*). In brief, social identity theory represents the convergence of two earlier traditions in the study of intergroup attitudes and behavior—social categorization (e.g., Doise 1978) and social comparison (e.g., Pettigrew 1967). The theoretical perspective rests on two basic premises:

(a) Individuals organize their understanding of the social world on the basis of categorical distinctions that transform continuous variables into discrete classes; categorization has the effect of minimizing perceived differences *within* categories and accentuating intercategory differences.

(b) Since individual persons are themselves members of some social categories and not others, social categorization carries with it implicit *ingroup–outgroup* (we–they) distinctions; because of the self-relevance of social categories, the ingroup–outgroup classification is a superimposed category distinction with affective and emotional significance.

These two premises provide a framework for conceptualizing any social situation in which a particular ingroup–outgroup categorization is made salient. In effect, the theory posits a basic *intergroup schema* with the following characteristic features:

(a) Assimilation within category boundaries and contrast between categories such that all members of the ingroup are perceived to be more similar to the self than members of the outgroup (the *intergroup accentuation* principle).

(b) Positive affect (trust, liking) selectively generalized to fellow ingroup members but not outgroup members (the *ingroup favoritism* principle).

(c) Intergroup social comparison associated with perceived negative interdependence between ingroup and outgroup (the *social competition* principle).

The affective and behavioral consequences of this schema lead to intergroup situations characterized by preferential treatment of ingroup members, mutual distrust between ingroup and outgroup, and intergroup competition. According to this theoretical perspective, the starting point for intergroup discrimination and prejudice is a cognitive representation of the social situation in which a particular categorical distinction is highly salient.

1.1 Behavioral Consequences of Ingroup–Outgroup Differentiation

The role of category salience in intergroup bias has been well documented in experimental research using the 'minimal intergroup paradigm' (Brewer 1979, Tajfel 1978). These experiments have demonstrated that merely categorizing individuals into two arbitrary, but distinct, social groupings is sufficient to elicit discriminatory evaluations and behavior (ingroup bias). The tendency to favor members of one's ingroup over outgroup members has been demonstrated in many different forms, including evaluative biases (attributing more positive characteristics to ingroup members than outgroup members), attributional biases (holding outgroup members more responsible for negative outcomes and giving ingroup members more credit for positive outcomes), allocation biases (distributing more positive rewards and credits to ingroup members than to outgroup individuals), and interaction biases (greater cooperation toward ingroup members and competition toward outgroup members).

Outside the laboratory, the apparently universal tendency for human beings to differentiate themselves

according to group membership has been widely recognized. In 1906, William Graham Sumner coined the term *ethnocentrism* to refer to people's attachment to ingroups and their preference for everything associated with the ingroup over that of outgroups. Ethnocentric attachment underlies group loyalty, adherence to ingroup norms, and trustworthiness in dealings with fellow group members. At the same time, it sets the stage for intergroup competition, hostility, and conflict (LeVine and Campbell 1972).

1.2 Theories of Ingroup Bias

Although ingroup–outgroup discrimination is the defining characteristic of intergroup behavior and documented in many forms, a central concern of intergroup relations researchers is understanding the cognitive and motivational processes that underlie and fuel ethnocentric preference and discrimination. Some theoretical perspectives on this issue come from outside social psychology. These include sociobiological theories that postulate a genetic disposition to behave differentially toward 'insiders' (kin and extended family) vs. 'outsiders' (nonkin) as a strategy of inclusive fitness (see *Evolutionary Social Psychology*), and various psychoanalytic theoretical perspectives derived from Freud's analysis of group psychology (see also Adorno et al. 1950).

Social structural theories emphasize the role of realistic conflict between groups derived from competition over scarce resources (e.g., Sherif 1966). The basic premise of realistic group conflict theory is that intergroup attitudes and behavior reflect group interests. Where these are incompatible—where what one group gains is at the expense of another—the social psychological response is negative intergroup attitudes and hostile behavior. When group goals are compatible, the intergroup atmosphere should be more positive, characterized by tolerance and amicability. Within a given sociopolitical system, group conflicts of interests are most likely to be manifest in struggles for recognition, status, and power (e.g., Sidanius and Pratto 1999). Hence, a substantial amount of research in the intergroup relations arena has been devoted to understanding the relationship between intergroup differences in status and power and intergroup discrimination and bias.

Although realistic conflict may provide a sufficient condition for the emergence of negative intergroup relations, most social psychological theories question the assumption that realistic competition is a *necessary* condition for ingroup favoritism and intergroup discrimination. These theories hold that ingroup–outgroup differentiation and associated preferences serve basic human motives that are independent of competition over tangible resources. The original social identity theory perspective held that achieving *positive distinctiveness* of one's ingroup in the context of intergroup social comparison serves to maintain and enhance *self-esteem*. This idea has given rise to the concept of *collective self-esteem*, self-worth derived from membership in valued groups. The relationship between self-esteem and ingroup bias has proved to be a complex one. Results of cumulative studies suggest that personal self-esteem and collective self-esteem may have different relationships to intergroup discrimination. Ingroup bias may be motivated by the need to restore or enhance collective self-esteem, but particularly for those individuals who are already high in personal self-esteem.

Another motivational theory of ingroup identification and intergroup discrimination gives primacy to the need to *reduce uncertainty* in social situations. According to this perspective, ingroup–outgroup differentiation provides a basis for assigning meaning and structure to otherwise ambiguous social information and provides the individual with guidance and rules for social behavior and decision making. Intergroup discrimination serves to enhance differentiation and achieve greater certainty, particularly when uncertainty has been aroused. Finally, yet another motivational theory of ingroup identification and differentiation from outgroups is based on the idea that social groups meet human needs for inclusion and differentiation as basic social motives. Ingroup membership provides for secure inclusion at the same time that intergroup boundaries serve the need for differentiation and distinctiveness.

2. Intergroup Contact and Cooperation

Whereas theories of ingroup identification and ingroup–outgroup differentiation provide a basis for understanding and explaining intergroup discrimination, another focus of social psychological research has been on identifying conditions for controlling or reducing the prejudicial effects of ingroup–outgroup distinctions. The so-called 'contact hypothesis' is actually a general set of ideas about reducing intergroup prejudice and discrimination that developed among social scientists in the 1940s in the context of inter-racial relations in the US. Although the general idea was expressed in earlier forms, credit for the full contact hypothesis is most frequently accorded to Gordon Allport as a consequence of his presentation in his influential book, *The Nature of Prejudice* (1954). The basic idea behind the hypothesis is that hostility between groups is fed by unfamiliarity and separation and that under the right conditions, contact among members of different groups will reduce hostility and promote more positive intergroup attitudes.

Specification of the 'right conditions' for positive contact constitutes a key part of the fully elaborated contact hypothesis. According to Allport (1954), the

four most important of these qualifying conditions were (a) integration has the support of authority, fostering *social norms* that favor intergroup acceptance, (b) the situation has high 'acquaintance potential,' promoting *intimate contact* among members of both groups, (c) the contact situation promotes *equal status* interactions among members of the social groups, and (d) the situation creates conditions of *cooperative interdependence* among members of both groups. Each of these conditions was derived from results of early research on racial desegregation and intergroup contact in the US, on which the hypothesis was initially based (Miller and Brewer 1984, Pettigrew 1998).

2.1 The Robber's Cave Experiment

Of the contact conditions specified by Allport, the one that has received the most attention and research since the 1950s is the stipulation regarding cooperative interdependence between members of different social groups in the contact situation. This focus is due in large part to the influence of the now classic field experiment conducted by Muzafer Sherif and his colleagues in the summer of 1954 in a boys' camp in Robbers Cave, Oklahoma (Sherif 1966). After successfully creating two rival groups at the campsite, the researchers tested conditions for reducing the intensity of intergroup conflict and ingroup bias among the campers. Having demonstrated that contact under neutral conditions alone failed to have any positive effects, the research team then introduced a series of *superordinate goals* that brought the two groups together under conditions of mutual interdependence and shared outcomes. The descriptive record and systematic measures taken by the researchers provide rich documentation of the effectiveness of cooperative interaction in reducing conflict and promoting cross-group friendships by the close of the summer camp experience.

From Robbers Cave onward, many field studies of intergroup contact have confirmed that intergroup cooperation leads to more friendliness and less ingroup bias than situations that do not promote or require cooperative interaction. Probably the most extensive application of the contact hypothesis has been the implementation of cooperative learning programs in desegregated school classrooms. Different methods of cooperative learning strategies have been devised, but all incorporate basic principles of the contact hypothesis (Miller and Brewer 1984). There is a sizable body of evidence from these settings that demonstrates the effectiveness of cooperative learning groups for increasing attraction and interaction between members of different social categories. Meta-analyses of studies in ethnically mixed classrooms confirm the superiority of cooperative learning methods over individualistic or competitive learning in promoting cross-ethnic friendships and reduced prejudice.

2.2 Laboratory Experiments: Defining the Limits of the Contact Effect

The elements of the Robbers Cave experiment also provided a prototype for subsequent laboratory experiments on the contact hypothesis and its moderating conditions. The basic laboratory paradigm is essentially a scaled-down version of the summer camp model. Participants in a laboratory session are first divided arbitrarily into two separate groups or social categories and given an opportunity to form distinct ingroup identities. The presence of ingroup bias and outgroup derogation is assessed at the end of this stage, and then members of the two groups are brought into contact under conditions that are experimentally manipulated to test features of the contact hypothesis and its underlying assumptions.

A brief review of these laboratory experiments identifies a number of factors that either inhibit or facilitate the effectiveness of contact to reduce ingroup–outgroup biases and promote positive attitudes toward outgroup members. Among the moderating variables confirmed by experimental studies are the frequency and duration of intergroup interaction, the presence of intergroup anxiety, the structure of cooperative tasks, the outcome of cooperation, and status equalization. In general, results of laboratory experiments confirm the premises of the contact hypothesis but also indicate the complexity—and potential fragility—of effects of intergroup contact even under highly controlled conditions.

In what is probably the most comprehensive laboratory test of inter-racial contact effects, Stuart Cook (see Miller and Brewer 1984) conducted a series of experiments in which highly prejudiced white subjects worked with a black confederate in an ideal contact situation (equal status, cooperative interdependence, with high acquaintance potential and egalitarian social norms) over an extended period of time. Perceptions of the black co-worker were measured at the completion of the contact experience, and general racial attitudes were assessed before, immediately after, and up to three years following the experimental sessions. Across all variations of this experiment, white participants displayed predominantly positive behaviors toward their black co-worker and expressed highly favorable evaluations in the postexperimental questionnaires. Whether liking for this individual member of the outgroup resulted in changed attitudes toward blacks and race-related issues, however, varied across the experiments and for different attitude measures.

One major reason why generalization fails is that the newly positively valued outgroup member is regarded as an exception and not typical or rep-

resentative of the outgroup in general. In Cook's studies, significant differences in postcontact attitude change among those who participated in the contact experience compared to control subjects were obtained only in an initial experiment in which what Cook referred to as a 'cognitive booster' was introduced during the course of the experiment. This added element was a guided conversation (led by a research confederate) in which the negative effects of discriminatory policies and practices were directly connected to the now-liked black co-worker. This booster served to make salient the co-worker's category membership and to establish a link between feelings toward this individual and members of the group as a whole. This explicit linkage appears to be a necessary mechanism for the effects of contact experiences to be generalized.

3. *Combining Categorization and Contact: Models for Reducing Intergroup Discrimination*

A significant advance toward a more integrative theory of intergroup relations was achieved when contact research was combined with concepts of social categorization and social identity theory to provide a theoretical framework for understanding the cognitive mechanisms by which cooperative contact is presumed to work (see Miller and Brewer 1984, Hewstone and Brown 1986). From the social categorization perspective, the issue to be addressed is how intergroup contact and cooperation can be structured so as to alter cognitive representations in ways that would eliminate one or more of the basic features of the negative intergroup schema. Based on the premises of social identity theory, three alternative models for contact effects have been developed and tested in experimental and field settings.

3.1 *Decategorization: The Personalization Model*

According to the premises of social identity theory, a primary consequence of salient ingroup–outgroup categorization is the depersonalization of members of the outgroup. Social behavior in intergroup situations is characterized by a tendency to treat individual members of the outgroup as undifferentiated representatives of a unified social category, ignoring individual differences within the group. This perspective on the contact situation implies that intergroup interactions should be structured so as to reduce the salience of category distinctions and promote opportunities to get to know outgroup members as individual persons.

The conditional specifications of the contact hypothesis (equal status, intimate, cooperative interaction) can be interpreted as features of the situation that reduce category salience and promote more differentiated and personalized representations of the participants in the contact setting. Attending to personal characteristics of group members not only provides the opportunity to disconfirm category stereotypes, it also breaks down the monolithic perception of the outgroup as a homogeneous unit. Repeated personalized contacts with a variety of outgroup members should, over time, undermine the value and meaningfulness of the social category stereotype as a source of information about members of that group. This is the process by which contact experiences are expected to generalize—via reducing the salience and meaning of social categorization in the long run.

The personalization model is supported by the early empirical evidence for the effects of extended, intimate contact on racial attitudes. More recently, extensive data on effects of intergroup friendships have been derived from surveys in Western Europe regarding attitudes toward minority immigrant groups. Across samples in France, Great Britain, the Netherlands, and Germany, Europeans with outgroup friends scored significantly lower on measures of prejudice, particularly affective prejudice (Pettigrew 1998). This positive relationship did not hold for other types of contact (work or residential) that did not involve the formation of close personal relationships with members of the outgroup.

3.2 *Recategorization: The Common Ingroup Identity Model*

The second social categorization model of intergroup contact and prejudice reduction is also based on the premise that reducing the salience of ingroup–outgroup category distinctions is key to positive effects. In contrast to the decategorization approach, however, recategorization is not designed to reduce or eliminate categorization. Instead, the goal is to create a superordinate category that encompasses both ingroup and outgroup in a single social group representation. This approach to the reduction of intergroup discrimination is known as the Common Ingroup Identity Model (Gaertner et al. 1993). It is based on the premise that when a superordinate category has been made salient, group members are more likely to think of themselves as one unit rather than two separate groups. When this form of recategorization is successful, ingroup loyalties are transferred from the original subgroups to the common social group as a whole.

The common ingroup identity model has been tested extensively in laboratory experiments assessing the conditions under which two previously segregated work groups can be successfully merged in a superordinate team. The experimental manipulations in these studies focus on situational variables that reduce the perceptual salience of ingroup–outgroup categorizations during the cooperative contact. Conditions

that enhance the salience of the common team identity and reduce the salience of subgroup categories are found to diminish or eliminate ingroup–outgroup biases in the evaluation of fellow team members. To the extent that participants perceive the combined team as a single entity, rather than two separate groups, evaluations of former outgroup members become more positive.

3.3 The Mutual Differentiation Model and Dual Identities

Although the structural representations of the contact situation advocated by the decategorization (personalization) and recategorization (common ingroup identity) models are different, the two approaches share common assumptions about the need to reduce category differentiation and associated processes. In fact, the underlying processes may be complementary in that personalized interactions facilitate common ingroup identity and shared ingroup membership promotes positive interpersonal relationships. Because both models rely on reducing or eliminating the salience of intergroup differentiation, they involve structuring contact in a way that will challenge or threaten existing social identities. Both cognitive and motivational factors conspire to create resistance to the dissolution of category boundaries or to re-establish category distinctions across time. Although the salience of a common superordinate identity or personalized representations may be enhanced in the short run, these may be difficult to maintain across time and social situations.

Pre-existing social–structural relationships between groups may also create strong forces of resistance to changes in category boundaries. Cognitive restructuring may be close to impossible (at least as a first step) for groups already engaged in deadly hostilities. Even in the absence of overt conflict, asymmetries between social groups in size, power, or status create additional sources of resistance. When one group is substantially numerically smaller than the other in the contact situation, the minority category is especially salient and minority group members may be particularly reluctant to accept a superordinate category identity that is dominated by the other group. Another major challenge is created by pre-existing status differences between groups, where members of both high and low status groups may be threatened by contact and assimilation.

These challenges to processes of decategorization/recategorization led Hewstone and Brown (1986) to recommend an alternative approach to intergroup contact wherein cooperative interactions between groups are introduced without degrading the original ingroup–outgroup categorization. In order to promote positive intergroup experience, Hewstone and Brown recommended that the contact situation be structured so that members of the respective groups have distinct but complementary roles to contribute toward common goals. In this way, both groups can maintain positive distinctiveness within a cooperative framework.

Although ingroup–outgroup category salience is usually associated with ingroup bias and the negative side of intergroup attitudes, cooperative interdependence is assumed to override the negative intergroup schema, particularly if the two groups have differentiated, complementary roles to play. Because it capitalizes on needs for distinctive social identities, the mutual differentiation model provides a solution that is highly stable in terms of the cognitive-structural aspects of the intergroup situation. On the other hand, this model of intergroup contact also reinforces the perception that the two groups are distinctly different and thus perpetuates ingroup–outgroup differentiation, and the potential for fission and conflict along group lines remains high.

To reduce the impact of ingroup–outgroup distinctions, some social psychologists have recommended combining the mutual differentiation and common ingroup identity models—creating contact conditions that preserve category identities at both subgroup and superordinate group levels. When participants simultaneously see themselves as members of different groups but also as part of the same superordinate category, intergroup relations between subgroups are more positive than in the absence of the common identity. Moreover, dual identities may also lead to even more positive outgroup attitudes than those associated with a superordinate identity alone.

Research on the dual identity model of intergroup contact challenges the assumption, implicit in much previous work in intergroup relations, that social identities are mutually exclusive, with only one social categorization (ingroup–outgroup differentiation) salient at any one time. New research is beginning to explore the implications of holding multiple group identities, or identities at different levels of inclusiveness, simultaneously. The hope is that a better understanding of the combined effects of mutual differentiation, cross-categorization, and recategorization will provide the social psychological underpinnings for successful pluralism in multicultural societies.

Internal Migration: Developing Countries

1. Introduction

There is widespread agreement among students of population on both the importance of migration for social and demographic dynamics and the difficulty that, by its multifaceted nature, its study raises for the researcher. The intensification of migratory movements always implies societal transformations, including the accentuation of regional and social inequalities, modifications in patterns of population distribution, and changed demographic profiles in both origin and destination areas. Migration studies, however, are complex. The definition of the term itself and its measurement and interpretation are not straightforward. Depending on the type of migration and the focus of the analysis, very diverse theoretical approaches have been used.

As a component of demographic growth, migration plays a fundamental role in the rapid growth of developing countries' large cities, as well as producing significant alterations of the population's distribution over its territory. Migration is responsible, therefore, for a considerable part of the demographic concentration which characterizes many of these countries.

All of the studies concerned with measuring the role of migration show that, to a great extent, it was the volume of movements from rural to urban areas which explains the intense rhythm of urban population increase in the second half of the twentieth century. However, considering its multiple facets, internal migration is not restricted to rural–urban movements, since other types may emerge and grow in importance as a result of changes in economic and sociocultural contexts and in spatial configurations, as well as resulting from specific historical moments of differing countries. This is why, especially in Latin America, types of movements typical of developing countries, such as rural–urban or rural–rural migration, coexist in the same territories with types observed in developed countries, such as urban–rural and urban–urban migration. These movements reflect new forms of organization and structuring of space.

2. Definition and Data Sources

The difficulties of studying migration begin with its definition. Unlike mortality and fertility, this demographic phenomenon has no single definition, but varies according to historical context and the spatial and temporal referents chosen. In fact, even when migration is considered, in a general way, as the move of an individual from one geographic unit (generally defined in administrative terms) to another and as involving a change in usual residence (United Nations 1970, Bilsborrow 1998b, Oucho 1998, Courgeau 1988), several questions remain for such a definition to be used empirically. On the one hand, the type of geographic unit and the boundaries which define it must be specified. The rural/urban dichotomy is one of the most commonly used distinctions, although movements between municipalities, states, or large regions are also important. From the point of view of the spatial dimension, then, migration admits several definitions.

As if this were not enough, another element must be considered for a correct definition of migration: time (Bilsborrow 1998b). What constitutes a change of residence? How long must a person remain in the place of destination to consider the move as definitive and, therefore, a change of residence? These are not easy questions to answer, a situation reflected in another

Table 1
Proportion of population residing in urban areas, by major world areas, 1975–2015

Major area	Percent of urban population		
	1975	1995	2015
World	37.7	45.2	55.5
Africa	25.2	34.4	47.2
Asia	24.6	34.6	47.8
Latin America and the Caribbean	61.3	74.2	82.1
Europe	67.1	73.6	80.1
Northern America	73.8	76.3	81.9
Oceania	71.8	70.3	72.1

difficulty with migration: its measurement. Although international organizations such as the United Nations endeavor to convince countries to adopt minimum criteria which would guarantee the comparability of data, through recommendations and manuals (United Nations 1970), the measurement of migration is problematic. This is so, not only because of the considerable variation in the number and size of territorial divisions among and within countries, but also because of the various possible movements which these divisions may capture.

Classic data sources, such as the demographic censuses, due to space limitations in the questionnaires and to financial constraints, must generally decide which type of question or territorial division to use for the migration question, when and if it is possible to include this dimension in the questionnaire. There are other problems as well, such as the temporal gaps of censuses, precarious data publication in many countries (Oucho 1998, Chen et al. 1998, Bilsborrow 1998b, Lattes 1998), and financial and operational difficulties for carrying out specific and periodic surveys, sources which would be the most adequate to obtain a better understanding of the phenomenon, especially of its determinants and consequences (Bilsborrow et al. 1984).

Problems of periodicity, availability, quality, and publication of data have meant that much of the information on migration is obtained through the use of indirect demographic estimation techniques, a fact which not only limits analytic possibilities but also affects the reliability and precision of results.

3. *The Role of Rural–Urban Migration in the Urbanization Process*

The twentieth century ended with more than half of the world's population living in urban areas. Nevertheless, there remain considerable differentials among countries in this respect, especially between developed and developing countries. While European and North American countries have proportions of urban population over 70 percent, and are likely to pass 80 percent by 2015 according to United Nations estimates (Chen et al. 1998), in Africa these values are under 35 percent and will not reach 50 percent even by 2015. There are, of course, important differences among developing countries. In Latin America, the region with the highest level of urbanization—especially in countries such as Argentina, Brazil, Uruguay, Chile, and Venezuela—close to 80 percent of the population live in cities. Table 1 presents estimates of the proportion of urban population residing in major world areas.

Comparing data on rural and urban population is problematic, however, and precaution should be taken, since this definition depends on each country (Bilsborrow 1998b, Lattes 1998). There is no doubt, however, that the developing world is on the path of increasing concentration of population in cities.

In this continuous process of urbanization, internal migration of rural origin plays an important role, especially considering that the higher level of rural fertility favors greater natural growth in these areas, therefore having an inverse effect. Authors such as Chen, Valente, and Zlotnik (1998), Lattes (1998), and Lucas (1997) leave no doubt as to the preponderant weight of migratory movements from rural areas to the growth of cities in developing countries.

Table 2 shows much variation, however, in the relative contribution of migration and reclassification to urban growth in developing countries. Unfortunately, in view of the lack of adequate data, existing estimates of the effect of migration on urban growth, having been obtained by residual methods—the difference between total observed growth and estimated natural growth—do not permit separating the effect of reclassification of rural to urban areas, which also contributes to the increase of urban population. For the majority of countries for which data exist, the combined contribution of migration and reclassification is greater than 40 percent. Lucas (1997) shows that for a sample of 29 countries this proportion reached 41.4 percent in the 1960s.

The more countries urbanize and the more complex and heterogeneous are their social, economic, cultural, and political structures, the more diversified are the types of population mobility. As Bilsborrow notes, the emphasis of migration research on the rural–urban type reveals 'a severe case of myopia,' since 'this bias is inconsistent with reality' (Bilsborrow 1998b, p. 8). Indeed, besides the several variants of internal migration in terms of the temporal dimension (permanent or short-term moves—seasonal, temporary, and circular (see Bilsborrow 1998b)), the spatial perspective also leads to other considerations, such as migration of urban origin.

In fact, phenomena such as 'counter-urbanization' (Champion 1989, Frey 1988, Lattes 1998), 'rural rebound' (Johnson 1999), and 'nonmetropolitan turnaround' (Fuguitt 1985), typical of developed countries, are already felt in developing countries, especially in Latin America. In addition, there are phenomena typical of developing countries. On the one hand, the settlement of frontier regions implies migration to rural areas, while on the other hand, demographic pressure in stagnating areas, concentration of land ownership and technological and organizational changes in agriculture dislocate population from rural zones. At the same time, the peripheral growth of metropolitan areas encompasses a large variety of urban–urban and urban–rural movements, which become increasingly visible and significant in these countries, especially as urbanization reaches high levels.

Rural–rural movements should not be underestimated either, least of all in some countries of Asia and Africa, where the proportion of population living in rural areas continues to be high. Skeldon (1986) shows, for example, that for India, 57.4 percent of those who had moved in the 10 years before the 1981 census did so from one rural area to another, while other types of movement were less important: rural–urban (19.5 percent), urban–urban (15.2 percent), and urban–rural (7.9 percent). Refugee movements, driven by war and environmental disaster, continue to displace populations, often resulting in permanent dislocations; such movements are rarely examined by students of internal migration.

For the largest cities, it is not only the movements originating in the less developed regions which are important. Both intra-metropolitan moves, responsible for a major part of the growth of urban peripheries (Cunha 1998), and commuting, whose growth reflects growing distances between residence and workplace, are significant features of urban life in developing countries.

4. *Characteristics and Conditioning Factors of Migration*

In view of the multifaceted character and the many forms of the migratory phenomenon, its characteristics and conditioning factors are also considerably varied, depending, on the one hand, on whether one adopts a macro or micro level of analysis, and on the other hand, the historical moment and the economic, social, political, and cultural context in which migration occurs. Thus, conditioning factors will vary and characteristics of population movements between distant regions of a country, with different degrees of development, will certainly be distinct from those referring to moves between municipalities of a metropolitan area.

Although in terms of age and sex there are regular references in the literature concerning the tendency for migration to be concentrated among young adults, in general between the ages 15–30 years, and concerning a greater proportion of women in rural–urban streams (United Nations 1993), these generalizations are very abstract and therefore incapable of capturing the entire range of possibilities encompassed by this complex phenomenon. There are social-structural factors which condition movements, as well as specific cultural aspects and geographic realities (the distances involved in the migration, for example). Such elements as life cycle, the composition and forms of family organization and characteristics of origin and destination areas are fundamental elements for determining who moves and who stays.

In terms of migration by age, selectivity reveals the importance of economic factors, especially those associated with the forms and possibilities of the insertion of the individual in the local labor market (both in terms of employment and remuneration). The greater predominance of young adults reveals a greater incidence of movements of one person or of couples in early stages of their life cycles. From the point of view of destination areas, migration will depend also on pull factors. For large urban centers, for example, selectivity will be affected by the number of opportunities available in the formal and informal labor markets.

With the restructuring of the world economy, with the accompanying flexibilization of production and employment and the ever more intense use of technology and information (Castells 1996, Harvey 1990), the employment/migration relation will not be as strong as in the past. The levels of wealth in urban areas, creating a demand for unskilled personal services, will continue to attract migrants, able to survive on irregular odd jobs, with no prospect for real employment. On the other hand, in agricultural frontier areas, for example, family migration is more likely to predominate, which would alter the age structure of migration, making it less selective.

As for sex, the available data (United Nations 1993) show that although women predominate in rural–urban migration streams, this tendency is not so clear when data from different countries are observed, especially controlling for age. Even in African countries, where the predominance of male migration is

clear, controlling for age makes a difference: in the 10–19 and over 45 categories, women dominate, while in the highly productive ages, it is men who migrate more (Singelmann 1993). The fact that younger women represent greater proportions may be explained by the differences between the ages of men and women within marriage; for older women the data probably reflect the effect of differential mortality by sex which, as is well-known, favors women. This means that for the sex variable also, migration characteristics depend greatly on the contexts in which they occur and any generalization may be, to say the least, simplistic.

In addition to factors linked to the needs and preferences of migrants or to the structural conditions of origin and destination areas, the role of social networks must also be considered among the major conditioning factors of migration. Networks, of fundamental importance in the direction and volume of streams, supply information on destinations; reduce risk; and facilitate adaptation of the individual to the new area.

5. *Conclusions*

The late twentieth century was marked by immense population movement between regions of developing countries, especially by rural–urban migration. A slowdown in technological development in these countries at the century's end, coupled with increasing productivity in agriculture, point to a change of pace in these movements. According to Brockerhoff (1999, p. 772): 'the sluggish performance of manufacturing (compared to agriculture) remains largely responsible for the observed slower pace of urban growth in developing countries, and may have decelerated urban growth from what otherwise would have been higher rates in the 1980s and 1990s by curbing net rural-to-urban migration.'

The beginning of the twenty-first century is marked by a radically altered situation. Globalization, in both its economic and sociocultural aspects, together with the demographic transition and the environmental crisis, have greatly affected the factors which condition population mobility. The most intense phase of urbanization has been completed in many countries. The mobility and flexibility of multinational capital have weakened the relation between place of residence and place of work. New forms of mobility become more important: commuting, tourism, circular migration, and seasonal migration, in addition to the increase in short-distance, intermunicipal moves. International migration, which in the nineteenth century implied a permanent move of large populations, has become an option not radically different from internal migration, and nearly as reversible. The rapid population growth phase of the demographic transition, which contributed to internal migration, has also given way to slower growth in many countries, reducing pressures in places of origin. Finally, an 'empty world' has been substituted by a 'full world' and the resulting environmental restrictions will be ever more important conditioning factors of population mobility (Hogan 1993).

Policy responses to internal migration in developing countries have varied widely. Desires to colonize new agricultural regions, to promote industrialization or to curb what is perceived as excessive growth of 'megacities' have led governments to adopt a wide range of policies. The success of such policies has often been questioned, although Brockerhoff (1999) observes that countries which expressed an intention to effect policies for slower urban growth, such as Mexico, Egypt, and India, have had lower urban growth rates than their global subregions and especially lower than their neighbors. In the coming period of slower demographic growth, policy initiatives may be more generally successful.

The diversity which is currently observed in the world demographic situation has no historical precedent. Rates of internal migration and urbanization levels are extremely varied, but the tendencies in all major regions point to convergence and a less varied situation in the future.

Internal Migration (Further Types): Industrialized Countries

Residential mobility and migration are pervasive facts of life in most industrialized countries, where migration is a major mechanism through which labor resources are redistributed geographically in response to changing economic and demographic forces. The migration literature may be classified into two areas of research, one dealing with the *determinants* and one with the *consequences* of migration. Some studies treat both the determinants and consequences within the same framework. Migration research is strongly oriented toward the former.

The *determinants* of migration are the factors that affect migration, including characteristics both of places and of persons and their families. The term refers to the qualitative and the quantitative importance of each factor. Place characteristics are specific to a given area, such as employment and wage opportunities, the presence of family and friends, and location-specific amenities. Personal and family characteristics help shape individual and family responses to opportunities that may exist at different locations. The *consequences* of migration refer both to the performance of migrants in their new locations relative to a benchmark (their presumed performance in their former place) and to the impacts that migrants have on others in sending and receiving areas. Traditionally, research has addressed several questions:

(a) Who migrates?
(b) Why do these people migrate?
(c) Where are the migrants coming from and where are they going?
(d) When do they migrate?
(e) What consequences result from migration?

Many studies have aimed primarily at describing migration.

1. *What is Migration?*

The United Nations manual, *Methods of Measuring Internal Migration* (1970), has served as the basis for several definitions of migration and migrants. It proposes the following (p. 2):

> A migration is defined as a move from one migration-defining area to another (or a move of some specified minimum distance) that was made during a given migration interval and that involved a change of residence. A migrant is a person who has changed his usual place of residence from one migration-defining area to another (or who moved some specified minimum distance) at least once during the migration interval.

2. *Comparing Internal Migration Rates in Industrialized Countries*

In most countries people migrate from one place to another in pursuit of increased utility resulting from better employment opportunities, higher wages, and many other factors, but international comparisons of internal migration rates are difficult to make for several reasons.

Various countries define migrants differently in terms of whose movement is being considered, in terms of the type of border they must cross, and in terms of the interval over which the movement occurs.

The method of measuring migration differs widely. In some countries, censuses are the main source of information concerning migration, whereas in others, population registers and other types of administrative records are the major source.

The size and shape of the spatial areas between which migration is measured are not uniform either within or between countries.

Migration propensities are sensitive to national economic and demographic conditions, and conse-

quently interregional migration propensities could differ for behavioral reasons.

The most unambiguous method of making cross-national comparisons is to focus on residential moves, but residential mobility includes more than what is commonly regarded as migration. Nevertheless, such measures suggest that rates of mobility vary widely across industrialized countries. Movement rates are high for Australia, Canada, New Zealand, and the USA. A second group of industrialized countries that is far behind these four includes France, the UK, Israel, Japan, Sweden, and Switzerland. Belgium, Ireland, and The Netherlands have the lowest rates of residential mobility.

3. *The Determinants and Consequences of Migration—Overview*

3.1 *Migration Patterns*

Many factors contribute to the decision to migrate. Differential characteristics of sending and receiving regions provide a potential incentive for moving, and individual and/or family traits help condition the responses to utility differentials that may arise from these different characteristics. An individual's personal characteristics—including accumulated job skills, general labor market conditions, and employment composition—will help determine the probability of gaining employment during a period of job search. Conditions in land and housing markets also may be important, and state and local taxes and the associated availability of public goods may be critical for certain potential migrants.

A number of lifecycle considerations—such as marriage, divorce, completion of schooling, entry into the labor force, start of a career, birth, aging, leaving home of children, home ownership, and retirement—are critical in an individual's or a family's decision to migrate. Other personal circumstances, often related to the lifecycle, are also important, such as employment status, earnings, education, accumulated skills, age, job tenure, sex, and health.

One of the most universal mobility relationships is that between age and migration. Migration propensities peak during the early to mid-20s and then decline steadily, with a slight upturn at retirement age in some countries. For example, in the USA during the 1980s a person aged 25–29 with four years of college education was over twice as likely to make an interstate move as his or her counterpart aged 35–44; over three times more likely to make such a move than someone with comparable education aged 45–64; and over three times more likely to make such a move than a peer in age who had less than eight years of education.

Studies of the determinants of migration commonly have been formulated in the context of individual utility maximization, with some attention given to the family or the household as the decision-making unit. Models based upon such behavioral foundations have frequently been estimated with aggregate data relating both to migrants and to the determinants of migration. Before the general availability of micro and longitudinal data, virtually all applied migration research was of necessity based on aggregate data. Although aggregate data were and are limiting in many respects, they did not prevent a boom in migration research during the 1960s and 1970s. Even in the presence of many microdata sets, aggregate data are frequently studied today. Not only are aggregate trends and tendencies of interest in their own right, but for many countries, such aggregate data are all that is available.

During the 1960s, the main thrust of migration research began to take on a more formal tone. Most of the research was not formal in a theoretical sense, but rather intuitively generated hypotheses at first were tested formally in an econometric sense with aggregate data, typically but not always with place-to-place migration data. Such models were frequently specified in the context of modified gravity models. The models are 'gravity type' in that migration is hypothesized to be directly related to the size of relevant origin and destination populations, and inversely related to distance. The models are 'modified' in the sense that the variables of the basic gravity model are given behavioral content, and additional variables that are expected to influence migration are included in the estimated relationship. These studies showed clearly that migration diminishes rapidly with increased distance and that migration is greater between more populous regions, but migration did not always appear to be from low to high wage regions nor from those with high unemployment rates to those with low rates.

3.2 *Theoretical Perspectives on Migration*

In almost all migration research conducted by economists prior to the late 1970s, the theoretical perspective taken was that of a disequilibrium system. The perspective is called 'disequilibrium' because migration is assumed to be driven by the existence of a set of non-market clearing regional wages. Spatial variations in wages or earnings are assumed to reflect opportunities for utility gains. During more recent years, this disequilibrium perspective has been challenged by proponents of the equilibrium hypothesis, which assumes that spatial variations in wages are compensating and therefore do not reflect opportunities for utility gains.

According to the human capital approach, the potential migrant will select the locality at which the real value of the expected net benefit that accrues to him from migration is greatest. The income that the individual expects to earn at each alternative destination enters importantly into his judgment concerning the benefits associated with each location. The

relevant income measure for the individual to consider is the present discounted value of his expected future stream of net pecuniary returns.

Due in part to the fairly consistent tendency for empirical studies based on aggregate data to fail to confirm the importance of wages or income in migration decisions, the equilibrium approach has been offered as an alternative to the traditional disequilibrium perspective described above. The equilibrium theorists begin by assuming that households and firms are in proximate equilibrium at any point in time. This assumption means that the marginal household and firm, while maximizing utility and profit, respectively, are spatially arrayed so as to receive zero consumer and producer surplus from their location. Thus, any movement from the general equilibrium configuration cannot improve utility or profit.

According to the equilibrium approach, changes in lifecycle factors or generally rising real incomes continuously change the demand for consumer amenities. Because amenities are not evenly distributed spatially, migration occurs and quickly reequilibrates households. Net in-migration to amenity-rich areas tends to drive down wages and drive up the prices of locally produced goods and services and land. In amenity-poor areas, opposite patterns of change occur. Wages and local prices diverge across regions until they just compensate households for the differing amenity bundles that the various regions supply.

Family ties result in negative personal externalities that are usually internalized by the family and thus tend to discourage migration. 'Tied persons' in the family are 'those whose gains from migration are (in absolute value) dominated by gains (or losses) of the spouse' (Mincer 1978, p. 753). Presuming that their joint net returns on migrating from *i* to *j* exceed their joint net costs of migrating, a couple would presumably migrate from *i* to *j*. If, for example, the wife's expected earnings in *j* were less than in *i*, but the husband's were sufficiently greater in *j* than in *i* to offset these losses, the wife would be a 'tied mover.' On the other hand, if the husband's earnings gain in *j* were to fail to offset his wife's earnings loss in *i*, the couple would remain in *i*, and the husband would be a 'tied stayer.' Moreover, according to Mincer, such ties tend to reduce the employment and earnings of those wives who do migrate and to increase the employment and earnings of their husbands. Mincer goes on to show that increased labor force participation rates of women cause an increase in migration ties, which results in both less migration and more marital instability. Increased marital instability in turn encourages migration as well as increased women's labor force participation.

3.3 Consequences of Migration

The consequences of migration have been addressed at two levels. The first deals with the migrants themselves, where the emphasis has been on the benefits to migrating, often measured in terms of earnings gains. The second deals with migration's impact on others in the origin and the destination. Do migrants depress local wages in receiving areas and displace local residents from jobs? To the extent that migrants tend to be young and well-educated, does migration deprive source regions of critically needed human capital that ensures these regions of long periods of economic stagnation?

4. Conclusions

4.1 Pressing Questions

Who migrates? Why do they migrate? Where do the migrants come from and where do they go? When do they migrate? What consequences does migration have for the migrants themselves and others in origin and destination regions? During the last 30 years, firm answers have been provided to many of these questions, but at the same time new, narrower, and in certain ways more refined, interesting, and certainly more challenging questions have arisen.

Migration propensities appear to vary considerably across industrialized countries for reasons that are not always obvious. Moreover, estimated parameters that address the questions raised above, while generally in qualitative agreement, are quantitatively somewhat different across industrialized countries, even when the models and data are roughly comparable. With regard to internal migration, rigorous crossnational studies are virtually nonexistent, but differences in geographic size (and hence spatial distribution of economic opportunities) and culture are likely to importantly underlie observed differences.

4.2 The Human Capital Model

Until about 20 years ago, aggregate data were used almost exclusively to study various migration phenomena. Such data embody a number of shortcomings that prevented the study of many important issues bearing on migration. The relatively recent availability of micro- and longitudinal data have had a major impact on four areas of migration research.

(a) Such data have gone far toward clearing up earlier puzzles concerning the relationship between unemployment and migration.

(b) They have allowed the human capital model to be tested in the migration context by allowing the estimation of migrant earnings equations.

(c) They have permitted a clarification of the relationship between personal characteristics and the decision to migrate, and they have allowed a deeper understanding of the relationship between various lifecycle and familial factors and migration.

(d) They have permitted a detailed focus on different types of migrants, particularly primary, return, and other repeat migrants.

Researchers now know that local unemployment in the USA has a significant influence on the migration decisions of the unemployed and those who are seeking new jobs, but has little influence on individuals who are secure in their jobs. However, they do not know why this relationship fails to hold for European countries. Moreover, they do not know with great confidence why some unemployed individuals are quicker to migrate than others. To some extent, immediate migration could be discouraged if a person's spouse remains employed. What characteristics of a spouse's employment discourage migration? To what extent does it matter whether the party remaining employed is the husband or the wife? What role does the availability of unemployment insurance play in discouraging immediate migration? Institutional settings differ substantially by country, such as in the nature of unemployment insurance programs, and could cause differences in the response to personal unemployment.

The human capital model has provided a powerful analytical tool for the study of numerous important issues. It is somewhat surprising that this model has not typically provided a comparably powerful explanation of internal migration. Whether migrants are compared to otherwise comparable individuals in the origin or the destination, they appear to suffer earnings losses for at least several years after migration. This finding has been verified repeatedly for the USA and for other countries. Although several explanations have been offered for these findings, we still do not know enough about why they occur. The most likely explanation for the apparent failure of the human capital model is that the model has not failed, but rather it has just not been properly or fully implimented.

4.3 Lifecycle Impacts on Migration

The influences of lifecycle changes on migration decisions have only barely been touched by researchers. The relationships between many such changes and migration therefore have remained undiscovered. Completion of education; birth and aging of children and the anticipation of these events; changing marital status and especially divorce; death of a spouse; acquisition of a home; retirement—these are only a few potentially important lifecycle changes that are likely to importantly affect migration in industrialized countries and about which much remains to be learned.

Little is known about the interactions between migration and fertility in the contemporary USA or in other industrialized countries. A sizable literature on this topic began developing in the 1930s, but was mainly focused on rural-to-urban migration. A good deal of more recent work has also focused on rural-to-urban migrants in less developed nations, and a few studies concentrate on immigrants to the USA. However, in spite of the availability of more and better data in recent years, little has been done to study how the act of migration affects fertility in the USA or in other industrialized countries.

4.4 Migration Policies

Migration serves an equilibrating function in the economy, expediting the balancing of demand and supply forces within and across regions, and thus facilitating the operation of market economies. This facilitating role of migration has attracted the attention of policy makers. In a number of European countries, such as the UK, France, and The Netherlands, migration policy has been tied directly to regional development policy; in others, such as Sweden, migration policy has been oriented toward improving the efficiency of the labor market. In either case, a major objective has been to reduce unemployment. Subsidization of relocation expenses and employment information exchanges are the most common forms that migration policy has taken in Europe.

In the USA, policy concerns regarding migration generally are passive, although this was not the case during the nineteenth century. These concerns have been directed toward both how various national, state, and local policies have affected in- or out-migration and how migration has affected the public sector of states and localities. One policy concern that has arisen in this respect is whether the jobs created by economic development efforts go to previous residents or inward migrants.

Internal Migration (Rural–Urban): Industrialized Countries

1. Basic Concepts

Migration is a demographic process that moves people between places, and so contributes to population change along with fertility and mortality. Migration is the movement of individuals, households, and groups between residences or residential locations. The residences or residential locations before the move are referred to as origins and the postmove residences or residential locations are labeled destinations.

The exact definition of what constitutes a migration has proved to be more difficult to pin down than the definitions of birth and death, and alternative concepts used to measure migration are outlined below. This survey is, however, restricted to migration that takes place entirely within the boundaries of national states. This type of migration is called internal; also very important as a contribution to current demographic change is international migration, in which the migration takes place between countries. We also confine attention to internal migration within industrialized countries, broadly the rich countries housing in 2000 some 1.19 billion people out of the world total of 6.06 billions (UN 2000). Many of these countries have economies in which manufacturing industry plays a relatively small role in employment terms and in which services of an ever-increasing complexity play the biggest part. Industrialized countries include most in Europe, Northern America, Australasia, and some of those in East and South Asia.

The article focuses on the variation in levels of internal migration across countries, the changing relationships between internal migration and national settlement systems, and shows how one major process, urbanization, is being replaced in part by another, labeled counterurbanization. The article concludes by examining the way migration processes vary through the life course and by commenting briefly on the forces working to produce these new patterns.

2. Levels of Internal Migration

Internal migration is measured by national statistical offices in all industrialized countries but there is as yet no international consensus on how it should be measured and reported on a harmonized basis. No international agency compiles statistics reporting on the level, the characteristics, the distances involved, or the impact on population change. Two attempts to compare migration levels are discussed here. Long (1991, 1992) has compiled and interpreted statistics on all changes in residence within a one-year interval, drawing mainly on census statistics or national population registers which capture all migrations. Rees and Kupiszewski (1999b) have used an index proposed by Courgeau (1973a) that makes possible comparison of migration flows at different scales. In both comparisons the intrinsic differences between the types of data captured by registers (all moves within an interval) and by censuses (transitions between start and end locations in an interval) are ignored. These differences are less serious when the time interval is one year.

2.1 Rates of Change of Residence

Table 1 sets out migration intensity estimates (for all changes of residence) from censuses around 1981 derived by Long (1991, 1992), supplemented by further computations by Rees et al. (2000). The statistics derive principally from periodic population censuses, which ask questions about where respondents were living at a date in the recent past (usually one or five years ago). A comparison of residences reported at the start of the reporting period with current residence yields a table of migrant transitions. Censuses or surveys count surviving migrants and normally omit repeat and return migration events, migration events made by persons not surviving the reporting period, and migrants born within the reporting interval. Census derived migration measures are also sensitive to the length of reporting interval (Courgeau 1973b, 1980).

The countries of the English-speaking world outside Europe stand out as experiencing significantly higher internal migration activity than Europe countries or Japan, with 17 to 19 percent of their populations moving each year (Table 1). Because New Zealand, United States, and Australia have, for industrialized countries, relatively youthful populations, standardizing these rates on age reduces the gap a little: the

Table 1
One-year migration intensities based on census data for selected countries

Country	Year	Crude migration rate	Age-standardized
New Zealand	1980–1	19.4[a]	19.6[c]
United States	1981	17.5[a]	17.5[c]
Australia	1980–1	17.0[a]	
	1980–1	16.3[b]	
	1995–6	18.3[b]	15.5[d]
Great Britain	1980–1	9.6[a]	10.6[c]
	1980–1	9.0[b]	
	1990–1	8.8[b]	
Sweden	1981	9.5[a]	
Japan	1979–80	9.5[a]	9.9[c]
France	1975–82	9.4[a]	
Netherlands	1981	7.7[a]	
Belgium	1981	7.3[a]	7.8[c]
Ireland	1980–1	6.1[a]	6.4[c]

a Long (1992). These include all residents. b Rees et al. (2000). These exclude any residents who immigrated in the year to census. c Long (1992) standardized on the 1981 US Age distribution. d Rees et al. (2000) standardized on the 1991 GB Age distributions.

Australian rate, when standardized on the Great Britain population distribution, lowers from 16.3 to 15.5 percent.

2.2 A Scale Independent Measure of Internal Migration Activity

A majority of European national statistical agencies adopt the event view of migration (Rees and Kupiszewski 1999a). This requires use of a population register (centrally consolidated but locally administered), which records an individual's current usual residence and to which inhabitants are required by law to report changes of address. Population registers vary in quality from very high (e.g. Norway: Rees et al. 1999) to moderate, suffering, for example, from mismatches between reported in- and out-migration totals for countries (e.g. Italy: Rees et al. 1998a). Some countries use administrative registers as substitutes for population registers, which suffer from omission of some population subgroups (e.g., the United Kingdom: Stillwell et al. 1992).

Migration measures suffer severely from scale dependency: the larger the number of territorial units recognized the greater the number of migrations observed. It is therefore very difficult to compare migration between N territorial units in one country and M units in another. Long (1991, 1992) therefore confined his international comparisons of internal migration levels to all residential migration (moves between comparable household units). However, Courgeau (1973a) proposed a method to overcome this scale dependence which regresses the scale-specific migration rate against the logarithm of the number of spatial units. The index shown in Table 2 is the slope of this regression, when the intercept is fixed at zero. It measures the rate at which migration activity increases as the number of observation units is augmented. This method enables indexes of migration activity to be computed for countries such as Italy where intramunicipal migration is not recorded in the register statistics. Table 2 is focused on Europe but some measures for Australia are also included. All computations used data for a one-year interval although the data derived from both registers and censuses. Australia stands out in the list (as in Table 1), followed by countries in Northern and North Western Europe. Mobility falls off in Southern and Eastern Europe.

2.3 Factors Influencing the Level of Internal Migration

Why do industrialized countries differ so much in their internal migration propensity? We can only speculate, in the absence of a definitive cross-national investigation, but the following factors can be suggested as influential.

(a) The degree of flexibility and ease of transfer in the labor is of vital importance. European countries have more rigid labor markets and higher unemployment, which dampen migration.

(b) European countries have large social housing sectors which encourage locational inertia, while large private rental sectors in the United States, New Zealand, and Australia facilitate regular housing adjustment.

(c) The rules operating within social housing systems (e.g., length of residence requirements, the territory within which housing can be allocated) affect migration. For example, social housing tenants find it easy to migrate within Australian states; in Britain, migration between municipalities is difficult for social housing tenants.

(d) Traditions of frontier development and rapid adjustment to changing economic circumstances characterize the United States and Australia, whereas traditions of localism and familism, together with welfare state provision, help keep unemployed Italians in the Mezzogiorno and British ex-miners in coalfield villages.

(e) The compact size and denser settlement patterns of European countries allow an adjustment, within many metropolitan agglomerations, through commuting changes rather than residential migration. There is, for example, little relationship between unemployment and migration exchanges in the Netherlands (Rees et al. 1998b).

Table 2
Comparable measures of the intensity of internal migration in 10 European countries and Australia, using an index developed by Courgeau (various years in the early 1990s)

Country	Period	Courgeau's K index with zero intercept	Source of migration data
Australia	1980–1[a]	1.52	Census
Norway	1994	0.71	Register
The Netherlands	1994	0.61	Register
Great Britain	1980–1[a]	0.54	Census
	1990–91[a]	0.52	Census
Germany	1994	0.51	Register
Portugal	1989–91[b]	0.38	Census
Estonia	1995	0.33	Register
Czech Republic	1994	0.21	Register
Italy	1994	0.19	Register
Romania	1994	0.16	Register
Poland	1994	0.15	Register

a The year prior to the census. b A longer interval of one year and 104 days has been prorated to a year.

(f) The per capita income levels in countries influence the degree to which inhabitants in later or postworking life can make consumption-related migrations. Retirement migration is important in higher income countries but has not yet emerged in Eastern Europe.

3. *Internal Migration and Settlement Structure*

Migration within countries shifts people between settlements distinguished in two principal ways: (a) by size, density, and type of economic activity and (b) by the health of the regional economy. The first dimension is usually operationalized as an urban–rural dichotomy, but needs also to be viewed more generally as a settlement hierarchy from large metropolis through medium sized city to village, hamlet, and isolated farmstead. Settlements are recognized as urban if their populations exceed a low threshold (2,000–20,000 depending on country) and if economic activity is mainly outside farming.

3.1 *Long Run Urbanization*

Internal migration has made a vital contribution to the growth of the urban population over the past two centuries. This urbanization process is monitored and projected regularly by the United Nations. Table 3 reports summary statistics from the latest evaluation (UN 2000). In more developed regions, the half century 1950 to 2000 saw a doubling to 900 million in their urban population, though this was dwarfed by urban population increase in less developed regions. The rural population of more developed regions fell during this period. The UN's Population Division sees urbanization in industrialized countries continuing in the future but at a slower rate. The main driver of urbanization has been net internal migration from the countryside to the city.

3.2 *Is Urbanization Turning into Counterurbanization?*

In the mid-1970s, the American researcher Calvin Beale pointed out that in much of nonmetropolitan America, there was a revival of population growth after decades of decline (Beale 1975). The term counterurbanization was coined shortly afterwards by Berry (1976) to label this process, which was swiftly recognized in Australia and Canada (Bourne and Logan 1976). An avalanche of studies of this new settlement dynamic has subsequently occurred, establishing its prevalence in a large number of industrialized countries but also indicating that its strength has fluctuated since the 1970s, when it was probably most strong (see Champion 1998 and Kontuly 1998 for recent reviews).

There have been considerable difficulties in agreeing an operational definition of the counterurbanization process. Researchers often use the population of settlements and their variation as indicators, but natural increase also contributes to population change, so the indicator of choice is either net total migration or internal migration. Wherever possible, researchers use statistics on internal migration, as international migration has a very different distribution in industrialized countries with external immigrants frequently replacing the population leaving

Table 3
Urbanization prospects, 1950–2030

	Populations (billions)		
Unit	1950	2000	2030

large cities through internal migration. At first, the spatial framework of analysis used to analyze population or migration trends was a simple rural/urban dichotomy or metropolitan/nonmetropolitan county division (in the United States). It was soon realized that this was both arbitrary and inadequate for capturing the complexity of population processes under way. Researchers sought to look at migration within the urban system in two ways: by the size of town or city (a hierarchical classification) and by the degree of linkage in distance or transaction terms between places and urban centers. The definition of counterurbanization was extended to mean a process of shifting the population from larger to smaller places over time, either down the urban hierarchy or outwards within any one urban field. This latter process of migration to the less densely settled urban periphery had been underway for decades before the 1970s and so some researchers argued that counterurbanization was simply an extension of suburbanization to a much wider area than hitherto, made possible by better transportation and telecommuting links.

Table 4 shows the typical table used by researchers aiming to diagnose the presence of this new population redistribution process. The small units (Statistical Divisions) for which migration is reported in successive Australian censuses were organized firstly into time consistent units and then grouped into zones on the basis of proximity to metropolitan centers (Blake et al. 2000). The resulting 35 city region-zones are further grouped in Table 4 into six categories, two metro and four nonmetro. In the 1976–81 period there were substantial losses from metro cores and gains within the rest of Australia's five metro regions. Near metro and attractive east coast zones also gained migrants. However, the deep countryside (far regions, mainly wheat, sheep and cattle farms) and the remote outback (mainly mining settlements) lost internal migrants. Comparison with the situation in the 1991–6 period shows that these most peripheral regions exported even more people, reflecting a depression in farming and a switch in mining to manning by workers with permanent residences elsewhere. Metro losses were lower reflecting urban revival and redevelopment, and metro rest and near gains lower. However, coastal regions showed larger gains as the foci of consumption led migration.

European evidence from the 1970s is gathered

together by Kontuly (1998) and presented in a generalized format in Table 5. The table makes a 'fuzzy' judgment about whether studies found urbanization or counterurbanization to be in train in different periods. The picture is a complicated one, with studies in some countries (e.g., Belgium) disagreeing about trends because of differences in exact period studied and in the spatial scale of observations. In Austria, Czechoslovakia, Finland, Norway, and Portugal urbanization is still the dominant process, though in each country there is evidence of deconcentration from capital cities. Italy, Ireland, and Spain appear to be in process of moving from an urbanization pattern (1970s) to a moderate counterurbanization in the 1980s and 1990s. Denmark, France, Germany, Sweden, and Switzerland all exhibited consistent counterurbanization patterns over the 1970s, 1980s, and 1990s.

It is, of course, difficult to compare studies by different authors, so Rees and Kupiszewski (1999b) in their work for the Council of Europe carried out a set of similar analyses for a set of 10 European countries. Table 6 summarizes their findings in terms of the degree to which countries had moved to a counterurbanization pattern by the early or mid-1990s (1994 usually). The method used was to tabulate net internal migration rates in each country by municipality (or equivalent unit) grouped into population density bands (used earlier by Fielding (1982) but for larger regions). The direction and slopes of graphing net internal migration against density resulted in the assignments shown in Table 6. The results broadly confirm the Kontuly review of previous studies and show additionally that the Netherlands and the United Kingdom, along with France, exhibit the strongest forms of counterurbanization.

We can ask whether there is a sequence in the development of national urban/rural settlement systems that leads from urbanization to counterurbanization. There is no clear answer to this question as yet. The Rees and Kupiszewski studies showed that the

strength of counterurbanization in 1994 (or 1990–1) was weaker than in 1984 (or 1980–1) in Western European countries, while the strength of urbanization in transition societies was weakening. In other countries there was considerable fluctuation in the prevailing relationship and sometimes it depended on the size of the different age groups taking part. So, in Norway, urbanization at the younger ages masked some deconcentration from Oslo city in the family ages.

3.3 Relationships Between Net Internal Migration and Settlement Structure

We now look at some particular country examples from different points in the urbanization–counterurbanization spectrum. Table 7 shows an example of a country, Poland, that is still urbanizing. Rural areas experienced in 1994 net internal migration losses, but the pattern of gains to urban places is not strongly related to size. Plots of population growth in the 1984–94 period and of net internal migration in 1994 against settlement density suggests a diminution of the relationship over time. Once the poorer countryside areas have emptied of their surplus labor, then we can expect deconcentration from urban centers to become a dominant influence.

Table 8 illustrates the relationship between settlement type and net internal migration for Italy, a country with weak counterurbanization. Urban communes lost internal migrants in both 1984 and 1994 but at a lower rate in the later year. The gaining rate for semirural communes increased between these two years but this was countered by a fall in gains to rural communes. The Italian case confirms the need to focus on internal migration as the variable of interest, as large numbers of rural and semi-rural communes in central and northern Italy now experience natural decrease.

A seminal study of internal migration by Boudoul and Faur (1986) established the way in which France transited from a country of urbanization in the 1950s to one of strong counterurbanization in the 1970s. Table 9 confirms that this continues to be the case in the 1980s, with the country's main urban centers losing migrants to surrounding communes and smaller centers. However, rural gains from internal migration are relatively small.

To tease out the relative contributions of urban deconcentration within a metropolitan region from the shift of population to different and smaller settlements requires a good urban–rural classification based on commuting patterns. Such a classification is available for the United Kingdom and has been used by Champion, Atkins, Dorling, and others to demonstrate the 'counterurbanization cascade.' Table 10, taken from Rees et al. (1996), uses their classification to group small areas by urban region size and by urban region zone (core, ring, periphery). The net internal

migration rates show the simultaneous operation of both cascading down the urban hierarchy and deconcentration from urban centers. However, on balance the statistics suggest that deconcentration is more significant than cascading. Most rural areas in the United Kingdom in 1990–1 gained through internal migration, and the remote region effect noted earlier for Australia was absent.

4. *Conclusions*

The review in the previous section has looked at patterns of internal migration for the population as a whole. There are, of course, important differences between different population groups. Of particular interest has been life course variation in internal migration patterns. The relationship of migration in intensity with age is well known and has been studied exhaustively (see Rogers and Castro 1981). There is also a strong relationship between life course stage and migration direction in counterurbanizing countries (see Illeris 1996 on Denmark, for example). Table 11 shows how the direction of migration across settlement type varies by age group in the Netherlands. The all ages pattern is one of small losses from urban cores and small gains to commuter towns and the rural periphery. Young adults aged 15–29 swim against this counterurban stream, showing high internal in-migration rates to city cores and high out-migration

Table 11
Net internal migration rates by age, Netherlands, by settlement type, 1994 (per 1,000 per year)

	Ages						
Settlement type	0–14	15–29	30–44	45–59	60–75	75+	Total

a Very large free-standing towns.

Figure 1
Net internal migration effectiveness in two capital cities and two attractive nonmetropolitan regions, Australia and the United Kingdom, 1976–81 and 1991–6

rates from commuter towns and the countryside. This pattern is repeated in most of the other strong counter-urbanizing countries (the United States, Australia, Denmark, the United Kingdom). The other ages show losses from the city cores and gains in commuter towns and the periphery, though the balance between these two varies from group to group. The strong gains of the elderly (75+) in the ring commuter towns and low gains in the periphery are linked to a desire to be close to health and support services, for example.

Figure 1 shows the way in which the redistributive effect of net migration (measured here by the effectiveness ratio, the ratio of net migration to the sum of in- and out-migration) varies by age, for two metro and two nonmetro regions in Australia and the United Kingdom. Despite vast differences in area extent, economic structure, and settlement history between these two countries, there is a remarkable similarity in internal migration patterns by age. Migration in the retirement ages is strongly effective in both countries, with people leaving the largest city at retirement and returning rarely thereafter. The metro and nonmetro curves form approximate mirror images of each other. The only major difference between countries is the greater effectiveness of younger age migration to the Brisbane Gold Coast, an attractive resort and beach region which holds on to its young people, while the Bristol Coast and Country region (Devon, Cornwall, Dorset) is less successful.

A final word is appropriate on the explanations suggested for the new pattern of counterurbanizing internal migration. A full discussion is provided by Champion (1989, 1998). One set of explanations focuses on changes in the way production is organized. New economy, high value manufacturing is no longer constrained to metropolitan centers and finding locations attractive to high skill workers is more important. Large cities suffer from many problems of growth and high density: congestion, pollution, crime, concentrations of poverty, all of which deter both enterprises and individuals from locating there. This effect, together with the restructuring of the economy, was probably most important in the 1970s and first part of the 1980s. But the emptying out of the cores of cities has created some opportunities for new enterprises and residential developments, accounting for the subdued level of counterurbanization in the 1990s. There have also been more particular 'production' factors involved in some countries: the degree to which the state has invested in rural areas and rural activities. An important boost to internal migration in the United States or in the United Kingdom has been the foundation or growth of higher education colleges or universities.

Consumption-led migration has also been important. In many countries the retirement of a generation with generous pension provision has given them the freedom to choose new residential locations. The rural–urban price gradient also provided an incentive for persons not tied to workplaces to move. However, there have had to be developments in rural and smaller towns to make them attractive to internal migrants. Rural accessibility has improved with the construction of new highways, telecommunications have spread to all parts of the national space, and in some countries improved rail services have increased accessibility. The importance of accessibility to urban services in rural areas and smaller towns is a recurring theme in many studies of internal migration patterns. Inaccessible, remote areas have been shunned by counter-urbanizing migrants. Also important, where migrants have choices, are residential preferences for living in particular environments, with the 'rural idyll' being a strong component of some national cultures while in others the preference is for the interactions, activities, and freedom afforded in urban places.

Internal Validity

Internal validity refers generally to the accuracy of inferences about whether one variable causes another. In the context of an experiment, internal validity is concerned with conclusions about whether (and to what degree) the independent variable, as manipulated, makes a difference in the dependent variable, as measured. This article addresses the meaning of internal validity, the practice of achieving it, and the challenges of understanding it.

1. *Internal Validity Defined*

The concept of internal validity apparently originated with Donald T. Campbell and was popularized in his and his collaborators' work (Campbell 1957, Campbell and Stanley 1966, Cook and Campbell 1979). The term was coined as a counterpoint to 'external validity,' which deals with the generalizaSbility of a finding to persons, settings, and times other than those examined in the research (see *External Validity*; *Generalization: Conceptions in the Social Sciences*). Internal validity, in contrast, then, involves the accuracy of a causal inference pertaining to the particular persons, settings, and times examined in the research. As Cook and Campbell (1979) made clear, internal validity is also concerned only with the particular research operations used in a study, that is, with the independent variable as it was manipulated and the dependent variable as it was measured.

The term internal validity originated in the context of research methods designed to probe cause–effect relations, such as randomized experiments and quasi-experiments (see *Random Assignment: Implementation in Complex Field Settings*; *Nonequivalent Group Designs*). This remains the typical usage. However, the term is sometimes applied to procedures that do not investigate causal relations, specifically to measurement instruments such as personality scales. In this alternative usage, the apparent intention is to refer to

the structure of the scale and the interrelationship among scale items as 'internal validity,' thus differentiating these properties from the scale's relationship to other measures and behaviors. Such a different and nontraditional use of the term may invite confusion. The remainder of this article focuses on internal validity as it applies to cause-probing research.

2. *Differentiating Internal Validity from Other Forms of Validity*

Campbell (1986) noted that the term internal validity (even when restricted to cause-probing research) was often used in ways somewhat different from the original intended meaning. He proposed the infelicitous term 'local molar validity' as a substitute. This term has not been widely adopted but can help in differentiating internal validity from other forms of validity. Consider as an example a study conducted in a middle school to see whether an anger management program reduces students' aggressive behaviors such as fighting on the playground. Internal validity is 'local' in the sense that it is concerned with the immediate context of the study, that is, the specific children and school that were observed. Attempts to generalize, whether to other middle schools, to high schools, or to adults, instead involve external validity. Internal validity is 'molar' in the sense that it is concerned with whole manipulations and with measures, whatever they are, rather than with pure theoretical abstracts. Attempts to draw conclusions about theoretical concepts, say about 'affective regulation training' and 'aggression,' rather than about the program as implemented and the raters' observations of the number of fights on the playground, instead involve construct validity.

Some competing validity frameworks define internal validity in different ways. For instance, Cronbach (1982) defined internal validity as involving certain *intended* generalizations (for a summary and integration of this and other validity frameworks, see Mark 1986). Cronbach's alternative definition of internal validity includes generalizations to the categories of persons, settings, and times and to the theoretical constructs that were the original, intended targets of the research conclusions. The original concept of internal validity, as developed by Campbell and associates, continues to predominate, however.

The greatest difficulty has been in differentiating internal validity from the construct validity of the cause, that is, the proper labeling of the independent variable in abstract terms. This difficulty is seen most clearly in terms of 'threats' to validity (see Sect. 3). Cook and Campbell (1979) presented four threats to internal validity that depend upon comparative processes involving the members of the treatment and control group. For instance, the threat of 'resentful demoralization' can occur when one group, say the control group, receives a perceptibly less desirable treatment. If control group members become resentful, this resentment, rather than the intended treatment, may cause differences between the groups. Even Cook and Campbell (1976, 1979, Campbell 1986) have wavered in their judgment about whether these are internal or construct validity threats. More generally, threats to both internal validity and construct validity of the cause involve confounds with the independent variable, suggesting that it may be difficult to differentiate the two types of validity.

One possible resolution is based on the counterfactual conception of cause (Reichardt and Mark 1998; see *Causal Counterfactuals in Social Science Research*). From this perspective, a treatment effect can be defined as the difference between what happens when a (molar) treatment *has been* administered and what *would have happened* if the (molar) treatment had *not* been administered but everything else had been the same. The practical problem is that, absent time travel, *everything* cannot be the same between the treatment and control conditions except for the treatment and its effects. The same people may be compared at different times, or different people may be compared at the same time, but a researcher cannot compare the same people, with and without the treatment, at the same time. But if one allows the fiction of the ideal (but unattainable) counterfactual comparison that only time travel would make possible, the distinction between internal validity and construct validity of the cause can be clarified.

Threats to internal validity would not arise if the ideal comparison could be made. In contrast, a threat to the construct validity of the cause is a mislabeling of the cause that could arise even with the ideal comparison. For example, in studying an anger management program, it would be an internal validity problem if one compared pretest and post-test levels of aggression and if aggression changed simply because the children were older at the post-test. But this internal validity problem would disappear if the ideal counterfactual could actually be obtained, because the comparison would involve the same children at the same age, with and without exposure to the program. In contrast, it would be a construct validity problem if the program's activities modified children's affective regulation skills but the program were labeled as a 'self-efficacy intervention.' This problem would not be avoided by the ideal counterfactual. Nor would the ideal counterfactual alleviate other construct validity problems, such as various subject and experimenter artifacts (see *Experimenter and Subject Artifacts: Methodology*). In the case of resentful demoralization, this threat would not occur if the ideal counterfactual were attainable. If a researcher could travel back in time, there would be no need to construct two groups of participants who could be aware of each others'

treatment. Resentful demoralization thus is a threat to internal validity.

3. Threats to Internal Validity

The literature on internal validity consists largely of detailed lists of validity 'threats.' Internal validity threats are generic categories of causal forces that may frequently obscure causal inferences. Take as an example, once again, a researcher's efforts to determine whether an anger management program reduces aggressive behavior in a middle school. 'History' refers to the possibility that specific events, other than the intended treatment, may have occurred between the pretest and post-test observations and may obscure the true treatment effect. If the researcher observed the level of aggressive behavior on the playground before the anger management program, and again afterward, history would be a problem if a different, stricter teacher became playground monitor in the interim. 'Maturation' refers to the possibility that natural processes which occur over time within the study participants, such as growing older, hungrier, more fatigued, wiser, and the like, may create a false treatment effect or mask a real one. Less aggression may occur at the post-test simply because the children are older than at the pretest, for instance. 'Attrition' refers to the possible loss of participants in a study. For example, if children from troubled families are more likely to drop out of school or to move away in the middle of the school year, then attrition could cause a decrease in aggression from the pretest to the post-test. 'Instrumentation' arises as a validity threat when a change in a measuring instrument causes erroneous conclusions about the effects of an intervention. For instance, if observers' standards shifted over time, such that later incidents had to be more violent to be rated as aggressive, this could cause the appearance of a treatment effect when in fact there is none.

'Selection' refers to the possibility that post-test differences between a treatment group and a control group may be due to initial differences between the groups rather than to a treatment effect. Selection problems might occur if a researcher attempted to assess the effectiveness of an anger management program by comparing the level of playground aggression in two middle schools, one of which had implemented the program. In addition, more complex internal validity problems can occur, whereby some threat operates only (or more powerfully) in one group than another. For instance, 'selection by maturation' indicates that participants in the treatment condition are maturing at a different rate than those in the control condition. See Cook and Campbell (1979) for additional discussion of internal validity threats, including the threats of testing and regression to the mean.

4. Achieving Internal Validity

Most discussions about how to achieve internal validity focus on research design. Randomized experiments are generally recommended, because random assignment eliminates systematic selection bias and allows traditional statistics to estimate and account for purely random selection differences (see *Random Assignment: Implementation in Complex Field Settings*; *Selection Bias, Statistics of*). Randomized experiments also rule out most other internal validity threats, if sound research procedures are used and there is no differential attrition (but see Sect. 5.1). If random assignment is either impractical or unethical, the common recommendation is to enhance internal validity by using a strong quasi-experiment. Quasi-experiments are approximations to experiments but lack random assignment (see *Nonequivalent Group Designs*; *Time Series Quasi-experiment*; *Regression Discontinuity Design*). More generally, the process of ruling out internal validity threats can be seen as a special instance of the logic of pattern matching (see *Pattern Matching: Methodology*). In addition, especially in terms of the threats of selection and selection by maturation, the choice of proper statistical analyses can influence internal validity (see *Nonequivalent Group Designs*; *Selection Bias, Statistics of*).

5. Common Misconceptions about Internal Validity

Several misconceptions exist regarding internal validity. Three relatively common ones are discussed in this final section.

5.1 Misconception #1: Successful Random Assignment Guarantees Internal Validity

Although random assignment of participants (or other units) to treatment condition can greatly enhance the likelihood of internal validity, problems can still occur. Most widely recognized is that differential attrition may occur, with more (or different kinds of) participants dropping out of one group than another. As noted earlier, Cook and Campbell also suggested that threats such as resentful demoralization may apply in a randomized experiment. Even if these problems do not occur, internal validity threats can arise in a randomized experiment if proper research procedures are not followed. An experimenter might, for instance, have one rater observe aggression in the treatment group and another rater observe in the control group. This would create an instrumentation threat. As another example, researchers sometimes randomly assign individuals to conditions but then have all members of a group participate together. For example, in a study with mood as the independent variable, following random assignment all members of the positive mood condition may be sent to one room to

watch a funny movie, while all members of the control condition see a 'neutral' movie in another room. This can allow the independent variable to become confounded with any of a number of other factors, such as the characteristics of the experimenter conducting each session, creating a selection by history threat. To minimize internal validity threats, random assignment must be combined with careful methodology (see *Laboratory Experiment: Methodology*).

5.2 Misperception #2: Presence of a Validity Threat = Internal Invalidity

Despite clear statements by Campbell to the contrary (e.g., Campbell 1969), discussions of internal validity often make it sound as though the theoretical existence of a validity threat necessarily equates with weak internal validity. Some writings seem to suggest, for example, that, because history and several other validity threats *can* apply to a simple pretest–post-test comparison with one group, the findings from such a study are necessarily invalid. Such thinking is incorrect for at least three reasons. First, a given threat may not operate in a specific case, whether or not it is ruled out by the design. Maturation does not always cause changes in every pretest–post-test study, for instance. Second, conclusions about the causal impact of a treatment on some outcome may be accurate, even when a validity threat is operating, if the threat's effect is too small to invalidate the conclusion drawn. In a pretest–post-test design, for example, maturation may occur but be small enough not to obscure a reasonably accurate conclusion about the treatment effect. Third, even if a threat is not trivial in size, in some cases it may be possible to estimate the magnitude of the threat and adjust for it. This is the basic logic of efforts, for instance, to model selection bias (see *Selection Bias, Statistics of*; and see Reichardt 2000 for an elaboration of this logic). Still, assessing the plausibility and magnitude of validity in a nonexperimental context remains an imprecise art. The development of empirically supported theories of the conditions under which various validity threats operate, with what magnitude, would be an important future development.

5.3 Misconception #3: An Emphasis on Internal Validity = A 'Black Box' Experiment

Some critics contend that giving priority to internal validity implies a disinterest in mediating processes. In applied social research, for example, the claim has been made that those who give priority to internal validity commonly estimate the effect of an intervention without trying to peer into the 'black box' and learn about underlying processes. In fact, the methods associated with strong internal validity, such as the randomized experiment, do *enable* researchers to conduct black box experiments. However, they do not require it. Experiments (and other methods used in the service of internal validity) can be integrated with other methods used to study mediational models). Moreover, methods that maximize internal validity are also widely used in investigations designed specifically to test hypotheses about underlying causal mechanisms (see *Laboratory Experiment: Methodology*).

Internal Warfare: Civil War, Insurgency, and Regional Conflict

Internal wars are those that take place within the boundaries of one country, making them distinct from interstate war which is generally fought between two (or more) states. Internal conflicts often—but need not—involve the state on one side of the conflict. There are different ways to categorize internal conflicts. Some think of them as breaking along the lines of the goals of the combatants (irredentism, secession, ideological), while others focus on the primary orientation of the groups in conflict (religious, ethnicity, ideology). While an increased prevalence of internal warfare seems to coincide with the end of the Cold

War, their increased frequency shows up most dramatically as the former European colonies gained their independence (Gurr 1994, Regan 2000). Because nonstate actors are involved in these conflicts and they take place within the territorial boundaries of one country, conflict management is often difficult.

1. Conceptual Issues Regarding the Causes and Frequency of Internal Conflict

Early scholarship focusing on internal conflict proposed that there are at least three categories—or levels—of conflict, and that each might be thought of as having unique precipitating conditions. The three categories are (a) political turmoil, (b) organized conspiracy, and (c) internal warfare (Gurr 1970). Political turmoil reflects conditions of spontaneous and unstructured conflict. Food riots might be one example. Such turmoil, however, holds the potential to expand into more organized violence. Organized conspiracies are those conflicts in which opposition groups have some form of structure, but the level of violence remains rather contained. A conflict generally is considered an internal war once the level of fatalities exceeds a certain threshold—most often considered 1,000 battle deaths per year (Small and Singer 1982).

Internal conflicts tend to result from disputes over current or anticipated access to resources. In many instances those controlling the distribution of the resources—usually the state—largely comprise a culturally homogeneous group that discriminates against another (or several) homogeneous groups. For example, in the Rwandan upheaval of 1994 the politically dominant Hutus engaged in the genocidal slaughter of the Tutsi. Although the two groups lived together for centuries, albeit not always peacefully, a power-sharing arrangement between them appears to have altered expectations of the future distribution of resources such that the Hutus chose conflict over accommodation. The main exception to cultural homogeneity forming the organizational lines between the groups in conflict can be found in ideological conflicts. In ideological conflicts the groups form along class lines which can breech cultural distinctions. If one thinks of conflict organized along cultural lines as incorporating two nations within one state, with the conflict waged over control of the state or the distribution of resources from it, then ideological conflict can be thought of as fighting within one nation over two ideologically opposed ideas about how the state should distribute resources.

There are several competing explanations for the causes of internal conflicts. Gurr (1993) has undertaken an extensive examination of the make-up and character of minority groups at risk, identifying 233 politically mobilized groups. The core of his explanation for internal conflict turns on issues of resource distribution, though this is not the only way to think about the etiology of internal warfare. Some propose what is called the 'contact hypothesis' which argues that increased contact between different cultural groups increases the opportunity for and frequency of violent conflict among them (Forbes 1997). Counter arguments point to multiethnic countries like the United States, Canada, and New Zealand to demonstrate that cross-cultural contact is not sufficient to cause conflict. They argue that in highly multiethnic societies the propensity for conflict is diminished. Others argue that conflict results from relative or absolute deprivation (e.g., Gurr 1970, Davies 1962). Relative deprivation reflects judgments about individual or group resources relative to group expectations, what Gurr called value aspirations vs. actual capabilities. Absolute deprivation largely reflects a condition of poverty, and would generally show up as a result of low levels of economic development and/or a skewed distribution of resources (e.g., Muller and Seligson 1987). In spite of the logical robustness of deprivation-based arguments, a cursory examination of conditions in countries around the world reveals that there are large numbers of people living under conditions of relative or absolute deprivation who do not revolt against their government. Clearly being deprived is not a sufficient condition for internal conflict. One way to think about a necessary condition is that the masses will rise up only when expected gains from violent political action outweigh the likely costs. Future expectations form a core component in thinking about the onset of internal violence from this perspective (Fearon 1998). If people hold dire expectations about their prospects for access to resources in the future they will be more likely to engage in violent political action now. Under these conditions—where people react to costs and expected benefits—the ability of the state to repress opposition movements is critical. Convergence around the conditions most associated with internal conflict demonstrates that political regime types play a considerable role in the likelihood of internal unrest (e.g., Henderson and Singer 2000). As countries become partially democratic the people begin to hold increased expectations and make increased demands on the state, yet the state apparatus lacks sufficient institutional capacity to cater to or channel these demands. Some see these internal conflicts as part of the processes contributing to state building (Cohen et al. 1981).

Empirically we know that there have been about 150 violent internal conflicts beyond simple political turmoil since the end of World War II (Regan 2000). According to the Correlates of War data between 1946 and 1992 there have been 53 of conflicts that could be categorized as an internal war (Singer and Small 1994). These conflicts range from rather small and short-lived events like Gambia (1981) to long-running and extremely violent conflicts such as Rwanda (1994), Somalia (throughout the 1990s), or El Salvador (in the

1980s). Internal conflicts are not confined to the less developed part of the world. Great Britain has been fighting an internal conflict against the IRA since the mid-1970s; the Spanish have a conflict over the Basque region, and Turkey has experienced a quite violent conflict with members of its Kurdish population. Each country is a member of the NATO alliance. Russia, furthermore, has been involved in a very aggressive conflict in its republic of Chechnia.

Recent empirical evidence on postcolonial civil wars suggests that the most important factors associated with their onset are: (a) the regime-type of the state, falling somewhere between a full democracy and a complete autocracy, (b) the level of economic development, and (c) the level of military spending by the state. Interestingly, this research does not support the idea that cultural polarization is related significantly to the onset of civil war in the post colonial period (Henderson and Singer 2000, Collier and Hoeffler 2000, Hegre et al. in press). Other recent research has attempted to develop empirical models to forecast the onset of internal rebellion (Gurr and Moore 1998, Gurr 1998). Although the forecasting capabilities of these models are not perfect, they do provide rigorous and generalizable mechanisms to evaluate the risk of internal conflict in specific settings.

The role of parties outside internal conflicts is also of central importance. Even though one could consider third party interventions as one form of conflict management, there is some evidence to suggest that outside interveners tend to increase the duration of internal conflicts (Regan 2000, in press). The internationalization of internal conflicts has become an increasingly important area of research, with emphasis placed on the role of third parties, the effectiveness of peacekeeping forces, and the conditions for negotiated settlements (see Lake and Rothchild 1998, Brown 1996, Regan 2000, Diehl 1993, Walter 2000). This has taken on central importance in international organizations such as the World Bank, which has organized a research group to study the onset and management of internal conflicts (Ibalwaldi and Sambanis 2000, Collier and Hoeffler 2000, web site can be accessed at: www.worldbank.org).

2. *Conflict Management in Internal Conflicts*

One can think of the resolution of internal wars like wars in general as being most likely when the costs of continued fighting exceeds expectations for future gains. If the probability of victory is low and/or the expected payoff from victory is insufficient, then one would anticipate that the parties would prefer a negotiated settlement. Resolving internal conflicts, then, requires generating the conditions whereby continued fighting is the least attractive course of action. Internal conflicts, however, pose different types of problems when thinking about conflict management than international wars. First, international convention inhibits outside parties from intervening on behalf of at least one side (the nongovernmental actors) in such conflicts. Although third parties do intervene on behalf of antigovernment forces, such interventions tend to violate at least the spirit of the UN charter. Second, there is little incentive for the parties involved in the conflict to demobilize if and when a settlement is reached (Walter 2000). Since difficulties with enforcement leads to a built-in incentive to violate a peace accord, such as by failing to demobilize, fully implemented peace agreements are difficult to achieve without some form of outside intervention. International management of internal conflicts requires outside actors to intervene in a manner that contributes to the conditions where conflict is too costly, the benefits from resolution are reasonably high, and all sides to the conflict hold similar expectations about implementation. The most pressing question is how outside parties can generate the conditions that lead to a stable and fully implemented peace agreement. Although the amount of empirical evidence is rather meagre there are a few studies that point toward effective mechanisms.

Using data on 139 internal conflicts between 1944–94 Regan (2000) identified a set of conditions that increase the likelihood of successful third party interventions in internal conflicts. Success was defined as stopping the fighting for a period of at least 6 months, and, therefore, reflects a short-term interest in the settlement of conflicts rather than a long-term resolution. The results of the analysis suggests that intense conflicts are more likely to be settled by outside interventions than are those with lower levels of hostilities, and that the most important predictor of successful interventions involves the interveners strategy. Walter has also shown that internal wars rarely are resolved without power sharing arrangements and security guarantees by outside parties (Walter 2000). In effect, there is little chance of the parties to an internal war resolving their conflict without the involvement of outside parties. These parties might take on the role of a supporter of one of the antagonists (in an attempt to alter the balance of capabilities), a unilateral observer of the terms of an agreement, or multilateral supervisor of an interim agreement (Walter 2000, Diehl 1993, Regan 2000). There is some empirical evidence, however, that when a third party intervenes in support of one side of an internal conflict it is likely that the conflict will have a longer expected duration than a similar conflict without an outside intervention (Regan in press). The role of unilateral interventions, therefore, may have a very narrow role as a tool of conflict management.

3. *Summary*

Since the end of World War II internal conflicts have been much more frequent than interstate wars. In fact, some estimate that the number of deaths attributable

to internal conflicts far exceed those of all interstate wars of the twentieth century. The causes of internal conflicts are rather complex, though empirical evidence and theoretical logic point toward competing access to limited resources. When resources are limited and people make demands for them, the ability effectively to channel or repress these demands determines the likelihood of violent conflict. Because of the unique aspects of territorial sovereignty and nonstate actors, the resolution of these conflicts poses problems for the international community. Peacekeeping troops under the auspices of the UN or other multinational organizations have become an increasingly visible mechanism to control internal conflict (see Diehl 1993).

International Advertising

International advertising entails dissemination of a commercial message to target audiences in more than one country. Target audiences differ from country to country in terms of how they perceive or interpret symbols or stimuli, respond to humor or emotional appeals, as well as in levels of literacy and languages spoken. How the advertising function is organized also varies. In some cases, multinational firms centralize advertising decisions and budgets and use the same or a limited number of agencies worldwide. In other cases, budgets are decentralized and placed in the hands of local subsidiaries, resulting in greater use of local advertising agencies.

International advertising can, therefore, be viewed as a communication process that takes place in multiple cultures that differ in terms of values, communication styles, and consumption patterns. International advertising is also a business activity involving advertisers and the advertising agencies that create ads and buy media in different countries. The sum total of these activities constitutes a worldwide industry that is growing in importance. International advertising is also a major force that both reflects social values and propagates certain values world wide.

1. International Advertising as a Communication Process

In international markets the process of communicating to a target audience is more complex because communication takes place across multiple contexts, which differ in terms of language, literacy, and other

cultural factors. In addition, media differ in their effectiveness in carrying different appeals. A message may therefore not get through to the audience because of people's inability to understand it (due to literacy problems), because they misinterpret the message by attaching different meanings to the words or symbols used, or because they do not respond to the message due to a lack of income to purchase the advertised product. Media limitations also play a role in the failure of a communication to reach its intended audience.

The process of communication in international markets involves a number of steps. First, the advertiser determines the appropriate message for the target audience. Next, the message is encoded so that it will be clearly understood in different cultural contexts. The message is then sent through media channels to the audience who then decode and react to the message. At each stage in the process, cultural barriers may hamper effective transmission of the message and result in miscommunication.

In encoding a verbal message, care needs to be taken in translation. Numerous examples exist of translation problems with colloquial phrases. For example, when the American Dairy Association entered Mexico with its 'Got Milk?' campaign, the Spanish translation read 'Are You Lactating?' Low levels of literacy may result in the need to use visual symbols. Here again, pitfalls can arise due to differences in color association or perception. In many tropical countries, green is associated with danger and has negative connotations. Red, on the other hand, is associated with weddings and happiness in China. Appeals to humor or sex also need to be treated with considerable care as their expression and effectiveness varies from one culture to another. The dry British sense of humor does not always translate effectively even to other English-speaking countries.

In addition to encoding the message so that it attracts the attention of the target audience and is interpreted correctly, advertisers need to select media channels that reach the intended target audience. For example, use of TV advertising may reach only a relatively select audience in certain countries. Equally, print media will not be effective where there are low levels of literacy. Certain media may also be more effective in certain cultures. For example, radio advertising has substantial appeal in South America where popular music is a key aspect of the local culture.

The cultural context also impacts the effectiveness of communication. In what has been termed 'high context' cultures, such as Japan and China, the context in which information is embedded is as important as what is said (Hall 1976). In 'low context' cultures, which include most Western societies, the information is contained in the verbal messages. In these cultures, audiences tend to demand explicit informational content (De Mooij 1998). Conversely, people in high context cultures are often more responsive to image or mood appeals, and rely on personal networks for informational content.

2. *International Advertising as a Business Practice*

When a firm develops an international advertising strategy, one important issue is whether to develop a global or regional advertising campaign or tailor communications to differences in local markets (Peebles and Ryans 1984). If the purpose of advertising is to develop a strong corporate or global image, a uniform global campaign is more likely to be used. When, on the other hand, the objective is to launch a new product or brand, or to more clearly differentiate the product or brand from other competing brands or products, local campaigns tailored to local markets are more typical.

A global campaign offers a number of advantages. In the first place, it can be an important means of building a strong and coherent global image for the firm and/or its products worldwide. Use of the same image in different countries builds familiarity and generates synergies across world markets. It allows utilization of good ideas and creative talent (both of which are scarce commodities) on a worldwide basis. In addition, use of a single campaign provides substantial cost savings in copy development and production costs. Conversely, development of multiple local campaigns can lead to duplication of effort, result in inconsistent brand images across countries, and confusion in consumers' minds with regard to the benefits offered by the brand and corporate image.

While use of uniform advertising appeals offers a number of advantages, differences in customer perceptions and response patterns across countries and cultures, as well as media availability and government regulation, are major barriers to the use of a standardized campaign. Even though technological developments allow adaptation of advertising appeals to different languages (for example, TV can have audio channels in two languages, Internet messages can be automatically translated), development of visual and verbal copy that works effectively in multiple countries poses major creative challenges.

Faced with this dilemma, firms may use a global umbrella campaign combined with local country or product-specific advertising. The global umbrella campaign develops a uniform image for the company or brand worldwide, often relying on consistent visual images and the corporate logo. Product-specific or country advertising builds on this image, modifying the appeal and providing information tailored to the local market (see Rijkens 1992). The objective of the umbrella campaign is to provide an integrating force, while local campaigns provide greater relevance to specific local customers and markets. The organiz-

ational structure of the firm often plays a key role in the choice of global vs. locally adapted campaigns. If international operations are organized on a country-by-country or geographic basis and operate as local profit centers with local advertising budgets, pressures exist for the use of local advertising campaigns. If, on the other hand, the company is organized by product divisions, with centralized advertising budgets at corporate or regional headquarters, the use of regional or global advertising campaigns is more likely (see Douglas and Craig (1995) for more information on global strategy).

3. *International Advertising as an Industry*

The world advertising industry is characterized by a large number of small and medium-sized advertising agencies that operate primarily in one country, and by a small number of very large advertising agencies with operations in many countries. These agencies have developed extensive networks of offices throughout the world in order to coordinate the advertising process in all the countries where their clients do business. These networks often include both wholly-owned subsidiaries and formal relationships with local advertising agencies to establish a presence in new markets, particularly in emerging markets.

In an effort to establish greater control over their advertising, many major advertisers are consolidating all their advertising with one agency. For some major advertisers such as IBM and Citibank, this represents annual advertising expenditures in excess of $500 million worldwide (Grein and Ducoffe 1998). As a consequence, advertising agencies that do not have a global network are at a serious disadvantage when competing for new advertising accounts or attempting to retain existing ones that are expanding globally.

The majority of these large advertising agencies are headquartered in the US. Of the 10 largest advertising agency groups, six are headquartered in the US, two in France, and one each in Japan and the UK. The largest agency group, WPP, is a British agency holding company made up of three large US-based agencies. With the exception of Dentsu, the Japanese agency, most other agency networks generate the majority of their revenues outside their home country. The second largest agency group, Omnicom, places over $45 billion of advertising for its clients around the world and derives half its revenue from outside the US. Omnicom has 891 offices in over 85 countries and employs 35,600 persons worldwide (57 percent work outside the US). US-based advertising agencies and their subsidiaries are responsible for most of the advertising throughout the world. Consolidation and concentration are major trends. The three large agency groups (WPP, Omnicom, and Interpublic) have grown through aggressive acquisitions and now account for 39 percent of the world's advertising expenditures (*Advertising Age* 2001). Of the approximately $60 billion in advertising placed by the top 25 agency networks in Europe during 1995, 89 percent of the total was placed by subsidiaries of US-based agencies. This general pattern holds in most parts of the world that do not have restrictions on foreign ownership. The major exception is Asia, where the three major Japanese agencies account for 62 percent of the advertising placed by the top 25 agency networks. Current and comprehensive information on advertising can be obtained from *Advertising Age's* website, www.adage.com.

Table 1
Advertising spending in the top 10 global ad markets

Country	1997 advertising expenditures (millions)	Percent
US	117.0	50
Japan	35.7	15
UK	20.8	9
Germany	20.3	9
France	9.7	4
Brazil	8.8	4
Italy	7.2	3
Australia	5.5	2
Canada	5.4	2
S. Korea	5.3	2
Total	235.7	100

The expenditures reflect only the 13 measured media tracked by *Advertising Age* such as TV, magazines, radio, the Internet, and Yellow Pages. The $400 billion figure cited on the next page includes unmeasured spending such as direct mail, promotion, co-op advertising, and catalogues

Worldwide over $400 billion is spent on advertising. Approximately half of that amount is spent in the US and the other half outside the US. Information on advertising spending can be obtained from *Advertising Age's* website and from McCann-Erickson's website (www.mccann.com). The bulk of expenditures outside the US take place in Europe and Japan, although Brazil, Canada, Mexico, and Australia are also important advertising markets. Outside of these markets, China is the next largest advertising market and is also growing rapidly.

Table 1 shows advertising spending in the top 10 global ad markets. The US and Japan account for 65 percent of the total advertising spending in these markets and the four European markets account for an additional 25 percent. Outside of these markets, no other market, except for Brazil, accounts for more than 2 percent of the total spending. The concentration of spending in the US in part explains the dominance of US-based advertising agencies. Not only do they work for US-based clients that continue to expand outside the US, but also they accumulate knowledge

and experience in the practice of advertising that can be applied elsewhere.

Once the advertising message has been created, a media plan must be developed and specific media vehicles purchased to deliver the message to the target audience. Media differ from country to country in their availability, effectiveness, and efficiency in delivering a message, and with relatively few exceptions, tend to be organized on a country-by-country basis. Notable exceptions include StarTV, MTV, CNN in television, *Business Week International*, the *Asia Wall Street Journal*, the *International Herald Tribune* in print, and selected industry and medical publications that are read worldwide. There is also a trend toward consolidation of media in order to achieve greater economies of scale and leverage content developed in one market to others. This consolidation facilitates the purchase of media on a regional and global basis. In addition, the Internet is emerging as a truly global medium that does not conform to country boundaries.

4. International Advertising as a Social Force

In the view of the advertiser, the primary objective of advertising is to sell products or services. In achieving this primary goal, there are often profound secondary consequences. Advertising exerts a formative influence whose character is both persuasive and pervasive. Through the selective reinforcement of certain social roles, language, and values, it acts as an important force fashioning the cognitions and attitudes that underlie behavior not only in the marketplace, but in all aspects of life. In an international setting, advertising has an important social influence in a number of ways. First, much international advertising is designed to promote and introduce new products from one society into another. Often this results in radical changes in lifestyles and behavior patterns of a society, stimulating for example the adoption of fast food, casual attire, or hygiene and beauty products. International advertising also encourages desire for products from other countries, it creates expectations about ' the good life,' and establishes new models of consumption. Advertising is thus a potent force for change, while selectively reinforcing certain values, lifestyles, and role models.

Often the symbols, ideals, and mores that international advertising portrays and promotes are those of Western society and culture. Through global advertising, brands such as Levi's, Nike, Marlboro, and McDonalds are known by and have become objects of desire for teens and young adults throughout the world. Similarly, images and scenes depicted in much international advertising are either Western in origin or reflect Western consumption behavior and values. Even where adapted to local scenarios and role models, those shown often come from sectors of society, such as the upwardly mobile urban middle class, which embrace or are receptive to Western values and mores.

Consequently, a criticism frequently leveled at international advertising is that it promulgates Western values and mores, notably from the US, in other countries. This is viewed particularly negatively in societies with strong religious or moral values which run counter to those of the West as, for example, Islamic societies in the Middle East. When Western advertising depicts sexually explicit situations or shows women in situations considered as inappropriate or immoral, it is likely to be considered a subversive force undermining established cultural mores and values. Equally, in some countries such as France, there is a strong negative reaction to the imposition of US culture, values, and use of English in advertising. Promotion of tobacco products by US and UK companies in countries where there is no legislation regulating or banning cigarette advertising has also been criticized.

At the same time, international advertising also acts as an integrating force across national boundaries. It disseminates messages using universal symbols and slogans, and establishes a common mode of communication among target audiences in different parts of the world. At the same time, multicultural values are reinforced by advertisers, who adopt images incorporating peoples of different nations and diverse cultural backgrounds, as, for example, the Colors of Benetton campaign or the British Airways 'Peoples of the World' campaign. The impact of such campaigns is further reinforced by the growth of global media such as Star TV, CNN, MTV or print media that target global audiences worldwide.

Consequently, while, on the one hand, international advertising can be viewed as a colonizing force propagating Western values and mores throughout the world, it is also an important force integrating societies and establishing common bonds, universal symbols, and models of communication among peoples in different parts of the globe.

International and Transboundary Accords, Environmental

The need for international environmental accords, agreements specifying the terms of environmental policy coordination among participating governments, arises from the political fragmentation of the world into more than 190 separate states—the boundaries of which generally fail to correspond to the limits of the habitats, ecosystems and bioregions comprising the Earth's biosphere. International environmental accords range from 'soft law' declarations of goals and principles or programs of action outlining desirable priorities and guidelines for conduct, to 'hard law' agreements specifying policy measures that participating governments obligate themselves to undertake, and, in many cases, creating joint institutions for ongoing policy review and adjustment (Dupuy 1992). They can take the form of bilateral treaties between pairs of states, regional treaties among a few states, or global treaties involving many states. This article focuses on the regional and global agreements, tracing their number and subject matter, outlining their main features, and indicating the main directions of social science research into their effectiveness.

1. Subject Matter and Number of International Environmental Accords

International environmental problems can be divided into four broad types: management of international common pool resources, management of international common sinks, redress of transboundary harm and regulatory harmonization. Common pool resources—such as oil fields or fish stocks—exist in such close physical inter-relation that they cannot be easily divided into separate portions for each user, with the consequence that overhasty or overintense exploitation by any one user depletes the resource for all users. Common sinks are physical places like the atmosphere, a river, or an open tract of land which large numbers of people can reach for disposing of unwanted substances. Common sinks become environmental problems when human injection of gaseous emissions, liquid effluents or solid by-products of agriculture and industrial production are made at such a rate and/or in such aggregate amounts that the sink's assimilative capacity is exceeded. International common pool resources and international common sinks can be present either in common areas outside the jurisdiction of individual states (the high seas, the atmosphere above the high seas, outer space, Antarctica) or in areas that straddle the boundaries of two or more states.

Both domestically and internationally, common pool resources and common sinks are the exception; the majority of the world's resources and spaces can be divided into separate portions permitting each user (whether individual, corporate, or communal) to adopt effective management policies on its own. Yet overexploitation of resources that leads to environmental degradation (such as soil erosion from clear-cutting forests) and excessive emissions from industrial production or concentrated urban populations can produce negative effects for others. When these negative effects cause transboundary harm by extending into the territory of neighboring states, governments face demands that they fulfill the obligation to ensure that activity within their borders does not harm persons or places outside. Regulatory harmonization occurs when governments perceive that differences in national rules are hindering efforts to protect species or habitats, or when governments, firms, or both, believe that variation in national rules cause enough difference in the cost of economic activity to give firms in one state a significant advantage over competitors elsewhere.

Nineteenth-century international treaties addressing what we now define as environmental problems were typically bilateral or regional accords about sharing rivers that form international boundaries or traverse the territories of more than one state, reversing localized overexploitation of fish or marine mammals on the high seas, controlling the spread of disease, or protecting migratory wildlife (Ruster et al. 1983). Thus, most of them addressed common pool resources problems and a minority involved regulatory harmonization. The number of environmental treaties and the range of problems they addressed increased steadily after World War I. Of the 62 regional or global environmental agreements concluded between 1920 and 1972 (UNEP 1990), 15 addressed high-seas fishing, 12 marine pollution, 10 human health hazards, 10 wildlife or plant protection and five shared river resources. Of the 103 concluded between January 1973 and December 1998 (UNEP 1990, http://www.sedac.ciesin.org/entri/texts-home.html, http://www.tufts.edu/fletcher/multilaterals.html), 65 addressed the familiar problems: marine pollution (36), high seas fisheries (11), human health hazards (11), plant protection (3) and shared river resources (4), while the other 38 addressed new issues: general environmental

cooperation (17), atmospheric pollution (10), nonhuman diseases (6), waste transport (3), and river pollution (2). The balance among types of problems addressed also shifted. The 1920–72 treaties included 24 addressing international common pool resources (mainly high seas fishing), nine protection of international common sinks (mainly the oceans), 11 transboundary harm and 18 regulatory harmonization. The post-1973 treaties include 20 addressing common pool resources (primarily high seas fishing), 36 common sinks (oceans and the atmosphere), 14 transboundary harm and 33 regulatory harmonization.

This broadening of attention was reinforced, and the character of international environmental accords altered fundamentally, by the reconceptualization of environmental problems promoted through the 1972 United Nations Conference on the Human Environment (Stockholm Conference). Previous international environmental agreements addressed problems as isolated difficulties, usually only after the negative effects of current activity were highly visible. Later accords have been informed by clearer understandings of ecology, visions of ecological sustainability, and awareness of the interrelatedness of problems (Schachter 1991, Caldwell 1996). Some, like the 1971 Ramsar Convention on Wetlands, the 1980 Convention on the Conservation of Antarctic Marine Living Resources and the 1992 Convention on Biodiversity, explicitly adopt ecosystems management approaches; even the larger number focused on a particular problem define that problem in ecological terms and reflect growing consensus that problems should be addressed before negative effects become serious. The diffusion of new scientific knowledge informed by ecological paradigms to policy-makers and publics, and the accession of more people sharing ecologically informed beliefs to influential positions in governments, international organizations, nongovernmental organizations and business firms has helped entrench the new beliefs. Citizens, experts, business executives, and political leaders alike are now aware that natural ecosystems and human–environment interactions involve dynamic processes, and that successful environmental policy coordination requires long-term cooperation, periodic assessment of results and frequent policy revision.

2. *Features of Contemporary International Environmental Accords*

Though each global or regional multilateral environmental accord contains unique provisions (see descriptions in e.g., Haas et al. 1993, Cameron et al. 1996, Victor et al. 1998, Grubb et al. 1999, Miles 1999, Wettestad 1999, Earthscan and Fridtjof Nansen Institute 1998/99), the most prominent of them share a number of broad features. Most notably, they establish an organizational structure for ongoing consideration of the problem and potential solutions, which involves a conference of the parties (representatives of all participating governments) assisted by an array of advisory committees and a secretariat. This and other features are institutional responses to the need for frequent revision, the desire to expedite the process of bringing international agreements into effect, the character of the actual addressees of policy measures, and the need to assess whether and to what extent environmental improvement is occurring by direct observation of natural ecosystems.

The general consensus that international environmental accords must be designed for frequent revision derives from two forms of uncertainty. The first is the initial inability to identify the full contours of the environmental problem at hand and the type and extent of action needed to redress it, an inability that often makes governments hesitant to accept binding obligations. Uncertainty about the physical aspects of the problem is usually addressed before or during negotiations by convening scientific panels to secure or assemble relevant data, assess its implications, and present the results in a form that policy-makers will understand—as happened in negotiations regarding transboundary air pollution in Europe, protection of the ozone layer and climate change. Uncertainty about the remedial action needed is addressed by adjusting the type and extent of policy measures. Governments often start by agreeing only to cooperate in elucidating the problem or to adopt 'soft law' statements of desirable policy directions. Only when they are confident that they understand the basic contours of various possible solutions do they move towards the 'hard law' of specific and binding commitments. The second and more persistent form of uncertainty arises from the dynamic character of nature, human–nature interactions, technological innovation and continual revision of scientific knowledge. More than in other areas of international cooperation, participants realize that even the best current understanding is provisional and likely to be revised in light of additional experience or research.

Consensus on the need to facilitate revision of international environmental accords has encouraged extensive use of a new form of international agreement developed in a number of fields after World War II: the framework treaty plus associated protocols (Kiss 1993). The framework treaty specifies the problem to be addressed, the common objectives, and the collective procedures for organizing cooperation while the protocols (sometimes called annexes or schedules) specify the particular regulatory and programmatic measures participating governments agree to implement. This form was foreshadowed in the river-sharing and fisheries agreements of the late nineteenth and early twentieth centuries creating intergovernmental commissions whose suggestions of particular policy measures often formed the basis for additional treaties

and explicitly adopted in a number of technical fields, such as safety of navigation and use of the radio frequency spectrum. Current framework treaty-protocol arrangements link the initial and later agreements more clearly, and provide an organizational platform supporting current efforts to expedite the process of international rulemaking.

Both of the organizational forms common in contemporary international environmental accords—periodic conferences of the parties and heavy reliance on scientific and technical advice provided by committees of relevant experts—also have long antecedents. The early river and fisheries commissions met periodically and secured scientific advice either from a specially constituted scientific advisory committee or an existing international scientific body. The conferences or meetings of the parties institutionalized in contemporary accords differ from the meetings of the early international commissions mainly by involvement of a larger number of governments, participation by higher level officials, greater elaboration of procedures for securing expert advice and greater attention by a wider array of nonstate actors.

The widespread sense of urgency regarding environmental problems has encouraged extensive use of various procedures for expedited international rule-making. In the nineteenth century, multilateral agreements could be opened for acceptance only by unanimous agreement of the states participating in the conference drawing them up (a rule tempered by the deference of others to the views of the great powers), became binding only on those governments which formally ratified the result and did not come into effect even for ratifying governments until all or most of the governments represented at the negotiating conference had ratified. Even with twentieth-century relaxations of the unanimity rule, the need for ratification often means a five to ten year delay between the end of negotiations and the treaty's taking effect. Waiving the ratification requirement is one way to expedite rule-making. A few agreements concluded in the mid-twentieth century, including the 1946 International Convention on the Regulation of Whaling and agreements on aviation safety negotiated under International Civil Aviation Organization auspices, substituted an 'opt out' procedure for changing technical policy measures (the sort of detail now placed in protocols). Under this procedure, an agreed change goes into effect for all participating governments that have not filed a written objection by a particular date. What this means for implementation depends on who objects. Any objection introduces greater unevenness into implementation; objection from a government that has jurisdiction or control over the activity causing a large part of the problem effectively halts change. As the experience of international fisheries commissions shows, the prospect of objections from major governments create strong pressures for 'least common denominator' agreements. Yet an 'opt out' clause also means that objectors cannot prevent supporters from proceeding, freeing the latter from the need to persuade even the most skeptical before they try out some policy measure.

The framework treaty-protocol form facilitates taking advantage of other devices for expedited international rulemaking. Most contain two-tier amendment clauses allowing new or modified protocols to be opened for acceptance by smaller majorities of participating governments than are required for proposing changes to the framework treaty. The process of bringing new protocols or modifications into effect has been speeded up by providing for immediate 'provisional application' pending acceptance, stipulating shorter deadlines for filing objections, or even, as with 'adjustments' to deadline or emissions reductions in the Montreal Protocol, allowing a consensus or qualified majority vote in the meeting of parties to establish an immediately binding obligation.

Though international environmental accords are addressed to governments, the policy measures they specify are meant to affect the behavior of business firms, social groups, households and individuals. Participating governments therefore promise not only to instruct their own officials and agents to act in particular ways but to use their administrative apparatus to affect the actions of private persons and entities. The fact that private individuals, groups and entities are the ultimate addressees of international environmental accords affects both their initial negotiation and their subsequent implementation.

Democratic norms of domestic governance and governments' awareness that channeling behavior is much easier when policies elicit voluntary compliance, both press governments toward allowing interest groups, social movements and citizens—many of whom have strong material stakes in or strong views about potential policy measures—a voice in the formulation of regulatory measures. This complicates the negotiation of international environmental accords by linking the intergovernmental discussions to both the domestic politics of individual states (particularly the larger industrial ones) and the transnational politics of the environmental movement (for example, see *Social Movements: Environmental Movements*; *Environmental Policy: Protection and Regulation*).

Implementation of agreements is more complicated because affecting the behavior of citizens and private entities requires greater administrative capabilities than simply instructing and supervising officials. The relevant expertise, resources and administrative skills are distributed very unevenly, with the governments of many developing states hard-pressed to develop and maintain them. Those governments need help building capacity to administer the policies they promise to carry out. Awareness that noncompliance may be the result of inability rather than will has altered perceptions of the compliance problem by fostering the

realization that punishments or rewards, which rest on assumptions that the recipient has the capacity to comply and only needs the spur of changed incentives, will not work with those who lack capacity. Striking a balance between capacity-building and incentive-shifting is the subject of an ongoing debate between advocates of a 'management approach' focused on removing obstacles to compliance through capacity-building (e.g., Chayes and Chayes 1995) and advocates of an 'enforcement approach' stressing the continued relevance of rewards and punishments (e.g., Downs et al. 1996).

The general agreement that developing more systematic compliance assessment is important to improving the implementation of international environmental accords has inspired development of more coherent 'systems of implementation review' (Victor et al. 1998) drawing on precedents developed in the fields of labor standards, human rights and development aid. They combine periodic government self-reporting of activities, comments on those reports or periodic policy review, and in some cases receipt of information from private entities with the traditional devices of intergovernmental complaint and third party dispute resolution. They are managed through new organizational structures, typically small intergovernmental implementation committees reporting to the conference of the parties. Though the details of these review processes vary from treaty to treaty, implementation committees have favored a low-key, nonconfrontational approach premised on the belief that some slippage is inevitable while governments acquire needed resources and learn to cope with their new regulatory tasks.

Even intentional noncompliance is handled in new ways. Most international environmental accords do not employ one of the primary traditional remedies for noncompliance with treaties: retaliatory violation by another participating government. Counterviolation is effective when obligations are reciprocal and counterviolation exerts direct pressure on the noncomplying government, as is common in international trade. It is a less useful device in environmental affairs because few counterviolations put pressure on a violator, and even when they do they take governments further from their joint goal by producing more environmental harm. In response, governments have emphasized other forms of pressure. Implementation committee meetings and conferences of the parties offer ample opportunities for application of peer pressure and shaming. Some multilateral environmental treaties include provisions for trade sanctions. The project evaluation processes included in aid programs instituted in response to Third World governments' arguments that the industrial states, as causers of most current environmental harm, have the obligation to bear most of the cost of redressing it, provide opportunities for guiding recipient governments towards particular measures. Public concern about environmental problems and the strong transnational organization of the environmentalist movement create the conditions for supplementing—or even substituting for—inter-government pressures by nonstate actor provision of information that would otherwise go unnoticed, public shaming through media and protest campaigns, or organization of consumer boycotts.

The need to assess the results of cooperation separately from levels of compliance stems from the character of environmental problems. Most international agreements, including those on human rights, trade and arms control, establish human-designed conventions and the desired result flows directly from obeying the terms of the agreement. Environmental agreements, in contrast, deal with physical systems having autonomous dynamics. Even complete compliance with treaty commitments will fail to yield environmental improvement if those commitments are too weak or rest on a faulty analysis of the cause and effect relationships between human conduct and environmental degradation.

Determining the existence and extent of environmental improvement requires ongoing monitoring of those portions of the biosphere addressed by the treaty, and periodic scientific assessment of their current and likely future condition. Under most international environmental accords, the monitoring function is performed cooperatively, with governments or national scientific institutes providing parallel observations of conditions in different places derived from terrestrial, marine and atmospheric observation or satellite remote sensing (for example, see *Remote Sensing and Geographic Information Systems Analysis*). The integration of these data and analyses of what they convey about current and future natural conditions is performed by a scientific committee composed of relevant experts drawn from many countries that typically reports six months to a year in advance of the conference of the parties at which the assessment will be considered.

When, as is often the case, the scientific assessment indicates a need to alter policy measures, a separate process of identifying potential solutions and selecting among them comes into play, a discussion that hinges on technological feasibility and economic costs and benefits. Recent international environmental accords make provision for securing expert knowledge in these areas through advisory committees of economic and engineering experts, also drawn from various participating states, whose task is to suggest new or revised policy measures to the conference of the parties. These committees also contribute expertise that the political and diplomatic generalists at the conference usually lack and, if they include members of business firms and environmentalist organizations as well as government-employed experts, provide opportunities for expression of nonstate actors' views on potential regulatory measures.

Neither the scientific nor the technical assessment processes involves substituting 'expertise' for 'politics,' because decisions about whether and how to revise the policy measures specified in the treaty depends on governments' calculations of interest and hard political bargaining. However, the advisory committees do form an essential part of the treaty-based 'preordained learning process' (Sand 1996, p. 792) by helping policy-makers update their understanding of the biosphere, human–biosphere interactions and feasible policy measures.

3. *Factors Influencing the Success of International Environmental Accords*

Efforts to identify the conditions facilitating or inhibiting the negotiation and implementation of international environmental accords have focused on three broad sets of factors: institutions, actor beliefs and material conditions. There is as yet little consensus on how these factors, singly or in combination, contribute to success or failure. This stems partly from the scarcity, until very recently, of carefully designed comparative case studies, but even more from the use of two very different conceptions about how actors think and choose: a rational choice account, regarding actors as utility maximizers with stable interests focused primarily on material costs and benefits, and a social practices account, regarding actors as developing their understandings of themselves and their interests from membership in a wider society and socialization into its norms, discourses and collective learning processes.

Rational choice approaches treat actor interests and motivations as stable and inquire into how material conditions and institutions affect actor choice. Insights into the impact of material conditions and the possible roles of institutions in facilitating negotiation and implementation of agreements have been developed in two ways, by looking at particular features of activity and by classifying problems into broad types posing distinct cooperative challenges because of the way in which actor calculations of self-interest intersect in interaction. The first stream of work has highlighted such considerations as the greater difficulty of regulating large numbers of actors, each creating a small part of the problem, than a small number, each creating a significant part of it; the different opportunities for particular governments to regulate depending on whether those involved in an activity move from place to place (as in shipping) or remain in one place (as in mining); the impact of linkage or separation between costs and benefits of better environmental practice (for instance, the great difficulty of securing cooperation from upstream or upwind polluters); and the influence of changing cost–benefit ratios of environmentally superior action as new technology is developed or regulations alter the relative cost of continuing old rather than adopting new forms of activity.

The second stream, drawing strongly on economic theories of property rights regimes, provision of collective goods and government regulation of markets (e.g., Sandler 1997, Symes 1998), has identified the distinct regulatory challenges posed by different types of situations. In this view, the management of common pool resources and common sinks poses the toughest challenges to successful cooperation because they involve collaboration situations in which actors remain tempted to maximize short-term gain by violating their commitments. The common image of these problems as resembling a 'prisoner's dilemma' (Hardin 1968) leads analysts to conclude that effective institutions are those that reduce actor temptation through lengthening their time horizons and deterring cheating by monitoring and enforcement, tasks more difficult when dealing with large rather than small communities (see *Environment and Common Property Institutions*). Transboundary environmental problems, in this analysis, are international level expression of the familiar problem of negative externalities, complicated by the fact more than one government is involved (see *Environmental Policy: Protection and Regulation*). The range of policy solutions suggested for single countries, ranging from central government 'command and control' measures to 'market-based measures' resting on conducive property rights, taxation and regulatory regimes, can work across borders only if governments cooperate quite closely. Yet, as rational choice analysts have noticed, this cooperation is hindered because governments (and other actors) have a strong stake in continuing to use the regulatory scheme with which they are already familiar. Rational choice analysts treat regulatory harmonization as a coordination problem in which firms and governments have different preferences about regulation but little incentive to depart from an agreed regulatory scheme once it is established. Here, institutions can be used to increase the likelihood of cooperative action by augmenting the flow of information about actor preferences and behavior, providing possibilities of reducing discontent about differences in costs or benefits through concessions on related issues, or reducing transaction costs by substituting group discussions for one on one bargaining.

Rational choice analysts anticipate that the substantive provisions of international environmental accords will have a strong focus on enforcement mechanisms when addressing common pool resources or common sinks, and a strong focus on information flows, compensation mechanisms and reducing transactions costs when addressing regulatory harmonization. However, the actual development of international environmental accords has not conformed to these expectations. Through addressing these matters current international environmental accords reflect greater concern for developing

common information about the environmental problem and fostering joint deliberation regarding standards for proper conduct. This has provided openings for the social practices theorists who claim that actor choices are guided by logics of appropriateness derived from shared definitions of social roles and proper conduct by role-holders, rather than by utilitarian calculation of material interests. In this view, institutions serve primarily to define legitimate and illegitimate courses of conduct, facilitate socialization of actors into their roles, facilitate actor engagement in learning about particular situations, and promote joint deliberation about the content of the shared social beliefs and norms.

Social practices analysts expect greater cooperation on environmental problems when governments (and other actors) adopt an ecological worldview, accept protection of the biosphere as a distinct policy goal, redefine government responsibility and sound business practice to include fostering ecologically sustainable forms of human activity, and include effects on the biosphere among the criteria for judging the merits of alternate economic and social policy measures. For social practices theorists successful international environmental cooperation is not a matter of altering incentives while leaving interests unchanged, but of altering beliefs so definitions of interest will be changed. In their view, institutions are important primarily as mechanisms for facilitating redefinition of social roles and norms, socialization into and internalization of new norms, and continued actor learning.

This orientation has led social practices theorists to focus on the conditions under which learning occurs and new beliefs become disseminated from small groups of initial advocates to wider segments of society (e.g., Clark et al. 2001). These analyses highlight the importance of visible negative effects in triggering reconsideration, of scientific consensus on the extent and material causes of environmental degradation in facilitating acceptance of new information, and of activity by transnational sets of policy entrepreneurs and social movements in disseminating new worldviews, beliefs and information more widely.

Though rational choice and social practices approaches are often treated as irreconcilable theoretical rivals, they are actually complementary because each illuminates particular aspects of human behavior. Social practices analysis is strongest on the importance of causal and normative beliefs in guiding actor choices, and in beginning to identify the mechanisms of deliberation and learning through which those beliefs are maintained or changed. Rational choice analysis is strongest in indicating how material calculations factor into actor choice within the areas of discretion permitted by all but the most determinate social norms, and how different patterns of individual actor positions affect the likelihood of different compromises and the stability of various coalitions that might arise. The complementarity of the two approaches has been recognized implicitly in the stream of policy analysis inquiring into how each of the mechanisms of persuasion, alteration of information, shift in the availability of opportunities to engage in particular behaviors, reward and punishment can be used to bring about desired behavioral change. It is also acknowledged by the growing attention paid among both rational choice and social practices theorists to the ways in which international institutions are affected by and affect domestic realignments that create new constituencies for environmental policies or alter the balance between existing constituencies. Though many social scientists will continue to prefer one approach over the other, a growing number will explore integrating the two more explicitly in more careful empirical tracings of actual processes of establishing, implementing and revising international environmental accords.

International Arbitration

International arbitration can refer to practices involving either commercial disputes or disputes between states. The practice for states, exemplified by disputes about borders, are ad hoc and infrequently invoked. Of much more practical relevance at the beginning of the twenty-first century is the system of private justice created to resolve international business disputes, which has become the standard system for international transactions. When two businesses with headquarters in different countries enter into a contractual arrangement, the contract will generally provide that any disputes relating to the contract will be resolved through private arbitration. It is the default arrangement. International commercial arbitration involves hundreds of international commercial arbitration centers competing to have the most prominent rosters of arbitrators and the largest number of high stakes international cases. However, the number of international commercial arbitrations is impossible to determine precisely since many of the arbitrations are not administered by any formal organization, and there is no clear line between domestic and international. International commercial arbitration may be institutional, under the auspices of one of the institutions competing for the business of international commercial arbitration, or it may be *ad hoc*, handled solely by the parties and their counsel. It is especially difficult to count the *ad hoc* arbitrations.

It is clear, however, that the numbers of international commercial arbitrations increased at the end of the twentieth century, particularly in China and Latin America. The most important of the institutions is the International Chamber of Commerce in Paris, France, and it generally has the largest caseload and the cases involving the highest stakes. In 1999, some 529 requests for arbitration were filed with the ICC, concerning 1,354 parties from 107 different countries. The places of arbitration assigned to the cases involved 48 different countries on five continents. Arbitrators of 57 different nationalities were appointed or confirmed under the ICC Rules, and the amount in controversy exceeded one million dollars in 58 percent of the new cases. The ICC Court, which confirms the awards, had 269 new awards submitted in that year.

International commercial arbitration—as arbitration generally—involves a process whereby a third party issues an opinion that is formally binding on the parties. Unlike domestic arbitration as it has traditionally been practiced in the USA, international commercial arbitrators typically write formal opinions. These formal opinions are typically not published nor even made public informally. They belong to the parties, who must therefore consent to any publication. The awards made by the arbitrators are binding and very difficult to challenge or appeal. The New York Convention of 1958, which has been adopted by well over 100 states, make an arbitral award in practice more easily enforced within a contracting state than would be a judgment obtained through litigation. In addition the procedures of international commercial arbitration have been converging around a set of rules that tend to detach arbitration from its site and to emphasize party autonomy. The UNCITRAL (United Nations Commission on International Trade Law) model law has been the major model for this convergence.

The most prominent feature of international arbitration is that the arbitrators are private individuals without any formal connection to the state or a state judicial system. In theory almost anyone could be selected as an arbitrator. In practice, however, there is a relatively small group that tends to dominate selection for major arbitrations. The group consists largely of European lawyers, professors, and retired judges; but there are also prominent arbitrators from other parts of the world.

The advantages of arbitration in international disputes are usually listed as follows: the ability to select elite private judges, the secrecy of the proceedings, and the ability to avoid having to submit to the judicial system of the opposing party. Not generally listed as advantages, are the cost and the duration of

the proceedings, since in fact arbitrations may cost as much or more, and take as much or more time, than litigation in a national court system.

The leading centers in addition to the International Chamber of Commerce in Paris include the London Court of International Commercial Arbitration (LCIA), the American Arbitration Association (AAA), the Cairo Regional Center for International Commercial Arbitration, the Stockholm Chamber of Commerce, and the Chinese International Economic and Trade Arbitration Commission (CIETAC). While there are many centers, most contracts that contain arbitration clauses will typically select one of the established centers. The ICC is especially useful in this regard for relatively new participants to international commercial arbitration. The ICC, while more expensive, helps to guide new parties and new arbitrators through the processes, and it also has a reputation as an institution that can ensure that its awards are respected in domestic courts.

There are a number of interesting socio-legal issues that relate to international commercial arbitration. They include: (a) how this system of private justice came to be considered the legitimate way to resolve international business disputes; (b) what this system means for issues concerned with alternative dispute resolution more generally; and (c) how people become international commercial arbitrators (Dezalay and Garth 1996).

1. *Building the International Arbitration System*

International business was long a world of complex personal relations rather than formal laws and dispute resolution processes. The number of actors was relatively small in any given field, and the actors could get to know and take account of each other. There might be contracts, but the contracts were relatively unimportant documents either in the negotiation or when disputes might arise. Histories of the petroleum industry, in particular, reveal the key actors behind the 'seven sister' oil companies and how they interacted with the countries in which they did business. Lawyers were very much part of this history, but lawyers for the oil companies—including John McCloy, the famous lawyer for the Rockefeller family who was termed the 'chairman of the establishment'—relied much more on personal influence and connections than on their expertise as lawyers.

When this relatively stable set of relationships was shaken up, especially by new entrants in the 1960s and 1970s willing to offer more favorable terms to produce the oil, the lawyers for the oil companies used contract and international law to try to hold on to their privileged positions. At the same time, a small number of elite actors in the exporting countries had taken advantage of oil company paternalism to obtain education abroad—in law and engineering, for example. They and a few maverick legal advisors began to formulate legal arguments that slowly built the legal infrastructure of the industry. The major transformation, however, came when the processes of readjustment of the relationships resulted in nationalization of the oil industries in most of the oil exporting countries. The oil concession agreements typically had arbitration clauses through an analogy to the arbitration that had long been practiced in disputes between nations. When the oil was nationalized in places such as Kuwait, Libya, and Saudi Arabia, the companies invoked the arbitration clauses and began arbitration processes.

Legal accounts of this period typically celebrate the grand arbitrations that resulted, suggesting that important legal principles supporting the stability of contracts trumped the political acts of nationalization. Other accounts, including those by journalists and historians, however, do not mention the arbitrations at all. They instead emphasize the negotiations that took place between those who had long invested in the relationships, the negotiations between governmental actors at another level, and the gunboats that were putting not so subtle pressure on behalf of the oil companies. Lawyers involved at the time suggest that their activity in the arbitrations was not highly valued or even much noticed by company executives.

The arbitration processes did go forward, however, and they produced raw material that equipped international business with people and principles to handle trans-national disputes. The raw material was in the form of written opinions that were widely circulated, academic articles about the principles in the opinions, and individuals who gained or enhanced their reputations as potential arbitrators by virtue of their participation in the arbitrations. The petroleum arbitrations thus contributed to the production and legitimization of international commercial arbitration for trans-national business disputes.

When new sets of problems arose that related to some of the themes of the petroleum arbitrations, in particular disputes involving the numerous construction projects that took place in oil-producing countries after the price of oil increased in the early 1970s, international commercial arbitration played a crucial role. The continental academics who developed these principles into a new *lex mercatoria* also developed relationships with students from the less developed world, and the students helped to reinforce the legitimacy of these principles in their own countries. Put very simply, the process produced lawyers on both sides, legal principles, and a legitimacy that made it possible to generate a demand for what this group supplied. For the International Chamber of Commerce, this increased demand meant that the while the first 3,000 requests for arbitration came between 1923 and 1976, the next 3,000 came in the following 11 years.

2. International Commercial Arbitration and Alternative Dispute Resolution

The world of international commercial arbitration was dominated in the 1960s and 1970s by continental academics who wrote about the *lex mercatoria*, but also tended to encourage the parties to find a way to settle the dispute. The *lex mercatoria* could be used by the arbitrators to find a solution that fit the business relationship and left the parties satisfied with the result. Consistent with the general orientation of the leading arbitrators and lawyers associated with the pioneers of international commercial arbitration, the process was not very adversarial, was relatively inexpensive except for the arbitrators, did not tend to produce extensive documentary evidence, and did not contemplate such US practices as cross-examination of witnesses. The model was quite consistent with Continental practices, even for others who participated in the processes.

When the arbitration business began to take off in the 1970s and 1980s, it coincided with the rise to prominence of business litigation in the USA. The US law firms in Paris, France, were long involved in international commercial arbitration, but they tended to play according to the Continental rules. As the practice of international commercial arbitration grew and expanded outside of a relatively small circle of people, US businesses became increasingly involved in arbitration, and developing countries found it to be in their interests to hire US law firms as well. The enhanced presence of US litigators had important consequences. They naturally sought to use the techniques of discovery, intensive production of documents, cross-examination of witnesses, and more generally the kind of aggressive adversarial behavior that was beginning to characterize litigation in the USA. They also sought to retain arbitrators who would permit the lawyers to use the techniques that they had developed. The result was that the processes of international commercial arbitration changed substantially. They did not become identical with US litigation, but they moved much closer to US adversarialism. International commercial arbitration became much more document intensive, much more adversarial, and much more expensive.

Litigation in the USA had also been transformed, and that transformation had produced the beginnings of the alternative dispute resolution movement in that country. New organizations such as the Center for Public Resources had begun to encourage corporations to practice more mediation as a way to avoid the high costs and adversarial nature of business litigation. The movement became quite influential in the USA and some of the individuals associated with it began to suggest that it would also be useful for international commercial arbitration. Not surprisingly, the first reaction of many within the international arbitration community was that they already practiced mediation as part of the normal process. They argued that the practice of international arbitration provided an effective alternative to litigation as practiced in the USA.

As international commercial arbitration became more like US litigation, however, the US-promoted alternative began to gain more adherents within the international arbitration community. By the end of the twentieth century, the menu of US alternatives—including mediation but a range of others as well—had become much more common. This gradual transformation illustrates the way that the formal categories of dispute resolution—litigation, arbitration, and even mediation—can disguise profound transformations in the way that the underlying practices proceed. The center of gravity of international commercial arbitration moved much closer to US-style litigation, which was itself a relatively new invention, and the shift also helped to bring the US-antidote, alternative dispute resolution.

3. Becoming an Arbitrator

The international commercial arbitration community is relatively closed, often termed a 'mafia' even by insiders. One reason for this 'club' is simply that for high stakes arbitration, the parties typically want to select arbitrators who are known quantities. Untested arbitrators are very risky from the point of view of the parties. It is also deemed important to select arbitrators who are known for their ability to 'speak the language' and be taken seriously within an arbitral tribunal. Since arbitrators often serve as counsel because of their familiarity with the processes and people, it is common for people from the relatively closed arbitral community to nominate others from the community. The key to success in the arbitration proceeding is selecting an arbitrator who will be impartial enough to persuade the chair of the tribunal but will also be able to understand and put forward the case of the party that appointed him or her. The selection of established names also serves a protective function in case the decision does not favor the selecting party. It is easier to avoid blame for a safe selection than for a novel one. For many reasons, including the fact that a relatively small supply serves the economic interests of the arbitrators, it is not easy to gain entrance into this community.

The easiest way to gain entrance for at least some small cases that may provide a basis to build a practice is to conform to the characteristics of those already in the field. The individuals who set the norms emphasized scholarly accomplishments, which put an emphasis on publications, cosmopolitanism, and linguistic ability. Those who seek to enter must probably also attend a number of the major conferences in order to display the appropriate characteristics and be judged more personally. However, the general point is

that invitations to enter the community tend to be issued most easily to those who can offer something to the existing community—most obviously persons of high status who reflect that status back on the arbitral community, persons from areas that are not yet committed to the legitimacy of international commercial arbitration (which means they offer both credibility and a potential new caseload), or sometimes disciples of those already in the arbitral community. This process helps to explain why individuals without high status may study, write, and attend conferences, but lacking a prestigious platform, they cannot gain entry. On the other hand, individuals from developing countries who serve as judges on the World Court do typically gain entry. The process also helps explain why there are so many arbitration centers despite the fact that the caseloads are concentrated in a relatively few places. Those who create new centers gain the attention of the elite of the arbitral community and also help to provide new domains where businesses will contemplate arbitration and courts will respect the awards. As a result, the new center may promote the local leader into a position closer to the core of the arbitral community. There tends to be relatively few of these peripheral arbitrators in each relevant site.

International Business

The term 'international business' refers to economic activities that take place across the boundaries of nation–states. The most important of these are trade and foreign investment. Merchandise trade has grown 12-fold since the end of World War II, and trade in services has increased even faster since the early 1980s. Foreign direct investment (as opposed to portfolio investment not seeking the managerial control of the foreign asset) has grown at a rate twice as fast as that of trade. Foreign direct investment gives rise to multinational enterprises, i.e., firms with operations in more than one country (see *Multinational Corporations*). There are some 54,000 of these enterprises in the world today which collectively control about 450,000 affiliates. They account for one third of world merchandise trade and for the vast majority of trade in technology. While theories of international trade were first put forward during the sixteenth century and largely have remained the province of economics, the study of foreign direct investment and the multinational enterprise started only after World War II and has been approached from a variety of social and behavioral perspectives. The three most important ones—economic, managerial, and sociopolitical—are covered here (see Table 1).

1. The Economic Approach

Modern economic thinking about foreign direct investment and the multinational enterprise properly starts with Hymer's (1976) thesis, posthumously published in 1976. The key insight was to see foreign direct investment not as a capital movement but as the decision of a firm to produce some good or service in a foreign location. Hymer noted that foreign direct investors did not seem to go abroad in search for higher interest rates—as the theory of investment would predict. Rather, he argued that 'control of the foreign enterprise is desired in order to remove competition between that foreign enterprise and enterprises in other countries' (Hymer 1976). Thus, Hymer was the first to observe the monopolistic behavior of the firm that engages in foreign direct investment. In other words, the multinational was seen as an anomaly that could only be explained by reference to imperfections in the markets for production factors and goods, economies of scale, and/or government intervention. The most complete rendering of the oligopolistic thesis is that of Knickerbocker (1973). He observed that firms in a loose-knit oligopoly in the home country match each other's investments in foreign locations following a pattern of action–reaction or move–countermove out of fear that not keeping up with rivals might erode their profitability and competitive position or endanger their sources of supply.

Hymer was also the first scholar to note that 'the control (of a foreign enterprise) is desired in order to appropriate fully the returns on certain skills and abilities' (1976), especially those having to do with product and process innovation. Vernon (1979) further argued that patterns of trade and foreign investment had to do with the so-called 'product cycle' and not so much with comparative advantage. Vernon saw entrepreneurs and managers as relatively myopic, i.e., most knowledgeable about, and responsive to, con-

Table 1
Three perspectives on international business and the multinational enterprise (MNE)

	Economic	Managerial	Sociopolitical
Name of the literature(s)	IB (international business)	IM (international management)	Development studies and international relations
Research community	AIB (Academy of International Business); AEA (American Economic Association).	AIB and AOM (Academy of Management)	ASA (American Sociological Association) and APSA (American Political Science Association)
Research questions	Why do firms go abroad? How do they go abroad? What are the welfare implications?	Why and how do firms go abroad? How are MNEs organized?	What role do MNEs play in economic and political development and in international relations?
Assumptions and answers	Rationality; constrained maximization; calculation of trade-offs	Capability-based strategies; organizational structure follows strategy	Power and interest drive processes and outcomes
Ways of doing research	Deductive reasoning; formal modeling; large samples	Conceptual framing; grounded theory; case studies and large samples	Mostly inductive; grounded theory; case studies; comparative–historical method
Key scholars	Hymer (1960); Caves (1971); Knickerbrocker (1973); Vernon (1966); Buckley and Casson (1976); Dunning (1979); Kogut (1983)	Perlmutter (1969); Stopford and Wells (1972); Wells (1983); Prahalad and Doz (1987)	Vernon (1971); Moran (1974); Kobrin (1982); Evans (1979); Haggard (1990)

ditions in the home market. The features of new products reflected characteristics of the home market and affected the pattern of foreign expansion of the firm. Vernon proposed that firms would only pursue foreign market opportunities after the home market became saturated. Foreign markets relatively similar to the home market in terms of purchasing power and tastes would be entered first, and exports would probably be the preferred mode of entry. Licensing or foreign production would come later in response to host country protectionism and/or rising production costs in the home country.

The economic approach to the multinational enterprise acquired a high degree of internal consistency after scholars started to draw from the insights of transaction cost economics, which has become the backbone of the widely-accepted view among economists that multinationals are an efficient governance response to certain market failures (Buckley and Casson 1976; Dunning 1979; Caves 1996). The multinational enterprise is expected to exist if two conditions are met. First, the necessary condition is that there be differences in the productivity and cost of production factors by location (in the case of vertical expansion by multinationals) or significant transportation costs, trade protectionism, adverse changes in exchange rates, and/or needs to customize products to local demand (in the case of horizontal expansion). Transaction cost theory, however, warns that a second, sufficient condition must be met in order to guarantee that foreign production will be controlled managerially by a multinational firm: market failure due to asset specificity or uncertainty (vertical expansion) or the possession of intangible assets such as patents, brands, and other proprietary skills that cannot be protected in a contractual, arm's length fashion (horizontal expansion). A final, distinctive contribution to the economic approach was made by Kogut (1983), who proposed to see the multinational enterprise as a flexible network in which resources are arbitraged across borders, a view that revisited Vernon's insight that multinationals approach foreign investment decisions as a sequential process. A significant body of empirical evidence exists corroborating the major tenets of the economic approach (Caves 1996).

2. *The Managerial Approach*

While the economic approach has focused on the questions of why and how firms go abroad, the managerial approach has contributed an understanding of how multinationals are organized and managed (see *Multinational Corporations*). This second approach relies on typological conceptual frameworks and inductive reasoning rather than formal modeling. In addition, theoretical development frequently results from case studies, although testing of the main propositions has also been undertaken with large

samples, as in the economic approach. Perhaps the first noteworthy typology of the multinational enterprise in the managerial literature was proposed by Perlmutter (1969), who distinguished among three types of multinational 'mindsets.' Ethnocentric multinationals are the ones assumed by Vernon's (1979) produce-cycle approach. They have simple but inflexible organizational structures. Polycentric multinationals, by contrast, adapt to local circumstances but have difficulty co-ordinating. Finally, geocentric multinationals are costly but very good at gathering and integrating information from various locations. Drawing on a rich data set on US multinationals assembled under the co-ordination of Vernon, Stopford, and Wells (1972) presented the first comprehensive treatment of the various factors at the firm, industry, and country levels affecting the choice of organizational structure and degree of ownership over the foreign subsidiaries of the multinational firm.

The early insights by Perlmutter and by Stopford and Wells were further developed in their respective dissertations by Prahalad and Doz as the 'integration-responsiveness' framework (Prahalad and Doz 1987). Multinationals are seen as organizations responding to environmental pressures for global integration (so as to reduce costs through economies of scale and scope) and to pressures for local responsiveness (so as to adapt to local tastes, institutions, or regulations). Following the strategy–structure paradigm in organizational theory, they identify different organizational structures and managerial processes that allow multinationals to operate under different configurations of global integration and local responsiveness. Although still in its infancy, a neoinstitutional approach to the multinational enterprise as a firm exposed to isomorphic pulls from both the home and the host country is also emphasizing the organizational problems associated with multinationality.

3. *The Sociopolitical Approach*

A third perspective on international business has built on the insights of both the economic and managerial approaches to the study of the political and social context of multinational activity. Vernon (1971) was the first to explicitly argue that the spread of multinational corporations creates 'destructive political tensions,' and that there is a 'need to re-establish balance' between political and economic institutions.

Political scientists have looked at the impact of multinationals on international relations. They argue that changes in the international location of activities due to foreign direct investment have reinforced the importance of domestic policies, as countries engaged in regionalization, sectoral protectionism, and mercantilistic competition during the 1980s so as to cope with globalizing trends. They have also analyzed the relative bargaining positions of host governments and multinationals. In a classic book, Moran (1974) analyzes Chilean efforts to seize control over its vast copper industry, finding that nominal ownership and control does not guarantee success in a worldwide oligopoly. Sociologist Evans (1979) published his landmark book *Dependent Development*. He argues that foreign investment attracted by import–substitution industrialization policies results in a 'triple alliance' among local entrepreneurs, state bureaucrats, and foreign capital that perpetuates and even enhances patterns of dependence of the host country on foreign technology and capital. Haggard (1990) summarizes the bargaining power literature writing that the host government is relatively powerful vis-à-vis multinationals making huge fixed investments (e.g., in extractive industries), relatively weak when dealing with export-oriented firms looking for cheap labor, and weakest when multinationals are attracted by import-substitution policies that create a political base of support among local suppliers, distributors, employees, and joint-venture partners. Kobrin (1982) offers a different, yet complementary, approach to the politics of multinational activity by examining how multinationals evaluate political risk and try to protect themselves against it.

Sociologists have also examined the effects of international business activity on economic growth and inequality in the world. One major controversy in the literature is whether foreign investment retards long-term economic growth and exacerbates income inequality in the host country or not. Capital dependency theorists have long argued in the affirmative using cross-national empirical evidence, while other sociologists have pointed out that the data do not support such claims (see Kentor 1998). This protracted debate—now three decades old—does not take into account the fact that the effect of foreign investment on host-country growth and income inequality is mediated by the economic development strategy of the host government. Countries allow more or less foreign investment depending on a number of ideological, political, and economic considerations, and the effects of multinational activity differ widely between import-substitution and export-oriented contexts (Haggard 1990). While it is easy to point to examples of the harmful effects of multinationals, and even of their outright wrong-doing, the social science literature has been slow to recognize that they have played a largely constructive role in many countries, e.g., Singapore, Malaysia, Puerto Rico, Ireland, Portugal, Spain, in which even organized labor and the left have welcomed them.

Since the 1980s the expansion of international business activity has acquired a new, qualitatively different outlook. Globalization in the late twentieth century is different from the internationalization of the world economy during the nineteenth century through increasing cross-border flows of trade and investment. The 'global' economy is driven by the increasing scale

of technology, the surge in cross-border collaboration between firms along the value-added chain, and the cross-border integration of information flows. While the conventional wisdom is that globalization undermines the nation–state and compels firms to converge towards 'universal best practices,' sociologists and political scientists document that governments exercise a great deal of choice in the global economy and firms continue to adopt organizational structures and patterns of behavior that are related to the institutional conditions in their home countries (Orrù et al. 1997). Thus, globalization is far from being a monolithic, uniform, and inexorable trend. Rather, it is a fragmented, contradictory, and heterogeneous process of change (Guillén 2001). More empirical and theoretical research is needed to describe the causes of globalization—including those having to do with international business activity—and to understand its effects on political, economic, and social outcomes in various parts of the world.

International Communication: History

International communications includes communications between the inhabitants and between the governments of different states. Such communications have increased in speed, reliability, and volume since the beginning of civilization, until they now constitute a flood.

1. Ancient and Medieval Communications

Messengers were the first means of conveying information over long distances. Before the Battle of Marathon in 490 BC, Phidippides, 'by profession and practice a trained runner,' ran to Sparta, 120 miles away, arriving 'on the very next day.'

Inhabitants of cities and isolated communities had no choice but to rely on messengers and travelers, but kings needed more regular communications. To keep control of their far-flung domains, the Persians established a permanent postal system with relays of horses along the Royal Road that stretched from Susa in western Iran to Ephesus on the Aegean Sea. The Romans created a similar network of imperial messengers and relay posts along their major roads, called *cursus publicus*. The Chinese, Inca, Mongol, and other empires established similar systems. These early imperial networks were reserved for official messages; anyone else who had a message to send would have to

find a traveler going in the right direction, and hope for the best.

The Middle Ages saw the decline or disappearance of the governmental apparatus of classical times and the emergence of numerous unofficial channels of communication, some of them well organized. The Benedictine monks of Cluny entrusted pilgrims with messages to other monasteries from Spain to Poland. The merchants of the Hanseatic League carried documents and messages along with merchandise. Butchers, who traveled from place to place buying and slaughtering livestock, carried messages for people. The most organized of these nongovernmental networks was the one centered on the University of Paris, whose students came from all over Europe and carried and sent messages between Paris and their homelands. Although they were supposed to serve only the university community, in fact they commonly carried messages for the public as well. These networks were slow and unreliable, however, for they did not operate on a schedule, nor did they use relays of horses or messengers.

2. *Postal Communications*

The first postal system that established permanent relays and offered its services to the general public was founded in 1489 by Franz von Taxis, postmaster to the Holy Roman Emperor Maximilian I. The Thurn and Taxis family provided a regular postal service throughout most of Europe until 1867. With up to 20,000 messengers and relays of horses on all the main routes, their postal service was reliable and, by the standards of the day, fairly swift: from Brussels to Paris in 44 hours, to Innsbruck in six days, and to Toledo in 12 days. Service, however, was very costly.

The Habsburgs may have trusted the Thurn and Taxis family, but the rising national monarchies of France and England did not, nor did they trust any other private or nongovernmental message service. The first royal messenger service in France, established in 1464, was reserved for official messages. Private individuals could bribe the royal couriers to carry messages surreptitiously. The royal postal service was opened to the public in the early seventeenth century. It set the rates for private letters very high, to subsidize the official mail. Once the royal mail service was opened to the public, the government attempted to suppress private messengers, in order to protect its lucrative monopoly and permit easier surveillance of potentially subversive communications; the last nongovernmental service in France, that of the University of Paris, ended in 1719.

The evolution of the English postal system paralleled that of France. There had long been royal messengers, but the first permanent service was founded in 1512. Royal messages to and from foreign countries, however, were still hand-delivered by special messengers. Meanwhile, merchants had their own networks, such as the Merchant Adventurers' Post for English merchants engaged in foreign trade, and the Foreigners' Post for foreign merchants in England. Queen Elizabeth, suspicious of Catholic plots, ordered all mail leaving or entering the country to be carried by the royal post. This decree, though often repeated by her successors, was never fully enforced.

In 1635, the royal postal service began to serve the public; two years later it included the foreign mails as well. As in France, 'public service' was a euphemism, for postal rates were kept extremely high as a source of income for the treasury and for the king's favorites and officials had the right to open and read private letters. Surreptitious inspection of letters, especially those from abroad, was a common occurrence in the eighteenth and early nineteenth centuries. Most people who needed to correspond across borders preferred to send letters with a friend, a servant, a hired messenger, or a traveler. Surveillance abated in the mid-nineteenth century, as the increased volume of mail overloaded the postal bureaucracies.

The mid-nineteenth century saw a tremendous surge in the volume of mail, thanks to two innovations. One was the penny post with prepaid stamps, introduced in England by Rowland Hill in 1840 and soon imitated in other countries. The other was railroads and steamships, which made transportation cheap and fast. Letters from relatives or friends in foreign countries, a rarity until then, became a commonplace experience for middle-class families in the Western world.

Airplanes began transporting mail right after World War I. In parts of the world, such as Africa and South America, that had poor telegraph and rail connections, airmail represented a breakthrough comparable to the effect of railways in Europe a century earlier. In places well served by traditional postal services, airmail competed with the cheapest kind of telegram, the 'night letter.' After World War II, airmail became the standard means of sending first-class postage over long distances.

3. *The Telegraph*

Many scholars believe that modern telecommunications began with the electric telegraph. From a technical perspective, the advent of electricity was certainly revolutionary. From an information point of view, however, the revolution began half a century earlier with the optical telegraph, invented by Claude Chappe in France in 1794.

Throughout the French Revolution and after, every French government expanded the optical telegraph network and supported the family that ran it. Chappe and his brothers built lines east to Strasbourg, west to Brest, and north to Dunkirk and Brussels; under

Napoleon, they extended the network south to Lyon and Marseilles. As Napoleon's empire grew, lines radiated to Turin, Milan, and Venice, to Antwerp and Amsterdan, and to Mainz. After the defeat of Napoleon the French network was reduced to its domestic lines. Other European countries, as well as the USA, Egypt, and Australia, built individual lines linking their major cities to the nearest harbors. Some of these were government-owned lines reserved for official or military traffic, while others served the merchant communities. In the few instances where two systems met at a border, any message going from one country to the other had to be decoded, translated, hand-carried across the gap, and encoded for further transmission. International telecommunication had to await the electric telegraph.

During the 1830s, several inventors came up with methods of transmitting information over long distances by electricity. The one that eventually displaced all others was invented by Samuel Morse. Morse's contribution was not the use of electricity but a code which allowed the use of only one wire, with the earth serving as a return. The cost savings of Morse's system made up for the need for trained operators.

During the next two decades, the nations of Europe and North America began installing electric telegraph lines. At first, they used incompatible systems; messages had to be written out, translated, hand-carried across the border, then retransmitted. As traffic grew, governments strove to overcome this barrier to communication. In 1850, Austria and several German states signed the Austro-German Telegraph Union. Treaties between France and its neighbors followed. Finally in 1865, all European governments except the UK founded the International Telegraph Union, to be administered by the International Bureau of Telegraph Administrations, the first permanent international organization. It encouraged national telegraph administrations to adopt compatible technical standards and to connect their lines across border. By the 1860s, it was possible to send telegrams across Europe and between the USA and Canada.

Meanwhile, engineers had solved the technical problems of communicating across the sea. The first successful submarine cable crossed the Channel in 1851. Cables across oceans were a greater challenge, however. The first Atlantic cable failed in 1858, as did the first cable from Egypt to India two years later. After many trials and errors, cable technology finally caught up with the demand. The Atlantic cable of 1866 proved reliable. In the 1870s, British companies rushed to lay cables from the UK to India and from there to China and Australia. Cables reached South America and Africa in the 1880s. By World War I, cables criss-crossed all the oceans and connected every continent and every country.

Submarine cables were phenomenally expensive, however. Only the North Atlantic had enough traffic to justify several competing cables. In other parts of the world, the high cost of cables had to be amortized over small numbers of customers, and a few firms, most of them branches of the British conglomerate Eastern and Associated, dominated the market. The high cost of sending messages over long distances led business customers and news agencies to develop elaborate code books.

4. *Wireless Telegraphy*

Although the telegraph had 'annihilated time and space' (to use a favorite expression of nineteenth-century boosters), it left many people dissatisfied, for both economic and political reasons. Economically, international telegrams were very expensive, and transoceanic ones exorbitantly so, placing them out of reach of all but the wealthiest clients and commercial enterprises. And politically, the fact that most ocean cables belonged to British firms, and that most intercontinental telegrams passed through British hands, made all other governments very uncomfortable, especially after 1900, when the UK proved that it was not averse to intercepting, delaying, and censoring foreign messages during a crisis like the Boer War (1900–2).

In 1895, Guglielmo Marconi demonstrated the possibility of transmitting information through the ether by electromagnetic radiation. He found immediate backing from the Royal Navy and from British shipping lines, which had long wanted to communicate with their ships at sea. France, Germany, and the USA also greeted the new technology with enthusiasm, for they had fallen far behind the UK in the cable business, and saw radio as a means of building international connections independent of the UK.

Until the late 1920s, wireless used longwaves (over 1 km, or less than 300 kHz), which required power in proportion to the distance to be covered; stations powerful enough to transmit across continents or oceans needed dozens of huge towers, miles of antennas, and alternators that used as much electricity as a small town. Within countries, wireless could not compete with the cheap and efficient telegraph networks. Across oceans it was competitive only under unusual circumstances. Before World War I, the four major powers built stations linking them to their colonies. During the war, when it was impossible to lay cables, the US expeditionary force built stations in France to supplement the overloaded transatlantic cables. After the war, to meet the booming demand for transatlantic communications, companies found it faster and cheaper to build gigantic transmitters than to lay costly cables.

Longwave wireless had two flaws to which cables were immune: they were vulnerable to atmospheric static and to interception and cryptanalysis. The British, with their heavy investment in cables and their far-flung colonies and bases, were concerned with

keeping their cables viable. Thus, it came as a shock when Marconi, the man who had invented wireless, announced a new technology that threatened to make both longwave radio and submarine cables obsolete, namely shortwave radio (c. 13–120 m or 2.5–22 MHz).

Shortwave, though more vulnerable to atmospheric conditions and less reliable than longwave, had one enormous advantage: it was extraordinarily cheap; a transmitter cost a few hundred dollars instead of hundreds of thousands. Even small inexpensive transmitters could, at certain hours of the day, reach across oceans and around the globe.

The advent of shortwave coincided with the Depression. The collapse in international trade brought the British cable companies to the brink of bankruptcy, but they were rescued at the last moment by their government for strategic reasons. Although cables served a useful function in World War II for the transmission of top-secret information, they were overshadowed by the proliferation of shortwave transmitters throughout the world. Indeed, a war of movement over enormous theaters of war like the Russian plains or the western Pacific would have been inconceivable without a multitude of radios. At the same time, the reliance of armed forces on radio meant that the outcome of battles depended on communications intelligence and cryptanalysis as much as it did on ships, tanks, and planes.

5. *Broadcasting*

Broadcasting, the transmission of radio and later television programs to many receivers at once, played a tremendous role in the cultural history of every twentieth century nation. The first experiments in transmitting voice and music over the airwaves took place before and shortly after World War I. However, broadcasting had little impact on international relations before the 1960s, for two reasons. One was that most broadcasting was in the medium wave range (150–600 m, or 500–2,000 kHz), which did not carry far; only border regions could receive foreign broadcasts. The other was that programs were in the language and culture of each country (or rather, of each country's elite), with little appeal to foreigners.

International shortwave programs, such as those pioneered by the BBC in the early 1930s, were specifically designed to appeal to people in other countries. Soon, every major country had its shortwave station beaming news and propaganda to the world, often in many languages. No doubt such broadcasts appealed to the converted and reminded exiles of their homelands, but whether they persuaded more than a handful of foreigners is questionable.

Mention should be made of the interesting cultural phenomenon of ham radio operators who communicated around the world, not so much to convey information as to collect lists of other distant amateurs they had contacted, much as birdwatchers collect the names of birds they have spotted.

Television uses high-frequency waves that cannot bend with the curvature of the earth. Until the advent of satellites in the 1970s, transmitters could only reach local viewers. Satellite television, however, has opened up the world to broadcasts from foreign countries; all that is needed is a dish antenna. Countries with conservative theocratic or tyrannical regimes resent the intrusion of such foreign cultural phenomena as sex, violence, and free speech. However, prohibition is hard to enforce, and people around the world are much more interested in foreign television programs than they ever were in shortwave news broadcasts.

6. *International Telephony*

Telephony is a recent phenomenon. Though invented in the 1870s, it affected few people before the early twentieth century in North America, the 1920s in western Europe, and the post-World War II period in other parts of the world; at the beginning of the twenty-first century, there were fewer telephones in all of Africa than in Manhattan.

International telephony is an even more recent phenomenon. Due to the bandwidth requirements of the human voice, telephone messages could not use telegraph wires, but needed repeaters every few hundred miles. International calls were possible only between adjacent countries. Most telephone systems were government controlled, and calls to foreign countries had to go through an operator and were extremely costly. Calls overseas required two radio stations in each country, one to transmit and one to receive. Until the 1950s, such calls were considered newsworthy events rather than a medium of communication.

This situation began to change after the first transatlantic telephone cable was laid in 1954, and especially after the advent of satellite transmission of telephone calls in the 1970s and fibre-optic cables in the 1980s. As prices fell from dollars to pennies a minute, the number of international calls has multiplied exponentially, with no end in sight. Businesses and even many individuals now make calls to distant countries as readily as their parents once called across town.

As this is written, a new technology promises to change international telephony as dramatically as the first telephone cables: low-earth-orbit (LEO) satellites that can relay calls to and from portable telephones anywhere on earth, bypassing national networks. Although governments and national companies are likely to resent this intrusion on their monopolies, telecommunications technology is too invasive to stop. Eventually, the well-to-do will be connected around the world, regardless of governments and borders, while the rest of humankind looks on in wonder.

7. Data Communication and the Internet

The current revolution in communication is as radical as the telegraph's 'annihilation of time and space' that so amazed our ancestors a century and a half ago. By turning text, voice, music, pictures, and video images into bits, electronic digitization allows the transmission of all forms of information with equal ease and speed. Two associated technologies, microwaves and fiber-optic cables, have reduced the cost of transmission almost to zero. The results are nothing short of phenomenal. The first transatlantic telephone cable could carry a dozen or so telephone calls at once; the most recent fiber-optic cables across the Atlantic carry hundreds of thousands of simultaneous calls, or dozens of television channels, or any combination of data, voice, text, or images. Communication is not free because other costs remain, such as switching and distribution. But the price differences between local, long-distance, and international communications are shrinking fast.

The Internet began in the 1970s as a US military project to link the mainframe computers of research institutions. By the mid-1980s, when personal computers began to proliferate, engineers in Europe, North America, and Japan first created simple networks to transmit data, then linked them together into a super-network called the Internet that could transmit any information to any connected computer. The demand for this new form of communication soared beyond anyone's prediction, as the public logged onto a virtual world of chat rooms, bulletin boards, electronic mail, shopping, entertainment, advertisements, even music and video clips from around the world. And the cost is very low. For people who own a computer (even a primitive 'Web-TV' box) this amazing service costs a few dollars a month and the price of a local telephone call. All other costs (servers, cables, switches, software, and administration) are borne by governments or by advertisers. In the near future, the Internet promises to offer television and telephone service, and to compete with newspapers, libraries, and even universities. And unlike the technologies that it replaces, the Internet is oblivious to borders and political jurisdictions. We can only speculate about the effect on cultures and on the politics of nation-states.

What the public sees is only a fraction of the world of international digital data transmission. Computer networks, connected by fiber-optic cables, have revolutionized finance and commerce as well. Credit-card charges, engineering drawings, business contracts, stock market reports, late-breaking news, banking transactions, and myriad other data flit across the globe at the speed of light. The amount of money—in the trillions of dollars—that circulates at any given moment dwarfs the economies of the largest countries. The new communications media offer the potential for phenomenal economic growth and for disastrous crashes. Humans may still be bound by the laws of physics, but for information, space and time have truly been annihilated.

International Communication: Regulation

The regulation of international communication was launched in Paris, in 1863, at a conference convened to lay the foundation of an international postal system

(Hamelink 1994, Mattelart 1996). For most of the next century, the regulation of international communication focused mainly on providing a few basic rules to ensure that communication resources could be used nationally, according to the goals and capacities of individual nation-states, and only minimally on relations between states. But the assumption that communication was a national affair requiring a minimum of international coordination disappeared with the emergence of a global communication environment in which communication technologies pay increasingly less attention to national borders. In the twenty-first century, any discussion of communication regulation has to be placed in an international context; thus, it is increasingly pertinent to speak of the international regulation of communication.

1. *The History of Regulation of International Communication*

In any field of endeavor, regulation implies recognition of a problem to be solved by authorities in a position to propose and eventually implement a solution. In the field of communication, regulation has typically sought to deal with issues involving the need to harmonize technical standards, allocate scarce resources, and ensure that at least a substantial portion of these resources is used in the interest of the common good.

The invention of the telegraph placed these issues on the international diplomatic agenda during the latter decades of the nineteenth century. The world's first permanent intergovernmental organization, the International Telegraph Union, was set up in 1865 to provide a framework for development of international telegraph and telegram services and the issue was problematic enough to spawn a spate of international conferences in Paris (1865), Vienna (1868), Rome (1872), and St. Petersburg (1875), resulting in a series of conventions regulating international telegraphy. Telegraph communication introduced a new set of challenges to national sovereignty, as signals paid no attention to national borders. However, the telegraph was still reliant on cable connections and these, of course, were territorially based. With hindsight, it may be said that regulating telegraphy was a relatively simple matter compared with what was yet to come.

The problem took on its modern face when wireless radiocommunication came on the scene at the turn of the twentieth century. Wireless radio made communication possible between any two points, provided that two conditions were met: each party had to be equipped with an appropriate apparatus and both had to be tuned to the same wavelength or frequency. Each of these conditions raised an important issue that soon required international regulation.

In 1901, a ship carrying Prince Henry of Prussia ran into difficulty off the coast of England. Its call for help was heard by a Marconi company receiving station on the Isle of Wight, which refused to forward it because of a company policy limiting dealings to ships equipped with Marconi transmitters. Prince Henry's ship, unfortunately, was outfitted with a rival German company's apparatus. The incident led to an international conference in Berlin in 1903, the essential purpose of which was to break the Marconi company's attempt to set up a worldwide monopoly in wireless radiotelegraphy.

It soon became clear that effective use of the 'air' would require some kind of prescription of the use of certain wavelengths for certain purposes, but it would be another 30 years before such a system was put in place. A more substantial conference—31 governments as opposed to eight—followed in 1906, and culminated in the first International Radiotelegraph Convention. The treaty opened ship-to-ship and ship-to-shore communication for the first time, obliging operators to exchange messages irrespective of their corporate affiliation. A subsequent conference in London in 1912 refined the treaty.

By the 1920s, a new and hitherto unexpected use of the new technology had appeared. Taking their lead from amateur operators, entrepreneurs in the budding US electronics industry realized that ordinary folk could be interested in acquiring radio receivers provided that some kind of attractive listening content were made available. The broadcasting industry was born, and with it a whole new set of international regulatory issues.

The main technical challenge to broadcasting was finding a way to organize the use of a radio spectrum characterized by scarcity: there were a limited number of wavelengths suitable for transmission and reception, and too many people, governments and companies who felt they had something to say (or sell). Within national jurisdictions this could be handled by licensing the use of the spectrum to specific parties. Different countries each had their own criteria for doing this. In most of Western Europe and the British Dominions, for example, licensing favored national public service broadcasting monopolies such as the BBC. In the USA, most of the broadcasting spectrum was licensed to privately owned commercial stations. However, regardless of the use to which broadcasting would be put in various countries, an overall international framework had to be put in place before national broadcast regulation could be effective at all.

With the rapid spread of radio broadcasting to multiple uses, including commercial entertainment, authorities feared the result of chaotic traffic jams unless a modicum of order were applied at the international level. In October 1927, representatives of some 70 countries (and 40 communication companies) convened in Washington at the behest of the US government to discuss the matter. US President Calvin Coolidge, opening the conference, declared that, 'An instrument of such far-reaching magnitude, fraught

with so great a power for good to humanity, naturally requires *national and international regulation and control*... In many fields our country claims the right to be the master of its own independent development. It cordially concedes the same right to all others. But in the radio field the most complete development, both at home and abroad, lies in mutual concession and cooperation. Your main endeavor will be to discover the rules which will be for the mutual advantage of all those who are connected with this great industry and who are the users of this means of communication.'

The conference's main order of business was to allocate spectrum use to different classes of activity: military, commercial shipping, broadcasting, etc. Rather than divide the spectrum among countries, it would be divided by group; all nations would be free to use the spectrum for the purposes thus decided, regulating national use accordingly. Further regulation might be necessary at the regional level, e.g., North America. But regulation would begin at the international level and everything would flow from that.

Categories of spectrum use were thus defined in a set of General Regulations annexed to the International Radiotelegraph Convention. A subsequent conference in Madrid in 1932 further refined the regulations and merged wireless and conventional telegraphy in one association, to be known as the International Telecommunication Union, or ITU. The term telecommunication has since evolved to encompass any form of distance communication—telephone, radio, telegraph, television—and more recently satellite, computer and Internet communication. Each of these technologies has added its own specific twist to the complexity of the international regulation of communication.

2. *Towards the International Regulation of Communication*

The regulation of international communication changed in character after the Second World War, with the emergence of the United Nations system of multilateral organizations (Schiller 1969). As we have seen, the oldest of these, the International Telecommunication Union, traces its lineage to 1865. However, an important change in quality was introduced in the immediate post-War period as international agreements began to deal with not only international but also domestic issues. A wide range of new issues, from trade to human rights, now came into play.

The immediate post-War period brought with it a new era in international communication. Article 19 of the Universal Declaration of Human Rights underscored the right to freedom of information. UNESCO, created in 1946, undertook a series of activities which have been crucial to developing an understanding of the links between communication and culture and their importance for human development. New regional bodies such as the Council of Europe have included communication in their sphere of concern, through periodic resolutions on specific themes and issues.

At the same time, communication issues began to crop up in the wake of the new economic multilateralism that flowed from the Bretton Woods agreements and creation of institutions such as the World Bank and the International Monetary Fund. The first General Agreement on Tarifs and Trade in 1947 was the setting for a vigorous debate that culminated in the acceptance of foreign film import quotas, notwithstanding the GATT's general thrust towards liberalization of national markets. The extent to which cultural 'products' constitute a specific type of commodity requiring its own set of international trade rules has been a constant feature of multilateral and regional trade negotiations since that time.

The question of national sovereignty over communication took on a new color in the political and technological context of the 1960s and 1970s, with the emergence of dozens of new postcolonial states and the development of satellite technologies making it possible to transmit sound and images irrespective of national borders (Smythe 1981). The unequal flow of information content from north to south and the increasing importance of technological resources led, conceptually, to the articulation of a 'cultural imperialism' thesis and, politically, to efforts to create a 'New World Information and Communication Order' (Tomlinson 1991, Galtung and Vincent 1993). These issues were highlighted by publication, in 1980, of the report of a UNESCO commission chaired by Irish jurist and human rights activist Sean MacBride (UNESCO 1980) and the subsequent withdrawal from UNESCO of the USA, UK, and Singapore. Meanwhile, with far less fanfare, an ITU report of the same period documented the unequal distribution of technical resources for communication worldwide (International Telecommunication Union 1984).

UNESCO has since adopted a more low-key communication strategy, emphasizing the training of communication professionals and development of media institutions in the 'transitional' states of central Europe, Africa and Asia. In 1995, however, a UN/UNESCO World Commission on Culture and Development published a major report which brought many of the lingering issues back on the table, with an updated analysis (United Nations/UNESCO 1995).

Meanwhile, the collapse of the Berlin Wall made it possible to extend the development of a global communication system under the hegemony of the western alliance. Cultural and communication goods and services were consistently integrated to the international trade agreements of the 1990s, despite the resistance of countries with strong traditions of national regulation in these areas, such as Canada and France. Under the auspices of the World Trade

Organization, an open global market in telecommunications is emerging—paradoxically, one in which, through a raft of mergers, there are fewer and fewer players. Foreign ownership and content regulations are increasingly under attack and threatened with extinction in blueprints for the future such as the aborted Multilateral Agreement on Investment (MAI), an initiative of the Organization for Economic Cooperation and Development that failed to crystallize in 1998. Experiences such as the MAI and the heavily contested Millenium Round of the WTO which opened in Seattle in December 1999 illustrate the highly politicized nature of international regulation in general. Communication, however, is not only an object of such regulation, it is also in many respects the catalyst for it.

Generally, the social science study of the regulation of international communication has developed along parallel lines with the area itself. For many decades it occupied, at best, a sleepy corner in the study of international relations. Still a relatively sparse field, it has grown substantially since the late 1960s, however, with the emergence of a wide range of critical studies in mass communication. A seminal work in this regard was Herbert Schiller's (1969) *Mass Communication and American Empire*. Throughout the 1970s, the work of scholars such as Armand Mattelart, Cees Hamelink, Hamid Mowlana and Kaarle Nordenstreng began to shape a more general field of international communication, which broadly focused on the previously mentioned 'new world order' debates centered within UNESCO. Issues such as inequality in east–west and north–south information flows and the absence or inadequacy of international regulatory mechanisms were often highlighted by this scholarship.

More recently, a younger generation of communication scholars has begun paying attention to international regulatory issues in the context of broader debates on globalization and global governance. This interest has generated a wide range of institutional studies of organizations such as the ITU and, especially, the WTO, from the perspective of international regulation of communication. The trend towards international media conglomerization and the spread of new global communications technologies such as the Internet have also led to more scholarly focus on international regulatory issues such as access and copyright. Much of this scholarship is policy-oriented and has a strong normative thrust.

3. *The International Regulation of Communication in a World of Trade*

Since the late 1980s and particularly in the wake of the collapse of the Berlin Wall, it is fair to say that a new global communication environment has been taking shape. From a regulatory perspective, this environment is characterized by the fact that, unlike in previous eras, there is no discernible center. Rules continue to be made at the national and regional level but these are increasingly impacted and constrained by supranational agreements.

Multilateralism is clearly one of the central trends in global governance; but different players have different stakes and, consequently, need different strategies for intervening in a political system based on multilateral relations. In this context, even large powers are recognizing the need for global coordination and regulation in order to create the state of order necessary for the flourishing of their interests. Thus, for example, at the turn of the century the European Union and the USA were each floating proposals for some kind of formal regulatory framework to govern global communication.

The need to provide some kind of stability to the context in which the Internet was developing lay at the heart of the matter. Paradoxically, over the rhetorical claims of users and entrepreneurs alike, this most open and freewheeling communication technology was crying out for the institution of an orderly governance framework—much as radio had a century earlier.

The urgency of such a project was driven home in September 1999 when CEOs of the world's most important communication companies met in Paris to discuss the global regulation of electronic commerce. The Global Business Dialogue on Electronic Commerce, or GBDe as the group is known, urged governments and international organizations to coordinate their regulatory efforts regarding the Internet, which it described as a global medium requiring a global policy approach. This is but one example of the regulatory challenges facing the emerging global communications environment.

Indeed, the powerful technology of the Internet has exacerbated many old problems related to communication policy at the national level while introducing new ones globally. Oddly, national regulators are tending towards abandoning attempts to regulate the Internet, just as the global issues it raises cry out for some kind of transnational regulatory intervention (see 'Regulating the Internet' 2000).

The example of the Internet illustrates that while most of the debate around questions of communication regulation still pit the market against the state, the issues are increasingly international. In the case of the Internet, it has been suggested (Mathiason and Kuhlman 1999) that we should be moving towards an *international framework convention*, which would articulate basic norms of how the Internet is to be governed and establish a mechanism for monitoring compliance with those norms and determining future changes. A framework convention would be different from a treaty-based regime such as the one pertaining in trade under the auspices of the WTO. Its task would be to sort out the roles and responsibilities of the various national, international and private actors

involved in the development of this 'global enabling technology'. It would need to be negotiated, these authors suggest, on the basis that the Internet is part of the global commons. This type of proposal clearly depends on a broad consensus of what communication is about. It can only hope to work to the extent that communication technology is recognized as a public good. In other words, the normative view one takes about something like the Internet is much more important in determining the limits and possibilities of regulation than the nature of the technology or the policymaking capacity of the state. Debates surrounding the normative definition of communication technologies are therefore a key prerequisite to any attempt at international regulation in this area.

4. *Models for Regulation and a Global Approach to Communication*

There are at least *four models* that can be identified with respect to the international regulation of communication:

(a) The libertarian model: no regulation. With the new digital technologies such as the Internet, this is the approach that is being taken by most national regulators (Australia's being an important exception), mainly because they do not know what to do or how to do it. It is also largely favored by grassroots activists who are benefiting from the system's present openness. However, the history of communication technologies shows that left to its own devices, this open access is not likely to last. A libertarian model of Internet governance will likely lead eventually to closed doors, restricted access, and limited communication.

(b) Self-regulation: this is the approach most often favored by industry players, with the encouragement of national regulators. It is presented as the solution to problems such as abusive content and the protection of rights, on the argument that consumers will respond if they are not satisfied. However, as we saw with the example of the GBDe, even the promoters of self-regulation recognize the need for a global structural framework for communication activity, within which industry self-regulation would take place.

(c) The closed club, or top-down institutional model: where plans are negotiated in organizations such as the OECD, G7, or WTO, as well as in the new institutions emerging as the corporate sector fills the vacuum created by the retreat of national governments from regulatory issues. One such agency is the Internet Corporation for Assigned Names and Numbers (ICANN), a private organization set up at the initiative of the US government in 1998 for the purpose of directing traffic on the Internet.

(d) The long march through the institutions: a process that is tied to the broader project of democratization of global governance, reflected in some of the initiatives around UN reform and in notions such as 'cosmopolitan democracy' (Archibugi et al. 1998). Access to global policymaking is being fostered to some extent by some important initiatives in multilateral agencies such as UNESCO and the ITU which have demonstrated some sensitivity to the concerns of civil society and the inclusion of NGO representation in their activities.

The international regulation of communication can also be seen as part of a larger sphere of intervention encompassing other aspects of policy. By thinking about *a global public policy approach to communication* it becomes possible to begin addressing a whole range of issues for ensuring the public interest in communication globally, such as the following:

(a) regulation of commercial activities in the public interest, to guarantee equitable access and basic services;

(b) funding and institutional support for the creation and sustaining of public service and alternative media;

(c) placing limits on corporate controls resulting from transnational concentration of ownership in new and conventional media and telecommunications;

(d) guarantees of access to available media channels on the basis of public interest criteria;

(e) development of universal codes and standards for curtailing the spread of abusive contents;

(f) facilitating networking capacity through communication technologies of not-for-profit organizations; and

(g) provision of public communication spaces for conflict resolution and democratic dialogue on global issues.

Before this can happen, however, credibility will need to be given to the idea that the global communication environment, from the conventional airwaves to outer space, is a public resource, to be organized, managed and regulated in the global public interest. Broadening access will require appropriate transnational regulatory mechanisms, in addition to mechanisms for a more equitable distribution of global commercial benefits. From a perspective that places high priority on the importance of the public interest obligations of communication systems, there is a need for the international appropriation of some air and space for distribution outside the country of origin of viable creative products that currently have no access to the global agora that figures so prominently in utopian discourses on information technology. The convergence of communication technologies requires a parallel convergence in programs and policies, and also the invention of new models, new concepts, and a general new way of thinking about communication.

In the twenty-first century, the international regulation of communication will be an essential part of the global governance system. This indicates a need to develop democratic mechanisms for ensuring access to the regulatory process at the global level, without which it will soon be difficult, if not impossible, to

promote a public interest through policy intervention *in any area* influenced by communication.

Communication has always been linked to democratic struggles, and is increasingly relevant to thinking about broader issues such as the role of the state and human rights. In the twenty-first century, because of the particular situation of communication in the overall environment of globalization, issues regarding the regulation of communication have an important impact on a range of related questions. The international regulatory framework for communication is therefore emerging as a key structural component of the emerging global governance framework in general.

In grappling with this, it is important to see that even if it is true that we are moving towards a global society, this does not mean that there is no longer a need for regulation. The development of economic or market globalization does not in itself negate the need for rules; indeed, the new communication environment recognizes this and is constantly searching for new regulatory mechanisms appropriate to capturing and defining what might be termed the global public interest.

Communication and information technologies, although of little interest in themselves, are strategically critical in efforts to intervene economically on the one hand, and in the cultural sphere on the other. The regulation of communication revolves around struggles over who gets to use these technologies, under what conditions, in order to promote which projects, and in who's interests. In the contemporary context of globalization, 'communication' is another way of describing the technological space at the interface of the economic and the cultural. What goes on in that space—the international regulation of communication—is thus of great import for human and social development.

International Justice: Philosophical Aspects

International justice, like justice within borders, is largely concerned with duties of aid in response to inequality and duties of noninterference. However, the change to an international context strikes most people as profoundly altering the moral norms to be applied. They think that tax-financed aid to the needy should attend to foreigners to a far lesser extent than to compatriots. And they think that considerations of national sovereignty support stringent prohibitions against intrusion in another country's affairs, even to promote just and humane goals rightly pursued within a country's borders. Current philosophical debate over the proper norms of foreign aid and national sovereignty is a forum both for challenges to the routine assessments of the moral importance of borders and for appeals to these assessments as exposing the typical insensitivity of modern moral philosophy to the special ties of obligation binding compatriots.

1. International Inequality

Most people in countries that are relatively rich per capita think that foreign aid should be a small part of their government's total aid budget even if it is an effective means of relieving the most urgent deprivations in the world at large. Much philosophical

thinking about international justice has been prompted by arguments that this patriotic bias is incompatible with the equal valuing of everyone's life that morality demands.

1.1 Impartial Concern

This challenge to ordinary patriotism is clearest in moralities that take the moral point of view to be, fundamentally, a perspective of impartial concern for all. Utilitarianism is the most familiar and simplest example. If the right choice is always the one that creates as much happiness as any alternative, then each of us should always be willing to contribute to the needy whenever the consequent loss in happiness would be less than the consequent gain. Since the vast majority of the neediest live in countries with relatively few local means of relief, citizens of richer countries should use tax-financed aid to relieve these desperate foreign needs even if serious but lesser domestic needs for education, meaningful work, or comfortable housing go unmet.

Even within a morality of impartial concern and under the factual assumption that foreign aid effectively provides for urgent foreign needs, transfers are ruled out when they would so lower a rich country's productivity that it becomes a less efficient instrument for increasing world happiness. Moreover, if one departs from the classical utilitarian focus on individual acts and determines moral responsibilities by asking what institutional assignments of responsibility produce the most happiness, there is (as Goodin and others have noted) a powerful case for some significant duty of patriotic bias in most countries. A worldwide system of institutional responsibilities including special responsibilities toward needy compatriots relies on the spontaneous concerns of the most effective social groups, guides aid according to the best-informed deliberations, and favors the least costly transfers. Still, if responsibilities are to be determined by welfare-maximizing institutions, then the efficiency of modern international communication and transportation, the vastly unequal resources of the richest countries and poor ones, and the specially desperate neediness of the many who suffer in poor countries would seem to call for a demanding responsibility of citizens of the richest countries to help needy citizens of poor countries, a responsibility overriding the standard patriotic bias, appropriate though the latter might be in a less unequal world.

The challenge to routine attitudes toward foreign poverty is especially daunting because it does not depend on utilitarianism's distinctive view of the dictates of impartial concern. In assessments of domestic justice, many political philosophers favor, instead, the perspective of Rawls' *A Theory of Justice*, (1971) according to which the justice of a society's basic institutions is determined by standards of political choice which all participants would prefer in the so-called 'original position,' in which each seeks to promote his or her life-goals while ignorant of their specific content and of his or her special advantages or disadvantages (see *Contractarianism*). The outcome, Rawls argued, would include an egalitarian 'difference principle' requiring that the life-prospects typical of the worst-off social position be as great as possible. Although Rawls has resisted its use in assessing global economic justice, others (for example, Beitz and Pogge) have taken a cosmopolitan original position, in which the deliberants do not know where in the world they live, to be an appropriate response to worldwide interdependence and inequality. If (as some of Rawls' own arguments suggest), commitment to the original position reflects a duty to use institutions to reduce lifelong burdens of the brute bad luck of birth in a disadvantaged social situation, then this cosmopolitan original position, presumably yielding a global difference principle, seems an appropriate response to the enormous, undeserved lifelong difference it makes to be born in Burkina Faso, say, rather than in Belgium.

The case for demanding duties of foreign aid is also strengthened by a parallel, which Singer strikingly deployed, with certain well-established duties of rescue. It is wrong for a passerby to refuse to save a toddler drowning in a wading pool because rescue would ruin his expensive suit. It is hard to discern any morally relevant difference between this obligatory rescue and preventing the death from dysentery of a child in a foreign country through a similarly costly donation to a project of foreign aid.

1.2 Ethical Nationalism

Arguments that impartial concern entails stringent duties of international aid are frequently offered in criticism of routine patriotic biases. But others (for example, David Miller) take these shocking consequences to reveal the inadequacy of moral universalism, the assumption, widespread among philosophers, that all moral duties ultimately derive from some perspective of equal appreciation of everyone's worth. Perhaps this universalism underrates special obligations of loyalty to certain kinds of unchosen associates.

Alleged duties of special concern for fellow-members of one's nationality have been of special interest to critics of universalism because such claims have a powerful appeal and yet are hard to reconcile with a universalist morality. Most members of a nationality feel a special obligation to help continue the distinctive culture and history with which they identify and to look after the well-being of those who share this culture and history. According to an ethic of nationality, this sentiment is morally insightful. Those who can

be part of such a project of continuity and special concern ought to seize this opportunity. As a consequence, they will have less concern for outsiders, even though these outsiders have equally valuable lives.

Current philosophical partisans of ethical nationalism are well aware that nationalism can lead to callousness and brutality. As a moral barrier to nationalist excesses, they insist on respect for certain basic rights possessed by everyone in virtue of mere common humanity. Even if one's positive duty of aid to foreigners is quite undemanding, one must respect stringent negative duties not to steal from them or kill them. However, it is troubling that the vast distance between this humane nationalism and the outlook that motivates genocide and wars of national expansion has been created by piecemeal stipulation of a limited set of duties to humanity. If the duty of loyalty to the nationalist project of mutual concern and cultural continuity so easily overrides positive concern for outsiders' needs, why can't it justify ethnic cleansing, as a means of preventing the eventual disintegration of a nationality through intermarriage and cultural intermingling? A principled explanation of why the ethnic cleanser's nationalism is depraved would appeal to some regulative principle on the basis of which both goals of nationality and specific human rights receive their moral authority—but the principles claiming such comprehensive power are the bases for universalist moralities. Moreover, any political morality in which nationality-based concern is fundamental seems open to morally troubling discriminations in policies of domestic aid, for example, the provision of lesser health benefits to those who are not members of the dominant nationality.

1.3 International Justice and Domestic Fairness

In addition to its role in stimulating doubts about the adequacy of universalist morality, resistance to demands for global beneficence has contributed to investigations of forms of universalism that do not express a fundamental perspective of impartial concern. In general, there is no need to be impartially concerned for different people in order to regard them as having equal moral worth. Parents are usually much more concerned for their own children than for other people's children, without remotely supposing that the lives of other people's children are any less valuable.

Because of its well-established role in discussions of political obligation, the duty to treat others fairly was one of the first universalist resources used to justify patriotic bias in a framework of equal respect but not of impartial concern. Benefiting from one's engagement in a cooperative scheme that depends on most participants' willingness to subordinate immediate self-interest to the advancement of the scheme, one ought to seek a fair division of the benefits and burdens of the shared project among all participants. Free-riding shows inadequate respect. So, on general grounds of fairness, compatriots have a special mutual obligation of reciprocity for one another's contributions to their shared political community. Dagger and others drew the international moral: lacking a similar debt of reciprocity to outsiders, just participants in a political community will be less concerned for the nonparticipants' well-being.

Such duties of political community are far from excluding foreign aid. If important foreign burdens can be relieved without any serious loss to compatriots, this help might be required in order to express the equal valuing of all. Moreover, citizens of per capita rich countries participate in an international system of economic and political institutions, involving lesser, but significant, benefits and burdens, and consequent lesser duties of reciprocity.

In criticizing this appeal to mere political community, ethical nationalists have questioned its capacity to generate adequate obligations of concern for needy compatriots. It is hard to see how an obligation of reciprocity could dictate special concern for compatriots who cannot contribute to one's political community because they suffer from severe lifelong physical disabilities. (Similarly, compatriots burdened by natural, rather than social, disadvantages seem inadequately supported by a complementary argument from political fairness, the argument that the ultimate coerciveness of government makes special concern for those burdened by laws that one upholds a dictate of respect for persons.)

1.4 Universal Respect and Special Relationships

Such doubts concerning the adequacy of appeals to political fairness have contributed to growing interest in the interaction of equal respect for all with the proper valuing of special relationships. Most people would deny that someone properly values friendship if she would desert a friend as part of a strategy for introducing friendship into the lives of two other, friendless people, taking friendship to be nothing more than a good to be impartially promoted. In general (as Scheffler, Scanlon and others have emphasized), the proper valuing of a worthwhile relationship entails special concern for others to whom one happens to be so related. Since those who lack valuable and beneficent relationships, through no fault of their own, can be specially needy, the proper valuing of relationships conflicts with standards of distributive fairness requiring the minimization of burdens of brute bad luck. But it does not obviously conflict with the injunction to show equal respect for persons; indeed, the failure properly to value one's relationships, as in the case of the philanthropic desertion of the friend, seems to show disrespect. By the same token, the proper valuing

of relationships seems a dictate, rather than a competitor, of alternative fundamental precepts equivalent to the injunction to conform to rules that could express equal respect for all, precepts requiring conformity to rules that all could freely impose on themselves without lacking self-respect or that all could freely impose on themselves in light of a rationale that would be a reasonable basis for their joint agreement.

A hybrid strategy in which the demands of equal respect are specified, in part, by reflection on special relationships may be a means by which a broadly universalist morality can avoid duties of impartial global beneficence without lapsing into callousness. When compatriots' potentially demanding loyalty to their political institutions is compatible with their self-respect, perhaps, as in the case of a worthwhile friendship, proper valuing of their relationship entails special loyalty to one another, a loyalty that should not be calibrated to others' actual contributions any more than loyalty among friends. This loyalty, deriving from political obligations acquired at birth, may preclude the hard words, 'I would do nothing for you if you had been unable to contribute to our joint political project, through no fault of your own.' If so, then, on pain of arbitrariness, this special concern might have to be extended to others who cannot take part in the joint political project because of severe disability but are within the scope of an obligation to take part if one can. Assuming that special concern for associates ought to be proportionate to the importance of the shared institution and the potential demands of the institutional loyalties that sustain it, there would be a significant though lesser duty of foreign aid, reflecting engagement in international cooperation.

A related recent trend in moral philosophy has insisted on the irreducible role of one's special relationship to oneself in limiting duties to aid others. Many advocates of legitimate self-concern deny that someone is obliged to embrace rules of giving that would, foreseeably, seriously worsen his or her life, even rules solely dictating the relief of burdens much greater than the burdens of giving. Perhaps the morally crucial difference between the practices of rescuing victims close at hand that are Singer's starting point and the practices of global rescue meeting his demand for global concern is that the balance of foreseeable lifelong costs and potential benefits would violate the legitimate self-concern of the less vulnerable if the rules of rescue were global. Perhaps (as Richard Miller and others have argued) departures from patriotic bias in tax-financed aid on the part of governments of countries that are the best off per capita would impose losses on their citizens, in trusting civic relationships and other morally important goods, that would be too great a cost, even as a means of relieving more urgent needs abroad. If so, unequal concern would show no disrespect, but only a legitimate concern for one's own well-being, whose legitimacy the foreign poor could acknowledge without any lack of self-respect.

Of course, much depends on how the seriousness of costs and deprivations is assessed, on how respect, self-respect, and reasonableness are construed, and on how the line is drawn between mere nongiving and participation in coercive projects, contexts in which appeals to one's well-being or one's valuable relationships provide much less support for partiality. For example, Shue has argued that poor people in the poorest countries would lack self-respect if they accepted practices of foreign aid that neglected their basic rights, i.e., their rights to the security, subsistence, and health care needed to enjoy any further rights, even if this neglect protected cultural goods in per capita rich countries or the relatively expensive life-projects with which many people in rich countries intelligently identify as giving order and value to their lives. Pogge has emphasized the constraints on the self-advancement of people in poor countries imposed by the worldwide economic dominance of firms and institutions controlled by people in rich countries, and the tendency of international practices of investment and purchase to encourage the corrupt repression that blights many poor countries. An appropriately nuanced moral typology of coercion and complicity might reveal duties of justice toward the poor of these countries that could require large sacrifices from people in richer parts of the world. The shift from a universalism of impartial concern to a universalism of equal respect is a shift to a broad framework, whose content and coherence is the subject of heated controversy.

2. *Sovereignty*

Rights to freedom from interference play an important role in international political discourse, as they do in domestic controversies over civil liberties. However, the characteristic explicit topic of international complaints of unjust interference is the autonomy of governments (or, more precisely, national governments), rather than individuals. There is broad agreement on certain presumptions against international interference: special justifications are required to legitimate interference by one government in political life within the territory controlled by another; this burden of proof is extremely heavy when interference takes the form of armed invasion, which is never justifiable merely as a means of advancing the interests of the invading government or its citizens; defensive war is usually a just response to armed attack. Still, virtually every theorist agrees that the burdens of justifying interference can sometimes be met and that some regimes could not justly be defended against armed attack from abroad. After all, individuals, not governments, are the ultimate bearers of moral rights, and, far from uniformly protecting the rights of people in their territories, governments often violate them, sometimes in atrocious ways. Different views of the

relationship between the rights and morally urgent needs of individuals and the collective political processes in which they take part have sustained conflicting specifications of the duty not to intrude on sovereignty and the rightness of defending sovereignty.

2.1 Moral Individualism and Political Autonomy

The gap between alleged rights to noninterference of governments, on the one hand, and rights and morally significant needs of individuals, on the other, is specially wide in moralities that value political arrangements solely as instruments for promoting individualist goods, i.e., goods enjoyed by individuals which do not intrinsically depend on their participation in any specific kind of societal process. A strong presumption against invasion which does not respond to an armed attack may be justifiable on this basis. Such intrusion usually provokes resistance and deadly violence, which may disastrously expand as military alliances and rival national interests are mobilized. If the government of the invaded territory has protected people in the secure enjoyment of fundamental liberties, they lose a vital basis for well-being, and a new one may be hard to create. On the other hand, a government that violates fundamental liberties is apt to receive new popular support when nationalist sentiments are inflamed by invasion.

Still, just as a universalism of impartial concern challenged routine favoritism toward needy compatriots, impartial concern for individualist benefits challenges moral barriers to interference that most people would impose. Since the well-being of those in the invaded country has no special standing, a war of conquest could, in principle, be justified by net gains to all affected due to increased benefits to the subjects of the invading government—say, the gains to poor people in Iraq from the acquisition of oil reserves formerly controlled by rich Kuwaitis. Moreover, since no intrinsic value is ascribed to such collective goals as joint participation in government on the basis of a shared, distinctive culture, foreseeable benefits to the conquered in health, literacy, or material prosperity can yield a case for imperialist conquest that destroys popular local political institutions.

2.2 Collective Self-determination

Seeking to raise higher moral barriers to interference, many theorists have ascribed independent moral value to individuals' engagement in certain collective processes through which they determine their own political institutions within their own familiar political communities. If participation in such a collective process can enrich someone's life, apart from individualist benefits, then it is easy to explain why the conquest of another people's territory cannot be justified simply by net individualist gains. The difficulty is to avoid the overvaluation of the project of basing political outcomes on what is locally shared. In 1994, the government of Rwanda massacred a half-million Tutsis and moderate Hutus, acting solely within its borders. Foreign governments surely had no duty to permit the bloody enactment of this local drama to run its course just because it was local.

What exceptions will be made to the presumption against military intervention and how far they will extend to nonmilitary interference will depend on what forms of collective self-determination are valued. Both a strong presumption against interference and strictly limited exemptions (such as Walzer's 'rules of disregard' of the prohibition of nondefensive war) can be derived from the special value of national self-determination, the effort to base common political arrangements on the shared identities constitutive of nationality. Foreign invasion normally interferes with this process, but may promote it, in exceptional cases, by supporting the national uprisings of minorities or by countering the prior intervention of outside powers; moreover, if the value of national self-determination is contingent on avoidance of the gravest injustices in the struggle to determine national institutions, there is a room for intervention to stop massacre or enslavement.

Still, a valuing of national self-determination that supports distinctive prohibitions of military intervention must fence off some struggles in which some compatriots threaten others with injustices so grave that they are rightly resisted with deadly force. Lesser injustices, after all, are not just causes for the use of deadly force by any group, domestic or foreign. To insist that those grim struggles must be kept fratricidal strikes many as a dangerous overvaluing of the national character of political life as opposed to its justice. In addition, basing foreign military neutrality on the valuing of national self-determination often seems to combine cleareyed acceptance of nonideal national political processes with naive blindness to international economic processes. Far from relying solely on local resources, tyrannical sovereign governments have nearly always benefited from internationally recognized prerogatives to negotiate loans, sell natural resources and buy arms.

In constructing substantial but nonabsolute barriers to intervention, Rawls has relied on a different standard of valued collective self-determination, analogous to his domestic political liberalism, through which fellow-citizens of a single society respectfully respond to diversity in their comprehensive moral doctrines (see *Public Reason*). His international analogue is a 'law of peoples' that would be willingly accepted by representatives of all peoples whose dominant political culture is, at least, 'decent'—morally flawed, perhaps, through departures from liberal democracy, but still meriting respect as in-

cluding an international precept that military force is not to be an instrument for advancing the national interest and a domestic commitment to the rule of law and the pursuit of the common good.

This respect for certain illiberal political cultures has troubled many of those who share Rawls' view that such cultures are, nonetheless, seriously defective. If, for example, a political culture disrespects women, despite seeking in its own way to include their good in the common good, should there be a strict prohibition of international interference, even through trade discrimination and diplomatic pressure? A rigid rule of noninterference seems to deny that individual persons are the bearers of moral rights.

2.3 Kantian Sovereignty

In assessing international duties of noninterference, as in assessing duties of international aid, some theorists try to steer a middle course in which a perspective of universal respect for individuals ascribes moral authority both to certain local forms of collective self-rule and to norms of world community. This broadly Kantian project has an important antecedent in Kant's own arguments that world justice requires a world federation of sovereign liberal democracies.

A broadly Kantian assessment of the virtues and limits of political sovereignty takes its start in arguments for liberal–democratic forms of political association and against world government. If a morally responsible person is someone committed to living by principles expressing full and equal respect for all, then such a person will aspire to a political life through which each can freely, rationally and self-respectfully commit himself or herself to uphold the outcome of the shared process of public deliberation. Such a political order will guarantee each the civil liberties and democratic rights that no one could self-respectfully renounce and will base legislation on principled persuasion in which each can effectively participate, seeking common ground yet open to inevitable compromises. Because the diversity of cultural norms makes it impossible to base adequate legislation on principled persuasion worldwide and because the diffusion of civic activity worldwide would make it so hard to resist an oppressive central authority, a mutually respectful political life must be based on national sovereignty (which Kant contrasted with the 'soulless despotism' of world government). However, the commitment to base one's life on principles expressing equal respect for everyone everywhere also dictates support for appropriate worldwide norms of conduct among governments.

Because of the connection between worldwide respect for persons and localized republican polity, such international norms would require noninterference with foreigners who are working out the terms of their shared political life on the basis of deliberative democracy and respect for civil liberties, even if the process and its outcomes are currently defective. In addition, presumptions against interference will extend to more deeply flawed regimes. Given the dispersal of military power among national governments, a broad permission to intervene to rectify serious injustice could produce a ghastly enlargement of the perils of Locke's state of nature, in which the anarchic pursuit of justice by individuals leads to a deadly spiral of intervention and counterintervention, driven by inevitable disagreements and conflicts of interest. Moreover, an ethic based on observance of rules that all could freely and self-respectfully impose on themselves will count it as a serious loss when people who have attained Rawls's standard of decency in their political outlook are forced to conform to laws departing from their own defective understanding of the demands of justice. Finally, if peace and commerce tend to be the best background for displaying the advantages of liberal democracy and overcoming social conflicts that make it unworkable, international institutions will tend to promote an ultimate pacific confederacy of liberal democracies if they prohibit military intervention and enhance economic interaction among governments above a threshold of civil and political liberties which is well below the full demands of justice.

These considerations parallel some of Rawls' arguments for his law of peoples and are one natural extension of civic republican thinking into the international realm (see *Republicanism: Philosophical Aspects*). They would sustain an international code of conduct, expressing an aspiration to worldwide liberal democracy, which includes a strong presumption against military intervention and a corresponding right to repel invasion. The precise nature of the limited rules allowing intervention will depend on the global milieu of military capacities and political sentiments. But they would probably permit some military interventions against home-grown tyrants, invited by popular movements in the direction of liberal democracy, even when humane nationalists' threshold of atrocity has not been crossed. There would be even greater scope for nonviolent interference with foreign tyranny through diplomatic pressure, trade discrimination, or public condemnation meant to change political life within a foreign territory.

A role in affirming and preserving the distinctive culture of a nationality will not be a fundamental reason for leaving a government alone. This ultimate detachment from nationalist concerns strikes some as a recipe for cultural imperialism. In addition, ethical nationalists argue that stable and effective justice depends on pervasive sentiments of solidarity based on nationality. If so, the universalist appraisal of sovereignty leads to the alienated stance of support for the public encouragement of evaluative outlooks whose insightfulness the universalist denies.

Perhaps the most distinctive feature of Kantian and civic republican justifications of the presumption against intervention is their tendency to support systematic shifts in political authority that would reduce the scope of national sovereignty. These justifications ground the international rights of national governments on the need to support public facilities through which people can express respect for one another's autonomy. Without any intention to meddle in another government's political affairs, decisions made in the territory of one government (for example, interest-rate policies of the US Federal Reserve) can have a profound impact on the lives of people elsewhere. If we should show respect for fellow-citizens by giving them a voice in regulating processes that would otherwise subordinate their lives to the unconstrained will of others, then, on the same grounds, we ought to show respect for those whose lives are molded by transnational processes, by providing them with a voice in the collective regulation of these processes. As the needed international institutions expand their scope and their democratic legitimacy, many disputes over the morality of foreign aid and intervention may be ended, not by conclusive arguments but by obsolescence, due to new international patterns of political loyalty, reciprocity and self-respectful trust.

International Law and Treaties

1. *Definition*

International law and treaties is a term that in English has at least three modern meanings: (a) legal rules and legal processes generated by more than one state; (b) legal rules and legal processes that concern interstate relations; and (c) legal rules and legal processes that regulate the international transactions of both states and private parties.

2. *Nature and History*

Traces of what we now term *international law and treaties* are as old as written history. Evidences of compacts between states and rulers of states date back at least four thousand years; they chronicle agreements about, *inter alia*, war and peace, foreign merchants, and ambassadors, all still lively topics of the discipline. It is safe to say that international law and treaties figure as necessary features of human society, regardless of any juristic definition, description, or argument.

The modern intellectual tradition relating to international law and treaties owes much to Roman law. The Roman term *jus gentium*, the law of nations, described legal rules pertaining generally to foreigners when specific foreign rules were unknown or in conflict. These were rules thought to be so basic that they were shared by all nations. Hence, like natural law, the law of nations was presumed to exist without positive expression, for example, in legislation. In Roman law, *jus gentium* ordinarily was employed in

legal matters concerning private transactions, for example, marriage, wills, and commerce.

Despite its origins in Roman private law, the law of nations was adopted by European jurists in early modern times to describe certain public legal relations. For example, in the sixteenth century, Spanish writers such as Suarez and Vitoria employed principles of *jus gentium* to argue that the Spanish Crown owed legal duties, for example, of basic humanitarian conduct, to all peoples, even the indigenous peoples conquered by Spain in the Americas.

The often alleged 'father' of international law was Hugo Grotius (1583–1645), a Dutch jurist exiled to Paris following the suppression of the liberal party in the Netherlands. Already an accomplished diplomat, jurist, and theologian, Grotius devoted the remainder of his life to the cause of peace. In the midst of Europe's disastrous Thirty Years War (1618–48), Grotius published the law of nations' most famous book, *De Jure Belli Ac Pacis*, to demonstrate that legal rules and processes defined and limited the sovereign rights and aggressions of otherwise bitterly divided Catholic and Protestant states, and that such legal rules and processes even applied to relations between Christian and non-Christian states.

Grotius elaborated a legal theory that still serves as the foundation of modern international law. He argued that sovereign states were defined and bound by two kinds of legal rules drawn from the law of nations: positive law and natural law. The positive law of nations, expressed in treaties and custom, was made by the explicit and implicit agreement of sovereign states. The natural law of nations, expressed in the natural laws of reason and religion, was the result of necessary rules binding everyone, even rulers of states.

The first part, at least, of Grotius' theory of *jus gentium* was quickly married to emerging seventeenth-century political theory, like that of Hobbes, positing the idea of *sovereign* states. Grotius' consensual theory of the law of nations helps explain why treaties, such as the Peace of Westphalia that terminated the Thirty Years War in 1648, are legally binding: sovereign states have authority both to legislate rules internally for their own territory and to make rules externally for themselves through interstate agreement. Grotius' legal theory also explains why sovereign states should not interfere in the internal affairs of other sovereign states: a nation's sovereign authority must be limited so that the sovereign authority of other states is protected. Such international legal principles that weave sovereign states together with international law continue to guide international relations today.

In his age, Grotius' *jus gentium* excited many rulers, including Gustavus Adolphus of Sweden, who is said to have used Grotius's book as a pillow while campaigning on his many wars, as well as many universities. In Germany, The Netherlands, and England, professorial chairs in the new discipline of the law of nations were created, commencing an outpouring of scholarly works further describing and developing the discipline.

Not all students, of course, were pleased by their professors; one of the earliest pupils of the noted English law professor, William Blackstone, rebelled against what he was taught about the law of nations. In 1789, Jeremy Bentham (1748–1832) rejected the term the *law of nations* as professed by Blackstone; Bentham argued in *An Introduction to the Principles of Morals and Legislation* that the discipline should be renamed *international law*. Bentham's invented word, *international*, successfully passed from international law to denominate many other disciplines, for example, *international relations*, *international politics*, and *international economics*.

More or less inadvertently, Bentham changed not only a term but the very definition of a discipline. Grotius' and Blackstone's classical definition of the *law of nations* focuses on legal rules and processes generated by more than one state. Bentham's definition of *international law*, however, focuses on the subjects of the discipline; these Bentham said were states and states alone. The classic *jus gentium* regards individuals, as well as states, as its subjects, possessing legal rights and duties and accessing legal process. For the sake of theory, Bentham rejected individuals as proper subjects of *international law*.

A third definition of the discipline, along with a new term to describe it was provided by the US jurist, Philip Jessup, when in 1956 he proposed replacing both the term the *law of nations* and the term *international law* with a new term *transnational law*. Jessup defined the discipline of *transnational law* as encompassing any legal rule or process, municipal or international that has to do with international transactions of any state, entity, or individual.

It may or may not make a difference how one defines the discipline. For example, a rule about delimitation of the continental shelf not only emerges from a multistate source, a treaty, *à la* Grotius's *law of nations*, but it also relates to interstate relations *à la* Bentham's *international law*, and deals with international transactions *à la* Jessup's *transnational law*. Hence, such a rule easily fits within the discipline as described by all three definitions. However, other times the different definitions lead to conflict. For example, if one believes, along with Bentham, that only states may be subjects of *international law*, then one cannot believe that individuals have international legal rights and duties, for example, be protected by international human rights law against abusive state action. A contrary position is usually taken by those who subscribe to the ordinary definitions of the *law of nations* and *transnational law*. Nowadays in practice, although the term *international law* is very popular, some of its exclusivities have been softened both by the classical tradition of the *law of nations* and by the modern sentiment expressed in *transnational law*.

3. Domain

The domain of *international law and treaties* is vast and growing. The discipline's classical fields, many hundreds of years old, include the *laws of war* (both about going to war, *jus ad bellum*, and about the proper conduct of war, *jus in bello*), the *law of the sea*, the *law of ambassadors and diplomacy*, the *law of treaties* (how treaties are made, interpreted, and implemented), the *law of the recognition and succession of states*, and the *law of merchants* (traditionally, *lex mercatoria* was part of the law of nations). More recently, new fields in the discipline have emerged, including the *law of international organizations and institutions*, *international humanitarian law*, *international human rights law*, *international trade law*, *international financial law*, the *international law of Antarctica*, the *law of outer space*, *international environmental law*, *international refugee and immigration law*, *international criminal law*, the *law of international arbitration*, *international tax law*, and the *international law of state responsibility*. The proliferation of fields in the discipline of international law is due in large measure to the increasing numbers and kinds of international relationships among states, peoples, corporations, and institutions, as well as to the inability of national law and regulation to adequately cope with such international transactions.

4. The Legislative and Enforcement Questions of International Law

To comprehend the fundamentals of modern international law, it is important to understand that two questions have always beset the discipline. First, how is it possible to authoritatively generate international legal rules? And second how is it possible to realistically enforce international law? In short, without an effective international political system, it seems at first glance that there is neither an authoritative way to make international law nor a realistic process to enforce it. These questions are answered in practice by remarkably effective systems of international legal rules and international legal process.

5. International Legal Rules

How are international legal rules authoritatively made? International lawyers often turn to Article 38 of the Statute of the International Court of Justice (the 'ICJ') to begin to describe the formation of international legal rules. Article 38 sets forth the rules available to the ICJ, the United Nations's court, in deciding cases before it, albeit there are other kinds of international legal rules as well. The three principal sorts of international legal rules available to the ICJ are (a) rules drawn from explicit international agreements (mostly treaties), (b) rules drawn from international custom, and (c) rules drawn from general principles of law. These are sometimes described as the *formal sources* of international law in that they are the sorts of rule-making that are acceptable in form as legitimate in international law (cf. the *material sources* of international law which are the evidences that show the features of a specific rule).

Rules drawn from international agreements include international legal rules set out in treaties, compacts, conventions, protocols, or whatever may be a written agreement between or among states. Nowadays, there are tens of thousands of such instruments; their norms constitute the greatest number of international legal rules. These explicit international rules are comparable both to statutes in municipal law (in that they establish rules for general conduct) and to domestic contracts (in that they are based on party consent). Treaty rules are the international legal rules that tend to be both least ambiguous and most clearly based on state consent. All other kinds of international legal rules are more troubled by problems both of ambiguity and of authority.

The second type of international legal rule is *customary international law*. Ordinarily, customary international law is perceived as based on the implicit agreement of states and is composed of two elements. First is a consistent pattern of state practice; this defines the rule. Second is a belief, an *opinio juris*, that compliant state behavior is based on a sense of binding legal obligation. In practice, the determination of a consistent pattern of state practice is almost always controversial and involves a subjective weighing of evidences from state practice proving and disproving the rule. *Opinio juris* is even more controversial: states rarely indicate that they are behaving in international relations in a certain way because they feel compelled to do so by a sense of international legal obligation. Rather, *opinio juris* is usually an evaluation added by a judge or a commentator to a description of state practice.

The third kind of legal rule prescribed by Article 38 of the ICJ Statute is *general principles of law*. These are principles generally shared by all legal systems. This concept is rather similar to the original Roman notion of *jus gentium*: rules so basic that they are to be found everywhere. In modern practice, general principles of law are usually developed by jurists through a comparative law search. The method proceeds by examining diverse municipal legal systems. If a rule is found to be common to most or all of the municipal legal systems examined, then the rule is also presumed to exist as a general principle of law in international law.

Of the three formal sources of international law provided for in the ICJ statute, treaty and custom are, more or less, consensual in nature. Even general principles of law can be seen to have a consensual aspect since it can be argued that if states already

recognizes a legal rule internally, they may be presumed to accept that self-same rule externally. Beyond the ICJ statute, however, other formal sources of international legal rules exist without displaying such real or alleged consensual foundations.

Such nonconsensual rules may be seen as being no longer in the camp of positive law, but belonging to that of natural law. Indeed, natural law itself has long been an important formal source of international law. However, the term *natural law*, once so common, is nowadays rarely used in discussions of international law. Instead, newer equivalent terms have emerged. Key among these are *jus cogens* and *fundamental norm*, both expressing the natural law idea that some legal rules are so fundamental that they can not only be found everywhere, but that they trump any conflicting rule of positive law. *Jus cogens* or fundamental norms are often thought to include both the basic principles underpinning the international system, for example, the very notion of 'sovereignty,' as well as those basic principles protecting key human rights, for example, legal norms protecting individuals against genocide, slavery, and torture.

Another nonconsensual form of international law is *equity*. Sometimes viewed as a corrective of the strict application of a legal rule (equity *contra legem*), equity can also involve rule creation (equity *praeter legem*), and rule interpretation (equity *infra legem*). Equitable rules or principles can be based on nonlegal criteria, for example, distributive justice and basic notions of fairness.

6. *International Legal Process*

How are international legal rules really enforced? Most times when international legal rules are recognized in practice, they are applied by the nation states themselves. So, for example, all kinds of international legal rules, whether they be drawn from treaties, custom, general principles of law, *jus cogens*, or equity, are applied from time to time by municipal courts. Approaches to this process usually are thought to be either *dualistic* or *monistic*. *Dualism*, the prevalent view, holds that municipal legal systems and international legal systems are distinct from each other (dualist) and that there needs to be rules of *incorporation* providing why, when, and how a rule of international law is to be applied by a municipal court. *Monism*, the less usual view, sees both international law and municipal law as parts of a unified system of law where incorporation of international legal rules into municipal law is to be presumed.

Different municipal legal systems have different answers to questions of the incorporation of international law. Moreover, a municipal legal system's rules about incorporation may vary depending on the type of international legal rule concerned. So, for example, though treaty rules are sometimes deemed to be *self-executing* in the United States, that is, requiring no domestic legislation to put them into internal effect, in England treaty rules are never self-executing: all require an act of Parliament before they can be employed as rules of decisions by municipal courts. However, respecting customary international law, the United States and England share a similar approach. Both municipal legal systems deem some sorts of customary international law to be part of the *law of the land* and available to municipal courts without legislative act.

Besides providing rules of decision for municipal courts which then enforce the international rules alongside municipal law, international law is also enforced by procedures in the international legal system. There are, for example, an increasing number of international courts. Oldest among these is the International Court of Justice at the Hague, which dates its antecedents to the Permanent Court of Arbitration established by the Hague Peace Conference of 1899, and to the Permanent Court of International Justice, established under the auspices of the League of Nations in 1921. The International Court of Justice was established alongside the United Nations, its parent institution, in 1945. The Court is composed of 15 judges elected by the UN General Assembly. There are usually ICJ judges from China, France, Russia, the United Kingdom, and the United States.

Reference has already been made to the ICJ Statute, the treaty that constitutes the Court. The ICJ statute also provides for two kinds of jurisdiction for the Court. First is its *contentious jurisdiction*; here the Court, with the prior consent of the parties to the dispute, actually decides cases between states. However, neither international organizations nor individuals may be party to the ICJ's contentious jurisdiction. The second sort of ICJ jurisdiction is its advisory jurisdiction: at the request of some international organizations (though neither states nor individuals), the ICJ may render a legally non-binding advisory opinion on a legal matter. Since 1921, the practice of the Permanent Court of International Justice and the International Court of Justice has remained roughly steady: about three or four judgments or advisory opinions rendered each year.

Since 1950, a great many new international courts have been created. Each of these courts is limited either geographically or by its subject matter, but some have become a great deal busier than the older and more universal ICJ. Europe's two regional international courts—the European Court of Human Rights in Strasbourg (to which 41 European states belong) and the European Court of Justice in Luxembourg (numbering 15 adherent states)—nowadays decide hundreds of cases each year. Less busy, but still important are such international courts and international dispute-settlement procedures as the Law of the Sea Tribunal in Hamburg, the World Bank's

International Centre for the Settlement of Investment Disputes in Washington, the Inter-American Court of Human Rights in Costa Rica, the World Trade Organizations's dispute settlement procedures in Geneva, and the international criminal tribunals for the former Yugoslavia in the Hague and that for Rwanda in Kenya. Unlike the states-only provisions limiting the ICJ, all these newer international tribunals permit individuals in some circumstances to be parties to litigation.

In addition to the increasing number of international courts, there are a great many international arbitral procedures available to provide *ad hoc* jurisdiction to settle international legal disputes, public and private. Many of these international arbitrations are organized under the auspices of one of the international arbitral institutes. Two of the busiest are the International Chamber of Commerce in Paris and the American Arbitration Association in New York.

Finally, international law is often enforced simply by the practice of governments. Reciprocity and good faith account, outside any formal dispute settlement procedures, for the lion's share of cases in which international law is effectively employed. It would be difficult for much of the world's business, public and private, to get done unless governments followed the similar practices set out in treaties, custom, and the other kinds of international law.

7. *Prognosis*

It is likely that international law and treaties, already employing tens of thousands of international lawyers worldwide, will continue to prosper and expand. Modern trade, communications, and transportation have all been globalized much more thoroughly than modern politics that is still largely state-centered. It is unlikely that without a political or social impetus for internationalization of political decision-making, that the sovereign state will remain the principal vehicle of government. Accordingly, it will be international law and treaties that will shoulder the burden of harmonizing and facilitating the growing transactions among the nations.

International Marketing

International marketing has grown out of the weaknesses of international trade theory which considered no differences in local consumer tastes and preferences and did not take into account the possibility for firms to launch marketing operations directly on foreign markets through sales subsidiaries. Definitions of international marketing are first examined, followed by a review of the central debate in this field, that is, whether products and marketing strategies should be standardized for increasingly globalized world markets or whether they should be tailored to local consumer needs and marketing environments. With the emergence of global markets, culture now appears as a prominent variable for international marketing decisions. The third section explains how cross-cultural differences must be taken into account to highlight significant differences in areas such as consumer behavior, market research, and advertizing practices. An in-depth understanding of what is global and what remains local is a key input for designing successful international marketing strategies.

1. *Definitions of International Marketing*

1.1 *Traditional Definitions of International Marketing*

The early definitions of international marketing in the 1950s emphasized foreign market operations, that is,

the distribution of products abroad and the development of marketing channels and consumer franchise in foreign countries as ways and means to reach larger customer bases. As a consequence, emphasis was put on developing stable relationships with agents and dealers in foreign countries. This view of international marketing was linked largely to international business concerns such as the choice of the right mode of entry, the assessment of political risk in target countries, and the logistics of international marketing (see *International Business*).

In the 1970s, with growing foreign direct investment of multinational companies, international marketing more and more has focused on the design of marketing strategies for local markets and their co-ordination within world markets (Wind et al. 1973). The understanding of local peculiarities in consumer behavior and marketing environments increasingly was considered as a required step in the definition of marketing strategies in an international context. The 4Ps paradigm of marketing (product, price, place, promotion) has been applied extensively to foreign markets (see *Marketing Strategies*), considering how to adapt products to local tastes and requirements, to adjust price policies internationally, and manage local distribution channels and advertizing campaigns in diverse areas of the world. International marketing has, therefore, been a replication and extension of marketing knowledge 'made in the USA.' Up to the 1980s this process has been implemented pragmatically with much respect for local contexts through customized marketing strategies. However, the issue of co-ordination of marketing strategies across national markets, either at the regional or global level, has emerged as a key organizational issue in the 1980s and 1990s for multinational companies (see *Multinational Corporations*). More centralized control of exceedingly independent subsidiaries has been required because the increasing globalization of the world economy imposes large-scale operations.

1.2 International Marketing as the Diffusion Process of Marketing Knowledge

Marketing concepts and practices were developed initially and for the most part in the United States and have been popularized by Kotler's *Marketing Management* in its numerous translations and editions (Kotler 1994). Most of the books on marketing management were borrowed from the United States and then translated directly without much adaptation. As Van Raaij (1978) stated concerning consumer research: 'Consumer research is largely "made in the USA" with all the risks that Western American or middle-class biases pervade this type of research in the research questions we address, the concepts and theories we use, and the interpretations we give.'

However, the success of the word 'marketing' gave a new image to trade and sales activities in countries where previously it had been socially and intellectually devalued. Despite the success and the seemingly general acceptance of the term 'marketing' at the international level, there have been some basic misconceptions of it in many countries, marketing often being reduced to one of its dimensions such as market research, sales promotion, or advertizing. Marketing knowledge has been imported progressively, first plainly, as universal and explicit knowledge, then merged with local tacit knowledge and ways of doing. In many countries, marketing superimposed itself on local selling practices and merged with them rather than replaced long-established commercial practices. As Lazer et al. (1985) point out in the case of Japan: 'what has occurred (in Japan) is the modification and adaptation of selected American constructs, ideas, and practices to adjust them to the Japanese culture, that remains intact.'

2. The Adaptation/Standardization Debate in International Marketing

2.1 The Trend Towards the Globalization of Markets

As advocated by Levitt (1983), we see the emergence of global markets for standardized consumer products on a previously unimagined scale of magnitude. Ancient differences in national tastes would tend to disappear, while local consumer preferences and national product standards would be 'vestiges of the past.' Consumers world-wide would look for good quality/low-cost products and global competitors would seek to standardize their offer everywhere. In Levitt's words it would 'not (be) a matter of opinion but of necessity' (1983).

However, globalization is a process that occurs mostly at the competition level. The GATT treaty (General Agreement on Tariffs and Trade) and the WTO (World Trade Organization) progressively have replaced tariff and nontariff barriers by entry barriers related to scale of operations, marketing knowledge, and corporate experience. As far as consumer behavior and marketing environments are concerned, natural entry barriers related to culture and language diminish progressively and only in the long term. There are still many different marketing 'villages' rather than a 'global village.'

The globalization of consumption displays a complex pattern of mixed global and local behavior. On the one hand, there is striking convergence as concerns basic demographics, for instance, the population, comprises more and more older persons, the size of households is constantly decreasing, and the proportion of immigrants is increasing in most countries,

Table 1
Arguments in favor of international standardization or local adaptation

Product attributes	Arguments in favor of adaptation	Arguments in favor of standardization
Physical attributes	Cost-reducing adaptations Local standards and regulations, marketing environment	Experience effects Economies of scale International standards
Services attributes	Local peculiarities in service, maintenance and distribution	Significant learning effects 'global' customer base
Symbolic attributes	Unfavorable image of company, country-of-origin, or brand name Inappropriate symbolic meaning	Favorable image of company, country-of-origin, or brand name Demands for 'universals'

with higher concentration in large cities. The same convergence phenomenon is to be observed for the sociocultural environments in the form of growing equality between men and women and increasing percentages of working women, while health and environment concerns are on the rise. Convergence in consumer behavior can be observed at a broad level: services tend to replace durables in household budgets and demand is growing for healthcare, environmentally friendly, fun, and convenience products (Leeflang and Van Raaij 1995)

2.2 How to Design 'Globalized' International Marketing Strategies

The real issue is not a dichotomous choice between total adaptation or full standardization since international marketing performance has been shown to be a combination of both adaptation and standardization strategies (Shoham 1996) and to depend on a large number of factors related to the four components of the marketing mix (Baalbaki and Malhotra 1995). Around a core product offering that is standard worldwide, most global companies such as Coca Cola or McDonald's customize when needed. Product customization may also result in market differentiation thus creating a competitive advantage vis-à-vis actual competitors and raising entry barriers against potential competitors. Excellent global companies standardize as much as feasible and customize as much as needed.

Table 1 proposes a systematic description of arguments in favor of adaptation or standardization, according to the different levels of product attributes: physical, service, and symbolic attributes. Some arguments in favor of either adapting or standardizing originate from within the company which can benefit from changing its way of operating. Other arguments are related to external constraints imposed by the environment, consumer behavior, and regulations: they imply company adaptation to market demand, either by adapting or standardizing its offer.

As concerns the physical attributes, consumer behavior matters a lot, especially the frequency of consumption, the amount consumed per helping, etc. For instance, the required size of a cereal packaging will not be the same in a country where an average consumer eats 50 grams of cereal daily for breakfast and in another country where servings are larger but it is consumed less frequently. Even pizza, a product supposed to be the epitome of international standardization, largely is customized to local tastes. Brand names, although in some rare cases global, need some attention when transferred to foreign markets to avoid unintended meaning.

3. The Emergence of Culture in the Field of International Marketing

Traditional international trade doctrine has laid the foundations for a denial of culture in international marketing. Ricardo's law of comparative or relative advantage is based on the assumption that products and consumers' tastes, habits, and preferences are perfectly identical across countries. However, quantity and price do not matter solely: local consumers invest meaning beyond the utilitarian aspect of the product. Rather than being merely commoditized, generic, and indefinitely marketable, goods and services increasingly are viewed in international marketing as being singularized and invested with cultural meaning by local consumers who display both utilitarian and nonutilitarian consumption motives.

3.1 Unique Consumption Experiences

Consumption is still largely a local reality. Far from being uniquely related to culture, local consumption reflects also climate, customs, and the mere fact that much of our lives is still experienced, shared, perceived, and interpreted with near people who share the same kind of 'local knowledge' in the Geertzian sense

(Geertz 1983). Consumption experiences remain local while integrating much global influence because part of the cultural meaning vested in goods and services is now shared world-wide. As noted by Applbaum and Jordt (1996): 'Globalizing influences have bored intercultural tunnels around the world, but core meaning systems such as those wrapped up in the idea of the family, continue to differ significantly.' Consumers attribute meaning to products and services in context, especially what it means to desire, to search, to evaluate, to purchase, to consume, to share, to give, to spend money, and to dispose. Consumption experiences are full social facts based on the interaction with other participants in the marketplace such as manufacturers, distributors, salespeople, and other consumers.

For instance, consumption as disposal involves views of what is the appropriate relation to the environment, of what is clean vs. dirty, and of how cleaning efforts should be allocated. Consumption generally leads to the final destruction of goods, this being true also for consumer durables when they are obsolete or out of order. Paper-based products are a good case in point: filters for drip-coffee machines are white in France and yellow-brown in Germany (*naturbraun*), paper handkerchiefs are generally white in France and yellow-brown in Germany, and toilet paper is generally rosy or white in France and greyish in Germany. The Germans express their willingness to be environmentally friendly (*umweltfreundlich*) by purchasing paper-based products whose color exhibits their genuinely 'recycled' nature, that is, not bleached with chlorine-based chemicals used to whiten recycled paper. The same holds true for the German writing and copy paper whose greyish and irregular aspect would be considered by most of the French as 'dirty' and poor quality. The difference in consumer experience lies in the difference of continuity in the ecological concern. Germans are deeply committed to protect their natural environment because they live on a territory about three times more densely populated than France and they insist on strong coherence between pro-environment discourse and actual consumption behavior. The two peoples seem in any case to have different ways of combining and reconciling nature and culture. Understanding local consumer behavior in a cross-cultural perspective (Howes 1996; Sherry 1995) is seen more and more as a prerequisite for the design of sound international marketing policies.

3.2 International Market Research and the Issue of Cross-cultural Equivalence

A basic issue in cross-cultural marketing research is to assess whether the concepts used in questionnaires and interviews have similar meaning for respondents in different cultural contexts. For instance the issue of conceptual equivalence has to be addressed before testing the influence of certain constructs on consumer behavior. Such basic concepts as beauty, youth, friendliness, wealth, well-being, sex appeal, and so on often are used in market research questionnaires where motivation for buying many products is related to self-image, interaction with other people in a particular society, and social values. They seem universal. However, it is necessary to question the conceptual equivalence of these words when designing a cross-cultural questionnaire survey. Even the very concept of 'household' (widely used in market research) is subject to possible inequivalence: Mytton (1996) cites the case of Northern Nigeria where people often live in large extended family compounds or *gida* which are difficult to compare with the prevalent Western concept of household which reflects the living unit of a nuclear family. In general, market research measurement instruments adapted to each national culture (the Emic approach) offer more reliability and provide data with greater internal validity than tests applicable to several cultures (the Etic approach, or 'culture-free tests'). But it is at the expense of cross-national comparability and external validity: results may not be easily transposable to other cultural contexts.

3.3 Understanding How Culture Influences International Marketing Strategies

While being globalized as much as possible, international marketing strategies must be tailored to local consumer behavior, taking into account cultural influences in the design of the 4Ps. For instance, European cars overwhelmingly have manual gearboxes. Europeans do not consider an automatic gearbox as a standard feature for a car, as in the United States, for a number of reasons, certain being related to regulation (driving licenses have to be obtained on a car with a manual gear box, except for handicapped persons), others to deep-seated prejudices (automatic cars consume more petrol) or to social beliefs such as that automatic gear-boxes are only for luxury cars or for handicapped persons (Usunier 1999).

Price is a central element of relational exchange, that is, as a signal conveying meaning between buyer and seller, marketers and consumers, and between companies and their middlemen. In the area of international price policy, it is important to assess which is the dominant price-related behavior: do local consumers tend to use price as a proxy of quality? Do they tend to be price minded? Is bargaining prices a behavior that is considered socially acceptable? Answers to these questions will be key inputs in defining adequate local pricing.

The case of Japanese distribution *Keiretsus* exemplifies the cultural embedding of distribution channels and the difficulty to enter foreign channels when being a 'cultural outsider.' Relationships be-

tween channel members are rooted deeply in local patterns of human and economic relationships; distribution appears a 'cultural filter,' which must be considered carefully along with other criteria before choosing a foreign distribution channel.

Cross-national variations in sales promotion methods have to be considered when transferring promotional techniques across borders. One must check that the very purpose of the promotional technique is understood locally, a problem in conceptual equivalence. For instance, in many societies being given a free sample is difficult to interpret. Gratuity is understood either as a sign of poor quality ('they give it because they cannot sell it') or as a sign of naivety of the manufacturer ('let's take as much as possible'). In recent years, Procter and Gamble experienced major problems with free samples in Poland where some people disregarded free samples while others broke mailboxes to steal product samples.

For reasons of image consistency, many companies now try to promote their products globally through standardized advertizing campaigns which use the same advertizing strategy, themes, and execution world-wide. However, marketing communications are based on language, both verbal and nonverbal. Language shapes our world-views in as much as the words we use and the way we assemble them in speech correspond to particular experiences and assumptions about the world in which we live (see *Sapir–Whorf Hypothesis*). Advertizing, as the main tool for communicating marketing messages to customer audiences is sensitive to local cultures and languages. Thus, before transferring campaigns cross-nationally, international companies have to decide which elements should be localized and which ones can be similar world-wide in two main areas, advertizing strategy (information content, advertizing appeals, etc.) and advertizing execution (characters and roles represented, visual and textual elements, etc.).

International Migration by Ethnic Chinese

The mass international Chinese migration began in the middle of the nineteenth century and today makes up 30 million people. It has evolved towards a diasporic configuration characterized by a multipolarity of migration and an interpolarity of relations in which networks play an important role and explain the economic efficiency of this diaspora.

1. The Migration from China

For centuries, or even millenniums, there has been a migration from China to Southeast Asia. These migrations mainly comprise an economic, political, or military urban elite. The Chinese migration really reached its peak in the middle of the nineteenth century when the combination of several factors made people leave. It was the result of the two Opium Wars, the Taiping Rebellion, the abolition of slavery, and the colonial enhancement of Southeast Asia by the English, the Dutch, and the French.

The two Opium Wars (1840–42 and 1856–60) and the Taiping Rebellion (1860–65) provoked tremendous social change and terrible famines, especially in the southern provinces, which are principal centers of

departure even today. The progressive abolition of slavery during the first half of the nineteenth century brought about a demand for cheap labor in order to replace slave work in former slavery countries. But above all, the colonization of Southeast Asia and the development of new English, French, and Dutch colonies (Indochina, Indonesia, Malaysia, Singapore, and so on) also created a demand for workers in plantations (hevea, pepper plant, sugar cane, tobacco, and others) and in mines, a demand that was no longer filled by slavers or by local labor.

From then on, the geography of international Chinese migration was maintained for a long time, almost exclusively affecting the southern provinces of continental China and mainly spreading into Southeast Asia and into former slavery areas. This geography still plays a fundamental role in the general distribution of migration today, although there have also been substantial modifications. As a result of the treaties of the Opium Wars, the creation of the 'coolie trade' allowed colonial powers to hire workers in order to develop their dependent territories. The coolie trade produced flows of departure towards the Caribbean, the Indian Ocean islands, and Polynesia, but especially towards Southeast Asia. These workers were, for the most part, landless peasants. They were among the poorest and saw in these contracts, however miserable, the possibility for them and for their families to survive. The large majority of workers came from the southern provinces of China (Guangdong, Fujian, and Hainan).

Within 25 years, from 1876 to 1901, 4,850,000 emigrants, a considerable figure, are assumed to have passed in transit through ports in southern China. During that time, the number of people belonging to the Chinese diaspora was estimated at 8 million, most of whom were found in the Nan Yang areas (South China Sea) of Asia. Moreover, several dozens of thousands of people were scattered over the insular constellations of the Indian and Pacific Oceans, some hundreds of thousands went to the eastern rim of the Pacific Ocean, from Canada to Chile, and also to the Caribbean islands, in particular to Cuba and Jamaica.

1.1 Chinese International Migration Today

The ancientness of the migration, interracial marriages, the constant flow of migration and the fact that the ethnic Chinese usually take the nationality of their receiving countries make an accurate measure of the extent of the diaspora difficult because it is hard to determine what an 'ethnic Chinese' is. What differentiates ethnic identity from other social identities (professional, religious, and so on) is, as Max Weber states, the shared belief in a common origin, whether it is real or imagined. Ethnic identity is, therefore, a social construction not a natural one. It is still a valid criterion for defining a population because this belief strongly configures the relationships among individuals themselves and thus determines specific social behaviors with important effects on economic, political, and cultural patterns.

Bearing these considerations in mind, one can use the extensive study and evaluation of data made by Poston et al. (1994) from various sources: *Overseas Chinese Economic Year Book*, 1991, 1992; data from national censuses of different countries; data from *Britannica Book of the Year* and from a special issue of *Revue Européenne des Migrations Internationales*. Figures provided by Poston et al. concerning Hong Kong and Macao are not included in Table 1 because they cannot be considered places of settlement of international Chinese migrants, nor have we included figures for India (130,000) and Turkey (60,000) because these populations are mostly Tibetan refugees (India) and Khazakhs refugees (Turkey). From these numerous and diverse estimates, one can consider the number of ethnic Chinese in the world to be around 30 million (not including Hong Kong and Macao).

Ethnic Chinese are present in nearly every part of the world, ranging from nine individuals in Finland to more than 7 million in Indonesia. One can note the presence of more than 1,000 ethnic Chinese groups in almost 80 countries, exceeding 10,000 individuals in more than 40 countries, 100,000 in nearly 20 countries, and a million individuals in at least five countries (Indonesia, Thailand, Malaysia, Singapore, and the United States). The majority (85 percent) live in Asia, but their presence there is proportionally less important than it was 40 years ago (96 percent). There is now a redeployment of the diaspora, notably towards the non-Asian Pacific (North America, Australia) and towards Europe.

1.2 Main Places of Origin

One can distinguish several categories of places of origin, namely continental China, Hong Kong, and Taiwan and the other zones where a Chinese presence can be found, corresponding to the different poles of the diaspora.

In continental China, the main zones of origin remain the southern provinces: Fujian and Guangdong, to which one can add Zhejiang (north of Fujian). As usual migration relies on already existing migratory networks, which most often turns migrants towards North America, Australia, and Europe. Migration towards Southeast Asia still continues, but is no longer dominant, and migration to the countries of former Indochina had stopped for obvious reasons during the 1970s. These 'proletarian' migrations are often the result of people living in modest conditions who leave to join their compatriots (close and distant relatives, acquaintances), who have already established themselves abroad. For this reason, they are not very different from the labor migration of other popula-

Table 1
Distribution of overseas Chinese (countries of more than 10,000 ethnic Chinese)

ASIA	26,178,000
Indonesia	7,315,000
Thailand	6,000,000
Malaysia	5,471,700
Singapore	2,112,700

Mauritius	35,000
Madagascar	14,500
Réunion	14,300
TOTAL	30,656,000

tions. Given the more and more restrictive laws of immigration in the receiving countries, part of these migrations are illegal (at least from the point of view of the receiving countries), and produce a lucrative form of trafficking for those who organize them. The cost of such a move can reach the equivalent of US$20,000 to US$25,000.

Migration from Hong Kong appears to be different. It has been caused by the uncertainty concerning the future of Hong Kong and the fears about its rejoining China in July 1997. This migration is either illegal 'proletarian' migration or migration of individuals and families with British nationality who are able to migrate to the countries of the Commonwealth. Otherwise, many entrepreneurs and businessmen are able to immigrate into Canada, for example, because of the financial investments they can make in this country. (The candidates must be able to make an investment of $150,000.) Such migration can also be possible towards Southeast Asia. In fact, the inclusion of Hong Kong into China does not seem to have caused a massive flow of departures, contrary to what was expected.

Migration from Taiwan is not the result of a fear of the future. It is often due to the local *bourgeoisie* having the financial means to be accepted in the receiving countries. Such migration is notably directed towards the west coast of North America, and has produced a strong presence in Los Angeles (Monterey), in San Francisco, and to a more modest extent in Vancouver and in Seattle (Waldinger and Tseng 1992). There is also a notable migration of entrepreneurs to Southeast Asia. In recent years, a number of them have established themselves in Vietnam.

In addition to the migration from the various parts of China, there are the moves, between the various poles of the diaspora. It consists of persons already established (or born) in one of these poles who move to another country. In this context, all combinations between poles are possible. This interpolar migration also includes the flow of people during the 1970s and 1980s, provoked by the wars in Vietnam, Laos, and Cambodia. A large part of the populations with a Chinese origin in these countries were forced to flee under terrible conditions, and they settled in other countries of Southeast Asia or in Europe and North America, where they joined already established compatriots. This exodus, whose size it is difficult to measure because it was not only composed of persons of Chinese origin, may have mobilized three to four million people. It has, thus, deeply modified the geographical distribution in the Chinese diaspora.

Among all this overseas migration, one needs to add a new phenomenon for which there is little hard information, namely Chinese migration towards the territories of the former Soviet Union along the border of China, migration towards Central Asia, Siberia, and the far east of the former Soviet Union. It seems mainly to be a question of business migration, and includes people who have set up small businesses specializing in the distribution of products made in

China. Labor migration to South Korea and a flow of people to Japan should also be mentioned.

2. The Chinese Diaspora

The multipolarity of the migration and the interpolarity of relations are two morphological factors that define the international migration of ethnic Chinese as a diaspora (Ma Mung 1998). The multipolarity of the migration corresponds to the diaspora in the original sense of dispersal (from Greek, *speiro*, to sow), and the interpolarity of the relations refers to the existence of relations between the different settling poles of the Chinese diaspora.

2.1 Multipolarity of the Migration

Since the nineteenth century, Chinese migration has had a pronounced multipolar feature because of its direction towards many territories in Southeast Asia, the American continent, Polynesia, the Indian Ocean, the Caribbean, South Africa and, in a more modest way, in Europe (Thuno 1996). Throughout the twentieth century, a change in the destinations and a reinforcement of the Chinese presence was noticeable. As previously stated, the presence of more than 10,000 overseas Chinese in each of more than 40 countries is recorded, with more than one million people in at least five countries. One of the main features of this distribution is therefore a strong multipolarity of the migration. The other feature of the international Chinese migration is a strong interpolarity of relations.

2.2 Interpolarity of Relations

Interpolar migrations are often linked to major geographical trouble. The wars in Vietnam, Laos, and Cambodia, and the political take-over by totalitarian regimes that followed them, caused the departure of more than three million people, most of whom where first or later generations of Chinese origin. For the most part, they joined already established communities in Europe, North America or Asia by means of diverse itineraries, sometimes passing through various receiving countries. More recently, in Indonesia, where more than 7 million ethnic Chinese are recorded, demonstrations against the government and President Suharto have at times degenerated into anti-Chinese pogroms. During the first half of 1998, some 1,200 individuals of Chinese origin are believed to have been killed by rioters in the city of Jakarta alone, and other deadly anti-Chinese riots took place in other towns, in particular in Medan, in the north of Sumatra. From 100,000 to 125,000 ethnic Chinese are thought to have left Indonesia within 1 year, for the most part heading towards Singapore, Malaysia, Australia, or even Hong Kong (*Strait Times*, Singapore, July 18, 1999), where 38,300 Indonesians of Chinese origin were recorded in February 1999 (*AFP*, Hong Kong, May 21, 1999). More modest flows of people headed for Thailand, the United States, and other destinations where there were overseas Chinese already. Fortunately, all migration is not due to dramatic events, but is rather a search for better opportunities elsewhere. This is the case for the Chinese who settled in Italy (Campani 1994) or even in Spain (Beltran 1997), among whom a good part came from France in the 1980s and 1990s because the French government immigration laws became ever stricter, and because of the relatively greater freedom in the new receiving countries. It is worth noting that these Chinese also came to join small communities that had already been settled for several decades. This also happened between France and the Netherlands during the period between the two world wars (Pieke 1992).

The diversity of the national origins of the Chinese within the receiving countries is a good indicator of the interpolarity of the migrations. In France, and today also in Spain (Beltran 1997) and possibly in Great Britain, more than 20 different national origins are recorded among the ethnic Chinese, with even a greater number in North America: nearly 30 in Montreal alone (Chan 1991) for instance and 40 in the United States.

These interpolar migrations are the basis of relations between the different settling poles. They represent the networks of movement of persons, materials and non-material values (goods, money, information, social norms and codes, cultural models).

The classic example is the establishment of trading networks between China and the different receiving countries of the diaspora. These networks have been strengthened considerably since the opening of the Chinese economy. On a more subtle scale, such migration represents an extension of distributional networks in the various areas of settlement in a given country, as long as the migration spreads. The most interesting point is the growth of trading networks among the different receiving countries. The way a diaspora works, it induces a diversification of the geographical areas of supply and distribution. In grocery stores, to take a simple example, specialized products came from several dozen different countries in addition to continental China, namely from Taiwan, Singapore or Hong Kong, Hawaii, Thailand, Brazil, and even Spain and California. A study made out in an Asian supermarket in Paris in 1998 revealed that the products came from 37 different countries that had an ethnic Chinese population. A similar study from a Chinese supermarket in San Diego (California) in 1999 revealed more than 40 different countries of origin.

The existence of interpolar relations can allow people engaged in business to move from one country to another when working conditions worsen. This explains why Sino-Indonesian capital was particularly withdrawn from Singapore and Thailand in the 1960s and 1970s. This is also the reason why today there is a shift in capital from Southeast Asia to the American west coast in order to take advantage of economic opportunities (financial flow from Taiwan or Singapore) and/or anticipated difficulties (flow from Hong Kong in connection with its retrocession into continental China). Lin (1992) underlines the role of a Chinatown in attracting investors.

2.3 Decisive Economic Effects

Southeast Asia makes up 85 percent of the number of individuals in the Chinese diaspora. The presence of these immigrants has asserted itself in the nineteenth century already, and it has been reinforced constantly ever since. At first, this immigration included labor force for mines and plantations, but it shifted quickly to small shop-keepers, craftsmen, and sometimes to manufacturers and businessmen. Already at the beginning of the twentieth century, the rice business and commercial distribution were operated by these immigrants or their descendants even in the most remote villages. Since then, their presence in economic activities has constantly been reinforced. In order to appreciate the economic weight of the Chinese diaspora in this area of the world, one can note that the ethnic Chinese control 81 percent of the market value of listed companies; in Indonesia, they control 73 percent of such capital (KPMG International, July 1996), and 61 percent in Malaysia. As far as their banking power is concerned, more than 100 banks are entirely or partially controlled by Chinese in the diaspora; 45 of them are in Indonesia, 19 in Malaysia, 14 in Singapore, 14 in Thailand, and 13 in the Philippines (Trolliet 1994). *The Economist* (July 18, 1992) notes that 'Worldwide, the overseas Chinese (including Taiwan and Hong Kong) probably hold liquid assets worth US$1.5–2 trillion.'

Since 1979, the Chinese diaspora has increasingly had important economical relations with continental China. This has contributed in a very decisive way to the spectacular development of this country since the mid-1980s. Numerous authors agree that 70 to 80 percent of foreign investments (US$10 billion in 1995) was due to the Chinese diaspora. They also play a role in the creation of businesses, and in this way contributed to more than 100,000 joint ventures in 1994, totalling US$17 billion (Lever-Tracy et al. 1996).

3. Conclusion

The international migration of ethnic Chinese, which started in the mid-nineteenth century, has evolved into a diaspora-type configuration. Today, this migration constitutes the most important population in a diaspora (30 million people). Networks play an essential role in such a diaspora. Even if today it seems too powerful and rich, one should remember that originally it was composed of labor migration, and that this remains an element to this day. Current migrants are still mainly proletarians.

This migration, like other migrations, form new social groups—the diasporas—settled on transnational territory. A diaspora is based on an identity of ethnic features. This ethnic consideration does not exclude other elements. Studies of the Chinese diaspora constantly remind the investigator of the singularities of the individuals who have different national and/or geographical origins and speak many different languages. Zheng (1995) found that no less than eight languages were spoken among the staff of a famous Chinese restaurant in Paris, French and English included. Therefore, an 'internal' cosmopolitanism is at work even within a single diaspora, which guarantees multiple allegiances across the different countries where the diaspora has been established, as well as with China.

International Migration by Ethnic Germans

In the late 1930s and early 1940s, members of ethnic German minorities living in Central and Eastern Europe were in part resettled in Germany at the request of the Nazi government, and in part deported from the European area of the Soviet Union to the Asian area, as a consequence of Stalinist policies. Altogether, this affected at least 2,000,000 people. Between 1945 and 1948 the post-war expulsion of 12,000,000 Germans led to the largest state-organized ethnic cleansing in the history of the twentieth century. German citizens as well as ethnic Germans from other Central and Eastern European states were deported from their traditional areas of settlement, taken mainly to the British, the Soviet and the US occupation zones within Germany. After 1950 the West German government decided to facilitate immigration for members of the remaining ethnic German minorities living in the communist countries of Europe. Officially they were called resettlers (*Aussiedler*). In total, some 4,000,000 people arrived as ethnically privileged migrants to Germany between 1950 and 1999. There are similar immigration regulations for members of co-ethnic diasporas in Israel, in Greece, and in several Central and Eastern European countries. This article analyzes the ethnic German expellees and resettlers, their regions of origin, the most important periods of the partly voluntary, but mostly involuntary, migration, the magnitude of these migration flows, as well as the legal regulations and their political context.

1. *Historical Overview*

From the fourteenth to the eighteenth century hundreds of thousands of German settlers migrated from the southern and western parts of Germany to Central and Eastern Europe. This included in part the conquest and colonization of territories, e.g., by Teutonic Knights. In other cases German settlers were recruited by local rulers. Still others left their homelands for political or religious reasons.

With the founding of nation states on an ethnic basis, the majority of ethnic Germans in Central and Eastern Europe became members of a German diaspora. In 1871, with the creation of the second German Empire, some 12,000,000 German speaking people (both ethnic Germans and Jews) remained citizens of the Habsburg and tsarist empires. After 1918, notable German-speaking minorities lived in France, Belgium, Poland, Czechoslovakia, Hungary, Romania, Yugoslavia, as well as in Italy and in the Soviet Union. Even during the inter-war period the future of the ethnic German diasporas became a key issue of German domestic politics, and later also a foreign policy issue. The German government and the ruling elites promoted two ethnopolitical solutions: the revision of borders in order to include territories with ethnic German populations, and the resettlement of ethnic Germans from their historical areas of settlement, sometimes portrayed as necessary 'evacuation.' Nazi Germany realized both: in 1940 through the annexation of areas of compact German settlement (Austria, parts of Bohemia and Moravia, Danzig, western Poland and Alsace-Lorraine); and between 1939 and 1944 through the 'transfer' of between 625,000 and 650,000 ethnic Germans living outside territories annexed to, or occupied by, Germany in 1938 and 1939. This forced resettlement affected ethnic Germans from the Baltic countries; from Polish territories that later became parts of Ukraine (Volhynia, Bucovina); from Crimea (today also part of Ukraine); from the Caucasus; from Romania (Bessarabia, Dobrudja); from Slovenia (Gottschee); and from Northern Italy (South Tyrol/Alto Adige; see Table 1).

In 1941, some 1,400,000 ethnic Germans living in the Volga region and in other parts of the USSR, alongside many other ethnic groups, became victims of Stalinist policies. They were deported mainly to Siberia, Kazakhstan and Kyrgyzstan because of alleged collaboration with Nazi Germany, or at least sympathies for the German invasion of the USSR. And, unlike other deported groups, ethnic Germans were not allowed to return to their traditional settlement areas in the European area of Russia.

2. *Post-war Expellees and Their Resettlement in the Allied Zones of Occupation*

At the end of World War II, German refugees came in large numbers from what were until then the eastern provinces of Germany and formerly annexed terri-

a Between 1939 and 1944 some 625,000 to 650,000 ethnic Germans were transferred to Germany, while another 1,400,000 were internally deported to the Asian part of the USSR. b Between 1939 and 1942 some 130,000 ethnic Germans from the Baltic countries and a relatively small number of Germans from the Crimean peninsula and from the Caucasus (25,000) were transferred to Germany. c Quasi-expellees are persons originating from territories where the expulsion took place, but who themselves in 1945 already lived in Germany (in its current borders) or had become prisoners of war.

tories, to the territory of present day Germany. Between 1945 and 1948, an even larger number of people—12,000,000 in all—were expelled from former German provinces annexed to Poland and the USSR, from other parts of Poland, as well as from Czechoslovakia, Hungary, and Yugoslavia (see Table 1). The victorious Allied powers had allowed Poland and Czechoslovakia to deport all members of their ethnic German minorities. During 1945 and 1946, Hungary and Yugoslavia carried out similar measures. To a larger public this was explained as retaliation and collective punishment for Nazi and war crimes, but the ethnic cleansing was also made to ensure that no relevant groups of people with German citizenship or of German origin would remain in East-Central Europe. The underlying rationale was that this would prevent, once and for all, any further interethnic conflicts or future territorial claims by Germany vis-à-vis its eastern neighbors.

The last all-German census of 1946 listed 5,800,000 expellees in the three western zones of occupation, and 3,600,000 expellees in the Soviet zone. Further expulsions in the years 1947 and 1948 and the migration of expellees from the Soviet zone to the Western zones led to a situation in which some 7,900,000 expellees were already living in West Germany—mostly in the British and American zones by 1950—and another 3,600,000 in East Germany (DDR) (Lemberg and Edding 1959). During the same period Austria absorbed some 430,000 ethnic German expellees (see Table 1).

By the beginning of the 1950s, some 12,000,000 German citizens and persons of German origin from former German provinces and from East-Central Europe had been resettled to East and West Germany as well as to Austria, which was also occupied by the Allies of World War II (see Table 1; see also Benz 1995, Stanek 1985). A further 500,000 people who originally

came from regions with German residents were not expelled, because they had either left the area before 1944 to 1945, were still serving in the German army, or were already prisoners of war in Allied camps in 1944 or 1945. Later these quasi-expellees, for whom return to their old homelands had become impossible, were given the same legal status as those actually expelled, at least in West Germany. This gave them, among other benefits, a legal claim to compensation payments for lost possessions and property (*Lastenausgleich*).

Of the 12,500,000 expellees and quasi-expellees of the years 1945 to 1949, more than half (56 percent) were from former Eastern provinces of Germany (now parts of Poland and Russia); 24 percent from Czechoslovakia as re-established in 1945; and 8 percent from Danzig and territories of inter-war Poland (see Table 1). In relation to population size there were more involuntary migrants in East Germany (DDR)—3,600,000 or almost 19 percent of the total population—than in West Germany (FRG)—7,900,000 or 16 percent of the total population—while the proportion of German expellees in Austria was small by comparison, at 400,000, or 7 percent of the total population.

The influx of German expellees and their integration were in no way free from conflicts, for they were unwanted in many places. In the integration of this group and its later acceptance by German post-war society the recognizably involuntary nature of the expulsion played as big a role as the fact that they were Germans by ethnic origin or by citizenship (Frantzioch 1987).

3. *German Resettlers and the Legal Basis of Their Absorption in (West) Germany*

From 1950 to 1987 the immigration of ethnic Germans from East-Central and Eastern Europe to Germany continued at a low level (see Fig. 1). Until 1987, some 1,400,000 ethnic German immigrants were registered in West Germany. Only thereafter did a clear increase begin. Between 1988 and 1999 a further 2,600,000 arrived. The (West) German Constitution (*Grundgesetz*) of 1949 defined as citizens not only former citizens of Nazi and inter-war Germany but also all ethnic Germans who had found refuge on German territory within the boundaries existing in 1937. Since the 1950s, an extensive interpretation included other ethnic Germans still living in Central and Eastern Europe as potential citizens. The first legal basis of the ethnically privileged immigration of these potential citizens to Germany was the Federal Law concerning Refugees and Expellees (*Bundesflüchtlings- und Vertriebenengesetz*). This Law of 1953 regulated the admission and absorption of former German citizens and ethnic Germans, who, after the completion of the general expulsion measures left those of Germany's (former) Eastern provinces currently under foreign jurisdiction (Danzig, Estonia, Latvia, Lithuania, the Soviet Union, Poland, Czechoslovakia, Hungary, Romania, Bulgaria, Yugoslavia, Albania, or China). The original regulation was aimed at persons whose situation was comparable with that of the expellees of 1945 to 1948. In 1957, ethnic German immigrants were officially called resettlers (*Aussiedler*) for the first time and were given the same status and access to benefits as post-war expellees. In this context the concept of ethnic origin was clarified: 'Somebody is a member of the German nation, who has professed his (her) Germanness in his (her) homeland,' the law stated. Beside this declaration, so-called objective features were brought into play in order to distinguish ethnic Germans from other persons. Ethnic Germans were defined by descent, language and cultural or ethnic orientation. All those fulfilling the criteria and living in the aforementioned countries were (and some still are) entitled to claim German resettler status and to be admitted as privileged immigrants. The publicly-declared moral and political justification for this admission to Germany were repressive measures against members of ethnic German minorities (e.g., deportation, suppression of the German language, political and economic discrimination, etc.) at least in part legitimized as retaliation measures for Nazi and German war crimes. But the fact that, until 1989 and 1990, all ethnic Germans of Central and Eastern Europe lived under communist rule was used as an additional argument in their favor.

Ethnic German immigrants (*Aussiedler*) became German citizens immediately upon arrival in Germany. They could also make use of a series of benefits designed to facilitate their integration: the claim to a council apartment; free German language courses and courses of vocational training, as well as professional retraining; and a claim to transfer payments for which most foreign immigrants would not be eligible—e.g., public pensions even for those ethnic German immigrants who did not contribute to German pension insurance (Heinelt and Lohmann 1992).

Figure 1
Immigration of ethnic Germans to Germany by country of origin, 1950 to 1999
Source: German Federal Administration Office, Ministry of the Interior

The origins of the considerable material support for ethnic German immigrants lay in the material compensation for persons who had lost or left behind all their property in Germany's former Eastern provinces, originally introduced after 1945. This can hardly justify the benefits accorded to *Aussiedler* of the late twentieth and early twenty-first centuries. They do not come from regions once belonging to pre-war Germany. And since 1990 the post-communist countries of origin no longer force them to give up real estate or other possessions. Now, the existing measures only serve the purpose of integrating the *Aussiedler* into German society as quickly as possible.

Until 1988 the chance to emigrate was offered to ethnic Germans mainly on the basis of bilateral agreements between West Germany and the governments of Poland, Romania, Czechoslovakia, and the Soviet Union. The migration was voluntary to a greater extent than the expulsions of the years 1945 to 1949, and usually only occurred when members of the ethnic German diaspora made a corresponding application. Against this background the analytical distinction between expellees (*Vertriebene*; 1945 to 1949) and resettlers (*Aussiedler*; since 1950) makes sense, although the latter term was only introduced in 1957. Nevertheless, members of the German minorities living in Poland, Romania, and the former USSR were discriminated against in many cases—not only before, but also after 1950. Large parts of the West German public interpreted the *Aussiedlers*' decisions to emigrate both as a response to political and social discrimination at home and as a clear profession of Germanness and belief in the political system of the FRG. Rarely was the emigration of *Aussiedler* primarily seen as an economically-motivated decision (Bethlehem 1982, Delfs 1993).

4. *Areas of Origin and Periods of Immigration*

From the beginning of the 1950s and until the 1980s, Central and Eastern Europe's communist regimes limited the freedom of movement of their ethnic German citizens almost to the same extent as that of citizens belonging to the ethnic majority. The borders were well guarded. Leaving the state without authorization was treated as a crime. Only privileged people received a passport valid for international travel to Western countries. After the end of the organized post-war expulsion there were, for a while, only a few cases of family unification. In 1950, 47,000 ethnic immigrants came to West Germany; in 1952, only 5,000. During the following Cold War period (1953 to 1987) on average 37,000 *Aussiedler* per year came to Germany. The annual fluctuations mirrored, on the one hand, periods of domestic political liberalization or crisis in the countries of origin—during the second half of the 1950s in Poland, 1967 to 1968 in Czechoslovakia, and after 1986 in the USSR—and, on the other hand, the communist regimes of Poland and Romania also used concessions on exit permits for *Aussiedler* as 'leverage' in order to improve their political relations with the FRG and to receive economic or financial aid. At the same time, the political elites of these two sending countries hoped that the still existing ethnic minorities would be weakened and finally disappear through emigration. This all played a role in the mid-1950s when some 250,000 persons of German and mixed ethnic background were allowed to leave Poland in the direction of West Germany. It was also true for the period before and after the conclusion of a Basic Treaty (*Grundlagenvertrag*) between Bonn and Warsaw. In 1970 the number of ethnic Germans who were allowed to leave was almost five times higher than 1968 and 1969 combined. During the 1970s, Poland received substantial financial support in return. In the case of Romania, Germany even agreed on a fee per ethnic German migrant (Münz and Ohliger 1998).

Between 1950 and 1987 almost two-thirds (62 percent) of all ethnic German immigrants came from Poland (848,000) and a further 15 percent from Romania (206,000). Although there also was a strong German minority in the Soviet Union, in that period, only 110,000 persons (8 percent of the *Aussiedler*) were able to emigrate from that country (see Fig. 1). Despite this emigration, the greater part of the still existent German minorities continued to live in their traditional areas of settlement—Upper Silesia, Transylvania, Banat—or in regions into which they were deported during World War II—in particular Siberia, Kazakhstan, Kyrgyzstan. With the fall of the Iron Curtain and the rescinding of administrative travel restrictions in East-Central and Eastern Europe at the end of the 1980s, the number of ethnic German immigrants rose considerably. In 1988, 203,000 *Aussiedler* came to Germany, almost three times as many as in the previous year. And in 1990, the influx of *Aussiedler* reached its highest mark ever, at 397,000 persons. From 1988 to 1999 a total of 2,600,000 *Aussiedler* migrated to Germany. In this phase, the post-Soviet successor states—namely Kazakhstan, Russia and Kyrgyzstan—became the most important regions of origin (1,775,000 *Aussiedler*, or 69 percent). The second largest group was the ethnic German immigrants from Poland (574,000 or 22 percent over the same period). Those from Romania ranged third (219,000 or 8 percent).

Until 1989 and 1990 members of ethnic German minorities from East-Central and Eastern Europe were not able to freely leave their home countries, but were allowed free entry to West Germany, and almost automatically became German citizens. The application for *Aussiedler* status could be made during a short-term visit to Germany, or even after illegal entry. Fast and unbureaucratic naturalization allowed ethnic Germans under such conditions an immediate stay in the country of their forefathers. But with the

fall of the Iron Curtain, Germany became a lot more restrictive. Since 1990 members of ethnic German minorities have had to apply in their country of origin for *Aussiedler* status and for a special entry permit to be issued by the relevant German consulate. The 'Germanness' of the applicants is now checked in advance. These new regulations immediately led to a much smaller influx of ethnic immigrants (221,000 people in 1991), and to a backlog of applications to be processed. In 1992 an annual quota for the admission of *Aussiedler* was established. Until 1999, the size of this quota was 220,000 persons per year, and in 2000 it was reduced to 110,000. On top of this, in 1996, the German administration introduced a language test, in which potential *Aussiedler* have to prove their proficiency in German. This led to a further reduction of the inflow: in 1994, 222,000 *Aussiedler* were given permission to enter Germany, by 1999 the number was only 105,000 (see Fig. 1). Another reason for this reduction is the pace of administrative procedures and individual decisions to actually migrate. In 1999, some 400,000 applications for *Aussiedler* status were pending. Another 180,000 ethnic Germans had already acquired *Aussiedler* status, i.e., the right to immigrate and become a German citizen, but have not exercised this right so far.

5. *Reduction and Foreseeable End to the Immigration of Ethnic Germans*

The immigration of ethnic Germans to Germany has been declining since 1990. There are several reasons for this decline. Since 1993 the unconditional right to immigrate to Germany has existed only for ethnic Germans living in the successor states of the Soviet Union. The regulation by which ethnic Germans must prove their linguistic competence also has a restrictive effect on the influx of *Aussiedler*, because people with poor or no knowledge of German are denied privileged access to Germany. In the years 1996 to 1998, some 50 percent of all applicants passed the mandatory language test. The remaining 50 percent have no right to repeat the test. However, some of those who fail the test later come to Germany as family members (i.e., spouses, parents, children, or children-in-law) of someone who successfully claimed *Aussiedler* status. Unlike those who pass the test, their spouses, their children, the other accompanying family members remain foreign nationals. They are not entitled to a number of integration measures, and they have no immediate access to the German labor market.

An end to the ethnically-privileged immigration into Germany is forseeable. In 1992 the so-called 'Law concerning late consequences of World War II' (*Kriegsfolgenbereinigungsgesetz*) limited the options of future applications for *Aussiedler* status and subsequent entry into Germany to ethnic Germans born before 1993. This regulation will become important after the year 2010, when people born in 1993 and later reach the age of 18. This younger generation of ethnic Germans will have no independent claim to *Aussiedler* status, though some of them will still be able to immigrate legally into Germany within the framework of family unification.

Between 1950 and 1999 a total of 4,000,000 *Aussiedler* came to Germany. Most of them were from the Soviet Union and its successor states (1,800,000) and from Poland (1,400,000). The potential for a further influx of *Aussiedler* is not exactly foreseeable, but it is limited. There are almost no ethnic Germans still living in the successor states of Yugoslavia, in the Czech Republic, and in Slovakia. In Romania, the great wave of emigration (1989 to 1992) reduced the German minority population to a core of older people, no longer willing to emigrate (approximately 60,000 in 1999). Estimates say that there are 500,000 to 800,000 people in Poland who see themselves as ethnic Germans, in particular those living in Silesia. Many of them have already received permission to immigrate as *Aussiedler*, but have not yet exercised this right. Others migrated but did not settle in Germany permanently and returned to Poland as dual citizens. A considerable number successfully regained German citizenship without emigrating. For this reason the number of people in Poland with both German and Polish citizenship has grown (to approximately 275,000 in 1999). In the successor states of the USSR, the remaining number of ethnic Germans and people of mixed origin with at least some German ancestry is estimated at 500,000 to 1,000,000. In the face of the crises of economic transformation as well as political and ethnic conflicts, one can expect that many of them will either have declared themselves as Germans already, or will do so in future, in order to keep open the option of later emigration to Germany or to profit from public funds earmarked by Germany for the support of ethnic Germans in the Eastern diasporas.

International Migration by Ethnic Russians

Throughout most of their history, ethnic Russians have migrated from the Russian heartland to the borderlands, first, of the Russian Empire and, then, of the Soviet Union. More recently, much of their migration has involved 'repatriation' to the heartland and emigration to 'foreign' countries, i.e., to residences beyond the borders of the former Soviet Union. This article examines these migration flows.

1. The Migration of Ethnic Russians Within the Russian Empire and USSR

1.1 The Russian Empire

The expansion of the Russian Empire and development of its huge territory was accompanied by mass migration from the country's ethnic Russian heartland to its non-Russian frontiers. This process began in the seventeenth century and continued for several centuries. As the political boundaries of the state expanded, the territory populated by ethnic Russians expanded as well, beginning with the territory between the Black and the Baltic seas, the Volga region, the Urals, Northern Kazakhstan, Siberia and the Far East, and eventually including Transcaucasia, Kazakhstan, the Baltic region, and also—at the beginning of the twentieth century—Central Asia.

More or less reliable estimates of migration can be made starting from 1719, when Russia began conducting regular counts of the adult population. According to these estimates, during the eighteenth century no less than 1.7 million adults, mostly ethnic Russians, moved from the center of the country to its peripheries. In the first half of the nineteenth century, there were 1.5 million such migrants; in the second half—4 million; and between 1897 and 1916—5.3 million. A significant portion of these migrants moved outside of Russia proper into the borderlands of the enormous empire. In 1719, there were about 100,000 such migrants, by the end of the eighteenth century they numbered over 400,000 (Kabuzan 1996).

The main surge of imperial Russian expansion took place around the end of the nineteenth century. By 1897, there was a tenfold increase in the number of ethnic Russians living in the territory of the future Soviet republics—to 4.5 million. By the eve of the Bolshevik revolution, this number had reached 7.5 million, about 10 percent of all ethnic Russians. Almost half of the Russians outside Russia proper (47.3 percent) lived in the Ukraine, with 19.1 in Belarus, 16.7 in Kazakhstan, 5.8 in the Baltic countries, 3.5 in Central Asia, and 1.7 percent in Moldova (Kabuzan 1996).

The migration of ethnic Russians before the Revolution was, generally, of a colonial nature and often followed upon wars of conquest. Migration was the imperial regime's main method of settling and developing acquired land, of controlling and defending its borders, and of ensuring stability. At the same time, in many border regions, such as the Caucasus and Central Asia, the Russians became emissaries of urban culture and education.

Despite sizable migration, the share of ethnic Russians in the population of the border regions in 1917 was not very large. It was highest (21.7 percent) in the territory of what is now Kazakhstan, especially in its northern areas adjacent to Russia proper. Ethnic Russians constituted 14.5 percent of the population in Belarus, 9.6 in Latvia, 9.3 in Ukraine, 8.4 in Azerbaijan, and 2.1 percent in Uzbekistan.

1.2 The USSR

World War I and the subsequent October revolution and civil war led to a sharp reversal in the migration of Russians from center to periphery. In 1926, 25 percent fewer Russians lived in the non- Russian territories of the former Russian Empire than had lived there in

1917—only 5.8 million. Most of those concerned resettled in Russia proper, although some joined the sizable group of Russians who left the country altogether. In the late 1920s and early 1930s, however, the historic process of centrifugal migration resumed at a much accelerated pace.

Centrifugal migration in the Soviet period was spurred by the regime's commitment to rapid industrialization and by its determination to russify sensitive border regions, where native populations were sometimes deported en masse and replaced by ethnic Russians. This process began along the country's western and southern borders, and accelerated after 1939–40, when the USSR annexed the Baltic States and parts of Poland and Romania (Polyan 1996). As a result, by 1939 almost 11 million ethnic Russians lived in border regions of the USSR—one and a half times more than had lived there in 1916.

During World War II, there was a massive evacuation of population and of industrial production from central Russia to, and beyond, the Ural mountains. This gave another push to ethnic Russian migration, especially to Central Asia and Kazakhstan. After the war, the economic reconstruction in the western part of the USSR was accompanied by further mass migration by ethnic Russians, especially into the Ukraine, while the Sovietization of the reconquered Baltic states gave rise to wholesale 'ethnic cleansing' and Russification. And, somewhat later, the campaign to develop the so-called virgin lands of Kazakhstan was accompanied by another large influx of ethnic Russians. As a result, the number of Russians living in the non Russian republics of the USSR rose from 10.7 to 16.2 million between 1939 and 1959. In the same period, the ethnic Russian population of Russia proper increased by 8.8 percent.

The large-scale migration of ethnic Russians into the non-Russian republics of the USSR continued into the 1960s and was linked closely with rapid urbanization. Most migrants moved to areas where cities were growing fast but the local rural population was not yet ready to live in them. This was the case in the Transcaucasia, Central Asia, Kazakhstan, and Moldova in particular. In the Baltic states, the influx of Russians had less to do with the unpreparedness of the local population for urban and industrial life than with low population growth rates and ethnic cleansing. The migration of Russians to non-Russian territory was also facilitated by the low standard of living in Russia's villages, which is where most migrants came from.

In the later 1960s, the inflow of ethnic Russians into the non Russian republics of the USSR began to slow down and stopped altogether by the 1980s, at which time some 24 million ethnic Russians, almost 17 percent of the entire ethnic Russian population, lived outside of Russia proper. In part, this was a reflection of the virtual disappearance of 'surplus labor' in Russian rural areas as well as of the improvement of educational and employment opportunities in Russian cities. At the same time, in Central Asia and the Transcaucasia, a demographic explosion and accompanying large increases in native workforce entrants led to an intense competition for urban jobs—jobs that non-Russian natives were now psychologically and educationally ready to perform and ethnically self-conscious and self-assertive enough to demand. The magnitude of the resulting change is indicated by the increase in the percentage of non-Russians in the industrial workforce between 1967 and 1987: from 43 to 61 percent in Uzbekistan, from 26 to 41 percent in Kirghizia, from 35 to 54 percent in Tadjikistan, and from 38 to 59 percent in Turkmenistan. Similar changes took place in Azerbaijan, Georgia, Moldova, and Kazakhstan. Such changes were even larger in the case of white-collar workers and professionals.

As the 'indigenization' of the workforce in the non Russian republics of the USSR spread and accelerated, and for largely the same reasons, Russian residents of those republics began to migrate (or re-migrate) to Russia. Beginning in Georgia and Azerbaijan in the 1960s, this trend became evident in Central Asia in the 1970s, and affected most of the non- Russian republics by the 1980s. The only exceptions were Ukraine, Belarus, Moldova, and the Baltic states, where it began only in the 1990s. Claims that the collapse of the Soviet Union marked an abrupt turning point in Russia's migratory history are incorrect. This notwithstanding, the collapse did have an enormous and probably enduring impact on Russian migratory behavior.

2. *Migration to Russia From the Other Newly Independent States*

With the collapse of the USSR, the 'repatriation' of ethnic Russians ceased to be a largely voluntary process and assumed a forced character, driven by ethnic discrimination, human rights abuses, and communal violence. Many of the 'repatriates' were responding to newly imposed limitations on their civil and political rights, restrictions on use of the Russian language, displacement from administrative jobs and intellectual occupations, and curbs on their private sector activities. In many cases, they were also 'displaced persons,' fleeing from armed conflicts.

In the Ukraine and Belarus, where discrimination, coercion, and violence were absent, the overwhelming majority (well over 95 percent) of resident Russians stayed put, and those who migrated to Russia did so solely for economic reasons, as did Ukrainians and Belarussians who migrated with them. In the other newly independent states of the former Soviet Union, however, the outmigration of Russians assumed mass proportions. Thus, between 1990 and 1998 the number of Russians in Armenia and Tajikistan declined by over 50 percent. In Azerbaijan and Georgia the decline

was only slightly smaller, while the decline in the Central Asian states (Kazakhstan excluded) and the Baltic states was 25 and 14 percent, respectively. In general, the Russian Diaspora in non-Slavic countries of the former Soviet Union has fallen by 20 percent as a result of repatriation. Furthermore, although there has been some slowdown in the process since 1995, repatriation will almost certainly increase further, especially if and as Russia's economy recovers and begins to grow.

3. *Russian Emigration Beyond the Borders of the Soviet Union and the Newly Independent States*

3.1 *Pre-Soviet and Soviet Emigration*

Until the end of the nineteenth century, very few ethnic Russians settled beyond the borders of the Russian Empire. In the eighteenth and nineteenth centuries, small groups of religious sectarians resettled in Romania (Old Believers) and Canada (Dukhobors), but Poland was the only country with a sizeable Russian diaspora (about 300,000 people in 1900).

Early in the twentieth century, the flow of people migrating from Russia increased substantially. Four million people emigrated to the USA between 1901 and 1920, but the vast majority of them were Jews. According to the US census of 1910, there were 65,600 non-Jews among residents 'of recent Russian origin.'

The first large wave of ethnic Russian emigration was generated by the Bolshevik revolution and attendant civil war and Red terror. In the first years after the revolution, between 1.5 and 2 million people left the country (Polyakov 1986; Maksudov 1989). This was the so-called 'White emigration,' consisting mostly of ethnic Russians. The main stream of White emigration initially went to Poland (one million), Germany (560,000), France (175,000), and Latvia (12,000), and then on to the USA (Kulischer and Kulischer 1948). At the same time, over three million former prisoners of war returned to Russia from Germany and Austria, mostly ethnic Russians (Volkov 1930, Maksudov 1989).

World War II brought about further mass migrations of ethnic Russians. Thus, of the four million people who were sent to German labor camps from the USSR, 1.2 million were ethnic Russians. Russians also comprised the majority of the millions of Soviets in German prisoner of war camps. Of these slave laborers and prisoners, some 31,000 ethnic Russians stayed in the West after the war (Polyan 1996).

Between 1947 and 1957, they were joined in the West (chiefly Canada, the USA, and Australia) by another 128,000 emigrants from the USSR, almost all of whom were Russians or Ukrainians who were allowed to emigrate on grounds of family reunification (Mariansky 1969). Except for these people, however, almost no one was allowed to emigrate from the Soviet Union from the second half of the 1920s until the years immediately preceding the disintegration of the union.

3.2 *Post-Soviet Emigration*

Despite the complete abolition of barriers to emigration following the collapse of the Soviet Union, ethnic Russians have remained largely at (or returned) home. Between 1992 and 1998, 178,500 ethnic Russians left Russia as legal emigrants. This was 29.1 percent of the total number of documented emigrants from Russia, the majority of whom were Jews or Volga Germans. There is probably a higher percentage of ethnic Russians among undocumented emigrants from Russia, but there is no reliable information available either on the number of undocumented emigrants or their ethnic composition. What is clear is that the proportion of highly educated specialists among Russian emigrants is significantly larger than the proportion of such specialists in Russia's overall population.

Today, around 1.5 million people who consider themselves Russian live outside the borders of the former Soviet Union, including over one million in the USA, 90,000 in Canada, 80,000 in Brazil, 50,000 in Argentina, 40,000 in France, 35,000 in Romania, and 20,000 in Austria (Bruk 1986, Kabuzan 1996). Although the number of such emigrants may grow over time, it is unlikely to grow as rapidly or reach the magnitude that many in both Russia and the West once forecast and (for various reasons) feared. This is both because Russians do not seem particularly interested in emigrating and because their neighbors have created strong barriers to their doing so.

International Migration by Ethnic South and Southeast Asians

1. Introduction

South (including the countries of India, Pakistan, Bangladesh, and Sri Lanka) and Southeast Asia (including the countries of Indonesia, Philippines, Thailand, Vietnam, Singapore, Malaysia, Brunei, Cambodia, Laos, and Myanmar) are home to 31 percent of the world's population at the turn of the twentieth century (1,879.4 million persons) and the region has experienced massive population change since the 1980s (Leete and Alam (1993). The rapid increase in population movement between countries that has accompanied the process of globalization in this period in all of the countries of this region has been affected significantly. There has been a major increase in the levels, complexity, and impact of international migration in the region. Whereas at the end of the 1970s such movement was limited to a selected small proportion of residents in the region, it is now within the calculus of choice of a major part of the population as they weigh up their life chances. With the increase in movement has come an increased awareness of it and intervention to influence it by governments in the region. This article seeks to summarize the evolving patterns of movement and address some of the major issues relating to it.

2. Patterns

The data available to examine international migration in South and Southeast Asia are limited in the extreme. The increase in significance and intensity of movement has outpaced the development of data systems to measure it. Moreover, undocumented migration in the region is arguably as great in scale as legal migration and, by definition, the information relating to that migration is limited. While there is a great deal of complexity in the spatial patterning of the movement, the degree of permanency, the characteristics of movers, and its legality, it is possible to identify three main subsystems of movement in the region. These include a so-called south–north, more-or-less permanent flow to developed countries, a predominantly temporary labor flow to the Middle East, and a third set of interactions within the region. Each subsystem involves different balances of forced and nonforced movement, males and females, permanent and nonpermanent, documented and undocumented, labor related and other movement, etc.

South–north movement is one of the most dominant global international migration flows (UN 1997) and South and Southeast Asia is one of the dominant origin areas of such flows. The largest nation in the region, India, is estimated to have a diaspora of 15 million persons living overseas with US $150 billion in assets (*Migration News*, November 30, 1998). There are said to be 3.2 million overseas Pakistanis (*Asian Migration News*, June 15, 1999). Table 1 presents estimates of the numbers of South and Southeast Asian migrants in more developed countries. These are underestimates of the impact of immigration because the data are obviously incomplete; undocumented migrants are excluded and the children born overseas to migrants and later generations are not included. Nevertheless, the scale of the movement can be appreciated.

However, more-or-less permanent settlement in North countries is not the only type of movement out of South and Southeast Asia. International labor migration whereby workers from the region move to other countries to work, usually under contract, for a set period (usually around two years) before returning to their home country has expanded since the 1980s. One of the major streams of this type out of the region is directed toward the Middle East. There has been a long tradition of South Asians working in that region which extends back to colonial times, but the steep increase in oil prices after 1973 saw massive flows of foreign exchange into the region which fostered massive infrastructure construction which in turn saw the expansion of recruitment of foreign workers

initially from South Asia but later from Southeast Asia.

In the late 1980s this movement changed to include more women and service workers. Again, data are poor since many Middle Eastern countries do not release information on migrant workers due to the sensitivity attached to heavy reliance on foreign labor in several countries where these workers in some cases outnumber local workers. Nevertheless, Table 2 presents some information for the main labor-exporting countries. The bulk of migrant workers from Southeast Asia are unskilled while South Asia has sent both skilled and unskilled workers. Female domestic servants have become more significant in the movement over time, especially those from Indonesia, the Philippines, and Sri Lanka.

In the 1980s and 1990s there was a growing tempo of movement of international labor migrants to

b Undocumented

Asian destinations, including other countries in the Southeast Asian region. This is evident in Table 3, which consolidates estimates of the stocks of overseas migrant workers from the various nations of South and Southeast Asia. These indicate that for many the main destination is an Asian nation. In fact, several of the East and Southeast Asian nations which began their transitions to low fertility in the 1980s and 1970s have suffered significant labor shortages in recent years. This has been a function of both rapid economic expansion and the declining numbers of new entrants into their workforces due to low fertility. This has been accompanied by a distinct segmentation of their labor forces whereby local workers have eschewed entry into low-income, low-status jobs which have created niches for overseas migrant workers in these areas. Hence, particular industries in particular Asian countries have become quite dependent on foreign labor. These include some activities in countries like Thailand and Malaysia which themselves are supplying migrant workers to Japan and Taiwan. Hence, in Thailand the rice milling and fishing industries are heavily reliant on labor from Myanmar while in Malaysia the plantation and forestry industries rely upon gaining workers from Indonesia, the Philippines, and Bangladesh.

It is apparent, then, that one can recognize three distinct subsystems in South and Southeast Asian migration. One has involved movement to the so-called northern nations; another links the region to the Middle East; while a third involves intra-Asia movement. While permanent settlement in the case of the first subsystem and labor migration in the case of the second two are dominant, there are a number of other forms of international movement involved in the subsystems. Dealing first with the south–north movement, a most important factor was the abolition of racially biased immigrant selection policies in the main immigration countries (USA, Canada, Australia, etc.) in the 1960s and 1970s. Immigration policies were developed in which selection was based upon skill/education and/or family linkages as well as acceptance of refugee/humanitarian migrants. Hitherto, migrants from South and Southeast Asia could not compete on an equal basis for migrant places with people from Europe. In addition, migration flowed along linkages established by colonial rule (e.g., Indians and

Table 4

Pakistanis to the UK, Indonesians to The Netherlands, etc.) or by military involvement (Koreans to the USA, etc.).

An important element in the south–north movement, as well as migration within Asia, has been that of the refugees. Table 4 shows the current stock of refugees in countries in the region. While there have been several such flows since the 1950s, two have been on a particularly large scale and have differed substantially in type. The outflow of refugees from Indochina following reunification of Vietnam in 1975 was predominantly initially to other Asian (especially Southeast Asian) nations.

This involved more than two million people, the vast majority of whom have been settled in third countries (predominantly in the 'north') or repatriated back to their home countries. These movements have resulted in substantial subsequent migration since these refugee settlers functioned as anchors in destinations to bring other family members to these destinations, often using the family reunification components of migration programs.

The second major refugee migration occurred from Afghanistan, especially into the neighboring nations of Pakistan and Iran. This involved several million people, most of whom were not settled in third countries or repatriated but stayed for long periods in their countries of temporary asylum. There have been many smaller but nevertheless significant movements, mostly involving movement into neighboring countries—Myanmar into Thailand, Tibet into India, Bangladesh into India, Philippines into Malaysia, etc.

Table 5
Percentage of foreign students from Asia studying in tertiary institutions in some north countries

Country	Year	Total number of foreign students	Percentage from Asia
USA	1995/96	453,785	64.1
Australia	1999	83,111	85.8
Japan	1994/95	53,511	92.1
New Zealand	1997	6,415	70.8

Source: LINESCO 1999; DETYA 1999

Another strand in the south–north migration has been the acceleration in the migration of students to undertake secondary but especially tertiary education. Table 5, for example, provides data on the percentage of foreign students from Asia studying in tertiary institutions in some north countries. In Australia, for example, over the 1983–1999 period the number of overseas students increased from 9,098 to 83,111. There is a strong connection between such movement and eventual settlement in the destination nation. Indeed, gaining an educational qualification in the 'north' country can facilitate entry as a permanent settler.

A related element in the intra-Asian subsystem involves the movement of trainees from labor surplus nations like Indonesia, Thailand, and the Philippines to countries with shortages such as Japan and Korea. The movement ostensibly is for workers of multinational companies in the former countries to spend a period in the home country of the companies to gain training. There has been discussion of the extent to which companies are using this system to import unskilled or semiskilled workers when government policy prevents such movement.

While the net effect of the south–north movement is emphatically in favor of the north, the flow in the opposite direction is not to be ignored. This in part involves former emigrants returning to their home country but in the case of some Southeast Asian nations also involves natives of north countries to meet the demands for skilled workers in areas like accountancy, engineering, management, etc. which cannot be met locally. Most of the latter will remain only temporarily in the Asian country. The fact that there is return migration into Asian countries from the north, however, is often neglected. It often can take the form of a 'reverse brain drain' involving highly qualified people who return and take up important positions in the economy or government of their home country.

Obtaining estimates of international migration in the South and Southeast Asian regions is very difficult. Data collection systems generally are not well de-

veloped and there is a high level of undocumented migration. The highly complex nature of the movement needs to be stressed as does the fact that there are complex linkages between the different types of movement.

3. The Migrants

Migration is always a selective process in that the groups of people who move differ from those who are left behind or those which they join at the destination. Each of the three main subsystems briefly described above is distinctive not just in terms of the countries involved but also the types of people who move. The south–north migration generally can be characterized as being selective of the better-educated and skilled populations since entry criteria in the destination countries usually require this, although 'business' migration programs involving the investment of minimum levels of personal wealth at the destination are increasingly common. Under family reunification and refugee/humanitarian programs and the United States Quota Program, there are some, but limited, opportunities for unskilled people to move but the overall selectivity remains. One characteristic of the south–north movement is the increasing involvement of women such that in several north countries women immigrants from the region (especially Southeast Asia) outnumber their male counterparts.

The composition of the flows in the Asian and Middle East subsystems is quite different. While there are certainly exceptions (these include some of the flows out of South Asia and the Philippines), the outmovements are dominated by unskilled workers. These are directed at particular labor market niches at the destination which, due to low wages or low status, are unable to attract local workers. Several of these flows are selective of women so that in some sending countries (e.g., Sri Lanka, Indonesia, and the Philippines), women outnumber men among the outgoing migrant workers. These women especially are directed to a number of specific occupations which sometimes make them vulnerable to exploitation. These especially include work as domestics in private homes in destination countries but also in some cases are associated with the so-called entertainment industry. In some countries (e.g., the Philippines) it has been found that migrant workers sometimes take up jobs in the destination country which are at a level below their qualifications.

4. The Process

There can be no doubt that the level of international population movement in South and Southeast Asia has increased substantially since the 1980s. Whereas in the 1970s the possibility of international migration was only within the reach of relatively few people in the region, it is now within the calculus of choice of a much larger number of people and a wider range of socioeconomic, cultural, and gender groups. Clearly, the whole process of globalization, especially as it has impinged upon labor markets, has been an important factor. This has increased greatly the linkages between nations involving flows of goods, finance, ideas, etc., and it is inevitable that movements of people also have increased although the barriers erected by nation-states to flows of people have been reduced.

Neo-classical economics explanations have relevance for migration in the region. South and Southeast Asia contain four of the 10 largest labor surplus countries in the world. The demographic and economic gradients between richer and poorer countries both globally and within Asia have increased since the 1980s so that there are not only steep differences in income and wages between nations but also in the rate of increase of the working age populations. Labor-importing economies are undergoing economic transformation from manufacturing to service-based economies and this is creating jobs for migrant workers. Labor shortages in areas like information technology, management, and a number of skilled areas is encouraging the development of international labor markets but, also, the labor market segmentation referred to earlier is creating opportunities for migrant workers in low-skilled, low-paid, and low-status areas. The South and Southeast Asian region is able to supply workers both in the skilled areas (from South Asia, the Philippines) and the unskilled occupations.

Nevertheless the widening gaps between nations in population and economic growth and income and wage differentials are not sufficient explanation of the burgeoning of migration in the region, although they are an important component of any comprehensive accounting for it. There are a number of other elements which are also involved. Among the most important is the development of social networks between origin and destination nations. Empirical research indicates that the majority of movers from the region migrate to join family and friends who migrated earlier to the destination. A large proportion of South and Southeast Asians now have social capital in countries other than their own in the form of a family member or friend who lives and/or works in those countries. Those linkages form important conduits along which international migration, both documented and undocumented, takes place. The development of ever cheaper and better transport and communication systems enhances the operation of these networks in initiating migration.

Another element involves the so-called migration industry, which has a long history in the region but has proliferated in recent times. This involves a plethora of immigration agents, recruiters, travel agents, travel providers, immigration officials, labor brokers, and

other intermediaries who are involved in initiating and facilitating international migration. Part of this infrastructure are the people smugglers and traffickers who transport migrants outside of government regulations but it also involves many who operate within the law.

Another element is the greater involvement of government in international migration in the region. While governments in destination countries are predominantly concerned with controlling the numbers and characteristics of immigrants, those in sending countries increasingly are becoming involved in the emigration process. Realization that international migration can relieve under- and unemployment at home and enhance foreign exchange earnings has seen governments in several nations intervene to encourage emigration and to protect the rights of their nationals living and/or working in other countries. Some countries have been active in encouraging former migrants with needed skills to return while others have policies and programs to encourage their nationals in other countries to invest their earnings in their home countries.

5. *Issues*

The proliferation of international migration in South and Southeast Asia has seen the emergence of a number of significant issues both in the countries of origin and destination as well as among the migrants themselves and their families. One of the most debated of these relates to remittances—those moneys earned by migrants abroad that are sent to or brought back to the country of origin. There is debate as to the scale and impact of these financial flows but the data relating to them are largely incomplete. This is because much of the flow does not pass through official channels. Nevertheless, it is clear that the impact of remittances can be considerable. Table 6, for example, shows the significance of reported remittances in relation to foreign exchange earnings from trade in three Southeast Asian countries. While global figures such as those in Table 6 understate the scale and impact of remittances nationally, there can be no doubt that their impact within regions of South and Southeast Asian countries is much greater. This is because migrants tend to be drawn from particular *regions* rather than randomly across the nation. Hence, remittances tend to be focused on particular parts of countries such as Kerala in India or Flores in Indonesia. Moreover, these regions are often among the poorest in the origin countries and the remittances represent one of the few sources of investment in those regions. For example, a December 1999 report from the State Planning Committee of Laos indicates that remittances from abroad represented 28 percent of all household earnings in the Vientiare Valley compared with 25 percent from agriculture, 22 percent from wages, and 18 percent from business (Litner 2000, p. 48). However, remittances have also been seen to increase costs and widen income distribution in origin areas as well. There have been several interventions by governments in the region to encourage nationals overseas to put their earnings in national banks and to invest in their home countries as well as to encourage the sending of remittances to the home country.

Another important issue relates to the exploitation of migrants from the region. While it is incorrect to depict all such migrants as victims subject to exploitation, there can be no doubt that some groups are vulnerable to exploitation of a number of kinds. This is particularly the case among some groups of female migrants, especially those who work in occupations where protection is difficult, such as domestic workers in private homes and in the entertainment industry. Those who are undocumented are especially vulnerable to exploitation but lack of knowledge and local languages and customs can also increase vulnerability

Table 6
Main Southeast Asian labor exporting countries: workers' remittances relative to exports and imports in US$ million, 1980–98

			Total Merchandise		R	
Country	Year	Workers Remittances	Exports (X)	Imports (M)	X	M
Indonesia	1980	33	21,908	10,834	0.1	0.3
	1992	264	33,815	27,280	0.8	1.0

of immigrants. Governments of sending countries vary considerably in the efforts they have made to protect their nationals abroad. The Philippines, for example, leads the way in this area but even so significant exploitation still occurs. The issues of protection of nationals overseas is most pressing but governments find it difficult to interfere in the affairs of other countries. Accordingly, some of the most effective protection comes from the activities of nongovernment organizations and through informal networks established by the migrants. Exploitation of the migrants can occur in the process of movement when they may be forced to pay exorbitant amounts of money or suffer physical abuse. There have been several documented cases of undocumented migrants from the region losing their lives due to suffocation or drowning in the process of migration. At destinations they can be subject to exploitation and discrimination especially if they are undocumented migrants. Such migrants usually are depicted as criminals rather than as victims of the groups that exploit them in the process of migration or at the destination.

The pressing issue of protection of migrants and migrant workers from the region is related to that of controlling the intermediaries in the migration process. While all such intermediaries do not operate outside of the law, a substantial number do. Indeed, the involvement of crime syndicates in people smuggling and trafficking has increased exponentially and has become an important issue in international crime. The multinational nature of these groups makes them difficult to control and their influence is widespread, even involving officials involved in immigration. The thriving of such organizations clearly is related to the failure of documented migration systems and enhanced policing of migration is unlikely to solve the problem of undocumented migration. Improvement of official migration systems must be part of the increasing international effort to combat the people smuggling and trafficking which is especially rife in South and Southeast Asia. In countries of origin there is a need for information programs which provide potential migrants with detailed, accurate information about the costs of the migration process and the nature of the experience at the destination. Studies in several countries indicate that migrants are often poorly informed on both these counts and this can lead to them paying excessive amounts to move and to them having false expectations of the destination. The latter, for example, results in up to one-half of Indonesian women going to the Middle East to work as domestics returning to Indonesia before their contract time has expired. There needs to be a crackdown on the activities of unscrupulous intermediaries in several countries.

The issue of south–north migration representing a 'brain drain' of skill and talent needed for development in the home countries is a longstanding one in the region. In several origin countries, however, the occupational profile of migrant workers is largely an unskilled and semi-skilled one so that movement out of a country like Indonesia certainly cannot be characterized as a brain drain. On the other hand, much of the movement out of countries like India, Pakistan, Philippines, and Singapore is of skilled and highly educated groups. In those cases, however, the movement is not necessarily a net economic loss to the nation. Economic studies have shown that in some cases individuals have a net positive economic impact if they go overseas and remit money back to their home country rather than remain behind. In countries like India and the Philippines there appears to be an oversupply of some skilled groups in relation to the opportunities available locally. Nevertheless, there can be no doubt that the emigration of some skilled groups can be detrimental to local economies in some cases. With the globalization of labor markets such mobility is inevitable. Some countries in the region (e.g., Pakistan) have put in place programs to encourage former emigrants with certain skills to return to their home country. The growth of India's information technology industry, for example, has lured some former emigrants to return.

The interrelationship between international migration and development in the region is much argued. There can be no doubt that international migration can have both positive and negative effects on the well-being of communities left behind. This presents a challenge to policy makers to put in place institutional structures which maximize these benefits and minimize the negative effects. All empirical evidence points to the fact that there is little to be gained from policies and programs designed to stop population movement when there are economic imperatives behind that movement. The challenge is in creating policies and structures which enhance the benefits of the movement.

There is a range of issues which relate to the experience of migrants from South and Southeast Asia in destination countries. Several groups settling in northern countries show a tendency to concentrate in particular communities or develop ethnic enclaves, especially in major metropolitan areas. Debate on this ranges between those who see such areas as barriers to the adjustment of migrants and those who see them as having a cushioning effect in allowing migrants to adjust to life in the new country in a gradual way and with the support of community networks. Other issues relate to discrimination experienced by some groups in housing and job markets as well as nonrecognition of qualifications leading to occupational skidding and deskilling.

6. *Conclusion*

The South and Southeast Asian region represents one of the world's major reservoirs of potential international migrants accounting for more than one-

quarter of the global population and several of its largest labor surplus economies. Until recently, the impact of international migration in the region has been limited but it is now of significance in all countries in the region. Although fertility decline has been significant the labor force in the region continues to grow rapidly. Economies in several countries in the region are also growing rapidly but all of the pressures which have created greater movement since the 1980s than previously will continue to operate. Hence, the twenty-first century will see an increase in the scale and complexity of movement out of, within, and into the region.

International Migration: Mediterranean Basin and the Middle East

In this article, the Middle East is defined to include primarily the Gulf oil-exporting countries and Israel, and the Mediterranean basin is defined to include the countries surrounding the Mediterranean sea. The types and volumes of international migration experienced by these regions during the 1970s, 1980s, and 1990s are quite different from one another. To the Gulf countries, temporary labor migration has been the predominant type and has been large enough to constitute a major migration system measured on a worldwide scale. Migration to the Mediterranean region has been relatively smaller and includes permanent settlers, temporary workers, and asylum seekers.

1. Data Availability and Quality

Lack of reliable and valid data are frequently a hurdle in correctly documenting the stocks and flows of international migrants. For the Middle East, several advances have been made in establishing data gathering institutions in the major sending countries, especially in South and Southeast Asia (Appleyard 1998, Arnold and Shah 1986). Information about the non-national population is also gathered by the receiving countries and is published regularly (ESCWA 1997). One weakness of the annual flow data from several sending countries is the high percentage of persons who are not reflected in official statistics. In some cases the annual flow may be twice as high as the recorded level.

Data on some countries of the Mediterranean region (France, Greece, Italy, Spain, and Turkey) is available from the annual statistics of the Organization for Economic Cooperation and Development as part of its continuous reporting system on migration (OECD 1993, 1998).

2. The Middle East

Six oil-rich Gulf countries (Bahrain, Kuwait, Oman, Qatar, Saudi Arabia, and the United Arab Emirates) predominate as major receivers of migrants in the area. Migrants to the Gulf originate in many parts of the world, and some countries are host to over 100 nationalities (Serow et al. 1990).

Major features of the receiving countries that underlie the migration process are as follows. Oil is the major source of revenue for all the six Gulf Cooperation Council (GCC) countries. All of them are governed by kings or emirs who are regarded as benevolent patriarchs, and who generally share a policy of providing to their subjects free or highly subsidized social welfare services such as education, health care, housing, and employment. All but Saudi Arabia have small indigenous populations. A unique feature of their populations is the extremely high percentage of non-nationals, especially in their labor forces (Table 1). All have high birth rates, which they want to maintain, resulting in young populations and rapid rates of labor force growth.

Table 1
Total population by nationality and percentage of non-nationals in the labor force

Country	Population 1996 Total	Percent non-national	Percent non-national in the labor force (1990)
Saudi Arabia	19,814,330	27.7	60
Kuwait (1997)	2,152,775	65.4	84
Bahrain	566,726	37.4	51
Qatar	568,242	76.5	92
UAE	2,392,927	73.1	89
Oman	2,240,073	27.5	70
Total	27,735,073	51.4	74

2.1 Volume and Characteristics of Migration to the Gulf

Labor migration to the Gulf dates back to the 1930s when oil was discovered and the oil industry began to be established. A remarkable upsurge in such movement occurred after the 1973 oil embargo, which resulted in a dramatic rise in oil prices. The additional income led to ambitious development programs of the Gulf countries that had become rich in capital but were short of labor.

The majority of the migrants to the Gulf are either Asian or Arab, with a larger percentage of the former. Among Arabs, Egypt is currently a major sender. Yemen and Jordan have also been important countries of origin during 1970s, 1980s, and 1990s. Among non-Arabs, four countries in southern Asia (Bangladesh, India, Pakistan, and Sri Lanka) and two in Southeast Asia (the Philippines and Indonesia) supply most of the migrants. Less than five percent of all migrants are from European or American countries.

The Gulf War of 1991 played an important role in restructuring the nationality composition of migrants in the Gulf. Kuwait banned the return of five nationality groups whose governments had supported Iraq during the Gulf War, namely, Iraqis, Palestinians, Jordanians, Yemenis, and Sudanese. About 800,000 Yemenis were expelled from Saudi Arabia, and about 350,000 Palestinian/Jordanians left Kuwait, mainly for Jordan. The persistently high outflows from the sending Asian countries suggest that the trend towards Asianization has been maintained steadily. In Kuwait, for example, the expatriate labor force in 1988 comprised 66 percent Asians, 33 percent Arabs, and only 1 percent other nationalities.

The number of migrants can be estimated in terms of the stock at any point in time or annual flows. The stock of workers from the four major southern Asian senders was estimated to be 4–5 million in 1994–5. Data on annual flows from selected countries are shown for the latest available year in Table 2. Since these data reflect only the documented migrants, they are likely to be an underestimate of the real numbers, probably by 30–50 percent.

Table 2
Annual migration flows and percentage going to Middle East (ME), selected countries

Country of origin	Total	Percent to ME
Bangladesh (1998)	267,667	90.2
India (1997)	416,424	92.8
Pakistan (1997)	153,929	96.0
Sri Lanka (1997)	149,843	84.6
Indonesia (1994)	118,000	40.6
Philippines (1996)	660,122	62.0

Among the receiving countries, Saudi Arabia is the largest recipient and therefore holds special importance. During the late 1990s, about one-third of the Sri Lankan, one half of the Pakistani and Bangladeshi, and 63 percent of Indian migrants headed annually for Saudi Arabia.

The majority of migrant workers from India, Pakistan, and Bangladesh are male. However, 75 percent of migrants from Sri Lanka, about two-thirds from Indonesia, and half from the Philippines were female during the 1990s. One major reason for the feminization of the migrant workforce is the increasing demand for housemaids. Published data actually underestimate the number of female workers from some countries (e.g., India) who do not allow this type of migration because workers therefore move illegally and are missed by official statistics.

Among the male workers, especially those from South Asia, more than half consist of unskilled or semiskilled workers employed as laborers, servants, cleaners, and gas station attendants. Less than 10 percent are professionals.

2.2 Working and Living Conditions of Migrants

Surveys of migrant workers and returnees indicate that for a large majority, labor migration to the Gulf is a positive experience (Gunatilleke 1992). Despite the downward trend in salaries, migrants are able to earn wages that are several times higher than possible in the home country. A majority would like to stay as long as possible, and try to bring in as many of their friends and relatives as they can. For workers and their families who have become used to higher levels of income, there seem to be no better alternative than to keep their Middle East jobs by whatever means possible. The workers themselves are willing to undergo a fair amount of hardship for the sake of their families. In about 70 percent of cases the migrants are married but are not accompanied by their families since the rules often do not allow it. Absence of the migrant has been found to create marital and social problems only in a minority of families.

2.3 Reasons Underlying the Large Flows to the Gulf

In the sending countries, several political, demographic, and socioeconomic factors serve as push factors, while the large wage gap between the sending and receiving countries is a major pull factor that motivates labor migration in the region. Poverty in the sending countries is the single most important push factor. According to the UNDP, South Asia has the largest number of people in income poverty. Its human poverty index shows that 48 percent of Bangladeshis and 47 percent of Pakistanis faced various forms of deprivation in 1997 (UNDP 1997). The rapidly growing population and consequently the expanding labor force, in several countries, exacerbate the level of poverty. Other factors that have contributed to poverty are political conflicts and natural disasters.

Labor migrants often do not come from the poorest or most destitute groups. They are the relatively more enterprising and 'fit' individuals who can afford the ever-increasing financial cost of migration, and many are employed before migration. However, high unemployment rates in the sending countries are also push factor in many cases.

A major facilitator of migration is the formation of informal networks of friends and relatives, making it a self-perpetuating phenomenon. This also results in the formation of migration pockets in the sending country. Some surveys show that friends and relatives arrange work visas for 34 percent of respondents (Shah 1998).

In the receiving countries, several factors perpetuate the demand for foreign workers. The major ones are the small indigenous population and labor force, limited skills among the national workforce, the abundant and cheap supply of expatriate labor, its willingness to work in 3D (dirty, dangerous, and demanding) jobs that nationals shun, and the relatively low participation of women in the workforce in some countries. In addition, the profit that accrues to a fairly large number of intermediaries is a factor. It is well known that labor is sometimes brought in not to satisfy genuine demand but to earn transfer fees. Another important factor is the structural imbalance in the host country labor force. Nationals are employed overwhelmingly in the public sector, about 94 percent of them in Kuwait and 93 percent in Saudi Arabia. Nationals prefer to work in the public sector where work is less arduous and less competitive, and remuneration is generally as good as in the private sector.

2.4 Policies of Sending and Receiving Countries

Governments of the sending countries are highly pro-emigration (United Nations 1998). Most South and Southeast Asian countries have revised their emigration rules and procedures and developed administrative machineries to regulate the outflow, ensure worker welfare, and promote further worker emigration. However, countries differ in the degree of aggressiveness with which they promote manpower export. Bangladesh, for example, has successfully found a new market for labor export, Malaysia.

Remittances from overseas workers have been a lifesaver for the economies of several countries and continue to be a powerful force in shaping government policies (Amjad 1989). In 1994, remittances from overseas workers accounted for 34 percent of the revenues earned from all goods and services exported from Bangladesh. In the case of India, Pakistan, and Sri Lanka, this percentage ranged from 14 to 17 percent. For several Arab senders, remittances have been an equally important source of foreign exchange earnings.

In the receiving countries, the major thrust of the current policy is to reduce the percentage of expatriates. One of the major government policies is therefore to encourage employment of nationals in the private sector. A related policy is to restrict the employment of expatriates in the public sector. A third policy is to curb the visa trading that encourages the import of workers. A fourth policy consists of the crackdown on illegal migrants.

2.5 Becoming Illegal and Amnesty Return

Before the mid-1990s, illegal migration was not a major issue in the Gulf. With the worsening economic situation of the host countries, and the increasing level of unemployment among the nationals, the GCC countries have made concerted efforts to reduce the number of illegal residents. Two ways that a migrant becomes an illegal resident are as follows. The first way is if the migrant takes a job without having the

appropriate visa. This happens if a person works for an employer other than the one who sponsored the work visa, or the type of visa is different from the one required for that work. Second, the migrant becomes an illegal resident by overstaying the permitted duration. Many Gulf migrants are in an illegal status, especially of the first type.

Punishments for living in the Gulf illegally include fines ranging from US$240 in Oman to several thousand dollars in Saudi Arabia, and jail terms ranging from one to six months in different countries. In response to illegal migration, from mid-1996 to mid-1998, all the six countries declared periods of amnesty during which they allowed illegal workers to leave, or regularize their stay, without paying fines or being jailed. It is estimated that more than one million persons were repatriated during the amnesty periods.

2.6 *Protection of Workers' Rights and of the Most Vulnerable*

The Gulf migrant needs protection in the sending as well as receiving country. When abuse occurs, recruitment agents and employers are the two major violators of the migrant's rights. Recruitment agents who arrange the employment for a majority of workers sometimes charge up to ten or fifteen times more than they are allowed officially. In some cases, the workers are abandoned in the host country or a third country of transit. Rules and procedures exist for punishing fraudulent agents. Yet, many loopholes remain. What is reported to, and handled by, the protectorate offices in sending countries is only the tip of the iceberg.

In demanding the rights of their workers in the Gulf, sending country governments are usually quite tolerant of occasional mistreatment. The relationship between the sending and receiving country is not equitable; the former is in a clearly weaker position. In the receiving country, the embassy of the home country typically intervenes only in cases of dispute with the objective of achieving reconciliation rather than promoting the rights of workers. Egypt and the Philippines are known to demand the protection of their workers' rights more actively than other sending countries.

The labor laws of some host countries (e.g., Kuwait) do not cover certain categories of workers, such as housemaids, a fact which implies that this group requires special protection. Even though a large majority (about 80–85 percent) of the housemaids appear to be satisfied with their migration experience, abuse of housemaids is a reality. Among the countries that export female domestic workers, only the Philippines collects and publishes systematic data on the types of abuse suffered by housemaids reporting such violence. The usual complaints are nonpayment of wages, long working hours, and general mistreatment. However, cases of physical assault, verbal abuse, and rape are also known. Runaway maids present a special problem. The embassies of some countries have set up shelters in the host country for temporary accommodation of runaway maids.

2.7 *Migration to Israel*

Since its creation in 1948 as a homeland for the Jewish people, Israel has been a destination for Jews from many different countries, the major ones being Poland, Romania, Iraq, Iran, Morocco, and Tunisia (Appleyard 1991). In the latter years of the twentieth century, many Soviet Jews have migrated to Israel as a result of the relaxation of emigration restrictions. In 1989–96, an estimated 669,000 persons from the former Soviet Union were admitted to Israel (Zlotnik 1998).

Different origins and phases of migration have resulted in a society with distinct ethnic groups, varying in degree of social status and access to resources and power. European Jews (Ashkenazi) are at the top of the hierarchy while Arabs and some other groups, particularly recent arrivals, are at lower levels in the social and political structure.

During the 1990s Israel experienced a new type of migration, namely, one of foreign workers. Since its occupation of large amounts of Arab territory in 1967, Israel had depended on Palestinian workers to fill certain positions at the lowest end of the labor force. These workers often had work permits, but some were illegal. In 1993, the government announced a closure of the Palestinian territories and the supply of such workers became intermittent, depending on the degree of restrictions on work permits. The demand for workers in the construction and agricultural sectors necessitated the import of non-Palestinian foreign workers. In 1996, the government had issued 104,000 work permits to employ foreigners who came mainly from three countries, Romania, Thailand, and the Philippines. Together with legal foreign workers, an upsurge in illegal workers has occurred. It is estimated that there may be as many as 100,000 illegal foreign workers in Israel (Bartram 1998). In 1998, nearly 5,000 illegal workers, most of whom were overstayers, were deported.

3. *The Mediterranean Basin*

The countries surrounding the Mediterranean basin have experienced different magnitudes of migration. Three types of migrants can be considered as typical, namely, permanent settlers, temporary foreign workers, and asylum seekers.

3.1 *Volume and Types of Migration*

The percentage of foreign-born persons in the population of a country provides one indicator of migr-

ation. For seven countries in the Mediterranean basin, these percentages during the 1980s and 1990s were as follows:

France (1990)	6.3 percent
Italy (1996)	2.0 percent
Turkey (1980)	1.9 percent
Greece (1981)	1.9 percent
Spain (1996)	1.3 percent
Tunisia (1984)	0.5 percent
Morocco (1982)	0.3 percent

In March 1990, France had 3.6 million foreigners in its population. Of them, 1.5 million were foreign workers. Major countries of origin were Portugal, Algeria, and Morocco, each of whom had more than half a million nationals living in France. Other countries that had 200–50 thousand nationals in France were Italy, Spain, Tunisia, and Turkey.

Italy was host to about 1,095,000 foreigners in 1996, coming from over 170 different countries. The largest number was from Morocco (120,000). Albania and the Philippines had 64,000 and 57,000 nationals, respectively, in Italy. The above data are based on stock estimates and do not provide an indication of annual flows. Foreigners residing in Italy can obtain nationality after 10 years of residence.

Turkey has been a country of both emigration and immigration. In 1991, about 2.8 million Turkish nationals lived abroad, the largest numbers in Germany (1.8 million), and The Netherlands (0.21 million). Regarding immigration, around 1.6 million ethnic Turks have migrated to Turkey since 1923, mainly from Bulgaria, the former Yugoslavia, Greece, and Romania. Turkey has also provided asylum to refugees from the former Yugoslavia and more recently to Kosovars from Yugoslavia. It has also sent contract migrant workers to the Gulf states and several other countries, especially Saudi Arabia.

Spain had been an emigration country during the last few decades but in recent years has received increasing numbers of immigrants. Between 1989 and 1996, the foreign population increased from 250,000 to 539,000, originating largely in Europe and America. Several measures have been introduced to tighten migration inflows, especially from North Africa.

3.2 Current Issues

Preventing the entry of illegal migrants is a major issue in most receiving countries. Several Mediterranean countries have signed the Schengen Agreement, which provides guidelines on border regulation and works toward preventing the entry of undocumented and unwanted migrants. Restrictive efforts have had limited success, however, and trafficking of migrants is a booming business. Turkey and then Greece (a European Union member) are among the main routes for people from developing countries into Europe. Spain is also considered a possible corridor for immigrants to reach northern Europe (Huntoon 1998).

General anti-immigration sentiment and xenophobia in Europe have been on the rise. Some extreme-right politicians in France are trying to promote a 'national preference law' that would advocate the repatriation of Arab and African immigrants and give a preference to French citizens in housing and jobs. At the same time, however, concerted efforts are being made to regularize the stay of illegal workers and address the issues of naturalization and integration. Several new laws to this effect have been passed recently.

4. The Outlook for the Future

With budget deficits and unemployment among nationals of the immigrant-receiving countries, a slowdown in demand for foreign workers is imminent in the Gulf. Rising unemployment among nationals has raised difficult political questions about the wisdom of importing large numbers of foreign workers. Forceful actions to expel illegal workers are a vivid reflection of the changed mindset. The six GCC countries plan to 'replace 75 percent of foreign workers with their own citizens by 2020' (CISNEWS 1998). If the receiving countries are actually able to implement their restrictive policies, migration to the Gulf will be reduced markedly. The persons most affected by these policies will be the unskilled and semiskilled. However, the demand for such workers will be conditional on the profit accruing to the intermediaries and employers, and on the possibilities of replacing expatriates with nationals. It appears that the demand for housemaids and some types of service workers will continue unabated in the near future.

Policy makers in sending countries will need to recognize the changing attitudes and plans of the Gulf countries. They will also need to plan for the returnees and encourage their entrepreneurial abilities fully. In the long run, sending countries cannot regard migration as a substitute for development at home. It is only through an improvement of its economic and social sectors that the sending country will gain any leverage in the migration process.

Adequate protection of migrant workers remains a difficult issue. There is a need to devise and implement protection through policies such as a guaranteed minimum wage and adequate living and working conditions. However, instituting such policies is at odds with the labor market realities, where the employer decidedly has the upper hand and final word.

In the Mediterranean region, too, immigration policies of the receiving countries are becoming more restrictive. Illegal migration and trafficking are issues of major concern. In terms of border controls and harmonization of their policies, European Union members are faced with many difficult points, espe-

cially in dealing with family reunification and integration.

A general policy that may be recommended for both regions is the facilitation of social and economic development of the countries where migrants originate. In the meantime, mounting evidence shows that restrictions inevitably result in exploitation of migrants. The goal should therefore be to address the root causes of migration and reduce inequalities in standards of living between countries so that migration results from choice, and not compulsion.

International Organization

1. Definition

The term International Organization (IO) refers to norms of conduct and processes of interaction among more than 6,000 (1999) concrete organizations and their members, bureaucracies wishing to attain objectives that are seen by them as unrealizable without cooperating across political and organizational boundaries. Of these 6,000 IOs, 254 (170 in 1962) were entities whose membership was composed of states (IGOs), such as the United Nations (UN) and the Caribbean Community; another 5,766 (1,542 in 1962) represent private associations with international objectives (NGOs), such as Doctors Without Borders and the European Confederation of Free Trade Unions; 72 percent of the IGOs and of the NGOs represent a regional, as opposed to a universal, constituency. (*Yearbook of International Organizations*, 1998–9, Vol. 3, App. 3, Table l; 1962–3, Vol. 2, pp. 15 and 19, as amended by author's computations from tables of content of Parts I, II, III, IV; count based on the *Yearbook's* categories A, B, C, D only; Murphy 1994.)

1.1 Cooperation in International Relations Theory

The terms cooperation, collaboration, and coordination are widely used but do not have identical connotations in international relations theories. Realists and neorealists doubt the possibility of institutionalizing cooperation across borders but agree with other practitioners of utilitarian rational choice approaches, notably neoliberal institutionalists, in attaching the specific technical meanings to each term used by game theory. For constructivists, peace theorists, and world systems theorists, to collaborate (or cooperate, or coordinate) means that the actors in question have achieved a consensus, often temporary, that their objectives (or interests or values) coincide sufficiently so as to make joint action more effective than individual action. Although these schools agree that in many cases consensus varies with the nature of the issues, the schools disagree in assigning reasons for the differential patterns of cooperation. But without

belief in the efficacy of and the need for cooperation there can be no IOs, either in theory or in the practice of actors.

1.2 Organization, Institution, or Regime?

The term 'international institution' is often used interchangeably with IO. IOs are instances of the attempted institutionalization of overarching norms to govern state and private behavior. But the notion of institution is much broader since it refers to any routinized and sanctioned practice in social life. Institutions may make use of organizations, but need not do so. Similarly, 'international regimes' are often confused with IOs. Regimes are highly institutionalized forms of collective behavior in specific issue-areas (e.g., trade, telecommunications, security from aggression) that may, but need not, make use of IGOs. Often several regimes are embodied in single comprehensive IOs, notably in the UN, the Organization of American States (OAS), and the European Union (EU).

2. Historical Evolution of Organizations

2.1 Main Events

After 1860 there developed a number of IGOs dedicated to coordinating national measures for dealing with communicable diseases and standardizing postal and telecommunications services. In 1919 the League of Nations was founded by the victor nations of World War I to prevent a repetition of the war they had just won. In the event of an interstate dispute, the IGO was to provide dispassionate inquiry, offer peaceful methods of settling disputes, and—failing these efforts—restrain the aggressor state by the use of collective force (sanctions). The outbreak of World War II in 1939 confirmed the failure of the League.

The victors of World War II, in 1945, founded the United Nations (UN) on the same principles of collective security that had guided the League. One reason for the League's failure had been a requirement for unanimity in its main decision-making organ; the UN sought to remedy this by stipulating only the consent of the five largest powers to make binding a decision to use force. But like the League, the UN was powerless to stop aggression by one of these five. With less faith in law and good will than the founders of the League, the creators of the UN preferred a dozen 'specialized agencies'—independent IGOs loosely linked to the UN—whose services where thought to improve the lot of humankind and thus reduce the reasons why states would wish to resort to force. Such agencies arose in the fields of food and agriculture (FAO), public health (WHO), labor standards (ILO), education (UNESCO), intellectual property (WIPO), and meteorology (WMO). In addition, hundreds of other universal membership IGOs with special missions, often not linked to the UN system, continue to be created. The tidal wave of NGOs developed in response to the growth of IGOs, to be able to press the interests of their members in IGO forums, to shape IGO decisions and to aid in their implementation (Claude 1956).

Other than the UN's measures for dealing with aggression, these IGOs have no power to coerce their members; few of them have the right to make decisions firmly committing members to specific policies. The exception is a group of universal membership IGOs set up after 1944 to free international trade and investments, stabilize currencies, and avoid large-scale international economic crises. The World Bank, the International Monetary Fund (IMF), and the World Trade Organization (WTO) do have the power to make binding decisions and to enforce them with monetary and trade sanctions.

2.2 The New Descriptive Terms for a Postidealistic IO

Many advocates of the UN had seen IOs as stepping stones gradually leading toward world government, because IGOs were expected to attain greater autonomy from their members and NGOs were thought to grow in numbers and influence, a sentiment that had never inspired many political leaders. IOs were relaunched after World War II under three different ideological banners: conservatism was used to justify the new collective security, functionalism the creation of the specialized agencies, and liberalism legitimated the new emphasis on human rights and the abolition of colonial empires.

Conflicts among these rival ideologies were never resolved and they continue to characterize the arguments employed by advocates and politicians. The creation of regional IOs—*regionalism* as the alternative to the UN's *universalism*—was urged by many governments and some scholars as a better way to assure peace and plenty than the UN's; in the 1950s and 1960s many new regional IOs were created, especially in Europe and Latin America, competing in some instances with the UN system and representing institutionalized conflicts between blocs of states.

Current writing dealing with IOs distinguishes between three core types of organization seen as expressions of their charters or constitutions. *Intergovernmentalism* refers to a system in which all major decisions are made by member states acting in conformity with the IGOs' decision-making rules; these IGOs mostly rely on their member states for the implementation of decisions. *Supranationality* describes IOs which possess some powerful organs not dominated by governments; such IOs also are able to make binding decisions relying on their own bureaucracies, such as the EU and the WTO. *World* (or

regional) *government* exists when a group of states chooses full-fledged federal institutions for itself, such as the Caribbean and East African federations which failed in the 1960s, and abortive efforts to write a world constitution (Clark and Sohn 1958).

IGOs animated by close ties among the specialized bureaucracies of their members, such as defense, agriculture, money, or public health, feature *transgovernmental* relations, to highlight the dominating role of specialized bureaucracies rather than the states' central organs. IGOs in which NGOs play a crucial role (such as the ILO) as well as ties among NGOs themselves, are called *transnational* to stress their autonomy from the nation-states who normally dominate world politics. Advocates of the growth of a global civil society stress the growing importance of transnational ties. *Epistemic communities* are networks of experts committed to knowledge-based views on the causes of phenomena they are called upon to abate; they actively shape the decisions of many IOs with science-related programs (Keohane and Nye 1977, P. Haas 1990).

3. IO and Social Science

3.1 From Advocacy to Analysis

By and large, social scientists ignored IO until the 1960s, considering the field dominated by idealist advocacy and resistant to systematic analysis by scholars other than lawyers. Idealism held out the hope that reasonable politicians, accepting as binding the international law of the day, would always avail themselves of the means of peaceful accommodation. Political scientists, sociologists, and economists in advanced industrial countries, once idealism was seen as incapable of answering complex questions, became interested in applying theories of organization, along with quantitative methods, to the systematic study of IO (E. Haas 1964, Alker and Russett 1965, Kriesberg 1968). Others sought to embed the study of IO in theories about modernization and pluralism (E. Haas 1958, Cox and Jacobson 1973), to be followed in the 1980s and 1990s with the application of rational choice and modeling constructs (Cedarman 1997). Writing on IO in formerly communist countries was almost entirely dominated by the defense of national policies, a situation which changed to some extent after 1990. Research and writing in developing countries is still dominated by advocacy of preferred positions.

3.2 Normative Evolution: from Organization to Institution

Lawyers and sociologists proposed to study change in world politics by tracing the evolution of norms of state behavior.

The term 'norm' may refer to prevalent state practices considered right and self-evident as well as to desirable standards of behavior, whether generally observed or not. In either and both senses, change can be mapped by investigating whether a more constraining set of norms is gaining adherence (Hoffmann 1981, Kratochwil 1989). The explanation of such changes became a chief interest of social scientists.

One way of conceptualizing these changes is to stipulate an evolution from organizations to institutions. Organizations are thought in all current theories to be animated, at first, by the instrumental interests of their members; a change in interest can trigger either organizational growth or decay. Institutions, however, are dominated by norms actors take for granted as being desirable. An *organization* whose members move away from the purely instrumental (and usually short-run) view of their interests becomes an *institution* when the same members come to value the IO for its own sake and then come to think in longer-run terms when defining their interests.

3.3 Aspects of Global Change

Constructivist and neoliberal scholars believe that there is no longer an agreed hierarchy among the objectives of states (Keohane 1984, Ruggie 1998). Nor is there a hierarchy among IGOs, no organizational core at the global level. Alongside ties and conflicts among central decision makers, transgovernmental and transnational ties proliferate and increasingly influence core decisions by heads of government and foreign ministries. The world of IOs is one of many overlapping and competing networks involving many types of actors. The main activity of these networks is the continuous negotiation of agreements, following agendas no longer set exclusively by a few powerful nation-states. Scholars who study forms of organizational decision making that sidestep the core executive power of member states draw increasingly on sociological network theory (Powell 1990).

In selected issue-areas, e.g., environmental rules, human rights protection, trade disputes, and loan negotiations, something approximating supranational competencies are evolving in some regions and also in the UN system, owing to commitments that member states made earlier, usually for instrumental reasons, and later find inconvenient or embarrassing to disown. In fact, although not in formal law, the vessel of national sovereignty is springing bigger and bigger leaks as the formerly sharp distinction between international and purely domestic policy issues becomes blurred: such 'local' events as famine and civil war involving genocide become matters of global concern.

Different schools of thought advance different reasons for this trend. Neoliberals stress that states

allow new, sovereignty-restricting, norms to evolve because the transaction costs of engaging in all kinds of international activity would rise too high if IOs did not provide important information and if trust and reciprocity were allowed to decay. Game theorists stress the parties' need for maintaining their reputation for honesty. Peace theorists explain the trend by suggesting that leaders are learning to accept peaceful norms. Constructivists argue that leaders, under certain conditions, learn to change their 'identities' and redefine their interests so as to stress cooperation when they experience the costs of aloofness or the limits of acting alone (P. Haas and E. Haas 1995). Because theorists disagree about the significance and roles of IO, indicators for judging change were devised.

3.4 Indicator of Organizational Change: Autonomy

The degree of autonomy of an IGO is an indicator of the distance the world (or a region) has traveled away from the initial condition under which single sovereign states, or groups of sovereign states opposing one another in alliances, were the only players in the game. Such was the global order in 1945. The IGOs founded then were entirely the creatures of the states that were their creators and paymasters. An increase in autonomy is a step toward world government, a decrease a reaffirmation of state sovereignty and hegemony.

The attainment of supranational powers by an international bureaucracy is one measure of autonomy, and so is the ability of an IGO to make binding decisions by majority vote. Autonomy is advanced when epistemic communities of experts shape decisions, or when NGOs act in this fashion, alongside instructed representatives of states. Autonomy also increases when the making of binding decisions is left to panels of bureaucrats, judges and other experts. Autonomy grows to the extent that an IO, or the network of which it is a part, is an open system whose members are able to obtain and assimilate new knowledge about the issues on its agenda, when decision making is no longer monopolized by the relatively fixed interests of a few member governments (Adler and Crawford 1991, Reinalda and Verbeek 1998). Increasing autonomy implies that international relations are mediated by forces that represent a higher degree of institutionalization than was true in 1945. Increasing IO autonomy is associated with more powerful IGOs and with growing success in solving the problems of peace and well-being IOs are expected to master. Deinstitutionalization is gauged by observing reversals in such trends.

3.5 Indicator of Organizational Change: Multilateralism

Another way to gauge the growing (or waning) influence of IOs on global affairs is to observe changes in multilateral dealings among states and NGOs. (Ruggie 1993) An increase in items on the agenda of global issues, a waxing of international negotiations and of networks of actors conducting them betoken a growth in the density of contacts, needs, and responses. Increases in multilateralism are measured by the frequency of meetings, the number of international agreements concluded, and the widening scope of these agreements, driven by the expectations of actors that unilateral action is both ineffective and improper. Like growing autonomy, increases in multilateralism imply more restraint on state behavior. Unlike autonomy, a growth in multilateralism need not imply more efficient and more effective IOs—just denser relations among IGOs, NGOS and in joint efforts by both types. Autonomy refers to institutionalized power of IGOs, intergovernmental and supranational, universal and regional; multilateralism is concerned with the density of communication networks, not with power.

4. How Much Organizational Change Has There Been?

4.1 Regional IOs and Regional Integration

Only the EU has demonstrated marked increases in both multilateralism and autonomy and has thus contributed to the rapid integration of the continent. Many IGOs in the Caribbean and Central and South America—dedicated in principle to regional integration—have lost autonomy. IOs associated with the former Soviet Union have mostly disappeared and their successors remain weak. Nor do groupings in Southeast Asia and the Pacific Rim demonstrate expanding autonomy. Only the Cono Sur in South America and the organization of West African states show some growth in autonomy and are making visible contributions to the closer integration of their regions.

The situation with respect to multilateralism is slightly different. Western hemisphere IOs are associated with a sharp rise in multilateral ties despite the poor showing regarding autonomy. The same is true of Southeast Asian and Pacific Rim IOs. On the other hand, disintegration and fewer ties are evident in most of the African and the Middle East/Islamic organizational worlds.

In the Caribbean and Central America an earlier trend toward greater autonomy and multilateralism was reversed as both regions seek greater integration with a North American region in which multilateralism is growing apace.

4.2 Universal Organizations

Since 1945, the family of UN-affiliated IGOs has clearly contributed to, and remains the core actor in, a

rapidly increasing network of multilateral ties. Multilateral practices are concentrated in these issue areas: environmental protection, use and allocation of scarce resources, articulation and protection of human rights, economic development, public health, and the stabilization of the global economic system. The phenomenal growth in the numbers and influence of NGOs active in shaping UN policy is evidence of this trend.

The same cannot be claimed of the autonomy of the UN system. The pattern is mixed. Probably, the autonomous powers of the Secretary-General and of the High Commissioners for Refugees and for Human Rights have increased slightly over the years, but not dramatically. The influence of the Economic and Social Council has waned. Such autonomous powers as had been enjoyed earlier by the ILO, FAO, and UNESCO are no longer discernible. On the other hand, the autonomy of the World Bank, IMF, and WTO has sharply increased since 1980 (Culpeper 1997), and so has the autonomy of the International Atomic Energy Agency (IAEA) as it responded to major crises and emergencies.

5. *Toward a Synthesis of Theories about IO?*

Much of the literature is still driven by contributions that advocate increases in autonomy and multilateralism. 'Global governance' is the current label under which international integration of all kinds, including world government, is being discussed. The term is also used to describe any desired reforms of IGOs to enable them better to address new issues on the global agenda (Ramphal and Carlsson 1995). Advocacy stresses the need for more popular participation in the work of IOs, for more equality in the representation of state interests, for greater transparency in decision making, and for more accountability to people as well as to governments. If acted on, these suggestions would move IO much closer to world government. As advocacy, then, idealism remains very much alive, but only peace theorists embrace this approach on analytic grounds.

Most social science theories about IO, however, are not concerned with this goal. They remain committed to including the discussion of global institutional trends in overall explanations of collective behavior, social statics, and social change. Neorealists continue to marginalize IO altogether whereas neoliberals remain wedded to utilitarian–microeconomic principles in their search for the explanations of interests animating actors in IOs. World systems theorists, like neoliberals, are unable to account for growing autonomy and multilateralism in the protection of human rights and of the environment, issue areas outside the materialist foundations of these schools.

The ontological commitments of these theories are so different as to make a synthesis very difficult. If one is possible it may be the result of constructivists' efforts to explain all actor behavior in terms of material *and* non-material 'identities,' qualities that are ontologically prior to expressed interests. Thus a commitment to norms for their own sake can be considered as genuine an interest as the devotion of wealth and security. Autonomy and multilateralism are thus given a theoretically endogenous status.

International Relations, History of

International relations comprise the ensemble of economic, demographic, cultural, and military exchanges among states as well as among peoples gathered in organized societies. Among other fields of social sciences, the theory and history of international relations have contributed to the knowledge of international relations, each one having a different focus. This article traces the latter's evolution.

1. *German Origins*

International relations was converted into a field of historical sciences study during the first half of the nineteenth century; this means that, by then, international relation's were isolated as an investigation object, whose treatment originated its own scientific procedures, capable of evolving with relative autonomy. The conception of this research area was associated with the creativity of Leopold Von Ranke considered by many to be the founder of scientific historiography. Ranke was convinced that European civilization fermented in the states system and could achieve a universal dimension. He constructed a history of international relations based on a tripod: (a) the study of European great states' internal development; (b) the study of collective movements and the forces resulting from institutional, religious, or social experience; and (c) the analysis of foreign policies, involving the relations among states, and particularly the confrontations among great powers.

From German unification, in 1870–71, to the First World War, a deviation of German historiography from international relations took place, reducing Ranke's original European and universal scope of study, and establishing the primacy of foreign policy, which served to exhibit the ascension of Prussia during the Wilhelminic Era. This type of 'germanocentric' approach acquired national equivalents in other European countries, which caused history of international relations to be reduced into a diplomatic history. This new form of history of international relations preserved, within Europe and outside it, the scientific character of exploring archival documents; however, it turned apologetic by receding its arguments to those of chancelleries belonging to the countries to which historians were connected; it became, then, poor in cognitive terms, since it merely treated the apparent movement of states' behavior, and neglected the other relevant aspects of Rankean analysis.

During the same period, the study of international relations had to face imperialism, a phenomenon related to the domination, either formal or informal, direct or indirect, of European States, as well as of the United States and Japan, over other territories, especially the southern area of the planet. This fact coincided with worldwide spread of the great powers' foreign policies. Responses to the challenge of explaining imperialism came, on one side, from imperialism theories—which were neither theory nor history of international relations—and, on the other side, from diplomatic history, this one ambitiously searching scientific explanations which were, nevertheless, attached to the interests of national states. When the Versailles Peace Treaty of 1919 blamed the German Empire for the onset of the First World War, the fact that many historians from various countries debated the causes of the conflict and the responsibility of different states reinforced the introspective character of diplomatic history. It thus distanced itself more and more from Ranke's conceptual definition and universalist proposals.

2. *Multiple Causes—the French Contribution*

It was not before the period between the World Wars that historiographical revolution took place which would rescue the study of international relations to the modern world of social sciences. This movement was strongly influenced by French historians, and it had one of its centers in the *Institut d'Histoire des Relations Internationales Contemporaines* (Institute of Contemporary International Relations History), created in 1935 at the Sorbonne, and directed by Pierre Renouvin, Jean-Baptiste Duroselle, René Girault, and Robert Frank successively. The knowledge elaborated by the Sorbonne group encompasses hundreds of Ph.D. theses, a general history of international relations, works of theoretical reflection on the theme, as well as dozens of specialized books and the periodical *Relations Internationales*, published in association with the Graduate Institute of International Relations, in Geneva, since 1974.

Despite recognizing the role of the state, particularly the great powers and empires (Duroselle), the French have penetrated the social dimension of international relations (Renouvin) and given special emphasis to the role of economics as a long-term factor conditioning the trends (Girault). Consequently, the object of study won higher precision and scientific adequacy. Reflections on how to make both a history of international relations and a critical evaluation of the knowledge produced about it have led to the method's refinement towards multiple causes. This was accompanied by the diversification of information sources in order to embrace the complexity of factors aggregated to the research.

These French historians tried to create a *corpus* of knowledge for understanding international relations by defining four complimentary investigation directions. First, historians should identify the components of international life involving statesmen—whose temperament is to be disclosed in the light of anthropology and psychology; the images people have of foreigners; the importance of borders and of groupings, such as small organized communities; nation-state and plurinational organizations. Second, the historian is expected to investigate origins and causes of international relations, comprehending a body of historical forces (nature elements, demography, economics, principles and values), whose movement and efficacy should be described and connected to foreign policy decisions. Third, the study should turn to identifying the purposes of international action, which involve the determination of agents, the role of information, as well as the means, ends, and risks of strategic planning. In order to circumscribe the object of study in all its dimensions, the historian should, fourth, follow the movement, the process of international relations through time, unveiling the scheme of symmetrical or asymmetrical relations, peaceful or conflicting negotiations, war, and diplomacy.

These four groups of factors represent diverse ways of research and illuminate the object of study in an attempt to provide it with a understanding. The multiple causes system consists precisely of this complex approach. According to Duroselle, the theory of international relations, the point to which historical investigation flows, should be based on empirical knowledge, and would have as its cognitive frontier the establishment of regularities, rules, and recipes taken from history's advice. One example is the idea that the empire—the excess of power—will always perish, either because it engenders the unbearable on its dominions, or because it provokes the coalition that destroys it.

3. *Order Over Anarchy—the British Perspective*

Since the 1950s, an intellectual effervescence comparable to the earlier one in France, motivating studies on international relations history, could be observed in England. The renovating spirit has modified its historical focus, evolving from strong empirical hues to systemic approaches. In the origins of this modernizing movement are Donald Watt, professor of International History at the London School of Economics and Political Sciences, the members of the British Committee on the Theory of International Politics, which operated for 25 years congregating researchers among whom are Herbert Butterfield, Martin Wight, Hedley Bull, and Adam Watson. *The Expansion of International Society* (1984) and *The Evolution of International Society* (1992), amid other works, have divulged new research trends and British contributions to the field of knowledge.

These British scholars on international relations kindled the faith on the classics (Hobbes, Locke, Grotius, Kant, Pufendorf, Heeren, Clausewitz, Hanan, Tocquéville, Ranke). British historians accentuated enduring aspects of human nature which reflect on the evolution of international relations, by making international life somehow predictable and emphasizing continuity over change. According to them, economic, political, and military interactions among states which depend on each other and are guided by their own interests eventually lead to establishing rules, institutions, and common relationship values which, in turn, orient the external conducts of those states. Thus, the *system of States* or *international system* is formed. In some cases, this international system intensifies its net of interactions on the basis of specific rules and values, originating the *international society*, this one having a strong cultural tone. This evolution characterizes the passage, in the eighteenth century, from the *European States system* to the *European International Society*.

Despite not admitting associates to its directory group, the *European International Society* expanded towards American countries and Japan in the nineteenth and twentieth centuries. It gave room to an international system on a worldwide scale—movable, pluralist, competition-prone—whose expansion device was the great powers' European concert. It imposed forms of internal organization and relations among States, juridical regulations, ways of trading, living and thinking, and engendered, from 1800 to 1914, the greatest global domination system ever yet known. Conflicts among its protagonists and protests against Western supremacy allowed the rise of a new scenario, marked by the emergence of the two superpowers, against the background of the Second World War, and of the Third World afterwards. A new international society was born. This worldwide international society of the twentieth century's second half, partly heir to the former, partly led by diverse rules, institutions, and values, evidences the decline of the European matrix in terms of both world order conformation and international relations. At the end of the Cold War, with the challenges of world

reorganization, British historians would do better—according to the Italian critic Brunello Vigezzi—if they insisted less on European inheritance and influence on the configuration of international society, and recognized in it the fecundity of its richness and possibilities.

The British school had, therefore, the merit of fruitfully associating the theory and history of international relations, thus creating the key concepts of *system* and *society* in order to advance in the comprehension of international life. The English connected past and present and cultivated a belief in the ability of international agents to administrate anarchy via consensus. If Duroselle was convinced that there is no possible theory of international relations without a historical basis, to Watson, Theory and History blend together. But British scholars, unlike the American political scientists, are not interested in a *prince counseling* theory. They are concerned more about the cognitive side and reflect intellectual preferences, ideals, and values, which they consider most adequate to study international life.

4. Contributions from Italy and Switzerland

In Italy, modern international relations historiography established a dialog with the French school. Federico Chabod and Pierre Renouvin conversed about methodological conceptions and approaches. This dialog broadened with the diffusion by Brunello Vigezzi of the above-mentioned British Committee works in Italy. As a result of these interactions and of its own creativity—take, for instance, the works of Mario Toscano and Ennio Di Nolfo, among others—the Italian school became fertile and diversified. Its originality lays on the insistence on *spiritual forces* inherent to the movement of international life: mentalities, sentiments, public opinion, collective passions, systems of values. The Italians' works mirrored, therefore, their peninsula's international relations and foreign affairs, that is, the divisions which have opposed conservatives to revolutionaries, monarchists to republicans, expansionists to moderates, in the last two centuries.

Even denser/tighter/closer was the collaboration between the French and the Swiss. Nevertheless, also in this case there was a singularity characterizing the studies developed especially by the Graduate Institute of International Relations at Geneva University (Antoine Fleury, Jacques Freymond, Daniel Bourgeois, Yves Collart). This Institute, organized to refine interdisciplinary studies of international relations, has distinguished itself precisely for incorporating to history contributions from other disciplines, above all political science, but also economics and law. In addition, it has not left aside the interest on neutrality, which has been one of the historical trends of Swiss foreign policy.

5. The National Imperatives in the United States

Two facts conditioned the expansion of studies on international relations history in the United States: the escalating role of the country in twentieth century international relations, and the extraordinary development of international relations theory evidenced since the Second World War. The two facts granted the field of study an introspective trait not observed in other regions, with respect to both the study method and the elaborated knowledge. This introspective trait separates American scholars from the universalist approach of the European schools. Nevertheless, it is inappropriate to conclude that the history of international relations in this country has had a linear development of its object, focus, and method. Perhaps no other historiography has presented such anguish and hesitations.

As of the 1930s, similarly to what happened in the rest of the world, a documental and scientific yet ethnocentric diplomatic history flourished in the United States, exemplified by the works of Samuel Bemis. As in other countries, the reaction came in the following two decades; it was conducted, to the greatest extent, by Thomas Bailey and Charles Beard whose studies brought back internal factors, as well as universal, economic, social, and ideological conditionings of foreign policy decisions. The movement *inwards* was substantiated in the years following the Second World War, when a strong nationalist interpretation trend was observed as a result of the Cold War and of the country's expanding international responsibilities. Realist theorists and consensualist historians such as Hans Morgenthau, George Kennan, and Walter Lippman privileged the state as an agent of international relations and appealed to the elements of national unity to confront external threats, among which were firstly nazi-fascism, and then communism. An official and ideological knowledge was produced.

The refraining of the Cold War and the painful experience of the Vietnam War strengthened critical reflections about international relations. In the 1970s, numerous historians followed researchers like William Appleman Williams and David Horowitz among others, on the path of their discoveries about the relativity of national ideals; the responsibility, shared with the Soviet Union, for the onset of the Cold War; and the prevalence of North American economic interests over international politics.

This critical refinement has gone further in the last decades of the twentieth century, particularly due to the opening of archives and the handling of classified documents in the United States, Russia, and other countries; also relevant has been the use by researchers of modern technological resources. This is how British Alan Milward rebuilt, on the base of new empirical information, the history of relations among European countries, and remade the path to European integration shifting away from the idealistic explanations

originated by Jean Monnet's conceptions. In the United States, Arthur M. Schlesinger Jr., Stanley Hoffman, Robert Gilpin, Samuel Huntington, and John Lewis Gaddis—although it is unfair to mention only these names—reintroduced discussions about important issues referring to the North American great power's relations with the world after the Cold War and the collapse of the Soviet Union. Research again revolved the decision-making process in foreign policy and began to understand the United States' role as the only hegemony on a planetary scale since the end of the Cold War.

At the end of the twentieth century, one cannot identify a hegemonic current of contemporary international relations interpretation in the United States. Nor can it be affirmed that this country's historians have released themselves from the cognitive constraints of the past. These constraints derive from both the frustrations of international theory to explain the evolution on international life, and the endless contending of interpretations. Gaddis has expressed in these circumstances North Americans' pessimism towards the scientific value of historical knowledge.

It does not seem adequate to apply to the United States the notion of an international relations history school valid for European research groups earlier mentioned, since American historians have not demonstrated continuity and coherence in the method's choice and in the definition of the study object. North Americans have accomplished a rich and diverse research experiment, whose long-term profile lies on the value of realist approaches, which restrict the observation scope of their nation-state's actions. In a certain way, they have prolonged throughout modernity and postmodernity the introspective traits of old diplomatic history elaborated before the 1930s.

6. *Brazil, Argentina—the Southern Approach*

Just as in other parts of the world, Latin America also displayed the treaty-led, factual, and apologetic diplomatic history so common before the Second World War. Pandiá Calógeras, in Brazil, and Vicente G. Quesada, in Argentina, clearly represent this approach. The History Department at the University of Brasilia and the Instituto de Investigaciones de Historia Económica y Social (Institute for Social and Economic Historical Research) at the Buenos Aires University have gathered precursory advanced study groups which allowed modernization of that field of knowledge in the region. In those institutions, studies of international relations history acquired a unique profile deriving from Latin American country's own way of viewing the world, supplied by their concerns and external designs.

Thus, the perspective of international analysis in the region diminished the role of war and security, since the subcontinent has a pacific tradition. At the same time, the Southern approach emphasized the role of the development in international studies. The central argument explored by Latin American scholars has been the fact that development is the axis of majors countries' foreign policies since the 1930s.

In addition to general histories of Brazilian and Argentinean international relations (José Paradiso Juan Archibaldo Lanús, Paulo G. F. Vizentini Clodoaldo Bueno, Amado Luiz Cervo) various studies have explored the relations between these countries and the great powers, mainly the United States (Gerson Moura, Moniz Bandeira, Mario Rapoport), between these countries and Africa (José Honório Rodrigues, José Flávio Sombra Saraiva), as well as regional relations (Paulo Roberto de Almeida, Edmundo Anibal Heredia, Francisco Doratioto). Historians have concentrated their analyses both on the economic possibilities opened by the expansion of capitalism and on mechanisms to bear or overcome historical backwardness. They had to face the local foreign policy options dilemma: to choose either an autonomous development, based on a robust and sustainable national economy, or a development associated with international economic forces, based on foreign capital and enterprises. Amidst the bipolar world and the globalization taking place in the end of the twentieth century, relevant issues were constantly discussed. Among them, development's legitimacy, inequality among nations, asymmetric relations between superpowers and developing countries, international cooperation, exploitation and dependence, the permanence of power and wealth structures, as well as other ingredients of Latin American countries' experiences of international insertion.

7. *The Specific and the General in Historians' Works*

The international relations history field of study is not merely the field of multiple causes resulting from the empirical dimension of research and from the relevance of the process over the event. It is also the field of the political world, in which peoples' necessities, interests, ideas, and values sprout when they envisage other peoples or move beyond their borders. Historians reflect this double-faced research on their work.

Cognitive improvement depended in the past and depends nowadays on the careful conservation of historical documents and on the easy access that governments and international organizations grant researchers. This improvement has evidenced the need to diversify information sources, going beyond diplomatic archives kept in chancelleries and similar institutions, which are necessary but insufficient to clear up some questions posed by international life analysts. Schools and interpretation currents spread all over the

world reveal, first, that international relations have consolidated as a study object for historians; second, that they developed coherent and efficient research methods; and third, that the amount of knowledge elaborated should be proportional to the growing importance of international relations in the lives of individuals and societies in the last two centuries.

The march towards the expansion of this field of knowledge has profited from two dialogs established in its course. Historians organized the Commission of History of International Relations within the International Committee of Historical Sciences in the 1980s, which promotes frequent colloquia where experts exchange research experiments aiming at purifying concepts and practices. Apart from this process, historians have broadened their interactions with akin sciences, such as economics, psychology, anthropology and, especially, political science and the theory of international relations.

When theorists and historians of international relations work, they meet in one *underground stream* (Brunello Vigezzi) of international life; in it, theorists realize that their explanatory formulations become more coherent provided the enlargement of the observation field's empirical base, and historians agree that theories illuminate reality and open ways to its comprehension. Notions suggested by some authors to oppose Theory to History are precisely the same ones advocated by other authors in order to unite these two areas of knowledge. The greatest masters in the study of international relations tend to unify History and Theory by using the evidence and the hypothesis, the past and the present, the internal and the external, the empiric and the theoretic, the comprehension and the decision.

Cooperation between history of international relations and social sciences has led people to believe that the evolution of this study area, taken the increasing interdependence observed in international life after the Cold War and the North–South dialog, requires new method adjustments and problem identification. Nation-state and national interest conceptual categories, which served scientific development in the past, are challenged by new concepts such as global governance and universal citizenship. In this sense, why not request that the British equip their *concepts* of international system and international society in order to follow the transformations of the study field and to step on the terrain of global responsibilities? Why not expect from Italians the application of new *ideas* and systems of *values* to fill the gap left by the collapse of ideological imperialism which impregnated the world during the Cold War period? The versatile and rapid North Americans, just as the structuralist South Americans, might be required to provide *instruments of analysis* and explanations to phenomena such as international violence and oppression, solidarity and indifference, exploitation and cooperation, the exercise of power and self-determination of peoples. Also, the French may advance towards the consolidation of multiple causes as an applicable *method* to the study of factors and agents on a perspective of interdependence. And shouldn't the Germans, in their turn, heirs of the rankean tradition, seek the combination of local impulse and universal impact of international forces over the shaping of an unequal world?

Historical knowledge bears strong consistence due to the empirical analytic method which establishes the primacy of induction over deduction. Nevertheless, it is imperative to rethink History continually and to provoke ruptures of interpretation as did German Fritz Fischer concerning First World War origins, and some North American historians regarding the role of the United States in delineation of the Cold War order.

This article has summarized the history of international relations by emphasizing the contribution of the dynamic groups within the key countries and regions. But this has not meant the exclusion of pluralism inside these countries nor common guidelines which exist among different national backgrounds. It has elected some names and some schools or interpretation currents of international relations history in intending to define its field of study, trace its evolution in the last two centuries, and underline its relevance in the ensemble of social and behavioral sciences. Beyond those whose names were mentioned, hundreds of others add the result of their works to the historians' rich and diversified contribution. Thus, come to mind the historiography from other European and non-European countries such as Russia, Australia, Japan, India, and China. For pedagogical purposes, the history of international relations should first maintain its reference to history of civilization, and second, it should purify itself and absorb the dialogs among historians and between them and other experts in social and behavioral sciences on a global scale.

International Relations: Theories

International relations analyzes the strategic interaction among countries within the framework of an international system. As such, it involves issues in the interdependence of unit and system, common to many problems in the natural and social sciences. States (or other units) interact in a situation of anarchy—the absence of a supranational government able to enforce agreements. Theorists of international relations disagree strongly on the impact of anarchy. Does it lead irresistibly to conflict as nations seek to protect themselves, or to cooperation as nations see the benefits of peace? All elements of the interaction are contested in debates, from the definition of the unit (is it the State, or elements of society, or transnational forces beyond the State) to the properties of the system (anarchic or structured, culturalist or materialist). The notion of strategy is widely shared—whatever the units are, they must decide on a course of policy where they must anticipate the actions of other units—but the influences upon strategy are in sharp dispute.

The disputes can be sorted into two major lines of cleavage: one set of disputes focuses on the nature of the system, the other on domestic influences on foreign policy.

1. *System Theories*

At present, system theory is split among three contending schools: realism, neoliberal institutionalism, and constructivism. For realists, whose leading theorist in recent decades has been Waltz (1979), anarchy compels nations to behave in ways that may lead to conflict. Without centralized authority, nations face the security dilemma. Operating in uncertainty, they cannot be certain if they will be physically attacked by neighbors, so they take action to protect themselves, such as building up their armed forces. This frightens other countries which in turn cannot be sure whether the military will not be used for offense, so they have to arm as well. The results are arms races, bristling militaries, and a propensity to fight—the condition of 1914. All states, regardless of type (democratic, peace-loving, moral, or the contrary of each) are driven by this logic to prepare for war. Only deterrence, only power balancing, can therefore keep the peace by making war too costly. Nations cooperate only if it is in their obvious self-interest to do.

In contrast, neoliberal institutionalists argue that nations can and do cooperate in conditions of anarchy. Conflict under anarchy is often the result of the problems of collective action. International institutions can overcome these problems: they may reduce transaction costs, provide incentives to trade concessions, create mechanisms for dispute resolution, facilitate information sharing, and supply processes for making decisions, and, through frequent iterations, build trust through frequently observing such mechanisms. Conflict is thus a pole on a continuum, not an inevitable outcome of anarchy. Institutions can increase cooperation even without coercive power over the units. This body of ideas, championed by Keohane, (1984) has been used to explain the substantial growth of international institutions such as WTO (World Trade Organization), the IMF, (the International Monetary Fund) the European Union, and numerous regulatory 'regimes' such as those that supervise international aviation, post services, telecommunications, and others.

A third school, constructivists and sociological theorists, complain that both Keohane and Waltz neglected the nonrationalist and nonmaterial aspects of the interaction of units: culture, ideas, values, the internalization of norms, the constitutive elements of identity, and all the tissue of human exchanges and cultures. For constructivists, the interaction of States is socially constructed: 'anarchy is what you make of it.' The units form understandings about the world and norms of conduct which guide action. Strategic interaction, for such theorists, is a cultural construction. States internalize from world society a set of norms about their goals and proper practices that shape their behavior. They learn from international society how to act: what is acceptable, what not. Discourse and communication shape behavior. Colonization and slavery were abandoned when world culture turned against them. Notice that this group of theorists stress system, not domestic politics. It is not domestic culture which constrains States here, but the culture of the 'system.'

The constructivist approach is particularly strong among European researchers, while the realist and neoliberal institutionalists approaches are strong in the US. This is to some degree a historical reversal. *Realpolitik* arose in Europe, while the Americans were strongly influenced by moralist thinkers, such as Woodrow Wilson. It may also express changing problems: the European countries in the year 2000 examine the multidimensional issues of integrating traditional national cultures into a new institutional form, the European Union; the US thinks about a global role of security and trade.

2. *Unit-centered Theories*

Unit-centered theories argue that countries have choices. The system is not wholly constraining. Most of the time, for many States, especially the large ones, the system provides some 'slack,' some possibility for alternative responses. This creates a need for theories that explain the choice among alternatives allowed by the system. Three can be noted here: individual cognition and culture; institutions and political system; and interest groups.

2.1 *Cognition and Culture*

As countries engage in strategic interaction, their leaders must evaluate complex situations. Is Japan's home Defense Force purely for protective purposes or could it threaten others? Theorists of perception, such as Jervis, examine the ways individuals process information. They see 'misperceptions,' such as intelligence failures, arising from the limitations of our cognitive capacity, and from the rational strategies people devise for managing those limitations. The need to use analytic priors, for example, to sort out 'noise' from reality, creates a vulnerability to miscalculation. Information cognition theorists stress rationality. They stress what all people have in common, as human beings, that shapes their strategic behavior.

By contrast, cultural theorists stress the differences among people. The most common version of this approach examines the culture of a nation or a civilization. Theorists of this kind argue that Germany or Japan could go to war in the future because the culture of these nations is 'militaristic.' Huntington (1996) argues that cultural differences form the basis of conflict in the coming years, as civilizations struggle to protect and defend their core values.

2.2 *Political Institutions*

Decision-making systems influence outcomes. The way in which decision making is structured shapes the content of what comes out. If preferences are held constant, varying the institution varies the outcome. To understand foreign policy we must analyze the institutions within countries.

A major distinction is between democracies and authoritarian systems. Woodrow Wilson is famous for the theory that war is caused by authoritarianism. WW II and the events that followed discredited this view in favor of realism, but it has revived in recent years with a vigorous literature arguing that democracies do not fight each other.

Another line of reasoning examines variance among democratic institutions: the relationship of executive to legislatures, voting rules and party systems, bureaucratic structures and organizational processes, the structure of the armed forces and its relationship to civilian authorities. All of the institutionalist arguments have in common that they attribute causal effect in making foreign policy to patterns of decision-making.

2.3 *Interest Groups and Social Structure*

A third line of domestic politics reasoning explains foreign policy by the demands made on governments by the social groups on which governments rely for support. Governments need backing in society. In democracies, they need to win elections and enjoy the confidence of key players in the economy; in authoritarian systems, they need the support of key members of the 'selectorate' or elite with control of major power centers. Policy will reflect the preferences of these groups.

International economic policy, concerning such issues as tariffs, trade treaties, and common markets, is examined in this approach as a function of social cleavages around the beneficiaries of policy change: competitive industries support free trade, uncompetitive ones oppose it. Similarly, defense policy has been analyzed in reference to lobbies: defense spending reflects the preferences of a military–industrial complex, a lobby that fights for contracts and a big establishment which confers influence and power.

These three approaches to domestic politics sustain research programs that call attention to quite different processes and types of evidence: on cognition, perception, psychological mechanisms, values, cultural systems, fables, myths, analogies; on the institutions of government, elections, party systems, bureaucracies, voting rules, procedures, agreements and mechanisms; and on the structure of society, the economy, religious groups, business associations, trade unions, and professional groups.

3. *Cross-cutting Approaches*

Several lines of research seek to cut across the divide between unit and system, seeking to analyze the

interaction between them. One approach examines the impact of system upon the internal properties of the unit itself. This effect has been called 'the second image reversed.' Another variant looks at the interaction of the politics of the two dimensions, or 'two-level games.'

Another brand of theory challenges the centrality of the State in the system–unit approach. The state can be seen as but one of many actors in the international arena: firms, churches, cultures, NGOs, all comprise 'transnational forces' which operate in the world, and which may constrain state behavior or supplant it altogether. Thus there are different actors operating in the world, with no need to privilege the State. Theorists in the English School posit these transnational forces as comprising a kind of 'civil society' at the international level. They are not part of formal government, either national or international, but part of the culture, organizations, and structures that define the context within which governments operate. These arguments seek to de-center the State, as well as to de-center politics, economics, and military/security variables which tend to dominate most writing on international relations.

3.1 Law, Institutions, Norms

The failure of the League of Nations to prevent WW II undermined belief in the relevance of international law to the study of international relations. In recent years, interest in law has returned. International institutions and agreements, especially on fields concerning trade and regulation, the spread of the European Community, and the revived interest in democracy and norms have all contributed to this revival. Countries appear increasingly to delegate authority to institutions which operate in a judicial framework and process. Dispute resolution is shifted away from political processes—direct negotiation by interested parties operating from positions of power—toward formalized procedures in structured institutions administering codes of law or agreements. The European Court of Justice is the most developed example of this kind, but others are evident as well. Specialists dispute whether there is more 'legalization' or rather a shift in different issue areas, more in some, less in others, and what the various forces may be at work that shape these patterns.

3.2 Civil Wars, Disintegration; New Political Forms and Integration

At the frontier of the interaction of unit and system is the transformation of the units. Some countries disintegrate as civil war or other processes erupt. Austria–Hungary, the colonies of Britain, France and the Netherlands, the USSR no longer exist, giving way to their component entities. At the same time, other processes appear to be forming new units, of a kind without clear name or label. Economic and political integration have formed the European Union; which is not quite a state nor an international government. It has some properties or functions of many different categories. Is it a harbinger for similar destinies in other parts of the world? Will there be more such entities in Latin America, Southeast Asia, Africa? Answering these questions requires the integration of international relations with issues of domestic politics, of transnational forces and local ones, of culture and rational action, of strategic action and unilateralism, of security and economics.

3.3 Globalization

World trade, the flow of capital, peoples, and culture, gives rise to debates about globalization: is the world more integrated and interdependent, if so why, is this good or bad, and who benefits from it? The processes at work involve countries, as it is they who make the policies that encourage or inhibit globalization, and transnational forces, which may influence the internal preferences of countries and the contexts in which they operate. The debates on this topic involve all the core conflicts of this field.

International Research: Programs and Databases

The availability and diversity of databases for international research in the social sciences increased significantly in the latter half of the twentieth century. Social scientists use international databases constructed from data obtained in many ways, ranging from multinational sample surveys to Earth observation images. They are used to compare the behavior of both individuals and institutions by examining economic, social, spatial, environmental, or political change across many countries. International databases can consist of quantitative or digital observations describing a group of nations, a multinational geographic region, or even the Earth as a whole. Comparability of the data is generally achieved through the repeated use of the same data collection instrument, such as a survey questionnaire, in a number of countries, or by combining comparable national statistics or other records into a single data set.

The creation of global or multinational databases and their use in research are related to developments both within and outside the social sciences over the past 50 years. Among these are changes in the theory and focus of social science research, the emergence of international institutions and research programs capable of assuming responsibility for obtaining and maintaining large data collections, and advances in computers and the technology of data collection, analysis, management and distribution (see, e.g., *International Science: Organizations and Associations*). Today's diversity in and widespread availability of international research data are a relatively new phenomenon. In the early twentieth century, quantitative social science analysis was frequently focused on the urban neighborhood. Often linking their research to social reform activities, social scientists obtained data by conducting intensive surveys of the housing, working, and family conditions of the poor or working-class residents of specific neighborhoods. Because the physical area of these urban neighborhoods was small, social scientists could map the data manually, thus obtaining a spatial component for their analysis (Kellogg 1914).

By mid-century, quantitative social science had broadened both its theoretical focus and its data collection methods, in part because of improvements in the techniques and the instruments used for data collection. The use of sampling, developed in the 1930s and 1940s, permitted social scientists to construct databases on national populations through the use of questionnaires distributed to a probability sample of the population. Information obtained from the members of the sample was then used to construct inferences about the population from which the sample was taken. Data obtained from probability samples of a population were not geo-referenced, although the sampling framework was often based on geographic criteria. The use of data obtained from samples of a larger population freed social scientists to examine members of a variety of social groups, regardless of their geographic location. The use of the questionnaire as a data collection instrument led to an analytic emphasis on subjective data, such as individual opinions, perceptions, and self-reported behaviors. It also reinforced the growing interest in the analysis of national or macro-social phenomena.

In the immediate postwar period, there was an increased policy and research emphasis on comparing economic development among countries. Prewar research on national income accounting by Simon Kuznets became the foundation upon which the United Nations created a framework for comparable national income accounting in 1952. These accounts, once standardized and available for many countries, constituted a multinational database for economic research as well as for policy. Shortly after this, Deutsch (1960) attempted to identify comparable non-economic as well as economic data for international research into what he called the capability and stability of nations. Significantly, the basic unit of analysis for this work, as for the national income accounts, was the nation state, and the multinational data required for analysis contained one observation per variable per state.

The new international institutions that were formed in the wake of World War II assumed responsibility for maintaining large databases comprising data on each member nation. Although the League of Nations

and the International Labor Organization had obtained national data to create international databases beginning in the 1920s, it was the creation of the United Nations and its associated institutions that provided the greatest stimulus to the development of a wide range of multinational databases. The United Nations itself stimulated member countries to conduct decennial censuses and then maintained international databases on a number of socioeconomic conditions. Specialized United Nations agencies collected data on more specific topics (e.g., the Food and Agriculture Organization, the World Health Organization, UNESCO, and others). In addition, regional economic organizations such as the Organization for Economic Co-operation and Development (OECD) published economic and social data on member states and sponsored international meetings to define data elements that were comparable from country to country. Similarly, the multilateral financial institutions, such as the World Bank and the International Monetary Fund, created and disseminated multinational economic and social databases. Nongovernmental organizations also began to produce international databases, such as the annual list of military equipment produced by the International Institute for Strategic Studies in the United Kingdom. Since that time, these international organizations have continued to update and maintain a wide range of databases for international research and analysis.

A somewhat different approach to the creation of international databases was taken by Almond and Verba (1963) in their study of political culture. (See also *Databases, Core: Political Science and Political Behavior*.) Instead of using countries as the basic unit of analysis, they were interested in comparing what was taking place within countries. They conducted sample surveys of the population in five nations (Germany, Italy, Mexico, the United Kingdom, and the United States) to examine political attitudes and democracy. The result was an international database of five noncontiguous countries that provided social scientists with far greater breadth and depth of internal or national data than could be obtained using the types of databases maintained by multilateral organizations with a single datum per variable per nation. Other international databases of this type include the Level of Living or social indicator surveys coordinated by the OECD in the 1960s and 1970s; the World Fertility Survey and the International Social Survey Project (ISSP), which used the same questionnaires in a number of countries to obtain comparable international data; and the Luxembourg Income Study (LIS), which is an international data collection comprising dissimilar national surveys that measure a single phenomenon (income distribution) over time. Like the economic databases which resulted from basic research on national income accounting in the 1930s, these international databases were extensions of data collections that were defined and initially obtained for theoretical or policy purposes. In most cases, the data originated as national databases and were subsequently combined with other data sets to create an international database. Social scientists increasingly turned to comparative or international research—and the use of international databases—to illuminate and extend their understanding of complex processes and socioeconomic relationships within nations. (See related entries *Databases, Core: Sociology*; *Microdatabases: Economic*; *Statistical Systems: Economic*; *Statistical Systems: Labor*.)

In the late 1980s, a new type of research—and new types of international databases—began to emerge in some areas of the social sciences. For example, in the physical and ecological sciences, international research programs on global environmental change resulted in a growing appreciation of the environmental significance of socioeconomic and behavioral phenomena. Increasingly, scientists recognized that anthropogenic forces were responsible for a series of interrelated changes in the Earth's environment and, in turn, that global environmental change could have a wide range of impacts on human populations. The concept of global-scale research issues, together with the international salience of environmental problems and the broad research agenda developed in international scientific programs, led social scientists to consider developing global-scale rather than multinational databases.

At the same time, new technological developments made it easier to create and use global databases. Advances in computers and software made it possible for individual social scientists to obtain and analyze very large databases. The advent of geographic information system (GIS) software provided a means of spatially integrating diverse types of data; the availability of satellite remote sensing on a global scale has provided Earth observation images that are used to create global-scale databases; and advanced scientific computing has provided a means of managing and analyzing the data. Among the earliest global databases were those developed with remote sensing data, such as the so-called 'City Lights at Night' data, which are based on images obtained through the Operational Linescan System of the Defense Meteorological Satellite Program (DMSP). Satellite instrumentation was able to observe faint sources of visible near-infrared emissions on the surface of the Earth, specifically, the light from human settlements, fires, and gas flares. The global DMSP image of night-time lights provides a dramatic image of the density and spatial distribution of human settlements on Earth. However, satellite imagery of night-time lights provides only a rough guide to the distribution of human populations and tells little about what takes place within settlements. In 1992, a report to the International Social Science Council's Standing Committee on the Human Dimensions of Global Environmental Change recommended the creation of a gridded population database for use

with remote sensing data (Clarke and Rhind 1992). The first Gridded Population of the World (GPW) database, prepared in response to that report, was released in 1995. Although the data were originally obtained from national censuses, the GPW database displays population as a function of space rather than political units. It can provide either the number of people in 2.5-minute by 2.5-minute latitude/longitude cells across the surface of the Earth or the density of settlement (persons per square kilometer), and serves as a prototype for other types of gridded or vectorized socioeconomic databases.

Not only do the new computer capabilities make it possible to obtain the data required by broadening theoretical perspectives in the social sciences, but, at times, the databases themselves stimulate changes in these perspectives. Social scientists now have at their disposal a broader range of comparable international data than in the past and far greater flexibility in analysis, visualization, and manipulation of these data. New developments in data management and analysis, such as data mining, combined with this rich diversity in international databases, constitute a valuable and rapidly expanding component in the research infrastructure of the social sciences.

International Science: Organizations and Associations

The formal infrastructure to support and promote international collaboration in the social and behavioral sciences consists of several associations based on disciplines or subdisciplines, the International Social Science Council (ISSC), and to a certain extent the International Council for Science which was formerly known as the International Council of Scientific Unions (ICSU). This infrastructure is largely a product of the period since World War II. The United Nations Educational, Scientific, and Cultural Organization (UNESCO) played a major role in encouraging the establishment of the infrastructure and supporting it. Participation in the associations and their activities has broadened and become more global, and activities sponsored by the infrastructure have increased over time. Despite this, at the dawn of the twenty-first century the infrastructure designed to support the social and behavioral sciences remained weaker than that designed primarily to support the natural sciences and there were fewer international collaborative programs.

1. History

The first steps toward the creation of science organizations and associations for the social and behavioral sciences were taken in the nineteenth century (Baker 1992, Greenaway 1996). These steps included both disciplinary based and broader developments. Geographers held their first international congress in 1871. This eventually led to the formation of the International Geographical Union (IGU) in 1922. The Association for the Reform and Codification of the Law of Nations was founded in 1873. This eventually became the International Law Association. Psychologists held their first international congress in 1889. At their third congress in 1900, they created a continuing committee, the International Congress of Psychology, to organize subsequent congresses.

In 1899 nine national academies formed the International Association of Academies. In 1919 this was transformed into the International Research Council, which in 1931 was succeeded by the International Council of Scientific Unions (ICSU). ICSU was comprised of 40 national members—national academies—and eight scientific unions, one of which was the International Geographical Union (IGU). The IGU was the only social science association among the eight. Because ICSU's forerunner was an organization of national academies and because it had national academies as members, the ICSU was supported by funds from national governments from the outset.

In addition to the IGU, two other social science associations were established in the inter-war period, the International Union for the Scientific Investigation of Population Problems in 1928 and the Standing International Commission of the International Congresses of the Administrative Sciences in 1930. The former changed its name to the International Union for the Scientific Study of Population in 1961, and the

latter became the International Institute of Administrative Science in 1977.

Despite these steps, there was relatively little international collaboration in the social and behavioral sciences prior to World War II compared to the collaboration that occurred in the natural sciences, and while the social and behavioral sciences were firmly established in North America and Western Europe they were weak or nonexistent in most countries in other parts of the world.

UNESCO was created in 1945. Its constitution directed it to support science and international scientific collaboration. The social sciences had a special place in UNESCO (Laves and Thomson 1957, Sewell 1975). UNESCO's Constitution begins with the assertion '… since wars begin in the minds of men, it is in the minds of men that the defenses of peace must be constructed.' There was a strong conviction among many of those who participated in the creation of UNESCO and the development of its early programs that social science could contribute to the promotion of peace, social justice, and human dignity. They believed that the development of social science and international collaboration among social scientists was essential to realize these aims.

They were generally unwilling to recognize that scholars and many government leaders questioned whether the social sciences had, or could, or should have the same universal qualities that the natural sciences had. As the Cold War developed and tensions grew between developed and developing states, many governments and a few scholars sought to enlist UNESCO to support their causes (Dunn 1950). Although these broader conflicts have plagued UNESCO and its own programs, they have largely been avoided in the organization's efforts to promote and support international science organizations and associations.

In the early years after World War II, UNESCO promoted the formation of international disciplinary associations. With UNESCO's encouragement the World Association of Public Opinion Research was created in 1947; the International Union of Anthropological and Ethnographical Sciences, and the World Federation of Mental Health in 1948; the International Economic Association, the International Political Science Association, and the International Sociological Association in 1949; the International Committee of Comparative Law in 1950, which became the International Association of Legal Science in 1955; and the International Union of Psychological Sciences in 1951. UNESCO provided subventions to the newly established associations.

At the same time that it encouraged the formation of disciplinary associations UNESCO sought to establish a facility that would promote social sciences generally and collaboration among them. UNESCO convened two consultative meetings in 1951 to recommend a course of action. The second consultative meeting in December 1951 unanimously recommended that an International Social Science Council should be created, a recommendation that UNESCO's General Conference endorsed in a resolution. The ISSC was established the following year at an UNESCO sponsored meeting.

ISSC was created as a confederation of five disciplinary based international associations. When the constitution was revised in 1972 it became a federation. By the 1990s the number or member associations had settled at 14. Beyond the 12 associations mentioned above these included the International Peace Research Association, which was founded in 1964, and the International Federation of Social Science Organizations, which was founded in 1979.

ISSC also included 15 associate members. Among them are such bodies as: l'Association Internationale des Sociologues de Langue Française; the International Association for Applied Psychology; the International Association of Economic History; the International Committee for Social Science Information and Documentation; the International Federation of Data Organizations; the International Society of Criminology; the International Studies Association; and the World Future Studies Federation.

Unlike ICSU, ISSC did not include national or regional members until its constitution was amended in 1992. Despite this constitutional change, national academies have not rushed to join ISSC. As of 1999 there were only eight national and three regional members, and none of these was from Japan, North America, or Western Europe, the affluent areas of the world most able to support scientific collaboration. In contrast, eight of the nine academies that founded the International Association of Academies, the forerunner of ICSU, were from Western Europe and the ninth was the United States National Academy of Sciences. In 1999 ICSU had 98 national members from 96 countries.

The founders of ISSC feared that including national members might subject the council to ideological and political pressures, and when the possibility of having national members was raised again in the 1970s this fear was even more pronounced (Baker 1992). In addition, the place of social and behavioral sciences in national structures varies substantially. Which if any national body, would be an appropriate national member, was not as clear as it was with respect to the natural sciences. Not having national members has been one of the factors why ISSC has not had the same access to funds from national governments that ICSU has had. UNESCO's subvention has always been ISSC's predominant source of funds.

2. *Activities and Accomplishments*

As the twenty-first century opened, most of the formal infrastructure to support international collaboration

in the social and behavioral sciences had been in place for half a century or longer. Many things happened during this period (see IPSA 1999).

The disciplinary associations grew. They were comprised of both collective members—national associations—and individual members. They were founded by as few as a handful of national associations. By 1999 most of the 14 member associations of ISSC had from 40 to 60 collective members. This growth represented a considerable increase in social scientists in areas other than North America and Western Europe. In addition, the largest associations had from 1,000 to 2,000 individual members from about 100 states. While national associations from North America and Western Europe accounted for only about 40 percent of the collective members they accounted for from two-thirds to three-quarters of the individual members.

When ISSC was founded, UNESCO gave ISSC funds for its own operation and to disperse to the disciplinary associations. These funds were dispersed as block grants. This system continued until 1996. Since 1996 UNESCO continued to provide funds for ISSC and the disciplinary associations, but the funds were provided for projects only. Beyond providing a subvention, since ISSC's creation UNESCO has given it contracts to execute projects and office space in UNESCO House. ISSC has never had any other space.

Following the tradition set by the geographers, international legal specialists, and psychologists in the nineteenth century, the disciplinary associations have organized congresses. The frequency of the congresses varies from once a year to once every three or four years. Participation in congresses has grown to 1,500 or more. The disciplinary associations also convene smaller meetings, and sponsor roundtables, study groups, and research committees. They publish abstracts, journals, and newsletters and sponsor book series. By the end of the twentieth century, the disciplinary associations had come to manage substantial scientific exchanges.

ISSC's activities have been constrained by its limited funds. In its early years, ISSC focused on providing services for its member associations and for UNESCO. Most of ISSC's early projects and publications derived from UNESCO contracts. Both UNESCO and ISSC proposed topics for the projects. There always has been a close connection between UNESCO's social science program and ISSC's activities.

In the 1980s ISSC took steps that led to the creation of two broad international interdisciplinary research programs, the International Human Dimensions Program (IHDP) on Global Environmental Change and the Comparative Research Program on Poverty. Sponsoring large-scale research programs was a new venture for ISSC. These programs required raising additional funds granted specifically to support them.

Social scientists and social science associations also have connections with ICSU. Three social science associations are among its 25 scientific union members. The IGU was a founding member. The International Union of Psychological Science became a member in 1982, and the International Union of Anthropological and Ethnological Sciences was admitted in 1993.

ICSU was established before UNESCO was. Although UNESCO's financial assistance was crucial in creating ICSU's first professional secretariat, and ICSU has regularly received funds from UNESCO, UNESCO has not been the predominant source of ICSU's funds. The ICSU secretariat has been located in Paris since 1972, but it has had its own building.

One of ICSU's first activities was to sponsor a large-scale international collaborative research program, the Second International Polar Year in 1932–3. Starting with the International Geophysical Year in 1957, ICSU has sponsored many international collaborative research programs in the period since World War II. The largest of these in 2000 was the International Geosphere-Biosphere Program, A Study of Global Change, which began in 1986. Other programs that ICSU co-sponsors include The World Climate Research Program, the IHDP (with ISSC), and the Scientific Committee on Problems of the Environment.

ICSU could build on earlier practice. The first International Polar Year was held in 1982–3. There is great pressure for international collaboration in the natural sciences. Natural science frequently requires data from all over the world, and these data must be collected according to common protocols and measured according to identical scales. There is a deep tradition of unfettered exchange of knowledge in the natural sciences.

The three social science associations that are members of ICSU have participated actively in ICSU's international collaborative research programs. There have been discussions about additional international social science associations becoming members of ICSU and about closer collaboration between ISSC and ICSU. In a step toward greater collaboration, in 1996 ICSU became a co-sponsor with ISSC of the IHDP. A merger of ISSC and ICSU would be difficult. Not all of the 11 ISSC member associations that are not members of ICSU would fit easily into ICSU.

As a consequence of the relative weakness of the formal infrastructure to support and promote international collaboration in the social and behavioral sciences, many collaborative efforts for training, data collection and archiving, and research have been conducted under the auspices of regional and national organizations such as the European Science Foundation, the Research Directorate-General of the European Commission, the Latin American Social Sciences Council, the US National Academy of Sciences, and the Social Science Research Council or under *ad hoc* arrangements.

Interestingly most US professional associations in the social sciences have many members who are not citizens or residents of the USA. For instance, in 1999 such individuals comprised 35 percent of the membership of the American Society of International Law.

How the infrastructure for supporting international collaboration in the social sciences would evolve was an open question. The infrastructure was created and utilized to promote the development of the social sciences in what frequently was a top-down process. Development of a more robust infrastructure would probably require bottom-up pressures from both the social and natural science communities and government support.

International Trade: Commercial Policy and Trade Negotiations

'Commercial policy' describes any form of government intervention towards international trade. The study of commercial policy is a branch of international trade theory, itself a subfield of microeconomics. None of this sounds likely to arouse passions, but in practice trade policy has often prompted bitterly divisive political debates and has been a central concern of domestic and foreign policy.

In the early modern period, 'Mercantilist' writers rationalized the use of restrictive trade policy by expansionist monarchs to foster exports and ensure trade surpluses. David Ricardo in 1817 provided the intellectual case against this approach. His theory of trade patterns, based on specialization according to comparative advantage (see *International Trade: Economic Integration*), predicted that no free-trading country would lose relative to autarky. This laid the foundations of the modern enthusiasm for free trade on the part of most mainstream academic economists. However, Ricardo's arguments were probably less important than the increasing ascendancy of commercial over landed interests in leading to the repeal of the UK Corn Laws in 1848, which ushered in an era of (mostly) falling barriers and expanding trade. Twentieth-century world wars and depression reversed this trend and were themselves influenced by trade policy: commercial and imperial rivalries contributed to the onset of the First World War, and the 1930 Smoot–Hawley tariff worsened the depression in the US and hastened the collapse of world trade. Postwar attempts to restore the multilateral trading system led in 1947 to the General Agreement on Tariffs and Trade (GATT), reconstituted in 1995 as the World Trade Organisation (WTO). Under their auspices, successive rounds of trade negotiations have yielded progressive reductions in trade barriers. However, the chaotic events inside and outside the abortive Seattle meeting in 1999, which it had been hoped would launch another trade round, showed that progress towards further liberalization will face opposition from critics of 'globalization.'

As this brief background makes clear, a full account of the theory and practice of trade policy would require an extensive discussion of general intellectual currents, economic history, and contemporary international relations. This article has the more limited objective of summarizing what economic theory has to say on the topic. It begins with some necessary taxonomy and then reviews the principal theoretical arguments for and against trade restrictions.

1. Varieties of Commercial Policy

The most obvious form of commercial policy, and historically often the most important, is a *tariff*, a tax on imports which raises their domestic price above the world price, and so 'protects' domestic producers at the expense of home consumers. Confusingly, an export *subsidy* has a similar effect, raising the price of an export good to domestic producers and consumers above its world price. The two measures have opposite effects on the relative price of imports to exports, which is the basis of the Lerner symmetry theorem: a uniform tariff on all imports has exactly the same effects on relative prices as a uniform tax on all exports. Both raise the relative price of imports at home and thus discourage trade. A corollary is that trade can be liberalized either by reducing tariffs or by leaving them in place and subsidizing exports: politically a more expedient route and one followed successfully by some of the newly industrializing countries of East Asia.

Tariffs have declined in importance since the Second World War relative to nontariff barriers such as import quotas, 'voluntary export restraints' (i.e., quotas imposed by exporting countries), and government procurement rules. Such policies are qualitatively similar to tariffs in their protective effects, though the conditions for exact equivalence rarely hold. Finally, most domestic policies (taxes, subsidies, health and safety regulations, etc.), even if not explicitly discriminatory, have external repercussions. Though not strictly forms of commercial policy, their effects are increasingly recognized in trade negotiations.

Constructing a true measure of trade policy is an index-number problem: how to aggregate all these different types of trade restriction into a single measure which is comparable across countries and across time. Solutions in principle to it have been devised, but implementing them in practice is extremely difficult. In applied work, levels of protection are usually measured by trade-weighted average tariffs and, even less satisfactorily, by 'coverage ratios,' the percentage of traded commodities which are subject to nontariff barriers.

This article considers only the case where commercial policy applies indiscriminately to imports from whatever source. The desirability of this is enshrined in Article I of the GATT, which requires that all trading partners be treated as favorably as the 'most-favored nation.' However, Article XXIV allows exceptions for regional trade agreements, which have grown in importance in recent years with the widening and deepening of the European Union and the signing of the North American Free Trade Agreement. For further details, see *International Trade: Economic Integration*. The GATT also tolerates tariffs imposed on exporters found guilty of 'dumping'—selling below cost or below the price charged in their home market. Such 'anti-dumping' tariffs are an important form of protection in the contemporary world economy: even the threat of imposing them can deter foreign exporters.

2. *Trade Policy in a Competitive Small Open Economy*

Devising criteria for trade policy which will hold universally is a daunting task, and it makes sense to begin with a simple benchmark case. The classical starting point is an economy which is both competitive—individual consumers and firms cannot affect domestic prices—and small—the economy as a whole cannot affect world prices. Free trade must then maximize real national income, since it removes the constraint requiring an exact match between domestic production and consumption patterns. Specialization in production increases the value of aggregate output at world prices, while consumers benefit by being able to buy from the cheapest supplier worldwide.

However, individuals are both consumers and income recipients, and aggregate gains can mask big shifts in internal income distribution. The near certainty that there will be some losers is implied by the Stolper–Samuelson theorem. This was originally formulated for a special model, where it predicts that protection will raise real wages (so trade liberalization will lower them) if imports use labor relatively intensively. More generally, the logic of the theorem implies that there are almost always some factor-owners who will lose from a reduction in trade barriers. Most obviously, this will be true of factors which are specific (even if only in the short run) to import-competing sectors.

Losers notwithstanding, the existence of national gains from trade ensures that 'aggregate welfare' must rise, meaning that it would be possible to tax some of the winners' gains, compensate the losers, and still leave no one worse off. Free trade is thus the archetype of a situation which is potentially Pareto efficient or simply 'efficient' (confusingly, the term has a more precise sense than in common parlance). The same result holds even if the government has limited taxing and spending powers, and can only redistribute income through changes in commodity (or 'indirect') taxes. Of course, all this is poor consolation for the losers if the compensation is not actually carried out. Nonetheless, trade theorists tend to emphasize the efficiency gains, and prefer to try and devise programs of adjustment assistance to help those adversely affected rather than to recommend foregoing the national gains. In this they are motivated by professional division of labor (losses to particular groups mandate changes in the tax and social welfare system, not protection), and a belief that the poor rarely gain from highly restricted trade, rather than heartlessness. For the same reasons, the remainder of this article concentrates on the effects of trade liberalization on aggregate welfare, and will not repeat these essential qualifications about its distributional consequences.

Even though the case for free trade is clear, the best way to move towards it may not be (except in the trivial case where there is only a single tariff). Abolishing all tariffs at once is unlikely to be politically feasible. Two rules of piecemeal trade liberalization are then available. The first is the uniform reduction rule: reduce all tariffs by an equiproportionate amount. Heuristically, this kind of reform leaves relative tariff rates unchanged, so it is 'as if' there is only a single tariff rate, which is steadily reduced. Hence it is not surprising that (pathological cases apart) it guarantees a welfare improvement. The second is the concertina rule: reduce the highest tariff rate. A sufficient condition for this to raise welfare is that the good in question is a substitute for all other goods subject to tariffs. Substitutability is not necessary, however. For example, if all goods subject to tariffs are complements for each other, then a reduction in any tariff (not just the highest) raises

imports of all tariff-constrained goods and a welfare gain is again assured. Finally, the concertina rule does not justify increasing the lowest tariff, unless all exports are subsidised at higher rates: only raising the lowest *distortion* guarantees a welfare gain.

This discussion illustrates the distinction between 'first-best' and 'second-best' welfare economics. Policy recommendations are more complicated in the latter case, when some pre-existing distortions cannot be abolished. Nevertheless, a general principle applies: activities which from a welfare perspective are under-supplied in the absence of intervention should be encouraged and vice versa. A related rule of thumb with many useful applications in practical policy making is the principle of targeting: intervention should be applied as closely as possible to the desired target, whether this is to offset an irremovable distortion or to attain a 'noneconomic' objective (such as restricting imports of certain types of goods or protecting industries deemed essential to cultural independence or national security). From this perspective, trade policy is rarely a first-best instrument. For example, if there is a minimum wage in the import-competing sector, protection may raise welfare because it partially offsets the minimum wage. But other forms of intervention, such as employment or production subsidies, would have the same effect at lower welfare cost.

3. *Trade Policy in a Large Open Economy*

Relaxing the assumption that the economy is 'small' admits a specifically economic argument for protection which was clearly stated by Bickerdike in 1906. Reducing home demand for imports now lowers their world price, improving the home country's terms of trade (i.e., reducing the price of imports relative to exports) and yielding a welfare gain. The optimal tariff is the tariff which just balances this gain from manipulating the world price against the loss from trading at a different price from the rest of the world. A corollary is that, if a country is a major supplier of a good, and if local producers are competitive, an export tax can improve national welfare. In effect, the home government acts as a monopolist: a role which uncoordinated private producers cannot adopt by themselves. It should be stressed that these policies are only optimal from a national point of view (which explains why some authors prefer the term 'exploitative' to 'optimal'). World welfare definitely falls, though once again transfers, this time international, would be needed to compensate losers from universal free trade.

In practice, very few if any individual countries have a major influence on world prices. Cases where a group of countries acting together would have such power are more common, especially producers of primary commodities with few close substitutes. Hence the tendency for cartels and commodity price agreements in such markets. However, such groupings are typically unstable, since each member has an incentive to 'free-ride' on its partners' output restrictions. The Organization of Petroleum Exporting Countries is the outstanding counterexample and is probably best explained by a dominant firm model, where one large producer with very low marginal production costs (Saudi Arabia) in effect sets the price, and a 'competitive fringe' of other oil-producing countries (whether OPEC members or not) adjusts its outputs accordingly.

4. *Trade Policy with Economies of Scale and Imperfectly Competitive Markets*

The arguments reviewed so far assume that firms are perfectly competitive and produce in equilibrium with constant returns to scale. A great deal of research in recent years has relaxed these assumptions and explored the implications for trade policy.

A useful starting point is the case of Marshallian 'external economies': individual firms lack market power but expansion of the industry as a whole lowers costs for all. This isolates the implications of increasing returns, while retaining the assumptions of perfect competition. In such markets, industries which enjoy significant economies of scale are likely to concentrate in large countries under free trade. However, this need not justify protection by small countries, since this would condemn them to high-cost local production and to foregoing the gains from participating in the international division of labor. It is only medium-sized countries which are likely to lose from free trade by specializing in the 'wrong' commodities. Even for them the principle of targeting continues to apply: production subsidies rather than tariffs are the optimal policy.

Relaxing the assumption that firms are perfectly competitive complicates matters considerably, since there are many varieties of imperfect competition. It is convenient to distinguish between two: monopolistic competition and oligopoly. To begin with the former, it resembles perfect competition in two important respects: individual firms are too small to influence their rivals; and they enter or leave the industry in response to profit opportunities, so that in equilibrium profits are zero. The key distinguishing features are that firms enjoy economies of scale and that each produces a distinct variety. This in turn reflects consumers' tastes, which exhibit a preference for diversity. In this kind of economy, restricting trade has an additional harmful effect: it reduces the range of choice available to consumers. Policy choice is complicated because the free market may lead to more or less varieties being produced than the social optimum. However, the principle of targeting continues to apply: provided anti-trust measures are used if necessary to

ensure an optimal number of domestic firms, free trade remains desirable.

A different set of issues arises in the case of oligopoly, where there are barriers to entry and a relatively small number of firms. Since firms perceive that they are interdependent, they behave 'strategically,' taking into account the reactions of their rivals. In such markets, there may be scope for governments to intervene in favor of home firms, an idea which has come to be known as the theory of strategic trade policy.

The key insight is that, if a home and a foreign firm make their decisions simultaneously, the home firm cannot credibly commit to a level of output which would maximize home welfare conditional only on the behavior of the foreign firm. By contrast, the home government is assumed to be able to credibly commit to policies before both firms take their decisions. Hence there is scope for the home government to make the commitment on behalf of the home firm. In the simplest example, where a single home firm competes against a single foreign firm in a third market, the implications are dramatic. The optimal policy for the home government is to provide a positive export subsidy. This allows the home firm to credibly commit to more aggressive behavior, raising its output, market share, and profits at the expense of its foreign rival. This 'profit shifting' result seems to provide a rationale for the support of 'national champions.' Similar results apply to import-competing firms: tariffs may serve to raise welfare by shifting profits from foreign to home firms.

However, the profit-shifting argument turns out to be subject to many qualifications. The underlying model assumes that firms compete in the marketplace by choosing their outputs, taking the output choices of their rivals as given (i.e., that firms engage in Cournot competition). This sort of behavior is plausible when technology requires firms to commit in advance to their capacity output levels. If instead output can be varied with little change in marginal cost, then firms are more plausibly modeled as price-setters (engaging in Bertrand competition). In that case, firms behave more aggressively in the absence of intervention, and the optimal policy is an export *tax* rather than a subsidy. The rationale for intervention is the same in the two cases: the home government uses its superior commitment power to achieve an outcome which the domestic firm cannot achieve on its own. However, the practical relevance of the theory is reduced by the sensitivity of the actual policy prescription to assumptions about how firms behave. One slight defense of intervention comes from recent research, which suggests that the ambiguity is reduced when subsidies are given to pre-production variables such as R&D or marketing expenditures rather than directly to exports.

Other criticisms of strategic trade policy are that with many home firms there is a countervailing incentive to tax them (just as in the competitive large open economy case of Sect. 3); that the gains from intervention are more than offset if foreign governments also subsidize their own firms (see Sect. 6); and that general-equilibrium interactions with the rest of the economy are ignored. For example, if applied to a number of sectors, all of whom draw on a limited supply of some factor of production (such as skilled labor), an export subsidization policy merely raises the wages of that factor with little or no effect on the pattern of output or the level of national welfare. For these and other reasons, attempts to quantify the likely gains from strategic trade policy suggest that they are very small at best. However, the gains could be much larger if subsidies made it possible for a home firm to compete in the first place, especially if the alternative was domination of the world market by a foreign monopoly. (The huge subsidies to Airbus by European governments are often justified on these grounds.)

A final issue which arises when markets are imperfectly competitive is that trade policy can itself affect the degree of competition. With price in excess of marginal cost, firms are producing below their optimal scale. Hence any policy, including protection, which raises domestic output may increase welfare. However, as noted in Sect. 2, protection is not the best form of intervention. Exposing home firms to foreign competition is likely to be more effective, reducing prices to consumers and allowing any surviving home firms to produce at a more efficient scale.

5. *Trade Policy and Growth*

To assess the effects of trade policy in a growing economy, all the issues discussed in previous sections remain relevant, and some new ones arise. Until recent years, the standard approach to modeling economic growth was the neoclassical model of exogenous growth due to Solow. In that framework, the long-run or steady-state rate of growth is determined by exogenous rates of population growth and technological progress. Hence, trade policy cannot affect the steady-state growth rate, though it may affect the rate at which the steady state is approached.

More recently, attempts have been made to provide endogenous explanations for economic growth. These stress the importance of resources devoted to research and development (R&D), both in encouraging technological innovations and in facilitating the introduction of new and higher-quality products. They also emphasize the importance of externalities, as the benefits of R&D typically cannot be fully appropriated. This has immediate implications for trade policy. For example, if a sector of the economy is disproportionately engaged in R&D, protecting that sector will raise the long-run growth rate. These arguments are related to an older, 'infant-industry' argument, which defends transitional protection to enable a new firm to benefit from learning-by-doing

and scale economies. For such firms, a tariff, by guaranteeing higher home sales, may allow a firm to compete in export markets.

Once again, the principle of targeting must be mentioned. At best, these arguments justify production or R&D subsidies: since the industries involved are likely to be oligopolistic, they provide a case for strategic industrial rather than trade policy. Many of the qualifications noted in Sect. 4 continue to apply. Success is more likely to come from general policies which foster a culture of innovation and enterprise, rather than specific interventions which seek to 'pick winners.' A final caution is that, even when income distribution and externalities are ignored, GNP per head is not the same as welfare in a growing economy. Policies which raise the growth rate in the short or long term may do so at the expense of current consumption.

Given the theoretical ambiguities surrounding the effects of trade policy on growth, it is hardly surprising that empirical studies have failed to find a conclusive link between trade and growth. Some authors have shown that various measures of 'openness' can explain the relative growth performance of different countries, but such measures are not directly related to trade policy. The case against modest restrictions on trade is not proven. Nevertheless there are strong theoretical and empirical reasons for believing that countries, especially those with small home markets, which close themselves off from international movements of goods, factors, and ideas, are likely to have lower levels of welfare and growth.

6. *Institutions, Politics, and Trade Policy*

The discussion so far has confined attention to the case of trade policy which is set unilaterally by a single country. It has also adopted an exclusively 'welfarist' perspective in evaluating trade policy: the practical relevance of this is questionable unless decisions on trade policy are devolved to public-spirited bureaucrats. A variety of approaches has been taken to relaxing these assumptions. While much remains to be done, recent research has thrown light on the political pressures for and against protection, and on the role of international institutions such as the GATT in underpinning moves towards freer trade.

Many of the potential gains from unilateral intervention identified earlier must be qualified when it is recognized that foreign governments face similar incentives. Though often described as 'retaliation,' this phenomenon is usually modeled by viewing governments as players in a simultaneous-move game, often assuming only two countries for simplicity. The effects on welfare in the cases of optimal tariffs (from Sect. 3) and optimal export subsidies to Cournot firms (from Sect. 4) are similar: at least one country must lose relative to free trade and both may lose. The latter outcome (which must ensue if the countries are relatively similar) illustrates a 'prisoner's dilemma': unless the countries explicitly cooperate on free trade, each has an incentive to adopt an interventionist policy and the result is lower welfare for both. The case of optimal export taxes on Bertrand firms is different: now, both countries may gain relative to free trade (though only at the expense of consumers). Nevertheless, it exhibits a feature that holds in all cases: cooperation between governments leads to higher welfare than noncooperative choice of trade policy.

With or without international cooperation, all the theories of trade policy discussed so far are normative, assuming that national welfare is the primary policy objective. Hence they fail to explain why governments so frequently restrict trade by more than the welfare-maximizing extent. In response, the burgeoning field of political economy has proposed a variety of positive explanations for the pattern and prevalence of trade policy. It may be determined by spending on 'rent-seeking' by factors of production for protection of the sectors which use them intensively (or, in the limiting case of immobile factors, exclusively). It may be determined by direct voting on tariff rates, in which case the rate chosen will reflect the factor ownership of the median voter. Finally, it may be the outcome of campaign contributions to politicians by lobby groups, whether to increase the probability of their preferred party being elected, or to influence the policies of an incumbent government.

All these theories rely on special assumptions about the nature of the political system (often assuming that politicians seek to maximize some weighted average of welfare and political support) and the manner in which individual preferences influence political decisions. They also assume that trade policy is used for redistributive purposes, and for the most part they allow no role for other forms of public policy. They are therefore vulnerable to the criticism that they fail to explain satisfactorily why trade policy is the preferred instrument when more efficient methods of redistributing income are available.

Finally, just as the widespread use of trade policy is a puzzle, so also is the steady trend towards greater liberalization in the period since the Second World War. It can be explained by shifts in prevailing ideology, combined with the superior economic and political performance of those countries which were first to move towards open markets. But economic explanations have also been proposed. To the extent that trade is intra- rather than interindustry (which appears to be the case for much trade between developed countries), trade liberalization imposes lower costs of adjustment and so has less distributional impact. The GATT can be rationalized as a mechanism for implementing the international transfers needed to compensate countries for foregoing nationally optimal tariffs which would lower world welfare. Free-trade agreements of all kinds may serve as a commitment device: a government has an in-

centive to join them because they provide a way to credibly distance itself from the domestic pressure groups which lobby for protection.

7. Conclusions

In the benchmark case of a competitive, small, open economy, free trade must raise aggregate national welfare, although some individual groups will lose unless compensation is actually paid. Relaxing the benchmark assumptions allows exceptions to the case for free trade: 'optimal' tariffs to manipulate world prices; 'strategic' tariffs or export subsidies when home firms engage in oligopolistic competition with foreign rivals; and infant industry protection to allow home firms benefit from learning by doing. Protection can also raise the growth rate, though it is less likely to raise welfare in a growing economy. All these possible arguments for protection are subject to many qualifications. Moreover, on closer examination, most economic arguments for protection turn out instead to be arguments against *laissez-faire*, and so must be qualified by the principle of targeting: corrective measures should be applied as close to the source of the 'distortion' as possible, suggesting that other forms of intervention (such as R&D or production subsidies) are preferable to trade protection in most cases. Overall, with due allowance for some ambiguity, both theoretical arguments and empirical evidence suggest a pragmatic case for free trade.

8. Suggestions for Further Reading

Bhagwati (1988) and Irwin (1996) provide contemporary and historical background. Bhagwati (1971), Corden (1974), and Dixit (1985) give overviews of the theory of trade and welfare, using mainly prose, diagrams, and algebra, respectively. More recent updates are given in the contributions to Grossman and Rogoff (1995): see especially the chapters by Brander on strategic trade policy, Feenstra on estimating the effects of trade policy, Grossman and Helpman on technology and trade, Rodrik on political economy, and Staiger on rules and institutions for international trade. For more details and further references on particular topics, see Anderson (1992) on dumping and anti-dumping; Anderson and Neary (1996) on index numbers of trade restrictiveness; Bagwell and Staiger (1999) on the GATT; Dixit and Norman (1980), especially Sects. 3.2 (on redistribution through commodity taxation), 9.1 (on trade and competition), and 9.3 (on product differentiation and intra-industry trade); Ethier (1982) on trade policy under increasing returns; Grossman and Helpman (1991) on trade policy and growth; Krugman (1984) on import protection as export promotion; Neary (1995) on tariffs and quotas; Neary and Leahy (2000) on strategic trade and industrial policy; and Rodriguez and Rodrik (1999) on empirical studies of trade policy and growth. Among the many important topics not covered are effective protection (see Ethier (1977)) and the interaction of trade and environmental policy (see Neary (2001)).

International Trade: Economic Integration

Regional integration agreements (RIAs) are groupings of countries formed with the objective of reducing barriers to trade between members. They have long historical antecedents, sometimes being a stage to nation building (most famously in the Zollverein of nineteenth-century Germany), and sometimes as part of colonial trading arrangements. In the postwar period, developments were led by the European Union (EU, originally the European Economic Community (EEC), founded in 1958), and in the 1960s and 1970s there was a number of rather inward looking (and largely unsuccessful) RIAs between developing countries. Since the mid-1980s there has been a dramatic increase in regional integration activity. Of the 194 RIAs notified to the General Agreement on Trade and Tariffs/World Trade Organization (GATT/WTO) at the beginning of 1999, 87 were notifications since 1990. Now almost all countries are members of at least one RIA, and more than one third of world trade takes place within such agreements. The new developments include the expansion and deepening of the EU; the construction of new and more open RIAs between developing countries; and the advent of RIAs in which both high-income and developing countries are equal partners, lead by the North American Free Trade Area (NAFTA) which, in 1994, extended the Canadian–USA free trade agreement to Mexico.

RIAs come in many shapes and sizes. They vary in income levels, in openness to trade, and in the share of trade that takes place within the RIA, (60 percent for the 15 members of the EU, but just 10 percent for the eight members of the West African Economic and Monetary Union). Structures vary, from the loose agreements to facilitate trade of the African Cross-Border Initiative and Asia Pacific Economic Cooperation (APEC) forum, through to the deep integration of the EU, involving the construction of shared executive, judicial, and legislative institutions. The focus of this article, in common with most of the economics literature, is on RIAs as mechanisms for trade liberalization, not addressing the integration of factor markets, monetary systems, or political institutions. Even with this focus, RIAs differ widely in structure. 'Free trade areas' remove internal tariff and non-tariff barriers, but permit members to retain independent external tariff policies. 'Customs unions' go further, in fully harmonizing external trade policy. And it is increasingly recognized that effective integration of markets requires more than reducing tariffs and quotas. Many other barriers—such as differing national product standards and a host of minor border frictions—impede trade and support market segmentation, and some RIAs are now pursuing 'deep integration' policies to eliminate these barriers.

This article is organized under four main headings. Section 1 outlines the main effects of RIAs on member countries, Sect. 2 discusses some of the wider policy choices faced in RIA formation, and Sect. 3 looks at the implications of RIAs for the world trading system as a whole. Section 4 concludes.

1. *Economic Effects on Member Countries*

1.1 *Trade Creation and Diversion*

The modern analysis of RIAs dates from Viner (1950), who drew the distinction between the trade creating and trade diverting effects of RIA formation. The classical source of gains from trade is that global free trade allows consumers and firms to purchase from the cheapest source of supply, hence ensuring that production is located according to comparative advantage. In contrast, trade barriers discriminate against foreign supply, inducing domestic import-competing producers to expand even though they have higher costs than imports. This in turn starves domestic export sectors of resources and causes them to be smaller than they otherwise would be. Since a RIA liberalizes trade, reducing at least some of the barriers, doesn't it follow that it too will generate gains from trade? Viner's contribution was to show that the answer is; not necessarily. The gains from trade argument applies if all trade barriers are reduced, but need not apply to a partial—and discriminatory—reduction in barriers, as in a RIA. This is because discrimination between sources of supply is not eliminated, it is just shifted. If partner country production displaces higher-cost domestic production then there will be gains—trade creation. But it is possible that partner country production may displace lower cost imports from the rest of the world, and this is welfare reducing trade diversion.

The analysis of trade creation and trade diversion constitutes one of the first formal analyses of the more general problem of 'second-best welfare economics.' Given that distortions remain in place in some activities in the economy, it is not necessarily the case that removing just some of the distortions (e.g., eliminating trade barriers on partner countries and leaving them in place on external countries) is welfare improving. In the literature on regional integration the response to the fundamental ambiguity created by the second best took three main forms.

First, authors established circumstances under which there is no interaction between formation of the RIA and external trade flows, so no possibility of trade

diversion. Meade (1955) pointed out that if trade barriers with nonmembers take the form of fixed quantitative restrictions, then a RIA must raise the total welfare of member countries since there is no possibility that imports from the rest of the world are displaced. Ohyama (1972) and Kemp and Wan (1976) showed how, when external trade barriers take the form of tariffs, it is possible to adjust these to hold external trade volumes constant, so preventing trade diversion from occurring.

Second, researchers identified conditions, in terms of changes in endogenous variables, for welfare gain. For example, welfare increases if the initial-tariff weighted change in trade volume is positive (Meade 1955). If internal tariffs are close to zero, then reducing them to zero raises welfare if it increases tariff revenues earned on external trade (Ethier and Horn 1984).

The third approach is to identify features of economies (in terms of their underlying exogenous characteristics) under which they are more or less likely to gain or lose from RIA membership. Lipsey (1957) argued that joining with countries that are already one's largest trading partners is unlikely to lead to diversion, since the fact that the countries were originally the largest trading partners suggests that they are the lowest cost source of supply. Similar reasoning, including transport costs in the costs of supply, leads to the 'natural trading bloc' argument (Wonnacott and Lutz 1989, Summers 1991). Venables (2000) shows that those members of an RIA with comparative advantage most different from the world average are most likely to lose from trade diversion, as their trade is diverted to partner countries with comparative costs between theirs and the world average.

Empirical work on trade creation and trade diversion has taken two main forms; econometric studies of changes in trade flows, and computer simulation studies of the full general equilibrium effects of RIA membership.

Econometric studies seek to quantify the changes in trade flows attributable to membership of a RIA, and thereby identify trade creation and diversion. A variety of different econometric models have been developed, the most common being based on the gravity model which estimates bilateral trade between countries as a function of their GDPs, populations, the distance between them, and physical factors such as sharing a land border, and being landlocked or an island. Dummy variables capture whether or not countries are in a particular RIA, their estimated effect indicating whether countries in a RIA trade more or less than would otherwise be expected. Using this technique, Bayoumi and Eichengreen (1997) find that the formation of the EEC reduced the annual growth of member trade with other industrial countries by 1.7 percentage points, with the major attenuation occurring over 1959–61, just as trade preferences were phased in. Soloaga and Winters (1999) look at a wide range of RIAs, producing a mixed picture with little evidence of widespread trade diversion. Overall, there appears to be weak evidence that external trade is smaller than it otherwise might have been in at least some of the blocs that have been researched, but the picture is sufficiently mixed that it is not possible to conclude that trade diversion has been a major problem. Furthermore, it cannot be inferred that trade diversion has been economically damaging without information on relative costs and tariff structures, variables that are not revealed in this sort of aggregate exercise.

The second empirical approach is based on computable equilibrium modeling. This involves construction of a full computer model of the economies under study and use of the model to simulate the effects of the policy changes associated with the RIA. Such a model typically contains a great deal of microeconomic detail, so can be used to predict changes in production in each sector, and changes in factor prices and real incomes. In models that assume a perfectly competitive environment, the combined effects of trade diversion and trade creation typically give very small welfare gains—just a fraction of 1 percent of GDP (see Baldwin and Venables 1997 for a survey). The strength of these models is that they have sufficient microeconomic structure for the effects of a policy change to be traced out in detail, and its real income effects to be calculated. They are also often used for prediction—to estimate the likely effects of a policy change before it is implemented. But they have the major weakness that they are not usually fitted to data as carefully, or subject to the same statistical testing, as econometric models. The cost of the microeconomic detail is a complexity that makes rigorous econometric estimation impossible.

Although the focus of the trade creation and diversion literature has been on the changes in trade flows induced by regional integration, two consequent effects are important. First, changes in trade flows may change world prices, possibly improving the terms of trade of member countries, although this gain arises at the expense of outside countries. For example, if trade diversion occurs then RIA imports from outside countries are reduced, and any reduction in import prices that this causes is a terms of trade gain. Empirical work on this issue by Winters and Chang (2000) shows that Brazil's membership in Mercosur has been accompanied by a significant decline in the relative prices of imports from nonmember countries.

Second, changes in tariffs and trade volumes will lead to loss of government tariff revenue. This can occur directly (as intra-RIA tariffs are cut) and as a consequence of trade diversion (as imports are diverted away from external, tariff inclusive, sources of supply). Its cost depends on the social cost of raising funds by alternative means, and can be severe in some developing countries. For example, in the South African Development Community, where some coun-

tries are quite heavily dependent on trade with South Africa, substantial amounts of revenue are involved, amounting to perhaps 5.6 and 9.8 percent of government revenue for Zambia and Zimbabwe respectively. Cambodia derived 56 percent of its total tax revenues from customs duties prior to its entry into the Association of South East Asian Nations (ASEAN), and Fukase and Martin (1999) argue that entry into ASEAN provided a powerful stimulus for the introduction of a value-added tax.

1.2 Scale and Competition Effects

A second mechanism through which member countries are affected by RIA membership derives from the fact that countries may be too small to support, separately, activities that are subject to large economies of scale. Regional cooperation offers a route to overcome the disadvantages of smallness, by pooling resources or combining markets. These scale benefits can arise in public projects (see World Bank 2000) and also at the level of the private firm, where they typically interact with imperfectly competitive market structures. These considerations are absent from the trade creation and trade diversion approach outlined above, which is based on the perfect competition and constant returns to scale paradigm of traditional trade theory. It was only in the 1970s and 1980s that formal analysis of the interaction between trade, economies of scale, and imperfect competition began with the 'new trade theory,' and these techniques have now been extensively applied to regional integration.

The basic argument is that there is a trade-off between the extent to which firms can achieve economies of scale, and the intensity of competition in the market. For a given size market, larger firms means fewer firms and hence more monopolistic outcomes. If regional integration combines markets, then it shifts this trade-off, potentially allowing firms to be bigger and markets to be more competitive (Smith and Venables 1988). For example, there might be an initial situation in which two economies each have two firms in a particular industry, and these firms exploit their 'duopoly' power, setting prices well above marginal cost. After formation of the RIA this becomes four firms in one combined RIA market. This increases the intensity of competition, and possibly induces merger (or bankruptcy), perhaps leaving only the three most efficient firms. The net effect is increased competition, increased firm scale, and lower costs. 'Triopoly' competition is likely to be more intense than the original duopolies, and surviving firms are larger and more efficient, so can better exploit economies of scale. A further source of gains comes from possible reductions in internal inefficiencies that firms are induced to make. If the RIA increases the intensity of competition, it may induce firms to eliminate internal inefficiencies (X-inefficiency) and raise productivity. Since competition raises the probability of bankruptcy and hence layoffs, it also generates stronger incentives for workers to improve productivity, and increases labor turnover across firms within sectors. Although these are significant potential sources of gain, they have been difficult to achieve in many RIAs. This is addressed further in Sect. 2.1.

1.3 Winners and Losers

A continuing concern is with the distribution of the costs and benefits of regional integration between member countries. Do central regions gain at the expense of peripheral ones, and do poor countries tend to catch up or get left behind? The evidence is, broadly, that RIAs composed of developed countries tend to show convergence (for example, the narrowing of per capita income differentials observed in the EU, see Ben-David 1993). However, the picture for RIAs composed of developing countries is more mixed, with some examples of divergent performance (World Bank 2000).

The analytical literature on these questions is quite sparse, but provides several clues why this might occur. First, as mentioned above, trade diversion is more likely for countries with 'extreme' comparative advantage, suggesting that in a RIA among developing countries it might be the lowest income countries that experience diversion. For example, their imports of manufactures might be diverted from nonmember countries to a partner that has a comparative advantage in manufactures within the RIA, but not relative to the world at large. Second, industries might tend to cluster in locations that have relatively good market access, or that are well supplied with business services or provision of other intermediate goods. This is more likely to occur in developing countries than in developed ones, partly because of their sparser provision of business infrastructure, and partly because the small size of their manufacturing sectors means that clustering is less likely to run into congestion and other sources of diminishing returns. The clustering may lead to wages being bid up in one member country at the expense of others.

2. Policy Making

2.1 The Depth of Integration

The simplest form of regional integration is the elimination of tariffs (or quotas) between member countries. Beyond this there is a wide range of policy options open to countries considering integration, many of which turn on the 'depth' of integration sought by member countries—ranging from modest trade liberalization, through full economic integration, to the formation of shared institutions.

The distinction between a free trade area and a

customs union, in which a common external tariff is set, has already been made. The latter involves greater sharing of sovereignty and requires establishing procedures for revenue sharing, but in return can yield much greater market integration. In a free trade area where countries set different external tariffs the free internal circulation of goods is impossible; border formalities have to be maintained to ensure that external imports do not all enter through the member with the lowest external tariff, for re-export to other member countries. Since these imports include intermediate goods that are further processed in member countries, in practice this involves enforcing complicated 'rules of origin' governing trade flows within the RIA. (The EU's agreement with Poland has 81 pages of small print in its rules of origin section, and NAFTA some 200, Krueger 1997.) These rules are not necessary in a customs union, enabling simplification—or elimination—of internal border formalities.

It is increasingly recognized that tariffs and quotas alone may be just a small part of the overall barriers to trade created by an international border. Rules of origin create frictions, and so too does contingent protection (such as antidumping rules, known to have a 'trade chilling' effect even when not used), duplicative customs procedures, differing national product standards, and simple border red tape. The cost of border formalities on intra-EU trade in the early 1990s has been estimated to be more than one percent of the gross value of internal trade, despite implementation of procedures to cut these costs; in many RIAs the costs of border formalities are much larger.

Furthermore, relatively minor border frictions may constitute large real trade barriers because it can be in the interests of firms to try and limit effective cross-border competition in order to maintain collusive market-sharing arrangements. This will prevent the 'scale and competition' effects discussed in Sect. 1.2 from being achieved.

Recognition of the importance of these barriers—and of the failure of more than 25 years tariff-free trade to truly integrate markets—was a motivation behind the 'deep integration' of the EU's 1992 Single Market Program (Flam 1992). The program involved adoption of almost 300 measures falling into the following five main types.

(a) Simplification and in some cases abolition of intra-EC border controls, involving, e.g., replacing border paperwork by an EU-wide system of administering value added tax on cross-border transactions.

(b) Adoption of the 'mutual recognition' principle for product standards, under which a product that can be legally sold in any EU country can be legally sold in all, thereby removing the need for expensive re-testing and re-certification of products.

(c) Progress towards deregulation of the transport sectors of EU countries, including measures to reduce restrictions on truckers from one country accepting loads in another.

(d) Opening of public procurement in EU countries to effective competition from suppliers in all EU countries.

(e) Deregulation of service sector activities, including opening financial services to competition and giving service providers and professionals the right of establishment in other EU countries.

Estimates of the gains from these measures range up to as much as 5 percent of EU GPD, although these are based largely on computable equilibrium studies rather than an actual survey of outcomes (see Baldwin and Venables 1997).

2.2 *Policy Reform and Commitment*

Trade policy reforms—and other sorts of reform—are often hampered by the expectation that they may be reversed. Adjusting to reform typically involves investments, but these investments will not be made unless investors are confident that the reform will persist. These problems are mitigated if a country has a 'commitment mechanism' guaranteeing that the reform will be durable, and membership of a RIA can, in some circumstances, provide such a mechanism (Fernandez and Portes 1998).

The commitment mechanism operates most obviously for trade policy—membership requires that tariffs with member countries be cut, and reneging on agreed internal liberalization is likely to bring swift retaliation by partner countries. However, it has been argued that RIAs are valuable as commitment mechanisms for a much wider range of measures. Although NAFTA was ostensibly about trade policy, an important part of its motivation was the desire on the part of both the Mexican and US governments to lock in the broad range of economic reforms that the Mexican government had undertaken in the preceding years. The EU Articles of Agreement with eastern European accession candidates are explicit in promoting 'full integration into the community of democratic nations.' And the intervention of other Mercosur countries is credited with having averted a military coup in Paraguay in 1996 (Survey on Mercosur, *The Economist*, October 12, 1996). Paradoxically, it is even suggested that the value of a RIA as a commitment mechanism is greatest in areas other than trade policy, because there is already a way committing to tariff reductions—the tariff bindings of the GATT/WTO.

3. *Regional Integration Agreements and the World Trading System*

The effect of regionalism on the world trading system as a whole has been the subject of extensive recent debate. Is the growth of regionalism part of a process towards global free trade, or is it a substitute for it,

damaging to multilateral negotiations and likely to lead to a situation of protected trading blocs? It is noteworthy that RIAs go against the fundamental principle of the GATT/WTO, the 'most favored nation' principle under which trade policy must be non-discriminatory. They are permitted only via Article XXIV of the GATT, which requires that they cover 'substantially all trade' of member countries and lead to external tariffs that 'shall not on the whole be higher or more restrictive.'

There are essentially three issues. First, does a given structure of RIAs create a force for more or less liberal external trade policy? Second, is there an inherent dynamic of RIA formation which will lead to ever larger RIAs—perhaps even a RIA of the whole world, giving global free trade? And third, is there evidence that the presence of RIAs has assisted or retarded progress in the multilateral trade system?

An insight into the effect of the number of RIAs on incentives to set external tariffs was provided by Krugman (1993) who noted that if tariffs are set to improve member countries' terms of trade, then they will be lowest—and consequently world income greatest—in two opposite circumstances. One is when there is a single world trade bloc containing all countries, i.e., global free trade. The other is when trade policy is set by many small independent jurisdictions, each so small as to have no market power and no reason to deviate from free trade. Between these extremes each trading bloc has an incentive to use external tariffs to try and improve its terms of trade, suggesting that a situation of relatively few large trading blocs might be the worst possible outcome.

This line of argument has been criticized from a number of different angles. From the theory side, it should be recognized that tariff setting is a repeated game, so the incentives to cooperate, or to deviate from cooperation, need to be taken into account (Bond and Syropoulos 1996, Winters 1998). From the institutional side, it has been pointed out that article XXIV of the GATT expressly forbids RIAs from raising external tariffs. And from the empirical side, no evidence has been found to suggest that RIAs are in fact prone to set higher external tariffs than are separate countries (Foroutan 1998).

What of the dynamics of RIA formation? Does adding a member country to a RIA increase the incentives for further countries to join, and will existing members be willing to permit unrestricted entry? A number of researchers have argued that the incentives to join increase as RIAs become larger—a phenomenon termed 'domino regionalism' by Baldwin (1995). This may be because of perception of growing benefits of membership, or because of increasing costs of being outside. These costs can arise as outsiders' terms of trade may decline (the other side of the members improving terms of trade referred to in Sect. 1.1). Perhaps more importantly, countries fear that firms may relocate, in search of the benefits of a larger market (evidence of foreign direct investment flows in Europe at the time of the Single Market Program suggests that this occurred, Baldwin et al. 1996). Another source of loss from nonmembership of RIAs is the risk of being isolated if a trade war occurs (Whalley 1998).

Although these arguments suggest a growing demand for membership of RIAs, it is less clear that this will be matched by a willingness to accommodate new members, at least within existing RIAs. The most important tradeoff here is between the benefits of 'deeper' integration, and the difficulty of achieving this with larger memberships. Thus, while the EU has continued to enlarge, worries about the difficulty of accommodating new entrants impedes progress. An important contribution to the ideas on regionalism was made when the Asia Pacific Economic Cooperation (APEC) forum announced the principle of 'open regionalism.' Although this term has been given a number of quite different meanings, the key idea is that of open access, whereby the RIA announces that any country willing to abide by its rules may join. However, at time of writing, the idea remains to be put to the test, since APEC itself has yet to develop as a RIA. Overall, then, it seems that regional integration does create its own dynamic, attracting further countries to want to join. But there is no reason to believe that all such requests should be successful, or that the end of the process is more likely to be a single world free trade area than it is to be a number of competing trade blocs.

Finally, are there any reasons to believe that the presence of RIAs has facilitated or impeded progress in multilateral trade negotiations? The argument for impedance hinges mainly on finite government capacity. Investment of time and effort in regionalism reduces the capacity of governments to invest in multilateral negotiation. On the other side, it is argued that regionalism can help, by reducing the number of separate negotiators (since members of a customs union negotiate as a single body)—an argument that begs the question of how members formulate their common position.

Also, it is suggested that regionalism has proved valuable by providing 'laboratories' for trying new approaches to issues of trade reform, particularly on more difficult issues. As for the track record of RIAs and multilateral negotiations, views are again divided, although there is a view that fear of fragmentation into regional blocs provided a spur for successful completion of the Uruguay round of trade negotiations (WTO 1995).

4. *Conclusions*

Joining a RIA is a major 'one-off' event for a country. It affects all aspects of the economy—goods prices, the structure of production, and income flows to different

economic agents. Generalizing about the implications of such occasional and large changes is inevitably difficult. Nevertheless, research has established the circumstances under which gains or losses are more or less likely, and drawn out the implications of this for the design of agreements (World Bank 2000). Future research needs to pay greater attention to strategies for developing countries, and the role of RIAs in assisting them to participate effectively in the world trading system.

International Trade: Geographic Aspects

1. Introduction

International trade is the physical movement and electronic transfer of goods and services across national borders. It includes the movement of commodities, such as natural resources and manufactured goods, and the transfer of services, such as personal

and commercial data, banking and financial transactions, and various other kinds of professional and business-related activities. These are important because they link local, regional, and national economies with the global economy, and in so doing serve as a conduit for the international diffusion and exchange of ideas and information, culture, technology, social and political institutions, managerial know-how, business cycles, and capital investment funds.

In order to understand the nature, evolution, and significance of international trade over time, geographers analyze specific attributes of trade flows. These characteristics of trade are usually defined as the *direction* of trade, which refers to the origins and destinations of trade; the *composition* of trade, which describes the specific goods and services being transferred; the *magnitude* or level of trade, which pertains to the value and/or volume of trade; and the *means* whereby goods and services are conveyed or transmitted, which may refer to specific trade routes or to competing modes of transportation and communication. The remaining sections describe the intellectual context of the geographers' interest in trade, and portray the changing emphases geographers have given to the study of international trade over the past several decades.

2. *Geographers' Inherent Interest in International Trade*

Geographers are interested in the various characteristics of international trade because they reflect the interrelationships that exist between local, regional, and national space-economies and the world economy. Examining the dynamics of trade enables geographers to forecast the interrelationships that exist between world trade patterns and global competitiveness, the internationalization and changing spatial structure of economic activities, global–local relationships, corporate strategy and government policymaking, and economic growth and development strategies.

More specifically, the intellectual context of the geographer's interest in international trade is based upon a set of traditional themes and characteristics of spatial systems that can be described as the 'geographical aspects' or 'geographies' of international trade. These core spatial concepts are *places* (e.g., cities, regions, and countries); *locations* in space (e.g., the absolute and relative locations of producers and consumers); *distributions* (e.g., spatial patterns of human activities, such as the international locations of manufacturing and agricultural production); *spatial interactions* (i.e., the movements and interconnections among places across space and over time); *scales of resolution* (i.e., units of observation, which may refer to individuals, corporations, or national governments); *change* over time (i.e., spatial and nonspatial outcomes of human behavior); *regions* (i.e., areas at varying spatial scales, such as regional trade blocs, that have common geographic characteristics and that can be utilized to examine the relationships between spatial processes and spatial patterns over time); and *potentially constraining factors*, such as the distance between buyers and sellers, or international boundaries, which may contribute to the differentiating characteristics of places, and which may increase the transactional costs of spatial interaction.

Examples of the questions that geographers ask about the attributes of international trade, which are designed to provide an understanding of the 'geographies' of trade, include the following: (a) To what extent does the distance, as measured by transportation and other transactional costs, between consumers and producers in different countries impact the direction and magnitude of international trade? (b) In what ways has the emergence of strong regional trading blocs and international institutions within the world economy affected the direction, composition, and magnitude of international trade in goods and services among nation-states? (c) What is the relationship between the magnitude and composition of a region's international trade and its long-term economic growth and development prospects? (d) As the predominant focus of global trading activities has shifted from the Atlantic to the Pacific, what changes have taken place, or may be anticipated, in the location and spatial distribution of economic activities at the local level within the countries of the North American Free Trade Association? (e) In what specific ways have globalization and the processes of internationalization changed the competitive relationships among metropolitan areas in the world, and how have these dynamics affected the direction, composition, and magnitude of international trade generated by these urban areas? (f) What is the relationship between shifts in the location and concentration of industrial production from the industrialized economies of the world to the newly emerging countries and the changing composition and growing importance of intra-firm and intra-industry trade? Over the years, questions such as these have guided geographers in their efforts to investigate the geographical aspects of international trade. In the following section, an overview of the legacy of these efforts is set forth.

3. *Evolution and Diversity of Research by Geographers*

The history of research on international trade by geographers since the 1970s or so has progressed from a period when little or no interest has been visible to one that during the decade of the 1990s has been marked by heightened and redirected activity by an increasing number of researchers. In general terms, this legacy has emphasized two approaches. Prior to the early 1990s, most of the research has been focused

upon describing various individual attributes of the international trade system, with little emphasis upon developing an integrated, theoretical body of knowledge. In contrast, more recent research has been well grounded in theory and focused upon the geographies of international trade at different spatial scales.

3.1 Early Perspectives

Prior to the late 1980s, most of the research on the geographical aspects of international trade can be characterized as infrequent and generally descriptive in nature, with an emphasis upon commodity movements between nation-states (see McConnell 1970, 1986 for reviews). Among the investigations carried out by geographers during this early period are studies of the development of international ports, overseas trading routes, and econometric models designed to explain the direction and magnitude of country-to-country trade flows. These models attributed the spatial patterns of international trade to variations in levels of gross national product, population size, distances between countries, and so-called trading preferences, which were usually based upon the membership of individual countries, in particular trading blocs.

With few exceptions, therefore, most of the pre-1990 studies are focused upon trade as country-to-country commodity flows, with little attention given to the evolving theory of international trade that was being advanced by economists and researchers in international business schools. As noted by Johnston (1989, p. 400), '… the explanatory content [of these studies] is weak; they can tell us what the world is like, but not why it is like that.' Moreover, little recognition is given to the importance of corporate-level decision making in efforts to explain the movement of goods and services across international frontiers. Finally, most of the research during this period pays little attention to the rapidly changing global economy and the interrelationships between such dynamics and the geographies of subnational places and space.

3.2 Recent Investigations

Beginning in the early 1990s, geographers have begun to intensify their interests in international trade and have been approaching this research utilizing two potentially interrelated perspectives, which are differentiated primarily by their spatial scales. One approach examines the international trade system from a macro perspective, focusing upon the flow of goods and services among nation-states. In contrast, a second area of research views international trade from a micro perspective, and examines the relationships and interdependencies between the dynamics of the global economy and subnational economies. In both of these approaches, however, the empirical research is strongly grounded in the evolving theory of international trade. The principal characteristics and representative studies of each of these two bodies of research are presented later.

The *macro-oriented* studies examine the changing spatial structure of the global trading system by emphasizing the decisions and activities of nation-states, groups of nations allied within regional trading blocs, or countries at different stages of economic and industrial development. Most of this research is focused upon the relative importance and consequences of the regional trading blocs that have emerged since the 1940s in North America, Europe, and Asia (Michalak and Gibb 1997); the formulation of econometric models that are designed to account for statistical variations in the patterns of country-to-country trade flows (O'Loughlin and Anselin 1996); and the role of international trade, and particularly the role of government trade policies, in advancing the economic growth and development of nation-states (Gwynne 1966, Poon 1994).

An example of this research is the work by Poon and Pandit (1996), which questions the suitability of the nation-state as the relevant spatial scale for analyzing the international trade system. Following a detailed statistical analysis of inter- and intrabloc trade in 1970 and 1990, the authors identify two regional hierarchies that are emerging in the spatial structure of world trade: a Pan-Eurasian region state, which consists of Europe, the former USSR, and Africa; and a Pan-Pacific trade region comprising Asia and North and South America. Contrary to expectations, they find that trade is increasing between these two region states, which supports the premise of the new trade theory that scale economies and large, efficient markets are the major forces underlying the existing international economic system. Moreover, rather than moving toward a more closed, protectionist trade environment, which has been suggested by others, these emerging region states are outward looking spatial entities that are fostering a more open, global trading environment.

In contrast to the macrobased analyses, the *micro-oriented* investigations are typically designed to explore the interrelationships that exist between the dynamics of the global trading environment and subnational space economies. Particular attention has been focused upon states, regions, technology districts, metropolitan areas, and industry sectors within particular countries. The underlying assumption of this perspective is that the global and local space economies are intertwined, with domestic markets becoming increasingly internationalized and affected by forces beyond their national borders. At the same time, however, the individuality and uniqueness of specific sub-national places contribute in important ways to the international competitive advantages of their local business establishments and to the orien-

tation, composition, and magnitude of the international trade that is conducted. Given the increased importance of international trade to local economies, it is not surprising that politicians and business leaders are interested in ways in which this segment of the local economy can be enhanced. Hence, many of the micro-oriented studies by geographers have raised normative questions about trade policy and trade-promotion efforts under the constraints of globalization.

Several studies are representative of the micro-level emphasis. Research by Erickson (1989) and Leichenko and Coulson (1999) explores the relationship between the industrial growth of states within the US and changes in the value of the foreign export shipments and direct export employment of these states. The more recent study tests a basis tenet of the new international trade theory that a bidirectional causal relationship exists between exports and regional economic growth at the state level. In other words, the model forecasts that a strong regional economy promotes exports, and exports, in turn, promote the regional economy. The theory also postulates that the growth of certain scale-sensitive industry sectors will be more strongly tied to export growth than will others. The study confirms the complex relationship that exists between state industry growth and exporting, and finds that the relationship is indeed sector dependent; in other words, some sectors, such as electronics, chemicals, instruments, paper, and wood products are good candidates for export promotion programs, while other sectors are less likely to respond favorably. In short, this study contributes to the theoretical literature on international trade and regional growth, and, at the same time, endeavors to provide practical guidelines to local government policymakers regarding the relationship between trade and industry policies.

Another example of this more recent research is a study of the impacts of intensified international trade on regions and metropolitan areas in the US (Noponen et al. 1993). The authors examine how the forces of international trade have shaped the changing location and geographic concentration of various industries in the USA, and how this geography has impacted the economic wellbeing of people living in regions throughout the country. By investigating the recent history of the steel, auto, insurance, machine tool, shipping, and pharmaceutical industries in the USA, the authors conclude that the size and location of these industrial sectors are not the result of natural comparative advantages or domestic cost differentials, as theory would suggest. Instead, they are the result of the US government's free trade policies and similar strategies in other nation-states. The study also concludes that the economic fortunes of places within the country are closely tied to the worldwide system of trade agreements, and that the US government has played a major role in developing and sustaining industrial leadership and international competitive advantage in these key industry sectors.

Finally, two additional pieces of research are representative of research that is designed to demonstrate that despite the forces of globalization and internationalization operating in the world today, sub-national places and spaces continue to possess enormous power in shaping not only the geographies of the domestic space economy, but also the international economic system. Storper (1997) makes the case that regions within nation-states continue to play a key role in the composition of international trade. Focusing attention upon production systems that are organized to carry out continuous product innovations, such as the production of scientific instruments and aircrafts, the author argues that such systems are located in highly concentrated and distinctive sub-national regions—agglomerations that he labels as 'technology districts.' The wealth of human and resource assets of these regions creates specific advantages that enable local business establishments to compete successfully in the international marketplace.

A similar argument about the relative advantages of local space economies is advanced by Clark and O'Connor (1997). The authors examine the global operations of the financial services system and conclude that the geography of specific places shapes these global markets. The power of 'local' is attributed to the informational content of financial markets that is embedded in the local markets. In particular, well-structured international financial systems are dependent upon locally specific information networks of producers and the monitoring of firms' financial and investment performances. In other words, the effect of geography in the trade of financial services is its impact upon the production and content of information at the local level. Thus, the geographic aspects of place and location have a direct impact upon the international operations of this particular service sector.

4. *Epilogue*

The recent emphasis by geographers on research that is designed to advance theory-building and to examine further the interrelationships that exist between the dynamics of the global economy and national and sub-national space economies is encouraging. By focusing upon place and space at different spatial and temporal scales, and by recognizing the interdependence of geographic scales, geographers are in a favorable position to advance our understanding of the processes that underlie the geographic aspects of international trade and to forecast more accurately the impacts these processes are likely to have on national and regional economies at different spatial scales.

Future research by geographers on the geographic aspects of international trade may be expected to

explore the six questions put forth earlier as well as the following concerns: (a) Researchers are just beginning to investigate the dynamics of international trade in services. Given the increased importance of this sector within the global economy, more research is needed to understand the influence trade in services is having upon places and space economies. (b) In addition, the interdependence of spatial scales is a two-way process: the geographies of places are outcomes of the diversity of processes, and yet these places are part of the processes themselves. For example, economic and political processes operate across spatial scales and cannot be fully understood when looking at a particular scale in isolation. Therefore, more research is needed to understand how these processes are related to international trade and how they interact across geographic scales. (c) Attention should also be given to the steps that can be taken by local places to strengthen and exploit their local assets and relative economic and political power in the global system. This seems especially important in the coming years for metropolitan areas, which are increasingly the primary actors in the global trading environment.

Internet: Psychological Perspectives

A remarkable transition in the penetration of computing and communications concepts into the routines of both professionals and the public has been seen since 1990. It is arguable that no other innovative technology (such as radio, television, video recorders, or fax machines) has entered the societal consciousness as rapidly and pervasively as has the Internet and its most famous application, the World Wide Web. As recently as 1990, the Web was unknown and the Internet remained largely the domain of academics, scientists, and government agencies. Today it is rare to see a television commercial that does not provide a Web address for the company; electronic commerce constitutes a multibillion-dollar economy on the Internet; the Web has penetrated the educational system at all levels (including K-12 classrooms in the public schools); and it is common for individuals to turn first to the Internet for information that they once would have sought from friends or from libraries—or failed to find at all.

The Internet and the Web have also profoundly affected the conduct of science. First, these technologies now support new kinds of scientific cooperation and distributed collaboration, with major implications for the conduct of research in cognitive psychology and cognitive science. Second, the societal changes that are resulting from the technology are rich areas for study and analysis by cognitive scientists. This article offers brief introductions to both these topics.

1. A Brief Internet Tutorial

Like the international telephone networks and the banking infrastructure for electronic funds transfer, the Internet is technically complex. Yet, like the telephone and ATM machines used to access those other networks, the basic user interface for the Internet (and especially the browser concept used for the Web) is simple and requires no detailed understanding of the network's technical underpinnings. A few basic principles can support a robust conceptual grasp of the Internet and the Web; once a user understands these notions, conquering the Internet and the Web can be straightforward.

The Internet is made possible by collegial agreements on standards for networking connectivity and information exchange; individual networks can connect to the Internet (and access machines on all other networks that are connected to the Internet) if they agree to abide by the standards that assure compatibility. The individual networks in the Internet must use a standard protocol for exchanging information, and this is known as the Internet protocol (IP). Coupled with another standard known as the transmission control protocol (TCP), these two standards are now the dominant communications protocols for all networking. References to TCP/IP indicate that a network has adopted the Internet standard for communications.

The World Wide Web is only one application on the Internet. Others include electronic mail, file transfers, news groups, and remote login to computers. The basic protocol that supports the Web is known as the hypertext transfer protocol (or HTTP). Addresses for sites on the World Wide Web are known as uniform resource locators, abbreviated to URLs. If you know the URL for a site of interest, it is trivial to 'visit' that site by typing the address into a Web browser on a machine that has been connected to the Internet. Access to Web pages can also be simplified by allowing a user to click on an active area or *link* on one page, which automatically requests the retrieval of the associated page, even if it is on a different computer somewhere else on the Internet.

2. *Internet Support for Collaboration*

With the recent emergence of distributed cognition as a framework for considering group decision making (see *Cognition*, *Distributed*), there has been increasing research regarding the role of technology in supporting cognitive activities distributed among a number of agents, potentially consisting of both humans and machines. This perspective emphasizes understanding the role of computers and technology, including the Internet, in the context of workplaces and for tasks that often involve collaboration.

Two new disciplines have emerged as a result of this trend. One is computer supported cooperative work (CSCW), concerned with developing new technologies to support work among members of groups. The other is computer mediated communication (CMC), concerned with the psychological, sociological, and cultural aspects of computer based collaboration. Combined with the disciplines of computer science and psychology, CSCW and CMC form the basis for a multidisciplinary perspective for studying human interaction with technology. Use of the Internet to support communication and collaboration is a natural extension of such work.

In many problem-solving domains, the immensity of the research challenges, coupled with the opportunities for redundancy when research is not coordinated, have led to recognition of the need for multi-investigator and multi-institutional collaboration (Cerf and The Committee on a National Collaboratory 1993). Internet-based collaboration can allow groups of researchers at diverse locations to share resources, to pool expertise, and to offer standardized programs and tools for use at their local sites (Kouzes et al. 1996). Formal experimental work has been undertaken accordingly to understand better the impact of the Internet when scientific collaborators are geographically distributed (Patel et al. 1999, Shortliffe et al. 1998). Results from such studies suggest changes in skills required with this new medium of communication, and hence the implied challenges for education and training.

The collaboratory notion has emerged as a cohesive aggregation of individuals and institutions that work towards a common set of objectives across disparate geographic locations (Cerf and The Committee on a National Collaboratory 1993). One of the central goals of a collaboratory is to create a synergistic and interdependent research entity whose whole is greater than the sum of its parts. At present, collaboratories can best be construed as grand-scale social experiments in the development of collective intelligence, 'as if the conceptual object were produced by a single good mind' (Smith 1994). Evidence suggests that, although computer mediated collaboration is a difficult enterprise, fraught with numerous cognitive, cultural, social, and technical challenges, effective network supported collaboration at a distance is attainable (Patel et al. 1999).

3. *The Internet as a Subject of Study*

As with all computing technology, effective use of the Internet requires attention to cognitive issues in the optimal use of computers, but the distributed nature of the environment has created certain unique elements that distinguish the Internet and its use from other computing and communications environments.

3.1 *Human–Computer Interaction*

An important challenge in the development of technology based environments, including those delivered via the Internet, is the design of effective user interfaces. The World Wide Web provides an unprecedented opportunity for the widespread access to information in professional domains. However, as the number of sites increases, both professionals and lay people are finding themselves overloaded with a wealth of information that is in need of automated filtering.

A number of additional issues center around human factors and cognitive issues related to meeting the

information needs of extremely varied audiences and end-users. For example, in healthcare these users range from medical specialists to patients, each having varied background knowledge (Patel et al. 2000). The development of methods for evaluating Internet applications regarding their effectiveness and utility, even though these systems are accessed from locations ranging from the workplace to the home, is accordingly an immense challenge. Work in this area typically addresses the application of usability–engineering methods, including advances in the remote recording and analysis of end-user interactions with web-based systems.

3.2 The Social Consequences of the Internet

The Internet has permeated almost all facets of life. The societal transformations are likely to be immense and somewhat unpredictable. Much has been written about the potential consequences and promises in the area of healthcare (Shortliffe 1998). Education is another arena in which the Internet is likely to produce profound changes. The new networking technologies not only afford great opportunities for distance learning, but are also beginning to have a substantial impact in the classroom. Perhaps this impact is most strongly felt in science education, where new tools allow instant access to a wealth of information resources plus collaboration with peers and experts (Linn et al. 1998). New computer mediated collaborative learning paradigms are beginning to emerge (Koschmann 1996). However, the benefits of such an approach over traditional classroom practices has yet to be clearly established.

How does Internet use affect social and psychological well being? Kraut and colleagues (Kraut et al. 1998) studied 93 families (256 individuals) who were provided with free Internet access for two years in Pittsburgh. The results indicate that as people used the Internet more, they reported communicating with fewer friends and spent less time with their families. These subjects also experienced more stress, reported feeling more lonely and depressed even though interpersonal communication was their most important reason for using the Internet. The authors concluded that despite the remarkable advantages afforded by this new medium, it could cause too much disengagement from real life. Individuals need to moderate their use of this technology and endeavor to strike an appropriate balance.

4. Requirements for New Human Abilities

If information becomes more readily accessible in the near future, will the need to engage in effortful learning be diminished? If answers to questions can be obtained more easily through the Internet, will it be as important to have such knowledge in one's head? Many scientists believe that diminishing one's knowledge base or skills is inappropriate despite these new technologies for knowledge access. Individuals will have to be capable of discerning relevant from irrelevant information (filtering) and interpreting information within a particular context. A clear lesson from a number of years of cognitive science and artificial intelligence research is that prior knowledge critically shapes one's perception of new information. In general, the better one's understanding of the domain, the more useful and powerful information-finding resources are likely to be.

Yet new skills for technology use are clearly needed. In the world of rapid technological change, no workplace has all the skills today that are going to be needed in 20 years from now. As a result, people have begun preparing for these new skills now, such that they are continually being updated with the changing society. Literacy will need to evolve continuously, since emerging technologies are increasingly part of the routine fabric of life.

Interorganizational Relationships and Networks

1. Interorganizational Relationships and Networks

The study of interorganizational relationships and networks focuses on the antecedents, patterns, content, forms, and outcomes of longer-term ties among organizations, be they suppliers, customers, competitors, or other entities. Research on interorganizational relations with regard to the level of analysis mainly concentrates on individual organizations and their bilateral linkages, both vertical and horizontal. Objects of study include, for example, alliances, joint ventures, and long-term supplier or customer relations. Research on interorganizational networks focuses predominantly on the overall patterns of relationships among a larger group of organizations and their members. For example, it examines social networks among members of different organizations, interlocking directorates, or regional firm and industry clusters.

Studies of interorganizational relations and networks have their roots in three distinct research traditions. A tradition of business research, mainly in the fields of strategic management and organization science, predominantly in the form of studies of interorganizational relationships. Emerging since the 1980s, this research tends to focus on the reasons for collaboration between organizations, on the particular forms of collaboration, and the impact on participating organizations.

In research on interorganizational networks, there exist two broad perspectives. The tradition of social network analysis is mainly founded in social-psychology and sociology. In particular, it stems from sociostructural analysis, namely sociometry, developed from the 1930s. This research concentrates on how the structural patterns formed by the relations that exist among multiple actors (be they organizations or individual organization members), and an actor's position within a network, influence the actor's behavior and performance. Implications of networking for individual actors thus constitute the focal point of these studies. The research tradition highlighting clusters of organizations, mainly based in economics, economic geography, and sociology. This literature focuses on the emergence, functioning, and effects of local agglomerations of co-specialized firms, including supporting institutions such as educational or financial organizations.

Viewing recent developments in the field of research on interorganizational relations and networks, it seems that the disciplinary boundaries separating these three research traditions have become more permeable. Scholars from all three research traditions have begun mutually to recognize their research and to adopt concepts and methods from one another. Specifically, organization and strategy researchers have begun to acknowledge that the way in which organizations are embedded in wider networks of relationships and in specific institutional contexts enables and constrains organizational behavior. Researchers exploring local clusters of firms have likewise investigated how social networks impact on the functioning of such clusters. Finally, social network analysis has begun to complement its traditional focus on network analytical methods by theoretical insights often derived from strategy and organizational research. Nevertheless, the following sections will discuss the three noted research traditions separately, as sufficient differences remain between them.

2. Interorganizational Relationships

The phenomenon of interorganizational collaboration is not new. Since the 1980s, however, one could witness in many industries a fast proliferation of joint ventures, alliances, consortia, and other forms of collaboration that has triggered a burgeoning literature (see *Alliances and Joint Ventures: Organizational*). Among the prominent research questions addressed by this research are the following: Why do firms engage in interorganizational cooperation, and when? With whom are firms likely to ally, and why? How do firms organize and manage their cooperative relationships? What are the outcomes and implications of particular forms of interorganizational relationships for the participating firms and for third parties?

2.1 Motives

Actors' motives for engaging in interorganizational relationships can be quite varied (see Glaister and Buckley 1996). Some firms cooperate in order to collude against common rivals or reduce competition by binding competitors as allies. Others use cooperation in an attempt to access needed resources and/or capabilities in order to enhance their competitiveness, e.g., in terms of improved products, better or wider market access, or faster market entry. Moreover, the formation of interorganizational relationships is seen as a means of fast, effective, and efficient learning, thus short-circuiting the process of acquiring and appropriating knowledge. In addition, cost savings in various ways can motivate the formation of interorganizational relationships. Through joint research, procurement, production or marketing, firms strive

to realize economies of scale and/or scope. Furthermore, firms can also cooperate in order to achieve specialization benefits, when they decide not to engage in the full spectrum of a particular product's value chain but to specialize in particular stages of production, and then to cooperate in the provision of the final product. A better information flow and improved coordination of resource flows among cooperating firms can also lead to cost and time savings. Finally, reduction of risk and uncertainty represent motives for forming interorganizational relationships when organizations seek to spread financial or other risks, for example when shouldering (mostly large) innovations or other projects (Nohria and Eccles 1992).

2.2 Forms of Interorganizational Relationships

There exists considerable variation in the formal and informal structure of interorganizational relationships. Research has suggested numerous and diverging conceptualizations and measurements in order to capture this variety. Perhaps the most widely used conceptualization refers to the contractual and organizational arrangements by which collaborating firms govern their relationship. Specifically, different forms of collaboration are distinguished on the basis of the distribution of ownership- and decision-rights between the parties, and the coordination mechanisms employed in the relationship. In this vein, research distinguishes more hierarchical, hybrid and more market-like forms of governance (Ebers 1997, Powell 1990; see *Hierarchies and Markets*). Other conceptualizations focus on the collaborators' motives, the types of resource interdependencies that exist between the collaborating organizations, or on the norms, rules and processes that characterize the collaboration.

2.3 Consequences of Interorganizational Relationships

Compared to the numerous studies on the antecedents and forms of interorganizational relationships, the consequences of interorganizational relationships for the collaborating firms, let alone for third parties such as consumers, have received considerably less scholarly attention. Depending on the specific rationale and design of a relationship, interorganizational collaboration may enhance firms' innovativeness through mutual learning, augment their resource base and capabilities through privileged access to their partners' knowledge and resources, enhance their reputation through association with reputed partners, or improve their cost position through better coordination of interdependencies and production cost savings. However, as a consequence of collaborating, firms may also experience an erosion of their competitive position by imitating or faster-learning partners. Moreover, lock-in effects of collaboration may impede necessary adjustments due to partner-specific investments and limited access to new information. In addition, a number of studies have addressed indirectly some consequences of interorganizational relationships by studying the stability and termination of interorganizational relationships (Doz and Hamel 1998).

2.4 Theoretical Approaches and Methods

As in the field of organization studies as a whole, research examining when, why, how, and to what effects organizations engage in interorganizational relationships has employed a number of different approaches and theories. Most prominently, these include resource dependence theory, organizational economics, industrial marketing and purchasing, strategic management, and institutional theory (see Oliver and Ebers 1998). Resource dependence theory views interorganizational relations as a means for securing needed resources and of enhancing control over resource supply. Power relations and the effective management of resource dependencies are at the center of researchers' interest. Organizational economics approaches, mostly informed by agency or transaction cost theory (see *Transaction Costs and Property Rights*), offer comparative assessments of various forms of interorganizational relationships. These stress the economizing effects of particular arrangements that result from an alignment of particular transaction and actor attributes with contractual and organizational features of the relationship. Industrial marketing and purchasing approaches, often with regard to technological collaboration, study how the resource, informational and social interdependencies that exist between the collaborating organizations impact on their behavior (Håkansson and Snehota 1995). Scholars from the field of strategic management focus on the exchange and allocation of resources and information within interorganizational relationships, and on how interorganizational relationships can be utilized for improving a firm's conduct and profitability (Jarillo 1993). Neo-institutional theory, by contrast, emphasizes ideological and cultural factors. This school of thought views interorganizational relationships in the context of organizations seeking support and legitimacy. It studies how legitimacy pressures, social institutions and institutionalized behaviors shape the forms and functioning of interorganizational relationships. With regard to methods employed, case study and survey research dominate the study of interorganizational relationships. Longitudinal studies are still rather rare, as are experiments and simulations.

3. Interorganizational Networks: Social Network Analysis

Social network analysis views interorganizational networks as a set of linkages (e.g., resource, friendship, informational ties) among a set of actors (individuals,

groups, or organizations). Social network analysis offers various algorithms designed to describe and analyze positions of nodes within, and structural properties of, interorganizational networks. The basic aim of this research tradition is to understand how the overall structure of an interorganizational network, and an actor's position within that network, provides opportunities and constraints for actors' behavior (see Scott 1991; see also *Network Analysis*). Compared to research on interorganizational relationships, this strand of research thus pays more attention to the overall embeddedness of organizational and individual actors in networks of relationships than to individual attributes of the actors and of their individual relations.

Social network analysis suggests two broad ways in which overall structural features of social networks influence actors' behavior. First, particular network structures and positions have implications for the information that is available to actors and thus shape their decision-making and behavior. Second, particular network structures and positions in various ways invest actors with, or deprive them of, power to exert control over other actors. Such power may stem, for example, from utilizing informational advantages, privileged access to other actors, invoking obligations associated with particular relations, or from being able to mobilize sanctions by third parties (see Burt 1992).

3.1 Principal Methods of Network Analysis

Simulation and experiment represent important methods within social network analysis. However, more and more social network analysts have begun to complement these traditional methods with survey research and sometimes ethnographic analysis. Important concepts that have been explored include network and actor centrality (i.e., measures of the connectedness of actors within a network); measures concerning structural properties of networks such as the density of a network (indicating the number of established ties in relation to the possible ties among the actors in a network); and the concept of clique (denoting a subset of actors within a network all, or most, of whom are directly tied to one another); or similarity measures: for instance, structural equivalence (two actors occupy structurally equivalent positions if they entertain identical linkages with the same third parties in the network) (see Wasserman and Faust 1994).

3.2 Major Research Subjects

Prior to the 1980s, the bulk of research in social network analysis concentrated on developing and analyzing mathematical models of social structures and ensuing behaviors. Since then, however, there has been a proliferation of studies that apply these models to empirical phenomena (see Mizruchi and Galaskiewicz 1993). Two issues in particular have received considerable attention: interlocking directorates and social capital.

3.2.1 Interlocking directorates. This research studies how the composition of firms' boards of directors influences firm behavior. If firms' directors sit on the boards of other firms, the directors of which in turn sit on the boards of other firms, this creates interlocking directorates. There exist several competing views as to the role that such interlocks play. However, many scholars suggest that interlocks represent an indicator of social relations among organizations, and of the extent to which firms are integrated into particular networks. Research has shown that interlocking directorates influence, for example, the use of 'greenmail' and of 'golden parachutes' policies for top management, the prevalence of structural defenses against takeover attempts, participation in mergers and acquisitions, and other elements of firm strategy such as the extent of research and development and the form of firm financing (see Mizruchi 1996).

3.2.2 Social capital. The notion of social capital originates from community studies that highlighted the role of strong, intense personal relationships among the members of a local community that invested them with mutual trust and the power for collective action. Social capital endows actors with a credential that entitles them to credit, and with a resource that can be utilized in action. At least two competing conceptualizations of social capital can be distinguished. A *structural view* sees social capital as a function of the information and control advantages that an actor enjoys who is in a broker position between otherwise unconnected actors; this position exploits a 'structural hole' in a network (Burt 1997). A *relational view* sees social capital as a function of the intensity and extensiveness of personal bonds among actors. In this perspective, strong ties among actors, intense relationships characterized by mutual trust, a sense of obligation, common norms and expectations, create social capital on which the respective actors can draw (Coleman 1990).

In examining the consequences of social capital, research has identified two main effects. First, social capital can be utilized for increasing the efficiency of action through increasing the efficacy of information diffusion. Strong ties and intense relationships among

actors that share many characteristics make information exchange easier and less ambiguous; likewise, exploiting the position of a structural hole enables a more efficient diffusion of information, because redundant contacts are minimized. Second, social capital can be utilized as a productive resource that enhances actors' goal achievement. This can be realized, for instance, by exploiting the position of a structural hole for learning about, and exercising control over, more rewarding opportunities; for instance, with regard to career advancement or firm profit. Likewise, in densely connected networks characterized by strong ties among actors, information about actors' behavior is disseminated quickly and evaluated on the basis of similar norms; thus, behavior can readily be socially sanctioned, cooperation is enabled and opportunism constrained. Interorganizational networks whose members command significant relational social capital were thus found to thrive and prosper.

4. *Interorganizational Networks: Clusters of Organizations*

It has long been a well-known phenomenon that firms are not evenly distributed in geographic space but to a greater or lesser extent cluster locally. From the streets and quarters occupied by specialized trades in medieval towns, to the diamond-cutting industry of Antwerp and Tel Aviv; the coal and steel industry in the Ruhr, Lothringia and Silesia regions; the cutlery industry in Sheffield and Solingen; the financial services industry in London and New York City; to the software industry in California's Silicon Valley, firms during different periods of time have formed regional or local clusters. While regional interorganizational networks thus by no means are a novel phenomenon, research interest in regional interorganizational networks since its inception in the late 1800s (Marshall 1920) has experienced a revival beginning in the 1980s.

4.1 *The Formation of Clusters*

The literature identifies two broad reasons why firms, together with some supporting organizations, cluster regionally or locally. First, through clustering firms can realize agglomeration economies. These result from both urbanization advantages and localization advantages. Urbanization advantages include economies of scale with regard to a shared infrastructure (e.g., for communication or transport), economies of scope (e.g., technological spillovers and informational externalities), specialization benefits (leading to technological or skill advantages), and transaction cost savings (e.g., reduced search costs for buyers and suppliers) (Krugman 1995). Localization benefits comprise most importantly easy access to locally concentrated resource inputs (e.g., raw materials, specialized skills, specific attitudes of a local workforce, or co-located suppliers). A related line of reasoning stresses that clustering among firms is enabled and supported by regionally embedded institutions such as chambers of commerce, employers' unions, banks, science parks, universities, and training centers. These institutions often provide important resources, e.g., capital or access to distribution channels and potential customers. Moreover, they often act as informational brokers that support the exchange of information among firms, encourage and facilitate mutual learning, and can thus foster the responsiveness, adaptability and innovativeness of networked firms.

Second, relational advantages emanating from the business and social relationships among geographically concentrated firms and individuals can also foster clustering. Vigorous competition from nearby competitors and face-to-face contact with demanding local customers can put pressure on the competitiveness and innovativeness of firms. Frequent contact with employees from rival firms and their products can further mutual learning. Family and friendship ties among local business people, common membership in local trade associations, sports clubs and political institutions can be a source of knowledge and learning and provide better access to resources, e.g., capital and political influence, that are required for successful business development. Moreover, intense social ties, behavioral norms and routines may smooth cooperation, enable the exchange of tacit knowledge, encourage a ready and more trustworthy exchange of information among network members, and may thus support mutual learning and innovation (Porter 1990, Lane and Bachmann 1998).

4.2 *Outcomes of Local Clusters*

In line with these driving forces, research has identified a number of consequences associated with regional clusters of firms. Perhaps the most widely debated outcome concerns the increased competitiveness of regional cluster firms. Two major driving forces can be identified. On the one hand, clusters enhance competition through intense competitive pressure from nearby rivals and customers; this puts high pressure on firms and their employees to compete. On the other hand, localization and relational benefits provide competitive advantage over nonclustered rivals.

A second theme widely discussed in the literature concerns learning and innovation advantages. Local proximity and shared norms and traditions are said to allow for better cooperation even among rival firms, and to promote technology and informational spillovers. Together with competitive pressure, this can

contribute to enhanced incentives as well as opportunities for learning and innovation. In addition, it is noted that clusters of small co-specialized firms that can flexibly recombine their resources and capabilities can be lighter on their feet than larger, more integrated competitors. Collectively, these firms are therefore said to be able to adapt more quickly to changes in demand, both quantitatively and qualitatively (Piore and Sabel 1984, Nooteboom 2000).

Both postulated effects make regional clusters a favored theme in discourses on regional economic development. Endogenous growth and development of regions as well as sustained regional competitiveness are among the promises that have been associated with regional clusters (Staber et al. 1996).

However, there is evidence from research that the above-noted effects of regional clusters can, but need not necessarily, arise. There exist numerous examples of clusters that thrived at one point in time, only to fail later. Many coal and steel regions in the USA and Western Europe have shared this fate, as has the once admired mini-computer cluster along Route 128 in Massachusetts, USA. Several factors may contribute to the decline of regional clusters. Some of these are inherent to the functioning of regional clusters, some associated with external developments. They include: failing demand for a cluster's product, obsolescence of particular modes of production, competition from similar clusters in other regions, loss of the ability to coordinate co-specialized activities, and inertia due to a loss of developmental abilities. As this debate about the consequences of regional clusters for the participating firms and their respective regions shows, performance evaluations of business networks and regional districts are extremely difficult and problematic.

4.3 Methods and Approaches

Most research to date builds on case study evidence. A large number of conceptual studies engage in transferring more general insights from particular disciplines, for instance, economics or sociology, to the field of regional clusters.

At the end of the nineteenth century, economics was among the first disciplines to analyze the phenomenon of regional clusters. Paradoxically, the increasing globalization in the 1980s revived interest in internationally competitive, regional clusters, both in economics and economic geography (Porter 1990, Krugman 1995). Evolutionary economics developed a particular interest for the learning and innovation characteristics of regional clusters (Nooteboom 2000) that is also shared by the innovative milieu approach (Maillat 1991). Pioneered by the work of Piore and Sabel (1984), sociology too took note of regional clusters, particularly of so-called industrial districts. The new industrial spaces approach to interorganizational networks (Storper 1997) builds on this tradition. Piore and Sabel's work was further complemented by institutional theory sociologists, who emphasized the social and institutional structures underlying regional clusters (Herrigel 1996). One important branch of this work concentrates on national and regional systems of innovation (Lundvall 1992). Despite a network approach within cluster research that emphasizes the importance of social bonding and social networks (Fisher et al. 1999), however, compared to the research on interorganizational relationships and social network analysis, in research on regional clusters cross-disciplinary dialogue seems to be far more uncommon.

Interpersonal Attraction, Psychology of

In this article we consider the nature and history of the study of interpersonal attraction in social psychology; theoretical perspectives on attraction; predictors of attraction, including perceiver, situational, and dyadic factors, and characteristics of the object of attraction; and future research directions.

1. *What Is Interpersonal Attraction?*

Interpersonal attraction is traditionally defined in social psychology as a positive attitude or evaluation regarding a particular person, including the three components conventionally ascribed to attitudes: behavioral (tendency to approach the person), cognitive (positive beliefs about the person), and affective (positive feelings for the person). Another approach treats attraction as the desire to form a friendly or romantic relationship with a particular person. Attraction is often treated as equivalent to liking. Loving, particularly being 'in love,' with someone, is sometimes seen as a very strong or special kind of attraction—'romantic attraction'—including exclusivity and sexual interest. Attraction in the above senses is distinguished from attractiveness—characteristics of people such as good looks or desirable personality that make others be attracted to them.

2. *History of the Study of Interpersonal Attraction*

Social psychologists have focused mainly on friendly and romantic attraction between previously unacquainted peers, with most research being conducted in North America. The first major research programs, conducted in the 1960s, consisted mainly of experiments on the effects of perceived attitude similarity and, to some extent, appearance. Interest in attraction between strangers largely waned by the mid-1970s as researchers became more interested in ongoing relationships. However, a new wave of research, beginning mainly in the mid-1980s, focused on a possible evolutionary basis of mate selection, and on the specific facial and bodily features that are normatively seen as attractive. Among the most recent systematic reviews of the attraction literature are a textbook chapter by Simpson and Harris (1994) and a section of a chapter by Berscheid and Reis (1998) in the most recent *Handbook of Social Psychology*. Shorter reviews of this literature are included in most social psychology and personal relationship textbooks.

3. *Theoretical Perspectives on Attraction*

The most influential theory in the early period of studying attraction, put forward by Byrne (1971) in relation to his large and successful research program on perceived similarity effects, is based on classical learning theory approaches: we are attracted to those who provide valuable rewards. Thus Byrne argues that one is attracted to someone perceived to share one's attitudes because it is rewarding to be agreed with. Other theorists have used reward approaches to explain why people are attracted to those with good looks (e.g., aesthetic values and that we gain status from being seen with them; Hatfield and Sprecher 1986). Recently, Aron and Aron (1997) posited that people are attracted to being in relationships with people who provide, specifically, the reward of 'self-expansion'—increasing one's potential efficacy by being able to include in one's self the others' desirable resources, perspectives, and identities.

A competing, influential theoretical approach from the early period of studying attraction is based on Gestalt-influenced cognitive models. For example, balance theory, and especially Newcomb's (1961) A-B-X model, posits that people are attracted to similars because people spontaneously organize cognitive elements in a balanced fashion. If person A has a positive relation to attitude object X, and A knows that person

B also has a positive relation to X, then A's cognitive elements will be balanced only if A has a positive relation to B. (Balance theories also predict that A will like B if both A and B have a negative relation to X.) A related model, cognitive dissonance theory (Festinger 1957), predicts that A will come to like B in the above situation in order to reduce or avoid the dissonance (distressing psychological contradiction) if A were not to like B.

Another set of models focus on the role of stereotypes and culture. The idea is that in a particular cultural context certain features (such as good looks and intelligence) are normatively linked—so that when a person has one of these characteristics, they are assumed to have the others—in order that attraction is strongly facilitated (e.g., Dion et al. 1972).

Finally, much recent work employs models from evolutionary psychology (see Buss and Kenrick 1998, for a review). The idea is that modern individuals are likely to be those whose ancestors had psychological tendencies that made them most successful at producing offspring. According to this view, women have evolved to prefer mates who show signs of being able to protect and support the upbringing of the child (e.g., status) while men have evolved to prefer mates who show signs of vitality (e.g., physical beauty), suggesting that they are more likely to bear healthy children.

4. *Perceiver Characteristics*

Individuals who are extroverted, dispositionally lonely, or who have low self-esteem, a preoccupied attachment style, or high need for affiliation are especially likely to become attracted to other people (see Simpson and Harris 1994). The physically attractive are also more likely to be sociable, date, and engage in sexual relationships earlier (see Berscheid and Reis 1998).

5. *Situational Factors*

Attraction requires at least some exposure to the object of attraction and attractions usually occur among people who live in the same environment, and thus who also share similar backgrounds and experiences (see Berscheid and Reis 1998). Attractions are also more likely the more interaction one has with the person—indeed familiarity effects show up even comparing exposure times varying only by seconds (Zajonc 1968). Further, attractions are likely to occur among people who are seen as appropriate for the particular kind of relationship, so that attractions are most common among age peers, among people of the same social class, and among people who are approved of by one's friends (see Aron et al. 1989). Romantic attractions are also more likely when one has just ended another romantic relationship (Aron et al. 1989), but are less likely when one is deeply committed to a current relationship (Johnson and Rusbult 1989). Finally, romantic attractions are more likely under conditions in which one is physiologically aroused (the arousal is misattributed to the person) or under unusual or challenging circumstances (which become associated with the person) (Aron et al. 1989).

6. *Dyadic Factors*

As noted earlier, a long-standing, thoroughly replicated finding is that attraction is greater toward people perceived to share one's attitudes than to those perceived not to share one's attitudes (Byrne 1971). Much of the effect is due to a dislike of those who do not share one's attitudes, though shared attitudes also play some positive role (see Berscheid and Reis 1998). Actual shared attitudes are less important than perceived shared attitudes, and similarity of personality and backgrounds has generally shown little direct effect on initial attraction (see Berscheid and Reis 1998).

A number of studies have attempted to test the idea that opposites attract, or at least that there is an attraction between those with complementary needs (such as liking to take care of people and liking to be taken care of). For the most part, this research has not yielded impressive results (see Berscheid and Reis 1998). One suggestion, with some support, is that under conditions in which a relationship is unsure, people seek those who are similar, but when people are confident that a relationship is likely, similarity plays less of a role (Aron and Aron 1997).

Another kind of similarity that has been studied is matching on social value—such as similar levels of good looks (e.g., Walster et al. 1977). Research has shown that pairs of friends and pairs of lovers do indeed tend to be matched on attractiveness and that people tend to assume such matches on desirability overall (so that if one is shown a couple where one is much more good-looking than the other, people presume the less good-looking partner must be very successful or intelligent or have some other offsetting characteristic). However, studies of initial attraction suggest that when given the opportunity, everyone would prefer the most desirable partner. Only if the possibility of rejection is highly salient does one's own level of desirability play much of a role in whom one is attracted to (or at least whom one will approach).

A highly influential influence on attraction is the discovery (or imagined discovery) that the other person likes oneself. Being liked or admired by a reasonably appropriate and attractive person plays a role in the vast majority of initial strong friendship and romantic attractions (Aron et al. 1989). Indeed, in accounts of friendship formation and falling in love, the moment of discovery of being liked is often emphasized as the moment of the onset of strong feelings of attraction.

7. Characteristics of the Person to Whom One is Attracted

Buss (1989) asked participants (mainly college students) in 37 different cultures to rate the importance of various characteristics in selecting a marital partner. The characteristics most preferred by both women and men were being a good companion, considerate, honest, affectionate, dependable, and intelligent. However, women, more than men, preferred mates described as college graduates and as having a good earning capacity; and men, more than women, preferred mates described as physically attractive. These findings, including the gender differences, have held up well in subsequent studies employing diverse research approaches. Other research has focused on more general characteristics. For example, Sadalla et al. (1987) found women and men both judged men displaying dominant behavior to be more sexually attractive, but that dominance played little or no role in either gender's judgments of a woman's sexual attractiveness.

Regarding physical appearance, a major area of research interest has been facial attractiveness. In one series of studies conducted with US samples, Cunningham (e.g., 1986) demonstrated that having large eyes, prominent cheekbones, a big smile, a large chin, and high-status clothing were all associated with a man's attractiveness as judged by women. Women's facial attractiveness as judged by men includes having large eyes, prominent cheekbones, and a big smile. However, unlike women's preferences with regard to men, men prefer women with a small chin, a small nose, narrow cheeks, high eyebrows, and large pupils. Researchers studying facial attractiveness often interpret their results in terms of general traits of attractive faces being ones that are average and symmetrical, and that such traits serve as indications of evolutionary fitness.

Another recently researched aspect of physical appearance is body shape, particularly the waist-to-hip ratio. This work, conducted mainly by Singh (e.g., 1993), posits that people are attracted to other-sex individuals with specific mathematical ratios of body fat distribution. Key findings are that women judge waste-to-hip ratios around 0.85–0.90 as most attractive in men, and that men judge ratios of about 0.7 as most attractive in women (in both cases, these ratios hold regardless of overall weight).

8. Future Directions

There is likely to be continued periodic interest in traditional issues such as similarities and differences, and there seems to be a growing interest in evolutionary approaches and the defining features of physical attractiveness. Two possibly emerging areas are understanding the role of attractiveness in long-term relationships and identifying neural systems involved in attractiveness perception.

Interpersonal Psychotherapy

Interpersonal psychotherapy (IPT) is a brief, time-limited psychotherapy (i.e., 12–16 sessions) that was developed in the 1970s for the treatment of nonbipolar, nonpsychotic depressed outpatients by Klerman and colleagues (Klerman et al. 1984). IPT was initially formulated not as a novel therapy, but as an attempt to represent the current practice of psychotherapy for depression (Klerman and Weissman 1993). IPT makes no assumptions about the causes of depression; however, it does assume that the development of clinical depression occurs in a social and interpersonal context and that the onset, response to treatment, and outcomes are influenced by the interpersonal relations between the depressed patient and significant others (see *Depression*). IPT moves through three defined phases, each of which is associated with specific strategies and tasks for the therapist and patient. It is similar to many other therapies in terms of techniques and stance but is distinct in terms of strategies. Its well-defined treatment strategies are aimed at resolving problems within four social domains: grief, interpersonal role disputes, role transitions, and interpersonal deficits. Although the initial goal of IPT is to reduce symptoms of depression, the overarching goal is to improve the quality of the patient's current interpersonal relations and social functioning. IPT has been found efficacious for major depression and has also been successfully adapted to treat other types of mood and nonmood disorders. The extensive empirical background and theoretical foundation, including the strategies and techniques of IPT are fully described in a comprehensive book (Weissman et al. 2000).

1. Development

Adolf Meyer's (1957) theory that psychopathology is a result of maladaptive adjustment to the social environment lay the groundwork for IPT. Harry Stack Sullivan (1953) stands as the theorist who most clearly articulated the interpersonal paradigm and popularized the term 'interpersonal' as a balance to the then-dominant intrapsychic approach. Sullivan believed that psychiatry involves the scientific study of people and the processes that go on among them, rather than the exclusive study of the mind or of society. According to Sullivan, the unit of clinical study is the patient's interpersonal relationships and people cannot be understood in isolation from them. In his theory, Sullivan (1953, p. 13) posited that people have 'relatively enduring patterns of recurrent interpersonal situations' which can either foster self-esteem or result in hopelessness, anxiety, and psychopathology.

Sullivan developed a comprehensive theory of the connections between psychiatric disorders and interpersonal relations for the developing child in the family and for the adult in the multiple transactions of life. The roles of major interest to interpersonal psychotherapy occur within the nuclear family (as parent, child, sibling, partner); the extended family; the friendship group; the work situation (as supervisor, supervisee, or peer); and the neighborhood or community. The interpersonal approach views the relationship between social roles and psychopathology as occurring in two ways: disturbances in social roles can serve as antecedents for psychopathology; and mental illness can produce impairments in the individual's capacity to perform social roles. IPT is also associated with the work of John Bowlby (1982), originator of attachment theory, who acknowledged the importance of early attachment to subsequent interpersonal relationships and psychopathology. In sum, IPT is derived from theories in which interpersonal function is recognized as a critical component of psychological adjustment and well-being.

IPT is based not only on theory but on empirical research linking change in the social environment to the onset and maintenance of depression. Considerable research exists that documents support for the key interpersonal problem areas. For instance, scientists have demonstrated that people become depressed in the circumstances of complicated bereavement, marital disputes, and the life changes associated with interpersonal role transitions, particularly in the absence of social ties. Moreover, several longitudinal studies have focused on the interpersonal consequences of depression (e.g., separation and divorce, withdrawal from social activities), showing that not only can life events trigger depression, but indeed depression can trigger adverse life events (for a review see Frank and Spanier 1995, Weissman et al. 2000). In combination, these data provide strong support for use of an interpersonal approach for the understanding and treatment of depression.

Depression is conceptualized as having three component processes: symptom function, social and interpersonal relations, and personality and character problems. Symptom function entails the development of depressive affect and the neurovegetative signs and symptoms (low energy, sleep and appetite disturbance, etc.). These are believed to have both biological and psychological precipitants. Social and interpersonal relations entail interactions in social roles with other persons derived from learning based on childhood experiences, concurrent social reinforcement, and personal mastery and competence. Personality and character problems refer to enduring traits such as inhibited expression of anger or guilt, poor psychological communication with significant others, and difficulty with self-esteem. These traits determine a person's reactions to interpersonal experience. IPT intervenes in symptom formation and social dysfunction associated with depression, rather than enduring aspects of personality, because of its relatively short duration and low level of psychotherapeutic intensity.

There is little expectation that IPT will have a pronounced effect upon personality structure; however, many IPT patients do acquire new social abilities that may help offset personality difficulties. An important component of IPT for depression is the deliberate avoidance, during the treatment of the acute symptomatic episode, of issues related to personality functioning (Weismann et al. 2000).

The methods and techniques of many schools of psychotherapy share common ground (Frank 1973), including attempts to help patients gain a sense of mastery and reduce social isolation. A major difference among the therapies lies in their conceptualization of the causes of the patient's problems, and in the typical length and focus of treatment. For instance, IPT differs from traditional psychodynamic approaches in that it is time-limited, focused, examines current rather than past relationships, and recognizes but does not focus on intrapsychic defense mechanisms and internal conflicts. IPT also differs from cognitive and behavioral approaches in that maladaptive thoughts and behaviors are addressed only as they apply to problematic interpersonal relationships. The goal is to change the relationship pattern rather than associated depressive cognitions, which are acknowledged in IPT as depressive symptoms. Although the therapeutic style is less directive in IPT than in cognitive and behavioral approaches (i.e., less didactic/prescriptive), the therapies are similar in terms of their active current focus on specified target areas. In contradistinction to other psychotherapies, IPT recognizes but does not directly focus on the patient's personality characteristics.

2. *Treatment Phases, Goals, and Strategies*

The initial phase, ordinarily the first one to three sessions, includes diagnostic assessment and psychiatric history and establishes the context for the treatment. After a standardized diagnostic symptom review is conducted, the patient is diagnosed as depressed and assigned the 'sick role.' Patients are given the 'sick role' to exempt them from additional social pressures, increase their awareness of the need for help, and elicit their cooperation in the process of recovery. A detailed examination of the patient's interpersonal history (the interpersonal inventory) is conducted, which includes a review of the patient's current social functioning and current close relationships, their patterns and mutual expectations. During this review, changes in relationships are illuminated that were proximal to the onset of symptoms (e.g., the death of a significant other, changing to a new job, increasing marital discord, or disconnection from a friend). The interpersonal inventory provides a structure for elucidating the social and interpersonal context of the onset and maintenance of depressive symptoms and delineates the focus of treatment.

An evaluation of need for medication is based on the severity of symptoms, previous experience with medications, and patient preference. The therapist and patient then discusses the diagnosis and what the patient might expect from treatment. Symptom relief starts with helping the patient understand that the vague and uncomfortable symptoms are a part of a known syndrome, which responds to several treatments and has good prognosis. The therapist then links the depressive syndrome to one of four interpersonal problem areas: grief, role transitions, interpersonal role disputes, or interpersonal deficits. After the major interpersonal problem area associated with the onset of the depression is identified, the therapist makes a specific treatment plan with the patient to work on this problem area.

During the intermediate phase of treatment, typically the middle 7 to 11 sessions, the therapist implements treatment strategies that are specific to the identified problem area. Grief is identified as the problem area when the onset of the patient's symptoms are associated with the death of a loved one, either recent or past. The goals for treating complicated bereavement include facilitating mourning and helping the patient to find new activities and relationships to substitute for the loss. Role transition includes any difficulties resulting from a change in life status (e.g., divorce, retirement or change in one's work role, moving, leaving home, diagnosis of medical illness). The patient is helped to deal with the change by recognizing positive and negative aspects of the new role they are assuming, and pros and cons of the old role this replaces. Interpersonal role disputes are conflicts with a significant other (e.g., a partner, other family member, co-worker, or close friend) which emerge from differences in expectations about the relationship. The therapist assists the patient to identify the nature of the dispute and generate options to resolve it. If resolution is impossible, the therapist assists the patient in dissolving the relationship and in mourning its loss. Interpersonal deficits include patients who are socially isolated or who are in chronically unfulfilling relationships. The goal is to reduce the patient's social isolation by helping to enhance the quality of existing relationships and encouraging the formation of new relationships. The problem area may change during the course of treatment. The patient may have several related problem areas and may work on more than one or may select the most prominent or changeable.

In the termination phase of treatment, usually the last few of the 12 to 16 sessions, the therapist assists the patient in evaluating and consolidating gains, acknowledging the feelings associated with termination, detailing plans for maintaining improvements in the identified interpersonal problem area(s), and outlining remaining work. Patients are also encouraged to identify early warning signs (e.g., low energy) and to identify plans of action.

Throughout IPT, focus stays on the interpersonal context of a patient's life. For example if a patient is having depressive symptoms, the therapist will focus on relationship difficulties that exacerbate the symptoms rather than review cognitions or inner conflict associated with the depression. Interpersonal goals are derived from specified problem areas and are formulated within the first three sessions. Meetings should not pass without reference to these goals, as they are unique and require specific and directive interventions by the therapist. Indeed, research on IPT maintenance treatment for recurrent depression has demonstrated that the therapist's ability to maintain focus on interpersonal themes is associated with better outcomes (Frank et al. 1991). In session, unfocused discussions are redirected to the key interpersonal issues, and abstract and general discussions are minimized in order to preserve focus. Therapists refrain from making inquiries that evoke vague or passive responses, such as general questions about the patient's week. Rather, sessions begin with questions such as 'What would you like to work on today?' and 'How have things been since we last met?' These questions provide more direction for patients and focus them on recent interpersonal events and recent mood, which the therapist attempts to connect. Patients who describe problem areas will be asked about recent mood and other depressive symptoms; alternatively, if the patient focuses on symptoms, the therapist asks about recent life events and interactions (Weissman et al. 2000).

3. *Therapeutic Stance and Techniques*

Each model of psychotherapy can be characterized in part by the positioning of the therapist in terms of the nature of the relationship with the patient and the level of therapeutic activity. The IPT therapeutic stance is one of warmth, support, and empathy. The IPT therapist is active and advocates for the patient rather than remaining neutral. Moreover, the therapeutic relationship is not viewed as a manifestation of transference, nor is it to be treated as a friendship (see *Therapist–Patient Relationship*). Whereas IPT is distinct at the level of strategies, it is similar to many other therapies at the level of techniques. Some of the most frequently used techniques include exploratory techniques, encouragement of affect, clarification, and communication analysis; other techniques include use of therapeutic relationship, behavior change techniques, and adjunctive techniques.

4. *Outcome Research*

IPT has demonstrated efficacy for the treatment of several mood disorders including nonpsychotic major depression and recurrent depression (Weissman et al. 2000), as well as bipolar mood disorder (Frank et al. 1999). IPT has also shown efficacy for bulimia nervosa (Agras et al. 2000), and binge eating disorder (Wilfley et al. 1993) (see *Eating Disorders: Anorexia Nervosa, Bulimia Nervosa, and Binge Eating Disorder*). In addition, a number of new research applications are currently under investigation for various disorders including dysthymia, post-traumatic stress disorder, social phobia, body dysmorphic disorder, chronic somatization, borderline personality disorder, and anorexia nervosa. For a comprehensive review of empirical support and studies in progress see Weissman et al. (2000).

IPT has been adapted for various populations including the elderly, adolescents, and patients with comorbid medical conditions (e.g., human immunodeficiency virus) (Weissman et al. 2000). IPT also has been modified for groups (Wilfley et al. 2000), long-term treatment, couples, telephone intervention, primary care, and adjunctive self-help, and has been translated into several languages (Weissman et al. 2000). Together, these findings indicate that IPT is not only an effective and promising treatment for a range of psychiatric disorders, but it also has the potential for wide dissemination.

5. *Future Directions*

Four key areas are in need of further investigation. First, although a number of outcome studies in IPT clearly document its efficacy, little is known about the mechanisms by which IPT exerts its effects (Frank and Spanier 1995). A greater understanding of the mechanisms by which change occurs in IPT would assist in further refinements of the treatment and yield insights about the nature of the psychiatric syndrome under investigation. Second, increased efforts to improve the effectiveness of IPT are warranted. Frank and Spanier (1995) suggest that specific efforts to improve outcome in IPT could entail altering the structure of the treatment itself (e.g., timing, duration, frequency of the sessions) and identifying specific therapists' behaviors and patient responses and features that are associated with better outcome. For instance, initial data suggest that high treatment specificity (i.e., consistent focus on the interpersonal problems and consistent use of IPT techniques) is associated with better outcome (Frank et al. 1991). However, it still remains unclear how treatment specificity translates into specific actions of the therapist and patient. Moreover, data from a comparative treatment trial in patients with bulimia nervosa (BN) suggests that IPT is slower acting than cognitive behavior therapy (Agras et al. 2000). Further research is needed to determine whether refinements can be made to increase the rapidity of BN patients' response in IPT which may lead to improvements in ultimate outcome as well. Third, continued research is

warranted to examine whether IPT is effective for other populations and disorders. For some conditions and formats the original form of IPT will be sufficient whereas for others unique adaptations may need to be employed to increase the overall effectiveness and applicability of IPT. It will be critical to determine the optimal length and dosing for particular disorders as well. Fourth, IPT was developed as a research intervention and still remains to be well disseminated among clinicians (Weissman et al. 2000). Thus, there exists a need to translate IPT efficacy data to effectiveness studies and routine clinical practice.

Interpersonal Trust across the Lifespan

An examination of the literature in psychology indicates that interpersonal trust (referred to as trust) bears on virtually every facet of social functioning and has profound affects on mental and physical health. Trust plays a critical role in the formation and maintenance of friendships (Rotenberg 1991), romantic relationships (Lamm 1998), and relationships in business organizations (Kramer and Tyler 1996). Individuals' willingness to trust others is linked to longevity, physical health, psychological well-being, and academic performance (Bernath and Feshbach 1995, Barefoot et al. 1998). Trust is negatively associated with lying, stealing, engaging in delinquent acts, loneliness, and depression (see Rotenberg 1994, Bernath and Feshbach 1995). Establishing trust with others plays a critical role in the successful treatment of various psychological problems, such as attempted suicide and abuse (see Bernath and Feshbach 1995). Finally, scientific progress involves a fundamental trust in the integrity of researchers and authors in the scientific community. The purpose of this article is to examine trust as it changes across the lifespan.

1. A Theoretical Framework

The present examination of trust is guided by Rotenberg's (1994) 3 (bases) $\times$ 2 (domains) $\times$ 2 (target dimensions) framework. According to Rotenberg (1994), there are three bases of trust: (a) reliability, which refers to the fulfillment of word or promise, (b) emotional trust, which refers to the reliance on others to refrain from causing emotional harm, such as being receptive to disclosures, maintaining confidentiality of them, refraining from criticism, and avoiding acts that elicit embarrassment, and (c) honesty, which refers to telling the truth and engaging in behaviors that are guided by benign rather than malicious intent and by genuine rather than manipulative strategies.

The three bases of trust are further differentiated with respect to two domains, cognitive/affective and behavioral. The cognitive/affective domain pertains to individuals' beliefs/attributions of the three bases of trust or of trust *per se*, and the emotional experiences accompanying those beliefs or attributions. The behavioral domain pertains to individuals' behavioral

tendencies to rely on others to act reliably, in an emotional trustworthy fashion and honestly. In addition, both the bases and domains are further differentiated by dimensions of the target of trust that are specific qualities of trusted–distrusted persons. The dimensions of the target of trust are (a) specificity, which ranges from generalized to a specific person, and (b) familiarity, which ranges from somewhat unfamiliar to very familiar. Included in Rotenberg's (1994) framework was the principle that interpersonal trust has a strong reciprocal quality.

2. *Trust Across the Lifespan*

The following is a description of trust across the lifespan derived from an integration of Rotenberg's (1994) trust framework and the relevant research.

2.1 *Infancy* (*0–2 Years*)

During this period, individuals establish (a) basic trust versus mistrust, according to Erikson (1963), (b) different qualities of attachment with caregivers, (c) working mental models of relationships (on the basis of the latter) that affect the development of subsequent social relationships (see Bernath and Feshbach 1995), and (d) shyness arising from temperamental differences. Accordingly, infants primarily base their trust on behavioral honesty in which they attempt to determine whether persons have benign rather than malicious intentions (behaviorally identified). Caregivers and others in the immediate family are the targets of infants' trust but, as a result of internal working models and temperament, trust is generalized in a rudimentary fashion toward unfamiliar others.

2.2 *Early Childhood* (*2–6 Years*)

During early childhood, children develop (a) 'theory of mind' in which they understanding that persons can engage in acts of deception designed to evoke false beliefs in others, and (b) the ability to comprehend the link between promises and behavior by the conclusion of the period. During early childhood, children establish within a cognitive domain an honesty basis of trust, predicated on the intention to deceive, and a reliability basis of trust, predicated on the fulfillment of promises (see Rotenberg 1991, Bernath and Feshbach 1995). Because children's social network grows, they extend interpersonal trust to a larger range of adults and peers.

2.3 *Middle Childhood* (*7–12 Years*)

During this period, parents continue to affect children's social cognition and behavior and children become increasingly involved in school, peer friendships, and peer groups (primarily same-sex). Across this period, children demonstrate increasing sophistication in their reasoning about violations of social expectations and moral issues (see Kahn and Turiel 1988). As a consequence, children's honesty, reliability, and emotional trust are (a) affected by parents' trust beliefs and behavior, (b) an integral part of same-sex peer friendship, (c) part of same-sex peer group interactions, (d) linked to their reasoning about the violation of social expectations and moral principles (see Selman 1980, Kahn and Turiel 1988), and (e) associated with academic achievement (Rotenberg 1991, Bernath and Feshbach 1995). Because of the increasing exchange of intimacies among peer friends and peer group, an extensive emotional basis of trust is developed during middle childhood.

2.4 *Adolescence* (*13–19 Years*)

Adolescents' sexual development, moral development, increased ability to comprehend abstract concepts, and their involvement in broader social networks and social events result in further changes in trust. As a consequence, adolescents' trust extends to sexual matters such as birth control and the contraction of sexually transmitted diseases including AIDS (see Lear 1997). Also, adolescents begin to include sociopolitical events and the moral issues pertaining to wider groups such as society (see Colby and Kolhberg 1987) in their trust domain (generalized unfamiliar others). As a consequence, adolescents' trust is particularly susceptible to sociopolitical changes. For example, Hochreich and Rotter (1970) found that the trust beliefs of college students decreased from 1964 to 1969, spanning the social revolution of the 1960s. Adolescents' trust in the establishment decreased (national and international politics, judiciary, the mass media) and in society in general decreased (the hypocrisy, self-seeking, and competitiveness of people in general). Adolescents' trust may be a 'barometer' of social change.

2.5 *Early and Middle Adulthood* (*20–29 Years and 30–55 Years, Respectively*)

During this period, individuals most commonly become involved in extended romantic relationships and enter the workplace. Accordingly, trust during this period is highlighted by trust within the context of romantic relationships (Rempel et al. 1985). Individuals' trust in marriage partners has been found to be associated with their love of their partners and the belief that partners are concerned about their (the individuals') welfare (Rempel et al. 1985). This period is also marked by trust issues concerning superiors and co-workers in the workplace (Kramer and Tyler 1996). All bases, domains, targets, and dimensions of trust in Rotenberg's (1994) framework are viable throughout the course of adulthood.

2.6 *Later Adulthood* (*55–75 Years*)

This period is marked by individuals' concerns over quality of life and physical safety. Older adults' trust centers on the extent to which their offspring (adult children), social networks, and social agencies will provide care and help to establish or sustain a satisfactory quality of life (Bierhoff 1992). During this period, individuals are concerned about their vulnerability to being victims of crime and thus their trust centers on their physical safety (Rotenberg 1990).

2.7 *Very Old Age* (*75 + Years*)

During very old age, individuals confront issues of distribution of inheritance and, as a consequence, re-evaluate their trust in family members. They deal with the issue of their immortality and specifically whether the trust they place in family members and perhaps in society or mankind to construct a better world will be confirmed after death.

3. *Directions for Future Research*

The major problem faced by researchers is the lack of a coherent theory to guide the examination of trust, notably a theory that outlines the development of trust across the lifespan. This article marks one attempt at developing such a theory (see also Bernath and Feshbach's (1995) theory of trust across childhood and adolescence). Nevertheless, a more structural model of trust development is necessary, one that *predicts* the relations between trust and other aspects of interpersonal functioning at each age period and *predicts* developmental changes in trust. Also, it is important to note that there is a scarcity of research on trust during the first (infancy) and the final periods (later adulthood and very old age) of development. Despite Erikson's (1963) emphasis on trust during infancy, researchers have not attempted to examine that phenomenon directly. Rather, researchers have assessed trust indirectly, primarily as an implicit facet of the quality of attachment. Also, gerontologists are encouraged to examine a critical facet of interpersonal functioning during old age, that of trust.

Interpretation and Translation: Philosophical Aspects

If we are to make sense of people's behavior, we need to understand their utterances and identify their beliefs and desires, as well as grasp the meanings of other cultural artifacts and practices. Philosophers have described this as finding an 'interpretation' of the agents' behavior and mental states; 'translation' is the more specific task of finding sentences in a person's own language that express the same meanings as sentences in some another language. Both issues have been central to philosophical investigations since the 1950s.

The topic raises important issues about how knowledge is possible in the social sciences, and it also engages with some central philosophical issues about how humans can have knowledge of the minds of other people, and how linguistic communication is possible. It presents a pair of closely related problems:

(a) The first is an issue in the philosophy of language. How are we able to discover the meanings of words and sentences? This problem arises in different forms: how are people able to be sure that fellow English

speakers understand words as they do? Also, how (if at all) can they understand the speech of those whose languages are different from their own?

(b) The second is a problem in the philosophy of mind. How is it possible to understand the behavior of other people by identifying the beliefs, desires, and other mental states that lead them to act as they do? Once again, this can take several forms. How is it possible to understand the people we live with, people who share a common culture' and how are we able to understand those whose ways of life are very different from our own?

These two sets of issues are closely related, and seem to be two aspects of the same problem. Unless people's beliefs and desires can be identified, it will be difficult to make sense of their speech. Moreover, unless account is taken of what people say, it will often be difficult to make sense of their mental states.

These issues became fundamental to the philosophies of language and mind when Willard van Orman Quine challenged the underlying dogmas of logical positivism in books such as *From a Logical Point of View* (Quine 1953) and *Word and Object* (Quine 1960). He did so by arguing that the positivists made assumptions about language and mind that could not be combined coherently with the sort of account of interpretation and translation that was required by their empiricist epistemology. In addition, Donald Davidson's distinctive anti-reductionist account of mind, developed in a series of papers in the 1960s (reprinted in Davidson 1980, 1984), grew out of related reflections about how we are constrained in interpreting people's behavior, verbal and otherwise. For these philosophers, and those influenced by them, examining problems about translation and interpretation was our best clue to the nature of linguistic meaning and of mental states such as beliefs and desires. These discussions have focused on how translation can capture the cognitive aspects of meaning, leaving to one side issues arising when we consider the translation of, for example, literary works.

As these remarks suggest, investigation of these topics has had two different kinds of focus or motivation. In Quine's work, it was originally a device for criticizing the views of others: examining the nature of translation shows that meanings are much messier and more indeterminate than most analytical philosophers have supposed. Davidson's efforts, largely endorsed by Quine in his later writings, have a more constructive intent: studying the standards that guide our practice of interpretation is supposed to show that our thought about mind is guided by acceptance of normative standards of rationality rather than by a search for natural laws that govern mental phenomena. The remainder of this introduction explores these motivations further, with a view to seeing why this focus on meaning and interpretation has seemed so important.

Logical positivists typically endorsed two views. First, rationality depends upon the use of principles and standards that are analytic. They are 'true by virtue of meaning,' reflecting the conventional rules that fix the meanings of words and sentences. For example, my grasp of the word 'bachelor' reveals that that bachelors must be adult unmarried males, and this fixes the criteria for the truth of claims about some person being a bachelor. Once I grasp the rules determining the meaning of a proposition, I recognize some propositions as necessarily true and I have standards for evaluating arguments and propositions. For most positivists, rationality depends upon a set of rules and principles that are analytic. Second, understanding a proposition involves knowing what evidence would show that it was true. What implications does this have for an account of how we understand other speakers? In order to obtain knowledge of their beliefs and desires, and of the meanings of their utterances, we must discover which propositions they treat as analytic, and what verification conditions they associate with their assertions. Also, since we understand people on the basis of their verbal and nonverbal behavior, we must rely solely upon that. The position is coherent only if this is indeed possible. Quine argued that it is not possible: behavior does not provide a sufficient basis for identifying propositions held to be analytic, and identifying which verification conditions are associated with particular sentences. He argued for this by examining the epistemology of translation: that there are alternative translations of one language into another which are intuitively nonequivalent, but which observations of verbal behavior are powerless to choose between. The consequence of this is the indeterminacy of translation: the idea that our utterances have determinate *meanings*, like the view that our beliefs have determinate contents, is 'metaphysical' and nonrespectable (Quine 1960, Chap. 2).

Even if we do not share Quine's empiricism, it is plausible that we understand other people's speech on the basis of their behavior. Although I have so far treated issues about the identification of people's mental states and issues about the meanings of their words as on a par, Quine's more recent writings suggest that this is potentially misleading (Quine 1990). There may be limits to how much we can know with certainty about people's thoughts and other mental states. This need not undermine the thought that studying interpretation is the best way of explaining just what our grasp of concepts such as belief and thought consists of. We have already noted that Davidson adopts this strategy, and a similar view is found in the work of Daniel Dennett. But the case of meanings and language is different. Language is a *public* means of communication, and meanings are 'open to view.' It makes little sense to suppose that all speakers of some language may associate different conventional meanings with its expressions. Hence we need an account of the epistemology of language use that in some way makes room for the publicity of these

linguistic facts. Quine has claimed that although behaviorism is implausible as an account of the mind, it is compulsory in linguistics (Quine 1990 pp. 37–8).

In *Word and Object*, Quine emphasized that he was concerned with 'radical' translation. Also, Davidson's writings on related topics were focused on 'radical' interpretation (Davidson 1984, Chap. 9). Hence we must begin by explaining what this means, and why it is important. Ordinary domestic issues of translation arise when we wonder whether one of our fellows understands properly some word or idiom: we can discover that some person uses the word 'refute' with the same meaning as 'deny,' and we can discover that this does not conform to normal usage. Or we work out the meaning of some word or construction that we do not currently understand. In doing this we may be guided by the explicit explanations of other speakers, and we exploit our understanding of some of the other things that the people say. Our problem then arises against a background of shared knowledge of the meanings of at least some words and sentences. Something similar often arises when translating a language that is unfamiliar to us. If we already understand languages that are related to the one we wish to translate, this can provide valuable clues that enable us to get started. We may even rely upon the expertise of bilinguals who speak both the language we are studying and some other language with which we are already familiar. In such cases, once again, we take for granted extensive knowledge of meanings, mental states, and cultural practices, and we use this as a springboard for making sense of particular words and utterances in familiar or unfamiliar languages. Radical translation occurs when none of these aids is available: We approach a wholly unfamiliar language and understand it without relying upon any dictionaries or bilinguals, or prior understanding of languages we know to be related to the object of our study. We have nothing to go on, it seems, but verbal behavior. Quine believed that if our aim is to advance our philosophical understanding of meaning and mind, this is the fundamental case. Similarly, Davidson approached questions of interpretation by asking how we arrive at an account of the beliefs, desires, and meanings of people without any prior knowledge of their mental states or their language. This makes our epistemological position wholly transparent when we attempt translation or interpretation.

This emphasis on radical translation is controversial. Some philosophers influenced by Wittgenstein—for example Peter Winch (1958, and see Wilson 1974)—argue that understanding of a culture or community is only possible 'from the inside,' that we must enter a community and learn to cooperate in its practice before understanding is possible. Otherwise, interpretation will be a distortion that imposes our values and standards of rationality upon the community we wish to understand.

So far, I have presented these issues as if their interest was wholly epistemological. But there is a further motivation for focusing on radical translation, one that is metaphysical (see, especially, Lewis 1973). Many philosophers believe that human beings are fundamentally physical objects; indeed, that the universe is a physical system. There are important questions about the place of mental states, such as beliefs and desires, and facts about the semantics of languages in this physical world. For thinkers such as Dennett (1979, Chap. 1) and Davidson, studying our practice of interpretation helps us to see how phenomena such as minds and meanings are related to physical phenomena. Radical interpretation relies on no evidence about the contents of the subjects' thoughts and the meanings of their words. Hence, it encourages us to focus on the relations between evidence that is characterized in nonsemantic, nonpsychological terms, and propositions that have a semantic or psychological subject matter. This leads to another reason for taking radical interpretation seriously, and another way of characterizing what makes such interpretation *radical*. The behavioral evidence for interpretation is characterized initially in ways that make no use of problematic psychological or semantic vocabulary. Thus, it provides one way of studying the relations between the physical facts and these distinctive ways of thinking about them. Davidson, for example, uses his study of interpretation to argue that mental phenomena are real, and are grounded in physical facts without being reducible to them (Davidson 1980).

1. *Quine's Claims and Arguments*

As the remarks above may suggest, Quine remained true to the empiricism of the positivists. He held that the main evidence for arriving at translations of an unfamiliar language is information about the experience that speakers take to be relevant to the acceptability of claims expressed in their language (Quine 1960, Chap. 2). We can describe the 'sensory stimulations' that would lead someone to assent to a sentence, as well as the stimulations that would lead them to reject it. Putting this into terminology inherited from behaviorism, Quine claimed that such descriptions would identify the positive and negative 'stimulus meaning' of the sentence in question. 'Observation sentences,' such as 'that is green' or 'there is a rabbit over there' will have a fairly determinate stimulus meaning, varying little among speakers and across time; but relatively few sentences will meet this condition. Some sentences will be agreed upon by all speakers in pretty much any stimulus conditions; for example, 'green is a color': these are 'stimulus analytic.' Some pairs of sentences will turn out to be accepted in the same circumstances—they are 'stimulus synonymous.' Translations should then be tested by seeing whether they preserve 'stimulus meanings,' translation observation sentences by sentences which

are accepted in the same circumstances, stimulus analytic sentences by stimulus analytic sentences, and so on. But this only gets us so far. A huge variety of sentences will be stimulus analytic: consider 'three plus three is six,' 'birds can fly,' and 'the Earth has existed for many years.' Hence there is much freedom in how they are translated. Also, many sentences will neither be stimulus analytic nor have a definite stimulus meaning. Some sentences (both occasion and standing) will be controversial, speakers disagreeing about whether they should be accepted in particular circumstances. Others will be problematic, because most speakers simply will be agnostic about whether they can be accepted, and will have no disposition to accept or reject them in any circumstances. If we adhere to the requirements of an empiricist account of meaning, the possible evidence for the correctness of a translation seems very limited.

In *Word and Object*, Quine seems to claim that these facts about stimulus meanings, stimulus synonymy, and stimulus analyticity provide the only evidence that can be relevant to translating the cognitive meanings of the utterances of some alien language. When we recall that one target of his account is to attack some positive ideas about meaning, this may not be implausible. For empiricists, who defend a verificationist theory of meaning, these links between the acceptance of sentences and experience may indeed be all that could be relevant to identifying the meanings of words and sentences. A suitably empiricist account of translation would then require us to map sentences of the alien language on to sentences of the home language in a way that preserves empirical content: we map observational sentences on to observational sentences with the same stimulus meaning; we map stimulus analytic sentences on to stimulus analytic sentences; and so on.

Quine's famous thesis of the indeterminacy of translation holds that, given this empiricist account of what makes a translation correct, there will be many intuitively nonequivalent manuals of translation between any two languages that fit all possible evidence equally well (Quine 1960, Chap. 2). There is no objective basis for choosing between them, and hence no fact of the matter which is correct. This challenges the assumption which grounded positivist epistemology: that an adequate scientific language embodies a determinate structure of analytic principles and a body of sentences associated with determinate criteria of verification. There is not enough space to examine in detail Quine's reasons for supposing that this is true, but all exploit the idea that the relations between language and experience have a holistic character. Our evidence for translation will always involve associations between experience and particular sentences or sets of sentences. But whether a stimulation will lead a speaker to assent to some sentence can depend on background knowledge. Consider Quine's famous example 'Gavagai,' supposedly accepted whenever rabbits are present. However, in practice it can make a difference whether the informant believes that there are other animals superficially like rabbits, or believes that some insect is a sure sign of the presence of rabbits. Once we consider very theoretical sentences, the links with experience are so remote and dependent on the support of other sentences taken to be true, it would be surprising if there were not ways of adjusting translations systematically that were equally compatible with the evidence. Even when we could associate a fixed stimulus meaning with some observation sentence, the translation of many non-observation sentences will depend on how we read syntactic and semantic structure into that sentence, and how we assign meanings to its subsentential parts. Again, it would be surprising if there were not ways of doing that which led to radically distinct translations for sentences which are more remotely linked to experience (see Hookway 1988, Chaps. 8–9, Wright 1997).

As arguments against a fairly austere empiricist view about distinct meanings, these arguments—albeit schematic—may carry conviction. But what this shows is unclear. Quine concludes that meanings and propositions, synonymies and analyticities are not scientifically respectable: if translation is indeterminate, then so is meaning and intentionality. Others may interpret it as a *reductio ad absurdum* of the empiricist views about meaning that Quine employed in his argument. As a constructive account of how translation proceeds, Quine's story seems to fail to take account of all the resources that are normally available to a translator or interpreter. He appears to conclude that we do employ criteria that help us to select one among the 'correct' translation manuals, but that these guide a practical choice among correct manuals rather than a further criterion of correctness. However, it is not wholly clear that this is his view, and, in his most recent writings, his commitment to the indeterminacy of translation is qualified. Influenced by the views of Davidson that will be discussed below, Quine now acknowledges that there are more constraints on the correctness of translation than were listed above, and even grants that the indeterminacy of translation is an empirical thesis that could turn out to be false (Quine 1990).

The discussion of *Word and Object* makes passing use of another 'maxim of translation,' one that subsequently has acquired much greater prominence. The 'principle of charity' rests on the idea that 'one's interlocutor's silliness … is less likely than bad translation' (Quine 1960, p. 59), and this urges us not to trust translation manuals according to which our subjects make assertions that are 'startlingly false on the face of them.' Occurring in a discussion of the anthropological idea of a 'pre-logical mentality,' Quine argues that it is rational to expect speakers of other languages to adopt the same logical standards as we do, and to reject translations that defeat this expectation. So a good translation should preserve

stimulus meanings, etc., and it should avoid attributing to our informants beliefs that are strikingly and inexplicably false.

2. Davidson and Radical Interpretation

Although Donald Davidson has always emphasized the continuities between his work and Quine's, many readers find in his writings some innovative ideas that transform the position found in *Word and Object* radically. Most strikingly, Davidson abandoned Quine's empiricism and gave center stage to a development of Quine's claims about the principle of charity (Davidson 1984). The result was a very distinctive epistemological and metaphysical position that provided underpinning for a general philosophical vision which appeared in a series of papers expressing views that have been enormously influential. Davidson's contributions can be divided into two kinds: he offered a new way of describing the enterprise of translation and interpretation; and he transformed our understanding of the evidence that was available for testing interpretations. We shall examine these in turn.

First, Davidson was emphatic that he wanted a theory of interpretation, not a theory of translation. As we have seen, this means that he seeks a systematic specification of the beliefs, desires, and other mental states of an agent, along with an account of what they mean by the words and sentences that are uttered. These tasks are inseparable: unless we have opinions about a speaker's beliefs and desires (etc.), we shall be unable to make a reasonable guess about what they are saying; and since speech is often a crucial clue to beliefs and desires, we cannot decipher someone's beliefs and desires *before* beginning to make sense of their linguistic behavior. The two tasks must be attempted as a unified whole. Hence we defend a particular assignment of meanings to someone's sentences as part of the best overall account of their mental states and linguistic behavior.

From early papers such as 'Truth and Meaning' (Davidson 1984), Davidson emphasized that a semantic theory for a natural language should use the notion of truth: understanding a sentence requires knowledge of its (possibly context relative) truth conditions. So an adequate theory should assign truth conditions to all the sentences of the language, drawing on axioms about the semantic properties of parts of sentences, and taking into account the significance of the ways in which the parts are combined in meaningful sentences. His proposal for doing this, drawing on the work of Alfred Tarski in formal semantics, need not detain us here. The correct interpretation of a sentence in an unfamiliar language will be the statement of its truth conditions that forms part of the best overall interpretation of the beliefs, desires, and behavior of its speakers. Like Quine, Davidson asks what evidence we can rely upon in establishing the correctness of interpretations (Davidson 1984, Chaps. 10–11).

Davidson's early account of how we test such theories is apparently simple. He assumed that we could identify when our subjects accept sentences as true, when they *take* them to be true. Ignoring the worry that this presupposes there is no difficulty in identifying expressions of acceptance and dissent, its value as evidence appears limited: even if we can identify the circumstances in which the informants believe that these sentences are true, it does not follow that we can identify when they *are true*—that we can pin down their truth conditions. The speakers may have systems of beliefs that contain extensive falsehood. Davidson simply denies this possibility: our practice of interpretation is guided by a principle of charity which requires us to assume, other things being equal, that when agents assent to sentences, those sentences are in fact true. We can indeed make sense of people having beliefs that are false, but we can only do so by relying on the background assumption that their other beliefs are predominantly true. Error is possible about some abstract or theoretical matters, and about everyday matters in unusual circumstances. But they are normally reliable about uncontroversial everyday matters: whether something is a blade of grass; whether it is green when seen in good lighting conditions; whether two plus two is four, and so on. Without this bridgehead of unproblematic true belief, we could not interpret our subjects' behavior by reference to beliefs and desires, and making utterances at all. Hence the principle of charity: 'We take the fact that speakers of a language hold a sentence to be true (under observed circumstances) as *prima facie* evidence that the sentence is true under those circumstances' (Davidson 1984, p. 152). Interpretation is possible because 'We can dismiss a priori the chance of massive error' (Davidson 1984, p. 169). Charity extends further than that: Davidson held that to treat someone as a person *is* to make a normative assessment—to hold that we can expect their beliefs to be (for the most part) true, their desires to be for things we can see the value of, their inferences to be sound (by our standards), and so on. Interpretation involves expecting people (*ceteris paribus*) to conform to familiar, normative standards of belief and reasoning, allowing for error and foolishness only in unusual cases. It makes no sense to think of someone as a person whose beliefs are overwhelmingly false, and whose actions seem pointless (see Hookway 1988, Chap. 10, Heal 1997).

However, things are more complex: that hunter-gatherers possess truths about fundamental particles would be just as silly as that they should fail to acknowledge things that are plainly open to view. There are many cases where error is more likely than truth: we expect people to be deceived by perceptual illusions; and psychological research teaches that we

often go wrong in thinking about probabilities, and so on. So even if the principle of charity embodies an important truth, the formulations we have employed are too simple to capture it.

This can be accommodated in two different ways. First, Richard Grandy urged that we replace the principle of charity by a principle of humanity (Grandy 1973): a good translation or interpretation should enable us to view our subjects as believing what we would believe, were we to be in their shoes, to share their experience and background beliefs. This explains why we should not expect hunter-gatherers to hold beliefs about nuclear physics, and why we expect others to share many of the tendencies to error that come naturally to us.

Second, an adequate account of interpretation and translation must incorporate an epistemology. Quine's theory did that explicitly: the role played by stimuli and observation sentences revealed his commitment to empiricism. Davidson rejected empiricism and, in his earlier writings, provided no alternative epistemological position. The principle of charity can recognize that our beliefs result from our causal interactions with our surroundings. Beliefs tend to be true when they are caused by the states of affairs that make them true, or when they are caused by reliable signs of those states of affairs. This provides guidance concerning when we should expect our subjects to possess truths, and when we should be surprised that they do so. A properly qualified principle of charity can make allowance for this, exploiting information about when we should expect agents to possess truths, and when we should expect them to be in error.

Grandy's principle is a partial acknowledgement of this, one that can operate when we are ignorant of the causal processes involved in forming our knowledge. The result that it is *a priori* that we are reliable in forming beliefs, other things being equal, can also be secured. If utterances containing 'London' typically are caused by exposure to London, then this is evidence that 'London' refers to that city. In that case, our practice of interpretation will ensure that we find the causal interactions between thought and the world that are required to ensure that our beliefs are generally true. But we should also expect that over time we would build up a philosophical anthropology, an account of people's capacities and tendencies, which will further constrain our judgments about what is being said and about what agents believe.

Exploring these various possibilities reveals that we rely on many sources of information about the anchorage of our beliefs and utterances in formulating and assessing translations and interpretations. In his writings from the 1970s, Davidson continued to claim that interpretation was indeterminate, that there would be many distinct interpretations between which no objectively grounded choice could be made. However, as Quine has insisted recently, the more we see the range of considerations that constrain translation and interpretation grow, the less obvious is this claim: it may be an empirical question about how much indeterminacy there is, if any.

3. Conclusion

Thinkers other than Quine and Davidson have also developed the idea that it is in some way constitutive of interpretation that we rationalize people's behavior, interpreting people as logical and generally truthful. It is fundamental to the 'Intentional Systems Theory' of Daniel Dennett (1979), an account of the relations between a functionalist account of mind and our ordinary vocabulary of psychological interpretation and explanation. In a series of papers, Martin Hollis (Wilson 1974, Chaps. 10–11) has applied a similar idea to problems about explanation in anthropology, challenging a variety of relativist views about rationality, and about the interpretation of ritual and magical practices.

As more and more information is taken to be relevant to reducing the range of possible interpretations and translations, the distinction between radical and nonradical interpretation may be less important than was once supposed. That a translation enables us to cooperate with those we wish to understand, to participate in their practices, should clearly be a point in its favor. However, this does not undermine the underlying insight that interpretations which follow Davidson's strategy are not thereby false. Our grasp of the mental is, indeed, shaped by a sense of the norms that govern belief, desire, and action, and interpretation is an attempt to understand behavior as reasonable in context in the light of those norms.

Interpretation in Anthropology

Since the beginnings of the discipline, interpretation has occupied and affected everyone who practices anthropology. Being all-pervasive, a concept or practice can become invisible such that in most standard works on the theory and history of anthropology 'interpretation' does not rate an entry in the index, and that goes, curiously, also for the book that more than others put interpretation on the map of debates in recent anthropology (Geertz 1973). Half a decade later, anthropology figured prominently among the social sciences that were said to have turned to an 'interpretive or hermeneutic approach' (Rabinow and Sullivan 1979, but see Bauman 1978 for the long and deep history of the challenge of hermeneutics). Significantly, this claim was made in a Reader, a collection of authoritative essays. As a genre of scholarly books, we expect Readers to appear when a theoretical concept and its attendant practices of research and writing are either programmatically announced or have already congealed as a distinctive (sub)discipline. The latter, as far as we can tell, has not happened. Since a clearly defined hermeneutic anthropology does not exist, a statement about 'interpretation in anthropology' is a peculiar task, and one which calls for narrative rather than systematic presentation.

1. *The Burden of History: Hermeneutics*

A way to get a grip on elusive 'interpretation' in anthropology is to trace the concept to the discipline's modern beginnings. Most historians locate them in the Age of Enlightenment, and this proves helpful provided that the scope is not narrowed unduly (and anachronistically) to a search for eighteenth-century predecessors of anthropology as a natural or social science. Thinkers whom we recognize as proto-anthropologists formulated their ideas in a context of theological, philosophical, and (often overlooked) philological debates. These debates were carried out in a field of tension that developed between the Enlightenment and, largely contemporary, Romantic thought (a complex story still best covered in Gusdorf 1973). From this broader view of our genealogy one can derive a heuristic model whereby modern conceptions of interpretation are seen to go back to moves between two poles. One of them is a long tradition of the exegesis of authoritative texts such as the Scriptures, the Classics but also corpora of Law. Typically, interpreters of such texts partook in the authority of their sources and had an interest in promoting and defending a transhistorical status for their sources. At the other pole, we find a tradition of secular critique. It emerged from moves to historicize authoritative texts by submitting them, often building on methods and techniques developed by theological and philological exegetes, to literary, social, and political analysis and interpretation (a conceptual pair that shows up also in most modern writings). Biblical criticism and what was called the Homeric question had demonstrated that these texts of quasi-transcendent religious and aesthetic authority had a mundane history of creation, collection, and editing under multiple individual and collective authorship. Because they had a past they were relevant to a critical understanding of the present. In a line leading from Hegel to Marx and Weber, to reveal the historicity of human affairs became a foremost task of social science.

Anthropology owes its openness to ideals of rational inquiry into, and appreciation of, the creations of other traditions ('cultures') at least as much to this secular tradition of critical interpretation as to the principles and habits of natural science. Given this double inheritance, distinctions between interpretive hermeneutic and explanatory scientific positions that keep the two facing each other in binary opposition become stultifying. The same applies when exegesis, interpretation working close to the material surface of texts, is contrasted with hermeneutics concerned with deep meanings. Least of all do such divisions correspond to that between a subjective quest for authority and power and the objective pursuit of scientific truth. Those who interpret and those who explain have about the same potential for turning into authoritative pundits. In sum, to acknowledge the double genealogy of anthropology in a hermeneutic and a scientific lineage maps a conceptual space necessary to discuss interpretation in anthropology; distinctions between them do not validate or invalidate, or even classify approaches.

While unproductive oppositions should be rejected, it is important to keep in mind that, in its modern

usage, interpretation has been a critical and often militant concept. To cite one of Bauman's conclusions: '*The method of sociological hermeneutics*, like that of empirical science, *can serve the practice of communication only in its negative capacity, as the method of criticism*' (1978, p. 241, emphasis in the original).

2. *Interpretation and the Object of Anthropology*

Anthropology may have owed much to a tradition of critical interpretation, and J. G. Herder, a thinker steeped in that tradition, can be credited with having bequeathed to anthropology essential elements that went into its guiding idea, culture. Yet interpretation or hermeneutics did not assume a prominent position in debates about the production of anthropological knowledge until the late 1960s. Of the two paradigms under which anthropology gained admission as an academic discipline toward the end of the nineteenth century, evolutionism (as represented by E. B. Tylor) emerged from the Scottish Enlightenment and embraced principles and taxonomic methods of natural history. It derived its methods above all from disciplines such as geology, biology, and comparative anatomy. Diffusionism can be traced to the Romantic project of a universal cultural history but it practiced a hermeneutic that had been narrowed to a positivist methodology of interpreting historical sources, as exemplified in F. Graebner's (1911) adaptation of the work of E. Bernheim (1970, orig. 1889), a medieval historian. In both paradigms, notwithstanding the literary ambitions of some proponents, such as James Frazer, and the influence of literary critic Matthew Arnold on E. B. Tylor, anthropology seemed to lack an object for critical interpretation comparable to the great texts, the Scriptures, or the Classics. This did not change with the succeeding paradigms of British functionalism, French structuralism, or even (and at first) American culturalism. Primitive, nonwestern societies were not to be interpreted; they called for functional explanation, structural decoding, or structural-functional systemic analysis, until the study of cultural 'meaning' took the center stage.

This last development was tied to the concept of symbol that, unbeknownst to many who wielded it (leaning on Freud, Cassirer, Kenneth Burke, or Susanne Langer), always threatened to take anthropology back to precritical hermetic traditions of interpretation. Most daringly stated by Roy Wagner (1975), a 'symbolic anthropology' staked its claims—also with a Reader (Dolgin et al. 1977)—at about the time when calls for an 'interpretive and hermeneutic' approach were first heard (possibly prepared by Palmer's excellent general introduction to hermeneutics in English published in 1969). Clifford Geertz was invoked as an authority by the symbolic as well as the interpretive movement. He remained somewhat aloof of both and continued to call his approach 'semiotic' (that is, sign-centered) although he went further in the direction of hermeneutics than any of his predecessors when he suggested that anthropology's object of study, culture, might be approached as (or like) a text (an 'ensemble of texts' in his words). Geertz referred to an essay by Paul Ricoeur (1971, reprinted in Rabinow and Sullivan 1979, pp. 73–101). Ricoeur had advanced the 'hypothesis' that the human sciences, by adopting a hermeneutic approach, could proceed from 'Explanation to Understanding' (for a broader statement of the relevance of hermeneutics and interpretation to the social sciences, see Ricoeur's influential study of Freud, 1970). Earlier influences from Dilthey and Weber had prepared the ground for giving to 'understanding' this new and sharp focus.

3. *Interpretation and Method*

Thus, by the mid-1970s, one of its most influential proponents seemed to have steered anthropology back to the Romantic tradition of interpretation. However, important as this move may have been at the level of theory (that is, in redefining the object of anthropology and in clarifying the status of the discipline as an interpretive rather than explanatory science), its practical consequences were limited. The model of the text did not generate a new distinctive method; thick description and a knack for discerning 'webs of signification' continued to work as the ethnographer's 'magic.' For those who embraced the hermeneutic stance, text remained essentially a metaphor and few among these writers were compelled by this figure to direct their ethnographic research and writing to actual texts and their interpretation. The latter happened in a movement that was roughly contemporary with Geertzian hermeneutics and had intellectual roots that, acknowledged or not, go back to W. von Humboldt. It took its departure from a critique of formalist structural linguistics, of purely classificatory approaches in folklore, and of positivist views of ethnography. It was in this field of innovative endeavors where critical thought in language-centered anthropology (Hymes 1974) and the philosophy of social science (Habermas 1988, orig. 1967) converged that we began to see how interpretation might develop from a theoretical figure to a practical guideline, a method organizing the production of anthropological knowledge from field research to writing.

Whether or not certain choices, steps, procedures, and strategies devised for interpretation can count as an anthropological method is an epistemological question: how must we conceive the nature of anthropological inquiry, how the nature of its object? From a hermeneutic position the answer would roughly be this: anthropology, though aware of, and in some of its branches concerned with, neural, etiological, and certain statistically demonstrable

determinations of human behavior, starts with the assumption that human experience as well as the study of that experience are always mediated. Mediated means that experiences (and our understandings) are made, shared, and transmitted by means (lit. things in the middle, media) that include language (in the broadest sense of the term), practices of communication and representation, and material objects. This is an epistemological, not an ontological view: When we conceive of an ensemble of mediations as culture this is not to posit culture as an entity. Culture is a discourse on mediations and practices. In this view, mediations are objectifications of human action somewhat but (as we shall argue) not quite in the sense envisioned by Ricoeur when he stated that 'action itself, action as meaningful, may become an object of science, without losing its character of meaningfulness, through a kind of objectification similar to the fixation which occurs in writing. By this objectification action … constitutes a delineated pattern which has to be interpreted according to its inner connections' (1971, p. 538). The analogy with fixation in writing (the reason to introduce the model of the text in the first place) 'prepares the detachment of the *meaning* of the action from the *event* of the action' (1971, p. 538). In the passages from which these quotations are drawn Ricoeur deploys the vocabulary of Weberian–Parsonian culturalism (pattern, meaning, meaningful action, interaction) and thereby advocates interpretation as an operation on elements of culture that, though objectified, are disembodied—a point often made in the critique of American culturalism and echoed in Bourdieu's (1977, p. 96) qualifying the hermeneutic stance as 'objectivism.'

In contrast, approaches to text and interpretation in anthropology that, explicitly or not, focus on mediation and on culture as praxis are concerned with maintaining or restoring the event-character of action. Interpretation then becomes a method of translating the texts and documents, that is, those 'fixations in writing' that are the 'data' produced by interactive, communicative ethnography (notes, recordings, collected texts, including some that made their way into historical or administrative archives), into events and eventually into processes. Not the model of 'the' text but models of text making are required for such interpretive work, much of which has been inspired by Dell Hymes's (1974, orig. 1964) seminal observations on components of speech events. His ideas, sometimes called 'sociolinguistic,' were further developed by the contributors to Bauman and Sherzer (1974). Linking the notion of speech event to that of genre, Dan Ben Amos has shown methodological consequences for folklore studies (1976), and a classic in this vein is Dennis Tedlock's collection of essays (1983). Fabian has stated the philosophical (anti-positivist) point of departure, offered a model of text production, and a warning against tendencies to grammaticalize Hymes's pragmatic approach to texts (1991, Chaps. 1, 3, 5).

4. *Interpretation and Performance*

The move away from semiological to pragmatic concerns reflected and promoted yet another understanding of interpretation. 'Interpretation' used to be a discipline and skill taught in speech and drama departments; today, many of them have become part of a multifaceted field called Performance Studies. Performance, as a theoretical concept usually paired with 'competence,' was adopted by Hymes from generative linguistics and applied to his ethnography of speaking but it undoubtedly gained its wider currency in anthropology in the more specific, theatrical understanding promoted, above all, by Victor Turner (stated most comprehensively in 1986). Actually, as his work shows, attention to performance in the interpretation of culture has a complex intellectual history. Turner began by giving focus and life to drama, a pervasive but mostly dead theatrical metaphor in social theory (for instance in Parsonian functionalism–structuralism) that was at the origin of such crucial sociological terms as role, actor, and enactment. He saw drama above all in ritual, and came close (as did Max Gluckman) to postulating a distinctive type of premodern society whose social dynamic was not determined by linear accumulation of change and innovation but by cyclical enactment of a dramatic script. Undoubtedly, this presented a gain over static views of primitive or traditional societies. However, not unlike the model of culture as a text, the drama metaphor had its limits when it came to understand its practical consequences for the production of ethnographic knowledge. What was needed was an epistemological conception of performance as both a way in which a culture works and a method by which it may be studied and represented. Taking an increasingly literal approach to performance as theatrical performance (including experimental collaboration with Richard Schechner, a producer and theorist in the field of theater), Turner ended in an impasse that eventually led him to advocate a biological (neurological) position not unlike that earlier taken by Lévi-Strauss (see Turner 1986, pp. 156–77). Nevertheless, his work helped to make anthropologists aware that large parts, perhaps most expressions, of cultural knowledge are performative in the sense that what they say is also constituted by how contents are enacted. An emerging 'ethnography of reading' (Boyarin 1993) applies this to texts fixated in writing and opens to anthropology a wide field of interpretation no longer predicated on categorical distinctions between orality and literacy; for methodological consequences and procedures, see Finnegan (1992) and Tonkin (1992). What changed, and was gained, by including pragmatic (sociolinguistic) and performance aspects in methods of interpreting oral sources is best illustrated by comparing Vansina's classic work on oral tradition (1961) with its radical revision (1985).

Finally, it should be mentioned that a pragmatic

and critical stance toward the interpretation of texts also leads to a re-evaluation of 'context,' a concept that has had a long history in anthropology. It was applied mainly in the validation of ethnography and often, much like text, in a metaphorical manner in admonitions to place specific facts or data in their historical, political, economic, religious, etc. 'context.' In-as-much as this suggested that, though relevant to an interpretation of findings, context was itself not subject to interpretation (at least not at the moment when it was invoked), this has become an untenable proposition. Context poses problems of interpretation, it does not solve them.

5. *The Politics of Interpretation*

A review of theoretical and practical views of interpretation in anthropology would not be complete without developments that emerged in the 1980s. They consisted of moves giving anthropology a 'literary turn,' an apt designation if it is understood as promoting attention to writing in the production of ethnography and anthropological knowledge. Not metaphorical invocations of text as a model, but calls for critical interpretation of ethnographies as texts were formulated by a group resolved to lift the veil under which modern, scientifically minded anthropology had kept ethnographic authorship (Marcus and Cushman 1982, Clifford and Marcus 1986, Clifford 1988). Postmodernism became a convenient but doubtful label for this movement—doubtful because it obscures its roots in decidedly modern advancements in the historiography of our discipline, in the theoretical confrontation with its colonial and postcolonial political role that had occupied critical anthropology since the 1960s, and, though less obviously, in feminist critique of anthropological discourse.

As regards interpretation, the subtitle of the Clifford and Marcus volume, 'The Poetics and Politics of Ethnography,' pointed to the directions further work could, and did, take. Along the lines of a hermeneutical understanding of the term, interpretation now applied to the canon of anthropological writing the tools developed by literary theory and criticism (exemplified by Geertz 1988). Interpretation in the performative sense encouraged, beyond literary deconstruction, 'experimentation with genre' which resulted, if not quite in its demise, then in relativizing the status of the monograph as the authorized form of ethnography: narrative, dialogue, poetry, collage, and autobiographic inclusion of the ethnographer in his or her account have begun to shape much of anthropological writing. Perhaps it is not always easy to draw a line between hard-won freedom from scientism and gratuitous literary posing; postmodern ethnography is at its best when it is able to justify its choice of representational forms on epistemological grounds. How an author translates practices of research into writing has become a foremost task of critical interpretation in anthropology. To be able to discern narrative plots and strategies, identify tropes and other rhetorical devices, and to recognize intertextual connections is now required when we discuss the validity of ethnographies. Conversely, though it would be foolish to cast away all our prior habits and techniques, field research can no longer rely largely on preconceived methods that once were thought to yield data without being themselves subject to constant interpretation (which would have made methods useless in a classical positivist research setup). Attempts to formulate these insights have reached the level of textbooks and handbooks that steer a difficult course between opening a back door to flat-footed methodology and scaring anthropological novices with hermeneutic hypersensitivity.

Distinguishable but never separable from attention to poetics is the concern with the politics of ethnography, that is, with relations of power that determine production of anthropological knowledge in all its phases from research to writing. Therefore the question of interpretation in anthropology cannot be raised without (taking a lesson from Michel Foucault) questioning the devices of control and domination deployed in the discourse anthropology pronounces on others. Interpretation may be 'just interpretation,' but neither as a hermeneutic alternative to scientism nor as a pragmatic method should it make anthropology complacent about its achievements.

Interpretive Methods: Macromethods

The goal of all interpretive methods, both macro and micro, is to make sense of some slice of reality—to render it understandable or intelligible. Since the work of Max Weber (1949, 1958, 1978) has been central to articulating macrointerpretive methods, this essay uses Weber's work to elucidate key features of these methods and to help outline their key tensions.

1. *Webers* Protestant Ethic *as an Illustrative Case*

Weber's (1958) *The Protestant Ethic* exemplifies the meaning-oriented (verstehende) and explanatory goals and strategies of macrointerpretive work. Noting a historical association between the Protestant reformation and the rise of capitalism in Western Europe, Weber outlines a puzzle. How could a religion leading to more *conformist* behavior than did Catholicism become associated with radically *innovative* economic behavior? Unraveling this historical and theoretical puzzle requires understanding the cultural beliefs occasioned by the Reformation and the dilemmas they created for the Protestant believer. Detailing exactly how the new beliefs provided for social control allows Weber to make sense of a culturally significant and historically specific pattern of institutional change.

To do this, Weber constructs the ideal types 'capitalist ethos' and 'Protestant ethic.' *Ideal types* are analytic tools for interpretive, explanatory work. The social scientist creates ideal types by abstracting elements from concrete historical situations, then combining the elements into a meaningful conceptual whole. The ideal type does not exist in empirical reality, but it is constructed inductively from that reality to illuminate something of cultural significance (Weber 1958, p. 47, 1949, pp. 91–111, 1978, pp. 18–22).

According to Weber (1958, pp. 51–68), the spirit of capitalism combines two elements: an absolute ethical duty to accumulate capital and to do so in a rigorously calculating rational way. The ideal-typical capitalist must increase his or her capital as an end in itself, methodically identifying and following courses of action that lead to profit-making, while strictly avoiding any enjoyment of life. Weber argues that any account of the rise of modern capitalism must explain how this ethos, which then helped transform economic institutions, evolved.

The ideal-type Protestant ethic analytically combines three elements (Weber 1958, pp. 79–154). First is Luther's idea of the calling—that people have a moral duty to their work. Second is ascetic mastery of the world, the idea that at each minute of every day, the individual must bring God's glory to fruition in the world, rather than by withdrawing to a monastery or nunnery. Third is the Calvinist doctrine of predestination, arguing that by the decree of God for the manifestation of God's glory, some people are predestined for grace and others for damnation. Only God knows which people are which, and nothing people do in their lives can change their preordained fate.

Once Weber has theoretically constructed his object of inquiry—the capitalist ethos—and his explanatory concept—the Protestant ethic—he creates the interpretive links tying the two together. He asks and answers the question, what does predestination *mean* and how is it likely to orient behavior for the people who believe in it, given that they *also* believe in the calling and ascetic mastery of the world? He then argues as follows.

> In its extreme inhumanity, this doctrine must above all have had one consequence for the life of a generation [that] surrendered to its magnificent consistency. This was a feeling of unprecedented inner loneliness of the single individual. In what was for man

> of the age of the Reformation the most important thing in life, his eternal salvation, he was forced to follow his path alone to meet a destiny which had been decreed for him from eternity … the complete elimination of salvation through the Church and the sacraments was what formed the absolutely decisive difference from Catholicism (Weber 1958, p. 104).

Attaining salvation is so central that believers will question constantly whether they are saved. Since there is no way of knowing, most people will feel intolerable psychological strain. Strain is amplified because at the same time that participation in Protestant churches and rituals cannot guarantee salvation, believers are told by religious leaders that it is 'an absolute duty to consider oneself chosen … lack of self confidence is the result of insufficient faith, hence of imperfect grace' (Weber 1958, p. 111). It becomes imperative to resolve this 'Catch-22' situation and justify certainty in one's salvation.

What will the believer do? Faced with a preordained outcome, some people might become fatalistic and others might commit suicide. To explain why believers do not take these paths, Weber situates predestination in its broader belief context. Because of the conjunction of belief in predestination with beliefs in the calling and ascetic mastery of the world, the Protestant believer is likely to try and relieve his or her incredible psychological insecurity by bringing God's glory to fruition through efficacious action in a calling in the world. 'Good works' cannot bring salvation, but they *do* provide an effective way to get rid of the fear of damnation, assuming that the believer lives an entire 'life of good works combined into a unified system' (Weber 1958, pp. 115–17).

In short, predestination and the need for proof of salvation provide a psychological basis for constant self-regulation and the rational ordering of moral life. The other elements of the Protestant ethic explain how and why the solution to the need for proof will be found in the systematic rationalization of moral life in the world rather than being found elsewhere. As a meaningfully interpreted whole, the Protestant ethic is powerful brew. The interpretive link to the capitalist spirit now is clear: purposive-rational orientation to capital accumulation as an end in itself is a strategy to provide the believer with a clear, continuous and unambiguous sign of his or her own salvation. As a collective attribution of meaning and action orientation, the strategy—and the macro religious structure that created it—unintentionally reorders economic behavior and institutions.

2. *Key Features and Tensions in Macrointerpretive Work*

As illustrated by Weber, imputation of chains of meaning, motivation, and consequent likely courses of action are a hallmark of macrointerpretive explanation. Because actors are front and center, with social institutions providing the cultural scripts that orient actors' attributions of meaning and their behavior, macrointerpretive work is ideally suited to reconciling agency and structure (Sewell 1996). Similarly, macrointerpretive work is profoundly historical, although it is not necessarily historicist in the narrowest meaning of that term.

Because most macrointerpretive work is concerned with imputing actors' meanings, culture and ideology loom large as objects of inquiry or as explanatory factors (Wuthnow 1989, Mahoney 1999). However, macrointerpretive methods also signal the interrelated construction of historical narratives and social science concepts to interpret historical wholes, processes or particularities, so that they are rendered meaningful to us as social scientists (Ragin 1987). These two analytically distinct aspects of macro interpretive work tend to be found together, as in Weber's *Protestant Ethic*, but they sometimes appear separately (Mahoney 1999).

Macrointerpretive scholarship is enriched by multiple analytic techniques including diverse formal and nonformal narrative and comparative methods (see, e.g., Ragin 1987, 2000, Griffin 1993, Stryker 1996, Mahoney 1999). Some scholars view strategies such as narratives stressing sequence, path dependence, and 'eventful temporality' and comparisons emphasizing the divergent structural and cultural contexts of events as alternative approaches to doing macrointerpretive work (Griffin 1992, Sewell 1996). However, others argue these strategies are complementary (Quadagno and Knapp 1992, Stryker 1996, Mahoney 1999).

Like Weber's own work, macrointerpretive scholarship embodies a tension between the concrete and particular and the abstract and general (compare Bendix (1978) with Moore (1966)). Often, macro interpretivists resolve the tension between specificity and generality, as did Weber, by using the concepts they create to resolve puzzles and explain historically specific events and event sequences, while also seeking limited historical, or conditional, generalizations (Quadagno and Knapp 1992, Stryker 1996, Mahoney 1999, Paige 1999). The underlying assumption about the relationship between history and social science theory guiding macrointerpretive work is that history is theorized at the same time as theory is historicized. In other words, the two are 'mutually constructed' and 'mutually adjusted' so that they are 'logically interdependent processes' rather than 'analytically independent things' (Stryker 1996, p. 312).

Macrointerpretive work often is portrayed as wholly inductive. But as Weber's *Protestant Ethic* demonstrates, it cannot be characterized fairly in this way. Neither can its practitioners be characterized as formalistically applying Mill's method of agreement, indirect method of difference or some combination of the two. Notwithstanding much literature describing

comparative variants of macrointerpretive methods in terms of Mill's canons, Goldstone (1997, p. 108) shows why 'Mill's methods cannot be used and are not used by comparative case-study analysis.' Instead, Goldstone (1997) likens case-oriented comparative methods to sophisticated detective work. Like all macrointerpretive analysis, these methods involve a constant interplay of ideas and evidence to solve anomalies, they carefully combine inductive with deductive reasoning, and they involve attending to the complexities of multiple and conjunctural causation (Stryker 1996, Goldstone 1997, Ragin 1987). A final hallmark of macrointerpretive scholarship is selection of research topics according to their 'value-relevance' and 'cultural significance' for the scholar and intended audience (Weber 1949, pp. 76–7, Sewell 1996, Mahoney 1999).

This run-down of multiple currents and tensions within macrointerpretive work is not exhaustive, but it should suffice to show that macrointerpretivists debate (a) whether or not interpretation must involve causal explanation as well as imputing meaning and (b) the prominence that should be accorded to narrative as opposed to comparative techniques. Much, but not all, macrointerpretive work is explicitly or implicitly causal-analytic (Skocpol and Somers 1980, Ragin 1987, Goldstone 1997). Similarly, much macro interpretive work is explicitly or implicitly comparative, even as it relies heavily on narrative strategies (Skocpol and Somers 1980, Mahoney 1999). For a good introduction to diverse causal-analytic strategies and to the multiplicity of comparative techniques employed by macrointerpretivists, see Skocpol and Somers (1980), Skocpol (1984), Ragin (1987), Rueschemeyer et al. (1992), Goldstone (1997), and Mahoney (1999). For a good introduction to the diversity of narrative techniques, including very different concepts of narrativity and its role in macro interpretive social science, see Stone (1979), Griffin (1993), Sewell (1996), Stryker (1996), and Somers (1997).

A final tension involves questions of subjectivity and objectivity in social science. Some contemporary scholars—notably feminist standpoint theorists such as Smith (1990) and Collins (1990)—suggest that it is neither possible nor desirable to transcend the lived experience of the actors one studies. Meanings should be imputed through dialogic techniques practiced with real subjects or, if this is not possible, with historical texts, so that the actors studied would recognize and verify these meanings as their own.

Deconstructionist critiques such as these have been useful to elucidate how class, race, gender, and other categories of domination and subordination are implicated in the production of social science knowledge. However, most macrointerpretive scholars follow Weber (1949) in assuming that *interpretive objectivity* is both possible and desirable. Although there is substantial disagreement over which concepts and procedures are best, most macrointerpretive scholars presume that if the analyst is clear about his or her concepts and how they are operationalized and if he or she employs an explicit set of procedures to establish the interpretations he or she makes, he or she can arrive at interpretive objectivity. Here Weber's (1949, 1978) discussion of the use of ideal types, counterfactuals, and principles of objective possibility to arrive at explanations that are causally adequate and adequate on the level of meaning is seminal. Contemporary promotion of techniques of 'strategic narrative,' (Stryker 1996), of formal qualitative comparative analysis (QCA) and its extension into fuzzy set logic (Ragin 1987, 2000), and of event structure analysis (Griffin 1993), can be seen as updates on Weber's (1949) rules for achieving objectivity in macrointerpretive social science. In these extensions, issues of validity, reliability, and replicability are emphasized.

3. *Conclusion*

In sum, there is no one macrointerpretive method. Macrointerpretive scholarship is built around a diversity of techniques. Both old methodological stalwarts and new developments are playing their role in generating the culturally significant findings of macrointerpretive research. In the twenty-first century, there is an enormous body of writing illuminating the rich variety found within macrointerpretive methods. What all varieties share with Weber's *Protestant Ethic* is an emphasis on imputing meaning to render large-scale social actions and processes intelligible. As comparisons of such diverse studies as Wallerstein's (1974) on the world system and Somers (1997) on English working-class formation suggest, macrointerpretive scholarship of all sorts is well suited to forming and empirically examining concepts, hypotheses, and theories that help us understand how social structures work, how they reproduce themselves and how they change. Although macrointerpretive scholarship relies on analytic logic completely different from that of frequentist statistical methods, it proceeds based on coherent methodological principles and procedures.

Interpretive Methods: Micromethods

In this article, recent developments in the uses and representations of interpretive, research methods are analyzed. Micromethods are focused on those interpretive approaches which yield close readings of texts and social situations. This will require serious attention to forms of narrative analysis, and the uses to which narrative material can be put by a society and its members, including social scientists. Accordingly, my intentions are fourfold. First, to analyze the problems and issues confronting the use of micro-qualitative methods and research evidence. Second, to define and locate this sprawling, interdisciplinary field of qualitative inquiry within the history of interpretive methods in the United States in the twentieth century. Third, to discuss the multiple uses and forms of qualitative inquiry, including its uses in participatory, applied action research settings. Speculations on where interpretive narrative inquiry will go in the twenty-first century form the conclusion.

1. *The Field of Interpretive Research and its History*

Interpretive research methods produce descriptions and accounts about the ways of life of the writer and those written about. There are multiple forms, or strategies of qualitative research (see below), including ethnography, participant observation, and case study analysis. The use of these strategies is connected to specific methodological practices, ranging from interviewing, to participant observation, to the use of visual, narrative, and personal experience methods. These methods generate specific types of empirical materials. These materials come in multiple forms, ranging from transcribed interviews and field observations, to life stories, cultural texts (stories, music, cinema, soap operas, TV news, televised sporting events), the artifacts and symbols of material culture (building and burial sites, pottery, tools, clothing), photographs, archival records, biographical, and historical documents. Traditionally, these materials are seen as producing the evidence that qualitative researchers use when they formulate interpretations of social and cultural phenomenon. Three interconnected activities define the interpretive research process. They go by a variety of labels or names, including theory,

method, and analysis. Behind these terms stands the researcher who has a gendered biography, and who speaks from a particular class, race, cultural, and ethnic perspective. This researcher confronts the world with a set of ideas, or basic beliefs. These beliefs can be called a paradigm (Guba 1990). A paradigm consists of an epistemology, an ontology, and a set of research strategies. Specific types of methodological practice are specified by a paradigm's epistemology. Ontology raises basic questions about reality and the nature of human nature. Methodology addresses the issue of how we gain knowledge about the world. Today in qualitative inquiry multiple paradigms, each with its particular ontology, epistemology, and methodology, compete for attention. These paradigms include logical postivism, postpositivism, constructionism and feminism, Marxism and critical theory, cultural studies and ethnic models. (Logical positivists believe in an external reality that can be apprehended by the methods of objective science. In contrast, postpositivists assert that there may be an external reality, but it cannot be known perfectly.)

The positivist paradigm, within interpretive methodology, presumes an objective world that can be studied with objective, micro-research methods. The constructivist paradigm presumes multiple realities, and contends that the researcher and those studied create understandings about the world and its meanings. Terms like trustworthiness, credibility, transferability, dependability, and confirmability replace the traditional positivist criteria of internal and external reliability and validity. Feminist, ethnic, critical theory, and cultural studies models privilege a real world that makes a material difference in the lives of men, women, and children. Interpretive methods are used, and researchers experiment with new ways of writing and presenting empirical evidence.

These paradigms, which structure qualitative research, operate in a complex historical field which cross-cuts five historical moments. These five moments simultaneously operate in the present. They are defined as the *traditional* (1900–50), the *modernist*, or golden age (1950–70), *blurred genres* (1970–86), the *crisis of representation* (1986–90) and *postmodern*, or present moments (1990–present). The present moment is defined by the refusal to privilege any method or theory, or methods claim to validity.

Successive waves of critical, epistemological discourse move across these five moments. The *traditional period* is associated with the logical positivist, quantitative research paradigm. In this period qualitative researchers attempted to justify their research methods in terms of traditional criteria of reliability and validity. Researchers sought to maintain a detached, objective stance toward the world and their objects of study. Research methods were the means by which evidence about the world was collected. The other who was studied was alien, foreign, and strange.

The field worker, during this period, was lionized, made into a larger-than-life figure who went into and then returned from the field with stories about strange people. These accounts were structured by the norms of classical ethnography. This sacred bundle of terms (Rosaldo 1989, p. 31) organized ethnographic texts in terms of four beliefs and commitments: a commitment to objectivism, a complicity with imperialism, a belief in monumentalism (the ethnography would create a museum-like picture of the culture studied), and a belief in timelessness (what was studied never changed). This model of the researcher, who could also write complex, dense theories about what was studied, holds to the present day.

The *modernist* and *blurred genres* moments are connected to the appearance of postpositivist arguments. The logic of multiple methods (and triangulation) was adopted, embodied in the development of empirically grounded theory. During this period, researchers started to move away from the detached observer stance of the traditional moment. At the same time a variety of new interpretive, qualitative perspectives made their presence felt, including hermeneutics, structuralism, semiotics, phenomenology, cultural studies, and feminism.

The modernist phase or second moment builds on the canonical works from the traditional period. Social realism, naturalism and slice-of-life ethnographies are still valued. This was the golden age of rigorous qualitative analysis.

By the beginning of the third stage (1970–86), *'Blurred Genres,'* qualitative researchers had a full complement of paradigms, methods, and strategies to employ in their research. Geertz's two books, *Interpretation of Cultures* (1973) and *Local Knowledge* (1983), defined the beginning and end of this moment. In these two works he argued that the old functional, positivist, behavioral, totalizing approaches to the human disciplines was giving way to a more pluralistic, interpretive, open-ended perspective. This new perspective took cultural representations and their meanings as its point of departure. Calling for 'thick descriptions' of particular events, rituals, and customs, Geertz suggested that all qualitative writings were interpretations of interpretations. The observer had no privileged voice in the interpretations that were written. The central task of theory was to make sense out of a local situation.

In the blurred genre phase the humanities became central resources for critical, interpretive theory, and the interpretive research project broadly conceived. The blurred genres phase produced the next stage, the crisis of representation. Here researchers struggled with how to locate themselves, their empirical materials, and their subjects in reflexive texts. It became increasingly clear that research methods were not neutral tools that produced value-free observations. Rather all observations were understood to be theory-laden; facts were not independent of the observer's values; and observers could not sustain an objective,

detached view of themselves, the world, and the research process.

The *fifth moment* is the present. It is characterized by a sensibility which doubts all previous paradigms and historical moments. Theories are now read in narrative terms, as tales from the field (Geertz 1988). Preoccupations with the representation of the 'Other' remain. New epistemologies from previously silenced groups emerge to offer solutions to this problem. The concept of the aloof researcher has been abandoned. Action, activist-oriented research is on the horizon, as are more social criticism and social critique. The search for grand narratives is being replaced by more local, small-scale theories fitted to specific problems and specific situations.

1.1 Reading History

The following conclusions can be drawn from this brief history. Each of the earlier historical moments continues to operate in the present, either as legacy, or as a set of practices that researchers follow or argue against. The multiple and fractured histories of qualitative research make it possible for any given researcher to attach a project to a canonical text from any of the previous historical moments. Multiple criteria of evaluation now compete for attention. There have never been so many paradigms, strategies of inquiry, or methods of analysis to draw upon and utilize. Researchers are in a moment of discovery and rediscovery, as new ways of looking, interpreting, arguing, and writing are debated and discussed. The qualitative research act can no longer be viewed from within a neutral or objective perspective. Class, race, gender, and ethnicity shape the process of inquiry, making research a multicultural process.

1.2 Interpretive Inquiry as a Site of Multiple Methodological Research Practices

Any definition of micro-interpretive research and the evidence generated by qualitative methods must work within this complex historical field. Qualitative research and qualitative evidence mean different things in each of these moments. Nonetheless, an initial, generic definition can be offered.

Interpretive inquiry is multimethod in focus, involving a naturalistic approach to its subject matter. This means interpretive researchers study things in their natural settings, attempting to make sense of these things in terms of the meanings people bring to them. *Qualitative research* involves the studied use and collection of case study, personal experience, introspective, life story, interview, observational, historical, interactional, and visual texts which describe routine and problematic moments and meanings in individual's lives.

Qualitative research, as a set of interpretive practices, privileges no single methodology over another. It has no theory, or paradigm that is distinctly its own. Multiple theoretical paradigms, as argued above, claim use of qualitative research methods and strategies, from constructivism, to cultural studies, feminism, Marxism, and ethnic models of study. Qualitative research does not belong to a single discipline.

These separate and multiple uses and meanings of the methods of qualitative research make it difficult to agree on any essential definition of the field, for it is never just one thing. Still a definition must be made. I borrow from, and paraphrase Nelson, Treichler, and Grossberg's attempt to define cultural studies (1992, p. 4).

> Qualitative research is an interdisciplinary, counter-disciplinary field. It cross-cuts the humanities, the social and the physical sciences. Qualitative research is many things at the same time. It is multi-paradigmatic in focus. Its practitioners are sensitive to the value of the multi-method approach. They are committed to the naturalistic perspective; and to the interpretive understanding of human experience. At the same time the field is inherently political and shaped by multiple ethical and political positions. Qualitative research embraces two tensions at the same time. On the one hand it is drawn to a broad, interpretive, critical sensibility. On the other hand it is drawn to more narrowly defined positivist, postpositivist, humanistic and naturalistic conceptions of human experience and its analysis.

This rather awkward statement means that qualitative research, as a set of interpretive practices, embraces within its own history, constant tensions, and contradictions over the project itself, including its methods, and the forms its findings and interpretations take.

2. The Crisis of Interpretation

Today qualitative researchers confront a double crisis of representation and legitimation. Embedded in the discourses of poststructuralism and postmodernism (Denzin 1997, p. 6, Lather 1993), these two crises are, as Lather (1993) notes, coded in multiple terms, variously called and associated with the narrative, 'interpretive, linguistic, and rhetorical turns' in the social sciences. This linguistic turn makes problematic two key assumptions of social theory and interpretive research. The first assumption, as suggested above, presumes that theorists and researchers can no longer directly capture lived experience; such experience, it is argued, is created in the social text written by the researcher. This is the representational crisis. It confronts the inescapable problem of representation, but does so within a framework that makes the direct link between experience and text problematic.

The second assumption makes the traditional criteria for evaluating and interpretive theory and re-

search problematic. This is the legitimation crisis. It involves a serious rethinking of such terms as validity, generalizability, and reliability, terms already re-theorized in postpositivist, constructionist-naturalistic, feminist, and interpretive discourses. This crisis, asks, 'How are interpretive, ethnographic studies to be evaluated in the poststructural moment?' Clearly these two crises blur together.

2.1 The Representational Crisis

A single but complex issue defines the representational crisis. It involves the assumption that much if not all social science and ethnographic writing is a narrative production, structured by a logic that separates writer, text, and subject matter. Any social text can, accordingly, be analyzed in terms of its treatment of four paired terms: (a) the 'real' and its representation in the text, (b) the text and the author, (c) lived experience and its textual representations, and (d) the subject and his or her intentional meanings. The text presumes a world out there (the real), that can be captured by a 'knowing' author through the careful transcription (and analysis) of field materials (interviews, notes, etc.). The author becomes the mirror to the world under analysis. This reflected world then re-presents the subject's experiences through a complex textual apparatus which typically mingles and mixes multiple versions of the subject. The subject is always a textual construction, for the 'real' flesh-blood person is always translated into either an analytic subject as a social type, or a textual subject who speaks from the author's pages.

Qualitative researchers have historically assumed that their methods probe and reveal lived experience. They have also assumed that the subject's word is always final, and that talk directly reflects subjective-lived experience. The literal translation of talk thus equals lived experience and its representation.

Poststructuralism challenges these assumptions. Language and speech do not mirror experience, they create it and in the process of creation constantly transform and defer that which is being described. The meanings of a subject's statements are, therefore, always in motion. There can never be a final, accurate representation of what was meant or said, only different textual representations of different experiences. As Lather (1993, p. 3) observes, these arguments do not put an end to representation, they signal instead the end of pure presence (Lather 1993, p. 3). The task at hand is to understand what textually constructed presence means, since there is only ever the text. This leads to the question of a text's authority.

2.2 The Legitimation Crisis

Many contemporary qualitative researchers challenge postpositivist arguments concerning the text and its validity. Lather (1993) and Scheurich (1997, p. 84) argue that validity is a text's call to authority and truth. Lather calls this version of validity epistemological. That is, a text's authority is established through recourse to a set of rules concerning knowledge, its production, and representation. These rules, as Scheurich (1997) notes, if properly followed, establish validity. Without validity there is no truth, and without truth there can be no trust in a text's claims to validity. With validity comes power, and validity becomes a boundary line 'which divides good research from bad, separates acceptable (to a particular research community) research from unacceptable research … it is the name for inclusion and exclusion' (Scheurich 1997, p. 84).

Poststructuralism reads the discussions of logical, construct, internal, ethnographic and external validity, text-based data, triangulation, trustworthiness, credibility, grounding, naturalistic indicators, fit, coherence, comprehensiveness, plausibility, truth, relevance, as attempts to reauthorize a text's authority in the postpositivist moment. Such moves still hold (all constructionist disclaimers aside) to the conception of a 'world-out-there' that is truthfully and accurately captured by the researcher's methods and written text.

These words, and the methodological strategies that lie behind them, represent attempts to thicken and contextualize a work's grounding in the external empirical world. They represent efforts to develop a set of transcendent rules and procedures that lie outside any specific research project. These rules, if successfully followed, allow a text to bear witness to its own validity. Hence a text is valid if it is sufficiently grounded, triangulated, based on naturalistic indicators, carefully fitted to a theory (and its concepts), comprehensive in scope, credible in terms of member checks, logical, truthful in terms of its reflection of the phenomenon in question. The text's author then announces these validity claims to the reader. Such claims now become the text's warrant to its own authoritative representation of the experience and social world under inspection.

2.3 Resistances to Qualitative Studies

The academic and disciplinary resistances to interpretive, micro-research further illustrate the politics embedded in this field of discourse. The challenges to qualitative research are many. Qualitative researchers are called journalists or soft scientists. Their work is termed unscientific, or only exploratory, or entirely personal and full of bias. It is called criticism not theory, or it is interpreted politically, as a disguised version of Marxism, or Humanism.

These resistances to qualitative inquiry reflect an uneasy awareness that its traditions commit one to a critique of the positivist project. But the positivist

resistance to qualitative research goes beyond the 'ever-present desire to maintain a distinction between hard science and soft scholarship' (Carey 1989, p. 99). The positive sciences (physics, economics, and psychology) are often seen as the crowning achievements of Western civilization, and in their practices it is assumed that truth can transcend opinion and personal bias (Carey 1989, p. 99). Qualitative inquiry is seen as an assault on this tradition, leading some positivists to retreat into a 'value-free objectivist science' (Carey 1989, p. 104) model to defend their position. But these critics seldom attempt to make explicit, and critique the 'moral and political commitments in their own contingent work' (Carey 1989, p. 104).

The opposition to positive science by the postpositivists and the poststructuralists is seen as an attack on reason and truth. At the same time, the positive science attack on qualitative research is regarded as an attempt to legislate one version of truth over another.

2.4 Action Research

In the contemporary period greater use is being made of qualitative evidence in participatory and applied action programs. Life stories, case histories, and personal narratives are often used as key documentary evidence to establish the need for social change. Such materials are also used as proof that an applied action program works. Indeed qualitative (and narrative) evidence lends itself especially well to those applied action programs which stress the subjective, reflexive dimensions of social experience. They further imply that such materials are critical to the implementation of participatory action research as a practical, collaborative, participatory, emancipatory, and reflexive project. First-person narrative texts allow Third World and indigenous persons to share in the ownership of the research endeavor. Such texts anchor research in the context of ongoing community life. They help community members develop a shared orientation toward collective action aimed at addressing social injustice.

Participatory ethno-dramas, forum, and political theater can be used to mobilize community consciousness around an instance of perceived injustice or repression. For example, Brecht's Epic or Dialectical Theatre is deliberately disruptive and political, and thus anticipates the more radical forms of contemporary postmodern, political theater that has connections back to Artaud's concepts of a pure theatre (Birringer 1993, p. 217). Third World popular theater has been used by 'oppressed Third World people to achieve justice and development for themselves' (Etherton 1988, p. 991). This form of dramatic representation extends what theater and narrative can do politically.

3. In Conclusion

The legacies of the present move in several directions at the same time. They all turn on social texts and narratives, their uses and how they are read. The narrative turn in the social sciences presumes that social texts, including recorded or visual texts, interviews, fieldwork notes, transcribed conversations, speeches, film, music, advertisements, personal, electronic, and archival documents, can be rigorously and scientifically analyzed through the methods of narrative analysis.

But Trinh (1989, p. 141) warns us that traditional, empiricist narrative methods represent an approach to storytelling that must be avoided. They turn the story told into a story analyzed. In so doing they sacrifice meaning for analytic rigor. They only hear and read the story from within a set of predetermined structural categories. They do not hear the story as it was told. The goal is to recover these lost stories.

Intrinsic Motivation, Psychology of

Motivation concerns the processes through which behaviors are initiated and directed. Intrinsic motivation is a type of motivation that does not require reinforcers, pertains to activities that individuals find interesting, and requires the nutriments of psychological need satisfaction to function optimally. Herein, we review the emergence of the concept, discuss the field of inquiry as it has evolved, and point to its real-world relevance.

1. Historical Roots of Intrinsic Motivation

During the middle decades of the twentieth century, the initiation and direction of behavior was addressed primarily by learning theory (Hull 1943) and operant theory (Skinner 1953)—the two strands of behaviorism that dominated empirical psychology at that time. The two theoretical approaches shared several fundamental beliefs and theoretical propositions, the most important being that both claimed external reinforcers were the basis for behavioral regulation. The most important difference was that Hullian theory gave content to motivational processes by defining reinforcements in terms of the reduction of universal physiological needs, whereas Skinnerian theory defined reinforcements functionally as consequences of behavior that change its likelihood of recurring.

During that same period, studies began to uncover anomalies related to exploration and manipulation that could not be explained by either behavioral approach (Harlow 1953). Thus, White (1959) stated that a new type of motivational concept was necessary. Calling it effectance motivation and giving it a critical role in development, White suggested that people are inherently motivated to be effective in dealing with their surroundings. Subsequently, de Charms (1968) proposed an additional motivational propensity that does not operate by reinforcement principles, calling it personal causation.

Deci (1975) used the term intrinsic motivation to encompass both ideas about people's inherent tendency towards effective, volitional engagement with the environment. Suggesting that people are intrinsically motivated to take interest in novelty, assimilate experience, and apply their acquired skills flexibly, he defined the concept both operationally and theoretically. The operational definition, which was formulated in contrast to the Skinnerian assertion that all 'voluntary' behaviors are controlled by reinforcements in the environment, stated that intrinsically motivated behaviors are self-rewarding and thus do not require reinforcers that are operationally separable from the behaviors. The theoretical definition of intrinsic motivation, which was formulated in contrast to the Hullian assertion that all behaviors are derived from the four universal physiological needs, defined intrinsically motivated behaviors as those that people do out of interest when they experience satisfaction of the universal psychological needs for competence and autonomy.

At about the time reinforcement processes were found inadequate for explaining a variety of behaviors, intention emerged as the central concept for explaining behavioral regulation (Heider 1958). Accordingly, people undertake intrinsically motivated activities expecting to find them interesting and enjoyable, assuming they feel competent and self-determined while doing them.

2. The Organismic Metatheory

The concept of intrinsic motivation was a dramatic departure from motivation as it had been viewed in experimental psychology, for it eschewed the ideas of passivity and conditioning in favor of natural proactivity and growth. As such, it necessitated a significant shift from a mechanistic toward an organismic metatheory within the psychology of motivation. It became essential to view people as self-initiating beings who learn and develop as they proactively engage the environment. Intrinsic motivation represents the prototype of self-initiated behavior.

The explication and early investigation of intrinsic motivation involved contrasting it with extrinsic motivation, which refers to engaging in an activity for consequence other than the spontaneous feelings that accompany it. The classic example of extrinsic motivation is doing an activity to attain a reward or avoid a punishment. Employing attribution theory, de Charms (1968) stated that intrinsically motivated behaviors have an internal perceived locus of causality, while extrinsically motivated behaviors have an external perceived locus of causality, and Lepper et al. (1973) defined intrinsic motivation as behaviors for which people infer internal causes, and extrinsic motivation as those for which they infer external causes. Kruglanski (1975) proposed that when intrinsically motivated, rewards are endogenous to the activity, whereas when extrinsically motivated, rewards are exogenous.

3. Research on Intrinsic Motivation

Initial research on intrinsic motivation examined the effects of extrinsic rewards on intrinsic motivation, finding that extrinsic rewards did undermine intrinsic motivation within limiting conditions (e.g., Deci 1975). Specifically, the undermining occurred when the activity was initially interesting and the rewards were both contingent on doing the activity and expected while doing it.

This general finding, which has now been replicated numerous times was controversial when it first appeared and has remained controversial ever since. In fact, the controversy was very apparent recently when Eisenberger and Cameron (1996) published a high visibility article in which they reported having done a meta-analysis of experiments examining reward effects on intrinsic motivation and having found little evidence for the undermining effect. However, Deci et al. (1999) subsequently pointed out many errors and inappropriate procedures in that Eisenberger and Cameron meta-analysis and did a new meta-analysis that corrected the previous shortcomings. The newer meta-analysis, involving 128 studies, confirmed, in fact, that tangible extrinsic rewards do reliably undermine intrinsic motivation for the rewarded activity, as had been concluded previously in narrative reviews of the literature (e.g., Deci and Ryan 1985).

Part of the significance of the undermining effect is that it indicates that motivation is not a unitary concept, varying only in amount, because these two types of motivation—intrinsic and extrinsic—are not additive. Indeed, it has turned out that the orientation of motivation—whether a behavior is intrinsically or extrinsically motivated—is more important than the overall amount of motivation for predicting behavior and its consequences (Ryan and Deci 2000).

In fact, numerous studies have shown that intrinsic, relative to extrinsic, motivation was associated with better conceptual learning, greater creativity, more cognitive flexibility, greater behavioral persistence, and enhanced well-being (Deci and Ryan 1985, Utman 1997). Given these findings, a thorough investigation of the social–contextual conditions that facilitate versus impede intrinsic motivation seemed essential.

Because the needs for competence and autonomy were theorized to be crucial nutriments for intrinsic motivation, contextual factors that allowed satisfaction of the needs for competence and autonomy were predicted to enhance intrinsic motivation, whereas those that thwarted satisfaction of these basic needs were predicted to undermine intrinsic motivation.

Studies concerned with competence showed that positive performance feedback enhanced intrinsic motivation, that negative feedback diminished it, and that perceived competence mediated these effects. Other research found that increases in perceived competence must be accompanied by feelings of autonomy in order for the perceived competence to enhance intrinsic motivation. In fact, far more studies have examined autonomy than competence as a mediator of contextual effects on intrinsic motivation. This research has shown that threats, deadlines, directives, and pressured competition, like extrinsic rewards, diminished intrinsic motivation, presumably because people tend to experience them as limiting their autonomy (i.e., as controlling their behavior). On the other hand, choice, the opportunity for self-direction, and acknowledging people's feelings have been found to enhance intrinsic motivation because they provide a greater sense of autonomy (Deci and Ryan 1985).

Other research conducted in real-world settings such as homes, classrooms, and work groups revealed a general interpersonal style referred to as autonomy supportive (in contrast to controlling) that, when used by parents, teachers, and managers, catalyzed greater intrinsic motivation and self-determination in their children, students, and employees. Thus, both specific external events, such as the offer of rewards, and general interpersonal ambiences can affect intrinsic motivation, enhancing it by supporting people's feelings of autonomy and competence and undermining it by diminishing those feelings (Deci and Ryan 1985).

4. *Extrinsic Motivation*

The abundance of research showing that extrinsic motivators such as rewards, deadlines, threats, and evaluations tend to undermine intrinsic motivation would seem to imply that extrinsic motivation is invariantly nonautonomous. However, research has shown that extrinsic motivation can become autonomous or self-determined through the processes of internalizing and integrating behavioral regulations and their underlying values (Ryan and Deci 2000). Internalization is the process of taking in a value or regulation, and integration is the process of transforming that value or regulation into one's own.

Self-determination theory (Deci and Ryan 1985) suggests that when extrinsic motivation has merely been taken in but not transformed or integrated it will continue to control and diminish feelings of autonomy. An example is ego-involvement (i.e., internal pressure to do a behavior in order to feel worthy), and studies have shown that this type of motivation is antagonistic to autonomy (Deci and Ryan 1985).

However, extrinsic motivation that has been more fully integrated allows the feeling of autonomy and has been found to predict more positive outcomes, such as better school performance, greater persistence at healthy behaviors, and enhanced psychological well-being not only in the USA but in various countries including Japan (Ryan and Deci 2000).

Research has also considered the effects of social contexts on internalization and integration, focusing primarily on whether contextual factors tend to be controlling versus supportive of self-determination. In both laboratory and field settings, these studies demonstrated that providing a meaningful rationale for an uninteresting behavior, along with supports for autonomy and relatedness, promoted internalization and integration. Controlling contexts (relative to contexts that allowed need satisfaction) yielded less overall internalization, as evidenced by less subsequent behavior, and the internalization that did occur in controlling contexts was less well integrated (Deci et

al. 1994). Field studies using both cross-sectional and longitudinal designs also found fuller internalization of values and regulations when parents (Grolnick and Ryan 1989) and instructors (Williams and Deci 1996) were more supportive of autonomy, competence, and relatedness, thus suggesting that supports for these three basic needs facilitate the internalization and integration of extrinsic motivation.

5. Conclusions

The central element in the psychology of intrinsic motivation is the critical distinction between behaviors that are volitional and accompanied by the experience of freedom and autonomy—those that emanate from one's sense of self—and behaviors that are accompanied by the experience of pressure and control and are not manifestations of self (Ryan and Deci 2000). Intrinsically motivated behaviors, which are performed out of interest and are characterized by perceived competence and autonomy, are the prototype of self-determined behaviors.

Research examining internalization and integration of extrinsic motivation and the conditions that facilitate it is important for the psychology of intrinsic motivation for two main reasons. It shows first, that although the naturally occurring state of intrinsic motivation is the prototype of volitional, self-determined activity, extrinsic motivation can approximate that state if the organismic processes of internalization and integration have operated effectively, and second, that the inherent processes of intrinsic motivation and integration of extrinsic motivation are similarly facilitated in social contextual conditions that allow satisfaction of people's innate psychological needs for competence, autonomy, and relatedness.

Thus, it seems that interpersonal contexts created by teachers, parents, managers, healthcare providers, and other individuals in positions of responsibility can have a substantial impact on the degree to which others, such as students, children, employees, and patients maintain their intrinsic motivation and become more volitional and self-determined with respect to extrinsic motivation.

Introspection: History of the Concept

The term *introspection* refers to the self-observation of mental events. Historically, it is a relatively recent term that achieved prominence in the course of debates about the status and the subject matter of psychology as a science. Critics stressed the incompatibility of self-observation and objective, scientific, observation; defenders proposed versions of introspection that could lead to reliable results.

1. The Philosophical Background

1.1 Origins

There is no documented occurrence of the term *introspection* before the late seventeenth century.

Serious discussion of the phenomenon described by this term began a century later and only gathered momentum during the course of the nineteenth century. Positivists like Auguste Comte now began to contrast the reliable, objective methods of science with the speculations of philosophers supposedly based on self-observation. Introspection would then be as old as philosophy, a claim that is hardly supported by an analysis of the relevant early texts.

The origins of the modern concept of introspection are closely tied to the rise of an empiricist philosophy at the end of the seventeenth century. For John Locke (1690) all knowledge was based on experience, but there were two sources of experience: the external senses and 'the perception of our own mind within us' which he likened to an 'internal sense.' The modern concept of introspection emerged out of the empiricist philosophers' belief that self-knowledge was based on acts of internal observation that were closely analogous to the acts of observation by which we gain knowledge of the external world.

1.2 The Classical Controversy

Objections to the empiricist concept of introspection were launched from two entirely different directions, though there was some convergence on specific criticisms. One set of objections came from German Idealist philosophers, the other from scientific positivists like Comte. Among the first group a beginning was made by Immanuel Kant, who gave several reasons why an empirical study of the psyche could never amount to a natural science. Among these reasons was the consideration that one could not observe one's mental states without thereby altering them. This position was based on a rejection of the empiricist analogy between knowledge of the natural world and self-knowledge. At best, self-observation would yield information about the self as it appears to itself, not as it really is. Idealism led to the development of methods of investigation in the human sciences that were neither introspective nor natural scientific in character.

Scientific *positivism*, on the other hand, rejected introspection along with any knowledge gained by methods other than those of the natural sciences. These methods demanded a strict separation of the observer and the objects observed, a separation that, according to Comte, no one could achieve in regard to their own mind. Introspection did not merely modify what was observed, it was actually impossible.

Safeguarding the foundations of philosophical empiricism, John Stuart Mill replied to Comte by offering what came to be the classical defense of introspection: mental events do not disappear in a flash, they are remembered. What is actually observed during introspection are the memories of recently past mental events, not the events as they occur. In other words, introspection is really retrospection, the examination of memory images. This defense was taken over by William James (1890) and other empiricists, though by the closing years of the century their advocacy of introspection was qualified by warnings about possible errors of memory. Some conceptual clarification was introduced by Franz Brentano (1973/1874), who distinguished between the immediate awareness of ongoing mental events, which he called 'internal perception,' and 'self-observation,' the retrospective attending to past mental events. It can be confusing to refer to both as 'introspection.'

2. Introspection and Experiment

The turn to experimental methods of psychological investigation was closely linked to the controversial nature of introspection. Wilhelm Wundt, who played a major role in the launching of experimental psychology, believed that the psychological laboratory provided the only conditions under which reliable introspective data could be gathered (Danziger 1990). He accepted the distinction between inner perception and self-observation but, unlike his predecessors, totally rejected the latter. Instead, he advocated a control of the conditions of internal perception so as to approximate the conditions of external perception. This could be accomplished in the laboratory by such measures as the repetitive presentation of relatively simple stimuli and the requirement that reactions be immediate and automatic. However, adherence to these conditions would necessarily limit the scope of experimental psychology (and of valid introspection) to the investigation of 'elementary' psychological events, mainly in the areas of sensation and reaction times.

At the beginning of the twentieth century these restrictions were rejected by a new generation of experimental psychologists who greatly extended the scope of experimental introspection so as to enable them to investigate more complex psychological processes like thinking and problem solving. The reliability of results was now thought to depend on the adoption of certain attitudes while introspecting. But there was no unanimity about the nature of these attitudes. E. B. Titchener (see *Structuralism*, *History of Structuralism*), a major exponent of experimental introspectionism, demanded that introspective descriptions should be in terms of simple, irreducible, units and should abstract from any meaning the stimulus might have. In Europe, members of the Wurzburg School (see Humphrey 1951) emphasized the importance of clearing one's mind of preconceptions while introspecting. (Titchener's requirements were prime examples of such preconceptions). Later, the *Gestalt* psychologists extended this *phenomenal* approach by insisting that perceptions should be described exactly as they appear in daily life, i.e., in terms of interrelated, meaningful, patterns.

The investigations of the Wurzburg School raised a new kind of question: what is the relationship between the conscious experience of the introspector and the verbal report he or she makes of this experience? In the empiricist tradition it had always been assumed that the relationship is one of description, not different in principle from a description of objects experienced as located outside oneself. However, it now appeared that some of the verbal reports in introspection experiments could not be regarded as descriptions of inner states, they were much more like *expressions* of these states, e.g., when someone reports feeling: 'Oh no, not that again!' The German term for this is *Kundgabe*, which has connotations of broadcasting and proclaiming. This distinction pointed towards recognition of the communicative features of introspective reports. It also suggested that the result of treating introspective reports purely as descriptions of mental events was likely to be a misleadingly intellectualistic account of such events.

3. *Behaviorism and its Aftermath*

Divergent attitudes to the practice of experimental introspection led to divergent results among different laboratories. Titchener claimed that sensory images could always be discovered in any thought activity but this was disputed by the Wurzburg School, by Binet in France, and by others. This became known as the 'imageless thought controversy.' Situations in which the results from one laboratory are at variance with those from other laboratories are far from unknown in the history of science. However, the imageless thought controversy acquired a special significance because its existence was used as evidence for the uselessness of introspection by a new movement in American psychology, namely, *behaviorism*.

Early behaviorists like J. B. Watson considered introspection to be entirely bogus, while others, like K. S. Lashley, conceded that it might provide 'cues to physiological problems.' Certainly, no scientific hypothesis could ever be verified by means of introspection. But in retrospect it seems that the behaviorists drew unwarranted conclusions from the practical difficulties of introspection (Mackenzie 1977, Howe 1991). Both pragmatic and metaphysical reasons were operative here. Pragmatically, it seemed advisable to dispense with a practice that would never yield the kind of knowledge that the science of psychology increasingly aspired to, i.e., knowledge that would be useful in dealing with practical psychological problems on a large scale. Metaphysically, the behaviorists were committed to the elimination of mind from the category of things that could have effects in the real world. Therefore, the study of mental events was pointless.

Behaviorism was more successful at denigrating introspection than at offering an alternative explanation of what actually happened when someone claimed to be introspecting. Its attempts to do so generally involved assumptions about the existence of subtle physical processes like subliminal movements of the vocal cords and other as yet undetectable examples of 'covert' behavior. It was these, rather than mental states, that supposedly gave rise to introspective reports. Behaviorism effectively accepted the original philosophical analogy between internal and external observation. It differed from those it called introspectionists only with regard to the kind of stuff that was the target of internal observation.

There was a strong rhetorical element in the behaviorists' critique of introspection which led to the construction of historical legends. One such legend was that of a category of 'introspective psychology' that comprised prebehaviorist and antibehaviorist psychologies in general. This blurred the significant distinctions that existed among those not prepared to outlaw all forms of introspection. None of them had characterized themselves as 'introspectionists' and all had often been critical of many forms of introspection.

Debates about the nature of introspection reached their height during the first quarter of the twentieth century and were followed by a period during which the topic was usually regarded as a closed chapter in the history of psychology. Subjects in psychological experiments could still be questioned about the reasons for their responses, but their replies were treated as 'verbal reports,' a form of overt behavior, not a description of internal mental events. Theoretical discussions about the nature of introspection were largely restricted to professional philosophers like Russell, Wittgenstein, and Ryle and had little or no influence on scientific psychology. One exception was the latter day behaviorist B. F. Skinner (1953) who continued to regard introspective reports as an effect of various forms of covert behavior, but also added the possibility that at times they might be no more than a claim by a person to have accomplished a particular discriminative task. Disappointing evidence in the area of 'covert behavior' as well as the unscientific multiplication of highly speculative hypotheses eventually robbed the behaviorist position of its early plausibility.

More recently, the question of introspection has resurfaced in the context of computer models of mind and consciousness (Dennett 1978; see also *Digital Computer: Impact on the Social Sciences*). Here, introspective reports are seen as the output of some kind of language processing system that receives input from various sources, notably, one or more memory systems, an attentional perceptual system, and perhaps a central 'control' system. The nature of the output will depend on the 'information' that is in these systems and on their functional inter-relationships. In some versions of the model the final subsystem only has access to the results of previous information processing, not the processing itself. This accounts for

certain inadequacies of introspective evidence; problems of memory account for others (see Ericsson and Simon 1993).

Other recent contributions have begun to be concerned with the obvious fact that all experimental introspection and much everyday introspection occurs in a social context and that introspective reports are always limited by the linguistic resources available to the reporter (Lyons 1986). The content of introspective reports is therefore circumscribed by social and cultural factors.

Inv

Invariance in Statistics

1. *Invariance in Statistics*

The use of the word invariance in a statistical context most often refers to situations where a statistical model transforms in a suitable way when potential observations are transformed. Describing this context requires the specification of two ingredients. The first is the collection of probability distributions which specify the statistical model. The second is the group of transformations which describes what type of invariance is under consideration. Using the invariance of a statistical model to suggest inferential schemes, such as estimators or tests of hypothesis, is one of the most important applications of invariance reasoning. Such uses of invariance, via concrete examples, form the connective tissue in this article. These examples provide applications of the *principle of invariance* which asserts that invariant problems should have invariant solutions.

The ideas of invariance provide not only the motivation for many statistical procedures but supply the insight and techniques for establishing both distributional and optimality properties of modes of inference. This is most pronounced in the area of linear statistical models—univariate as well as multivariate. For example, in standard regression and analysis of variance models, the affine invariance is reflected in maximum likelihood estimation, in classical F-testing procedures as given by ANOVA tables, and in the structural equation approach to linear models (Fraser 1968) (see *Fiducial and Structural Statistical Inference*). In addition, nonparametric procedures based on ranks and inference based on permutation distributions receive their basic statistical justification from invariance considerations. A full explication of the role of invariance in statistics requires no mean amount of mathematical and statistical theory. However, much of the motivation and pioneering work can be appreciated without all the formal details. Readers wishing just to get the main ideas are advised to skip Sect. 4 and focus on the concrete examples given in Sects. 2, 5, 7, and 8 of what follows.

2. *An Example Due to E. J. G. Pitman*

One of the first full fledged invariance arguments to appear in the statistical literature of estimation is due to E. J. G. Pitman 1939). Here is a special case of his argument which provided motivation for later work on invariant estimation.

Example 1. Suppose f is probability density function on the real line R^1. For each real number $\theta \in R^1$,

$$f(u-\theta), \quad u \in R^1 \tag{1}$$

is a density with a *translation parameter* θ. The density in (1) serves as a *translation model* in some very simple experimental situations. Now, suppose that $X_1, \ldots, X_n$ are independent and identically distributed according to (1). To describe the statistical model for the data $X_1, \ldots, X_n$, first form the $n \times 1$ column vector X with coordinates $X_1, \ldots, X_n$. On Euclidean n-space R^n, X has a density

$$p(x \mid \theta) = \prod_{i=1}^{n} f(x_i - \theta) \tag{2}$$

where x is an element of R^n with coordinates $x_1, \ldots, x_n$. Equation (2) gives the likelihood of the data $x = (x_1, \ldots x_n)'$ where the prime denotes vector transpose. The density p in (2) together with $\theta \in R^1$ specifies the *statistical model* for the vector X.

Now, let c be a real number and consider the transformed random variables and parameter

$$\tilde{x}_i = X_i + c, \quad \tilde{\theta} = \theta + c \quad \text{for } i = 1, \ldots, n \tag{3}$$

If X has a distribution corresponding to θ, then $\bar{X} = (\tilde{x}_1, \ldots, \tilde{x}_n)'$ has a distribution corresponding to $\tilde{\theta}$. In other words, if X_i are all translated by c, then the model parameter is translated by c. For this reason the model for X is said to be *invariant under translation*.

Next suppose the statistical problem is to estimate θ. Given an estimator

$$T = t(X_1, \ldots, X_n) \in R^1 \tag{4}$$

let

$$r_T(\theta) = \mathscr{E}_\theta (T-\theta)^2 \tag{5}$$

be the mean squared error of T. Here, $\mathscr{E}$ denotes expectation under the distribution of X.

In essence Pitman now argued as follows:

> Consider an estimate $t(x_1, \ldots, x_n)$ of θ. From the invariance of the model, $t(x_1+c, \ldots, x_n+c)$ is an estimate of $\theta+c$. Thus,

$t(x_1+c, \ldots, x_n+c)-c$ is also an estimate of θ. Equating these two estimates yields

$$t(x_1+c, \ldots, x_n+c) = t(x_1, \ldots, x_n)+c \tag{6}$$

for all $x_1, \ldots, x_n$ and all c.

An estimate satisfying (6) is called an *invariant estimate*. Pitman asserted that the invariance of the model strongly suggested that only invariant estimates of θ should be considered. He then showed that, within the class of invariant estimators, there is one which is *best* in the sense that it has the smallest mean squared error (see (5)) for every θ. This best invariant estimate is given by the formula

$$t_0(x) = \int_{-\infty}^{\infty} \theta p(x \mid \theta)\,\mathrm{d}\theta \Big/ \int_{-\infty}^{\infty} p(x \mid \theta)\,\mathrm{d}\theta, \quad x \in R^n \tag{7}$$

To say that the *Pitman estimator* $T_0 = t_0(X)$ is *best invariant* means that if T is any invariant estimator, then $r_{T_0}(\theta) \leqslant r_T(\theta)$ for all $\theta \in R^1$.

The argument leading to the best invariant estimator T_0 is based on two observations. First, the model given by (2) for the random vector X transforms in a very simple way when the data are translated (see (3)). Second, the problem of estimating θ also transforms in a simple way and rather naturally leads to estimates satisfying (6)—namely, the invariant estimates. Generalizing Pitman's argument to cover other inferential problems is much of what invariance is about, although the earlier work of Hotelling (1936) had already introduced invariance into hypothesis testing. The next sections describe in mathematical terms what is meant by an invariant statistical model. It is helpful to keep the Pitman example in mind.

3. Statistical Models

Consider an experimental situation which will give rise to a vector $X = (X_1, \ldots, X_n)'$ of observations. In essence, a statistical model for this situation is a collection of probability distributions for X, one of which is supposed to be an adequate description of the potential variability that might be expected in X. Because X is an n-dimensional column vector, the distributions for X are defined on R^n. The collection of distributions is often written $\{P(\cdot \mid \theta) \mid \theta \in \Theta\}$ and the index θ for the collection is a *parameter*. The set Θ is called the *parameter space*. The collection $\{P(\cdot \mid \theta) \mid \theta \in \Theta\}$ is the *statistical model* for X. Statistical models are typically based on a detailed knowledge of the science underlying the generation of the vector X, the type of data similar experiments have yielded, plus a variety of other considerations including analytic tractability.

In Example 1, the sample space is R^n, the parameter space is $\Theta = R^1$, and $P(\cdot \mid \theta)$ is given by

$$P(A \mid \theta) = \int_A p(x \mid \theta)\,\mathrm{d}x \tag{8}$$

where A is a subset of R^n. The density $p(\cdot \mid \theta)$ is given in (2). Therefore $\{P(\cdot \mid \theta) \mid \theta \in \Theta\}$ is the model for the Pitman example when $P(\cdot \mid \theta)$ is given by (8).

4. Groups of Transformations

A simple but very useful type of algebraic system is a group. In essence, a *group* is a set G together with a binary operation $\circ$ so that the following hold:

(a) if g_1 and g_2 are in G, then $g_1 \circ g_2$ is in G. Thus G is *closed* under the binary operation;

(b) there is an element e in G called the *identity* so that $e \circ g = g \circ e = g$ for all $g \in G$;

(c) each element g has an *inverse*, g^{-1}, which satisfies $g \circ g^{-1} = g^{-1} \circ g = e$; and

(d) for g_1, g_2 and g_3 in G, $g_1 \circ (g_2 \circ g_3) = (g_1 \circ g_2) \circ g_3$. Thus the binary operation is *associative*.

It is common notational practice to delete the binary operation $\circ$ and write $g_1 g_2$ for $g_1 \circ g_2$. This convention is followed here. A standard example of a group is the set R^n where the binary operation is addition. A more interesting example is the set Gl_n of all $n \times n$ nonsingular matrices where the binary operation is matrix multiplication. For further examples see MacLane and Birkhoff (1967).

The notion of a group of transformations arises when each element g of a group G can also be thought of as defining a bijective (one-to-one and onto) transformation on a set $\mathscr{X}$. Here are two familiar examples.

Example 2. Take G to be the set of real numbers and the binary operation to be addition. Let $\mathscr{X}$ be Euclidean n-space R^n and let x_0 be a fixed vector in R^n. Each $g \in G$ defines a bijection of R^n to R^n given by $x \to x + gx_0$. Here gx_0 is the real number g times the vector x_0. The above notation means that the function defined by g maps x onto $x + gx_0$. For example, if x_0 consists of the vector of all ones, then $x + gx_0$ is just the vector x with g added to each coordinate. This case arose in Example 1—see (6).

Example 3. Take G to be all $n \times n$ nonsingular matrices with the binary operation of matrix multiplication. With $\mathscr{X} = R^n$, each g defines a bijective transformation $x \to gx$ where gx is the matrix g times the vector $x \in R^n$.

Although not completely obvious in the above two examples, the group operation 'fits together' with function composition when the group element is thought of as a bijective function. In Example 3, what this means is that

$$A_1(A_2 x) = (A_1 A_2)x \tag{9}$$

The left hand side of (9) is the 'function' A_1 evaluated at $A_2 x$. Hence $A_1(A_2 x)$ is the composition of the two functions A_1 and A_2 in that order. The right hand side of (9) is the 'function' $A_1 A_2$ evaluated at x where $A_1 A_2$ is the group element formed by composing the two

group elements A_1 and A_2. This 'fitting together' is what defines a *group of transformations*.

Let $\mathscr{X}$ be a set, G be a group, and assume each $g \in G$ defines a bijective transformation from $\mathscr{X}$ to $\mathscr{X}$. The value of the transformation g at x is written gx. For notational convenience, the action of the function g on $\mathscr{X}$ is written

$$x \to gx \tag{10}$$

That is, x is mapped onto gx by the function g.

The group G is said to *act on* $\mathscr{X}$ if

(a) $g_1(g_2x) = (g_1g_2)x$ for $x \in \mathscr{X}$ and $g_1, g_2 \in G$.

(b) $ex = x$ for $x \in \mathscr{X}$ where e is the identity in G.

Conditions (a) and (b) imply that the group inverse of g is the function inverse of g when g is thought of as a bijective transformation. When G acts on $\mathscr{X}$, G is a *group of transformations*.

In statistical applications, it is common for a group G to act on more than one set in the same problem. This happens in Example 1 where G acts on the sample space R^n as noted in Example 2 and G acts on the parameter space $\Theta = R^1$ (3). More complicated examples are given in the next section.

When the group G acts on $\mathscr{X}$, the set $\{gx \mid g \in G\}$ is called the *orbit* of x. The orbits decompose $\mathscr{X}$ into disjoint sets. Further, G defines an equivalence relation on $\mathscr{X}$, say $\cong$, where $x_1 \cong x_2$ if and only if $x_1 = gx_2$ for some $g \in G$. The partition of $\mathscr{X}$ induced by $\cong$ consists exactly of the orbits (MacLane and Birkhoff 1967). A function h defined on $\mathscr{X}$ is called *invariant* if $h(x) = h(gx)$ for all $x \in \mathscr{X}$ and $g \in \mathscr{X}$. In other words, h is invariant if and only if h is constant on orbits. Functions h which are invariant and which take different values on different orbits are called *maximal invariants* because such functions identify the orbits in $\mathscr{X}$. Maximal invariants are important objects in the study of invariant hypothesis testing problems, which are discussed later in this article. Here is a simple example of a maximal invariant.

Example 4. Take $\mathscr{X} = R^n$ and $G = O_n$, the group of $n \times n$ orthogonal matrices. Then G acts on R^n by matrix multiplication of vectors

$$x \to gx, \quad x \in R^n \quad \text{and} \quad g \in O_n$$

The orbits in R^n are $S_r = \{x \mid x'x = r^2\}$ where $r \geqslant 0$. The orbit S_r is just the rim of the sphere of radius r in R^n. Then $h(x) = x'x$ is a maximal invariant.

5. *Invariant Models*

Coupling the idea of a statistical model with that of a group acting on a set leads naturally to the notion of an invariant statistical model. Consider a random vector X with values in a sample space $\mathscr{X}$ and a statistical model $\{P(\cdot \mid \theta) \mid \theta \in \Theta\}$ for the distribution of X. The parameter θ may also be a vector. Assume a group G acts on both the sample space and the parameter space, although the action of G on the two spaces may be quite different.

Definition. The statistical model for X is *invariant under* G if for all $g \in G$, when X has distribution $P \cdot \mid \theta)$, then gX has distribution $P(\cdot \mid g\theta)$, for all $\theta \in \Theta$.

Example 5. Suppose the real valued random variable X is normal with mean μ and variance σ^2. With $\theta = (\mu, \sigma^2)$, X is $N(\mu, \sigma^2)$ when the parameter value is θ. In this example, the sample space $\mathscr{X}$ is R^1, while Θ is

$$\Theta = \{(\mu, \sigma^2) \mid \mu \in R^1, \sigma > 0\}$$

The group G is

$$G = \{(a, b) \mid a > 0, b \in R^1\}$$

and the binary group operation is

$$(a_1, b_1)(a_2, b_2) = (a_1a_2, a_1b_2 + b_1)$$

The action of G on $\mathscr{X}$ when $g = (a, b)$ is

$$x \to gx = ax + b$$

while the action of G on Θ is

$$\theta = (\mu, \sigma^2) \to g\theta = (a\mu + b, a^2\sigma^2) \tag{11}$$

Of course, when X is $N(\mu, \sigma^2)$, then $aX + b$ is $N(a\mu + b, a^2\sigma^2)$. This motivates the group action in (11) and shows that the normal model with arbitrary mean and variance is invariant under the action of G.

The above example is far too simple to be of much interest in inferential problems. A natural extension of Example 5 follows and is of direct relevance in both estimation and hypothesis testing—topics to be considered in sections to follow.

Example 6. The notation established in Example 5 is used here. Suppose $X_1, \ldots, X_n$ are independent and identically distributed as $N(\mu, \sigma^2)$. The random column vector $X = (X_1, \ldots, X_n)'$ takes values in R^n and the distribution of X is the n-dimensional normal distribution $N_n(\mu\mathbf{1}, \sigma^2 I_n)$ where I_n is the $n \times n$ identity matrix and $\mathbf{1}$ is the vector of ones in R^n. The parameter space for this model is Θ given in Example 5. Take G to be the group in Example 5, so G acts on Θ as in (11).

For $g = (a, b) \in G$, the transformation on R^n defined by this g is

$$x = (x_1, \ldots, x_n)' \to ax + b\mathbf{1}$$

The model for X is $\{P(\cdot\,|\,\theta)\,|\,\theta = (\mu, \sigma^2) \in \Theta, P(\cdot\,|\,\theta) = N_n(\mu\mathbf{1}, \sigma^2 I_n)\}$. This is an invariant model for X when G acts on R^n and Θ in the manner indicated.

6. *The Principle of Invariance*

When a statistical model $\{P(\cdot\,|\,\theta)\,|\,\theta \in \Theta\}$ on a sample space $\mathscr{X}$ is invariant under a group G, it is common statistical practice to search for good inferential procedures, such as estimation schemes or hypothesis tests, which are also invariant. The normative form of this practice leads to the principle of invariance: If a statistical model is invariant under a group, then invariant inference problems should have invariant solutions.

The argument in Example 1 which led to invariant estimators (Eqn. (6)) is a direct application of this principle applied to an estimation problem. Although a precise definition of what an invariant inference problem is would take us far afield, the estimation and testing examples of the following sections will well illustrate the principle. For a thorough and rigorous treatment of invariant inference problems, see Ferguson (1967), Eaton (1983, 1989), Berger (1985), Lehmann (1986), Lehmann and Casella (1998).

7. *Invariant Estimation*

Given an observable random vector X whose distribution belongs to an invariant statistical model $\{P(\cdot\,|\,\theta)\,|\,\theta \in \Theta\}$, the search for a good invariant estimation of the parameter θ is a common inferential problem. Formally an estimator is a function t defined on the sample space $\mathscr{X}$ and taking value in the parameter space Θ. The abstract version of the argument used by Pitman is the following:

> The model for X is invariant under the group G so if X has distribution $P(\cdot\,|\,\theta)$, then gX has distribution $P(\cdot\,|\,g\theta)$. If $X = x$ is observed then $t(x)$ is the estimated value of θ. But if $gX = gx$ had been seen rather than x, then $t(gx)$ should be the estimated value of $g\theta$ since gX has distribution $P(\cdot\,|\,g\theta)$. Therefore $g^{-1}t(gx)$ should estimate θ. Equating these two point estimates of θ leads to $t(x) = g^{-1}t(gx)$, or equivalently
>
> $$t(gx) = gt(x) \quad \text{for} \quad x \in \mathscr{X}, g \in G \tag{12}$$

Estimators which satisfy (12) are called *invariant* by some authors and *equivariant* by others. It should be emphasized that in (12), the expression gx means the transformation determined by g evaluated at $x \in \mathscr{X}$ where as $gt(x)$ means g evaluated at the point $t(x) \in \Theta$. Equation (12) involves the action of G on both $\mathscr{X}$ and Θ.

Example 7. The notation and assumptions of Example 6 hold here. The maximum likelihood estimators (MLE) for μ and σ^2 are

$$\hat{\mu}(x) = \frac{1}{n}\sum_1^n x_i = \bar{x}$$

$$\hat{\sigma}^2(x) = \frac{1}{n}\sum_1^n (x_i - \bar{x})^2$$

Then, written in vector form, the MLE for $\theta = (\mu, \sigma^2)$ is

$$t_0(x) = (\hat{\mu}(x), \hat{\sigma}^2(x)), \quad x \in R^n$$

Thus t_0 is an estimator defined on R^n taking values in Θ. This estimator satisfies equation (12) so that the MLE is invariant.

Example 7 is a special case of a general phenomenon—namely, when statistical models are invariant under a group, then the MLE is an invariant estimator. This is not to say that the MLE is necessarily a good (or the best) invariant estimator, but just that finding MLEs respects the principle of invariance. For example, the Pitman estimator (7) is usually not the MLE.

8. *Invariant Hypothesis Testing*

In multiparameter hypothesis testing problems, it is rather unusual to find a testing procedure with optimality properties when compared with all other tests. However, certain tests in multivariate statistical analyses (Muirhead (1982), Eaton (1983), Anderson (1984)) do have optimality properties within the class of invariant tests when the testing problem is invariant.

Again suppose an invariant model $\{P(\cdot\,|\,\theta)\,|\,\theta \in \Theta\}$, for $X \in \mathscr{X}$ is given where the group G acts on both $\mathscr{X}$ and Θ. Consider a hypothesis testing problem

$$H_0\colon \theta \in \Theta_0 \quad \text{vs.} \quad H_1\colon \theta \in \Theta - \Theta_0$$

such that H_0 is the null hypothesis and H_1 is the alternative. This testing problem is called *invariant* if the model under H_0, $\{P(\cdot\,|\,\theta)\,|\,\theta \in \Theta_0\}$ is also invariant under G. A testing procedure is invariant if it can be expressed in terms of a maximal invariant (see Sect. 4).

Example 8. Let $X_1, \ldots, X_n$ be a random sample from a $N_1(\mu, \sigma^2)$ population and consider the classical Student-t problem of testing $H_0\colon \mu = 0$ vs. $H_1\colon \mu \neq 0$. With $\bar{x} = n^{-1}\sum x_i$ and $s^2 = \sum(x_i - \bar{x})^2$, the Student-$t$ test rejects H_0 for large values of $(\bar{x}/s)^2$. This testing problem is invariant under the group $G = \{a\,|\,a \in R^1, a \neq 0\}$ where the group operation is multiplication. The action of G on the sample space is

$$x_i \to ax_i, \quad i = 1, \ldots, n$$

and the action of G on the parameter space is

$$\mu \to a\mu, \quad \sigma^2 \to a^2\sigma^2$$

The Student-t test is not uniformly most powerful (UMP) within the class of all tests but it is UMP within the class of invariant tests (Lehmann 1986). It is also true that the Student-t test is UMP within the class of unbiased tests—a fact which does not extend to the multivariate case. However, the invariance argument does extend as the following example shows.

Example 9. Let $X_1, \ldots, X_n$ be a random sample from a p-variate normal distribution $N_p(\mu, \Sigma)$. The mean vector μ is in R^p and the $p \times p$ covariance matrix Σ is assumed to be nonsingular. The multivariate analog of the Student-t problem is the hypothesis testing problem H_0: $\mu = 0$ vs. H_1: $\mu \neq 0$. Set $\bar{X} = n^{-1}\Sigma X_i$ and $S = \Sigma(X_i - \bar{X})(X_i - \bar{X})'$. The likelihood ratio test (LRT) of H_0 vs. H_1 rejects H_0 for large values of Hotelling's T^2 statistic (Anderson 1984) given by up to constants)

$$T^2 = \bar{X}' S^{-1} \bar{X}$$

This is a natural multivariate extension of the Student-t statistic. The above hypothesis testing problem is invariant under the group $G = Glp$ of all $p \times p$ nonsingular matrices with matrix multiplication as the group composition. The action of G on the sample space is for $A \in G$

$$X_i \to AX_i, \quad i = 1, \ldots, n$$

and on the parameter space is

$$\mu \to A\mu, \quad \Sigma \to A\Sigma A'$$

Hotelling's T^2 test is invariant and within the class of invariant tests, it is UMP.

Example 9 contains elements that are common to a variety of invariant testing problems. First, the LRT is always an invariant test for any testing problem which is invariant. Therefore restricting attention to invariant tests never excludes the LRT. Second, within the class of invariant tests, there is one test that is optimal. This happenstance occurs in some, but certainly not all, invariant testing problems in multivariate analysis (see Eaton 1983).

9. *Concluding Remarks*

The examples given above reflect only the simplest invariance arguments. In fact invariance has found many applications outside the hypothesis testing and estimation contexts described here. For example, Lehmann (1986) illustrates such arguments in nonparametric problems while other applications can be found in Eaton (1983, 1989), Berger (1985), and Wijsman (1990).

A review of the statistical literature shows that many of the best known statistical procedures have attractive invariance properties. These properties not only appeal to our aesthetic sense of symmetry, but also provide powerful theoretical tools for the study and development of new inferential methods. Although the theory of invariance was well developed by the 1970s, it continues to be an active area of research in mathematical statistics. For example, some recent work in statistical prediction theory has been heavily influenced by invariance considerations (see Eaton and Sudderth 1999).

Ion Channels and Molecular Events in Neuronal Activity

The most fundamental mechanism for imparting information in the nervous system is the opening of ion channels. This responsibility begins early in life, where opening of ion channels in progenitor cells

induces neuronal differentiation. Indeed, ion channels mold the growth and behavior of neurons throughout each phase of the life span. While there are many different classes of ion channels involved in regulating nervous system activity, Ca^{2+} entry serves as the internal ionic message of neural experience. Developmentally, calcium triggers differentiation, guides the growth of neuronal processes, and contributes to the selective elimination of neurons. Ca^{2+} mediates neurotransmitter release, the simplest form of interneuron communication, and its entry is the primary intracellular event for encoding the frequency and number action potentials generated pre- and postsynaptically. Activity- or use-dependent increases in Ca^{2+} serve as an intracellular message for initiating neuronal plasticity which may be involved in circuit modifications required for learning a memory. Finally, completing the cycle of neuronal ontogeny, Ca^{2+} in excess triggers a cascade of mechanisms leading to neuronal degeneration during senescence and age-related disease.

1. *Activity-dependent Increases in Neuronal Ca^{2+}*

Internal Ca^{2+} is maintained at extremely low concentrations creating an enormous driving force for its movement into the cytoplasm from internal stores or the extracellular space. Ca^{2+} levels are estimated to be at about 100 nM in neurons at their resting hyperpolarized state, while extracellular Ca^{2+} is in the 2–3 mM range and 10 μM to 1 mM inside the endoplasmic reticulum (Ghosh and Greenberg 1996, Mattson et al. 2000). The gating mechanisms for Ca^{2+} entry into the cell's cytoplasm includes plasma membrane voltage-dependent Ca^{2+} channels (VDCC), plasma membrane neurotransmitter or ligand-activated channels, and Ca^{2+} release from internal stores. All of these mechanisms are recruited by neuronal activity, they experience Ca^{2+}-mediated feedback regulation, and they are modulated by neurotransmitter activation of G-proteins (Lee et al. 1999, Zhang et al. 1998, Zamponi and Snutch 1998, Zuhlke et al. 1999). Each mechanism of Ca^{2+} entry is compartmentalized to produce localized increases in intracellular Ca^{2+} and site-specific activation of Ca^{2+}-sensitive pathways (Magee et al. 1998, Neher 1998, Yuste et al. 2000).

Adaptive thresholds for Ca^{2+} entry ensure its action as a second messenger will reflect high levels of neuronal activity. Voltage-gated and neurotransmitter gated channels interact during periods of neuronal activity to determine the degree of Ca^{2+} entry and thus the direction of Ca^{2+}-mediated adaptation. The classic sequence for initiating Ca^{2+} entry begins with presynaptic release of neurotransmitter acting postsynaptically to depolarize the cell beyond the threshold for triggering an action potential (Colquhoun and Sakmann 1998). The pioneering work of Hodgkin, Huxley, and Katz demonstrated action potentials were initiated by activating voltage-dependent Na^+ channels and rapidly terminated by the combined action of Na^+ channel inactivation and the opposing activation of voltage-dependent K channels (Hodgkin et al. 1952). Activation of VDCCs is facilitated by the rapid depolarization initiated by Na^+ channel activation, but it is not an absolute requirement. High- and low-threshold Ca^{2+}-mediated action potentials can be triggered by depolarization independent of Na^+ channel activation (Magee et al. 1998, Huguenard 1996). The duration and peak depolarization of the action potential, and consequently the extent of Ca^{2+} entry, is limited by activation of voltage-dependent K^+ channels and intrinsic kinetics of Ca^{2+} channel inactivation.

Unique patterns of Ca^{2+} can be achieved by the selective expression of ion channels in different populations of nerve cells. For example, the expression of inwardly rectifying K^+ (K_{ir}) channels raises the threshold for action potential generation by hyperpolarizing the resting membrane potential of striatal neurons, while the expression and interaction of low-threshold Ca^{2+} channels (T-type), Ca^{2+}-activated K^+ channels (slo), and hyperpolarization activated K^+ channels (I_H) contribute to regular, intrinsic firing in neurons of the substantia nigra and thalamus (Huguenard 1996, Santoro et al. 2000, Wilson and Callaway 2000). Regional differences in ion channel distribution can also create microenvironments of Ca^{2+} control within the cell. Clustering of Na^+, K^+, and Ca^{2+} channels in dendrites create local sites for integrating synaptic input (Magee et al. 1998, Safronov 1999), and direct association of P/Q and N-type Ca^{2+} channels with vesicle fusion proteins mediates activity-dependent release of neurotransmitter in synaptic terminals (Goda and Sudhof 1997, Neher 1998).

The molecular diversity of ion channels present in neurons creates opportunity for exquisite control of Ca^{2+} influx through differences in gating mechanisms and kinetics of activation and inactivation (Catterall 1995, Ghosh and Greenberg 1995). Calcium channels are heteroligomeric complexes containing α_1, $\alpha_2\delta$ and β subunits. Ca^{2+} channels contain a single α_1 subunit which serves as a pore and voltage sensor. Nine α_1 subunit genes have been identified, corresponding to each type of VDCC channel previously categorized by pharmacology. α_{1A} encodes for ω-Aga IVA sensitive P-type, α_{1B} encodes for ω-Ctx GVIA sensitive N-type, α_{1C}, α_{1D} and α_{1S} all encode for dihydropyridine sensitive L-type and α_{1G} and $_{\alpha 1H}$ encode for Ni^{2+}-sensitive T-type calcium channels (Zamponi and Snutch 1998). K^+ channels represent a much larger and more diverse collection of ion channels. At present, nine families of voltage-activated K^+ channels are described (Kaczorowski and Garcia 1999). Many are derived from homologues of *Drosophila* channel genes *Shaker*, *Shah*, *Shaw*, and *Shal*, referred to as K_V1, K_V2, K_V3, and K_V4 in mammals. They usually form homotetrameric channels, but association with β-subunits can alter channel kinetics (Kaczorowski and Garcia 1999). A separate class of K^+ channel funda-

mental in regulating neuronal excitability is Ca^{2+}-activated K^+ channels. They are classified by single channel conductances of 2–25 pS (small or SK channel), 25–100 pS (intermediate or IK channel), and 100–300 pS (large or BK channel) (Kaczorowski and Garcia 1999). Ca^{2+}-activated K^+ channels serve as an activity-dependent feedback mechanism for reducing neuron firing frequency and returning the membrane potential back to its resting state.

Excitatory synaptic input increases intracellular Ca^{2+} directly, by activating ionotropic and metabotropic glutamate receptors, and secondarily by driving the membrane potential beyond the voltage-dependent threshold for activating VDCCs. The cooperation of these mechanisms ensures robust Ca^{2+} signals in response to strong synaptic drive. Ionotropic glutamate receptors (AMPA, kainate, and NMDA receptors) are the postsynaptic mediators of fast excitatory synaptic transmission. Functional ionotropic glutamate receptors contain four or five structurally related subunits. The combination of subunits GluR1–4 make functional AMPA receptors, GluR5–7 and KA1–2 make kainate receptors, and NR1 and NR2A-D make NMDA receptors (Bigge 1999). Flip or flop splice variants of AMPA receptor subunits influence gating kinetics. AMPA receptors generally have low Ca^{2+} permeability, due to the Q/R site of GluR2 subunits. GluR2 is the most common subunit found in the brain, but examples of receptors without GluR2 exist and are implicated in Ca^{2+}-dependent changes in neuronal physiology (Conti and Weinberg 1999, Bigge 1999). NMDA receptors have greater glutamate affinity than AMPA receptors, slower activation and deactivation kinetics, and they are highly permeable to Ca^{2+}. The Ca^{2+}conductance/Na^+ conductance is > 5 for NMDA receptors, 2 for AMPA receptors lacking GluR2, and 0.1 for AMPA receptors containing GluR2 (Conti and Weinberg 1999). The combined action of greater Ca^{2+} permeability and slower channel inactivation results in dramatically more Ca^{2+} influx for NMDA receptors. NMDA receptors are made of NR1 and NR2 heterodimer complexes and generally composed of 4–5 subunits. NR1 is essential for channel function and NR2 confers the voltage-dependent Mg^{2+} block and glycine modulation of NMDA receptors (Conti and Weinberg 1999). The voltage-dependent Mg^{2+}-block acts as an activity sensor, allowing large increases in intracellular Ca^{2+} only when the depolarization threshold for releasing the Mg^{2+} block is exceeded. Kainate receptors, like AMPA receptors, lack voltage dependency. Compared to AMPA receptors, kainate receptors contribute little to the peak postsynaptic response, but their slower decay kinetics results in comparable charge transfer (Ferking and Nicoll 2000). Kainate receptors also mediate presynaptic inhibition of excitatory and inhibitory synapses in the hippocampus.

Slow excitatory synaptic events mediated by activation of metabotropic glutamate receptors (mGluRs) is another important mechanism for elevating intracellular Ca^{2+}. Group-I mGluRs stimulate phospholipase C via GTP-binding proteins. Phospholipase C cleaves phosphoinositol-(4,5)-bisphosphate (PIP_2) into diacylglycerol (DAG) and inositol 1,4,5-triphosphate (IP_3). DAG activates protein kinase C (PKC) and $I(1,4,5)P_3$ activates IP_3 receptors located on the surface of the smooth endoplasmic reticulum (Fagni et al. 2000, Mattson et al. 2000). IP_3 receptors trigger the release of Ca^{2+} stored in the endoplasmic reticulum at concentrations of 10–100 μM (Mattson et al. 2000). Other neurotransmitters use the same mechanism for releasing Ca^{2+} from intracellular stores, but glutamate is by far the most ubiquitous.

2. *Activity-dependent Control of Neuronal Development*

Ca^{2+} influx stimulates differentiation and directs the course of development in excitable cells (Spitzer et al. 1994). VDCCs, ionotropic glutamate receptors, and mGluRs all participate in regulating intracellular Ca^{2+} at key steps in neuronal development. Glutamate activation of NMDA and AMPA receptors induces proliferation of progenitor cells during neurogenesis and their migration to appropriate cell layers (Haydar et al. 2000). Evidence also exists for neurogenesis mediated by Ca^{2+} entry through voltage-dependent L-type Ca^{2+} channels and Ca^{2+} waves mediated by release of Ca^{2+} from intracellular stores. In postmitotic cells, Ca^{2+} continues to direct neuronal differentiation by influencing ion channel expression, neurotransmitter phenotype, growth factor expression, and neurite extension (Spitzer et al. 1994). Ca^{2+} influx through VDCCs (L- and N-type) stimulate cell adhesion molecules (CAMs) (NCAM, cadherin, and L1) to promote neurite outgrowth via CAM-mediated cell to cell interactions and the binding of CAM to actin-based cytoskeleton (Doherty and Walsh 1994). Ca^{2+} may initiate neurite extension by binding to calmodulin (CaM) and phosphorylating microtubule associate proteins (MAP2) through the activation of Ca^{2+}/CaM-dependent protein kinase II and IV (Kuhn et al. 1998). A parallel mechanism implicated in MAP phosphorylation is the mitogen activated protein kinase (MAPKs) pathway stimulated by mGluR activation (Quinlin and Halpain 1996). It is clear that Ca^{2+}-mediated remodeling is based upon a Ca^{2+} set point, since differences in responses exist depending on the Ca^{2+} level achieved and the neuronal population examined. Some neurons experience growth cone collapse with increases in Ca^{2+}, due to severing of microfilaments by Ca^{2+}-activated gelsolin (Neely and Nichols 1995). Support for this mechanism comes from the observation of downregulated VDCCs coincident with neurite extension and increases in neuronal activity producing decreases in CAM expression.

Protein synthesis is also critical to activity-dependent plasticity and growth, a process Ca^{2+} mediates through interacting steps of protein phosphorylation (Ghosh and Greenberg 1995). Activity-dependent increases in Ca^{2+} stimulate the expression of immediate early genes like c-fos and c-jun, as well as delayed 'effector' genes for neurotrophins and, in a mechanism of positive feedback, genes for VDCCs, NMDA receptors, and AMPA receptors (Ghosh and Greenberg 1995). The pattern of gene expression is dependent on the pattern of neuronal activity and Ca^{2+} accumulation. Intracellular pathways appear to act in parallel to alter gene expression, but they may respond differentially to changes in Ca^{2+} concentration. A final point of convergence for Ca^{2+}-stimulated pathways is phosphorylation of cAMP-responsive element binding protein (CREB), which activates RNA polymerase by forming a complex with CREB-binding protein (CRP). The independent pathways proposed to trigger this mechanism include Ca^{2+} activation of Ras/mitogen activated protein kinase (MAPK) pathway, Ca^{2+} activation of adenlyate cyclase and subsequently protein kinase A (PKA) and Ca^{2+} binding to CaM, and activation of Ca^{2+}/CaM kinase II and IV (Ghosh and Greenberg 1995).

A clear division does not exist between the actions of Ca^{2+} and neurotrophins in driving activity-dependent change in neurons. Activity not only increases intracellular Ca^{2+}, but it also causes the release of neurotrophins, and neurotrophins and Ca^{2+} produce similar responses in nerve cells (McAllister et al. 1999). Ca^{2+} and neurotrophins both trigger the Ras-MAPK pathway to change gene expression, neurotrophins by binding to membrane-bound tyrosine kinase (*trk*) receptors, and Ca^{2+} by activating Ras directly (Heumann 1994). Neurotrophins have both direct-rapid and slow modulatory effects on ion channels involved in excitation (Benedikt and Poo 1996). Neurotrophins cause rapid depolarizations by activating Na^{+} channels linked to *trk* receptors and they modulate glutamate-activated channels and intrinsic voltage-activated channels to increase intracellular Ca^{2+} (Jarvis et al. 1997, Kaflitz et al. 1999). Neurotrophins also increase neuronal excitability and thus Ca^{2+} influx through acute inhibition of $K_{ir}3.1$, $K_{ir}3.4$, and $K_{ir}2.1$ (Wischmeyer et al. 1998). Neurotrophins also act presynaptically to increase neurotransmitter release (McAllister et al. 1999). Testament to the intimate relationship between neurotrophins and Ca^{2+}, neurotrophins produce long-term changes in Ca^{2+} entry by increasing the expression of VDCCs, NMDA receptors, and AMPA receptors, and activity-dependent increases in Ca^{2+} produce a reciprocal increase in neurotrophin expression (McAllister et al. 1999).

The gearing of neurons toward excitation during development is clearly illustrated by the unique behavior displayed by neurotransmitter activated channels early in development. Embryonic synaptic AMPA receptors are highly Ca^{2+} permeable and mEPSC (minature excitatory postsynaptic current) amplitude can be more than twofold larger than at mature synapses (Rohrbough and Spitzer 1999). Postnatal neurons preferentially express flip variants of AMPA receptors, which increase the depolarization-mediated Ca^{2+} signal by slowing desensitization (Conti and Wienberg 1999). It should be noted, however, that many synapses show only functional NMDA receptors and only with activity to 'silent' AMPA receptors appear (Petralia et al. 1999). Early postnatal development also shows a shift in the molecular structure and physiological properties of NMDA receptors. NR2B subunits are preferentially expressed early in development and they show less voltage-dependent block by Mg^{2+} and slower kinetics, properties which lower the threshold for Ca^{2+} entry during synaptic excitation. With maturity, there is a shift to NR2A and NR2C subunits which increase the Mg^{2+} block and speed up the NMDA activated response. This postnatal disposition toward synaptic excitation is augmented by a developmental shift in the property of $GABA_A$ receptor mediated inhibition (Ben-Ari et al. 1997). Rather than inhibiting action potential generation and VDCC activation, as is seen in adults, immature $GABA_A$ synapses cause slow depolarizations triggering bursts of action potentials and Ca^{2+} influx through VDCCs (Ben-Ari et al. 1997). Later in development, the Cl^{-} gradient changes resulting in hyperpolarizing $GABA_A$ responses and an inhibition of action potential generation and Ca^{2+} channel activation (Ben-Ari et al. 1997).

3. *Activity and Synaptic Function*

Ca^{2+} entering presynaptic terminals during action potentials stimulates the fusion of synaptic vesicles with the presynaptic membrane and the release of neurotransmitter into the synaptic cleft. P/Q and N-type Ca^{2+} channels are the primary VDCCs subserving this function in the central nervous system (Goda and Sudhof 1997). Entrance of Ca^{2+} through individual channels is proposed to form microdomains, where Ca^{2+} levels may reach as high as 100 μM (Neher 1998). It is proposed that 'core complex' proteins of the synaptic fusion machinery maximize their proximity to these domains by binding syntaxin to Ca^{2+} channels (Goda and Sudhof 1997). Prior to and independent of Ca^{2+} influx, synaptic vesicles dock to the presynaptic membrane in active zones and undergo priming to make them ready for releasing neurotransmitter with Ca^{2+} influx (Goda and Sudhof 1997). The docking and priming steps are mediated by an interaction of a 'core complex' of NSF attachment protein receptors (SNAREs) located on the vesicle (v-SNARE) and attachment SNAREs located on the target membrane (t-SNARE). The core complex or SNARE is made up of syntaxin and synaptosome-associated membrane

protein of 25 kDa (SNAP-25), which are localized in the synaptic plasma membrane, and the vesicular protein synaptobrevin (also known as vesicle associated membrane protein; VAMP) (Goda and Sudhof 1997). The process of vesicle fusion and neurotransmitter release is believed to be mediated by the interaction of the synaptotagmin Ca^{2+} sensor with the 'core complex.' Synaptotagmin I and II are the leading candidates as Ca^{2+} sensors, although other presynaptic proteins with Ca^{2+} C_2-binding domains are proposed to serve the same function (Goda and Sudhof 1997). The mechanism for fusion is proposed to be a rapid electrostatic or conformational change in the fusion complex mediated by Ca^{2+} binding to synaptotagmin (Goda and Sudhof 1997). The vesicle collapses into the membrane and is retrieved away from the active zone by a clathrin-dependent mechanism involving the GTPase dynamin I (Cremona and De Camilli 1997).

Invasion of the presynaptic terminal by multiple action potentials results in a short-term change in the probability of vesicle fusion and the release of neurotransmitter. Depending on the number and timing of the action potentials, and thus the degree and duration of Ca^{2+} increase, the processes of facilitation (time constant less than one second), augmentation (time constant of several seconds), and potentiation (time constant of a few minutes) are initiated (Zucker 1999). One mechanism proposed for mediating short-term synaptic enhancement is the binding of Ca^{2+} to synapsin I. Synapsin I is a Ca^{2+}-regulated ATPase which binds to actin and may facilitate vesicle transport via the actin matrix (Zucker 1999). Other mechanisms proposed to participate in short-term synaptic plasticity include facilitating actions of synaptotagmin and Ca^{2+}-dependent facilitation of presynaptic Ca^{2+} currents (Zucker 1999). An exciting new explanation for the longest form of short-term plasticity, PTP, is based on Ca^{2+} dumping by mitochondria following mitochondrial sequestration of Ca^{2+} during spike trains (Zucker 1999). New studies indicate another key role for Ca^{2+} in mediating short-term synaptic plasticity lies in a clathrin-independent form of rapid endocytosis of synaptic vesicles. The proposed mechanism suggests that Ca^{2+} binds to synaptophysin during repeated excitation and Ca^{2+}-stimulated synaptophysin binds to dynamin I to produce rapid endocytosis (Daley et al. 2000).

Large and sustained increases in intracellular Ca^{2+} on the postsynaptic side of the synapse is the primary event for inducing long-term forms of synaptic plasticity or long-term depression (LTD) and long-term potentiation (LTP). Critical to determining whether LTP or LTD occurs are the extent and kinetics of the Ca^{2+} signal and the molecular mechanism underlying the Ca^{2+} increase (Zucker 1999). These factors and other mechanisms vary considerably between brain areas. Based on cortical and cerebellar studies, a few general themes emerge. Ca^{2+} entry through NMDA receptors is a critical event in the induction of LTP and the Mg^{2+} block of these receptors sets a stimulus and depolarization threshold. Weaker stimuli, which activate VDCCs, often lead to the induction of LTD (Zucker 1999). LTD also requires the activation of group I mGluRs at many synapses and the subsequent activation of nitric oxide synthetase (Daniel et al. 1998). VDCCs can augment the NMDA Ca^{2+} signal if back-propagating action potentials precede activation of NMDA receptors (Zucker 1999). This receptor based scheme depends on the parameters of the Ca^{2+} signal, and thus examples of NMDA receptor-dependent LTD and mGluR-dependent LTP also exist (Nicoll et al. 1998).

The mechanisms used to induce synaptic plasticity in adult animals often follow the same pathways utilized for development and growth in the nervous system. Phosphorylation plays a critical role in LTP and it is triggered by Ca^{2+} influx (Soderling and Derkach 2000). Ca^{2+} activation of Ca^{2+}/CaM kinase and Ca^{2+} activation of the Ras/MAPK pathways play distinct roles in the maintenance phase of LTP. Autophosphorylation of Ca^{2+}/CaM kinase makes it Ca^{2+} independent and creates a mechanism for maintaining long-term phosphorylation. Active Ca^{2+}/CaM kinase increases AMPA receptor responses and may be involved in the unmasking of silent receptors and the trafficking of new receptors to the extracellular membrane (Malinow et al. 2000, Soderling and Derkach 2000). Keeping Ca^{2+}/CaM kinase phosphorylated and active is opposed by the activity of protein phosphatase I. Herein lies another critical step in LTP: inhibiting protein phosphates. Phosphatase inhibition is mediated by Ca^{2+} activation of adenlyate cyclase, activation of PKA, and phosphorylation of inhibitor 1 (I1). I1 shuts off protein phosphatase I and Ca^{2+}/CaM kinase thus stays phosphorylated and active (Soderling and Derkach 2000). Another critical component of LTP expression is protein production. Ca^{2+}/CaM kinase is also implicated in gene expression as well as Ca^{2+}-activation of Ras/MAPK and, just like observed developmentally, phosphorylation of CREB (Platenik et al. 2000). Another similarity to development is the clear involvement of neurotrophins in LTP expression. Neurotrophins directly modulate Ca^{2+} physiology and they activate the Ras/MAPK pathway (McAllister et al. 1999, Klintsova and Greenough 1999).

4. *Ca^{2+} in Aging and Degeneration*

The role of Ca^{2+} in development and plasticity requires flawless control over its intracellular concentration. Aging in the brain, and in many other tissues, occurs in part through a disruption in the ability to maintain Ca^{2+} homeostasis (Thibault et al. 1998). A system level theory for explaining aging poses that chronic exposure to glucocorticoid stress hormones creates a disruption of Ca^{2+} homeostasis (Thibault et

al. 1998). In the hippocampus, stress hormones and/or aging increases the expression of L-type Ca^{2+} channels (Thibault et al. 1998). The increased Ca^{2+} signal suppresses hippocampal neuron activity by stimulating Ca^{2+}-activated K^+ channels and, consequently, the hippocampus becomes less effective in its role of terminating the stress response. Circulating levels of stress hormones therefore progressively increase over an animal's lifetime and consequently the deleterious effects of Ca^{2+} overload also become progressively worse. Elevated Ca^{2+} in aged neurons is proposed to create dysfunctional plasticity and to reduce the threshold for Ca^{2+}-mediated cell death.

Disruption of Ca^{2+} homeostasis is also proposed to be a critical event in apoptosis and necrosis produced in many age-related neurodegenerative disorders (Mattson 1998, Mattson et al. 2000, Thibault et al. 1998). Periods of excessive excitation, as might occur during stroke or in response to β-amyloid stimulation, cause abnormally high levels of Ca^{2+} ions to enter the cell. The candidate mechanisms for the pathological increase in Ca^{2+} influx include VDCCs, NMDA receptor gated channels, and mGluR activation and downstream release of Ca^{2+} from internal stores. The consequent Ca^{2+} overload stimulates Ca^{2+}-sensitive proteases and it plays a significant role in the generation of reactive oxygen species (ROS) (Mattson et al. 2000). High levels of cytoplasmic Ca^{2+} cause mitochondrial Ca^{2+} loading which stimulates mitochondrial ROS production and release of apoptotic factors (Mattson 1998).

The flood of Ca^{2+} triggers abnormal activation of calpain and free radicals activate caspases, both of which are viewed to create excessive proteolysis. In addition, Ca^{2+} sequestration by mitochondria during excessive excitation reduces the production of ATP with a critical cost of shutting down ATPases responsible for maintaining the cell's membrane potential (Albin and Greenamyre 1992). Plasma membrane Na^+/K^+-ATPases require huge amounts of energy and their reduced activity leads to cellular depolarization, activation of VDCCs, and the removal of Mg^{2+} voltage-dependent block from NMDA gated channels.

Ca^{2+} also triggers cytoplasmic production of ROS through the activation of Ca^{2+}-dependent enzymes. Ca^{2+}-activated proteases convert xanthine dehydrogenase into xanthine oxidase which produces superoxide anions and H_2O_2. High levels of cytoplasmic Ca^{2+} triggered by NMDA receptor activation also activate nitric oxide synthetase (NOS). NO produced by the activation of NOS is a free radical, as well as a ubiquitous mediator of biological processes (Dawson and Dawson 1998). NO turns into a much more potent oxidant, however, after it reacts with the superoxide anion under conditions of oxidative stress to produce highly reactive peroxynitrite. The ROS generated by these mechanisms cause lipid, protein, and nucleic acid oxidation and ultimately cell death.

IPAT (Impact, Population, Affluence, and Technology)

For a given population group, the impact of human activity on the natural environment can be decomposed into the per capita impact × population size. Per capita impact, in turn, can be decomposed into the per capita level of consumption or 'affluence' × the environmental impact per unit of consumption under the existing technology. These statements can be combined as the identity $I = PAT$ (Impact = Population × Affluence × Technology). In this form the equation can be attributed to Ehrlich and Holdren (1971, 1972), and is sometimes called the Ehrlich–Holdren equation. IPAT refers to the equation and to the broader view of population–environment relations that it connotes.

'Impact' here indicates a persisting rather than transitory environmental effect. In Commoner's (1971) definition, it is an external intrusion into an ecosystem which tends to degrade the system's natural capacity for self-adjustment. For population–

environment interactions the impacts of most concern are those that reduce the system's capacity to provide environmental services. An example of an environmental impact is a country's carbon dioxide emissions, which degrade the environmental service provided by the atmosphere in regulating heat radiation from the earth's surface. The decomposition in that case would be population × per capita GDP × the 'carbon intensity' of the economy. At a given level of affluence and carbon intensity, emissions rise in proportion to population.

1. *IPAT as a Causal Relationship*

The IPAT equation is more widely employed not as an identity but as a causal relationship, intended to point to the environmental damage that results from one or more of population size, a high-consumption lifestyle and environmentally destructive technology, each amplifying the others. Implicitly, it asserts that these factors can together be seen as the main human causes of degradation. That assertion is debatable: in particular, social organizational and behavioral factors would often warrant separate scrutiny as causes of degradation rather than being subsumed within A and T.

This causal use is mostly confined to elementary or rhetorical discourse about the environment. A familiar instance is in contrasting the environmental impacts of population growth in rich and poor regions. If per capita energy use is a proxy for $A \times T$, the environmental impact of an additional person in America or Europe consuming at the average level for those societies would be an order of magnitude greater than that of an average person in Asia or Africa—a disparity cited in many popular writings that seek to assign responsibility for degradation or resource depletion (see *Consumption, Environmentally Significant*). The relationship is also used simply to organize a discussion, sometimes expressed in a more general functional form: $I = f(PAT)$.

If P, A, and T were independent of each other, the multiplicative relationship would be equivalent to an additive relationship among growth rates. In the case of carbon dioxide, the growth rate of emissions would equal the sum of the growth rates of the three components. However, P, A and T are not independent of each other. For any defined population and environment, they are variables in a complex economic, demographic and sociocultural system. Each also has major distributional dimensions and is a function of time. Consumption—or any other measure of human welfare—is an output of this system; environmental effects, both intended and unintended, are outputs as well. And even at the global level the system is not autonomous: it is influenced by 'natural' changes in the environment and by environmental feedbacks from human activity.

One kind of dependency among P, A and T follows from the common situation of diminishing returns: successive increments to population may do more than proportional environmental damage if they require recourse to ever more powerful technologies to maintain consumption levels. The IPAT equation might then be seen as illustrating a best-case scenario. But other kinds of dependency would tend to lessen the impact. For example, as affluence increases, so typically does a society's demand for a clean environment and wilderness preservation—that is, there is a high income elasticity of demand for environmental quality. This would support a policy response emphasizing conservation or restoration, and the development and adoption of 'clean' technologies (see *Greening of Technology and Ecotechnology*). Similarly, population growth rates generally fall, even to negative values, with rising incomes. If such interactions are acknowledged, the PAT decomposition retains heuristic and pedagogical value but does not bear much empirical scrutiny. In particular, it cannot resolve disputes on the relative contributions of factors responsible for environmental degradation.

For this latter task, Preston (1994) has proposed looking at the variances of the growth rates of I, P, A and T over different regions or countries. Writing these as $\sigma^2{}_I$, etc., the additive relationship among growth rates implies the following relationship among variances and covariances:

$$\sigma^2{}_I = \sigma^2{}_P + \sigma^2{}_A + \sigma^2{}_T + 2\ \mathrm{cov}_{PA} + 2\ \mathrm{cov}_{PT} + 2\ \mathrm{cov}_{AT} \tag{1}$$

The covariance terms are the interaction effects. If each is relatively small in a given case, there is a simple decomposition of the impact variance into the variance imputed to each factor. Otherwise, the one or more significant interaction terms can be explicitly noted. In Preston's analysis of carbon emission data for major world regions between 1980 and 1990, population growth makes a minor contribution to the total variance; the major contributors are the growth of A and T, with a substantial offsetting effect from the interaction of A and T.

2. *Environmental Spillovers*

With a strong management regime or effective community norms and sanctions, population growth in a region need not adversely affect the local environment. Access to a resource can be rationed, behavior strictly governed; or the growth can be diverted elsewhere, usually to urban centers. Ultimately, limits on the environmental services that can be drawn on would be reached and thereafter degradation would probably ensue. Well short of that limit, however, conditions of rapid economic or political change can undermine a management regime or erode norms and sanctions,

with adverse environmental results. Excessive deforestation can often be traced to such institutional breakdowns (or to ill-considered efforts at institutional reform) rather than to population growth. In other cases, a resource may have been so abundant that no management or sanctions were needed: this is a setting where the familiar 'tragedy of the commons' may unfold as the number of claimants to the resource or their exploitative abilities increase (see Hardin 1968).

Environmental effects of human activities may extend well beyond the region of origin, as with the case of acid rain or watershed destruction. In addition to such literal spillovers, trade and other economic relationships among societies may allow adverse effects to be 'exported' to another region: a poorer society may be more willing to incur environmental damage in return for economic gain, or be less able to prevent it. The concept of a community's 'ecological footprint' offers one means of accounting for such displaced effects in terms of the total area required to sustain the community's population and level of consumption (see Wackernagel and Rees 1996; see also *Human–Environment Relationship: Carrying Capacity*). Where the environmental effects involve degradation of a global commons, as with carbon emissions into the atmosphere, an effective response requires devising an international regulatory regime that takes account of economic level, demographic scale and technological capacity.

At the global level, a calculation of human environmental impact, in the spirit of IPAT, is that of the extent of human domination of various components of the global ecosystem. Examples would include the proportion of the land surface transformed by human activity, the anthropogenic share of atmospheric carbon dioxide, and the proportion of marine fisheries that are fully exploited or depleted (Vitousek et al. 1997). A summary impact measure proposed by Vitousek et al. (1986) is the proportion of total organic material produced through photosynthesis that is used directly by humans or used in human-dominated ecosystems, which they calculated at the time to be around 30 percent of the terrestrial total and 2 percent of the marine total.

3. *Nonlinearities in Environmental Systems*

An evident difficulty for impact assessment is the nonlinearity of environmental systems. Ecosystems may have multiple equilibria; they may exhibit cyclical or chaotic behavior. Small human populations and primitive technology do not ensure small environmental impact: in prehistoric times minuscule populations of hunter–gatherers may have been responsible for some mammalian extinctions and possibly for large-scale ecological change following the introduction of new fire regimes (see Martin and Klein 1984; see also *Human–Environment Relationship: Prehistoric*). Ecosystems may be resilient under the pressure of human activity until a point is reached at which there is sharp discontinuous change (see Holling 1986). Kasperson et al. (1995) identify a series of thresholds in nature–society trajectories as human activity in a region intensifies beyond sustainability: first a threshold of impoverishment, then endangerment and finally criticality—the stage at which human wealth and well-being enter an irreparable decline.

The thresholds may not be evident in advance. Under some greenhouse scenarios, for example, gradual ocean warming leads to an abrupt shift in the course of ocean currents—possibly over a period as short as a few decades—with major effects on weather patterns and the climates of coastal states. As systems models of the environment, such as general circulation models of global climate, expand in size and sophistication, their value in prediction is expected to increase. However, they may always be defeated in this task by the inherent uncertainties created by nonlinearities in nature itself. Application of the precautionary principle, aimed at keeping human environmental impact below the threshold of sustainability, may lower the likelihood of a surprise outcome but cannot eliminate it. (See also *Environmental Surprise*; *Precautionary Principle*.)

4. *Subjectivity of Impact Assessments*

The transformation of natural environments by human activity is typically identified with damage or degradation. In the case of agricultural practices leading to erosion, salination, laterization, etc, that assessment is clearly justified. The spread of crop and forest monocultures is seen as ecologically damaging through the consequent loss of biodiversity and increase in vulnerability. Some human interventions, however, can be seen as positive in ecological terms—and not only in cases of restoration of earlier damage. It is also important to note that scientific judgment in characterizing environmental impact does not necessarily accord with public sentiment. Radically transformed environments—say, English hedged fields or Balinese rice terraces—may be regarded as aesthetically pleasing, provided their ecological stability (at a new level) is maintained. Indeed, Dubos (1980) notes that some of today's most admired landscapes are products or by-products of human activity, representing 'areas deforested, swamps drained, hillsides gouged of their stones and sand.' Prior to the Romantic age, 'wilderness' tended to evoke feelings of horror more than of beauty.

Thus, it is necessary to distinguish between an environmental impact of human activity as construed by ecologists (summarized in stylized fashion by the I of the IPAT equation), and the subjective assessment of that effect. In common usage the environment is

nature viewed through human eyes, valued by human preferences. Preferences differ among people and over a person's life; they may be socially constructed; they tend to adapt to or track realities. An environmental impact that is seen by ecologists as an effectively irreversible change in a natural system—for example, extinction of a species or loss of a tropical rainforest, or the much earlier loss of temperate forests—may offer apparently compensating gains at the time and in the locality; the full costs and accompanying regret may only be felt much later or by groups far removed geographically. Moreover, regret wanes as people's expectations adjust to the new environmental circumstances. An active and timely public response in limiting adverse impacts calls for heightened ecological awareness at the various different levels of society and fuller realization that ecological stability and environmental services cannot be taken for granted.

Irrationality: Philosophical Aspects

1. The Aristotelian Tradition vs. the Heuristics and Biases Program

There is a philosophical tradition, reaching at least as far back as Aristotle, which maintains that man is a rational animal. According to this Aristotelian traditional, human beings are intrinsically rational, though of course even the most ardent defender of this view would admit that people's decisions and thought processes are sometimes very irrational indeed. When people are tired, or drunk, or in the grip of rage, they can think and act in ways that no account of rationality would condone. To accommodate this obvious fact, contemporary defenders of human rationality often appeal to a distinction between competence and performance similar to the one invoked by contemporary linguists (Chomsky 1965, Samuels et al. 1999). The claim that human beings are rational is interpreted to mean that normal humans posses a rational reasoning competence—a tacit knowledge of normatively appropriate principles for reasoning and decision-making. Under ordinary circumstances these principles are reflected in people's thinking and their actions, though sometimes, for various reasons, our performance can fail to reflect this underlying rational competence.

In the early 1970s, however, Amos Tversky, Daniel Kahneman, and a number of other psychologists began reporting findings suggesting that the Aristotelian view of human rationality is seriously mistaken. What these studies demonstrated is that even under quite ordinary circumstances where fatigue, drugs, and strong emotions are not factors, people reason and make decisions in ways that appear systematically to violate familiar canons of rationality on a broad array of problems. Those first surprising studies sparked the growth of an enormously influential research program whose impact has been felt in a wide range of disciplines including psychology, economics, political theory, and medicine. The expression 'heuristics and biases' is often used as a label for this tradition, since it holds that much of our reasoning and decision-making relies on heuristics and biases rather than rational principles.

In the sections that follow we will offer some examples of the sort of experimental findings that many have interpreted as showing that the reasoning and decision-making competence of normal humans is

far from rational. (For more comprehensive reviews of the literature see Dawes 1988 and Baron 1994.) But first we need to say what standards of rationality are being applied by those who think the experimental findings demonstrate widespread irrationality. Though writers in the Heuristics and Biases tradition rarely offer an explicit and general theory of rationality, the most plausible reading of their work is that they are assuming some version of what Edward Stein (1996) calls the 'standard picture'. On this view, to be rational is to reason and make decisions in accordance with principles that are based on the rules of logic, probability theory, and decision theory. Sometimes, of course, it is far from clear how these theories are to be applied—a problem that we will return to in Sect. 4. For the moment, however, we will follow the lead of those who work in the Heuristics and Biases tradition and assume that the irrationality manifested in the experiments we describe is intuitively obvious.

2. *Irrationality in Reasoning*

2.1 *The Conjunction Fallacy*

In what has become perhaps the most famous experiment in the Heuristics and Biases tradition, Tversky and Kahneman (1982) presented people with the following task.

> Linda is 31 years old, single, outspoken, and very bright. She majored in philosophy. As a student, she was deeply concerned with issues of discrimination and social justice, and also participated in antinuclear demonstrations.
>
> Please rank the following statements by their probability, using 1 for the most probable and 8 for the least probable.
>
> (a) Linda is a teacher in elementary school.
> (b) Linda works in a bookstore and takes Yoga classes.
> (c) Linda is active in the feminist movement.
> (d) Linda is a psychiatric social worker.
> (e) Linda is a member of the League of Women Voters.
> (f) Linda is a bank teller.
> (g) Linda is an insurance sales person.
> (h) Linda is a bank teller and is active in the feminist movement.

In a group of naive subjects with no background in probability and statistics, 89 percent judged that statement (h) was more probable than statement (f) despite the obvious fact that one cannot be a feminist bank teller unless one is a bank teller. When the same question was presented to statistically sophisticated subjects—graduate students in the decision science program of the Stanford Business School—85 percent made the same judgment! Results of this sort, in which subjects judge that a compound event or state of affairs is more probable than one of the components of the compound, have been found repeatedly since Tversky and Kahneman's pioneering studies, and they are remarkably robust. This pattern of reasoning has been labeled 'the conjunction fallacy.'

2.2 *Base Rate Neglect*

On the familiar Bayesian account, the probability of a hypothesis on a given body of evidence depends, in part, on the prior probability of the hypothesis. However, in a series of experiments, Kahneman and Tversky (1973) showed that subjects often seriously undervalue the importance of prior probabilities. One of these experiments presented half of the subjects with the following 'cover story.'

> A panel of psychologists have interviewed and administered personality tests to 30 engineers and 70 lawyers, all successful in their respective fields. On the basis of this information, thumbnail descriptions of the 30 engineers and 70 lawyers have been written. You will find on your forms five descriptions, chosen at random from the 100 available descriptions. For each description, please indicate your probability that the person described is an engineer, on a scale from 0 to 100.

The other half of the subjects were presented with the same text, except the 'base-rates' were reversed. They were told that the personality tests had been administered to 70 engineers and 30 lawyers. Some of the descriptions that were provided were designed to be compatible with the subjects' stereotypes of engineers, though not with their stereotypes of lawyers. Others were designed to fit the lawyer stereotype, but not the engineer stereotype. And one was intended to be quite neutral, giving subjects no information at all that would be of use in making their decision. Here are two examples, the first intended to sound like an engineer, the second intended to sound neutral:

> Jack is a 45-year-old man. He is married and has four children. He is generally conservative, careful, and ambitious. He shows no interest in political and social issues and spends most of his free time on his many hobbies which include home carpentry, sailing, and mathematical puzzles.
>
> Dick is a 30-year-old man. He is married with no children. A man of high ability and high motivation, he promises to be quite successful in his field. He is well liked by his colleagues.

As expected, subjects in both groups thought that the probability that Jack is an engineer is quite high. Moreover, in what seems to be a clear violation of Bayesian principles, the difference in cover stories between the two groups of subjects had almost no effect at all. The neglect of base-rate information was even more striking in the case of Dick. That description

was constructed to be totally uninformative with regard to Dick's profession. Thus the *only* useful information that subjects had was the base-rate information provided in the cover story. But that information was entirely ignored. The median probability estimate in both groups of subjects was 50 percent.

Before leaving the topic of base-rate neglect, we want to offer one further example illustrating the way in which the phenomenon might well have serious practical consequences. Here is a problem that Casscells et al. (1978) presented to a group of faculty, staff, and fourth-year students at Harvard Medical School.

> If a test to detect a disease whose prevalence is 1/1,000 has a false positive rate of 5 percent, what is the chance that a person found to have a positive result actually has the disease, assuming that you know nothing about the person's symptoms or signs? — percent.

Under the most plausible interpretation of the problem, the correct Bayesian answer is 2 percent. But only 18 percent of the Harvard audience gave an answer close to 2 percent. Forty-five percent of this distinguished group completely ignored the base-rate information and said that the answer was 95 percent.

3. *Irrationality in Decision-making*

3.1 *Framing*

In a study that is widely believed to illustrate a deeply irrational feature of human decision-making, Tversky and Kahneman (1981) presented a group of subjects with the following problem:

> Imagine that the US is preparing for the outbreak of an unusual Asian disease, which is expected to kill 600 people. Two alternative programs to combat the disease have been proposed. Assume that the exact scientific estimate of the consequences of the programs are as follows:
>
> If Program A is adopted, 200 people will be saved.
>
> If Program B is adopted, there is a 1/3 probability that 600 people will be saved, and a 2/3 probability that no people will be saved.

A second group of subjects was given an identical problem, except that the programs were described as follows:

> If Program C is adopted, 400 people will die.
>
> If Program D is adopted, there is a 1/3 probability that nobody will die and a 2/3 probability that 600 people will die.

On the first version of the problem most subjects chose Program A. But on the second version most chose Program D, despite the fact that the outcome described in A is identical to the one described in C.

3.2 *The Ultimatum Game*

Consider a game that works as follows: There are two players, an 'Allocator' and a 'Recipient' whose identities are unknown to each other. At the beginning of the game the Allocator is given a sum of money (say $10) and asked to divide it between himself and the other player. The only restriction is that the Allocator must offer *something*. So, if the smallest unit of money available is $1, then the Allocator must offer at least this much to the Recipient. Once the Allocator has divided the money, the Recipient gets to decide whether to accept or reject the amount offered. If the Recipient accepts, each player gets to keep the sum specified by the Allocator. If the Recipient rejects the offer, then both players receive *nothing*. The game is not repeated, and the players know from the outset that they will play only once.

On one widely accepted analysis of the problem, it is never rational for a Recipient to reject an offer, since it is better to get *some* money rather than none. If this is right, then it is always rational for the Allocator to offer the Recipient the smallest amount of money possible, since rational Recipients will always accept the offer, and this will maximize the amount of money the Allocator receives. However, people who have played the game rarely make these choices. Indeed, in many studies the modal offer is to divide the money equally. Moreover, Recipients frequently reject offers of less than 25 percent of the total, preferring instead to go home empty-handed. (For an overview of the literature see Thaler 1992.)

4. *'Bleak Implications', or 'Ecological Rationality'?*

The results we've sketched are just a tiny sample of an enormous and growing literature on human reasoning and decision-making. But what conclusions about human rationality—and irrationality—should we draw from these findings? On this question opinions are sharply divided. In one often quoted comment, two leading investigators in the Heuristics and Biases tradition claimed that the experimental results have 'bleak implications' for human rationality (Nisbett and Borgida 1975). Other researchers have concluded that 'individuals are generally affected by systematic deviations from rationality' (Bazerman and Neale 1986). Still others have suggested that the fault may be in our genes, or at least in our evolutionary history—'that people lack the correct programs for many important judgmental tasks … [because we] … have not had the opportunity to evolve an intellect capable of dealing conceptually with uncertainty' (Slovic et al.

1976). But many other theorists have argued that conclusions like these are unwarranted. In what follows we discuss two of the more important kinds of argument proposed by those who reject the bleak implications view. (For an extended review of the debate see Samuels et al. 2001.)

4.1 Problems with Specific Experiments

There is a substantial literature arguing that one or another experiment in the Heuristics and Biases tradition is flawed and thus does not really demonstrate that the subjects' performance is irrational. Some of the putative flaws are methodological. One charge that obviously has some merit is that it is often less than clear that the subjects understand the problem in the way that the experimenters want them to. For example, principles of conversational implicature might lead subjects in the 'feminist bank teller' experiment to assume that choice (f) (Linda is a bank teller) means that she is a bank teller who is *not* active in the feminist movement (Schwarz 1996). Other putative flaws turn on the way that the experimenters propose to apply the normative principles to particular problems. For instance, Gigerenzer (2000) argues that there are typically several different ways in which the principles of statistics and probability can be applied to a given problem and that these different analyses of the problem lead to different answers—or in some cases to no answer at all. If this is correct, then obviously we cannot conclude that subjects are being irrational simply because they do not give the answer that the experimenters prefer. Similarly, it has been urged that it is far from clear that a rational Recipient in the Ultimatum Game ought to accept all offers.

4.2 Darwinian Problems

A second response to the claim that the human mind is prone to 'systematic deviations from rationality' comes from recent work by evolutionary psychologists. These theorists argue that the ability to use probabilistic information effectively would have been highly advantageous to our hominid forebears, and therefore, they maintain, it would be surprising if we had not evolved 'an intellect capable of dealing conceptually with uncertainty.' But, the evolutionary psychologists continue, we should expect this capacity to manifest itself most clearly when probabilistic information is presented in a format that would have been common in ancestral environments. In these environments, probabilistic information would almost invariably have been presented in the form of information about frequencies as opposed to single events. Thus, evolutionary psychologists argue, we should expect people to do much better on probabilistic reasoning tasks if the problems are presented in a frequency format. It appears that they do. In the 'feminist bank teller' problem, for example, if the description of Linda is followed by a question like the one below, the number of subjects who commit the conjunction fallacy drops from over 90 percent to only about 10 percent.

> There are 100 people who fit the description above. How many of them are:
> ...
> (f) bank tellers?
> ...
> (h) bank tellers and active in the feminist movement?
> ...

Further evidence comes from Cosmides and Tooby's (1996) systematic exploration of the 'Harvard Medical School problem' discussed in Sect. 2.2. They showed that subjects find it much easier to use base rate information rationally on 'frequentist' versions of the problem, like the one that follows.

> 1 out of every 1,000 Americans has disease X. A test has been developed to detect when a person has disease X. Every time the test is given to a person who has the disease, the test comes out positive. But sometimes the test also comes out positive when it is given to a person who is completely healthy. Specifically, out of every 1,000 people who are perfectly healthy, 50 of them test positive for the disease.
> Imagine that we have assembled a random sample of 1,000 Americans. They were selected by lottery. Those who conducted the lottery had no information about the health status of any of these people.
> Given the information above:
> on average,
> How many people who test positive for the disease will *actually* have the disease? __ out of __.

On this version of the problem, 76 percent of subjects—as opposed to the mere 18 percent in Casscells et al.'s original study—gave the correct Bayesian answer.

In light of findings like these, evolutionary psychologists have introduced a notion of 'ecological rationality' (Gigerenzer et al. 1999). An inferential or judgmental strategy is ecologically rational if it is both accurate and efficient on the sorts of tasks that were important in the environments in which we evolved. If we interpret Aristotle's thesis as the claim that man is an ecologically rational animal, evolutionary psychologists maintain that there is a growing body of evidence indicating that he was right.

Irrigation Societies

The notion of 'irrigation societies' derives from one of the most durable ideas in social science, that the construction and operation of large-scale irrigation systems leads to a concentration of power in the state. An early formulation of this proposition is found in Marx's writings on 'Asiatic societies': 'This prime necessity of an economical and common use of water—necessitated in the Orient—the centralizing power of Government' (Marx 1853, p. 7). In the 1950s, Karl A. Wittfogel (1957) elaborated Marx's thesis, correlating irrigation scale and political hierarchy. Beginning in the 1960s, archaeologists incorporated these ideas into theories of state formation in the Old and New Worlds. The control of water was linked to the appearance of civilizations in Mesopotamia, Peru, the Valley of Mexico, the Indus Valley, China; and to chiefdoms in the prehistoric American Southwest, Polynesia, and elsewhere (Wright 1986). In the 1970s, sociocultural anthropologists began to take issue with the Wittfogel thesis, noting that in some cases small-scale irrigation systems actually appear to promote egalitarian social systems, not despotic states. Contemporary research on irrigation societies consists of case studies; comparative cross-cultural investigations of the relationship between irrigation and power; analysis of the 'design principles' (Ostrom 1992) of successful irrigation systems; and studies of the ecological impact of irrigation.

1. Overview of Irrigation Systems

It is estimated that humanity now uses 26 percent of total terrestrial evapotranspiration and 54 percent of runoff that is geographically and temporally accessible. Most of this water is used for irrigation. The average water application rate in 1990 was estimated at 12,000 cubic meters per hectare for 240 million hectares of irrigated lands worldwide (Postel et al. 1996). In the past three decades, there has been an enormous expansion of new irrigation systems. According to the World Bank, an average of 885 large dams ($>$ 15 m high) were constructed per year between 1950 and the 1980s. During the same interval, the total area of irrigated agriculture in the world increased by about threefold (Cernea 1985, p. 23). Recently, the rate of construction of large dams has begun to decline, averaging no more than 500 per year, and this number is expected to decline further because of rising economic, social, and environmental costs (Postel et al. 1996).

Meanwhile, small-scale, hand-built, gravity-flow canal systems managed by small groups of farmers still account for about 85 percent of the world's irrigated cropland, according to World Bank estimates. Small-scale systems operated by local irrigators are still used to grow most of the crops in Asia. For example, more than 15,000 systems of less than 50 hectares are managed by farmer's associations in Korea (Oh 1978). In southern India (Andhra Pradesh, Karnataka, Kerala, and Tamil Nadu), more than 125,000 community tanks provide water for 30 percent of the irrigated croplands (Sakthivadivel and Shanmugham

1987). More than six million small tanks and reservoirs are managed at the village level in China (Yu and Buckwell 1991). Similarly, in Morocco 830,000 hectares are irrigated by locally managed systems utilizing perennial flows and seasonal floods, which range in size from 50 to 3000 hectares (Abdellaoui 1989). About a million hectares are cultivated in Nigeria using traditional irrigation or flood-recession systems, while an estimated quarter million hectares of pre-Hispanic Peruvian terraces are still irrigated in the Andean highlands (Mabry 1996).

Small-scale irrigation systems are also found in the developed world. Fifty thousand local irrigation systems exist in Japan, some in continuous operation since the early seventeenth century, and together constitute about a quarter of Japan's total irrigated area (Takeuchi 1980). Centuries-old irrigation systems also thrive on the Mediterranean coast of Spain (Glick 1970), in the Swiss Alps (Netting 1981), and in the Southwestern USA (Mabry 1996).

2. *Environmental Constraints on Irrigation*

The physical environment constrains the kinds of irrigation systems that can be constructed. Wittfogel's thesis was based on the demands imposed by large-scale, pre-modern canal irrigation systems, fed by large rivers. Such systems, typical of arid and semi-arid regions such as those adjoining the Tigris, Euphrates, and Indus rivers, required the coordinated labor of thousands to be constructed and maintained. Tropical, semitropical, island, and desert environments impose quite different constraints, leading to different technical and managerial solutions. Scarborough (1998) has proposed an 'accretional' model for the modification of tropical and semitropical environments, where there is great species diversity but little abundance of one specific species in any single niche or patch. Archaic civilizations evolving in these settings adapted to this dispersed resource base in a manner markedly different from that of early states located in semiarid settings with access to large rivers. According to Scarborough, the political economies of tropical archaic states adapted to the interconnectivity of dispersed resources, discovering and refining the ecological pathways that made useable resources accessible to humans. For example, the civilizations of the archaic Lowland Maya, and in many regions of South and Southeast Asia developed irrigation systems based on tanks designed to capture wet-season flows and release them in the dry season. Such tanks are still in use in southern India and Sri Lanka.

Oasis civilizations of Central Asia, China, and Arabia developed tunnels called *qanats* to capture the snow melt from the Himalayas and other mountain chains, transporting the flow for great distances under the deserts. In parts of North Africa, including the Nile Valley and the American Southwest, flood recession systems were invented to capture and control scarce seasonal rainfall. Mandelbrot and Wallis (1968) showed that data on the annual flood of the Nile River exhibits chaotic behavior. Using this historic data from the Nile as well as modern data from the Senegal river basin, Park (1992) has argued that farmers adapted to the risks of too much or too little water by creating institutions to reallocate land among cultivators annually, fostering control by the elite and class stratification long before population pressure reached significant levels.

3. *Management of Irrigation*

The relationship between the technical and social aspects of irrigation is an ongoing topic of research. There are two major schools of thought. One tradition, emanating from Wittfogel and pursued primarily by archaeologists, is concerned with the power-centralizing effects of large-scale irrigation systems. A second tradition approaches small-scale irrigation systems from the perspective of common property management (or 'common-pool resources'). A key issue for both research traditions is the relationship between the scale of irrigation systems and the structure and complexity of management institutions. Hunt (1989) distinguishes between 'irrigation communities' and 'water-user associations': the former are autonomous, self-contained organizations that are supported by consensual, mutually beneficial institutional arrangements while the latter are units within larger bureaucratic structures that require communication and coordination across organizational levels.

It appears that many small-scale systems of irrigation management are self-governing. Hunt (1988) compared fifteen irrigation systems in industrialized and developing countries, ranging from 700 to 30,000 hectares in extent, and found no strong relationship between system size and the structure of authority. But he predicted that any system larger than about 100 hectares has a 'very high probability' of being managed by a 'unified administrative authority structure' (Hunt 1988, p. 347). Netting has argued that water scarcity can be a stimulus for the centralization of decision making, when it threatens widespread conflict that will seriously reduce the efficiency of the system. Kappel identified 5,000 as the upper limit of the number of people who can be supported by local self-governing systems, based on a study of 17 historic and contemporary cases. However, Uphoff found that irrigation systems with command areas of up to 40 hectares tend to be managed by the entire group of irrigators; those between 40 and 400 hectares are managed by a central official, either elected by the irrigators or appointed by the state, and systems between 400 and 4,000 hectares often have three layers of management (cited in Mabry 1996).

Turning to the dynamics of management in small-scale irrigation systems, Ostrom (1992, p. vii) notes that 'a self-governing irrigation system is a prime example of a public enterprise in which a segment of society governs itself for itself.' A frequent starting-point for the analysis of irrigation communities is Hardin's (1998) 'tragedy of the commons' thesis, which holds that rational self-interest will motivate individuals to take as much of a common resource as possible. This is linked to the 'tail-ender' problem in irrigation systems: irrigators closer to the source can control the flow to their downstream neighbors, so the farmer at the tail end is always vulnerable. How then are sustainable cooperative systems of water sharing possible?

One answer is suggested by game theory, specifically the iterated Prisoner's Dilemma, which shows how it can be in one's interest to cooperate with other users if there is an expectation that such cooperation will result in continuing access to a valuable, shared resource. Irrigation systems do not only provide benefits, they often entail high labor costs, and this can also be a motive for cooperation. Ostrom (1992) found that in negotiations over the rules of water use between the members of a local water-user association, the bargaining power of tail-enders is greater if their labor is needed to maintain the system.

Ecological factors may also influence patterns of cooperation. Rice farmers on the Indonesian Island of Bali must cope with a suite of rice pests, including rats, insects, and bacterial and viral diseases. The traditional method for controlling these pests is to plant large blocks of rice terraces at the same time. After harvest the fields are flooded, depriving the pests of their habitat, and in some cases killing them outright. Thus upstream farmers, who control the flow of water, may benefit by cooperating with their downstream neighbors. In this way, the scheduling of irrigation can be used to manage pests (Lansing 1991).

4. *Irrigation and Agro-Ecology*

Salinization resulting from over-irrigation and poor drainage has significantly reduced yields on more than 60 million hectares, about a quarter of the total worldwide, and 25 million hectares have been abandoned because of salt accumulation (Mabry 1996, p. 229). Annually, for every additional hectare brought into production by new irrigation projects, another goes out of production because of salinization (Umali 1993).

Flowing water can pick up and transport mineral nutrients needed by plants, such as nitrogen, phosphate, and potassium. Traditional Asian rice paddies use irrigation systems to bring these nutrients, as well as water, to the plants. For example, volcanic ash from Indonesian volcanoes contains about 1 percent potassium, and relatively high levels of phosphate. Until the advent of the 'Green Revolution' in rice in the 1970s (the spread of high-yielding crops designed to rely on chemical fertilizers), most of the nutrients needed in Asian rice paddies were supplied by this process of mineral leaching. In Western Europe and the USA, the spread of 'Green Revolution' farming techniques has created an over-abundance of nutrients: too much of a good thing. Worldwide, between 1960 and 1980 the application of nitrogen fertilizers increased more than five-fold, and in the decade that followed, more synthetic fertilizer was spread on land than had been applied in the entire previous history of agriculture. Rivers like the Mississippi and the Colorado acquire heavy loads of nutrients like phosphate, and generate enormous pollution problems downstream. Every summer, approximately 18,000 square kilometers of the deep waters of the Gulf of Mexico become a 'dead zone.' European countries like The Netherlands have begun to implement strict regulations restricting fertilizer use in order to protect freshwater ecosystems, but meanwhile pollution problems have scaled upwards from lakes and streams to the Baltic and North Sea. Worldwide, virtually all coastal zones are experiencing rapidly increasing pollution from agricultural runoff and domestic waste (Nixon 1998). Archaeologists generally agree that environmental problems associated with the expansion of irrigation systems led to the decline of many ancient states. Today, the spread of irrigated agriculture on which the continuing expansion of the human population depends poses a 'tragedy of the commons' problem on a global scale.

Islam and Gender

In Islam, religious texts define the parameters of the relationship between Islam and gender; modern scholarship then interprets and gives meaning to this relationship. This essay on Islam and gender comprises two parts; part one discusses the pertinent Islamic religious texts, and part two reviews their interpretation in modern scholarship.

The gender experience in Islam is defined mainly through the *Koran*, the Book of God according to the Muslims, which is regarded as perfect, eternal, and unchangeable. Containing 114 chapters (*sura*s) and 6000 verses (*ayat*s), the *Koran* often addresses all believers, and, in specific instances, women alone. These latter instances are located specifically in chapters (*sura*s) 4 (*Al-Nisa'*), 5 (*Al-Ma'ida*), 24 (*Al-Nur*), and 60 (*Al-Mumtahana*). Chapter 4 contains the most number of verses on women and Chapter 5 spells out the conditions of marriage, dowry giving, divorce, and inheritance. Among these, three instances that affirm the male dominance over the female have been challenged, particularly by feminist scholars. One instance on polygam states that 'you may marry other women who seem good to you: two or three or four of them. But if you fear that you cannot maintain equality among them, marry only one'…(4:3). Another instance on inheritance claims 'a male shall inherit twice as much as a female' (4:11). The last instance is on punishing women that 'men have authority over women because Allah has made the one superior to the other, and because they spend their wealth to maintain them. Good women are obedient. They guard their unseen parts because Allah has guarded them. As for those from whom you fear disobedience, admonish them and send them to beds apart and beat them. Then if they obey you, take no further action against them (4:34).' There is also a reference to homosexuality in this chapter stating 'if two men among you commit indecency punish them both. If they repent and mend their ways, let them be (4:16).'

Chapter 24 refers to conditions of adultery and modesty, whereby those who defame honorable women and cannot produce four witnesses will be punished (24:4). The portions on modesty have also become contentious in that they provide the only possible reference to justify veiling and seclusion. Specifically, 'enjoin believing women to turn their eyes away from temptation and to preserve their chastity; to cover their adornments; to draw their veils over their bosoms and not to reveal their finery except to their husbands, fathers … (24:31).' However, it should be noted that restrictions are also brought upon men in the preceding part which states 'Enjoin believing men to turn their eyes away from temptation and to restrain their carnal desires (24:30).' Chapter 60 in turn asks believers to test believing women who seek refuge from them to attest if they are true believers and to protect them if they are. It is interesting to note that even though men and women are treated unequally in society, they are equal in the eye of God as believers. It is important to note that male dominance also existed in the early Jewish and Christian scriptures as well (Genesis 3:16, 1 Timothy 2:11), reflecting the status of women in the times in which they were written (Cook 2000, p. 38).

The religious texts also help portray the ideals of gender behavior in a Muslim society. According to the pre-Islamic tribes of Arabia, the 'ideals and norms of their ways were of life had been contained and preserved in their social practices (*sunna*, trodden path), the customs or oral laws handed down from the previous generations by word and example (Esposito 1988, p. 14).' The lives of the prophet Muhammad, his wives, companions, and other pious Muslims therefore provided models for all believers to emulate. Since the recorded practices of the prophet (termed *hadith*) in particular revealed God's will, they became the norm

for community life alongside the Koran. Yet these *hadith*, unlike the *Koran*, could contradict one another since they were narrated by humans rather than given by God; most of the political and social debates in the Muslim world do indeed revolve around different *hadith* versions. Nevertheless, the *Koran* and the *hadith* together form the main sources of Islamic law, followed by legal reasoning (*ijtihad*), consensus of the community (*ijma*), as well as other influences such as custom, public interest, and jurist preference or equity.

Since Islam literally means submission to the will of God, Muslims particularly emphasize correct practice; gender practice is therefore based on the lives of exemplary males and females (Ahmed 1986, 1992, Esposito 1988, Zuhur 1992). According to these authors, marriage emerges as mandatory on every Muslim man and woman unless they are financially or physically unable to marry. In marriage, husband and wife then have complementary roles, as the men mainly participate in the public sphere to secure the livelihood, and the women principally manage the family and household. Marriage recognizes the needs and wants of both partners, paralleling the story of the 'fall' in the *Koran* that identifies Adam, not Eve, as the one personally tempted by the devil. Hence neither is the woman portrayed as the cause of the 'fall' nor is there a notion of an inherited original sin for which all humanity suffers. The wives of the prophet provided, through their lives, different qualities of the ideal Muslim woman. Khadija, the first, and at the time only wife of the prophet, was a wealthy widow who employed the prophet to oversee her caravan; her prominent economic and social position as a wealthy merchant provided a strong female model. 'Aisha, whom the prophet married at age ten after Khadija's death, and who became his favorite wife, was also a forceful woman who participated in the political affairs of the community and who also narrated many of the *hadith*. Fatma, the Prophet's only recorded surviving child, provides the primal mother figure for all virtuous women to follow; one who is chaste, immaculate, and sinless. The generational transformation from Khadija to 'Aisha to Fatma captures the changing position of women. During and after the prophet's lifetime, women were gradually removed from leadership positions within the community and the prophet's wives were secluded from the public sphere to preserve the wives' honor. The public prominence of women became limited to exceptional individuals who could stand out in spite of the exclusion and seclusion. In the contemporary period, Islamist reformists such as Muhammad Abduh and Ahmad Khan did indeed identify the plight of women as the cause of the decay of the Islamic family and society, and attempted to reason that the *Koran* contained social practices of its time that needed to be reformulated in the modern period to overcome the biases against women. Western colonial practice used the same plight of women to justify their political intervention in the Middle East. The reformulation of women's position in response to both has been contested by the secular Westerners as inadequate and by the fundamentalists as inappropriate. Feminist scholars instead proposed another rereading of the sources, suggesting that in the modern period Khadija and 'Aisha rather than the obedient Fatma, need to be identified as the ideal for Muslim women (Ahmed 1986, 1992, Smith 1985).

The modern scholarship on Islam and gender centers around issues concerning the status of women in Middle Eastern societies in general, and the public participation of veiled women in particular. This selective focus, scholars argue, has largely resulted from the historical experience of the region with European colonialism when differences between the East and West were highlighted at the expense of similarities, and the image of the veiled women was specifically employed to justify the 'civilizing mission.' Historically, the publication of Edward Said's book (1978) entitled *Orientalism* alerted scholars to the European portrayal of Islam as a different, traditional, immutable, monolithic force resisting change, and the veiled oppressed image of Muslim women as its visual proof, one that also justified Western intervention. Criticism of gender analysis in other non-Western contexts (Mohanty 1984, Ong 1988, Spivak 1990) also proved helpful in further deconstructing the Western gaze in Islam and gender. These criticisms specifically engaged the growing literature of Western feminist analyses of non-Western women, pointing out how the Western gaze was uncritically replicated in these.

The literature criticizing the Western gaze over the field of Islam and gender thus identified overcoming the untexturedness of the non-Western subject and conveying her complexities as the first step in reversing the Western domination over the field of Islam and gender. The two most influential works that set the stage for the studies on gender in the Middle East (Fernea and Bezirgan 1977, Beck and Keddie 1978) were published as edited, collaborative volumes, letting the Middle Eastern women speak for themselves. More in-depth, specialized studies on particular dimensions of women's existence followed in problematizing Middle Eastern woman's alleged immutability or silence, as they studied archival court records (Tucker 1986) or women's poetry and songs (Abu-Lughod 1986). Following the queries generated by feminist theory, scholars also reflected on their own subjectivities in doing research in the field and commented on the dual structuring of knowledge by gender (Altorki and El-Solh 1988). Attempts to situate Middle East feminism in the larger context of feminist theory followed (Badran and Cooke 1990). After defining their own social space, Middle Eastern women were now located in the larger society, especially in relation to the state (Kandiyoti 1991). Redrawing the temporal and spatial boundaries of gender analysis followed as scholars reanalyzed his-

tory (Keddie and Baron 1991). More recently, the relation of religion and gender (Ahmed 1992, pp. 1–2) was studied, where it was argued that in the Middle East, women's realities are no longer captives of religion but equal partners, and that women now hold their own in the religious processes that had epistemologically obliterated their existence in the mid-twentieth century.

The most recent work in the field of Islam and gender juxtaposes theoretical abstractions with empirical realities, employing a multiplicity of academic, literary, and personal narratives to highlight the spectrum of gender experience in the Middle East both spatially and temporally (Göçek and Balaghi 1995). These range from the emergence of Islamic Eve and the reconstruction of motherhood (Spellberg 1996) to the construction of the relation between Islamic law and gender in Ottoman Syria and Palestine (Tucker 1998) to the origins of modernity and feminism in the Middle East (Abu-Lughod 1998). New efforts compare experiences within the field as they analyze the relationship between gender and support for Islamist movements in Egypt, Kuwait, and Palestine (Tessler and Jolene 1996), gender and identity construction across Turkey, Central Asia, and the Caucasus (Acar and Güneş-Ayata 2000), gender and politics in the Middle East (Berkovitch and Moghadam 1999), or women's human rights in the Muslim world (Afkhami and Friedl 1997). Other contemporary issues that engage scholars' interests range from the impact on gender relations of migration (Erman 1997), the Gulf War (Mojab 1997) or citizenship and parliamentary elections (Göçek 1999).

Works on Iran need to be mentioned as a separate category since the relation of gender and Islam has been particularly problematic after the Iranian revolution. Even though women had to re-veil in Iran, the changed nature of their participation in the public sphere became hotly debated. In spite of the religious rhetoric of returning women to their homes, the number of women in the public sphere has actually increased since the revolution whereby women have evolved a new gender politics that is empowering within the limits set by religion. The various dimensions of this new politics is currently being analyzed in relation to national memory (Najmabadi 1998), to secular versus religious gender politics (Sedghi 1996), and to the religion debate in contemporary Iran (Mir-Hosseini 1999).

A significant new effort differentiates, for the first time, the social history of women and gender (Meriwether and Tucker 1999) while another (Joseph 1999) focuses on the interaction among gender, identity, and the self. While these works provide new insights, there are still two important shortcomings in the field of Islam and gender. In defining Islam, scholars rarely take into account the vast variation in theory and praxis throughout the world. Islam is often spatially limited to the place where Islam emerged, namely the Middle East, often shortchanging its presence in the West, the emerging Muslim communities in North America and Europe, in North Africa and Africa proper, the East, Central Asian republics, the Muslim communities in China and India, and, of course, in Asia proper. Social issues such as the Islamic veil in France (Troper 1999) or women's participation in Islamist parties in Bangladesh (Shehabuddin 1999) need to be brought more to the center stage. In defining gender, even though the category theoretically includes the social interpretation of the biological divide into female and male, in practice scholars focus overwhelmingly on women often to the exclusion of men. This emphasis is again a reaction to the skewed narration in human history, which naturalized men's actions as the norm and silenced the women's contributions. More work needs to be undertaken in the field of Islam and gender emphasizing men's experiences and sexuality.

Islam: Asia

Islam is often understood as a Middle Eastern and, even more narrowly, an Arab religion. While the origins and core scriptures of Islam are indeed Arabic, the majority of the world's Muslim population is located in South, Southeast, and East Asia. This article concerns the Islamicate civilizations and societies of these regions. It examines theoretical and methodological approaches to the study of Islam in the region, the historical processes through which Islam came to be an Asian religion, relationships between ethnicity and religion in Asian societies, popular religion and vernacular literatures in Islamic Asia, the diverse roles played by Islam and Muslims in public life in contemporary Asian States, and the significance of Islamist or fundamentalist movements.

1. 'Islam' and 'Muslim' Definitional and Theoretical Concerns

In both western and Muslim writing the terms 'Islam' and 'Muslim' are used in various and often contradictory ways. Conflicts concerning their use and definition are apparent in, and have done much to shape, scholarly discourse about religion and culture in Muslim Asia. In a theological sense the term Islam means 'submission to god.' A Muslim is a person or *jinn* (spirit) who practices submission. Debates concerning the meaning of submission are a central feature of Islamic discourse. Muslim jurists define Islam as an all encompassing behavioral code and do not distinguish between religious and other modes of social behavior. Mystics (*Sufis*) define Islam as an emotional or spiritual state and are less concerned with personal

and social behavior. Proponents of both positions often describe their opponents as *kafir* (non-Muslim).

The line between social scientific and confessional scholarship in and about the Muslim world is a fine one. Many social scientific studies share the Muslim juristic assumption that Islam is first and foremost a legal tradition and that there is a universal and normative core against which the 'Islamicness' of particular cultures can be evaluated. The result has been that societies in which the influence of Muslim mysticism predominates have often been described as nominally and even trivially Muslim (see, for example, Snouck Hurgronje 1906 and Geertz 1960). Since the early twentieth century many of the basic reference works on Islam in European languages has been written by Muslim apologists whose definitions of 'Islam' are theological motivated (for a contemporary example see Rahman 1980). For the most part their works assume a legalistic understanding of Islam. To the extent that the social science literature has been shaped by these works, it employs Muslim theological categories. Muslim scholars have, in turn, begun to use social scientific works by Western scholars with whom they are inclined to agree, as authoritative references in overtly apologetic treatises.

Recent scholarship has challenged this approach and the related view that Arabs are the guardians of Muslim orthodoxy. Increasingly, social scientists and textualists have been concerned with the dynamic tension between textual and lived Islam in diverse cultural and historical settings. The textual tradition is now understood as the product of discursive practice. Recent scholars have examined the ways in which this tradition describes, and argues for, a variety of possible 'Islams.' This perspective attempts to capture both the variety of Islamic texts and cultures and historical and doctrine linkages among them. The term 'Islamicate' is now used in reference to societies and civilizations whose development has been shaped by the interaction of Islam, as a religion, and a variety of local cultures. The use of this term circumvents concerns with orthodoxy inherent in early scholarship.

The chief difficulty with this approach is that by privileging the local character of Muslim discourse, it runs the risk of accepting the local as normative. Progress in understanding the local Islams of Asia, and elsewhere, will require additional attention to the ways in which elements of the pan-Islamic textual tradition are interpreted, understood, and put into practice, and alternatively the ways in which specific histories and cultures constrain and limit the implementation of the social ideals described in universally recognized Muslim texts. There is also a need for comparative studies of the various Asian Islams.

2. *Historical Background*

Political, economic, and military factors all contributed to the establishment of Islam as an Asian religion and the foundation of Asian Islamicate civilizations. In the seventh and eighth centuries Arab Muslim armies carried Islam into central Asia and western India. Muslim military traditions resulted in the conquest of most of South Asia. Here, Muslim expansion was motivated as much by the religious conviction that Muslim rulers have an obligation to expand the Muslim world (*dar al Islam*) as by economic considerations. Commerce spread Islam further. Arab control of the western terminus of overland and maritime trade routes linking the Mediterranean basin and China led to the expansion and consolidation of Islam in Central, East, and Southeast Asia.

2.1 *South Asia*

There has been a prominent Muslim presence in what are now Afghanistan and Sind (western Pakistan) since the early eighth century. It was not, however, until approximately 1000 CE that the conquest of the plains of what is now India began in earnest. A long series of raids and invasions based in Afghanistan led to the establishment of Islamicate empires centered in the Gangetic plain. The expansion of Muslim polities continued until the establishment of British power early in the eighteenth century. The Central Asian origins of South Asian Islam account for Turkish and Persian influences on South Asian Muslim literature and popular religion and for the presence of a significant *Shia* minority not found elsewhere in Asia. British conquest of Burma in the nineteenth century (1825–85) led many South Asian Muslims to emigrate to this Southeast Asian nation. Arab Muslim traders reached the southwest coast of India and Sri Lanka in the eighth century. Here, trade, rather than conquest, was the primary factor facilitating the expansion of Islam. The Islamicate cultures of this region resemble those of Southeast Asia and southern China more closely than those of northern portions of the Indian subcontinent.

2.2 *Southeast Asia*

Islam came to Southeast Asia in the thirteenth century. It was brought to the Malay world by Arab and South Asian Muslim traders who dominated the Indian Ocean trade during that period. Muslim states were established on both sides of the straits of Malacca and later spread southward to Java and as far east as the southern Philippines. Largely owing to the power of coastal Sultanates it rapidly became the dominant religion in the Malay-speaking world. Muslim communities in Vietnam, Cambodia, southern Thailand, and Burma originated in similar ways, but never displaced the political dominance of Indianized and, in the case of Vietnam, Sinicized states. Islam came to Burma from two additional sources in the precolonial period, from Bengal in the west and from Southern

China. During the period of British rule large numbers of south Asian Muslims migrated to Rangoon, Mandalay, and other Burmese urban centers. There are also scattered Chinese Muslim populations in northern regions of Thailand, Laos, and Vietnam.

2.3 China

Arab Muslim armies reached China's western border in AD 714. Muslim control of the silk road stretching across central Asia to western China was the avenue through which Islam came to be the religion of the various Turkic-speaking communities of central Asia, and substantial portions of northwestern China. The Mongol conquest of China and the Islamic lands of central Asia promoted closer contacts between China and the Middle East. The Mongol conquest of Persia and the sack of Baghdad in 1258 CE was a devastating blow to Islamicate cultures. However, the subsequent conversion of the Mongol elite to Islam enhanced the position of Chinese Muslim communities and resulted in the Islamicization of most of central Asia.

Legends preserved by Muslims in Southeastern China speak of Muslim emissaries and traders arriving during the lifetime of the Prophet Muhammad. While the veracity of these accounts is difficult to determine, Chinese records and archaeological evidence point to a significant Muslim presence in Southern China from the seventh century onwards. Muslims played a major role in Chinese international and internal commerce and politics from the eighth century until the establishment of the Ching dynasty in 1644. Muslims were a sizable and 'convenient' minority. Islam enabled them to establish and maintain relationships with the outside world that was both feared and belittled by the Chinese elite. At the same time Islam precluded its adherents from competition for political power within China. Javanese and other Southeast Asia chronicles mention China, as well as Arabia and India, as being among the sources of Islam. This speaks of the importance of the premodern Asiatic commercial system in the expansion of Islam in Asia.

3. Islam and Ethnicity in Asian Societies

Sociologically, religion and ethnicity are closely intertwined in the Asian Muslim world, though in complex and varied ways. In some instances Islam transcends ethnic distinctions, in others Muslim communities are divided along ethnic lines, despite the normative doctrine and political ideology of 'Muslim brotherhood.'

In nation states with Muslim minorities 'Muslim' has become an ethnic, and often political category, even where Muslims themselves would not recognize it as such. In China, the Philippines, and the Buddhist societies of mainland Southeast Asia, majority populations and governments define Islam as an ethnic category, despite linguistic and religious differences within the Muslim community. Burma provides a clear example. As the result of the inclusion of Burma in the British Indian empire, the Muslim community is extremely diverse. In addition to communities with historical ties to many regions of India, there are Chinese and ethnic Burmese Muslim communities. Typically each of these communities has its own mosque and religious officials. Burmese Buddhists and the national government ignore these distinctions and categorize all of these diverse communities as simply 'Muslim.' In nation-states with Muslim majorities Islam is generally understood as a unifying force that transcends ethnic differences.

In colonial and postcolonial societies Islam has often been used as a unifying ideology. The use of Islam as an organizing principle contributed to the rise of nationalist movements in British India and Malaysia and the Dutch Indies (Indonesia). The effectiveness of Islam as a political principle has proved to be uneven. It was largely responsible for the division of British India into the states of India and Pakistan in 1949. It provided the basis for Malay nationalism in Malaysia, but also contributed to Singapore's succession and for ongoing tension between Malay Muslim, South Asian Hindu, and Chinese communities.

3.1 South Asia

Religion and ethnicity have long been salient features of social and political discourse in South Asia. Pakistan was founded on the basis of a common religious identity, obscuring ethnic and cultural relationships between Hindus and Muslims in both the Northwest and Eastern regions as well as ethnic and linguist differences among Muslims. Pakistan subsequently split into Pakistan and Bangladesh, a division that reflects, geographic, ethnic, and linguistic differences. Bangladesh is an ethnic as well as a religious state. Pakistan is a multiethnic state that uses Islamic ideology to transcend ethnic divisions. The rise of militant Hindu nationalism as a potent political force in India has led to the identification of Islam and Muslims as an ethnically distinct and 'foreign' element of Indian society. Contemporary Indian Muslims are inclined to disregard sectarian and ethnic differences in the face of a mounting tide of Hindu religious nationalism.

3.2 Southeast Asia

Southeast Asia is characterized by extreme ethnic and religious diversity. Islam is the dominant religion in Indonesia, Brunei, and Malaysia. There are important Muslim minorities in the Buddhist countries (Burma, Thailand, Laos, and Cambodia), Sinicized Vietnam, and the Christian Philippines.

The role of Islam in the political systems of the majority Muslim nations of the region, Indonesia, Malaysia and Brunei differs fundamentally. Malaysia is officially an Islamic state, although little more than 50 percent of its citizens are Muslims. Political parties compete to appear 'more Islamic than each other.' Despite the fact that it is the world's most populous Islamic nation, Indonesia defines itself as being neither a religious or a secular state, but rather as one with the state ideology *Panca Sila* (the Five Principles) which comprise: belief in the one true God, a just and civilized humanity, national unity, democracy based on consensus of the people, and wise leadership and social justice for all of the Indonesian people. This ideology seeks to transcend religious differences in a Muslim state in which there are small, but important, Christian and Hindu minorities. Islamic political parties, several of which advocated the creation of an Islamic state, play significant roles in Indonesian politics. These groups understand Islam as an ideology that transcends ethnic distinctions. Other, more liberal, Muslim organizations have attempted to establish an Islamic theology of tolerance promoting ethnic and religious pluralism. Brunei is by far the smallest of the Muslim states of Southeast Asia. It is officially defined as a Malay Islamic Monarchy. Power is located with the Sultan and members of his immediate family. The current Sultan is known as a pragmatist and has sought to limit the influence of Muslim scholars and fundamentalists.

Other Southeast Asian nations have significant Muslim minorities. There is, however, considerable variation in the social and economic status of Muslim minority populations. There is a basic distinction between immigrant and native Muslim communities, that is, between those who define themselves in terms of ethnic categories indigenous to the region and those of Arab, Persian, and South Asian origin. The largest communities of native Muslims are found in the Southern Philippines and Southern Thailand. While Muslims make up less than 10 percent of the Philippine population, they are concentrated in the Sulu archipelago and the southern Island of Mindanao. Phillippino Muslims are culturally and linguistically related to those of eastern Indonesia and the Indonesian/Malaysian island of Kalimantan (Borneo). They fiercely resisted both Spanish and US colonialism and have never been fully integrated into the modern Philippine state. The conquest of these territories was not completed until 1914. The modern state has continued the anti-Islamic policies of Spanish and US colonialists, and encouraged Christian immigration to Muslim majority areas. The result has been continued armed struggle between the army and the Moro National Liberation front. Muslims make up approximately 10 percent of the population of Thailand and are of diverse ethnic origin. Most of the Muslim population of the Southern provinces are Malay, although there are also significant Muslims of the Thai origin. Much of this area was not part of the Thai state until the mid-nineteenth century. There are still periodic outbreaks of resistance to Thai rule. In the vicinity of Bangkok there are diverse Muslim communities of Malay, Thai, Persian, and Cham (Cambodian) origin. In the northern region there is a substantial community of Chinese Muslims originating in Yunan. In general the Thai Muslim community is not well organized as it faces continuous pressure to assimilate Thai cultural norms and Theravada Buddhism. Prior to the Khmer Rouge persecutions there were approximately 500,000 Cambodian Muslims Most are the descendants of Muslim refugees from the kingdom of Champa which was destroyed by the Vietnamese in the fifteenth century. They retain distinct ethnic and linguistic identity. Very few survive.

3.3 China

Chinese Muslims (*Hui*) are recognized by the People's Republic as an official nationality, despite considerable cultural and religious differences within the community. Some southern Chinese communities that trace their descent to Arab Muslim traders have sought to be officially recognized as *Hui* to obtain economic benefits granted to minority nationalities. Descent and refusal to eat pork are the primary factors distinguishing them from the larger *Han* Chinese community. In northwest China Turkic Muslim communities employ a combination of ethnic and religious criteria to distinguish themselves from the *Han* majority. The collapse of the Soviet Union led to an Islamic revival among the Turkic people of central Asia. This has led to an increased concern with ethnic and Islamic identity among the Muslim peoples of northwest China. The Chinese Nationalist government of Taiwan views relationships between religion and ethnicity differently than the People's Republic. It does not officially recognize the distinctiveness of Muslim Chinese. Nor does it limit or regulate expressions of Muslim religiosity.

4. Popular Religion and Vernacular Literatures

Arabic religious texts are known throughout Islamicate Asia. The *Qur'an Hadith* (traditions attributed to the Prophet Muhammad), legal, mystical, and theological works are studied in theological academies throughout the region. There are also significant vernacular literatures in Urdu, Bengali, Tamil, Javanese, and Malay. Vernacular literatures are often based on a combination of pan-Islamic and pre-Islamic components. Many recount tales of the spread of Islam and the exploits of local Muslim saints, kings, and warriors. Throughout the twentieth century there have been concerted efforts to translate

Arabic theological texts into Asian languages. This has contributed to an increased awareness and appreciation of Islamic theology and law in almost every Asian Muslim society.

The ritual complex mandated by Islamic law—the five daily prayers, alms, fasting during the month of *Ramadan*, and the pilgrimage to Mecca—are known and practiced throughout the region. Other kinds of popular religion reflect the significant role played by Muslim mystics (*Sufis*) in the conversion process. These include pilgrimage to the tombs of saints, ritual recitation of the *Qur'an*, healing rites, and the celebration of the *maulid* or birthday of the Prophet Muhammad. Sufi orders continue to play significant parts in social, religious, and political life in most Asian Islamicate societies. For many Asian Muslims Sufi devotionalism is more important than that required by Muslim law.

5. *Islamist Movements*

Islamist movements advocate the 'purification' of Muslim religious life. In general they seek to restrict devotional acts to those prescribed by Islamic law. They strongly oppose *Sufism* and rituals rooted in or associated with pre-Islamic traditions. They also seek to establish the Islamic law as the basis for social and political life. They are significant voices in intellectual, social, and political discourse throughout Islamicate Asia. Most have intellectual roots in the theology of the nineteenth century Egyptian modernist Muhammad Abduh. They emphasize a combination of modern education and religious zealotry. Many believe that the realization of the goals can be facilitated by the establishment of Islamic states. Support for these movements is found primarily among urban, middle-class movements. They are strongly opposed by traditional religious elites and in most instances ignored by rural populations.

Islam: Middle East

This article outlines some of the major principles and practices of Islam, connecting them to the Middle Eastern historical and cultural context. It also briefly discusses the alternative forms offered by Shi'ism and Sufism.

1. *Islam in Historical Context*

Islam claims to be the direct word of the almighty and omniscient God (Allah), as directly revealed to His Messenger, Muhammad. Written down in the Quran, Allah's commands provide Muslims (those who submit) with the final and authoritative pathway to salvation, as well as a code of proper conduct covering all aspects of ordinary life. Islam is arguably the fastest growing of all religions, daily continuing its rapid spread throughout every corner of the world. Yet, despite its cosmopolitan character, Islam remains inextricably linked in language and in character to its past in the desolate heart of Saudi Arabia, where it arose in the beginning of the seventh century AD (for standard histories, see Hodgson 1974, Lapidus 1988).

This arid place was an extraordinarily unlikely spot for a new world religion to bloom. In fact, Arabia had avoided conquest by the stronger surrounding powers primarily because of its geographical isolation and physical harshness. The marginalization of Arabia meant that none of the major religions of the surrounding world had gained ascendance there, although the Arabs traced their own genealogical charter back to Ishmael, the son of Abraham and

Hagar, and therefore had a historical connection with Judaism and Christianity. But in practice they worshipped a plethora of local gods (who remain powerful today under the guise of *jinns*). These divinities offered their devotees protection from the unpredictable environment and acted as guardians during holy months when clan feuds were set aside and markets were organized on sanctified ground. One of these markets, according to many scholars, was to be found in the central Arabian crossroads of Mecca, site of the kaaba, the holy black stone that is now the goal of the *hajj*, the annual Muslim pilgrimage (for a contrary view, see Crone 1987).

There is great controversy among Western scholars over the accuracy of Islamic records concerning the early years of the religion (c.f. Crone and Cook 1977, Humphreys 1991, Wainsbrough 1977, Watt 1973, 1988), but most accept that Muhammad, the Prophet of Islam, was born in Mecca in approximately the year 570 to a member of the Quraysh clan, the kin group that controlled the market and its gods. As a posthumous child he had to rely on the guardianship of his paternal uncle, Abu Talib, and in his later revelations Muhammad was especially concerned with the protection of widows and orphans. With the help of his first wife, the successful and much older tradeswoman Khadija, he eventually became a well-to-do merchant, much respected for his integrity, good judgment, and fairness by his fellows, who called him al-Amin, the trustworthy.

At the age of 40, during a meditative retirement on Mount Hira, Muhammad was gripped by the first of the uncanny revelations that would eventually be collected into the Quran. In his vision, the angel Gabriel spoke to him, commanding him to 'Proclaim! In the name of thy Lord and Cherisher, who created—created man out of a leech-like clot.' Later revelations occurred at intervals throughout his life. One hundred and fourteen of these revelations, presented in rhymed verse of surpassing beauty and novelty, were definitively collected and collated in sections or *suras* of descending order of length (not chronology) shortly after the Prophet's death. These became the Quran, the central holy text of Islam. For the Arabs, whose major art form is poetry, the extraordinary aesthetic power of the Quranic verses was a convincing proof of their divine source. Oral recitation from the Quran remains today as the most important way for the faithful to experience the sacred (Nelson 1986).

According to Muslim hagiography, Muhammad's revelations originally had little influence in Mecca. His first converts were Khadija and some of his closest relatives, including Abu Talib's son Ali, who was later to marry Khadija's daughter Fatima. But most of the early believers were those who were poor, disenfranchised, and humble. They were drawn to the Quran's condemnation of excessive riches, to its advocacy of generous donations to care for the disadvantaged, and to its repudiation of the arrogance and selfishness of the wealthy. Yet the Quran also had a place for the interests of the upper strata. According to Muhammad's revelation, wealth and power were not bad in themselves—only greed, arrogance and an absence of community responsibility.

Nonetheless, most of the Meccan populace were unwilling to follow the Islamic demand that they pay *zakat* (a tax to be redistributed to the community of believers), cease to hoard, participate in community charity, and refuse interest on loans. According to legend, many were especially angered at Islam's absolute denial of the might of their clan gods in favor of the complete domination of Allah—a threat to the basic structure of their patriarchal society. Also galling for them was the Quranic demand that the great show submission by prostrating themselves in prayer to the Almighty God who would judge them on the Last Day.

After the death of his defender and uncle, Muhammad and his followers suffered increasing persecution in Mecca and looked for refuge elsewhere. Eventually, in 622 the Aws and Khazraj tribes of the agricultural oasis of Yathrib (later called Medina), anxious for a leader who could mediate their interminable feuds, begged Muhammad to migrate there. Fearing for his life in Mecca and hopeful of increasing his following, Muhammad accepted this invitation, and undertook the *hijra* to Medina with his followers—an event marked as the beginning of the Muslim calendar. It was there that he built the foundations of his holy empire, attracting converts from the surrounding tribes as he sought to conquer the Meccan confederation that had repudiated him. Following his inspiration, he rallied his following to struggle against the odds, defeating a much larger Meccan army at the battle of Badr in 624, successfully raiding Meccan caravans, and threatening Meccan commercial dominance. Finally in 630 the Muslim army occupied Mecca itself, as Muhammad's Qurayshian cousins were obliged to convert to his cause. When Muhammad died in 632, his followers had conquered the whole Arab peninsula, and had begun their great and ultimately successful war against the surrounding Sasanid and Byzantine empires. All of these events remain in the forefront of Muslim imagination to this day.

The Muslim explosion which burst from the hinterlands of Arabia was historically unparalleled; it united the Middle East into one open trade area, paving the way for the rapid creation of new prosperity. At the same time, the radical Muslim message of the equality of all believers struck a cord with the common people of the empires, who, theoretically at least, were liberated from their inferior status by the simple act of conversion. The rise of Islam was thus both an economic and social revolution, offering new wealth and freedom to the dominions it assimilated under the banner of a universal brotherhood guided by the

message of the Prophet of Allah. Of course, in practice the situation was more complex and ambiguous, as Arabs—proud of their early support of Muhammad—claimed superiority over the more recently converted Persians and Berbers, who in response demanded equal rights for themselves under the *sharia* or Muslim law. There was also rivalry between the old Qurayashian elite and the upstarts who had gone into exile with Muhammad, and now claimed special precedence for themselves. Nonetheless, Islam expanded rapidly, and soon predominated throughout the Middle East, from Morrocco to Afghanistan (for accounts, see Bulliet 1994, Gibb 1962, Shaban 1971, Wellhausen 1927).

In the Muslim imagination this was a period when the 'City of God' was actually realized in historical reality, under the authority of the Prophet himself and the four pious Caliphs after him: Abu Bakr (d. 634), Umar (d. 644), Uthman (d. 656), and his patrilateral parallel cousin Ali (d. 661)—who led Islam in its holy war against the unbelievers. To compare the Muslim experience with Christianity, it is as if Jesus had commanded an army that subdued Jerusalem, and Peter had become Emperor of Rome. Muslim thought is saturated with longing for a return of this idealized era when ordinary men and women worked together selflessly to realize the will of Allah under the leadership of just and divinely guided leaders, and were rewarded for their efforts by vast power and wealth.

Recalling their millennial past, the Muslim devout, unlike their Christian cousins, have never inwardly consented to the disjuncture between the religious experience of the community of believers (equal before God, led by the Prophet and his deputies) and the later reality of power-seeking secular rulers given to political intrigue and physical coercion. The remembered unity of politics and religion during the first years of Islam has always remained available as an inspiration to Muslim reformers and as a rebuke to politicians. That unity is evoked today by Muslim reformers, who inevitably decry the corruption of the times and call for a return to the pure faith and practice of the past (for an example, see Mitchell 1969).

To a great degree, the extraordinary victories achieved by early Islam were a result of the manner in which Muhammad's message transformed and expanded the worldview of the tribesmen who became fighters for the faith. As in a tribe, within the Muslim community—the *umma*—co-responsibility was required, and all believers were strictly prohibited from exploiting, injuring, or enslaving one another; they were obliged as well to share their resources through charitable contributions redistributed to the community at large. They were also expected to unite together in holy war (*jihad*) against the enemies of the faith. Joining the *umma* was a voluntary matter, but once the faith was accepted then a Muslim was forever committed, just as a tribesman was forever linked to his kin.

Also ratified and transformed by Islam were the mercantile values Muhammad had grown up with in Mecca. The Quran does not repudiate commerce, nor did the growth of Islam destroy trade and markets. On the contrary, Muhammad's message favored entrepreneurship, and integrated the ethics of the merchant into Islamic virtue. Profit, if fairly made and appropriately spent in the service of God and to help the deprived, is praised in the Quran, while the absolute right of individuals to own and dispose of personal property is assumed, as is the right to make contracts. In fact, the Quran is permeated with the imagery of the marketplace, which must have appealed directly to the individualistic mercantile values of the people of the time, both urban and rural, who were all so dependent on trade for their livelihoods (Rodinson 1973, Torry 1892).

Most importantly, the Quran emphasized the spiritual equivalence of all persons, who are held to be responsible for their own destinies and who will be judged as individuals by Allah on the Last Day. In principle, Islam is the least hierarchical of all religions: there are no priests, no church, no monks, no difference between clergy and laymen. Everyone is alike in the eyes of the transcendent and absolute God to whom all must submit. This aspect of Islam applied even to the Prophet, who was at pains to deny any sacred or superhuman status to himself. When doubters asked Muhammad to verify his revelation by miracles, he replied that the miracle of the Quran was sufficient, and that he was but an ordinary man, who had been singled out by God as the messenger of His word. In its egalitarianism and individualism, Islam accurately reproduced the dominant mores of its tribal and mercantile Arabian environment (Lindholm 1996).

Yet Muhammad's community, though it reflected the surrounding culture, was also something completely different than had existed previously. In their own imagination of themselves, the early Muslims were not yet another tribal grouping gathered around a sacred marketplace; they belonged to the 'party of God'—opponents were infidels. Nor was Muhammad one judge among many; he was the ultimate and final authority over a millenaristic nativist movement that aimed at nothing less than transformation of the world. Despite his protestations, for his followers Muhammad was not like everyone else; he was the perfect man who had actually seen the face of God (an event celebrated throughout the Muslim world).

In its prophecy, Islam followed in the tradition of the Middle Eastern exemplary religions already proclaimed by Moses, Jesus, and Zoroaster, who had all called for believers to submit to the moral codes imposed by an all-powerful yet personalized God: for them, faith and deeds, not heredity and power, were the true measure of spiritual enlightenment; the ethical action of individuals in this world was a prerequisite for passage into paradise (see Weber 1978 on the

nature of exemplary prophecy). Far from wishing to repudiate his predecessors, Muhammad believed his mission as 'the seal of the Prophets' was to correct and complete these earlier revelations, which had been misinterpreted and garbled. Because Muslims believe that the Quran preserves God's direct words in a pristine state, most are extremely reluctant to apply modern Western methods of textual criticism to the holy book.

1.1 The Rise of Shi'ism

While Muhammad lived, the *umma* was united under his charismatic leadership, but after his death, it inevitably began to lose its moral cohesion. Rebellions and internal schism rent the community, and after the death of Ali in 661 the realm of Islam was plunged into a cycle of tyrannical rulers and foreign invasions, punctuated by intermittent religiously inspired insurrections. Ali's own son, Husain, led one such revolt, but was pitilessly slaughtered in the battle of Karbela in 680—an event re-enacted and mourned today in the great self-lacerating celebrations of Muharram held among Shi'ites—the 'partisans' of Ali—who are the largest sectarian group in the Middle East (Chelkowski 1979). Today Shi'ites of different types compose nearly all the population of Iran, over 50 percent of the population of Iraq, 70 percent of Bahrain, and one-third of the populace of Lebanon. Altogether, the Shi'ites are estimated to make up 11 percent of all Muslims.

Ever since Husain's martyrdom, uprisings against the corruption of the faith have periodically been undertaken in the name of Ali and his descendants, who were believed by their partisans to be the legitimate inheritors of Muhammad's sacred authority. By restoring Ali's line to the throne, the schismatics hoped to re-establish the realm of God on earth. Usually, these movements fell victim to repression by powerful rulers, and they also suffered from internal disorganization, as there was disagreement over which of the possible claimants deserved the title of the Imam—the divinely appointed ruler. Even when successful, Ali's partisans suffered from problems of maintaining a sacred polity over several generations. For example, the great Fatimid dynasty of Egypt (969–1171) disintegrated over issues of succession, as one Imam denied his own divinity, while a later one had no sons (for a short history of Shi'ism, see Richard 1995).

The most successful Shi'ite strategy was followed by the so-called twelvers, who presently dominate in Iran. After their eleventh Imam died without issue, it was argued that the next Imam was actually living in occlusion, and would not return until the final judgement, though he could sometimes be contacted in dreams and visions. This sect then developed a complex and rigorous educational system that aimed to produce religious scholars capable of both interpreting sacred texts and of attaining mystical communion with the hidden Imam. Such men, acclaimed by their fellows for their special spiritual gifts, became exemplary figures in themselves, and were recognized as *ayatollahs*, 'miraculous signs of God.' Every *ayatollah* had his own loyal disciples, as well as access to endowments and to donations from followers; most importantly, each retained the right to independent judgment. Only with the political ascendance of Ayatollah Khomeini in the 1979 revolution was this pluralistic system overthrown, and a new centralized spiritual authority inaugurated by the state, which proclaimed itself to be the final arbiter of truth. The future of this experiment remains to be seen, but it must be noted that it flies in the face of twelver Shi'ite tradition (Arjomand 1988).

1.2 Sufism: the Mystical Path

A second reaction to the disintegration of the Caliphate was Sufism: so called, it is said, because practitioners wore rough woolen robes to indicate their unworldliness. Like the Shi'ites, Sufis also hoped for a renewal of the faith, but for them this could only be accomplished by a spiritual return to what they believed were the original practices of Islam. The more ardent of them withdrew into the wilderness where they practiced severe austerities in pursuit of an immediate experience of the divine. Many devoted themselves to repetition of devotional phrases (*dhikr*) which were combined with special breathing patterns and rhythmic movement to induce spiritual illumination (Arberry 1950, Schimmel 1975).

By the twelfth century, the Sufi pursuit of enlightenment had become institutionalized, as saintly figures (often called *shaikhs*) founded various lodges (*tariqas*) where they taught followers their own mystical practices. Students (*murids*) were immersed in a community of brothers detached from the ordinary world, obedient to the will of their spiritual guide, who alone could provide the blue patched 'frock of blessing' and dervish cap to pupils judged to have achieved a measure of divine grace. These newly enlightened individuals could then act as spiritual guides to their own pupils, adding to the *silsila*, or chain of knowledge, reaching back to the original teacher. While the Shi'ites argued for a hidden Imam, the Sufis claimed there was a *qutb*, a pivot of the universe, a perfect man veiled from ordinary men, to be discerned only by the spiritual elite, who themselves were organized in a secret hierarchical order of the 'friends of God,' manifested on the local level in the *tariqas* (Trimingham 1971).

Sufism had great influence throughout the premodern Middle East, and throughout the Muslim world, as wandering mystics furnished a cohesive vision of the cosmos in the face of a splintering polity while simultaneously providing new converts with an

experiential religion suitable for an unsophisticated audience. Establishing their lodges in the hinterlands around the tombs of saints, Sufis regularly served as the mediators in local tribal disputes and as guardians of the peace, gaining disciples and considerable power —so much so that they could occasionally become leaders in revolts, uniting tribes against the state (Gellner 1981). The greatest historical example were the Safavids, who originated as followers of a Sufi saint, and who ruled Persia from 1501 to 1722. Sufism also found a receptive audience in the cities, where the ranked organizations of worker's guilds and local clubs paralleled the hierarchical order of the *tariqas*. Military groups too found the Sufi message to their taste, while intellectuals and scholars were attracted to the controlled 'sober' forms of Sufism, so much so that it was quite common for an orthodox Muslim cleric to be a Sufi adept as well—the best known example being al-Ghazali (d.1111) (Watt 1953). In contrast, radical 'drunken' forms of Sufi worship appealed to the impoverished and sensation-seeking urban masses, who could lose themselves in ecstatic performances of *dhikr* (see Massignon 1982).

Sufism spread with Islam to the rest of the Muslim world, where it still is a powerful spiritual force. However, in the modern Middle East, Sufism has more or less lost its significance. It only remains powerful in Turkey, where the complete assimilation of orthodox Islam into the Ottoman state meant a repudiation of orthodoxy when that state lost legitimacy, leaving Sufism as the major alternative to secularism. Elsewhere, the oppositional role traditionally played by Sufism has been taken over by various fundamentalist groups which loudly accuse Sufis of being anti-Islamic saint worshippers. Yet, like Sufi *tariqas*, these groups too are founded by zealous individuals who believe they have direct access to a purer faith, and who demand the absolute and self-abnegating loyalty of a cadre of followers. The Sufic social structure thus lives on, even though its mystical content has been denied (Roy 1994).

2. *Islam in Theory and Practice*

While there has always been a powerful impulse in Middle Eastern Islam toward charismatic leadership, for the vast majority of Muslims the Quran remains the primal source of spiritual knowledge. Ideally there should be no need at all for human leadership when God has sent down rules to regulate and evaluate all human actions; rules which can be discovered by anyone who can read the holy text. But the Quran, being finite, does not and cannot explicitly cover all circumstances. There are many areas of behavior left out, some questions are not answered, other precepts are ambiguous, and sometimes there are contradictions or apparent impossibilities in the text.

In the face of these difficulties, some early Islamic thinkers (Mutazilites), influenced by Greek thought, attempted to force the Quran to conform to reason, but this effort was defeated in the ninth century by the 'traditionalists' led by the great theologian Ibn Hanbal (d. 855), who argued that the omnipotence of God meant that any constraints on Him and on His word—even the constraints of reason—were a form of idolatry. This did not mean that reason was banished —in fact, the use of analytic argument flourished in Muslim scholarship—but reason was firmly limited to explication of the legal implications of the sacred text; it could not be extended to put limits on God.

In place of an explanatory theology that attempted to unite logic and religion, Islam concerned itself with the obligations and prohibitions commanded by Allah: individual devotional practice and acceptance of the Word are what is crucial, not reflection or rationalization. In its emphasis on application, Islam has been appropriately described as a religion not so much of orthodoxy as of orthopraxy, reliant on ritual actions to reveal and inculcate faith (Smith 1957). The very word 'Islam' signifies an act—the initiatory act of surrender and submission to God. The essential practices required of all Muslims are five: the public profession of the faith (God is one, and Muhammad is his Prophet—recitation of this is sufficient for conversion), five daily prayers, the pilgrimage to Mecca for those who are able, donation of *zakat*, and the month-long fast of Ramadan. Some Muslims now say holy war should also be seen as compulsory, but this is a matter of controversy, and in any case can be interpreted as a struggle against one's own base instincts.

In all instances, these shared practices are simple, direct, and spiritually compelling. The aim of each is to infuse the faithful with the necessity of a willed subordination of the self to the dictates of the overarching Muslim community while offering in return both the promise of reward in the afterlife and immediate compensation in the here and now. The human rhythm of Muslim practice is clearest in the fast of Ramadan, which is the ninth month of the Islamic lunar calendar. During this period it is strictly forbidden to eat, drink, smoke, or have sexual contact. However, fasting is not regarded by Muslims as a way of atoning for sins through suffering, as it is in the Judeo-Christian tradition. Rather, all restrictions are lifted as soon as the sun sets, so that a greater quantity of food is eaten during the evenings of Ramadan than during the rest of the year, and the meals are of higher quality. Ramadan feasts also involve celebratory gatherings of friends and family, and a public redistribution of alms and food to the needy.

The rhythm of constraint and release, solitude and community, culminates in the great Muslim festival of *Eid al-fatr*—literally the lesser festival, but in actuality the major celebration of the year (*Eid al-attar*, the 'greater festival,' is a re-enactment of Abrahamic sacrifice in which a sheep is slaughtered and shared out

with family, dependents and the poor). *Eid al-fatr* is very much an affirmation of participation and renewal, as Muslims everywhere put on new clothes, visit, embrace, share food and drink, and gather for prayer. Forgiveness of all insults and enmity is mandated; debts are canceled and old enemies embrace to show their renewed brotherhood. The music and celebrations that marked the whole month are intensified, and the tombs of the ancestors are visited, reaffirming again the continuity of the community with its sacred past. High and low are leveled through the giving of alms; sharing in hunger gives the wealthy a sense of the contingency of their plenty and brotherhood with the impoverished, who, like all other Muslims, take part in both the fast and the feast. The egalitarian and individualist message of Islam is reaffirmed through action, as salvation is achieved by the deeds of individuals in this world, who unite with their fellows in the performance of socially and spiritually rewarding acts of self-sacrifice.

Within this theology of practice there is no original sin. Mankind has been placed on the pathway and given directions, he only needs to heed and obey. The Quran is a light to guide travelers as they work their way through the darkness of earthly life toward the climactic moment of the final judgment. Redemption, atonement, an irredeemable inner sense of evil—these aspects of Christian dogma are left aside in Islam where the punishment for turning away from the path is simple and terrible—God withdraws Himself, and leaves the individual alone to wander without a guide in the moral wilderness, destined never to reach paradise.

Yet despite the absence of original sin and the emphasis on practice, Islam is not a religion of positive thinking. Election to the ranks of the saved cannot be assumed to follow from proper practice or good works; salvation is solely a consequence of God's ineffable and unpredictable grace. Fear of the utter power and unknowability of God is mitigated only by reliance on His positive qualities. In the Quran Allah has continually described Himself as merciful and compassionate, and Muslims hope for His forgiveness. Notwithstanding God's compassion, the impossibility of pleasing an utterly transcendent, unpredictable, and indeterminable Deity necessarily leaves Muslims in a state of trepidation and perplexity as to the state of their souls.

2.1 The Primacy of Memory

In their effort to please God, and fearing their own all-too-human fallibility and hypocrisy, Muslims have naturally sought other means to secure salvation beyond the study of the Quran and following its precepts. In particular, they have tried to emulate the actual practices of Muhammad and his followers (*Sunna*—the 'trodden path'), reasoning that these must serve as the most reliable template for behavior approved by Allah. As a result, Islam, more than any other religion, has always been preoccupied with discovering, preserving, and imitating its own past. Such historical memories serve, with the Quran, as the major source for Muslim moral consciousness.

So it is that where other religions interpret their holy texts through the decisions of authoritative legislative bodies, or through deduction from general principles, Muslims instead discovered principles and authority through the collection of historical records of the words and deeds of the founder and his companions. This was the task of the preservers of reported history or, as they are conventionally known, the *ahl al-hadith*, people of 'tradition,' who at first were simply individuals who had lived in the original *umma*, and could report on its practices.

Over the generations, reciters became professionals who concentrated on developing their memories and eliminating personal biases so they could repeat, verbatim, what they had heard from those before them, without interpretation, comment, elaboration, or condensation. They also had to be moral exemplars, since *hadith* were judged reliable not only on the basis of historical criterion, but also on the basis of the integrity of the reciter. Those approved could then enter into the *isnad*, or 'chain' of reliable transmitters that was recited whenever the tradition was spoken. As Islam spread, the traditions were codified, validated, and published in six so-called 'canonical' collections, which served, with the Quran, as the basis for legal decisions.

2.2 Legalism and the Problem of Interpretation

The jurists (*faqih*) who interpreted the sacred texts at first overlapped almost completely with the *ahl al-hadith*. Neither had any formal education, and both were devoted to the study of the Quran, the *sunna*, and the traditions. The difference was that the lawyers developed regulations for matters left unclear by scripture, such as the exact nature of a property transfer. They also had to clarify the weight of any particular rule: was a practice obligatory, merely recommended, or neutral; if obligatory, should failure be punished by men, or left to the discretion of Allah?

However, from the point of view of the traditionalists, the jurists' use of reason and analogy to fill in lacunae or resolve apparent contradictions in the holy texts was frivolity at best, idolatry at worst. The potentially disastrous dispute between literalists and interpretivists was classically resolved by the theologian al-Shafi (d. 820), who argued that *ijma*, the agreement of knowledgeable scholars, ratified by the community itself, decides the manner in which ambiguities in sacred texts are to be understood. In other

words, Islamic theological disputes ought to be decided democratically, by consensus—albeit a consensus arrived at over generations.

This consensus is never final, since an authoritative dissent can, in principle, cause a reopening of the debate if that dissent manages to gain scholarly sanction and public endorsement. Shafi's compromise retained the egalitarian and populist character of Islam while simultaneously recognizing the importance of expert legal knowledge as the arbiter of tradition. Continuity through collective consensus still permitted the theoretical possibility for new interpretation—a possibility that continues to be the source of intense debate among contemporary Muslims.

Two centuries after Shafi's reforms the legal schools or *madhhab* (literally a 'chosen way') were whittled down to four, each named after its supposed founder: al-Shafi, Ibn-Hanbal, Malik b. Anas (d. 795), and Abu-Hanifah (d. 767), and each teaching its version of the law in specialized colleges (*madrasas*), and producing scholar-judges (*ulema*—people of knowledge). After some violent wrangling, it was eventually accepted that the schools should be considered equally accurate in their interpretations of divine law, since 'only God knows' the truth (Makdisi 1981). Though ideally one could choose any school to follow, most Muslims accepted the *madhhab* prevalent in their area. The central Middle East remains Hanafite or Shafite, the Malikites prevail in North Africa, while the Hanbalite school remains fairly small, but is intellectually influential. Shi'ites too have their own legal schools, slightly variant from those of the Sunnis—in fact, the first college in the world, al-Azhar in Cairo, was founded in 970 by the Shi'ite Fatimids.

Even today, despite public efforts at rationalization, Islamic law has remained remarkably personalized and open to interpretation, since there is still no central ecclesiastical organization enforcing rules, nor any standard procedure for appeal to a higher ecclesiastical court (indeed, there is no hierarchy of courts whatsoever). For these reasons, different juristconsults can issue *fatwas* (legal opinions) at odds with one another—much to the confusion of Western observers (Coulson 1964, Goldziher 1981).

2.3 Muslim Resistance to the State

Efforts by Middle Eastern states to incorporate, rationalize, and secularize Islamic law have always met with ambiguous results, as the majority of Muslims remain suspicious of the motives of secular authorities. For a recent example, when al-Azhar was completely integrated into the Egyptian state in 1961, its graduates were increasingly seen as minions of the government. In response, many self-taught Muslims have opened their own local schools for the training of religious scholars (Gaffney 1994). Similar patterns have occurred elsewhere in the Middle East, where popular mistrust of the official *ulema* has periodically led laymen and reformers to try to find a pathway to a purer and more egalitarian form of Islam.

This is so much the case today that, except in Iran, those offering an 'Islamist' critique of the state are usually autodidacts self-consciously distancing themselves from the class of the traditionally religiously educated, who are tainted by their graduation from state schools. But although ordinary Muslims are suspicious of the state, they are equally distrustful of those zealots who say they have privileged access to the truth. The best course, they believe, is to avoid conflict with the secular authorities, submit to the precepts of the Quran, *sunna*, and *hadith*, and rely on Allah's infinite mercy.

Islam: Sub-Saharan Africa

An estimated 140 million Muslims live in tropical Africa, also referred to as sub-Saharan and Black Africa. The majority are concentrated in the Sahelian and Savannah regions that lie to the south of the Sahara proper, between the Atlantic to the west and the Red Sea to the east, in the Horn of Africa and along the East African coast from Somalia to the northern region of Mozambique. Nigeria's Muslim population, generally estimated to be over 50 million, is the largest in this part of Africa, and the focus in this article will be on the growth and impact of Islam there, and in East Africa, especially in Tanzania where, as in Nigeria, there is also a heavy concentration of Christians, a situation that affects the character, policies, and objectives of both religions in both countries. Elsewhere either Muslims or Christians are in a clear majority.

The advance of Islam and Christianity throughout tropical Africa has not undermined all traditional beliefs and rituals. On the contrary, as modernization has brought new challenges to community and personal life, people have not rejected the traditional belief systems for the 'newer' religions but have tended to juxtapose—the term syncretize is misleading—them, and to have recourse to either one or the other depending on the concerns that require a spiritual solution.

Broadly speaking, there have been three stages in the development of Islam in tropical Africa: quarantine, mixing, and reform. In the first of these stages Muslims, mainly merchants from North Africa, tended to live in closely-knit communities and apart from the indigenous population. The second stage was characterized by the mixing of Muslim and traditional beliefs and rituals, a process which gave rise to the third stage, that of reform.

1. West Africa Until the Nineteenth Century

It was through commerce that, over 1,000 years ago, Islam began to spread to West Africa and indeed to most of tropical Africa. During the eighth century, Muslim merchants of both Arab and Berber origins began to work their way across the trans-Saharan trade routes to the Ancient kingdoms of Ghana and Kanem Borno situated within the frontiers of what is today western Africa.

After gradually establishing itself as the religion of court and commerce, Islam came to be seen as a progressive, modernizing force in Tropical Africa. The traveler Ibn Battuta (1304–68/77) left an account of the healthy condition of Islam in Mali in the middle years of the fourteenth century. He was impressed by the meticulous observance of the Friday prayers, the importance attached to the learning of the *Qur'an* by heart and the fidelity with which *zakat* or almsgiving was practiced. Ibn Battuta also pointed to what has been a feature of Islam in West Africa since its beginnings there: mixing. He noted the retention in Muslim circles of traditional religious customs, including divination, prostration before a ruler, and the matrilineal system of inheritance, considered to be contrary to Islam, and given by reformers as the principal reason for *jihad*.

Early on Islam encountered Christianity in tropical Africa. By the middle of the seventh century, Arab Muslim traders had come into contact with the

Christian kingdom of Nubia which, when unified, stretched from the second to the sixth cataract of the Nile, although there was little by way of Islamization until the arrival of the Mamluk dynasty in Egypt in the second half of the thirteenth century. A combination of military pressure from Egypt and royal marriages between the Egyptian and Nubian dynasties resulted in the establishment of Muslim rule in the capital of the Nubian state of Muqurra in the first half of the fourteenth century.

2. *The Scholar-mystic as Reformer and Nationalist*

While Islam in tropical Africa has been spread largely by peaceful means and has used the same means to reform itself, the launching of the Almoravid movement in the southern sector of the Sahara in 1054 by Abdullah b. Yasin initiated a tradition of militant reform that was to influence the course of West African Islam down the centuries, inspiring future *jihads* or holy wars.

In the fifteenth century, this tradition was given intellectual and doctrinal weight by the Muslim scholar Al-Maghili (1425–1502) from Tlemcen in southern Algeria, who spent many years teaching Islam and counseling rulers in Hausaland (present day northern Nigeria) and the central Sudanic kingdom of Songhay (present day Niger). His radical teachings on the Shari'a (Islamic law), Muslim government and education, gender and taxation were communicated in reform manifestos to scholars and rulers across the western Sudan.

The seventeenth century saw the beginnings of a series of *jihads* in western Africa culminating in the Sokoto *jihad* which was to change the cultural and religious landscape of that region during the first half of the nineteenth century. It was launched by the scholar and mystic from the hinterland of Hausaland in northern Nigerian, Shaykh Uthman dan Fodio (1754–1817) early on in the thirteenth century of the Muslim *hijra* (1785–1882)—the century which, it was widely believed, would witness the advent of the Mahdi (God-guided one) who would ensure the triumph of Islam everywhere. The principal target of this jihad, one of the most thoroughgoing in the history of Islam, were the nominally Muslim urban based government administrators and the jurists who were accused of every kind of corruption and oppression. Oppression of fellow Muslims, Shaykh Uthman preached, was tantamount to infidelity on the ground that a believer was duty bound to befriend a fellow believer.

The Madhi, many were convinced, had arrived in the eastern Sudan in 1881 in the person of Muhammad Ahmad. A member of the puritannical *Sammaniyya* Sufi order, Muhammad Ahmad, in a brief period, overthrew Egyptian rule in the Sudan and established an Islamic state there which lasted until 1898. Like that of Shaykh Uthman dan Fodio, the Sudanese Mahdi's religious nationalist movement was both rural based and directed against the corrupt urban based elites, mostly Turco-Egyptian officials. The careers of both men highlight the crucial role of the mystic as reformer in African Islam.

After the Madhi the Sudan was to become, in theory, a condominium under joint British and Egyptian rule until 1952. The Sudan has suffered from a civil war between the largely Muslim North and the Christian, traditionalist South since 1955. Since that time several administrations have been engaged in extending Islamic law and education across the South.

3. *Islam on the East African Coast Until the Nineteenth Century*

As in West Africa, Islam's early development on the East Coast was slow. It spread more easily and evenly among the nomadic and seminomadic populations of Somalia and the Horn generally, while further south it remained confined to many of the island populations including those of Lamu, Pate, Pemba, Comoros, Mombasa, and Zanzibar, and to a few settlements on the coast itself. The best documented of the early coastal settlements is Kilwa, founded by Shirazi immigrants from the Arabian peninsula in either the tenth century or in the twelfth century. Though early Islam was largely confined to the coast Arab immigrants had established a Muslim state far inland in Shoa in Ethiopia by the ninth century which was later absorbed by Ifat, one of seven Muslim kingdoms all tributaries of Christian Ethiopia.

By the first half of the fourteenth century a well-developed Muslim society had been established on parts of the coast of East Africa. Once again Ibn Battuta, the chronicler and traveler, who visited Mogadishu in Somalia in 1331, provides a picture of the state of Islam at the royal palace at this time. He describes a deeply Islamized court around the Arabic speaking ruler and/or shaykh who was assisted by a Muslim judge or *qadi* from Egypt. Furthermore, East African students had already begun to travel to study in the Islamic university of Al-Azhar in Egypt, a tradition begun in West Africa much earlier.

Though historically less militant than western African or Sudanese Islam, the fusion of Islam with local coastal customs and traditions created the context for reformers to engage in *jihad* or holy war. The reformer Ahmad b. Ibrahim (1506–43), better known as Ahmad Gran, waged several *jihads* from the Muslim state of Adal, situated in the interior, into the Christian kingdom of Ethiopia which involved not only the purification of Islam but also the conversion of Christians. Paradoxically, the indirect consequence

of those *jihads* was the disintegration of the largely Muslim region of Adal, the main area of relatively settled Islamic life in the interior, although Harar, to the south, remained for Somalis a center of Muslim orthodoxy. In the second half of the sixteenth century the Galla, originally from south central Ethiopia, began to expand and by the nineteenth century a number of ethnic groups further north including the Wallo were largely Muslim.

Though Islam made little further progress in the East African interior until the nineteenth century, Arab Muslim culture had begun to interact with the indigenous Bantu cultures through marriage and concubinage to produce the new and distinctive culture known as Swahili, an Arabized-Bantu lingua franca spoken in Kenya, Tanzania, and in the eastern sector of the Democratic Republic of the Congo. The Muslim presence on the coast, on the other hand, was strengthened by the arrival of the Ottomans who occupied Masawa in 1557, and came into conflict with the Portuguese who had burnt down Zayla' in 1517.

4. *East African Islam Turns Inland*

The Yao people, situated midway between Lake Nyasa and the Indian Ocean and part of a trading network that included slave trading stretching from the Indian Ocean west to Katanga, were the only major ethnic group south of Somalia to turn Muslim prior to the nineteenth century. During the first half of that century increasing economic expansion inland began to effect a profound reorientation in outlook, attitude, and priorities among the Muslims of the coastal settlements. Muslim traders and agriculturalists began to move into the interior to Tabora, Ujiji, Nyangwe, Buganda, Lake Nyasa, Katanga, and elsewhere, and while not actively proselytizing they were, nonetheless, spreading Islamic culture by imitation.

The first Muslims arrived in Buganda, part of present day Uganda, from Zanzibar in the mid-nineteenth century during the reign of Kabaka Suna. Arab influence increased in the 1860s under Suna's successor Mutesa, not a full Muslim himself (he was not, for example, circumcised) and this was manifest in Buganda's adoption of the Islamic calendar, the observance of Ramadan, and the wearing of Arab dress which had become fashionable.

Tension created by the uneasy relationship between the demands of Islam and local custom and culture was never far below the surface and erupted in violence as protests by strict, orthodox Muslim visitors to Buganda against Mutesa's leading of the Friday prayers led to a backlash in which 100 Muslims were massacred. The situation was further complicated by the arrival of Christian missionaries in Buganda in 1877. Though in 1888 Christians and Muslims united to expel Mutesa's successor Mwanga, too much a pagan for either, unity soon turned to hostility as the Muslims expelled the Christians and installed Kalema as Kabaka. A civil war followed and by 1890 the Christians had gained the upper hand and were to receive the backing of the colonial regime. By the treatises of 1890 and 1892, Captain, later Lord, Lugard, acting in the name of the Imperial British East African Company, allocated Bugandan landed chieftainships along religious lines in favor of Christians and this was confirmed by the Ugandan Agreement of 1900. Christianity's dominance in Uganda had been institutionalized.

5. *Colonialism and Islam*

Muslim resistance to colonialism has been mentioned in the case of the Sudan and Muslim opposition, both passive and militant, emerged in many other parts of tropical Africa including the Senegambia, Somalia, and Northern Nigeria.

While profoundly disturbing culturally, psychologically, and spiritually everywhere in tropical Africa, the indirect consequences of colonial rule on the actual spread and institutional development of Islam were uneven both in time and place and depending on colonial aims, interests, rivalries, and manpower requirements. At first the German use of Muslims for administrative purposes in East Africa contributed to Islam's progress in the interior, while later this same practice worked against its advance by dividing government personnel from the indigenous peoples opposed to foreign domination. The strongest opposition to German colonial rule came in the form of the Maji-Maji (*maji* in Swahili means water) rebellion (1905–7), organized by Kinjikitile, once again a Sufi or Muslim mystic.

British colonialism which replaced the German system after World War I tended to slow the progress of Islam in Tanzania and elsewhere in East Africa. The system of Indirect Rule at the level of local government tended to protect the power of the local chiefs from being undermined by wealthy Muslim merchants from the coast. Moreover, Christian schools became the main supply of local administrators, teachers, police, and army personnel. The perception was formed of Christianity as the religion of progress, while Islam, as it was gradually sidelined, came to be seen as an obstacle to advancement in the modern sector of the economy and politics.

By contrast with East Africa, British colonial rule in Northern Nigeria relied heavily on Muslim personnel to implement the system of Indirect Rule and even extended Muslim authority to cover the so called 'pagan areas' such as the Jos Plateau. Muslim courts and schools were improved and, as in the Sudan, Colleges of Islamic Law were opened. What mostly assisted the spread of Islam during the colonial era was

the improvement in communications, while what mostly disadvantaged Islam and assisted Christianity was the growing importance of western education.

6. Postindependence Islam in the Context of the Nation State

The independence struggle and the regaining of independence itself provided Muslims, previously under represented in the modern sector of political life and in the civil service in many parts of Tropical Africa, with the opportunity to insert themselves in a more positive and sometimes aggressive manner into the political affairs of the new nation state.

Since independence in 1963, Nigerian Muslims have created a nationwide network of Islamic institutions and have supported the territorial integrity of the federation when threatened by seccessionist movements which continue to exist and the most serious of which, in recent times, came from the eastern region and resulted in the Biafran Civil War (1967–70). On the other hand, in the late 1970s as the country prepared to return to civilian rule after more than a decade of military rule, Muslim members of the Constituent Assembly appointed to approve the Constitution of the Second Republic became embroiled in a serious controversy over the establishment of a Supreme Shari'a Court at the Federal level that threatened the unity of the nation. Many Nigerians not only resented and felt threatened by the Muslim demand for a Federal Shari'a Court but also by the Muslim call for the removal from the preamble to the 1978 draft of the Constitution of the Second Republic the term 'secular state' on the grounds that it promoted secularism, atheism, and immorality. Those skeptical of northern Muslim intentions and more favorable, if not to seccession, then to greater regional autonomy, claim that Muslim enthusiasm for a strong central government reflects a concern not with harmony and unity but over the resources of the country, principally oil, which are located in the South.

Evident in tropical Africa since the 1970s is not only the greater role of Islam in the affairs of the nation state but also the steady increase in Muslims in what were traditionally non-Muslim areas such as Meru country in Central Kenya. The precise number of Muslims in Kenya is unknown but the best estimate would seem to be somewhere between 10 and 20 percent of the population. Islam is also expanding among the black population in South Africa where it was first introduced by slaves and political prisoners from the Dutch East Indies, Madagascar, and West Africa in the late seventeenth to early eighteenth century. Numbers were boosted by the influx of Muslim traders, many of them from Bombay, who distinguished themselves from the indentured laborers from India, a majority of whom were Hindu, who began arriving from 1860.

In the 1980s Muslims joined with Christians of all denominations, Jews, and Hindus in South Africa against the enforced pluralism of apartheid. Today most of South Africa's major cities have a sizeable Muslim presence, and increasing attention is given to education, community integration, and links with the wider Muslim world in Africa and beyond from which it was largely cut off during the apartheid era.

7. Conclusions

It is usual to stress the fit between Muslim culture and the African condition, and while there was, and is, undoubtedly much common ground between the two, Islam, like Christianity, has been both a destructive and creative force. It has produced many distinguished scholars, mystics, and philanthropists, among them a Muslim William Wilberforce in the person of Shaykh Uthman dan Fodio (1754–1817) of Hausaland in present day northern Nigeria whose writings and program of reform continue to influence and motivate contemporary Muslims not only in Africa but also in the United States and Europe.

Islam has been a major agent of globalization in tropical Africa. Wherever it has settled it has brought numeracy and literacy in Arabic and turned what were regional and/or national trading and commercial networks into international ones. It has also introduced new forms of religious community and spirituality in the form of the *turuq* or Sufi brotherhoods that link believers in tropical Africa to those in the wider Muslim world.

Whether Islam, or for that matter Christianity, has been an innovator or simply a catalyst, where the introduction of such core beliefs as belief in the Supreme Being as totally unique and independent is concerned, is both a fascinating and much debated point among social scientists and historians of religion, but one which space prevents us from discussing here.

Islamic Fundamentalism

Islamic fundamentalism grew among sections of Muslim peoples worldwide in the twentieth century. It is not a unitary and coherent movement but represents a constellation of political, social, ideological, and intellectual trends with varying orientations and national settings.

1. General Features

Islamic fundamentalism is too much a product of modern history to admit to being regarded, as is often the case, as *sui generis*. It is much too severed from Muslim learned and popular traditions over centuries to admit to being considered, as is habitually presumed, an authentic, albeit condensed, resultant of these traditions. In so far as it represents the political expression of a particular attitude towards scriptural material, it is a phenomenon generically belonging to the history of religions, with distinctive affinities to the other monotheistic fundamentalisms, Judaism and Christianity, as well as to other fundamentalisms that are recasting themselves along monotheistic patterns, namely Buddhism, especially in Sri Lanka, and to a lesser extent Hinduism. In so far as this attitude towards scripturalist religious origins is made to converge with the modern political ideologies that power modern political movements, Muslim fundamentalism subtends conceptions of history, society, state, and of political action that quite naturally freely draw on the universal modules of populism, vitalism, and the entire repertoire of standard anti-Enlightenment motifs in the history of European and non-European peoples.

Finally, in so far as Muslim fundamentalism, in its wide variety of national settings, ideological and sectarian inflections, and political orientations, was an ideology of increasingly wide appeal in the closing decades of the twentieth century, it shares the common socio-economic characteristics of contemporary subalternist populist movements everywhere, both as diffuse sentiment and as centrally-organized, party-political movements of contestation and of revolution, mobilizing crowds as well as building up organizational structures and, in some extreme cases in Egypt, Algeria, Afghanistan, and some Western countries, re-socializing their members completely and constructing counter-societies.

2. Intellectual Origins

2.1 Muslim Reformism

The ultimate intellectual, as distinct from social, origins of Muslim fundamentalism go back to the latter part of the nineteenth century. Much like right-wing European nationalist and royalist ideologies on the ascendant at the time, and in line with the long tradition of sentiment and polemic against the Enlightenment and the French Revolution associated with, among others, Herder, Burke, and de Maistre, these were premised upon a vitalist conception of society and history. At the heart of this conception lay the contention that societies and histories constituted organic wholes sundered and rendered into a condition of morbid distemper by the historical processes of modernity. While these processes in Europe were identified as French Republicanism, socialism, and anticlericalism, in Muslim domains, and particularly in Ottoman lands, which were at the forefront of rapid change among Muslim peoples, they were identified with the state-led reforms in the domains of law reform, educational and cultural advancement, and modernist social engineering—all of which were galvanized by a positivist notion of historical evolution correlative with the assumption by the Ottoman state of direct control on the Bonapartist pattern, which saw cultural and legal hegemony as a primary task and prerogative.

Just as Herder and other conservative Germans derided the court of Frederick the Great as effeminate and 'inauthentic,' so the subalten rungs of the emergent Ottoman bureaucracy and modern, non-clerical intelligentsia saw the reformist Ottoman state and the upper rungs of the state administration as being captive to European domination. These groups likewise saw this domination personified in westernized life-styles and progressive ideas. Expressed initially by the Young Ottomans, these sentiments were vigorously expressed and most consequentially by the Persian Jamal al-Din al-Asadabadi, alias al-Afghani (1839–1897) and his then disciple, the Egyptian Muhammad Abduh (1849–1905), through the medium of the short-lived, but highly suggestive and influential review, *al-Urwa al-Wuthqa*, *The Sure Bond* (a Koranic expression), published in Paris in 1882–1883.

It was suggested in this review that nations are corporate entities which cohere around moral drives, a notion which bears close comparison with Herder's

notion of *Kräfte*. Once adulturated by foreign influences, these drives tend to atrophy, and to weaken the body-national which, in this social-Darwinist world of nations, is perforce made subject to stronger parties. Thus history is a cyclical process, an alternance of purity and adulteration, corresponding to phases of power and powerlessness: in the history of Islam, *al-Urwa al-Wuthqa* traced the causes of adulturation of the early Muslim empire to non-Arab newcomers to the faith, and to heterodox sects, and the adulteration of the Ottoman polity to the infiltration of modernist ideas and institutes of European provenance. Afghani and Abduh discounted race and ethnicity from their definition of a nation, and viewed religion as 'the sure bond' of Muslim nations. It was the Muslim religion, very broadly defined in culturalist and utilitarian rather than in devotional or dogmatic terms, which caused the organic unity of the nation to cohere, to acquire direction, and to gather force. Political action was thus conceived as an educational enterprise for the broad mass of people captive to superstition, and a conspiratorial political task directed at winning over prominent statesmen who might provide the authoritarian armature of this historical project.

Over subsequent decades, and until the late 1920s, the two prongs of this enterprise bifurcated, with Afghani, a charismatic and highly complex arch-conspirator but a superficial thinker, failing to build a Muslim internationalist coalition. Abduh, who became Grand Mufti of Egypt, independently charted the intellectual and cultural highlights of a lasting religious reform, explicitly inspired by the example of Luther, whose main thrust was to combat what he regarded as superstitious and irrational accretions that overcame what he took for the original Koranic foundations of the Muslim religion: folk religiosity, traditionalism, clericalism, and virtually all interpetations of religion that were contrary to modern science (including Darwinism) and modernist forms of political, legal, and social organization. At Abduh's hands, Islam became highly latitudinarian and episodically regarded almost as a natural religion corresponding to the social evolution of humanity.

2.2 From Reformism to Fundamentalism

It was with Abduh's star pupil, the Syrian Muhammad Rashid Rida (d. 1937), initially as liberal as his teacher, that what might be termed political Afghanism became ascendant. In his monthly review *al-Manar* (1898–1934), published from Cairo and prodigiously influential all the way fom Morocco to Java, he laid the foundations of an alliance between social conservatism and a cultural-political activism in the name of a religious reform shorn of its previous latitudinarianism, retained as a slogan voided of practical consequence, and with a pronounced anti-modernist polemical tone that sought to expand the definition of religion to encompass the entire surface of social life, rendering politics, in the words of a prominent follower, 'social devotions.' The emphasis on the strict observance of ritual, the emblematic use of politico-cultural spectacle such as extreme forms of punishment, the vituperative strictures against equally emblematic manifestations of modernity, particularly secularism and the social liberation of women, vigorous opposition to nearly all but literalist interpretations of the Koran and to miraculous and salvational views of Islamic history, and the hostility to modern legal reforms in the name of fidelity to Koranic and classical norms, propounding the 'restoration of the *Shari' a*' as a fundamental political slogan, and the revival of the notion of apostasy. These became leitmotifs of all subsequent Muslim fundamentalism in the Arab World and beyond.

This expansive definition of religion was influenced by the example of the literalist medievalism of the Wahhabi movement which led to the foundation of the Kingdom of Saudi Arabia in 1925. This movement, born in a deprived and isolated territory during the era of the French Revolution, represented a ritualistic puritanism which referred directly to the Muslim scriptures and certain fundamentalist figures in Muslim traditions, at the same time impoverishing these considerably, and reducing them to formulism.

3. Culture into Politics

To this expansive definition of the religious sphere was added an organized political moment in the 1920s and 1930s with the emergence of the Society of Muslim Brothers, first in Egypt, later spawning similar movements elsewhere.

3.1 Incipient Organization

Like subsequent moments in the history of Muslim fundamentalism, this political emergence followed the rhythms and patterns of international history which, in the interwar period, was characterized by the anti-Enlightenment and anti-Communist vitalist motifs that provided ideological sustenance to racism, hyper-nationalism, xenophobia, and cognate trends, both organized and socially diffuse. Thus, the Society of Muslim Brothers and its Muslim and Hindu homologs in India, the Jamaat-i Islami and the RSS, for instance, conceived themselves as sporting and paramilitary youth organizations, ostensibly beyond party and class politics in the name of the unity and homogeneity of the nation, conceiving of the state as a natural and organic emergence from a homogenous society, fully corresponding to its essence, momentarily in diremption and in the course of restoration to an arcadian past prior to its violation and corruption by inauthentic modernity.

This rhetoric of history underlying a political project of hegemonism and of the seizure of state power by means both gradual (emphasizing re-education and re-socialisation) and insurrectional, was given added ideological and systematic force and relevance in the period of the Cold War, with large-scale borrowing from state-led nationalism in Muslim countries and from populist conceptions of popular will, interpreted as fundamentally and abidingly religious, whereby Muslim peoples were thought to be, by natural instinct, Islamist in political orientation. This explains to a large degree the extraordinary degree of social, symbolic, and physical violence needed for nurturing these movements in their quest for power. Correlatively, these movements derived concrete logistical, institutional and organizational sustenance from the US and from Saudi Arabia, and may be said to have constituted the cultural plank of the Truman Doctrine, to which military and political aid was added, most dramatically in the Malay Peninsula in the 1950s, in Indonesia in 1965, and in Afghanistan in the 1980s.

3.2 Radical Islamism and Society

The main ideological innovation in this third phase of Islamic fundamentalism resides in the notion of *takfir*, the notion that Muslim societies are not only aberrant and unfaithful to their natural history, but that they are territories of degeneration and godlessness in need of a total recasting along models derived from the prophetic period in Islamic history, now transformed into a Utopia. First propounded by Abul-A'la Mawdudi (1903–79), the founder of the Jamaat-i Islami in India and later its leading light in Pakistan, it was taken over by the Egyptian Sayyid Qutb (1903–66), crossed with the notion of degeneration current in right-wing European political thought during the *fin-de-siècle* and the inter-war periods (prominent here was the influence of Alexis Carrel), and provided the cornerstone of the extremist fundamentalism of the 1990s: among certain groups in Egypt, Algeria, and Afghanistan, and more episodically elsewhere. Most specifically, the civil war in Afghanistan spawned a class of itinerant professional Islamist revolutionaries of various nationalities who took up arms in Algeria, Egypt, the US, Bosnia, Kashmir, and elsewhere.

At the close of the twentieth century, further elements were added to the ideological and activist repetoire of these movements, some of which had taken over state power (as in Iran, Afghanistan, and Sudan) or became potent players on the national scene (as in Pakistan), where they have been directing operations of social engineering aimed at recasting laws and public mores. The most important of these elements, again reflecting international flavors of the time, is the hyper-nationalist use of the vitalist notions of 'identity,' of cultural difference, and their cognates in a situation marked by the waning of projects of development and their cultural and social correlates, the weakening of states in the developing world under conditions of global deregulation, including cultural and social deregulation. These derive sustenance from armies of the slum-dwellers, the structurally unemployed, small businessmen belonging to a previous age, and subaltern intellectuals including members of the clerisy, most potently and successfully in Iran, where the break-up of the modenist state was most spectacularly displayed in the revolution of 1979 which has highly specific ideological and organizational characteristics.

An expansion of religious thought, in the name of culturally specific protocols of knowledge, led to an auxiliary and most important element that sustains fundamentalist bids for intellectual hegemony, namely the institutional and conceptual development of the 'Islamization of knowledge': Islamic social science, Islamic economics, Islamic democracy, the renewed hostility to Darwinism, and Islamic feminism. These currents of thought exercised collateral influence on sectors of political thought in many Muslim countries, some of them irreligious and hostile to political Islamism, and certain of these vocabularies seeped into the mainstream of political discourse, quite apart from state sponsored religion which had hitherto been marked by a latitudinarian reformism, now feeling the need to protect its flanks and pushed into a more conservative direction.

Issue Constraint in Political Science

The simplification of political alternatives—to left vs. right, conservative vs. liberal, authoritarian vs. democratic—often structures public discourse and policy making on important questions, such as the size of government, the authority of the central government, the extent of redistribution or market regulation, or the balance between individual liberties and social institutions. For the social scientist, this notion—ideology—provides a simple empirical metric for evaluating political alternatives, such as candidates and parties. It also offers a mathematically tractable basis for deriving clear, intuitively appealing theoretical predictions, such as are found in spatial models of elections and of legislative politics (Downs 1957, Krehbiel 1998). Most social scientists and historians not wedded to these mathematical rigors also use the shorthand of 'ideology' to interpret the complexity of politics (Beer 1978, Lowi 1979).

The adequacy of this description of politics has been the subject of intense empirical scrutiny. Perhaps the most significant concern is whether ideology adequately characterizes the way people think about political choices. Does a person's belief or opinion about one issue predict or constrain his or her beliefs and opinions on other issues? Is there, as Philip Converse termed it, 'issue constraint'?

Issue constraint consists of three separate conjectures: (a) rationality of individuals, (b) existence of general belief systems for individuals, and (c) existence of aggregate or widely held belief systems that simplify political debate.

1. *Individual Rationality*

Issue constraint presumes a high degree of rationality. Specifically, at a minimum it is posited that individuals have consistent preferences among directly comparable alternatives, such as spending priorities on the budget and candidates running for a given office. A strong definition of rationality holds that if person prefers alternative A to alternative B and alternative B to alternative C, then he or she, in turn, prefers alternative A to alternative C. (For a more complete discussion of concepts of rationality, see Brady and Ansolabehere (1989).)

If individuals cannot order alternatives that are immediately comparable, they likely do not possess more general belief systems.

Do individuals reason consistently? Some observers deny this basic conjecture of rationality, citing the low correlations across issue items in national surveys and low correlations in responses to specific items over time (Converse 1964). Response instability, however, might reflect problems with question wording, rather than actual inconsistencies in people's opinions. (The literature on measurement problems and response instability is lengthy. Zaller (1992, Chap. 4) provides an excellent discussion of such problems).

A more appropriate approach to measuring and testing rationality uses a strong definition of consistency. A number of researchers have designed survey instruments that offer people pairs of choices, among multiple choices. For example, for the alternatives A, B, and C, the survey would ask people their preferences between A and B, between B and C, and between A and C. The answers to all possible combinations of pairs are, then, combined to examine the ability of people to sort the alternatives in a way consistent with some underlying structure of well-ordered preferences. In psychometrics this question-wording technique is known as paired comparisons. Studies of primary election candidates (Brady and Ansolabehere 1989), taxing and spending priorities (Hansen 1998), and national defense strategies (DeNardo 1995) show high degrees of individual rationality. Use of paired comparisons to study attitudes about public policies is relatively new, and much wider use of the approach is in order for measuring the consistency and structure of preferences.

2. *Individual Belief Systems*

The idea of issue constraint posits that individuals use general rules in their thinking about politics. They apply their own general conceptions of justice and the public good to each new issue they encounter. As a result, an individual's preferences on one topic constrain preferences on other topics, problems or policies. Do individuals use principles or rules, or logic that they apply across issues, such as standards of fairness, or do individuals reason about each issue differently?

There is considerable debate about whether individuals have belief systems, or instead have preferences that are specific to given social problems. Research on learning and on partisanship is broadly consistent with the notion that individuals have belief systems: individual people do interpret political communications through partisan or ideological lenses (Berleson et al. 1954, Zaller 1992). However, it is difficult to say whether such behavior reflects the use of principles in reasoning about politics or other causes, such as habitual behavior.

The theoretical difficulties lie in establishing the bases for general political beliefs and distinguishing them from factors that are specific to certain domains. Specifically, do people reason in a consistent way regardless of which interests are at stake?

The search for a few basic principles that people use has proved difficult. Various schools of thought posit different foundations for people's beliefs. Beliefs, for example, may be structured entirely around social institutions and attitudes of tolerance (Herbert McClosky (1964) goes so far as to tie these beliefs to personality types).

Beliefs may also be structured around economic interests, such as income or class (a classic expression of the foundation of belief systems in economic interests is Downs (1958)).

One particularly important conjecture derives from social contract theory. Every society embraces a set of principles on which consent is based. Political scientists in the middle of the twentieth century, for example, posited that Americans adhere to three principles—commitment to majority rule, to equality of opportunity, and to individual liberty (minimal government)—and applied these principles to specific policies. The give and take in politics is over the interpretation of the terms and how conflicts among these principles are resolved. (McCloskey and Zaller (1984) provide an excellent discussion of the basis for the American creed. For dissent about the basis of consent about fundamentals, see Prothro and Griggs (1960) and Dahl (1961 Chap. 28).)

Racial politics has served as the locus for the most intense debate over the notion that individuals have stable, general belief systems. Research by Donald Kinder and others suggests that individuals expressed preferences about public policies, such as jobs programs and school funding, depend on which racial groups those programs are perceived to benefit (Kinder and Sanders 1996). Paul Sniderman and his collaborators argue, contrary to Kinder and others, that people use general principles about fairness and the authority of government in thinking about politics that affect specific groups. Among other things, Sniderman and his colleagues demonstrate that racially intolerant 'liberals' can be prompted using political statements to support more tolerant positions, whereas racially intolerant 'conservatives' cannot (Sniderman and Carmines 1997). How much racial differences undercut the power of more general ideological belief systems remains a hotly debated question, with fundamental implications about whether people reason about public issues using general principles or rely on specific interests and stereotypes.

How survey researchers elicit beliefs when sensitive matters such as fairness and race are involved raises a troublesome set of methodological concerns. Sensitive matters may lead to biased answers. Individuals may wish to give the 'correct' response to a survey question because of social stigmas associated with certain attitudes. Looking across questions, people may exhibit more (or less) constraint than they truly have if some of the survey questions are corrupted by response biases. The challenge is to develop unobtrusive measures of preferences that will allow researchers to separate specific interests and stereotypes from general principles or beliefs. This remains a substantial methodological challenge.

3. *Aggregate Constraint*

Ideology, or more generally the notion of issue constraint, is useful to the extent that it allows people to sort out the political beliefs of those involved in politics in some simple way, say, from liberal to conservative. Shorthand assessments of politics are extremely common. The Americans for Democratic Action, the American Conservative Union, and many other interest groups publish annual ratings of legislators, which rank politicians from 0 to 100 according to legislators' consistency with the groups' ideology. Survey research organizations and interest groups publish similar classifications of voter 'types' based on clusters of answers to questions, ranging from abortion to zero-based budgeting. In fact, several public interest groups wishing to improve voter decisions offer simple on-line questionnaires that allow people to evaluate their own 'ideology' and compare it with the candidates' (e.g., GoVote.Com (www.govote.com)).

A central question for political scientists who analyze ideology is whether politics boils down to one dimension or multiple dimensions. The greatest degree of aggregate issue constraint is provided by positing one dimension; that is, everyone sorts out along a continuum from one extreme (say, liberal) to another (say, conservative). The least degree of aggregate constraint is when every issue differs so the number of dimensions over which people take differing political stances equals the number of issues on the public agenda. For social choice theory, larger numbers of dimensions create analytical difficulty and lead social scientists to the conclusion that institutions that constrain the political agenda and thus open political discourse are needed.

What does the dimensionality of politics look like? The most intensive study of the subject has been of roll-call votes in the US Congress. The US Congress typically takes over 1,000 roll-call votes each year covering hundreds of different policy concerns and issues. Using statistical scaling techniques, political scientists analyze the correlations across all roll call votes to determine how many different factors describe the behavior of legislators. (Two different techniques have been developed expressly for this purpose and are widely used by congressional scholars. Poole and Rosenthal (1997) use a nonlinear maximum likelihood technique, which assumes probabilistic voting and normal probability distributions for each vote. Heckman and Snyder (1997) assume probabilistic voting in a spatial model with uniform probabilities, which implies a linear factor analysis model with boundary constraints.) The number is very small,

possibly just one. One factor dominates congressional roll call voting, and it is most strongly distinguished by legislators' votes on important economic issues, such as taxation, Social Security, education, welfare, and the minimum wage.

This factor explains seven times more of the variation in roll-call votes than any other factor. Other, much less important dimensions, tap conflicts over civil liberties and international relations. In the 1950s 1960s, and 1970s, race served as a much stronger second dimension of conflict in American politics; it has since been subsumed by the first dimension. (For details on the dimensionality of Congress, see Poole and Rosenthal (1997) and Heckman and Snyder (1997).)

Studies of aggregate constraint among the public have been limited by the nature of the survey enterprise. The costs of interviewing large samples within legislative districts or asking detailed questions about dozens of policies are prohibitive. However, within the present limitations, only a handful of dimensions typically appear, with the main dimension tapping attitudes about the economic authority or size of government. A fundamental conjecture of representative politics is that elected officials are responsive to the citizenship. This general idea has been applied to questions of issue constraint. Do elected officials show the same sort of issue constraint on their beliefs that the public exhibits? This question has proved incredibly hard to study, owing to the enormous cost of doing extensive elite and mass surveys. Many studies of this question suggest that the degree of constraint differs between the elite and mass levels and that the degree of agreement between elites and masses varies across issues. In his classic article 'On the nature of mass belief systems,' Philip Converse (1964) documented significantly lower correlations across issues among the masses than among elites, and suggested that people with higher education levels exhibited higher degrees of constraint. It is unclear whether there is much association, then, between the belief systems of mass publics and the belief systems of elites.

Evidence of responsiveness or aggregate constraint comes, again, from the US Congress. A number of important studies have attempted to measure the responsiveness of elected officials to voters by associating roll-call voting behavior with mass attitudes. Political scientists have found strong association between district ideology, proxied by presidential vote, and roll-call voting behavior (e.g., Ansolabehere et al. 1999). Perhaps the most striking evidence of linkages between mass beliefs and elite beliefs and behavior comes by taking a broader historical perspective. Over time, the policies embraced by the courts, Congress, the President, and the electorate move strongly together. Across a wide range of concerns on the public agenda, as the populace moved to the left from the 1950s to the 1960s, so too did American institutions and policy, and as the populace moved to the right in the 1980s, so too did institutions and policy (Mayhew 1991). Without settling who—masses or elites—moved first, these broad historical patterns provide strong evidence of important issue constraint in American politics.

Despite empirical concerns about the degree of issue constraint in public thinking, ideology remains a central organizing principle for political science. The reason is parsimony. For observers of politics, ideology is a useful shorthand; for voters, who have to sort out complicated choices, it may be essential.

Issue Evolution in Political Science

Issue evolution refers to a model of partisan change in which issue competition among political elites gradually leads to a transformation in mass party alignments along the issue dimension. There are two characteristics that distinguish this model of partisan change. The first is the prominent role played by elites. Unlike most models of elite–mass linkage political elites are not seen as merely responding to the demands of the mass electorate but as shaping and establishing the reputation of political parties on a political issue. The masses are seen as eventually reacting to these elite cues (MacDonald and Rabinowitz 1987, Zaller 1992). However, since it takes time for parties to establish a reputation on a political issue and for citizens to perceive and act on this difference between the parties, mass partisan change typically occurs gradually over a lengthy span of time. Ultimately, the transformation of mass party alignments occurs when the issue moves current voters to change their partisan identifications and biases the recruitment of new partisans.

1. *The Standard Model of Partisan Change: The Critical Election Perspective*

The standard model of partisan change was provided by V. O. Key in the 1950s (1955). His model of critical elections postulates that dramatic events can quickly transform the fortunes of political parties, leading to a realignment during the course of a single election. His account seems to fit almost perfectly the New Deal realignment. The Republicans, ascendent in national politics since the 1860s, were held responsible for the Great Depression and, as a result, millions of voters deserted the 'Grand Old Party' and became Roosevelt Democrats during the 1932 presidential election. The New Deal realignment thus seems to be a case of partisan change that was both dramatic and quickly realized, resulting in the rapid replacement of an old majority party by a new one.

1.1 *Criticisms of the Standard Model*

Key's model of critical election realignments, especially as amplified in Burnham's *Critical Elections and the Mainsprings of American* Politics (1970), became the standard framework for understanding changes in the US party system. Despite its popularity and influence, however, several major criticisms have been directed at the critical election realignment perspective. In the first place, it has been impossible to specify exactly what constitutes a critical election. This vagueness has led to claims of realignment for virtually every recent presidential election (Bass 1991). The generalizability of the theory has also been questioned since it is difficult to build a general theory based on a single historical case (Carmines and Stimson 1989, Silbey 1991). Finally, it has been argued that the critical election perspective overemphasizes short-term partisan change, while neglecting more gradual changes that extend over a long period of time (Carmines and Stimson 1989).

2. *The Issue Evolution Model*

Carmines and Stimson (1981, 1986, 1989) have developed an alternative model of partisan dynamics which they refer to as issue evolution. Unlike the classic realignment model, it presumes that most partisan change occurs gradually and incrementally over a lengthy span of time, unfolding over several elections and perhaps decades instead of a single election. At no single point in time is partisan change necessarily striking but its culmination through time can leave an indelible imprint on the party system.

Most issues, according to Carmines and Stimson, lack the capacity to generate significant partisan change. This is because most issues either reinforce the existing party alignment, never capture public attention, or have effects that are entirely short term. It is only those relatively rare issues that transcend these limitations that have the capacity to lead to fundamental and permanent change in the party system. In other words, an issue evolution only occurs when a new issue emerges that cuts across the existing party–issue alignment, captures the public's attention for an extended period of time, and cannot be resolved in the normal policy-making process.

Carmines and Stimson (1980) put particular emphasis on the amount of cognitive processing required to deal meaningfully with a political issue as a critical dividing line between those issues that can and cannot lead to issue evolutions. Issues that are complex, technical, and obscure are not good candidates for issue evolution. Instead, if issues are to transform mass party alignments, they must be able to be understood at a 'gut' level, engaging the raw emotions of the citizenry.

Two basic aspects of an issue evolution are its structure and sequence.

2.1 *The Structure of Issue Evolution*

There are two main actors in issue evolution: partisan elites and the mass electorate. Partisan elites include presidents, members of Congress, candidates for major political offices, as well as delegates to the nominating conventions. A party's position and reputation on a political issue is established through the public acts and pronouncements of their elites. When

a president sets out his position on an issue in the State of the Union Address or when senators express their opinions on an issue through their roll call votes, they are helping to build the position of their party on a given issue. When this process is repeated over time and in different political arenas, the party establishes a reputation on the issue.

A party's reputation on the issue, in turn, serves as a partisan cue to the mass public.

But why do elites of different parties adopt contrasting positions on at least some political issues and how does this process begin? Riker (1982) suggests a plausible answer. A political party, finding itself temporarily in the minority, always has an incentive to defeat the majority winning party and, according to Riker, political issues are a natural vehicle for this purpose. New issues—if they can split the coalition of the majority party and are sufficiently attractive to the electorate—can turn old losers into new winners (and old winners into new losers) (Carmines 1991). Thus, for Riker, losing minority parties always have an electoral incentive to adopt distinctive positions on new issues in their never-ending quest to upset the current status quo. Riker's logic can also be applied to minority factions within majority party coalitions. For example, the new left operating within the majority Democratic coalition appealed to anti-war forces and those on the left on the new moral and cultural issues of abortion and gay and women rights to help it take control of the party in 1972 (Layman 2001). The point is that it makes sense for losing and disadvantaged political elites to develop and advertise new issue proposals in an effort to improve their public standing and gain political leverage.

The other major group in the issue evolution process is the mass electorate. The political masses are not only less active in the political process than elites they also have no particular incentive or capacity to create new issue alternatives themselves. Their key role in issue evolution is to respond—or, more frequently, fail to respond—to the issue cues of party elites. Moreover, even when the citizenry does respond to elite issue cues, it does not do so instantaneously. Instead, the response is gradual, delayed, inert.

2.2 *The Sequence of Issue Evolution*

According to Carmines and Stimson's model of issue evolution, changes in elite partisan behavior do not lead directly to mass partisan response. Rather, two intervening steps are necessary to link elite policy shift to mass issue realignment. First, the mass electorate must perceive a difference in the issue positions of the parties. But awareness of party differences on an issue, by itself, is not likely to lead to mass issue realignment. Citizens must care about the issue. The changed perceptions of the parties on the issue must carry with them a strong dose of affection and disaffection for the parties if they are to overcome the stubborn inertia of existing partisan identifications (Campbell et al. 1960). Only when these two intervening conditions are met—clarified mass cognitive images of the parties and polarized affection toward them—will issue reorientation among partisan elites lead to changes in mass issue alignment.

Time ordering is critical. That is, the issue evolution process should follow a specific temporal sequence with changes in the cognitive and affective images of the parties occurring after elite reorientation on the issue but before mass partisan response.

3. *Illustrations*

What partisan changes have been illuminated by the issue evolution model? Three cases of issue/partisan change in contemporary US politics have been examined through the lens of issue evolution.

3.1 *Racial Issues*

Carmines and Stimson (1989) offer a detailed account of racial politics in mid-twentieth century America as an example of issue evolution. Historically, Republicans—the party of Lincoln—had a more progressive racial tradition than did the Democrats with their support first of slavery and later of segregation. But during the 1950s and 1960s their positions on race became reversed. The Democrats became the party of racial liberalism while the Republicans became the party of racial conservatism.

Carmines and Stimson show that this partisan transformation on race closely followed the model of issue evolution. In the first place, the change was gradual and incremental, unfolding over several decades instead of within a single critical election. Through an analysis of presidential speeches, party platforms, and congressional roll-call votes, they also demonstrated that partisan elites altered their racial positions years before mass partisans reversed their positions. There was strong evidence, in other words, that elites initiated the issue evolution on race. Finally, the racial issue case follows the sequence of changes postulated in the issue evolution model. The process began with reorientation among partisan elites and ended with mass issue realignment but bracketed between this beginning and ending was the electorate's increasingly accurate perceptions of the parties' racial positions and polarized affections based on them. All in all, the partisan transformation of racial issues fits the issue evolution model extremely well.

3.2 *Abortion*

Changes in the abortion issue during the 1980s and 1990s provide another example of an issue that has undergone a partisan evolution, according to a study

by Adams (1997). Examining roll-call votes in the House and Senate, Adams shows that Democrats and Republicans were only moderately divided over abortion throughout the 1970s. But, beginning in the early 1980s, the difference between these partisan elites grew steadily during the next 15 years. By the mid-1990s, congressional Democrats clearly had adopted the pro-choice position just as Republicans had become overwhelmingly pro-life. This change unfolded gradually and incrementally over a two-decade period, a pattern predicted by the issue evolution model.

Mass partisans have also become more polarized on abortion during this period, as Adams demonstrates through an analysis of public opinion polls. Throughout the 1970s, and up until the mid-1980s, Democrats, in the aggregate, were actually more pro-life than Republicans. But during the 1990s a partisan shift occurred, resulting in Democrats becoming significantly more pro-choice than Republicans.

Adams shows, finally, that there is likely a causal connection between the elite and mass changes, with elite level changes producing mass level responses. Not only did the shifts in abortion attitudes occur earlier among partisan elites than among the partisan masses but the degree of issue polarization is sharper and more pronounced in the former than the latter.

In sum, in every major regard, abortion is consistent with the issue evolution model. Issue polarization gradually develops among both partisan elites and masses and as the issue cues of partisan elites become clearer and more distinct over time the partisan masses respond more readily to them. The process culminates in a mass issue realignment.

3.3 The New Religious Divide and Moral and Cultural Issues

In *The Great Divide: Religious and Cultural Conflict in American Party Politics* (2001) Layman provides a comprehensive account of how the new traditionalist–modernist cleavage in American religion has come to shape the contemporary American political party system, the extent to which the religious and cultural divide between the Democratic and Republican parties has grown over time, and the process through which this growth has occurred. Similar to Carmines and Stimson's discussion of the types of issues capable of creating issue evolutions, Layman contends that the traditionalist–modernist religious cleavage came to affect party politics because it is associated with political issues that are easily understood, arouse strong emotions in a large number of people, reflect a deep-seated social conflict, cut across the lines of party conflict that existed in the 1970s, and appealed to the strategic incentives of certain groups of politicians within both parties.

He draws on the issue evolution framework to develop a model of the process through which polarized stands by party leaders on cultural and moral issues such as abortion, gay rights, and the role of women have been translated into changes in the religious composition of the parties' coalitions. Party activists have played a significant role in making this connection by sustaining and extending elite polarization and by providing cues to an inattentive public about the nature of issue change at the elite levels of party politics. The mass electorate gradually responded to elite- and activist-level change by first adjusting its perceptions of and affect toward the parties, and ultimately by reshaping its partisan ties along traditionalist–modernist religious lines.

Layman's research shows that the process of partisan religious change generally has followed the patterns predicted by the issue evolution model. It began among party elites and activists and activists also provided the link between elite-level issue change and the response by a relatively inattentive public. Over time, the mass public has come increasingly to see differences in the positions of the parties on cultural and moral issues and to care about these differences. These changes in mass perceptions of the parties and affect toward them have led ultimately to a substantial shift in the religious and cultural composition of the parties' coalitions.

Issue Networks: Iron Triangles, Subgovernments, and Policy Communities

Studies of issue networks and other forms of networks examine the relationships between interest groups and the state. As political scientists analyzed policy making, they found that simple models of representative government in which only elected officials and political parties took decisions and had a clear, coherent overview of policy across government were inadequate. Instead, interest groups were active participants in decision making and implementation, building up close relationships with elected and unelected officials. Policy making was fragmented, with differing participants and relationships in each segmented policy field.

1. *Early Development*

Initially, in the 1960s and 1970s, there were two distinct views of the relationships between interest groups and officials. 'Iron triangles' and 'policy communities' suggested that very closed 'subgovernments' of stable participants in long-term relationships effectively made policy in well-delineated policy fields such as agriculture or defense. In the USA, 'iron triangles' were composed of the interest groups active in a particular policy field, members of Congress (especially those sitting in the relevant committees) and officials (particularly unelected) in the relevant parts of the bureaucracy with powers in the field. These actors knew each other, were in constant interaction, and exchanged concessions, advantages, and information. They were a closed group, able to exclude outsiders. The concept of 'policy community' was used and developed in studies of Britain from the 1970s onwards (Jordan 1990). Policy formation was argued to be segmented into subsystems composed of policy communities of civil servants from government departments (or units within them) and interest groups. They were built on exchange relationships and a sense of 'community,' and possessed a set of dominant values (Richardson and Jordan 1979). Both iron triangles and policy communities paid close attention to interest groups with powerful and continuing material interests, the basis of exchange relationships.

The concept of 'issue networks' was developed by Hugh Heclo in opposition to the 'iron triangles' literature in the USA, which he argued monopolized attention on closure and subgovernments, but ignored forces for fragmentation and the development of new forms of interest groups (Heclo 1978). An issue network consists of a large number of issue-skilled 'policy activists' drawn from conventional interest groups and sections of the government, together with academia and certain professions but also comprising expert individuals regardless of formal training. Participants are constantly changing, and their degree of mutual commitment and interdependence varies, although any direct material interest is often secondary to emotional or intellectual commitment. No-one is in control of the policies and issues covered by a network and it is very difficult to identify clearly the dominant actors.

Neither policy communities nor issue networks offered a free-standing, developed model of policy making (Thatcher 1998). Rather, they represented enriching metaphors and useful concepts that were empirically applicable, and provided counterbalances to previous well-established views of policy making. They encouraged disaggregated analysis and drew attention to the effects of the fragmentation of government into subsystems, the interdependence of government and interest groups and increased specialization in policy making. However, issue network, iron triangle, and policy community literatures suffered from several limitations: they covered only specific categories of relations between groups and officials; they omitted key aspects of policy making, such as ideas, the distribution of power among actors, and change; and the factors explaining the emergence of different types of issue network or policy community remained general.

2. *Network Typologies*

In the face of these limitations, more general network approaches were developed. One path involved creating typologies of networks. The concept of 'policy network' or sometimes 'policy community' became generic, covering different forms of relationship between interest groups and officials arising from variations in network characteristics. Rhodes and Marsh (1992) offer a six-category typology covering a continuum from issue networks to policy communities and based on differences in the degree of integration, membership, and distribution of resources among members. Jordan and Schubert (1992) claim that different terms for state/group relations in fact refer to

variants of networks and hence they place terms such as iron triangles, clientelism, subgovernment, policy community, and various types of corporatism and pluralism in relation to each other using three 'dimensions,' namely number of members, whether the network is sectoral or transectoral, and the level of its stability.

In extending the scope of networks, the typologists pursue more ambitious theoretical aims. They seek to relate existing different terms and categories to each other within one overarching typology in order to avoid a jumble of overlapping and confusing terms. They claim to assist in ordering and categorizing information, permitting policy subsystems to be described, classified, and compared. Explanatory aims have ranged from specifying the key characteristics of policy networks in order to allow the systematic ordering of material, linking the 'structural' features of state and society and policy making (Atkinson and Coleman 1989), and offering a 'model' of the role of interest group intermediation based on different forms of power dependence embodied in the types of network (Rhodes and Marsh 1992).

Yet network typologies have suffered from considerable difficulties (Dowding 1995). Terminological disputes over whether the generic term should be policy network or policy community have created confusion. Placing differing forms of state-interest group relations under the heading of 'policy network' has not led to a common terminological currency. As the concept of policy network/community became generic, definitions have become loose and frequently contradictory. The empirical applicability of network typologies has encountered important obstacles. Several of the 'dimensions' that form the basis of categories are difficult to operationalize, or are unlikely to generate agreement between different researchers; examples include the 'degree of integration,' 'pre-eminence,' and 'serving the interests of producers' (Rhodes and Marsh 1992). Categories are poorly defined and identifying a type of network in practice is difficult, since categories are not mutually exclusive and different types of policy network or aspects of several network types can exist in the same policy area.

3. *Interorganizational Analyses*

An alternative generalizing strategy has been to develop interorganizational analyses of networks. Drawing on social network analysis and work on interorganizational relations, they view policy making as an example of decision making by interdependent actors who engage in exchange relations (Knoke et al. 1996). Policy is seen as the product of complex interactions among actors drawn from both 'public' and 'private' sectors. Such actors are partly interdependent but also partly autonomous. They are linked horizontally without being part of a single organizational hierarchy; their relations are based on exchange, thereby producing policy networks, but nevertheless combine elements of conflict with those of cooperation (Marin and Mayntz 1991). Analysis focuses on the interaction of actors—the unit of analysis consists of the relations among network participants.

Interorganizational network analyses 'map' network structures, using qualitative and quantitative methods to reveal linkages between actors. Frequently, mathematical techniques derived from formal network analysis are used to establish the network position of actors and relationships amongst them, applying indicators/measures such as intensity of communication, reputation among network participants, or resources. Mapping networks to provide a systematic picture of linkages serves several purposes. It draws attention to the interrelations and interdependence between public and private actors. Quantification enables complex patterns to be revealed that would be difficult to find because the events studied are too numerous, vast, and/or scattered and allows comparison of networks across sectors, countries, and time periods. The most important ambition of interorganizational approaches is to offer a 'structural analysis' by looking at patterns of network relations. It is insufficient merely to analyze the attributes of individual actors, as the influence of such attributes on behavior depends on the network of relations of each actor (Emirbayer and Goodwin 1994). Instead, relations amongst actors must be studied as a whole. A structural analysis of private and public actor configurations in policy formation identifies the position of actors and the ways in which networks influence actors' capacity to use their resources. It therefore permits explicit consideration of the ways in which different structures create different mechanisms or logics in policy making.

The scope of interorganizational approaches is very broad. Thus, for example, policy network refers to 'structures' located 'beyond or between policy markets and policy hierarchies' that are composed of 'relatively autonomous action units' (Marin and Mayntz 1991). From an 'organizational state' perspective, Knoke et al. (1996) have conceived policy networks as relations linking organized interests with public officials, transforming heterogeneous communities of policy actors into webs of common benefit-seeking actors. To operationalize and apply in empirical studies, important choices must be made to narrow the scope of interorganizational networks. Similarly, applying quantitative techniques requires the choices over matters such as questions posed, categories created, the relationships to be analyzed, and variables to be controlled for. Social network analysis may embody a particular 'theoretical orientation' towards the structure of the social world, notably the need to study behavior as a set of relationships, but it provides a particular set of concepts and methods and a frame-

work for testing arguments/models rather than a substantive set of hypotheses or a specific body of substantive theory.

In response to criticisms of important omissions in the policy network literature, current research has seen diversification (Thatcher 1998). This has taken two forms. First, additional explanatory factors are incorporated into network frameworks, often with attempts to analyze changes in networks. Thus, for instance, modifications of the institutional framework within which network actors operate, the technological and economic features of a policy problem, and the ideas, values, and knowledge of network actors have been examined. Second, in search of greater explanatory power, network concepts have been linked to other models of policy making (*Journal of Theoretical Politics* 1998). Thus, for instance, using rational choice theories, networks have been analyzed as institutions, notably in their capacity to establish rules and long-lasting patterns of social relations for the interactions of actors in the policy process. They are argued to reduce uncertainty and transactions costs by aiding the creation of relations of trust that allow exchange. Ideas-based models, notably the 'advocacy coalition framework', have provided a different partner for network analyses. The effects of networks on coordination of actors under conditions of different forms of beliefs have been considered. Hence networks offer an intervening variable for the effects of ideas.

4. Conclusion: Constant Expansion

Analyses of networks have become increasingly broad: from modest origins as concepts of issue networks and iron triangles, they have expanded to overarching frameworks of relations between public officials and private interests.

Jackson, John Hughlings (1835–1911)

John Hughlings Jackson was born in Providence Green, Yorkshire, England on April 4 in 1835, of English antecedants on his father's side and Welsh on his mother's (Critchley M and Critchley E A 1998). His father was a gentleman farmer and a brewer who, as a surviving letter shows, was a wise and kindly man. Jackson's mother died aged 29 when he was one year old. He was educated at an undistinguished boarding school which he left at the age of 15, and did not go to university. In later years 'he held that by exemption from over-teaching his mind had retained more of freedom and energy than might otherwise have been the case' (Hutchinson 1925).

When Jackson left school he was at once apprenticed to a general practitioner in York. Two years later, in 1852, he enrolled at the York Medical School and in 1855 he proceeded to St. Bartholomew's Hospital in London. He qualified in 1856 and returned to the York Dispensary for three years as a resident medical officer. In 1860 he submitted a thesis (the title of which is unrecorded) to the University of St. Andrews and was awarded the MD.

By this time Jackson had returned to London. He had become increasingly interested in philosophy and seriously considered abandoning medicine for this field. He was dissuaded by his friend Jonathan Hutchinson (who later became one of the leading surgeons and ophthalmologists of his day). About this time (Hutchinson records) Jackson came under the influence of C E Brown-Sequard who 'told him strongly, that it was foolish to waste his efforts in wide observation of disease in general, and that if he wished to attain anything he must keep to the nervous system' (Hutchinson 1925). As a result, Jackson was appointed in 1862 to the staff of Brown-Sequard's hospital, the National Hospital for the Paralysed and Epileptic in Queen Square. In the same year he became a clinical assistant at the Royal London Ophthalmic Hospital (now known as the Morefields Eye Hospital) in London and in the following year he was appointed to the London Hospital. These three institutions provided him with the experience on the basis of which he made his fundamental contributions to our understanding of the organization of nervous function.

Jackson was a shy, modest, self-effacing individual, much loved by his students and colleagues. His wife died after only eleven years of marriage. A place at the lunch table was always set for him at the home of his colleague Dr. Thomas Buzzard. Jackson came to lunch irregularly and without notice. As Buzzard's son recalled, '… he would pull a chair up to the table, exchange a few remarks, perhaps tell a humorous story with only a twinkle of the eye disturbing the solemnity of his features, and after five, perhaps ten minutes he would mumble something about remembering an engagement and leave the room' (Buzzard 1934). In his last years Jackson lived an even more solitary, though serene life. He retained an interest in the lives of his pupils and their families to the end. He died on the October 7, 1911. His contribution was widely acknowledged by the academic world during his lifetime, but to the surprise of all he received no national honor.

Jackson's contemporaries and pupils recorded that he was a meticulous observer of clinical phenomena, and from his earliest days in medicine he was committed to the necessity for pathological verification of clinical inferences. His understanding of the nervous system based on this approach was molded by two main influences. The first derived from his teacher at medical school, Dr. Thomas Laycock (later Professor of Medicine in Edinburgh) who was interested in psychology and in nervous function and dysfunction. The other influence was the writings of the philosopher Herbert Spencer with whom Jackson corresponded up to the beginning of the twentieth century. It was from Spencer that Jackson derived the notion of the evolution of nervous function, which led to his idea of a hierarchical arrangement of functions, and that disease (neurological and psychiatric) led to a successive regression from the 'least automatic' and 'least deeply organised' to the 'most automatic' and 'most deeply organised' levels. As Walshe (1961) has pointed out, these ideas derived from Jackson's life-long study of five kinds of clinical phenomena: focal seizures, chorea, hemiplegia, speech disorders, and mental disorders.

A remarkable consequence of Jackson's work was his prediction, on the basis of unaided clinical observation, of a number of physiological principles which were later confirmed experimentally. One of them is the concept of localized cerebral discharges generating focal seizures, and that such focal seizures are caused by local brain disease. The comparison between the clinical symptomatology and subsequent neuropathology showed that the distribution of focal motor and sensory signs depended on the site of the

lesion. The topographical structure–function relationships laid the ground for the topological functional organization of the cortex long before cytoarchitectonic anatomical maps were established. The general idea of the functional specialization of the cortex had already been proposed by Gall (1825). His phrenology was derived from the attribution of certain personality features to the individual 'microstructure' of the scalp as inferred from palpation. Gall's postulate that cerebral function must be localized was correct in principle but based on inadequate evidence. The first real evidence came from Jackson, who published his first account of epilepsy in 1861, almost 10 years before his clinically based concept was confirmed by using electrical stimulation of the cortex (Fritsch and Hitzig 1870, Ferrier 1876).

The first pioneers of cortical neurophysiology indeed recognized the pivotal role of Jackson in the development of the concept of epileptogenic discharges in distinct areas generating focal seizures as the following two quotations show: '… I was precisely the first one, now some thirty or more years ago, to confirm by *physiological experiment* and to define more closely that which Hughlings Jackson had concluded from clinical facts' (Hitzig 1900); '… Dr. Hughlings Jackson who from a clinical and pathological standpoint anticipated many of the more important results of recent experimental investigation into the functions of the cerebral hemispheres… (Ferrier 1886).

Another concept put forward by Jackson related to the effect of lesions on function. In order to understand the pathophysiology of the effects of lesions he introduced the term 'negative and positive elements.' The negative elements were derived from the more global effects of epileptic seizures as apparent from dreamy states and the loss of consciousness. This was regarded as a dissolution 'of so many nervous elements of the highest centres' by the epileptic discharge, so that the 'most special and complex sensorimotor arrangements' would affect the adjustment of the organism as a whole to the environment. Convulsions were recognized as due to excessive neuronal discharge. From his clinical observations Jackson deduced that 'there are two ways in which nerve tissue suffers. It may be destroyed, and then there is loss of function. It may be unstable, and then there is disorder of function—'discharge' (Jackson 1931, Vol. 1, p. 29).

The 'positive element' was exemplified by speech disturbances, where the inability to express oneself demonstrates the negative effect of a brain lesion, whereas the paraphasia—the insertion of wrong words or inadequate sentence formations—would show the effect of the damaged part on the function of the remaining neural circuitry. These views later inspired Sigmund Freud's contributions to aphasia, in particular his early insight into the emotional determinants of speech disruptions. The positive and negative elements also had an impact on subsequent hypotheses on psychotic disorders.

Jackson's explanation of the clinical deficits associated with lesions was based on his view of the three levels in the evolution of the nervous system. Each element of each level was seen to contain a complete representation of the next lower level. Consequently, each element of the middle and highest levels would contain a representation of the entire body. If the nervous system is damaged the clinical impairment is not due just to the damaged part, but represents the compensatory action of the lower level circuitry that would then partially compensate for the function of the destroyed tissue.

The concept of evolution of the nervous system was therefore instrumental to his view that dissolution of the nervous system due to the effects of lesions results from the function of the remaining, nondamaged parts being liberated from control by the damaged part. This approach to understanding the pathophysiology and nature of the neurological signs and symptoms was later replaced by 'localizationists' who considered these to be deficits in a mechanical framework, i.e., saw them as loss of function of the destroyed tissue. It soon became clear that phenomena like spasticity, tremor etc., could not be explained in this way. With the advent of new, experimentally-based conceptions of the brain as a complex, densely interconnected and re-entrant network, the Jacksonian views were basically confirmed.

Jackson's contribution was not limited to the conceptual advances we have described. His skill in precise clinical observation, together with his analytical and deductive powers, led to advances of practical value in clinical neurology. For example, he was one of those who pioneered the introduction of the Helmholtz ophthalmoscope to medicine, his first paper on the topic appearing in 1863. His papers of 1871 and 1873 on 'optic neuritis' from intracranial disease, and the diagnosis of brain tumours, represented a major advance. He made contributions to neuro-ophthalmology, particularly in relation to eye movement, and to the effects of syphilis on the nervous system.

The writings of Jackson have a reputation for being difficult to read, being filled as they are with qualifications in the text and in extensive footnotes, as he strove to get as close as possible to the truth about inherently complex problems; they are still illuminating. Many appeared in *Brain* (of which he was a cofounder) but many others appeared in journals which are now difficult to obtain. Fortunately a comprehensive selection was published in 1931 and reprinted in 1958.

Jakobson, Roman (1896–1982)

Roman Jakobson was one of the major linguists, literary theorists, and semioticians of the twentieth century. He contributed to linguistics such concepts as feature, binary opposition, markedness, redundancy, and universals. He also showed the importance for linguistics of child language acquisition, aphasia, poetry, the act of communication (language usage), the meaning of grammatical categories, and the systematicity of language change. And he pointed out the relationship of linguistics to semiotics, cultural anthropology, literary studies, neurology, and so forth. (Most of Jakobson's work is reprinted in his *Selected Writings*. For a one-volume introduction to his work in linguistics, see his *On Language*. For more detail and further bibliography for this article, see Waugh and Monville-Burston 1990.)

1. Brief Overview of Jakobson's Life

Jakobson was born in Moscow on October 11, 1896 and died in Cambridge, Massachusetts on July 18, 1982. While still a student he helped to found the two groups known now as Russian Formalism. The Formalists called for an immanent analysis of literary works, with a focus on the properties that distinguish literary material from any other kind. In 1920, Jakobson went to Prague and in 1926 helped to found the Prague Linguistic Circle, the cradle of (functional) structuralism. For the Prague School, language serves for communication and thus its internal structure has to be studied from the standpoint of the tasks it performs. Jakobson first coined the term structuralism in 1929 as a cover term for this viewpoint and was a leading proponent of this highly influential twentieth century trend in linguistics and in many allied humanistic, social, and behavioral fields.

In 1939, Jakobson fled the Nazis and in 1941 went to the USA. He taught at the *Ecole Libre des Hautes Etudes*, New York, from 1942–46 and in 1943 he began teaching at Columbia University. In 1949, he obtained a professorial Chair at Harvard University. From 1957 on, he was also Institute Professor at MIT. He was President of the Linguistic Society of America in 1956 and received the International Prize for Philology and Linguistics in 1980 and the Hegel Prize in 1982.

2. Structural Phonology, Child Language, and Aphasia

During his Prague period, Jakobson and fellow Russian linguist Nikolai Trubetzkoy argued that phonological systems are structural wholes, which have to be studied in terms of their relational properties, and that language change has to be seen in terms of systems (see *Phonology*). They investigated types of phonological systems (see *Linguistic Typology*) and established the study of linguistic affinities between languages (*Sprachbunde*)—how languages that are geographically and culturally related may acquire traits in common (see Jakobson 1971a).

During this time Jakobson also turned his attention to the acquisition of phonology by children and its dissolution in aphasics. His monograph—*Child Language, Aphasia and Phonological Universals* (Jakobson 1941)—demonstrated that the order of acquisition follows the laws of typology: from universal to nonuniversal, unmarked to marked, simple (optimal) structures to more complex ones. He also showed that aphasic loss follows a reverse order.

3. Theory of Distinctive Features and Functional View of Sound

In his American period and with the aid of advances in acoustic phonetics, Jakobson developed his famous theory that phonemes such as /t/ and /d/ in *ten* and *den* and /b/ and /m/ in *bat* and *mat* are not the ultimate (smallest) constituents of language. Rather, the distinctive features are: the smaller properties of

sound by which phonemes are differentiated from each other. For example, /t/ is differentiated from /d/ as unvoiced (voiceless) vs. voiced in many languages, and /b/ from /m/ as oral (nonnasal) vs. nasal. Jakobson also defined a small set of such (acoustic-perceptual) features that underlie the phonological systems of all the languages of the world (Jakobson et al. 1952, Jakobson and Halle 1956, Jakobson and Waugh 1979). He also showed the relevance of these notions for grammatical meaning, which he decomposed into semantic features (see Jakobson 1984).

Influenced by communication (information) theory and cybernetics, Jakobson explored more deeply the function of language for communication. He insisted, in particular, that all facets of the speech sound have a function (Jakobson and Waugh 1979): while distinctive features differentiate between words which are different in meaning, redundant features serve to support and enhance the distinctive features (see *Phonology*). Other features may show the boundaries of words (configurative), inform about the attitude of the speaker (emotive), or indicate the age, sex, and social class of the speaker (physiognomic).

Since distinctive and redundant features have no positive content, but all other types of signs in language do (including words and sentences), there are two types of signs in language; and language and the genetic code are the only systems to have this kind of structure. This differentiation led to a new dichotomy for language (see Jakobson and Waugh 1979, Jakobson 1980): mediacy (elements with an indirect relation to meaning, such as distinctive features) vs. immediacy (direct relation between sound and meaning: phenomena such as sound symbolism, synesthesia, glossolalia, and mythic, poetic, and magical uses of sound. In many cases of mediacy, there is an iconic (nonarbitrary) relation between sound and meaning (see also Jakobson 1966). This dichotomy is also related to the hemispheres of the brain (left vs. right, respectively) in Jakobson (1980).

All of the feature types together represent the entire makeup of a sound and there is nothing that is pure sound (Jakobson and Waugh 1979). Consequently, the oppositions traditionally made between linguistic and nonlinguistic, abstract and concrete, functional and nonfunctional, (phon)emic and (phon)etic are inappropriate.

4. *Invariance and Relational Structure*

Invariance was, for Jakobson, the dominant topic and methodological device underlying his research: any sign is defined by invariant properties, which differentiate it from the other elements in the system of which it is a part. Across languages too, he also insisted on the importance of universal invariants (language universals), establishing the equivalence of diverse signs. In addition, he correlated invariance with contextual variation: any sign evidences variation as it enters specific contexts. Contextual variants are not equal, but hierarchized: some are more basic, others more marginal. Invariance and variation apply to the *signans* (e.g., variation across phonemes) and the *signatum* (e.g., the semantic properties of the case and verbal systems of Russian (see Jakobson 1984). In semantics, by incorporating invariance (context-independent meaning, general meaning) and variation (context-specific meaning, polysemy, reference), he gave the basis for a rigorous semantics.

Invariance for Jakobson was always invariance in relationship (equivalence); and the primary type of relation in language is that of binary opposition, phonological (e.g., nasal vs. oral), grammatical (e.g., singular vs. plural), or lexical (e.g., near vs. far), etc. (see Jakobson 1971a, 1971b, 1987, Jakobson and Waugh 1979). Such binarism is based on an asymmetry in the relationship between a marked (focused or weighted) and an unmarked (neutral) term, for example, marked nasal, plural, near vs. unmarked oral, singular, far). For Jakobson, markedness is a fundamental way by which we organize not just language, but cultural systems in general (see *Linguistics: Markedness*).

5. *Functions of Language*

For Jakobson, the *raison d'être* for language is communication and language is suited to various communicative goals, which in turn are correlated with the act of communication in which language is used. In his famous article, *Linguistics and Poetics*, he defined the six primary factors of any speech event: (a) speaker, (b) addressee, (c) context (including the thing referred to), (d) message (*parole*), (e) code (*langue*), and (f) contact (medium) of communication. In conjunction with these, he then defined the functions of language in terms of a focus in the message on one of the factors: (a) emotive function (focus on the speaker), for example, intonation showing anger; (b) conative function (focus on the addressee), for example, imperatives and vocatives; (c) referential function (focus on the context), for example, talk about the real world; (d) poetic function (focus on the message), for example, poetry; (e) metalingual function (focus on the code), for example, definitions of words; and (f) phatic function (focus on the contact), for example, 'hello, do you hear me?' These functions may be dominant in a message or may be subsidiary, for example, a referential message may carry expressive information about the opinion of the speaker.

6. *Metaphor and Metonymy: Similarity/Contiguity*

In 1956, Jakobson published his famous *Two Aspects of Language* where he analyzed the relation between communicative processes and properties of linguistic

structure. First, he distinguished the two fundamental operations: selection (substitution) for encoding (production) and combination for decoding (comprehension). Then, he contrasted two types of relations: similarity (all types of equivalence) and contiguity (temporal and spatial neighborhood), and said that they underlie the two operations. Put simply, the elements in a selection set are normally associated by similarity, and those in combination by contiguity. Since in aphasia, the normal patterning of speech is disturbed, Jakobson proposed that these factors be used as a way of categorizing types of aphasic disturbances (see *Aphasia*).

For Jakobson similarity/contiguity is a fundamental polarity of language, texts, culture, and human thought (cognition) in general. He used it for much of his work in semiotics of the cinema and music. He also used it to refine his definition of the poetic function (1960): in poetry, where focus on the message is dominant, equivalence (similarity) relations are used to build the combination rather than only to underpin the elements of the selection set. Thus, rhyme, alliteration, parallelisms, metaphor, etc. help to structure the poetic text, whereas in prose contiguity is the essential constructional principle.

7. Grammar

Jakobson also focused on the function of grammatical categories. His famous article on *Shifters* (1957) focuses on those elements whose general meaning in the code can only be specified by taking into account their use in messages, because the codal meaning includes information about particular elements of the speech event. For example, deictic pronouns designate speaker (I) and addressee (you). Thus, language encodes pragmatic factors of the context of utterance and linguistics necessarily includes syntax, semantics, and pragmatics (see *Deixis*; *Pragmatics: Linguistic*).

Grammatical categories (both morphological and syntactic), for Jakobson, are defined as those which are obligatorily present in the construction of acceptable messages (1959a, 1959b), whereas particular lexical categories (e.g., words referring to space) are optional. Through this view of grammar, Jakobson provided a semantic and operational approach to the relation between language and cognition: grammatical categorizations provide the necessary patterns of thought.

Jakobson was also inspired by Charles Sanders Peirce's notion that the essence of a sign is its interpretation, that is, its translation by some further sign. Henceforth, he defined the *signatum* as that which is interpretable or, better, translatable (Jakobson 1959b) by a potentially unlimited series of signs (see *Interpretation and Translation: Philosophical Aspects*). He characterized the Peircian approach as the only sound basis for a strictly linguistic semantics.

8. Jakobson's Legacy in Linguistics and Allied Disciplines

Jakobson's influence on twentieth century thought was considerable and many of his contributions have become a permanent part of American and European views of language. He has had such a towering role in linguistics that his work has defined the field itself (see *Linguistics: Overview*). Many of Jakobson's concepts and discoveries are now so deeply ingrained in the theoretical basis of modern linguistics that they are thought to be commonplace or self-evident. This discussion will consider, in particular, his influence on linguistics in the last quarter-century and later offer some brief notes on other disciplines. (For more details of Jakobson's influence, see Waugh and Monville-Burston 1990.)

8.1 Influence on Linguistics

Jakobson's view of language as a relational whole and a communicative tool with many functions opened the door to functionalist approaches more generally and abetted the development of linguistic studies that look at discourses and texts and consider their wider linguistic and 'real-world' environment (see *Functionalism in Anthropology*). His work on *Shifters* showed that grammar, semantics, and pragmatics are but different sides of the same phenomenon and aided present-day interest in pragmatics (see *Pragmatics: Linguistic*). Work in pragmatics has led linguists to explore the boundaries of their discipline with the neighboring fields of anthropology, sociology, mythology, philology, and philosophy in a truly Jakobsonian interdisciplinary spirit. His writings on grammatical meaning have inspired others to investigate the interdependence of invariance and variation, the semantics of case systems, and the interrelation of tense and aspect with syntax, discourse and the lexicon (see *Semantics*).

Jakobson's insistence that language is a complex and dynamic whole with a variety of subcodes (speech styles) helped to pave the way for the advent of sociolinguistics (see *Sociolinguistics*). The ethnography of communication has also taken its inspiration from Jakobson's multifunctional perspective on communication (see *Ethnography*). His work on the functions of language and their relation to the speech (communication) act remains central in the investigation of speech in interaction. Anthropological linguists—who adopt a functional and pragmatic perspective with an interest in folklore, poetics (oral traditions), and discourse analysis—draw on and develop the ideas of the Prague School and of Jakobson in particular (see *Anthropology*).

Jakobson stressed the need to search for general laws governing all linguistic systems and thus helped to foster the current interest in generalizations. He saw a definite equivalence between the search for ex-

planatory adequacy in generative grammar and the elicitation and interpretation of the entire network aimed at by Praguian structuralism (see *Generative Grammar*). His monograph on child language and aphasia, generally regarded as one of his most original and influential works, has been signaled as the point of departure of a new era in linguistics and has been lauded by many because it showed the relation between child language and phonology, launched psycho- and neurolinguistics, and ushered in a new focus on universal and law-governed, general (explanatory) properties of language (see *Psycholinguistics: Overview*).

The widespread movement that presently investigates universal properties of language, both universal grammar and language universals, is deeply indebted to Jakobson. When the linguist Noam Chomsky came in contact with Jakobson and worked with Jakobson's student and coauthor Morris Halle, he fully realized the explanatory power of universals and their relation to language acquisition: thereafter, he set out to determine universal constraints on the form of grammars. The other stream of research in universals, practiced by Joseph Greenberg and his associates, examines concrete materials from a great variety of languages in order to establish typological classifications and discover the general laws that underlie the structure of human language.

Many scholars agree with Jakobson that typology is important for the study of language change, areal linguistics, and historical reconstruction (see *Linguistic Typology*). His work in historical and geographical linguistics continues to be reprinted in readers in these areas. The seminal idea that changes must always be treated in view of the system that undergoes them is the essential premise for textbooks in historical linguistics. And Jakobson's view of the teleological basis for language change has been instrumental in inspiring further work (see *Historical Linguistics: Overview*).

By revealing the close relationship between developmental studies and vital questions of linguistic theory, Jakobson's *Child Language* also launched psycholinguistics. Many psycholinguists now recognize that the broad outlines of this bold synthesis continue to be confirmed. Following Jakobson's example, scholars interested in language pathology have studied aphasia from a linguistic point of view and, for many, Jakobson's distinction between similarity disorders and contiguity disorders is regarded as fundamental and firmly supported by contemporary ideas of the functional organization of the human brain (see *Psycholinguistics: Overview*; *Aphasia*). Jakobson was the first modern linguist to investigate in depth the concurrent constituents of linguistic elements. Many linguists have claimed that the distinctive feature was Jakobson's greatest insight and, after the phoneme, the most significant step forward in modern phonology. Generative phonology recognizes Jakobson as one of its founding fathers, in particular through Halle. Markedness and the correlated notion of binary opposition are now widely used in linguistics and other disciplines. Componential analysis—analyzing an item into smaller properties and representing them as a combination—was generalized as a methodological model for semantics and lexical representation and has been adopted in other approaches as a means of describing the structure of a variety of semantic fields (see *Phonology*).

8.2 *Influence on Other Fields*

Jakobson's influence on contemporary thought has also spread to disciplines such as literature, poetics, semiotics, social anthropology, mythology, and folklore. His theoretical papers *Linguistics and Poetics* and *Poetry of Grammar and Grammar of Poetry* and his analytical studies of poems by Baudelaire and Shakespeare established him as an important theoretician of literature. He is the source of not only structuralist but other contemporary trends in literary theory. He also helped to develop semiotics as a discipline in its own right and has been called the major catalyst in the contemporary semiotic reaction (see Jakobson 1973). And he is credited with introducing the American semiotician Charles Sanders Peirce to Americans and with showing them the importance of Peirce's insights. His work in semiotics has also had repercussions in fields as diverse as economics, mathematics, especially catastrophe theory, sociology, and philosophy (see *Semiotics*).

Jakobson's influence on anthropology is considerable (see *Anthropology*). In American anthropology, for example, three convergent Jakobsonian ideas have proven to be particularly fruitful: the structure of the poetic text, the closeness of ties between poetry and mythology, and the relationship between discourse and cultural context. His greatest impact, however, has been on structural anthropology, especially through Claude Lévi-Strauss, who considers himself a disciple of Jakobson and has repeatedly acknowledged his indebtedness to him. He used many Jakobsonian ideas in his work on kinship systems, cooking, folk tales, myths, and primitive thought.

With the breadth and depth of his knowledge, his brilliant imagination, his prodigious output, the originality of his accomplishments, and his international influence on a variety of fields, Roman Jakobson has been recognized worldwide as one of the major creative minds of the twentieth century.

James, William (1842–1910)

William James, American philosopher and psychologist, remains a vivid presence in psychology because of his two classics, *Principles of Psychology* (1890/1981) and *Varieties of Religious Experience* (1902/1985). His work at once embodies the culmination of nineteenth century psychology, in his critical review of the older philosophical psychology and of the new experimental psychology, and the launching of twentieth century psychology, especially the functionalist tradition. He is remembered in philosophy as one of the last philosophers in the grand style who also sought to communicate his insights to a broad audience, an audience attracted by the informal felicity of his writing, public lecturing, and teaching. Distinctively American in his promotion of a pragmatism that viewed abstract concepts critically in terms of their 'cash value,' he participated actively in the European intellectual scene and like his eminent novelist brother Henry James advanced the linkage of the American and European intellectual and cultural worlds.

His enduring significance at the end of the twentieth Century is reflected in the publication of definitive scholarly editions of his complete writings in 17 volumes (1975b–88) and of his correspondence (1992) of which 12 volumes were planned. As members of an unusually creative family, he and his brother Henry and sister Alice have been the subject of extensive biographical attention (e.g., Lewis 1991, Myers 1986, Perry R. B. 1935).

1. Family Background and Early Life

The James family was economically privileged. William's father, Henry James Sr. (1811–82), who had inherited a comfortable living, was a restless, questing intellectual who found inspiration in the writings of the Swedish mystic Emanuel Swedenborg. He attracted visits from the New England transcendentalists Emerson and Thoreau while William was an infant in New York City, where he was born January 11, 1842. William's education was irregular, including periods of schooling or tutoring in England, France, Germany, and Switzerland. The intense moral and intellectual climate of the family seemingly entailed severe costs in physical and mental health for William and his gifted siblings. Teasing out the sources of creativity and of pathology in the James family has challenged its biographers.

When William was 18, he embarked on the study of painting in the Newport studio of William Hunt, a prominent American artist. But he gave up painting after about 6 months, turning next to science. He pursued studies in chemistry and comparative anatomy at Harvard, and, in a smaller shift in direction, entered Harvard Medical School when he was 22. These were years of increasing doubt, depression, and psychosomatic discomfort. James interrupted his medical training for a year to take part in an expedition to the Amazon with the Harvard biologist Louis Agassiz, and interrupted it once more to spend a year and a half in Germany taking therapeutic baths and reading widely in German literature, philosophy, and science. Returning to complete his M.D. degree in

1869, he spent several years of mental distress and near collapse living with his parents.

It was during this period that, by his own account, he drew on philosophy in a turn toward recovery, as he recorded in a subsequently famous passage in his diary of April 30, 1870:

> I think that yesterday was a crisis in my life. I finished the first part of (Charles) Renouvier's second *Essais* and see no reason why his definition of free will—'the sustaining of a thought because I chose to when I might have other thoughts'—need be the definition of an illusion. At any rate, I will assume, for the present—until next year—that it is no illusion. My first act of free will shall be to believe in free will (Perry, 1935, vol.1, p. 323).

This passage heralds the theme of voluntarism that pervades his later writings, as well as suggesting roots of his pragmatic philosophy.

James's productive life began in 1873 when he was appointed instructor in anatomy and physiology at Harvard. By 1875 he was teaching his first course in psychology, in connection with which he established a teaching laboratory that, as American historians of psychology like to note, preceded Wilhelm Wundt's laboratory at Leipzig in 1879, a date often enshrined as the founding of scientific psychology. By 1878, when he was 36, he had contracted to write the textbook on psychology that was not to see publication until 1890. It was also in 1878 that he married Alice Gibbens, a teacher who shared his intellectual and spiritual interests and had spent 5 years in Heidelberg with her widowed mother. This event reflected the stabilization of his personal life and also contributed greatly to it. In the following year he offered his first course in philosophy. He was effectively launched in his dual career as psychologist and philosopher at Harvard where he remained for the rest of his life. He died on August 26, 1910, at his family retreat at Chocorua, New Hampshire.

2. *Major Themes*

Three themes pervade James's contributions to psychology and philosophy. One is his commitment to voluntarism, the primacy of human agency, which led him to reject mechanistic doctrines. A second is his continual struggle to find a place for religious spirituality as exemplified by his father in the world revealed by Darwinian science. The third, an essential ingredient in his handling of the first two, is his commitment to pluralism and openness in theorizing, as shown in his distaste for abstract systemization and in his opposition to what he saw as the absolutism of both scientific materialism and Hegelian idealism. These themes characterize James's thought throughout his career as psychologist and philosopher, but in the spirit of the third theme, paradoxical inconsistencies recur in his psychology and philosophy.

3. *James's Psychology*

In his great book, *The Principles of Psychology* (1890/1981), James presented an account of mental life in the positivistic spirit of natural science. That meant for him that speculative entities beyond experience like the soul or psychological faculties were to be avoided. He took a commonsense dualism of mind and body for granted, though he was explicit that fundamental metaphysical issues would have to be faced eventually. The principal psychological method for him was introspection, by which James mostly meant the informal and avowedly fallible self-observation that he did so well, not the disciplined and quantified introspection of the new German experimental laboratories, which he respected while noting wryly that the method 'could hardly have arisen in a country whose natives could be *bored*.' (p. 192).

3.1 *James's Functionalism*

To apply a term that emerged with his immediate American successors, James was presenting a functional psychology, in the senses subsequently intended by the Chicago functionalists. His focus was on mental processes (functioning), not on the analysis of mental contents into constituent sensory elements. Further, he emphasized the adaptive functions of psychological processes, in line with evolutionary theory. Consciousness, he proposed, emerged to organize and direct neural processes in the brain that had become too complex to be guided by a mechanistic concatenation of reflexes. His vision of scientific psychology was committed to a mind–body interactionism troublesome to both scientific materialists and philosophers.

James viewed the nervous system and the brain as organs of mind, and devoted early chapters of the *Principles* to the functions of the brain. There follows a chapter on habit, foreshadowing the later preoccupations of J. B. Watson's behaviorism. James's account of habit was primarily physiological. Currents in the cerebral cortex originating in the sense organs 'leave their traces in the paths which they take. The only thing they can do … is to deepen old paths or to make new ones. … (A) simple habit … is, mechanically, nothing but a reflex discharge; and its anatomical substratum must be a path in the system' (p. 112). From this physiological base James proceeded with recommendations for the cultivation of good habits, putting neural mechanism to voluntary use for moral purposes, a characteristically Jamesian manoeuver.

3.2 *The Stream of Thought*

If James's treatment of the brain and of habit pointed toward later developments in neuropsychology and behaviorism, his classic treatment of the stream of

thought provided a sensitive and persuasive alternative to the prevalent approaches of introspective psychology that sought to decompose ideas and images into sensory elements. For James, the proper starting point in psychology is not sensations or feelings, as in prevalent elementaristic psychologies, but the sheer fact that thought goes on. 'Every thought tends to be part of a personal consciousness,' he wrote (p. 220). Thought seems continuous but is always changing. It deals actively and selectively with objects independent of itself. The idea that thought is actively selective underlies James's later discussion of attention, which in turn provides the rationale for his treatment of will, in terms of holding a thought of action in focus long enough for the action to occur.

No two states of consciousness are ever the same. 'A permanently existing "idea"… which makes its appearance before the footlights of consciousness at periodical intervals is as mythological an entity as the Jack of Spades' (p. 230). Relationships and transitional states are given in the primary data of introspection just as directly as the more substantive states on which consciousness may momentarily 'perch.' James's views here anticipated those of the Würzburg school regarding imageless thought, and foreshadowed Gestalt psychology in their rejection of sensory elements. James's evocative term, 'the stream of consciousness,' found a place in the context of world literature.

3.3 The Consciousness of Self

Since the stream of thought is always a personal consciousness in which the objects of awareness are divided into 'me' and 'not me,' James followed his treatment of the stream of thought with a chapter on 'The Consciousness of Self' that was very influential on later scholarship. If 'I' is taken to label the person as agent and introspective observer, 'me' is the self as object of introspective observation. For the purposes of his psychology, the 'I' is simply the passing thought in the personal stream, which appropriates the person's memories of the past and anticipations of the future. The 'me' comprises a hierachy of three selves. First is the material self—one's body, clothes, and the material possessions that one regards as 'mine.' The social self, or more properly, selves, consists of the views of oneself held by others that one cares about, as one understands them. The spiritual self is 'a man's inner or subjective being, his psychic faculties and dispositions, taken concretely… the most enduring and intimate part of the self' (p. 283). These three aspects of 'me' are the focus of motives of self-seeking and self-preservation, and of self-feelings of self-complacency and self-dissatisfaction. James provided a famous 'formula' for self-esteem as the ratio of Success to Pretensions, anticipating much later research and theory about Level of Aspiration.

The distinctively human attribute of reflective self-awareness highlighted in James's treatment of selfhood was subsequently developed mainly by social psychologists in the sociological tradition, especially C. H. Cooley and G. H. Mead, but returned as a central concern of psychologist students of personality and social behavior in the latter half of the twentieth century.

3.4 Emotion

Of all the special psychological topics that James discussed, his theory of emotion evoked more notice and controversy than any other. It was known as the James–Lange theory because in the *Principles* James linked his ideas as previously published in the 1880s with similar views of the Danish physiologist Carl Georg Lange published at about the same time. James's version held that the stronger or 'coarser' emotions of grief, fear, rage and love arise from feeling bodily changes that are aroused directly by an 'exciting fact.' In contrast with folk belief, we do not weep because we feel sad; we feel sad because we are weeping. We feel fear because we are set to run away. We feel because we act.

During the first half of the twentieth century, the James–Lange theory did not fare well. In one important critique, the physiologist Walter Cannon showed in animal research that centrally mediated emergency emotional responses do not depend on feedback from the viscera, a finding that bore more critically on Lange's version of the theory than on James's. More importantly, in a period dominated by behaviorism, James's central interest in emotion as conscious feeling seemed scientifically irrelevant. With the subsequent decline of behaviorism, each of several competing treatments of emotion looked back to James as anticipating their conclusions. Paul Ekman and Carroll Izard focused on the role of sensory feedback from the facial musculature in emotional expression as crucial to the distinctiveness of felt emotions, whereas Stanley Schachter launched a cognitively focused line of research emphasizing the interpretive context in which arousing stimulation is encountered. As cognitive perspectives on human psychology developed one-sidedly, James's emphasis on the centrality of feeling became more attractive.

3.5 Other Aspects

As embodied in the *Principles*. James's psychology dealt with many other topics, some familiar in later textbooks, others less so. At first encounter, James's account of the will seems foreign to present students of psychology, who are accustomed instead to non-consensual chapters on motivation. For James, voluntary movements are a secondary development from

the primary organic functions involved in reflex action, instincts, and emotional movements (p. 1099). The link between thought and voluntary action is provided by ideo-motor action, the concept that thoughts of a movement lead directly to making the movement, unless contrary inhibiting thoughts intervene. With the resurgence of cognitive and neuropsychology, James's focus on the selectivity of attention and on the relation between thought and action returned as central to the discipline. His century-old formulations are no longer useful, but his identification of significant problems for psychology earns renewed respect.

Other topics broached in the *Principles*, particularly hypnosis and divided consciousness, anticipated concerns beyond the boundaries of positivistic science that continued to preoccupy James during his mainly philosophic period that followed its publication (see Taylor 1983). James was much interested in the work of the French psychopathologists Charcot, Janet, and Liébeault, who preceded psychoanalysis in giving attention to nonrational processes outside the scope of normal consciousness.

4. *James as a Philosopher*

In spite of James's expressed intent in the *Principles* to avoid metaphysics, the book was infused with his philosophic thinking, particularly in his critique of earlier philosophic psychology, and contains the germ of most of the philosophic positions on which he elaborated subsequently. His specific impact on philosophy is identified with pragmatism and radical empiricism. Pragmatism, launched by James, became a vigorous philosophic movement which enjoyed a renaissance late in the twentieth century. Radical empiricism was James's attempt at the fundamental metaphysical construction that he postponed in the *Principles*. The work was incomplete at the time of his death, and the book presenting it (James 1912/1976) was assembled posthumously from journal articles.

4.1 *Pragmatism*

When James published *Pragmatism* (1907/1975a), a popular book that was much reprinted and translated, he drew on his earlier writing and thinking over three decades. Here, he offered the pragmatic method as a way of settling metaphysical disputes that might otherwise be interminable, such as those between tenderminded religious and toughminded materialistic world views: 'The pragmatic method…is to try to interpret each notion by tracing its respective practical consequences. What difference would it make practically to anyone if this notion rather than that notion were true?' (1907/1975a, p. 28) The pragmatic method entails a perspective on meaning. As he writes, 'to develop a thought's meaning, we need only determine what conduct it is fitted to produce: that conduct is for us its sole significance' (p. 29). And with pragmatic meaning comes a pragmatic conception of truth, as characterizing beliefs that receive confirmation when acted upon. 'The truth of an idea is not a stagnant property inherent in it. Truth *happens* to an idea. It *becomes* true, is *made* true by events. Its verity *is* in fact an event, a process…' (p. 97). With characteristic generosity, James attributed his initial ideas about pragmatism to his friend the semiotic philosopher C. S. Peirce, who did not agree with James's developed approach.

The extensive philosophical controversy about pragmatism in the first decade of the twentieth century appears to reflect considerable mutual misunderstanding on the part of both James and his critics, as well as some problems with his mostly informal exposition (see Myers 1986). He can be interpreted as treating claims of pragmatic truth as similar to the provisional truth claims of empirical science, in the spirit of Peirce and, later, John Dewey, or alternatively, as rationalizing wishful thinking (religious faith has good personal and social results, so it may be accepted legitimately as true by its believers). The idea that philosophical abstractions and assertions should be judged in terms of their practical consequences came to seem typically American, to both his supporters and his critics.

Late in the twentieth century, interest in pragmatism revived, with similar diversity of interpretation. One strand of thought prominently represented by the philosopher Rorty (1979) became part of the 'postmodernist' attack on the scientific world view to which some disaffected psychologists subscribed. Knowledge, in this version, is a human construction for human purposes and cannot be taken as a 'mirror of nature,' a view with roots in James. Some other humanistically inclined applied psychologists called for a pragmatic psychology focused on useful contextually limited truths rather than general laws. This version of pragmatism retains a commitment to evidential empiricism like that of the early James.

4.2 *Radical Empiricism*

As James entered his final decade increasingly troubled by his failing heart, he turned to the fundamental metaphysical issues that he had tabled when he wrote the *Principles*. In pragmatism, he had crystalized a theory of knowledge developed over his full career. Radical empiricism, in contrast, proposed an ontology that continued his attack on Hegelian absolute idealism but broke sharply with the commonsense mind–body dualism of his scientific psychology. To transcend this Cartesian dualism, and the cognitive dualism of thought and its object or consciousness and its contents, he now proposed pure experience as the fundamental reality. Pure experience prior to analysis

or conceptualization does not distinguish between thing and thought. The commonsense categories, he believed, could be recovered from the contexts in which ingredients of pure experience are embedded and their various relationships. His apparent move toward philosophical idealism was qualified by his continuing commitment to pluralism: '… there is no *general* stuff of which experience at large is made. If you ask what any one bit of pure experience is made of, the answer is always the same: "It is made of *that*, of just what appears, of space, of intensity, of flatness, brownness, heaviness, or what not'" (1912/1976, p. 14–15).

5. *Religion and Psychic Research*

James continually struggled to find a place for the moral and hopeful view of humanity's place in the universe that religions can provide. Pragmatism was one route through which he sought to reconcile the world views of religion and science. Another was psychic research. For two years he was president of the Society for Psychical Research, to which he belonged from 1884 until his death. He was ever hopeful of finding supportive evidence for spiritual realities, and never satisfied that the evidence actually obtained was adequate (cf. James 1986).

James was already esteemed as a leading philosopher and psychologist when he delivered invited lectures on 'natural religion' at the University of Edinburgh in 1901–2. Their publication as *Varieties of Religious Experience* (1902/1985) became his second enduring classic, one that, a century later, is not only cited and respected but also read. Displaying the meaning of religion in the religious experience of individuals, it draws richly on accounts by saints, mystics, and others who provide evidence of their relation to what they regard as the Divine. The conceptual distinctions around which he organized his description and analysis have entered our common culture: the religion of healthy-mindedness vs. that of the sick soul; the 'divided self' and 'once-born' and 'twice-born' characters.

Although his sympathetic feeling for the many forms of religious belief is clear throughout, his presentation of religious experience is rightly esteemed by believers and unbelievers alike. His way of deploying 'case materials' to display the nature of a human phenomenon is a model for contemporary qualitative research to emulate.

James regarded the subconscious mental states revealed by the French psychopathologists as important in religious conversion. Speculatively, he declared his conviction that subliminal consciousness overlaps other realms of consciousness in mystical experience. By 'being faithful in my poor measure to this over-belief, I seem to myself to keep more sane and true' (1902/1985 p. 408). Here, James made radical and pragmatic use of his developing 'radical empiricism.' In the late twentieth century, this mystical side of James appealed to disaffected psychologists identified with a 'transpersonal' psychology with religious undertones.

6. *On Public Issues: Imperialism and War*

As a public intellectual, James was involved in the social issues of his day. A political as well as a philosophic liberal, he was opposed vehemently to emerging American imperialism in the wake of the Spanish American War. It was as an advisor to the peace movement that he wrote *The Moral Equivalent of War* (1910/1982), one of his last essays published in his lifetime, which remains a classic document in the psychology of war and peace.

After an evolutionary account of human warlike propensities, he noted that the militarists of his day held warfare to be the mainstay of admirable, martial virtues, and that as a 'pleasure economy' supplants the earlier 'pain and fear economy,' these virtues are likely to degenerate. He agreed that war fosters 'manliness' and surrender of private interest, but, given the monstrosity of modern war, he proposed planning for alternative sources of energizing challenge. Specifically, he suggested 'instead of military conscription a conscription of the whole youthful population to form for a certain number of years a part of an army enlisted against *nature*…' (p. 171). That he focused on 'manliness' and cast nature in the role of enemy shows James as a creature of his time, but his idea of the moral equivalent of war remains attractive. The equivalence is not in regard to the release of aggression, however, but to self-testing for the common good against difficult challenge.

7. *William James Today*

James's vivid and unconventional writings assure his continued influence, as they won him acclaim but evoked controversy in his lifetime. In North American psychology, James has become such a revered ancestor that his name gets called upon in many divergent contexts. His pragmatism is still very much alive. At one point, James considered humanism as an alternative term to pragmatism. Certainly, the influence of James in psychology and philosophy has favored humanistic responsiveness to the richness and variety of human experience, in contrast with the abstractness of absolute idealism in his own day and the dehumanized barrenness of behaviorism, logical positivism, and analytic philosophy that followed. His sensitive phenomenological treatment of thought and self remains unsurpassed, though it has been built on and superseded in various ways. His openmindedness and pluralism set a valuable counter-ideal to the dogmatism that is always a potential liability of mainstream doctrine. This counter-ideal inspired mid-

century psychologists of personality such as Gordon Allport, Gardner Murphy, and Henry Murray. At the turn of the millenium, it further inspires transpersonal psychologists who find in James respectable company for their own tendencies toward mysticism. The controversy surrounding James continues.

Janet, Pierre (1859–1947)

Pierre Janet, pioneering French psychologist and psychiatrist, was born May 30, 1859 in Paris. He studied philosophy at the elite *Ecole Normale Supérieure* and began his career teaching philosophy in aprovincial *lycée*. While teaching at Le Havre from 1883–9, he worked with local physicians to conduct experiments on hypnosis with hysterical patients. These experiments led to several publications, including the thesis for his doctorate in philosophy, *L'automatisme psychologique* (1889). In the same year, Janet obtained a position teaching in a Paris *lycée* and began formal training in medicine. He worked at the Salpêtrière hospital under the direction of the foremost authority of the day on hysteria, the neurologist Jean-Martin Charcot. Janet received his medical degree in 1893 and continued to work at the Salpêtrière until 1910. The cases he studied there formed the foundation for some of his most important works. In 1902, Janet was named to the chair of experimental psychology at the Collège de France, where he taught until 1935. He also co-founded and edited the *Journal de psychologie normale et pathologique*. He died on February 24, 1947 in Paris.

Janet's thought can be separated into an early and a late period, with 1910 as a rough dividing line. In the early period, which was by far the more influential, Janet focused on extending the domain of mental life and on elaborating a psychology based on a distinction between automatic and synthetic mental activity. As a result of his investigations into hypnotism and post-hypnotic suggestion, Janet rejected the then-common assumption in scientific and medical circles that unconscious mental functioning was physiological in nature. He insisted that it depended on the intervention of ideas, just as conscious mental functioning does. These ideas simply are not connected with the consciousness of the self. Because the word unconscious implied 'neurological' for so many at the time, Janet coined the term 'subconscious' to characterize ideas separated from consciousness.

The distinction between automatic and synthetic mental activity separated Janet from British associationist psychology. Janet held that association could only recall connections previously established by the mind; in other words, association explained automatic functions such as habit and conditioned response. Associations initially are established by mental synthesis, which combines the disparate elements of perception into related wholes. Synthesis is the basis for the integration and interpretation of experience. Beginning at the simplest level of combining sensory data into perceived objects, synthesis works on its own products to build ever higher levels of object, culminating in the concepts of the self and the world. By conceiving the self as the product rather than the origin of synthetic activity, Janet rejected the traditional Cartesian notion of the self as simple and primary; rather, the self is one of the most complex mental phenomena, and it appears only at an advanced stage of mental development. In addition, Janet dismissed the philosophical tendency to characterize abstract reason as the pinnacle of human mental

functioning. Influenced by evolutionary theory, Janet insisted that adaptive behavior in the real world required the greatest mental effort and that, in the real world, the social world posed more challenges than the natural world.

Synthesis requires energy, which Janet characterized through a concept of psychological force. An individual's psychological force determines the quantity of psychological stimuli they can hold together in synthetic unity. To describe the quality or level as well as the quantity of synthetic activity, Janet developed the idea of psychological tension. When individuals lose psychological force, they can no longer synthesize all of the stimuli impinging upon them. The inability to integrate perception leads to various kinds of mental illness, which Janet grouped into two major classes. One was hysteria, in which sufferers respond by abandoning or dissociating whole classes of perception. They may lose consciousness and control of parts of their body (producing hysterical paralysis), memory (amnesia), or behavior patterns (tics and fugues). In extreme cases, synthesis continues to operate on the dissociated portions of mental life beyond the awareness or control of the self, producing what was then known as double consciousness and what today would be called multiple personality or dissociative identity disorder.

To describe the other major class of mental illnesses, Janet coined the term 'psychasthenia,' which he used instead of the existing term 'neurasthenia,' to emphasize the psychological rather than biological nature of the condition. Psychasthenics retain consciousness of their uncontrollable thoughts and actions even as they are powerless to stop them. Such individuals suffer from obsessive-compulsive disorders and from feelings of inadequacy related to their inability to control themselves.

Janet attributed the lack of psychological force to two main causes—constitutional deficiency and traumatic emotions. Following in a long hereditarian tradition, Janet held that some people are born with less psychological force than others. Such individuals are more prone to mental illness, because they are more likely to be overwhelmed by the external world. In addition, traumatic incidents may produce emotions that sap energy and disrupt the normal process of synthesis. Individuals lose the ability and the desire to integrate into consciousness painful memories, which continue to play a disruptive role as dissociated subconscious ideas.

Janet's treatment of patients began with what he called 'psychological analysis,' during which the therapist attempts to separate symptom complexes into their elements and to uncover the origins and development of the ideas behind these elements. Janet used a variety of techniques in psychological analysis. He began his career relying heavily on hypnotism to reveal subconscious memories and dissociated personalities. He supplemented hypnotism with automatic writing and other techniques designed to elicit responses from the patient's subconscious. Such methods had limitations, however. Janet became sensitive to issues of suggestion in the production of hysterical symptoms. Indeed, he was one of the first historians of hypnotism, tracing the origin of the classic hysterical symptoms described by Charcot to the effects of earlier magnetizers on the patients Charcot examined. Janet also found that psychasthenics tended to be less susceptible to hypnotism. He came to rely more on repeated observations of and conversations with the patient over long periods. Through this interaction, Janet was able both to discover the origins of neurotic symptoms and to establish a relationship with the patient that would aid in the therapeutic process.

Once the origins and elements of the symptoms were discovered, Janet attempted to eliminate their pathogenic effects by a variety of methods. By enabling patients to reintegrate dissociated memories into consciousness, Janet was able to reduce their disruptive power. He also tried to dissolve such memories through suggestion and substitution. One case he reported was that of Justine, who had hysterical crises provoked by an intense fear of cholera. Through analysis, Janet discovered that as a child Justine had developed a fear of death by helping her mother, who was a nurse, care for dying patients. This fear was further focused by an incident in which Justine saw the putrefying corpses of two cholera victims. Janet recovered these memories, and then, through an elaborate and gradual process of suggestion, substituted more acceptable images—a Chinese general with the name Cho-le-ra for a diseased corpse. Eventually, the word cholera lost its power, and the symptoms disappeared.

Janet also tried various measures to adapt a patient's psychological force to the demands of her or his environment in order to prevent a recurrence of symptoms and to avoid the development of new illnesses. He used mental exercises to increase the patient's psychological force and recommended reductions in the stresses imposed by the patient's occupation and social life. Though powerless in most cases to change the sufferer's situation, Janet recognized the significance of environment in contributing to the onset of mental illness.

After about 1910, Janet began to redescribe his psychology in terms of conduct rather than ideas. He did this because he came to view the proper goal of psychology as the explanation of the adaptation of the organism to its environment. Ideas are instruments that lead to adaptive action. Janet also expanded and systematized his conception of the hierarchy of psychological levels. In addition, he became increasingly interested in the psychology of religious belief. These new directions came together in his most important late work, *De l'angoisse à l'extase* (1926), based largely on a case study of a highly religious patient with hysterical symptoms.

Janet's influence was considerable at the end of the nineteenth and beginning of the twentieth centuries. His concepts of dissociation and of subconscious ideas found adherents from Carl Jung to William James. Alfred Adler acknowledged his indebtedness to Janet's analysis of feelings of inadequacy. Jean Piaget cited Janet's work on the levels of psychological activity as inspiration for his own developmental theory. In 1906, Janet gave a series of lectures at Harvard Medical School, which made him better known in the US.

However, Janet's influence diminished rather than grew with time. Janet failed to train many followers. He also suffered in competition with Sigmund Freud. Not only was Freud more adept at forming a devoted following, he was more successful at defending the issues over which he differed with Janet, such as the sexual etiology of neuroses and the origin of repressed memories in fantasy. The rise of behaviorism, which despite its focus on action owed little directly to Janet, also eclipsed Janet's own psychology of conduct. In psychiatry, neurological and pharmacological approaches became dominant where Freudian psychoanalysis did not prevail, and in psychology, experimental methods replaced Janet's reliance on psychopathology.

In the last two decades of the twentieth century, a number of psychologists and psychiatrists began to study Janet anew. As Freud's abandonment of the seduction theory was challenged, some found a corrective in Janet's emphasis on actual traumatic events. Theorists who questioned Freud's insistence on the sexual origins of neuroses turned to Janet for a more inclusive view of psychological trauma. The resurgence of dissociative identity disorder as a diagnostic category also led researchers to seek guidance in one of the early students of that condition. Renewed interest in these and other areas to which Janet made substantial contributions assure him an important place in the history of psychology and psychiatry.

Japan: Sociocultural Aspects

A sociocultural overview of Japan appears straightforward. Yet, shifting political boundaries of the nation state called Japan, its multi-ethnic composition of the population, and global movements of the 'Japanese,' together with recent epistemological and theoretical questions in various fields have reminded us that such an undertaking is a highly complex enterprise (Ivy 1995). The anthropology of Japan, practiced by an increasing number of scholars all over the world, is an enormously active field now that anthropologists no longer specialize only in nonliterate 'primitives.' It is a testing ground for new approaches to anthropology, including various attempts to historicize anthropology (Kelly 1985, Ohnuki-Tierney 1987, 1993). Presented below is a brief summary of the 'anthropology of Japan,' identifying important contributors but focusing primarily on scholarship based in Japan, the United States, and the United Kingdom for reasons of space (see also Hendry 1992, Eisenstadt 1996).

1. Anthropology of Japan: In the Beginning

Anthropology *in* Japan may be represented by two major approaches, both called *minzokugaku*, each having a different character for *zoku*, one referring to folklore or folk traditions, and the other, 'people.' 'Folklore' is equivalent to 'ethnography,' rather than 'folklore' as practiced in the United States. The basic approach was founded by Yanagita Kunio (1875–1962), who emphasized the fieldwork aspect of the discipline. Its emphasis on rural and other marginalized populations was later extended to urban populations under Miyata Noboru (1936–2000). Orikuchi Shinobu (1887–1953), another pillar of this school,

made extensive use of classic literature as ethnographic texts, thus introducing history to ethnography.

The other major approach is sociocultural anthropology, which began with the influence of the Viennese school, then turned to British social anthropology, and most recently to American cultural anthropology. Most Japanese scholars in this tradition specialize in non-Japanese cultures.

American anthropology in Japan is largely a product of World War II, when the American government commissioned scholars to decipher its enemy, with a most celebrated, and often criticized, case being *The Chrysanthemum and the Sword* (1946) by Ruth Benedict. Early works focused on 'village Japan,' where they sought a more 'traditional' Japan than modernized city life.

2. *Making the Majority and Marginalizing the Internal 'Others'*

Wet-rice agriculture, introduced from the Asian continent to Japan around 400 BC, gradually supplanted the previous hunting–gathering subsistence economy and provided the economic and symbolic foundation for the Yamato state and the imperial system, which lost its political power after the twelfth century, until it was nominally 'restored' through the Meiji Restoration in 1868.

The rice-based agrarian political economy and cosmology provided a lasting impact on the social structure and cosmological tradition, which became *the* Japanese cosmology *sui generis* for all the Japanese, including non-agrarian peoples. This development contributed to the representation of Japan as 'Agrarian Japan,' writing off many social groups from Japan's history and society. We now see a burgeoning interest in 'minorities' and counter-discourses within Japanese society, especially among foreign scholars. Since the cultural, linguistic, and biological identities of the Japanese, Koreans, Ainu, and Gilyaks remain uncertain, and anthropology no longer recognizes 'race' as such, the question of Ainu identities remains controversial. The Ainu engaged in a hunting–gathering economy without a writing system, with, however, a highly developed oral tradition (Ohnuki-Tierney 1981). Subscribing to the scheme of social evolution, the Japanese as well as Westerners were eager to identify the Ainu as 'primitive hunter-gatherers' or, even 'archaic Caucasoids.' Their way of life and physical characteristics were exoticized. As they were colonized (Takakura 1960), they were forced to abandon their way of life and became a minority, the Other within the Japanese nation state. Previously occupying the Kuriles, southern Sakhalin, Hokkaido, and northeastern Honshu, the Ainu are now confined mostly to Hokkaido. Their population dropped from a peak of 80,000 in the eighteenth century to anywhere between 25,000 and 50,000 at the end of the twentieth century. Since the 1960s, various Ainu political groups have made great strides in asserting their indigenous rights.

The so-called *hisabetsu-burakumin* is another by-product of the development of 'Agrarian Japan' (Ohnuki-Tierney 1987). Until the late medieval period, they constituted loosely defined social groups in non-agrarian occupations dealing with culturally defined 'impurity,' including animal and human deaths, and the visual and performing arts. In 1582 they were codified as 'outcastes,' becoming increasingly marginalized in later periods. Despite legal emancipation in 1870, social discrimination has continued into the twenty-first century. The 1987 government census figures are: 4,603 districts with a total population of 1,166,733, while the Buraku Liberation League suggests at least 6,000 districts with a population of 3,000,000. The Okinawans also constitute a minority whose 'distinctiveness,' if there is any, is based primarily on regional differences. Okinawa's past isolation from the main islands and its location as the gateway of influence from outside created some cultural differences, and their dialect was once regarded as non-Japanese.

There are various 'foreign' residents, of which 85 percent (700,000) are Koreans. Others include Chinese, Westerners, and more recent immigrants from Southeast Asia and the Middle East. In other words, Japan, although stereotyped as demographically homogeneous, has been a multi-ethnic nation throughout its history.

Although scholarly work on women had previously been available, studies undertaken at the end of the twentieth century have included feminist and other new perspectives, foregrounding their voices, their life experiences, and women as social agents who actively carve out or change courses of their lives (Hara Chieko, Iwao Sumiko, Karen Kelsky, Takie Lebra, Ueno Chizuko). The issue of gender preferences, institutionalized or culturally sanctioned as well as individual, has also received considerable attention (Robertson 1998).

3. *'Culture'—Non-localized*

Another burgeoning genre of scholarly work derives from an emphasis on how 'culture,' or a particular people such as the Japanese, is not localized. Our awareness of the nonisomorphic nature of culture, locality, and people and an unprecedented flow of population across borders of nation states has led to a number of studies of 'transnationalism' and transnationals in the past and in the contemporary context of globalization (Mannari and Befu 1983). These have included studies of overseas Japanese communities, young Japanese who have returned to Japan after being raised overseas due to their parental occupation (Goodman 1990), Japanese businessmen overseas (E. Ben-Ari), and emigrants who have returned to Japan

(Takeyuki Tsuda), as well as transnational economic activities (T. Bestor; H. Miyazaki). Studies of Japanese colonization have become another powerful lens to understand Japanese culture and society, along with Japanese cultural and political nationalisms (K. Yoshino).

4. 'Culture/History' at the Confluence of the Local and the Global

If the political economy and cosmology of rice agriculture were born as a result of the interaction between the global flow and the local development, so were subsequent major historical watersheds of Japanese history. Japan's 'modern' era was ushered in because of the threats of Western colonialism all over Asia. In 1868 Meiji oligarchs used the 'return of the imperial system,' which had been virtually nonexistent since the end of the twelfth century, as a means of overthrowing the shogunal government, which had proved incapable of coping with Western threats. The Constitution of Imperial Japan, drafted by German (Prussian) and Austrian scholars, transformed the emperor from an apolitical deity in the Japanese pantheon to a sovereign, Almighty God, and Commander of the military. With Japan's defeat in World War II, another constitution was written by the American occupying forces, creating a 'symbolic' emperor and introducing equal rights for women, coeducation in public schools, and land reform which drastically leveled social inequality.

Changes in the educational system too are the result of the local/global interactions. With a high literacy rate, less than 4 percent leave school at the age of fifteen, while almost all the rest complete senior high school education. Some 500 four-year universities and 580 two-year colleges in the 1990s contrast with the prewar system, which consisted of the National Higher Schools and the Imperial Universities, whose graduates, all male, dominated the key posts in the government, business, and intellectual fields. Today, in addition to the University of Tokyo, University of Kyoto, other major national universities, and the top private universities, such as Keio and Waseda, there are alternative routes to success, offered by the International Christian University or Jōchi University, run by Jesuits, Chūō University for law, and others. Holders of doctorates from US and UK universities receive increasing recognition. Despite democratization of the educational system in some sense, the recent affluence has produced more economically based inequality, with wealthy parents sending their offspring to costly 'cram schools' to increase their chances of passing the entrance examination to prestigious universities (J. Hendry; T. Rohlen).

Late twentieth-century debates over the enforcement of the national anthem and the national flag, textbook revisions, and curriculum changes form an ongoing debate about Japan's military past. After World War II, the American occupation forces enforced the well-known 'blacking out' of passages about Japan's aggression from school textbooks. Half a century later, the Japanese face the problem of how to reintroduce the Pacific war experiences, including atrocities committed by the Japanese military, such as the Nanking Massacre, 'comfort women,' and chemical experiments. Many Japanese are enormously sensitive to any signs of nationalism, and even patriotism, yet also remain sensitive to the 'foreign pressure.' A major factor in potential curriculum changes in pre-university education and also in teacher training is the call for 'globalization' or 'internationalization.' Another factor is pressure to locate the Japanese more solidly among other Asians, rather than upholding Westerners as their mirror, as has been the case in the past. Culture as a product of local–global interactions is well articulated in Japanese religions. Nominally, the Japanese religions consist of native Shintoism and two religions of foreign origin—Buddhism and Confucianism. In addition, the mountain ascetic practice (*shugendo*) continues to be practiced, while numerous 'new religions' came into being often during periods of unrest. At the end of the twentieth century several new religions enjoy large memberships, including Soka Gakkai, which also forms a successful political party.

Mahayana Buddhism came from India via China in the late sixth century and was first embraced by the elite but later became influential among common people. With the rise of political and military nationalism in the early Meiji period, it was targeted as a 'foreign' religion, and many Buddhist temples and works of art were destroyed. In contrast, Shintoism was 'elevated' to be the exclusive national religion. These changes at the institutional levels, however, had little to do with the common folk who subscribed to Shintoism and Buddhism, both of which had become a part of their daily lives. Most rites of passage celebrating life are Shinto rites, while most mortuary rituals are Buddhist. In Japanese folk religiosity, humans and superhumans constitute a continuum—exceptional humans are assigned power over humans who nonetheless manipulate and cajole the superhumans to their advantage. Japanese religions are decisively 'this-worldly,' rather than focusing on salvation after life. The major 'functions' of deities and buddhas are to provide business prosperity, traffic safety, recovery from illness, good health, success in one's undertaking, including high school and university entrance examinations, and other worldly gains (J. Kitagawa).

Christianity was introduced to Japan when Jesuit missionaries arrived in 1549. The converts were persecuted during the sixteenth and seventeenth centuries, when the rulers saw Christianity as potentially subversive of their authority, and again later during the nationalistic period. However, many Meiji Christian

leaders were highly respected by a broad spectrum of people as intellectuals and pillars of moral conscience under the increasingly totalitarian government.

Numerous practices that fall under the rubric of 'magic' and 'superstitions' are found in profusion in urban centers and are practiced by a large number of Japanese, including the young and the educated, who carry amulets in their cars, and hang them on children's rucksacks and hospital beds. Children and high school students hang votive plaques on which they write a prayer, for example, for success in examinations and dating. Young and old alike practice divination of all kinds when choosing a marriage partner, a date for a wedding, a date for opening of a store, etc.

Although worldly concerns occupy a central place in Japanese religiosity, at its core is a belief in the soul, especially that of the deceased. Various practices associated with souls of the deceased constitute the most important rituals at the end of the twentieth century. These include funerals and later rituals connected with them, as well as the daily offering of water, tea, freshly cooked rice, and favorite foods of the deceased on their ancestral alcove. Municipalities own large cemeteries where the family tombs of the residents are located. During the Bon festival, when the ancestors are supposed to return to this world, and at other prescribed times, families in cars form caravans heading toward these cemeteries. This practice continues in intensity despite the almost complete absence of a vision of the afterworld (Smith 1974).

With a population of about 123 million, Japan's demographic pattern is characterized by a large proportion of people over 65 (about 20 percent at the end of the twentieth century), the world's lowest infant mortality rate, and a very low birth rate. The household, *ie*, consisting of an extended family with its emphasis on generational continuation and the primogeniture system, has been considered the basic social unit, although it was codified only in the Meiji period and outlawed in 1947. This image is misleading, since the 'continuation' of *ie* does not mean a continuation through blood line—a high incidence of adoption characterizes Japanese kinship, and the system was most important only for families with substantial wealth and/or important occupation. For most, the nuclear family has been far more important. Since the mid-nineteenth century, industrialization accelerated the migration of nuclear families to urban centers where well over three quarters of the population is concentrated today, leaving the rural areas primarily in the hands of the elderly.

Abortion, legalized in 1948 although practiced with high frequency even earlier, and infanticide were formerly the primary means for birth control. At the end of the twentieth century the condom (80 percent of contraceptive users) and the rhythm method are used, with the oral contraceptive legalized only in 1999. In spite of the lowest infant mortality rate in the world, the Japanese population growth is alarmingly low. The physical and psychological involvement of fathers in child rearing has increased in recent years, so that they spend more time with their families, especially on weekends.

While studies of workplaces by anthropologists are by no means neglected (Kondo 1990, C. Turner), popular culture now receives much attention (Moeran 1989; A. Allison; J. Callas; I. Condry; M. Creighton; K. Kelsky; P. Noguchi). 'Globalization' is most visible in 'youth culture,' a product especially of American influence. Whether or not they are in the mainstream of society, today's youth flourish in their youth culture, listening to the latest pop music, following the latest youth fashion, and eating out with their friends at popular restaurants. Many color their hair, sometimes blond. They have adopted body piercing after the fashion of American youth, in contrast to the centuries-old Japanese refusal to imitate Chinese ear piercing, which was seen as a form of impurity. Before the last decades of the twentieth century, even married couples did not show their affection in public. At the beginning of the twenty-first century, public places are crowded with young dating couples who openly display their feelings.

Young and old, twenty-first century Japanese spend a great deal of money and time on leisure activities, including 'traditional' nature viewing—viewing of cherry blossoms, chrysanthemum, and colored leaves. Television and games constitute the major sources of leisure activity. Sports have become primarily spectator sports watched on TV, with baseball and sumo the most popular. Both professional and high school baseball are enormously popular (W. Kelly). Sumo, the oldest professional sport in Japan, received a great deal of attention when it broke with tradition by giving the highest ranking of *yokozuna* to foreign-born wrestlers. There are now sumo organizations throughout the world (R. K. Tierney). One of the most popular participant sports is golf. Domestic and foreign tourism has become a major leisure activity for Japanese of all ages (N. Graburn). The young sometimes combine tourism with their passion for consumerism, going to France, Italy, and the United States to purchase 'brand name' merchandise. A 'unique' leisure activity is the reading of comic books, with some comic books having a weekly circulation of over 4 million—the only arena of recreation competing against the electronic media.

The healthcare system, too, has developed as a result of Japan's interaction with various others. After the introduction of Chinese medicine, Dutch medicine was introduced during the early eighteenth century, followed by the German system. Today most Japanese go to a biomedical doctor for major acute diseases and surgery, while using Chinese medicine for day-to-day health maintenance and chronic illnesses, in addition to going to temples and shrines to pray for speedy recovery (J. Breslau; M. Lock; E. Ohnuki-Tierney). In

1959–60, all Japanese became legally eligible for pension coverage and health insurance, provided either by one's employer or the government. During the affluent mid-1970s, a national system of free medical care for the aged was introduced, and there was a massive increase in the pension benefits. When the 'bubble' burst, the national scheme of free care for the elderly was discontinued in 1983, and various other contractions were enforced. At the beginning of the twenty-first century, state of the art biomedical technology is available in Japan, although brain death was legally recognized only in 1999, and the Japanese have shown considerable resistance toward organ transplantations in general.

Japan enjoys one of the lowest crime rates in the industrialized world. However, organized crime is a serious problem without any realistic solution in sight. The targets of organized crime are usually highly specific, without threatening the general public. However, periodically, Japan is shaken by outbursts of crime such as the Aum Shinrikyo cult, which in 1995 spread poisonous gasses in a Tokyo underground station, causing 5,000 deaths and injuries.

5. *Conclusion*

The critiques of 'totalizing' and 'essentializing' representations of culture/society/people have led the anthropology of Japan in several productive directions, foregrounding diversity and multiple voices, whereas the awareness of the nonlocalized nature of culture/society/people has stimulated anthropologists to come to terms with various new ways of looking at what indeed is the 'anthropology of Japan.' These new perspectives place Japanese culture and society in the global historical flow and geopolitics, rather than treating them as a hermetically sealed entity.

Jeffreys, Sir Harold (1891–1989)

Sir Harold Jeffreys, F. R. S. was born on April 22, 1891 in Fatfield, County Durham, England and died on March 18, 1989 in Cambridge, England. He was educated at Armstrong College, Newcastle-upon-Tyne and at St. John's College, Cambridge University. After brilliant scholastic performance, he became a Fellow of St. John's College in 1914. From 1946 to 1958, he was Plumian Professor of Astronomy and Experimental Philosophy at Cambridge University. In 1925, he was elected a Fellow of the Royal Society, later became its Bakerian Lecturer and Royal Medalist and received the Copley Medal in 1960. He was knighted in 1953, President of the Royal Astronomical Society, 1955–57, and President of the International Association of Seismology and Physics of the Earth's Interior, 1957–60. In 1962, the Harold Jeffreys Lectureship was created by the Royal Astronomical Society and Jeffreys presented the inaugural lecture in 1963.

The obituary in the Times of London, March 23, 1989, noted that Jeffreys's 'famous treatise, *The Earth: Its Origin, History and Physical Constitution*, which with re-editing and improvements, went through seven editions between 1924, when it first appeared, and 1976, did perhaps more than any other book to make the geophysics of the solid earth a coherent study. His researches in seismology, in particular, established his reputation as one of the leading authorities on that subject.'

His early research was centered on astronomical and meteorological dynamics. An accomplished mathematician, he wrote two monographs, entitled *Cartesian Tensors*and *Operational Methods in Mathematical Physics*. He and his wife, Dr. Bertha Jeffreys, a very able mathematician, wrote *Methods of Math-*

ematical Physics, which was published in several editions by Cambridge University Press and became a highly respected and widely cited classic. In a review of the work in *Nature*, it is stated that 'The authors distinguished for their knowledge of mathematical physics and cosmogony, and by their researches in these fields, possess also a remarkably comprehensive and deep understanding of pure mathematics. Their purpose has been to synthesize the mathematical knowledge for the service of physics … The work is a benefaction to the cause of progress in natural philosophy.'

The Collected Papers of Sir Harold Jeffreys on Geophysics and Other Sciences was published by Gordon and Breach, London, in six volumes. Volume 6 is entitled, *Mathematics, Probability and Miscellaneous Other Sciences*. Work reported in this volume and in his books, *Scientific Inference* (1931 and later editions) and *Theory of Probability* (1939 and later editions) reflected Jeffreys's concerns with the foundations of science and, in particular, scientific inductive procedures. His book, *Theory of Probability* presents an axiom system for inductive inference applicable in all the sciences and operational procedures for description, measurement, modeling, data analysis, estimation, testing, and prediction. Many applications of these procedures to important statistical problems encountered in many sciences are provided in his books and papers.

Since he began research on probability theory after World War I in a series of papers written jointly with Dr. Dorothy Wrinch, his contributions have been of fundamental importance to the philosophy of science, scientific method, and theoretical and applied statistics. The general nature of this research has been stated in the preface of the second edition of *Scientific Inference* as follows: 'The general standpoint that scientific method can be understood if and only if a theory of epistemological probability is provided, remains unaltered. Consequently, I maintain that much that passes for theory of scientific method is either obscure, useless or actually misleading.'

In his book, *Theory of Probability*, Jeffreys presents a theory of epistemological probability, discusses its relevance for work in all areas of science, and applies it to solve many practical, important estimation, testing, prediction, and other statistical problems including those considered by R. A. Fisher, Joey Neyman, Karl Pearson, and others. Irving J. Good, an eminent statistician who reviewed Jeffreys's 1961 edition of *Theory of Probability* wrote that Jeffreys's book '…is of greater importance for the philosophy of science, and obviously of greater immediate practical importance, than nearly all the books on probability written by professional philosophers lumped together.'

As regards to Jeffreys's work on scientific method, he along with Pearson (1938) stressed the 'unity of science principle,' namely, that any area of study, for example, economics, physics, psychology, etc., can be scientific if scientific methods are employed in analyzing data and reaching conclusions. Or as Pearson (1938, p. 16), cited by Jeffreys states, 'The unity of all science consists alone in its method, not in its material.' With respect to scientific method, Jeffreys, in his book, *Theory of Probability*, provides an axiom system for probability theory which is useful to scientists in their efforts to learn from their data, explain past experience, and make predictions regarding as yet unobserved data, fundamental objectives of science, that are applicable in the natural, biological, and social sciences. He states that scientific induction involves observation and measurement and the production of generalizations or models to explain past data and predict new data, a view of induction that is fundamentally different from those of Mach and Popper. Further in induction, deduction plays a role but alone is inadequate for scientific work, mainly because deduction provides just three attitudes towards a proposition, namely, proof, disproof, or complete ignorance. As Hume and others have stressed, there is always the possibility of an exception to a scientific proposition. Thus, Jeffreys saw a need for statements less extreme than those of deductive logic, namely proof, disproof, or complete ignorance. His inductive logic provides such statements that involve reasonable degrees of belief in scientific propositions.

Jeffreys considers a probability to be a measure of the reasonable degree of confidence that an individual has in a proposition given the individual's available background information and data. This individualistic, subjective definition is compared to other definitions, including the axiomatic, long-run frequency, and hypothetical infinite population definitions in Chap. 7 of *The Theory of Probability*. He points out that the first definition is widely employed, for example, in the work of J. Neyman, the second is the Venn limit and strongly advocated by R. Mises, and the third is usually associated with R. A. Fisher although it had appeared earlier in statistical mechanics in the work of Gibbs and others. His criticisms of these concepts of probability are ingenious and devastating and have not been refuted in the literature, perhaps because they are irrefutable. In addition to specific detailed examples illustrating the inadequacies of these three definitions, Jeffreys comments, 'No probability has ever been assessed in practice, or ever will be, by counting an infinite number of trials or finding the limit of a ratio in an infinite series … A definite value is got on them only by making a hypothesis about what the result would be. The proof even of the existence is impossible. On the limit definition, … there might be no limit at all … the necessary existence of the limit denies the possibility of complete randomness, which would permit the ratio in an infinite series to tend to no limit.'

After further detailed criticisms of the above three definitions of probability, he writes, 'The most serious

drawback of these definitions, however, is the deliberate omission to give any meaning to the probability of a hypothesis.' (1998, p. 377). Also, he remarks, '…in practice no statistician ever uses a frequency definition, but that all use the notion of degree of reasonable belief, usually without even noticing that they are using it and that by using it they are contradicting the principles they have laid down at the outset' (1998, p. 369). See also Jeffreys's (1998 pp. 30–3) discussion of the 'personalistic' or 'moral expectation' views of probability.

Having provided a definition of probability, Jeffreys's axiom system provides procedures for using such probabilities in a coherent way. That is, he provides basic analysis that yields the addition and product rules and other results, including Bayes's Theorem or the principle of inverse probability that Jeffreys states (1998, p. 28) was '…first given by Bayes (1763). It is the chief rule involved in the process of learning from experience.' It is invaluable in using data to revise our initial beliefs in propositions regarding the values of parameters, alternative hypotheses and models, future values of variables, etc. With this analysis, Jeffreys presents a logically consistent framework for learning from data to explain the past and to make predictions about future outcomes, primary objectives of science, as mentioned above. He demonstrates, through analyses of many applied problems using data, that his estimation, prediction, and testing procedures work well in practice and makes many comparisons with results provided by the maximum likelihood approach of Fisher and others, Neyman-Pearson testing procedures, Fisher's p-value approach to testing, etc.

Central in Jeffreys's work on statistical estimation, prediction, and testing problems is Bayes's Theorem. Whatever the estimation problem, use of Bayes's Theorem enables an investigator to combine his prior information regarding possible values of the parameters, represented by a 'prior density' with the likelihood function that incorporates the information in the data to obtain a 'posterior density' for the parameters that incorporates all the prior and sample information. That is, using Bayes's theorem, the posterior density is proportional to the prior density times the likelihood function with the factor of proportionality a numerical constant such that the integral of the posterior density over its range is equal to one. Thus for whatever problem, given the inputs, a prior density and a likelihood function, a posterior density for the parameters is available. This posterior density can be employed to compute the probability that a parameter's value lies between any two given values, say between 0.4 and 0.6, a solution to the famous inverse problem posed by Bayes. Optimal posterior point estimates for parameters are obtained easily from a given posterior density, say a posterior mean, median or modal value that are optimal in terms of minimizing posterior expected loss *vis à vis* squared error, absolute error and zero-one loss functions, respectively. Further, in large samples, Jeffreys (1998, p. 193) shows that under general conditions, the posterior density assumes a normal shape centered at the maximum likelihood estimate with a covariance matrix equal to the inverse of the estimated Fisher information matrix (1998, p. 193) and remarks that R. A. Fisher's maximum likelihood methods yields '…results which are indistinguishable from those given by the principle of inverse probability (in large samples), which supplies a justification for it' (1998, p. 194).

Since a suitable prior density is needed to utilize Bayes's Theorem and has been a bone of contention for many years, Jeffreys devoted considerable attention to the problem of formulating appropriate prior densities. In particular, he put forward a reproducible way of formulating invariant prior densities appropriate for use in situations in which an investigator is ignorant, or wishes to proceed as if he were ignorant, about the possible values of parameters. His famous recommendation in such circumstances is to take the prior density for the parameter(s) proportional to the square root of the determinant of the Fisher information matrix (see p. 179ff for material on invariant priors). Use of this 'ignorance' or 'diffuse' or 'non-informative' prior density provides invariant posterior probability statements for all continuous one-to-one transformations of the parameters, a remarkable and highly original solution to the choice of prior problem. Jeffreys derived many invariant priors and used them in analyses of applied problems. He is usually given credit for being a pioneer in considering and solving the problem of formulating invariant priors.

With respect to prediction, in general a probability density function for future, as yet unobserved, observations is formulated conditional on parameters with unknown values. If we have, for example, a proper prior or posterior density for the parameters, the product of it and the conditional predictive density can be formed and the parameters integrated out to yield an operational predictive density. It can be used to make predictive probability statements, for example, to compute the probability that a future, as yet unobserved, observation will lie between, for example, 3.4 and 4.7. Also, optimal point predictions can be derived for given predictive loss functions, for example, a mean for quadratic loss functions, etc. For more on uses of predictive densities for forecasting and control, see the general references cited above.

As regards to the evaluation of alternative models or hypotheses put forward to explain empirical phenomena, Jeffreys recommended workers to start with simple models and complicate if necessary. He and Dorothy Wrinch put forward the Simplicity Postulate, namely a statement that simpler models have higher probabilities of performing well. Jeffreys considered all possible models ordered with respect to degree of complexity and assigned probabilities to each, with

simpler models receiving higher probabilities, in an infinite sequence that is assumed to converge.

Within this broad modeling framework, on considering two alternative hypotheses, Jeffreys used Bayes's Theorem to derive an expression for the posterior odds on these two hypotheses that is equal to the prior odds on the two hypotheses times the Bayes's factor, the ratio of the predictive densities for the observations under the two alternative hypotheses. Jeffreys used posterior odds in his pathbreaking work on significance tests and compared his results for fundamental testing problems with those provided by use of Fisher's p-values and Neyman-Pearson testing procedures. Since Jeffreys's pioneering work on significance testing, many have employed and extended his methods to deal with a wide range of testing and model selection techniques, see, for example, the review paper by Kass and Raftery (1995). Given Jeffreys's brilliant formulation, interpretations and uses of significance tests based on posterior odds, much improved methods for evaluating and/or combining hypotheses and models evolved and are now in widespread use.

Since Jeffreys's initial work in the 1920s, many have come to appreciate his outstanding contributions to the philosophy and practice of science. It is noteworthy that he analyzed much nonexperimental astronomical and geophysical data. Yet his analysis of randomization in experimental design in his book *Theory of Probability* is extremely penetrating and valuable. In addition, he has made important contributions in the areas of distribution theory, asymptotic theory and expansions, robust estimation, invariance theory via differential geometry, information measures for distributions, mixture distributions, contingency tables, a key nonparametric problem, and in modifying the Pierre Simon Laplace Rule of Succession. And last, that Jeffreys's methods work not only in solving physical science problems but also in solving problems in biology, the social sciences, business, law and other areas is noteworthy. Finally, while many orthodox statisticians were critical of Jeffreys's work years ago, it is the case that his approach and results are currently widely employed and valued.

Jewish Diaspora

The study of international migration focuses on individuals or groups of people moving between countries. National boundaries constitute one key criterion in assessing which geographical mobility constitutes international migration, as well as the sociodemographic profile of the different relevant populations: the whole residents of a given country of emigration, the particular subset of actual movers, and the residents of immigration-receiving countries. Within this framework, the study of a diaspora is atypical. Rather than a clearly defined territorial entity, a diaspora is a globally dispersed set of subpopulations mutually related by common values, symbols, and historical experiences. Besides describing the experiences of each local subpopulation, diaspora studies aim to uncover the existence, determinants, and consequences of common patterns, if any.

The Jewish diaspora is a particular case of such a territorially dispersed sociodemographic collective de-

fined by religious–ethnic–cultural criteria. Variable definitions of 'who is a Jew' may affect evaluation of sociodemographic change (DellaPergola et al. 2000). While during earlier history group boundaries were rather rigid, namely concerning the status of the Jews, in the modern era of political emancipation, modernization, secularization, intensive communication and social interaction, religious, ethnic, national, or cultural identities tended to blur. While a declining number of countries have provided relevant information on Jews (or Hebrews) as a religious or ethnic category in their censuses and migration statistics, more recent sources such as population surveys increasingly rely on the respondents' self-definitions of group identity. The identificational boundaries and consequent quantitative assessment of Jewish populations become increasingly operative as people may declare different identifications under variable circumstances. However, since 1950 the state of Israel has used a broad normative definitional framework through the Law of Return (Hok hashvut) granting immediate Israeli citizenship to Jewish immigrants, their children, grandchildren, and respective spouses, even if they are not Jewish. The related concepts of a core Jewish population, and an enlarged Jewish population also including non-Jews of Jewish origin and other non-Jewish household members, should be kept in mind in the study of the Jewish diaspora's sociodemographic change, including international migration.

1. *Geographical Change in Historical Perspective*

Like other diasporas but to a greater extent than for other groups, Jewish international migration has spread over a very long time span. The unique amount of geographical mobility experienced by Jews over history stands behind the negative stereotype of the wandering people—a rootless ideal type presumably associated with other negative characteristics. While repeated large-scale migrations did occur along Jewish history, explanations stem from a complex array of political, economic, social, and cultural determinants. In a historical perspective, minority status often exposed Jewish populations to legal, socioeconomic, and cultural constraints. These influences deeply cut across Jewish communities worldwide, though in each locale significantly different sociopolitical and cultural environments generated unique incentives or constraints to stay or move. Repeatedly in the Jewish experience this took the form of expulsions or deportations.

The main focus of this article is since 1850 with an emphasis on the period after World War II. It suffices, therefore, to note that Jewish populations had high levels of geographical mobility from antiquity throughout the middle ages and the early modern period. The initial stages of Jewish peoplehood formation and consolidation occurred through wanderings across the area between Mesopotamia and Egypt. The land of Canaan—later known as Eretz Israel, the Holy Land, and Palestine—eventually became the center of ancient Jewish settlement and political hegemony. A Jewish diaspora was permanently established by since the deportation to Babylon (eighth to sixth centuries BC). The Jewish presence expanded to North Africa and Southern Europe during the last centuries BC and the first centuries CE after the fall of the second Jewish Temple under the Roman Empire, and especially following the westward expansion of Islam since the seventh century. By the end of the first millennium northbound migration had led to the consolidation of the culturally influential Jewish communities of *Ashkenaz* (Germany in Hebrew). Jewish population growth in the Iberian peninsula created the other main cultural center of *Sepharad* (Spain in Hebrew). It is only after the thirteenth century that significant numbers of Jews moved eastward to Poland and Lithuania, eventually expanding to the whole of Eastern Europe.

Reflecting these migrations, the main centers of Jewish settlement repeatedly shifted. Evidence from the late twelfth century still points to a predominantly Middle Eastern geographical distribution. The subsequent rise of Western European Jewry was curtailed by numerous expulsions from European cities, provinces and countries, culminating in the major exodus of Jews from Spain and Portugal in the fifteenth and sixteenth centuries and their dispersal throughout Europe, the Mediterranean, and the Caribbean. Eastern Europe consequently became the main regional center of Jewish presence.

Following at least ten centuries of stagnation at an estimated level of a few hundred thousands to slightly above one million, since the early seventeenth century world Jewish population rapidly increased, mostly in Eastern Europe. The estimated global total grew from 1 million in 1700 to 2.5 million in 1800, 10.6 million in 1900, and 16.5 million in 1939. Demographic change reflected a comparatively early transition to lower levels of mortality in the presence of widespread marriage and moderate to high fertility. Rapid population growth and a consequent impoverishment along with the social–environmental pressure of antisemitism accompanied by outbursts of physical violence stimulated large-scale Jewish transoceanic migration during the last two decades of the nineteenth century and the first two decades of the twentieth century. Major Jewish communities thus rose in the US, Canada, Latin America, Southern Africa, and Australia.

After World War II and the destruction of Jewish communities in Central and Eastern Europe (6 million estimated victims), North America became the largest regional concentration of world Jewry. Since independence in 1948, large-scale immigration was the leading factor in Israel's rapid rise to have the second largest Jewish population worldwide, drawing from all diaspora communities but especially from Eastern

Table 1

Europe, North Africa and the Middle East. Table 1 summarizes the main changes in world Jewish population distribution over the nineteenth and twentieth centuries.

2. *Volume of Jewish Migration, Countries of Origin and Countries of Destination*

The changing structure and interrelated character of modern Jewish international migration fits a systemic perspective (Kritz et al. 1991). The number, direction and characteristics of Jewish migrants at any time were significantly determined by the existing worldwide distribution of Jews—in turn, to a large extent, the product of previous migration (DellaPergola 1998; Lestschinsky 1960; Schmelz 1971).

About a quarter of a million Jews migrated mostly from Central Europe between 1840 and 1880. Estimates of the changing volume of Jewish international migration between 1880 and 2000 are presented in Fig. 1. Five-year moving averages were computed

Figure 1
International migration of Jews, 1880–2000—five-year moving averages

from yearly migration data and estimates for each of the main countries of destination. Overall, over eight and a half million Jews migrated between continents, including all Jewish migration to Israel and to the US. Of these, about 2.4 million moved between 1880 and 1918, 1.6 million between 1919 and 1948, 1.9 million between 1948 and 1968, and about 2.6 million between 1969 and 1999. These figures do not include several hundred thousands more who migrated between neighboring countries within the same continent, nor does it provide a full account of return migration.

The continuous wave-like pattern in Jewish international migration demonstrates recurrent crises affecting the position of Jewish communities in different parts of the world and the consequent need for prompt relocation, which in turn suggests dependency of the Jewish diaspora on changing political, socioeconomic, and cultural circumstances in the respective countries. Some of the stimulating factors of large-scale emigration operated in recent years in essentially the same way as they did at the turn of the twentieth century in spite of the deep intervening sociopolitical changes across world society and Jewish communities alike.

Three major waves were: (a) the pre-World War I mass migration from Eastern Europe to North America, peaking in fiscal years 1905–1906 (154,000 Jews admitted), 1906–1907 (149,000) and 1913/14 (138,000); (b) the massive transfer to Israel of displaced and refugee Holocaust survivors and of sizeable Middle Eastern and North African Jewish communities between 1948 (239,000 in 1949) and 1951; and (c) the more recent exodus from the former Soviet Union (FSU) (228,000 in 1990 and 195,000 in 1991). These major moments of crisis or post-crisis adaptation occurred at comparable intervals of about 40–45 years, much in response to major events in the global polity (pre-World War I and post-World War II adjustments, the end of the Soviet Union). While no mechanical or deterministic assumption is suggested about the alignment of global geo-political forces, economists and demographers have discussed the possible cyclical unfolding of economic change and its

Table 2
Estimated Jewish international migration, by major areas of origin and destination—absolute numbers, percent distribution, and rates per 1000 Jewish population in countries of origin, 1881–1999

impact on national political systems (Kuznets 1958). Consequences for specific social or ethnoreligious groups tended to stimulate mass migration.

The volume of the main Jewish migration flows is summarized in Table 2 according to a fourfold typology: Eastern Europe; Muslim countries in Asia and Africa; Western countries including America and Western Europe; Ottoman and British Palestine turning since 1948 into the state of Israel. Until 1918, Eastern Europe was the main sending region and the US the main recipient. During the inter-war period, Eastern Europe continued to be the main area of origin but migration was sparser and Palestine emerged as a main country of destination. Since 1948, Israel became the dominant country of destination, especially between 1948 and 1968 when the majority of Jewish migrants came from Muslim countries in Asia and Africa. Since 1969 Eastern Europe again became the main supplier. Over the whole period 1881–1999, 60 percent of all Jewish migrants went to Western countries, primarily the US, and 40 percent went to Palestine/Israel.

Against the predominant Eastern European origin of Jewish migration, its intensity as reflected by yearly rates of emigration per 1000 Jews in the countries of origin was highest from North Africa and the Middle East, fairly low and declining from Israel, and lowest from migration-receiving western countries. At the beginning of the twenty-first century, the overwhelming majority of world Jewish population was located in countries with low emigration propensities. In prospective, and short of significant changes in the current global and regional circumstances, Jewish international migration was bound to decline.

Jewish migration to Israel, usually called by the value-oriented term of *aliyah* (ascent in Hebrew) consistently followed a wave-like pattern. Historiography has numbered such migration waves serially, starting with the 'first' (1881–1903) through the 'fifth aliyah' (1932–1938). The same cyclical pattern actually prevailed throughout the nineteenth century, though with relatively small numbers of migrants, and it clearly continued after Israel's independence. In absolute numbers the greatest single wave occurred in 1948–1951, followed by others of declining size until the major surge of the early 1990s. However, relative to a rapidly expanding receiving population, the highest and quite unique impact of immigration on the receiving society was recorded during the 'fourth aliyah' (283 immigrants per 1000 Jewish residents in

Figure 2
Immigration of Jews to Palestine/Israel, 1919–2000—numbers and rates per 1,000 resident population

1925), followed by Israel's 'great aliyah' (236 per 1000 in 1948 and 266 per 1000 in 1949) and the 'fifth aliyah' (201 per 1000 in 1935) (see Fig. 2).

3. *Main Determinants of Jewish Migration*

International migration has usually represented a major mechanism of adjustment for Jewish communities endangered by disruption of the orderly relationship with the surrounding society and severe worsening of civic rights and economic opportunities. Besides the variable intensity of pro-migration forces reflecting the socioeconomic and political situation within countries of origin (DellaPergola 1998), migration policies were an important factor (Bachi 1977, Friedlander and Goldscheider 1979). Regarding the actual possibility to leave, during the inter-war period and after World War II restrictive Jewish emigration policies were implemented by the Soviet Union and its allied countries in Eastern Europe (in the framework of more general limitations) and other mostly Middle Eastern countries. The effect of border opening is clearly demonstrated by the migration wave from the FSU in the 1990s.

Availability of alternative countries of destination crucially affected the volume and direction of Jewish migration. The landmark was the introduction of restrictive immigration policies by the US in 1921 and 1924. The latter established annual quotas for each country of origin amounting to no more that 2 percent of the respective population already present in the US by 1890. The number of Jewish immigrants to the US was forced down drastically to 10,000 per year. Restrictions followed in Canada, Argentina, Brazil, South Africa, Australia, Palestine (based on 'economic absorptive capacity'), and in Western Europe. Opportunities radically changed after Israel's independence in 1948 and its opening to virtually unrestricted Jewish migration. Israel's ideological call for mass Jewish immigration came together with instant citizenship rights and a modicum of socioeconomic help aimed at easing the initial integration of new immigrant households. Since World War II repeated changes in the Jewish quota again affected the number of Jewish migrants to the US, namely from the FSU. Around 2000, Germany was the second main recipient of Jewish migration after Israel.

Assistance provided by Jewish international and Israeli agencies generally enhanced migration. Various bodies promoted, directed, supported, and subsidized Jewish migrants, such as the Jewish Colonization Association (JCA), the World Zionist Organization, the Jewish Agency for Israel, the American Jewish Joint Distribution Committee (JDC), the Hebrew Immigrant Aid Society (HIAS), and Nativ, the liaison bureau of Israel's government in the FSU (Avni 1991, DellaPergola 1998, Wischnitzer 1948).

The recent migrants' feedback reflected their satisfaction with the situation in the new countries. Information sent back to family and other social networks in the countries of origin significantly affected the latter's decisions about further emigration. The final impact of migration was determined by the amount of return migration. The ratio of net to total immigration was generally higher among Jews than among other comparable groups. At the peak of migration to the US in 1908–1924, the amount of return migration was 5 percent among Jews versus 33 percent among all immigrants (Hersch 1931, Sicron 1957). Later, the rate of immigration retention was higher in Israel (78 percent in 1948–1998, including emigration of Israeli-born) than in the US, Argentina, Brazil, Australia, New Zealand, and countries in West Europe at the peak of the respective immigrations. Short-term economic determinants were the main explanatory factor of emigration from Israel.

4. *Characteristics of Migrants*

The demographic, socioeconomic, and sociocultural characteristics of the Jewish population significantly affected differential propensities to emigrate, and the choice of country of destination.

4.1 *Demographic Characteristics*

Because of its political–cultural character and its more irreversible, rather than merely economic and temporary nature, Jewish migration was comparatively less demographically selective than other migration streams. Entire families moved, including men and women of the whole age range rather than just young single individuals. This meant comparatively high

dependency ratios. Wide demographic differences separated Jewish diaspora communities that had undergone different degrees of modernization, such as the contrast between Jewish populations in Europe and populations in North Africa and the Middle East. In comparison, Jewish migration to Israel included more child and elderly dependents than migration from similar countries of origin to western countries such as the US or France.

4.2 Socioeconomic Characteristics

Jewish migrants included a broad cross-section in terms of socioeconomic stratification. Jews usually had higher-than-average education in the respective environments, with special concentrations in trade, selected branches of industry, and the liberal professions. Jewish migration propensities were higher at the lower and upper ends of the social spectrum. Here again structural differences that had emerged in the diaspora affected the characteristics of migrants to different countries. Israel absorbed a comparatively higher proportion of migrants previously employed in trade and blue-collar occupations. The difference was especially notable in the case of migration from North Africa to France and to Israel during the 1950s and 1960s (Bensimon and DellaPergola 1984, Sicron 1957). Immigration from Western countries and the more recent wave from the FSU contributed unusually high proportions of university graduates that enhanced the quality of Israel's labor force.

4.3 Ethno-Religious Identification

While the general definition of Jewish migration applies to the whole of migration flows reported here, not all of the migrants who moved together as families or as communities were actually Jewish. Intensive assimilation experienced by Jews in the diaspora in recent decades translated into high percentages of mixed marriages. The enlarged Jewish population inclusive of non-Jewish household members in the FSU at the close of the twentieth century amounted to twice or more the size of the core Jewish population. The number and proportion of people entitled to emigrate under special provisions for Jewish migrants established in Israel under the Law of Return, in the US quota system, and in Germany, therefore tended to grow significantly.

5. Consequences for Jewish Communities and for Countries of Destination

Mass relocation played a crucial role in shifting the main centers of Jewish presence globally. Even more significantly, the passage from less to more modern environments produced significant changes in demographic behavior, socioeconomic opportunities, and cultural outlook among Jewish communities. In the US and other western countries, successful immigrant absorption over a three-generation span stimulated a fast rise of Jews from one of the lowest to one of the highest-ranked ethnic and religious groups in the social ladder.

In Israel, absorption of mass migration created the backbone of a new society and significantly stimulated national economic growth and complexity (Metzer 1998). Between 1948 and 2000, net migration contributed about one half of Israel's total population growth of 4.3 million, while much of the natural increase was produced by immigrants and their descendants. Diverse levels of modernization and socioeconomic development attained by Jewish diaspora communities in the respective countries translated into internal social gaps within the new framework of Israeli society. The ingathering of the exiles and fusion of the diasporas became central tenets of Israeli social policies both in the immediate and in the longer term (Bachi 1977, Schmelz et al. 1991).

Jewish Law

The term 'Jewish law,' the modern English epithet for halakha, covers legal arrangements in different geographic areas and historical eras, from biblical times to the present. Jewish law, the foundational texts of which are the Torah (the Pentateuch) and the Talmud, is a normative system regulating all aspects of daily life, private and public, including ritual, property, family, commercial and penal law, and the law of obligations. In the public domain, it encompasses the judiciary, taxation law, communal regulations and constitutional law. Although some segments of the halakha are valid only in the land of Israel, the jurisdiction of Jewish law is personal, not territorial, and applies to Jews everywhere. Jewish law also makes a claim on humanity in general through its code known as the seven Noahide laws: the injunction to establish courts, and the prohibition of blasphemy, idolatry, sexual transgressions, bloodshed, robbery, and eating flesh cut from a living animal (bSanhedrin 56a). (Tractate names prefaced by b, j, and t refer to the Babylonian Talmud, the Jerusalem Talmud, and the Tosefta respectively). Today, not all Jews accept the authority of Jewish law, though in previous millennia it was accepted as binding by Jews everywhere.

This article will provide an overview of Jewish law from the perspective of legal theory; descriptions of institutions and trends are therefore general and do not mention exceptions and unique cases.

1. *Preliminary Remarks*

The role of the halakha in postbiblical Jewish civilization cannot be overestimated. It is not only the force that held Jews together, both in the land of Israel and throughout the Diaspora, but its study and interpretation are also the primary focus of Jewish intellectual endeavor, by far overshadowing philosophy, homiletics, and Kabbala. Study of the law is a paramount religious duty, to be carried out daily by laymen as well as scholars. Social and personal success are measured by achievement in studying the law. Furthermore, students are encouraged to speak their mind, even if their opinions diverge from the received view, empowering individuals to participate in the evolution of the law. Though limited to those actually engaged in Torah study, this participation has a ripple effect, generating a sense in the community that the law, being an ongoing enterprise rather than dictated from above, is democratic, so to speak. Most halakhic literature is authored by individuals who hold no official position, and whose authority is accepted by the community due to their erudition and integrity. Another element that reflects the participatory dimension of Jewish law is its cardinal, all-embracing decision-making principle that the law is in accordance with the majority view.

1.1 *Historical Survey*

The following periods can be distinguished in the history of Jewish law: the biblical period, the talmudic period (first century BCE to fifth century CE), the Geonic period (sixth century to twelfth century), the period of the Early Authorities (Rishonim) (thirteenth century to sixteenth century); and the period of the Later Authorities (Aharonim) (seventeenth century to the present). Four main geographic centers of legal activity are similarly distinguished: the land of Israel and Babylonia, in the talmudic and Geonic periods, and later, Sfarad the Iberian peninsula (north Africa, and Ashkenaz Franco-Germany). Peripheral centers were largely under the influence of these four centers. As to the biblical era, on the internal self-understanding of Jewish law, the Torah is an expression of a unified divine revelation, a claim unacceptable to contemporary biblical research. Hence a convention has emerged among most scholars of Jewish law to the effect that biblical research is considered a field distinct from research in Jewish law.

1.2 *Jewish Law as a Legal System*

From the jurisprudential point of view, it is difficult to see the different periods and centers as constituting a single system of law, since the hierarchical institutional structure that is the hallmark of any legal system is absent. Jewish law developed despite the fact that it is not the positive law of any state, and its central institution, the Great Sanhedrin, the high court—the institution responsible for maintaining the system's uniformity and coherence—has not existed for about 2,000 years. Certain parts of Jewish law, especially those corresponding to modern criminal law, have not been in force since. A tension between this anomalous

reality and the ideal of a sovereign Jewish regime in its own territory with its own institutions, reflected in the frequently encountered term 'in our day,' which connotes the inferiority of our times, pervades Jewish law.

In the absence of a constitutive institution, Jewish law is generated by the following elements, between which there is yet more tension: (a) the rabbinical establishment, the teachers and students of the law at the rabbinical academies (*yeshivot*), where they study the canonical texts of Jewish law, engaging in debate and dialogue as questions arise; (b) the Jewish communal establishment, responsible for conducting the civic affairs of Jewish communities; (c) the members of the community, who, by adopting certain customs and comportments on their own, force the establishment to acknowledge these behaviors, sometimes condoning them, sometimes attempting to repress them; and (d) the Gentile societies within which Jews live. The extent of the autonomy of Jewish communities varied from place to place and era to era, but there was always a certain trickledown effect by which Gentile mores penetrated the Jewish communities; it may explain, to some extent, the diversity of the different Jewish communities.

A more direct source of this diversity of customs and behaviors, which is tantamount to a state of *de facto* legal pluralism, is the fact that communities are guided by different halakhic authorities. Special status is accorded the local authority, the *mara deatra*. The halakhic establishment validates the community's acceptance of the halakhic authority of its choice, recognizing his decisions as binding on residents of that locale, even if at variance with the prevailing views on the issues at hand.

At the same time, no rigid schools of thought were created in the Jewish world, and the works and rulings of every halakhic authority, regardless of the place and time of their composition, are considered relevant to the halakhic dialogue. Even if it is difficult, from a conceptual point of view, to justify the claim that the various centers, throughout the different periods, make up a single system, from the sociological point of view there is no doubt that the communities see themselves as constituting a single system.

1.3 Legislative and Judicial Institutions

The two main organs of any legal system, the judicial and the legislative, are also found in Jewish law. Whereas rulings of the Sanhedrin were universally valid, 'in our day' all legislation (*takanot*) is of local validity only. Nevertheless, it is abundant and of wide scope, covering all areas of civil and ritual law. The judiciary, too, is highly developed. The following issues pertaining to courts (*batei din*) are extensively discussed in the halakhic literature: alternative methods of dispute resolution, such as arbitration and compromise; appointment of judges; qualifications for judges; payment for judging; composition of the court; self-representation and representation by an agent; due process and equal treatment of all sides; the prohibition against personal or financial interest in the case on the part of the judge; fitness of witnesses and their examination; issuing rulings in writing; and the publication, finality, and implementation of rulings. The extent to which these theoretical discussions can be applied in practice, however, is a function of the degree of autonomy granted the community by the Gentile authorities. Adjudicating disputes within the Jewish court system, where possible, is zealously insisted upon, resort to Gentile courts being considered tantamount to renunciation of the halakha's authority.

2. Talmudic Law

2.1 The Talmudic Period as the Formative Era of Jewish Law

The formative era of Jewish law is the talmudic period, during which foundational texts of Jewish law—the Mishna and the Talmud—were composed. The Mishna is the pre-eminent compilation of the teachings of the Tannaites, sages who lived in Palestine in the first two centuries CE. Arranged thematically, it covers all aspects of Jewish law. The Mishna itself became a focus of interpretative analysis by later sages, the Amoraites, whose work was not limited to commentary on the law, but also addressed the general culture of the time. Palestinian Amoraic academies produced the Jerusalem Talmud, compiled around 400 CE; Babylonian Amoraic academies produced the Babylonian Talmud about a century later. Redaction is far more evident in the latter than in the former.

2.2 Divine Origin and Human Elaboration

Talmudic law is premised on the divine revelation of the Torah to Moses (first half of the thirteenth century BCE) at Mount Sinai (the written law), and the accompanying oral revelation (the oral law), later committed to writing. Together, they record the divine precepts (*mitzvot*) according to which the Jewish people must conduct themselves. Despite the Torah's divine origin, it was subjected to human scrutiny and elaboration. A distinction emerged between *deoraita* and *derabanan*, the former term denoting that deemed of divine origin, the latter, that deemed of human origin. Rabbinic interpretation of the law is not arbitrary, but applies what are known as 'the 13 exegetical principles by which the Torah is interpreted.' Some of these principles of logical inference determine the meaning of the written law, others

enable new rules to be extrapolated from it. There is, however, some debate as to whether these rules were actually employed by the sages of the Talmud to generate new laws, or were but a literary device used to link new laws to the biblical text (*asmakhta*).

Talmudic law distinguishes between precepts pertaining to interpersonal relations (*mitzvot bein adam lehaveiro*) and precepts pertaining to the relationship between individuals and the Almighty (*mitzvot bein adam lamakom*). These realms are not altogether distinct, being interwoven, both conceptually and in practice. The precepts can also be divided into those falling under monetary law (*mamonot*) and those falling under ritual law (*isur veheter*). Monetary law, deemed *jus dispositivum*, is generally approached with greater flexibility, allowing adjustments necessitated by changing circumstances to be readily instituted. Despite this flexibility, in monetary disputes extreme caution is exercised before ruling that someone's assets are to be taken away.

2.3 Jewish Law as an Elaboration of the Talmud

The evolution and philosophy of Jewish law cannot be understood without a firm grasp of talmudic law. The unique position of the Babylonian Talmud vis-à-vis later works is grounded in the fact that it is the latest text universally accepted as binding by the halakhic authorities. Responsible for establishing its authority were the Geonim, heads of Babylonian talmudic academies after the Muslim conquest of Babylonia. From then on, every legal discussion takes as its starting point the Babylonian Talmud's position on the question at hand, though it is not necessarily followed. Accordingly, the remainder of this article will focus on the features of Jewish law that emerge from talmudic law.

Due to its interpretative nature, halakhic creativity emerges in successive layers, in tree-ring fashion. As earlier contributions are always retained, the evolution of the law can be traced relatively easily. Most of the halakhic literature is essentially elaboration of and commentary on the Talmud—the pre-eminent commentator being Rashi, R. Solomon Yitzhaki (France, 1040–1105)—and its application to changing circumstances. The Tosafists, students of Rashi, were pre-eminent in this enterprise. At various times, so-called 'legal codes,' expositions of the law up to that point, were complied, particularly in the Sfardic tradition. Notable examples are the code of Maimonides (Spain-Egypt, 1135–1204), the *Mishne Torah*, the sole completely comprehensive treatment of Jewish law; the *Arbaa Turim*, by R. Jacob b. Asher (Franco-Germany, Spain, c. 1269–1343); and the *Shulhan Arukh*, by R. Joseph Caro (Israel, 1488–1575). These codes themselves became the focus of interpretive activity, generating a new genre of commentaries that came to be known as 'armor bearers,' the codes being the 'knights.'

3. Characteristic Features of Jewish Law that Emerge from Talmudic Law

3.1 Exposition and Implementation

A potentially misleading duality between the exposition of the law and its implementation in practice has always existed in Jewish law. The use of exact measurements and precise formulations (*midot veshiurim*), the meticulous phrasing of laws, the avoidance of such abstract formulations as 'reasonable behavior' and 'bona fide conduct,' could create the impression that talmudic law is a dry legalistic system within which rights and obligations are decided pedantically. But this impression is fundamentally incorrect. The nature of talmudic law as implemented in practice (*halakha lemaase*) cannot be inferred from its theoretical exposition (*halakha*). This distinction is not imposed upon the sources, but found in the sources themselves. Thus, for example, the Talmud explains a misunderstanding as follows: 'He was talking in terms of theoretical law, and they understood him as if he was talking about the implementation of the law' (jBeitza 2a); and states: 'One who inquires about practical law must state that he is inquiring for practical purposes…[given] a practical inquiry and a theoretical inquiry, the practical takes precedence' (tSanhedrin 7:7).

Any attempt to describe Jewish law must therefore carefully distinguish between law intended for implementation and theoretical law. An account of the former for the talmudic period must be based on episodes, precedents, and rulings related in the Talmud; for the post-talmudic period, the responsa literature is a far more reliable source for ascertaining the law intended for implementation than the other genres of halakhic writing. The responsa literature, which originated in the Geonic period, and has flourished ever since, consists mainly of legal opinions issued in response to queries submitted by courts regarding cases before them. Over the years, a corpus of some 250000 responsa has accumulated; part has been electronically indexed by the Bar llan Responsa Project. Another source of information about actual application of the law is extant records of the legal activity, judicial and legislative, of various communities (*pinkasei hakehilot*) from centuries past, as well as extant collections of legal instruments.

3.2 Judicial Deviation from the Law

An accepted truism in western legal thinking is that a judge's ruling must accord with the law. It must be presented as grounded in a well-defined body of norms supplied by the system, known in advance, and applied to the case at hand. The jurisprudential approach that emerges from the Babylonian Talmud does not fit this model. Rather, the judge has the power to deviate from the law and base his ruling on extralegal

considerations. A tradition reported in the name of R. Eliezer b. Jacob encapsulates this aspect of the judicial process: 'I heard that the *beit din* punishes… not according to the Torah' (bSanhedrin 46a).

Obviously, in most cases there will be no discrepancy between the theoretical law and concrete rulings. What is significant is not the frequency of deviation, but the fact that it is an option. The judge does not see himself as constrained by the legal rules, and if, in his eyes, the circumstances of the case justify deviating from them, he need not hesitate to act accordingly. Of course, this does not sanction arbitrary, unreasoned deviation. When a judge deviates from the law, he does so in order to impose the spirit of the Torah, which is traditionally perceived as not given to reduction to a set of rules. Over time, this became the norm in the application of the law throughout the halakhic world, and while judges did not always feel comfortable deviating from the law, their authority to do so was never questioned.

Thus, three levels of law, the first two of which, will, more often than not, overlap, can be discerned: theoretical law (*halakha*), law intended for implementation (*halakha lemaase*), and concrete rulings, which will occasionally diverge from the law intended for implementation.

3.3 Governed by Men, Not by Rules

There is, therefore, a salient difference between the approach of Jewish law and that of western law with respect to the judicial process. The dictum, 'governed by rules, not by men,' which reflects the western ideal, does not reflect the halakhic outlook (see Ben-Menahem 1991). The western approach is based on the idea that a litigant is one who claims his due, not one who seeks succor. The litigant's claim is premised on the court's submission to a well-defined, publicly known body of norms, and on a legal rule that, in the eyes of the litigant, entitles him to a favorable ruling. In contrast, a litigant appearing before a rabbinical court claims no entitlement to a favorable ruling, even if there is a legal rule that, in his eyes, entitles him to such a ruling. Because the judge is permitted to deviate from the rule and decide the case as he sees fit, the litigant's status is that of one who seeks the court's aid. The converse adage, 'governed by men, not by rules,' thus more accurately expresses the worldview of Jewish law.

This analysis may explain the absence of three almost universal legal institutions from Jewish law: equity courts, courts of appeal, and the doctrine of binding precedent. Given the potentially *ad hoc* nature of a halakhic legal decision, as outlined above, the doctrine of binding precedent is beside the point. Courts of appeal are intended to ensure the uniformity of the law and the supremacy of legal rules, objectives that are not a priority for the halakha. Equity courts are a corrective device to redress possible inflexibility on the part of the law. Given the freedom accorded the judge in the Jewish legal system, no need for them was perceived.

From the judge's perspective, the freedom to deviate from the law if necessary is anchored in the notion that judging is a religious precept, the fulfillment of a divine calling. While the weightiness of this charge may induce a paralyzing fear that the law will be distorted and justice miscarried should he misrule (bSanhedrin 6b), it may liberate the judge from the sense that he is bound by legal rules, which, formulated in human language, are subject to human limitations. The judge's mission transcends the simple application of a rule to a given case. He becomes, as it were, God's partner in administering the law: 'Judges should know whom it is that they are judging, before whom they are judging, and who will call them to account [if they pervert justice], as it is written. 'Consider what ye do, for ye judge not for men, but for the Lord' (II Chron. 19:6)' (bSanhedrin 6b). The religious—transcendental dimension of the halakha is most apparent here.

A judicial system of this type can thrive only in a community that accepts the judge as a spiritual leader and role model, and not just an expert technocrat hired to administer the law. At the same time, this concept of the judge is to be distinguished from that of the cadi under the palm tree, as the outlook of the judge in a halakhic proceeding is thoroughly informed by the halakhic discourse.

4. Jewish Law in the State of Israel

With the renewal of the idea of the return to Zion, the idea of constituting Jewish life in the land of Israel on the basis of Jewish law was put forward out of ideological motives by nonreligious thinkers. At the beginning of the twentieth century, the now-popular phrase *mishpat ivri*, Hebrew law, was coined, to denote that part of Jewish law corresponding to civil and criminal law, excluding the halakha's ritual aspects. The foundational work in Hebrew law, which sought to provide a comprehensive picture of Jewish law from a legal perspective, was Rav-Tzair's (Tchernowitz's) *History of Jewish Law* (1945–53, Hebrew); Menachem Elon's *Jewish Law: History, Sources, Principles* (1994) is essentially an updated and much-expanded version of this work. Overall, however, this agenda never gained acceptance. When the founding of the state of Israel began to appear imminent, the idea was reintroduced, this time by national religious circles. Again, it failed to catch on. Today the positive law in Israel recognizes Jewish law as the law of the state only in the realm of family law, which is adjudicated in state-run rabbinical courts, and in a few isolated laws pertaining to religious observance. Otherwise, the influence of Jewish law on Israeli law is minuscule. However, rabbinical courts unconnected to the state thrive in Israel, as they have throughout history in the Diaspora.

Nevertheless, Jewish law is the focus of much scholarly interest at Israeli universities and colleges, as well as, of course, in Israel's numerous *yeshivot*. Contemporary work in Jewish law treats, among other subjects, bioethics and halakha, feminism and halakha, and economic analysis of the halakha.

5. *Non-orthodox Understanding of Jewish Law*

Beginning in the nineteenth century, the hegemony of the halakha as understood by the rabbinical establishment was challenged. The most radical critique came from the Reform movement, which altogether rejected the halakha. The Conservative movement sought to accelerate the pace of halakhic change, in view of the rapid technological and social changes of the twentieth century, and to articulate more explicitly the role of conscience in the halakha. Given the preceding analysis of the halakha as pluralistic, it appears to be unnecessary to dwell on the Conservative understanding of Jewish law. While the divide between Conservative and Orthodox Jews may be highly significant from a sociological perspective, there is no divide with respect to acceptance of the halakha's authority. The divergences between the Orthodox and Conservative communities are essentially no different than those between other communities on the halakhic landscape. As for the Reform movement, to the extent that it has rejected the halakha, it is outside the purview of this article.

Job Analysis and Work Roles, Psychology of

1. *Introduction*

Work analysis is essential if we are to understand and change the way people work and their work environment. If we wish to solve work-related problems, work analysis is not normally a matter of choice: we are either obliged to perform it explicitly or at least base our decisions on implicit work-analysis information.

Job analysis is part of work analysis. It is necessary (see also Ghorpade 1988) because

(a) jobs and their constituent tasks are the basic (design) elements of an organization, forming the basis for the constitution of work groups, departments and other larger divisions;

(b) jobs are consciously designed and changed; by people (e.g., industrial engineers) who do not normally perform them; and

(c) modern organizations are constantly changing (job analysis allows a continuous adjustment of job-related requirements to changing organizational goals).

There are a large number of jobs (e.g., in the production, office/administration and service sectors) and elements of the work situation (e.g., organizational structures, agreements on working hours, work objects, and means of work), and a wide variety of ways in which job-related information can be used, that practically preclude the possibility of adopting a universal approach or analysis method here. Accordingly, there is no one job-analysis method, but rather a number of systems, techniques, and methods that can be used to analyze jobs (see Dunckel 1999, Gael 1988).

Nor are there any universally valid definitions; terms such as job, position, task, and element being used differently in different countries and approaches. This fact should be taken into account by the reader, for this paper, too, uses terms in a way that would certainly not be endorsed by all job analysts.

Job analysis is the systematic, empirically oriented, problem-based collection of information on the interaction between humans and the work tasks and conditions that constitute a job or are connected with it.

Depending on the respective problem or goal (e.g., organizational planning and design, human-resource management), different approaches and different tech-

niques and methods are normally required (Dunckel 1999, Gael 1988, Ghorpade 1988). A distinction should be drawn between job analysis and job evaluation: job evaluation in the narrower sense aims to determine compensation levels for a job (Landy 1993); in a broader sense, job evaluation is also the evaluation of jobs according to given criteria, e.g., the extent to which jobs are conducive to health or personality development.

Jobs are composed of tasks, i.e., the same jobs are characterized by largely identical tasks. Task analysis is therefore a key element in job analysis (see Landy 1993). Task is generally taken to mean the purpose of a work system or the goal to be achieved under given conditions. Tasks specify goals to be attained by the worker, taking into account different overall conditions. Elements of jobs are therefore defined as work tasks if they relate in each case to different goals (see more detailed treatment in Oesterreich and Volpert 1987, Ghorpade 1988). Tasks are the points in a job at which the organization meets real individuals and makes concrete demands on the activities of these individuals. The task is thus the 'interface' between organization and individual and an essential element in psychological job analysis.

Psychological job analysis systematically captures and evaluates information on a working individual's activity. Here, it is not only concerned with the externally visible activity and the conditions surrounding it, but also with the psychological processes (e.g., thinking, motivation) and structures (e.g., memory) determining and regulating this activity. Psychological job analysis thus focuses on the concrete work activity as a psychologically regulated activity—i.e., the activity of a working individual.

Unlike 'classical' work studies or technical (job) analyses, psychological job analysis is inconceivable without involvement of the real working individual concerned. Supplying the workers affected with comprehensive information on the aims and objectives of an analysis, taking into account the fears and anxieties caused by it and providing feedback to the workers on the results are (or should be) essential elements of any psychological job analysis.

2. *Classification Criteria*

Job-analysis methods and techniques can be distinguished on the basis of various criteria (see also McCormick 1976): the unit of analysis, intended applications, theoretical foundation, method users and methods of data collection, methodological standards and results.

2.1 *Unit of Analysis*

The job-analysis unit is the job itself and the tasks that comprise it. For this reason, many job-analysis systems relate directly to the tasks and the immediate work conditions. More comprehensive job-analysis systems (see Dunckel 1999, Gael 1988) take into account the fact that essential features (e.g., the potential of the individual for defining goals self-reliantly) and results of the tasks become comprehensible only if the overall organizational conditions and the knowledge, skills and attitudes of the workers are taken into consideration. They therefore extend the analysis to include both the organizational conditions (e.g., degree of responsibility, codetermination potential, values and norms, leadership climate) and the working individuals with their respective knowledge, skills and attitudes.

Methods can be classified, based on widely accepted criteria, according to whether they are more job/task-oriented or worker/person-oriented. Job-oriented analysis is concerned with analyzing tasks, job conditions or job features, without regard for the concrete individuals involved and their different knowledge, skills, abilities and attitudes. Person-oriented analysis, on the other hand, is centred on the person and specifically concerned with differences between individual workers in the perception, interpretation and performance of the job.

Typical job-oriented approaches are: Functional Job Analysis, Task Inventories, Health Services Mobility Approach; typical person-oriented approaches are: Position Analysis Questionnaire, Critical Incident Technique, Ability Requirement Scales (see Gael 1988, Ghorpade 1988).

The distinction between job-oriented and person-oriented analysis is of conceptual and practical significance. In stress research, for example, it is conceptually important to begin by determining stress factors independently of the person involved (and their individual perceptions and coping behavior) in a job-oriented manner, then going on to examine how objectively identical stress factors are perceived and dealt with differently by different individuals and how they affect different people. However, the (person-oriented) analysis of these inter-individual differences means first determining objective stress factors, because we are concerned here with inter-individual differences in relation to objectively identical stress factors. This distinction is of practical significance when planning future workplaces for which there are not yet any workers. Here, the job-oriented approach is the only way of obtaining job analysis information.

2.2 *Intended Applications*

Techniques and methods have been and are being developed for different goals and potential applications. Job-analysis literature contains numerous different lists of goals and proposed uses for job-analysis information (see Ash 1988, Lees and Cordery

2000). Basically speaking, two goals complexes can be distinguished: work/job and organization design, and personnel development. More concrete aims of job analyses are, for instance, comparing work activities, changing and planning the work situation and organization, determining skill requirements and factors defining aptitude requirements, technology assessment, maintenance of industrial health and safety standards, and job evaluation.

Job-analysis methods and techniques play an important part in human-resources management and personnel selection (see Algera and Greuter 1998). There are used to determine more precisely the requirements a person must meet to perform their work tasks. These requirements may be specified as tasks to be accomplished, as behavioral requirements (e.g., required behavior or behavioral repertoire), as eligibility requirements (e.g., knowledge and skills) or as trait requirements (e.g., abilities and interests). For each of these requirement types, there are a number of techniques available (see Gael 1988).

If the results of such analyses are combined, job analysis can also be used to describe (work) roles as defined by Katz and Kahn (1978). According to these authors, roles are standardized behavior patterns demanded of all persons involved in a given functional relationship. Here, job analysis can also help identify when and under what conditions role expectations (of the different organization members with respect to individual workplace occupants) can lead to conflicts and job stress.

The intended applications of job analysis are not necessarily independent of one another. If, for example, the goal is to change the work organization, it will often be necessary to analyze the technological implications and the consequences for the workers involved as well.

Besides the application purpose, the application area also plays an important role. Job-analysis techniques and methods consider different levels and units of an organization. A distinction must be made between:

(a) sectors (e.g., industrial, administrative, service);

(b) levels of an organization (e.g., enterprise as a whole, business division, department, workplace group, workplace, work task);

(c) professional groups (e.g., executives, specialized professional groups); and

(d) activity classes (e.g., assembly, control and monitoring activities, administrative activities, service activities).

Depending on the specific concern, the emphasis will be on different information. Job analysis, too, faces the problem of breadth vs. depth. The more detailed the information, the more limited the application purpose. It may therefore be a good idea to proceed in several steps, starting with rough analyses to determine the key analysis areas, which are then analyzed in greater detail.

2.3 Theoretical Foundation

The theoretical foundation largely determines which information is captured at which level or with which analysis unit.

Work studies as defined by Taylor or Gilbreth (see Ghorpade 1988) are based on an additive *movement* (or motion) model. Techniques working on this basis thus attempt to define elementary movement units (e.g., grasping with the hand), combining these additively in order to then determine, say, the standard time required to perform the work.

Approaches rooted in behaviorism also attempt to identify elementary units (of behavior) (e.g., processing materials, recognizing optical differences). Their units are bigger, though; they are therefore not movement- but *behavior*-oriented.

These approaches, however, fail to take into account the fact that movements merge to form 'wholes,' are integrated in complex webs of activity and the regulating mental processes and representations and are codetermined by these. This is why many recent developments, especially in Germany, are based on the '*action regulation* theory' (see Frese and Sabini 1985, Oesterreich and Volpert 1987), thus giving priority to questions relating to the psychological regulation of action, the level of psychological regulation, the completeness of actions, the degrees of freedom (Hacker 1998) or the scope for action or decision. The guiding idea here is that of humane work, i.e., work geared to human strengths and enabling individual workers to perform their job under permanently tolerable conditions, without impairment of their well-being and in a manner conducive to their personal development.

In the emphasis they place on characteristics such as scope for action, variability, identity and importance of the task, action-theory approaches are in keeping with the traditions of industrial sociology, e.g., the work of Turner and Lawrence (1965) and the work of Hackman and Oldham (1975) that builds on this. Since the latter approaches are specifically concerned with questions relating to the 'motivation potential of work,' they can also be classified as oriented to *motivation theory*.

Besides drawing on approaches based on behavior, action, and motivation theory, job-analysis systems also have recourse to concepts of stress theory, ergonomics and human engineering; in addition, worker-oriented approaches draw on concepts of personality theory.

2.4 Method Users

The main users of job-analysis methods are the workers themselves, first-level supervisors, higher-level supervisors, job analysts, technical experts and other company experts, but also works and staff councils.

Whether and to what extent a method can be used depends, among other things, on the application requirements that must be met by the users. Important factors here, besides formal qualifications, are the amount of experience the users need in analysis techniques, whether they can teach themselves how to use such techniques or whether special training is required.

2.5 Methods of Data Collection

There are also fundamental differences between techniques in terms of the data-collection methods used, e.g.:

(a) interview methods (e.g., individual and group interviews, technical conferences with experts, more or less structured questionnaires and check lists);

(b) observational methods (e.g., direct and indirect observation, continuous observation, work sampling);

(c) analyses of company data (e.g., working hours lost, accident statistics, workplace descriptions);

(d) analyses of documents (e.g., file analyses, form analyses);

(e) work activities performed by job analysts.

Each of the methods has its advantages and disadvantages. It is therefore a good idea to combine several methods (see Gael 1988). These advantages and disadvantages can be highlighted by comparing interview and observation methods.

2.5.1 Interview methods. It is a good idea to interview workers, for they are the ones that know their own work activities best. Furthermore, such interviews are indispensable when the workers' subjective assessment of the work is needed or psychological processes are to be evaluated because these can only be accessed directly by introspection. In addition, interview methods, especially questionnaires, are frequently the method of choice because they are relatively easy to develop and use. Interview methods are the most frequently used job-analysis technique.

This should not, however, blind us to the fact that interview methods have a number of weaknesses. Some typical problems are:

(a) comprehension problems of workers who are not so accustomed to dealing with the written language (e.g., in the case of questionnaires);

(b) the ambiguity of everyday language;

(c) difficulties in translating scientific terms into everyday language; and

(d) the problem of putting into words many aspects of psychological regulation processes (Hacker 1998).

2.5.2 Observation methods. Observation methods are generally used in cases where it is important to avoid the sort of errors that can occur in interview methods or 'bias' as a result of evaluation and interpretation processes on the part of the workers, or when, in future workplace design, no workers are yet available for the planned jobs.

Observation methods are often seen as a way of getting round the problems inherent in interview methods and obtaining 'more objective' data. In reality, they are subject to the same sort of problems as interview methods, in some cases giving rise to additional problems:

(a) the quality of job observations deteriorates for complex work activities.

(b) certain temporally dynamic aspects of the work activity (e.g., pressure of time) are harder to observe.

(c) infrequent events, which are nevertheless of significance for the job, (e.g., starting and stopping machines, annual accounts) are often not included.

(d) observers, too, are subject to evaluation, interpretation and 'biasing' processes. For instance, observers tend to rate workplaces as uniformly good or bad.

These typical advantages and disadvantages mean that proper job analysis involves considering precisely which methods are suitable. This also means that users must be aware of the problems inherent in these methods, carrying out, where necessary, appropriate training measures to reduce them.

It is also a good idea—whenever this is feasible—to combine different methods, e.g., questionnaires, interview, and observation methods. For this reason, many techniques also include the *observational interview* as a proven data-collection method, based on structured observation of the work processes and related interviews with the workers involved at their workplace.

2.6 Methodological Standards

Job-analysis methods differ, among other things, in their degree of standardization—ranging from non-standardized 'free' descriptions to semi-standardized interviews to observations and interviews following exactly prescribed rules. They differ in the amount of time they take (from 30 minutes to several hours), their psychometric quality, the number of dimensions captured, etc. Which method to choose is not generally decidable; this depends largely on the intended application and on available knowledge and theory building with respect to the problems under investigation.

Scientifically based methods should be reliable and valid:

(a) The *reliability* of a method shows whether and to what a extent a method can be used to obtain 'stable,' 'reliable,' or 'replicable' results. Ideally, repeated measurements of the same object should show as little deviation as possible (see Oesterreich and Bortz 1994).

(b) The *validity* of a method indicates the extent to which it actually measures what it is supposed to measure.

Examining these quality criteria is not only of scientific interest, but also of utmost practical importance. If the results of the analysis are to have practical consequences, e.g., for job design, decision-makers must be able to depend on the fact that the results are reliable and valid.

2.7 Results

Job-analysis methods provide quantitative and qualitative results. Qualitative results are mostly verbal, narrative descriptions of the job or the tasks; quantitative results are presented in numerical—and in some cases graphical— form. Complex methods generally present results in both qualitative and quantitative form.

3. Outlook

In the future too, job analysis will continue to constitute a major basis for organization and personnel development. Given the numerous potential applications, there will be no one universal method covering all application purposes, even though the latest techniques allow more effective forms of information analysis and evaluation.

Job-analysis methods were developed principally for the industrial and administrative sectors. They exhibit shortcomings, for example, when analyzing activities in the service sector, domestic and family work and the self-employed sector. Furthermore, job analysis, too, will be obliged to respond to changes in the working world. New forms of work, e.g., jobs in virtual and networked organizations, teamwork within virtual structures, teleworking, and electronic business, also present new challenges for job-analysis techniques and methods.

In addition, in the area of human-resources management, job analysis is still needed (see Ash 1988) to help reduce gender discrimination with respect to pay by showing that the still existing differences in income between men and women on the same jobs cannot normally be justified by differing job requirements and conditions.

Job Design and Evaluation: Organizational Aspects

Job evaluation is a method used to produce a hierarchy of jobs in an organization as the basis for determining relative pay levels. It seeks to measure the relative value of jobs, not that of the jobholders. Ideally, the performance of the individual should not enter into job evaluation although, in practice, it may be difficult

to dissociate individuals from their jobs. Job evaluation is based on the assumption that components of work can be isolated and that these can be decomposed into elements considered worthy of remuneration.

The main aim of job evaluation is to provide an acceptable rationale for determining the pay of existing hierarchies of jobs and for slotting in new ones. It may be implemented unilaterally or with varying degrees of participation by the workforce. Acceptability, consensus, and the maintenance of traditional hierarchical structures are normally the goals of such schemes.

Job evaluation schemes do not directly determine rates of pay. The rate for the job or the salary market for a job grade is influenced by a number of factors outside the scope of most schemes. Often, the pay determinants and indeed hierarchies are linked to external market pay rates, the relative bargaining strengths of the negotiating bodies, and traditional patterns of pay differentials between jobs. Job evaluation is concerned with relationships, not absolutes.

1. *The Rise of Job Evaluation*

Job evaluation grew up in the first half of the twentieth century, in an era of large, bureaucratic organizations and increasing unionization. There was a shift toward more 'rational' and 'scientific' methods of determining pay differentials. A major concern was to justify pay levels since many industrial disputes were concerned with wages. Collective bargaining, unilateral wage determination, or individual negotiations were seen as unsystematic compared to job evaluation. The rise of mass production and sometimes-militant industrial unionism was also important. As a result of new production methods introduced at the end of the 1930s and during World War Two, the number of varied yet unskilled occupations increased sharply. The clear line between mass production and traditional craft jobs had become blurred. Pay on the basis of job content, not personal attributes, complemented this system of industrial relations.

2. *Main Emphases in Job Evaluation Research*

For many years the main interest in job evaluation has come from scholars in the fields of industrial relations, labor economics, and industrial psychology.

During World War II some academic economists had been members of, or attached to, the US National War Labor Board, a body which encouraged the use of job evaluation. Subsequently, some of these scholars, notably Clark Kerr, wrote about the industrial relations aspects of the subject (Kerr and Fisher 1977). One of his conclusions was that the design of a scheme is of less practical importance than the context into which it is introduced and the way in which it is administered. Harold Northrup, another scholar with links to National War Labor Board, concluded that job evaluation was used by management 'partly to deter or prevent unionization, partly to rationalize its wage scales prior to unionization … and partly to stabilize the wage structure and eliminate continuous bargaining over particular rates after unionization.' (quoted in Hutner 1986, p. 25)

In the 1940s a very different strain of research was started by industrial psychologists interested in the design of rational, equitable pay systems and psychometric issues of reliability and validity. This early research generally concluded that trained individuals, familiar with the organization's jobs and given detailed instructions on how to analyze them, could reach similar conclusions on overall job worth (see, for example, Ash 1947). Interest in sex discrimination in pay systems stimulated further research on the validity of different job evaluation methods in the 1980s. This produced results which were much less clear (Arvey 1986). Madigan (1985) concluded that, while the reliability of various methods tested was in the range from .70 to .90, the accuracy with which the predicted pay grade matched the actual grade was much lower.

The validity of job evaluation has been investigated by looking at the results of different methods, using predictive validity procedures, factor analysis techniques, and testing for potential sources of bias. Results have been contradictory, since some researchers have concluded that the results will be similar whatever the method used (for example, Robinson et al. 1974), whereas others have found significant differences (see Madigan and Hoover 1986). There is some consensus that the skills and knowledge dimension, present in nearly all methods, is an overriding predictor of job evaluation results (Rogers 1946, Madigan 1985). It has been argued that this means that job evaluation mainly measures abilities that a person brings to the job, rather than the job content (Rogers 1946). Another research finding is that where the evaluators know the job title this significantly influences the results (Smith et al. 1989). A review of the psychological literature has proposed, unsurprisingly, that 'research models need to be expanded beyond focusing on the psychometric properties of job evaluation' (Gerhart and Milkovich 1992).

Recent research has drawn upon organization theory to study how individual and group power may influence the outcomes of job evaluation. The coalition model of organizations suggests that negotiation, bargaining power, and politics are key determinants of decision behavior, particularly resource allocation decisions (Pfeffer and Salancik 1974). Using this approach Welbourne and Trevor (2000) examined whether power in a university affected job evaluation outcomes. They concluded that both departmental and individual positional power helped predict the results. Departmental power predicted the number of job grade allocations and reallocations achieved and

positional power predicted the probability of favorable reallocation decisions. Powerful departments were more likely to approach the Human Resources Department with marginally acceptable requests and indulge in more extensive negotiations about the appropriateness of job descriptions and the proposed grade. The school's dean was likely to intervene prior to an official submission, particularly for higher graded positions. Welbourne and Trevor conclude that a rational model of behavior to explain outcomes is inadequate and that job evaluation captures the dynamics of the job's environment as well as its worth. Writing over sixty years earlier Viteles was less measured, claiming that 'beneath the superficial orderliness of job evaluation techniques and findings, there is much that smacks of chaos' (Viteles 1941, p. 165).

3. *Equal Pay and Job Evaluation*

In the 1960s equal pay legislation was introduced in many western economies. The concept of equal pay for equal work has been widened in many jurisdictions to include equal pay for work of equal value. In the European Union, where a dispute arises as to whether work is of equal value, a country is required to provide a process by which an assessment of value can be made. Such a process involves some form of comparison based on job evaluation or classification. Where job evaluation is used it must be shown not to discriminate against women. In some countries, particularly the US, equal pay for work of equal value, also known as comparable worth, has proved to be a highly contentious issue. Economists, labor lawyers, historians, and sociologists have joined the debates. The role of job evaluation in bringing about equal pay for work of equal value has been scrutinized and vigorously disputed.

Among economists there are many that dismiss the use of job evaluation as a remedy for pay discrimination against women. They believe that to attempt to compare the value of different jobs using job evaluation is like 'comparing apples with oranges.'

The power dimension in job evaluation has been made more transparent by historical analyses of the way in which job evaluation has been used to maintain traditional male differentials, reflecting the prevailing values or relative power in society. Job evaluation, despite its rhetoric of fairness, does not necessarily lead to pay equity for women. During World War Two a US National War Labor Board case by the United Electrical Workers against General Electric (GE) and Westinghouse sought equal pay for work of equal value (Milkman 1987). The job evaluation system used for all GE jobs gave different pay rates for men and women. The company responded that these gender-based rate differentials were longstanding, accepted by the union during bargaining rounds, and in line with industry practices. They argued that to pay women more would put the firms at a competitive disadvantage and that the board should consider 'sociological factors,' including women's different social and economic roles. Although the board decided in the union's favor, the companies ignored the decision (Milkman 1987, pp. 80–1). Although explicit references to male and female rates disappeared gendered concepts, such as the distinction between 'light' and 'heavy' work, became the basis for unequal pay.

Until recently most job evaluation schemes continued to incorporate the gender bias of the early twentieth century (Treiman and Hartmann 1981). Common practices were: the separation of men and women into different job evaluation schemes; greater weight being given to the attributes of male-dominated occupations; and using different scales for men and women when converting job evaluated points to pay rates (Baker and True 1947).

4. *The Law and Job Evaluation*

Equal pay legislation has exposed job evaluation to sometimes rigorous analysis in the courtroom. Out of this are emerging principles that seek to ensure that job evaluation schemes are constructed and implemented transparently and without obvious bias. A distinction accepted in the European Court is between analytical and non-analytical methods. In analytical schemes jobs are broken down into their component elements for the purposes of comparison. In non-analytical schemes the relative worth of the jobs may be based on a whole job comparison. More formal methods, particularly analytical schemes, have been judged to be more transparent and less susceptible to bias. However, it has been accepted that no scheme can ever be fully objective since the whole process is based on a series of judgments made about the facts presented to the evaluators. These judgments reflect each evaluator's background, experience, and attitudes.

5. *Future Directions*

By the middle of the 1980s job evaluation was being used by about 75 percent of US firms (Beer et al. 1985). However, for the past two decades increased individualization of the employment relationship has been developing and unions in most western economies have been on the retreat. Employers have been exhorted to be more flexible and willing to consider fundamental changes in employment practices. Increasingly job evaluation has been portrayed as bureaucratic, inflexible, reinforcing hierarchy, and not in tune with the needs of the times. Lawler has argued that in a rapidly changing, highly competitive environment, particularly where companies depend on

advanced technology and the knowledge of their employees, pay systems should emphasize growth, development, and performance (Lawler 1986, 1994). He claims that this is inhibited by job evaluation, which depersonalizes individuals by equating them with a set of duties, rather than concentrating on who they are or what they can do.

These views have been influential and there has developed a greater emphasis on paying people for their skills, knowledge, and performance. However, job evaluation, after becoming less fashionable in the 1980s and early 1990s, is in many countries more popular than ever. One reason for this is that the case against job evaluation has been overstated. Many of the problems associated with it can be overcome by redesigning schemes to fit the needs and values of modern organizations. A second reason is that there exists a flourishing job evaluation consultancy industry which has been quick to respond to some of the criticisms by modifying existing schemes and introducing new ones which incorporate more emphasis on skills, knowledge, competency, and performance. Broadbanding has introduced fewer, wider pay bands, thereby reducing hierarchical levels and the need for constant reevaluations.

A further influence has been that in many countries organizations have introduced job evaluation in order to be seen to be responding to legislative demands for pay equity between men and women. Job evaluation, carried out analytically, transparently, and with the participation of those concerned, normally provides a defence against potentially very expensive legal action.

Job evaluation will continue to change, but is unlikely to disappear. Employees expect equitable treatment. Even in an age of flexibility and individualism, it remains the most reliable means of achieving a pay structure that is perceived as both rational and fair by employees and their managers.

Job Design, Psychology of

Jobs are created by people for people. Whether deliberately or by default, choices are made about which tasks to group together to form a job, the extent to which job holders have to follow prescribed procedures in completing those tasks, how closely the job incumbent will be supervised, and numerous other aspects of the work. Such choices are the essence of job design, which may thus be defined as 'the specification of the content and methods of jobs' for individuals or teams' (Wall 1995). Other terms often used as synonyms for job design include 'job' and 'work restructuring,' 'work design,' and 'work organization.' It is difficult to distinguish among these terms, although those who employ the word 'work' in preference to 'job' tend to take a broader perspective linking the design of jobs more explicitly to the wider organizational context. Psychological interest in this topic is concerned with the effects of job design on employee attitudes and behavior, and with the technological and organizational factors that influence the choice of job design. In this article, the psychology of job design is described with regard to its main research emphases, historical context, proposals for job redesign, key theoretical approaches, research findings, and current issues and future directions.

1. Main Emphases in Job Design Research

In principle, the concept of job design covers all types of work and job properties. Within applied psychology, however, a more particular perspective has developed. First, with respect to types of work, attention has centered mainly on lower-level jobs in larger enterprises, e.g., those involving office and especially shopfloor manufacturing work. Second, with regard to job properties, the focus has been on key generic job characteristics, such as the variety of tasks in jobs and the amount of discretion or autonomy job incumbents have in completing those tasks. Those emphases reflect the history of job design practice, as described next.

2. Historical Context

Since the turn of the twentieth century, the trend in job design within enterprises has been one of 'job simplification' or 'deskilling.' The move from small craft-based industries to larger factories, the emergence of mass production, and the ideas of Adam Smith (1776) and Charles Babbage (1835) on the 'division of labor,' together with Frederick Winslow Taylor's (1911) exposition of the 'principles of scientific management,' are among the influences which led to the design of narrow jobs with closely prescribed tasks. (The above seminal writings are now difficult to find, but key extracts, along with other historically important contributions, are reproduced in Davis and Taylor 1972). The reasoning was that simplifying work in this way would reduce costs by minimizing the risk of errors, allowing less skilled labor to be used, and reducing training requirements. The epitome of this process is the assembly line, where jobs can be so simplified that they involve the continuous repetition of a single operation with a short cycle time, no discretion over how to carry out the task, and no control over the pace of work.

Concern about the human costs of job simplification inspired some of the earliest research in applied psychology. In the UK this was the focus of work conducted during the 1920s under the auspices of the government-funded Industrial Fatigue Research Board. Employees in highly repetitive jobs, such as cigarette making, tobacco weighing, and bicycle-chain assembly, were shown to be bored and dissatisfied with their work (Wall and Martin 1994). As this area of inquiry developed in the UK, the USA, and elsewhere over the next few decades, evidence also began to accumulate of more serious consequences in terms of a link between repetitive work and employee stress or mental health (e.g., Kornhauser 1965). Studies in the 1950s and 1960s extended the agenda by considering also how the restriction of job discretion or autonomy inherent in job simplification affected job holders, and showed similar and often stronger effects.

3. Job Redesign

Evidence of the negative consequences of job simplification fostered proposals for 'job redesign.' This normative term reflects the historical background outlined above. Job simplification is cast as the traditional form of job design, and job redesign is used to denote deliberate attempts to reverse its deleterious effects by building into jobs more task variety, autonomy, or associated properties. Understandably, suggestions for job redesign paralleled the history of job design research. Thus the earliest proposals focused on reducing repetitiveness by increasing the number of different tasks experienced by employees. One such proposal was for 'job rotation,' which involves moving employees at regular intervals between different (simplified) tasks. Another was for 'horizontal job enlargement,' which increases task variety by including a wider range of tasks in jobs.

Later job redesign proposals in the 1960s and 1970s were for 'job enrichment' or, as it is less commonly called, 'vertical job enlargement.' This approach reflected the concern about the low levels of discretion in simplified jobs, and focused on increasing employee autonomy over the planning and execution of their own work (e.g., by giving job holders responsibility for decisions that otherwise would be undertaken by support and supervisory staff). The term job enrichment, originally coined by Herzberg (1966) to denote the approach derived from his 'two-factor theory,' is now used more generally. That theory distinguished between intrinsic or 'motivator' job factors, such as achievement and responsibility; and extrinsic or 'hygiene' factors such as supervision and work conditions. The core proposition was that intrinsic factors were the key determinants of satisfaction and performance, hence the emphasis on redesigning jobs to promote these properties. A final proposal, aimed at enhancing the discretionary component of work at the team level, stems from the sociotechnical systems approach to work organization, and is for the implementation of 'autonomous work groups' or 'self-managing teams' (see below). It is effectively job enrichment for teams.

4. Major Theoretical Approaches

Two theoretical approaches have dominated research on job design, and have yet to be superseded. One of these, concerned with individual job design, is the 'Job Characteristics Model' (Hackman and Oldham 1976). This identifies five 'core job characteristics,' namely skill variety, task identity, task significance, autonomy, and feedback from the job itself, as determinants of work motivation, job satisfaction, work performance, labor turnover, and absence. The strength of the effects of the job characteristics on the outcomes is predicted to be affected by individual differences, in particular being stronger for employees with greater

'growth need strength' and (in later formulations) also for those with higher contextual satisfaction and more knowledge, skill, and ability.

The other dominant approach derives from the more general sociotechnical systems approach to organizational design. The emphasis in this case is on the design of work for teams, with the key proposal being for the implementation of 'autonomous work groups.' Six key criteria specified for such groups are that the work should be reasonably demanding and provide variety, afford the opportunity to learn and continue learning, include an area of decision making that employees can call their own, offer social support and recognition, be of wider social relevance, and lead to a desirable future (Cherns 1987). There is no particular acknowledgment of individual differences in the sociotechnical approach, but otherwise the specified properties of well-designed jobs are very similar to those of the Job Characteristics Model.

5. *Research Strategies*

Research on job design has been of two main types: cross-sectional field studies examining the relationship between job characteristics and outcomes, and change or intervention field studies investigating the impact of job redesign on outcomes. The latter are exemplified by two field experiments described by Wall, Clegg and colleagues (Wall and Martin 1994). In the first, previously simplified individual jobs in a confectionery department were replaced by autonomous group working. Team members were given greatly expanded responsibilities, such as allocating tasks among themselves and resolving every-day operational problems, within the constraints of agreed production targets and health and safety requirements. Effects were investigated over a period of 18 months and showed substantial increases in output and job satisfaction, and a reduction in strain. The second study compared the introduction of autonomous work groups in a greenfield site with a sister site within the same parent company which operated with a more traditional job design. Once again job attitudes (e.g., job satisfaction) were found to improve, but in this case output did not (though productivity was higher because of fewer support staff?).

The difference between these studies highlights a major feature of research findings more generally. Whereas the effects of job redesign on job attitudes appear highly reliable, the consequences with regard to performance are less consistent (Parker and Wall 1998).

6. *Current Issues and Future Directions*

Interest in job design, which peaked during the 1970s, making it then one of the most prominent topics of inquiry within industrial and organizational psychology, waned during the 1980s. However, at the start of the twenty-first century it is resurfacing in response to new strategies, practices and technologies emerging in manufacturing and elsewhere. Organizations see improved quality, flexibility, and responsiveness to customer demand as the route to greater competitiveness, as well as cutting costs, and are supporting this through the use of computer-based technology, just-in-time inventory control, total quality management, business process re-engineering, delayering, and other initiatives. It is widely appreciated that the success of these depends on their being supported by appropriate job designs.

This renewed emphasis on job design has been further strengthened by other developments, and in particular by more general proposals for 'high performance work systems,' 'high involvement organizations,' and 'empowerment' (e.g., Lawler 1992, Hardy and Leiba-O'Sullivan 1998). These proposals incorporate the traditional core principles of job design, inasmuch as they recommend that employees take on a wider range of tasks and be given much more autonomy and discretion in their work. At the same time they adopt a wider perspective than that usually encompassed within job design theory and research. In so doing they help to make explicit the limitations of existing knowledge and clarify directions for future development.

Several areas of development are high on the agenda (Parker and Wall 1998). The first concerns the relationship between job design and performance. Traditional job design theory, and its manifestation within the broader notions of high-involvement organizations and empowerment, is implicitly universalistic in this regard. It assumes positive effects of increased autonomy on performance irrespective of external circumstances. Yet, as noted above, evidence shows the impact of job redesign on performance is variable. Such inconsistency points to the existence of unspecified contingencies that need to be identified. One such contingency, suggested by organizational theory and recent research findings, is that of 'operational uncertainty.' It is likely that providing autonomy for employees benefits performance most under changing and unpredictable work conditions, but yields less benefit as requirements become more standard and predictable (Wall and Jackson 1995).

A second line of development concerns the need to investigate the effect of job design on a wider range of outcomes. Most studies focus on outcomes such as job satisfaction, organizational commitment, and mental health. Considerably less attention has been given to the consequences of job designs for health and safety (e.g., accidents, overexertion injuries, incidents of violence), employee learning and development (e.g., the development of knowledge, personal initiative), and outside-work outcomes (e.g., leisure activities, family relationships).

A third area for development is to broaden the range of work characteristics encompassed. At present the job characteristics considered are those stemming from traditional forms of work, in particular simplified jobs within manufacturing settings. The growth of service and knowledge work, the emergence of new computer-based technologies, and the opportunities being opened up by telecommunications suggest that a range of other job properties likely to affect employee well-being and performance will come into play. For example: many computer-based systems can substantially reduce the physical demands of work, but enhance learning and problem-solving demands; teleworking can accentuate social isolation; modern manufacturing initiatives such as lean production can increase employee work load and time pressure; and new forms of 'contingent working' (e.g., short-term, project-based contracts) raise questions of security and employment continuity. Job design theory will need to adapt to such changes.

Job design theory will also need to adapt to changes in the work force itself. Increasingly, employees are 'less young, less male, and less white' (Howard 1995, p. 33). Existing work design theory takes little account of age, gender, and race, yet these demographic factors could have an important influence on people's requirements for, and responses to, job design. For instance, autonomy over working hours might be especially key for working women with children because it allows them more easily to juggle work demands with domestic and child-care tasks (for which women still typically have the major responsibility). For older employees working in physically demanding jobs, autonomy over work breaks might be especially important because it allows for rests to alleviate any physical strain.

Perhaps the least-well understood aspect of job design is that concerned with the mechanisms, or processes, through which job properties affect outcomes. Historically, job design theory and practice have been founded on motivational assumptions, that gains from job redesign result from enhancing the effort people put into their work. More recent research suggests that motivation does not provide a complete explanation, and that consideration needs also to be given to the effect of job design for peoples' understanding of their work, their proactivity, their work orientations, and their feeling of self-efficacy (Parker et al. 1997, Parker 1998).

A final issue concerns the role of job design principles in the design of new systems. The emphasis within the job design literature has been on how jobs can be better adapted within their technological context. However, the technology may itself preclude job design alternatives that might be of value. It is equally important to ask how knowledge of job design might be exploited to design better systems in the first place, and to encourage social scientists and users to work alongside development engineers in the design and implementation of new systems (Clegg et al. 1996).

Job Stress, Coping with

Coping with job stress is a key concept in understanding people's adaptation to their work roles. In their jobs employees are confronted with various kinds of demands, which may become 'stressors' when they tax or exceed the employee's adaptive capabilities. Examples of common job stressors include work overload, role problems, poor job control, lack of support from supervisors and co-workers, and interpersonal conflicts. These stressors may lead to negative psychological (e.g., depression, irritability, burnout), physical (e.g., headaches, heart palpitations, hyperventilation) and behavioral (e.g., absenteeism, turnover, violence) symptoms or 'strains.' The psychological process that is involved in dealing with these job stressors in order to reduce strain is called 'coping.' More specifically, coping with job stress refers to the things employees do to handle the stressors they encounter in their work roles (see *Stress and Coping Theories*). These individual coping efforts may or may not be supported by the employing organization.

1. *The Concept of Coping*

Rather than a homogeneous concept coping represents a diffuse umbrella term. Nevertheless, a widely used definition of coping exists that refers to the constantly changing cognitive and behavioral efforts a person makes to manage demands that tax or exceed their personal resources (Lazarus and Folkman 1984). Coping refers to an interplay between person and environment that occurs when an individual appraises a situation or an event as stressful. As far as coping with job stress is concerned, this interplay involves the employee and his or her job environment or work setting that is appraised as stressful. It is important to note that coping refers merely to the effort made and not to the quality of the outcome. That is, coping may be either effective or successful in preventing, avoiding, or controlling individual distress or it may be ineffective or unsuccessful. For instance, compensatory or comfort behaviors such as excessive eating, smoking, drinking, or working commonly are cited as examples of maladaptive coping strategies. Furthermore, coping may refer to overt actions or observable behaviors as well as to covert, unobservable thoughts and events.

2. *The Historical Development of Coping*

As far as the conceptualization of coping is concerned, three approaches can be distinguished. Initially, coping was studied from a psychodynamic point of view in the general context of human adaptation. In the first half of the twentieth century, leading psychoanalysts like Freud, Adler, and Jung described adjustment and defense mechanisms by which individuals deal with intrapsychic conflict. Building upon this earlier work, in the 1960s and 1970s ego-psychologists distinguished between coping as an advanced or mature ego process leading to successful adaptation and defense as an unsuccessful neurotic mode of adaptation.

The second approach emerged from the 1960s and conceived coping in terms of personality traits. Relatively stable dispositions or coping styles (i.e., denial, repression, vigilance) were expected to determine the individual's coping behavior across various situations. Although empirical research has shown that people possess stable and consistent coping preferences it is likewise true that individuals are able to vary their responses to stressful situations in accordance with the demands posed by these situations. Personality traits have made a comeback in the 1970s and 1980s as so-called personal coping resources like 'hardiness,' 'dispositional optimism,' 'internal locus of control,' 'self-efficacy,' 'sense of coherence,' and 'self-esteem.' Such coping resources were expected to foster successful coping since the individual can draw upon them when under stress.

The currently dominant transactional approach originates from the work that Lazarus and his colleagues have performed since the 1950s. In contrast to the psychoanalytic approach, coping is defined in this approach by an effort that is independent from its success and includes pro-active as well as defensive strategies. Furthermore, coping is considered to be a dynamic and transactional process involving person as well as environment rather than the result from a relative personality disposition.

Coping has been applied to various aspects of human life. Initially, it was used predominantly in clinical and health psychology to understand how patients deal with chronic disease, substance use, loss, chronic pain, and trauma. More recently, minor coping efforts involving so-called daily hassles have been investigated. Coping with job stress (including unemployment) has been studied since the end of the seventies and involves long-term chronic job stressors (e.g., future job insecurity), short-term daily hassles at the job (e.g., interpersonal conflict), as well as acute severe stressors (e.g., armed robbery).

3. *General Coping Theory*

The leading cognitive-behavioral theory of stress and coping of Richard Lazarus and his co-workers (see *Stress and Coping Theories*) is usually applied to work situations as well. It assumes that a particular situation or event is appraised negatively as stressful in terms of threat, loss, or harm. Alternatively, the situation or event may also be appraised neutral or positive as a

challenge. In this so-called 'primary appraisal,' the person asks 'What do I have at stake in this encounter?' For instance, in a conflict with a colleague the employee's self-esteem may be threatened, whereas unemployment is likely to be perceived as a loss, rather than a challenge. In 'secondary appraisal' the concern of the person is 'What can I do? What are my options for coping?' The answer depends to a large extent on personal characteristics, such as motivation, beliefs about oneself and the world, and recognition of personal and situational resources for coping such as financial means, social and problem-solving skills, particular personality traits, and a favorable work situation that includes for instance social support from one's colleagues and supervisor. It is important to note that both appraisal processes—primary (demand) appraisal and secondary (resource) appraisal—are two components of one cognitive process that take place simultaneously, instead of one process (secondary appraisal) taking place after the other (primary appraisal).

Generally speaking a main distinction is made between two targets: (a) problem-focused coping, which involves attempts to deal with stress by directly altering the situation and (b) emotion-focused coping, which involves attempts to regulate the emotional responses to a stressful situation. For instance, employees might consult their supervisors after a conflict with a colleague (problem-focused) or they may try to relax or distract themselves (emotion focused). In addition, various methods of coping are distinguished such as active–cognitive (i.e., intrapsychic attempts to manage the appraisal of the stressor through, for instance, constructive dialogue or positive comparison), active–behavioral (i.e., overt attempts to deal directly with the stressor), and avoidance (i.e., avoiding or denying the stressor). Although targets and methods of coping can be distinguished theoretically this distinction is usually quite difficult to make at the practical level.

After the coping effort has been completed, a reappraisal of the initial stressful event takes place along the same lines as the original primary appraisal: 'Is there still something at stake in this encounter?' The conflict with one's colleague may be solved or one may have found a new job. In that case the reappraisal is positive and there is no need for further coping efforts. However, in case initial coping efforts failed and the event is reappraised as stressful coping attempts continue.

4. *The Individual and Organizational Perspective*

In Fig. 1 a taxonomy of individual ways of coping with job stress is displayed, including some examples of coping behaviors. Typically, in occupational settings workplace strain and coping are individual *as well as* organizational issues. This means that interventions to reduce workplace strain may be targeted at the individual or the organizational level (Quick et al. 1997). Interventions that focus on the individual include job stress education activities, relaxation programs, cognitive-behavioral programs, and employee skills training in such areas as time management and assertiveness (see *Stress Management Programs*). Interventions that focus on the organization seek to reduce strain by changing and improving macrolevel factors operating within organizations (e.g., job-redesign, selection and training policies, organizational development). Although organization-based interventions offer considerable potential for reducing or eliminating job stressors, most workplace initiatives focus on the individual employee. That is, their adaptability to the existing work environment is improved by changing their behavior and improving their life-style or stress management skills and augmenting their coping resources. In the last decades different programs have been developed to increase individual stress resilience and promote health and wellbeing at the workplace, including on-site fitness facilities, health screening, dietary control, smoking cessation, cardiovascular fitness programs, relaxation classes, stress-management training, antiburnout workshops, stress and health education, and psychological counseling.

Generally speaking, individual-based interventions, particularly relaxation programs and cognitive-behavioral programs, seem to be effective in reducing employee strain (i.e., burnout, distress, depressed mood, anxiety, and psychosomatic symptoms), whereas the effectiveness of organization-based strategies is still to be demonstrated unambiguously.

5. *Research*

Earlier studies on coping with job stress often found that employees use fewer problem-focused than emotion-focused strategies directed at changing the problems encountered in the context of work. This was interpreted by noting that the very nature of problems at work are perhaps not ameliorated easily by attempts to change them. It was reasoned that employees are perhaps better off by developing a renewed cognitive perspective and by regulating their negative emotions. More recent studies, however, point to the opposite: currently employees seem to favor problem-focused coping instead of emotion-focused coping. More detailed investigations have shown that the level of job control plays a crucial role. When a high level of job control exists, problem-focused strategies prevail, but when job control is poor employees seem to favor emotion-focused strategies. Unfortunately, the latter are generally less effective compared to the former. For instance, studies on organizational changes, such as corporate restructuring and downsizing, suggest that employees cope

METHOD	Problem/Task	Emotions/Reactions
Cognitive	Control Planning, organizing, and prioritizing assignments	Control Try to think of oneself as a winner, as someone who always comes through
	Escape Try to pay attention only to your duties in order to overlook difficulties	Escape To tell oneself that difficulties are unimportant
Behavioral	Social Sit down and talk things out	Social To express ones irritation to other colleagues to let off steam
	Solitary To do what has to be done, one step at a time	Solitary Spend time on a hobby
	Control Delay or leave some of ones normal job responsibilities	Control Show no emotional reaction and do not communicate distress to anyone
	Escape Get busy with other things to keep ones mind off the problem	Escape Change to nonwork activity; take pills, smoke more

Figure 1
Ways of coping with job stress (adapted from Latack and Havlovic 1992)

rather poorly with these events which are largely beyond their control. They use predominantly emotion-focused and avoidant coping strategies and suffer long-term adverse mental health.

As a general rule, the more active, problem-focused, and control-oriented the coping strategy the less (mental) health symptoms and the higher employee wellbeing. In contrast, emotion-focused strategies as well as escape-oriented or avoidant strategies generally are associated with poor (mental) health and unwellbeing. However, two factors seem to be important for successful coping: time frame and availability of coping resources. It seems that emotion-focused or escape/avoidant-oriented strategies are effective when dealing with short-term stressors, whereas problem-focused and control-oriented strategies are more effective when dealing with chronic or recurrent job stressors. Furthermore, employees who have more coping resources at their disposal appear to use active coping efforts more and avoidant coping less. Consequently, employees who can draw upon coping resources are more likely to deal successfully with job stress.

As far as the relationship between employee coping and sociobiographical factors (e.g., age, gender, education) and job factors (e.g., level and type of job) is concerned, no conclusive empirical evidence is available (Cartwright and Cooper 1996). For instance, among employees no consistent gender-specific or job-specific coping patterns have been observed. Most likely this lack of conclusive evidence has to be attributed to the complex interaction patterns that exist among the factors involved.

6. *Methodological Issues and Future Directions for Research*

The measurement of coping is fraught with problems that are partly imputed to the fact that almost exclusively self-report questionnaires are used. More specifically, inductively or empirically developed coping scales yield different dimensions or coping behaviors compared to deductively or theory-based coping scales. Furthermore, the number of coping dimensions included in various questionnaires ranges

from two to 28 and there is neither agreement on the hierarchy of these dimensions nor on the fact whether coping should be assessed dispositionally (as a trait) or episodically (as a state). Most importantly, to date, no generally accepted measure exists to assess coping in an occupational context.

At the theoretical level, the crucial distinctions between coping and coping resources, between coping styles and coping behaviors, and between appraisal and (cognitive) coping needs further clarification.

Joint Action

For the purposes of this article a 'joint action' is the action of two or more people. Thus, two or more people may hold a conversation, go for a walk (together), and so on. The participants will naturally refer to what 'we' did, as in 'We had a conversation,' and 'We went for a walk.' Joint actions are ubiquitous and it is hard to imagine a human life without them. At the same time it is not easy to say precisely what is required for the performance of a joint action. A variety of accounts have been envisaged by philosophers. This article explains some of the relevant considerations and issues, and reviews some of the central answers that have been given.

1. Some Initial Considerations on Joint Action

1.1 Joint Intentions are Integral to Joint Actions

Contemporary philosophy of action has tended to focus not on joint action but on the action of an individual person. A notion central to the philosophy of action is that of intention. It is commonly argued that what distinguishes an action (such as a man raising his arm) from a mere bodily movement (such as his arm rising) is an intention. When a man raises his arm, his arm rises in part by virtue of his intention to raise it. The sociologist Max Weber made a similar point when he characterized action as meaningful behavior.

Joint actions, similarly, appear to presuppose intentions, in this case joint intentions. Thus, for example, people cannot be conversing unless there is a joint intention to converse. The parties to a conversation act in light of a joint intention to converse, so as to implement that intention. A joint intention may be referred to by such statements as 'We intend to go shopping,'where our intending to go shopping is not, or is not simply, a matter of each of the people in question personally intending to go shopping. Precisely what is at issue is not obvious. Much of the growing body of philosophical work relevant to joint action is concerned with the nature of joint intention, or, in less formal terms, what it is for us to intend.

1.2 Joint Action Must be Cooperative Only in a Broad Sense

Joint action is not necessarily a matter of amicable cooperation. We may be quarrelling with one another or engaged in a fight. Quarrelling and fighting are species of joint action. Though it need not be amicable, there is clearly a broad sense in which joint action is always cooperative or collaborative. I cannot quarrel with you unless you quarrel with me; I cannot fight with you unless you fight with me. If you refuse to take me seriously we cannot quarrel. If you lay down your arms, we are no longer fighting.

1.3 Some Consequences of Involvement in Joint Action

Informal observation of the way people behave when doing things together makes it clear that the parties often rebuke one another for behavior contrary to the relevant joint intention. Such rebukes are commonly understood to be in order. For example, Jill and John are walking together, John begins to lag behind, and Jill rebukes John for doing so. John understands that, in the context of their walking together, Jill has the standing to rebuke him.

Less punitive responses are also commonplace, and routinely understood to be in order. For example, Jill asks John why he is lagging behind. John may not like being questioned like this, but he understands that Jill has a legitimate interest in the matter.

Underlying these responses is the understanding that, all else being equal, participation in a joint intention entitles each of the parties to relevant actions

from the others. If one party does not produce the relevant actions, therefore, the others have the standing to question and to rebuke that party, as they see fit.

A further point is this. Suppose John and Jill jointly intend to go for a five mile walk. At some point along the way John decides that this will be too tiring for him. He may then announce that he is turning back, and he may indeed turn back. If he does these things, then, failing some special background circumstances, he will be acting contrary to understandings that have been set up between him and Jill. It would be different if he said or did something that amounted to asking for and gaining Jill's permission for his turning back.

In general terms, no one party to a shared intention is in a position to cancel or change that intention unilaterally. Though I am in a position unilaterally to change my own mind, I am not in a position unilaterally to change our mind, that is, to change our joint intention.

1.4 Inferences from Statements about What 'We Intend'

A final observation on joint action is this. From 'We intend to walk for five miles' and 'In order for us to walk for five miles, I must walk for five miles,' it seems that John can infer that he has reason to walk for five miles. In other words, our intention can give me a reason for acting. It is at least not obvious that there need be any interposition in this reasoning of a premise about what John himself intends.

2. Two Central Questions

A satisfying account of joint action will incorporate an explanation of the observations just given. Two relevant questions deserve particular emphasis.

2.1 What is the Relation of Joint Intentions to Personal Intentions?

Are the joint intentions that underlie joint actions basically concatenations of personal intentions of the participants, perhaps personal intentions in favor of the joint action? This may be the conjecture that most immediately springs to mind. As we shall see, however, serious problems attend this idea.

2.2 Of What Kind are the Entitlements Associated with Joint Intention?

The parties to a joint intention understand their participation to entitle each of them to actions in conformity with the relevant joint intention. How is this understanding to be explicated? In particular, what kind of entitlement is at issue? One might assume that it is moral entitlement founded on moral principle. On the other hand, it may seem that joint intention is too basic and primitive a phenomenon to require moral understanding in all participants. It is certainly not obvious that it does require such understanding.

3. Some Problems with Accounts of Joint Intention in Terms of Meshing Personal Intentions

A carefully constructed account of joint intention that puts personal intentions at center stage is that developed by Bratman (Bratman 1999 contains a number of relevant articles). This may serve as an example of this type of account for the present purposes.

A somewhat simplified version of Bratman's account runs as follows. We jointly intend to go for a walk if and only if (a) (i) I intend that we go for a walk, (ii) you intend that we go for a walk. (b) I intend that we go for a walk in accordance with and because of (a) (i) and (b) (ii); you intend likewise. (c) (a) and (b) are common knowledge between us.

Bratman does not define the 'common knowledge' that he requires in condition (c). What is intended is, roughly, that (in the example) the fact that conditions (a) and (b) are fulfilled is completely out in the open as far as the two people involved are concerned. (For the first published discussion of 'common knowledge' see Lewis 1969.)

There are several problems with this account of joint intention. Two will be detailed here. Both are common to accounts that put personal intentions of the participants at the foundation of joint intention and hence joint action.

One problem has to do with the entitlements associated with joint intention. It does not appear that anyone is entitled to relevant actions from anyone else just by virtue of the satisfaction of the conditions laid down in the account. My intending that we go for a walk, and intending that this occur by virtue of my so intending and your so intending, does not seem to entitle you to any particular action from me. Nor does the fact that my various intentions are entirely out in the open between us seem sufficient to bring any such entitlement into existence.

If you know that I intend that we go for a walk, and have reason to think that I won't change my mind, then there is a sense in which you are 'entitled to expect' that I am going to make the appropriate contribution to our walking together. But this just means that you have a good basis for predicting that I am going to act thus. It does not mean that you are entitled to my acting thus in such a way that questioning or rebuking me is in order.

In related discussion, Bratman has invoked a complex moral principle to argue for the presence of the relevant entitlements in many situations in which his conditions on joint intention hold. The principle in

question is the 'principle of fidelity' proposed in Scanlon (1990). This principle runs as follows (Scanlon 1990, p. 208): If (a) A voluntarily and intentionally leads B to expect that A will do x (unless B consents to A not doing x); (b) A knows that B wants to be assured of this; (c) A acts with the aim of providing this assurance, and has good reason to believe that he or she has done so; (d) B knows that A has the beliefs and intentions just described; (e) A intends for B to know this, and knows that B does know it; and B knows that A has this knowledge and intent; then, in the absence of some special justification, A must do x unless B consents to x not being done.

Scanlon's principle of fidelity is not applicable in all situations where there are joint intentions on Bratman's account of them. So appeal to this principle will not rescue Bratman's account of joint intention insofar as joint intention by its nature entitles its participants to conforming actions.

Another problematic aspect of Bratman's type of account is that it does not explain the need for the concurrence of all parties in order to dissolve the joint intention. One with a personal intention is in a position to change it unilaterally. It follows that an individual who is party to a joint intention in Bratman's sense is in a position unilaterally to do away with one of the foundational personal intentions at any time. There is no need for the permission of the other party or parties. Thus a joint intention in this sense appears to be something relatively flimsy, flimsier than joint intentions as these are ordinarily understood.

4. *The Irreducibility of 'We Intend to Do Such-and-such'*

John Searle has claimed that at the core of joint intention and action lie irreducible thoughts of the form 'We intend to do such-and-such' in the mind of each participant (see, for instance, Searle 1995; see also Sellars 1963). These thoughts are irreducible in the sense that they cannot be reduced or broken down into thoughts about what 'I intend' and what 'you intend.' Searle's central concern is to describe the inner or subjective side of joint intention with respect to each participant. He evidently believes that there are requirements for the correctness of thoughts of the form 'We intend to do such-and-such,' though he does not focus on this issue.

What he writes at one point suggests that, in his view, one person's thought of the form 'We intend to do such-and-such' is correct as long as the other person or persons in question also think that thought with respect to the same people. This proposal does not seem to be right, if 'We intend to do such-and-such' is understood in accordance with everyday understandings about joint intention.

Suppose that Ben is currently thinking, with respect to himself and Elaine, 'We intend to get married.' Elaine is in a similar position. According to the proposal under discussion, it follows that each one is correct in thinking 'We intend to get married.' Yet according to everyday understandings it would not be plausible to claim that, solely by virtue of the facts described, Ben and Elaine jointly intend to get married. If one learned that they had never discussed the matter one would judge that their thoughts were not properly grounded.

5. *A Role for Joint Commitment*

5.1 *Joint Commitment*

When is one right in thinking an irreducible thought of the form 'We intend to do such-and-such,' according to everyday understandings? Margaret Gilbert has proposed that, in a sense she explains, the parties need to have established a joint commitment to intend as a body to do such-and-such (see Gilbert 1999).

The relevant notion of commitment may be introduced by reference to a personal decision. If Jane decides to go shopping this afternoon, she is then subject to a personal commitment to go shopping. She is not subject to such a commitment if she merely inclines to go shopping or hopes to do so.

According to Gilbert, people can be subject both to personal and to joint commitments. A joint commitment in Gilbert's sense is not an aggregate or conjunction of corresponding personal commitments of each party. Rather, it is a commitment of all the parties, or of the whole. By its nature a joint commitment requires the participation of each party for its creation and its dissolution.

Gilbert has argued that the idea of a joint commitment is a fundamental concept that underpins not only joint intentions and goals but also joint beliefs, and social rules and principles (see Gilbert 1989, 1996, 1999). Those engaged in joint action act in light of the joint commitment underlying the relevant joint intention or goal.

There are both basic and derived forms of joint commitment. In order to create a joint commitment of the basic type, each party must express to the rest his or her readiness to be committed with them through a joint commitment whose content is specified. When this has been done in conditions of common knowledge, the relevant joint commitment is in place. In general, when a joint commitment is formed the parties to it are committed simultaneously. They are committed through the joint commitment. Similarly, no one can be rid of their commitment through the joint commitment unless the others are. Once it is rescinded for one it is rescinded for all.

Without prior authorization, no one can unilaterally rescind or dissolve a joint commitment: all must rescind it together. Otherwise it stands as a constraint

on the parties. A joint commitment can of course be violated by one party acting alone, but this is precisely a matter of violation as opposed to dissolution. Unlike those who rescind or dissolve it, the violator acts against a standing joint commitment.

Gilbert construes the idea of being jointly committed to intend as a body somewhat as follows. The parties are jointly committed to constitute together, as far as is possible, a single body that intends to do such-and-such. Though they are plural, or many, they are jointly committed to make themselves as much like a singular subject of intention as they can. A joint commitment to intend as a body is sufficient to create, in Gilbert's terminology, a 'plural subject' of intention. In other words, in her terms, we intend to do such-and-such if and only if we constitute a plural subject of intention.

How do people express to one another their readiness to be jointly committed to intend as a body to do such-and-such? There are many such ways. Among these are such humdrum exchanges as 'Shall we go for a walk this afternoon?' with a following 'Sure, let's.'

Joint commitments are not necessarily set up through verbal exchanges. Two men who jump into a rowing boat in hot pursuit of a fugitive may signal by their attempts to coordinate the movements of the oars that, in effect, they stand ready to be jointly committed to intend as a body to row the boat. As each moves the oars in light of their ensuing commitment they engage in the joint action of rowing the boat.

In principle it may take some time for a particular joint commitment to be established. Each party's readiness to be party to the joint commitment may be made clear only gradually and over the course of many interactions with the other people in question.

5.2 Derived Joint Commitments

The foregoing examples of the formation of a joint commitment involve joint commitments of the basic type. A joint intention in Gilbert's sense may also involve a derived commitment, as in the following example.

Don asks his wife Sally 'Where do we plan to go on vacation this summer?' He presumes that though he is unaware of any such plan, there may already be such a plan, and Sally will know what it is. This presumption is based on the existence of a background commitment of the basic type. Don and Sally are jointly committed to accept as a body that Sally may make vacation plans for the two of them.

With this background commitment in place, Sally is in a position unilaterally to create joint vacation plans. In other words, by virtue of the background joint commitment and Sally's planning, Don and Sally may take on a derived joint commitment to plan or intend as a body to go to Spain this summer, for instance.

5.3 Large Populations

Members of large populations, such as the many inhabitants of a large island, are unlikely to know one another personally, or even to know of one another as individuals. If there are to be population-wide joint commitments in such populations, this will be through expressions of readiness to be jointly committed with all others with a certain common feature, such as 'those living on this island.'

By virtue of background joint commitments of the kind discussed in Sect. 5.2, the members of a large population can have a particular joint intention in Gilbert's sense though many of the members do not know of the intention in question. This accords with everyday understandings according to which it may be said that, for instance, a particular country intends a particular action, without it being assumed that everyone in that country knows of the intention, or, indeed, of the ensuing action.

Those who form intentions for the whole population may be authorized to ensure that these intentions are implemented. Their implementation need not involve all members of the population in order that the action in question be considered an action of the population as a whole.

5.4 Obligations and Entitlements of Joint Commitment

Gilbert has argued at some length that the concept of a joint commitment underlies a central concept of obligation, a concept of obligation for which there is a corresponding concept of entitlement or right (see Gilbert 1996, 1999). A brief indication of her position might note that if one violates a commitment that is joint, one is evidently answerable to the other parties to the commitment. They can observe that one has violated 'our' commitment as opposed to a commitment of one's own. They have a clear basis for questioning the violator and for administering rebukes on their own behalf. A natural way to characterize the situation in familiar terms is to say that the parties to a joint commitment are all entitled to conformity from the other parties. These others have corresponding obligations to conform: they are obligated to all parties to the commitment, their obligation being to conform to the commitment.

This and related arguments are arguments from the nature and structure of joint commitment. It may thus be best not to think of the relevant entitlements and obligations as moral entitlements and obligations. All that one needs to understand, in order to understand that they are there, is the nature of a joint commitment. One need not appeal to the value of anything such as, in the case of Scanlon's principle of fidelity, the value of what Scanlon refers to as 'assurance.'

Going back now to Gilbert's account of joint intention and action, it offers an explanation of how

those who are party to a joint intention have associated entitlements to conformity from one another. These are entitlements of joint commitment. There are derivative entitlements to ask questions, rebuke one another, and so on, should deviation from the joint intention be mooted. Gilbert can allow that in some situations where there are joint intentions it is morally permissible not to act in accordance with them. Such situations may include those where one party coerced another into participating in the relevant joint commitment, and those where the joint commitment is to intend something immoral. All things considered, then, it may be morally permissible not to fulfil the relevant obligations of joint commitment. This does not entail that those obligations no longer exist. They exist as long as the sustaining joint commitment exists (see Gilbert 1996).

5.5 *Joint Intentions as the Intentions of Plural Subjects*

Gilbert's plural subject account of joint intention and action does not appeal to personal intentions in favor of some joint action. She holds, in effect, that one who says 'We intend to do such-and-such,' referring to a joint intention, does not say something reducible to statements about what 'I' intend and what 'you' intend. To that extent she and Searle are in agreement.

The plural subject account of joint intention provides an explanation of how from an irreducible 'We intend to row to the other side' and 'My rowing more slowly than I am doing will best facilitate our rowing to the other side,' I can infer 'I should row more slowly.' My participation in the relevant joint commitment gives me reason to do what I can to implement the joint intention. It is not necessary, given this account, that I first form a personal intention that we row to the other side.

6. *Applications of the Plural Subject Theory of Joint Intention and Related Phenomena*

Concurring with the judgement of sociologists, Gilbert has argued that those who participate in joint intentions and actions constitute a social group, though the group may be a small and transient one (see Gilbert 1989). She argues, more generally, for the claim that plural subjects in her sense constitute an important, central kind of social group. Thus it can be argued that obligations of a special kind are part and parcel of group membership.

This line of argument makes it possible to bring Gilbert's plural subject theory of joint action and related phenomena to bear on a classic question of political philosophy, the question of political obligation. Is there an obligation to obey the laws of one's own country in particular, and, if so, what is the source of this obligation? Evidently, one possible source is participation in a joint commitment. Thus one might participate, for instance, in a joint commitment to accept as a body the rules prescribed by a certain person as the rules of the jointly committed population as a whole (see Gilbert 1996, 1999).

Gilbert's plural subject theory is also relevant to the topic of collective guilt in the sense of collective moral responsibility. According to Gilbert, an act is constituted as a joint act by virtue of an underlying joint commitment. That joint commitment unifies the people in question into a group. It may then sometimes be reasonable to ascribe moral responsibility for a joint act to a group as such, quite apart from the question of the moral responsibility of particular group members. This perspective on joint action also allows for the intelligibility of a common phenomenon: the experience of pride or guilt over the actions of one's group, as opposed to one's own actions (see Gilbert 1996).

7. *The Nature and Role of Agreements*

Another philosopher who has written at length on joint intention and action is Raimo Tuomela. In Tuomela (1984), he put what he called 'we-intentions' at the center of an account of joint action. Each party to a joint action must have a relevant we-intention. Tuomela's complex definition of a we-intention runs roughly as follows: a member Ai of a collective G we-intends to do X, where X is some act of G, if and only if (a) Ai intends to do his own part of X, given that every member of G will do X his own part of X; (b) Ai believes that every member of G will do his own part of X; (c) there is a mutual belief in G to the effect that (a) and (b).

Tuomela (1995) introduces the 'underlying assumption that we-intentions are formed in a process involving the making of an explicit or implicit agreement (or at least believed agreement)' (p. 127). Agreements determine what joint action is afoot; we-intentions ensue. If all goes as the parties we-intend, joint actions follow.

Clearly, agreements are a paradigmatic context for the production of joint intentions and actions. However, as the example of the rowers suggests, agreements as these are ordinarily understood and are not essential. If one says that there is an implicit agreement in such cases, the question arises as to what precisely this claim amounts to, since an implicit agreement does not seem to be an agreement proper. One might do well to start with an account of paradigmatic agreements. There has been less concentrated philosophical focus on such agreements than might have been expected, given the undoubted importance of agreements within the scheme of everyday social concepts. A standard claim, perhaps echoing statements in contract law, has been that an agreement

is an exchange of promises. Gilbert has argued at length against this view, on one interpretation of it, and in favor of the proposal that typical everyday agreements are, in effect, joint decisions, where a joint decision is constituted by a joint commitment to endorse as a body the decision in question (see in particular Gilbert 1996, Chap. 13).

Suppose that Phyllis and Joe jointly commit to endorse as a body the decision to get married next year. Presumably it is reasonable then to regard them as jointly committed to intend as a body to get married next year. Given Gilbert's account of agreements and joint intentions, then, agreements give rise to joint intentions, providing a basis for joint action. Agreements are not necessary for joint action, however, insofar as a joint commitment to intend as a body can be brought into being in the absence of a joint commitment to endorse as a body a certain decision. This accords with the way the relationship of agreements to joint actions is commonly understood.

8. *Individualism, Holism, and Joint Action*

Annette Baier has objected to the 'individualistic bias' she finds in recent philosophical work on joint intention and action (see Baier 1997). She objects in particular to the assumption that multiperson actions are constructed out of single persons, their abilities, and intentions. Baier proposes that doing things with others is more basic than doing things alone. To say this, however, is not yet to explain what doing things with others amounts to.

Clearly, the range of existing philosophical accounts of joint intention and action is wide. They include accounts in terms of personal intentions, with appeal to moral principles such as Scanlon's principle of fidelity to account for the associated entitlements and obligations. (This appeal is to be found in both Bratman's and Tuomela's work.) They also include Gilbert's account, which derives the associated entitlements and obligations from a joint commitment. Gilbert's account is a nonindividualistic, or holistic, account, at least insofar as a joint commitment in her sense is not simply a conjunction of personal commitments.

Accounts that make personal intentions central accord with the approach to social phenomena of Max Weber who put at the center of his sociological concepts the concept of an action that is oriented to the actions of others (called by Weber a 'social action'). They harmonize well, also, with the somewhat more recent idea of characterizing social processes in terms of the mathematical theory of games. Gilbert's plural subject account of social phenomena accords rather with the approaches of Emile Durkheim and Georg Simmel, among sociologists, and to Jean-Jacques Rousseau among political philosophers. (Gilbert 1989 proposes an interpretation of Durkheim that suggests a commonality between Gilbert's approach and that of Durkheim.) These thinkers all emphasized in one way or another that people engaged in joint action were unified in a significant sense.

Jokes and Joking

The terms joking, humor, laughter, and the comic are often used interchangeably. They refer to expressive culture. A joke is something done or said in a playful manner to excite mirth. It may take the form of a short narrative or action in which boundaries are transgressed. The capacity to joke and perceive something as funny is a universal. Humor is relative: what is held to be funny may differ from time to time, place to place, person to person. Joking is a complex behav-

ioral and cultural process in which the what is as important as the who, how, and when. This article reviews some forms, domains, and functions of joking.

1. The Nature of Humor

Humor is omnipresent yet elusive, nonsensical yet serious, friendly yet hostile, a universal yet specific. A joke can make sense across two millennia, as this 'stupid peasant' joke from ancient Greece testifies: 'A peasant, having heard that parrots live for a hundred years, bought one to see if it was true.' A joke may also change or lose its point as it moves between cultures. The 'dirty jokes' that provoke laughter in a Tamil popular theater hardly draw a smile from Dutch observers. Worldwide topics of joking relate to the boundaries between nature and culture (sex, food, health, death) and to persons on social boundaries (strangers and lunatics).

Understanding a joke requires intellectual effort, yet scholarly attention partly spoils the punchline. The comic is part of everyday life yet stands apart. Humor creates a momentary world of make-believe. It is closely related to laughter, yet one can appreciate a joke without laughing, and not all events and actions which trigger laughter are funny.

This paradoxical nature of humor is further complicated by the fact that it is both perception and performance, cognition and action, intellectual and emotional, institutionalized and spontaneous. Cognition is involved in grasping a *double entendre* or perceiving an incongruence. On the other hand, much humor touches the emotional stratum of cultural expectations and involves mimic, gestures, pantomime, and horseplay. An apt one-sentence summary of humor is 'a play upon form' (Douglas 1968) or 'a play upon meanings' (Zijderveld 1983).

1.1 The Study of Joking

The paradoxical nature of humor helps to explain why philosophers are interested in it and social scientists have neglected it. Philosophers including Plato, who detested humor, Erasmus and Rabelais, who celebrated it, and Bergson and Plessner, have devoted learned treatises to the mechanisms of joking. In their perspective, there is a bias towards intellectual and linguistic mechanisms, especially on the awkward incongruity, perceived in surprise, which most thinkers define as the essence of humor.

Freud promoted the psychological study of humor and considered joking a regression to infantile modes of thinking and a substitute for aggression and libido. Freud concentrated on *der Witz*, which is the quintessence of Yiddish humor: a short, pointed, witty story, or pun.

During the 1980s and 1990s humor research has expanded both in terms of disciplines involved and number of publications. In 1988 *Humor: International Journal of Humor Research* was founded. Psychologists and linguists dominate the inquiry into joking.

1.2 Anthropology

It is said that Bronislaw Kaspar Malinowski, a founding father of social anthropology, defined his discipline as the science of the sense of humor. Indeed, the anthropologist shares with the humorist a strategy of making the familiar strange and the strange familiar. Common sense is disrupted, the unexpected evoked in order to enhance the awareness that reality is socially and culturally constituted. This relativist perspective may be essential for the cross-cultural study of humor (Driessen 1997).

Yet, despite Malinowski's claim, until recently anthropologists have neglected joking as a topic. So have sociologists (Zijderveld 1983). Some early anthropologists studied humor from a folklorist and antiquarian perspective, but rarely as a resource for cultural analysis. In some fieldwork guides joking and laughter are not even mentioned. Radcliffe-Brown's article (1940) was a breakthrough, although his interest was in the structural implications and functions of joking relationships rather than their symbolic content. Mary Douglas found the essence of the joke in its attack on control. In the 1970s and early 1980s anthropologists used semiotic and narrative approaches to study joking *per se*, not just its functions (Handelman and Kapferer 1972). The first comprehensive, comparative anthropological study of humor and laughter appeared in the mid-1980s (Apte 1985), and since then there have been numerous articles and books. Yet, joking remains to the most part a spin-off of other research topics, despite the knowledge that it provides clues to what really matters in groups and societies.

2. The Faces of Jokes

2.1 Genres of Joking

In most cultures there is a distinction between the diffuse joking of common people in everyday life and institutionalized joking by experts at specific times and places, such as the clown in wedding ceremonies in Polynesia, the television comedian on New Year's Eve, or the trickster in a Javanese *wajang* play.

Humor ranges from mild jokes to biting satire. Benign joking is simple, informal, and harmless, intended for diversion and repose. It does not unsettle the course of daily life. In metropolitan Egypt, for instance, joking is considered the lubricant of social life. Persons who lack a sense of humor 'have thick

blood' and are scorned. A second type of joking is wit, banter, persiflage, or punning. This is a game of intellect and language, using irony to tackle discrepancies between appearance and reality. A third type is black or gallows humor which challenges and mocks tragedy and misery, for instance the 'Darwin Awards' on the Internet. A fourth form is satire, militant or aggressive joking, meant to criticize authority, common sense, and conventions, as in Carnival. The trickster of the Winnebagoo, Pueblo, and other Native Americans is a satirist *pur sang*, as were the Eurasian court jokers. The political cartoonist is a modern example of a satirist.

2.2 Domains of Joking

It is often hard to translate a joke from one language to another, especially in the case of puns and witticisms. Language is both a vehicle and topic of jokes. Linguistic play and rhetorical devices, such as incongruity, paradox and irony, are central to puns, tall tales, and riddles. Anthropologist Chagnon was the victim of verbal humor struggling to learn Yanomamö. Informants made a sport of inventing obscene and ridiculous names for people such as 'dirty rectum' or 'feces of the harpy eagle' which Chagnon wrote down and used without knowing their meaning (Driessen 1997). Apaches stage joking imitations of the 'whiteman' with exaggerated, loud, and fast speaking (Basso 1979). In many societies, for instance the Inuit, verbal virtuosity is expressed in duels in which humorous and obscene insults are recited to ridicule opponents. In Egypt these mock fights are ritualized in male coffee houses, for instance: 'Your father puts on his underpants with a shoehorn'; 'when your father sees a garbage truck coming he lies down like a heap.'

There is also a strong interdependence between gender and joking. Sexuality is a core subject of jokes everywhere and humor is an important element in attraction among the sexes. In most societies there is gender inequality in joking. While men tend to use more aggressive humor and laugh louder in public spaces, women remain more passive and restrained. Men play more prominent roles in ritual public joking. There are exceptions. Older women may publicly engage in humor and even compete with men. In Pacific island communities female clowns play important ceremonial roles. In many Mediterranean societies women perform for women mock imitations of men, their sexuality included. In Western society female comedians are gaining prominence.

Age is important in joking. Psychologists have noted the crucial role of humor in personality development and language learning. It serves as a general educational device. Children and adolescents have a special sense of humor with which they mock adults. Adults often find amusement in encouraging children to imitate adult etiquette. There are striking gender differences in the nature, devices, and approval of children's jocular behavior.

A widespread kin-related form of institutionalized humor is the joking relationship. Some categories of kin are licensed, sometimes even obliged, to tease, ridicule, and insult persons and groups belonging to another category, who must accept it without taking offence. In many societies kin of the opposite sex who are potential sexual partners are involved in joking relationships. In Western society mild joking is allowed with grandparents.

Where governments fear freedom of expression and rigidly demand conformity, political humor is repressed yet flourishes. 'Joking up' is a weapon of the subordinated whereas 'joking down' may act as a means of the powerful to express their superiority.

One of the main domains of joking in the globalizing world is ethnicity. Ethnic jokes make fun of supposed and farcically exaggerated defects in certain ethnic groups or nations. The deficiences appear in pairs, e.g., the stupid and canny, the stupid and cowardly, militarism and cowardice. Such dualities relate to commonly experienced ambiguous and contradictory situations (Davies 1990). The telling of ethnic jokes may be, but is not necessarily, an expression of racism and discrimination. Ethnic and many other jokes have a complex relationship with everyday experience.

Religion is replete with paradoxes and ironies. Consequently, joking, laughing Gods, and holy fools are to be found in the beliefs and rituals of many religions, global and local. There are counter-virtuosi who disturb and suspend the rigid ritual order by burlesque, inversion of roles, sexual, and scatalogical humor. Berger (1997) even argues for a 'theology of the comic' in which the experience of the comic is a promise of redemption.

Joking is not only a feature of face-to-face communication but also a major element in newspapers and magazines, movies, radio, television, and the Internet. Comic books have become a popular art form. There is musical humor and humor in novels and poetry. Humor is an effective device in advertising. In sum, joking permeates all domains of public and private life.

3. Meanings and Functions

Given the Protean nature of humor, it is not surprising that there is no universal structure of meaning to joking. The content of many jokes relates to commonly experienced ambiguities, dilemmas, and paradoxes that are part of the human condition. Joking is one of the ways to deal with such experiences, and this is a universal meaning of humor. Much joking involves entertainment. It produces pleasure and smoothes social interaction. One of the most widespread psychological and functionalist theories has it that joking

plays an important role in conflict resolution by releasing tension. Related theories hold that joking is a tool of cultural critique and social control by highlighting taboos and key values. Another social function of jokes is that they mark group boundaries and help to promote a sense of belonging, sometimes by testing and challenging social cohesion. Jokes can also effect greater commitment, regulate embarrassing behavior, and sustain serious interaction. And jokes are relativizers, creating in a playful manner distance from turmoil and toil, misery and misfortune.

Trends in humor research show an increased interest in the healing power of joking and laughter in cross-cultural communication, psychotherapy, neurology, and physiology. Ethnic humor is a topic of growing relevance as are differences in joking styles and tastes.

Journalism

Journalism is generally defined as the activity of gathering and presenting information and commentary about current events for public distribution. From a social science point of view, it can be conceived in a number of ways: as a distinct *occupation* with its own patterns of recruitment and socialization and occupational subculture; as a distinct form of social *activity* involving the gathering and processing of information; as a social *institution* with a set of relations with other institutions like the state; or as a *cultural form* or form of discourse.

Disputes about the boundaries of journalism have been common among both scholars and practitioners. Chalaby (1998), for example, has argued that journalism properly so-called emerged in Britain and the US with the development of commercial mass media; the production of news as a commodity, in his view, is radically distinct from the earlier practice of using the press to publicize political ideas. Journalists' organizations, particularly in countries with state-owned broadcasting systems, have sometimes excluded those who worked in broadcast news, on the grounds that they did not practice journalism independently, but merely transmitted the views of others. In many countries today there is also sharp debate about whether those who produce new forms of 'infotainment'—talk show hosts or producers of 'tabloid' news magazines, for example—can legitimately be called journalists. There is little to be gained conceptually by trying to adjudicate these disputes and establish the 'true boundaries' of journalism. These disputes are enlightening precisely because multiple forms of journalism have always coexisted, and because journalism has never been rigidly differentiated from other social activities, but has overlapped with and existed in relations of mutual interdependence with a variety of political, economic, social and cultural institutions, and practices.

1. Historical Evolution

The term 'journalist' emerged in the seventeenth century; originally, 'journalism' referred simply to the activity of producing a printed periodical. One can trace many of the social functions involved in journalism to earlier eras, but it seems best to say that journalism emerged with the development of the newspaper and other forms of print culture. The emergence of journalism was connected not only with the development of print technology, but also with an inter-related set of social and cultural changes. First, it was connected with the development of capitalism and the market. This was true in two senses. The market, first of all, increased the demand for specialized sources of information. Those involved in market relationships had an intensified need to know about occurrences beyond their own world of face-to-face relationships. Merchants were among the first producers and consumers of newspapers, and as increasing parts of the population were drawn into the market economy, newspaper readerships grew. Second, news-

papers were themselves distributed through the market; this was true even in their early days, when the primary motivation for their production was often political or cultural rather than economic.

The emergence of journalism was connected with the rise of the nation-state and political citizenship. It is connected of course with the emergence of democratic politics; early newspapers were often primarily vehicles for public political participation. Expansions of newspaper readership were often closely connected with expansions of the electoral franchise. In the US, for example, the rise of the 'penny papers,' which greatly expanded the audience for news, came on the heels of the Jacksonian revolution and the elimination of property qualifications for voting. In Uruguay, one of the few Latin American countries in which a mass circulation press has developed, newspaper circulations increased from one newspaper for every 11 inhabitants in 1870 to one for every four in 1916, a period which also saw the rise of mass-based political parties.

The notion of citizenship is broader that of democracy, however, and the connection between journalism and the rise of the nation-state goes beyond the development of democratic political institutions. Another way in which the modern nation-state draws the mass public into political life is through mobilization for war; newspaper circulations have typically expanded in times of war as well as in times of expanded political participation. As Anderson (1991) has pointed out, the culture of nationalism involves a sense of belonging to an imagined community of compatriots; journalism is one of the key cultural forms in the creation of this sense of national collectivity, and it can play this role with or without political democracy.

Finally, journalism is connected with the rise of realism as a cultural form; it emerges simultaneously with a number of related realist genres, including the novel and scientific writing, and indeed has in certain historical periods overlapped with these, as novels and scientific information were published in newspapers and novelists often wrote for the press. All three of these historical changes, of course, are connected with the rise of the public.

Max Weber (1947) once characterized the journalist as a 'type of professional politician.' Indeed in its early days journalism was substantially—though not exclusively—a part of the world of politics. Journalists were often advocates for political causes; Benjamin Franklin, for example, who like many others in his age was simultaneously a journalist and a politician, described journalism as essentially a form of oratory and thus part of a tradition that could be traced back to the political assemblies of Greece and Rome. In democratic countries, newspapers typically became associated with political parties, as these began to emerge, or factions of parties, and often were supported financially by parties or individual politicians. In authoritarian countries newspapers were often either political mouthpieces of the state or of insurgent movements. In Africa, for example, many leaders of the independence movements of the twentieth century were involved in journalism.

The identification between journalism and politics was substantially changed, however, by the rise of the commercial newspaper industry. This began in the United States in the 1830s, with the development of the 'penny papers,' which expanded newspaper circulations by an order of magnitude and became profitable cultural industries by selling the attention of a mass audience to advertisers (Schudson 1978). In Britain commercialization of the press was delayed by restrictive taxes, but got under way in the 1850s. In Japan, similarly, commercial papers began to compete with the earlier, politically oriented papers at the end of the 1870s. Commercialization did not push politics aside altogether. Most newspapers in the United States, for example, continued to have strong partisan loyalties throughout the nineteenth century at least, and their owners and editors to be active in politics. They were, however, financially independent of parties, and their owners independent political powers in a way their predecessors often had not been. In this sense it could be said that commercialization increased the power of journalism as an institution. Commercialization also changed the agenda and style of journalism, diminishing political advocacy in favor of the competition to provide news in a timely and sometimes sensational fashion.

A sharp debate has emerged in media studies over the implications of commercialization of the news media for democratic politics. One view holds that commercialization gives the press the independence it needs to serve as a 'watchdog' of the state and to provide the public as a whole with information 'without fear or favor.' The contrary view holds that commercialization tends to drive political content out of the press, replacing it with sensational human interest material, and also to consolidate control of the press in the hands of the upper class, leading to unequal political competition between competing social interests (Curran and Seaton 1997). This argument has been developed especially from the case of Britain, where a highly politicized working class press flourished in the period when taxes inhibited the development of commercial media. Weber (1947) also observed that the commercial papers in Germany 'have been regularly and typically the breeders of political indifference.'

Commercial newspapers were the first to employ hired reporters, editors, and eventually artists, photographers, and other specialized journalistic personnel. Throughout the nineteenth century journalism developed as a distinct occupation with specialized practices and a sense of identity. Many of the conventions for gathering and presenting information which we now think of as distinctively journalistic

emerged during these years, including for example the summary lead, which synthesizes the 'most important' information in a news story for the reader, and the practice of interviewing public figures, which was important in part because it gave journalists a more active role in the creation of news, and in some cases increased the public profile of individual journalists.

In the twentieth century the notion of journalism as a 'profession' began to emerge, most distinctively, perhaps, in the United States, where the idea of neutral expertise became a particularly strong element of political culture. Professionalization meant, above all, the development of the idea that the journalist serves the public as a whole, rather than particular political tendencies, owners, or other interests. It is associated with the shift, noted by Siebert et al. (1956), from the older 'libertarian' conception of press freedom to the 'social responsibility' model, which sees the press as the holder of a public trust. Professionalization was also associated with a shift toward balance and 'objectivity' as primary journalistic values, with corresponding changes in writing styles, and with increased autonomy of journalists, as against owners or managers within news organizations. Journalistic autonomy has nevertheless always been limited: despite aspirations in some countries for direct journalistic control of news organizations (perhaps most notably France after World War II; the Journalists at *Le Monde* still elect the paper's Director), ultimate authority in virtually all news organizations remains outside the hands of journalists.

Several decades of scholarship have painted a complex picture of the implications of the professionalization of journalism. Professional norms can be seen, for example, both as a mechanism of social control, constraining journalists and often serving to exclude nonconforming content from the news, and as a basis for journalists' autonomy, legitimizing their right to a space of action not constrained by their owner's political views, the pressures of advertisers, etc. (Soloski 1989). The concept of professional routines has become central to the analysis of the social role of journalism. Routines are the standard practices which enable news organizations to operate efficiently and which legitimate the many choices that must be made in the production of news, allowing them to be treated as matters of shared professional judgment rather than political debate (Tuchman 1978). Where professionalism is strong, these routines are powerful enough that particular individuals, including both journalists and owners, have limited ability most of the time to shape news content. Those routines, however, often have social biases built into them, and most scholars consider the biases built into journalistic routines to be the most important explanation for the politics of news (Gitlin 1980). Among the most important routines is the use of certain kinds of sources of information which are considered 'authoritative'—principally government officials and other elite members of society (Gans 1979, Hall et al. 1978).

Where professional autonomy—or 'internal press freedom,' as it is often called in Europe—is weaker, professional routines become less important for explaining news content, and more instrumental explanations, focusing on control by private owners or the state, are often more appropriate.

There are many views about what kinds of social biases prevail in contemporary journalism. Some, for example, have argued that journalism generally undermines the authority of established social institutions (this view began to grow in the 1970s, which probably saw the high point of journalistic autonomy in most Western countries, and also saw a decline in the legitimacy of many social institutions). Some have argued that they serve more or less consistently to support established social interests, and some that they are essentially neutral, and represent the full range of contending interests. The most common view among scholars is probably the view that in liberal societies media routines tend to reproduce the existing structure of power, but not in an entirely consistent way; under certain circumstances, for example, the dominant routines can open the media to penetration by new social movements or lead to periods of contestation over the boundaries of political debate.

2. *Differentiation*

Structural functionalism holds that human societies tend to evolve toward increased differentiation, in which institutions become increasingly specialized in the functions they perform. Some scholars—most notably Alexander (1981)—have argued that the development of journalism should be seen in this light. This does make considerable sense in societies where commercialization and professionalization are relatively advanced. Journalism in these societies has increasingly become separated from party politics, and has developed norms and routines of its own, a 'media logic' distinct from the logic of politics. In other ways, however, the notion that journalism tends to evolve toward differentiation seems doubtful. Most importantly, such a view neglects the tendency for journalism to become integrated into market mechanisms. Professionalization, to be sure, limits this to some degree, but the 'media logic' that has emerged in contemporary societies is very much a joint product of professional norms and the pressures of the market, which many argue are growing increasingly strong. Other scholars thus give a very different account of the history of journalism than the structural functionalists. Habermas, for example, decries the 'colonization' of the public sphere by the cultural industries, and Bourdieu argues that the journalistic field once heavily influenced by the political field is now heavily influenced by that of the market.

3. Journalism and the State

In some societies the state controls the news media directly. This is most common with broadcast news, but is also common with newspapers, particularly in developing countries where there are few sources of capital outside the state. In societies with clientelist political relations, journalism will often be tied to the state in various ways by systems of political patronage, as in Mexico, where until recently both journalists and newspapers were heavily dependent on state funding (Orme 1997), or in Greece, where industrialists often use their papers to bargain for favors from the state (Papathanasopoulos 1999). A similar pattern has emerged in Russia, and to varying degrees in other parts of the former Soviet Union and Eastern Europe.

In liberal societies journalism is generally thought of as standing apart from the state, serving to check its power as a watchdog or fourth estate. This is accurate to a significant degree, as reflected in incidents like the publication by *The New York Times* and other papers of the 'Pentagon Papers' (a secret government study of US decision-making on the Vietnam war 'leaked' to the press by a dissident former official). But close ties between the media and the state also exist in liberal societies. State subsidies and restraints do exist in such societies, as do clientelist relationships between politicians and media owners. But more important is the close relationship between journalists and government officials as sources and subjects of news, a relationship which has proved mutually beneficial to officials seeking publicity and control over the news agenda, and journalists seeking news (Bennett 1990). This relationship is highly developed, with the news media organizing much of the newsgathering process around the institutions of the state, and the state devoting considerable resources to accommodating them. In many cases the relationship is formally organized, as in the lobby system in the British parliament or the press clubs of Japan (Pharr and Krauss 1996). The closeness of the relationship between contemporary journalists and state officials means that journalists have access to considerably more information about the inner workings of government than they would as outsiders. It also means that they are often in an important sense part of the community of political elites, and reflect the prevailing viewpoints within that community. Here, again, doubts can be raised about the differentiation theory of journalism history: it could be argued that journalism is more entangled with the state than it was a century or two ago, when journalists had no privileged access to the corridors of power.

4. Varieties of Journalism

Journalism has always been plural; indeed one of the distinctive characteristics of the modern newspaper is the fact that it mixes widely disparate types of content, not only in terms of subject matter but in terms of the functions it fulfills for readers. Journalism provides both information and entertainment. It also provides moral and ideological orientation. Even in countries where objectivity became a dominant professional value, there continue to be many occasions when journalists communicate value judgments to their readers, particularly when the society's consensus or hegemonic values are considered to be at stake, in covering international conflict, for example, or in investigative reporting. Some scholars have also argued that journalists perform a ritual function, promoting a sense of community solidarity, particularly in the coverage of ceremonial events and crises

In most societies there is also some differentiation of journalism into distinct styles, often serving different parts of the community. The most striking example is probably the differentiation of the British press between the 'quality' or broadsheet press, serving middle and upper class readers and emphasizing informational journalism, and the mass or tabloid press, serving primarily working class readers with a much more entertainment-oriented form of journalism. In France a distinction has often been drawn among 'rationalist,' 'sensationalist,' and 'ideological' newspapers, the latter including Catholic and Communist organs. In many countries local and regional papers are more commercially oriented and lack distinct political orientations, while national (or capital city) papers reflect distinct political tendencies. In the US, ethnic minority media have played an important role, and often practice a form of journalism that was intended less to provide neutral information than to defend the interests of a particular part of the community.

Diverse social and political systems have also given rise to diverse forms of journalism. In Europe, for example, although partisan journalism in the traditional sense has declined dramatically since the Second World War (the longest important survivor was the Italian Communist paper *L'Unità*), newspapers nevertheless have more clearly differentiated political orientations than those in the US. European journalists are also more likely to see commentary and to some degree advocacy as integral to the journalist's role than their US counterparts (Mancini 1993, Donsbach and Klett 1993). An important distinction can also be drawn between societies where newspapers have mass circulations (mainly in Northern Europe, North America, and parts of East Asia) and those (in Southern Europe, for example, and most of Latin America) where their circulation is restricted to a relatively small, usually educated and politically-active elite. Print journalism tends to be more a part of the political world and less a part of the market in the latter, and it emphasizes 'horizontal' communication among political elites more than 'vertical' communication between elites and a mass public.

Journalism in Communist societies had its roots in the Western European tradition of party journalism, oriented toward political mobilization. But with the fusing of party and state, journalists became official figures and distinctive functions evolved. Journalists have often served a function similar to that of the ombudsman, for example—as someone to whom ordinary people would complain, hoping to be heard by those in power. Journalism was an important institution in Communist societies, well supported by the state, trade unions, and other official institutions to which it was attached. In countries where the communist party remains in power, particularly Vietnam and China, a complex hybrid of party control and market orientation is emerging (Zhao 1998).

In postcolonial societies, the most distinctive form of journalism to emerge was 'development journalism,' particularly prominent during the 1970s, which rejected the notion of the journalist as disinterested observer, and saw it as the function of the journalist to play an active role in promoting economic and political development. Development journalism was widely criticized for subservience to state power, though to a large extent the political caution which development journalists exercised was probably dictated by the same conditions of political life that affected all journalists in postcolonial societies, whatever model of journalism they espoused. In many ways, development journalism is similar to the tradition of 'boosterism' in US journalism, which similarly saw the newspaper as a force for the economic development of the community, and often similarly emphasized consensus over conflict.

5. *Current Developments*

A number of powerful forces are currently transforming journalism and its social role, described in the following sections.

5.1 *The Rise of Television*

In most of the world, television news has increased in importance at the expense of print journalism. The mass public increasingly relies on television as a source of news, and political communication, which was once channeled mainly through newspapers and party organizations, flows increasingly through television. The direction of influence within journalism has also shifted. Television once clearly followed the lead of print journalism. Today, there is a complex reciprocal influence, and newspapers still increasingly emulate the agenda and style of television. In some countries, the US, for example, this trend is decades old. In others it is more recent, dating from the 1980s or early 1990s when the public service monopoly on broadcasting ended.

5.2 *Commercialization*

In many countries the news media have become increasingly commercialized and journalism more strongly influenced by market factors. In the West the news media have been substantially commercialized since the nineteenth century. But for much of the twentieth century the effects of market forces on the news media were partly counterbalanced by professionalization, by public service broadcasting, and by press subsidies, which many European countries expanded in the 1970s to keep politically oriented papers alive and prevent market forces from eliminating competing voices (Gustafsson 1980). All three have become relatively weaker in recent years. The rise of television and, in Europe and some other parts of the world, the displacement of public service by commercial broadcasting is an important reason. Commercial television is primarily an entertainment medium, and journalism is much less central than in the newspaper industry.

The culture of journalistic professionalism may also have been undercut by a general decline in the prestige of political life. A key element of that culture was the idea that journalists should make independent judgments about what the citizens needed to know about public affairs. Today it is increasingly assumed that it is the journalist's job to provide whatever content interests the media consumer. The news agenda has shifted away from public affairs in the traditional sense, and toward human interest and 'service' journalism useful to ordinary people in everyday life (investment advice, health reporting) Journalistic autonomy has been undercut in important ways, as the business and editorial sides of news organizations are increasingly integrated.

Some argue that these changes have made journalism less elitist, more responsive to the concerns of the majority of the population, others that they undermine the integrity of the system of public communication. Journalism clearly has important functions for the society as a whole that most private industries do not have. It is central to political life, and to the process of opinion formation more generally; some have argued that it is increasingly central, as other institutions, political parties, and trade unions, for example, have weakened. It remains one of the key questions of media studies whether market mechanisms can provide the fulfillment of these functions, and if not, what other social mechanisms can be devised.

5.3 *Democratization*

In developing and newly industrialized countries, there has been a general move toward liberal democracy in recent years, with many authoritarian regimes giving way to multiparty systems and greater political openness. An increased emergence of independent news

media has been associated with these changes, probably as both cause and effect. Opposition parties have increasingly gained access to the media in many countries, political scandals have proliferated (Waisbord 1994), and elites have lost much of the tight control over public discourse they once held. Often commercialization of the media has accompanied democratization, and this has led to a dramatic reorientation of journalism away from serving government officials and toward the mass audience, sometimes resulting in rapid shifts from 'protocol news' to sensational crime reporting. Many questions remain about whether and how democratic media systems will be consolidated in these societies. To what extent will advertising-based media in societies where the middle class remains relatively small serve the majority of the population? To what extent will media owners—often small in numbers as the economic base of the media is limited—attempt to use the media to support their own political interests? Under what conditions can standards of professionalism evolve that will limit demagoguery or manipulation of political information?

5.4 New Technologies

Most discussion of the impact of new, particularly digital technologies remains speculative. It is clear that the boundaries between technology-based genres of journalism—print, radio, television—will be broken down. Some have argued that proliferation of channels will make journalism less central as a mediator of information—people will watch events live or exchange information directly on the Internet. Multiplication of channels has indeed created competition for the role of mediator as, for example, MTV or Internet gossip sheets compete with network television and mainstream newspapers. It is also quite possible, however, that the proliferation of information and its centrality in economic and social life will make those who collect and synthesize it more rather than less important. It is also not clear whether new technologies and the new information industries arising around them will result in fragmentation of journalism into distinct genres targeting different demographic groups, or in new forms of competition for a mass audience.

Journalism and Journalists

The journalist is the key employee of news organizations who, in the definition adopted by the International Labor Organization, 'collects, reports and comments on news and current affairs for publication in newspapers and periodicals or broadcasting by radio and television.' Due to national peculiarities in labor statistics a global estimate of the number of journalists—500,000 in 1989—remains quite unreliable.

Journalistic work is primarily based on the *symbolic manipulation* of the content (sense making) in contrast to those, like typographers, responsible for the *mechanical* production of the newspaper or other news medium. In large and complex electronic media

systems, journalism is contextualized and co-determined by other media output and occupations. Several groups of employees, who are occupied with symbolic manipulation or involved in administrative and organizational tasks, are conventionally not considered journalists. The development of electronic production and distribution of media contents, and the growth of new forms of journalism (e.g., tabloids and talk shows, the Internet) brought about numerous occupational groups (technicians and other employees in broadcasting, documentary production, audio-visual workers, computer programmers, designers) whose work cannot be classified exclusively into either side, i.e., they participate both in symbolic and technical (re)production of contents. The boundaries between journalism and nonjournalism, and between full-time and part-time journalists become even more problematic in the cyberspace dominated by a constant flux of information produced, reproduced, and distributed by millions of Internet 'visitors.'

There is no uniform 'journalistic culture' or concerted form of professional operation of journalists that would lead to a single concept of journalistic work and norms. In contrast to the rather technical meaning of journalism in English and most other languages of Western civilization referring to the workforce in institutionalized forms of (mass) communication, the Greek concept of journalism, *δημοσιογραφία* (*demosiografía*), means 'writing about/for the people' and is focused on the social substance of journalism by emphasizing people rather than a particular class, or nature. Since *demos* means more than population but *citizenship*, journalism implies political relevance, which indeed was its most significant common trait until very recently. A critical labor perspective in the 1960s led to the concept of newsworkers, suggesting a distinction between news, and entertainment or fiction without solving the problem of a clear sociological referent of the concept. In the Muslim world, journalists are required, similarly to those in the West, not to 'mix truth with falsehood' and to verify news, but reporting is not allowed to be conceived on suspicion, to ruin people's reputation or to mock them, and most importantly, news must have a 'use value' in that it must provide benefit (*Nafa*') to the people. The latter idea was central to 'development journalism' emerging in the 1960s in developing countries, emphasizing that reporting should contribute to national development of the country concerned. Similarly, 'public' or 'civic journalism' movements in the West in the 1990s suggest that journalists should not merely report, but discover a community's 'relevance' by meeting the people and experiencing their lives.

People have always passed on information from one to the next, but journalism as a distinctive occupational task did not begin until the seventeenth century, when it became a supplementary, part-time occupation of otherwise professionally committed individuals in the social communication process—e.g., printers, postmen, or tradesmen. Modern journalism, as a result of industrial and bourgeois revolutions, became fully institutionalized with the mass media. During that period, the press was largely liberated from censorship and party subservience. R. Park noted that the rise of the reporter had been one of the most important events in the 'age of news.' While in earlier centuries journalists largely belonged to self-sustained free professions of the middle class, with industrialization they joined the class of workers employed by the press publishers. The separation between the occupations of publisher and journalist was followed by the establishment of national and international professional organizations and trade unions of journalists.

During the nineteenth century, newspapers were generally still closely linked to political parties and journalists subject to the political credo of newspapers. The idea of objectivity represented an alternative to partisan journalism and a way to legitimate the professional status of journalists. The quest for objectivity was related to the need to establish a sort of professional, scientifically validated method for journalists to ensure their professional autonomy based on a 'standard' university education, also typical of traditional professions. The idea of journalistic objectivity as a professional norm was not widely recognized until the end of the First World War. In the early 1900s, the demand for objective reporting was embedded in the broader cultural movement of 'scientific naturalism,' which stressed the importance of methods in giving evidence of facts.

The conflict between subjective storytelling (the blending of facts and opinions, real events and trivial fictional material, news, and entertainment into a tightly packaged story) and 'objective news' (the classic function of journalism to sort out factual and reliable accounts of daily, particularly politically relevant events) was never solved. The growing number of journalistic *codes of ethics* since the beginning of the twentieth century to mark professional standards in journalism has never resulted in a single code that would universally define the standard of 'objectivity,' including the professional standards adopted by International Federation of Journalists (IFJ). There are two main reasons: (a) the two tendencies of storytelling and objective reporting are not mutually exclusive but intermingling extreme strategies in reporting events; (b) the competition for consumers causes competition for the latest news and makes journalists vulnerable to politics. Political authorities enter journalism either directly through interviews and press conferences or indirectly through 'information subsidies' (making information available to journalists on a *quid-pro-quo* basis), influence the journalistic agenda setting, if not attitudes and actions, and eventually make journalism subsidiary to *public relations*. For example, in Japan, news sections of newspapers are produced in close cooperation with

powerful news sources in government, industry, and the civil service, organized through the 'press club' system.

Journalism lacks the objective criteria—stressing the importance of universal norms, service to clients or altruism, intellectual activity and scientifically based expertise, autonomy and responsibility, and ethics—that would place it in the same social position as 'true' professions such as medicine or law. Although the social influence of journalism is rising, journalists in many countries have no specific professional standards to meet. Nevertheless, national codes of ethics share some common aims such as prohibiting editorial advertising and misleading audiences, and protecting individuals against invasion of privacy, defamation, and damaging publicity in general. Specific forms of (self-)regulation such as courts of honor, press or media councils, or press or media ombudsmen exist in a great number of countries to supervise the implementation of ethical standards by journalists and the media. They may be composed of journalists alone (as in the case of courts of honor within journalist associations) or representatives of the general public and media organizations.

There are invariably controversies between scholars, media workers, and media industries about the structure of journalism studies and the type of education needed for journalists. Early courses in journalism were mostly practical or vocational and connected with on-the-job training. In the 1920s and later, journalism curricula expanded into social sciences and included courses such as communication theories, public opinion, history of journalism, and ethics. The number of educational institutions in journalism has grown throughout the twentieth century, starting with the University of Missouri in 1908 in the United States (which at present has 350 schools of journalism) and soon followed by other regions in the world, where educational programs and materials were largely based on those from the USA and Europe. One of the first journalism schools linked to universities was set up in 1918 at the National Peking University in China. In Latin America the number of journalism faculties and schools increased from 13 in 1950 to almost 300 by the end of the century. There is no 'typical' journalism curriculum, but it usually combines journalistic and nonjournalistic courses, with the prevalence of the latter (e.g., in the USA in a ratio 25:75). Many schools offer specialization in print, radio and television journalism, public relations, and advertising; fewer have more specialized programs, e.g. in photojournalism, magazine journalism, or television documentary. Generally, two seemingly contradictory trends may be found in the development of journalism programs: more and more specialized and even fragmented curricula in different fields of journalism on the one hand, and on the other a more 'generic' approach to journalism, stressing the need for instruction in communication skills cutting across specific job demands and combined with nonjournalistic specialization such as arts, agriculture, economics, law, or politics. Both trends are restricted to larger and developed countries where many universities and schools can compete to 'supply' journalists to widely differentiated media.

In the developed world, a large proportion (often exceeding 50 percent) of newcomers to the profession graduate in journalism at a university or its equivalent. An international comparative study indicates that on average students choose journalism as senior teenagers, primarily because they believe that the work of journalists is interesting and useful for society, and that they personally are talented for this job. However, many of those who graduate in journalism never enter a journalistic career but rather other communication-related or even noncommunication occupations. Neither is specific education a condition for entering a journalistic occupation. The lack of entry conditions such as agreed upon professional qualifications and licensing may be related to the liberal idea that freedom of expression and press freedom should not be restricted, in order not to violate fundamental citizens' freedoms. Almost all countries outside the United States have a body of press or media law, but journalists have no special legal status other than as defined by the constitutional rights and freedoms of citizens and, in some countries, some minor state legislation, e.g., the protection of information sources. However, this 'ideology of nonprofessionalism' is under threat from reality, in which media owners and editors may define specific qualities and conditions that candidates for journalism must fulfil, and journalists may use mechanisms such as codes of ethics and forms of self-regulation to protect not only group autonomy but also monopoly in the labor market.

The lack of formal education in terms of theoretically grounded knowledge within a particular field contributes to the controversy about professionalism in journalism. Acquisition of such knowledge is central to the selection processes (search for the 'right' person for a job), and instrumental (skills) and expressive socialization (norms, ethics) by which entry into a profession may be controlled. The latter dimension of socialization gives primacy to the intellectual component of professionalism and to the production of expert knowledge resulting from research. In 1922, W. Lippmann complained that no research had been conducted in the field of journalism despite its immense impact on democratic life. Although the German *Zeitungswissenschaft* studied systematically the press beginning in the nineteenth century (e.g., journalistic genres, economics of newspapers), M. Weber was the first to suggest in 1910 to pay attention to journalism as a profession. He explained that a sociology of newspapers ought to include the study of journalists, part-time journalists, and other newspapers employees, 'collectivism and individualism in the creation of the content of the newspaper,' 'the

anonymity of newspaper' and its effects upon journalists, cultural specificities influencing journalism and the social functions of the press, and 'the fate and the situation of journalism as a profession' (particularly the questions of education and professional demands upon the journalist). Weber's ambitious research program was not systematically carried out until the 1950s, when during the rise of 'mass communication as a scientific discipline' in the United States journalists became the subject of empirical research. Similarly to university education, however, studies in media occupations and professionals were not always well received by working journalists.

In most countries journalists are closer to lawyers and politicians than teachers or public servants in terms of prestige and salaries. They are part of local and national élites although they are on average much younger if compared to other professions. Particularly journalists in developing countries begin with rather high social status. Generally, however, the journalists' opportunity for internal promotion within the profession is limited. Studies indicate a tendency to work in the field for a relatively short time and then move on to other activities because of comparatively low pay, inadequate work conditions, routine work, and limited opportunities for vertical mobility. Journalists often move to other media fields such as public relations or advertising, and less frequently they leave the field of mass media, e.g., by moving to politics. A strong professional mobility between the worlds of journalism and politics, which was particularly characteristic of the former socialist countries, and a too-close relationship of journalists with advertising, entertainment, and public relations may severely endanger the autonomy of journalists and mute their critical voices.

However, when journalists are critical to political and commercial events and actors, as in 'investigative journalism,' they are often exposed to intimidation and harassment by the elites, and even assassinations are used to silence unwanted journalistic voices not only in wartime or against war correspondents. During the 1990s, 662 journalists and media staff were killed or murdered in the course of their work, and many other disappearances were listed as under investigation by the IFJ and the International Press Institute. The killings are only the tip of an iceberg of physical assaults and jailings which affect journalists every year. However, the most widespread and epidemic peril of independent journalism in many countries is an increasing number of lawsuits against journalists, based on the legal provisions that the media should not harm the rights to privacy and reputation of individuals (including public officials); libel actions may be a disguised way of preventing journalists from performing a 'watchdog function' in society. Civil libel compensations became a sword of Damocles particularly in Eastern Europe and Russia in the 1990s, but prosecutions of journalists and high compensations threaten the media with bankruptcy and generally dampen investigative journalism in many other countries with a longer democratic tradition.

In terms of social and demographic characteristics journalists do not represent the population of citizens who rely on their reporting and interpretations, but are expected—like other professions—to carry out their work in the interests of the audiences rather than their own interests. Such expectations may be disputed by the facts that professional journalists disproportionately originate from the families in which professional and white-collar occupations prevail, live in elite neighborhoods, are disproportionately male (although this disparity is lessening during the last few decades), and their views of the world commonly depart from those of an 'average citizen,' usually leaning toward more liberal and democratic political views, in contrast to technical staff in media organizations who are usually more conservative. For example, in a 2000 *Los Angeles Times* survey, 82 percent of US journalists were found to back abortion compared to only 49 percent of the general population. This is not to argue that journalists are a politically coherent population. In some countries, such as Italy, journalists are clearly 'divided' among different political affiliations, a tendency advocated by some contemporary regulatory measures supporting (in the case of press also subsidizing, e.g., in Norway and Sweden) diversity and political plurality of the media.

The composition of the journalistic workforce is generally becoming more diversified in terms of gender, but men still represent the majority of the journalistic workforce. The increase in the number of female journalists indicates that journalism is no more a male preserve, but it also reflects a tendency of the intimization that permeates journalism. Yet the proportion of female journalists is still lower than the proportion of female students of journalism; female journalists are concentrated in the junior posts and in the non-news sector (e.g., magazines), and they tend to be paid less than men despite the fact that they are, on average, better educated than their male counterparts. The differences may be partly a consequence of the fact that female journalists relatively recently entered the profession, but they also may have to do with discrimination against women in journalism.

The least ambiguous mark of 'professionalism' in journalism is the establishment of professional organizations. Journalists are commonly associated nationally either into trade unions or professional associations; frequently, their organizations combine both these functions. Yet a long-term tension exists between professional associations, which stress the professional status of journalists (and usually also include employers and managers), and trade unions, concerned primarily with collective negotiations on behalf of working journalists (newsworkers) with employers. Journalists often tend to define themselves as experts claiming to be above politics, but in some

countries, journalistic associations also pursue political goals. The criteria for membership of journalists' trade unions and professional associations are fluid, particularly in relation to part-time journalists and 'boundary occupations' such as public relations. Trade unions of journalists negotiate for salaries, working conditions, and fringe benefits, and in some cases they also protect journalists' independence, e.g., by financial support to journalists penalized for refusing to do work incompatible with the professional standards (NUJ, National Union of Journalists in the UK) or, as in France, by effectuating the same benefits to journalists who would leave jobs because of the substantial political changes in the editorial policy as to those who lose their jobs involuntarily. In many situations unions also serve as 'tools of the employer' because an imbalance in power exists between unions and employers, due to the lack of unity among unions and guilds, their weak economic position, and goals narrowed to individuals' rewards.

The largest international associations of journalists and media staff are the IFJ and the Media and Entertainment International (MEI). First established in 1926 and relaunched in 1946 and 1952, IFJ is the largest international journalistic organization, with 460,000 members and 140 member-unions in 103 countries on all continents (July 2000). The aims of IFJ include the promotion of international actions to defend press freedom through autonomous national trade unions or (as in the USA) guilds of journalists and other 'authors,' representation of journalists in the international trade union movement, and assistance to journalists and their unions in fighting for their professional and industrial rights. Journalists from socialist and some other countries established in 1946 the International Organization of Journalists (IOJ) as the counterpart to the IFJ. The IOJ, which also claimed the IFJ of 1926 as its predecessor, was dissolved in 1991 after the collapse of communism. Members of 'technical' occupations in the arts, audiovisual, cultural, entertainment, and mass media sector represent the bulk of the membership of Media and Entertainment International which includes 130 trade unions around the world.

Judaism

Judaism, a religion of ethical monotheism in the class of Christianity and Islam, encompasses diverse, but kindred religious systems ('Judaisms') that in common exhibit these indicative traits: (a) they maintain that God is unique and made manifest in self-revelation, set forth to Moses at Sinai in the Torah; (b) they privilege the Pentateuch (Five Books of Moses, aka the Torah) among the Israelite Scriptures; and (c) they regard the Jews, or some Jews, at later times and in other places as the continuation of Scripture's 'Israel' in the Land of Israel. All Judaic religious systems—cogent theories of the social order, grounded in the Pentateuch, comprised by a way of life, a world view, and an account of who and what is 'Israel'—exhibit those three indicative traits. In antiquity a number of Judaic religious systems flourished, one represented by the Dead Sea Scrolls, another by the Elephantine Papyri, a third by the writings of Philo of Alexandria. The most influential and enduring is called Rabbinic Judaism (after the title of its principal authority, the rabbi), or Talmudic Judaism (for its principal document beyond Scripture), or classical or normative Judaism (for its paramount status). Rabbinic Judaism attained normative status in ancient times and retained a paramount position until the nineteenth century, when competing Judaisms took shape.

1. Rabbinic Judaism

Rabbinic Judaism in the fourth and fifth centuries AD responded to the crisis of the Christianization of the Roman Empire. With the triumph of Christianity through the conversion of Constantine in 312, Christianity's explicit claims, now validated in world-

shaking events of the age, demanded a reply. The sages of the Talmud of the Land of Israel provided it. At those very specific points at which the Christian challenge met head-on old Israel's world-view, sages' doctrines responded. The response took three forms. The Torah ('Judaism') was defined in the doctrine, first, of the status, as oral and memorized revelation, of the Mishnah, and, by implication, of other rabbinical writings. The Torah, moreover, was presented as the encompassing symbol of Israel's salvation. The Torah, finally, was embodied in the person of the Messiah who would be a rabbi. The Torah in all three modes confronted the cross, with its doctrine of the triumphant Christ, Messiah and king, ruler now of earth as of heaven. Judaism in the rabbis' statement did endure in the Christian West, imparting to Israel the secure conviction of constituting that Israel after the flesh to which the Torah continued to speak. When Islam gained its victory, Christianity throughout the Middle East and North Africa gave way, Judaism in those same vast territories retained the loyalty and conviction of the people of the Torah.

1.1 From Israel, the Nation Dwelling Alone to, the Jews, an Ethnic Group of Individual Citizens of the Nation State

A drastic shift in the political circumstance of a Judaism in the West, represented by the American Constitution of 1787 and the French Revolution of 1789, affected Jews' thought about perennial questions. From the end of the eighteenth century the secularization of political life and institutions defined a question not easily answered by Rabbinic Judaism. Earlier modes of organizing matters had recognized as political entities groups and guilds and classes, and, among them, the Jews found a place. In the hierarchical scheme, with church and monarchy and aristocracy in their proper alignment, other political entities could likewise find their location. With church disestablished, monarchy rejected, and aristocracy no longer dominant in politics, the political unit became the (theoretically) undifferentiated individual, making up the nation state. Within that theory was no room for a collectivity such as 'Israel,' the holy community, viewed as a political unit. But, political theory held, there might be room for the Jewish individual, in rightful place alongside other undifferentiated individuals. The individuation of politics produced a considerable crisis for the Rabbinic Judaism.

1.2 Modern and Contemporary Judaisms in the Context of Rabbinic Judaism

Rabbinic Judaism encompassed the whole of the existence of the Jews, who found its truth self-evident, its definition of life ineluctable. In the way of life of that system a Jew was not always a Jew, he or she was only a Jew. The other Judaisms acknowledged the former. Jews never stopped being Jews. The world would not let them, even if they wanted to. But Rabbinic Judaism made slight provision for Jews to be anything but Jews: the holy people had no other vocation, no alternative, to its holiness. Its history as a people different in kind from other peoples, its destiny at the end of time; these matched its distinctive holy way of life in the here and now. So Israel was always Israel and only Israel. But in modern times Israel became one of several things that Jews would be: also Americans, also workers, also Israelis, among the twentieth-century Judaisms, but never only Israel, God's people. And that theory of Israel matches in social terms the conception of the individual person as well. For in the received Torah, Israel—the Jew—lived out life in the rhythm of sanctification of the here and now, realizing in concrete deeds the Torah's words, once more, not only always but also Israel. It was not a romance, it was a marriage.

2. Emancipation

A process called 'emancipation,' part of a larger movement of emancipation of serfs, women, slaves, Catholics (in Protestant countries, for instance, England and Ireland), also encompassed the Jews. Benzion Dinur defines this process of emancipation as follows:

> Jewish emancipation denotes the abolition of disabilities and inequities applied specially to Jews, the recognition of Jews as equal to other citizens, and the formal granting of the rights and duties of citizenship. Essentially the legal act of emancipation should have been simply the expression of the diminution of social hostility and psychological aversion toward Jews in the host nation … but the antipathy was not obliterated and constantly hampered the realization of equality even after it had been proclaimed by the state and included in the law (Dinur, in: 'Emancipation,' *Encyclopaedia Judaica* **6**: 696–718).

The political changes that fall into the process of the Jews' emancipation began in the eighteenth century, and, in a half-century affected the long-term stability that had characterized the Jews' social and political life from Constantine onward. These political changes raised questions not previously found urgent, and, it follows, also precipitated reflection on problems formerly neglected. The answers to the questions flowed logically and necessarily from the character of the questions themselves.

Dinur traces three periods in the history of the Jews' emancipation, from 1740 to 1789, ending with the French revolution; then from 1789 to 1878, from the French revolution to the Congress of Berlin; and from

1878 to 1933, from the Congress of Berlin to the rise of the Nazis to power in Germany. The adoption of the American Constitution in 1787 confirmed the US position on the matter. Jewish males enjoyed the rights of citizens, along with all other whites. The first period marks the point at which the emancipation of the Jews first came under discussion, the second marked the period in which Western and Central European states accorded to the Jews the rights of citizens, and the third brought to the fore a period of new racism that in the end annihilated the Jews of Europe.

In the first period advocates of the Jews' emancipation maintained that religious intolerance accounted for the low caste status assigned to the Jews. Liberating the Jews would mark another stage in overcoming religious intolerance. During this first period the original ideas of Reform Judaism came to expression, although the important changes in religious doctrine and practice were realized only in the earlier part of the nineteenth century.

In the second period, the French revolution brought Jews political rights in France, Belgium, the Netherlands, Italy, Germany, and the Austro-Hungarian Empire. As Germany and Italy attained unification and Hungary independence, the Jews were accorded the rights and duties of citizenship. Dinur explains: 'It was stressed that keeping the Jews in a politically limited and socially inferior status was incompatible with the principle of civic equality … it is the objective of every political organization to protect the natural rights of man, [hence] all citizens have the right to all the liberties and advantages of citizens, without exception.' Jews at that time entered the political and cultural life of the Western nations, including their overseas empires (hence Algerian Jews received French citizenship). During this second period Reform Judaism reached its first stage of development, beginning in Germany. It made it possible for Jews to hold together the two things they deemed inseparable: their desire to remain Jewish, and their wish also to be one with their 'fellow citizens.' By the middle of the nineteenth century, Reform had reached full expression and had won the support of a sizable part of German Jewry. In reaction against Reform ('the excesses of …'), Orthodoxy came into existence. Orthodoxy no less than Reform asked how 'Judaism' could coexist with 'Germanness,' meaning citizenship in an undifferentiated republic of citizens. A centrist position, mediating between Reform and Orthodoxy, was worked out by theologians in what was then called the Historical School, and what, in twentieth-century America, took the name of Conservative Judaism. The period from the French Revolution to the Congress of Berlin therefore saw the full efflorescence of all of the Judaisms of political modernization. All of these Judaisms characterized the Jews of Western Europe, and, later on, America. But in America Reform, Orthodoxy, and the Historical School or Conservative Judaism radically changed in character, responding to the urgent issues of a different circumstance, producing selfevidently valid answers of a character not compatible with the nineteenth-century statements of those same systems.

In the third period, antiSemitism as a political and social movement attained power. Jews began to realize that, in Dinur's words, 'the state's legal recognition of Jewish civic and political equality does not automatically bring social recognition of this equality.' The Jews continued to form a separate group; they were racially 'inferior.' The impact of the new racism would be felt in the twentieth century. Judaisms of the twentieth century raised the questions of political repression and economic dislocation, as these faced the Jews of Eastern Europe and America.

3. *The Nineteenth Century Judaisms and the Political Question*

Reform, Orthodoxy, and Conservative carried forward Rabbinic Judaism, each in its own claim forming the natural and legitimate next step in the ongoing life of that Judaism. All make explicit their claim to stand in a linear, unitary, harmonious relationship with the dual Torah of Sinai, to form the necessary development of the Torah. Each of these three Judaisms negotiated issues of secularity, on the one side, and social and cultural and political change, on the other. None affirmed an essentially secular view, nor did any one of them formulate its systemic statement outside the framework of the dual Torah. The three main Judaisms born in the aftermath of the advent of modern politics have now to be specified. All of them continued the Torah as set forth in Rabbinic Judaism and adopted the Torah as their generative symbol and myth, its law as their norms, its theology as their touchstone. Between 1800 and 1850 all had taken shape.

Chronologically first is Reform Judaism, coming to expression in the early part of the nineteenth century and making changes in liturgy, then in doctrine and in way of life of the received Judaism of the dual Torah. Reform Judaism recognized the legitimacy of making changes and regarded change as reform, yielding Reform. Second was the reaction to Reform Judaism, called Orthodox Judaism, which in many ways was continuous with the Judaism of the dual Torah, but in some ways as selective of elements of that Judaism as was Reform Judaism. Orthodox Judaism reached its first systematic expression in the middle of the nineteenth century. Orthodox Judaism addressed the same issue, that of change, and held that Judaism lies beyond history; it is the work of God; it constitutes a set of facts of the same order as the facts of nature. Hence change is not reform, and Reform Judaism is not Judaism—so Orthodoxy. Third in line, and somewhat after Orthodox Judaism, was positive Historical

Judaism, known in America as Conservative Judaism, which occupied the center between the two other Judaisms of continuation of the dual Torah. This Judaism maintained that change could become reform, but only in accord with the principles by which legitimate change may be separated from illegitimate change. Conservative Judaism would discover those principles through historical study. In an age in which historical facts were taken to represent theological truths, the historicism of Conservative Judaism bore compelling weight.

Each of these Judaic systems exhibited three characteristic traits: (a) each asked how one could be both Jewish and something else, that is, also a citizen, a member of a nation; (b) it defined 'Judaism' (that is, its system) as a religion, so leaving ample space for that something else, namely, nationality; (c) it appealed to history to prove the continuity between its system and the received Judaism of the dual Torah. The resort to historical fact, the claim that the system at hand formed the linear development of the past, the natural increment of the entire 'history' of Israel, the Jewish people, from the beginning to the new day—that essentially factual claim masked a profound conviction concerning selfevidence. The urgent question at hand—the political one—produced a selfevidently correct answer out of the history of politics constituted by historical narrative.

That appeal to history, particularly historical fact, characterizes all three Judaisms. The Reformers stated explicitly that theirs would be a Judaism built on fact. The facts of history, in particular, would guide Jews to the definition of what was essential and what could be dropped. History then formed the court of appeal—but also the necessary link, the critical point of continuity. The Historical School took the same position, but reached different conclusions. History would show how change could be effected, and the principles of historical change would then govern. Orthodoxy met the issue in a different way, maintaining that 'Judaism' was above history, not a historical fact at all. But the Orthodox position would also appeal most forcefully to the past in its claim that Orthodoxy constituted the natural and complete continuation of 'Judaism' in its true form. The importance of history in the theological thought of the nineteenth-century Judaisms derives from the intellectual heritage of the age, with its stress on the nation state as the definitive unit of society, and on history as the mode of defining the culture and character of the nation state. History as an instrument of reform, further, had served the Protestant Reformation, with its appeal to Scripture as against (mere) tradition, its claim that it would restore Christianity to its (historical) purity. Finally and most important, the supernaturalism of the inherited Judaism of the dual Torah, its emphasis upon God's active intervention in history, on miracles, on a perpetual concern for the natural implications of the supernatural will and covenant—that supernaturalism contradicted the rationalism of the age. The one thing the Jewish thinkers wished to accomplish was to show the rationalism, the reason—the normality—of the Judaisms they constructed. Appealing to (mere) facts of history, as against the unbelievable claims of a Scripture placed upon a positive and this-worldly foundation that religious view of the world that, in the received system of the dual Torah, rested upon a completely supernatural view of reality.

Just as the questions before all three important Judaisms of the nineteenth century were the same, the answers of the three systems remarkably congruent to one another. The three Judaisms of continuity exhibit striking traits in common. All looked backward, at the received system of the dual Torah. All sought justification in precedent out of a holy and paradigmatic past. All viewed the documents of that system as canonical, differing, of course, on the relative merit of the several components. They concurred that texts to prove propositions deemed true should derive from those canonical writings (or from some of them). All took for granted the enduring, God-given authority of those writings. None doubted that God had revealed the (written) Torah at Sinai. All looked for validating precedent in the received canon. Differing on issues important to both world view and way of life, all three Judaisms concurred on the importance of literacy in the received writings, on the lasting relevance of the symbolic system at hand, on the pertinence of the way of life (in some, if not in every detail), on the power of the received Judaism of the dual Torah to stand in judgment on whatever, later, would serve to continue that Judaism.

True, the differences among the three Judaisms impressed their framers and with good reason. The Reformers rejected important components of Rabbinic Judaism and said so. Written Torah, yes, Oral Torah, no. The Orthodox explicitly denied the validity of changing anything, insisting on the facticity, the givenness, of the whole. The Conservatives, in appealing to historical precedent, shifted the premise of justification entirely. Written Torah, yes, Oral Torah, maybe. They sought what the Orthodox thought pointless and the Reform inconsequential, namely, justification for making some few changes in the present in continuation of the processes that had effected development in the past. None of these points of important difference proved trivial. But all of them, all together, should not obscure the powerful points of similarity that mark all three Judaisms as continuators of the Judaism of the dual Torah. The points at which each Judaism took its leave from the received system do not match. In the case of Reform, the break proved explicit: change carried out by articulate, conscious decision, thus change as a matter of policy, enjoys full legitimacy. And as for the positive Historical School and of its continuators in Conservative Judaism, the gulf between faith and fact took the measure of the

difference between the received system of the dual Torah and the statement of mere historical facts that, for the Historical School, served to document the faith. In saying that 'things have changed in the past, and we can change them too,' Reform established its primary position. It pointed to precedent, and took as implicitly conceded the power of the received system to stand in judgment. All the more so did the Orthodox and Conservative theologians affirm that same power and place themselves under the judgment of the Judaism of the dual Torah. All three established a firm position within the continuation of that Judaism. Each claimed to take priority as the next step in the linear and incremental history of Judaism.

4. *The Twentieth Century and its Mythic Ideologies*

Three Judaisms were born in the twentieth century, two in 1897, one in 1967. The first was Jewish Socialism and Yiddishism; the second, Zionism; and the third, three generations later, the American Judaic system of Holocaust and Redemption. Jewish Socialism took shape in the Bund, a Jewish union organized in Poland in 1897. Zionism was founded in the World Zionist Organization, created in Basel in 1897. American Judaism—'the Judaism of Holocaust and Redemption,' explaining in ethnic and political terms why and where one should be Jewish in the formulation under discussion—came to powerful expression in the aftermath of the 1967 war in the Middle East. All three Judaic systems answered profoundly political questions. Their agenda attended to the status of the Jews as a group (Zionism, American Judaism), the definition of the Jews in the context of larger political and social change (Jewish Socialism, Zionism). It follows that the urgent questions addressed by the twentieth-century Judaisms differed in kind from those found acute in the nineteenth century. In the twentieth century, powerful forces for social and economic change took political form, in movements meant to shape government to the interests of particular classes or groups, the working classes or racial or ethnic entities, for instance. The Judaic systems of the century responded in kind.

Jewish Socialism presented a Jewish-ethnic system congruent to the political task of economic reform through state action. The Jews would form unions and engage in mass activity of an economic, and ultimately, therefore, of a political character. In that same century the definition of citizenship, encompassing ethnic and genealogical traits, presented the Jews with the problem of how they were to find a place in a nation state that understood itself in an exclusionary and exclusive, racist way—whether Nazi Germany, nationalist Poland, Hungary, Romania or France. Zionism declared the Jews 'a people, one people,' and proposed as its purpose the creation of the Jewish State. Later on, shifting currents in American politics, a renewed ethnicism and emphasis on intrinsic traits of birth, rather than extrinsic ones of ability, called into question the Jews' identification with the democratic system of America as that system defined permissible difference. A Jewish ethnicism, counterpart to the search for roots among diverse ethnic groups, responded with a tale of Jewish 'uniqueness'—unique suffering—and unique Jewish ethnic salvation, redemption in the Jewish State. So three powerful and attractive movements, Jewish Socialism, Zionism, and American Judaism, presented answers to critical issues confronting groups of Jews. All of these movements addressed political questions and responded with essentially political programs. Zionism wanted to create a Jewish state, American Judaism wanted the Jews to form an active political community on their own, and Jewish Socialism in its day framed the Jews into political, as much as economic, organizations, seeing the two as one, a single and inseparable mode of defining economic activity and public policy.

5. *Comparing the Nineteenth- and the Twentieth-century Judaisms*

On the surface the three Judaic systems of the twentieth century took up political, social, economic, but not theological questions. While the nineteenth-century Judaisms addressed issues particular to Jews, the matters of public policy of the twentieth-century Judaic systems concerned everyone, not only Jews. All of the new Judaisms intersected with comparable systems—like in character, unlike in content—among other Europeans and Americans. Socialism then is the genus, Jewish Socialism the species; American ethnic assertion the genus, American Judaism the species. The issues addressed by the Judaisms of the twentieth century, the crises that made those issues urgent, did not affect Jews alone or mainly. The crises in common derived from economic dislocation, which generated socialism, and also Jewish Socialism; the reorganization of political entities, which formed the foundation of nationalism, and also Zionism; and the reconsideration of the theory of American society, which produced, alongside the total homogenization of American life, renewed interest in ethnic origins, and also American Judaism.

The nineteenth-century Judaisms made constant reference to the received system of the dual Torah, its writings, its values, its requirements, its viewpoints, its way of life. The twentieth-century Judaisms did not. True, each Judaism born in the nineteenth century faced the task of validating change that all of the nascent Judaisms in one way or another affirmed. But all of the new Judaisms articulated a principle of change guiding relationships with the received system,

which continued to define the agenda of law and theology alike, and to which, in diverse ways, all the Judaisms recognized themselves as answerable. We cannot point to a similar relationship between the new Judaisms of the twentieth century and the received Judaism of the dual Torah. For none of them made much use of the intellectual resources of that system, found important issues deemed urgent within that system, or even regarded itself as answerable to the Judaism of the dual Torah.

For the twentieth-century systems birth came about within another matrix altogether: the larger world of socialism and linguistic nationalism, for Jewish Socialism and Yiddishism; the realm of the nationalisms of the smaller peoples of Europe, rejecting the government of the international empires of Central and Eastern Europe, for Zionism; the reframing, in American culture, of the policy governing social and ethnic difference, for American Judaism. None of these Judaic systems of believing and behaving drew extensively on the received Judaic system of the dual Torah, and all of them for a time vastly overshadowed in acceptance among the Jewish group the Judaisms that did. So the passage of time, from the eighteenth to the twentieth century, produced a radical attenuation of the bonds that joined the Jews to the Judaism of the dual Torah. Our interest concerns not explaining the social change at hand, nor even in invoking the political explanation that seems to me paramount, but only in reviewing the simple program with which we began.

The Judaisms of the nineteenth century attained a high measure of self-consciousness because they had before their eyes the image of the innocent faith of their predecessors, and many in their own time as well. The Judaisms of the twentieth century, abandoning all pretense at a connection to the received Judaism, lost also the awareness that change took place, people made choices, and, in all, a dimension of decision-making took the measure of their Judaisms. So they entered a new phase of selfevidence, appealing now for vindication not to received texts but the obvious facts of the everyday world. So history now proved propositions for the new Judaisms, and the text of those Judaisms was the world out there. Proof texts derived from headlines in newspapers. The continuators of Rabbinic Judaism developed systems of belief and behavior that invariably fell into the category of religions, in our setting, Judaisms. Whether or not the twentieth-century successor systems constitute religions, Judaisms, presents a question bearing only slight consequence. Clearly, Jewish Socialism and Zionism provided the deep meaning for the lives of millions of Jews, so, defining ways of life and world views and the Israel subject to realize both, they functioned entirely as did the religions, the Judaisms, of the nineteenth century and of the twentieth as well. But Socialism–Yiddishism and Zionism differ from the continuator-Judaisms, because neither invoked a supernatural God, revelation of God's will in the Torah, belief in Providence, or any other indicator of the presence of the family of closely-related religions, the Judaisms; and, moreover, their framers and founders did not claim otherwise. Had the framers alleged that theirs was a continuator-Judaism, we should have to introduce that fact into our analysis and interpretation, but none did. The Socialists took a position actively hostile to religion in all forms, and the Zionists compromised with the religious Judaisms of the day but in no way conceded that theirs was a competing Judaism. As to American Judaism, in its contemporary form, in its appeal the salvific myth of Holocaust and Redemption, it crosses the border between a genuinely religious and an entirely secular system addressed to an ethnic group, the Jews, not a religious community, 'Israel.'

5.1 Influence of Twentieth-century Systems

No Judaic religious systems of broad influence took shape in the twentieth century. Three factors explain why.

5.1.1 The Holocaust. First let us consider the demographic factor. The most productive sector of world Jewry perished, and the social and political and cultural conditions that put forth the great systemic creations vanished with the six million who died. Judaic systems in all their variety emerged in Europe, not in America or in what was then Palestine and is now the State of Israel, and, within Europe, they came from Central and Eastern European Jewry. We may account for the systemopoia of Central and Eastern European Jews in two ways: (a) the Jews in the East, in particular, formed a vast and coherent population, with enormous learning and diverse interests; (b) the systems of the nineteenth and twentieth centuries arose out of a vast population living in self-aware circumstances, not scattered and individual but composed and bonded. The Jews who perished formed enormous and self-conscious communities of vast intellectual riches.

5.1.2 The demise of intellect. The second explanation for the end of systemopoia is the as yet unappreciated factor of sheer ignorance, the collapse of the system of cultural transmission of Judaism. That second factor is constituted by the utter loss of access to that permanent treasury of the human experience of Jewry preserved and handed on in the canonical Torah. The Judaisms that survive—political and ethnic in the main—do provide ready access to emotional or political encounters, readily available to all by definition. But they offer none of that confrontation of taste and judgment, intellect and reflection,

that takes place in traditional cultures and with tradition. The twentieth-century systems resort mainly to the immediately accessible experiences of emotions and of politics. The repertoire of human experience in Rabbinic Judaism presents as human options the experience of the ages. By contrast Israeli nationalism and American Judaism—the two most influential systems that move Jews to action in the world today—scarcely concern themselves with that Judaism. They work with the raw materials made available by contemporary experience: emotions on the one side, politics on the other. Access to realms beyond requires learning in literature, the only resource for human experience beyond the immediate. But the Judaic systems of the twentieth century do not resort to the reading of books as a principal act of their way of life, in the way in which Rabbinic Judaism and its continuators did and do. The consequence is a strikingly abbreviated agenda of issues, a remarkably one-dimensional program of urgent questions.

5.1.3 The triumph of large-scale organization. Third and distinct from the other two is the bureaucratization of Jewry in consequence of the political tasks it rightly has identified as urgent. Jews have had to work through very large organizations and institutions. The contemporary class structure of Jewry therefore places in positions of influence those Jews who place slight value on matters of intellect and learning, and that same system accords no sustained hearing to Jews who strive to reflect. The exemplary experiences of those who exercise influence derives from politics, through law, from economic activity, through business and industry, from institutional careers, through government, politics and law. As the gifts of establishing routine take precedence over the endowments of charisma of an intellectual order, the experiences people know and understand—politics, emotions of ready access—serve, also, for the raw materials of Judaic system-building. The great war conducted against the Jews, beginning not in 1933 but with the organization of political antiSemitism joined to economic exclusion, from the 1880s onward, effected the change. In a profound sense the type of structure now characteristic of Jewry represents one of the uncounted costs of the Holocaust.

Judaism and Gender

Contemporary Jewish feminist scholarship (Hyman, Hyman and Moore, Peskowitz and Levitt, Plaskow, Alpert, Heschel, Prell, Boyarin, Baskin, Adler, Kaplan) and activism (Pogrebin, Klepfisz and Kaye/Kantrowitz, Brettschneider, Beck, Balka and Rose, Barack Fishman, Weidman Schneider) are transforming notions of Jews, Jewishness, and Judaism. Through these efforts Jewish culture, religion and history are being transformed. The simple logic of inclusion is giving way to more radical reconfigurations of the Jewish past, present, and future.

Jewish feminist activists and scholars were a part of the broader feminist movement not only in the so-called second wave of US feminist activism but even earlier efforts (Kuzmack, Hyman, Kaplan). By the 1970s they were demanding that Jewish women be included in all aspects of Jewish communal life as equals (Pogrebin).

Building on Virginia Woolf's suggestion that we add a supplement to history as a way of remedying the inequities between men and women, feminist historian Joan Scott calls our attention to the ambiguities within what she has termed 'the logic of the supplement.' As Scott explains, 'women are both added to history and they occasion its rewriting; they provide something extra and they are necessary for completion, they are superfluous and indispensable' (Scott 1993, p. 241). This contradictory logic is at the heart of what it means to think about gender, Jews, Jewishness, and Judaism in the beginning of the twenty-first century. A consideration of women much less the larger category of gender in the context of Jewish communal, religious and/or scholarly life, has resulted in a radical rethinking of the basic assumptions that have defined all dimensions of contemporary Jewish life. On the one hand, the inclusion of women within Jewish life constitutes a simple expansion of existing narratives. On the other hand, it has made clear that any overview of Jewish life without a consideration of gender would be both inaccurate and incomplete.

1. *Some Historical Background*

As feminist scholars have argued (Hyman 1995, Kaplan 1991, Levitt 1997), the call for inclusion has its origins in the legacy of Jewish emancipation in the West where individual middle-class Jewish men were granted rights as citizens of liberal states. They were not emancipated as Jews. By giving up various forms of Jewish communal authority, they came to see themselves reflected in the universal democratic vision of the French and American revolutions.

Although these revolutions excluded many, their universal vision offered the promise of emancipation to many who remained disenfranchised within Western culture including middle-class women. Jewish women whose husbands, brothers, uncles, and fathers had become citizens, began to ask questions about their own status. Using the logic of these liberal revolutions, by the late nineteenth century Jewish feminists became active in larger women's movements. With other women they fought for the right to own property and the right to vote (Kaplan 1979, Kuzmack 1990, Hyman 1995) but these struggles also inspired them to challenge various inequities within Jewish communal life as well. These included the dramatic increase in the number of Jewish women attending synagogues for public worship and the opening up of once gender segregated seating (Peskowitz and Levitt 1997). By the 1970s Jewish women used notions of liberal justice and equality to demand their inclusion in all aspects of communal worship. By arguing that specific Jewish communal practices either excluded women or treated them as inferior to men, they demanded their rightful place on the *bema*, reading torah and leading prayer services. In these ways, they were able to critique the masculinist bias of traditional worship. This liberal critique has expanded to include Jewish social and communal practices from religious observance to the various fields of Jewish studies scholarship.

The increasing presence of Jewish women and attention to issues of gender have occasioned the rewriting of Jewish history and the rereading of classical Jewish texts in the various fields of Jewish Studies scholarship (religion, literature, history, sociology, political science, and language study) as well as a resurgence in Jewish cultural production including art, poetry, fiction, film, music, and dance.

2. *Jewish Religious and Communal Life*

In Jewish religious worship these changes have been palpable. They include a transformation in the language of prayer. Not only is there now gender inclusive language but whole new liturgies that take account of the experiences of Jewish women (Falk 1996, Adler 1998). Since the 1970s, in increasing numbers of Jewish communities, women are engaging in once restricted religious practices. They are chanting sacred texts, participating in worship services, having honors once granted only to Jewish men and they are leading communal worship as rabbis and cantors (Nadel 1998). They are also becoming presidents of congregations and Jewish religious organizations. Although many of these efforts remain contested especially among various Orthodox Jewish communities, among liberal Jews, reform, conservative, reconstructionist and renewal Jewish communities, the inclusion of women in all of these realms including their role as rabbis and cantors are now very much established practices especially in the United States. Even among certain modern orthodox communities these roles and practices are changing. The growth of orthodox Jewish

feminist prayer groups, study centers, conferences, and the creation of women rabbinic interns throughout the 1990s all attest to the growth of an Orthodox Jewish feminist movement (Greenberg 1981, Grossman and Haut 1992). Even within ultra-orthodox communities, women are reclaiming the rituals of family purity, for example, as attractive Jewish practices for women (El Or 1994, Davidman 1991, Kaufman 1991, Ochs 1990).

Jewish women are also very much a part of passing on Jewish religious traditions through the work of Jewish education. Since the nineteenth century, Jewish women have playing an ever increasing role in the education of Jewish children in what had been an exclusively male domain. Jewish women are increasingly running Jewish day schools sponsored by the various religious movements and training day school teachers and administrators in graduate programs in Jewish education. Among liberal Jews, women are playing an increasing role in the education of future rabbis and cantors. The number of women on the faculties of the conservative, reform, and reconstructionist rabbinical colleges are growing. Jewish women are also taking on leadership roles as administrators at these institutions.

In all of these realms there is a growing commitment to include women in the vital life of Jewish religious practices and Jewish communal life more broadly understood (Barack Fishman 1993, Prell 1999). Increasingly Jewish women are taking on a variety of leadership roles both in North America and in Israel, running Jewish agencies, social service organizations, and federations.

Through these efforts other changes are also being fostered. Feminist efforts have also opened up Jewish communal life to gay and lesbian Jews. Here lesbian Jewish feminists have made substantial contributions as rabbis, lay leaders, activists, and scholars (Alpert 1997, Plaskow 1990, Beck 1982, Balka and Rose 1989). They are powerfully challenging notions of family, community, and religiousness by their strong presence within and outside of organized Jewish communities. They are challenging the criteria for membership in Jewish congregations and communal organizations; constructing new rituals of recognition such as commitment ceremonies and events to celebrate 'coming out' in a Jewish context. They have also demanded that the Jewish community address homophobia and the impact of the AIDS epidemic on Jews.

3. *Jewish Studies Scholarship*

The various fields of Jewish Studies scholarship have also seen the addition of women as a precursor to more critical transformations of scholarly practice particularly in the fields of textual study, religion, history, literature, and the various social sciences. Although Jewish women scholars were already active in the academic study of Judaism beginning in the late nineteenth century, the most powerful and dramatic changes came with the second wave of US feminist activism. Feminist scholars have not only added women to the study of ancient Jewish text, Jewish philosophy, theology, history, literature, and social study, they have raised questions about both the content of Jewish studies courses and the ways they are being taught in colleges and universities (Peskowitz and Levitt 1997, Davidman and Tenenbaum 1994, Rudavsky 1995).

Work on classical Jewish texts, Hebrew bible (Pardes 1992) and especially rabbinic literature (Peskowitz 1997, Boyarin 1993, Hauptman 1998, Wegner 1988, Adler 1998, Biale 1984) have changed how these sources are read. Feminist scholars have not only looked at how Jewish women figure in these texts, they are increasingly raising questions about how gender (both masculinity and femininity) is produced in these texts and how these visions of gender have become normative. Here reading practices are crucial. As Miriam Peskowitz notes, such normative texts can and should be read as legal fantasies following the lead of recent scholars in critical legal theory. As Peskowitz argues, these texts tell us about the desires of those who produced them.

Jewish feminist scholars have also taken on the traditions of Jewish theology, ethics, and philosophy to offer new approaches to these various fields of Jewish religious studies scholarship (Adler 1998, Plaskow 1990, Alpert 1997, Levitt 1997, Falk 1996). These scholars not only question the gender of God but the subject of ethical discourse. Who is the person making moral choices and from what standpoint are these issues being addressed. They also challenge the mind–body dualisms that mark medieval as well as modern Jewish thought and their implications for Jewish women.

In Jewish history, feminist scholars have used the addition of women to their readings of the Jewish past to rethink some of the grand narratives that have shaped Jewish historical study. By demonstrating the role women played in emancipation and enlightenments, for example, modern Jewish historians have shown us how vital Jewish women were to these transformations in Jewish life (Hyman 1995, Kaplan 1979, 1991, Kuzmack 1990). Jewish feminist historians have also called our attention to the role of Jewish women in assimilation into America culture (Hyman and Moore 1997, Stahl Weinberg 1988, Glenn 1990, Prell 1999).

Broader works on twentieth-century Jewish history have also been transformed by accounts of gender. Included in this scholarship are powerful accounts of zionism as a masculinist national movement (Berkowitz 1993, Boyarin 1997, D. Biale 1992) as well as a growing body of literature about the role of women in the devastation of the holocaust (Ofer and Weitzman 1998, Rittner and Roth 1993). As Daniel Boyarin

points out, Zionism was a way of remasculinizing the Jewish people. On the other hand, feminist scholars have begun to examine how the experience of genocide was gendered. They point to how and in what ways pregnancy, menarche, menstruation, and motherhood marked Jewish women in the holocaust. They also address the particular devastation of sexual assault in this context. Finally, women's historians have called attention to the various roles of Jewish women in the ancient past. Not only were they wives, daughter, and mothers, they were also workers. They were dyers and weavers, spinners and crafts-people alongside men (Peskowitz 1997, Meyer 1988) and, in some instances, they were also communal leaders (Kraemer 1992, Brooten 1982). The work of feminist scholars has offered us new evidence of the lives of Jewish women in the past. In the fields of the social sciences, feminist scholars have called our attention to the role of Jewish women in Jewish communal and political life including their role in the process of Jewish assimilation. How did they dress themselves and their families or decorate their homes? What did they serve their families for dinner? These are all crucial questions for feminist ethnographers who are re-examining American Jewish assimilation (Prell 1999, Barack Fishman 1993, Davidman and Tenenbaum 1994).

The work in Jewish literature is massive and complex. Feminist scholars have not only discovered heretofore forgotten or unknown texts by Jewish women in various languages including Hebrew, Ladino, Yiddish, and English (Alcalay 1996), they have also offered new accounts of more well-known texts (Fuchs 1987, Seidman 1997). Scholars like Naomi Seidman have also asked us to reconsider the relationship between Jewish languages and how gender is used to naturalize the privileging of Hebrew over Yiddish. As she explains, like the relationship between husband and wife, Yiddish, the language of daily life was subservient to Hebrew, the masculine language of prayer and traditional Jewish study.

4. *Jewish Cultural Production*

Recent works of feminist art and literature have not only built on the work of Jewish scholars in a variety of fields, they have also used popular and material culture to offer critical perspectives on Jewishness as a cultural and ethnic as well as a religious identity. Some works highlight the absence of Jewish women from certain forms of religious or cultural production like the reading and writing of sacred texts in Helene Aylon's work (Kleeblatt 1996). Others have used these artifacts including texts to create new theatrical or cinematic productions on or about Jewish women.

Since the 1970s there has been a growing body of Jewish feminist literature especially by lesbian Jewish feminists (Alpert 1997, Beck 1982, Klepfisz and Kaye/Kantrowitz 1986). These writers often focus on Jewishness as a cultural and political and not a religious practice. More recent efforts have included the reclaiming of Klezmer music and the resources of Yiddish film for new cultural production (Fox 1999).

In the arts the inclusion of women has expanded the realm of Jewish cultural production in the United States as well as Israel. Increasingly Jewish women are playing an active role in these efforts by creating new works, sponsoring exhibits, and participating in various forums to present feminist artistic works to a broader audience (Kleeblatt 1996, Pellegrini 1997, Antler 1998, Prell 1999). Here Jewish museums have become a crucial site for new forms of Jewish feminist cultural production.

5. *Future Prospects*

Although Jewish women are, now more than ever, a part of Jewish communal life, there is much more work to be done. Efforts to make explicit the inequities at the heart of many Jewish communal practices much less the exclusion of women from sacred texts and the problematic roles they do have when they are included in these texts all demand ongoing critical examination. Among Jewish feminists the idea of giving up these traditions is too simple. Although they are critical of these texts, they continue to claim them and try to find ways of forging new and more powerful relationships with these legacies. Jewish women are doing this labor as university scholars, day school teachers and administrators, as cantors and rabbis, and as poets and artists.

L. Levitt

Judges

A judge is a public officer appointed to administer the law in a Court of Justice impartially and independently. Judicial independence is instrumental to judicial impartiality, since only an independent judge can be expected to be fully impartial: hence 'his and it

usually is his' configuration as an officer within some governmental structure, a measure originally meant to protect him against pressures from the confronting parties (Shapiro 1981). However, while this official status of the judge may provide protection against the parties it may also facilitate pressures and influences from those to whom he owes his office. In some highly infrequent cases (such as early Roman Law) the judge is freely elected by the parties who commit themselves to abide by his decisions. However in most historical instances the judge's authority and binding capacity is independent from the will of the involved parties and derives from the backing granted to his actions by the political system. This creates a direct link between the legitimacy of judicial institutions and the type of legitimacy of the prevailing form of political government. Judicial impartiality can thus be expected to be reasonably guaranteed only under strict democratic rule, one of the basic requisites of a democratic polity being the existence of an effectively independent judiciary.

Officially empowered to determine in a binding way with which of the contending parties lies the legal right, the judge constitutes a key, central figure in all legal systems, past or present. However, the judge is but one among other possible conflict-solving institutions. Rather than as a discrete, fully differentiated category, he can be better understood as one of the extremes of a continuum that would run: *go-between*, *mediator*, *arbitrator*, *judge* (Shapiro 1981, p. 3). All these roles require an impartial implementation but differ in the degree of formalization and depersonalization presiding the relation with the contending parties. The *go-between*, who operates on a pure consent basis, represents the more informal, face-to-face, and equity-oriented end of the continuum; the *judge*, professionally, trained, vested with official authority and required to lack all personal acquaintance with the parties, occupies the opposite end.

As societies become more complex and differentiated, and as the state-controlled legal system increases its centrality in social life, the role of the judge gains predominance. However, the other conflict-solving roles do not disappear; instead, they subsist as alternative—and usually very active—instances. The continuum can be thus perceived as a cumulative process, allowing for the emergence of progressively more complex and formalized agencies of conflict resolution that co-exist with the preceding ones (see *Dispute Resolution in Economics*).

1. Types of Judges

A basic typology of judges can be attempted from the combination of three factors intervening decisively in the shaping of judicial roles. In the first place, the *type of legal system* within which the judge operates: a basic distinction can be made between Western legal systems (comprising both Common Law and Civil Law systems), and all other types of systems, such as *Far Eastern* (Chinese and Japanese), *Religious* (Islamic or Hindu), or *Socialist* (see Zweigert and Kötz 1998). In the second place, the type of political legitimacy behind the body of laws to be applied, and consequently behind the political system which upholds those laws (Weber 1947). Third, the basic function that is attributed to the judge: a basic distinction can be made between authoritative adjudication and mediating arbitration. The following classificatory grid (Table 1) results:

Three basic configurations of the judicial role can thus be established:

(a) *Democratic judge*. A type of judge who adjudicates cases applying rules of general validity, enacted by duly elected representatives of the citizenry. This type of judicial system corresponds to representative democracies (legal-rational type of domination in Weberian terms). There are two possible formats for the *democratic* type of judge: Common or Civil Law.

(b) *Traditional or predemocratic judge*. A predominantly arbitrating, conciliatory type of Judge who applies norms embodying a traditional legacy, contained in religious, moral, or ethical codes, or in local customs, *mores*, or folkways. This type of judge would correspond to the Weberian category of 'traditional' political domination. Several classical types of judicial roles could be included within this category: the Islamic type of judge (who attempts conciliation—if and when the compromise does not permit what is forbidden or does not forbid what is permitted by the religious law—or who adjudicates on a case-by-case basis according to equity); the traditional Far Eastern Judge (Chinese or Japanese), more concerned with mending and preserving social harmony and equilibrium than with legal arguments or questions of individual rights; and the African or Native-American type of customary judge.

(c) *Nondemocratic judge*. A type of judge corresponding to autocratic political situations where the norms to be applied may be claimed to express the will of the people, *but as interpreted and elaborated by an autocratic ruler* (or ruling body), self-appointed as exclusive, natural spokesman for the collective will, and as such above any need for elective confirmation. This third situation would be the equivalent to Weber's concept of *charismatic* rule.

2. Increasing Convergence

This threefold typology provides basic global models or *ideal-types* but is not meant as a description of real contemporary judicial systems. The judicial systems of the more economically developed and more democratically stable countries would generally fit well into the first ('*democratic judge*') category. Most other countries, striving in many cases to consolidate modernized and democratic polities, and as such immersed in

Table 1
Judges: a basic typology

			Prescribed Basic Judicial Function		
			Adjudication (Judge imposes a solution on the parties)		Arbitration/ Conciliation (Judge assists the parties in finding an arrangement)
			Applying rules with universal validity	On a case-by-case basis	
Type of Legitimacy of the Body of Laws to be applied (The laws are considered legitimate because they embody…)	(a) The Will of the People, as expressed by duly elected representatives		Civil Law Judge; Common Law Judge		
	(b) Tradition, i.e., a traditional legacy contained in religious or moral codes or in local customs	Religious norms		Islamic Judge, *Cadi Justice*	
		Ethical norms			Far Eastern Judge (Chinese, Japanese)
		Customary norms			Customary Judge (African)
	(c) Mandates of a Ruler or Ruling Body, of an autocratic ('charismatic') nature who claims to express the true will of the people		'Socialist' and 'Totalitarian' type of Judge		

transitional situations, represent mixed, intermediate stages. However, the generalization can be made that as processes of economic, social, and cultural globalization take place at a world scale, and as political democratization and the rule of law tend to become increasingly undisputed, universal goals, the tendency can be detected in most developing countries towards the adoption of judicial systems parallel to the two models of Justice prevailing in stable democracies (predominantly, the Civil Law type of judicial system). In quite a few cases this has implied some degree of *denaturalization* of the imported model, since the modern Civil Law (as well as the Common Law) type of Judge is designed to function under democratic conditions. Certainly this was not always the case: both systems (Civil and Common law) had emerged and consolidated well before the modern idea of the rule of law had even begun to develop. But their current configuration results from the substantial redefinitions they both experienced in the wake of the democratic revolutions of the eighteenth century.

3. *Judicial Systems in Developing Countries*

Purely customary judicial systems can be now said to have become a rarity of merely anthropological or historical interest. By 1990, all Francophone African countries, with the only exception of Cameroon, had suppressed all types of customary courts, establishing a State system of Courts of the Civil Law type (Mangin 1990). In Anglophone Africa, customary courts are still allowed to exist in most countries, but as marginal institutions, their decisions being in any case appealable to State Courts, in most cases modeled along Common Law lines (Coldham 1990). One of the most conspicuous instances of Far Eastern traditional type of Judge, the Japanese, is now extinct and has given way to a Civil Law type system of Justice, with some elements of Common Law (Oda 1992, quoted in Zweigert and Kötz 1998).

Apart from China, one of the few remnants of the 'socialist' category of judicial system, most traditional systems are experiencing assimilation to the Western models. In India, where a process of *hybridization* gave birth to 'Anglo-Muhammadan' and 'Anglo-Hindu' law (Zweigert and Kötz 1998, pp. 310, 318), these bodies of law are administered by State judges in Common Law style.

In the case of the Islamic world a distinction has to be made between: (a) countries (such as Iran or Afghanistan) which in the wake of Islamic fundamentalist revolutions reorganized as Islamic Republics

and which would still fit into the traditional/religious category of judicial systems; and (b) countries (such as Egypt, Tunisia, or Jordan) which though experiencing in different degrees a trend towards the re-Islamization of social, legal, and political institutions still maintain a secular State-courts system created in most cases in the 1950s and 1960s, along the Civil Law model (Botiveau 1994).

4. *Civil and Common Law Judges*

The two types of judicial systems increasingly predominant in the contemporary world (Civil and Common Law) share a basic common, though distant, root: Roman Law, Justinianean and Classic, respectively (van Caenegem 1988). Their historical development led to differing legal and judicial traditions: Common Law is 'judge-made law, that is to say (consisting of) rules to be collected from the judgments of the Courts' (Dicey 1905/1963), whereas codification stands out as the basic identifying feature of Civil Law (Merryman 1969). But they both embody what seems to be the final stage of the centuries-long process of evolution of the Western legal tradition. As pointed by Berman (1983) the emergence of Canon Law (which gave rise to the first full legal system), the Protestant Revolution (which secularized the legal world) and the English Revolution (which established the supremacy of Parliament) paved the way for the two versions of democratic judicial systems predominant today and brought about by the American (1776) and French (1789) Revolutions. As democratically reborn judicial systems, both the Civil Law (as reshaped by the French Revolution) and Common Law (as amended in American soil) share a similar contextual prerequisite for their adequate operation: the existence of the rule of law within a pluralistic, representative democracy.

However, both systems diverge in the way in which they attempt to keep the organization of Justice in line with the commonly shared dogma of popular sovereignty. The variant of the Civil Law originated in the French Revolution was basically intended to prevent judges from interfering with the popular will as expressed in the statutes enacted by duly elected representative bodies—a reaction against the preeminence of *Parlements* under the *Ancien Régime*. In the new, democratic situation the judge had to be in Montesquieu's words just 'the mouth of the law.' Only from an unswerving application of democratic laws would the judge acquire a democratic character. In contrast, the main purpose of the judicial system established by the 1787 American Constitution was to make of the judge an essential element of the system of checks and balances that the new democratic polity was intended to be. To this effect, the judge had to apply the new statute law which had been democratically enacted (and which should be given priority in cases of collision with judge-made law); at the same time he was empowered to insure that statutes passed by ephemeral, temporary majorities would not go against the basic covenant contained in the 'supreme law of the land' (i.e., the Constitution). (See *Judicial Review in Law*.)

As a consequence, two clearly differentiated models of 'democratic Justice' crystallized. On the one hand, the Common Law judge, as watchman of the Law, that is, of the 'patchwork quilt of legislative provisions held together by thread woven out of general principles and sewn by the judges' (Bell et al. 1998, p. 5), performs his functions with a basic policy-implementing orientation (Damaska 1986) predominantly within an adversarial system. On the other hand, the Civil Law judge, as a specialized anonymous civil servant decides the cases brought to him by applying a body of written legal norms, which is assumed to provide a complete and coherent repertoire of solutions; his functional orientation is inquisitorial and conflict solving. Intended to be a system of Justice rigidly respectful with the popular will, the Civil Law system turned out in practice to be a machinery of Justice Administration insulated from politics. Although this sounds favorable, what it means is that the Civil law model of Justice, devised for a democratic setting, proved equally functional when the overall political system ceased to be democratic. The system had been designed to provide a dutiful application of the laws in force, whatever their nature, not to scrutinize their legitimacy or interpret their contents. A change from democracy to autocracy meant no difference for the internal logic of the system, which could continue operating practically unchanged. The cases of Italy, Germany, and Spain in the twentieth century, to quote but some particularly conspicuous cases where breakdown of democracy, autocratic rule, and return to democracy did not entail any proportionally correlative reorganization of the judicial system (and even just marginal changes in the composition of the judiciary) provide a telling example (Toharia 1975). This unintended political floating ability and adaptability of the Civil Law model explains the successive attempts to amend its original late-eighteenth-century design in order to reinforce its original democratic structure. The increasing importance given to *jurisprudence* (or binding judicial interpretation of norms), a word which Robespierre wanted to see removed from the French vocabulary; the gradual introduction of varying forms of judicial review (in most cases in the form of Constitutional Courts) largely under Hans Kelsen's influence in the 1920s and 1930s; the increasing questioning of the inquisitorial principle (which in the early twenty-first century is still in force, even though it is likely to disappear soon in three European Civil Law systems—France, Spain, and Portugal); and new forms of judicial activism (Guarnieri and Pederzoli 1996) are clear examples of the reorganization that the original structure has been experiencing. In a sense,

these changes reflect an increasing pattern of convergence between Civil and Common Law models (Cappelletti 1989), a convergence which goes both ways: the impact that the legal system of the European Union is having on the legal and judicial practices of the United Kingdom has also meant substantial and gradual redefinitions of some basic Common Law features (White 1999).

5. *The Selection of Judges*

A key element in the configuration of any judicial system is the way in which judges are selected. An ideal system of judicial recruitment should allow for: (a) the selection of competent and qualified persons; (b) thorough mechanisms unlikely to impair their impartiality and independence while in office; (c) making room for mechanisms of discipline, evaluation, and accountability of the judicial personnel; and (d) aiming to create a judiciary as representative as possible of the social body (in terms of ideology, social class, gender, race, religion, or other relevant social attributes). These four requirements are obviously difficult to meet and most existing systems of judicial recruitment attempt to achieve them through a wide variety of arrangements, which probably explains why 'no other governmental official is selected by so many different methods' as the judge (Stumpf 1998, p. 135).

A basic, preliminary distinction can be made between *professional* and *bureaucratic* systems of selection (Guarnieri and Pederzoli 1996), corresponding respectively to Common Law and Civil Law judicial systems. The *professionalized* selection looks for judges among already experienced, practicing lawyers which produces an older body of judges who have relatively short tenure as judges. (On mechanisms of selection see *Judicial Selection*.) By contrast, the *bureaucratic* system of selection prevailing in Civil Law systems allow for much longer judicial careers: from an average entrance age barely around or well below 30, to compulsory retirement around age 70 or even 75. The system is not meant to select mature, experienced lawyers and make them judges but rather to select young law graduates, without any previous legal practice, and prepare them for a lifelong career in the judiciary. The sense of achievement within the legal profession and the social aura and moral *auctoritas* that characteristically go with the image of the Common Law judge, is lacking in his Civil Law counterpart.

6. *Judges' Social Representativeness*

As professionals called to perform a highly specialized task implying extensive legal training, judges have tended historically to be recruited among members of educated, well-to-do sectors of society. This has originated an almost universal double structural bias within all judiciaries: a *class bias* (middle- to lower-class people, as well as people from minority groups, were likely to be strongly under-represented) and a *gender bias* (women were particularly likely to be strongly under-represented, as a result of the late recognition of their rights to equal education and equal access to professional life). A third, additional bias might even be said to have traditionally characterized the Judiciary: a *conservative bias* (as suggested originally by Max Weber, who pointed to the inherent conservative implications of legal reasoning and thence its more likely appeal for conservative-minded persons). As a result women, members of minorities, persons of lower-middle- or lower-class origin and people with ideologically progressive orientations were only rarely found within judiciaries.

To a large extent, all these biases seem to be gradually fading, as educational systems have become more inclusive and affirmative action programs have promoted higher levels of social equality. As for the social origin of their members, Civil Law judiciaries have been traditionally less elitist than their Common Law counterparts: in countries such as France, Italy, or Spain most judges tended to come from rural and middle- to low-middle-class families whereas in the US or in the United Kingdom urban upper- or upper-middle-class origin usually prevailed. But in both cases the presence of judges with lower- or working-class origin was practically nil. This situation is changing substantially in both systems as judiciaries gradually become more representative of the prevailing social structure (Toharia 1987). The data in Table 2 reflect the gradual increase of social pluralism within most judiciaries since the 1970s. The change is particularly perceptible with respect to the increased presence of women, especially in civil law systems. The universalistic, competitive nature of the *bureaucratic* process of selection (generally based purely on personal performance in public entrance examinations, which leaves less room for blatant discrimination), and the fact that it takes place at a much earlier point in life seem to account for this seemingly more advanced degree of *feminization* of most Civil Law judiciaries. The presence of women within the judiciary may be said in any case to have passed well beyond the 'tokenization' phase, and to be becoming a fully institutionalized pattern. Even in Arab countries such as Tunisia, in spite of the controversy reopened by the religious fundamentalists' questioning of the eligibility of women for judicial office, in 1994 one out of every four judges was a woman (Botiveau 1994). Racial and religious minority groups appear to have also increased their presence within the judiciary, though to a somewhat lower degree. As for the *ideological bias* the issue seems to have lost much of its former intensity. In Common Law countries, appointment or direct election of judges on the basis of their ideological

Table 2
How socially representative is the Judiciary?

Women and other social groups within the Judiciary. Selected dates and countries		
Date	Country	
1835	USA	First Roman Catholic appointed to the Supreme Court (Roger B. Taney)
1916	USA	First Jewish-American appointed to the Supreme Court (Louis Brandeis)
1961	USA	African-American judges represent 0.8 percent of all State and Federal Judges
1962	UK	First woman appointed as County Judge (Elizabeth Lane)
1965	UK	First woman appointed to the High Court Bench (Elizabeth Lane)
1967	USA	First African-American appointed to the Supreme Court (Thurgood Marshall)
1967	Tunisia	First woman admitted into the Judiciary
1977–80	USA	President Carter's positive action program results in the appointment of 100 women, African-Americans, and Hispanic-Americans,to the Federal Bench
1979	UK	England's first Sikh judge appointed
1979	California, USA	Governor Brown appoints America's first openly homosexual judge
1980–1	USA	3.1 percent of all US State Supreme Court Justices are women
1981	USA	First woman appointed to the Supreme Court (Sandra Day O'Connor)
1981	California, USA	Governor Brown appoints first openly lesbian judge
1986	USA	First Italian-American appointed to the Supreme Court (Antonin Scalia)
1989	Germany	18 percent of all judges are women (compared with 3 percent in 1960)
1990	The Netherlands	28 percent of all judges are women (compared with 11 percent in 1973)
1992	Georgia, USA	First African-American woman appointed to the Supreme Court of a former Confederate State
1992	Costa Rica	42 percent of all judges are women
1992	Buenos Aires, Argentina	26 percent of all judges are women (compared with 11 percent in 1985)
1993	USA	10 percent of all federal judges are African-Americans
1993	USA	3.3 percent of judges in all levels of the US Judiciary are African-Americans
1994	Tunisia	23 percent of all judges are women
1994	Venezuela	First woman ever appointed as Chief Justice of a nation's Supreme Court (Ms Cecilia Sosa)
1994	UK	Percentage of women in the different levels of British Judiciary: Heads of Division: none;Lords Justices of Appeal: one out of 32; High Court Judges: 6 percent; Circuit Judges:6 percent; District Judges: 10 percent
1995	Italy	41 percent of all judges are women
1996	France	47 percent of all judges are women
1996	USA	Of all Judges within the Federal Judiciary, 9 percent are African-American, 4 percent Hispanic-American, 0.6 percent Asian-American and 0.2 percent Native-American. These minority groups add up to 13.8 percent, compared with 4.9 percent in 1976
1996	USA	Within the Federal Judiciary, 17 percent are women (compared with 1 percent in 1976 and 9 percent in 1989). During President Clinton's first administration (1992–6) 31 percent of all appointments to the Federal bench corresponded to women (as compared with 0.4 percent under Nixon, 16 percent under Carter, 8 percent under Reagan and 19 percent under Bush), and 33 percent to members of minority groups
1999	Spain	34 percent of all judges are women, compared with 12 percent in 1987. Among the last class of new judges selected, 58 percent are women

orientation is perceived as a legitimate way of creating a bench that 'looks like the country.' In Civil Law countries, where judicial systems are supposed to be person proof, the scant data available indicate nonetheless that the ideological composition of the judiciary tends to reflect quite closely the ideological pluralism prevailing in the global society (Toharia 1987). The pattern of affiliation to the ideologically

oriented unions of judges existing in countries such as Italy, France, or Spain provides an additional evidence of such pluralism.

Judicial Review in Law

Judicial review may be defined as the institutional capacity of courts of law to assess the validity of actions taken by both inferior and coordinate branches of government. In the United States, judicial review has been associated historically with Supreme Court decisions regarding the allocation of powers among the branches of the national government, and between the national and state governments. In the last half of the twentieth century, the federal judiciary also used the power of judicial review to play a prominent role in protecting individual rights. Most modern nation-states now incorporate some variant of this power into their laws and constitutions.

1. Historical Origins

Judicial review is an outgrowth of efforts to limit the scope of power held by those authorized to interpret both sacred and secular texts. Societies, particularly (but not exclusively) those with complex governing structures, have created systems of law that constrain or influence official and social behavior through expressed codes or instructions. These, in turn, are overseen by special, trained officials. The fear that written laws and those empowered to enforce them will subvert the basic structures and values of a society form a prominent chapter in the history of self-government. Enabling government while protecting against its abuses is both an age-old and a universal concern.

In the Judeo-Christian tradition, for example, one finds such concerned in the books of Exodus, Leviticus, and Kings I and II. There, following the example of the primary law-giver, Moses, the prophets often contested the interpretations of both sacred and civil law provided by the kings and other secular rulers. Again, intellectuals in ancient China engaged in an extensive debate as to whether *li* (ritual) or *fa* (law) should govern human behavior. Mo Tsu, one such intellectual, argued that government was necessary to establish and govern meanings, including those pertaining to human conduct. Other intellectuals countered that the attempt to codify essential rituals or forms of conduct would lead to sophistry in political life. The Prince's advisors, it was reasoned, would confuse the Prince with various interpretations of essential political terms (Pocock 1971).

2. Tension with Democracy

In modern democratic polities, the dilemma presented by judicial review is often referred to as the 'counter-majoritarian difficulty.' This is a recognition of the inherent tension between democracy and the rule of law. Courts and the law would seem to be ideal guardians of a political system's fundamental principles and values. Yet, it is also recognized that, structurally, courts are not majoritarian democratic institutions, and their decisions and interpretations of laws and constitutions may be at variance with popular values. There is always the fear that, in the guise of

interpretation, a judge will substitute his or her personal values for those of a democratic majority.

The emergence and practice of judicial review in the United States is a textbook example of this continuing tension. Although the American Constitution does not mention judicial review, it was not unknown to the framers. In *Marbury v. Madison* (1803), the Supreme Court held that 'it emphatically is the province and duty of the judicial department to say what the law is,' and that, under a written constitution of enumerated powers, the Court could not enforce a law repugnant to it. An act of Congress that contravened the Constitution, the Court held, was null and void.

Only a few laws were held invalid in the nineteenth century, but the scope and incidence of judicial review expanded rapidly in the twentieth century. It is today a centerpiece of a 'judicialized' American political system. There is general agreement at the theoretical level about the utility of judicial review, but also constant disagreement about its application in particular cases and the alleged perils of an 'imperial judiciary.'

3. *Globalization of Judicial Review*

As Americans continue to debate the use and consequences of judicial review, it has taken root elsewhere. Most postwar constitutions in Europe, as well as India and Japan, incorporated some variant of it. And it now has been adopted, at least formally, by many of the nations of the former Soviet empire. Many of these nations had, in fact, once deliberately rejected it. Post-Napoleonic Europe, for example, firmly placed the judiciary under the control of the positivistic codes and enactments of the parliaments. Asian countries struggled throughout the nineteenth and early twentieth centuries to develop independent judiciaries that would be 'acceptable' to the United States and the other Western powers (Grovogui 1996, Millard 1931).

The rise of authoritarian and totalitarian regimes with little regard for basic human rights in the twentieth century led to an 'Americanization' of the governing regimes in Turkey, the Philippines, Japan, France, and Germany after the Second World War. Each of these nations has joined many others in adopting some measure of constitutional and liberal reform in their political arrangements, reforms that include an expressed power of judicial review. In Africa, judicial review and 'constitutional courts' have taken root in places like Benin, South Africa, Ghana, and many other countries where, previously, the judiciary was almost completely subservient to the executive or legislature (Shapiro and Stone 1994, Prempeh 1999).

But even in Great Britain, which has no written constitution, no bill of rights, a strong tradition of parliamentary supremacy, and no formal mechanism for judicial review, in the same period that the US was undergoing a transition toward a more 'activist' judiciary with respect to civil rights, British judges increasingly policed the administrative realm for violations of governing statutes. Some scholars have looked to internal factors, such as intergovernmental support and rights-advocacy organizations, as well as the influence of the increasingly rights-oriented and litigious culture of the United States, to explain the development and persistence of what might be called clandestine review (Shapiro and Stone 1994, Epp 1998).

The British experience is but one indicator that, while the United States has consciously sought to export its 'unique' institution, the results have not been uniform. Courts in Europe, Africa, and Asia continue to retain much of their traditional character even if consciously aware of the American example. This is particularly true of countries with civil code rather than common law systems. European constitutional courts, for example, are usually special courts that hear cases brought by the government, not private litigants. In France, the Constitutional Council may only review legislation in the immediate time period after passage and prior to promulgation. After that time, the statutes in question cannot be reviewed by that body. Moreover, the fact that members of both the Assembly and Senate can, with great ease, bring a constitutional challenge to legislation has further, blurred the edges separating legislating from adjudicating. The legislator proposes and debates a law 'as if' a judge will hear the same; and judges write decisions 'as if' the audience will be a legislator. Whether the parliament is the creature of the judge or the judge is the creature of the parliament is, in all respects, an important question (Shapiro and Stone 1994, pp. 400–2).

Characteristics such as those retained by the French point to important differences from American cultural and jurisprudential conventions. The US Supreme Court has never viewed itself as a court of 'instruction.' It is not empowered to issue merely advisory opinions; judicial review of constitutionality can only be undertaken in the context of an adversary 'case or controversy' proceeding. Organizing principles of government such as federalism and the separation of powers also vary widely in their acceptance, meaning, and application, insuring many variants of judicial review.

4. *Judicialization of Politics?*

The fact that judicial review has become a global phenomenon has led some social scientists to speak of a 'judicialization' or 'juridicalization' of politics. At its root, the thesis suggests that political institutions such as legislatures and administrative agencies have come to expect and even welcome courts as arbiters or overseers of their actions. They tailor their actions accordingly to accord with an expected response by the

judiciary (Stone Sweet 1999, p. 164, Shapiro 1994). The electorate itself has come to have similar expectations. In the American political context, for example, judicialization has had the paradoxical effect of legitimizing, *de facto*, the role of judicial review in a democratic process. While most Americans lack a deep knowledge of American history, politics, or law, they are well able to speak the language of rights and can, with some measure of accuracy, defend or dispute the validity of the legal holdings involved in such famous cases as *Brown v. Board of Education* (1954), *Miranda v. Arizona* (1966), and *Roe v. Wade* (1973) (Friedman 1990. Grossman and Epp 1991). At the same time, the idea that the US Supreme Court is both the final arbiter of legal disputes, and should be so, is not seen by a significant portion of the electorate as contrary to basic democratic values. Judges, from this view, are the lesser of many evils in a world where state and national institutions have come to be mistrusted. What citizens oppose most is decisions with which they disagree!

Outside of the United States, the tension between judicial review and democracy has been less of an issue. This is due, without doubt, to the association of judicial review with postauthoritarian reforms and constitutions that establish the primacy of fundamental human rights principles, and entrust their protection to constitutional courts. The rise of supranational courts such as the European Court of Justice has not only created a second level of review that transcends the courts and law of individual countries, but has also added considerable force to the argument that the enforceability of basic rights is critical to the maintenance of democracy and a civilized world order.

When judicial review transcends national boundaries, the problems of legitimacy and acceptance may be even greater. As the legal philosopher H. L. A. Hart pointed out, judicial review (or some variant of it) is likely to be a problem in any political community or arrangement in which those who are authorized to make or interpret the laws are institutionally (and even more so, culturally) distinct from the members of that community (Hart 1961). Governing structures and particular social and political conflicts are continually readjusted to meet the shifting strengths and needs of the community. This is particularly true where, as with the European Court or the new constitutional courts of eastern Europe, the role of courts is still evolving and not yet fully understood or accepted. But it is also true, if to a lesser extent, in nations or communities where judicial review and an activist judicial role is endemic and expected.

5. *Contemporary Debate*

The wide-ranging debates that pervaded the American academy from roughly 1940 to 1990 tapered off as the US Supreme Court drifted rightward, and as the *de facto* presence of judicial review in American political life came to be more or less taken for granted. While the American literature on judicial review might seem to be of immediate and obvious interest to legal reformers in Europe, Asia, and Africa, it remains to be seen whether the American experience (or the 'counter-majoritarian difficulty' for that matter) will be of deep interest in those places. Rather, as judicial review has become less a species of *American exceptionalism* and a broader, global issue, current scholarship has turned increasingly to a hybrid of the American debate. At issue is the empirical question of *why* judicial review develops in some times and places and whether, normatively speaking, judicial review may not be better employed in some systems than in others.

Some scholars have argued that for judicial review to take root there must be some level of commitment to the rule of law, and to government that is both democratic and limited. In polities where pure majoritarianism prevails there is, of course, no necessary limit to what the legislature can do in the electorate's name. Where the government is limited by some overarching set of principles, the ability of courts of law to intervene and veto legislation in apparent conflict with such principles is more pronounced (Shapiro 1998). In a twist on the American experience, then, the inversion of the relationship of rights-to-the-state in regimes throughout Europe after the Second World War has enshrined their constitutional courts as defenders of pre-existing and constitutive rights held by the citizenry. Many of these rights find their sources not merely in written constitutions (such as the German Basic Law's protections of 'Human Dignity,' which many nations lack) but in sources both internal or external to the political system (e.g. treaties and conventions) (Shapiro and Stone 1994). Conversely, in some African countries like Ghana, the long-standing tradition of judicial deference to executive authority has led the judges to use their new powers to adopt a jurisprudence seemingly at odds with the more recent, liberal written constitutions. In these cases, commentators have suggested, new 'constitutional courts' with judges learned in foreign jurisprudence and committed to constitutional reform will have to be substituted for a judiciary that is, in large part, a holdover from the *ancien régime* (Prempeh 1999).

Other oft-cited factors include the existence of commerce and internal geographic and cultural divisions, such as federalism. Commercial actors conventionally use legal devices to secure both formal agreements and sanctions should the terms of those agreements be violated. Written law, and the search for a neutral third party who is an expert in such law, has long been an important part of trade. Social scientists have argued that commerce was of great importance in accounting for the historical emergence of judge-made law. The origins of the professional lawyer, Max Weber argued, are to be found in the *cavere*: the Roman practice of drafting contracts, wills,

and other legal devices. The lawyers, seeking to make commercial relations more predictable for their clients, would change the meanings of extant legal terms or invent new legal devices and then seek out judges who would institutionalize the changes as authoritative (Weber 1954, p. 72).

A recent study of the World Trade Organization (WTO) lends support to this observation. The WTO's predecessor, the General Agreement on Tariffs and Trade, consisted originally of a Panel System of diplomats who mediated issues between states. With time, the treaty came to be viewed as authoritative law and the Panel's decisions regarding that law were seen as both binding and precedential. Accordingly, the argument was made that legal specialists were needed who might then study the treaty and relevant Panel decisions to further enforce its terms. Beginning in the early 1970s, the Nixon administration pushed to place trade disputes into the hands of lawyers familiar with trade laws. And in fact it was the American bar that, in the 1970s and 1980s, spearheaded a shift toward the more legalistic model that is at the heart of the WTO today (Stone Sweet 1999, pp. 164–71).

The existence of federative or federal government is also cited as a factor. Divisions of power among disparate electoral, legislative, and executive bodies, and vertical divisions of power, invariably occasion conflict that is itself caused by, and therefore cannot be corrected easily by, 'normal' political procedures. As the judge is often regarded as a sort of theorist of the state and its basic arrangements, her appeal is in clarifying or mediating the existing division of power among such entities (Dworkin 1988).

Supranational courts, such as the European Court of Justice, have added yet another layer of review. That Court, for example, has claimed a sweeping power of judicial review for itself by converting the various treaties it oversees into a sort of overarching constitution binding on both member nations and the courts and citizens of those nations. Such a practice undermines the close connection between judicial review and national sovereignty; and it may also contravene basic principles of international law, at least in theory. Yet the European Court has been successful in part because it provides stability and some manner of coherence, and balances national sovereignty interests with the goal of integration.

Scholars also cite more temporally specific factors. In the United States, commercial elites dominated constitutional litigation for most of US history. Yet in the post-Second World War era, nontraditional litigants were able to pool time, monetary resources, and available legal talent to press for important constitutional guarantees (Epp 1998). And the Supreme Court, over time, 'adjusted' the Constitution to facilitate the development and legitimacy of the American welfare state. In Europe, somewhat differently, the devolution of legislative power in parliamentary systems and the concomitant rise in cabinet/party-enforced government, has occasioned a role for courts, particularly in those countries (e.g. Germany) where even a governing majority cannot prevent legislation from being referred to a constitutional court (Shapiro and Stone 1994, p. 405).

The French social historian and philosopher, Michel Foucault, argued that, since the early modern period, juridical institutions and discourses have been displaced gradually by administrative institutions and their discourses. The world of sovereigns and their landed jurisdictions had given way to a world of populations and institutions to 'normalize' these populations (Foucault 1976). If we take both the American experience and the recent proliferation of legal and constitutional norms in Europe and elsewhere as our guide, the thesis would have to revised to account for the appearance of administrators who come garbed as judges. The influence of legal and constitutional norms, vocabularies, and institutions on the socioeconomic and political structure of much of the planet has been considerable; the effects of this process, are, however, poorly understood and in need of further study. In this respect, 'postmodern' arguments have to be seriously qualified. Whether justified in fact and theory, the expectation that judges and legal norms can ground individual rights and provide a constitution for transnational and intercultural contact is shared increasingly today. The very American *Marbury v. Madison*, as it were, has found a place for itself in the global environment.

Judicial Selection

Judicial selection is a topic and research area that is intimately associated with the assessment of the quality of justice a legal system provides through its courts of law. What is the link between judicial selection and judicial independence? What should be the goals of a selection system? What are the principal methods for choosing judges? Do different methods produce different kinds of judges and justice? These questions need to be addressed in order to understand how justice is dispensed; they are explored here primarily with reference to American courts but with some attention to the courts of other countries.

1. *Judicial Selection and Judicial Independence*

Judicial selection was very much on the minds of the American colonists in the eighteenth century when they included among the list of 'repeated injuries and usurpations' in the Declaration of Independence that the king 'has made judges dependent upon his will alone, for the tenure of their offices, and the amount and payment of their salaries.' The framers of the American Constitution, mindful of this and also influenced by Montesquieu's work, incorporated the principle of the separation of powers among the branches of government, with the judiciary envisioned as a separate and distinct governmental entity. Unlike the English form of government, as they understood it, the judiciary was not to be linked to the legislative and executive branches. Neither the executive nor the legislative branch was to be solely responsible for the selection of judges; they were to share that power. The President was charged with nominating and the US Senate given the task of advising and consenting by either confirming or not confirming nominees by majority vote. To ensure the independence of the federal judiciary, judges were given lifetime tenure removable only by the cumbersome process of impeachment by the House of Representatives and conviction by two-thirds vote of the Senate after a trial. Thus, for the American framers, judicial selection was inextricably associated with judicial independence.

Can there be justice from a judiciary whose members owe their jobs to an executive who can remove or discipline them at will? Can a judge whose selection and retention is by election be as neutral and objective as a judge with life tenure? Are civil service methods of selection superior to more political selection methods in producing fair and objective justice?

There are a variety of judicial selection methods used to staff courts in countries around the world. Legislatures, the chief executive or heads of executive branch departments or agencies, and even members of the judiciary can be found participating in selection processes. Are there consequences of differing types of selection methods for the quality of justice?

2. *Goals of a Selection System*

To begin to answer the questions raised above, it is necessary first to formulate what ought to be the goals of a selection system. It is reasonable to argue that at bottom, a selection system ought to produce 'good' judges, that is, professionally outstanding individuals who have demonstrated that they have judicial temperament, including a reputation of being even-tempered and fair-minded, and, if already on the bench, a track record as competent and impartial. A 'good' judge will exercise his or her discretion so as not to be obviously biased at either end of the ideological spectrum. Furthermore, a good selection system will *not* discriminate against qualified women and ethnic/racial minorities, something that it can be argued is essential for the legitimacy of a judiciary.

3. *Methods for Selecting Judges in the States of the USA*

Five methods for selecting judges are used by the states and one method used by the federal government. Close to half the states elect some or all of their judges at general elections where individuals run for judicial office as members of a political party (partisan elections) or are required by law to run without a party affiliation (nonpartisan elections). About one-third of the states use the merit plan whereby a nominating commission often of lawyers and judges submits to the governor a list of names to fill a particular judicial position and the governor by law must make the

selection from that list. Eight states and the federal government select their judges by appointment by the chief executive with the approval of another body, typically the executive council or senate. Three states use the legislature to select those for judicial office with the governor having no constitutionally mandated role in the process.

In practice, scholars have found that all these methods involve politics of one sort or another. There is the most obvious form of party organizational politics that at the local level is evident with the electoral methods of selecting judges. Even where the nonpartisan ballot is used, in some states local party leaders endorse a candidate or otherwise make known their support for the individual running for judicial office. At the state level, party organizational politics are often prominent in the legislative and gubernatorial appointment systems. Governors not only are central to the gubernatorial selection method but they can influence the merit selection process by naming friends and associates to the nominating commissions. Interest groups not only can influence the outcome of judicial elections, they can exert influence on the governor and legislature. And still another form of politics is bar association politics which cuts across all selection methods—for example, the bar may rate or even endorse candidates for judgeships. And, of course, the organized bar has great influence in the merit selection process.

Electoral methods have been studied and scholars have found that judicial elections tend to be ignored by the electorate, with low voter interest and low turnout on election day. Furthermore, the majority of judges in electoral systems are initially selected for interim appointments by the governor to fill vacancies on the bench that occur between elections due to resignation, retirement, or death. This means that at the next election such judges run as incumbents and are often uncontested (which is true for most judicial elections across the board). Research has found that the party label is the most significant factor in the voter's choice.

Merit selection plans have also been the subject of scholarly investigation. The commissions themselves have been found to be characterized by intense negotiation and in some instances commissions have been found to stack the list of names so that the favorite of the commissioners would be the likely person chosen by the governor. The partisan makeup of the commissions has occasionally resulted in partisan considerations being taken into account in preparing the lists.

4. *Selection of Federal Judges in the USA*

Judicial selection of federal judges in the USA contains some similarities with selection in the states. Party organizational politics, the politics of policy, and bar association politics all come into play. But because federal judges are nominated by the President, the center of selection activity lies in the executive branch. Participants in the negotiations, particularly for lower-court judgeships include not only Justice Department and White House officials, but also US Senators and other major leaders of the President's party from the state in which a federal judgeship is to be filled or the state that by tradition expects to be represented on a federal court of appeals. Furthermore, since 1953 the American Bar Association (ABA) Standing Committee on Federal Judiciary has investigated and provided ratings that are transmitted to the executive branch of leading candidates for judgeships. An ABA rating of 'not qualified' frequently will result in the nomination being abandoned. But note that, in March 2001, President George W. Bush removed the ABA from the pre-nomination process.

Senators of the President's party expect to play a decisive role in the nomination of federal district judges from their states. Judgeships in the federal territories (including the District of Columbia), as well as those for the specialized courts and, of course, the US Supreme Court are considered more within the prerogative of the President. But the Senate institutionally has a key role to play in the process as it must confirm a nominee before he or she becomes a federal judge. When the President's party is in control of the US Senate, confirmation typically is a smooth process. But when there is divided government, the confirmation process has been bogged down in partisan and ideological battles. This is certainly a drawback of federal judicial selection.

In the nomination process, there are several considerations that ought to be mentioned. First is the professional credentials of the candidates. The legal qualifications of candidates are subject to close scrutiny by the Justice Department and the ABA making it less likely that unqualified individuals are appointed. Second is the political reality that typically 90 percent of judicial appointments go to members of the President's party. Third, senators from the state of the prospective judicial nominee must approve the nominee. Although rarely invoked, a senator can claim senatorial courtesy if the nominee is objectionable to that senator and that means that the senator's colleagues would refuse to confirm. Fourth is the policy or ideological outlook of the candidate. If an administration sees the judiciary as affecting its policy agenda, as was notable with the Franklin Roosevelt and Reagan–Bush administrations, it will tend to screen judicial nominees to eliminate those antithetical to its policies.

Because the Supreme Court is widely acknowledged to be the judicial policy maker for the nation, appointments to the nation's highest court have been the subject of keen interest and occasional controversy. A frequent presidential campaign issue has been what sorts of people will be named by the person elected president. Presidents have always been per-

sonally involved in the selection of justices and have made their choices based on a variety of considerations including the personal, the political (such as party affiliation and affect on constituent groups in the President's coalition), and the ideological. During the nineteenth century close to one out of three nominations failed in the Senate. In the twentieth century the proportion was one out of twelve (with four of the five Senate rejections occurring in the last third of the century). Thus confirmability must also be added as a consideration, especially when the Senate is in the hands of the opposition party.

5. *Evaluation of Selection Methods*

Does any one selection method produce more 'good' judges than any other method? The evidence is scanty and inconclusive that one method produces superior judges or judges with vastly different backgrounds or qualifications, with the exception that appointive methods appear to result in more women and minorities being chosen for the bench. However, not one selection method has been shown to be a superior method for the appointment of judges with the qualities that make for 'good' judges or judges whose on-the-bench performance is considered to meet the highest standards. Likewise, the evidence linking the method of judicial selection with judicial decisional trends is inconclusive.

6. *Judicial Selection and its Impact in Countries Outside the USA*

For countries other than the USA, relatively little research has been conducted on judicial selection and its impact. The principal judicial selection mode in civil law countries is that which considers the judiciary a form of civil service and part of the government bureaucracy. The judiciary is not considered a co-equal branch of government. Judges work their way up the judicial hierarchy—all outside the political appointment process. Judges are typically viewed as conservative supporters of the regime insofar as the regime is responsible for the law that judges must apply. The concept of judicial review is for the most part alien to civil law systems.

The bureaucratic route to a career judiciary may be by a competitive entrance examination that enables those who pass to attend a school for judges (the selection method, for example, in France, Spain, and Portugal) or directly by a competitive entrance examination (the method found, for example, in Belgium, Italy, Peru, and Brazil). Grades on examinations will typically determine first judicial appointments, and subsequent promotions are usually based on seniority and the assessments of senior judges or state ministries of justice. An alternative bureaucratic selection method utilizes a type of apprenticeship without examinations and schooling (as for example in Germany, Argentina, Ecuador, and Chile). Many civil law systems have recently allowed lawyers with a minimum level of professional experience to be candidates for a set proportion of judicial vacancies. Those selected are thus able to substitute their years of practice for the examination, schooling, or apprenticeship requirements.

In England, a common law country, there are some similarities to the USA in that judgeships are not considered a form of civil service and that there is a tradition of political experience and party patronage playing a role in the Lord Chancellor's selection of judges for the appellate courts (e.g., between 1832 and 1906 Members of Parliament accounted for 58 percent of appointments). In more recent decades the proportion has been dramatically lower. Higher court judges are drawn from the legal elite and tend to be drawn from the upper class. In general, partisan considerations are much more muted in England than in the USA although both countries tend to place an emphasis on professional qualifications. Women and minorities are slowly achieving representation in the ranks of the English judiciary but at a far slower pace than found in the federal judiciary in the USA. For example, in 1990 the Law Lords were all male, while there was one woman on the Courts of Appeals and on the High Court. By contrast, in the USA there was one woman on the Supreme Court, 17 on the US courts of appeals, and 50 on the district courts (roughly 10 percent of judgeships as compared to under 2 percent of the higher English judiciary).

The Appellate Committee of the House of Lords is Britain's highest court, the functional equivalent of a supreme court although its membership is somewhat flexible. The Law Lords, chosen by the Lord Chancellor although officially appointed by the Queen after consultation with the Prime Minister, are drawn from a narrow pool of lower appellate judges who themselves have risen through the judicial hierarchy. Entry into the judicial profession is from the elite group of barristers known as Queen's Counsel. The selection process generally favours the appointment of judicial conservatives.

In India, lower court judges are civil servants chosen by competitive examination, but the higher judiciary is appointed from eminent members of the bar. The president has sole authority to appoint Supreme Court justices but is constitutionally required to consult certain government officials, including the Chief Justice of India, before making the appointment. Previous judicial experience is generally required and in practice only those who have served on the High Court of one of India's states are chosen. There is also a mandatory retirement age of 65. Turnover tends to be higher and here, too, there has been a tendency for judicial conservatism to prevail.

A number of questions initially asked earlier in this article cannot be answered definitively on the basis of research conducted thus far. Much more is needed by way of systematic empirical analysis to be able to sketch in the details of judicial selection and its impact around the world. Yet it is clear that any assessment of how justice is administered needs to take into account precisely those considerations of judicial selection.

Jung, Carl Gustav (1875–1961)

Carl Gustav Jung was born in Switzerland at Kesswil, near Lake Constance, on July 26, 1875, a parson's son. He died at the age of 85 on June 6, 1961 as one of the great pioneers of depth psychology, in his house in Küsnacht on Lake Zurich, where he had lived and worked for more than 50 years. His external life was relatively uneventful, in contrast to the riches of his inner life, as he stated at the end of his life. It was the inner life—psychic reality—as he called it, which captured his tireless and careful attention, and formed his life and work.

In 1895, Jung began his medical studies at the University of Basle. The sudden death of his father in 1986 caused some financial troubles, and left him to take care of his mother and sister Gertrud, who was nine years younger than him. His poverty contrasted with the continued reputation of both of his late well-known grandfathers, both fathers of 13 children and both professors of Basle University. Carl Gustav Jung senior (1794–1864), a political refugee from Mannheim, Germany, had been a professor of medicine and president of Basle University. Samuel Preiswerk (1799–1871), C. G. Jung's grandfather on his mother's side, professor of theology and ancient Hebrew at the university, had served as the president of the reformed ministers in the Basle Canton. After his exams in December 1900 Jung decided to leave Basle and to follow a professional career as a psychiatrist at the psychiatric hospital at Burghölzli in Zurich.

The Burghölzli hospital, a representative building on a hill in the south of the city of Zurich, was affiliated with the newly founded University of Zurich. Since 1898, the hospital had been directed by Eugen Bleuler (1857–1936), who followed his teacher Auguste Forel. Forel was the doyen of Swiss psychiatry and had established professional standards not only for his institution but for Swiss psychiatry as a whole. Confronting strong mistrust towards the new institution from the Zurich population, he established control of the medical direction of the administration of the hospital, set legal conditions for the admission, treatment, and release of patients, and last but not least, emphasized, with regard to the discipline of psychiatry, an unbiased empirical approach to mental phenomena, focusing on the neurological, psychological, and social aspects of mental disorders. Most importantly, Forel (a Swiss francophone) introduced hypnosis (as practiced by the French School of Nancy) as a first psychotherapeutic treatment for inpatients. In hypnosis he found the proof for the existence of subconscious processes which were equivalent to externally observable neurological phenomena (scientific monism).

Jung experienced his first time at Burghölzli hospital, where he lived as an intern together with about 400 mentally ill patients, about 80 attendants, and only three other medical colleagues (including Bleuler; see *Bleuler, Eugen* (*1857–1939*)), as quite a shock: 'My inability to understand gave me such a sense of inferiority, that I couldn't bear to go outside the hospital' (Jung 1989). He read through the available literature and dedicated himself to the study of his cases. Soon he began his dissertation, '*On the psychology and pathology of so-called occult phenomena*' (1902).

In this first scientific publication Jung studied his spiritualistic experiments with his cousin Hélène Preiswerk carried out at the end of his medical studies, and treated her case in the context of other (hysterical) patients of the Burghölzli hospital. In a quite minor context he referred to Freud and Breuer's *Studies on Hysteria* and to Freud's *Interpretation of Dreams*, but mainly he relied on the new studies of Pierre Janet (see *Janet, Pierre (1859–1947)*), and Théodore Flournoy. Flournoy, professor of psychology in Geneva, had just published a scientific best-

seller *Les Indes à la planète Mars* (1900, see Flournoy 1994), a long-term study of a spiritualistic medium. Jung got in touch with Flournoy and showed special appreciation for his 'objective-distanced' approach to mental phenomena (which was influenced by his personal friend William James; see *James, William (1842–1910)*) and his having arranged the new findings in a bigger context. Jung's untroubled friendship with Flournoy outlasted the much more famous, but never as untroubled, friendship with Freud, which began several years later.

In October 1902, Jung quit his strenuous job at Burghölzli for the first time. He went to Paris to study at the Collège de France with Pierre Janet and also learnt English at the Berlitz School. He then married the 21-year-old Emma Rauschenbach (1882–1955), the daughter of a factory owner, and settled in a town residence in Zurich. At the end of the 1903, he returned to Burghölzli hospital, initially as an external representative for absent colleagues. In December 1904, he finally took over the regular post of resident doctor, and moved into the resident doctor's family apartment at the hospital. Three of his five children were born there and grew up together with Bleuler's family. Bleuler had also recently married the philologist and writer Hedwig Waser, one of the first academic women in Switzerland. Both women shared the interests of their husbands and took part in their scientific discussions.

Bleuler's psychiatric approach was formed by his previous experience as director of the remote Rheinau asylum, where he had lived as a bachelor in very close contact with more than 500 'incurable' chronically mentally ill patients. Concerning therapy, he emphasized the therapeutic value of the 'active community' (*tätige Gemeinschaft*), in which everyone worked according to their abilities in meaningful activities. For his special scientific interest—the dynamics of psychotic behavior—he favored a hypothesis of neurological conditions which caused a discontinuity in the forms of association.

It was with some enthusiasm that, in 1904, Jung and Bleuler set up a psychological laboratory for association experiments. These played a prominent part in psychological research at the time, especially in Wundt's (see *Wundt, Wilhelm Maximilian (1832–1920)*) school. Their findings soon led to passionate debates in the debating club which Bleuler had established with his friend and colleague, the Swiss Russian pioneer neurologist C. V. Monakow. In giving account not only to the regularities of the test person's responses to the stimulus words, as was usual in the Wundtian approach, but also to the 'intruders in the mind,' the irregularities (delays of reaction times, repetitions and other disturbances), Jung and his coworkers (initially Franz Riklin, Sr., Jung's wife, and several volunteers) identified the 'emotional-toned complexes' (*gefühlsbetonte Komplexe*) of the test persons as autonomous expressions of their repressed or dissociated unconscious conflicts. These results were particularly decisive for Jung. Behind completely 'mad' behavior he discovered quite normal hopes and desires. Paranoiac ideas and hallucinations revealed their hidden sense in the context of the patient's life stories. 'At the bottom we discover nothing new and unknown in the mentally ill; rather, we encounter the substratum of our own nature,' he stated. 'That was at that time a very moving experience' (Jung and Jaffé 1962).

When Jung was preparing a paper for his application as lecturer at Zurich University in 1905, he realized that his findings threw a new light on Freud's theory of repression. He decided to stand up for him, despite Freud's bad reputation in academic psychiatry. In 1906, Jung published a first volume of Association Studies, which he sent to Freud in Vienna. In 1907, he published *On the Psychology of Dementia Praecox*, which included a detailed case study with association experiments of an old female patient of the clinic, who since Forel's time had served as a demonstration case for students. These two publications inaugurated a remarkably passionate personal relationship with Freud which is documented in hundreds of letters (McGuire 1974). Bleuler shared a special enthusiasm for Freud, although, like Jung, he was always somewhat critical of Freud's recently elaborated sexual theory. In October 1907, Jung—against some initial opposition from Bleuler—founded an informal 'Freud Club' at the Burghölzli, which excluded Freud critics. In April 1908, Jung organized a first Psychoanalytical Congress. On this occasion a first joint publication was founded—the *Jahrbuch*, edited by Bleuler and Freud, and compiled by C. G. Jung. Thus Jung, with the decisive support of Bleuler, inaugurated the reception of Freudian psychoanalysis in academic psychiatry, and the beginning of the so-called 'psychoanalytic movement.'

The culmination of—as well as the turning point in—the relationship of Freud and Jung was their joint trip in September 1909 to the 20th Anniversary Conference of Clark University, Worcester, USA. Both had to lecture and were honored with their first honorary degrees. Jung had been invited independently, because of traditional connections between the Burghölzli hospital and Clark University through Forel's relations. In the six weeks together with Freud during the trip to USA, some strange personal behavior and some critical points in mutual dream interpretations inevitably revealed to Jung the limits of a friendly and cooperative relationship with Freud. Nevertheless, he continued to act for Freud as organizer and founder of the International Psychoanalytical Association, a role which he later remarked on as *collaboration à toux prix*. In 1910, he was elected president of the International Psychoanalytical Association. Shortly after Freud's provoked break with Alfred Adler in 1912, Freud challenged Jung's leadership with the organization of a 'secret committee,'

consisting only of very 'confidential' followers—excluding Jung. Jung subsequently resigned as the editor of the *Jahrbuch* in October 1913, and as president of the International Psychoanalytic Association in April 1914.

In March 1909, some months before his trip to the USA with Freud, Jung quit his job at the Burghölzli clinic and opened a private practice as psychiatrist in Küsnacht, Lake Zurich. In the 1920s and 1930s, his popularity began to grow. In 1933, he accepted the presidency of the German General Medical Society for Psychotherapy and the editorship of the affiliated *Zentralblatt für Psychotherapie*. He defended this compromising collaboration with German psychotherapists with his aim to reorganize the society as an international institution in order to help some colleagues maintain their functions, and to prevent a general abolition of psychotherapy as a medical discipline in Germany. Indeed, Jung resigned in 1940 when he saw that his endeavors had been in vain.

In 1935, he was appointed professor for psychology at the Federal Institute of Technology, Zurich (ETH); from 1944–5 he held a professorship in medical psychology at the University of Basle. In 1948, the Jung Institute in Zurich (later Küsnacht) was established by an international committee of some of his associates as a research and training center for Jungian analysts.

1. *Analytical Psychology: Contribution to Science*

Immediately after his return from the USA, Jung immersed himself in archeological and mythological literature in order to differentiate his own view of the unconscious from Freud's. The result was his major work *Wandlungen und Symbole der Libido* (1912), later published in English as *The Psychology of the Unconscious* (1916). In contrast with Freud's personalistic view of the psyche—i.e., his attempt to reduce the unconscious to a hiding place of the personal, sexual conflicts of the dreamer—for Jung, sexuality was not the sole determining factor; rather, the main point was that the unconscious had an autonomous life, which reflected not only the personal, but also the common, collective history of the mind. The manifestations of the unconscious stood not only for a causal, reductive purpose, but also had a final i.e., forward-looking meaning. Relying on some products of automatic writing (two hymns and the dramatic myth of an Indo-American hero) produced by a young American, Miss Frank Miller (first published in 1905 by Flournoy), Jung presented his own conception of the libido as a general 'psychic energy' with a dual nature, split into positive and negative poles with a steady flux between construction and de(con)struction. He also outlined an 'anatomy and embryology of mental development,' which followed common patterns of changing imaginary processes in the history of mankind as well as in the personal history of each individual person. Wavering between an analysis of Miss Miller's fantasies, some hidden self-analysis, a detailed analysis of religious hero myths of humankind from Mithraism to Christianity, and an analysis of classical and romantic philosophy and literature, he developed his theory of the structure and energetic functioning of the psyche without yet coining a decisive terminology of his own.

In the years between 1912 and 1918, Jung experienced a time of personal insecurity and scientific isolation. He resigned from his post as lecturer at the university; instead, he dedicated himself to his international practice as a psychotherapist, and concentrated on his private studies and on his confrontation with his own unconscious.

In 1921, Jung published his major book, *Psychological Types*, in which he linked his historical researches with the findings of his self-analytical process. He outlined the key concepts which later became characteristic of analytical psychology such as 'types,' 'collective unconscious,' and 'individuation process.'

He had become interested in the question of psychological types because of the differences he perceived between Adler and Freud. With critical reference to historical material, Jung elaborated a model of typology, with eight psychological types—two main attitude types of extroverts and introverts, further subdivided by the predominance of one of four psychological functions: thinking, feeling, sensation, and intuition. While sensation conveys concrete reality through the senses, intuition conveys the hidden possibilities in the background. And while thinking leads to a judgment about the meaning of concrete reality, feeling leads to a judgment of its worth. Normally one attitude or function prevails (superior function) and the opposite (inferior) attitude or function remains undeveloped, more unconscious and undifferentiated. The value of this model lies less in its contribution to differential psychology than in the theory of knowledge and the theory of the therapeutic process as a quest for wholeness.

From this experience of the relativity of every standpoint with respect to psychic reality, Jung highlighted the significance of the 'personal equation' as a prior condition of any psychological statements—i.e., the position that what a psychologist claimed to be true of human psychology as a whole was first and foremost a subjective confession. Additionally, he developed a conception of the therapeutic process, which involved not only becoming conscious of repressed contents of the unconscious but also integrating the psyche and developing a much more complete approach to inner and outer realities. This process of individuation involved withdrawing projections which are structured according to certain autonomous images of the unconscious (archetypes); these reflect the common history of mankind (archetypes of the collective unconscious) as well as the repressed images of one's own personal history (personal com-

plexes). Common and ubiquitous archetypes are the shadow, the unconscious negative side of the personality; the hero, the idealized picture of the person; the anima, the animus; and the repressed female/male soul picture in men and women. This process provokes an ethical conflict in each patient: they have to take responsibility for their mental attitudes, and develop a fuller approach to reality not only in ideas, but also in feelings, sensations, and intuition. As a result, the center of a person moves from the ego (the center of consciousness), towards the self (the center of the whole, individual, conscious and unconscious psyche). As therapeutic methods for this process, Jung developed active imagination (as a method of assimilating unconscious contents by several forms of self-expression) and amplification (circumambulation) of the symbols (instead of free association in Freudian analysis).

The foundation of the dynamic concept which became known as analytical psychology and the institutionalization of Jungian analysis were connected with the founding of the Psychological Club in 1916. This was made possible by the generous financial gift of Jung's US patient, Edith Rockefeller McCormick. After Jung's separation from the Burghölzli clinic and the Freudian circle, the 'Club' reestablished an important debating forum in which he could communicate his ideas to interested patients, colleagues, and scientists. Here many of his former patients—among them his life-long special assistant and friend Toni Wolff (1888–1953), his secretary and the compiler of his biography, the psychologist Aniela Jaffé (1903–91), and the philologist in ancient languages Marie Louise von Franz (1915–98)—were encouraged to take up public lecturing. In the 'Club' he also met outstanding academics in his main subjects of interest, such as mythology, religious studies, philosophy, psychology, and archeology. 'Club' lecturers included Karl Kerényi (1897–1973), pioneer in Greek mythology, the young Mircea Eliade (1907–86; see *Eliade, Mircea (1907–86)*), pioneer in the science of religions, and other representatives of different Christian, Indian, Jewish, and Eastern religious traditions. Richard Wilhelm (1873–1930), missionary to China and sinologist, had special impact on Jung. Wilhelm shared with him the old mystical Taoist text *The Secret of the Golden Flower*. It was in this text that Jung first discovered the correspondence of his individuation concept with Eastern philosophy and worked out his mandala symbolism for psychic wholeness or the self.

From 1933 on, the 'Club' lectures and Jung's public lectures at ETH were supplemented also by the Eranos Conferences, which took place every summer for a fortnight in Ascona, Lake Maggiore, at the house of Olga Fröbe, an enthusiastic admirer of Jung, Richard Wilhelm, and the Jewish philosopher Martin Buber (1878–1965). In the atmosphere of these meetings with contemporary authorities and pupils, Jung first presented his view of traditional Christianity and medieval alchemy, and the archetypes of the collective unconscious.

An encounter with death in 1944 marked the beginning of the period of Jung's final elaboration of ideas. His main work on traditional Christianity, *Answer to Job* (1952) and his major work on alchemy *Mysterium Conjunctionis* (Mystery of Conjunction) (1955) appeared at this time. The common principles of the reconciliation of the opposites of the dual nature of the psyche, which he had worked out in this major book, led to the final formulation of his main pioneering concept, *Synchronicity as a Principle of Acausal Relations* (1952), which he published in collaboration with Wolfgang Pauli (1900–58), professor of physics at ETH. The idea of an ultimate psychoid archetype represents the connecting principle of psyche and matter, which are two aspects of the same thing and can realize themselves in both dimensions 'synchronistically.' The relative autonomy and unpredictability of the synchronistic phenomena correspond with the new findings of the subatomic and cosmic physics, and hint toward a metaphysical order to which both the psyche of the perceiving person as well as nature itself submit.

2. *Contemporary Influence*

In contrast with Freud, who gave the impression that psychoanalysis 'may be likened to Athena's springing forth fully armed from the head of Zeus' (Eissler 1965), Jung always tried to trace back his ideas to older, universal traditions. His pioneering work was the rediscovery of an uninterrupted chain of psychic manifestations and spiritual traditions from gnosticism through alchemy to the present. His early claim for a constructive, forward-looking meaning in unconscious manifestations led to some changes in early psychoanalytic treatment which are now common in psychotherapy: for instance, the symmetrical setting (instead of the patient lying down), focus on present conditions as responsible for the outbreak of neurosis, and focus on transference and counter-transference as the crucial in changing mental attitude. In addition, Jung's conception of the spiritual nature of psychic life influenced the later transpersonal and humanistic schools of psychotherapy. His concern with spiritual mystical traditions often led to controversial claims that he himself was a mystic, selling false dreams of spiritual redemption. The alleged evidence of a recent recriminatory voice (Noll 1997) has been traced back to an obviously misidentified and misinterpreted document and shown to be fallacious (Shamdasani 1998). Jung emphasized that he had no 'doctrine' to offer, but rather some methods of looking at facts, phenomena, and natural laws. His approach to these facts is empirical in the sense of a critical reflection on

the nature of all experience which relates to self-experience and the nature of the perceiving psyche.

This view, which valuates the psyche as 'the mother of all science and arts,' reveals its special importance in the approach to religious phenomena. The unconscious psyche with its autonomous operators (collective archetypes) reflects the numinous, awful, frightening, and timeless spirit in changing images which correspond to changing religious images from ancient times to the present. In differentiating between religious images and religion itself, Jung pointed to the inner experiences open to everyone independently of every external belief system.

Juries

The jury is a group of laypersons recruited by the legal system to resolve a dispute. In contrast to professional judges, jury members are amateur and nonrecurring decision makers. They are selected from the community at large rather than for their legal expertise, and they adjudicate disputes only on occasion rather than on a routine basis. The jury is both a cultural icon and a popular scapegoat, praised as a champion of democracy, and denounced as incompetent or biased when it reaches an unpopular verdict. Empirical research offers a more measured view of the jury, revealing a motivated set of decision makers, often admirable in the way they handle the complex and contentious disputes they are asked to resolve, but always human in their struggles to deal with limited resources and imperfect information and to balance competing values in reconstructing events and assessing mental states.

The ideal jury too conjures up multiple images: a thorough and impartial judge of the evidence presented at trial, a faithful representative of the community from which it is drawn, a compliant follower of its legal instructions, a protector of citizens against the power of the state, and a repository of commonsense justice that tempers the harsh hand of the law. Critics charge that juries fail to meet one or more of these standards. Behavioral scientists who study the jury

find some variation from this set of ideal attributes, in part because the attributes can be inconsistent with one another, in part because the jury's cognitive and motivational characteristics influence its behavior.

1. Jury Variations

The jury has gone through numerous incarnations over time and exists internationally in a variety of forms. The early English jury was limited to male property owners who were summoned to decide a case because they were familiar with the facts. They acted as witnesses, investigators, and tribunal, determining both the facts and the law. The modern American jury is drawn from the citizenry at large, with the parties entitled to eliminate some prospective jurors if they have preconceived notions about what the verdict should be before the trial begins. Jurors generally are expected to sit quietly through the trial, apply the law as it is described in the judge's instructions, deliberate until they reach a verdict or an impasse, and disperse without personal consequences, except for the occasional inquiries of the American press in high-profile trials. The right of citizens to have both criminal and civil controversies resolved by groups of ordinary fellow citizens is guaranteed by the US Constitution and by every state constitution.

Although the majority of criminal trials decided by a jury occur in the USA, juries are also part of the criminal justice system in the countries of the British Commonwealth. Moreover, a resurgence in juries is taking place (e.g., in Spain and Russia), reflecting the perception of citizen adjudication in the justice system as a mark of democratic reform. In civil cases, jury trials occur almost exclusively in the USA and Canada. England eliminated juries in most civil cases by the 1930s, retaining the civil jury primarily in defamation cases.Most modern juries are small, compared to the ancient Greek jury of several hundred that tried Socrates. For example, the Brazilian jury has seven members, and some American jurisdictions have juries of six. Under the ancient Greek jury system and the modern Brazilian jury system, deliberations are omitted and verdicts are determined by the position taken by the majority in a secret ballot vote. Like the American and English juries, the Spanish jury includes deliberation, but it adds the requirement that the jury provide a rationale for its verdict.

Although the jury is prominent in discussions about the American legal system, legal disputes are infrequently resolved by the verdict of a jury, even in the USA. Most criminal cases in the USA end in dismissals or guilty pleas; most civil cases are dismissed or settled. An estimated 150,000 jury trials occur annually in state courts and an additional 10,000 in federal courts. The influence of the jury extends far beyond the trials it actually decides, however, as litigants and attorneys anticipate what a jury would do if asked to resolve the dispute. Inaccurate expectations are common, based on impressions gleaned from high-profile but idiosyncratic trials and from trials resulting in unusually high awards that attract media attention. The absence of direct and reliable feedback on what would have happened had a jury actually decided a case that was resolved without trial provides little opportunity to correct misimpressions.

2. Political Roles of the Jury

In addition to adjudicating disputes, the jury is a potential source of legitimacy for the legal system. To the extent that the jury is viewed as representing a fair cross-section of the community, its verdict is likely to be seen as the product of fair consideration and can carry a legitimacy that the decision of the judge, as an employee of the state may lack. Even when its verdict is unpopular and even if observers believe that the jury does not fairly represent the community, the jury acts as a lightning rod, insulating the judge and other parts of the state legal system from criticism.

The jury also can act as a conduit for community standards. For example, in evaluating a claim of self-defense, the jury must determine what a reasonable person would be expected to believe, as well as what the particular defendant did believe. Although the jury is charged with applying to the facts the law it receives from the judge, the self-defense example illustrates the fuzziness of the division between law and facts. The jury must often inject its understanding of appropriate standards into its fact-finding even while scrupulously following the instructions that the judge provides.

A final political role for the jury is its educative function, identified by De Toqueville as the jury's great strength. Surveys suggest that more than half of American adults have had some personal involvement with the courts, and of this subgroup, half have served on a jury. Citizens also receive information and misinformation on the courts from other sources, including the media. The extent to which jury service provides additional or corrective information is unclear, but jury experience tends to make jurors feel more positive about the jury system

3. Methodological Challenges in Studying the Jury

Study of the jury is a particularly thorny project because the jury speaks publicly only to deliver its verdict: deliberations occur outside the presence of any nonjuror. Although not all jurisdictions have legislation that bars access to jury deliberations, there have been only a few instances in which deliberations have been observed or recorded. Courts have been

reluctant to permit observation even when no law forbids it. Researchers interested in the jury have generally been left to study the jury more indirectly. They have used a variety of approaches (each with strengths and limitations): archival studies of jury case characteristics and verdict patterns (records provide information on large samples of cases, but limited variables are recorded by courts, and local commercial jury verdict reporters systematically under-report cases); post-trial interviews with jurors (the jurors are reporting on the actual process of reaching a verdict, but what they report is limited to what jurors noticed, accurately recorded, remember, and are willing and able to report); surveys of other trial participants, such as judges and attorneys (these respondents are informed court observers, but they have only indirect information on jury behavior and their reports may be influenced by the verdict); field experiments (these can offer strong evidence on the impact of a legal reform like juror note-taking, but provide little information on process and are hard to implement correctly); and simulation experiments (simulations are strong on process information and provide unambiguous causal inference, but whether the findings can be generalized depends on correspondence with dynamics of real jury behavior).

4. *How Jurors Evaluate Evidence*

The traditional legal model of the jury trial portrays jurors as passive recipients of the evidence and legal instructions. Empirical studies of jury behavior find jurors to be active processors of incoming information. Early models of jury decision making included, first, averaging models in which jurors assess and weigh pieces of evidence, combining the results to reach a verdict and, second, Bayesian models in which jurors consider and evaluate each new piece of information, revising their position on the appropriate verdict in light of their prior position and the additional evidence. These formal models have enjoyed limited success as descriptions of how jurors actually decide cases. Explanation-based models of jury decision making, such as Pennington and Hastie's (1986) story model, provide an account of jury behavior that comports better with empirical evidence. Consistent with the story model, jurors do not simply record and store the evidence for later use as they receive it. Rather, they actively select and organize the trial evidence to construct a story about what happened. The story they construct is based on the evidence, but jurors also use it to fill in gaps in the evidence with inferences based on their understandings about how the world works. Jurors arrange evidence in the form of a sequence of motivated human actions that include important events, the circumstances of the case, inferences about character, and the parties' motivations and states of mind. By influencing jurors' understanding of what took place, the order in which facts are presented (i.e., in story order rather than witness order) can affect verdicts.

5. *Jury Composition*

The modern American jury is far more heterogeneous and representative of the citizenry at large than was the early English jury or even the jury in the early twentieth century. Nonetheless, the jury is not a random sample of citizens. It is the product of a multistage selection process that typically begins with a list of potentially eligible jurors drawn from voter registration lists and often supplemented by individuals holding drivers' licenses in the general geographic area where the court sits. Prospective jurors may be excused from jury service on the basis of hardship, but losses also arise from geographic mobility, a failure to update the lists, and non-response by prospective jurors to a court summons. The loss of prospective jurors in the qualification and summons process results in a systematic under-representation of minorities, younger individuals, and those at lower income levels.

The final stage in jury selection occurs when prospective jurors are brought into the courtroom and questioned to determine whether they will serve in the particular case. Those who clearly express preconceived notions about what the verdict in the case should be or those with clear conflicts of interest are excused by the judge (the challenge for cause). In addition, the parties can excuse a limited number of prospective jurors without giving a reason (the peremptory challenge). The US Supreme Court has ruled that peremptory challenges based on race or gender are constitutionally prohibited, but it is likely that the prohibition fails to eliminate racially and gender motivated challenges. Courts generally do not require much justification from the party initiating the peremptory challenge when the opposing party charges that the challenge was improperly motivated. Also, the small number of challenged jurors in the typical trial means that an attorney can generally identify a unique and non-discriminatory reason for each challenge.

The result of this variety of shaping and sometimes cross-cutting forces is that juries tend to be somewhat more educated, wealthier and older, and less likely to include a representative number of minorities than the distribution of these groups in the adult population. The selection process that occurs before the jurors enter the courtroom is primarily responsible for the difference between the composition of the American jury and the adult population as a whole. Although the difference is likely to persist, the American jury today is more representative than it has ever been, and is more heterogeneous than the juries of other coun-

tries with jury system. Moreover, jury participation is extensive. Surveys indicate that 25 percent of American citizens are likely to serve on a jury trial at some point in their lives.

6. *Jury Size and Decision Rule*

Traditional English and American juries consisted of twelve members who were required to reach a unanimous verdict. Some American jurisdictions now permit juries with as few as six members and non-unanimous verdicts of 9:3 or 10:2; England permits a 10:2 verdict if the jury has been unable to reach unanimity within a specified period of time. Reducing jury size increases the likelihood of an aberrant jury verdict. A majority decision rule tends to reduce the rate of hung juries and to shorten deliberations because jurors in the majority do not need to gain the support of all jury members. It may also result in less thorough deliberations if the deliberators can arrive at a verdict without considering the reasons why there is disagreement among the members of the jury.

7. *Individual Differences*

Attempts to predict juror verdict preferences from background characteristics have generally been able to explain only a modest amount of variance in outcomes. Demographic characteristics like gender, race, and age generally account for very little of the variation in response. Attitudinal characteristics can be more powerful, albeit also modest, predictors.

Expectations, beliefs, and values affect the way that jurors react to evidence. In that respect, jurors are no different from any other decision makers, because people ordinarily scrutinize more carefully and are more likely to reject information that is inconsistent with their beliefs and expectations, because it is generally easier for people to remember theory-consistent information than theory-inconsistent information, and because ambiguous information tends to be interpreted as theory-consistent.

Some types of cases are more likely than others to implicate strongly held beliefs or values. A primary example involves the death penalty: even among jurors willing to impose the death penalty in some cases, the strength of their support for the death penalty can strongly influence the likelihood that they will vote for a death sentence.

8. *Pretrial Publicity*

The American constitutional right to a free press occasionally provides the public with information or misinformation about the case that a jury will be asked to decide. Under such circumstances, the constitutional rights to a free press and to a fair trial are potentially at odds, a conflict not faced in countries like Canada and Great Britain where the press is prohibited from writing about impending trials. Pretrial publicity about issues like a defendant's alleged confession can affect the expectations and beliefs of prospective jurors in the USA. Although some limited research indicates that the effects of some types of pretrial publicity are generally small, it also suggests that jury selection and the passage of time cannot be depended upon to eliminate them. In some high-profile cases, the legal system faces not only the cost of moving a trial, but the increasing difficulty of identifying a location that media coverage has not saturated with pretrial coverage.

9. *Competence, Including Reactions to Experts*

Both criminal and civil trials increasingly involve the testimony of experts who present technical and scientific evidence (e.g., DNA analysis, econometric modeling, epidemiological and toxicological research). Such complex evidence presents a challenge for the experts who must communicate with a lay audience, for the judge who acts either as a gatekeeper in ruling on which experts can testify and what they can say or as the trier of fact, and for the lay jury.

Although jurors typically exert considerable effort in trying to understand the content of expert testimony, questions arise about the ability of jurors (and judges) to evaluate technical and scientific evidence. Jurors (and judges) can be confused by expert testimony, but that confusion can often be reduced or avoided if the expert is also a good teacher. Moreover, jurors frequently express skepticism about the trustworthiness of experts presented by parties within the adversary system and they adopt reasonable strategies to evaluate expert credibility. In addition, juries can and do draw on the expertise of their most competent members to assess the strength of the evidence, providing a resource that is unavailable to the trial court judge.

10. *Reactions to the Law, Including Nullification*

Jurors are instructed to apply the law as the judge describes it to the facts as the jury finds them. Juries may not always follow the instructions, but the primary cause of that failure is the inadequacy of the instructions rather than a willful disregard by the jury. Jurors may fail to follow the judge's instructions on the law if they are either unmotivated or unable to apply the instructions, but they typically see themselves as obligated to apply the law and spend a significant portion of their time during deliberations discussing the law. Nonetheless, legal instructions often fail to provide jurors with helpful legal guidance. The major goal in writing jury instructions on the law is to produce language that will accurately reflect the relevant law so that appellate courts will find the instruction acceptable. Little attention is generally

given to ensuring that the meaning of the instruction is clearly communicated. Although comprehension of instructions is often low, it can be significantly improved by using plain language, simplifying sentence construction, providing definitions for technical terms, and specifically correcting jurors' inaccurate expectations and misconceptions.

Although the most common source of jury deviations from legal standards is a failure of the legal instructions to convey clearly what the appropriate legal standard is, jurors also may deviate from the path outlined in the instructions due to cognitive or motivational biases. For example, jurors admonished to disregard particular information may find it difficult to do so. Other legal instructions may ask the jurors to engage in demanding mental gymnastics—for example, to use a defendant's criminal record only to assist in evaluating his credibility, but not as evidence of bad character; to forget that they learned about damaging evidence that the judge ruled inadmissible—and jurors may be unwilling or find it impossible to perform the required cognitive adjustments. It is unclear whether these failures are significantly less likely when the trier of fact is a judge, or whether they represent heuristic patterns of using information that neither can be expected entirely to overcome.

Finally, jurors may depart from the judge's legal instructions when the application of the legal standard to the particular case so substantially violates the jurors' sense of justice that they are persuaded to temper the letter of the law in that case. Although such deviations are rare, explicit jury nullification plays a central role in conceptions of the appropriate role of the jury and has been a source of extensive debate. Although courts have long recognized the power (as opposed to the right) of the jury to nullify, courts and commentators have argued about whether juries should be told about that power. When jurors are explicitly told that they have the right not to apply the law as the judge describes it, they are more willing to reach verdicts that avoid the literal application of the law.

11. Deliberations

Deliberations resulting in a group verdict distinguish the jury from its chief alternative, the trial court judge, in two ways. By requiring agreement from multiple jurors, the jury verdict in principle reduces the likelihood that the decision will represent an idiosyncratic view of a single deviant decision maker. Moreover, in theory, deliberations give the jury an opportunity to profit from the resources of its multiple members, to pool its knowledge and sensibilities, and to resolve differences, ultimately producing a verdict that reflects more than what could be achieved either by a single decision maker or by mechanically combining or averaging the preferences of the individual members.

The extent to which deliberations actually do affect jury verdicts, however, is in dispute. Some scholars (e.g., Kalven and Zeisel 1966) have suggested that jury verdicts simply reflect the position of the majority before deliberations begin. The picture they present is consistent with the verdict-driven jury that takes an immediate vote to see where each juror stands and then focuses its attention on persuading the minority to join the position initially held by a majority of the jurors. When a vote is immediate, it is likely to reflect predeliberation preferences. When a discussion of the evidence precedes a vote (the so-called evidence-driven jury), that vote will be affected by any changes that have occurred as a result of the discussion. Although jurors often call for an immediate vote, discussions can interrupt before a vote is completed, so that first votes often are not immediate and they imperfectly reflect the individual predeliberation preferences of the jurors. Nonetheless, most juries probably do end up with a verdict that reflects the majority that is visible by the time most of the jurors have expressed a verdict preference in deliberations. The majority, using both normative and informational pressure, persuades the minority to accept its position. The outcome of deliberations is less predictable when a majority position is less likely to emerge because there are multiple verdict choices or in civil cases where damages are at issue.

12. Civil Liability and Damages

Civil juries are sometimes viewed as pro-plaintiff when it comes to liability, although there is little evidence to support the claim that they are more likely than judges to find the defendant liable. Although jurors do hold corporations to a high standard of behavior, the standard primarily arises from an expectation that corporations are better able to control their behavior than an individual might be. On the issue of damages, the pattern of jury behavior is less clear. Compensatory damage awards generally vary with the severity of the injury (i.e., vertical equity), but there is some evidence that plaintiffs with small losses tend to be overcompensated and those with large losses tend to be undercompensated. Compared to special damages (e.g., lost wages, medical expenses), the difficult-to-measure general damages (e.g., pain and suffering), show greater variation in the amounts awarded for injuries at the same level of severity (i.e., horizontal inequity). In the absence of a standard for the 'correct' amount that will compensate for pain and suffering, some scholars have suggested that juries be supplied with information on the pattern of pain and suffering awards in previous jury trials involving similar injuries. Although the problem of defining 'similar injuries' remains, this additional information may reduce some unwarranted disparity across cases.

Civil juries are sometimes instructed that they can award damages for punishment and deterrence (i.e.,

punitive or exemplary damages) as well as damages for compensation. Punitive awards are rare, however. They most frequently occur in cases involving intentional harms and financial rather than physical harms.

13. The Jury vs. Alternative Triers of Fact

Discourse on the performance of the jury frequently ignores a basic reality of legal systems: in evaluating the jury, the relevant comparison is not some hypothetical ideal decision maker, whatever qualities such a model decision maker would have. Rather, the appropriate comparison is the human alternative or set of alternatives that might be used in the jury's stead. Alternatives to the jury include professional, legally trained judges and mixed tribunals composed of laypersons and legally qualified professionals. Studies that have compared the reactions of laypersons and legal professionals to the same criminal trials indicate, first, high levels of agreement on verdict (74–90%), and, second, a greater inclination to acquit by laypersons when they disagree with the professionals. In addition, agreement rates do not vary with the complexity of the trial, suggesting that disagreement is not a product of an inability of the laypersons to understand the evidence.

The assumption of the legal system that judges can 'compartmentalize' and discount legally inadmissible information when they are exposed to it appears to be an inflated expectation. However, the few studies that compare the process of decision making by judges and jurors show a surprising correspondence even in response to case characteristics that might be expected to influence laypersons more than professionals. Both laypersons and professional judges fail to disregard inadmissible evidence, are influenced by outcome information in their judgments about the probability of that outcome (the hindsight bias), and are reluctant to find for the plaintiff when presented with statistically based evidence. If judges are influenced by inadmissible evidence, the jury trial may provide an effective way to avoid burdening the trier of fact with much of the potentially biasing information that judges regularly confront. In addition, the trial judge in a jury trial retains the power to override a conviction by a jury if the judge determines that the conviction is unwarranted by the evidence, providing a rarely used but available extra protection for the defendant in a criminal jury trial.

14. Reactions to Jury Trial and the Reform Movement

As a lightning rod for popular debate, the jury is regularly the subject of calls for reform. Some proposed reforms, such as those advocating that jurors be permitted to take notes and to submit questions for witnesses during the trial, do not assume that juries are failing to perform adequately but rather are designed to assist them in reaching well-considered judgments, to improve the comfort of the conscripted citizens who serve as jurors, and generally to optimize jury performance and juror satisfaction. Other proposed reforms aim at reducing the right to jury trial or limiting the power of the jury, such as calls for a complexity exception to the right to jury trial in civil cases and for legislative caps that place a ceiling on jury awards. High-profile trials resulting in unpopular verdicts have stimulated some of the proposed changes in the jury system as have the concerted lobbying efforts of particular interest groups (e.g., the insurance industry). It is likely that calls for reform of all kinds will continue to follow the jury. The real question is whether the increasing scholarly literature on jury behavior will inform popular and political discussions about the jury.

Justice and its Many Faces: Cultural Concerns

Claims for justice and protests against injustice are ubiquitous in social life. Political movements, revolutions, and wars are initiated under the banner of justice. Justice is a prominent issue in all fields of politics. The courts are swamped with law suits, and the demand for new forms of conflict settlement is increasing. The injustice suffered by individuals is the core of everyday conflict in private life, and the victims of misfortune have to cope with the injustice of their fate. The concern for justice seems to be an anthropological universal.

However, there does not appear to be a universal consensus on what is considered to be just or unjust. We speak of justice in the singular as if there were only one just solution for any problem. Yet there may be diverging views on what would be a just solution for any given injustice, and on which principles of justice should be applied. Many conflicts concerning justice become intense because people are not aware of the basic dilemma structure of such conflicts. This will be outlined in the first section of the present article. The second section will deal with procedural justice and the settlement of justice conflicts. In the third section, the justice motive will be depicted as a primary motive which may assume many different faces.

1. Principles of Justice and Disputes about Their Validity

Justice is typically regarded as the *normative standard for decision making and valuation*. In actual fact, there is no single standard of justice, but instead many different ones. This is true for all three domains of social life in which justice is critical: distribution, social exchange, retribution and the acknowledgment of deeds. Moreover, the application of different standards of justice results in diverging and conflicting outcomes.

1.1 Distributive Justice

In *the domain of distribution*—i.e., the allocation or distribution of material resources or symbolic goods, rights, duties, positions, power, opportunities, taxes, etc., within or between groups or populations—*equality* certainly constitutes the basic idea of justice. However, equality can be specified in many different ways. It may mean *equal shares for all human beings* or, if that is impossible or dysfunctional, equal opportunities. Or else, according to Aristotle, it may mean *equal shares or equal opportunities for all equal human beings*. This second view implies that human beings differ and that certain differences justify unequal allocations and inequalities in the overall distribution of resources, rights, duties, etc., (for instance, according to their membership to a group, organization, or population; according to their social status, specific merits, professional qualifications and productivity, age, gender, neediness, etc. Another rule of distributive justice is the conservation of the status quo and of previously acquired rights). In this sense, equality means equal shares for all those in the same position, for all those with the same kinds of merits or needs, and so forth. The equal opportunity rule can be specified, for instance, as the equal chance rule, in which a lottery procedure is used when it is impossible for goods to be split up (e.g., in the allocation of organs for transplantation), or the rotation schedule, which may be appropriate when it would be dysfunctional for a position to be split.

Walzer (1983) somewhat neutralized the problems of justice with the inequalities in allocation and distribution by his concept of '*complex equality*,' which postulates that distributions in different 'spheres of justice' (material wealth, social recognition in various contexts, political power, education, kinship and love, recreation time, etc.,) are not perfectly correlated. Thus, a lower rank in one sphere may be compensated by a higher ranking in another. Moreover, the subjective importance of the different spheres of justice varies, so that perceived overall inequalities may be reduced further.

However, the question of which differences between people justify which inequalities in allocations and

distributions remains open. In the ongoing discussion, arguments are inspired by cultural traditions and social philosophies such as egalitarianism, liberalism, social welfarism, utilitarianism, and the human and civil rights movement. We are far from having reached a general consensus in this question: the preferred standards of distributive justice vary between and within cultures.

This is true in all fields of distributive justice. For instance, the populations of postcommunist states are less tolerant of inequalities, and ascribe more responsibility for individual welfare to the government than do the populations of states with a liberal tradition (Kluegel et al., 1995). The rules of justice for the allocation and withdrawal of scarce goods such as scholarships, state-subsidized housing, jobs, etc., vary greatly within and across states (Elster 1992). In the dismissal of employees, for instance, the criteria applied include the seniority of the employees, their acquired skills, current productivity, neediness, responsibility for a family, age, and gender. Though it may be possible to justify the application of each of these criteria, each will result in different decisions, and not in a single just solution.

1.2 Justice within Social Exchange Relationships

Modified forms of the equality criterion for appraising justice can also be found in *other domains of social and societal life*. In *exchange relationships* the equality criterion is found in *the principles of reciprocity and equity* as well as in *the concept of fair contract*. Social exchanges are regarded as just if *reciprocity* is established. This is true for positive exchanges, where equal mutual advantage is the normative standard, as well as for negative exchanges, as portrayed in the biblical rule of 'an eye for an eye and a tooth for a tooth.' Equal mutual advantages have also been postulated in the social contract conception of the state (Hobbes 1651, 1968) and in the sociological theory of role-bound exchanges (teacher-student, physician-patient, employer-employee, leader-follower; in Parsons, [1951]). However, the general truth of this postulate of equal mutual advantage has been criticized with good reason (Gouldner 1960): Some social roles or positions are certainly more attractive, powerful, and profitable than others. *Equity* has also been proposed as the normative standard for informal social exchanges, implying equal ratios of investments, costs and outcomes, and benefits for all parties involved (Homans 1961). The equity principle appears to be more clear-cut than it actually is, however, since the evaluation of justice or injustice is guided by personal balances of subjectively focused exchanges (of goods, services, love, respect, trust, loyalty, harm, negligence, hostilities, etc.).

Moreover, indirect exchanges (e.g., services to third parties or to the community which are of indirect benefit to the partners in the exchange) may or may not be included in these subjective evaluations—the same is true for same chained exchanges, e.g., in the generation contract (Emerson 1976). (The generation contract involves members of one generation supporting the older generation in the expectation that, in their own old age, they will be supported by the next generation.)

The *contract* is a prototypical form of social exchange. Contracts are regarded as just when the partners are equally informed and equally free to consent to them (Nozick 1974). Justice is threatened if relevant information is withheld, if pressure is exerted, or if one party is not free to refuse to enter into the contract on account of a certain predicament. But even contracts made by informed and freely consenting parties may be unjust with respect to third parties (e.g., cartel contracts made at the expense of others).

1.3 Retributive Justice and the Justice of Awards

Within the *domain of retributive justice* equality is specified firstly as *impartiality* in blaming and punishing people for their misdeeds or in praising and rewarding people for their achievements and heroic or moral deeds. Impartiality means that the same standards are applied to similar people in similar circumstances. This allows different standards to be applied to different people. For example, different standards of achievement may be applied in schools so that culturally or socially disadvantaged or less gifted pupils have any chance of being praised and rewarded. Secondly, equality in the domain of retributive justice is specified as *proportionality*, e.g., of punishment and guilt, reward and excellence. The major problem with proportionality is to determine how blame, guilt, praise, and achievements can be reliably gauged. Another crucial question with respect to retributive justice remains unanswered, however, namely which norms should be applied in the evaluation of actions. For instance, the atrocities legalized by the laws of a totalitarian regime cannot be punished if these laws are observed, but taking human and civil rights as normative standards here would violate the juridical prohibition against enacting laws retrospectively.

1.4 The Justice of the Social System and Politics

Since *the constitution*, *the legal system*, and *the institutions* of a society impact on distribution, social exchange, and retribution, these components of the societal system are also the objects of justice appraisals, e.g., the economic system, the labor laws, the health and welfare system, the educational system, environmental protection laws, immigration rules, the

generation contract—all of these maybe valued as basically just or may be criticized as unjust as well as *the politics* responsible for the implementation and the adaptation of the system. Constitutions may be criticized for failing to guarantee human rights, the protection of the environment, or animal welfare; the economic and tax systems may be criticized for allowing the development of huge inequalities in wealth or for demotivating individual productivity; the educational system may be blamed for failing to provide equal opportunities for the socially disadvantaged or failing to meet the needs of gifted students. Arguments concerning justice can be found to support or censure any given policy. And all parties concerned usually seem convinced that their view is the only valid one. This is how normative standards are conceived—as generally valid and as binding for all concerned.

1.5 What is Unjust, What Would be Just?

It is easier to reveal injustices than to establish justice within complex social and societal systems. In the following, a few examples will be given to illustrate this thesis.

An action such as the distribution of grades may be evaluated as unjust with respect to a specific standard or principle of justice, e.g., the correspondence of grades and performance. Any failure to establish this correspondence would be unjust and subject to correction. This is an easy case. It becomes much more complicated when the performances are not assessed objectively, or when the principle of justice is questioned, e.g., when those giving the grades are asked to consider the individual, social, and contextual conditions of achievement which may have been favorable or unfavorable, fairly or unfairly allocated, justly or unjustly distributed.

In many cases, efforts to correct one injustice result in the creation of another. A prominent example of this is the affirmative action taken to correct the indisputable historical disadvantages of women on the labor market which still persists to this day. For instance, woman are still underrepresented in top-level positions. Interpreting this fact as an unjust discrimination against women, various types of affirmative action have been taken to give preference to female applicants over their male competitors. The problem with this policy as far as justice is concerned is that it aims to correct a historical problem by reversing gender privileges in today's generation of students and young professionals. Today's young women have certainly suffered fewer injustices in education and on the labor market than earlier generations of women, and today's young men are less privileged than their predecessors. Therefore, it is problematic for these historical injustices to be corrected by affirmative action affecting only the present generation of young women and men, and having no impact on preceding generations. The costs of this measure should not be borne exclusively by young men. Moreover, it would be an illusion to believe that the whole group of women will vicariously participate in and profit from the success of some young women. Women are not a social group, but a social category. Individually, most are members of gender-mixed social groups such as families, where they are bound not only to daughters, sisters, and mothers, but also to sons, brothers, and fathers. They may be proud of the careers of the male as well as the female members of their family.

Another example is the environmental protection policy. There is little doubt that current and future environmental pollution not only entails health risks, but the risk of climate changes with incalculable consequences. There is no doubt that the pollution of air, soil, and water entails gross injustices. As pollution is a side-effect of productive processes in agriculture, industry, and business, and of traffic, air conditioning, etc., the concern of justice is about the allocation of the profits, costs, and risks resulting from these processes. It goes without saying that some people and populations benefit more than others from these processes, and those who profit most are unlikely to be those who have most to lose from the risks and disadvantages of pollution. The costs of pollution are still typically externalized, meaning that the costs and risks are not borne by those responsible for their causation, or by those who benefit from the processes in question. One of the policies for reducing pollution is the internalization of the costs by means of pollution taxes. However, the problems for justice created by pollution are not solved by raising taxes, and this measure may result in new problems of justice. Firstly, there is no guarantee that the taxes raised will be used to compensate the victims of pollution. In fact, not all of the victims of pollution can be identified, as its harmful effects are long-lasting, may interact with many other factors, and may be cumulative. Furthermore, air and water pollution extend across rgional and state boundaries and may involve delayed risks for the future, when coming generations may be affected by the greenhouse effect. Secondly, pollution taxes may intensify social inequalities. They may be ruinous for poorer firms, but not for richer ones, and prohibitive for poorer car owners, but not for more affluent drivers. The result may be the bankruptcy of some firms, the consequent dismissal of employees, and the aggravation of economic inequalities, potentially causing new problems of social justice.

A final example: It is a rule of retributive justice that crimes are to be punished. Nevertheless, what exactly constitutes a just punishment for a concrete crime is constantly under discussion. The assessment of personal guilt is difficult, as is the assessment of what constitutes an efficient punishment with respect to various purposes—general and individual deterrence, resocialization, protection of the general public, or the victims' claims for retaliation. Equal punishment for

the same category of crime and similar degrees of guilt may seem just, but may have an entirely different impact depending on the personality, life perspective, and social context of the offender. For some it may represent nothing but a small hiccup in the life plan, for others it will destroy the whole life perspective. Moreover, the impact of legal punishments is frequently not restricted to the offender; those who are close to the offender are also affected, and may suffer social discrimination and economic hardship which they have not deserved.

Claims for justice result from perceived injustices. Injustices are typically perceived as the violation of a single principle of justice, and from a restricted view of reality. The intensity of resentment about perceived injustices does not corroborate the validity of the personal or collective views. Efforts to correct perceived injustices frequently result in new injustices if further principles of justice are not taken into account, or if the complexities of social and physical reality are not acknowledged. Awareness of existing justice dilemmas and of the complexity of social systems is usually necessary for sustainable and broadly acceptable solutions to be found.

2. *Procedural Justice and the Settlement of Conflicts*

Given this broad spectrum of options for appraising and constructing justice in the various fields of social life, conflicts about justice are preprogrammed. How can these conflicts be settled? How can peace be preserved? One answer is to ensure fair procedures of decision making, procedures which are broadly accepted as just within the population (Luhmann 1983). This holds for parliamentary procedures, elections, institutional decisions, decisions of courts, arbitrators and other authorities. The separation of powers is a crucial element in the appraisal of justice in a given society—this includes the right to appeal against institutional and parliamentary decisions in administrative and constitutional courts. Extensive empirical research has confirmed the impact of fair procedures on conflict resolution and on the acceptance of authoritative decision making. It is not only the impartiality of the authorities, the consistent use of norms and arguments, and the objectivity in the use of relevant information which people consider to be criteria of fairness—the granting of a 'voice' to all concerned, meaning that all concerned are given the opportunity to present their views and claims and to influence the decision-making process, is also seen as an essential criterion (Thibaut and Walker 1975, Leventhal 1980). There is ample general evidence of what has been dubbed 'the fair process effect,' describing the phenomenon that perceived procedural fairness helps the parties involved to accept decisions or outcomes which are less favorable than they had expected or hoped for. Decent and polite treatment by the authorities may add to this effect (Lind and Tyler 1988). There is also evidence that perceived procedural fairness bolsters trust in the justice of institutions.

The settlement of conflicts—in the political arena as well as in all other fields of social life—requires the parties to acknowledge that conceptions of justice different from their own are not completely erroneous, and that the realm of justice is not without contradictions. It might be helpful to demonstrate the divergent conceptions of justice in different fields of life, social contexts, historical periods, and cultural traditions. It is necessary for the parties involved to understand that *dilemmas of justice* are unavoidable since conflicting standards of justice all have some validity. Conflict settlement therefore requires all conflicting principles and views of justice to be considered. Moreover, solutions which harmonize them have to be sought. Diverging constitutional principles such as freedom, equality, and solidarity have to be harmonized in the same way, since one-sided applications of each individual principle in societal practice would violate the others.

It is the *wisdom of institutions* to pay heed to several contradicting justice standards in their policies. The 'social market economy,' for instance, is conceived as a way of harmonizing liberal capitalist principles with social welfare maxims. In his theory of justice, Rawls (1971) has tried to integrate the right of all citizens to free economic activities with the right of all citizens to participate in the general welfare. His 'maximin' principle justifies both freedom of economic activity for all and the resulting inequalities in economic wealth, but restricts freedom and social inequality to the point that the maximum benefit will result for the least privileged category of citizens. When asserting every citizen's right to participate in the general economic wealth, Rawls also justifies redistribution and regulation by the state.

Similarly, most of the procedures for the allocation or withdrawal of scarce goods described by Elster (1992) at the level of institutions and corporations combine several principles of distributive justice. Together with elements of procedural fairness, this might explain why these procedures are broadly accepted without considerable public protest in all of the countries studied.

3. *The Justice Motive and Its Many Faces*

It is not generally acknowledged that the *concern for justice* is *an anthropological universal*. When asked why people care about justice, one of two answers are generally given: (a) humans have a primary or primordial motive for justice (Lerner 1980), (b) they believe that it is in their own interest to apply and to respect the standards of justice. These two answers are radically different. The first implies that people

want or need justice as an end in itself. The second answer implies that the concern for justice is merely a function of another motive, namely self-interest (Walster et al. 1978).

This second answer mirrors the *rational choice hypothesis* of social contract theories in political philosophy. From Hobbes to Rawls, the metaphor used has been that of a fictitious original pre-state situation, in which a crowd of individuals consensually contracts to establish a society with a binding normative system and powerful institutions restricting individual freedom because they believe that this would be mutually advantageous to all and that it would best serve their own interests in the long run.

By applying the rational choice model, concerns for justice are reduced to self-interest. For instance, it may be argued that equity rules are observed in business exchanges because the actors expect this approach to pay off in the long run of continued exchanges. Similarly, politicians may commit themselves to the cause of social justice because they hope to win the votes of those whose claims they are voicing. An employer may pay fair wages in the hope that this will enhance employees' motivation and performance. In such cases, justice is not the primary concern of the actors—not an end in itself—but a useful 'rational' choice for individuals aiming to maximize their own outcome.

There is no doubt that standards of justice may be observed for such reasons. But *once internalized, justice is no longer an option which is rationally deliberated*. Instead, *it imposes itself as an ought*, valid for oneself and for others, in the same way as Shweder and Haidt (1993) have postulated for moral norms. As long as justice is only an optional element in making rational choices, it is not an unconditionally valid ought, and can be disregarded without any moral disquiet if other useful options arise. As an ought, however, every unjustified violation will evoke moral reactions—guilt when the subject him- or herself has failed to meet a norm of justice by either action or omission, and resentment when others have violated such a norm (Montada 1998).

Justice concerns and self-concerns may be *confounded*, e.g., in cases of relative personal deprivation when compared with similar others, relative deprivation of one's own group when compared with other social groups (Crosby 1976), tangible cuts in salaries, increases of taxes or the prices of basic foodstuffs (Moore 1978), or when one's own interests are frustrated (Pastore 1952). In such cases, individual diagnostics will be required to decide whether self-interest or the justice motive is under primary threat. Empirical evidence indicates that violent responses only become probable in any of these cases when the frustration of self-interest is perceived as unjustified and illegitimate (Major 1994).

However, *self-interest* and *justice concerns* may also *conflict* with one another. Many of those who live in privileged conditions or who have been advantaged by fortune have *'existential' guilt feelings* when thinking about the fates and hardships of less fortunate others. Evidence of existential guilt feelings has been gathered from Holocaust survivors, Hiroshima survivors, released prisoners of war, and 'survivors' of layoffs, as well as from heterogeneous samples of well-situated people confronted with the hardships of poor people in the Third World, unemployed individuals in their own country, and other socially and physically disadvantaged groups (see Montada 1998 for a review).

Compelling evidence for the *prescriptive nature of justice* is provided by observations that subjects without any vested interest of their own resent injustices inflicted upon others, and engage in the support of these victims. It is not unusual for *social movements* to be initiated and *supported by people without any vested interests of their own*. Keniston's (1968) study of young radicals involved in the anti-Vietnam war movement and the study by Haan et al. (1968) of activists involved in the 1960s civil rights movement in USA serve as examples here.

However, other manifestations of the justice motive suggest that views of justice and injustice are personal or social constructions within specific contexts and realities. This can be observed in processes of emotional coping with experiences of loss, e.g., by denying obvious injustices or emphasizing questionable cases of injustice (Montada 1994). It can also be observed in the social emergence of perceived entitlements and political protest (Major 1994), as well as in mechanisms by which personal and social deprivation can be ignored (Wegener 1987).

The three psychologically fascinating phenomena described in the following can be interpreted as examples of *trade-offs between concerns of justice and self-interest*.

Blaming innocent victims was a phenomenon observed in many experiments conducted by Lerner and his students (Lerner 1980), as well as in studies carried out elsewhere (Montada and Lerner 1998). Blaming victims is plausibly interpreted as subjects doing an injustice in an attempt to preserve their Belief in a Just World which is, or would be, threatened by the victimization of innocent people. Belief in a Just World can be assumed to be a psychological resource which may be defended by attributing responsibility and blame to the victims themselves, thus reframing the injustice of their victimization.

Another phenomenon is the *exchange fiction* (Lerner 1980). It has been observed that many people tend to prefer buying an overpriced article, when they know that the profits will go to needy people, rather than directly donating an amount of money corresponding to the price difference. The explanation for this is that helping a needy person establishes a commitment and personal responsibility for this and other needy persons. Thus, any act of helping is problematic in several respects: It implies an acknowledgment of undeserved

neediness, thus threatening the Belief in a Just World, it creates a continuing and generalized responsibility for needy people which may interfere with personal concern and, finally, further injustices would emerge with respect to all other similarly needy people who have not been helped. Nevertheless, provided that they are not to blame for having inflicted their hardships upon themselves, needy people deserve to be helped. This conflict is best solved by an exchange fiction which allows the donation to be masked as a purchase.

The third phenomenon is called the *free riding dilemma*. Everyone will agree that free riding—profiting without investing—serves self-interest. Those who do invest resent free riders for their selfishness. A relevant observation here is that opinion polls conducted in Europe during the 1990s revealed that two-thirds of employees were, in principle, willing to reduce their working hours and income (on average by 10 percent to 20 percent), if this would result in the creation of new jobs for the unemployed. However, this willingness was very rarely translated into action. At least two hypotheses explain this discrepancy: (a) self-interest (preserving one's level of income) finally outweighs the justice motive, (b) moving the targets of social comparison changes the objects and contents of the justice motive: When considering mass unemployment and its undeserved sequel, it would be a just decision for the relatively privileged to share their working time and income. When comparing themselves with free riders (other full-time employees who are not willing to share their privileges), however, subjects who do choose to share would feel relatively deprived. Thus, not sharing can be justified as long as free riding is not prevented at the societal level. What at first glance appears to be selfish behavior may well be motivated by justice concerns.

In sum, the justice motive is an anthropological universal, but one which may assume many different faces.

Justice and Law

Justice has been called the fundamental moral virtue of social institutions (Rawls 1971). In similar fashion, 'legal justice' is the name commonly given to the fundamental moral virtue of legal institutions.

Theorists through the centuries have differed substantially over what this virtue is, and what relation legal justice bears to other forms of justice. In its commonsense meaning, according to which legal justice means treating people as the law provides, legal justice helps ensure that people are treated consistently and predictably. At the same time, however, it seems unlikely that treating people as the law provides invariably means treating them justly, because the law is at best an imperfect instrument of justice in its broader sense. Some theorists have responded to this concern by offering alternative accounts of legal justice. Others, of more skeptical bent, have doubted that legal justice has much to do with real justice, either because they deny that legal institutions have moral aims, or more commonly because they believe that other virtues, such as economic efficiency, pragmatic problem-solving, or compassion, are more fundamental aims of legal institutions.

1. *The Commonsense Conception of Legal Justice*

In its primary everyday sense, legal justice means treating people as the law provides. This view may be referred to as the *commonsense conception* of legal justice. Under the commonsense conception, law, rightly interpreted and properly applied to facts determined rationally, yields legal justice—indeed, 'legal justice' turns out to be nothing more than the name for the state of affairs in which law is rightly interpreted and properly applied to facts determined rationally. The phrase has no meaning independent of this. Under the commonsense conception, legal justice is roughly synonymous with legality itself. It is what most people mean when they speak of the 'rule of law,' an abbreviation for 'the rule of law, not of men.' Where the rule of men subjects people to the will of rulers, which may well be partial or capricious, the rule of law impartially subjects people only to the law itself (see *Rule of Law*).

In Western philosophy, it was Plato (428–347 BC) who in his late dialogue *The Laws* first introduced the idea that human rulers should be 'slaves of the law.' His student Aristotle (384–322 BC) also endorsed the rule-of-law idea in his work *Politics* (Bk. 3, ch. 16); it is also Aristotle who, in *Nichomachean Ethics* (Bk. 5) provided the first systematic analysis of the forms of justice. It is noteworthy, however, that Plato did not endorse the rule of law wholeheartedly. Drawing on the analogy of physicians who change their course of treatment when they find it is killing their patients (Statesman 295c–297c), he argued that officials should depart from legal rules when the good of the city requires it. The fear that rigid legality may lead to injustice haunts the commonsense conception of legal justice.

The commonsense conception raises large jurisprudential questions. How is law interpreted *rightly*? How is it applied *properly*? How are facts determined *rationally*? Competing philosophical schools offer various theories of legal interpretation; proceduralists disagree about how to adjudicate properly; and evidence scholars balance epistemological accuracy, investigative cost, and the protection of personal rights in rational fact-determination. As a result, the commonsense view that legal justice means treating people as the law provides is not as straightforward as it seems. It is fraught with ambiguity—an essentially contested concept if ever there was one. The commonsense conception of legal justice turns out to be an entire family of conceptions.

Perhaps the most fundamental divide among theories of legal interpretation and law application exists between views that try to bind decision-makers through objective general criteria and views that encourage decision-makers to exercise moral judgment. An example of the former is so-called *intentionalism*, the idea that laws should be interpreted according to the intention of those who drafted them, ascertained through objective historical evidence. An example of the latter is the theory of the distinguished philosopher Ronald Dworkin (b. 1931; see for example Dworkin 1977, 1980), who believes that judges are required to interpret law in the morally best light it can sustain. (For further discussion on this point see the articles *Legal Reasoning and Argumentation*; *Procedure: Legal Aspects*; *Scientific Evidence: Legal Aspects*)

2. *Justice and Legal Justice*

Regardless of how its ambiguities are resolved, the commonsense conception implies that legal justice will never be any better than the law itself. If the law itself is unjust, then treating people as the law provides will produce injustice. US Supreme Court Justice Oliver Wendell Holmes wrote in a letter, 'I have said to my brethren many times that I hate justice, which means that I know if a man begins to talk about that, for one reason or another he is shirking thinking in legal terms' (Holmes 1929). Legal justice, understood as legality, differs essentially from what might be called extralegal justice, or *justice simpliciter*. If Holmes is right that legal institutions do not deliver *justice simpliciter*, then two rather disquieting conclusions appear to follow. First, the term 'legal justice' is fundamentally misleading: the word 'justice' in it really doesn't mean justice. Second, there may be no reason to think of legal justice as a moral virtue at all. A good murderer is not good, and legal justice may be unjust.

Moreover, even when a law is good, inflexible application may yield outcomes in particular cases that are inequitable—unjust, in another everyday sense of the term—because of the exceptional facts of the case. Laws are general in scope, but, as Aristotle observes, even a good general rule may yield an unjust outcome when the case doesn't fit the rule. Thus,

alongside the problem of unjust laws there is a problem of unjust outcomes. Both problems generate a tension between justice and legal justice.

2.1 The Natural Law Alternative to the Commonsense Conception of Legal Justice

The most ambitious approach to the problem of unjust law simply denies the possibility that law can be unjust. At first blush, this sounds absurd, but the proposition that unjust law is not really law at all (*lex injusta non est lex*) has had powerful defenders in the so-called *natural law* tradition, among them St. Augustine and St. Thomas Aquinas (see *Natural Law*). The natural law argument may be put as follows. Inherent in the idea of law is the claim that the law ought to be obeyed, that the law creates a moral obligation over and above whatever sanction attaches to it. That is why a tax law is simply not the same as a gunman's command to hand over your wallet, and lawful authority is not merely the 'gunman writ large.' The difference is that one does nothing blameworthy by evading the gunman, but it is commonly believed that tax fraud is wrong—more generally, it is commonly believed that people have a moral obligation to obey the law. If the law is unjust, however, the moral obligation vanishes, and with it the status of law (Soper 1984).

Roman Catholic natural law theorists put the argument somewhat differently. Legal systems are instituted for a purpose, namely to promote the common good. The common good requires that there be law-makers and law-enforcers, who solve the various coordination problems that arise in organized society. Their role in fulfilling the common good is the sole reason that law-makers and law-enforcers have authority over others, and why others ought to obey them. The law-making authority therefore has an implicit limit: if legislators are not aiming at the common good, they have exceeded their authority, and the laws they enact are laws in form alone (Finnis 1980).

The intuitive basis to the natural law argument is that every recognizable legal system is built around a core set of rules, such as the proscriptions of violence, theft, and fraud. These are moral requirements recognizably directed toward the common good; they are 'natural law' in the sense that reason alone seems to dictate that they belong in every legal system. To natural lawyers, the idea that any arbitrary set of rules could constitute a legal system is unrealistic, because it denies that reason itself reveals the core of natural law at the heart of legal systems.

The natural law position can best be understood as an alternative to the commonsense conception of legal justice. Where the latter understands legal justice to mean treating people as the law provides, the natural law conception understands legal justice to require treating people in a manner consistent with natural law. The commonsense conception imbues legal justice with the virtues of impartiality and predictability; the natural law alternative imbues legal justice with substantive concern for the common good.

To the natural-law argument there are at least two responses. The most prominent is the argument of legal positivists (see *Legal Positivism*). Positivists hold that law consists at bottom of nothing other than posits of the sovereign authority. Any valid enactment by the sovereign authority is law, whether or not it is just. From the positivist point of view, natural lawyers are merely playing definitional games when they insist that a duly-enacted statute should not be honored with the title 'law' unless it is just. Taking away the word 'law' does not take away the problem of unjust law, because officials remain duty-bound to treat people as the statute provides. The commonsense conception of legal justice cannot be merely defined away.

Furthermore, even if the natural law argument is right that not just any capricious set of rules counts as law, and that only a system devoted to the common good will be recognizable as a legal system, it does not follow that every single law in a legal system is just: a system devoted to the common good can contain flaws and blind spots. The natural law argument applies most plausibly to entire legal systems, not individual laws. Perhaps a largely unjust system is not really law; but an unjust enactment of a largely just system is presumptively valid. In that case, the problem of unjust law reappears within the natural-law conception of legal justice.

A distinctive version of the natural law argument was devised by the American philosopher Lon Fuller. According to Fuller, a legal system must satisfy eight procedural requirements. To count as laws, enactments must be general in scope, public, prospective rather than retroactive, clear, consistent, relatively constant, capable of being obeyed, and enforced as written. Fuller believed that law serves as a baseline around which citizens organize their activities, and citizens must be able to know, understand, and comply with the baseline. The eight procedural requirements ensure that law satisfies these conditions. For Fuller, then, legal justice has more specific content than the commonsense conception—it includes the eight procedural requirements—but less content than the traditional natural law view.

Fuller's eight requirements have been widely accepted as an analysis of the rule of law. Fuller also believed that any legal system satisfying the eight procedural requirements would be substantively just, but his various efforts to demonstrate this ambitious conclusion are unpersuasive. American slave law satisfied the eight procedural requirements; so did many legal regimes that treated women as mere property of their fathers or husbands. Such legal regimes were procedurally just but substantively unjust, and most theorists agree that Fuller's theory of

'procedural natural law' fares no better than traditional natural law theories in eliminating the problem of unjust law.

2.2 Building Justice-enhancing Devices into the Law

An alternative approach to the problem of unjust law concedes that unjust law is possible, but tries to narrow the gap between justice and legal justice by building into legal systems devices for bringing law into line with justice. For example, legal language can be interpreted flexibly rather than rigidly, or interpreted in its morally best light, as Dworkin proposes. To take another example, many legal systems permit statutes to be invalidated when they conflict with constitutional principles, which are often framed in broadly moralistic language. In addition, common-law criminal juries have the power to nullify unjust law by acquitting a defendant in defiance of the law. Officials, too, may decline to enforce unjust laws, nullifying them through a kind of benign neglect. Arguably, nullification defeats legal justice in the name of *justice simpliciter*; but some theorists have pointed out that the discretion to nullify law is itself sanctioned by law, and may be regarded as an escape clause built into the concept of legal justice (e.g., Kadish and Kadish 1973). Law must be administered, and because laws are stated in general form, officials will always have some discretion to determine when laws apply; thus, the power to nullify will always exist.

Devices like these may well lessen the tension between justice and legal justice, but few theorists believe that they eliminate it. No method of interpretation is flexible enough to yield any desirable result, nor is every unjust law automatically unconstitutional. Furthermore, it seems unlikely that juries and officials will nullify unjust laws in every case—nullification is a device better suited to the exceptional case than to the rule itself.

2.3 Law and Equity

What about situations in which a law is just, but applying it strictly in a particular case yields an unjust outcome? Aristotle defines the word *equity* as 'a correction of law where it is defective owing to its universality,' and argues that justice requires that law should yield to equity. This, arguably, is what nullifiers are up to. In Aristotle's memorable image, rules of law should be like the soft lead rulers that builders use to measure irregularly shaped molding: 'the rule adapts itself to the shape of the stone, and so too the decree is adapted to the facts' (*Nichomachean Ethics*, bk. 5, ch. 10). (For further discussion, see *Equity*.)

But while the utility of soft rulers is clear, soft rules are more problematic. In contemporary terms, Aristotle was arguing that law should consist of context-dependent standards rather than rigid rules. A law that says 'drive no faster than 100 kilometers per hour' is a rule; a law that says 'drive at a reasonably safe speed' is a standard. Standards, unlike rules, are adaptable to facts in the case-by-case way that Aristotle recommends.

There are two problems with replacing rules by standards, however. The first is that standards are useful only when there is widespread social agreement on how they apply across a broad range of cases; where no such agreement exists, law must resort to rules if it is not to become fatally vague. For that reason, mature legal systems always contain both rules and standards.

The second problem is that the shift from rules to standards will not eliminate the need to supplement law with equity. Standards, like rules, must be general, and injustice can therefore result from applying them in particular cases. When a driver is rushing a stroke victim to the hospital, for example, he or she may be driving faster than 100 kilometers per hour *and* driving at an unsafe speed. If it seems unjust to punish the driver, that will not be because the speed limit takes the form of a rule rather than a standard—rather, it is unjust to punish the driver because his or her unusual situation does not fit any universal speed limit, either a rule or a standard.

Perhaps, then, the universality of laws should be abandoned. The problem with this approach is that the universality of legal rules and standards is taken by most theorists to be the hallmark of laws, distinguishing them from orders and directives. Furthermore, the virtues of legal justice lie precisely in the universality of law. Because law is general, legal justice treats like cases alike, and in that way it is fair and impartial; in addition, generality makes the law predictable, which allows people to plan their affairs around the law. Thus, treating people as the law provides honors the values of fairness and predictability, whereas allowing decrees to adapt to the facts undermines both these values.

2.4 Alternative Dispute Resolution

One way to reduce the tension between law and equity is to divert a dispute from the formal legal system to mediation, arbitration, out-of-court settlement, or other forms of alternative dispute resolution (ADR). Proponents argue not merely that ADR can resolve disputes more quickly, cheaply, and cooperatively than formal adjudication, but that also by particularizing outcomes to the unique facts of each case ADR creates higher-quality justice—it creates something that looks more like equity than law.

Here as elsewhere the argument is very ancient. In Greek authors of the Homeric period, the word

'justice' (*diké*) was synonymous with a mutually-agreeable settlement. In *The Laws*, Plato distinguished between the best judge, who destroys the wicked, the second-best judge, who subordinates the wicked to the good, and the third-best judge, who reconciles the contending parties with each other. Plato argued that in a real, non-utopian city the third-best judge, the one who settles cases through compromise, is better than the other two (627e–628a).

However, the virtue of ADR and the settlement process—that ADR makes an end run around legal formalities—raises questions about how to evaluate the justice of settlements. Negotiations, which often turn on nothing but naked bargaining power, can yield outcomes fully as inequitable as trials. Furthermore, critics of ADR suspect that informal processes may reinforce unequal power relationships, and that the lack of formal protections will leave vulnerable groups even more vulnerable. Should the justice of a mediated settlement be evaluated against the standard of an ideally fair trial (the 'shadow verdict'), or an ideally fair negotiation (the 'shadow bargain'), or something entirely *sui generis*? How are any of these standards to be determined? Does a compromise promote extra-legal justice, or does it merely compromise legal justice? Such questions yield no easy answers. (For further discussion of this point, see *Mediation, Arbitration, and Alternative Dispute Resolution (ADR)*; *Negotiation and Bargaining: Role of Lawyers.*)

2.5 Origins of the Conflict between Justice and Legal Justice

How grave the tension between *justice simpliciter* and legal justice is depends on what *justice simpliciter* consists of. Philosophical theories of justice differ dramatically from each other (see *Justice: Philosophical Aspects*), and none commands anything resembling a consensus. When Holmes wrote 'I hate justice,' his skepticism can be read as a complaint about the vagueness and debatability—hence, the contentlessness—of the concept of extralegal justice.

Yet despite the philosophical controversies, there is a recognizable Western concept of justice of which the philosophical theories may be said to offer alternative interpretations or conceptions. This concept draws on the two chief sources of Western moral thought, Greek philosophy and the Bible.

For Plato and Aristotle, and likewise for the biblical authors and redactors, justice is primarily a virtue of persons rather than of institutions. Thus, Plato's *Republic* investigates justice in the city only because Plato believes that the city is a plausible analogue to the individual soul, his real topic of interest; so too, Aristotle places his account of justice in his treatise on ethics rather than his treatise on politics. In the Bible, a just community is simply a community filled with just people. In this respect, the classical and biblical sources differ profoundly from contemporary theorists, who treat justice as a property of institutions rather than of persons.

It was Aristotle who first observed that the words 'unjust' and 'just' are ambiguous—the former refers both to 'the lawless man and the grasping or unfair man,' and similarly the latter refers both to the law-abiding and the fair man (*Nicomachean Ethics* Bk. 5, Ch. 1). One form that the virtue of justice assumes, then, is obedience to the law. Related to this form are special virtues of officials—to punish lawbreaking, and to judge impartially (which is a requirement found both in the Hebrew Bible and in Aristotle).

What about *justice simpliciter*, that is, justice apart from law-observance? Both the Jewish and Christian traditions locate the core ideal of justice in the Golden Rule and the injunction 'Love your neighbor as yourself' (Leviticus 19:18; Matthew 22:39), which commentators often regard as alternative formulations of the same duty. In addition, both traditions lay special emphasis on the injustice of neglecting or oppressing the poor. For Jews, loving your neighbor as yourself is so closely identified with the duty to care for the needy that the Hebrew word *tzedakah* carries the double meaning of 'justice' and 'alms-giving.' *Tzedakah* is a duty of the just individual, and a community will be unjust to the degree that it neglects the needy. In contemporary discussions, people often use the term 'social justice' in precisely this way. Similar themes appear in non-Western religious traditions as well (including a version of the Golden Rule in the Analects of Confucius).

This sense of *justice simpliciter* as solidarity with the least fortunate will inevitably generate conflicts with legal justice. Even within Leviticus 19, the duty to care for the needy lies in tension with the duty of judges not to favor the poor. Furthermore, as functionalists argue, laws aim to maintain and preserve a social order; law is an innately conservative institution, whereas the biblical conception of social justice is innately utopian and radical. One cannot really expect that laws in any society will be systematically formulated to enforce wealth-transfers from the prosperous and powerful to the poor and powerless.

There is another reason as well to anticipate divergence between legal and extralegal justice. Since Aristotle, it has been traditional to distinguish distributive justice from corrective justice. The former concerns fundamental questions of distribution in society; the latter deals with the rectification of injuries, both civil and criminal. Legal institutions such as courts deal principally with issues of corrective justice, and have very little to do with distributive justice (which is not to deny that legal decisions often have distributive effects). As writers from Aristotle onwards have observed, corrective justice may run contrary both to moral virtue and distributive justice—if a good man accidentally injures a wicked one, or a deserving poor man injures an unjustly wealthy one, the injurer

will owe compensation, even though in the former case the good man may be ruined for the sake of the bad, and in the latter case the distribution of wealth becomes even more lopsided than it was before. Legal institutions take established distributive principles and patterns as a given, regardless of whether they are just. In this sense, then, even when courts achieve corrective justice, they may well reinforce distributively unjust practices.

3. *Alternatives to Legal Justice*

So far this article has surveyed four conceptions of legal justice: the commonsense conception, according to which legal justice secures the goods of impartial consistency and predictability in the law; the traditional natural law conception, according to which legal justice secures the common good; Fuller's 'procedural natural law,' according to which legal justice provides an intelligible baseline against which people may order their own affairs; and the Aristotelian idea that genuine legal justice combines universal legal standards with equity. However, none of these is able to relieve the tension between legal and extralegal justice. The question remains whether other alternatives do better. Three alternatives have become prominent in contemporary debates.

3.1 *Law and Economics*

One response is simply to deny that achieving extralegal justice is an important aim of legal systems. A particularly influential contemporary version has been offered by law-and-economics theorists. According to Richard Posner (b. 1939), a founder of law and economics, the aim of legal systems is to maximize aggregate social wealth. If legal rules systematically fail to maximize social wealth, disputing parties could realize shared gains by bargaining around the law; inevitably, then, the law gravitates toward wealth-maximizing rules. Furthermore, wealth maximization is a normatively desirable aim, better than utilitarianism because it cultivates productive virtues rather than pleasure-seeking (Posner 1983). Critics, however, have found both the descriptive and normative claims of law and economics exaggerated. Inefficient legal rules sometimes linger for centuries, and the argument that a law prohibiting murder or rape can only be justified if it can be shown to maximize social wealth seems unsupportable (Dworkin 1980, Kronman 1980). (For further discussion of this point, see *Law and Economics: Empirical Dimensions*.)

3.2 *Pragmatism*

Another prominent alternative to the commonsense conception of legal justice is *pragmatism*. As one proponent defines pragmatic adjudication, 'a pragmatist judge always tries to do the best he can for the present and the future, unchecked by any felt duty to secure consistency in principle with what other officials have done in the past' (Posner 1998, p. 237). To the objection that this is an invitation to lawlessness, pragmatists respond that doing the best for the present and the future will in some cases require the judge to apply law and precedent in a rigidly formalistic manner; in other cases, however, pragmatism requires judges to look past formalities.

Pragmatists collapse legal justice into extralegal justice, where the latter is understood as achieving the best consequences overall. In one respect, pragmatism descends from the legal realists (see *Legal Realism*), who argued that legal formality is merely a disguise for implicit policy-choices, which should be made explicit and be guided by concern for consequences. In another sense, pragmatism represents a radical version of Aristotle's plea for context-specific equitable standards. The attractions of pragmatism are plain, but the general objection to broad standards applies in an acute form to pragmatism: there will seldom be agreement on what 'doing what is best for the present and the future' requires in any controversial case; thus, the virtues of predictability, transparency, and treating like cases alike will erode from the law.

3.3 *Feminism*

Feminists influenced by the work of psychologist Carol Gilligan have argued that the ethic of impartial justice is a quintessentially male construct—one that is in no way superior to the feminine 'ethic of care.' To illustrate the ethic of care, feminist legal scholars have fastened on the image of Shakespeare's Portia, who pleads that the 'quality of mercy' should replace rigid legal justice. The ethic of care focuses on repairing relationships and is directed toward individual needs rather than rules, policies, or the best overall consequences; unsurprisingly, this leads some proponents of the ethic of care to favor ADR over formal adjudication. On the other hand, other feminists caution that the ethic of care is part of legal justice rather than an alternative to it; conversely, care itself becomes corrupted without the virtues of consistency, integrity, and even-handedness—precisely the virtues promoted by legal justice in its commonsense conception (West 1997). (For further discussion on this point, see *Feminist Legal Theory*).

4. *Conclusion*

It is often unclear whether law and economics, pragmatism, and feminism are intended as alternatives *to* legal justice or as alternative analyses *of* legal justice. In a sense, all the theories surveyed here are responses to two fundamental tensions. The first is the tension between the rule of law, which subordinates particular cases to general rules, and the moral

demand to treat particular cases according to their individualized merits. The second is the tension between the values of consistency, predictability, and stability that legal justice serves and the more utopian values implicit in the broader notion of justice *simpliciter*. It may well be that no intellectual approach can eliminate this tension, or reconcile the competing senses of the word 'justice'

Justice, Access to: Legal Representation of the Poor

History and political theory both underscore the fundamental importance of providing equal access to justice for all citizens no matter what their economic and social status. It was promised to the subjects of emperors and kings long before those subjects began to even dream of the possibility of governing themselves. Then democratic theory, especially the social contract theory so influential with the founders of democracies in Europe and North America, emphasized that no man would surrender his natural right to resolve disputes through force unless government provided a forum to resolve those disputes where all citizens, rich and poor, had an equal chance. Thus, it is no surprise that constitutions of nearly every democracy guarantee their citizens 'due process' or 'fair hearings' and 'equal protection of the laws' or 'equality before the law' (Johnson 2000).

Despite these solemn guarantees, however, for most democratic nations it was well into the twentieth century before governments became serious about offering their lower income citizens equal access to justice. Progress has been uneven, with some countries forging far ahead of others. As of the beginning of the twenty-first century, this has become a field of study for political scientists, sociologists, historians, and legal scholars—seeking to analyze the problems, to devise solutions, to evaluate experimental approaches, to comprehend the political opposition to this goal, and to measure the progress.

1. An Overview Of Access to Justice Strategies

The study of access to justice issues in modern societies begins with an appreciation of the essential role lawyers play in the regular civil courts in every industrial society. In these societies, courts place most of the burden on the parties to investigate the facts, find the applicable law and present the case to the neutral, passive decision-makers—the judges or juries—supplied by the government. This is a heavy, often expensive burden the private parties must discharge and one typically requiring the expertise of lawyers. As a result of this division of responsibility between the government-funded courts and the private litigants, the latter bear most of the cost of the dispute resolution function as carried out in the courts of most modern nations.

This article analyzes how modern nations seek to supply counsel to those unable to afford their own, and also how some nations have sought to restructure the dispute resolution function to reduce the need for counsel. Three basic strategies are covered: (a) pro-

viding government-funded lawyers to disputants who are unable to afford their own legal counsel (II); (b) providing incentives to encourage private lawyers to represent people unable to afford to pay legal fees but without using government funds (III); and (c) providing dispute resolution forums where disputants can participate fairly without the assistance of a lawyer (IV).

2. *Increasing Access to Justice by Providing Government-paid Lawyers to Disputants Unable to Afford Their Own Legal Counsel*

Empirical studies conducted in the USA support the hypothesis that litigants who lack lawyers are severely disadvantaged in the courts, at least as those courts operate at the beginning of the twenty-first century (Galanter 1974). Debtors sued in collection cases who were represented by counsel had a six times better chance of winning than those who defended themselves. A study of unrepresented litigants who brought suit in the Washington, DC courts showed they suffered dismissal at the early stages of the proceedings and not one succeeded in even getting to trial. Also, low-income tenants representing themselves before New York's housing courts suffered eviction in almost every case while 90 percent of those represented by lawyers were saved from that fate.

Most governments did not require empirical research to reach the conclusion that their lower income citizens required free counsel if they were to enjoy effective access to justice in the regular courts. But the level of commitment to equal justice for all citizens and the willingness to fund the lawyers necessary to that goal vary greatly from nation to nation. Nonetheless, there was a trend toward greater access backed by larger government investments during the second half of the twentieth century in nearly all industrial democracies.

However, the legal status of the right to counsel in the regular courts is far different in the USA than elsewhere in Western democracies. While nearly all European and Commonwealth nations have enacted a broad statutory right to counsel in civil cases, as well as criminal cases, neither the federal nor any state government has done so in the USA. England's first such statute was enacted in 1495, France in 1852, Germany in 1877, the rest of Northern Europe in the early twentieth century, Italy in 1923, and most Canadian provinces and Commonwealth countries in the 1960s and early 1970s. In these countries, statutes guarantee low-income people that the government will supply them with a lawyer in any case where they qualify financially for such assistance, although they typically require the litigant's position to have some merit as well. In the past, most countries did not compensate the lawyers appointed to represent needy litigants but expected them to representation on a pro bono basis (Cappelletti et al. 1975). But over the course of the twentieth century more and more of the industrial democracies began to pay the lawyers serving poor people with government funds until by the end of the century a majority of European nations and all of the Commonwealth countries have chosen to do so (Johnson 2000).

Europe and the USA also have gone along different routes in recognizing a 'constitutional' right to counsel for indigent litigants. The courts on both continents have declared a constitutional right to counsel in criminal cases. But despite interpreting nearly identical constitutional language, the US Supreme Court and the European Court on Human Rights have reached opposite conclusions on the right to counsel in civil cases. In 1979, the European Court ruled the 'fair hearing' guarantee found in the European Convention on Human Rights and Fundamental Freedoms required member governments to supply free counsel to indigent civil litigants (Airey vs. Ireland 1979). Two years later, however, in a five-four decision the US Supreme Court held the constitutional guarantee of 'due process' did not require the provision of free counsel to civil litigants in the USA (Lassiter vs. North Carolina 1981). Switzerland, although not part of the European Community, anticipated the decision of the European Court on Human Rights over 40 years earlier when in 1937 the Swiss Supreme Court held that nation's constitutional guarantee that 'All Swiss are equal before the law' required government to provide free lawyers to those Swiss citizens who were too poor to hire their own (Judgment of Oct. 18, 1937, O'Brien 1967).

Lacking either a constitutional or statutory guarantee, poor people in the USA and many other countries around the world have legal assistance with their civil problems only if they can get help from a limited number of lawyers supplied through private or legislative charity (Zemans 1979). Indeed private charity was the only source of legal counsel for the poor during most of US history. It took the 'War on Poverty' declared in 1965 to create even a minimal level of government funding of legal services for the poor in civil cases (Johnson 1978).

As might be expected, comparative research documents that a statutory or constitutional right to counsel usually leads to a much higher financial commitment to government-paid lawyers for lower income citizens. Table 1 lists several industrial democracies in Europe, North America, and Oceania. The table first compares their total and per capita investments in government-funded civil legal services for those unable to afford lawyers. But the more salient comparison takes account of the relative prosperity of these different countries and reflects how much of a nation's gross national product its government commits to insuring access to justice for its lower income citizens (as measured by legal services investment per $10,000 of per capita GNP). Finally, the last two

Table 1

Comparative civil legal services investments [in US$] [Nations ranked by relative share of GNP invested in publicly-funded civil legal services—lowest to highest]

Nation (or political subdivision of nation, e.g., province, state)	This nation's total government investment in civil legal services (in US dollars) [In US includes Federal, State, local governments, and IOLTA expenditures]	Government's per capita civil legal services investment (in US dollars)	Government's civil legal services investment per $10,000 of GNP (in US dollars)	Total US governmental investment in civil legal services if US invested as much of its GNP as this nation does on civil legal services	Total English governmental investment in civil legal services if England only spent as much of its GNP as this nation does on these services
United States (FY 1998)	$600 million [population = 270 million]	$2.25	$0.70 [= 70 cents]	$0.6 billion [e.g., $600 million]	$80 million
Germany (1996)	$390 million [population = 80 million]	$4.86	$1.90	$1.6 billion	$200 million
France (1994)	$270 million [population = 59 million]	$4.50	$1.90	$1.6 billion	$200 million
Australia (FY 1998–99)			[Each state has its own program]		
–New South Wales	$31 million [population = 6 million]	$5.12	$2.75	$2.3 billion	$320 million
Canada (FY 1998–99)			[Each province has its own program]		
–Quebec	$52 million [population = 7.3 million]	$7.07	$3.50	$3.0 billion	$400 million
–Ontario	$82 million [population = 11.5 million]	$7.06	$3.60	$3.0 billion	$400 million
–British Columbia	$32 million [population = 4 million]	$7.80	$4.00	$3.34 billion	$465 million
Netherlands (1998)	$150 million [population = 15.5 million]	$9.70	$4.20	$3.5 billion	$480 million
New Zealand (FY 1998–99)	$27 million [population = 3.8 million]	$7.10	$5.10	$4.25 billion	$560 million
England (1999)	$2 billion $1.35 billion [population = 53 million]	$39.00 $26.00	Gross = $17.00 Net = $12.00	$14.2 billion $10.1 billion	$1.35 billion

1.2 *Note: An online version of this chart [updated periodically] can be found at http://www.equaljusticeupdate.org*

columns of the table illustrate what the total budget would be for two countries—England and the USA—were their investments the same per GNP as the other nations portrayed in this study. (These two nations are chosen because they represent the most generously funded (England) and least generously funded (USA) civil legal services programs included in these comparisons.)

Nations also differ in how they deliver their government-subsidized legal services. There are three common models: compensated private counsel, salaried staff attorney, and mixed systems.

Under the compensated private counsel model private lawyers represent lower-income people just as they would paying clients. But when serving those low-income clients the lawyers submit their bills to the government. The low-income clients, in turn, can usually choose any lawyer who has expressed a willingness to participate in the government program. This is the predominate delivery system in most countries, including England, the largest nations of continental Europe, and the Commonwealth countries.

Under the salaried staff model the government establishes separate legal aid offices, often in 'clinics' or 'neighborhood law offices' in close proximity to concentrations of low-income people. The offices are staffed with salaried lawyers, usually employed full-time. When poor people have legal problems they bring them to one of these offices and are represented by these salaried lawyers. The USA is the largest country that primarily relies on this delivery model.

A number of empirical studies have evaluated the costs and benefits of compensated private counsel vs. salaried staff delivery systems. Most comparisons suggest salaried staff programs deliver services at lower cost per case (Currie 2000). Both models score high on client satisfaction, but a substantial percentage also place a high value on the ability to choose their own lawyer—a feature of the compensated private counsel model. At the same time, salaried offices are better able to address community issues faced by the residents of low-income areas (Cappelletti et al. 1975).

Partly in response to the results of these studies and also in order to reduce program costs, several nations have moved to a mixed system that attempts to combine the virtues of the other two. Some of these mixed systems, such as those in Quebec, Canada and Sweden, adopt a 'client option' approach, allowing clients to choose between salaried staff lawyers and compensated private attorneys to represent them in a given case. Others, such as those in Ontario and British Columbia, divide legal problems between the two systems on a subject matter basis—typically with clients required to take all 'poverty law' cases to salaried attorney offices and the more traditional legal problems such as divorce to compensated private counsel.

Some countries using the compensated private counsel model to implement a right to counsel have experienced ever-expanding legal aid budgets. These budgetary considerations have led some governments, most notably in England, to begin exploring modifications calculated to reduce costs. These measures include 'franchising' where the government signs contracts with certain private lawyers and law firms to provide services at reduced fees. They also include variations of a 'capitation' approach where lawyers agree to handle all the legal problems generated by the entire low-income population in a defined geographic area for a fixed per capita sum (Moorhead 1998). British Columbia in Canada uses a form of 'managed care' common in some health delivery systems in which staff members closely monitor each litigation investment decision a compensated private lawyers might make during the course of a representing a poor person. In 1999 and 2000, England introduced several cost-control measures as part of a major overhaul of legal aid and the entire civil litigation process in that country (Regan et al. 1999).

3. Arrangements Which Encourage or Require Private Attorneys to Represent Lower Income People Without a Government Subsidy

In some nations, government-subsidized lawyers coexist with fee arrangements that encourage private attorneys to represent lower income clients without government funding in certain categories of cases. The most common of these are: (a) contingent fees, (b) conditional fees, and (c) court-awarded fees. In addition to these economic incentives, in many countries—especially those like the USA where government-funded legal services are in short supply—public policies encourage or require private lawyers to devote some of their time to the representation of poor people on a pro bono (uncompensated) basis (see Sect. 3.4).

3.1 Contingent Fees

The USA is almost unique in allowing lawyers to represent clients on a 'contingent fee' basis. Under fee contracts allowing them a percentage (typically 33 to 40 percent, but sometimes lower for early settlements and higher for trials) of the client's recovery, lawyers agree to assume the risk of failure, not charging any fee if they lose. Thousands of the poorest citizens are represented each year in cases where they are suing for a substantial sum of money and have a good chance of winning. At the same time, the contingent fee system offers no help to low-income people who are defendants, or who are plaintiffs in the many categories of legal disputes that do not involve monetary stakes or where the potential financial recovery is too modest to cover the risk of loss (Regan et al. 1999).

The contingent fee system is not without its critics. Some charge the fee percentages are too generous to lawyers, leaving their clients with less than full compensation for their injuries. Others, however, respond that if the percentages are set too low, lawyers will not find it economically feasible to take cases offering only modest potential recoveries or posing a significant risk of loss. Without the bonus of substantial fees when they win, contingent fee lawyers cannot afford to take riskier or smaller cases and thus can contribute less to increasing access for the low-income population (Regan et al. 1999).

Other studies have applied economic analysis to suggest the typical contingent fee structure places lawyers and their clients in a conflict situation. The lawyers maximize their profits when they get a decent recovery with a minimal investment of time while the client is best served by the largest possible recovery no matter how much time and effort the lawyer must expend. As a result, contingent fee lawyers may be inclined to settle too early and for too little, from the client's perspective. A recent empirical study, however, suggests contingent fee lawyers may come closer to maximizing their clients' returns than economic analysis predicted (Kritzer 1998a).

3.2 Conditional Fees

Most countries, other than the USA, use a 'loser pays' rule in allocating legal fees. That is, losing litigants pay not only their own lawyers but are required to pay at least a 'reasonable fee' to the winners' lawyers. A few nations, Ireland and at the beginning of the twenty-first century England, modify this rule in a way that may allow lawyers to serve low-income clients without a government subsidy in some cases.

In 1995, England introduced a modified form of the 'conditional fee' model, one that as of 2000 applies to nearly all civil litigation involving monetary stakes no matter the economic means of the parties. Under this model lawyers do not charge their clients a fee if they lose, but can charge an 'uplift' of up to 100 percent, in effect doubling their fee, if they win, with that 'uplift' payable out of the clients' monetary recovery. However, the total amount of the fee including the 'uplift' cannot exceed 25 percent of that recovery. Should they lose, clients are not relieved of their obligation to pay the other side's fees. But, if they can afford it, they can purchase insurance to cover this risk.

The UK government expects the 'conditional fee' system to supplant legal aid for the claimant's side of most cases offering the prospect of a monetary recovery. Critics point out the prospects of success must be unusually favorable before lawyers will be willing to provide representation under a 'conditional fee' system. They will not get a fee from either side if they lose and the 'reasonable fee' they do receive will ordinarily be less generous than the 33 to 50 percent of the judgment that contingent fee lawyers typically earn when they win at trial (Moorhead 2000).

3.3 Court-awarded Fees

Many jurisdictions in the USA depart from the general 'American' rule and shift fees to the losing party in certain categories of cases: (a) Statutory fee-shifting—in lawsuits under statutes specifically authorizing fee-shifting in favor of private parties whose cases enforce the public policies embodied in those statutes; (2) Public interest fee-shifting—in lawsuits where the court, rather than the legislature, determines that the public interest will be promoted by awarding winning litigants the bonus of requiring the loser to pay their legal fees.
