PREFACE

The *Encyclopedia of American Education, Third Edition* is designed as an easy-to-use reference for the entire educational community: above all, students of education, but also teachers, librarians, parents, school administrators, school board members, legislators and all others directly or indirectly affiliated with or interested in education and the education process. With more than 2,500 entries, the encyclopedia was honored by the American Library Association as one of the best new reference works when the first edition appeared in 1996. The second edition, published five years later, improved and expanded the contents, and now this third edition has raised the standards still higher. The most comprehensive reference work of its kind, the new edition of the encyclopedia covers every broad area of education: administration, federal and state legislation, court decisions, finance, pedagogy, special education, vocational education, history, school reform, classroom technology, and so on. The list is all but endless. The encyclopedia also presents in-depth examinations of the many complex problems facing American educators: illegal immigrants, the spread of Islam, bilingual education, ethnic and racial educational achievement gaps, campus crime, charter schools, intelligent design, rewards and risks of Internet in classrooms and libraries, failing schools, failing students, digital libraries, illiteracy, high school and college graduation rates, national testing, school vouchers, financial aid and hundreds of other topics. The

appendixes add another dimension, providing an extensive cross-referenced bibliography for each subject area, a chronology of education in America since 1607, a listing and summary of significant federal legislation in education since 1787, and a listing with summaries of major U.S. Supreme Court decisions affecting education since the first decision in 1819 to the most recent.

Another new dimension in the third edition of the encyclopedia is the revelation of new research into academic rankings for each state public school system and the correlation among student academic proficiency, education funding, teacher salaries, pupil/teacher ratios, poverty and other factors affecting student achievement. Startling statistics disclose that failing schools and failing students may have less to do with funding and education in schools than the economy, culture and society of neighborhoods that surround schools.

Since the groundbreaking first edition appeared in American libraries, American education has changed dramatically, and the encyclopedia has kept pace, adding nearly 100 new articles on a variety of topics, including electronic classrooms, digital libraries, and breakthroughs in special education such as RTI and DIBELS. Wireless and virtual classrooms did not exist when the first edition went to press, and e-textbooks and interactive whiteboards seemed little more than high-tech curiosities when the second edition appeared. These and dozens of other electronic teaching tools

are elements of growing importance to mainstream American education today and, accordingly, to this third edition of the *Encyclopedia of American Education*.

In compiling the third edition, we have updated thousands of statistics and revised more than 750 articles, including entries on the history, trends and quality of education in each of the 50 states and the District of Columbia; the results of national tests under the National Assessment of Educational Progress program, and the development of national academic standards. Like the two previous editions, the third edition does not shy from controversial areas—the decline in affirmative action and resegregation of American public schools, the obsessive struggle of Christian fundamentalists to inject biblical “truths” and creationism into public school science curricula and, perhaps the most controversial, the failure of the U.S. Department of Education’s massive, multibillion-dollar spending schemes to improve student academic proficiency or to budge the persistently low high school and college graduation rates from their levels of more than a decade ago.

The information in this encyclopedia was culled from the references cited in the bibliography as well as a host of other sources. Some are standard reference works, of course, but others

include the range of great works on education from Plato’s *Republic* to Rousseau’s *Émile*. Not every source can be cited for every iota of data in this work. The list would be endless, stretching from antiquity to Horace Mann, Booker T. Washington, Emma Willard and, more recently, John Goodlad and TheodoreSizer.

In addition to the many famous names that do appear, I would also have to list dozens of officials in public and private organizations who have invariably responded willingly and generously to my endless queries. They work at the U.S. Department of Education and at various state education departments, at schools and colleges and universities and at many non-school educative organizations such as museums, private foundations, trade associations and charitable organizations. Many teachers, librarians and school administrators have also proved generous with their insights, knowledge and time. I also wish to thank the brilliant educators who serve on the board of editorial consultants. I owe special thanks to editor in chief James Chambers and the entire editorial and production staff at Facts On File for invaluable contributions in producing this complex work and making it so important a contribution to teacher education in the United States.

—Harlow G. Unger

THE AUTHOR

HARLOW G. UNGER is a veteran journalist, broadcaster, historian and educator, and author of eight books on education and four historical biographies. He is a graduate of Yale University, with a master of arts in the humanities from California State University, whose articles appeared in newspapers and periodicals throughout the world during his years as a foreign correspondent and American affairs analyst. A former associate professor of English and journalism, he has published books on education, including in-depth examinations of public- and private-school education, vocational education, school choice and vouchers, and special education. Facts On File, Inc., the publisher of his previous books, also published his history of education for young adults and the first two editions of the *Encyclopedia of American Education*. The first work of its kind in the recent history of American education, the encyclopedia was honored by the American Library Association as one of the best new reference works when the first edition appeared in 1996. Mr. Unger is the author of five works on American history: *Noah Webster: The Life and Times of an American Patriot* (1998), *John Hancock: Merchant King and American Patriot* (2000), *Lafayette* (2002), *The French War against America* (2005), and *The Unexpected George Washington* (2006).

Board of Editorial Consultants

JAMES CHAMBERS, Editor in Chief, Arts and Humanities, Facts On File, Inc.

RICHARD EVERETT III is an educational financial consultant, with offices in Gloucester, Massachusetts, and the former business manager of the Groton School, an independent boarding school in Groton, Massachusetts. A graduate of Yale University, Mr. Everett was a financial administrator at Dartmouth College, Hanover, New Hampshire, and Tufts University, Medford, Massachusetts.

PETER H. GIBBON is a senior research fellow at the Boston University School of Education and a noted author on education. A former teacher of anthropology, ancient and medieval history, American history and modern European history, Dr. Gibbon was, for many years, the headmaster of Hackley School, in independent primary and secondary day and boarding school in Tarrytown, New York. Dr. Gibbon is a graduate of Harvard University, with a Ph.D. from Teachers College of Columbia University. His articles on education have appeared in the *New York Times* and *Newsweek*, as well as many professional journals. Dr. Gibbon has toured

British, German, Japanese and Chinese schools on a variety of foundation grants.

ELLEN S. HURWITZ is president of American University–Central Asia, Bishkek, Kyrgyz Republic. Past president of New England College, Henniker, New Hampshire, and of Albright College, Reading, Pennsylvania, Dr. Hurwitz is a graduate of Smith College and holds a Ph.D. from Columbia University, where she studied medieval Russian, Byzantine and European history. Dr. Hurwitz taught history at Wesleyan University, Middletown, Connecticut, and was chair of the history department at Lafayette College, Easton, Pennsylvania. A former academic administrator and trustee at Lafayette, she served as provost and dean of faculty at Illinois Wesleyan University, Bloomington, Illinois. Her publications include books on early Russian history and comparative medieval studies, and she has been a consultant in interdisciplinary and international curriculum development.

CAROL C. KNEELAND was the director and cofounder, with her husband, Theodore R. Kneeland, of the Language Retraining Program at Trinity-Pawling School, an independent boys' boarding school in Pawling, New York. She and her husband now direct the language retraining program at Fryeburg Academy, Fryeburg, Maine. One of the first programs in the United States to work with dyslexic adolescents, her program has been a model for similar programs throughout the United States and the world. Kneeland has lectured and presented workshops at independent schools, colleges and universities and at various organizations such as the Orton-Dyslexia Society and the Council for Exceptional Children. A graduate of Syracuse University, Ms. Kneeland trained in special education at the Carroll School, Lincoln, Massachusetts, and at the Massachusetts General Hospital.

KATHLEEN P. POTIER is a former teacher of gifted adolescents at Manheim Township

High School, Lancaster, Pennsylvania. A graduate of Middlebury College, Middlebury, Vermont, she has an M.A. in English and an M. Litt. in English from the Bread Loaf School of English at Middlebury College. A reader of Scholastic Assessment Test essays for the Educational Testing Service, she spent many years as a secondary school English teacher and as an adjunct instructor in English at Franklin and Marshall College, Lancaster, Pennsylvania, and Harrisburg Community College, Lebanon, Pennsylvania.

RONALD D. POTIER is a veteran college administrator, having served at Middlebury College, Middlebury, Vermont, and Clark University, Worcester, Massachusetts, before becoming director of admissions at Franklin and Marshall College, Lancaster, Pennsylvania, and, later, Elizabethtown College, Elizabethtown, Pennsylvania. A graduate of Middlebury College and a member of the National Association of College Admissions Counselors, he has served as a consultant for the Office of Overseas Schools of the U.S. Department of State and as a scholarship consultant for the Educational Testing Service and College Entrance Examination Board. An authority on all aspects of higher education, he has served on policy-making committees of the National Collegiate Athletic Association and the National Association of College Admission Counselors. He is a frequent speaker at meetings of school, college and university administrators and is a consultant to colleges and universities on international student recruitment.

EDWARD L. RICHARDS, JR., is professor emeritus of English literature at Norwich University, Northfield, Vermont, where he served as chairman of the English department. A graduate of Yale University, Dr. Richards holds a master's degree from Columbia University and a Ph.D. from New York University. A retired commander in the U.S. Navy, he is an authority on American literature and has a broad knowledge

of and has made extensive studies of military literature and literature of the sea.

DAVID S. SEELEY is a professor of education at the College of Staten Island, City University of New York, and coordinator there of the Certificate Program in Educational Supervision and Administration. An authority on all aspects of public education, Prof. Seeley was, for many years, executive director of the Public Education Association and has served as Assistant United States Commissioner of Education and as the director of the New York

City Office of Education Liaison. A graduate of Yale University, he has a law degree from Yale and a doctorate in educational administration from Harvard University. A prolific writer, he has written articles for a variety of educational journals, including *Education Week* and *Phi Delta Kappan*, and is author of *Education through Partnership* (Ballinger, Cambridge, Mass., 1981).

INTRODUCTION

The origins of education stretch back millions of years to the development of the first primitive vertebrates, which instinctively taught their young the techniques of survival: how to find food and how to defend themselves against predators. Over time, successful education has consistently proved critical to the survival of the individual and the entire species; unsuccessful education has inevitably led to extinction—of many human as well as subhuman species.

Education of primitive vertebrates as well as modern man begins at childbirth, as parents gradually impart knowledge, skills and values that permit their children to function safely and efficiently and make self-enhancing decisions. In early civilizations, children were educated informally, within the family unit, in preparation for the roles they would play in adult life—namely, man as hunter and fighter and woman as caretaker of infants and the home. As humans evolved into social beings and congregated in herds for mutual protection, education also evolved, and the number of skills children learned expanded. But education evolved in other ways as well—and not always for the betterment of the species. Enculturation, or institutionalization, of education broadened and hybridized it to add cultural indoctrination to the basic skills taught for the preservation and propagation of the species. God-centered religions in some societies indoctrinated followers in the belief that women were naturally weaker and inferior to men. Ancient Greece and

Rome reserved education for men, although the Greek philosopher and teacher Plato advocated equal educational rights for women in *The Republic*, his concept of the ideal state. In the Christian Bible, Saint Paul urged Christian wives to be obedient to their husbands. Hinduism promised virtuous women the reward of rebirth as men. Enculturation of education in some societies actually undermined the original goals of education—survival of the species. Like lemmings, humans in many societies learned to march in lockstep to their deaths in metaphorical seas—as French armies marched to their destruction on the Russian steppes in the early 1800s and as the German and Japanese pursued their own national destructions in World War II. Whether for good or evil, all modern education encompasses enculturation that teaches children the values of their society and the most prized forms of behavior in it. Churches have practiced such education for centuries, and state-operated schools have followed suit to a greater or lesser degree, in direct proportion to the extent of individual freedom in each society.

The roots of American education reach back to the earliest known Western civilizations, which taught the religion and traditions of the particular civilization as well as essential skills for perpetuating that civilization. The temple schools of ancient Egypt taught writing, mathematics, the sciences, and architecture, as well as religion and national traditions. The Greeks added another element to education:

the preparation of young men for self-government and leadership roles in their state and society.

Formal education in North America began about two decades after the arrival of the first European settlers in New England, New Netherland (now New York), and Virginia. Initially, parents and local churchmen shared the task of educating the young: Parents taught their children the gamut of skills they would need to survive on frontier farms, and churchmen taught the scriptures—to fend off the satanic barbarism the church feared life in the wilderness would inevitably produce. As the population expanded and the number of children increased, state-built schools began replacing churches as sites in which to educate the young. Boston was the first to establish a formal school, in 1635, and nearby Ipswich and Charlestown followed suit the following year. In 1638, Cambridge set aside three acres for “a public school or college” that would become HARVARD. Dorchester, Newbury and Salem opened schools the following year. Meanwhile, the Dutch West India Company established the first school in New Amsterdam, and five years later, in 1643, the Virginia Assembly voted to open the first school in that colony. Within a decade, schools were sprouting in villages across the colonies—with churchmen still leading most of them “lest degeneracy, barbarism, ignorance and irreligion do by degrees break in upon us,” explained Jonathan Mitchell, a leading New England minister who helped found Harvard.¹ Far from erudition, instruction in colonial schools ensured that children learned “to read and understand the principles of religion and the capital laws” of the colonies in which they lived. To that end, Massachusetts enacted its famed “Old Deluder Satan Act”—a landmark piece of legislation

that established education as a basic, universal human right in the New World. As parochial as the act now seems, it represented the world’s first universal compulsory education law, and it made the establishment and administration of formal schools an obligatory function of government. It also established the principle of local taxation to pay for local schools. Passed on November 11, 1647, the historic legislation ordered

every township in this jurisdiction, after the Lord hath increased them to the number of fifty householders, . . . [to] forthwith appoint one within their town to teach all such children as shall resort to him to write and read, whose wages shall be paid either by the parents or masters of such children, or by the inhabitants in general, by way of supply, as the major part of those that order the prudentials of the town shall appoint; provided, those that send their children be not oppressed by paying much more than they can have them taught for in other towns; and it is further ordered, that where any town shall increase to the number of one hundred families or householders, they shall set up a grammar school, the master thereof being able to instruct youth so far as they may be fitted for university, provided that if any town neglect the performance hereof above one year, that every such town shall pay five pounds to the next school till they shall perform this order.

The effect of the Old Deluder Satan Act was dramatic. Within 10 years of its passage, all eight of the 100-family towns in the colony had complied by establishing GRAMMAR SCHOOLS, and about one-third of the 50-family towns had established PETTY SCHOOLS. Connecticut enacted a similar law in 1650, and Plymouth—then a separate colony—followed suit in 1658. By 1689, schooling had become an established element of life in British North America. Virginia had six schools, Maryland at least one, New York at least 11, and Massachusetts at least 23.

1. Jonathan Mitchell, “A Modell for the Maintaining of Students & Fellows of Choise Abilities at the College in Cambridge,” *Publications of the Colonial Society of Massachusetts*, XXI (1935), 311.

Communities without formal petty or grammar schools depended largely on private tutoring, either by ministers at church, private tutors or literate mothers, who taught children for a fee in their homes—the so-called DAME SCHOOLS. Usually reserved for sons (and only an occasional daughter) of the wealthy, property-owning gentry, dame schools and more formal petty schools taught basic reading, writing and arithmetic (along with basic religious studies) to children five to seven years old. They were the forerunners of today's elementary schools. The higher-level grammar school extended the curriculum to include the study of Latin, Greek, literature, advanced religion and other studies needed “to prepare such youths for college and public service of the country in church, and commonwealth.”² The grammar school curriculum lasted seven years and was offered exclusively to sons of the propertied on a year-round basis, allowing students to take leaves of absence during planting and harvesting and resume their studies during those seasons when they were not needed in the fields. Ninety-five percent of the population were farmers, and even the wealthiest of them could ill afford to lose their sons at planting and harvesting time.

The 18th century saw little change in the basic patterns of education in the colonies. It did, however, reflect population growth with a startling expansion in the number of schools and colleges and a shift in the curriculum from the religious to the practical, with the introduction of courses on mechanics, agriculture, commerce and business to meet the needs of an expanding society and nation. As the industrial revolution gained momentum, American colonists demanded that schools teach their children courses needed to exploit the wilderness.

Education, however, was usually reserved for white males from families who could afford

to pay the required school fees. Although some girls were allowed to attend petty school, they were not permitted to attend grammar school or college, and what education they did receive was limited to the “domestic arts,” centering around skills needed for nurturing infants and maintaining the household. Even the expanded role of women necessitated by life in the colonial wilderness did little to expand women's access to formal education. English common law was clear: “Husband and wife are one, and man is the one.” Girls, like boys, were the property of their fathers, and women became the property of their husbands, having no control of their persons or their children, no right to own land or money and no access to an academic education. The domestic arts that they learned dealt with child rearing and household maintenance; the ornamental arts included singing, dancing and other skills to amuse husbands and “ornament” their households.

Black and American Indian children were also denied almost all education, despite efforts by a handful of school reformers such as ANTHONY BENEZET. What formal instruction they did receive was limited to simplistic biblical studies that reinforced the notion that people of color were inferior beings, descended from Ham and condemned by God to serve the white man in perpetuity. A few benevolent slaveholders—notably GEORGE WASHINGTON—taught some of their slaves basic skills such as carpentry and bricklaying.

Ironically, independence brought few changes to American education, despite demands from some humanistic signers of the Constitution for a national system of free, universal public education. George Washington, John Adams, THOMAS JEFFERSON, JAMES MADISON, BENJAMIN FRANKLIN and BENJAMIN RUSH all favored the establishment of a national school system that would ensure elementary school education for all children and allow all who passed competitive examinations to progress, respectively, to grammar school, col-

2. *American Journal of Education*, IV (1857), 710.

lege, and, for an elite few, to a national university that would prepare them for national leadership—a system similar to the one Plato outlined in his *Republic*. Successful completion of national university was to have been a prerequisite for service in all federal elective offices, including Congress and the White House.

The proposal was defeated by southerners, who feared that education of slaves would lead to manumission, and by northern industrialists, who profited from child labor and indentured female workers. As a result, the CONSTITUTION omitted all mention of education and, under the Tenth Amendment, left the question to the states. The latter, in turn, left education in the hands of local communities, and ultimately to parents. Few of the latter could afford not to take advantage of their children's earning power, and formal schooling declined in the early decades of the republic.

Some educational reformers were at work, however. In New England, CATHERINE BEECHER, EMMA WILLARD and MARY LYON were promoting the cause of women's education. In 1821, Emma Willard established the first female academy that offered an educational equivalent to that which men received. In 1823, Catherine Beecher opened a comparable academy in Hartford, and over the next 20 years she helped open the teaching profession to women. In 1837, Mary Lyon established the world's first college for women at Mount Holyoke, Massachusetts.

Meanwhile, HORACE MANN and HENRY BARNARD established the first statewide public school systems that guaranteed free, universal elementary school education in Massachusetts, Connecticut and Rhode Island, thus allowing the first black and poor white children to attend school and acquire basic literacy and numeracy skills. Although children continued to represent the cheapest and most profitable form of labor, some industrialists found that worker illiteracy was hurting the quality of their products and gradually costing them important shares of international markets.

Many responded by throwing their support to Mann and other educational reformers. In 1852, Massachusetts enacted the nation's first law making school attendance compulsory for at least 14 weeks a year for all children between the ages of eight and 14.

By the end of the Civil War, the public school movement had spread to almost all states outside the South, and northern military authorities forced the South to accept the concept as well. The decade following the Civil War saw the public school movement spread to higher education with the passage of the Land Grant (Morrill) Act of 1862, which granted each state federal lands on which to establish agricultural and mechanical arts colleges to give young Americans the skills needed to exploit and live along the nation's expanding frontiers. American farmers had exhausted much of the soil in the Northeast and Middle Atlantic states because, as hard as they worked, they had little or no knowledge of proper fertilization and crop rotation. In New England, Yale College president TIMOTHY DWIGHT wrote that "our fields are covered with a rank growth of weeds" because of "insufficient manuring, the want of good rotation of crops, and slovenliness in cleaning the ground."³ In Virginia, once the world's major supplier of tobacco, entire counties lay barren, unable to grow even wheat, much less tobacco.

Ironically, the decline in American farm productivity came just as demand for produce and livestock was soaring because of an explosive growth of American and European cities. Farmers themselves were as alarmed as political and educational leaders by their scientific and technological backwardness and their inability to profit from growing demand for agricultural products. The founding of land grant colleges—the heart of today's state university sys-

3. Timothy Dwight, *Travels in New England and New York* (1821–22), edited by Barbara Miller Solomon (Cambridge, Mass.: Harvard University Press, 1969, 3 vols.), I:76.

tems—offered farmers’ boys complete courses of education in agricultural and mechanical arts, as well as training for each state’s militia (today’s National Guard), and, in the end, the colleges proved to be the key to reviving and maintaining American agriculture. It was not lost on educators that the success of the land grant colleges was largely based on reversion to education’s original, prehistoric goals of teaching the young the basic techniques of survival: finding and producing food and protecting themselves against attack by predators.

By 1900, 32 states had passed compulsory education laws, but few states intended those laws to provide children with much more than basic literacy and numeracy, and almost none intended to provide those skills to women, blacks or American Indians. Indeed, only 10% of American children were attending high school in 1910. The rest were working in mines, fields and factories. It would not be until the mid-1930s that the federal government would pass a child labor law to prevent the exploitation of children and allow them to continue their education beyond elementary school. As late as 1940, only 30% of American children went to high school; few schools in the North and none in the South admitted blacks or American Indians. “Black codes” in most southern states made teaching literacy to blacks a felony punishable by heavy fines and imprisonment.

Nonetheless, the seeds of social change had been planted. The compulsory education laws that were on the books in the early 1900s produced a vast expansion in the number of elementary schools—and new opportunities for teachers. Men, however, scorned the low salaries and inadvertently opened a huge new profession to women. By the beginning of World War I, women had taken control of the teaching profession in elementary schools, and outstanding women’s colleges had been founded throughout the United States to train teachers. Even all-male colleges such as Harvard and Columbia established affiliated col-

leges for women, who suddenly used their education, their new-found independence and the strength they accumulated in their numbers to demand, and win, the right to vote shortly after World War I.

It was not until the end of World War II, however, that the concept of truly universal education envisioned by many of the Founding Fathers would become a reality. The first major step in that direction came with passage of the G.I. BILL OF RIGHTS of 1944, which guaranteed every veteran the right to complete high school and obtain a free college education—in effect, a reward from a grateful American public to the returning soldiers, sailors, marines and airmen who had saved the nation and the free world from the scourge of totalitarianism. As white veterans of all economic and ethnic stations marched through the gates of academe, however, blacks, Indians and women—even veterans—continued to find most of those gates barred to them, and the few institutions that did open their gates offered education inherently unequal to that afforded white men. Few women’s colleges offered courses in engineering, advanced sciences, advanced economics and other studies that prepared men for careers at the highest levels of the professions, industry and government. Blacks had even less access to quality education. In 1896, the U.S. Supreme Court had victimized American blacks by ruling in *PLESSY V. FERGUSON* that states had the constitutional right to segregate the races in “separate but equal” school systems. For the next 60 years, the SEPARATE-BUT-EQUAL DOCTRINE kept blacks segregated from whites in almost all areas of American life and condemned generations of African-American children to substandard education in the North as well as the South. While the latter subjected black children to *DE JURE* SEGREGATION, the North subjected them to *DE FACTO* SEGREGATION in equally inferior schools. In the 1946–47 school year, 17 states and the District of Columbia had laws that segregated black and whites in separate schools. Only 12 states had laws banning such segregation. In

1954, however, the National Association for the Advancement of Colored People (NAACP) won a dramatic victory when the U.S. Supreme Court reversed *Plessy v. Ferguson*. In the landmark case of *BROWN V. BOARD OF EDUCATION OF TOPEKA, KANSAS*, the Court ruled that separate schools, simply by their separateness, cannot be equal, and that segregation was unconstitutional. Unfortunately, nearly three generations of African Americans had grown up by then, in segregated, academically inferior schools set amid the poverty and crime of America's black slums, and it took the next half-century for desegregated public schools to begin closing the gap between the academic performances of black and white children.

The impact of *Brown v. Board of Education* was felt far beyond America's black slums. In fact, it was the progenitor of the CIVIL RIGHTS ACT OF 1964, which banned racial and ethnic segregation in American public schools, colleges and universities and all other educational institutions receiving federal assistance. With African Americans, Native Americans and Hispanic Americans free to attend the schools and colleges of their choice, it was not long before every other educationally deprived group of Americans demanded and won equal rights in education. Congress passed the EDUCATIONAL AMENDMENTS OF 1972, prohibiting discrimination on the basis of gender in educational institutions receiving federal aid. Universities across the nation were forced not only to open their doors to women but also to grant women access to the same courses of study as men. By 1994, more than half of all college students were women, and their numbers had grown dramatically in medical, law, business and other traditionally male graduate and professional schools.

In 1975, the last group of academically deprived Americans—some 8 million children with physical, emotional or intellectual handicaps—won virtually unrestricted access to the same education as other Americans. With approval of the EDUCATION FOR ALL HANDI-

CAPPED CHILDREN ACT OF 1975, Congress gave all handicapped individuals, aged 3 to 21, the right to the best possible education, free of charge, in the least restricted environment. The law provided funding for all necessary construction to make schools "barrier free" and accessible to handicapped children. When the law was passed, only about 1.6 million of the 8 million handicapped children in the United States were attending public schools. Most of the rest were either incarcerated in residential facilities or languishing idly at home. In both cases, they rarely received adequate academic or compensatory education to ensure their eventual independence.

With the advent of truly universal education came radical changes in the shape of American school systems, in the types of education offered, and in basic teaching techniques. In the 17th and 18th centuries, American schools had prepared only privileged white males for a small group of exclusive colleges and eventual lives in the ministry or public service. Secondary school and college curricula were limited to theology, Latin, Greek, mathematics, philosophy, French and English. The nation's westward expansion in the 19th century required a comparable expansion of school and college curricula to include more practical courses in business and commercial subjects, such as bookkeeping for those headed into commerce and agriculture, and mining and engineering for those intending to exploit resources along the nation's frontiers. The explosive growth of industrial production in the late 1800s forced American schools to expand their offerings into industrial and vocational training for future factory workers. Initially designed to teach a handful of traditional skills such as carpentry or printing, VOCATIONAL EDUCATION quickly expanded into an endless number of occupational skills, from aviation mechanics to cosmetology, to meet the needs of an ever-growing student population and an ever-expanding economy. By the end of the 20th century, American schools were fulfill-

ing every educational need of every American, with school curricula “limited only by the legitimate needs of adolescents,” according to the U.S. Department of Education. Critics of American public schools began arguing that the huge expansion of school curricula had undermined the quality of education and left too many students functioning below grade level. In the 1990s and early 2000s, Congress responded with a series of legislative forays into uncharted constitutional territory—the GOALS 2000: Educate America Act, the NO CHILD LEFT BEHIND ACT, and others—to develop national academic standards and eliminate state-to-state differences in academic achievement. All are under challenge as violations of the Tenth Amendment, which reserves regulation of education to the states.

The enormous expansion of the student population and curricula has forced radical changes in schooling patterns and teaching methods. Once organized into a relatively compact three-stage pattern over 10 years, schools today are organized in a two-decades-long, five-stage pattern—preschool, primary school, presecondary or “middle” school, secondary school and higher education—and each stage progressively less CHILD-CENTERED, or pedocentric. PEDAGOGY—the science of teaching—is said to be either scholiocentric or pedocentric. In scholiocentric pedagogy, the institution and instructor are central to the educational process, and the student is relatively passive and secondary. In pedocentric pedagogy, the student or child is central to and active in the educational process, while the institution and instructors serve as conduits. Historically, American pedagogy has evolved from extreme scholiocentricity to a range of pedagogic activities. The most extreme scholiocentric pedagogy dates back to early universities in Renaissance England, where the learned sermon was the sole method of instruction. Its modern counterpart, the lecture, remains the core of much college and university pedagogy. There is no active instruc-

tion, the lecture goes on whether students are present or not, knowledge is presented orally or in print, and students must gather the materials and teach themselves.

Preschool education today is almost entirely pedocentric, revolving as it does around socialization—that is, teaching two- to four-year-olds self-control, sharing, getting along with others and other social and intellectual skills needed for living and working in school and society. PRIMARY SCHOOL teaches five- to ten-year-olds basic academic skills—reading, writing, calculating and so forth—and basic concepts of history, geography, the natural and social sciences, music, art, crafts, sports and health and hygiene. It remains relatively pedocentric, as teachers inform, explain and demonstrate before asking questions and allowing students to imitate. (It is, in effect, similar to the pedocentric approach in old-style apprenticeships, in which the master demonstrated an aspect of his craft and the apprentice was expected to imitate.)

Secondary school generally has two levels: MIDDLE SCHOOL and HIGH SCHOOL. Although education at both levels progresses through continually advancing levels of traditional academics, middle school instruction is geared to coping with specific problems of pubescent children, 11 to 14 years old. High school instruction veers sharply from child-centered methods to subject-centered presentations, in which students are expected to have the maturity to sit quietly in class, taking notes, as teachers lecture at ever-increasing lengths. Higher education—college and graduate school—provides advanced, specialized studies leading to bachelor’s, master’s and doctorate degrees in specific academic or professional areas. Its pedagogical approach, as stated above, is largely scholiocentric—that is, subject-centered, with the institution and its instructors central to the educational process and relatively passive students acting as mere vessels into which knowledge is funneled. The admission of handicapped students to college, however, has forced some institutions to adopt

some pedocentric pedagogy for that student constituency.

As educational institutions have universalized their reach, schools at all levels have been forced to assume many noneducative roles, which, critics argue, are reducing their effectiveness as educational institutions. Among these new, noneducative roles are college advisory and job-placement services, career counseling, psychological counseling, sex education, drug and substance abuse education, antiviolen-
ce education, family intervention and social work, pregnancy counseling, supervision and educations of the handicapped and learning disabled, driver education, and on and on. Soaring divorce rates have forced many pre-schools, elementary schools and even middle schools to establish day-care facilities after normal school hours, and some school boards are pressuring schools to provide morality education and even moments of prayer during school hours—clearly an unconstitutional activity in tax-funded institutions.

“Today’s high school is called upon to provide the services and transmit the values we used to expect from the community and the home and the church,” declared the legendary American educator ERNEST L. BOYER. “And if they fail anywhere along the line, they are condemned. “What,” he asks, “do Americans want high schools to accomplish? Quite simply, we want it all.”⁴

Decades earlier, another great American educator, ARTHUR BESTOR, warned, “The idea that the school must undertake every need that some other agency is failing to meet, regardless of the suitability of the schoolroom to the task, is a preposterous delusion that in the end can wreck the system.”⁵

A

Aaron v. McKinley A 1959 federal court decision that declared Arkansas school-closing laws unconstitutional and ended a two-year crisis over desegregation of Little Rock schools. In 1957, Arkansas governor Orval E. Faubus blocked the enrollment of nine black students into previously all-white Central High School in Little Rock. Under federal district court order to desegregate its schools, the school had accepted the nine for admission under a long-term plan it had adopted for gradual desegregation. Faubus “interposed” his own authority between the federal government and the local school board by ordering the Arkansas National Guard to keep public order and bar the black students from school. After the federal court ordered Faubus to cease interfering with the promulgation of its order, he withdrew the Guard, and the students entered the school, but white mobs congregated around the school and threatened their safety.

President Dwight D. Eisenhower responded by federalizing the Arkansas National Guard and ordering it to disperse the mobs and enforce desegregation. Governor Faubus again intervened by ramrodding a school-closing law through the state legislature and closing Little Rock High Schools for the 1958–59 school year. In *Aaron v. McKinley*, the federal court reasserted the post–Civil War legal relationship between the states and the federal government by striking down the Faubus “doctrine of inter-

position.” It ruled the school closing law unconstitutional, and Little Rock schools reopened and remained integrated thereafter. Aaron was one of the nine students seeking admission to Central High School, and McKinley the Arkansas official who had closed it.

abacus An ancient device using large beads as units to calculate and to teach calculating. Believed to have originated in ancient Babylon, abaci have been used in virtually every civilization since. They are still used in commerce in the Middle and Far East. Because they require no literacy, abaci are useful for teaching young children to count, to recognize place numbers and to add and subtract. The beads are usually mounted on parallel wires set in a frame, although they can also lie free in parallel grooves. Regardless of the configuration, each bead represents a 1 on the far-right row, a 10 in the next row to the left, 100 in the next row, 1,000 in the next, etc.

Abbott, Jacob (1803–1879) Pioneering 19th-century educator-clergyman and author of children’s books. Born in Maine, Abbott studied physics at Bowdoin College, where he graduated in 1820. He taught at Portland Academy for a year (Henry Wadsworth Longfellow was one of his students) and then at an academy in Beverly, Massachusetts. After studying theology at the then-famed Andover

Seminary for five years, he became professor of mathematics and natural philosophy (physics) at AMHERST COLLEGE, where he led the faculty in an attempt to reform the classical curriculum by adding more practical courses to meet the needs of students bound for business, commerce and agriculture in an expanding nation.

Three years later he married and moved to Boston, where he founded the Mount Vernon School, a pioneer American school for young women. By then a legendary teacher, he discarded the usual, harsh methods for teaching and disciplining students and put students on their honor. In what may have been the first example of student self-government in the United States, Abbott trusted them to govern themselves.

After five successful years at Mount Vernon, he left to pursue his growing interests in preaching and writing. He gave up preaching after only two years and devoted the rest of his life to writing and traveling. Over the next four decades, he wrote 180 books, co-authored 31 others and wrote dozens of articles on education for various periodicals.

The Young Christian (1832) was his first important book. Designed as a children's guide to religion and moral behavior, it was one of the most popular books of its day and established Abbott as the foremost writer of children's books in the United States. In 1834, he followed up his success by launching a 28-volume series about a boy named Rollo—*Rollo at Work*, *Rollo at Play*, *Rollo's Travels*, etc. The series proved as popular with children in Britain, Europe and even the Far East as it did with American children. Teachers and parents were equally enthusiastic about the series. Filled with humor and adventure, the Rollo books were simply told tales about the worldwide travels of Rollo and his omniscient Uncle George. The books used anecdotes to teach children about good behavior, ethics, religion,

science, history, geography, travel and a wide variety of other topics.

Along with Abbott's Red Histories and Science for the Young series, the Rollo series entertained and informed a generation of young Americans. In the absence of universal free schooling and adequate textbooks, the Rollo series provided young people with a basic source of education both in school and out.

Abbott wrote manuals of advice such as *Gentle Measures in the Management and Training of the Young* (1871) and books for teachers such as *The Rollo Code of Morals*, with questions to ask students after reading each Rollo book. Abbott also wrote 22 volumes of biographical histories and the 10-volume *Franconia Stories*.

Abecedarian An obsolete term for a child learning the rudiments of the alphabet; derived from the Middle English *abecedary* and the Latin *abecedarium*, meaning "alphabet."

Abecedarian Project A 28-year longitudinal study of 111 African-American families in Chapel Hill, North Carolina, to determine the effects of quality day care on medically healthy infants and preschool children who, because of their sociocultural and economic circumstances, were deemed to be demographically "at risk" of eventual failure at school and beyond. The study found that, although all the children had tested below average for the nation, children who received high-quality day care not only scored higher on both cognitive and academic tests than children who did not get day care, they also were more likely to attend college or hold high-skill jobs as adults.

After pairing the children for cultural, intellectual and socioeconomic characteristics, the researchers placed half the children in high-quality, full-time day care from infancy to age five, while the others—their socioeconomic "twins"—received nutritional supplements to

ensure good health maintenance and the regular social work care provided for families in their economic circumstances. At five, the children enrolled in comparable public schools, attending the same kindergartens, and the entire group was studied for more than two decades, through elementary school, high school and early adulthood. By 15, only 30% of the day care children had been forced to repeat a grade, compared to 56% in the other group, and twice as many of the latter were in special education classes. Thirty-five percent of those who had been in day care enrolled in four-year colleges before their 21st birthdays, compared with 14% in the comparison group. At age 21, 65% of the day care children were either in college or had good jobs, while only 40% of the non-day care children were in similar circumstances. Fewer of the day care participants had children of their own by age 21, and those who were parents did not have children until they were 19, while parents in the other group began having children at 17. There were no significant differences in rate of criminal or immoral behavior.

The project was the first ever to study a large group of children from infancy, at four to six weeks old, to adulthood, and its results seemed to confirm the value of the U.S. government's huge, multibillion-dollar HEAD START program that provides day care and preschool education to about 750,000 economically deprived children across the nation every year.

ability grouping A controversial method of grouping children in classes, courses of study or schools according to any of a variety of abilities, as measured by tests, subjective observations or both. Students may be grouped by any of the following: I.Q., academic performance or academic potential; special talents or gifts in any of a wide variety of arts, crafts or vocational skills; athletic or physical ability; or degree of mental, emotional or physical disability or

handicap. Some groups of children may thus begin the school year at the appropriate grade level for their age, others one-half year ahead or behind in between-class groupings.

The broad argument in favor of ability grouping is that it allows student groups to progress at a pace appropriate to their level of skills. Faster students are not held back and slower students are not confused or humiliated by the pace of more advanced students. The broad argument against ability grouping is that it is a self-fulfilling prophecy. A wide range of studies have demonstrated that teachers of low-ability classes have lower expectations for their students and, therefore, demand less and teach them less. Similarly, teachers in high-ability classes have higher expectations, work their students harder and cover more material during the academic year.

Students, in turn, are almost always aware of the significance of ability grouping and respond according to teacher and school expectations for their group.

(See also ADVANCED PLACEMENT PROGRAM; HOMOGENEOUS AND HETEROGENEOUS GROUPINGS; TRACKING.)

absenteeism A term referring to the physical absence from class or school by students. The Department of Education estimates student absenteeism to be a serious problem in 12% of American public schools, with student tardiness a serious problem in 14% of schools and cutting classes a problem in 12% of schools. Absenteeism is especially troublesome in high schools, where nearly 35% of 10th graders and about 26% of 12th graders are absent 10 or more days during the school year and therefore are considered chronic truants. Absenteeism varies dramatically with socioeconomic status, ranging from rates as low as about 20% in high schools in the highest socioeconomic communities to higher than 40% in schools in low-income areas.

Although illness is one major cause of student absenteeism, truancy is another, as is parent-ordered absences for a variety of family-oriented reasons ranging from weddings or deaths to family outings and vacations. No statistics are available on the proportions of each cause, although some major cities such as New York estimate that chronic truants account for half the absentee rates in public school, with the number of chronic truants in high schools only slightly higher than the number in elementary schools. Most school principals cite parental indifference as a primary cause of absenteeism, and many school districts are stepping up efforts to combat truancy by prosecuting parents of chronically truant children and threatening them with fines and imprisonment. Absenteeism is not measured at colleges and universities, where class attendance is seldom a requirement for passing a course.

(See also ATTENDANCE; TRUANCY.)

abstract Usually a one-paragraph summary of an article, pamphlet or book. Abstracts permit researchers to scan a large body of literature to determine which particular items may be of specific help or relevance to their particular projects.

There are many journals devoted exclusively to publishing abstracts. For educational researchers, the most widely used are: *Children's Literature Abstracts*; *Child Development Abstracts and Bibliography*; *College Student Personnel Abstract*; *Completed Research in Health, Physical Education and Recreation*; *dsh* (deafness, speech, hearing) *Abstracts*; *Dissertation Abstracts*; *Education Administration Abstracts*; *ERIC—Resources in Education* (the most complete of the educational abstract journals, published by the Department of Education's Office of Educational Research and Improvement); *Exceptional Child Education Abstracts*; *Language and Language Behavior Abstracts*; *Rehabilitation Literature*; *Sociology of Education Abstracts*.

(See also EDUCATIONAL RESOURCES INFORMATION CENTER [ERIC].)

academic dress The caps, gowns and hoods worn by students, graduates and officials of schools, colleges and universities. Academic caps and gowns, or "academics," as academic dress is more properly called, date from the Middle Ages, and the first European and English colleges and universities. Most of these were schools for theologians, and students and teachers alike simply adopted the standard clerical dress—the "cappa," or plain, ankle-length cassock, and, when appropriate, a biretta, a stiff, square cap with a tuft on top, which eventually evolved into the modern tassel.

The cappa was the simplest of the toga-like clerical gowns and, therefore, the least costly and most appropriate for "clerks," or clerical students. Initially, gown colors indicated ecclesiastical rank or a particular order. As in today's Roman Catholic Church, scholars and lesser clergy wore black; bishops and monsignors, purple; cardinals, red; and the pope wore white. The colors themselves were symbolic of various elements of the passion of Christ—red being a symbol of Christ's blood, and so on. Only higher level clergymen wore birettas, whose colors also indicated a clergyman's rank. Under agreements between church and crown, the distinctive clerical dress rendered all wearers personally inviolable and immune from secular courts.

In the mid-14th century, some individual colleges and universities began to adopt cappas with distinctive shapes and colors. Doctors in the superior faculties also adopted distinctive colors. The materials from which cappas were made varied according to temperature and season. Because scholars were forbidden to wear birettas, they used fur "hoods" to cover their heads in winters and wore tippets, or long black scarves, over their robes to keep warm.

With the gradual secularization of universities in the 16th and 17th centuries, baccalaureate and then undergraduate scholars began wearing birettas, and hoods gradually disappeared. Today's academic hood is actually a variation of the tippet. Its color varies according to the wearer's degree and college or university. No longer restricted to college and university students, academics are worn by graduating students at all levels of education, including even elementary school students in some communities. The biretta's shape was changed to that of a "mortar board" in the 19th century to reduce the complexity and cost of manufacturing by standardizing the shape and size of the upper part of the headpiece.

academic freedom The freedom of college and university students, researchers and teachers to obtain and impart knowledge without interference by university administrators, government officials, nonacademics in or out of the institution or by other academics within or without the institution.

Although the concept of freedom of inquiry was first introduced in the American "academies" (see ACADEMY) of the early 18th century, academic freedom as used today is a relatively new concept. It was first defined in the United States by the AMERICAN ASSOCIATION OF UNIVERSITY PROFESSORS in a 1940 *Statement of Principles on Academic Freedom and Tenure*. This said that academic freedom included three basic rights: the right to teach students any matter related to their courses, regardless of how controversial; the right to conduct research and to publish the results of that research; and the right to exercise one's constitutional rights of free speech (oral and written) and freedom of association on and off campus.

In more normal times, the AAUP statement might have provoked more controversy than it did, for in 1940, American colleges and universities were hardly bastions of free speech or

protectors of constitutional rights. Indeed, few institutions of higher learning in the world, let alone the United States, had ever condoned free inquiry into or unrestricted teaching of ideas contrary to the interests of state or church, and almost all American college and university administrations kept strict controls over who could join their faculties or student bodies.

In 1940, the vast majority of American colleges barred entry to all but a handful of African Americans and maintained strict quotas on the numbers of Catholics and Jews they admitted. But American academe was also eager to disassociate itself from universities in Nazi Germany and other totalitarian countries, where once-great institutions were meekly acceding to government orders to crush political dissent and free thought. The flight of German professors and researchers from Nazi academic restrictions provoked JOHN DEWEY, then professor of philosophy at Columbia University, to help found the University-in-Exile in New York for them to continue their work. Support for the University-in-Exile and the statement on academic freedom by the AAUP, which Dewey also helped found, offered American higher education a way to feign support for academic freedom. It remained nothing more than a pretense for many years, however, and academic freedom remains a source of great controversy on virtually every American college and university campus.

During World War II, there was no question of academic freedom in the sense of freedom to present and publish ideas contrary to the interests of the American government. For security reasons, the federal government banned all disclosure of wartime research it sponsored on university campuses. By the end of the war, government control and sponsorship of on-campus research had grown so pervasive and so financially rewarding to university communities that few administrators were willing to test Washington's right to control what

campus researchers did, said or wrote. The cold war seemed to make continuation of such controls necessary for security reasons if nothing else.

Ironically, it was government, even as it insisted on secrecy, that was instrumental in opening university halls to a degree of academic freedom never before tolerated. As national security and the public interest demanded the most advanced level of scientific research, government and universities alike had to recruit many of the world's foremost intellects. Many were fiercely independent scientists who brooked no interference in their work by non-academic government or university bureaucrats. In agreeing to develop a new weapon in the interests of national security or a new vaccine in the interests of public health, they demanded and won the right of free inquiry and free exchange of ideas with colleagues.

As the cold war heated up in the late 1940s and early 1950s, however, fears began to take hold that communism might spread to the United States through "mind control." Government investigators stripped suspected "left-leaning" researchers and academicians of security clearance to work on government projects. Fearful of losing government grants, some college administrators summarily dismissed faculty members with links to communism or communist thought. The "wrong" books, the "wrong" statements in lectures or discussions and the "wrong" associations were enough to provoke the banning of books and the dismissal of researchers and teachers at some institutions. The AAUP statement was all but forgotten.

The 1954 Supreme Court decision banning racial SEGREGATION in public schools exposed university racial and religious intolerance to the entire world, however. Even the most exclusive private colleges were humiliated into opening their student bodies and faculties to members of racial and religious

minorities. The result was an immediate expansion of academic freedom, sometimes voluntarily, sometimes involuntarily. At some colleges, minority groups used the threat of legally sustainable discrimination complaints in court to force university administrations to revise and expand course offerings. At others, students and faculty rioted and seized administration buildings to win concessions in the name of academic freedom.

Whatever the means, they did win, and few colleges and universities did not expand studies of literature, history, sociology, economics, religion and other subjects to include a more accurate portrayal of the American past and present as they applied to other than the white Anglo-Saxon Protestant population that had founded and controlled the United States for nearly two centuries.

In effect, faculties and students seized control of American colleges and universities from their administrators, whose roles in many institutions were reduced to operational functions. Faculties took control of hiring and firing colleagues and determined who would teach, what they would teach and how they would divide their time between teaching and research. College students, meanwhile, had won legal independence from their parents when, in 1971, a constitutional amendment lowered the voting age and, in effect, the age of majority, from 21 to 18. Students now took full control over their choice of studies, and most schools acceded to student demands for abandonment of almost all course requirements. The Vietnam War expanded academic freedom even more, when protestors forced universities to reduce or eliminate their ties to the Defense Department. Their success, in many cases, opened an era of vast research into government policy and operations. The women's rights movement forced still further easing of university resistance to academic freedom by opening formerly all-male institutions to women students and faculty.

As academic freedom swept across many university campuses, however, many of those faculty members and students who had helped win that freedom seemed no more able to cope with it than the administrators who had fought it. In some institutions, faculty and students seemed unable or unwilling to draw a line between academic freedom and academic anarchy. Faculties in such relatively new areas as African-American studies or gay and lesbian studies, for example, distorted, exaggerated, rewrote, or even invented historical facts, justifying such distortions as necessary for student self-esteem. White supremacists, on the other hand, conducted specious research to prove a wide variety of racist theories—that blacks are genetically inferior, for example. At other institutions, faculty and students joined to ban or quash dissent, even shouting down the president of the United States when his views differed from theirs. Faculties at such private universities as Yale and Harvard banned the Army and Navy Reserve Officers Training Corps, thus depriving students of government scholarships, of the right to study military science and, indeed, of the right to serve their nation as undergraduates on campus. The State University of New York banned armed forces recruiters from its campuses. In the meantime, required study of traditional core curricula all but vanished from even the most prestigious, academically demanding colleges and universities, where few students graduate with even a rudimentary knowledge of history or the basic concepts (federalism, separation of powers, etc.) that shaped American institutions and government.

The courts have been of little help in resolving the conflict between academic freedom and academic license. Different courts, including the Supreme Court, have issued a wide range of confusing and often conflicting rulings on the frequent clashes between the right of free expression and the right to live free from fear of

humiliation and physical threat. In 1994, for example, a federal appeals court deemed it an unconstitutional abridgement of free speech for City University of New York to strip a black professor of his department chairmanship in African Studies for proclaiming in off-campus speeches that “rich Jews” had financed the slave trade. A year later, however, the same court reversed itself, saying that the professor’s statements were incendiary and threatened to disrupt college operations. On a different level, the courts upheld Brown University’s right to punish a student for shouting obscene anti-black remarks in a campus courtyard.

In general, the courts have supported certain limits to academic freedom as long as those limits do not impinge on a citizen’s constitutional rights. On the other hand, the Supreme Court ruled in *Waters v. Churchill* in 1994 that public employers have the right to dismiss employees whose speech, while constitutionally guaranteed, might disrupt normal operations in the workplace.

At the secondary school level, where almost all students are minors, the courts have consistently ruled that public school authorities, acting on behalf of parents, have the right to impose rules of conduct and academic requirements and to limit student access to a wide variety of materials, including Internet Web sites, which might include salacious or other materials deemed inappropriate for minors. Public school authorities may not, however, introduce any religious activity or otherwise violate the Establishment Clause of the First Amendment of the Constitution mandating complete separation of church and state.

academic proficiency See NATIONAL ASSESSMENT OF EDUCATIONAL PROGRESS.

academic quality A vague but widely used term usually referring to the breadth and depth of a school’s academic curriculum and

its success in teaching it to its students, as measured by objectively prepared and administered examinations. In short, academic quality refers to what is taught and how well.

Academic quality varies widely from school to school, town to town and state to state. The CARNEGIE FOUNDATION FOR THE ADVANCEMENT OF TEACHING estimates that 10% to 15% of American high school students are enrolled in schools providing the world's highest academic quality. About 20% to 30% of American high school students, on the other hand, attend schools that fail academically. The rest attend schools "where pockets of excellence can be found but where there is little intellectual challenge."

Socioeconomic and sociocultural conditions of the student population often determine academic quality. In general, the academic quality of schools with upper-income students is superior to that of schools with low-income students. The COLLEGE BOARD found that SAT scores of students from the poorest families, with annual incomes under \$10,000, scored more than 250 points lower than students from families with annual incomes above \$100,000.

At the low end of the academic spectrum are inner-city schools, whose students tend to be products of population dislocation, poverty, unemployed parents, broken homes, violence and crime- and drug-ridden neighborhoods. Many of these students are immigrant children who begin school semiliterate and unable to speak English. Most are two years or more below grade level and may be bored, restless and rebellious. Daily attendance at inner-city schools seldom reaches 60%. Students pay little attention in class and little learning takes place. Teachers have low expectations for their students and assign no homework. Half the students drop out before completing high school, and the majority of graduates are barely skilled enough to get part-time jobs. Few ever go to college. Also among schools of low academic quality are isolated rural schools in com-

munities where local religious and political beliefs intrude on or supersede the standard curriculum by banning books deemed too salacious, too liberal politically or at odds with local religious beliefs.

At the other extreme are a number of exclusive private schools and public schools in wealthy communities, where school facilities rival those of many colleges, and students go about their daily work purposefully and pay careful attention in class. At least 85% and often 100% of the students go on to four-year colleges. They take five or six subjects each semester and do two to three hours of homework each night. Academically high-quality high schools usually require students to study four years each of English, mathematics and history, three years each of science and foreign languages and two years each of music and art. Most students in such high schools have also studied each of those subjects intensively during two years of middle school.

The results of sociocultural differences are evident even before children enter high school. According to the U.S. Department of Education, only 43% of black eighth graders and 49% of Hispanic eighth graders achieved the two highest levels of reading proficiency in 1999, compared to 87% of white eighth graders. Only 4.4% of black eighth graders and 8.3% of Hispanic eighth graders achieved the two highest levels of mathematics proficiency, compared with 30.2% of white eighth graders. More than 37% of private school eighth graders achieved the two highest levels of mathematics proficiency, compared with 22.4% of public school children in the same grade.

The U.S. Department of Education and leading American educators tend to agree that a minimum acceptable curriculum for each year of school, from kindergarten through high school, should consist of a core of seven subject areas: English, mathematics, science, social stud-

ies, foreign languages, fine arts and physical education/health. How early and the extent to which each subject is taught serve as measures of academic quality. POOR-quality KINDERGARTENS, for example, operate only half-day sessions and concentrate on teaching children social skills rather than academic skills. Academically high-quality kindergartens, on the other hand, are full-day schools that expect children to have learned social skills in preschool and to concentrate instead on learning the basic CORE CURRICULUM: reading, writing, counting and computing, reasoning and problem solving, recognition of geometric shapes, an understanding of geographic and social concepts and an understanding of basic scientific concepts.

As important as the curriculum in determining academic quality are the educational results, as measured by objective testing. Unfortunately, many such tests produce misleadingly high results, either because of their simplicity or their predictability. Forty-nine states, for example, require students to pass competency tests to obtain high school diplomas, but some are so childishly simple that they produce misleadingly high scores. One asks high school seniors, for example, to put a check mark by the appropriate agency to call for a flu shot: the fire department, police department, doctor, ambulance, F.B.I. or Coast Guard.

Both President George H. W. Bush and President Bill Clinton called for the establishment of national academic standards, but Congress rejected the concept. With each state still setting its own standards, student achievement continues to vary widely, as seen in results of the U.S. DEPARTMENT OF EDUCATION'S NATIONAL ASSESSMENT OF EDUCATIONAL PROGRESS (NAEP). Although Idaho, for example, claims that 90% of its fourth graders (nine-year-olds) are proficient in mathematics, NAEP tests found only 41% proficient under its definition of proficiency. New York claims that 85% of its nine-year-olds met its standards of proficiency in

mathematics, and North Carolina reports 92% of its students proficient in mathematics. But only 36% of New York fourth graders and 40% of North Carolina fourth graders exhibited proficiency on the federal test.

The same variations emerged in reading proficiency. Fourth graders in Georgia, Alabama, Texas, Tennessee and North Carolina recorded astonishingly high levels of proficiency on state tests—87%, 83%, 83%, 88% and 88%, respectively. But only between 22% and 27% of those same students demonstrated acceptable reading proficiency on the federal NAEP test.

Even some of the more complex state achievement tests often fail as accurate measurements of academic quality because of the similarity of questions from year to year. Teachers can thus use questions from previous years to prepare students to get high scores without providing the underlying knowledge associated with academic quality. Such "TEACHING THE TEST" often produces high test scores, but neglects to teach the fundamentals of reading, writing, problem solving and an understanding of complex concepts. Teaching the test also makes students "test-wise" by teaching them to take "educated guesses," but leaves them with relatively little knowledge.

Among the most valid tests for measuring accumulated knowledge are those used for admission into academically demanding schools and college—for example, the Secondary School Admission Test and tests sponsored by the College Board and the American College Testing Program. The College Board's tests are the PRELIMINARY SCHOLASTIC ASSESSMENT TEST, the SCHOLASTIC ASSESSMENT TESTS and the ADVANCED PLACEMENT tests. The American College Testing Program tests accumulated academic knowledge in four broad areas: English, mathematics, social studies and science.

Academic quality is nevertheless a vague term over which there is legitimate disagreement between educators who favor a practical

education that will prove useful to students in the workplace and those who favor a purer aesthetic approach to learning—that is, knowledge for the sake of knowledge. Both arguments favor a basic core curriculum of English, mathematics, science, social studies, foreign languages, fine arts and physical education. The “practicalists,” however, favor reducing the number of years of study of these subjects in high school from four to three each and leaving the equivalent of at least one full year for such practical courses as applied mathematics, technology, workplace skills, and so on.

(See also NO CHILD LEFT BEHIND.)

academic rank The title given to college and university teachers and researchers. Most American colleges and universities have five academic ranks; instructor, lecturer, assistant professor, associate professor and professor, with annual salaries for all faculty averaging more than \$70,000 in 2006, for nine months of full-time teaching, with wide variations by gender:

Rank	Men	Women	Differential
Instructors	\$41,692	\$40,431	3.1%
Lecturers	48,776	44,573	9.4%
Assistant professors	58,296	54,052	7.85%
Associate professors	68,990	64,436	7.1%
Professors	97,642	85,747	13.9%

Source: American Association of University Professors

Salaries in higher education have increased steadily by about 3% to 5% a year over the last decade, but they have varied widely according to the type of institution. Faculties at two-year colleges earn 5% to 10% less than their counterparts at four-year institutions, and public two-year colleges offer faculty about 9% lower salaries on average than public four-year schools do, while salaries at private two-year colleges average about one-third less than those

at private four-year schools and 16% less than those at public two-year colleges. The average salary of full-time professors at doctoral institutions was \$108,404 in the 2005–06 academic year; private, independent doctoral institutions paid an average of more than \$131,000 a year and comparable public institutions offered about \$102,000. The average salary for full professors was more than \$80,000 at master’s institutions, more than \$77,000 at baccalaureate institutions, and \$66,000 at two-year colleges. At the lowest academic rank, instructor salaries ranged from about \$40,000 at private two-year colleges to about \$53,700 at church-related doctoral institutions.

Within each academic rank, salaries vary widely according to academic disciplines. At the undergraduate level, law professors earned the highest salaries at four-year institutions, averaging about \$137,000 in the 2005–06 academic year. In contrast, professors of liberal arts and sciences, general studies, and humanities earned an average of only about \$74,000, the lowest average in the academic mainstream and second only to the \$68,000 average of theology professors. After law, the best-paid professors in four-year colleges and universities were those who taught engineering (about \$108,000) and business management, marketing and related subjects (about \$103,000). The next-highest paying fields for professors were architecture (\$70,427), area/ethnic/cultural/gender studies (\$69,098) and computer and information sciences (\$69,024) in private institutions, and computer/information sciences (\$77,309), physical sciences (\$69,613) and any of three areas in public institutions: biological and biomedical sciences (\$68,815), natural resources and conservation (\$68,516) and agriculture and related sciences (\$68,432). The highest-paid faculty in graduate education were medical school professors, whose annual earnings range as high as \$3 million. In contrast, professors of education earned an average of \$57,000.

Until the development of universities in the 19th century, the title of professor applied to all college teachers whose positions were endowed. With the establishment of graduate schools and the proliferation of professors at such early universities as Columbia, Harvard, Cornell, Chicago, Michigan and Wisconsin, those with advanced degrees demanded titles that differentiated them from their less experienced or less learned teaching colleagues.

Depending on the institution, rank now depends on one or all of the following: academic and field experience and training, academic output (research and published articles and books), teaching ability, length of service in the profession and at the particular institution, and contributions to the institution. There are no universal rules governing academic rank. Some faculty members are promoted successively, while others are simply appointed to one or more of the upper ranks, sometimes immediately upon earning a doctorate. Some institutions leave academic rank to faculty committees in each department; others allow academic officers to share the responsibility and even award incoming teachers an academic rank independently. Some institutions automatically grant tenure to faculty when they obtain the rank of associate professor; others grant tenure on an individual basis, regardless of rank.

academic standard A broad-based criterion with which to compare scholastic performance, as measured by STANDARDIZED TESTS. An academic standard may be criterion- or performance-based and reflect knowledge of a specific academic discipline, or it may be norm-based and compare individual performance with average student performance. New York City's criterion- or performance-based standards, for example, require every third grader to "be able to write about, discuss and summarize the plot, setting, character and main ideas in a book"

and to "use periods, question marks, capital letters, exclamation marks and contractions correctly" to earn promotion in language arts. Promotion from third to fourth grade mathematics requires the ability to subtract two numbers, each less than 10,000; find the distance (perimeter) around polygons; and locate points on a grid and on a map.

Academic standards have been at the center of controversy in American elementary and secondary education for decades—a result of widely differing academic achievement of students of different races and gender and from different regions of the United States. The 1994 federal GOALS 2000: Educate America Act called for establishment of unified national academic standards to eliminate regional and local differences in academic standards and achievement. In 1997, the National Assessment Governing Board began a five-year program to develop new tests to be given nationwide to measure academic performance levels of American elementary and secondary school students. The United States was one of the only nations in the world without national education standards, and the plan to establish such standards ran into immediate opposition from state officials who saw national standards as an unconstitutional encroachment on the exclusive constitutional authority of individual states and local districts to control education. The Tenth Amendment of the U.S. Constitution specifically reserves to the states all powers not delegated to the federal government. There is no mention of the word *education* in the Constitution.

To stimulate establishment of higher academic standards by the states, the U.S. DEPARTMENT OF EDUCATION introduced a national testing program—NATIONAL ASSESSMENT OF EDUCATIONAL PROGRESS (NAEP)—in the early 1990s, and almost all the states, stung by mounting public criticism, began developing schemes to raise academic standards for each grade and to

Percentage of Fourth Graders Exhibiting Minimum Reading Proficiency

	State Tests	NAEP (Federal) Test
Arkansas	61%	28%
California	39%	21%
Colorado	63%	37%
Connecticut	69%	43%
Florida	60%	32%
Maine	49%	36%
Massachusetts	56%	40%
Michigan	75%	32%
Mississippi	87%	18%
North Carolina	81%	33%
South Carolina	31%	26%
Texas	85%	27%
Vermont	81%	37%
Wisconsin	80%	33%

monitor progress with standardized tests. Although students in 17 states produced startlingly high results, their counterparts in 24 other states scored so poorly that many schools were forced to ignore test results and to promote or graduate students despite dismal test scores—or see entire student bodies retained. Some educators called state testing a national educational disaster, and state after state immediately began lowering and resetting acceptable test grades to absurdly low levels. Two of three students in Chicago’s third and sixth grades were required to attend summer school after the first tests were administered, and half had to repeat their grades in the fall even after a full summer of instruction. Only one of 10 Arizona high school sophomores passed that state’s math test, while only 7% of Virginia students of all ages managed to pass that state’s tests. Wisconsin students did so poorly that the state abandoned testing requirements temporarily, while Massachusetts lowered the passing grade on its English and math tests rather than block graduation of 83% of Latino students, 80% of its black students,

43% of its white students and 41% of its Asian students. New York also reduced the minimum passing grade to permit student promotion to continue smoothly. Los Angeles and San Diego would have been forced to fail half their students if they had applied the academic standards imposed by the tests.

In lowering their academic standards to allow students to earn promotion to higher grades, however, many states unwittingly plunged their students into an abyss of near ILLITERACY and INNUMERACY. Although 90% of Idaho’s fourth graders (nine-year-old) exhibited proficiency in mathematics on the state tests, NAEP found only 41% of them proficient on its tests. New York claimed that 85% of its nine-year-olds met its standards of proficiency in mathematics, but only 36% exhibited proficiency on the federal test. The same variations emerged in reading proficiency in Georgia, Alabama, Tennessee, and other states recording astonishingly high scores on states tests, but fewer than 25% to 30% demonstrated reading proficiency on the federal NAEP test. Similar variations emerged in more than a dozen other states.

At the heart of the academic standards controversy is whether students should be penalized for the failure of teachers and schools to establish and maintain an acceptable level of ACADEMIC QUALITY. Those in favor of tough academic standards say it is unfair to allow students to graduate with academic skills too low to permit them to function in the job market. Those opposing academic standards say it is unfair to impose such standards on children until legislators raise academic quality of schools by investing more funds to relieve overcrowding in classrooms, improve teacher training, modernize and expand school plants and teaching materials.

academy A specialized school, whose specific purpose has changed radically from century to century and culture to culture. It has three modern connotations in the United States: an exclusive secondary school to prepare for college; a military school or college; and a specialized institution that provides instruction, funding and public recognition of individual artists, writers, crafts practitioners and scientists.

Akademia was originally the name of a park-like olive grove outside Athens, named for the Greek mythological hero Akademos. It was here that Plato began teaching philosophy in 387 B.C. The Academy, or Platonic school of philosophy and learning that he founded, lasted 900 years, until its suppression by Roman Christian emperors as a form of paganism. The term academy remained synonymous with scholarship, however, and in 1563 the first of the specialized academies—the *Accademia di Disegno*, for artists—was founded in Florence, Italy, for artists. The concept quickly spread to other cities. The Academy of St. Luke opened in Rome in 1593, the Royal Academy of Painting and Sculpture in Paris in 1648 and the Royal Academy of Arts opened in London in 1768. Today, specialized academies sponsor the work of a wide range of scientists as well as artists, writers and musicians.

At the same time as the Italians were opening specialized academies, the French and German courts founded academies to teach the noble arts to the sons of the nobility and the landed gentry. Unlike schools for commoners, the *courtly academies* taught Latin, modern languages, mathematics and exercises to keep young men fit, train them in the use of arms and prepare them for lives at the highest levels of society.

Limited to secondary education, the concept of the courtly academy quickly spread to the Low Countries, Scotland, England and, eventually, America, where unlike church-

sponsored schools, they became centers of dissent. They drew to their faculties many ministers who had either quit or been ejected from the established Church of England for questioning church authority. The break from the established church allowed these clerics to bring a spirit of intellectual and educational innovation to the academies they founded. They used English, rather than Latin, for instruction and, instead of limiting the curriculum to church doctrine, added sciences, politics and philosophy. Most important, they introduced freedom of inquiry as a fundamental concept of academic education.

The concept was a narrow one, however, and limited to scientific discovery and discussions of religious philosophy and relations between man and God. Almost all American academies were either church sponsored or owned and were operated by individual clerics or devout laymen. By the late 1800s, Presbyterian clergymen alone operated more than 50 academies. Although they were dissenters from the Church of England, none questioned God's existence or the fundamentals of church doctrines.

In contrast to the classical academies, a handful of practical laymen—almost all of them in major cities—also founded academies in the early 18th century. BENJAMIN FRANKLIN, for example, founded the Public Academy in the City of Philadelphia to prepare young men for life in the colonies by teaching them such practical subjects as mechanics, as well as classical subjects. Franklin also proposed equipping his school with “a Library . . . with Maps of all Countries, Globes, some mathematical instruments, and Apparatus for experiments in Natural Philosophy (physics), and for Mechanics.”

Most of the early academies were private schools for training the sons of landowners, merchants and noblemen to assume their fathers' places when they reached adulthood. Girls were forbidden entry until 1792, when

Sarah Pierce opened the nation's first school for young women—the Litchfield Female Academy, in Litchfield, Connecticut. Pierce trained such future pioneers of women's education as CATHERINE BEECHER. Early in the 19th century, Catherine Beecher, along with EMMA WILLARD and MARY LYON opened three more girls' academies, whose successes provoked a rapid expansion in women's education. From 1825 to 1850, about 6,000 women's academies opened their doors to more 240,000 students.

Despite the wealth and position of the families whose children attended such academies, the level of education varied widely, depending on location and the sophistication of students. Isolated schools in the wilderness were little more than elementary schools. Schools in such major cities as Boston, on the other hand, offered college-level courses. Most, however, were the equivalent of today's secondary school.

Depending on the level of schooling, some academies later evolved into colleges such as the United States Naval Academy at Annapolis, Md., and the United States Military Academy at West Point, N.Y. Benjamin Franklin's Public Academy in Philadelphia later became the College of Philadelphia and, in turn, the University of Pennsylvania. A few other academies remain today among America's most academically demanding (and still exclusive) secondary schools. They include the Phillips Academy at Andover, Mass. (founded in 1778), Phillips Exeter Academy, in Exeter, N.H. (founded in 1783) and Deerfield Academy, Deerfield, Mass. (founded in 1798).

The vast majority of early 18th-century academies, however, disappeared as public schooling emerged as the dominant provider of education in the last half of the 19th century and made them redundant.

Accelerated Schools Project A national program to reform and improve education of

socially and economically deprived, "at-risk" students in public schools. Developed at STANFORD UNIVERSITY in 1986, after a five-year study of AT-RISK STUDENTS, the Accelerated Schools program replaces conventional remedial programs for disadvantaged students with academic enrichment programs and accelerated teaching methods usually reserved for privileged, GIFTED students. One of three national programs designed to improve education of deprived children, the Accelerated Schools Project has spread to more than 1,500 public schools across the nation.

Created by Stanford education professor Henry M. Levin, the Accelerated Schools Project has scored dramatic improvements in academic achievement levels of elementary school students who had been six months to two years behind grade level in reading and mathematics before their schools adopted the Accelerated Schools approach to education. Two years after their schools became Accelerated Schools, most students either performed at or above grade level, while major discipline referrals and grade retention rates dropped by more than 75%. Moreover, the Accelerated Schools Project, according to Prof. Levin, transforms the typical inner-city school from a place where "gangs, vandalism, fighting, poor attendance, teacher turnover, low achievement were chronic conditions . . ." into "a place of joy for its students, staff, and parents. . . ."

Levin defines "at risk" students as children "from poverty backgrounds who are at-risk of educational failure. Such students are heavily concentrated among minority groups, immigrants, non-English-speaking families, single-parent families, and poverty populations." Levin estimates that about 30% of students in primary and secondary schools are educationally at risk, with the percentage rising to more than 50% in "many of the major cities of the U.S." and likely "to rise sharply" with increased immigration and poverty.

"At-risk students," Levin says, "enter school behind other children academically, and they fall farther and farther behind the longer they are in school. Over half fail to complete high school, and those that do are performing academically at the eighth grade level." His five-year study found that most conventional schools "embrace organizational, curricular, and instructional strategies that contribute to reduced expectations and stigmatization of at-risk students, uninspiring school experiences . . . [and] assure glacial progress and high failure rates. At-risk students," Levin concluded, "must learn at a *faster* rate than more privileged students—not at a slower rate that drags them farther and farther behind. An enrichment strategy is called for rather than a remedial one."

In designing the Accelerated Schools Project, Levin cited the philosophy of John Feldhusen, an authority on education of the gifted and talented:

Schools should abandon efforts to identify "gifted students" as though they were a biologically distinct category of human beings and concentrate instead on: (1) searching for talent or strengths in all children, (2) searching for those who might have very high levels of talent or precocity in a 'worthwhile area' of human endeavor, and (3) seeking to provide the best instruction to help youth develop their talents to the fullest.

The Accelerated Schools Project attempts to do just that by instituting three major reforms in public schools operations. First, it insists that each Accelerated School declare unequivocally its educational goals for its students and its "action plan" to achieve those goals. Second, Accelerated Schools must obtain school-site empowerment, with local administrators, teachers, other staff, parents and students participating in determining curriculum, instructional strategies and materials, personnel,

allocation of school resources and other school activities.

"Existing schools . . . are largely dominated by decisions made by entities that are far removed from the school site and classroom," Levin points out.

Federal and state governments and central offices of school districts have established a compendium of rules, regulations, directives, policies, laws, guidelines, reporting requirements, and "approved" instructional materials that serve to stifle educational decisions and initiative at local school sites. . . . [C]ompliance with these policies ensures failure, not success, as the historical record has shown.

The third element in the Accelerated Schools Project is to build on student strengths. Levin's research found at-risk children possessing many assets that can accelerate the learning process, if teachers identify them and use them as a basis for engaging students in the educational process. Among them are "interest and curiosity in oral and artistic expression, ability to learn through manipulation of appropriate learning materials . . . and a capacity for learning to write prior to mastering reading skills."

The Accelerated School program usually involves use of "rich language" (writing, speaking, listening, reading) across all subjects, even mathematics, with an early introduction to writing and reading for meaning. Teachers approach students with high expectations and "active learning experiences are provided through independent projects, problem solving and applying learning to concrete situations. By applying academic concepts and skills to real-life problems and events, students see the usefulness of what they are learning."

Transformation of a conventional school into an Accelerated School takes about six years, although academic improvement is evident after two years. Involved is the training of men-

tor teachers of "Accelerated Schools coaches" at eight-day training workshops held at the Project's university-based centers in cities across the United States. The coaches then return to their schools to help train coworkers.

Another key to developing an Accelerated School is to involve parents in day-to-day school operations and decision making. Levin calls parents "underutilized resources," who want their children to succeed and "can be powerful allies if they are placed in productive roles." Parent participation in Accelerated Schools often reaches between 90% and 100%.

(See also COALITION OF ESSENTIAL SCHOOLS; COLEMAN REPORT.)

acceleration A compressed rate of academic progression through high school and college to allow students to complete their work and graduate in less time than normal.

Acceleration has been a source of some controversy. One argument in favor of acceleration in elementary and secondary education is that it eliminates the boredom and restlessness that gifted children often suffer when forced to progress at too slow a pace. A second argument in favor of acceleration is that it cuts total costs of education. About 50% of American college students fail to complete the work for their undergraduate degrees—often because they cannot afford the costs. A three-year program at a college charging \$25,000 a year cuts the cost of an undergraduate degree by 25%, and some colleges have already compressed their traditional four-year programs into three years or less. Acceleration, these colleges point out, also expands the number of college seats available to prospective students.

Those in favor of acceleration contend that it is a standard process in every area of child development except academics. Students of instrumental music, for example, automatically accelerate as fast as their talents allow. More-

over, acceleration was the norm at the turn of the 20th century, when a combined college and medical school degree program, for example, ran six years instead of the current eight.

Opponents of acceleration contend that many intellectually mature children are not socially, emotionally or physically mature enough to attend classes with older students. Skilled educators, however, have established programs that combine the best aspects of acceleration without interfering with the normal social, emotional and physical development of participating students. Educators who work with gifted children strongly recommend psychological evaluation to help determine how well a child may adapt to acceleration. The Gifted Child Education Resource Institute at Purdue University claimed it "never had a child who accelerated after assessment who ran into difficulties."

The simplest and most widely available acceleration programs are ADVANCED PLACEMENT (AP) high school courses, which are equivalent to freshman-level college courses. AP courses are offered in a wide variety of subjects such as English, mathematics, history, science and foreign languages and may entitle students to college credits if they obtain high enough scores on the College Board Advanced Placement examinations.

Among the more complex acceleration programs is the university-in-the-school format, which allows gifted high school students to enroll in a limited number of college courses while still officially enrolled in high school. The college credits earned from such courses are transferrable to whatever college the student eventually attends.

Some high schools discourage their students from enrolling in such programs because school funding is based on average daily attendance, and public schools lose money when students leave the campus, regardless of the reason. Syracuse University circumvented

this problem with a program called PROJECT ADVANCE, which trains high school teachers to teach college-level courses in high school classrooms to eleventh graders. Project Advance, credits are usable when students enroll at Syracuse or any other accredited college or university. Kenyon College, in Ohio, and Hofstra University, in New York, have similar programs.

In addition to advanced programs during the school year, many colleges operate summer institutes that allow gifted children to speed through some of their high school courses more rapidly than their high schools would ordinarily permit. Such courses are of value only in high schools that allow students to "test out" of a required course at the beginning of the school year and jump ahead to the next level of study. Some summer institutes also offer college level courses for credit. For many years, a number of colleges and universities have also offered experimental programs for younger children whose intellectual maturity obscures their lack of social and physical maturity. Such programs allow students to progress intellectually as rapidly as they choose, while protecting them from the social and physical consequences of attending adult institutions.

In the 1920s, Pasadena City College set up a school for younger gifted children that combined eleventh and twelfth grades of high school with the first two years of college. In Great Barrington, Mass., Simon's Rock of Bard College has been doing much the same thing for gifted youngsters who have completed tenth or eleventh grades and are intellectually ready to handle college-level studies but too young to be comfortable with an older student population. The average age of freshmen at Simon's Rock, which offers both associate and full B.A. degrees, is 16, and the average age of the entire student body is 18.

The most famous effort by a college to identify and recruit young gifted children was

that of Johns Hopkins University, in Baltimore. Psychology professor Julian C. Stanley founded the program in 1971, when he tried to identify young mathematical geniuses whose minds functioned at levels incompatible with normal high school life. Called the Consortium of Talented Youth (CTY), the program allowed students as young as 15 to enroll and have access to any and all college courses. Many skipped four grades of high school to enroll, and some became doctoral candidates by the time they were 20.

accountability The obligation to provide proof of having fulfilled one's responsibility. In education, teachers and school administrators have traditionally made students accountable for their whereabouts, for completion of homework assignments and for their work and behavior in class and school. More recently, however, students, parents and state authorities have started holding teachers and school officials responsible for their effectiveness as teachers and administrators.

At the student level, accountability is usually taught through "cooperative learning," in which students are divided into several groups. Each group is then responsible for one element of a large project that can only be completed if each fulfills its responsibility. Thus, students are not only accountable to their teacher, they are accountable to their peers, who can often exert far more influence than teachers.

Teacher and school accountability is a relatively new concept that developed in the 1960s, as basic skills test scores of public school students began declining across the United States. The decline coincided with a deterioration of the American balance of international trade. As a torrent of lower priced, better quality products from Japan and West Germany displaced American products from the market, American industry blamed American public schools and their teachers for failing to teach future workers

adequate skills to compete with foreign workers. To try to make teachers and schools more accountable, some states introduced periodic retesting of teachers to measure their skills and knowledge.

Teachers unions have bitterly fought the accountability movement, saying public school teachers should not be held accountable for student competence until they, the teachers, have full control over the teaching curriculum and program. Teachers unions say that the failures of public schools reflect the failures of politicians, school boards and parents, who control what is taught and how it is taught in most public schools and have stripped teachers of much of their traditional authority.

accreditation The evaluation of a school or college by one or more of the eight regional ACCREDITATION ASSOCIATIONS and the more than 90 specialized groups that certify professional and occupation programs. Not to be confused with state certification, accreditation is purely voluntary and is an indication that a school is operating at standards well above those required by state law.

Every state requires every school to be certified, which is nothing more than legal approval to operate and may be based solely on conforming to state safety laws. The vast majority of public elementary schools are not accredited, although all are certified. Some 40% of public high schools are also unaccredited—some because of low academic standards, others because they cannot afford the costs involved in the accreditation process.

Accreditation involves a complex examination of a school's or college's educational goals and standards by teams of respected educators, who volunteer to conduct what amounts to a peer review of a sister school or college. Standards differ from region to region, but all eight accrediting associations demand that member schools clearly state their educational

goals and their methods for achieving those goals. The goals may vary depending on the student community and whether the school is public, private or church-related, but whatever the goals are, accreditation depends on a school's success in achieving them or a plan for doing so within a specified period. A private college-preparatory school whose goal is to send 90% of its students to college, for example, might have difficulty obtaining accreditation if, say, only 60% of its graduates gained admission to college.

Some other accreditation association standards include requiring all elementary and secondary school teachers to have at least a bachelor's degree from an accredited college and at least eight college courses in each subject they teach. Principals must have at least a master's degree in some regions. Some associations specify the minimum acceptable number of books and periodicals a school must have in its library—no less than 4,000 books, no matter how small the school, and at least 10 books (not including textbooks) for each student. Some associations also list acceptable teacher-pupil ratios, minimum acceptable student achievement levels, the minimum number of subjects and courses the school must teach in each grade and the acceptable materials it must provide.

Accreditation associations have come under attack for their failure to strip inferior schools and colleges of accreditation. Many university officials have also criticized the associations for broadening accreditation standards to include a "cultural diversity" standard that evaluates a college's minority hiring record (see AFFIRMATIVE ACTION) and the multicultural content of its curriculum. Complicating the accreditation process was the explosion of FOR-PROFIT COLLEGES into a \$20 billion-a-year industry that largely operates online without accreditation from traditional ACCREDITATION ASSOCIATIONS. Lack of accreditation, however, has left thou-

sands of students unable to transfer the costly credits from for-profit courses to accredited, degree-granting institutions.

accreditation associations The more than 90 voluntary and involuntary associations responsible for ACCREDITATION of American schools, colleges, graduate schools and professional and occupational programs. Almost all are independent and unaffiliated with any government agency.

Their origins go back to the 19th century, when a group of representatives from private academies in the Northeast met with representatives of several prestigious colleges to work out preparatory school curricula and standards that would mesh with college offerings and thus assure students a smooth transition into college.

They formed eight regional associations, each of which was responsible for accrediting public and private elementary and secondary schools and undergraduate colleges: the New England Association of Schools and Colleges (Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut); Connecticut Association of Independent Schools; Middle States Association of Colleges and Schools (New York, New Jersey, Pennsylvania, Delaware, Maryland, District of Columbia Puerto Rico, U.S. Virgin Islands); New York State Association of Independent Schools; Southern Association of Colleges and Schools (Kentucky, Virginia, Tennessee, North Carolina, South Carolina, Georgia, Florida, Alabama, Mississippi, Louisiana, Texas); North Central Association of Colleges and Schools (North Dakota, South Dakota, Minnesota, Wisconsin, Michigan, Ohio, West Virginia, Indiana, Illinois, Iowa, Nebraska, Wyoming, Colorado, Kansas, Missouri, Arkansas, Oklahoma, New Mexico, Arizona); Northwest Association of Schools and Colleges (Alaska, Washington, Oregon, Idaho, Montana, Nevada, Utah); Western Association

of Schools and Colleges (California, Hawaii, Guam, American Samoa, Republic of Palau, Republic of the Marshall Islands, Federated States of Micronesia, Commonwealth of the Northern Mariana Islands). In 1995 the U.S. Department of Education added a new national accrediting agency for colleges and universities, namely the AMERICAN ACADEMY FOR LIBERAL EDUCATION. Made up of conservative, "back-to-basics" scholars such as Columbia University professor JACQUES BARZUN, the academy was given authority to certify whether a college was qualified to receive federal financing.

The NATIONAL COUNCIL FOR THE ACCREDITATION OF TEACHER EDUCATION is the national accreditation organization for undergraduate and graduate professional education programs for elementary and secondary school teachers, school service personnel (counselors) and school administrators. To ensure the legitimacy of accrediting agencies, a private agency, the Council for Higher Education Accreditation and the U.S. DEPARTMENT OF EDUCATION keep lists of institutional and specialized accrediting agencies recognized by the federal government.

achievement tests Devices for measuring a student's accumulated knowledge and skills. Depending on the age of the student and the test objective, test administrators may use oral, written or performance tests in which students demonstrate their talents, physical skills or manual dexterity.

Tests may be objective or subjective, with the former designed to eliminate scorer unreliability by limiting student responses to one or more specific choices. Free-response, or subjective, tests allow the test-taker to determine the form or content of the answer, although essay questions obviously limit the answer to points relevant to the core topic. Scorers also have free rein in judging the answer and can deduct points for incorrect statements, omission of

relevant points, excessive length, grammatical errors, poor syntax or writing style and a wide variety of other reasons.

Verbal, oral or performance tests may be designed as either speed or power tests. Speed tests limit the time given to answer all the questions, and scores are based on the total number of correct answers. Few respondents are expected to finish the entire test. Power tests provide more time, but vary the difficulty of the questions to an extent that no test-taker can possibly know the answers to all questions. Speed tests tend to be used for measuring mathematical abilities and vocational skills. Power tests are generally used to measure academic achievement, although some elements of both power and speed tests are found in almost every type of test.

Teacher-designed tests to measure specific knowledge taught in that teacher's class are generally more accurate measures of a student's knowledge than standardized tests that may require knowledge that not every student has acquired. No test, however, can measure all knowledge a student possesses about any subject, and for that reason, testing has become a center of controversy among educators. In simplest terms, knowing when the Constitution was signed or the ability to repeat its contents verbatim says nothing about a student's understanding of that document. Critics of testing say subjective evaluation is a far better way of measuring a student's real knowledge than testing.

Although 49 states administer standardized achievement tests to elementary, middle and high school students, the tests vary widely in quality, depending on whether they are products of state departments of education or commercial test publishers. With only a handful of exceptions, state-developed tests tend to be simplistic, often unreliable measures of academic achievement. Commercially prepared tests, on the other hand, have evolved over many years in all parts of the nation and tend

to be accurate, reliable measures. The most widely used commercially prepared tests are published by three test publishers, CTB/McGraw-Hill, Harcourt Educational Measurement and Riverside Publishing Company. These tests include:

- California Achievement Tests, published by CTB/McGraw-Hill, are divided into 10 overlapping levels for testing reading, spelling, mathematics, language and reference skills of students from kindergarten through twelfth grade.
- Iowa Tests of Basic Skills, developed and published by Riverside Publishing Co. to measure performance of students from kindergarten through twelfth grade in reading, language arts, mathematics, social studies, science and information sourcing.
- Iowa Tests of Educational Development, developed and published by Riverside Publishing Co. to measure intellectual and evaluative skills of high school students in everyday life. The nine tests measure vocabulary; reading comprehension; language skills; spelling; mathematics concepts and problem solving; computation skills; and analytical skills in science, social studies and general information.
- Metropolitan Achievement Tests, published by Harcourt Educational Measurement to assess "critical thinking" of age groups in kindergarten through twelfth grade in reading, mathematics, science, language and social studies.
- Stanford Achievement Tests, published by Harcourt Educational Measurement to measure achievement in all academic areas from kindergarten through thirteenth grade.
- TerraNova Comprehensive Tests of Basic Skills (CTBS), published by CTB/McGraw Hill to test achievement of K-12 students in science, social studies and reading/language arts, including word analysis, vocabulary, language mechanics and spelling.

Among the best-known and most commonly used achievement tests for high school juniors and seniors are the SCHOLASTIC ASSESS-

MENT TESTS prepared by the COLLEGE ENTRANCE EXAMINATION BOARD and the college entrance examinations of the ACT ASSESSMENT PROGRAM.

In addition to group achievement tests, counselors and special-education professionals often rely on individual achievement tests in various subject areas for students who, for a variety of reasons (anxiety, disabilities, and so forth), are unable to function normally in group testing situations. Although individual achievement tests do not rely on exact timing, they usually last 30 to 60 minutes and can be administered orally. The most widely used are the Basic Achievement Skills Individual Screener (grades 1 to adult), the Peabody Individual Achievement Test (K to adult), the Key-Math Diagnostic Arithmetic Test (K–6) and the Woodcock Reading Mastery Tests (K to adult).

ACT Assessment Program A battery of four college entrance examinations lasting about three hours and consisting of four parts: English (45 minutes; 75 questions), Mathematics (60 minutes; 60 questions), Reading (35 minutes; 40 questions) and Science Reasoning (35 minutes; 40 questions). The English section measures knowledge of usage and mechanics and rhetorical skills. The mathematics test covers pre-algebra, elementary algebra, coordinate geometry, plane geometry and trigonometry. The reading test is a broad measure of knowledge in social studies, the sciences, the arts and literature, and the science reasoning test measures specific knowledge in the sciences and the ability to apply formulae. Sponsored by the American College Testing Program, the tests consist entirely of objective questions and are scored from 1 to 36. Although the average student score is 21, ACT has established so-called benchmark scores for each subject, based on studies correlating each score with the likelihood of a student's achieving a college grade of C in the particular subject. The benchmark ACT scores were 18 in English, 22 in mathe-

matics and 24 in science. Average student scores in each subject in 2006 were 20.6 in English, but only 20.8 in mathematics and 20.9 in science, with less than half the test-takers meeting the college-readiness benchmark in math and only one in four scoring as high as the benchmark in science. Only about 10% of students score 28 or better. Although most Eastern colleges accept ACT Tests, the ACTs are used primarily by colleges outside the Northeast. One-third of all four-year colleges require no standardized tests for admission, however. Special nonstandard accommodations for taking ACTs are available to students with documented visual, hearing, physical or learning disabilities.

(See also APTITUDE TESTING.)

acting out A term with dual meanings in education. It can refer to translation of fantasies or unconscious feelings into overtly destructive or antisocial action such as aggressive or sexual behavior. Acting out also refers to a valuable teaching and learning tool using dramatic performances by students who act out a story they have read or created. Aside from providing an easy-to-remember visualization of a story, acting out makes learning more fun, helps improve children's speech and teaches them to work together. It also encourages creativity and self-expression, channels children's natural restlessness into a creative learning activity, helps teach the relationship between words and various body parts and body movements, and helps shy children learn to feel comfortable expressing themselves publicly.

active learning A relatively new term for an updated form of indirect instruction, which JOHN DEWEY developed in his experimental LABORATORY SCHOOL at the University of Chicago in 1896. Pedagogical standards for active learning were developed in 1989 by the

70,000-member National Council of Teachers of Mathematics (NCTM), which called *DIRECT INSTRUCTION* of mathematics from teacher to student a “bankrupt” pedagogy.

Dewey was the first, however, to express the belief that children learned best when they acquire knowledge doing things that interest them and are helped only indirectly by teacher suggestions. By letting four- and five-year-olds “play house,” Dewey’s teachers taught children to cook, sew, cut and nail wood to build “furniture,” and “indirectly” taught them the necessary reading, writing, mathematical and scientific skills to make their “play” successful, educational and, in the end, more satisfying because of the visibly “professional” quality of the project.

Older children learned to “build” a farm, using blocks for each of the buildings and planting imaginary crops on a large sand table, which they divided into fields for different crops and thus had to learn to measure and work with fractions. They learned volume by counting bushels and how to calculate and use money by pretending to take their crops to market. They needed signs to label crops and set up the marketplace. Building the farmhouse and out-buildings meant drawing plans, carefully labeling and measuring, and adding and subtracting to use the correct number of blocks. Older children studied colonial life, prehistoric life, ancient history and other subjects in much the same way.

Today’s active learning is much the same, although the new NCTM standards offer a wider variety of pedagogical approaches. For example, teachers in one program foster independent thinking by refusing to tell students whether their answers are right or wrong. Instead, students work in pairs, solving problems and explaining their answers to their partners. When convinced they are correct, they explain their answers to the rest of the class, which eventually must decide on the accuracy

of the solutions. In another class, students are given the dimensions of a fictional giant in a literary work and asked to build a scale model pencil appropriate for him.

Although advocates of active learning contend students gain a better understanding of mathematics, test scores have showed no difference in achievement test scores from those taught by traditional direct learning techniques. In contrast, students who emerged from Dewey’s experimental schools scored significantly higher than students from conventional schools.

adapted (adaptive) physical education A physical education program modified to accommodate physically or mentally handicapped children. An outgrowth of armed services rehabilitation programs for injured servicemen and -women, adaptive physical education tries to provide as many elements as possible of conventional physical education. Almost all accredited schools and colleges have added adaptive physical education programs since the “mainstream” movement (see *MAINSTREAMING*) began encouraging handicapped students to attend conventional instead of special schools. Federal legislation requires all public schools to provide the handicapped with as many physical educational facilities as feasible. In recent years, most schools have expanded the scope of adaptive physical education to include obese children. By 2000, obesity was spreading at epidemic rates in America and was first among the nation’s top 10 health problems. At the beginning of 2006, 49.3% of American children were deemed obese, and about 40% of all children were prediabetic. A significant number were also suffering hypertension, high cholesterol and early-stage heart conditions.

adaptive programming The sequential ordering of self-teaching instructional materi-

als to maximize learning and retention of learned materials. An outgrowth of B. F. SKINNER's research in learning reinforcement, adaptive programming breaks materials down to the smallest possible units, or "frames," and does not permit continuation to a new unit until the student has mastered the previous unit and proved so by answering a series of questions. Students progress from question to question regardless of whether their answer is correct or not, because every right or wrong answer provides the student with a learning experience and reinforces learning of the knowledge unit in that frame. Although usually associated with teaching machines and computers, adaptive programming may be used to arrange materials in textbooks and classroom presentations.

Addams, Jane (1860–1935) Founder of Chicago's Hull-House, which was one of America's first settlement houses and a major educational center for social workers, social reformers and working women. Cowinner of the 1931 Nobel Peace Prize—with Columbia University president NICHOLAS MURRAY BUTLER—Addams was one of America's premier social reformers.

Opened in 1889, Hull-House grew into a settlement of 13 buildings, where prominent social reformers and social workers came to live, exchange ideas and offer educational and cultural opportunities to the poor immigrant population of the surrounding neighborhood. Based on Toynbee House, a similar institution in London, Hull-House gave rise to the settlement house movement in the United States and served as a model for hundreds of similar institutions that sprang up in cities across the nation.

Hull-House facilities included a day-care center for children of working women, a gymnasium, a community kitchen, a boarding house for working girls, living facilities for members, lecture halls, a reading room, an

Social reformer and Nobel laureate Jane Addams with some of the children for whom she founded Chicago's Hull-House, the first settlement house in the United States. (*Library of Congress*)

exhibition hall and a theater and concert hall. Its classes included college-level "extension" courses in a wide variety of subjects, as well as training in art and music and in many crafts. In addition to its regular classes, Hull-House operated a summer school and sponsored art exhibitions, regular Sunday concerts and plays by its own Hull-House Players.

With the help of her college classmate ELLEN GATES STARR, Addams designed the Hull-House curriculum not as an adjunct to existing college and university offerings but as a new and unique type of independent educational institution, where well-educated, cultured residents could share their education, skills and knowledge with the impoverished

residents of the surrounding slums. Besides herself, Starr and the other reformer-teachers who lived at Hull-House, her settlement house drew such notable educators as John Dewey to conduct classes there. About 60% of Hull-House residents were women and almost 90% were college graduates intent on bringing the benefits of a college education to working people.

In addition to their duties as teachers, Hull-House residents also were political activists who demanded that the city provide public libraries, parks, playgrounds and schools for their neighbors in the surrounding slums. Addams herself was also a leader of the pacifist and women's suffrage movements, and she helped win passage of laws to regulate tenement house safety, to limit women's workdays to eight hours, to establish factory safety inspections, to provide workmen's compensation insurance and to establish special courts for juvenile offenders. All the Hull-House facilities except the residence building were demolished in 1963, by which time public agencies had taken over most public service functions of settlement houses and made the latter almost superfluous.

adjunct A term referring to a temporary or part-time instructor at a college or university. Adjuncts may hold the same range of academic rank as full-time, permanent faculty—that is, adjunct professor, adjunct associate professor and so on. Like all part-time employees, adjuncts provide enormous savings for colleges and universities over the costs of full-time faculty. Although they make up nearly 33% of the faculty at four-year colleges and universities and 66% of the faculty at two-year colleges, adjunct faculty are paid only by the credit hour in courses they teach and are usually ineligible for union membership and such fringe benefits as health insurance and pensions. They are not eligible for tenure and engaged on a term-to-

term basis only. Colleges may end their employ at the end of each term by simply not renewing their contracts.

Despite their less favorable working conditions, adjuncts nevertheless provide students with educational benefits often unavailable from full-time faculty. Most adjuncts teach pre-professional courses such as accounting, advertising, journalism, and so on, and they are usually full-time practitioners of the trades they teach. They are, therefore, often more skilled and up-to-date on the latest developments in their field than full-time faculty who spend all their time on campus.

Adler, Felix (1851–1933) Founder of the New York Society for Ethical Culture, which was a major force for educational reform and center of the worldwide Ethical Movement. The son of a rabbi, Adler graduated from Columbia University in 1870, and after getting his doctorate in Germany, became professor of Hebrew and Oriental literature at Cornell University, Ithaca, New York. Sensing a growing dissatisfaction with traditional sectarian religious belief, he moved to New York in 1876 and established the New York Society for Ethical Culture—not as a new religion, but as a movement that stressed morality and ethics as a central theme. It made no reference to a supreme being, whose existence or nonexistence and relation to man were left to the individual to decide.

Adler and his society spearheaded many educational reforms in New York City, including the creation of the city's first free kindergarten, an advanced high school for gifted children, a teacher training school and a vocational school for working men that not only helped them become literate but also helped upgrade their skills by teaching them manual trades.

In 1888, he organized a society for the scientific study of children that later became the Child Study Association (see CHILD STUDY MOVE-

MENT). As chairman of the National Child Labor Committee from 1904 to 1921, he fought for enactment of federal child labor laws. In 1902, Columbia University created a chair for him in social and political ethics, a position he held for the rest of his life.

Adler's movement spread beyond New York to other American cities and Europe. In 1896, The International Union of Ethical Culture Societies was established in Zurich, Switzerland, and three years later, the American chapters federated into the American Ethical Union.

Adler, Mortimer J. (1902–2001) Educator, philosopher, author, editor, whose *Paideia Proposal* in 1982 called for massive reforms of American elementary and secondary school curricula and teaching methods. Adler earned his Ph.D. in 1928 at Columbia University, where he taught for 10 years, before becoming a professor of philosophy at the University of Chicago. There, he joined ROBERT M. HUTCHINS in espousing "PERENNIALISM," an educational theory that all knowledge of any value is contained in existing classical texts of literature, the arts, history, mathematics, philosophy, and science.

Adler and Hutchins converted their theory into a scheme for reforming the college curriculum through a "GREAT BOOKS PROGRAM." The program was based on the 54-volume Great Books of the Western World series, which they compiled and edited, and a two-volume index of great ideas that they created, *The Syntopicon*. After the Great Books project was completed in 1952, Adler became director of the Institute for Philosophical Research and, 10 years later, an editor for Encyclopaedia Britannica, Inc. Adler's three-volume *Paideia Proposal* called for public schools to adopt three teaching methods to achieve three educational goals: lecturing to transmit information; coaching to teach skills; and questioning by the SOCRATIC METHOD to

promote understanding. Adler said all public school children should follow a single, 12-year educational track, regardless of whether they are destined for manual trades or university. It would do away with the GENERAL EDUCATION and vocational education tracks and teach all students, from first through twelfth grades, an academic core curriculum of their own language, a modern foreign language, literature, fine arts, mathematics, natural science, history, geography and social studies. All would also have 12 years of physical education and training in industrial arts.

In the course of his career, Adler wrote or edited several hundred books on education, philosophy and history, along with several multivolume encyclopedias.

administration and organization The management and direction of schools, colleges, universities and other educational institutions and, collectively, those in command of such management and direction. In general, administration at any school consists of these broad functions: community relations; curriculum development and instruction; student supervision; teacher relations; control and direction of the administrative staff; plant management; budgetary and financial management.

In public schools, the chief administrator is usually the superintendent of schools for a district that typically includes one central high school for the entire district, to which students travel by bus, and several, relatively small, neighborhood elementary and middle neighborhood schools, usually within walking distance of student homes. Major cities and some outlying areas with student populations too large to house in a single building may have more than one high school under the direction of a single superintendent and several assistant superintendents. In theory, the superintendent has no policy-making powers and is subject to policies set by a school board, the

composition and size of which is determined by registered voters in the district. The school principal, or chief administrator, of each school in the district, is also subject to school board policies. Directly responsible to the superintendent of schools, each principal may, according to the size of the student population, delegate certain authority, such as discipline, academic affairs or administrative affairs, to assistant principals.

In private schools, boards of trustees replace school boards as the ultimate policy-setting group. Trustees may be elected by parents, alumni, or other trustees or any combination thereof, although clerics appointed by the church often serve in that capacity in church-related schools. The principal or headmaster/headmistress serves as chief administrator in private schools. As in public schools, principals may delegate authority to assistant principals or, in many cases, to deans. Unlike assistant principals, whose authority is limited to an area of activity for all students at school, a dean usually serves as the administrative head of an entire school subdivision, with almost all the authority of a principal. A dean of lower school, for example, is in effect the principal of the elementary school. Similarly, deans of middle schools or upper (high) schools have full authority over each of those school subdivisions.

Administrative leaders at public colleges and universities are appointed by and serve a board of trustees or REGENTS appointed by state education officials. The senior administrators at private institutions are appointed by boards of trustees who, in turn, may be self-perpetuating or elected from and by the alumni/alumnae of the college or university.

Titles (more colorful than those in secondary and primary education) and the range of duties vary from institution to institution. The most common titles are president or chancellor (the latter more commonly used in English universities), vice president or vice chancellor,

provost and dean. Together, they administer business, maintenance, personnel and record-keeping, along with fund raising and alumni affairs. The vast majority of academic officers emerged from the academic ranks during the 19th century and most of the 20th. As academic administration has become more complex, however, many institutions have turned to the world of business and industry and even politics for some of their chief administrators. Unlike college teachers, academic officers usually serve at the pleasure of the college president or board of trustees and are seldom granted tenure.

The president's, or chancellor's, duties are twofold. He or she is the chief administrator of the college or university and the most public visible spokesperson. At small colleges, the president's time will be equally divided between the two functions; at major universities the president's primary task will be to make public appearances to enhance the institution's reputation, to lobby for government funds and grants (in the case of public institutions) and to raise large sums of money from private individuals and foundations. His or her on-campus role is largely limited to important policy decision-making and ceremonial roles, with day-to-day administrative decisions delegated to any of a variety of vice presidents, usually under a single provost or chief administrator. Like all titles of academic rank, *chancellor* is derived from Latin; the *cancellarius*, or "gatekeeper," guarded the bars or grating that separated the public from the clergy in the chancel, in the case of Roman Catholic cathedrals, or from the judges in the chancery in English courts.

The vice president, vice chancellor or provost is usually the president or chancellor's chief administrator. (The term *provost* is derived from the Latin *praepositus*, meaning "to be placed or set before or over," as the head or chief.) Large universities, like large corporations, may have any number of vice presidents,

each with his or her own special area to administer—administrative affairs, academic affairs, finance, development (fund-raising), alumni affairs, public affairs, admissions and financial aid, personnel, and so on. Depending on the university, any or all of these areas may carry lesser titles such as dean or director. Usually nonacademic departments such as athletics are headed by a director rather than a dean.

In addition to administrative officers, colleges and universities also have academic officers or deans, each in charge of one or more specific areas of academic life, depending on the size of the college. A small college may have a single dean of students or, if larger, a dean of academic affairs, dean of “student life,” and so on. At large universities, deans are appointed as administrative and academic heads of each undergraduate and graduate school—for example, Dean of the College (undergraduates), Dean of the Law School or Dean of the Medical School, and each may, in turn, have assistant heads to whom the dean delegates various administrative duties. The term dean comes from the Latin *decurion*, a Roman cavalry officer in charge of a *decuria*, or division of 10 men. Later, the Benedictine monks divided their monasteries into *decuries*, or divisions of tens, with the tenth person, or dean, in charge of each.

administrative theory Any of a wide variety of assumptions designed to predict individual behavior within an organization such as a school. In any school, it is important to be able to predict as accurately as possible how students, teachers and staff members will respond to changes in curriculum, for example, or overall educational goals. Although individuals seldom respond exactly alike, administrative theory can help predict the general response of a school community to a wide variety of administrative and policy changes and the possible effects on student, teacher and staff pro-

ductivity, efficiency and morale. Administrative theory is designed to avoid the damaging confrontations that often follow such seemingly innocuous changes as shorter or longer class periods, curriculum expansion, salary increases, expanded or contracted duties, introduction of hierarchal titles such as “master teacher” and budget cutbacks.

admissions testing programs A battery of manually or computer-administered tests measuring scholastic aptitude and academic achievements of applicants for schools, colleges and university graduate schools, almost all of which use admissions tests to determine the academic level appropriate to each applicant. Admissions testing is also used by academically selective public and private schools, colleges and universities to screen out applicants deemed academically less suited than others to attend such institutions.

At the preschool level, tests may consist of nothing more than manipulating block puzzles—putting differently shaped blocks in the appropriately shaped openings, for example. In later elementary school and high school years, such tests almost always consist of written examinations, either one designed by the individual school or one of the standard ACHIEVEMENT TESTS such as the CALIFORNIA ACHIEVEMENT TEST, the IOWA TESTS OF BASIC SKILLS or the COMPREHENSIVE TESTS OF BASIC SKILLS. Some 500 academically selective private high schools require applicants to take the Secondary School Admission Test (SSAT), sponsored by the Secondary School Admission Test Board and offered at more than 250 test sites across the country.

There are two standardized admissions testing programs for admission to four-year colleges for study leading to bachelor’s degrees: the Scholastic Assessment Tests of the COLLEGE ENTRANCE EXAMINATION BOARD, used by many northeastern colleges; and the ACTs of the

American College Testing Program, used by many western, midwestern and southern colleges. About 1 million students a year take the ACTs, and 1.25 million take the Scholastic Assessment Tests (SAT). Both the SATs and ACTs measure student reasoning and problem-solving abilities, as well as specific knowledge in such basic high school subjects as English, mathematics and science.

University graduate schools require their own specialized admissions tests, such as the Allied Health Professions Admissions Test (AHPAT); Dental Aptitude Test (DAT); GRADUATE MANAGEMENT ADMISSION TEST (GMAT) for entrance to graduate business schools; Graduate Record Examination (GRE) for graduate study in the humanities and education; the LAW SCHOOL ADMISSION TEST (LSAT); the MEDICAL COLLEGE ADMISSION TEST (MCAT); and the Pharmacy College Admissions Test (PCAT).

adolescence A vaguely defined and extremely variable period of human development sometimes called the growing-up years or the transition between childhood and adulthood. Depending on the individual child, adolescence may stretch from the onset of puberty, at 10 to 14 years of age, to maturity at about age 20. The age of pubescent onset has declined steadily. By 2000, some breast development was evident among white girls before age 10 and before age nine in black girls, with the growth of pubic hairs beginning about a year later. But even at age seven, 27% of black girls and nearly 7% of white girls had started growing breasts, pubic hair or both, according to a study of more than 17,000 American girls published in 1999 in the professional journal *Pediatrics*. Characteristics of adolescence vary widely from culture to culture. Of greatest consequence to teachers in American schools, however, is the widespread tendency of American adolescents to test the limits of independence—sometimes with high-risk,

self-destructive or antisocial behavior in and out of school.

Adolescence typically begins with puberty and the development of secondary sexual characteristics. Boys develop facial and pubic hair, experience a deepening of the voice and broadening of the musculature. Girls experience the first menstruation and develop breasts and pubic hair. Both boys and girls develop sexual appetites and become more active sexually, although sexual potency varies widely from individual to individual. Their new appetites and physical capabilities, however, necessarily mean a new and sometimes overpowering distraction that can interfere with schoolwork. Capturing their attention requires exceptional skills, and most successful teachers of adolescents rely heavily on a mixture of one-to-one coaching and cooperative projects that make each student a key member of a peer team to which the student is responsible for the success of his or her task.

In addition to physical changes, adolescence is a period in which children increasingly seek to break ties of childhood dependency to parents and other adults and test their abilities to manage their lives independently. In doing so, they often find themselves in conflict with adult authority figures and tend to turn to each other for emotional support. The conflict with parents can be bitter and confusing for some children, who may find themselves under pressure to “act like a grown-up” at one moment, only to be told in the next to obey unquestioningly, like a child. The degree of their resulting alienation from adults often determines the degree to which adolescents turn to their peers for support. Conformity is a prerequisite for such support—in dress, clothes, personal grooming, speech patterns, musical tastes, and so on.

Often, however, peer conformity may also include high-risk behavior, including premature sex, alcohol abuse, drugs, crime, drop-

ping out of school, and other self-destructive and antisocial behavior. The degree and prevalence of high-risk and other aberrant adolescent behavior fluctuates wildly, depending on a variety of factors, including the stage of brain development of the individual adolescent, peer pressures, the prevalence and popularity of particular behavior among adolescents and efforts of the adult community to control or suppress harmful behavior by adolescents. During the 1980s, for example, pregnancy rates among 10- to 14-year-olds increased about 25%, while rates of gonorrhea quadrupled for that age group and tripled for 15- to 19-year-olds. During the 1990s, however, teenager birth rates plunged 23% and, by 2003, had reached their lowest levels in 40 years—less than 43 births per thousand teenagers, compared to 82 in 1960 and 53 in 1980. Teenage pregnancy rates among black girls fell from about 160 per thousand to about 80, while the rate for white girls dropped from 80 to just over 40. The decline in pregnancy rates, however, did not mean teenagers were abandoning sexual promiscuity. Quite the contrary, although they were obviously adopting precautions to reduce the rates of pregnancy and sexually transmitted disease. Indeed, a December 1999 study by the National Center on Addiction and Substance Abuse at Columbia University found that 38% of 15-year-old girls and 45% of 15-year-old boys had engaged in sexual intercourse, compared to only 5 percent and 20 percent, respectively, 25 years earlier. And another study found that 17 percent of seventh and eighth graders (12- and 13-year-olds, on average) had already engaged in intercourse. By 2003, a U.S. Centers for Disease Control study of youth risk behavior found 34.6% of high school girls and 33.8% of high school boys “sexually active,” with the race, ethnic, gender and age breakdowns as follows:

	Female	Male
White	33.1%	28.5%
Black	44.2%	54.0%
Hispanic	35.8%	38.5%
Grade 9	18.3%	24.0%
Grade 10	31.2%	30.0%
Grade 11	42.9%	39.2%
Grade 12	51.0%	46.5%
Total	34.6%	33.8%

Source: CDC *Youth Risk Behavior—United States 2003*

Rates of other high-risk behavior were equally paradoxical, as violent adolescent crimes fell dramatically while drug and alcohol use climbed. The drop in violent crimes coincided with passage of the federal SAFE SCHOOLS ACT OF 1994, which threatened public schools with loss of federal aid for failure to expel any student found carrying drugs or weapons in schools. From 1995 to 2003, arrests of juveniles 10 to 17 years old for violent crimes (murder, rape, robbery and aggravated assault) fell more than 45%, to 71,000—the lowest level in 20 years. Although drug use dropped during the last decade of the 20th century, the percentage of teenagers who used drugs regularly climbed from 9.7% to 11.6% from 2000 to 2003. Regular, excessive alcohol consumption, which had climbed 30% during the previous 30 years, continued its ascent in the new century, with 17.6% of teenagers describing themselves as regular users in 2002—an increase of more than 7% from 2000. Nearly 11% described themselves as binge drinkers (consuming five successive alcoholic drinks at a seating), compared with 10.4% three years earlier. Binge drinking varies dramatically with age: In the most recent surveys, about 15% of eighth graders, 25% of tenth graders and 30% of twelfth graders admitted to having participated in binge drinking within the previous two weeks. Teen use of marijuana and hashish, meanwhile, jumped from 7.2% to 8.2%, while cocaine use remained steady at 0.6% and the

use of hallucinogens declined from 1.2% to 1%. Cigarette consumption eased from 13.4% to 13% and the use of smokeless tobacco from 2.1% to 2% of all teens. Ironically, 40% of adolescents polled in 2004 claimed that they condemned peers who used drugs, compared with 35% a year earlier and fewer than 20% a decade earlier.

Other sectors of high-risk behavior by teenagers continued to puzzle researchers, however. Although suicide rates declined slightly from their peak a decade earlier, they were the third leading cause of death among teenagers, at a rate of 10.2 per 100,000 in the late 1990s, with the highest rates recorded in Alaska, the Dakotas and the Mountain states, and the rate among white youngsters more than 42% higher than that of black teenagers. Accidents of all kinds remained the leading cause of death, and homicides were the second leading cause, with a spate of mass killings by gun-wielding students adding to the carnage. Two students at Columbine High School in Littleton, Colorado, shot and killed 12 students and a teacher and wounded almost two dozen others before killing themselves on April 20, 1999. A month later, a 15-year-old gunman wounded six students at a high school in Conyers, Georgia. In December, a Fort Gibson, Oklahoma, middle school student opened fire with a semiautomatic handgun and wounded five students, and in March 2001, two students at Santana High School, Santee, California, shot and killed two students and wounded 13 others. The series of killings had at least one positive effect on America's schoolchildren—namely to break the pervasive code of silence against reporting fellow students to school authorities for rule violations. After the Santee killings, tips by students led to arrests in five California schools for planned violent attacks on students or teachers.

Adolescence can be a period of emotional turbulence for many students—and almost as

stressful for the adults who must work with them. For that reason, most school districts in the United States created “MIDDLE” SCHOOLS in the 1960s and 1970s, to segregate adolescents in schools of their own, limited to seventh, eighth and ninth graders, but often including fifth and sixth graders as well.

Regardless of the number of grades, all good middle schools are staffed with teacher-specialists trained to meet the needs of young adolescents—children “in the middle,” whose intellectual, physical and emotional needs differ substantially from preadolescents and from mature high schoolers. Middle school teachers are trained to convert the liabilities of adolescents into assets that promote learning. By relying on group projects, for example, teachers create new peer groups with class- and school-oriented goals that demand academic achievement if each youngster is to conform with his peers and help the group reach its goals.

(See also THERAPEUTIC SCHOOLS.)

Adopt-a-School Program A collaborative effort between local businesses and Chicago public schools to improve public school education and, in turn, improve the quality of the area's workforce. One of several dozen such cooperative education programs in almost every state, Chicago's Adopt-a-School program asks participating companies or industries each to adopt one school for at least one year. Each school provides an educational “wish list,” with all its unfulfilled educational needs for which tax dollars are unavailable. The adoptive company or industry usually tries to work with a school in its immediate area and, in weekly meetings with the principal, teachers and an Adopt-a-School coordinator, work out plans of action.

The degree and nature of a company's involvement varies dramatically from program to program. A utility company, for example, sent 20 employees to tutor reading and math-

ematics for 90 minutes twice a week. A bank set up a Foreign Language Resource Center to tutor 300 students for whom English is a second language and to take them to various cultural centers they would normally not visit. A telephone company set up an attendance squad that called all the homes of absent students of its school each morning to ask parents if their children had legitimate excuses for staying home. It reduced absenteeism from 20% to 13%. And a candy manufacturer set up a remarkable special project for about 100 students needing remedial help. It organized them into small groups charged with the responsibility of designing, developing, producing and marketing a new candy to fellow students. In so doing, students eagerly sought remediation to develop the needed academic and practical skills to reach their goals (see ACTIVE LEARNING).

Many other cities have similar cooperative, VOCATIONAL-EDUCATION programs. Houston has its Volunteers in Public Schools involving more than 100 companies, St. Louis has a School Partnership Program, and Pittsburgh has a Partnership in Education program. Boston's is the most far-reaching, involving almost all the city's public schools.

In general, the programs have five key goals: to provide remediation and hope, in the form of job opportunities, for disadvantaged students; to identify and nurture gifted students; to boost teacher skills and morale through behind-the-scenes support and special training; to provide job opportunities and ease the transition from school to work; to provide administrators and skilled managers to help principals and school administrators improve their performance.

To succeed, however, such programs must be based on three conditions. Teachers' and principals' unions must be willing and eager to work with nonprofessionals. That is often not the case. Fewer than half the schools in many cities have signed up for such programs. A sec-

ond condition for success is the promise of jobs for students—a difficult promise to fulfill for companies that are cutting costs and improving efficiency by reducing work forces. A third key condition is student ambition to succeed—a rare quality in emotionally and socially dysfunctional students from the inner city's poverty, broken homes and pervasive atmosphere of drugs and crime.

Adult Basic Education (ABE) The education of adults who never began or completed the normal kindergarten-through-twelfth-grade schooling experience. Designed primarily to eliminate adult illiteracy, Adult Basic Education can range from elementary school-level reading, writing and arithmetic for illiterates to high school-level American history to help prepare immigrants for citizenship. Most often, ABE is associated with non-English-speaking immigrants in major cities, and it has seldom reached out to American-born, rural illiterates in the Deep South or mountain areas. ABE peaked during the waves of immigration between the Civil War and World War I, although it is once again expanding to meet the needs of increased immigration from Latin America.

adult education A broad range of academic, vocational, professional and avocational courses of study designed for adults no longer attending formal school or college. Offered on site, on line or by mail by a wide variety of institutions, adult education may range from courses for hobbyists or for personal improvement to courses on nuclear physics, political theory or philosophy. In between these extremes are courses that teach arts and crafts, vocational, technical and professional skills and standard high school, college and graduate school courses. Some courses teach personal or family health, others political and social activism and others art or music appreciation.

Unlike ADULT BASIC EDUCATION, adult education assumes literacy and, depending on the particular offering, an elementary or even a high school education. Students can earn academic credit for some adult education courses and even certificates or diplomas, or they can simply take courses for the sake of learning. Usually offered on a part-time basis during nonoffice hours, adult education is available in many public schools, at two-year and four-year colleges, at universities, at proprietary trade schools and in museums, libraries and other public and private institutions. It is also available from associations and organizations, via television and radio, from correspondence schools and through individual instruction.

Some adult education falls under the category of continuing education, which usually consists of advanced courses designed for professional improvement at various times during midcareer. Some professions such as teaching require periodic continuing education to assure tenure or salary increases.

The growth in the number of students enrolled in adult education courses at colleges and universities soared during the last quarter of the 20th century, with the advent of DISTANCE LEARNING via the Internet expanding the number of enrollees logarithmically. By the end of 2005, the number of adults over 25 enrolled in American colleges had tripled to between 45% and 50% of total student enrollment. Of the more than 17 million college and university students in America, more than 20% were 35 or older, 14.5% were between 40 and 50 and nearly 7% were older than 50. About 21% of all students over 35 were enrolled full time, with 30% enrolled in two-year colleges, an equal number in four-year institutions and 40% enrolled in graduate schools. Women accounted for 52% of total enrollment. About 75% of all students were white. About 30% took work-related courses, 21% took personal-interest courses, and only

5% were studying to complete their post-high school degree programs. About 1% were enrolled in apprenticeship programs, and 1% were studying English as a second language. As for specific areas of study, nearly 25% of those enrolled took business and management courses (including computer math), and about 18% took courses in education. Humanities, health, and social and behavioral sciences were next in order of popularity.

Early 21st century adult education enrollment figures, however, did not—indeed, could not—take into account the increasing number of adults enrolling in the exploding distance learning industry via the Internet. Hundreds of educational institutions—public and private universities and colleges, along with for-profit PROPRIETARY SCHOOLS—tapped into the exploding \$200-billion-a-year higher education market by delivering undergraduate- and graduate-level courses electronically to students of all ages around the world. The University of Phoenix, in Arizona, for example, saw its enrollment explode from about 2,500 students in 1973 to more than 200,000 by 2005, while the burgeoning number of for-profit colleges as a group claimed more than 1.5 million students, of whom 44% were over 25 and nearly 17% over 35. By 2000, more than 2,000 institutions of higher education across the United States, along with at least 1,200 private corporations, also offered an ever-expanding number of course offerings via the Internet.

Advanced Placement (AP) Program A national program of freshman-level college courses for high school students who have successfully completed the standard high school curriculum in a particular subject before the beginning of their senior year.

Started in 1955 by the COLLEGE ENTRANCE EXAMINATION BOARD, Advanced Placement courses

are designed and graded by each high school, but the design adheres closely to guidelines set by CEEB and is followed by CEEB national AP examinations in each subject. AP exams are scored on a scale of 1 to 5, and a high score in a subject may earn a student advanced standing in that subject at some colleges. Many American colleges offer college credits for a passing grade on the AP test and some permit matriculation as a sophomore for six such credits. By entering as a sophomore, a college student can thus cut the time and money spent on college by 25%.

Offered only in high schools, AP courses are available in about three dozen subjects, including literature, English composition, mathematics, European history, American history, Latin, Spanish, French, German, biology, chemistry and physics. Nearly 15,000 of American high schools, or 60%, offer one or more AP courses, and more than 1 million high school students, or 6% of the high school population, take one or more of such courses each year; the number expands annually because of the belief that such studies not only enhance the chances of admission to prestigious colleges but also improve student academic performance at college. Ironically, neither seems to be the case. Indeed, a University of California study of more than 80,000 freshmen and sophomores at eight campuses over three years found no significant differences in academic performance between students who had taken AP courses in high school and those who had not. One result of that and other, similar studies has been a gradual abandonment of AP programs at academically demanding private secondary schools, where AP studies had forced costly and apparently unnecessary faculty expansion. One prestigious New York private school found no differences between its AP and non-AP seniors in terms of rates of admissions to academically demanding colleges or subsequent academic performance at college.

Academically demanding colleges have also soured a bit on AP programs. For many colleges, a passing score of three is sufficient to earn college credit in the particular subject, but Dartmouth, Duke, Northwestern, Stanford and similar colleges require fours or fives, depending on the subject. About 13% of AP test takers earn fives, 20% earn fours, and 27% earn threes, the lowest passing grade. Harvard refuses to award college credits for AP exam scores lower than five. Technically oriented schools such as California Institute of Technology and Massachusetts Institute of Technology refuse to give any credit for AP studies in many areas, regardless of exam scores.

Still another criticism of the Advanced Placement program is its tendency to give an advantage to the most privileged high school students in the college admissions process. Although well over one million students take AP courses each year, 40 percent of American high schools—largely in poor urban or rural areas—do not offer such courses.

advanced standing Placement of a student at a higher than conventional academic level at college. Advanced standing often permits completion of college work in less than the usual four years. Freshmen at many colleges, for example, may gain advanced standing in various courses if they obtain high enough scores on the appropriate ADVANCED PLACEMENT EXAMINATIONS or COLLEGE LEVEL EXAMINATION PROGRAM. Some colleges also grant advanced standing to students on the basis of credits earned at other institutions of higher learning or upon passing specific advanced placement exams administered by the college. A few colleges grant advanced standing on the basis of life and career achievements.

advance organizers A graphic presentation of new ideas and concepts to give students a preliminary, superficial understanding of the

material they are about to study and its relationship to what they have already learned.

Advance organizers may range from outlines of the work a course will cover over the entire semester to a presentation of the elements of a concept or body of materials that students are about to study—for example, plane geometry axioms and postulates or the breakdown of biological classifications into species, genera, families, phyla, and so on. The skill with which teachers prepare advance organizers can often determine the ease with which students absorb new materials.

aesthetics The study of beauty as expressed through the sensuous as opposed to practical arts. Aesthetic education concentrates on creation and appreciation of music, dance, fine arts, literature and the dramatic arts, the development of good taste and judgment and appreciation of cultural differences in the arts. Now taught at all levels of the curriculum, aesthetics formed the basis of academy education for women in 19th-century America, while men studied philosophy, religion, the natural sciences, classical and modern languages, history and political science, in other words, the practical arts.

affective domain One of three “domains” of learning that make up psychologist-educator BENJAMIN BLOOM’S taxonomy, or classification of the learning process and educational objectives. Bloom divided the learning process into the affective, cognitive and psychomotor domains, with each then subdivided into categories and subcategories representing different steps and levels of learning to which educational objectives are tied. The affective domain is made up of behavior and learning that stem from emotions and feelings, as opposed to physical and intellectual abilities. The affective domain of learning is divided into five “hierarchical categories” or learning stages: receiving,

responding, valuing, organizing and characterizing.

According to Bloom, learning in the affective or emotional domain begins as the student is first aware of a phenomenon or stimulus (receiving) and either ignores it or decides it is worth responding to (valuing) and then gives it a value or priority (organization) among many other stimuli being received. Depending on the priority assigned, the student may then organize it as part of a larger system of values (characterization) that will influence future behavior and learning.

affirmative action The disproportionate hiring and/or advancement of minority workers and enrollment of minority students (African Americans, Asians, Hispanics, Native Americans and women, among others) to compensate for discriminatory exclusion of those minorities prior to passage of the CIVIL RIGHTS ACT OF 1964. There are three forms of affirmative action: set-asides, factoring and standards readjustment. Set-asides reserve a specific percentage of opportunities—jobs or college acceptances, for example—for specific races, ethnic or religious groups or genders. Factoring merely takes gender, race or ethnicity into favorable account in admissions or hiring decisions. Under standards readjustment programs, colleges and schools intentionally lower academic standards and introduce remedial programs to permit disadvantaged students to achieve higher grade point averages. More than 90% of the nation’s public colleges, for example, offered remedial courses more appropriate for elementary or middle school children.

One goal of affirmative action is to bring minority participation in American life to levels at least proportionate to their numbers in the population and to assure equal hiring and promotion opportunities in the future. The Civil Rights Act also established an Equal Employment Opportunity Commission (EEOC)

to police the law by inspecting employment records, setting employment goals and timetables for fulfilling those goals, establishing training programs to upgrade minority worker skills to assure worker employability. The EEOC has the power to review complaints by workers or students who believe they have been denied access to a job or a seat in a school or college because of their minority status.

After slightly more than a decade of nationwide affirmative-action programs, set-asides for minority students and race-based admissions and scholarship grants, many colleges came under increasing attack for reverse discrimination against more qualified white applicants. In *UNIVERSITY OF CALIFORNIA REGENTS V. BAKKE*, in 1978, the Supreme Court, which had previously ruled that affirmative action was constitutional, reversed itself and ruled that the University of California, which had set aside a specific number of seats at its medical school for black students, had violated the rights of a better qualified white applicant when it denied him entry and filled its last available seats with less qualified minority students. Later, one federal court ruled that race-based scholarships open only to black applicants at the University of Maryland, a public university, were not discriminatory against whites and Hispanics, because they were intended to rectify past discrimination. A second court, however, reversed the ruling in 1991 on the grounds that discrimination had ended 30 years earlier and that the university had not proved the continuing effects of past racism and the need for affirmative action. Five years later, in 1996, a federal appeals court declared the affirmative-action program for admissions at the University of Texas Law School unconstitutional because it violated the rights of white students. Although privately sponsored race-based scholarships remain perfectly legal, the decisions affecting public universities, along with opposite affirmative action policies by successive Republican and Democratic administra-

tions, have left the legalities of affirmative action vague and imprecise.

Ironically, after 30 years of aggressive affirmative-action programs across the United States, the percentage—and actual numbers—of black teachers in public elementary and secondary schools had declined. By 1996, only 7.3% of public school teachers were black, compared with 8.1% in 1971. Fewer than 1% of black teachers in elementary schools were men and only about 2% of black high school teachers were men. In contrast, black students made up 16.9% of the total student population of about 45.6 million. In higher education, affirmative-action programs produced somewhat more gains for blacks at both the faculty and student level. Nearly 4.9% of college and university faculties were black, compared with about 2% a decade earlier, while the percentage of black students enrolled in colleges and universities climbed from 9.3% to nearly 10.5% of the student population.

Aside from preferential admissions policies, affirmative action in higher education has also meant preferential aid grants averaging \$1,500 more financial aid per student per academic year for black students than for white students with the same financial needs. A study by the Consortium on Financing Higher Education (COFE) found that 17% of the fees paid by students who pay the full costs of attending college represents a contribution to scholarship grants for needy students—with no concomitant tax deduction normally available for comparable charitable deductions.

Resentment against affirmative-action programs reached a climax in 1995, when the University of California Board of Regents voted to stop admitting students, hiring professors or awarding contracts on the basis of race and sex. The board was responding to public perceptions that affirmative action did indeed represent a form of reverse discrimination against qualified white males. California governor Pete Wilson,

who had demanded an end to quotas of all sorts, declared that affirmative action was “trampling individual rights to create and give preference to group rights. Race has played a central role in admissions practices . . . [and] some students who don’t meet minimum requirements are admitted solely on the basis of race.”

Although *Bakke* and a number of subsequent lower-court rulings banned the use of race as a consideration in college admissions, the U.S. Supreme Court effectively restored its use to a limited degree in 2003. In two cases involving the University of Michigan, the Court upheld the use of race as a consideration for admission to Michigan’s law school (*GRUTTER V. BOLLINGER*), but in the second case (*GRATZ V. BOLLINGER*) involving undergraduate admissions, the Court banned the use of so-called point systems that arbitrarily award different values to different factors—SAT scores, high school grades, extracurricular activities, gender, and so forth—and give undue weight to factors such as race and membership in other nonwhite minority groups. Michigan used a 150-point scale in evaluating admissions applications, with 100 points needed to win admission. The admissions office awarded a 20-point “race bonus” to black, Hispanic and American Indian applicants—the same amount awarded for a 4.0, or perfect, high school grade point average. Although the Court upheld the principle of affirmative action and allowed race to remain one consideration, it banned colleges from giving it more weight in admissions considerations than any other “personal characteristics,” such as being an Eagle Scout, president of the class or captain of the football team.

The university attempted to compensate for the effects of the Court decisions with an aggressive minority outreach program for needy students, with individual grants ranging from \$300 to \$1,500 a year. In November 2006, however, Michigan voters forced the university to abandon its outreach program and all other affirmative action by 58% to 42% in a statewide

referendum to amend the state constitution with an outright ban on affirmative action in public-college admissions and government hiring. The vote followed similar referenda in California and Washington, and Illinois, Missouri and Oregon have planned similar actions.

Over the years, decisions of the federal courts have left admissions officers at most selective colleges utterly confused. The bans on affirmative action in the 1990s produced dramatic declines in minority applications and enrollments, the former falling 13% at the University of Texas school of undergraduate studies, 23% at the medical school and 42% at the law school.

Court decisions affecting affirmative action at the public school elementary and secondary levels have been equally confusing. Aimed, in theory, at achieving racial balance in large urban school districts, affirmative action plans vary widely from state to state. Jefferson County, Ky., which includes Louisville, requires schools in districts that are one-third nonwhite to maintain black enrollment of at least 15%, though no more than 50%. Seattle, Wash., requires its schools to maintain black enrollment of 45% to 75%. The U.S. Supreme Court has generally allowed local courts and other local authorities to decide whether to continue, alter or end affirmative action in specific communities, but in 2006, the high court agreed to rule again on whether the use of race in determining school enrollment is not itself a form of official discrimination.

Before ending affirmative action in 1995, the University of California had admitted between 40% and 60% of all freshmen on the basis of academic merit alone, with the remaining freshmen admitted on the basis of many other factors, including athletic abilities, extracurricular activities, socioeconomic status, as well as race and gender. After ending affirmative action, the university admitted between 50% and 75% of all freshmen on the basis of academic merit, with the remainder admitted

on other factors, including socioeconomic factors, but not race, ethnicity or gender.

To prevent any return to affirmative action, the people of California in 1996 overwhelmingly approved a referendum banning racial and gender-based preferences in government hiring and contracting and in admissions to public colleges and educational institutions. After a federal court upheld the constitutionality of the ban the following year, other states, including Maine, Mississippi, Texas and Washington followed California's example by imposing legislative or court-ordered bans on affirmative-action programs in college admissions and financial aid. After years of court-ordered desegregation, Boston ended affirmative action in its admission policies at the BOSTON LATIN SCHOOL, a prestigious public high school and one of the nation's leading "MAGNET SCHOOLS" for gifted students. Reversing all previous court decisions, a federal appeals court ordered an end to affirmative action at Boston Latin, calling it a form of reverse discrimination, and it extended the new ban on affirmative action to all areas under its jurisdiction—namely, Maine, Massachusetts, New Hampshire, Rhode Island and Puerto Rico. Although outside the court's jurisdiction in the case, Virginia schools embraced the Massachusetts decision and immediately acted to end affirmative action. Boston Latin had admitted half its students solely on academic qualifications and used a race- and gender-based formula for admitting the other half, to assure compliance with a previous desegregation order that minorities make up 35% of each class. Although Boston Latin limited minority admissions to students who ranked in the top half of their classes at their previous schools, it was forced to reject hundreds of white applicants who were more qualified academically than the minority students it admitted, and one of the rejected applicants sued—and won.

Unlike Boston Latin, New York City magnet schools had never adopted affirmative action,

and the percentage of blacks and Hispanics combined never reached 10%, although they made up more than 50% of the city's population. But at the CITY UNIVERSITY OF NEW YORK, which instituted an affirmative-action program of open enrollment in 1970, blacks made up more than 30% of the student body and Hispanics more than 20% by 1995. Open enrollment guaranteed admission to all applicants, regardless of high school grade point averages or other academic qualifications. More than 10% of the students were enrolled in remedial programs in reading, writing and mathematics. By 1999, however, the academic standards of the university had dropped to such abysmal levels that public outrage forced the university to abandon affirmative action. Beginning in 2001, the university joined a growing number of academically elite four-year colleges that admitted students based only on academic merit—that is, high school grade point averages and standardized test scores. It also abandoned all remedial instruction and denied entry to any students requiring remedial work—even if their high school grade point averages or standardized test scores would otherwise qualify them for admission.

In a sense, the Supreme Court's 2003 University of Michigan decisions endorsed the "common sense" approach, but as in every situation where some discretion has been left to mere mortals, the results for minorities seeking to enroll at the most selective colleges and universities have been decidedly mixed. In the year following the Michigan decisions, a survey of 29 institutions with competitive admissions found 11 with increased black and Hispanic enrollments and seven with decreased minority enrollments. At the remaining 11 institutions, enrollments of at least one or the other minority group fell.

The end of most legally sanctioned race-weighted affirmative action, however, did not mean an end to widespread public concern about the failure of American education to

provide deprived minorities with adequate academic skills to compete in the economic mainstream of American life. To open the doors of higher education to deprived minorities, a growing number of states adopted limited open-enrollment policies for high-achieving high school students. Limited open enrollment was seen as a “commonsense compromise” between affirmative action, which often discriminated against qualified, high achieving whites and Asian Americans, and a purely merit-based program, which denied intelligent but culturally deprived minorities who scored poorly on standardized admissions tests of the chance to advance economically via higher education. California, for example, guaranteed all students who graduated in the top 4% of their high school class admission to a branch of the state university. Texas admitted the top 10%; Florida, the top 20%. Limited open enrollment was not without its own drawbacks, however, because automatic admission of all students finishing in the top percentages of every high school class permitted many poorly educated students from educationally inadequate inner-city schools to advance to college without proper academic qualifications, and many, if not most, such students subsequently dropped out without obtaining college degrees.

African-American education The schooling of American blacks, both within and without the mainstream educational establishment. Historically, the quality of education received by African Americans has been far below that offered whites. Only the education of HISPANIC AMERICANS in the United States has produced worse results than that of African Americans.

Little is known about the early history of African-American education in America. Whatever education they received in the 17th century was probably the result of occasional instruction by a benevolent slave master. The nearest resemblance to formal education did

not begin until the first decades of the 18th century, when a handful of public-spirited churchmen and pioneer educators such as ANTHONY BENEZET established small schools for black freedmen in such cities as New York, Philadelphia and even Charleston, South Carolina. By the Civil War, there were also three colleges for blacks, Wilberforce College (later, University) in Ohio, Berea College in Kentucky and Ashmun Institute (later, Lincoln University). All three had been founded in the mid-1850s, to train freed slaves as missionaries, some to migrate to Liberia under the auspices of the American Colonization Society.

Although “common,” or public, elementary schools for white boys had sprung up in

Separate-but-equal schools such as this one for African-American children in rural Tennessee subjected them to unconstitutional educational deprivation, according to the United States Supreme Court in its landmark decision in *Brown v. Board of Education of Topeka*. (Library of Congress)

hundreds of northern towns and cities after American independence, almost none were open to blacks. In the South, so-called black codes made teaching literacy to blacks a felony punishable by heavy fines and imprisonment. Nevertheless, black literacy climbed to 5% by 1860, according to the historian W. E. B. DuBois. Some gains were the work of sympathetic white churchmen. Others came in private classes run by black freedmen. In the South, semiliterate black preachers who held services in the slave quarters of southern plantations spread literacy by holding clandestine classes for black children to help them read the Bible.

After the Civil War, Northern generals who controlled civil government in the South attempted to establish Northern-style public school systems in the former Confederate states. For the first time, Southern communities that could afford to do so built common schools, open to all children, black and white. At the same time, white missionary societies, backed by wealthy northern industrialists, sent thousands of white teachers to found schools and speed the education of former slaves.

The result was a dramatic increase in the number of schools and colleges for blacks. By 1895, there were 62 secondary schools and 27 colleges, in addition to the 3 that had been founded before the Civil War. In addition, independent sponsors founded Atlanta, Howard and Leland Universities, and 13 other schools were founded under the provisions of the LAND-GRANT COLLEGES.

Together, these institutions began turning out the first generation of African-American leaders who would guide their race into the 20th century. By 1900, more than half the graduates of the black colleges had become teachers, while nearly 20% had become clergymen, most of whom were either directly or indirectly involved with education.

To most blacks, literacy became a symbol of liberation, and, with the Emancipation Proc-

lamation, the eagerness of southern blacks to get an education grew into what pioneer black educator BOOKER T. WASHINGTON called a "fever." The fever affected not only children but men and women in their seventies, whom Washington recalled seeing "tramping along the country roads with a spelling book or a Bible in their hands."

"The places for holding school," he wrote in his autobiography *Up From Slavery* (1901), "were anywhere and everywhere; the freedmen could not wait for schoolhouses to be built or for teachers to be provided. They got up before day and studied in their cabins . . . late at night, drooping over their books, trying to master the secrets they contained. More than once, I have seen a fire in the woods at night with a dozen or more people of both sexes and of all ages sitting about with book in hands studying their lessons. Sometimes they would fasten their primers between the ploughshares, so that they could read as they ploughed."

In addition to literacy, many educators also tried to teach former slaves various skills and trades that would give them economic independence. Backed by northern philanthropists, General Samuel C. Armstrong founded the pioneering Hampton Institute in Virginia. Booker T. Washington later founded a similar, trade-oriented school, the TUSKEGEE INSTITUTE, in Tuskegee, Alabama.

Washington believed that the minority status of blacks would prevent them from ever winning political or social equality. He proposed that blacks buy farmland and learn trades with which they could offer goods and services indispensable to the white community. He believed such products and skills would give blacks economic independence and establish mutually beneficial economic ties to whites without necessitating any social or political ties.

Ironically, Washington's success at Tuskegee became the center of one of the most important controversies ever to affect African-American

education. Northern black intellectuals such as DuBois believed academic education would serve blacks better than vocational education. DuBois believed vocational education would leave blacks in permanent servitude to whites. Only academic education, he said, would lead to complete social, civil and political equality. The Washington-DuBois debate produced a bitter split among black educators, and, before the issue was resolved, profound legal and demographic changes destroyed both men's dreams for universal education of black Americans.

When Southern states regained home rule in the 1870s, they segregated the races and slashed budgets earmarked for black schools. Black churches tried to pick up the slack by operating day schools as well as Sunday schools. Trade schools such as Washington's at Tuskegee staged vast expansions. Washington envisioned such schools not just as educational institutions that would give blacks economic independence, but as instruments in an eventual "accommodation" between blacks and whites.

In 1896, however, the U.S. Supreme Court ruled in *PLESSY V. FERGUSON* that states had the constitutional right to segregate the races in "separate but equal" school systems. For the next 60 years, the SEPARATE-BUT-EQUAL DOCTRINE kept blacks segregated from whites in almost all areas of American life and condemned African-American children to substandard education in the North as well as the South. While the latter subjected black children to DE JURE SEGREGATION, the North subjected them to DE FACTO SEGREGATION in equally inferior schools. In the 1946-47 school year, 17 states (Alabama, Arkansas, Delaware, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, Missouri, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia and West Virginia), as well as the District of Columbia, had laws that segregated blacks and whites in separate schools. Only 12 states had laws that banned such segregation.

In 1954, the National Association for the Advancement of Colored People (NAACP), which DuBois and other black intellectuals had founded in 1909 to fight for equal rights for blacks, won a dramatic victory. In the landmark case *BROWN V. BOARD OF EDUCATION OF TOPEKA, KANSAS*, the Supreme Court reversed *Plessy v. Ferguson* and ruled that separate schools, simply by their separateness, cannot be equal, and that segregation is unconstitutional.

Unfortunately, the decision came too late to produce the educational results DuBois had envisioned when he began his debate with Booker T. Washington a half-century earlier. By 1954, nearly three generations of African Americans had grown up in segregated, academically inferior schools set amidst the poverty and crime of America's black slums. The trade schools that Washington had envisioned had prepared many students for jobs that automation had rendered obsolete, and the academic schools envisioned by DuBois had failed to prepare students well enough to gain admission to college.

Although the legacy of segregation continues to affect the education of African Americans, 30 years of AFFIRMATIVE ACTION beginning in the late 1960s diminished those effects substantially and brought African Americans closer to statistical parity with whites. By 2002, about 89% of all African-American students were graduating from high school—below the 92.7% rate for white students, but significantly higher than the 59.6% black graduation rate two decades earlier.

The narrowing of disparities between white and African-American graduation rates, however, was not matched by comparable improvements in educational proficiency—despite dramatic gains in income and educational levels of black families and occupational status of black parents. Although the so-called achievement gap between white and black academic proficiency narrowed by a dramatic 20% from

1972 to 1992, it suddenly ceased narrowing. By 2005, black scores in reading, writing and math proficiency were almost unchanged from 1992.

Although black scores on SCHOLASTIC ASSESSMENT TESTS for admission to college improved slightly (less than 1% on the verbal and 1.8% on math), the 430 average black score on the verbal test and 427 on the math remained 18.6% and 17.7%, respectively, below the scores of white students.

In higher education, African-American gains have been mixed. Although African Americans made up 17.2% of the public school population, they constituted only 11.6% of total college enrollments in 2004—only about two percentage points higher than two decades earlier. The percentage of African-American high school students enrolling in college, however, improved substantially during the last quarter of the 20th century, from about 42% to 62% in 1998, before dropping to 54.6% in 2001. (White enrollment rates climbed from about 50% to a peak of 68.5% in 1998, before slipping to 64.2% in 2001). About 41.9% of African-American high school graduates obtained bachelor's degrees, compared with 54.5% of whites. African Americans make up about 12% of the college undergraduate population and earned 12.3% of the bachelor's degrees awarded in 2004, 4.1% of the master's degrees, 0.5% of doctoral degrees, and 0.8% of professional degrees. They made up more than 5.2% of faculties in institutions of higher learning and just under 7.6% of teachers in American elementary and secondary schools.

Court-ordered desegregation has nevertheless improved African-American education considerably. More African Americans are getting a better education than ever before in their history, as evinced in the steady improvement in Scholastic Assessment Test scores of African-American high school students. De facto segregation of schools, however, remains a problem that continues to deprive many African Ameri-

cans of equal educational opportunities—largely because of inadequate funding and the refusal of many gifted teachers to risk commuting in and out of neighborhoods in which many black schools are located. About two-thirds of all black students still attend public primary and secondary schools in which 50% to 100% of the student body is nonwhite.

Most states continue to fund public schools with property taxes levied according to market values of real estate—a system that automatically produces more funds for schools in wealthy areas than for those in poor ones. In some states, spending on each student in the wealthiest districts averages twice as much as per-student spending in the poorest districts.

Although some state courts have ruled such distribution of school funds unconstitutional, legislatures in many states continue to pass laws to legalize inequitable funding. At least one state, Michigan, abolished all property taxes to force state government to develop new, more equitable methods of funding schools.

(See also BLACK COLLEGES.)

African Americans Americans of African Negroid descent, comprising 12.1% of the American population in 2000. Displaced by Hispanics as the largest American minority, the African-American population grew 21.5% from 1990 to 2000 to about 34.7 million, compared to a growth rate of more than 62% for Hispanics, whose total reached 35.3 million. About 1.76 million Americans in 2000 described themselves as “mixed-race,” with some African-American bloodlines—a category never before measured by the U.S. Census. Of those who reported themselves as exclusively black in 2000, a disproportionately high percentage suffer social deprivation—23.6%, compared with 9.8% of whites, 10.7% of Asians and 22.8% of Hispanics. Nearly 37% of African-American children were living in poverty in 2000, compared to 10.6% of white children,

18% of Asian and Pacific Islanders, 34.4% of Hispanic children and a national average of 18.9%. Poverty in 1999 was defined as a household income of \$17,029 or less for a family of four. Some 53% of African-American children lived in one-parent households, of which 50.6% were below the poverty level; only 26% of all white children lived in one-parent households, of which only 29.8% were below the poverty line. Black unemployment has persistently stayed at about twice that of white unemployment over many years. Although a booming economy in the late 1990s reduced black unemployment from double-digit levels to 7.5% by mid-1999, it remained twice as high as the 3.8% unemployment figure for whites.

In education, African Americans fare no better (see AFRICAN-AMERICAN EDUCATION). They have a high school drop-out rate of more than 30% and a college drop-out rate of 70%. Many educators and sociologists tie these statistics to the black heritage of 200 years of slavery in America. The first blacks apparently arrived in America in 1619 as indentured servants. In 1650, however, the colonists legalized chattel slavery, and it remained legal in the South until Abraham Lincoln signed the Emancipation Proclamation in 1863. The North had gradually started freeing its slaves, state by state, shortly after the signing of the American Constitution. Massachusetts, for example, freed slaves in that state in 1780.

Few freedmen, however, were educated or skilled enough to be self-sufficient after emancipation—either in the North, after the Revolutionary War, or in the South after Lincoln's proclamation. During the century before American independence, missionaries had spread across the colonies to convert to Christianity those whom they called heathen savages—notably, American Indians and African slaves. There were few objections to their work with Indians, but slaveowners feared that conversion to Christianity, and its doctrine of the

equality of man, would lead to MANUMISSION, or emancipation from slavery. Unwilling to risk the enmity of wealthy and powerful slaveowners who underwrote their work, missionaries limited the range of their instruction of slaves. They imparted only enough biblical information for "salvation," which, they said, required unquestioned acceptance of one's lot in life as God's will. According to missionary interpretation of the Bible, blacks were the descendants of Ham, sent to America by God as slaves because of their racial inferiority. In the North as well as South, the church and whites generally reminded blacks that slavery was a sacred obligation. As blacks clung ever more tightly to Christianity and its promise of salvation, many necessarily clung to and taught their children and grandchildren the belief of their earthly destiny as slaves and, indeed, as inferiors to whites.

American independence helped only a handful of blacks. In 1830, there were two million slaves in the United States and 319,599 recorded free blacks. Thirty years later, in 1860, the number of free blacks—almost all of them living in northern cities—had climbed to only 488,070, and rigid segregation in education, employment and social services gave them few economic opportunities.

Even the Quakers, who abhorred slavery, maintained segregated meeting halls. While asserting in one breath their belief in the equality of all persons before God, they repeated, in their next breath, their firm belief in the savage origins and racial inferiority of blacks and the biblical stigmata they bear. The Reconstruction Acts of 1867 divided the South into five military districts, each under the control of a general, each assigned to impose northern-style democracy in the former Confederate states. Although blacks won legal equality with whites—many voted for the first time and some even won election to state and local offices—their victory was short-lived.

By the end of the 1870s, southern states had returned to home rule, and immediately enacted strict racial segregation laws that effectively disenfranchised most black people. Restricted to living in the poorest sections of most communities, blacks were forced to attend separate schools, eat in separate restaurants, travel in separate sections of buses and trains, use separate parks and public recreation facilities and even use separate public toilets and drinking fountains. They could not share public facilities with white friends, although they were always permitted to hold menial positions in white businesses and homes of the 1880s.

For most blacks, segregation also meant intolerable poverty that only grew worse with the collapse of the U.S. economy in the early 1890s, when nearly 10,000 businesses and banks failed. Railroads went bankrupt and ceased operations. Without trains, commerce came to a halt. Even the federal government exhausted its funds and had to borrow \$65 million from private bankers in New York to keep operating. Making matters worse, a drought swept across southern and midwestern farmlands. The winds that followed blew away the top soil together with 75% of American crops. Millions were forced out of work and marched on Washington to demand government help.

Faced with hunger on barren farms, tens of thousands of poor African Americans fled the South to find work in northern cities. Their numbers increased in 1896, after the Supreme Court upheld the constitutional right of states to segregate the races.

That case, *PLESSY V. FERGUSON*, marked the beginning of what would later be called the "Great Migration" that transferred half the black population of the United States from the rural South to the urban North and Midwest.

At the end of the Civil War, more than 92% of American blacks lived in the South—

almost always in rural areas. A century later, half the black population lived in the urban North. In the decade following *Plessy*, black migration northward doubled. In the 1920s it doubled again and once again in the 1930s, during the Great Depression.

The North, however, offered little respite from the crushing segregation of the South. By the end of the 1930s, most blacks found themselves as segregated in the North as they had been in the South—and with far fewer opportunities. Away from lands they could farm, most were crowded into "darktown" ghettos, competing for the lowest paying unskilled jobs. As the Great Depression of the 1930s sent unemployment rates soaring, welfare laws reserved public assistance to families headed by single mothers and encouraged husbands to abandon their families and single men to father children without marrying. The result was and remains a huge slum population of impoverished black families headed by single mothers. Without family structures to sustain them, many ghetto children "ended up illiterate, alienated, and unable to function productively except in the 'hidden economy' of hustling, drugs, and outright criminal activity, or in another generation of female-headed impoverished families supported by public welfare funds," according to education historian Lawrence A. Cremin.

Recent statistics confirm that more than half of all African-American families with children in the United States are headed by only one parent—usually female, usually poor and unskilled, and usually receiving public assistance.

African-American studies A curriculum of literature, history, geography, languages, music, fine arts and other courses emphasizing the contributions of black Africans to the world and, especially, to the United States. The curriculum is often called Afro-American or BLACK STUDIES.

Although the origins of the curriculum in the United States date back to the beginning of the 20th century, it did not generate widespread interest in primary and secondary schools or in colleges until the 1960s, following the struggle to desegregate American schools. A by-product of that struggle was a recognition by scholars, as well as most African Americans, that conventional liberal arts curricula at all levels either ignored or minimized the contributions of Africans and African Americans (and indeed most minorities) to world and American history and culture. African-American studies are designed not only to examine those contributions, but also to expose the extent and effects of the cruelties and deprivations that white Europeans and Americans inflicted on Africans and African Americans over the centuries.

Two nonacademic purposes of some African-American studies programs—especially those at primary and secondary schools—are to promote understanding and reduce prejudice between the races and to improve the self-image of African-American children by focusing on the achievements of their forebears.

African-American educator W. E. B. DuBois provided the first elements of the African-American studies curriculum in 1898, with the publication of his landmark study, *The Philadelphia Negro*. It was recognized as the first study ever to offer historical and environmental, rather than genetic and religious, explanations for the destitute conditions of African Americans. His work set new standards for future sociological studies of racial differences and led to an invitation for him to chair the sociology department at Atlanta University, where he developed a curriculum that became the first African-American studies program in the United States.

In 1915, historian CARTER G. WOODSON founded the Association for the Study of Negro Life and History and a year later, the *Journal of Negro History*. Woodson's goal was to encourage schools and colleges, whether segregated or not,

to offer unbiased courses on black history and make "the world see the Negro as a participant rather than as a lay figure in history." Woodson's journal continually pointed out the distortions of black history in standard history textbooks used in American schools and colleges.

Although black colleges were quick to adopt the African-American studies curricula developed by DuBois and Woodson, white institutions did not begin to follow suit until the late 1960s, when racial segregation had become illegal and black students began appearing in formerly all-white schools and colleges. In 1968, black students at San Francisco State College staged mass demonstrations demanding a black studies program and the appointment of a black teacher, with the rank of full professor, to head the program. The college agreed, and by 1970, 350 other American colleges and universities had followed suit. Programs varied from single courses to entire departments with courses in black history, black culture in the United States, black literature, black art, music and dance, imperialism and race, and many others. In December 1968, Yale University became the first American college to introduce an undergraduate major leading to a B.A. degree in Afro-American studies.

African-American studies, however, has not been free of criticism, both in and out of the academic community. Some scholars claim that just as many white authors and historians distorted history by ignoring, minimizing and even denigrating the role of blacks, some black scholars have exaggerated the role of blacks and, in some cases, invented roles they never played. Moreover, black scholars either ignore or diminish the role of Arabs, Muslims and black Africans in originating and perpetuating African slavery. Still another criticism by both academicians and nonacademicians is that some colleges have corrupted black studies curricula by hiring black activists instead of scholars and inflaming student prejudices against whites.

AFS International Programs See AMERICAN FIELD SERVICE.

after-school programs A wide range of public and privately operated academic and nonacademic enterprises to keep children constructively occupied between the official end of the school day and the time their parents are prepared to care for them at home.

After-school programs increased dramatically from the 1970s to the end of the century, as the percentage of full-time female employment grew from 37% of all women to more than 57% and the number of families with two working parents reached 51%. By 2000, well over half the mothers in the United States with school-aged children were full-time workers—many of them the sole support of their families. Single-parent families represented nearly 19% of white households, 33% of Hispanic households and 54% of black households in 2000—about twice the percentages three decades earlier.

Not to be confused with preschool, after-school programs may occasionally care for preschool-age children, but are primarily designed for older, school-aged children. Operated by public and private schools, government and church agencies, companies, community organizations and private organizations, after-school programs range from pure recreation to pure academics. Some programs consist of free play, sports or games. Others offer entertaining or informative field trips. Many schools offer extracurricular activities or programs that extend classes on a voluntary basis at the end of the official school day.

Agassiz, Elizabeth Cabot Cary (1822–1901) A founder of the Harvard Annex in 1879 and of its successor institution, the Society for the Collegiate Institution of Women, which was renamed Radcliffe College in 1894. Born to a wealthy patrician Boston family at the center of the city's rich intellectual and cul-

tural life, Agassiz obtained a broad, classical education from private tutors. Through her sister, the wife of a HARVARD COLLEGE professor of Greek, she met Louis Agassiz, the world-renowned Swiss naturalist whose arrival to lecture at Harvard in 1846 was described as “the event of the year.”

After his arrival, his wife died in Europe, and in 1850 Elizabeth Cabot Cary married Agassiz. A constant companion of her husband, she used her skills in mathematics and budget management to sort out his tangled finances, and she kept superlative, well-written diaries of her husband's pioneering naturalist expeditions between 1865 and 1872. She also helped her husband plan and manage the Anderson School of Natural History at Buzzard's Bay, Massachusetts, in 1873, just before his death, and her monumental two-volume work *Louis Agassiz: His Life and Correspondence* (1885) is still described as a “service to science” that “cannot be exaggerated.”

In addition to her importance as her husband's biographer and amanuensis, she was a pioneer in women's higher education, having founded and directed a select school for women in Cambridge in 1856, while her husband lectured at Harvard. The school, which closed in 1863, served her as an administrative apprenticeship, and after her husband's death, she approached Harvard president CHARLES WILLIAM ELIOT and the influential Harvard psychologist-philosopher William James “about Harvard education for women.” The result was the establishment of the Harvard Annex, which opened its doors to women students in 1879. Taught by Harvard professors, the school proved enormously successful and was incorporated as the Society for the Collegiate Institution of Women in 1882, with Elizabeth Agassiz as president. To honor her retirement, Radcliffe named her its honorary president in 1899. In addition to her collaborative works with her husband, she wrote *Seaside Studies in Natural History* (1865) with

her stepson Alexander, also a naturalist, and *A First Lesson in Natural History* on her own.

age-equivalent scales A somewhat controversial measurement system that converts a raw test score into an age group for which the score represents an average achievement level. Thus, if the average score of 14-year-olds on a test of 100 questions is 70, any score of 70 would be recorded as 14, regardless of the age of the test taker. A 10-year-old or a 17-year-old scoring 70 would receive an age-equivalent score of 14 on the age-equivalent scale.

The controversy surrounding such scales centers on possible misuse and misinterpretation—especially in schools where TRACKING OR ABILITY GROUPING can determine a student’s academic future. Even a gifted student can score below average on an age-equivalent scale if, for whatever reason, he or she has not had access to the information required for the particular test. Similarly, a slower student with a specific fund of information might score higher than the appropriate age group on a specific battery of tests but not be able to function at that level on a sustainable basis.

agnosias A broad range of learning disabilities usually associated with neurological damage and affecting sensory recognition of familiar objects. The degree of agnosia can vary widely and, unless supported by an abnormal electroencephalograph or other diagnostic evidence, symptoms of agnosia can appear in persons not suffering from it.

The sensory agnosias—visual, auditory and tactile—are displayed by an inability to identify, understand or interpret information or objects through each of those senses. However, common children’s games often demonstrate the frequency with which perfectly functional persons are unable to identify familiar objects by touch alone, without the aid of other senses. Other agnosias include autotopagnosia, which

is the inability to identify body parts, and form agnosia, which diminishes or blocks the ability to identify familiar shapes.

As he did about many learning disabilities, the pioneer researcher and neurologist SAMUEL T. ORTON, M.D., believed that the right hemisphere of the brain was “the exact mirrored counterpart” of the left. Although most affected children grow up using only one hemisphere, Orton believed they could often be retrained to use the other to compensate for cell damage in the first.

agraphia An extreme form of DYSGRAPHIA in which the individual has lost the ability to write because of a breakdown in neurological connections between the recognition of a number, letter or word and the motor response needed to write it. Agraphia can occur even when the individual has no muscular paralysis of any kind and can perform other routine manual tasks normally. Agraphics may also have no difficulty reading, speaking, hearing or understanding numbers, letters or words, but their agraphia prevents translation into the muscular activities needed to write.

agricultural education A complex curriculum whose roots lie in the training of farmers and future farmers to obtain maximum productivity from their land and maximum profits from their products at market. In colonial America, agricultural education was limited to an informal family apprenticeship system in which boys routinely helped their fathers maintain the family farm and gradually learned all the skills of planting, harvesting and managing crops, caring for livestock, control of pests, storing grains and produce, butchering animals, repairing tools, building and maintaining fences and maintaining outbuildings, barns and houses.

By the end of the 18th century, however, the farmlands of the Northeast and Middle Atlantic States were exhausted because farmers,

as hardworking as they were, lacked knowledge of proper fertilization and crop rotation techniques. In New England, Yale College president TIMOTHY DWIGHT wrote that "our fields are covered with a rank growth of weeds," because of "insufficient manuring, the want of good rotation of crops, and slovenliness in cleaning the ground." In Virginia, once the world's major supplier of tobacco, entire counties lay barren, unable even to grow wheat, much less tobacco.

Ironically, the decline in American farm productivity came just as demand for produce and livestock was soaring because of an explosive growth of American and European cities. Farmers themselves were as alarmed as political and educational leaders by their scientific and technological backwardness and their inability to profit from growing demand for agricultural products.

Several scientific societies helped somewhat by disseminating the latest advances in British agriculture to American farmers. The three most significant educational factors in reviving American agriculture, however, were the development of the agricultural fair, the founding of science-based "how-to" periodicals for farmers and the founding of private and public agricultural schools. All three institutions remain the educative foundation of American agriculture.

AGRICULTURAL FAIRS

ELKANAH WATSON, a businessman who had made and lost several fortunes by the time he was 50, was the founder of the first agricultural fair. Having scored a sudden and unexpected success raising Merino sheep, he organized 26 neighbors to stage the Berkshire Cattle Show in 1810 to display prize sheep. In 1811, he and the others organized the much broader Berkshire Agricultural Society, which absorbed the Cattle Show and became an annual event.

Encouraged by Watson, the Berkshire societies spread across the New England farmlands,

expanding their annual fairs to combine education with entertainment that permitted entire farm families to profit from the event. Except in the South, farmers themselves joined and supported the societies, and state governments added funds to ensure their success as educative organizations. Southern farmers refused to participate in the agricultural education movement because they feared educating their slaves. Without education, however, slaves were unable to operate the new farm machinery that was helping upgrade the northern agricultural economy.

The Berkshire societies began to lose membership after the Civil War, as farmers found their new technology producing huge surpluses that big-city buyers were bidding down in price. Faced with financial losses, farmers turned to new types of self-help organizations such as the Grange and the Farmers' Alliances, which used political action to lead farmers in the battle against the growing number of trusts.

Through these new organizations, farmers eventually won U.S. government guarantees of price stability through a system of subsidies that assured farmers minimum prices for produce and livestock. The legacy of the Berkshire societies, however, continues in the still-popular state and county agricultural fairs that remain an integral part of American agricultural life.

AGRICULTURAL PUBLICATIONS

The first successful farm publication was the *American Farmer*, an eight-page weekly founded in 1819 by John Stuart Skinner. Though not a farmer, Skinner had become alarmed by the exhausted lands and decline in farm productivity in his native Maryland. Skinner's weekly was the first of about 400 farm publications that would be published by the time of the Civil War. About 50 to 60 survived by then, with a total circulation of more than 250,000 farmers, to whom they disseminated information about the latest farm-management techniques.

AGRICULTURAL SCHOOLS

The third factor in the revival of America's vital agricultural economy was the founding of new agricultural schools and the introduction of agricultural courses in existing schools. The first of these was the Gardiner Lyceum, which opened in Maine in 1821 to offer courses to farmers and "practical men however employed," to make them "skillful in their occupations." The Rensselaer Institute opened in New York three years later, offering courses in chemistry, botany and zoology, along with teaching demonstrations of "agricultural techniques and the use of fertilizer in the cultivation of vegetables."

Under pressure to help educate farmers and build a firm and lasting foundation for U.S. agriculture, academies and colleges across America began expanding their curricula to include agricultural courses and programs. In 1855, the state of Michigan opened the Michigan Agricultural College, and in 1862, the U.S. government joined the effort by passing the first Morrill Act. Often called the Land Grant College Act, the first Morrill Act created a department of agriculture, headed by a commissioner, and granted federal lands to each state to build at least one college offering "practical education." Under the law, each state would receive 30,000 acres for each senator and representative in Congress, and each college it built would have to offer complete courses of education in agriculture, mechanical arts, and military tactics, as well as scientific and classical studies.

In 1890, Congress passed a second Land Grant College Act that provided annual appropriations for all the land-grant colleges, which later evolved into today's system of state universities. A year earlier, Congress had elevated the Department of Agriculture to cabinet status and thus added a new dimension to U.S. agriculture education that would continue to this day through the various educational programs

and experimental work conducted by the department. The thrust of many of the department's programs has changed, however, as the number of professional farmers has declined. Indeed, since 1900, when nearly half of all Americans lived on farms and ranches, the number of full-time farmers has dropped to fewer than 2 million, and the Department of Agriculture has redesigned many of its educational programs to meet the needs of home and property owners who need information on home design and maintenance, plant and lawn care, pet care, and the design and maintenance of flower and vegetable gardens.

Aguilar v. Felton A 1985 United States Supreme Court decision that declared unconstitutional New York City's use of public employees to provide instruction and services to students in private religious schools.

The city had been using federal funds to provide parochial schools with public school teachers and other professionals to give students remedial education, guidance and clinical services. The Court held the practice a violation of the ESTABLISHMENT CLAUSE of the First Amendment of the Constitution mandating complete separation of church and state. The Court had no objection to the city's providing such services to the same children in the city's own public schools.

(See also CHURCH-STATE CONFLICTS; *EVERSON V. BOARD OF EDUCATION*; *MEEK V. PITTINGER*; *MITCHELL V. HELMS*; *WOLMAN V. WALTER*.)

AIDS education Instruction explaining the transmission and prevention of acquired immune deficiency syndrome. An element of the sex-education curricula in schools across the United States from the early 1990s, AIDS education is now required in most states because of the progression of the disease to epidemic proportions. AIDS has presented the educational community with two major dilem-

mas. The first is to transmit knowledge youngsters need to avoid AIDS. Like all sex education, AIDS education has run into heavy opposition from parents and other groups who believe that parents alone, and not schools, should have exclusive control over sex education. A second problem has been the admission of HIV-positive or AIDS-infected children to school. Despite objections by parents and others who fear the accidental spread of infection, the courts have ruled that public schools must admit such children into their regular classrooms and school programs. Although health professionals have said such practices are safe, the admission of HIV-infected children to some public schools has led to boycotts that have threatened to close the schools.

Aid to Families with Dependent Children (AFDC) A federal welfare program providing funds to children in single-parent families below the poverty level as defined by the federal government. Administered by state welfare authorities, AFDC began as the Aid to Dependent Children program enacted as part of the Social Security Act of 1935, during the Great Depression. Expanded and renamed in 1962 as one of many amendments to the Social Security Act, it has grown into the second largest federal welfare program, after the Food Stamp Program. AFDC disburses more than \$19 billion a year to nearly 20 million families, including about 9 million school-aged and preschool children.

Like its predecessor program in the 1930s, AFDC has been the target of criticism from sociologists and many political leaders who say that, by making two-spouse families ineligible for aid, it encourages poor males to eschew or dissolve their marriages. In the past 20 years alone, the percentage of two-spouse families has declined from 64.3% to 46% of black families, from 74.1% to 67.6% among Hispanics and from 89.9% to 81.3% among white families.

Air Force Reserve Officer Training Corps A two- or four-year program in which young men and women may earn commissions in the United States Air Force while attending college. Offered for academic credit at more than 140 four-year colleges, the Air Force ROTC offers a monthly stipend to all participants and partial or full scholarships on a competitive basis. Students in the program combine four hours of courses a week of military studies—military history, military science, and so on—with a conventional academic college curriculum. During the summer break between sophomore and junior years, students have six weeks of field training. Successful graduates earn a bachelor's degree and a commission and must serve four to eight years as an officer in the U.S. Air Force. Their length of service depends on the type of training they select. Pilots, for example, must serve eight years; navigators five. The Air Force ROTC also offers a Health Professions Program that covers college costs and the costs of medical, dental and nursing school, and requires a seven- or eight-year postgraduate service commitment.

Alabama The 22nd state to join the Union, in 1819. Except for Mobile, the state had no county or local schools until 1854, when the legislature authorized the establishment of a state public school system, though without funding. Education remained private and was reserved for the wealthy for most of the rest of the century. The results are still evident. In June 1993, an Alabama Circuit Court judge ruled the state's schools "inadequate by virtually any measure of educational adequacy" and in violation of the state's constitution, which guarantees all Alabama children "a thorough and efficient . . . liberal" education. State officials are attempting to remedy the situation, but reorganizing the school system and retraining teachers may require a decade or more.

With 25% of its children living in poverty, Alabama students ranked 48th in the nation in

academic proficiency in 2005—before the devastation of Hurricane Katrina left families, homes and schools on the Gulf Coast in ruins. Only 22% of fourth grade and eighth grade students were proficient in reading, and only 15% of eighth graders were proficient in math. Nearly 40% of the state's more than 735,000 elementary and secondary school students are minority students, and 25% of the state's students live in poverty. The state has more than 1,500 public elementary and secondary schools.

In 1915, Alabama enacted laws authorizing collection of local property taxes to fund public schools and require annual attendance. The length of time for such attendance was left to the discretion of each community until 1927, when the state set seven months as the minimum; this was increased to eight months in 1943 and nine months in 1947. Free textbooks were not offered to students until 1965.

Like all southern states, Alabama maintained rigid segregation of the races in its schools until the 1954 U.S. Supreme Court decision in *BROWN V. BOARD OF EDUCATION OF TOPEKA*. Led by Governor George Wallace, state officials refused to comply with the Court's ruling, and Wallace physically attempted to block the door to the registrar's office at the all-white University of Alabama, when Autherine Lucy attempted to become the first black enrollee in 1956. After an assistant U.S. attorney general removed the governor from Lucy's path, she enrolled, but she was later expelled for academic failure. Seven years passed before the next blacks were admitted and the university began its slow conversion to a racially integrated university. Public schools were equally slow to integrate. In 1967, a three-judge federal court panel issued an order requiring *AFFIRMATIVE ACTION* to desegregate Alabama public schools.

Alabama has a total of 75 colleges, 46 of them public and the rest private. Eighteen of the public institutions are four-year colleges

and the rest two-year colleges. Graduation rates at four-year institutions range from 21% at Alabama State University to 75% at Birmingham-Southern College. The state's two largest public institutions are the University of Alabama, with three campuses, in Tuscaloosa, Birmingham and Huntsville, and a total of more than 40,000 students, and Auburn, whose two campuses at Auburn and Montgomery host a total of about 28,000 students. The state's private colleges include seven historically black institutions, such as Tuskegee University (see *TUSKEGEE INSTITUTE*) and Stillman College.

Alaska The 49th state admitted to the Union, in 1959. Alaska's educational tradition predates its acquisition by the United States from Russia in 1867. Russian colonist Griegor Ivanovich Shelikof opened the first formal school in Kodiak in 1785 to teach arithmetic, Russian and Christianity to the growing numbers of white and mixed-race children. In 1799, the Russian-American Company established small schools at company trading posts around the territory. They continued to operate until the United States purchased the territory.

The federal government virtually ignored its new acquisition and allowed education to all but cease until 1885, when Congress finally responded to demands from territory residents for a \$25,000 appropriation for the education of territory children. The principal spokesman for the residents was the Rev. Sheldon Jackson of the Presbyterian mission in Alaska. He used the funds to start Alaska's first six public schools along the populated panhandle region and on the Aleutian island of Unalaska.

During the first half of the 20th century, control over public schools was subject to constant jurisdictional battles between the territorial government and the Department of Interior's Bureau of Indian Affairs. All public schools eventually came under the control of the state government, however, and they now

rank high among the nation's public school systems because of the state's enormous oil wealth.

Fewer than 30% of Alaska's fourth grade and eighth grade students are proficient in reading, and only slightly more than 30% are proficient in math. Students scored about average for the United States in math proficiency, but Alaska's fourth graders finished 41st and its eighth graders finished 34th among the 50 states in reading proficiency. The state's 522 public schools host 136,000 students, of whom 60.4% are white and 25.5% are American Indian and Alaskan Natives (Aleut, Eskimo, and so on). The remaining students are Asian or Pacific Islanders, black, and Hispanic. About 14% of Alaskan students live in poverty. The state's only university is the University of Alaska, with some 24,000 students on three campuses—in Anchorage, Fairbanks and Juneau. All offer associate and bachelor's degrees. The state also has two-year public colleges and three small, private four-year colleges, including Alaska Pacific University, with nearly 700 students, in Anchorage, and Sheldon Jackson College, with 240 students, in Sitka. Graduation rates average only 40% at the state's colleges.

alcohol abuse The use of alcohol to a degree that impairs normal functioning. Between 15% and 20% of 12- to 17-year-olds reported using alcohol at least once a month in 2005, with the percentage rising to almost 50% for high-school seniors. More than 54% of adolescents say they have tried alcohol by the time they reached eighth grade. Two out of three American adolescents surveyed by the Carnegie Council on Adolescent Behavior said they had started drinking alcoholic beverages by the time they were in ninth grade.

Schools across the nation have added substance abuse education to standard health and hygiene courses, but such education has had limited effect, and it remains as much a center

of controversy as SEX EDUCATION over the question of whether it actually dissuades risk-prone children from experimenting with alcohol or tempts them to try to experience the sensations it produces.

Under a congressional mandate, the U.S. Public Health Service established the Alcohol, Drug Abuse, and Mental Health Administration (ADAMHA) in 1973. Its Division of Prevention, in cooperation with the National Institute on Alcohol Abuse and Alcoholism, supports alcohol-prevention programs in many schools. Many colleges and universities have on-campus alcohol abuse clinics offering education, counseling and clinical treatment for student, staff and teacher alcohol abusers. New Jersey's state university Rutgers started the nation's first on-campus alcohol- and drug-recovery program in 1983. Since then, colleges across the nation—notably Augsburg College (Minnesota), Dana College (Nebraska), Case Western Reserve University (Ohio), Grand Valley State University (Michigan), University of Texas at Austin, and Texas Tech University—have introduced on-campus alcohol-recovery programs for recovering alcoholics, including special housing in alcohol-free dormitories, on-campus support groups such as Alcoholics Anonymous, and organized activities that isolate alcoholic students from bars and on-campus drinking parties. Most colleges report relapse rates of only about 20% among students in such programs. Few comparable programs exist in high schools for preadolescent and adolescent alcohol abusers.

Alcott, Amos Bronson (1799–1888) Teacher, philosopher, author and eccentric visionary whose educational reforms liberalized American teaching methods and produced the first experiments in child-centered education. Born the son of a poor mechanic-farmer in Connecticut, Alcott attended local schools in Wolcott, Connecticut, but was largely self-educated.

Free-spirited (some called him irresponsible), he grew up tinkering and reading. At the age of 19, he began four years as a peddler, wandering through the South and, by trading for books he had not yet read, continuing his self-education.

In 1823, he returned to Connecticut to teach school near his boyhood home. Adopting the motto "Education's all," he introduced revolutionary child-centered teaching methods that caused a mixture of admiration, puzzlement, consternation and anger among parents of his charges. Like many thinkers of his day, Alcott was a Transcendentalist, who believed that each child's character was a gift of God, which the teacher/parent/mentor should nurture and nourish rather than alter or mold in any way. To that end, he dispensed with corporal punishment and introduced play, gymnastics and libraries. He used the honor system and allowed students to determine their own punishments. The worst of these was for the student to have to strike the teacher's—that is, Alcott's—hand with a ruler.

Most revolutionary of all, however, he discarded required textbooks and used gentle, persuasive conversations with students to instruct and inform. He used plain language at all times, breaking every element of teaching down to short steps, relating each new bit of knowledge "to familiar objects and occurrences [*sic*]." He encouraged students to turn to the books he supplied to explain, reinforce or supplement the knowledge gained in conversations.

His conversations produced scores of innovative, and now classic exercises, learning devices and teaching techniques, which he eventually codified in *The Record of a School: Exemplifying the General Principles of Spiritual Culture* (1836), a book edited by his assistant Elizabeth Peabody. His other voluminous writings on the teaching methods he developed and tested sired the 20th-century progressive education movement and most of the child-

centered educational techniques now standard in most schools. Although admired by teachers and educators, parental opposition forced him from school to school. By 1833, he had taught in five different schools in three states over the previous 10 years. Moreover, his imprudence in buying books for the libraries of each school left him almost penniless. In 1834, he opened his own school in Boston—the renowned Temple School, to which the most prominent members of Boston's society immediately sent their children. The publication of the first of his two-volume *Conversations with Children on the Gospel* (1836–37), however, caused a furor. Called indecent, obscene and nothing less than heresy, it reiterated his belief in Christianity while denying the divinity of Jesus. Although he said he modeled his own life on that of Jesus, he refused to confuse Christianity's "doctrines with its founder" by worshiping "one of my fellow-beings." By the spring of 1838, all but three children had been withdrawn from his school, and when he admitted a black child the following year, the rest of the children withdrew. He closed his school and ended his teaching career.

His teaching innovations had not gone unnoticed by educators, however. A group of reformers in England founded an experimental school which they called Alcott House to implement his methods. In 1842, he visited the school. While there, he met another eccentric utopian who returned to America with him to help him found "Fruitlands," one of a growing number of utopian communities that were sprouting across the United States. During the summer of 1843, Fruitlands was a gathering place for such intellectuals as Ralph Waldo Emerson, Henry David Thoreau, Nathaniel Hawthorne and other intellectuals, who spent the long summer days philosophizing with Alcott.

Amidst the stimulating conversations, however, Alcott forgot to plant any fruit trees—

or vegetables, for that matter—and because he was a vegetarian, he set his barnyard animals free rather than slaughter them. By the following January, the half-starved Alcott family abandoned Fruitlands, and for the next few years they lived off his meager earnings as a lecturer and tinkerer-handyman.

Alcott later moved his family to Concord to join his friends, among them Emerson, Thoreau and Hawthorne. In 1859, he became superintendent of schools and introduced many of the teaching reforms and innovations he had developed earlier, such as singing and calisthenics. In 1868, the family's fortunes turned for the better when his daughter, Louisa May, wrote of the values that inspired Fruitlands in her best-selling *Little Women*. This and her other books supported her and her parents for the rest of their lives.

Her father continued writing prolifically and organized the Concord Summer School of Philosophy in 1879, which he conducted in his home until 1882, when his mind apparently deteriorated and he at last retired.

Alcott, William Andrus (1798–1859) Educator, author and pioneer reformer who published the first periodical for children and redesigned the American school to make it a healthier, more pleasant institution. Born in Wolcott, Connecticut, he was the grandson of the original settler for whom the town was named. Educated at the district school with his cousin BRONSON, his lifelong passion for education began as a teenager, when he organized a library for the boys in town. At 18, he was appointed to teach school in his own town, as well as in Litchfield and Hartford. He spent every moment of his life teaching. When not in the classroom, he taught children and their parents in their homes. By age 24, he had redesigned each of his school houses, discarding crude, uncomfortable benches in favor of seats with backs. He added grammar to the curricu-

lum and brought flowers, plants and maps into the classrooms to expand children's knowledge and make the classrooms more pleasant.

During the winter of 1824–25, he contracted tuberculosis, which led to his redesigning school houses to provide ventilation—something never done before. It also led him to Yale Medical School, where he earned his medical and surgical degrees and studied physiology to improve his knowledge of children's health. For a while, he became an itinerant physician to remain in the outdoors and improve his own health.

In 1830, he helped found a model school whose structure he designed to include all the healthful improvements he had developed. His subsequent essay on the construction of schoolhouses won an award from the American Institute of Education and became a classic in the field of school construction. Based on the Swiss FELLEBERG school, it combined vocational and academic training and was one of the first U.S. schools with physical education—another Alcott innovation. In 1831, he founded and edited the first magazine for children ever published in the United States, the *Juvenile Rambler*. In 1838, he published his landmark book *A Young Man's Guide*, which went through 18 editions in eight years and taught young men about personal hygiene, proper behavior and character. In a chapter entitled "The Improvement of the Mind," he taught them how to educate themselves, laid out a complete curriculum and suggested the proper books and periodicals to read.

A prolific writer, his 19 volumes on education, 31 volumes on physical education, health and medicine and 14 volumes for families and school libraries influenced a generation of educators, as well as ordinary Americans. His concern with children's health earned him the sobriquet "the Father of Health Education."

***Alexander v. Holmes County Board of Education* (1969)** One of three U.S. Supreme Court decisions to speed the pace of desegregation and

outlaw all efforts to evade it. In the decade following the Court's landmark *BROWN V. BOARD OF EDUCATION OF TOPEKA* decision in 1954, many school districts, counties and states attempted a variety of schemes to preserve racial segregation by conforming to the letter of the law, while disregarding its spirit.

To strengthen the 1954 Supreme Court decision, Congress passed the all-encompassing CIVIL RIGHTS ACT OF 1964, followed by a series of education acts in 1965 to expand federal expenditures to education in desegregated school districts and, thereby, to encourage compliance. Nevertheless, resistance to desegregation continued, and in a series of three major decisions in 1968 and 1969, the Supreme Court crushed that resistance. *Alexander v. Holmes* was the second of these.

The first was *GREEN V. COUNTY SCHOOL BOARD OF NEW KENT COUNTY* in 1968, which outlawed a freedom-of-choice plan that allowed whites not to attend schools with black students and enroll in a body at a white school and leave no seats for blacks to fill. The Court held that the school board had "the affirmative duty to take whatever steps might be necessary to convert to a unitary system in which racial discrimination would be eliminated root and branch." The Court also defined what constituted a segregated and desegregated school, saying that any school with 85% or more of the students of a single race was in violation of the law. It ordered school boards to "convert promptly to a system without a 'white' school and a 'Negro' school, but just schools."

In 1969, after some districts were failing to comply, the Supreme Court responded angrily in *Alexander v. Holmes*. It defined "promptly" by ordering every school district in the South and, indeed, the United States, "to terminate dual school systems at once and to operate new and hereafter only unitary schools." In *United States v. Montgomery County Board of Education* later that year, the Court established racial

ratios for teachers, while reaffirming its earlier student ratios. By then, noncompliance was proving costly—not just in time and money, but in the loss of federal subsidies to education. Federal spending on education had climbed from \$4.5 billion in 1966 to \$8.8 billion in 1970 and would continue climbing to nearly \$20 billion over the next decade. Rather than risk losing its share of such funds, the South capitulated. By 1972, more than 90% of all southern black pupils attended biracial schools, compared to only 76.4% in border states and 89.1% in the North and West.

alexia The inability to read because of brain damage. An extreme form of *DYSLEXIA*, alexia is a form of *AGNOSIA* caused by irreversible neurological disruptions such as a severe stroke. (See also *APHASIA*.)

Alison, Francis (1705–1779) Irish-born Presbyterian clergyman and pioneer educator in the American colonies. Educated at the University of Glasgow, Scotland, he came to America in 1735, settling first in Maryland, then in Chester County, Pennsylvania, and finally in Philadelphia in 1752. He remained there the rest of his life.

Like most clergymen of his day, his obligations in each parish spilled over into education. His passion for teaching soon gained him a national and eventual international reputation as "the greatest classical scholar in America," in the words of Yale College President *EZRA STILES*. When Alison arrived in Philadelphia, "there was not a College, nor even a good Grammar school in four provinces, Maryland, Pennsylvania, Jersey, and New York," Stiles wrote. Alison responded in 1744 by founding a school in Newark, Delaware. His Newark Academy eventually became Delaware College, which is today the University of Delaware.

After the death of the rector at *BENJAMIN FRANKLIN'S* new Academy in Philadelphia, Ali-

son went there to teach. In 1755, he and WILLIAM SMITH reshaped and expanded the curriculum and converted the school into the world renowned College of Philadelphia, which eventually became the University of Pennsylvania. Yale and Princeton colleges and the University of Glasgow all honored him with honorary degrees.

Allegheny Conference on Community Development A regional private partnership started in the mid-1970s to stimulate educational, cultural and economic revival and growth in and around Pittsburgh, Pennsylvania. Working with the Pittsburgh Board of Public Education and the Greater Pittsburgh Chamber of Commerce, the conference sponsors the Allegheny Conference Education Fund, which has raised millions of dollars from corporations and foundations to improve public education. The fund established one of America's earliest cooperative education programs—Partnerships in Education—to encourage business ties to public schools by underwriting teacher-enrichment programs, scholars-in-residence programs, endowed teaching chairs for public schools, special educational projects, work connections to industry and many other schemes. Citing Partnerships in Education as a model for the rest of the nation, the Ford Foundation offers grants to encourage the formation of similar programs elsewhere.

(See also ADOPT-A-SCHOOL VOCATIONAL PROGRAM and COOPERATIVE EDUCATION.)

Allestree, Richard (1619–1681) Professor of divinity at Christ Church, Oxford University, England, provost of Eton College and author of popular devotional literature which, in the absence of schools in the wilderness of North America, became the essential primers for educating colonial children. Allestree's *The Whole Duty of Man* was one of the most influential and widely read books in the American colonies,

and it remained an essential element of school and church curricula for more than a century. *The Whole Duty of Man* gave parents specific instructions on educating their children:

As soon therefore as children come to the use of reason, they are to be instructed, and that first in those things which concern their eternal well-being, they are little by little to be taught all those things which God hath commanded them as their duty to perform; as also what glorious rewards he hath provided for them, if they do it, and what grievous and eternal punishment, if they do not.

allied health professions The vocations in health care that provide direct supportive services to doctors and dentists. Among those in the allied health professions are dental assistants and dental hygienists, dietitians, emergency medical technicians (paramedics), midwives, hospital pharmacists, registered and practical nurses, opticians, physicians' assistants, a wide range of therapists (including occupational, physical, respiratory and speech) and an even wider range of technicians (electrocardiograph, medical laboratory, medical record, radiologic [X-ray], surgical, ultrasound and so on). Formal education and training for each of the allied health professions ranges from on-the-job training programs to formal academic programs in two- and four-year colleges and universities. Many programs require only certificates of completion; others require associate, bachelor's and even master's degrees.

alliteration The repetition of consonant sounds in a series of consecutive words. A popular pedagogical device for children of all ages, alliteration makes phrases more vivid and entertaining, promotes understanding of many concepts, encourages memorization and teaches proper pronunciation of new spelling sounds—as in “Peter Piper picked a peck of pickled peppers.”

Allport, Gordon Willard (1897–1967)

Pioneer psychologist whose research into personality development and behavior led him to conclude that most normal behavior derives from current motives rather than infantile drives, as Freud proposed. The notion dispelled the idea popular among many teachers that children arrive at school with inflexible intellects, personalities and behavioral characteristics, and that the educational establishment can do little to change them.

Allport earned his B.A., M.A. and Ph.D. at Harvard University and spent the majority of his life teaching there. He was both president of the American Psychological Association and editor of the prestigious *Journal of Abnormal and Social Psychology* and was author of a dozen classic books and hundreds of scientific articles on psychology. His landmark works in psychology were *Personality: A Psychological Interpretation* (1937) and *Pattern and Growth in Personality* (1961), and he wrote an important analytical work entitled *The Nature of Prejudice* (1954). Allport's work was influential in the introduction of psychology into the teacher education curriculum.

alma mater A Latin term meaning bounteous or fostering mother and originally applied to such goddesses as Ceres, the Roman goddess of agriculture. Latin was the language in which classes were conducted in English academe, and the term was used in oratory and essays to describe English universities as fostering mothers. The earliest recorded references are those of Sir Walter Scott in 1803 and Thomas Carlyle 1866.

alphabet A set of characters that, individually or in combination, symbolize every sound in a language. Derived from the first two letters of the Greek alphabet (*alpha* and *beta*), the alphabet is usually taught in kindergarten, but no later than first grade. Many American teachers use alphabet rhymes, songs and large flash cards to help stu-

dents memorize and learn to pronounce each letter in the 26-letter English alphabet.

alphabet method An outmoded method of reading instruction that uses the alphabet and letter combinations as sounding devices with which to build words and phrases. Originated in the 16th century, the alphabet method required the beginning reader to memorize the alphabet first, then, with each letter, memorize all the sounds of that letter (for example, *ba, be, bi, bo, bu, by* for the letter "b"). In the third step of the method, the teacher presented students with word lists of successively increasing difficulty, progressing from monosyllabic words of two, three, four and more letters to words of two, three and more syllables. Each word list ended with one or more short reading lessons incorporating words from that list for students to practice by pronouncing each letter and word as they read aloud in unison. Thus, the first lesson in Thomas Dilworth's *New Guide to the English Tongue*, the most widely used speller in 18th century England and America, asked children to recite this poem:

*No man may put off the Law of God.
The Way of God is no ill Way.
My joy is in God all the Day.
A bad man is a Foe to God.*

Using the alphabet method, children in school recited the first line: "En, o, No; emm, ai, en, man; em, ai, wy, may; pee, you, tee, put; o, double eff, off; tee, aitch, ee, the; ell, ai, double you, Law; o, eff, of; gee, o, dee, God." They recited longer words by syllables and combinations thereof, until they built the complete word. The word "example" was read: "ee, ex, ex; ai, emm, am; ex, am, exam; pee, ell, ee, ple; ex, am, ple, example."

Alston v. School Board of the City of Norfolk The second in a 14-year series of five law

suits sponsored by the National Association for the Advancement of Colored People (NAACP), the climax of which came with the 1954 U.S. Supreme Court decision in *BROWN V. BOARD OF EDUCATION OF TOPEKA* declaring racial segregation in schools unconstitutional. In the 1940 *Alston* case, the Court upheld a lower court decision that a different salary schedule for equally qualified and similarly assigned black and white teachers in Norfolk, Virginia, schools violated the due process and equal protection clauses of the Fourteenth Amendment to the Constitution.

Like the three other NAACP cases, *Alston* was designed not to end segregation in southern public schools, but to lay a legal groundwork of Supreme Court decisions that would undermine the separate-but-equal doctrine established in the historic *PLESSY V. FERGUSON* decision of 1896.

(See also SEGREGATION.)

alternative certification (alternate route)

A program available in about half the states to attract the academically qualified into public school teaching without requiring study of pedagogical techniques normally taught in teachers colleges. Alternative certification programs vary from state to state. Most provide a temporary one-year certificate after successful completion of an intensive, short-term training in basic pedagogical techniques. In some states, alternate-route teachers must continue their pedagogical training on a part-time basis while teaching their regular classes. Depending on the state, alternate-route teachers are granted permanent teaching certificates after one or two years of full-time teaching and successful completion of either an M.A. in teaching or the equivalent number of courses in pedagogy and educational psychology.

Bitterly opposed by teachers unions, alternative certification was first used in the 1950s to ease teacher shortages that developed when

postwar economic expansion left teacher salaries noncompetitive with those of industry. Indeed, 40% of the graduates of teacher-education programs went directly to work in private industry and never applied for teaching jobs. Despite the low pay, there were indications that many liberal arts and science graduates who wanted to go into teaching refused to do so because of cumbersome pedagogical course requirements for traditional teaching certificates—requirements that often ignored knowledge in the subject the teacher intended to teach. Indeed, one criticism of American public schools is that traditional certification does not require teachers to have college degrees in the subjects they teach. Academically selective private schools, on the other hand, seldom require formal pedagogical training and prefer, instead, teachers who have majored or at least minored in the subjects they teach. The teacher shortages in many public school districts become so acute that many districts set up their own alternative certification programs, and, in the 1980s and 1990s, colleges and universities stepped into the picture with formalized curricula. By 2000, more than 250 institutions offered alternative teacher certification programs for people who had had careers or baccalaureate degrees in subjects other than education. The programs now provide about 10% of America's new teachers. The vast majority operate in cooperation with nearby public school districts.

Teacher unions argue that alternate certification undermines quality and professionalism of teaching and puts untrained teachers in classrooms with a broader range of children than those in private schools. The latter, say the unions, usually deal mostly with academically gifted, college-bound children. Many public school children, on the other hand, need more than purely academic help in the classroom—the kind of help that only teachers with appropriate pedagogical training can give.

alternative education In general, a broad spectrum of nontraditional teaching programs involving nonacademic curricula in preparation for jobs not requiring four-year college degrees or even, in rare cases, a high school diploma. Despite a national obsession with attending four-year colleges, almost 70% of all the jobs in the United States require only alternative education, and only about 30% require a four-year college degree or more. Technical, sales and administrative support jobs not requiring a four-year college degree account for 28.5% of all jobs, while precision production, craft and personnel jobs account for 13%.

Almost 37% of all jobs are filled by machine operators, fabricators, assemblers, inspectors, transportation workers, handlers, equipment cleaners, laborers, protective service workers, civil service workers (including fire fighters and police officers), household and hospitality workers, agricultural workers in farming, forestry and fishing, and workers in other service occupations. Training for all such jobs is available from one or more of the twelve basic sources of alternative education: comprehensive public high school vocational programs; specialized vocational/technical (vo-tech) public high schools; special-talent "magnet" high schools; cooperative education programs at high schools and colleges; "two-plus-two" tech-prep programs; two-year community colleges; technical institutes; private, not-for-profit junior (two-year) colleges; private, for-profit (proprietary) trade schools; nondegree courses and programs at public and private four-year colleges and universities; employer/union apprenticeship programs; and employer-sponsored training programs. (See individual entries for detailed descriptions of each type of alternative education.)

Although usually used to refer to VOCATIONAL EDUCATION, alternative education can sometimes refer to nontraditional schooling unrelated to practical training—for example, nontraditional

instruction for students with behavioral, emotional, physical or intellectual problems.

(See also ALTERNATIVE SCHOOLS.)

alternative schools Primary and secondary schools offering unique, custom-designed and often experimental educational programs designed sometimes for gifted students but most often associated with high-risk students with behavioral, emotional, physical or intellectual problems. The number of publicly funded alternative schools has declined sharply in recent years, from a high of 2,860 in the 1984–85 school year to well under 1,000 by 1995. There are several reasons for the decline. Simple economics forced some school districts to move alternative school programs into conventional public schools. Free-standing alternative schools are far costlier than conventional schools. Normally limited to about 200 students, they offer each student a faculty advisor, with each advisor seldom responsible for more than about a dozen students. Pupil-teacher ratios are half those of conventional public schools.

Another reason for the decline in the number of alternative schools was enactment of the EDUCATION FOR ALL HANDICAPPED CHILDREN ACT, a 1975 federal law that forced all U.S. public schools to guarantee all children, including the physically, intellectually and emotionally handicapped, "free and appropriate" public school education. The law allows such children to attend regular classes in conventional public schools with ordinary students and thus avoid the stigma often associated with attending alternative schools. Most alternative schools still operating are either special schools for exceptionally talented students in art, music, science or mathematics, or for students so severely disabled physically or emotionally that they cannot function in a conventional school setting.

Pedagogical techniques at alternative schools for high-risk students vary as widely as

the individual personalities and disabilities of the students. Some alternative schools combine instruction with flexible attendance policies that permit students to work. Others provide continuing, intensive, individual help to potential DROPOUTS whose diminished language ability has made school a site of constant failure.

One experimental program called Cities-in-School links social services to public school education in Atlanta, Houston, New York and other cities. Backed by public and private funding, Cities-in-School assigns each high-risk student a professional counselor from a public or private agency to monitor the student's school work and school attendance and to provide continuing, long-term counseling. Much of the criticism leveled at alternative schools, however, derives from the flexibility and lack of standardization in alternative-school education. Lack of standardization has prevented many schools from earning accreditation.

(See also INDIVIDUALS WITH DISABILITIES; EDUCATION ACT; MAGNET SCHOOLS; MAINSTREAMING.)

alumni/alumnae affairs A vital element of school and college administration to promote financial contributions by graduates. Many private schools and colleges depend on voluntary contributions of their graduates for as much as 40% of their annual budgets. Institutions of higher learning in the United States depend on private gifts for between 5% and 6% of their total annual revenues of more than \$200 billion. Of those gifts, about 25% come from alumni, although the percentage varies widely for each institution. Private gifts to public institutions account for less than 4% of annual revenues, while private gifts to private colleges account for about 9% of annual revenues.

Public primary and secondary schools rely almost 100% on government funding for their revenues, with private gifts amounting to less than one-tenth of one percent. Although no

overall figures are available for private elementary and secondary schools, mandatory fees for tuition and, where appropriate, room and board, generally cover only 60% to 90% of annual budgets. The remainder comes from voluntary contributions from alumni, parents and friends.

Alumni relations, then, are vital to private school funding and of growing importance to public institutions, whose government funding is declining. Most private colleges and many public institutions divide alumni affairs into two sectors—development, or fund raising, and alumni relations—with each headed by a vice-president who sits on the policy-making executive board of the institutions. Smaller institutions and schools may combine the two jobs.

Among the key functions of the alumni relations officers are publishing alumni bulletins and ALUMNI MAGAZINES with news of the school and its alumni and notices of forthcoming alumni events; organizing periodic alumni reunions on campus as well as in cities across the United States with significant numbers of resident alumni; encouraging alumni participation in certain college activities such as recruiting and interviewing student applicants or sponsoring alumni dinners for college officials visiting their areas; and encouraging alumni to form local alumni associations and clubs to help publicize their school and raise funds.

The functions of the development office are to obtain voluntary contributions from any and all sources—including alumni, foundations, corporations and nonalumni individuals such as parents and grandparents of students. Private contributions fall into two broad categories—gifts to the endowment, or capital fund, and current gifts for immediate use. In each category, gifts may be restricted by the donor for a specific purpose (scholarship, professorial chairs, etc.) or they may be unrestricted, thus giving the institution complete discretion in the use of funds.

Alumni fund-raising is accomplished in several ways: Periodic mail solicitations as part of the school's "annual campaign"; periodic telephone solicitations by fellow alumni calling their former classmates at organized "telethons"; and individual face-to-face meetings between one or more college officials or fellow alumni, with specific alumni targeted because of their wealth as potential donors of multimillion-dollar gifts for projects that will bear their names.

alumni/alumnae colleges A program of lectures or courses for the alumni/alumnae of a particular college or university. Usually offered by private colleges and universities as an extension of their alumni affairs programs, "alumni college" programs vary widely. Some are simply a series of lectures by a single professor over three days or a week. Others offer alumni opportunities either to audit or enroll in regular courses at college or graduate school, during the academic year. Costs of participation are usually low, because the courses are seldom offered for credit. Enrollment in for-credit courses is limited to those students who have gone through the regular college admissions process and are paying full costs of instruction.

alumni/alumnae magazines Professionally produced, glossy magazines produced by secondary schools, colleges and universities for distribution to alumni. Long in existence as a device for keeping alumni in touch with each other and with events at their old schools, the alumni magazine has evolved into a slick, four-color, glossy publication for stimulating financial contributions. Of the more than 2,500 four-year colleges in America, about 450 produce alumni magazines. Although public universities usually restrict distribution to paid-up members of their alumni associations, private colleges and universities send their magazines to all their gradu-

ates. Depending on average reader income, alumni magazines can be self-sustaining. The median household income of the more than 930,000 readers of magazines in the Ivy League Magazine Network (Yale, Harvard, Princeton, etc.) is \$136,000, and advertising by manufacturers of luxury products lures enormous spending by readers. Class notes are the most widely read features in alumni magazines, and articles dealing with campus problems are also of great interest.

ambilingualism The ability to speak all the languages of a particular country. Virtually synonymous with bilingualism, ambilingualism is usually applied to bilinguals and multilinguals of a particular country with two or more native tongues. Thus, an American fluent in French and English would be bilingual, while a Canadian with the same gift would be ambilingual, as would a Belgian who is fluent in both French and Flemish or a Swiss fluent in German, French and Italian.

American Academy for Liberal Education An accrediting group for undergraduate liberal arts colleges and humanities programs. Formed in 1993 by a group of a dozen leading scholars concerned with the deterioration of liberal arts education, the group accredits institutions on the basis of 17 standards. These include the importance of teaching over other activities such as research; the number of senior faculty members teaching introductory and other lower-level courses; and graduation requirements insuring that at least one-third of a student's course work be devoted to liberal arts courses and the humanities.

Many academy members believed that educational quality at liberal arts universities had declined as professors turned their attention to research and left teaching in the hands of inexperienced TEACHING ASSISTANTS. Academy members were also concerned that some uni-

versities might be flirting with consumer fraud by listing the names of professors in the course catalogs for courses actually taught by teaching assistants. Among the Academy's founders were Harvard University science professor and Pulitzer Prize-winning author Edward O. Wilson and Columbia University professor and author JACQUES BARZUN.

American Academy of Arts and Sciences One of two competing intellectual societies that tried in vain to establish a national system of public education in the first days of the American republic. Many of America's founding fathers agreed that a national system of public education was essential to the ultimate success of the great revolution they had engendered. Where they disagreed was over the question of what knowledge should be taught and whether the curricula should be "ancient" or "modern," that is, classical or practical. The American Academy of Arts and Sciences, supported by John Adams and his son John Quincy Adams, favored a classical curriculum that focused on Latin, Greek, literature and philosophy. Thomas Jefferson, president of the equally influential AMERICAN PHILOSOPHICAL SOCIETY, favored the study of more practical courses such as natural science and natural history. Indeed, he was instrumental in getting modern languages introduced into the curriculum at the COLLEGE OF WILLIAM AND MARY and in persuading the college to drop fluency in ancient languages as a requirement for admission. An angry John Adams responded in a letter, "I would as soon think of closing all my window shutters, to enable me to see, as of banishing the classics, to improve republican ideas."

In any event, neither Adams nor Jefferson succeeded in obtaining congressional support for public education, which the South feared might stir slaves to rebel. The academy's importance to education has continued to this day as an honorary society of leading scholars and a

center for interdisciplinary studies of and seminars on public, social and intellectual issues. It publishes the scholarly quarterly *Daedalus*.

American Association of School Administrators (AASA) The major professional association for public and private school principals and other administrators. Founded in 1865 as the National Association of School Superintendents, it was a department in the NATIONAL EDUCATION ASSOCIATION until 1969, when the disparate interests of NEA teacher members and administrators made it difficult for NEA to function smoothly. AASA provides a variety of professional services for its nearly 20,000 members and lobbies for legislation to improve education. On request, AASA conducts formal audits of curricula and teaching methods at individual schools to determine a school's strengths and weaknesses.

(See also CURRICULUM AUDIT.)

American Association of University Professors A powerful professional organization founded in 1915 by a group that included Columbia University's JOHN DEWEY. Its goals then, as now, were to improve conditions and protect the rights of college and university teachers and researchers. AAUP has been a force in the fight for academic freedom, shared governance, job tenure and the rights of non-tenured faculty, but it leaves most day-to-day operations in the hands of local chapters, which have more than 45,000 members at about 900 two- and four-year public and private institutions across the United States. About half the AAUP membership has collective bargaining agreements with their schools.

American Association of University Women An association of 140,000 graduates of accredited colleges, universities and two-year or community colleges, working for

the advancement of women. Founded in 1881 as the Association of Collegiate Alumnae, the AAUW lobbies Congress on women's issues and conducts important research on a range of topics, including women's education. One of its recent landmark studies presented a "wealth of statistical evidence . . . that gender bias in our schools is shortchanging girls—and compromising our country." Based on hundreds of research studies conducted during the 1980s, the report came to these conclusions:

- Teachers pay less attention to girls.
- Girls lag in mathematics and science scores, and even those who do well in those subjects tend not to choose math and science careers.
- Reports of sexual harassment of girls by boys are increasing.
- Some tests remain biased against girls, hurting their chances of obtaining scholarships and getting into college.
- Textbooks ignored or stereotyped women, and girls learned almost nothing about many of their most pressing problems, such as sexual abuse, discrimination and depression.

The report found that self-esteem of girls dropped faster than that of boys as they approached adolescence—at least in part because of what it termed sexist curricula in schools. Only one of 10 of the most commonly assigned books in high school English classes was written by a woman, according to the report. "Students sit in classrooms that day in, day out, deliver the message that women's lives count for less than men's," said the report.

The report triggered a nationwide effort by AAUW and other women's organizations to ameliorate the status of women in the broad education community. Women now make up more than 60% of the students enrolled in college, 57.5% of students earning bachelor's degrees and nearly 62% of those earning master's degrees. Gender discrimination, however,

continues to pervade American academia, however. Women faculty at American universities, for example, earned from 7% to 13% less than their male counterparts in identical positions in the 2005–06 academic year. And, despite identical mathematics proficiency scores between girls and boys at every age, myths persist about the innate inferiority of women in mathematics and technology-related fields, where they earn only 19% of bachelor's degrees in engineering and 11.5% of bachelor's degrees in engineering-related technologies.

American Baptist Home Missionary Society One of a number of religious organizations that helped found hundreds of mission schools throughout the South to educate former slaves in the decades following the Civil War. The society was responsible for making the Baptist religion the primary religion of southern blacks.

(See also AFRICAN-AMERICAN EDUCATION.)

American Bible Society An organization formed in 1816 to promote the distribution of Bibles and other religious publications—a task it continues to perform to this day. A union of 28 local Bible societies, the American Bible Society sent teams of canvassers through towns and cities across America to visit homes, talk to residents about Christianity, sell Bibles and subscriptions to Christian publications, collect contributions and recruit new members for local churches and Sunday schools. As the nation expanded westward and disorder and heresy threatened the frontier, the society pledged to supply every family in the West and the rest of the nation with a free or low-cost Bible.

Indirectly, many of the women canvassers became involved in education, as they grew friendly with residents and began serving as

tutors for the children in the households where they had sold scriptural materials.

(See also AMERICAN BOARD OF COMMISSIONERS FOR FOREIGN MISSIONS; EVANGELISM.)

American Board of Commissioners for Foreign Missions The first national organization to emerge from the evangelical fervor that swept the United States during the half-century following the Revolutionary War. Formed in 1810 by Congregational and Presbyterian Church leaders, the board was the result of the realization by church leaders that only by working together could they achieve their common goal of making the United States a Christian nation. At the time, charismatic church leaders such as the Rev. LYMAN BEECHER saw their new nation as divine in origin and predicted that its survival hinged on living according to scriptural dictates and waging constant war against Satan. They saw church and state as inseparable, and they formed organizations to teach their countrymen to believe the same. Initially, each group went its own way. The formation of the American Board of Commissioners for Foreign Missions, however, marked a new approach, and, while remaining independent, all such organizations agreed to work together toward a common goal. As new groups formed, each assumed a different function to complement the work of the others. Among the other groups were the American Education Society (formed in 1815), the American Bible Society (1816), the American Sunday School Union and the AMERICAN TRACT SOCIETY (both, 1825) and the AMERICAN HOME MISSIONARY SOCIETY (1826). All were led by a combined board of churchmen and well-to-do landowners and businessmen, and they raised funds from membership fees, church collections and individual contributions.

The American Board of Commissioners concentrated initially on opening mission schools among Indians, to make them “English

in their language, civilized in their habits and Christian in their religion.” Congress supported the effort with a Civilization Fund of \$10,000 a year. The board founded schools among the Iroquois of northern New York and Vermont, the Cherokees in Georgia, the western Carolinas, Tennessee and Arkansas, the Choctaws in Mississippi and the Cephass in Arkansas. It eventually expanded its work to American territories such as Hawaii and to the Far East and Africa. From 1820 to 1855, it sent more than 150 missionaries, including ministers, teachers, doctors, printers, farmers and businessmen to Christianize and Americanize Hawaii.

As the board’s work expanded, it shared its tasks with the other national organizations. The American Home Missionary Society took responsibility for missions in the newer and poorer regions of the United States, while the board concentrated on foreign missions. The American Education Society concentrated on training evangelical ministers to establish schools, academies, colleges, youth groups, discussion circles and other formal and informal educational organizations. The Sunday School Union, Tract Society and Bible Society handled publication and dissemination of scriptural and appropriate nonscriptural texts for use in mission schools as well as homes. The Sunday School Union also founded thousands of Protestant Sunday schools across the United States.

Like all religious schools of the time, both board and union schools combined secular and religious studies and often provided the only formal education for children in isolated areas with no access to secular common schools. In the 1830s and 1840s, the board and its sister organizations extended their educational efforts to arriving immigrants and to the poor. Until public education made mission schools unnecessary after the Civil War, the board remained one of the most ubiquitous forces and influences in 19th-century education. Although its goal was to popularize

Christianity, its primary lasting success was in popularizing education.

American Council on Education A non-profit, Washington-based organization of American colleges. It is the nation's largest association of colleges and universities and the largest nongovernmental body in higher education. Founded in 1918, the council has a number of divisions. One is purely a lobbying group that represents the interests of higher education in Washington. Another formulates acceptable policy positions for its members, while a third produces studies and reports on institutional management and curricula, as well as original research in these fields. Another council division, G.E.D. Testing Service, administers the General Education Development Program, which offers standardized examinations that permit anyone of any age to obtain a high school diploma without attending formal classes.

American Education Society An organization founded in Boston in 1816 for "educating pious youth for the gospel ministry." One of many national organizations that emerged from the evangelical fervor that swept the United States during the half-century after the Revolutionary War, the society was, however, as committed to spreading secular education as it was to spreading the Christian gospel. Indeed, it trained only evangelical ministers willing to accept two obligations—namely, to serve as missionaries and to establish schools, academies, colleges, youth groups, discussion circles and other formal and informal educational agencies. It also provided financial aid to new institutions with similar goals, such as Oneida Institute, which eventually became OBERLIN COLLEGE, and the Rev. LYMAN BEECHER's Lane Seminary in Cincinnati.

(See also *EVANGELISM*.)

American Federation of Labor A confederation of workers formed in 1886 by 25 craft unions. In 1902, the AFL embraced and encouraged the growth of the early teachers unions. It was a driving force in gaining passage of the SMITH-HUGHES ACT in 1917, providing for federal assistance for the establishment of vocational education in public high schools. The act incurred fierce opposition from private industry, which wanted to control all vocational education through company-operated apprenticeship programs that bound future workers to their jobs by teaching only enough skills to work in a particular company plant and nowhere else. In 1955, the AFL merged with the Congress of Industrial Organizations, an industrial union founded in 1935 to expand unionism to noncraft, assembly-line workers in industries such as automobile manufacturing. At the time, the combined membership of the new AFL-CIO was 15 million, but, as American assembly plants moved to lower-wage areas in foreign countries, union enrollment declined to about 13 million, and the percentage of unionized American workers plunged from 35% of the workforce to a mere 12.5% of all workers and only 7.8% of workers in the private sector. The struggle to preserve rapidly declining non-craft, assembly-line jobs in the United States—and the methods of doing so—produced huge rifts in the AFL-CIO leadership, and, by 2006, five former CIO industrial unions had withdrawn from the umbrella AFL-CIO coalition, reducing the number of participating AFL-CIO unions to 52. In 2006, however, the AFL-CIO climaxed a concerted effort to rebuild membership when the nation's largest union, the NATIONAL EDUCATION ASSOCIATION, announced it would allow its 13,200 local chapters to join the AFL-CIO—a decision that promised to increase AFL-CIO membership by at least one million members.

American Federation of Teachers An international labor union for teachers. Now

affiliated with the American Federation of Labor, the American Federation of Teachers traces its origins to 1897, when Catherine Coggin and Margaret Haley, two Chicago classroom teachers, split with the National Education Association and formed the Chicago Teachers Federation. Other female classroom teachers in New York, Los Angeles, San Antonio, Washington, D.C., and other cities formed similar groups to protest exploitation by predominantly male school administrators and school boards. In 1902, the San Antonio and Chicago groups joined the AFL and 14 years later, merged with other dissident NEA member groups to form American Federation of Teachers.

At the time, women teachers were denied job security and academic freedom and worked for salaries 50% below those of male teachers with the same rank, training and experience. Unlike the older, male-dominated National Education Association, whose top priority was school operations, the new female-dominated federation made its primary goals higher salaries, better working conditions and job security. To those priorities the AFT has since added fringe benefits and pension schemes, as well as collective bargaining agreements in nonunion schools and school districts. Initially limited to teachers below the rank of principal, AFT membership of about 1.3 million now includes about 400,000 nonteachers, such as nurses and even meat inspectors, who account for nearly half its membership. Most of its teachers work in urban schools. AFT assists its more than 3,000 locals in winning collective-bargaining agreements and in conducting elections and strikes. It offers members liability insurance and group health, life and accident insurance. Its Legal Defense Fund defends teachers when state laws forbid union organizing or striking by public employees. AFT also publishes a number of important periodicals, including *American Educator*, *American Teacher* and *Action*.

Despite a century of conflict, the AFT and NEA moved to merge their two organizations in 1998, in an effort to increase the political power of American teachers. With NEA membership of 2.7 million teachers and school-support workers such as janitors and cooks, the combined organization would have more than 4 million members with annual revenues approaching \$2 billion—enough to influence political policy in education across the nation and influence state policies on school VOUCHERS, SCHOOL CHOICE and other issues teachers oppose.

American Field Service A voluntary organization that provides grants to American students to study abroad and to foreign students to study in the United States. Founded in 1914 as a volunteer ambulance service to help the French army in World War I, the AFS discontinued its original function after the armistice in 1918. Its American members had formed such close ties to French colleagues, however, that they developed the concept of international student exchanges for Americans to pursue graduate studies in France and for French students to come to American universities. Now called AFS International Programs the AFS effected only a few hundred such exchanges between the two world wars, and the organization resumed its original function in 1939 at the outbreak of World War II. In 1947, however, the scholarship program resumed, and the AFS subsequently extended its reach to more than six dozen countries and to tens of thousands of American and foreign exchange students.

American Home Missionary Society One of many national organizations that arose from the evangelical fervor that swept the United States during the half-century following the Revolutionary War. The society was formed in 1826 by a group of wealthy Protestant parishioners to subsidize ministers in the newer states

and territories, which they perceived to be threatened with disorder and nonbelief.

American Indian Any of the people native to North America when Christopher Columbus first landed in the Western Hemisphere. In education, American Indians represent 0.8% of the population enrolled in U.S. institutions of higher education—about the same proportion as they represent in the general population.

Of the 4.2 million Americans who describe themselves as full-blooded Indians (nearly 2.5 million) or Indians of mixed blood (1.6 million), 48% live in the West, 29% in the South, 16.1% in the Midwest, and 6.6% in the Northeast. Six states have 100,000 or more full-blooded Native Americans: California, 333,000; Oklahoma, 273,000; Arizona, 256,000; New Mexico, 173,000; Texas, 118,000; and North Carolina, 100,000. Five other states—Alaska, Washington, New York, Michigan and Florida—have combined populations of more than 100,000 full-blooded Indians *and* Indians of mixed blood. Only about 29% of American Indians 25 years or older have high school diplomas, compared with 84.6% for the general population and 80% for African Americans. Only 7.6% of American Indians have bachelor's or graduate degrees, compared with 27.2% for the general population, and fewer than 18% of American Indians 18 to 24 years old are enrolled in college, compared with 41.6% of white non-Hispanics, 32.3% of black non-Hispanics, 23.5% of Hispanics and 60.3% of Asian/Pacific Islanders. American Indians have the lowest college graduation rate of any minority group—36.5%.

In an effort to increase college enrollment of American Indians, a number of colleges and universities have established outreach programs to increase Indian enrollment and to provide counseling and tutoring once they arrive on campus. Syracuse University has established a Native Student Program that pro-

vides its Indian students with American Indian mentors. Cornell, Dartmouth and Harvard colleges have established cultural centers as well as counseling and tutoring programs. As the 20th century came to an end, however, academic achievement among American Indians was improving—largely because of a transfer of control of Indian education from the U.S. government BUREAU OF INDIAN AFFAIRS to local tribes. Prior to tribal control, only about 60% of Indian children were enrolled in schools, and, on average, they scored 11% below white students in verbal and mathematics Scholastic Assessment Tests. Indian fourth graders (nine-year-olds) scored 17% below white students of the same age. By the end of the 20th century, tribal control of elementary and secondary schools had narrowed the gap between Indian and white children considerably. Scholastic Assessment Test scores of Indian high school students were only about 5% lower than those of white students and more than 12% higher than those of African Americans. Among fourth graders, reading proficiency of American Indians ranked 11% below the average scores for white children, but 2% above black children. About 160,000 American Indians are enrolled in college or university.

The history of American Indian education is intricately tied to the unrelenting efforts by the Christian churches to convert Indians to Christianity. The process may have started in Virginia, in Jamestown, in 1612, when the Rev. Alexander Whitaker converted the captured Indian princess Pocahontas. Baptized Rebecca, she married colonist John Rolfe and, in 1616, went to England, where she was received by the king and queen. Enjoined to “go forth and teach all nations,” many of the earliest priestly settlers believed that the “noble savages” they found in the new world thirsted for the gospel. In fact, some Indians admired enough of the white man's ways to respond to the call to Christianity as a simple price to pay for the

material goods the white man provided in exchange. The two earliest missionaries to devote their efforts to converting Indians were the Puritan clergymen the Rev. Thomas Mayhew Jr., of Martha's Vineyard, and the Rev. JOHN ELIOT, of Roxbury, in the Massachusetts Bay Colony. By 1652, Mayhew had converted nearly 300 Indians, while Eliot was conducting regular services for Indian sachems at Nonantum, on the Charles River, through which he persuaded many to adopt English ways by moving into so-called "praying towns." In 1649, the English Parliament created the COMPANY FOR THE PROPAGACION OF THE GOSPELL IN NEW ENGLAND to raise funds to support Mayhew's and Eliot's efforts. In 1651, Eliot used society funds to acquire 2,000 acres on the banks of the Charles, about 18 miles from Boston, to help Indian converts found Natick, the first of 13 Indian praying towns they would build over the next 14 years. In 1663, Eliot translated the Bible into Algonquian in hopes of making conversion a smoother process. By 1675, Eliot, Mayhew and other missionaries had converted an estimated 2,500 New England Indians to Christianity—about 20% of the local Native American population. Most lived in the praying towns, in apparent contentment with their colonist neighbors.

Colonist encroachments elsewhere in New England, however, provoked the Indian tribes to form a confederation that engaged the colonists in what is now known as King Philip's War. A year later, Philip lost and was killed, and the majority of Indians abandoned southern New England to the English.

The Society for the Preservation of the Gospel in New England (S.P.G.), however, continued to support efforts to convert the Indian, by supplying clothing, building materials and tools and paying the salaries of ministers and schoolmasters to teach them. Eliot, meanwhile, translated the primary sacred texts and prayer

books into Algonquian, and S.P.G. not only built a library to house them but an Indian College at Harvard. The college, however, failed for lack of qualified students. Although five Indians are known to have enrolled, only one, Caleb Cheeshahteumuck, earned his bachelor's degree, but he died of tuberculosis a year later.

Although Eliot continued to serve as an "apostle to the Indians" to the time of his death in 1690, his efforts had diminishing success in the face of colonist exploitation and mistreatment of Indians. A few individual missionaries in New England continued his work. The Rev. Eleazar Wheelock, a liberal "New Light" Presbyterian, tutored and converted young Indians, along with white youths, in his parsonage in New Hampshire. He eventually expanded his school into an academy which later was granted a charter in 1769 as DARTMOUTH COLLEGE.

Meanwhile, the S.P.G. redirected its efforts to teaching and converting the Mohawks in the Albany, New York, area. From 1702 to 1769, the S.P.G. established at least three schools that managed to bring some degree of literacy to hundreds of Indian youths but, because of continual colonist exploitation, produced few converts to Christianity. S.P.G. efforts to educate and christianize American Indians came to an end by the time of the Revolutionary War.

The optimism that came with the founding of a new nation revived the sentiment for assimilation of American Indians into the white Anglo-American community, however. As Thomas Jefferson put it, Native Americans were "formed in mind as well as body, on the same module with the 'Homo Sapiens Europeaus.'" Jefferson called for Indians and whites "to intermix, become one people. Incorporating themselves with us as citizens of the United States, this is what the natural progress of things will of course bring on, and it will be better to promote it than retard it." President George Washington launched a series of programs to help

Indian tribes to convert from a hunting and trapping economy to an agricultural way of life. Washington had widespread support. Although the tribes remained foreign nations, Congress allotted \$15,000 a year for Washington to promulgate various programs to promote trade with friendly Indian tribes and to send agents among them to teach them agriculture and homemaking and to help them set up factories and trading posts. Adams and Jefferson continued the so-called civilization programs.

On the educational front, Presbyterian and Congregationalist ministers from the AMERICAN BOARD OF COMMISSIONERS FOR FOREIGN MISSIONS supported the government's efforts by fanning out across New York, Vermont, Tennessee, Mississippi, Arkansas and elsewhere to open mission schools for Indians. In the South, the Cherokee Nation thrived under the assimilation policy. Made up of about 17,000 people in 40 villages in Georgia, the western Carolinas and Tennessee, the Cherokee Nation had signed the Treaty of Holston in 1791 and accepted Washington's 1796 offer of funds and technical assistance to convert from a hunting to an agriculture economy. Moravian and Presbyterian missionaries established schools in each of the villages, and by 1817 a Cherokee delegation was in Washington to ask for additional funds for more schools and for plows, hoes, spinning wheels and other equipment to make the Cherokee Nation American in every way.

The result was the construction of eight mission boarding schools, including the BRAINERD MISSION, which educated and Christianized hundreds of Cherokee children and led to a written Cherokee language and a Cherokee newspaper, thus helping to advance literacy throughout the Cherokee nation. By the end of the 1820s, the Cherokee drew up a constitution based on the U.S. Constitution and proclaimed themselves a republic, modeled on that of the United States. Unfortunately, white

sentiment toward the Indian had changed radically. During the War of 1812, a number of Indian tribes, angry at settler incursions into their lands, collaborated with the British. Presidents Madison and Monroe both soured on the Indian civilization process, and by the time the veteran Indian fighter Andrew Jackson assumed the presidency, Congress had adopted a new policy that reflected the lust of Americans to farm the vast unsettled lands that Indians reserved for hunting and trapping.

In 1830, Congress passed the Removal Act, which "reserved" the lands west of the Mississippi for tribes who ceded the lands they occupied to the east. Removal replaced assimilation as the official policy of the federal government and even the Cherokee, who with the government's official encouragement and financial help had adopted the white man's ways, were forced to leave their ancestral lands. The resettlement was an economic, social and educational disaster. Not only was the land unfit for farming, western Indian tribes had long ago claimed the lands west of the Mississippi as their own, and they resisted efforts of the new arrivals to encroach on their territory. Moreover, the removal did not prevent further encroachments by white farmers and squatters. With the help of the army, the lands reserved for Indians grew smaller, and as they fought to preserve what they had, the army imprisoned or massacred them. The Indian Act of 1834 established an Office of Indian Affairs to regulate trade in the new Indian territories, but unscrupulous white traders brought whiskey, guns and horses that added ammunition to the growing conflicts between Indians and whites. Indian agents, appointed by Washington to protect Indian rights, were more often agents of graft and corruption, selling off Indian land, timber and minerals.

Missionary-teachers continued their efforts to bring education to the Indians, but their efforts were largely useless in the face of over-

whelming Indian suspicion of the white man's every word. Moreover, there were so many Christian denominations that many Indians began questioning the validity of Christianity and began returning to their own, ancient beliefs. Chief Joseph of the Nez Perce warned that Christians "will teach us to quarrel about God as the Catholics and Protestants do. . . . We may quarrel with men sometimes about things on this earth, but we never quarrel about God."

In 1887, Congress tried to end the reservation system by allotting tracts of 160 acres each to Indian heads of households. The Dawes Act, as it was called, proved a failure, as unscrupulous traders bilked family after family of its property. In 1887, Indians owned about 138 million acres. By 1932, they retained less than 40 million. In the meantime, the Bureau of Indian Affairs had imposed a new system of compulsory education, whereby the sparsely settled children's population on the reservations were forcibly brought to central, reservation boarding schools. There, they learned trades which, as often as not, proved obsolete or useless on the barren reservation lands. Although the Citizenship Act of 1924 granted Native Americans *de jure* citizenship, it was not until the civil rights struggle of the 1970s and 1980s that they, along with African Americans, Hispanics, Asian Americans and other minorities won *de facto* citizenship and the same educational rights as all American citizens. In 1972, the Indian Education Act authorized a battery of new educational programs for Indians, including grants to local educational agencies and special literacy and job-training programs for Indian adults. By the early 1990s, these programs had reached about 78% of the more than 500,000 Indian children in the United States.

Two subsequent laws have also improved Indian education. The Indian Self-Determination and Education Assistance Act of 1975 and the Indian Education Act of 1978 together stripped the Bureau of Indian Affairs of many

of its powers and turned control of education over to Indians. The 1975 law allowed tribal groups to operate their own educational facilities, while the 1978 act empowered local Indian school boards to hire teachers and school staff, without interference from Washington. It also provided for direct funding of schools by the Bureau of Indian Affairs, which now underwrites more than 200 facilities, including day schools, on- and off-reservation boarding schools, tribally contracted schools and dormitories that permit Indian students to attend nearby white public schools. In 2000, the U.S. Department of Education created an Indian Teacher Corps to train 1,000 teachers to begin replacing the largely non-Indian teachers who work in reservation schools and have extraordinarily high turnover rates. At the same time, the federal government began giving annual scholarship grants averaging about \$3,000 to nearly 14,000 students attending America's 30 tribal-run Indian colleges. The Indian colleges serve more than 250 tribes in 12 western and mid-western states. Twenty-three are two-year colleges, and, in 2000, 85% of students were from families with incomes below the poverty level.

American Indian tribal colleges A group of 30 federally subsidized, tribal-run colleges serving about 14,000 American Indians and Alaskan natives from more than 250 tribes in 12 states:

- Arizona: Dine College (public, two-year)
- California: D-Q University (private nonprofit, two-year)
- Kansas: Haskell Indian Nations University (public, four-year)
- Michigan: Bay Mills Community College (public, two-year)
- Minnesota: Fond du Lac Tribal and Community College (public, two-year)
- Leech Lake Tribal College (public, two-year)
- Montana: Blackfeet Community College (private nonprofit, two-year)

Chief Dull Knife College (private nonprofit, two-year)
 Fort Belknap College (public, two-year)
 Fort Peck Community College (public, two-year)
 Little Big Horn Community College (public, two-year)
 Salish Kootenai College (private nonprofit, four-year)
 Stone Child College (public, two-year)
 Nebraska: Little Priest Tribal College (private nonprofit, two-year)
 Nebraska Indian Community College (private nonprofit, two-year)
 New Mexico: Crownpoint Institute of Technology (private nonprofit, two-year)
 Institute of American Indian Arts (public, four-year)
 Southwestern Indian Polytechnic Institute (public, two-year)
 North Dakota: Candeska Cikana Community College (public, two-year)
 Fort Berthold Community College (public, two-year)
 Sitting Bull College (public, two-year)
 Turtle Mountain Community College (public, four-year)
 United Tribes Technical College (private nonprofit, two-year)
 South Dakota: Oglala Lakota College (public, four-year)
 Si Tanka College (public, four-year)
 Sinte Gleska University (public, four-year)
 Sisseton-Wahpeton Community College (public, two-year)
 Washington: Northwest Indian College (public, two-year)
 Wisconsin: College of the Menominee Nation (private nonprofit, two-year)
 Lac Courte Oreilles Ojibwa Community College (public, two-year)

American Instructor, The By far the most widely used of the thousands of popular examples of didactic literature that flooded the American colonies during the 18th century. Cheap land, a boom in foreign trade and con-

stant labor shortages had put ingenuity, diligence and hard work on a par with inheritance as almost certain methods of obtaining wealth, status and power. Without schools, however, most would-be craftsmen were without the required literacy and skills. They turned for help to “how-to” books, and between 1689 and 1783, some 40 publishers throughout the colonial provinces had issued more than 18,000 titles.

Among the most popular were *The New England Primer* and *The American Instructor*. The former offered its readers literacy; the latter, an encyclopedia of information designed to further one’s career. It taught grammar and syntax, proper handwriting techniques, sample social and commercial letters, with all the accepted, stock clichés of the day, and the basics of commercial arithmetic and law. It also offered a lesson on currency values, provided sample commercial documents including bills of lading, invoices, deeds, wills and indentures, and offered practical advice in carpentry and bricklaying, in gardening and preserving fruits and vegetables, in British and colonial American geography, in astronomy and in preserving one’s health and treating illness and disease. Published in 1748 by Benjamin Franklin’s company Franklin and Hall, *The American Instructor* was actually a revision of an older work called *The Instructor: or, Young Man’s Best Companion*, originally attributed to a Mrs. Slack. Without the hindrance of copyright laws, printers throughout the colonies continued to print it in various forms for years thereafter.

Americanization The reshaping, through education, of the human character, regardless of national origins, into one uniquely suited for self-governance within the framework of the Constitution and laws of the United States. (*Americanization* is usually called assimilation by the lay public, but in education, *assimilation* is a technical term referring to the absorption

Americanization of millions of 19th-century immigrant men, women and children began with lessons in speaking, reading and writing English. (Library of Congress)

of knowledge.) Americanization was first envisioned by a handful of particularly idealistic and outspoken founders of the American republic. Among them were BENJAMIN RUSH, THOMAS PAINE, BENJAMIN FRANKLIN, John and John Quincy Adams, JAMES MADISON, NOAH WEBSTER and TIMOTHY DWIGHT.

Eager to overthrow the monarchic roots of the colonial social order, they planned to establish a uniform federal education system that would shape a new, republican and uniquely American character, based on a common new

American language, American history, American laws, literature and art and dedicated to creating a new American culture. But their vision of Americanization also included a common Christian Protestant religion and individual liberty for all. Other Americans had far different visions. The southern vision included slavery as integral to both the economy and Christianity. And most American men, both northern and southern, regarded women and children as chattel, again, with ample justification from the Scriptures. In addition, there

were few Americans in the North or South who welcomed replacing the centralized controls of the British monarchy they had just shed in the Revolution with a new federal board of education that would dictate how and what they must teach their children.

The War of 1812 reunited Americans against a common foe. The Protestant evangelical (see *EVANGELISM*) and the *AMERICAN LYCEUM* movements of the 1820s and 1830s furthered the process of Americanization by attempting to spread a common religion and a common approach to education across the nation. The Americanization movement suffered a setback when secularists such as *HORACE MANN* fought for disestablishment in states that had retained official religions, but the public school movement of the 1840s and 1850s, also led by Mann, restored the process by providing a common curriculum.

The Civil War all but reversed the process, and the peace that followed did little to revitalize it. In the South, *de jure* racial segregation of schools blocked Americanization of blacks for almost a century. In the West, Native Americans were herded onto reservations. In the North and East, hundreds of thousands of foreign immigrants jammed their way into American cities, where they settled in rigidly segregated ethnic ghettos, some voluntarily for the comfort of a familiar language, others, such as the Chinese, forced to live apart by their European predecessors.

At the end of the 19th century, an expanded public school system and a host of *SOCIAL SETTLEMENTS* set about trying to Americanize new arrivals, and social reformers coined the term “melting pot” to describe the assimilative process they hoped to inaugurate. Success was limited because only about 10% of American children went beyond sixth grade. Despite the hopes of social reformers and a few inspiring tales to the contrary, the vast majority of immigrant children at the turn of the century began

full-time work in factories, mines and farms at the age of five or six and spent the remainder of their lives in ethnic ghettos. There, they continued to speak the languages of the lands from which they had come and re-created as much as possible the culture of their countries. Even those who emerged from ghettos found life in the middle and upper classes rigidly segregated by religion and ethnicity. Jews, Catholics, Italians, Irish and other ethnic and religious minorities were routinely barred from many neighborhoods and towns, from many private schools and universities and from many companies and even entire industries. To compensate, members of such groups founded their own ethnocentric businesses, social clubs, living and recreation areas and even their own educational institutions. Moreover, not all the new arrivals to the United States sought assimilation—certainly not in the religious sense. The Catholic Church built the largest system of private schools in the United States to prevent religious assimilation of its members with the dominant Protestants. Jewish communities also built their own schools, and even among Protestants, the various sects vied to prevent assimilation of their memberships into a new common American Protestantism.

Blacks, meanwhile, remained totally segregated, in many states by law, by custom in the others. They lived in black neighborhoods, attended black churches, went to black schools and colleges, and held usually servile, uniquely black jobs. Although blacks were again excluded, World War I threw a generation of heterogeneous enlisted white men and draftees into the culturally homogenizing military machine. The Great Depression of the 1930s Americanized still more citizens by throwing them together into huge government-sponsored work and welfare projects. And when two generations of G.I.s marched home from the Second World War, dressed alike, talking alike and indeed looking alike, it appeared that the founding

fathers' vision of a single, uniquely American character had been achieved—especially when the G.I. BILL OF RIGHTS allowed tens of thousands of veterans of diverse backgrounds to attend colleges and universities together. But even G.I.s, who had assimilated on foreign battlefields and in colleges and universities after the war, were apt to encounter racial, religious and ethnic discrimination and segregation in housing, education, jobs and virtually every other area of American life. Once again, blacks did not participate in the process, and sociologists began to describe “two nations” in the United States, with two distinct cultures as well as skin colors. In 1946–47, 17 states (Alabama, Arkansas, Delaware, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, Missouri, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia and West Virginia), as well as the District of Columbia, had laws that segregated blacks and whites in all public facilities, including schools. Only 12 states had laws banning segregation. The landmark U.S. Supreme Court decision in the 1954 *BROWN V. BOARD OF EDUCATION OF TOPEKA*, however, seemed to set the nation on an inevitable path toward total Americanization. Not only did the Court declare segregation of the races illegal, it opened the door for similar lawsuits by other minority groups and forced passage of state and federal laws banning segregation and discrimination in housing, education, work and almost every other area of American life. For the first time in American history, complete Americanization—the assimilation and integration of all Americans, regardless of origin, into a single, unique new race—became at least legally possible.

Instead of seizing the opportunity they had fought so long and hard to obtain, however, Americans refused to give up their individual identities by abandoning their ethnoreligious traditions. Native Americans, Amish, Orthodox Jews, Blacks, Hispanics and many other ethnic

and religious groups openly resisted efforts by educators to assimilate them into an all-inclusive American culture. Blacks demanded courses in black studies (see AFRICAN-AMERICAN STUDIES); Orthodox Jews and Amish refused to attend public schools in many areas; Hispanics demanded BILINGUAL EDUCATION; and virtually every other ethnoreligious group demanded some degree of adaptation of the American curriculum to include instruction in their own cultures. By the early 1980s, sociologists had abandoned the term *melting pot* to describe American society, favoring instead the metaphor of an “American mosaic” made up of hundreds of distinct and dissimilar ethnoreligious minorities held together by a common cement. Later in the decade, a new, more accurate metaphor—“kaleidoscope”—prevailed, taking into account the overlapping of the different cultures in American society. Instead of ASSIMILATION, educators now talked of affiliation as the basic goal of the Americanization process.

In the 1990s, however, even the kaleidoscope concept began to fracture somewhat as an avalanche of illegal and legal immigrants thronged across U.S. borders. By 2006, the U.S. Office of Immigration estimated the number of illegal immigrants in the United States at more than 11 million, including about one million school-age children. In 2005 alone, an additional 1 million illegal immigrants were arrested and sent back across the Mexican border. About 60% of the illegals who successfully gained entry into the United States had crowded into four states—California (2.2 million), Texas (1 million), New York (500,000), and Illinois (450,000). Under a 1982 Supreme Court ruling in *PLYLER V. DOE*, all children in the United States are entitled to free elementary and secondary school education, regardless of immigration status. By 2000, the states were spending a total of about \$3.5 billion a year to educate non-English-speaking children, which included

legal as well as illegal immigrants. Since *Plyler*, eight states, including Texas, New York and Illinois, have extended in-state college-tuition benefits to illegal immigrants who attended high school in the state for at least three years and pledged to legalize their status by seeking permanent residency. Although 21 other states and Congress have considered similar laws, few immigrants have taken advantage of them. Most illegal immigrants are unaware of the laws, and even those who do know are, for the most part, academically unprepared for college. The few that are qualified to attend college can seldom afford even the reduced, in-state college tuition, and federal law bars illegal immigrants from receiving federal student loans and grants or participating in work-study programs. Although California, the state with the most illegal immigrants, passed a law allowing illegal immigrants to attend state colleges and pay reduced, in-state tuition rates, a group of out-of-state students sued the University of California, charging that the policy discriminates against American citizens by forcing them to pay higher tuition than students who are in the United States illegally.

Unlike immigrants of previous generations, only about one-third of new arrivals have applied for citizenship in recent decades. Estimated at nearly 20 million, the new alien population is believed to have resisted Americanization because of the ease with which air travel and efficient long-distance telephone service allow them to maintain ties to families and cultures in their native lands. Indeed, of the more than 33 million foreign-born people living in the United States in 2002, only about 13.5 million, or 41%, had become citizens. And unlike previous immigrant groups, the new immigrants have created subcultures that have remained unattached to the larger American society for as many as three generations.

Depending on their ages, between 10% and 20% of arriving immigrants are illiterate.

Twelve percent have no schooling. In contrast, most immigrants arriving in the United States 30 years earlier were Europeans with two years more schooling than the average American. By 1999, nearly one in five children born in the United States had at least one foreign-born parent. The number of children who spoke a language other than English at home made up 5% of all school-age children, as did the number of children who had difficulty speaking English. Two-thirds of all immigrants arrived from Latin America, and 40% found themselves in the lowest 20% in terms of income in the United States, and had two years fewer schooling than the average native-born American. To combat the resistance to assimilation by new immigrants, California and Arizona have, in effect, banned BILINGUAL EDUCATION in state public schools. In its place, schools have introduced new programs of at least one year of intensive instruction in English, to promote assimilation.

American Journal of Education A periodical edited by education pioneer HENRY BARNARD over a 27-year span from 1855 to 1881, it was the world's most important education periodical of its day, read by scholars everywhere. It eventually grew to 32 huge volumes of more than 800 pages each and remains the most important published 19th-century work in the field. Like many other journals of education of the era, Barnard's *American Journal* helped promote the public school movement and kept teaching professionals informed of new developments and techniques in their field. It contained many articles written by Barnard as well as by other leading educators, both American and European. It also provided a forum for school reformers who used its pages to share the political techniques they had used to coax the public and state legislatures to establish public school systems and expand educational opportunities for women. The journal also contained technical and professional informa-

tion for teachers, including pedagogical techniques and sample lessons and methods of teaching various subjects.

American Library Association The oldest and largest organization of professional librarians in the world. Founded in 1876 by about one hundred scholars, its early years were inextricably tied to that of MELVIL DEWEY. Although not a founder, the 25-year-old Dewey was everywhere to be seen at the initial, formative meetings. His goal was twofold: to convince the gathering librarians to adopt the new book cataloguing and classification system he had developed, and to adopt as their official publication the *Library Journal* that he and editor-publisher R. R. Bowker had founded. He succeeded in both tasks and became the association's first secretary.

With or without Dewey, the librarians would have formed their much-needed association. At the time, the number of libraries in America with more than 300 books in their collections had exploded to more than 3,500. Untold thousands of Americans who had not attended schools depended on library books for their education and entertainment. Librarians were, however, divided on the proper role of a library. Some saw libraries as repositories to preserve books for posterity and, therefore, to protect them from destructive handling by the public. Others saw libraries as educative institutions, whose role was to disseminate knowledge as widely as possible by distributing books into the greatest number of hands. Dewey influenced the new association to embrace the second position and adopt as its motto, "The best reading for the largest numbers at the least cost." By the mid-1920s, the association had become a force in making American libraries as central to the education of the citizenry as the public school system.

The ALA's tens of thousands of current members include librarians, library trustees

and others involved in librarianship. Among its primary functions are the accreditation of library education programs; promotion of government support for libraries; publication of the monthly *American Libraries* news magazine and of *Booklist* and *Choice*, two book guides to help public, school, college and research librarians select books and media; and the awarding of the annual Caldecott and Newberry medals for outstanding children's books. The association also promotes intellectual freedom through its Freedom to Read Foundation, the Intellectual Freedom Committee and the Office for Intellectual Freedom. The explosive growth of the ALA has forced it to apportion its functions among 11 semiautonomous divisions serving or dealing with, respectively, library trustees, library administrators and managers, college and research libraries, public libraries, school libraries, specialized libraries, children's library services, young adult services, reference and adult services, library technology, and resources and technical services.

American Lyceum The largest, best and most influential of the voluntary educational institutions that sprang up in towns and cities across America in the first half of the 19th century. The lyceum was founded in 1826 by Josiah Holbrook, a wealthy farmer-scientist who had attended Yale and emerged a fervent social and educational reformer. Inspired by Scotland's Andersonian Institution and similar organizations in England, Holbrook founded a network of self-help associations with two goals: to provide young men and the community in general with an inexpensive, practical education that would teach them various skills and crafts; and to bring higher education—especially science and technology—to the general public to help improve their lives.

Holbrook founded the first lyceum in Millbury, Massachusetts, where he delivered a series of lectures on the natural sciences. He then

organized his listeners—farmers, mechanics and others—to organize a self-help organization in which they shared skills, knowledge and other talents that improved the lot of all members. The Millbury Lyceum No. 1, Branch of the American Lyceum proved startlingly successful, and Holbrook set out as a missionary for his new educational movement. Within months, he had organized dozens of village lycea and county lycea, each with a local “board of mutual education,” which collected one dollar a year from each member.

The movement spread southward into Connecticut and other states, and by 1829 to every region of the United States. It became the most powerful new educative force in America at a time when Americans were hungry for skills and knowledge that would ensure their success in life. Public schools had yet to be established in most communities, and most ordinary Americans either could not afford or did not want to go to church-operated schools, which provided the only source of formal education. The movement was, in effect, America’s first secular public school system, and, more significant, its first public vocational school system.

The complexion of each lyceum varied from town to town, state to state and region to region, depending on member needs. It operated as a citizen democracy, providing varying degrees of education, culture, vocational training and entertainment and imbuing every community with heightened interest in education, libraries and intellectual pursuits generally. The Apprentices’ Literary Association in New Haven, Connecticut, was made up of workingmen. The Kennebunk, Maine, lyceum was largely a middle-class reading club and debating society. Cities such as New York and Chicago had various types of lycea—some for a general audience of young men, others for mechanics, still others for literary types. Initially, they drew on their own memberships for lecturers. The Concord, Massachusetts, lyceum, which was prob-

ably the most intellectually elevated in the nation, sponsored 14 concerts, 105 debates and 784 lectures during its first few years. More than 300 lectures were given by the area’s gifted residents, including Ralph Waldo Emerson, who gave 98 lectures, and Henry David Thoreau, who delivered 19. Many lycea created libraries, others provided the foundations for local schools and still others sponsored publications. Some evolved into important societies, associations and institutes for specific occupational groups, such as farmers, mechanics or teachers, while others became professional institutes to upgrade and provide mutual education for doctors, lawyers and engineers. The Franklin Institute in Philadelphia founded a high school, and Chicago’s Union Agricultural Society published the *Prairie Farmer*.

The voluntary self-help societies based on mutual help became one of the most important movements in the history of American education and may well have been responsible for halting the takeover of education by the church and opening the way for public acceptance of secular, public school education. The movement peaked in the late 1830s, then slowly began to fade in the years before the Civil War as public schools and then libraries sprouted across the nation and replaced lycea as primary providers of education.

American Missionary Association One of the many white, northern religious organizations that founded mission schools throughout the South to educate former slaves in the decades after the Civil War. A Congregationalist organization, the American Missionary Association insisted on keeping white faculties and white principals and presidents well into the 20th century at its all-black southern schools and colleges. This did not change until most were drafted during World War II and could only be replaced with blacks. When former (white) faculty and administrators attempted

to return, they were turned away amidst a barrage of criticism for having purposely undereducated their black students. Because of lack of adequate records, the quality of education under prewar white and postwar black administrations and faculty has never been compared.

(See also AFRICAN-AMERICAN EDUCATION.)

American Museum of Natural History

One of four great American museums whose founding after the Civil War marked a new era in the development of museums as public, educative institutions.

Opened in 1877, the American Museum of Natural History, along with the Art Institute of Chicago, the METROPOLITAN MUSEUM OF ART and the BOSTON MUSEUM OF FINE ARTS, was one of

the first great American museums founded as a nonprofit educational and cultural institution for the general public by a group of civic-minded wealthy benefactors, acting on behalf of the city government. The four museums represented a new concept in extracurricular American education, and they replaced the earlier profit-making museums such as PEALE'S NEW YORK MUSEUM and BARNUM'S AMERICAN MUSEUM, which had previously served that purpose.

Unlike many museums that concentrated on collecting, research and preservation, the American Museum of Natural History made public education its top priority from its inception. In addition to its exhibit halls and library, the museum publishes instructional literature, shows instructional films and conducts classes

President Hayes participating in the opening ceremonies of the Museum of Natural History, in New York City, December 22, 1877 (*Museum of Natural History*)

and offers lectures for school children, college students and the general public in its classrooms and auditoria.

Its role as an educative institution has not been at the expense of research, however, and it conducts important, original research in its extensive laboratories and sponsors scientific expeditions around the world. Not all of the latter have been free of controversy, however. In 1896, the museum's anthropologist Franz Boaz asked explorer Robert E. Peary to bring Eskimos back from Greenland to be studied at the museum. He brought back six—three men, two women and a boy—and exhibited them aboard his ship to paying customers before turning them over to be housed at the museum. With no natural immunities, all but the boy died of tuberculosis, and their bones were kept at the museum for nearly a century, before being returned to Greenland for burial in 1993.

Now maintained jointly by government and private contributions, the museum has an endowment of more than \$200 million and attracts about 3.6 million visitors a year. It maintains a collection of more than 36 million artifacts in halls of geology, minerals and gems, paleontology, forestry and conservation, invertebrates, insects, fishes, reptiles, birds, mammals, anthropology, biology and astronomy. The museum publishes the authoritative monthly magazine *Natural History*.

American Philosophical Society One of two competing societies made up of America's founding fathers and leading intellectuals. Founded in Philadelphia, in 1743 by BENJAMIN FRANKLIN, probably in conjunction with John Bartram, a farmer and botanist, the society was originally established as a scientific academy for "ingenious and curious men." At the approach of the American Revolution, it turned its attention to the diffusion of knowledge and the development of a system of public education for the new republic.

Like its competitor, the AMERICAN ACADEMY OF ARTS AND SCIENCES, the American Philosophical Society favored and worked for establishment of a national system of public education as essential to the ultimate success of democracy. Where the society differed from the academy was not over the question of a national education system but over the kind of knowledge the system would teach. The academy, supported by John Adams and his son John Quincy Adams, favored a classical curriculum, based on Latin, Greek, literature and philosophy. Benjamin Franklin and THOMAS JEFFERSON, who succeeded Franklin as president of the American Philosophical Society, favored the study of more practical courses such as natural science and natural history.

In 1795, the society held an essay contest calling for proposals for a national "system of liberal education and literary instruction . . . best calculated to promote the general welfare of the United States:—comprehending also, a plan for instituting and conducting public schools in this country. . . ." The proposal the society eventually espoused was "a uniform system of national education" made up of local parish schools, county academies, state colleges and a national university, with identical standards, curriculum and textbooks, under the direction of a central board of national education. Sectional differences in the 1830s eventually destroyed plans for implementing this and all other proposals for a national education system.

The American Philosophical Society is still located in Philadelphia and remains an honorary society, with members elected for their scholarly accomplishments in all fields of learning.

(See also EDUCATION; MADISON, JAMES; RUSH, BENJAMIN; WEBSTER, NOAH.)

American Samoa An unincorporated territory of the United States in the South Pacific

Ocean, acquired by treaty with Germany and England in 1899. Consisting of seven islands, of which six are inhabited by a population of more than 57,000, American Samoa has free, compulsory education for all children between the ages of 6 and 18. There are 30 public and 6 private schools, 160 primary village schools with a total enrollment of nearly 16,000 students and a community college with just over 1,200 students. Because of a chronic lack of education and job opportunities on the islands, the vast majority of Samoans have traditionally emigrated to Hawaii and California, where, together, they outnumber the population of Samoa.

American Sign Language (Ameslan) A language of the severely deaf that uses specific

finger, hand and wrist positions to signal letters, sounds, syllables and words. Considered by many to be a true language, Ameslan has its own grammatical rules and sentence structures and is not a word-for-word translation of English. The signed version of the English-language sentence "People label me as disabled" would, if translated literally, read, "Disabled, people label me, wrong."

(See also DEAFNESS.)

American Society Held in Philadelphia for Promoting and Propagating Useful Knowledge A clublike association formed in 1727 by Benjamin Franklin and nine other intellectuals to discuss "morals, politics or natural philosophy" and virtually every other area of human concern. Originally known

The sign language of the deaf

informally as Franklin's junto, it adopted its prodigious formal title in the 1760s as it grew in membership and influence. It had far-reaching influence in producing social reforms and legislation in Philadelphia and Pennsylvania. Franklin later merged it into the AMERICAN PHILOSOPHICAL SOCIETY after he helped found that organization.

American studies A wide-ranging, interdepartmental, college-level curriculum focusing on the history, political science, economics, sociology, science, literature, art, music, religion and culture, and their effects on the American nation and its society. Not all colleges have departments of or offer majors in American studies, and course offerings vary widely from school to school.

(See also AREA STUDIES.)

Americans with Disabilities Act of 1990

A federal law that expanded protection for the disabled with respect to employment opportunities and public services, including all educational facilities that receive federal funds.

(See also BARRIER-FREE CAMPUS.)

American Tract Society One of the many groups formed during the evangelical crusade of the 1820s and 1830s to convert Americans to Christianity. Originally formed in 1828 to publish Bibles and other scriptural literature for missionary societies, the American Tract Society organized huge networks of religious book peddlers who fanned out across the nation, as far west as the Mississippi Valley. In the absence of schools, school teachers and books of almost any kind, the American Tract Society's books served everywhere along the frontier as primary vehicles for learning to read, with the society's salesmen often serving as itinerant teachers.

American universities abroad A group of American colleges and universities either based overseas or operating overseas branch campuses of their U.S. facilities. Among the earliest American universities abroad were freestanding, independent entities founded to accommodate the personnel and children of the American diplomatic corps and American armed services. Founded largely after World War II and unaffiliated with one another, most differ from local universities in that they offer an American-style COLLEGE education. These institutions include the following.

American College of Greece, Athens, was founded in 1875 as the American School for Girls and now has more than 2,100 men and 3,200 women undergraduates—90% of them from Greece. It has no graduate school.

American University in Cairo, Egypt, was founded in 1919 and now has three undergraduate and three graduate schools—the former with more than 2,000 men and 2,250 women, the latter with about 350 men and more than 500 women. Ninety-two percent of students are from Egypt.

American University of Paris, France, was founded in 1962 and counts 700 men and women in its undergraduate school.

American University of Rome, Italy, was founded in 1969 and has about 135 men and 250 women undergraduates—65% of them from Italy. It has no graduate programs.

Franklin College Switzerland, Sorengo (Lugano), Switzerland, was founded in 1969 and now has about 100 men and 150 women undergraduates. It has no graduate programs.

John Cabot University, Rome, Italy, is a school of undergraduate studies founded in 1972. It now has about 200 men and 250 women.

Richmond, the American International University in London, Richmond, Surrey, England, was established in 1972 and has about 550 each of men and women undergraduates and about 50 men and 50 women in graduate program. The school also offers associate degrees.

American University—Central Asia, Bishkek, Kyrgyz Republic, was founded in 1994 and has

1,200 undergraduates, almost evenly divided between men and women, and 50 graduate students in business administration. About three-quarters of the students are Kyrgyz, and the remainder are largely from other Central Asian countries.

Other independent American universities are in Afghanistan (Kabul), Bulgaria (Blagoevrad), Lebanon (Beirut) and Sharjah, one of the seven autonomous emirates that make up the United Arab Emirates on the Persian Gulf adjacent to Saudi Arabia.

In addition to the independent American universities, however, are several dozen branch campuses of United States-based colleges and universities. Overseas operations range from freestanding campuses offering complete undergraduate and graduate degree programs to single-department offerings, such as business administration or American law, in existing foreign universities. State University of New York at Buffalo, for example, operates a branch campus in Singapore for 250 students enrolled in bachelor's and master's programs in business and communications. Although some American colleges have long maintained overseas study programs for American students of foreign languages or European art, for example, the new foreign-study programs are designed primarily for foreign students—often in response to tough new visa requirements for foreign students who seek to study in the United States. Expansion of international trade has made it essential for more and more foreign students to obtain the practical type of education in English offered by undergraduate and graduate business programs of American colleges and universities. Most foreign students come from wealthy families who gladly pay whatever the American colleges charge. Foreign students with degrees from both their home institutions and the branch campuses of American or other English-speaking institutions of higher education can usually enhance their

future earnings dramatically. The result has been a surge in demand for English-language institutions to expand overseas. Almost 40 Australian universities have opened overseas campuses, and British and Canadian institutions have followed suit. China alone has attracted 17 American colleges, Singapore six, and India and Qatar five each. Indeed, tiny oil-rich Qatar on the Persian Gulf has established a higher-education center, Education City, where the emirate royal family is spending more than \$1 billion to set up branch campuses of Weill Cornell Medical College, Texas A & M University Engineering School, Carnegie Mellon's business and computer-science programs, and Georgetown University's foreign-service education program. Similarly, the United Arab Emirates have built Knowledge Village, where, as in Qatar, the emirs insist they want no special admissions advantages for their princely heirs.

American institutions with overseas campuses include Boston University (Belgium), Carnegie Mellon University (Australia, Greece, Japan, Qatar, South Korea), Cornell University (Qatar), Florida International University (China), Florida State University (Panama), Fordham University (China), Georgetown University (Qatar), George Mason University (United Arab Emirates), George Washington University (Hong Kong, Singapore), Georgia Institute of Technology (France, Singapore), Massachusetts Institute of Technology (Singapore), Missouri State University (China), Ohio State University (Thailand), Ohio University (China), Pace University (China), Rochester Institute of Technology (Croatia, Czech Republic, Dominican Republic), Roger Williams University (Vietnam), State University of New York (India, Singapore), Stevens Institute of Technology (China), Syracuse University (China), Temple University (Japan), Texas A & M University (Qatar), Troy University (Ecuador, Germany, Hong Kong, India, Malaysia, Sri Lanka, Taiwan,

Thailand, United Arab Emirates, Vietnam), University of Chicago (Britain, Singapore), University of Delaware (Bosnia and Herzegovina), University of Dayton (India), University of Hawaii (Vietnam), University of Indianapolis (Greece), University of Maryland at College Park (China), University of Michigan (China), University of Nevada at Las Vegas (Singapore), University of Texas at Arlington (China), Virginia Commonwealth University (Qatar), and Washington University at St. Louis (China).

In addition to conventional, nonprofit institutions of higher education, companies operating for-profit American colleges and universities have established a presence across the Americas, with DeVry, Inc., Apollo International (PHOENIX UNIVERSITY), Laureate Education, and others operating in Canada, Mexico and nearly a dozen countries in Central and South America and the Caribbean, as well as Europe and Asia.

(See also FOR-PROFIT COLLEGES.)

America 2000 A national strategy proposed by President George H. W. Bush's administration to improve the quality of American public schools and make U.S. pupils "first in the world" by the year 2000. The program was designed by the 14-member bipartisan National Education Goals Panel of governors, appointed by President Bush in response to studies showing that academic skills of American students had declined despite increases in spending on education to more than \$400 billion annually.

Included in America 2000 was a federal legislative package, however, that died in Congress because of partisan disagreements over one of its central features: SCHOOL CHOICE. In addition, America 2000 proposed the first voluntary national academic standards for elementary and secondary school students.

The other goals of the program included:

- Making all incoming kindergartners school-ready;

- Increasing high school graduation rates to 90%, from less than 75%;
- Making American students first in the world in science and mathematical achievement;
- Making all American adults literate and equipping them with marketable job skills;
- Imposing an atmosphere of discipline conducive to learning in all schools and making them free of drugs and violence;
- Ensuring that all fourth, eighth and twelfth graders demonstrated competence in English, math, science, history and geography appropriate to their grade before permitting them to progress to higher grades or to graduate from high school.

The program would have provided federal funds to underwrite state education reforms and upgrade teacher training. It was revived in 1993 by the administration of President Bill Clinton, under the new name of GOALS 2000.

AmeriCorps A national service organization in which volunteers are rewarded with credits of nearly \$5,000 a year toward their college or university education. Established by President Bill Clinton in 1994, AmeriCorps enrolls young men and women to work on problems related to education, public safety, social services and the environment. In exchange for a two-year commitment, participants in the first year of operations were paid \$7,500 a year (minimum wage) and a credit of \$9,450 (\$4,725) a year that could be used for paying for college or graduate school at the end of their government service. Specific jobs included restoring wildlife habitats, conducting childhood immunization programs, escorting children and the elderly through dangerous inner-city neighborhoods, counseling drug abusers, providing preventive health services and improving neglected playgrounds, parks and wetland. Administered by the Corporation for National Service, AmeriCorps enrolled 20,000 in its first year. By 2005, enrollment grew to 70,000.

An AmeriCorps member tutors students in algebra. (Corporation for National and Community Service, Office of Public Affairs)

Amherst College One of America's most academically selective colleges and a pioneer in curriculum reform. Founded in Amherst, Massachusetts, in 1821 by a group headed by NOAH WEBSTER and including Samuel Dickinson (poet Emily Dickinson's grandfather), Amherst began much as ANDOVER THEOLOGICAL SEMINARY did, as a conservative alternative to the liberal Unitarian theological program at Harvard. By 1823, it had changed to a four-year college offering both classical and theological curricula.

In 1827, JACOB ABBOTT, a professor of mathematics and science, led the faculty in urging

reform of the classical curriculum to meet the needs of an expanding nation and a new class of students bound for business, commerce and agriculture rather than the learned professions. The reformers did not suggest abandoning classical education or, indeed, lowering the requirements for admission, namely competence in Greek and Latin. They merely suggested adding a second, nonclassical curriculum that would substitute French and German for Greek and Latin and stress modern history, civil and political law, the natural sciences and the art of teaching. The trustees agreed, but they refused to award a degree for the new curriculum, and after a surge of initial interest, students stopped enrolling in the program. Abandoned in 1829, it nevertheless served as a model for other colleges and, eventually, for Amherst itself after the Civil War.

Since then, Amherst (which is named for the town, not the British colonial officer in the college's official song) has remained a four-year liberal arts college dedicated to teaching undergraduates. It eschewed the post-World War II tendencies of similar colleges to expand into universities and avail themselves of the lucrative research grants available from the federal government. The college has more than 1,600 students taught by a faculty of about 160 men and women, 96% of whom have Ph.D.s. Once an all-men's college, it first admitted women in 1975, and they now constitute about half the student body. Amherst participates in the Five College Consortium with Hampshire College, MOUNT HOLYOKE COLLEGE, Smith College and the University of Massachusetts at Amherst, under which students may cross-register in courses at participating schools and receive credit toward their Amherst degree.

Amidon Plan One of the early BACK-TO-BASICS programs, introduced in the early 1960s in the Amidon Elementary School in Washington, D.C., by Superintendent of Schools Carl F. Hansen.

Hansen imposed strict student discipline and a track system that grouped students according to their abilities and rate of progress. Teachers used DIRECT INSTRUCTION and a rigid, predetermined schedule to teach what he called the “building blocks of intelligent behavior”: Reading, writing, spelling, penmanship, speaking, grammar, mathematics, science, U.S. history, geography, health and physical education, music and art. The program was the target of harsh criticism from many educators, who called it so scholastic and narrow in its educational coverage that it failed to meet the needs of its students. The program had few measurable effects on student performance and was abandoned at the end of Hansen’s incumbency.

analogies test item A commonly used question on standardized tests to measure scholastic aptitude. Such questions ask students to recognize the relationship between two words and demonstrate that recognition by constructing a second, parallel relationship with two other words. Analogous pairs may be based on a variety of relationships, such as opposites, as in black:white::dark:[*light*]; or makeup and composition, as in water:ocean::sand:[*desert*]; etc. Analogies test items, like other questions in standardized tests, may be presented in a variety of forms, including completion questions, true-false questions or multiple-choice questions.

ancient languages In American education, a term referring only to Hebrew, Greek and Latin, which together with the study of classical and biblical literature were required elements of the curriculum for Christian gentlemen in colonial grammar schools, academies and colleges. Hebrew and Greek were the languages of the Bible, and for centuries Latin was the language of the church, which controlled formal education and the great universities in western Europe and conducted classes in Latin.

Knowledge of Latin, Greek and Hebrew remained a requirement for admission to American colleges in the early 1800s, when the study of theology and of the scriptures in their original languages were central to the curriculum. To meet the needs of an expanding nation, however, colleges began broadening their curricula in the 1820s to include a more practical education. Public schools and colleges added such utilitarian courses as English, mathematics, chemistry, botany, physics, biology and zoology, American history and modern languages. The construction of canals and railroads and the discovery of valuable ores also made civil, mechanical and mining engineering essential elements of the curricula at all but a handful of colleges. There was no room or need for Latin, Greek or the rest of the classical curriculum—especially at LAND-GRANT COLLEGES that became the foundations of higher education in the Midwest, South and West.

Hebrew was the first of the ancient languages to be dropped from the classical curriculum at private colleges, although Greek and Latin remained requirements for the entire 19th century. The early 20th century saw Greek gradually disappear from the classical curriculum, but Latin remained a requirement until after World War II. After the war, however, tens of thousands of discharged veterans—mostly public school graduates with no knowledge of Latin and funded by the G.I. BILL OF RIGHTS—poured onto the nation’s college campuses. Rather than risk losing many gifted students, the few colleges that still required it dropped the Latin requirement. For a little more than a decade thereafter Latin remained a requirement for admission to graduate schools of medicine, but they too had to yield to the near impossibility of pursuing Latin studies at public schools and colleges. By the end of the 1990s, student interest in ancient languages had declined dramatically, with only about 16,000 college students studying any ancient Greek and about 25,000

studying one or more courses in Latin. Fewer than 750 of 1,165,000 American college students earned bachelor's degrees in ancient languages; only about 275 students earned master's degrees and fewer than 60 earned doctorates.

Andersonian Institution A system of popular, practical education in Glasgow, Scotland, and probably the model for Josiah Holbrook's AMERICAN LYCEUM. At the heart of the Scottish institution was the museum and library that Professor John Anderson had built and bequeathed to it to provide education for commoners in 1796. In 1800–1801, George Birkbeck, a young professor at the Andersonian, moved to London and founded a similar institution—the London Institute for the Diffusion of Science, Literature, and the Arts. The institute offered lectures on each of those subjects, as well as philosophy, to audiences of mechanics, artisans and other commoners. Groups of mechanics in Glasgow and London were so inspired by their educational experiences that they founded their own mechanics' institutes in both cities.

Sponsored by Birkbeck and HENRY BROUGHAM, a former classmate of his from the University of Glasgow, the new mechanics' institutes and the Andersonian institutions were the forerunners of the British state school system, and it was Brougham's article about the institutes in the *American Journal of Education* that inspired Holbrook to found what he first called the "Universal Lyceum" in the United States.

Andover Theological Seminary One of the first and most distinguished of the theological seminaries in the American colonies. It was founded in 1808 by Congregationalist conservatives who rebelled against the growing Unitarian influence at HARVARD COLLEGE, which was the former training ground for Congregational ministers. Andover was one of about 10 schools of theology of various denominations

that opened in the United States after the Revolutionary War to accommodate the growing number of Christian sects that immigrants were bringing to the young nation. The Dutch Reformed opened their first school of theology in 1784. The Roman Catholics followed suit in 1797, the Presbyterians in 1812, the Lutherans in 1815, the Episcopalians in 1819, the Baptists in 1820, the German Reformed in 1825 and the Methodists in 1839.

Instead of founding their own seminary, however, the UNITARIANS simply took over the theology department at Harvard College, thus forcing the more conservative Congregationalists to establish their own, new seminary at Andover, Massachusetts. Andover required applicants to have a baccalaureate degree from a liberal arts college and then examined them in Latin, Greek and Hebrew. Students came from such colleges as AMHERST, Williams and DARTMOUTH to study for three years under distinguished scholars such as Ralph Waldo Emerson. Among Andover's most distinguished graduates was author-educator JACOB ABBOTT.

andragogy The art and science of teaching adults, as opposed to PEDAGOGY, the art and science of teaching children. Adults generally enter the classroom voluntarily and are, therefore, readier and more motivated to learn, more self-directed, less dependent on others and more goal oriented. Goals vary widely, but are usually specific and near-term, such as acquiring skills for a higher-paying job.

anecdotal record A teacher's accumulated written descriptions of student behavior. Akin to a ship's log, anecdotal records detail everything the student did or said in specific situations deemed important by the teacher. The dated records should give the background of each incident and the setting (classroom, playground or extracurricular activity). Anecdotal

records also include summaries of all teacher-student and teacher-parent conferences.

Anecdotal records describe each student's day-to-day behavior patterns, interests, attitudes and strengths, as well as problems. Although anecdotal records can often be helpful to counselors and school psychologists dealing with troubled students, their subjective nature and the possibility of teacher bias can have harsh consequences for some children. Biased records, for example, can affect the chances of success for students applying to academically selective private schools or for high school students applying for jobs or for admission to college. To prevent misuse of anecdotal records, Congress passed the Family Educational Rights and Privacy Act as part of the Educational Amendments of 1974. Named after Sen. James Buckley (R, N.Y.) the Buckley amendment gives parents the right to see all confidential school records and challenge any anecdotal records or other data they deem unfair or inaccurate.

Annapolis The popular name for the United States Naval Academy, which is located at Annapolis, Maryland. See UNITED STATES NAVAL ACADEMY.

Annenberg Foundation A charitable foundation established in 1989 by publishing-broadcasting magnate Walter H. Annenberg to underwrite a variety of educational projects. Within four years of its founding, the organization had contributed more than \$1 billion to public and private education, including the largest single gift to public education in American history—a \$500 million “challenge” gift that generated \$566 million in matching grants from public and private sources for 18 school reform projects across the United States. The COALITION OF ESSENTIAL SCHOOLS and the New American Schools Development Corporation each received \$50 million grants, for example.

In turn, such groups used the funds to establish new types of public schools. In New York City, for example, advocacy groups used more than \$60 million in Annenberg Foundation funds to establish 50 small experimental schools to serve about 50,000 students who were transferred from large, overcrowded schools. Research at the time had indicated that students perform better academically in smaller schools than in large ones. Another \$25 million in New York was spent on school improvement projects, including support for the arts and music.

Similar grants went to school districts in Philadelphia, Detroit, Chicago and Los Angeles. In Philadelphia, \$50 million were used to divide 22 high schools, 65 middle schools and 100 large elementary schools into separate, independent “SCHOOLS-WITHIN-A-SCHOOL” of 400 to 500 students each.

Although urban education received the vast majority of the funds earmarked for public education, other grants were made for improving arts education, for improving rural education and for developing an electronic reference library that was to be made available to every high school in the United States.

Other major educational grants made by the Annenberg Foundation during its early years were \$120 million each to the University of Pennsylvania and University of Southern California; \$100 million to the Peddie School, a private boarding and day school in Hightstown, N.J., that Annenberg attended as a boy; \$50 million to the United Negro College Fund; and \$25 million each to Harvard University, Northwestern University and the Williamsburg, Va., Foundation Education Center.

Born in 1908, Annenberg founded *TV Guide* after the birth of the television industry and built it into one of the most widely circulated publications in the United States. He also owned such publications as *Seventeen* magazine and *The Racing Form*; in 1988, he sold his

magazine holdings for \$3 billion. Annenberg also underwrote the founding of the Annenberg School of Communications at the University of Pennsylvania in Philadelphia.

anomia (dysnomia) A learning disorder characterized by a consistent inability to recall names of common, well-known objects or persons.

antievolution legislation A succession of laws, usually enacted in southern states, that make it illegal to teach the theory of evolution. An outgrowth of the rebirth of Christian fundamentalism after World War I, antievolution legislation was introduced in six states. Kentucky, North Carolina and Texas narrowly rejected the new laws in 1921 and 1922. In 1923, however, Oklahoma banned from public schools any books containing the Darwinian theory and Florida made it "improper and subversive" to teach atheism, agnosticism, Darwinism or any other theory of evolution that tied man's origins to other forms of life. Two years later, Tennessee made it a crime for teachers in public schools or universities "to teach any theory that denies the story of the Divine Creation of man as taught in the Bible and to teach instead that man has descended from a lower order of animals."

To test the constitutionality of the law, the American Civil Liberties Union in New York found high school science teacher John Thomas Scopes, in Dayton, Tennessee, to agree to violate the law and face prosecution in what became the world-famous Scopes monkey trial. Although Scopes was found guilty, the public humiliation of those believing in literal interpretation of the biblical origins of man and Earth brought a temporary end to efforts to enact antievolution legislation.

Although Christian fundamentalism experienced another national revival after World War II, the new generation of fundamentalists

were schooled enough in constitutional law not to try to ban the teaching of evolution. Instead, they sought to introduce "creation science" as a part of the public school science curriculum. In 1987, however, the U.S. Supreme Court, ruling in the case of *EDWARDS V. AGUIL-LARD*, in effect declared the teaching of creation science in public schools unconstitutional. The Court said that creation science represented a specific religious belief and was contrary to accepted scientific theories. It held that a Louisiana law forcing students of evolution to study creation science violated the First Amendment of the Constitution, mandating complete separation of church and state. Despite the Louisiana decision, many states have continued to introduce laws mandating the teaching of creation science. Although each effort has been condemned by teachers and eventually overruled by federal courts, the efforts continue. The most recent of these have included state education board rulings ordering a more "balanced" approach to instruction about the origins of mankind. Although it reversed its decision in 2001, the Kansas Board of Education ordered schools to delete all mention of evolution in science curricula in 1999. Kentucky ordered schools to delete the word "evolution" in favor of the phrase "change over time," and Oklahoma officials ordered all science textbooks to carry a disclaimer about the certainty of evolution. In addition to officially mandated changes in the curriculum, a growing number of teachers committed to "the inerrant word of God" organized so-called creation clubs in several hundred public schools across the nation. Although public ridicule forced the boards of education in Kansas, Kentucky, Oklahoma and other states to rescind orders banning the teaching of evolution, the emergence of a repackaged form of creationism called INTELLIGENT DESIGN again placed the teaching of evolution in jeopardy in many areas. In 2005, the Kansas Board of Education mandated the

introduction of intelligent design in the state's public school science curriculum. A theory that an as-yet-unidentified guiding force directed the development of living organisms, including humans, intelligent design was developed as an alternative to Charles Darwin's theory of evolution and claims that living organisms are too complex to have evolved from common ancestors through natural selection and random mutation. Underlying the argument for intelligent design is the concept of "irreducible complexity," which holds that the interdependent parts of most organisms make it impossible for them to have existed in any other earlier, more primitive form. Unlike CREATION SCIENCE, or creationism, the theory of intelligent design carefully avoids all references to religious beliefs, which, by injunction of the United States Supreme Court, the public schools are prohibited from teaching or disseminating. Nonetheless, a Federal District Court in Harrisburg, Pennsylvania, ruled in late 2005 that intelligent design was as much a religious viewpoint as creationism and that public schools injecting it into the science curriculum were in violation of the First Amendment of the Constitution. Early in 2006, the Ohio Board of Education responded to the court decision by reversing a previous order that 10th grade biology classes include a critical analysis of evolution. Later in 2006, Kansas voters ousted the conservative majority on the state Board of Education and installed a new, moderate board that pledged to restore a traditional science curriculum that does away with all mention of intelligent design and restores straight-forward teaching of evolution.

Across the nation, the teaching community had been rather slow to react to the intrusion of religious zealots into education, but the National Center for Science Education, with 4,000 members, finally began staging a continuing series of seminars to prepare teachers to lead their communities in defending evolu-

tion theory as essential to proper grounding in science education. New Mexico's Board of Education responded by barring creationism from the public school science curriculum and endorsing the teaching of evolution theory.

(See also *KITZMULLER V. DOVER AREA SCHOOL DISTRICT*.)

Antioch College The first completely non-sectarian, coeducational college and the first to integrate off-campus work and practical education with academic classroom education. Founded in 1852, Antioch moved immediately to the forefront of education because of its innovative first president, educational visionary HORACE MANN. Mann replaced the traditionally adversarial teacher-student relationship with close student-faculty ties. He abolished the system of grade competition, put students on their honor and made Antioch the first college to integrate females into the faculty as well as the student body. One thousand applicants

The original main entrance to Antioch College, Antioch, Ohio (*Antiochana Collection, Antioch College*)

applied to enroll in the first class, which only had space for six students—four men and two women.

Named after one of the early centers of Christianity in ancient Syria, Antioch remained an innovative institution in the 20th century as well. In 1920, President Arthur Morgan introduced the first cooperative education program in which liberal arts college students alternated classroom study with off-campus work assignments. Designed to educate the “whole” student, Morgan’s required WORK-STUDY program sought to establish strong ties between local industries and the academic community.

In 1978, Antioch became a university. Still an innovator, it continues to require five co-op jobs for graduation, each lasting 16 weeks. The college is part of a consortium that permits cross-registration with 17 other institutions of higher education in Ohio, and it has an extensive study-abroad program in 15 countries. Of the college’s 570 students, about 350 are women.

anti-Semitism The hatred of Jews. With its roots tied to the death of Christ, anti-Semitism pervaded the American educational structure until the passage of the federal CIVIL RIGHTS ACT OF 1964 outlawing discrimination on the basis of race, color, religion, sex and national origin. Although passed ostensibly to redress the grievances of black Americans, the act effectively ended overtly discriminatory policies that blocked or limited the admission of Jewish and all other minority students and the hiring of Jewish and other minority faculty at thousands of private and public institutions. Prior to its passage, academically prestigious independent private schools and colleges had, since their beginnings, restricted or barred admission of Jewish students. In July 1934, for example, the Dartmouth College dean of freshmen and director of admissions proclaimed that he was “grieved beyond words” by the “Jewish prob-

lem” and pledged to limit the number of Jewish students to no more than 5% or 6% of the incoming freshmen class. As late as 1945, Dartmouth president Ernest M. Hopkins admitted turning down Jewish applicants simply because they were Jewish, adding, “Dartmouth is a Christian College founded for the Christianization of its students.” His words, in effect, pinpointed the origins of institutional discrimination against Jews in higher education. Most of the colleges had started as Christian Protestant schools of theology to train ministers for the church, and almost all of the private elementary and secondary schools had been founded by Christian ministers and run as offshoots of Christian churches. Even after they expanded their curricula to include an education in the arts and sciences, most retained a Christian bias. As they trained the first generations of teachers and professors to found and staff public schools and colleges across the nation in the 19th century, those biases permeated public institutions.

Evidence of anti-Semitism, as well as other religious, racist and sexist biases, continues to be seen in occasional student slurs and graffiti, but thousands of schools and colleges—many of which once openly barred Jews from their faculties and student bodies—have introduced Holocaust studies and other programs designed to foster closer ties and understanding among all students.

antistrike laws In education, those state laws that bar striking by public employees such as teachers, administrators and staff at state-run elementary and secondary schools and colleges and universities. Most simply make such strikes illegal and provide for fines, imprisonment or both for strikers and union leaders and fines for the union. Those without outright bans give government the right to obtain relief from such strikes by court injunctions that force workers back to their jobs

while their representatives engage in collective bargaining with management and impartial mediators. A strike or refusal to bargain under such laws allows the court to impose jail sentences and fines for contempt of court. Despite antistrike laws and the harsh penalties for violating them, teachers almost always strike some school system somewhere in the United States each autumn—usually over salaries. Some teachers are almost always imprisoned as a result.

The National Education Association, with 2.2 million members, and the American Federation of Teachers, with nearly 1 million, together represent almost all public school teachers in collective bargaining in the United States. Both maintain defense funds to provide striking and imprisoned teachers with legal assistance.

aphasia An inability to understand words and say them. Usually caused by neurological damage, aphasia may be limited to the inability to comprehend words (receptive aphasia) or the inability to express them (expressive aphasia)—even when the patient knows what he or she wants to say. Once called adult-onset aphasia, it was believed to be exclusively associated with strokes suffered by adults until researchers began describing similar symptoms among children who were subsequently identified as having congenital or development aphasia.

apperception A 19th-century term used by psychologists to describe the mental process by which individuals evaluate new knowledge (data, concepts, sensations, etc.) and, after relating them to previously acquired knowledge, absorb them into their knowledge base.

applied studies A curriculum of academic courses taught and learned by using new knowledge to solve immediate, practical problems. Usually associated with vocational edu-

cation, applied studies focus on practical goals. The training for cabinetmaking, for example, would involve not only learning manual skills but also the principles of measurement, mathematics, plane and solid geometry and even physics, and applying the principles learned to the construction of an actual piece of fine furniture.

Applied studies was an outgrowth of various 19th-century experiments in education. The HAMPTON INSTITUTE may have pioneered applied education after the Civil War, when it taught former slaves the academic and vocational skills needed to lead independent, productive lives. Booker T. Washington carried applied studies a step further at TUSKEGEE INSTITUTE, where he taught former slaves a broad variety of vocational skills and the academic basis for the successful application of those skills. All students learned all aspects of construction, manufacturing and farm management by participating in erecting and maintaining the institute's buildings and operating its many farms and factories. Graduates later took their skills into the community as working professionals.

Pioneer educator JOHN DEWEY refined applied studies as a pedagogical technique he called "learning by indirection," at his experimental LABORATORY SCHOOL, a primary school he founded at the University of Chicago in 1896. Now called indirect instruction, the method used entertaining class projects such as playing house and building and operating an imaginary farm to learn skills such as sewing, cooking, carpentry and planting. Indirectly, students also acquired the academic knowledge—arithmetic, reading, writing, history and science—needed for the successful application of their skills to class projects.

Abandoned in favor of more traditional and often swifter DIRECT INSTRUCTION for many years, indirect instruction, now often called ACTIVE LEARNING, is widely used in combination with direct instruction in most classrooms.

apprenticeship A formal vocational training program in which students learn the skills for a particular trade on the job—usually under the tutelage of a master craftsman.

Apprenticeships date back to the 13th-century European guilds, in which master craftsmen agreed contractually to train young men in their crafts, much as they might their own sons. Apprenticeships generally lasted seven years, during which the master provided his apprentices with room, board, clothing and tools. In exchange, apprentices provided labor, starting with menial tasks at first, but gradually becoming more valuable as their skills improved.

The 19th-century industrial revolution and the 20th-century technological revolution changed the complexion of apprenticeships, as the practice of even the simplest crafts demanded an ever expanding base of academic knowledge. Moreover, the demand for more skilled workers made it impossible for individual craftsmen to train as many workers as the market needed. Schools and colleges began filling the gap by providing basic apprenticeship training, along with needed academic skills. The post-Civil War years saw the HAMPTON INSTITUTE, the TUSKEGEE INSTITUTE and similar institutions providing a combined academic-vocational education for former slaves, while the LAND-GRANT COLLEGES did the same for whites. Graduates still entered the workplace as apprentices, but they came with enough basic skills to become master craftsmen after only one to five years of on-the-job apprenticeships.

The National Apprenticeship Act of 1937 gave the U.S. Labor Department responsibility for setting standards for apprenticeship programs in companies involved in interstate commerce, and the department maintains a Bureau of Apprenticeship and Training in every state. Most states have comparable regulatory laws and agencies. Today's typical apprenticeship programs require a high school diploma and a solid command of basic academics. Most pro-

grams require about 2,000 hours of supervised, on-the-job training plus related instruction either in classrooms, by correspondence or self-study. There are more than 800 types of apprenticeship programs officially approved by the U.S. Labor Department and the 50 states—most of them under joint sponsorship of unions and industry.

Because of a shortage of apprenticeship programs and rampant nepotism in admission policies, fewer than 2% of American high school graduates—less than 1,000—are enrolled in such programs, most of them sons and daughters of union members. Many trades offer no programs at all, and fewer than 20% of the 300,000 participants in existing programs are under 23 years old. In contrast, Germany, which has the most sophisticated apprenticeship system in the world, boasts nearly 2 million participants. Run by the Federal Labor Agency, the German system is a cooperative education program that puts about two-thirds of all students into vocational schools after their sophomore year of high school. A model for the growing COOPERATIVE VOCATIONAL EDUCATION programs in the United States, the German apprenticeship system combines the last two years of vocational high school with three years of on-the-job apprenticeships in virtually every German company. German industry spends an average of about \$8,500 a year per apprentice. The Federal Labor Agency's economists predict which industries are most likely to grow each year and guides apprentices accordingly. In contrast, most American companies prefer spending funds to train and retrain current workers and reserve apprenticeships for more mature applicants. More than three-fourths of American apprentices are 23 years and older.

apraxia An inability to perform specific voluntary muscular movements, such as speaking (verbal) or using classroom materials

(nonverbal), even in the absence of any evidence of paralysis. Believed related to the brain's neurological connections between ideation and motor activity, apraxia seldom produces muscle weakness, atrophy or spasms and does not affect involuntary muscles or movements. Thus, a student consciously unable to use his hand to pick up a pencil can involuntarily scratch a sudden itch. The degree of apraxia determines the ability of a student to adapt to conventional classroom conditions.

aptitude The ability to learn. A broad term, with a wide variety of meanings, aptitude may be genetic or acquired or both. Because of the developmental nature of various acquired aptitudes, they may change radically from year to year. Aptitude may be general or specific, mental or physical, scholastic or vocational, and may or may not reflect intelligence or accurately predict future performance. The most mentally retarded have aptitudes for learning some skills, and emotional factors may affect performances of students with high aptitudes. The correlation between aptitude and future performance usually depends on the amount and quality of subsequent training.

Scholastic aptitude, which reflects a student's general ability to perform in school, is made up of a wide variety of specific component aptitudes such as mathematical, verbal comprehension, verbal expression, language, abstract reasoning, scientific, artistic and musical.

(See also *APTITUDE TESTING*.)

aptitude testing Any of a variety of systems for evaluating an individual's ability to learn. Unlike achievement tests, which are designed to measure a student's accumulated knowledge, aptitude tests are designed to predict future performance by measuring what psychologists believe are intellectual constants that are akin to intelligence and remain unaffected by previous education. Many schools

routinely use standard intelligence tests, such as the *STANFORD-BINET INTELLIGENCE TEST* or *WECHSLER INTELLIGENCE SCALES*, to measure scholastic aptitude. Although many such tests correlate well with future academic performance, some educators argue that they may measure nothing more than a student's accumulated knowledge and level of mental and physical development. Despite denials from test designers, special tutoring has produced statistically significant improvements in test scores of some students. Nevertheless, all schools rely heavily on the results of aptitude tests—public schools to place students in an appropriate track or ability group, and private schools and colleges to determine which applicants to admit.

Test designers classify aptitude tests into three types: general, specific and special. The first type includes the standard intelligence tests mentioned above, along with the widely used *SECONDARY SCHOOL ADMISSION TEST*, the *SCHOLASTIC ASSESSMENT TEST* and the *ACT ASSESSMENT PROGRAM*. Preschoolers and students in the early elementary school years are generally tested for so-called learning readiness with tests for memory, verbal skills, reasoning and logic. Tests for specific aptitudes of older students attempt to measure such components of general scholastic aptitude as verbal aptitude (spelling, syntax and grammar), writing aptitude (speed and accuracy), numerical aptitude, practical and mechanical reasoning, abstract reasoning, spatial relations and logic. Special aptitude tests are performance-oriented and measure such physical and vocational aptitudes vision, hearing, manual dexterity, mechanical aptitude, clerical (writing) aptitude, musical aptitude, artistic aptitude and creativity.

Standard aptitude tests, however, can be notoriously unfair to students and individuals from different cultures and subcultures, including a large proportion of deprived Americans from minority groups with inadequate vocabularies and test-taking skills. To that end, several

test designers have developed so-called culture-fair tests that are relatively untimed and rely on nonverbal test materials such as diagrams, shapes and pictures that are universally familiar. All have fallen short of their goals, however, and culture-fair testing remains but a hope.

(See also *ACHIEVEMENT TESTS*.)

aptitude-treatment interaction (ATI) The degree of success or failure of a specific instructional technique and program (treatment) for a student at a particular aptitude level. ATI studies attempt to prescribe specific programs appropriate for each level of student aptitude and measure the degree of success or failure so that they can change the treatment.

Aquinas, Saint Thomas (1225–1274) Italian priest, philosopher and teacher, whose “Thomist” philosophy remains the heart of all education in Roman Catholic schools the world over. Born of a noble family near Aquino, Italy, he attempted to join a mendicant order in 1243, but his mother confined him to the family castle for more than a year. She released him in 1245, and he went to Paris to study under the philosopher Albertus Magnus (1200–80). He was ordained a priest in 1250, began teaching at the University of Paris in 1252 and was named professor of philosophy in 1256.

At the time, Western thought was dominated by the fourth- and fifth-century teachings of St. Augustine that all truth emerged from God as revelations through the human spirit and senses. Early in the 13th century, however, Islamic scholars had recovered and restored many works of Aristotle based on empirical knowledge as evidenced through the senses and independent of so-called revelations on which the Catholic Church based almost all its truths.

Thomas Aquinas attempted to resolve the differences, saying that the two sets of truths were compatible, with some truths and myster-

ies exposed through revelation, others through empirical study of material things and still others, such as the existence of God, known through both revelation and empirical evidence. A prolific writer, St. Thomas is believed to have authored at least 80 works, which continue to be studied and retranslated to this day.

area studies A college-level interdepartmental study of a specific geographical area of the world or specific nation. Area studies usually include an examination of the economics, political science, anthropology, sociology, psychology, biology, zoology, geography, literature, music, art and culture of such areas as the Middle East, Southeast Asia and Latin America or of large countries such as China, India, Russia or the United States (see *AMERICAN STUDIES*). Not all colleges offer area studies, and those that do offer it as a separate program leading to a degree. Others, on the other hand, build large departments specializing in one or more area studies.

area vocational education school A centrally located school offering primarily or exclusively a curriculum of courses and training that prepare students for work in at least one of five different skills or crafts. The term was first defined in the Vocational Education Amendments of 1968, which provided for government grants to schools to expand the supply of skilled craftsmen in the United States. The amendments were a total revision of the *VOCATIONAL EDUCATION ACT OF 1963*, which was designed to offer educational opportunities to young men and women who, for whatever reasons, were not succeeding in traditional academic programs and had either dropped out of school or were ready to do so. Although many area vocational schools are high schools, the concept also includes junior and community colleges and universities that provide vocational education in nondegree programs to prepare students for existing jobs.

Aristotle (384–322 B.C.) Greek philosopher, scientist and logician, whose extant works served as a basis for classical education in early American and, indeed, most western European schools and colleges.

A “graduate” of Plato’s Academy (see **ACADEMY**), he tutored young Alexander the Great and taught at the Lyceum, a school he founded in Athens. He developed the first system of classification for life forms, as well as Aristotelian logic, politics, metaphysics, ethics, aesthetics and science. Aristotle’s work had been all but forgotten in the West until the 12th century, when 47 surviving texts were rediscovered and set off an educational revival that helped lead to the founding of Europe’s first universities.

A knowledge of Greek (to read his works) was required in all American academies and colleges until the mid- to late 19th century, when this required reading was gradually replaced with practical courses to prepare young men for the industrial revolution and agricultural life on the frontier.

arithmetic The branch of mathematics that includes numbering, counting, measuring, adding, subtracting, multiplying and dividing with real, nonnegative numbers. Simple arithmetic, or “numbers,” was taught in homes and schools in early America as a skill needed for farm management and the marketplace. The industrial revolution of the 19th century and the technological revolution of the 20th required children to learn complex arithmetic.

Formal arithmetic education usually begins in kindergarten and is completed by the end of fourth grade, and it is normally integrated with other subjects such as science, history and literature by teaching students to tell time, learn dates and solve story problems with numbers. Kindergartners usually learn to count from one to twenty, forwards and backwards and to pick up the count from any number. They also learn comparative concepts such as larger than,

smaller than and to add and subtract numbers up to five. Most kindergartners also learn the use of balance scales, measuring instruments and pattern blocks, Cuisenaire rods (see **CUISENAIRE NUMBER-IN-COLOR PLAN**), plastic cubes, pumpkin seeds, acorns and other materials for weighing, counting, comparing, sorting and understanding that written and spoken numbers are conceptually the same as the equivalent number of objects.

First grade arithmetic progresses to include the following: counting forward and backward from 1 to 100; skip counting by twos, fives and tens; instant identification of numbers before and after any number from 1 to 100, the concept of place values; simple addition and subtraction of all single- and double-digit numbers; recognition of the inverse relationship between addition and subtraction; the use of the equality sign (=); the concept of fractions as parts of a whole; and the use of numbers in daily life to measure money, time, capacity, weight and temperature. First graders also extend their learning beyond arithmetic into other branches of mathematics by learning to recognize two-dimensional geometric figures.

In second grade, students learn to master numeration to 1,000—adding and subtracting three single- and two-digit numbers and “rounding off” to the nearest ten or hundred. The standard curriculum also includes counting by odd and even numbers and to 1,000 by twos, threes, fives and tens. Measurement skills include mastery of money, time and the calendar.

Third graders progress to mastery of the multiplication tables through 12. They also learn to add and subtract four- and five-digit numbers, to multiply or divide two- and three-digit numbers by single-digit multiplicands and divisors and to recognize the inverse relationship between multiplication and division. Calculation skills also include mastery of fractions, decimals and the ability to convert from one to the other. Numeration skills extend into the

tens and hundreds of thousands, millions and billions, and measurement skills advance to include length, area, volume, weight and time.

By the end of fourth grade, most schools expect students to have completed mastery of arithmetic, including addition, subtraction, multiplication and division of any combinations of two- and three-digit numbers. Students are also expected to have mastered place values, ratios, rounding and approximation of whole numbers, mixed numbers, decimals, fractions, the banking process, means, medians, modes and mental arithmetic. Story problems in the fourth grade prepare them for entering higher grades and the study of other branches of mathematics such as algebra, geometry and trigonometry.

Arizona The 48th state admitted to the Union, in 1912. Student academic proficiency ranks in the bottom 20% of the nation, with only about one-fourth of all fourth and eighth graders proficient in either reading or math, despite state requirements that students must pass basic skills tests to graduate from high school. In 2004, the state had more than 1,800 public elementary and secondary schools, with nearly 900,000 students, of whom 51.3% were minority students. Hispanic students made up 35.3% of the school population. About 20% of all students in Arizona lived in poverty. The public Arizona University System was established in 1945 to provide common administrative standards for the University of Arizona in Tucson, Arizona State University at Tempe and Northern Arizona University at Flagstaff, each of which has been in existence since the late 19th century—the first two since 1885, the third since 1899. Total enrollment is more than 100,000. The state has two other public four-year institutions and 20 public two-year colleges, with total enrollment of more than 200,000. The two-year and four-year colleges have been at odds for many years over demands

by the two-year colleges for the right to expand and develop new programs offering bachelor's degrees. In the meantime, 30 private four-year and 19 private two-year institutions have absorbed a growing number of students. Fifteen of the private four-year schools and 21 of the two-year institutions are for-profit organizations, including the pace-setting multicampus "Internet University," the UNIVERSITY OF PHOENIX, with more than 100,000 students worldwide. Graduation rates at Arizona's four-year colleges average 48%.

Arkansas The 25th state to join the Union, in 1836. For generations, the state's education system ranked all but lowest in the United States, but, as poverty rates soared and the state's best-educated men and women fled to other areas, the legislature determined to improve education. In the 1980s, the state began raising spending on education from 19% of total revenues to 42% in 1995—third in the nation in terms of spending on education as a percentage of total state and local revenues. By 2002, a better-educated workforce had helped swell the state's gross product, and although the dollar amount of spending on education continued to increase it represented a lower percentage of overall state spending, 29%. The effects of the state's focus on education have been dramatic, raising the overall academic quality of public schools from near-bottom in the nation to 37th—ahead of such states as Rhode Island, California and much of the South. Student-teacher ratios in public schools are among the lowest in the nation, student proficiency of eighth graders in reading has climbed from almost the worst in the nation to only two points below the national average, and fourth graders are now at the national average. Student proficiency of eighth graders remains low in mathematics, however, with only 22% proficient, but 34% of fourth graders are proficient, and their

average scores are touching the national average. In 1990, fewer than two-thirds of Arkansas's adult population had obtained high school diplomas, and less than 10% had college degrees. By 2002, the percentage of Arkansans with high school diplomas had climbed to 81%, and the percentage with bachelor's degrees was almost 20%.

Arkansas has about 450,000 students attending more than 1,100 elementary and secondary schools. Twenty-five percent of the students lived in poverty in 2001, compared with a national average of 15.1%, but the high school drop-out rate is only 5.3%, compared with a national average of 10.7%. The state has 11 public and 10 private four-year institutions of higher education and four public and four private two-year colleges. Although total enrollment at the state's four-year colleges is about 120,000, the graduation rate remains an abysmal 38.4%.

Armstrong, Samuel C. (1839–1893) A Union general in the Civil War who founded and headed the Hampton Normal and Industrial Institute to educate former slaves. Born and raised by missionary parents in Maui, Hawaii, he enrolled at Williams College, but left to lead a company of fellow students into the Union army. After action at Gettysburg, he was promoted to colonel and given command of the Ninth Regiment, U.S. Colored Troops. After distinguished service, he was promoted to brigadier general.

After the war, as freed slaves flocked to Union army camps in search of opportunities, Armstrong was appointed superintendent of education for the FREEDMEN'S BUREAU and took charge of a huge encampment of several thousand illiterate and destitute former slaves near Hampton, Virginia. "The thing to be done was clear," he later said. "To train selected Negro youth who should go out and lead their people. . . ." He proposed converting the mansion and estate he occupied into a school based on

the model of the Hilo Manual Labor School for native Hawaiians that he had seen developed during his youth. Armstrong obtained funds and teachers from the AMERICAN MISSIONARY ASSOCIATION and, in 1868, opened the Hampton Normal and Industrial Institute. As director, he combined academic and manual training in a three-year curriculum that included reading, writing and language skills, mathematics, history, natural science, an agricultural course, a commercial course and a course in mechanics. Armstrong expanded the school with funds from northern friends and turned it into a model for dozens of other, similar schools, including the famed TUSKEGEE INSTITUTE, whose founder, BOOKER T. WASHINGTON, was one of Armstrong's protégés at Hampton. Armstrong headed Hampton until his death at the age of 54. It later evolved into today's Hampton University, a coeducational institution with (in 1995) four undergraduate schools, one graduate school and more than 5,000 students, 95% of whom are black.

(See also HAMPTON-TUSKEGEE MODEL.)

Army Alpha and Beta tests A battery of tests to determine intelligence of U.S. Army recruits in World War I. Developed by Stanford University psychologist LEWIS M. TERMAN and a committee of the American Psychological Association, they were designed to help the Army place recruits in jobs appropriate to their intelligence and skills, a task that had become overwhelming when the United States started drafting recruits to go to war and the size of the military mushroomed from 180,000 to nearly 3 million. The Army Alpha Intelligence Test was a verbal test to measure intelligence of literate recruits, and the Army Beta Intelligence Test was a nonverbal test for the roughly 25% of recruits who were illiterate, either because they had been unschooled or because they were non-English-speaking immigrants swept up in the draft.

The tests were among the first intelligence tests developed in the United States. When they were released for civilian use following the war, they sired hundreds of other tests used in schools and businesses to evaluate intelligence and aptitudes.

Army Junior Reserve Officers Training Corps A high-school training program financed by the Army to teach beginner-level basics in military science, including drill, leadership, map reading, first aid, military history, marksmanship, weapons and weapon safety. Offered as electives in any public or private high schools that add it to their curricula, the program is cost-free (the Army provides instructors, textbooks and equipment) and incurs no obligations of any kind to the military, although it may improve the chances for obtaining ARMY RESERVE OFFICERS TRAINING CORPS college scholarships.

Army Reserve Officers Training Corps (ROTC) The program consists of two parts: a two-year basic course, followed by a two-year advanced course. The initial program includes on-campus basic education in military history, national defense and military management, along with physical training and military drills several times a week. The Army pays part _of the cost for all textbooks, uniforms and other essential materials but offers no pay to non-scholarship students during the two-year basic course. Those who complete the two-year physical and academic program successfully and show the potential to become officers can enroll in the advanced course—a two-year program of instruction in organization and management, military tactics, ethics and leadership development. Students must attend a five-week advanced training camp in the field during the summer of their junior and senior year. All cadets in the advanced course and at training camps receive annual stipends of \$4,000 each

per academic year. The army also offers a two-year ROTC program for junior and community college students, along with graduate school students and undergraduate upper classmen who have not taken the basic course during their first two years of college. To enter the two-year program, students must first complete the five-week summer basic training camp.

All ROTC applicants may apply for two-, three- and four-year scholarships. Awarded competitively, each scholarship pays annual college tuition and fees, textbooks and supplies and a tax-free stipend of \$4,000 per academic year. Four-year scholarships are awarded only to students entering college as freshmen. Two- and three-year scholarships are awarded to students already enrolled in college and to on-duty Army enlisted personnel.

Graduates of four-year ROTC programs receive a conventional bachelor's degree and a lieutenancy in the U.S. Army. They must serve for at least three years; scholarship students must serve four. Nursing students may enroll in the ROTC and attend a Nurse Summer Training Program instead of the regular camp, to prepare for the Army Nurse Corps. They must then serve in the corps for three years.

Although the ROTC provided the majority of Army officers during the Korean and Vietnam Wars, it is now offered on campus at only about 275 colleges in the United States, although about 1,000 other schools without on-campus ROTC have cross registration agreements with nearby colleges that do offer such training. ROTC was driven off many campuses during the Vietnam War and remains banned at most because of the Army's position on homosexual soldiers.

Army Specialized Training Program (ASTP) A World War II program that permitted draftees in college to finish their undergraduate and graduate education before entering military service. Designed to provide the Army with a

much needed corps of officers, doctors, engineers and other specialists, ASTP was an accelerated, year-round program that combined education with on-campus military training, akin to that of the U.S. MILITARY ACADEMY at West Point. Colleges and universities contracted to be either Army ASTP or Navy v-12. Depending on whether they were training to be future soldiers or sailors, students transferred to colleges that had been taken over by either the Army or Navy. Regardless of the college they attended, they received degrees from the colleges where they originally enrolled.

ASTP offered 22 programs of study including engineering, medicine, dentistry, veterinary medicine, personnel psychology and foreign languages. Those who completed bachelor's degree programs could either enter the Army as second lieutenants or continue graduate studies to become doctors, lawyers, engineers, etc., before serving in the Army in those capacities. The ASTP was the progenitor of the post-World War II RESERVE OFFICERS TRAINING CORPS.

Army War College One of several schools of graduate studies established for the military in the decades following the Civil War. Like the NAVAL WAR COLLEGE and Army General Service and Staff School (later, the COMMAND AND GENERAL STAFF SCHOOL), the Army War College has two purposes. One was to train professors of military science and tactics to teach in LAND-GRANT COLLEGES. Many required such studies and subsequent service in state militia in return for free tuition. The second purpose of the college was to provide prospective generals with the academic equivalent of a doctorate, which is not available at the U.S. MILITARY ACADEMY at West Point, New York. Only colonels are admitted to the War College, which is in Carlisle, Pennsylvania.

art education The teaching and learning of drawing, painting, sculpting and other meth-

ods of graphic and three-dimensional representations and the appreciation thereof. Art education consists of two elements: expressive and responsive. The former is taught in specially equipped studios by trained artist/teachers, who must be skilled in demonstrating what they expect of their students. Responsive art is usually taught as part of history in the lower grades or as a combined art appreciation/art history course in high school or college.

For centuries, art was a decorative craft taught by master craftsmen to their apprentices. It did not become part of the formal curriculum of educational institutions until females began to attend schools in the 18th and 19th centuries to learn the "ornamental" arts as a preparation for marriage. Thomas Jefferson proposed art as part of the original curriculum of the College of William and Mary—not as a decorative art, but as a practical skill for preparing architectural and mechanical drawings to build a new nation. Art education as we know it today did not enter the formal curriculum until the middle to late 19th century, as individual schools relaxed traditionally harsh disciplinary methods and allowed students time for free play. Most elementary schools continue to use art classes to give ordinary students an enjoyable break from the standard academic classroom routine.

The PROGRESSIVE EDUCATION movement of JOHN DEWEY first introduced art as a basic, required element of the educational day. The aim was to teach young children motor skills and to encourage them to express themselves freely with different media. Led by trained artist-teachers, art classes eventually became a standard part of the private school curriculum. Until the mid-20th century, however, public schools balked at including art and music in the basic curriculum. Unlike practical courses such as English, math, science and history, artistic expression was held to be reserved for a gifted elite, while art appreciation was consid-

ered useful only for a financial elite that could afford collecting. The prosperity that followed World War II allowed the fine arts to become a standard part of many public school curricula, though they tend to be among the first courses eliminated in schools with shrinking budgets.

Although colleges, universities, museums, specialized art schools and institutes offer advanced studies in art, art history and art appreciation, advanced students continue, as in earlier days, to rely on the individual tutelage of master craftsmen.

articulation (program) The meshing of course materials within each school grade (horizontal) and between grades (vertical). Effective horizontal articulation interrelates all courses within a curriculum to each other. **TEAM TEACHING** has proved an effective method of achieving horizontal articulation, by tying studies of every subject in each grade to each other. Thus, a teaching team would tie the study of ancient Egypt in history class, for example, to the study of plane and solid geometry in mathematics class, to the study of mechanical advantage in physics (science) class, to the study of hieroglyphics in language class and to the study of one- and two-dimensional drawing in art.

Effective vertical articulation permits students to progress academically from grade to grade smoothly, with no curricular overlap or gap or radical changes in teaching methods between the end of a course in one year and the beginning of the same course the following year. To achieve effective vertical articulation, some schools assign one teacher to the same group of students for two or more consecutive years.

Ineffective articulation within an individual school is usually the result of ineffectual administration and curriculum supervision. Excessive teacher absenteeism and introduction of substitute teachers also produces poor articulation. The most difficult vertical articula-

tion to achieve is between schools—elementary and middle, middle and high school and (the most difficult of all) high school and college.

artificial intelligence Software programs that permit computers to solve problems, communicate with each other, respond to human speech and otherwise imitate elements of human intelligence.

Art Institute of Chicago One of the great American **MUSEUMS** founded during the era of burgeoning cultural philanthropy in the last quarter of the 19th century. Although some museums were designed as art repositories for researchers and the very wealthy, many were built as educative institutions in an era when few Americans could afford the time or money to attend school.

The Art Institute was actually founded by artists in 1866 as the Chicago Academy of Design. A group of wealthy Chicagoans later transformed it into the Chicago Academy of Fine Arts and, finally, the Art Institute of Chicago. Their goal was to transform Chicago into a cultural rival of New York by establishing a superlative collection of European painting and sculpture. The institute continued to function as an art school, and like many museums of the era, rivaled nearby universities as centers of education. Its school eventually evolved into today's School of the Art Institute of Chicago, a specialized four-year college and graduate school offering bachelor's and master's degrees in the fine arts, art and design to 1,800 undergraduate and more than 500 graduate students. The institute's art collection has expanded to include American and Oriental, as well as European, sculpture, paintings, prints and drawings. It also houses African and pre-Columbian art, two libraries and a theater.

arts and crafts An extension of the art curriculum to include the making of decorative

objects, pottery, baskets, woven textiles and other handicrafts. The manufacture of simple handicrafts not only teaches and enhances motor skills, but it also allows far more children to discover and develop creative talents than art alone.

Ascham, Roger (1515–1568) English author of *The Scholemaster* (1570), the standard pedagogical text used by tutors and parents in the American colonies and in England to teach their sons during the 17th century. At the time, the colonial and English nobility and landed gentry were heatedly debating the advantages and disadvantages of schools over home instruction. English traditionalists favored home instruction by private tutors. Life in the American wilderness gave colonial parents little choice but to teach their children at home. To fill the role of tutors, most parents used *The Scholemaster* as their pedagogical guide.

A scholar at St. John's College, Cambridge, Ascham tutored the future Queen Elizabeth I in 1548–50; he remained a counselor when she ascended the throne and wrote all her official letters to foreign rulers. Ascham divided *The Scholemaster* into two volumes: The first was devoted to ethics; the second, to teaching methods. On the importance of tutoring, Ascham wrote that "learning teacheth more in one year than experience in twenty, and learning teacheth safely." He urged tutor-parents to use love rather than fear when teaching, gentleness instead of beating, encouragement instead of punishment and patience rather than irritation. Apart from his contribution to education, Ascham is also known as "the father of modern archery," a sport he described in his treatise on bows and arrows, entitled *Toxophilus*.

Asian Americans Americans of Asian origin or descent. An American missionary brought the first three recorded arrivals from China in the late 1840s. The graduation of one of the

three young men from Yale in 1854, however, marked a falsely auspicious start for Asian immigration to the United States. The 1850s saw Western military powers carve up China, and as American sailors spread word of the "Mountain of Gold" in California, an estimated 25,000 Chinese prospectors flocked eastward across the Pacific. By 1860, there were 34,933 Chinese in California (all but 1,784 of them men), and virtually all of them intended to return home to China after making their fortunes. White Californians greeted them with hostility. Miners physically forced them off the land and stole their most promising claims. Undiscouraged, the immigrants found other ways to profit from the gold rush by providing the tired, filthy white miners with services unavailable from Americans. They opened inns, restaurants and laundries.

In the 1860s, the Chinese took advantage of a labor shortage to sign on as "coolies"—from the Hindi for hired, unskilled laborers—to build the western half of the first transcontinental railroad link through the steep rocky canyons of the West. The white laborers originally hired for the job had deserted their railroad jobs to join in the continuing hunt for gold. When the railroad boom subsided, Chinese workers moved to the giant farms then spreading across California. Shunned by whites, the Chinese established their own communities in cities like San Francisco, where they could enjoy the social and cultural customs of their homeland in peace.

The economic depression of the 1870s, however, created job shortages that sent mobs of angry whites through the Chinatowns of the West, beating, looting and sometimes killing the hard-working Chinese. In 1878, the entire Chinese population of Truckee, California, was driven from town; in 1880, white mobs destroyed every Chinese business and home in Denver; and in 1885, 28 Chinese were massacred in Rock Springs, Wyoming. Although the

Chinese population of California only numbered about 75,000, or less than 10% of California's 865,000 residents, Congress passed a law in 1879 to prohibit any ship from bringing more than 15 Chinese passengers. Three years later, it passed the Chinese Exclusion Act of 1882 suspending entry of all Chinese laborers for 10 years and denying reentry by any who returned to China to visit. It also banned them from becoming naturalized American citizens, although by federal law children born in the U.S. automatically became citizens. Chinese immigration to the U.S. dropped from 39,579 in 1882 to 22 in 1885. Subsequent Exclusion Laws in 1892, 1894, 1917 and 1924 extended and hardened the prohibitions against Chinese immigration—even in American territories in the Pacific, such as Hawaii and the Philippines.

The closed-door policy, however, cut off a supply of badly needed farm workers, and California farmers turned to Japan to supply their needs. By 1900, more than 24,000 Japanese had arrived in the United States, and, by 1910, the Japanese population had jumped to 67,000. Spurred by powerful racist organizations, California again responded with strict laws that barred all aliens from landownership, denied Asians fishing licenses, banned them from many business enterprises and established a system of strict social segregation that even excluded their children from white schools, regardless of whether they were born in the U.S. or abroad. The California laws spurred many Asians to move eastward to start new lives in other American cities where they hoped to find less discrimination.

In 1917, Congress passed a law effectively barring entry of all Asians into the United States. The law remained in effect until the end of World War II, during which about 112,000 Japanese Americans—those born in the United States as well as those born in Japan—were interned in barbed wire concentration camps. America's alliance with China and the plight of

millions of displaced refugees during World War II led to reform of U.S. immigration laws and an easing of immigration restrictions. A new Immigration Act in 1965 replaced immigration quotas based on national origins with annual hemispheric limits of 170,000 new immigrants from outside the Western Hemisphere and 120,000 a year from within. The new law permitted no more than 20,000 immigrants from any single nation. Within those limits there was a complex system of preferences, including adult children, parents and kin of American citizens, scientists and professionals, artists and those with skills in great demand in the United States.

The result was a steady migration of Asians from all parts of the Orient, with occasional disproportionate surges of refugees from countries that have suffered national tragedies—Koreans, after the Korean War, for example; the Vietnamese after the Vietnam War; and Chinese fleeing poverty and political oppression. In 2003, the estimated population of Asians and Pacific Islanders in the United States reached about 12 million, compared to 3.5 million two decades earlier. Although they made up only 5% of the American population and their children constituted only 4% of the public elementary and secondary school student population, Asian Americans made up more than 6.1% of the total population at U.S. institutions of higher education. At some of the most academically demanding colleges, such as Harvard or Stanford, Asian Americans make up from 10% to 30% of the student population.

Moreover, Asian high school students outperformed all other students—whites as well as minorities—in almost all subject areas except English. Asian children acquire their academic skills at an early age, according to a 1998 longitudinal study of entering kindergarteners by the U.S. Department of Education. The study found that Asian youngsters scored nearly 5.8% higher than white children in reading and

nearly 4% higher in math. Tenth grade Asian students tested 5% higher than white students in mathematics, 1.6% higher in science, 1% in history and their average scores were identical with those of white tenth graders in English. Although college-bound Asian students scored 4% lower than American whites in the College Board's verbal Scholastic Assessment Test for college admissions in 2003, they scored 7.7% higher in the math SAT.

assembly A convening of the entire student body of the school into a central hall or auditorium. Once a fixture of the daily school schedule, most public schools did away with assemblies when they introduced schoolwide intercom systems for administrators to make announcements to students in their classrooms.

Still a fixture of most private schools, assembly is the one school activity that physically unites the entire student body, which the classroom system normally segregates on the basis of age, ability or subject studied. For that reason, many educators believe assembly is the most effective way of building a sense of community among students and faculty and imparting common values. Assemblies also provide opportunities to foster student government and to teach students proper behavior in large groups. Assemblies also permit an entire school to view artistic and cultural events or hear guest speakers that supplement classroom learning.

assimilation and accommodation The accumulation and absorption of new information and knowledge and the rearrangement of one's scheme of understanding to include the new knowledge. First described by Swiss scientist JEAN PIAGET, the two terms are interdependent. *Assimilation* is the first step in knowledge acquisition, as new information enters the *scheme*, or one's framework of knowledge and understanding. Whenever new data invades,

however, the shape of the scheme necessarily changes as it *accommodates* the new knowledge and reshapes the recipient's understanding. Thus, a young child's scheme, or understanding of the sun as it seems to pass overhead, is changed considerably when he or she assimilates new information that the Earth travels about the sun. Piaget called the process of reshaping the scheme through assimilation and accommodation *equilibration*. While new knowledge is assimilated, the scheme is said to be in disequilibrium, and once accommodation is complete—that is, the moment the subject can say, "I understand!"—the scheme is said to be in equilibrium. The scheme is in disequilibrium far more than in equilibrium, according to Piaget, because all new knowledge generates a need for more knowledge, more assimilation and, therefore, more disequilibrium. This constant reshaping of the scheme, by assimilation and accommodation, necessarily keeps it in a state of continual imbalance, or disequilibrium.

(See also COGNITIVE STYLE.)

associate degree A certificate attesting to the successful completion of a two-year course of study at a community college, junior college, technical institute or, in some cases, at a four-year college. Although the associate degree usually has considerable value and may be required in vocations not requiring conventional four-year degrees, in traditional academic terms, the "associate in arts," "associate in science," "associate in journalism," and the more than four dozen other associate degrees do not serve as academic credentials to continue into higher education. Individual courses in associate degree programs, however, may be credited toward the work for a bachelor's or master's degree.

associative learning The process of acquiring, understanding and retaining new informa-

tion by relating it to one's existing body of knowledge. In simplest terms, teachers of young children rely heavily on similes to promote associative learning—for example, by explaining that the moon is round, like a ball, rather than simply saying that a planet is round. Associative learning is one of many cognitive processes first described by Swiss scientist/psychologist JEAN PIAGET.

astronomy The scientific study of celestial space. Long a required part of the elementary and secondary school and college curricula in the United States, astronomy started to get “crowded out” of the American curriculum after the Civil War as education took a more practical direction with the industrial revolution and the expansion of the western frontiers. The new LAND-GRANT COLLEGES, especially, were far more concerned with teaching students to tame the earth beneath their feet than to recognize the stars in the sky. The startling advances in chemistry, physics, biology and zoology during the first half of the 20th century made them the dominant sciences in secondary schools and colleges, and astronomy was relegated to the status of a college elective. Secondary schools incorporated it into “general science” courses. The launch of the satellite *SPUTNIK I* in 1957 by the Soviet Union during the darkest days of the cold war provoked an acceleration of American efforts to explore space—and to teach astronomy to the young. Within a few years, astronomy courses were added to virtually every American high school and college curriculum, where they now form an important element of the science curriculum.

athletics Technically *athletics* refers to track and field, but the term is now widely used in the United States to mean all sports played at school and college. In English-speaking countries other than the United States and Canada,

athletics and non-English variations such as *athletisme* refer only to organized track and field events—running, jumping and throwing, as in the ancient Olympic Games. Derived from the Greek *athlein*, meaning “to contend for a prize,” athletics first became an element of the overall educational program in ancient Sparta, where physical education was meant to develop endurance and muscular strength as well as mental and moral fortitude. Gymnastic exercises and sports included the pentathlon (running, jumping, throwing the discus and javelin and wrestling), ball games and the pancratium (a combination of free-for-all wrestling, boxing and fighting—with no rules).

As used in the United States, athletics refers to the full range of organized interscholastic and INTRAMURAL PROGRAMS played by teams and individuals. Athletics had been a part of English educational tradition until 1580, when a Puritan proclamation transformed Sunday from a day of recreation into a variation of the Old Testament Sabbath, a day of penitence and prayer, thus relegating sports and other forms of recreation to the list of sinful activities banned among the pious. When the Puritans settled Massachusetts, they brought the ban against Sunday amusement with them. Although Virginia had a similar ban, some of the Middle Atlantic states were more tolerant. Philadelphia permitted Sunday fishing, while New York allowed officers to play cricket and rackets, and Long Island permitted racing. Nevertheless, when the First Continental Congress met in 1774, the Puritans still had enough influence to ban most sports in one of the Articles of Association.

Physical education did not make its way into the American school curriculum until 1817, when the UNITED STATES MILITARY ACADEMY built the first college gymnasium. It was used in the Spartan tradition, however, for physical training, rather than athletics. Physical education was introduced into the secondary

school curriculum in 1823, when CATHERINE BEECHER introduced calisthenics at her Hartford Female Seminary in Connecticut and GEORGE BANCROFT introduced gymnastics into his Round Hill School in Massachusetts. Both were imitating the much admired German GYMNASIUM, a school where physically fit young men were found to perform better academically.

Athletics, as Americans know it today, however, did not become a standard part of education until after the Civil War, when private academies and colleges expanded their curricula beyond theology and admitted less pious students than had been traditional. Several colleges, including Harvard, fielded informal rugby clubs, but injuries grew so severe that Harvard banned the sport in 1860. The first formal intercollegiate competition in any sport may have occurred on November 6, 1869, when Rutgers defeated Princeton in an early version of modern football. The years between 1875 and 1900 saw sports of every variety appear on the campuses of those private academies and colleges that could afford the space and, where students were wealthy enough to afford the equipment, uniforms and leisure time to field teams.

Public colleges and secondary schools did not incorporate athletics or recreation into their curricula until after 1900, when the CHILD-CENTERED EDUCATION reform movement swept across the United States and transformed play and recreation from religiously sinful activities into normal, healthy elements of child development. In schools and colleges, athletics are usually, but not always, an extracurricular activity, outside the realm of physical education. The exception is at some private secondary schools, which may require intramural sports participation as part of their PHYSICAL EDUCATION programs. Athletic programs are headed by athletic directors who have the authority to appoint coaches in each sport. Depending on the sport and its importance to the school or college, coaches may be faculty

members with teaching obligations who coach part-time for an extra stipend, or they may be a professional sports coach, in many cases retained at a salary considerably higher than his counterpart in the classroom. Some schools and colleges designate sports with the least participation as “clubs,” which receive no institutional financial support. Although club participants have permission to participate as representatives of their schools, they usually must pay their own expenses.

The range and importance of the athletic program varies widely, according to the size, wealth and location of the school or college and the gender of the student body. An average athletic program at a suburban or rural coeducational high school or college could include soccer, football, cross-country running and field hockey in the fall; basketball, swimming, wrestling and gymnastics in winter; and baseball, softball, volleyball, lacrosse, tennis and track and field in the spring. A wealthier school or college might also offer ice hockey, fencing, squash, golf, small boat racing or even polo, while schools in the snow belt or mountains would almost certainly offer ice hockey or skiing or both. Member colleges in the NATIONAL COLLEGIATE ATHLETIC ASSOCIATION (NCAA), one of the major governing bodies in intercollegiate sports, have as many as 20 sports for men and women, depending on the size of the college. Although college sports generate revenues of about \$16.5 billion a year—about 9.5% of total college revenues—almost all sports programs operate at a financial loss. Even high-visibility sports that draw huge paying crowds seldom produce enough profits to cover costs of facilities and equipment for less popular sports with few or no paying spectators and for the myriad of intramural and individual recreational sports that colleges provide at little or no charge to students.

Almost all intercollegiate sports are regulated by the NCAA and the National Intercol-

legiate Athletic Association. Interscholastic sports competitions are regulated by local and state leagues that usually try to group competing teams according to school size. City high schools and colleges tend to have the fewest athletic facilities; some have none. Suburban high schools and suburban and rural colleges tend to have the most. Student participation in athletics varies widely, according to school location and size. Suburban schools have higher rates of participation than urban or rural schools, and students attending schools with fewer than 1,500 students have higher rates of participation than larger schools. Although student polls show athletics to be the most popular extracurricular activity, only about 55% of all high school students—and only 43% of high school seniors—participate in any athletic activity. Boys participate more than girls—58.5% vs. 52.8% of all girls. Participation is highest among white, male, college-bound students. Minority groups participate less than whites, and Asian students participate more than black and Hispanic students. Students from the highest socioeconomic levels participate more than students from the lowest socioeconomic levels, and students with high grades participate more than students with low grades. Low female participation was, for many years, partly the result of gender discrimination, which was outlawed by the EDUCATION AMENDMENTS OF 1972. Since then, all schools and colleges receiving any federal funds must provide equal numbers of sports, athletic facilities and practice time for men and women. Several states, including California, have passed similar laws.

Those colleges that failed to obey the letter of the law were targets of lawsuits by the National Organization for Women and numerous women athletes charging gender discrimination in sports. As late as 2002, men still represented nearly 50% of participants in intercollegiate sports and received 59% of the schol-

arships and 58% of the recruiting funds. The figures are somewhat misleading, however, because of the absence of female baseball, football and wrestling teams. If participants in “unisex” sports such as men’s football and baseball and female field hockey and softball are deducted from total participants, female participants outnumber males, comprising 52.56% of all participants.

athletic scholarships Financial grants awarded by public and private colleges and universities and by some private high schools to outstanding athletes. Most athletic scholarships are awarded to athletes in high-profile sports with facilities for large paying audiences. Because of the revenue-producing potential of such popular spectator sports as football and basketball, many colleges and universities over the years have routinely ignored the academic qualifications of athletes to whom they awarded scholarships. More than \$500 million in athletic scholarships are awarded annually—many covering full room, board, tuition and college living expenses. To silence complaints that member colleges were exploiting young athletes, the National Collegiate Athletic Association enacted Proposition 48 in 1983, raising minimum academic standards for athletic scholarships. The new standards were based on a combination of SAT scores, high school grade point averages and degree of difficulty of high school courses in which the athlete had enrolled.

By 2004, graduation rates of all athletes at 320 Division I colleges—those with the highest-visibility sports programs—had jumped from less than 50% to 62%, about 2% higher than the graduation rates for all students at those colleges. Male athletes had graduation rates of 57% and women athletes 71%, compared with 57% and 63%, respectively, for men and women in the general student population. The graduation rate for black male athletes was a dismal 22%, compared with an even more

disastrous rate of 11% for all black students at the same group of schools. Football players had a graduation rate of 54% (62% for whites, 49% for blacks), while the graduation rate for male basketball players was 43% (53% for whites, 38% for blacks). Female basketball players had a graduation rate of 63% (69% for whites, 56% for blacks).

Of major colleges awarding athletic scholarships, the University of Texas had the lowest graduation rate in the nation among athletes—34%. (Although Mormon-run Brigham Young University had a graduation rate of only 19%, the figure was misleading because of the religious requirement that Mormons go on two-year missions during their college years and thus “drop out” in a statistical sense.) Other major colleges whose athletes have graduation rates of less than 50% were University of Arkansas (35%), University of Oklahoma (40%), Michigan State University (41%), Louisiana State University (42%), North Carolina State University (42%), University of Florida (42%), University of Colorado (43%), Arizona State University (44%), Oregon State University (44%), University of West Virginia (46%), Auburn University (48%), University of California (48%), Florida State University (49%) and University of Alabama (49%). Stanford University athletes had the highest graduation rate, 85%, followed by Boston College (78%), Notre Dame (77%), University of Virginia (75%) and Penn State (74%). Athletes at Kansas State University, University of Oregon, University of Nebraska and Purdue University had graduation rates of 60% to 70%. No Louisiana State University basketball players graduated in the 1990s, and only 8% of University of Kentucky basketball players managed to do so. Other colleges whose basketball players had abysmally low graduation rates were University of New Mexico, 14%; University of Louisiana at Lafayette and the University of Louisville, 17% each; and the University of Connecticut, Iowa

State University and University of Texas at Austin, with graduation rates of 27% each. In contrast, Bucknell University had a 100% graduation rate, University of Wisconsin at Madison 73%, and University of North Carolina at Chapel Hill and Villanova University 67% each.

Many factors affect graduation rates of athletes that do not affect other students, among them the lucrative offers from professional sports teams and the inordinate amount of time required for training. In 2004, the NCAA addressed the problem of athlete graduation rates with a new system of Academic Progress Rates that would reduce the permissible number of athletic scholarships if their athletes failed to meet minimum, college-level academic standards. To measure college compliance, the NCAA used a complex scoring system to grade teams as a whole, awarding points only for students who complete their course work. Some 48% of all major college football teams and 47% of basketball teams failed to meet the standards in the 2004–05 academic year. Forty-four percent of wrestling teams and 42% of baseball teams also failed. Rates of failures for other sports ranged from 3% for women’s rowing to 29% for men’s indoor track. In all, 1,198, or nearly 21%, of the 5,720 teams in sports at major colleges and universities failed to meet the NCAA minimum academic standards and risked losing one or more of the permissible number of athletic scholarships they could award in the coming year. Teams with failure rates of 20% or more were men’s indoor track (29%), men’s soccer (28%), men’s outdoor track (26%), men’s tennis (22%), women’s basketball (21%) and men’s cross-country (20%).

Atlanta Compromise BOOKER T. WASHINGTON’S proposal for achieving racial harmony through interracial economic cooperation devoid of all social integration. He delivered his proposal in a speech at the Cotton States International Exhibition, an 1895 world’s fair to

promote economic growth in the American South. In the Atlanta Compromise, Washington sought "to say something that would cement the friendship of the races and bring about hearty cooperation between them." The United States was suffering from a severe economic depression, however, and racial tensions in the South had erupted in widespread race rioting over black demands for greater equality. Whites feared that low-cost black labor would force them from their traditional jobs. The Atlanta Compromise sought racial peace. In effect, Washington accepted the "separate but equal" laws of the South, but sought accommodation by suggesting, "In all things purely social we can be as the fingers, yet one as the hand in all things essential to mutual progress."

"Nearly 16 millions of hands will aid you in pulling the load upward," he pledged, "or they will pull against you the load downward. We shall constitute one-third and more of the ignorance and crime of the South, or one-third of its intelligence and progress. . . ." Hailed as a peacemaker by whites across the United States and the Western world, he was castigated by intellectual blacks such as W. E. B. DuBois who demanded nothing less than complete equality and integration into white society, as guaranteed by the U.S. Constitution.

Atlanta University One of 20 colleges founded by the FREEDMEN'S BUREAU after the Civil War to provide higher education for blacks in the South. Now part of Clark Atlanta University, a predominantly black, private institution affiliated with the United Methodist Church, Atlanta University gained worldwide fame during the 23-year teaching career there of W. E. B. DuBois. America's first black sociologist, DuBois first went to Atlanta in 1897 to chair the sociology department; he also taught economics, history and political science. While there he conducted the first major sociological study of black life in the South. The 2,000-page

The main entrance to Atlanta University, one of 20 colleges founded to educate African Americans in the South after the Civil War (Atlanta University Archives)

work represented an encyclopedia of African-American life and culture and won a grand prize and gold medal at the 1900 World's Fair in Paris, France.

In 1909, DuBois helped found the NATIONAL ASSOCIATION FOR THE ADVANCEMENT OF COLORED PEOPLE, and in 1910 he left Atlanta University to serve as editor of the NAACP's magazine, *Crisis*. In 1934, he quit over policy differences regarding voluntary segregation and returned for a relatively uneventful 10-year tenure at Atlanta. Atlanta merged with Clark University in 1988 to form Clark Atlanta University, which now has nearly 4,000 undergraduates and nearly 1,000 graduate students.

at-risk students Students in danger of failing to complete their formal education because

they are either unable to respond to the demands of school or because the school is unable to respond adequately to their needs. Without intervention, the at-risk student usually either drops out, is expelled from high school or is functionally illiterate upon graduation.

Students of any age and social or economic background may be at risk, and students not at risk at any given age may, often quite suddenly, become at-risk students because of environmental or developmental factors. In general, urban minority adolescents from deprived areas are most at risk and, indeed, have the highest school drop-out rates (see DROPOUTS). Any average student, however, may be put at risk in schools whose faculty and staff are less responsive to the needs of average students than they are to those of exceptionally gifted or exceptionally troubled students. Gifted students are often channeled into college-bound honors programs, while students who are clearly unable to respond to academics are often shunted into vocational education. Some 40% of American high school students, however, are relegated to GENERAL EDUCATION programs, which provide no preparation for college and inadequate vocational training for the workplace. Many are intellectually, emotionally and physically healthy average students. Almost two-thirds of general education track students drop out—more than 2 million annually. They usually cite “boredom” and “not interested in school” as their primary reasons for dropping out. Just as average students may be put at risk in schools that fail to meet their needs, exceptionally gifted or talented students may also be put at risk in schools that fail to nurture their special gifts and talents.

In general, however, students most at risk are those with one or more of a host of emotional, intellectual or physical disabilities due to deep-seated emotional problems; economic, social, cultural or emotional deprivation; physical or sexual abuse; disease; substance abuse;

premature sexual activity; teenage pregnancy; racial, religious, ethnic or gender discrimination or harassment; lack of fluency in the English language; prior educational deprivation; deficiency in basic skills, especially language and mathematics; poor teaching and uninteresting curricula; inadequate school facilities; learning disabilities; physical and neurological handicaps; and mild mental retardation.

Alarmed by the steadily increasing high school drop-out rate (then in excess of 27% nationally and approaching 40% in some states), the federal government enacted the far-reaching ELEMENTARY AND SECONDARY EDUCATION ACT OF 1965 to provide for compensatory education and counseling for at-risk students, and many schools and communities have set up independent intervention programs that provide skilled counselors and tutors for at-risk students.

The programs seemed to produce a dramatic reduction of the national high school drop-out rate to 8.8% in 2002, with starting declines in drop-outs in all sectors of the student population—boys, girls, blacks and whites. Drop-out rates among white children fell by 23% to 8.7%, while drop-out rates among black children fell from a high of more than 30% in the mid-1960s to 10.1% in 2002. Some critics of compensatory education belittled the statistics, charging they were the results of increased “social promotions” to permit academically weak students to progress and graduate with their age-mates, regardless of their grades. Nationally, 31% of teachers reported promoting students on the basis of age in 2001, a decline from 41% in 1998. But the Los Angeles Unified School District, the nation’s second largest, admitted that, despite demanding statewide academic standards for graduation, many schools simply ignored the standards and granted social promotions to about 40% of their more than 700,000 public school students. Because of the huge proportion of non-

English-speaking immigrant students, about 45% of the students in the district had limited or no English-language skills. California was one of many states in 1999 that had prepared to replace social promotions with new, stringent academic standards designed to lift student academic achievement, but new standards proved so high that the state risked a disastrous increase in retention and/or drop-out rates, and many school districts followed the example of Los Angeles schools by ignoring the new standards or by lowering passing scores to levels that matched student academic achievement. California was not alone. Only one of 10 Arizona high school students passed its new state math exam in 1999, and the state was forced to promote all the students who failed. Only 7% of students in Virginia met its new standards, and the state had to grant social promotions to most of them. Massachusetts and New York had similar experiences.

Although social promotion undoubtedly contributed to part of the decline in national drop-out rates, compensatory education almost certainly helped tens of thousands of students who might otherwise have quit school to complete their education. The only apparent failure of compensatory education was with children of Hispanic origin. Although drop-out rates among such children declined from a high of more than 35%, they remained stubbornly elevated at 21.5% in 2002, and critics complained that compensatory education had failed to deal with all factors putting students at risk. Compensatory education at school, for example, seldom deals with or alters the effects of a student's home and neighborhood environment.

In 1965, the government's Office of Economic Opportunity also established Operation HEAD START to prepare deprived preschoolers for kindergarten by teaching them school-readiness skills and providing social, medical, nutritional and psychological support. Head Start has affected about 20 million economi-

cally deprived children. Some studies showed that Head Start children had significantly higher success rates in later schooling. As a result, they were far better able eventually to find and hold jobs than children without similar early education benefits. Other studies have found that for at least some children the benefits of Head Start begin to fade by the end of second grade—possibly because of the lack of adequate comparable compensatory programs to carry on the work of Head Start in later grades. The 1965 Elementary and Secondary Education Act and the subsequent 1981 Education Consolidation Improvement Act extended some of the academic benefits of Head Start to older children by providing funds for remedial reading, remedial mathematics and special summer programs. But the programs reach only half the number of children in Head Start and provide none of the social services.

Some communities have alternative schools to provide compensatory education and counseling to at-risk students. Although most have had mixed results and are still experimenting with a variety of approaches for teaching at-risk students, all can report dramatic results for many individual students. Most alternative schools rely on small classes, special tutoring and establishment of close, supportive one-to-one mentor-student relationships involving either a teacher or counselor.

attendance The physical presence of students on school premises or off premises at an officially sanctioned school activity such as independent study, work-study, athletic contests, off-campus academic or cultural activities and approved classes for home-bound students. For the student, failure to attend means a break in the continuity of his or her studies. For public schools, however, attendance is a vital element of their finances. All states allocate educational funds to school districts on the basis of AVERAGE DAILY ATTENDANCE at the

schools in each district. For that reason, all states have passed attendance laws specifying the minimum number of days and hours schools must remain open each year, the minimum age at which students may drop out of school and other regulations affecting attendance.

To enforce those laws, most schools and school districts have attendance officers on the school staff to identify absent students as early in the day as possible, determine the reasons for their absence and, if warranted, take remedial action. Some communities used to assign the task of enforcing school attendance to a police "truant officer" who had the authority to take truant children into custody and arrest parents. Attendance officers can file legal complaints against parents in court or obtain help from social welfare authorities and police if they believe parental failure to ensure a child's regular attendance at school borders on neglect. Most attendance officers, however, attempt to provide counseling for chronically absent students and, if necessary, for their parents. If that fails, they may order a student transferred to an ALTERNATIVE SCHOOL for troubled students.

About 8% of all students are absent from school on each of the 178 days of the average school year in the United States, while 9% of those who appear at school fail to appear at one or more classes each day. The absentee rate varies according to the socioeconomic status of students and the type of school. Absenteeism for students in the poorest socioeconomic quartile of families averages more than 11%, but often reaches above 50% at some inner-city schools. In contrast, absenteeism for students from the two middle socioeconomic quartiles average slightly more than 7%, while absenteeism for students from the top quartile averages less than 5.5%. Student absenteeism averages almost 10% at public schools and just over 5% at private schools. The attendance figure for public schools has improved steadily since the

beginnings of universal compulsory education in the 19th century. The 1870 census found attendance rates at just under 60%. They reached 75% in 1920 and 90% in 1960.

School enrollment rates figures have changed even more dramatically, largely the result of strict child-labor laws that limit the hours children under 18 may work each week. In 1870, only 57% of the population age five to 17 was enrolled in school, and only 1.2% attended high school. Although almost 70% of seven- to 13-year-old children attended elementary school by 1910, only about 5% of 14- to 17-year-olds were enrolled in high school. By 1940 the percentage of students enrolled in elementary school had climbed to just over 95%, and 79.3% of children 14 to 17 years old attended high school. In 1997, when 99.1% of all children attended school, 96.6% of children 14 to 17 years old attended high school. The percentage of children enrolled in school has diminished since then—largely because of HOME SCHOOLING, whose enrollment tripled from 2000 to 2005 and now absorbs nearly 1.5 million students from school systems.

attendance area The geographic area served by a public school. Inapplicable to private schools, attendance area has become an obsolete administrative concept in areas of the country where parents have been given the option of choosing out-of-district school for their children or where courts have ordered cross-district busing to promote racial segregation.

attendance register A daily log maintained by teachers and staff to record the presence, tardiness or absence of every student in school and used to calculate the AVERAGE DAILY ATTENDANCE. Depending on the school, the attendance register may also include specific data for each student, such as name, date of entry or transfer to the school, date of birth, gender, home address and telephone, parents' daytime

telephone numbers and cumulative data of days present and so on.

attention deficit disorder (ADD) A chronic inability to concentrate. Often called ATTENTION DEFICIT HYPERACTIVITY DISORDER, ADD is a puzzling, often frustrating disorder, which may evince itself among young school children in inability to pay attention, difficulty listening, fidgeting, squirming, running around the room, low frustration tolerance, argumentativeness, sudden impulsive acts, frequent and unpredictable mood swings, avoidance or withdrawal from group activities, excessive time in completing routine tasks or, in sharp contrast, falling asleep. Children with ADD are unable to pay attention in class, sit still, be quiet, act cooperatively or concentrate on their academic work, and they invariably fall behind.

ADD, however, remains a controversial syndrome for which there are no diagnostic tests. Almost every healthy child experiences symptoms of ADD from time to time—younger children more than older ones, boys more so than girls, and eight- to 10-year-olds more often than any other age group. Boys account for 80% to 90% of all ADD cases. How long and how severe each outburst becomes, how it affects the child's long-term academic performance and how the affected adults respond seem to be keys to its treatment and resolution. ADD invariably draws immediate attention from teachers and parents, and troubled children may unconsciously display symptoms of ADD for that purpose. Teachers often label restless children as having ADD to shunt them into special education classes, thus ridding conventional classes of the most difficult and disruptive children and restoring total teacher control in the class. Schools, too, profit from ADD, which entitles each school to hundreds of dollars in federal grants for each child assigned to special education. ADD is classified

as a disability under the federal INDIVIDUALS WITH DISABILITIES EDUCATION ACT. Parents also often grasp at the ADD label as a simple explanation for their own inability to cope with the problems of growing children and, in the case of parents on welfare, a way of obtaining additional government subsidies under the Individuals with Disabilities Education Act.

Many pediatric neurologists and psychiatrists maintain that ADD has become promiscuously overdiagnosed. The result, according to pediatric neurologist Fred Baughman, writing in the *Journal of the American Medical Association* in 1993, is that some perfectly healthy children are receiving drugs they do not need and growing up believing "they have something wrong with their brains that makes it impossible for them to control themselves without using a pill. . . ."

True long-lasting ADD probably occurs in well under 3% to 5% of the population, although ADD claims reached 11% after the AMERICANS WITH DISABILITIES ACT of 1990 included ADD as a disability that qualified for repayment for lengthy and costly testing. Some testing groups, which often stand to profit from their research, claim that 33% of all children suffer from ADD. Even the respected Yale (University) Center for the Study of Learning and Attention insists that ADD and attention deficit/hyperactivity disorder (ADHD) afflict 15% to 20% of American children or 12 million to 16 million. About 6 million children—11% of the total elementary and high school enrollment—received behavioral drugs such as Luvox and Ritalin (methylphenidate) to control ADD and other behavioral problems in 2005. Moreover, between 1.0 and 1.5% (depending on the particular study) of preschoolers two to five years old were also receiving drugs to control ADD or ADHD in 2000.

For true ADD and ADHD, with no complicating psychological factors, researchers assembled by the National Institutes of Health have

found Ritalin the most effective therapy—far more effective than BEHAVIOR-MODIFICATION therapy alone and even more effective than a combination of Ritalin and behavior modification therapy. Seventy percent of true ADD and ADHD cases, however, also exhibit psychological problems such as depression and anxiety, and, in those cases, the most effective treatment was a combination of Ritalin and behavior-modification therapy.

Such studies, however, have no bearing on the contention of many educators that teachers, counselors, school administrators and parents are grossly overdiagnosing normal boys with ADD and ADHD and, in effect, pathologizing normal, active, mercurial boyhood behavior. The number of Ritalin prescriptions to school-aged children increased 2½ times from 2000 to 2005 to more than 6 million, despite the drug's dangerous side effects—especially in normal children who do not need it. Although Ritalin is a stimulant, it has the paradoxical effect of calming preadolescent children, but its pharmacological effects and addiction patterns are similar to those of cocaine, to which it is related. Indeed, more than 500,000 school-aged children were found abusing the drug in 2005. A few educators and psychiatrists grew so alarmed by the increase in the use of such drugs that a number of state boards of education issued directives discouraging its use and urging teachers to emphasize behavior management. In fact, no accurate statistics for ADD exist, because their symptoms come and go in almost every normal, healthy growing boy and, more often than not, vanish with maturation (and discipline)—before testing can be arranged or completed. With testing costs well above \$1,000, a number of organizations have built huge staffs and treasuries by encouraging parents and schools to test every child who might seem to exhibit symptoms of the disorder.

Where chronic ADD does indeed exist, it may be emotional, developmental or neuro-

logical in origin, or it may be associated with a wide range of minor physical problems such as food allergies, visual or auditory disorders or normal growth spurts. Very rarely, ADD may also be associated with serious physical problems such as brain damage, biochemical imbalances, infectious diseases, mental illness and other serious illnesses that make appropriate medications necessary. The normal diagnostic route for students with ADD is a combination of intensive counseling and a thorough physical examination.

(See also HYPERKINESIS.)

attention deficit hyperactivity disorder (ADHD) A chronic inability to concentrate, marked by excessive impulsivity and hyperactivity. Causes are not dissimilar to those of conventional ATTENTION DEFICIT DISORDER, with one exception: ADHD has a statistically significant correlation with DYSLEXIA and math disabilities (MD). One study found that 33% of dyslexic or MD children had ADHD.

attention span The length of time an individual can concentrate on an activity. Attention span increases with age, visual and auditory acuity, language skills, intellectual level, motivation and interest. Emotional, physical, psychological difficulties and mental deficiencies all shorten attention span.

attitude A psychological, intellectual or emotional position that predisposes an individual to think or act in a predictable way. Whether temporary or enduring, attitudes are all learned and, therefore, of enormous consequence to educators seeking to imbue students with a wide range of positive attitudes toward learning, ethical and moral conduct, love of school, family, friends and country.

attitude scales Tests designed to measure attitudes by measuring responses to a series of

statements. The two most common methods are the Likert and Thurstone scales. The Likert attitude scale permits test takers a range of responses to each question: strongly agree, agree, undecided, disagree and strongly disagree. The Thurstone scale asks test takers to check those statements with which they agree and leave the other questions unanswered.

audiolingual instruction A method of teaching that depends exclusively on speech and visual demonstration, with no written materials. It is through audiolingual instruction, in effect, that children learn to speak their native tongue long before they learn to read or write. Long in use in Europe, audiolingual instruction did not find its way into American schools until after World War II. Initially, it was used to teach foreign languages to elementary school-aged children of American civilians and servicemen stationed with their families overseas. Often called the aural-oral approach, it remains the basic technique for teaching foreign languages to elementary school children.

(See also FOREIGN-LANGUAGE STUDY.)

audiologist In education, a specialist in testing, diagnosing and designing appropriate educational and counseling programs for hearing-impaired children.

audio-tutorial instruction A three-part, lecture-free instructional system that combines small seminars, large assemblies and audiocassettes to guide students through a course of independent study. Devised in the 1960s by botanist S. N. Postlethwait for college and university students, audio-tutorial instruction relied on audiocassettes to detail what the student must do to complete his or her independent study, including the required observations, reading, films, visits to other laboratories and experiments to conduct.

The approach is devoid of lectures, and students must obtain all the knowledge independently. Postlethwait used the general assembly of all his students, not to lecture, but to give general instructions and details on techniques to use in one's independent study. The small, weekly assembly sessions, or seminars, grouped eight to 10 students to test each other and respond to unexpected questions with short, but detailed lectures.

audiovisual aids Any of a wide variety of sound and projection devices used by teachers to engage as many student senses and faculties as possible in the learning process. Among the more modern audiovisual aids are tape and audiocassette players, slide and film projectors, closed circuit and cable television, computers and associated CD-ROMs and DVDs, and computers with one- and two-way telecommunications links that permit viewing textual, graphic, still and filmed materials. Designed to supplement materials from textbooks, lectures and the blackboard, audiovisual aids date back to 1696 and the magic lantern, a device that used candlelight to project pictures from transparent glass slides. Usually drawn by hand, magic lantern slides were used in classrooms for the next two centuries to illustrate the uninterrupted prose in textbooks and lectures. The 19th century saw a host of new visual aids introduced—models, diagrams, charts, graphs, cartoons, posters, maps, globes, sand tables, blackboards, display cases and dioramas. With the invention of photography and recording, photographs, slides and films were added.

(See also ADAPTIVE PROGRAMMING; COMPUTER-ASSISTED INSTRUCTION; LANGUAGE LABORATORY; PROGRAMMED INSTRUCTION; TEACHING MACHINE.)

audiovisual listening center An area of a kindergarten or early elementary school classroom equipped with books, tapes and headsets, a television and/or videocassette recorder

for children to listen or watch pretaped stories and educational materials.

audit Attendance in a course, usually at college or university, without credit or grades. Students who audit courses usually do not have to participate in activities normally needed for credit, such as examinations and class assignments. Students usually audit courses either because of deep personal interest or because they need a limited body of knowledge for which they do not want to or cannot commit the time or energy required for taking a course for credit. Auditing requires permission of the college and the instructor. The word “audit” usually appears on student transcripts.

auditory discrimination The ability to differentiate between the varying sounds and frequencies of vowels, consonants, syllables and words. Poor auditory discrimination can result from developmental differences or neurological damage. A common symptom among the elderly, poor auditory discrimination in early childhood can slow development of articulation and language skills. There are many auditory discrimination tests designed for every age group.

auditory memory span The length of time an individual can remember something heard. Development of the auditory memory span in the classroom is essential for academic achievement, and teachers at all levels try to teach students at an early age a wide variety of methods for improving auditory memory span. Among the many devices they use are rhymes, word games, silly sentences, mnemonics, startling visual associations, oral drills and silent periods for students to concentrate entirely on a gradually increasing number of teacher declarations.

auditory training Instruction of the hearing impaired to understand sounds and speech.

Usually involving the use of auditory amplification devices, auditory training includes teaching the hearing impaired how to listen by watching lip patterns as others speak. Auditory training may also include counseling.

augmented alphabet An alphabet of 45 characters and combinations of characters to teach young children the sounds of the English language as well as the names of letters in the alphabet. Developed in 1959 by Sir James Pitman, the grandson of the inventor of the Pitman shorthand system (see **SHORTHAND**), the augmented alphabet (or Roman Augmented Alphabet, as he called it) is printed on large cards that display not only individual letters of the alphabet but basic combinations thereof. Together these correspond to the 27 consonant sounds, 17 vowel sounds and the letter *y*. Also called the **INITIAL TEACHING ALPHABET**, or *i.t.a.*, the combination sounds such as *th* are displayed as digraphs, with the letters partially overlapping, to distinguish the aural from the written alphabet.

(See also **ALPHABET**; **PHONICS**.)

aural learning Learning by listening. Aural learning is the way infants learn language skills during preschool years and is essential to the development of learning readiness and reading and writing skills in the early school years.

authoritarian teaching A method of teaching based entirely on teacher lectures and allowing for no classroom discussion. Grades are based entirely on student ability to reproduce rather than interpret lecture and textbook material in exams.

authority A vested or implied power to command the obedience of others. Essential for effective education at every level, authority in schools, colleges and universities and in individual classrooms is established in many ways—by establishing warmth, respect and

even love in students for the institution, the individual teacher and each other; by establishing respect through demonstration of superior, expert knowledge; by the promise of rewards; by the fear of punishment. Exercising teacher authority should not be confused with AUTHORITARIAN TEACHING which is based on lectures alone and allows for no classroom discussion.

autism A multiple handicap affecting a child's mental, emotional and physical processes by age five and sometimes from birth. Although its causes remain unknown, it is believed to involve some sort of physical damage to the brain or neurological system—or both. Federal laws relating to handicapped children classify autistic children as both “emotionally disturbed” and “health impaired.” Usually uneducable in the conventional classroom setting, the typical autistic child tends to be aloof, disinterested, withdrawn, occasionally impulsive, and irrationally fearful at the sight of new objects. Autistic children respond only to certain sounds or voices and have extreme difficulty speaking and making coordinated body movements. They develop few social skills, cannot play with other children, and have difficulty understanding what is said to them. Among the many typical symptoms are refusal to make eye contact, repetitive behavior such as head banging or hand flapping and a preoccupation with unusual activities or interests. Half a million Americans suffer from the disorder. Massive, combined intervention, including educational and behavioral therapy by doctors, teachers, psychotherapists, social workers and parents and other family members, has produced few encouraging results in helping autistic children improve their abilities to function intellectually, emotionally or socially. A dozen different efforts with hormone therapy sponsored by the National Institutes of Health have also proved ineffective. Although some forms of intensive

individual psychosocial and physical therapy have helped some patients, two-thirds of autistic adults cannot live independently.

autodidact One who educates himself by studying all or most of a conventional curriculum independently. Autodidacts were common in the United States prior to compulsory universal public school education, when only the sons of the wealthy could usually continue their education past primary school. BENJAMIN FRANKLIN'S *Autobiography* urged Americans without the opportunity to attend formal schools to educate themselves. Franklin was himself an autodidact, as was Thomas Paine, who believed, “Every person of learning is finally his own teacher.” Among the most famous American autodidacts were steel magnate/philanthropist ANDREW CARNEGIE, inventor Thomas A. Edison and HORACE MANN, the “father” of American public schools. Mann educated himself by reading and memorizing all the Greek, Latin and English books in the Franklin, Massachusetts, town library during his teenage years prior to matriculation at Brown University, from which he graduated as class valedictorian.

automated speech Computer-produced words that simulate the sound of the human voice. Used as an integral part of computer-controlled programmed instruction, automated speech replaces the teacher in routine drills in language and other instruction in which the student has a choice of several responses. Automated speech tells the student, “That's right” or “That's wrong, try again.”

automaticity The voluntary performance of a task without conscious thought, such as walking. The educator's task is to help students achieve automaticity in reading, writing one's thoughts, calculation and other skills. A child's need to “sound out” the letters before pronouncing a word shows a normal, developmental lack

of automaticity. For an older child or adult to voice each word that is read can indicate a lack of automaticity that can impede academic achievement.

auxiliary services In education, the ancillary school functions of noninstructional personnel. The personnel offering such services may be highly trained professionals such as nurses, librarians, remedial teachers and therapists, or they may be noncertified, semiskilled workers such as cafeteria workers, bus operators and janitors.

average daily attendance (ADA) A statistic used by schools and school districts for determining the amount of funding due from the

state each year. Computed from data recorded in school ATTENDANCE REGISTERS, the ADA is calculated by dividing the total number of student attendance days during the entire school year by the number of days the school was open. The average daily absence is calculated by dividing the total number of student days of absence during the school year by the number of days the school was open and functioning.

average daily membership (ADM) A statistic used to determine allocation of teachers and school equipment within a school district. The ADM measures district size by dividing the total number of student enrollment days at a school or district by the number of days the school is open and functioning.

B

baccalaureate A term meaning “bachelor,” but with multiple meanings in education. In the United States, it may refer to the BACHELOR’S DEGREE obtained upon successful completion of a four-year college education, to the ceremony at which the degrees are awarded or to the speech delivered when conferring such degrees. In France and many other countries, the baccalaureate is the degree required for admission to university and granted upon successful completion of secondary school education and corollary comprehensive examinations. Probably derived from the French *bas chevalier*, or first stage of knighthood, it evolved into the French word *bachelier*, or “bachelor.” It was then Latinized as baccalaureate, because Latin was the language of scholars throughout Europe until the 19th century.

bachelor’s degree A certification by an institution of successful completion of four years of college academics. The two most common bachelor’s degrees are the Bachelor of Arts (B.A. or A.B., for the Latin *artium baccalaureus*), for work in the humanities, and Bachelor of Science (B.S.). Some colleges offer bachelor’s degrees in specialized areas—for example, Bachelor of Music (B.Mus.), Bachelor of Education (B.Ed.), Bachelor of Engineering (B.Eng.), and so on.

back-to-basics An educational movement and a curriculum stressing a return of American

public schools to a fundamental core curriculum based on English, mathematics, science and history and at the same time elimination of so-called educational “frills,” such as home economics and other personal improvement courses. Launched in the early 1970s, its roots lie in the early 20th-century “essentialism” movement that educator WILLIAM CHANDLER BAGLEY developed in opposition to the PROGRESSIVE EDUCATION movement of JOHN DEWEY.

Back-to-basics advocates would reinstitute strict classroom discipline and give primary and secondary school students little or no choice over what courses they would study. Although there are widespread differences regarding which courses constitute the required basics, they generally include those that provide basic academic skills such as reading, writing, spelling, punctuation, penmanship, a range of calculation skills, history and civics, biology, chemistry and physics. Some back-to-basics advocates also include music and art in their suggested core curriculum.

Proponents of back-to-basics also condemn OPEN EDUCATION and “cafeteria-style” curricula that offer students a wide choice of personal-improvement courses such as human interpersonal relations and “soft” academic courses such as media studies. Back-to-basics proponents also call for elimination of the GENERAL EDUCATION track, in which 25% of the credits are earned for physical and health education,

work experience outside the school, remedial math and English and “personal service and development” courses.

Bacon, Sir Francis (1561–1626) English philosopher, essayist, barrister, member of Parliament and counsel to the crown, whose *The Advancement of Learning* established new guidelines for education in England and the American colonies.

Along with Thomas More and DESIDERIUS ERASMUS, BACON helped revive the Platonic spirit of inquiry that centuries of Christianity had crushed with the tenet of clerical infallibility, the New Testament story of the temptation and fall and the Old Testament dictum “in much wisdom is much grief.” Bacon’s work marked the beginning of the end of clerical control of university education and its eventual takeover by humanists.

Bacon went further than either More or Erasmus, however, by declaring, “I have taken all knowledge to be my province.” Like most 16th-century and early 17th-century humanists, neither More nor Erasmus had completely abandoned the traditional contention originally propounded by Saint Augustine that scholarship is a “vain and curious longing” and a “lust of the eyes.”

Nevertheless, both More and Erasmus agreed that nature and the universe were God’s creation and that to study and know them is to know God better. Their humanism was still deeply rooted in religious belief. Bacon’s humanism, while never a religious, was grounded more in the potential benefits of knowledge to man, and together with the works of ROGER ASCHAM and others, became the basis of early American education.

Bagley, William Chandler (1874–1946) American educator, author, educational philosopher and antagonist of JOHN DEWEY’S PRO-

GRESSIVE EDUCATION movement. A prolific author and editor of six different journals of education and educational psychology, Bagley founded the ESSENTIALISM movement, which eventually spawned the contemporary back-to-basics movement.

A midwesterner by birth and a product of the Midwest’s practical, farm-belt universities, he taught in a one-teacher school in rural Michigan before becoming a principal in St. Louis, Missouri, in 1901. No theoretician, he learned teaching as a doer, moving to Dillon, Montana, in 1902, to serve four years as superintendent of public schools and professor of pedagogy and psychology at the State Normal School.

He spent the next two years as superintendent and professor of teaching methods at the State Normal and Training School in Oswego, New York. In 1908, he became professor of education and director of the University of Illinois school of education. There he gained a national reputation with the publication of his first books on education. In 1917, he joined John Dewey at Teachers College, Columbia University, in New York, where he remained for the next 23 years.

Bagley believed firmly in strict classroom discipline, rote learning and total mastery of basic facts he considered essential to success in adult life. He believed in a core curriculum that taught all students basic skills and a knowledge of American history and culture. He was a pioneer in education by RADIO. Despite his conservative approach to education, he was an ardent proponent of equal educational opportunity, regardless of race, religion, ethnicity or gender.

His books included *The Educative Process* (1905), *Classroom Management* (1907), *Craftsmanship in Teaching* (1911), *Educational Values* (1911), *School Discipline* (1915), *Education, Crime, and Social Progress* (1931) and many others. He was editor of the *Journal of the*

National Education Association (1921–24), *School and Society* (1939–1946), *Educational Administration and Supervision* (1917–46) and coeditor of *Journal of Educational Psychology* (1910–17).

ball-stick-bird A system of teaching the alphabet by using three basic forms—an oval (ball), a line (stick) and an angled V (bird)—from which all the letters of the alphabet can then be formed by adding one or more balls, sticks or birds. Made up of two series of five books each for students and a teacher’s manual, the system was designed in the early 1970s for the retarded, but is equally practical for teaching preschool children to read.

Bancroft, George (1800–1891) American educator, historian and statesman who, as secretary of navy under President James Knox Polk, presided over the founding of the UNITED STATES NAVAL ACADEMY, at Annapolis, Maryland, in 1845. In 1834, he completed the first of his 10-volume *History of the United States*, the first comprehensive, thoroughly researched history of the United States from earliest colonial times to the end of the Revolutionary War. Written over a span of 40 years, from 1834 to 1874, the work earned him the epithet “father of American history.”

Massachusetts-born and a HARVARD COLLEGE graduate, he turned down an opportunity to teach there in favor of joining Joseph Cogswell in founding the private, experimental Round Hill School, in Northampton, Massachusetts, in 1823. Round Hill was the first U.S. school based on the then-admired German GYMNASIUM model, which trained the body as well as the mind in the belief that physically fit young men performed better academically than the unfit. In addition to introducing physical education into the curriculum, Round Hill was the first true BOARDING SCHOOL, in that out-of-town students lived on campus rather than with local families. Unfortunately, the school’s

George Bancroft (Library of Congress)

discipline proved unpopular and Round Hill ended in failure eight years later.

Bancroft then plunged into Massachusetts and Democratic political life. He was appointed collector of the Port of Boston in 1838, navy secretary in 1845, minister to England in 1846 and minister to Prussia and then the German Empire, from 1867 to 1874.

Bank Street College of Education An independent, graduate education college, founded in 1916 in New York City as an experimental center to improve education. The college is coeducational and offers master’s degree programs and nondegree programs for a variety of work with students in educational settings. It also operates the School for Children (popularly called the Bank Street School) for 435 chil-

dren, 3 to 13 years old, and the Family Center, for infants and toddlers as young as nine months. The school and center provide students of early childhood education with opportunities for studying and interacting with children, parents and teachers. About 3,000 educators from around the world visit the college and its school each year. The college has about 900 students and requires a bachelor's degree for admission. (See also LABORATORY SCHOOL.)

Baptists Protestant Christians whose faith evolved from 17th-century Puritanism and Congregationalism, and is rooted in the belief that "conversion"—the deep, spiritual embrace of and commitment to Christianity—must precede Baptism. Moreover, just as conversion embraces the entire human spirit, baptism must immerse the total body.

There is no single Baptist Church. Like other religious groups, they sent missionaries fanning across North America to convert non-Baptists during the colonial era and during the peak of EVANGELISM and the MISSIONARY EDUCATION MOVEMENTS of the 19th century. Their churches were the common schools of the colonial communities in which they settled and their ministers the only schoolmasters. The earliest remaining educational institution they founded was Rhode Island College, which the Rev. James Manning began in the parsonage of his church in Warren, Rhode Island, in 1764. The college moved to Providence in 1770 and later became Brown University.

By 1850, Baptists were the second largest denomination in America, after the Methodists. The more than 9,500 Baptist churches made up about one-fourth of all the churches in the United States. As it did in other churches, the debate over abolition split the Baptists into three groups: the northern abolitionists, the southern whites who favored slavery, and the southern blacks, who would be separated from their white coreligionists for more than a cen-

tury thereafter. The wounds of the Civil War have yet to heal, and the Baptists remain divided by race in many areas of the country and by conservative and liberal social and political views.

Like other religions, the Baptists' influence on education diminished after disestablishment of churches in the United States in the early 19th century and the growth of state-controlled public school education and colleges following the Civil War.

Barenblatt v. United States A 1959 United States Supreme Court decision that upheld the constitutional right of congressional committees to conduct investigations in the field of education.

The ruling upheld the conviction for contempt of Congress of Lloyd Barenblatt, a graduate student and teaching fellow at the University of Michigan and a psychology instructor at Vassar College. Barenblatt had refused to answer questions from members of a House Un-American Activities Subcommittee investigating Communist influence in higher education.

Instead of invoking the Fifth Amendment (against self-incrimination), Barenblatt challenged the committee's right to inquire into his personal beliefs and associations, claiming that the inquiry had no valid legislative purpose (presumably the reason for all committee inquiries) and was an infringement of academic freedom. Although agreeing that academic freedom must be protected, the Court said that Congress was not "precluded from interrogating a witness merely because he is a teacher," and that the government's "right of self-preservation" against the threat of communism was a valid legislative purpose for its inquiry.

Barnard, Frederick A[ugustus] P[orter] (1809–1889) American educator and for 25 years president of Columbia College and

responsible for its growth and expansion into a university. Born in Massachusetts, he graduated from Yale College in 1828 and taught there until 1831, when his own increasing deafness interested him in teaching the deaf. From 1831 to 1837, he did just that, first in Hartford, Connecticut, and then New York City.

A professor of mathematics, chemistry and physics, he taught at the University of Alabama (1848–54) before accepting the presidency of the University of Mississippi in 1856. He resigned in 1861 because of his opposition to slavery and three years later was invited to become president of Columbia, when it was a small college of about 100 male students. By

Frederick A. P. Barnard (Library of Congress)

the time he died, Columbia University had grown to more than 2,000 students.

Originally a staunch conservative, he became one of the most innovative 19th-century American college presidents. He introduced the concept of elective courses for the last two years of undergraduate education and developed common examinations for college entrance. He expanded the curriculum and established graduate and professional departments and schools, including the famed Teachers College. Originally an opponent of college education for women, he reversed himself and fought his board of trustees over the issue of coeducation. In 1883, he established a women's department, which became Barnard College in 1889—unfortunately, six months after his death.

Barnard was also a prolific author. Editor of *Johnson's Cyclopaedia* (1872), he wrote books on teaching arithmetic and grammar, on student government, on industrial education and on science. He wrote a history of the United States Coast Survey. He was a founder of the National Academy of Sciences and president of the American Meteorological Society and other scientific groups.

Barnard, Henry (1811–1900) Pioneer American educator responsible for founding the public school systems of Connecticut, Rhode Island and Wisconsin. Born to a wealthy family in Hartford, Connecticut, Barnard graduated from Yale College, trained for the law and then spent a year in Europe, meeting such leading philosophers, writers and educators as Thomas Carlyle, William Wordsworth, PHILLIPP EMANUEL VON FELLEBERG and JOHANN HEINRICH PESTALOZZI. Together, they imbued him with a sense of mission to ensure universal public education in the United States.

Elected a Whig member of the Connecticut legislature when he returned in 1837, he immediately sponsored a variety of laws to improve the lot of the blind, the deaf, the insane, the

poor and the imprisoned. Then, emulating the work of HORACE MANN in Massachusetts, he sponsored a model school bill establishing a statewide public school system to provide universal, compulsory education. Unlike Horace Mann's call for free schools, however, Barnard proposed a system for which parents would pay according to their means—a forerunner of the property-tax system now used to pay for public schools.

Barnard's motives differed from Mann's as well. An advocate of practical education—bookkeeping, surveying, mechanics, and so on—Barnard saw universal education as a means of providing industry and agriculture with skilled work forces that would maintain the nation's parity in international commerce.

Barnard ran into considerable opposition from those who opposed equal educational rights for women. Barnard also antagonized the landed gentry of his era by proposing an

end to private academics, which he said created class distinctions that would lead to European-style conflicts between the laboring and propertied classes. He saw public schools as a way of teaching poor and rich alike a universal, common love of country that would prevent the Marxist-inspired revolutions then taking place in Europe from spreading to the United States.

In 1838, the Connecticut legislature finally yielded and established a State Board of Common Schools, which he was named to head. His acceptance marked the end of his life as a politician and the beginning of his career as an educator. To staff Connecticut schools, Barnard founded teacher training institutes, before moving to Rhode Island in 1843, to establish a public school system and a teacher training school in that state. After seven years, he returned to his home in Connecticut and once again took charge of the state's school system.

In 1854, he founded the *American Journal of Education*, which under his 27-year editorship would grow into a massive, 32-volume encyclopedia of education that was not only the world's first such encyclopedia but remains the definitive work on 19th-century education. In addition to his work on the journal, he was author of about a dozen books, including *School Architecture* (1849), *National Education in Europe* (1854), *American Pedagogy* (1860), *Science and Art* (1871), *Pestalozzi and His Educational System* (1874) and *English Pedagogy* (1876).

In 1859, he accepted the chancellorship (presidency) of the University of Wisconsin and helped found 14 teacher training institutes as a prelude to building the state's public school system. In 1865, he became president of St. John's College in Annapolis, Maryland, with the hope of establishing a public school system in that state. The opposition was too strong, however, and a year later he accepted a presidential appointment as the first U.S. commissioner of education in Washington, D.C. He

Henry Barnard (University of Wisconsin–Madison Division of Archives)

spent the next year organizing what would eventually (in 1979) become the U.S. Department of Education. He then retired to Connecticut and spent the next three decades writing on education, occasionally venturing out of state to lecture on the benefits of public schools.

Barnard College A private, nonsectarian college founded as a college for women in 1889 by the trustees of Columbia University in New York City. The founding of Barnard represented a compromise between the trustees and Columbia University president FREDERICK A. P. BARNARD, who vehemently advocated enrolling women into the all-men's Columbia College. He did succeed in establishing a women's department in 1883. Barnard died six months before the department he founded was reorganized as a college named in his honor. Now affiliated with Columbia University, Barnard remains an independent four-year college offering B.A. degrees in a wide range of arts and sciences to nearly 2,300 students. Barnard and Columbia University students have cross-registration privileges in all courses.

Barnum, Phineas Taylor (1810–1891) A shrewd entrepreneur, impresario, showman and, coincidentally, a major force in early 19th-century education and the development of the American MUSEUM as a conduit for education. Known today as a circus operator, Barnum did indeed begin his varied career as an itinerant showman, exhibiting such curiosities as an elderly black woman who claimed to be the 161-year-old former nurse to George Washington.

Born in Bethel, Connecticut, he had little formal education and went from job to job during his early years—clerking in a store, selling lottery tickets, editing a newspaper and, by the time he arrived in New York in 1841, managing entertainment troupes. At the time, New York's only two museums—Peale's Museum and the American Museum—were on the brink of clos-

ing. The two institutions were essential educative institutions in New York. The first public schools were only just then opening, in Connecticut, and most Americans relied on the AMERICAN LYCEUM movement, periodicals, libraries, fairs and museums for education. Fairs and museums were particularly popular. Fairs added practical education (agriculture, cooking, etc.) to a core of entertainment, while museums did the opposite, adding entertainment (dinosaur bones and the like) to a core of educational materials.

Barnum acquired and merged New York's two museums into a new, single institution, Barnum's New American Museum. He expanded the permanent collections of natural history specimens, stuffed animals, inventions of the industrial revolution and fine art as the core of the museum. He then added huge new viewing galleries with dioramas and dissolving views. He built auditoria for visitors to listen to spell-binding lecturers, singers, concerts, plays and other attractions.

Moreover, he added what he called "transient attractions"—performing dogs, jugglers, ventriloquists, albinos, giants and Indians who performed war dances—all intended to amaze as well as educate. He traveled the world to find attractions that would earn profits from public curiosity about the unusual. He found and displayed Chang and Eng, the Siamese twins, and General Tom Thumb, a midget only 25 inches tall, who attracted 20 million visitors. When he failed to find the unusual, he produced fakes such as the Feejee Mermaid. Fake or real, the exhibits at Barnum's popularized the museum by attracting 82 million visitors and assuring its role as a fixture in the broad picture of American education. Indeed, Barnum taught curators of future museums the necessity of making even their most serious exhibits entertaining.

Fires twice destroyed Barnum's museum. Each time, he rebuilt it bigger than before. In 1868, however, he set out on the career for

Architect's rendering of Phineas T. Barnum's (inset) New Museum, at Madison Square in New York City (*Library of Congress*)

which he is best remembered today—a circus showman, in partnership with James A. Bailey. In 1882, he purchased a huge six-and-a-half-ton elephant from the Royal Zoological Society. He called it “Jumbo,” probably derived from a mispronunciation of the Swahili word of greeting, *jambo*. The name *Jumbo* entered the English language as a new word for extra big. True to form, Barnum exhibited Jumbo as the world's only surviving mastodon. Jumbo's skeleton can still be seen periodically in the AMERICAN MUSEUM OF NATURAL HISTORY in New York, which acquired a number of other specimens from Barnum's museum.

Barnum did have a more conventional and serious side of his personality. He served

two terms in the Connecticut state legislature and was mayor of Bridgeport, where he battled fiercely and tirelessly against racial discrimination. He was a close friend of Mark Twain, Horace Greeley and other men of letters and, in 1855, he wrote his autobiography, entitled *The Life of P. T. Barnum, Written by Himself*. In it he revealed, for the first time, many of the deceptions he used to attract visitors to his great museum.

barrier-free campus A school or campus conforming to the federal REHABILITATION ACT OF 1973 and the AMERICANS WITH DISABILITIES ACT OF 1990 and to state and local regulations mandating free access to education and employ-

ment facilities for handicapped students, faculty and employees.

The act requires public buildings, public programs and private groups and schools that receive some form of federal aid to be accessible to the disabled. The Americans with Disabilities Act of 1990 mandates access for the disabled to employment and public services.

Depending on the age of the building and the extent of required renovations, the cost of converting a conventional public high school into a barrier-free campus can range from tens to hundreds of thousands of dollars. Federal regulations provide all specifications for adapting public buildings to accommodate the disabled, including ramps and ramp angles, elevators, escalators, barrier-free rest rooms with wheelchair-accessible sinks and toilets, wider doorways and lower water fountains. Other modifications include installation of special interior door levers and handles, installation of raised-letter signs for the blind and an additional parking area for cars and vans of the disabled. Classrooms must have portable or adaptable equipment, including accessible laboratory benches, lowered sinks, language-laboratory booths and machine-shop equipment. Also required are corridor handrails, lower fire alarm boxes, accessible shower stalls and lockers in locker rooms, lower emergency shut-off buttons and light switches, lower elevator control panels with raised letters and floor numbers.

Barron's Educational Series, Inc. A leading American publisher of college and university directories and guides to college and graduate school admissions tests. Founded in 1941, Barron's publishes a wide range of combination directories and guides to colleges and universities, of which the most widely used is the massive *Barron's Profile's of American Colleges*. This guide gives detailed descriptions of the programs of study, student life, extracur-

ricular activities, facilities and entrance requirements of every four-year college in the United States. The company publishes similar directories of graduate schools, as well as books on how to prepare for and take every type of college and university entrance examination.

Barzun, Jacques (1907–) French-born teacher, historian, author and critic of post-World War II American education. A member of the Paideia Group and coauthor of *THE PAIDEIA PROPOSAL*, Barzun moved to the United States in 1920, graduated from and taught at Columbia University and in 1958 became Columbia provost and dean of faculties. At Columbia, he urged undergraduates to avoid specialization during the first two years and obtain as broad a knowledge of the humanities as possible. He helped develop a two-year program of great books for that purpose.

Barzun published *Teacher in America* in 1945, and his 1959 essay "The House of Intellect" supported critics of the so-called culture explosion of the post-World War II years. During those years, 50% of American high school graduates flocked to four-year colleges, but half dropped out before graduation, with neither the academic skills to obtain white-collar jobs nor the vocational skills for blue-collar jobs. American colleges, Barzun contended, were not turning out a truly educated citizenry.

Barzun's other important works included *From Dawn to Decadence: 500 Years of Western Cultural Life* (2000) and *Science: The Glorious Entertainment* (1964), a criticism of the overpopularization of science and consequent awe of all things scientific. Both before and during his membership in the Paideia Group, Barzun is a strong advocate of ESSENTIALISM's core curriculum taught by a combination of rote learning, coaching and seminars. Like other critics of public school education in the United States, he called for abolition of general studies (see GENERAL EDUCATION) programs in public schools and "soft"

substitute courses—for example, social studies instead of history, and language arts instead of English. Barzun is an authority on music, art and literature. He has also written a number of books, some now classics, on these subjects.

basal readers Any of a series of books designed to teach children to read. Usually a part of a long-term instructional program, basal (or basic) reading programs include a series of readers, workbooks, activity sheets and a teacher's manual, with lessons planned according to grade level, from first to sixth grades.

Because it is the initial step, the program for first graders differs from those for older children. It includes two or three preprimers, a primer and a first reader. The preprimers are short and limit vocabulary to short, monosyllabic words—for example, "Dick sees Spot run." The primer is a collection of short stories with a limited, repetitive vocabulary, which the first reader expands into slightly longer stories with a more extensive vocabulary.

From second through sixth grade, the basal reading program usually includes at least two books for each level, designed to teach and expand reading, writing and spelling skills.

baseline data A statistical distribution system, which, for teachers, uses a straight line to represent data norms before they introduce a new or altered educational program. Thus, baseline data on one graph might represent a national or regional norm for a particular standardized test. A teacher might then post "dots" above or below that norm, each dot representing a student score. The result is a graphic portrayal of how the students in a class or school compare with the broader norms.

Baseline data may also refer to a variable line representing the results of a series of tests of a single student from which variations may be plotted after the student has completed programs designed to improve those results.

base-ten number system The Hindu-Arabic numeration system by which all basic calculations can be performed mentally, without the aid of mechanical devices. Introduced into western Europe by the Moors in the 12th century, it was not widely adopted in continental Europe until the 17th century. It has yet to be widely adopted in the United States for metric measurements.

basic education A curriculum that teaches fundamental reading, writing and calculating skills and a broad knowledge of science and history. Integral to essentialism and the BACK-TO-BASICS educational movement, basic education refers broadly to the knowledge and educational skills that best equip the individual for successful adaptation to modern society. Basic education stresses "hard" academics, as opposed to "soft" courses such as personal improvement, home economics, language arts and social studies.

Basic Principles of Curriculum and Instruction (1950) A small, classic pedagogical "how-to" work by Ralph Tyler of the University of Chicago aimed at introducing new courses and developing a curriculum. Concerned that too many courses were introduced to satisfy faculty egos or maintain faculty tenure, Tyler suggested that the existence of a course or curriculum should depend entirely on the needs of students, the needs of society or the essentiality of the knowledge. To test those needs or that essentiality, he said, a syllabus for a course or curriculum should detail the educational purposes of the course, the educational objectives, the organization of the course and the methods of measuring the success or failure of the course or curriculum.

basic skills Those intellectual functions taught in elementary school and deemed essential for independent functioning as an adult.

There has rarely been an era in American history in which educators have not debated what constitutes basic skills. In almost all eras, however, there has been agreement that reading, writing and calculating constitute at least three of them. From colonial days to the present, however, Latin, Greek, Hebrew, French, German, Spanish, Japanese, Russian, geography, map reading, astronomy, botany, biology, chemistry, physics, theology, philosophy and literature have all appeared on one or more lists of “basics” proposed by various educators.

Basic Skills and Educational Proficiency Program One of many federal programs established under the Educational Amendments of 1978 to improve elementary reading, writing and calculating skills of Americans of all ages and halt the spread of illiteracy. The three-pronged effort provided funds for public schools and nonschool educational agencies such as preschools and settlement houses to teach children and their parents. A second financial thrust provided funds to states to establish similar programs, and a third prong established national standards and achievement testing to measure basic skills. Like many federal educational projects, the program has had mixed results and provoked some criticism. In the 30 years following the program’s inception, reading proficiency for all students improved less than 1% by 2003, while writing proficiency declined nearly 3% and mathematics proficiency remained unchanged.

Critics of the program maintain that the lackluster academic performance of American students was *not* the result of inadequate funding, as some teachers and school administrators contend, but of poor quality teaching and school administration. Indeed, the United States spent \$6,995 per elementary school student in 2000, more than any country in the world except Denmark, which spent \$7,074 per pupil. At the high school level, the United States

spent \$8,855—the highest in the world except Switzerland, which spent \$9,780. Nevertheless, American 15-year-olds ranked only 18th in the world in reading literacy, 28th in mathematics literacy, and 14th in science literacy.

(See also ACCOUNTABILITY.)

battered-child syndrome A range of injuries symptomatic of physical abuse by a parent or surrogate, including fractures, hematomas (black-and-blue marks), skin tears and injuries, poor hygiene or evident malnutrition. Depending on the state or locality, teachers may be obliged by law to report or remand suspected victims of child abuse to the school nurse, their superiors or the police. Many are justifiably reluctant, however, because of the risk of lawsuits and the difficulty of lay people and even well-trained pediatricians of positively identifying many cases of battered-child syndrome. At best, many of those characteristics are often vague and ill-defined, and there is the ever-present possibility that a child’s injuries may have been self-inflicted in rough play or a simple accident.

Bay City, Michigan, Project An experiment in 1953 to improve public school education by freeing teachers from noninstructional duties and allowing them to devote more time to teaching. For two years, one paraprofessional was paired with each teacher to handle all clerical chores, but the students showed no academic improvements.

Bayly, Lewis (1565–1631) Author of *The Practise of Piety* (1619), one of the three most widely used books for self-education and family governance in the early colonies. Chaplain to King James I’s son Henry and, after Henry’s death, to the king himself, Bayly detailed how to read the Bible, how to govern a family, how to behave in church, how to perform good works and which prayers, meditations and

scriptural readings were appropriate for each of those functions. Designed to promote personal, social and religious stability, *The Practice of Piety* was second only to the Bible in importance to isolated colonial families who perceived themselves as surrounded and threatened by barbarism. It was one of four books to be translated into Algonquian in the 1650s, when missionaries attempted to build an “Indian Library” to convert Native Americans to Christianity in New England.

Beecher, Catherine (1800–1878) Pioneer educator and champion of women’s rights who won for American women the right to “a liberal education” and converted primary school teaching into a women’s profession. Born in Hartford, Connecticut, into one of the most

Catherine Beecher (Stowe-Day Foundation)

influential 19th-century American families, she was the daughter of the Rev. LYMAN BEECHER, the most powerful minister in a Christian America that heeded the words of its churchmen as much or more than the words of its president or governors. Connecticut was officially a Congregationalist state; Lyman Beecher was the recognized, albeit unofficial, head of that church.

Catherine was the oldest of four daughters and four sons and learned the “ornamental skills” at a fashionable school for young ladies. Devastated by the loss at sea of her fiancé, a Yale scholar, Beecher saw the loss as a sign from God to remain single and devote herself to the education of women. In 1823, she opened the famed HARTFORD FEMALE SEMINARY—one of only two such academies (secondary schools) for women in the United States that taught the same subjects as those taught in men’s academies. The idea of teaching chemistry, physics, history, Latin, English, French, German and philosophy to young women “dismayed” Hartford’s “leading gentlemen.”

Despite some initial “ridicule,” she built the academy into one of the world’s most celebrated institutions. She introduced the latest teaching techniques and equipment, and, in one of the great innovations of the day, introduced daily calisthenics and exercise as part of the regular curriculum. Inspired by her success, she reached out beyond Hartford, writing articles on female education and urging women “to act” and influence “the general interests of society.” She called on single women to help their country by building a nationwide system of schools that would unify the nation through education.

Beecher envisioned a national network of teacher training schools and, by 1831, she had converted her own academy into such an institution. She set out on a national crusade to found similar schools elsewhere and turned control of the Hartford Female Seminary to her

18-year-old sister Harriet, who would later gain fame as the author of *Uncle Tom's Cabin*. In 1833, she moved to Cincinnati with her father and founded the Western Female Institute to train more women as teachers. Two years later, she turned that school over to subordinates and returned east to begin a crusade to build a national network of teacher training schools that would eventually send an army of at least 90,000 women through the West to educate American children. She warned that "insubordination, anarchy and crime" were threatening to "run wild" and that the "education of the lower classes is deteriorating. . . . In one of the best educated Western states, one-third of the children are without schools." Beecher called teaching the most suitable role for women, who, as future mothers, were naturally endowed with the gifts required for nurturing the young, and she called on women to join her crusade to "save" the nation from ignorance.

Fearing that the spread of barbarism in the West would destroy their nation, men of wealth rallied around Beecher's cause and underwrote her Central Committee for Promoting National Education. The committee eventually trained and sent 450 women to bring education to rural towns throughout what was then the West (now the Midwest). Beecher's success made her the most influential woman of her day in the United States.

As her fame spread as a public speaker on behalf of the committee, so did her fame as a writer. A prolific contributor to periodicals, she produced a series of best-selling books and was far better known than her younger sister. Indeed, her *A Treatise on Domestic Economy for the Use of Young Ladies at Home and at School* was perhaps the most widely read book of its day. A "best-seller" for 15 years, it was as influential and widely read in its time as Benjamin Spock's *The Common Sense Book of Baby and Child Care* (1946) was from the late 1940s through the 1970s. It was the first single-vol-

ume book ever to detail every aspect of domestic life, including infant and child care, teaching the young, hygiene, nursing and healing the sick, cooking, cleaning, gardening, home maintenance and all other responsibilities for keeping the family alive and well.

There were few homes that did not depend on her book, and communities everywhere welcomed her as an authoritative speaker on home management and the role of women in American society. "The woman, who is rearing a family, . . . [and] the woman, who labors in the schoolroom," she wrote, "are . . . accomplishing the greatest work that was ever committed to human responsibility."

Fewer than 10% of American teachers were women when she started her crusade in 1830. By 1888, 10 years after her death, women made up 63% of the teaching profession overall, and 90% in cities. The Civil War helped by plucking male teachers from their classrooms, and when they returned from war, the industrial revolution had created factory jobs that paid more than teaching. Moreover, the war had left many towns too poor to pay teachers more than a subsistence wage. Schools saved money by hiring women, whose salaries were lower than men's.

Nevertheless, Catherine Beecher's work produced the initial momentum for women's entry into teaching. While traveling to promote her books, she helped found teacher training schools in Ohio, Illinois and Wisconsin. Ironically, of all the schools she founded, only the last has survived. It became the Milwaukee-Downer School and eventually part of the University of Wisconsin. Even her Hartford Female Seminary closed. She spent her last years living with her sister Harriet. Together they wrote *The American Woman's Home*—an updated version of Catherine's earlier *Treatise on Domestic Economy for the Use of Young Ladies at Home and at School*. She and Harriet also tried unsuccessfully to found a medical training institute that would train women as "home physicians."

Beecher, Lyman (1775–1863) Charismatic American Presbyterian minister whose hold over the minds of so many Americans of his day preserved Protestant influence in American education for nearly a century. Born in Connecticut, Beecher came from a family of farmers and blacksmiths whose forebears had arrived in Boston with the Puritans in 1637 and a year later founded New Haven.

He attended Yale College and, under the influence of college president TIMOTHY DWIGHT, emerged a fierce Calvinist conservative who

quickly became leader of the burgeoning evangelical movement that swept the United States at the beginning of the 19th century. After a 10-year apprenticeship as minister in a church in East Hampton, Long Island, he took over the pulpit in Litchfield, Connecticut, then a social and cultural center of the Northeast, from which his preachments and writings were heard across the nation and even in England. A rigid Calvinist, he told his wife after their marriage that he expected complete and unquestioning obedience from her. “She

Lyman Beecher (center, front), shortly before his death, surrounded by his illustrious children and their spouses. To his immediate right is famed educator Catherine Beecher; her sister, Harriet Beecher Stowe, the author of *Uncle Tom's Cabin*, is on the far right. (Stowe-Day Foundation)

entered my character completely," he later wrote.

He quickly became one of America's most powerful leaders, preaching twice on Sundays and speaking every day of the week to audiences throughout the Northeast. He was responsible for conversion of tens of thousands of Americans. After he succeeded in obtaining a ban on alcohol in Connecticut, state legislators decided to disestablish Congregationalism as the official state religion lest his ministerial powers supersede their own. This disestablishment in 1818 spurred him to found the Domestic Missionary Society to educate an army of devout young ministers who would control the nation's churches and, therefore, the education of the nation's children. Public schools were still 15 years away in Connecticut and as many as four to five decades away in many parts of the nation. The church was America's primary educational institution. Beecher knew this and prepared to take control of it through his new Missionary Society and the AMERICAN BIBLE SOCIETY, which he had helped found two years earlier.

In 1826, he moved to the even more visible pulpit of a Boston church, where, for six-and-half years, he attacked Unitarians, Roman Catholics and all others who refused conversion to what he considered America's church. One of his sermons provoked a Boston mob to sack the Convent of Ursuline Nuns in Charlestown.

In 1832, he accepted an offer to be the first president of the Lane Theological Seminary in Cincinnati, where he could spread his influence throughout the West. In 1834, however, the trustees banned any on-campus discussion of abolition, and most of the students left for OBERLIN COLLEGE, which had become a hotbed of abolitionism.

As abolition replaced EVANGELISM as the foremost issue in the United States, Beecher's influence began to wane. In 1850, he moved to Brooklyn, where he lived the remainder of his

life with his clergyman son Henry Ward Beecher, who would replace his father as the most influential Protestant minister in the United States. Besides Henry, Beecher had four other sons, who also became ministers of considerable influence, and four daughters. CATHERINE BEECHER became an educator, women's advocate and perhaps the most influential American woman of her day. Harriet Beecher married her father's chief ministerial assistant, Calvin Stowe, and later wrote the celebrated *Uncle Tom's Cabin*. Historians agree that next to the Adams family, Lyman Beecher's family was the most influential 19th-century American family.

behaviorism An early 20th-century school of psychology based on strictly objective experimental procedures for studying observable human behavior. Developed by American psychologist John B. Watson (1878–1958), the behavioristschoolrejectedtheearlierapproaches of psychological research based on the study of inner feelings and other nonobservable introspective reports by human subjects. Influenced largely by the experiments of Russian psychologist Ivan P. Pavlov, Watson used only objective laboratory procedures to obtain statistically significant results. The result was a stimulus-response theory of behavior that tied all human behavior, no matter how complex, to observable, measurable muscular and glandular responses.

behavior modification A broad range of psychological, medical and physical procedures for treating emotional dysfunction and maladjustment and changing behavior patterns. Procedures may include physical or mental coercion, brainwashing, brain surgery, drugs or psychotherapy, physical punishment or any combination of these or other procedures—all of them designed to alter subject behavior. Russian psychologist Ivan P. Pavlov stumbled

on behavior modification at the turn of the 20th century when he trained a dog to salivate at the sight of a circle projected on a screen. The dog did not salivate at the sight of an ellipse. As Pavlov gradually altered the shape of the ellipse to resemble a circle, the dog grew agitated and gradually ceased to salivate at the sight of the circle. Later, in 1920, John B. Watson, the American behaviorist, and his colleagues instilled a fear reaction to rats in an 11-month baby by sounding a loud noise at the approach of a white laboratory rat. Prior to behavior modification, the baby had played gleefully with the gentle white rat.

Belknap, Jeremy (1744–1798) Teacher, minister, prolific author of important early American histories and cofounder of the Massachusetts Historical Society. Born in Boston, he graduated from Harvard College at 18 and taught school while studying for the ministry. After holding ministries in various towns in New Hampshire and Massachusetts, in 1787 he assumed the pulpit at Boston's Federal Church, where he remained for the rest of his life. His ministry allowed him enough time to write the definitive, three-volume *History of New Hampshire*, which remains valuable for its depth of research into natural history as well as its social and political history. He later wrote a two-volume *American Biography*, covering the lives of famous early explorers and colonial leaders. In 1790, he met with other Boston men of letters, including JOHN ELIOT and James Winthrop, to form the Antiquarian Society, which, in 1794, became the Massachusetts Historical Society—the first institution of its kind in the United States. As corresponding secretary, Belknap encouraged men of letters in other states to form similar groups. Apart from his historical works, Belknap wrote several religious works and a collection of psalms and hymns.

Bell, Alexander Graham (1847–1922) Inventor and pioneer educator of the deaf. Bell's inventions of the telephone and other apparatuses were incidental and avocational outgrowths of his work in education.

Born in Edinburgh, Scotland, Bell was the product of a brilliant family whose multiple talents served as a foundation for his life's work. He was taught at home for the first 10 years of his life by his mother, a talented musician and artist and daughter of a Royal Navy surgeon. Bell's grandfather, Alexander Bell, was a professor of elocution in London. His father, Alexander Melville Bell, was a scientist, an author on elocution and the physiology of the voice, and the inventor of "Visible Speech," an important system that used symbols to indicate graphically the position of the vocal organs for each speech sound.

At the age of 10, young Bell went to an academy in Edinburgh and then high school. A brilliant scholar, he graduated at 13. By the time he was 20, he had spent a year at the University of Edinburgh, studied anatomy and physiology for three years at University College, London, had taught elocution and music for three years at an academy and for one year at Somersetshire College in Bath. He had also done substantial original research in his father's laboratory on resonance pitches of the mouth cavities and the electrical transmission of speech.

In 1868, Bell's father sent him to a school for deaf children in Kensington to adapt Visible Speech into a system for teaching the deaf. The elder Bell described his son's remarkable results in a lecture in Boston, and the following year the Boston School Board appointed Miss Sarah Fuller to start the first day school for the deaf in the United States.

In 1870, the Bell family moved to Canada, and in 1871 the Boston School Board asked Bell to come to Boston to train teachers for the deaf. Now dedicated to a career of educating the deaf, he adapted his father's Visible System

Alexander Graham Bell (top of stairs on right) at the Pemberton Avenue School for the Deaf, in Boston, where he trained teachers of the deaf (*Library of Congress*)

by adding a system of notation that is still the basic method of teaching the deaf to talk. After three months at Miss Fuller's school, he went on to train teachers at other institutions in Massachusetts and Connecticut. Demand for his services grew so great that he opened a teacher's training class in Boston, to which institutions from across the United States, Canada and even Europe sent teachers to learn Bell's use of Visible Speech. In 1873, he started a teacher training school at Boston University, which appointed him professor of vocal physiology and speech mechanics.

Bell also worked directly with private deaf pupils in his home, all the while inventing and developing acoustical devices to augment hear-

ing and help teach his pupils. In 1873, he agreed to accept in his home a five-year-old boy who had been born deaf and became, at the time, the youngest deaf pupil ever to attempt formal education. Bell had complete charge of his education for three years and lived with him at the boy's grandmother's. Combining, for the first time, kindergarten play with formal instruction, Bell achieved such remarkable results that the boy's grateful father, Thomas Sanders, agreed to finance all of Bell's experimental work, including the costs of materials and securing patents. The results were three inventions: a phonautograph to convert sounds into graphic representations that allowed deaf pupils to "see" the sounds they

made; a multiple telegraph that permitted more than one telegraph message to travel over the same line; and an electric speaking telegraph—the telephone. On March 10, 1876, while he was still working with the Sanders boy, Bell transmitted the first complete intelligible sentence over the telephone to his assistant Thomas Watson in the next room: “Mr. Watson, come here: I want you.”

With the help of Sanders and another wealthy benefactor, Gardiner G. Hubbard, whose daughter had been deaf from early childhood, Bell obtained patents for his devices and successfully defended himself in some 600 lawsuits by claimants to his rights. After the U.S. Supreme Court declared him the sole inventor of the telephone, Bell formed the Bell Telephone Company, with Hubbard as trustee and Thomas Sanders as treasurer. In 1877, Bell married Hubbard’s deaf daughter, Mabel, who bore him two sons, both of whom became speech teachers. Bell went on to invent the audiometer, an instrument to measure hearing, and a number of other devices which he declined to patent and simply gave to the world for treatment of the deaf.

In 1878, he founded the Volta Laboratory to study the causes and conditions of congenital deafness. In 1883, a year after he had become a U.S. citizen, he founded the periodical *Science*, and from 1896 to 1904 he served as president and helped expand the National Geographic Society and its magazine. In 1891, his gift to the Smithsonian Institution paid for the building of its Astrophysical Observatory. In 1915, he opened the first transcontinental telephone line from New York to San Francisco. Beloved by educators and students, he received innumerable honorary degrees from Harvard, Oxford and other universities. He died at his summer home on Cape Breton Island, Canada, where, as he was being buried, every telephone on the North American continent remained silent.

Bell, Terrel H. (1921–1996) The second secretary of education, appointed in 1981 by President Ronald Reagan, with specific instructions to dismantle and abolish the department and to reduce federal involvement in American education. The president’s order culminated nearly two decades of ever-increasing federal investment in education, with no tangible results to show but a steady decline in academic proficiency by American school children. Bell circumvented the president’s orders, however, and by the time he left his post in 1985, he had expanded the department’s role in education and its budget, and his successor, WILLIAM J. BENNETT continued that expansion.

Bellamy, Edward (1850–1898) A leader of the utopian school of American writing in the 1880s and an advocate of child labor laws and compulsory universal education for students up to 16. His best-selling book *Looking Backward 2000–1887*, published in 1888, portrayed a mythical Boston where all children obtained by right the finest physical, psychological and educational care in the world’s finest primary and secondary schools. All other social institutions were equally perfect, and men and women retired at 45 to pursue “improvement or recreation” for the rest of their lives.

Bellamy, Joseph (1719–1790) Colonial theologian and founder of the first “graduate school” for professional education. Like training for law or medicine, training for the Congregationalist, Episcopal and Presbyterian ministries in the American colonies began with a liberal academic education (including attaining fluency in the scriptural languages Latin, Greek and Hebrew) at one of several academies and colleges. Graduates then served apprenticeships with practicing ministers until they acquired enough knowledge to pass examina-

tions before a ministerial body and obtain ordination and a license to preach.

A farmer's son from Cheshire, Connecticut, Bellamy went to Yale College, then a school of theology a few miles away, where he studied under the charismatic JONATHAN EDWARDS. Edwards converted Bellamy into one of his most ardent disciples. After graduating and preaching in various Connecticut churches, Bellamy became pastor in the new parish of Bethlehem, Connecticut, where he remained the rest of his life. Jonathan Edwards inaugurated the church, and with so auspicious a beginning, Bellamy's pulpit brought him immediate prominence. A fervent, charismatic preacher, he quickly attracted flocks of young men seeking to serve apprenticeships with him. To accommodate them he formalized the normal apprenticeship training into a curriculum that became the first formal program of "graduate" education, which eventually replaced apprenticeships in professional education.

Opened in 1742 in his home, Bellamy's school is believed to have been the model for the first law school, which Tapping Reeve opened later in Litchfield, Connecticut. Bellamy's program lasted between one and two years and began with the presentation to students of a basic set of broad theological questions and a list of books; students were to study the books and discover the answers. Preliminary answers were debated, with Bellamy playing "devil's advocate." Each question required a final dissertation and a series of sermons. After completion of their studies, graduates armed with Bellamy's letters of recommendation were examined by a ministerial body for final examination and ordination. Bellamy operated his school until his death, by which time the first formal theological seminaries had opened.

Bell Telephone Co. A pioneer in workplace vocational education and one of the first

companies to establish formal, in-house educational programs to teach employees a wide range of managerial, scientific and vocational skills. Because of the new and specialized nature of the work, Bell set up operators' and telephone installers' schools in its offices and plants at the turn of the 20th century. Courses ran one or more weeks, depending on the complexity of the work. When American Telephone & Telegraph Co. established Bell Laboratories as a separate research arm in 1925, it put education in Bell's domain, and Bell Laboratories expanded the educational program to include almost every aspect of work within the company.

During the 1950s, Bell's education program expanded into one of the largest, most far-reaching adult education programs in the world, with an annual budget in excess of \$1 billion. Until the 1982 court-ordered breakup of American Telephone & Telegraph Co., the Human Resource Department, as the educational arm was called, boasted a university-style campus in Illinois where the company not only trained new and newly promoted employees for their jobs but offered advanced education to its entire scientific and technical staff. The advanced education consisted of classroom managerial instruction akin to graduate business schools.

Bender-Gestalt Test A test developed in the late 1920s—ostensibly to measure visual perception, but also valid as a broad indicator of maturation, emotional stability, intelligence, learning disabilities and possible brain damage. It is valid for subjects as young as four, as well as older children and adults. Developed by Lauretta Bender at the Johns Hopkins Hospital Psychiatric Clinic, the test asks a subject to draw from memory, one at a time, each of nine increasingly complex geometric designs.

Benezet, Anthony (1713–1784) One of the most important teachers in American history and a pioneer in the education of African Americans, the poor, the handicapped and the disenfranchised. He was also one of the few early teachers to introduce kindness and understanding into pedagogy.

Benezet was born in France to a Huguenot family that fled to Holland and then to England to escape the massacres of Protestants by French Catholics. His merchant father set up a successful business in England, but the family nevertheless decided to move to Philadelphia in 1731. Young Benezet joined the Quakers and studied for the ministry, which, at the time, provided almost all the teachers for American schools.

From 1739 to 1742, he taught at a Quaker school in Germantown, Pennsylvania, and then spent 12 years at the Friends' English Public School in Philadelphia, now the William Penn Charter School. Upset with the poor quality of education for girls, he founded a Quaker girls' school, where he taught until 1766, when poor health forced his retirement. During those years, however, he also conducted classes of his own and at his own expense for a wide variety of disenfranchised children to whom education was otherwise unavailable.

For more than 20 years, beginning in 1750, he conducted free classes for African-American children and educated poor children and adults of all races. He developed his own primers, spellers and grammars for the young—and a special curriculum for deaf and dumb children, whose education he also pioneered. Later, poor health forced his retirement. He returned to Philadelphia to conduct classes for indigent girls whom no one else was willing to teach. In 1782, he helped establish a formal school for African-American children, likewise shunned by teachers. He volunteered his services and remained there until he died, leaving his modest fortune to the school.

A prolific writer, Benezet railed against the slave trade, against war and against all the cruelties inflicted on man by man. He stood out as one of the few humane egalitarians in an era when even such men as Thomas Jefferson harbored no doubts about black inferiority and others believed that African Americans were not even human.

"I have found amongst the Negroes," wrote Benezet in an astounding treatise for the times, "as great a variety of talents, as among a like number of whites; and I am bold to assert, that the notion entertained by some, that the blacks are inferior in their capacities, is a vulgar prejudice, founded on the pride or ignorance of their lordly masters; who have kept their slaves at such a distance, as to be unable to form a right judgment of them."

In his pedagogical works, Benezet condemned the cruelties that most teachers inflicted on children in classrooms. He called compassion, gentleness and understanding primary to successful teaching.

Benjamin, Harold (1893–1969) American teacher, educator and university administrator who gained national attention in 1930 for his satirical work *The Saber-Tooth Curriculum*, written under the pseudonym J. Abner Peddiwell. His book mocked the American educational establishment for its resistance to change and unwillingness to adapt the curriculum to the needs of modern society. It details the refusal of the directors of a school in a primitive society to alter the curriculum after a glacier moves across the land and changes the skills required for survival.

During his career of more than 40 years in education, Benjamin held posts at the universities of Oregon and Minnesota and at Stanford University and was dean of education at the University of Maryland. He was the author of a number of serious works on education, including *Building a National System of Education*

(1955) and *Higher Education in the American Republics* (1965), and an autobiographical novel, *The Sage of Petaluma* (1965).

Bennett, William J. (1943–) Controversial secretary of education from 1985 to 1988, who constantly criticized the American education establishment for its mediocrity and failure to educate properly the children from middle and lower economic groups. In 1987 and 1988, he proposed a basic curriculum for elementary and high school students and challenged school districts across the United States to adopt it. Issued in two booklets entitled *James Madison Elementary School* and *James Madison High School*, the curriculum reflects the principles of the BACK-TO-BASICS educational movement with a core curriculum that provides a firm grounding in reading, writing and calculating skills, as well as science and history.

Bennett also denounced the general education track which absorbs about 40% of all high school students and produces about two-thirds of all high school dropouts—more than 2 million a year. “No American student” he said, “should graduate from high school without first completing four years of English and three years each of social studies, mathematics and science.”

Bennett Law A Wisconsin law passed in 1890 requiring the use of English in teaching specific subjects in all elementary and secondary schools. Enactment of the law was a response to the attempt of the Roman Catholic St. Raphael Societies in Europe to establish parochial schools in the United States headed by priests who spoke and would teach in the language of the ethnic groups in their particular parishes. Anticipating the backlash that did indeed follow, James Cardinal Gibbons, the leader of the American Catholic hierarchy, protested to Rome about the interference in American affairs by the societies, and the

papal secretary of state officially ended those efforts.

Nevertheless, the Massachusetts legislature made an abortive attempt in 1899 to require children between the ages of eight and 14 to attend schools offering an “English curriculum,” and Wisconsin passed the Bennett Law the following year.

Bennington College A private Vermont coeducational college based on the progressive educational philosophy of JOHN DEWEY and his close colleague WILLIAM H. KILPATRICK, who helped found the school in 1932. From its inception, Bennington was designed to give gifted students free rein to develop naturally, intellectually and emotionally. Originally a women’s college, Bennington had no required courses, no lectures, no examinations, no grades, no social organizations, no school colors, songs or yearbooks. The “curriculum” was based on independent study and designed by students who worked “with” rather than under their mentor-teachers. The faculty evaluated each student’s work with extensive critical appraisal, which became part of the student’s record. To this day, students receive either a “pass” or “fail” for their work and a B.A. (and sometimes an M.A.) at graduation. The college year is divided into two 14-week terms and a third eight-week field term during which students have to leave campus and work either in paid jobs or as volunteers, afterward writing reports on their experiences.

Bennington became coeducational in 1969, and by 2005 men made up more than 26% of its students. About 20% of students drop out by the end of freshman year, and only 83% of those who remain go on to graduate. There are about 25 social organizations on campus and three intercollegiate and 10 intramural sports for men and an equal number for women. There are no sororities or fraternities. Drama, dance and literature have always been

central to the Bennington curriculum. Seven-week work internships in January and February are required during each of the four years. The Bennington School of Dance, held in summers during the 1930s and 1940s, was an important center of early modern American ballet.

Berea College One of the few colleges founded before the Civil War that admitted African Americans. Started by missionaries in Berea, Kentucky, in 1855, the school is a private, coeducational institution with “a non-sectarian Christian focus” and more than 1,500 students, of whom 17% are African Americans. As they did at the school’s founding, all students must work on campus to help maintain the grounds and buildings, for which they receive “labor grants” in the form of credits (about \$3,000 in 2000) toward the cost of their education (about \$14,000 in 2000).

Berkeley, Sir William (1606–1677) Colonial governor of Virginia, from 1642 to 1676. He was a fierce opponent of the growing movement in favor of education as a way of promoting piety, civility and learning among the people. Berkeley’s most famous comment on education was his 1671 reply to the Commissioners of Trade and Plantations: “But, I thank God, there are no free schools nor printing, and I hope we shall not have these [for a] hundred years; for learning has brought disobedience and heresy, and sects into the world, and printing has divulged them, and libels against the best government. God keep us from both!”

In 1676, planter Nathaniel Bacon demanded that Berkeley explain “what arts, science, schools of learning, or manufacturies, have been promoted by those in authority.” Rebuffed, Bacon led planters in a rebellion in which Jamestown burned. Bacon died, and 23 of his followers were executed.

Berkshire Agricultural Society The first organization to provide AGRICULTURAL EDUCATION to American farmers. Founded in 1811 by ELKANAH WATSON, the society was the first organization to sponsor agricultural fairs which, while offering some amusements, had as their central purpose the education of farmers in the latest scientific agricultural techniques and the use of the most modern equipment. Although gentlemen’s agricultural societies modeled on those in England had been common during the colonial era, none was open to the poorer, so-called dirt farmers.

Watson, a businessman who had made and lost several fortunes by the time he was 50, scored a sudden and unexpected success raising Merino sheep on a farm he bought near Pittsfield, Massachusetts. Eager to show the results of his success, he organized 26 of his neighbors and staged the Berkshire Cattle Show in 1810 to display prize sheep. In 1811, he and the others organized the much broader Berkshire Agricultural Society, which absorbed the cattle show and became an annual event. Watson began promoting his “Berkshire Plan” nationally, writing letters, speaking to farmers’ groups and producing pamphlets. The Berkshire societies spread quickly across New England. Some fairs had more entertainment than others to permit the entire farm family to enjoy the fairs.

Except in the South, farmers themselves joined and supported the societies, and state governments added funds to ensure their success as educative organizations. Southern farmers refused to participate in the agricultural education movement because they feared educating their slaves. The Berkshire societies began to lose membership after the Civil War, as new farm technology produced huge surpluses that sent prices plunging. Faced with financial losses, farmers turned to new politically oriented self-help organizations such as the Grange and the FARMERS’

ALLIANCES, which added political action to agricultural education and led farmers to work collusively to bid prices upward in what became a long battle with the growing trusts in the food industry.

Bestor, Arthur E., Jr. (1909–1994) American professor of history, constitutional scholar and author of *Educational Wastelands: The Retreat from Learning in Our Public Schools*, a 1953 work that described and analyzed the deterioration of American public schools. An educational conservative and opponent of PROGRESSIVE EDUCATION, Bestor pointed out that the transformation of American high schools from an elite to a mass institution was destroying the quality of education. Universal high school education, he predicted, would force public schools to have to provide for the emotionally disturbed, the handicapped, the learning disabled, the mildly retarded, the semi-literate from other lands and a host of other children with social problems which public schools are not equipped to solve.

In trying to provide “something for everyone,” Bestor warned, the schools were gradually providing nothing for anyone. He charged that secondary education had deteriorated to the point where students had to be taught in college what they should have learned in high school. “The idea that the school must undertake to meet every need that some other agency is failing to meet, regardless of the suitability of the schoolroom to the task, is a preposterous delusion that in the end can wreck the educational system.”

A graduate of Yale University, Bestor was born in Chautauqua, New York, where his father was president of the Chautauqua Institution. He taught at Yale, Columbia University’s Teachers College and the University of Washington and was the first constitutional scholar to call for the resignation of President Richard M. Nixon.

Bethel School District No. 403 v. Fraser A 1986 decision that clarified the Supreme Court’s 1969 decision in *TINKER V. DES MOINES INDEPENDENT COMMUNITY SCHOOL DISTRICT* regarding student First Amendment rights of free speech. In that case, the Court had held that school officials had violated student First Amendment rights by suspending three high school students for wearing arm bands that, in effect, silently protested the war in Vietnam. Prior to the suspension, the school had routinely allowed other students to wear political buttons, and the Court held that the suspension of the boys with arm bands was based solely on official disagreement with the political opinions of the students and not because the students had disrupted school routine in any way.

In *Fraser*, however, school officials suspended a boy from school for three days after he had delivered a speech to the student assembly nominating a fellow student for elective office in the student government and punctuating his remarks with obscenities, profanities and explicit sexual gestures. After a referee rejected the boy’s appeal, the boy’s father sued the school for abridging his son’s First Amendment rights. Although two lower courts upheld the father, the Supreme Court ruled in favor of the school, making it clear—as it had not in *Tinker*—that student constitutional rights are far narrower than those of adults. Although the Court admitted that Fraser’s speech would have been guaranteed constitutional protection had he been an adult, it held that public schools have a right and an obligation to maintain an atmosphere of respect and civility in the school environment.

Bethune, Mary McLeod (1875–1955) Pioneer educator of African-American women and founder-president of what later became Bethune-Cookman College in Daytona Beach, Florida. The 15th and first free-born of 17 children of former slaves, Bethune did not begin her formal education until she was 11.

Mary McLeod Bethune (Library of Congress)

Eventually, she graduated from Dwight L. Moody's BIBLE INSTITUTE in Chicago, and after being rejected as a missionary to Africa, she became a teacher in Georgia and then Florida.

Upset by the lack of educational opportunities for black girls, she rented a rundown building in Daytona Beach and opened her own school, which she called the Daytona Normal and Industrial School for Negro Girls, with five girls and her own son as its first students. Bethune and her students sold sweet potato pies and fried fish, sang and even begged for funds to keep the school open until 1912, when James N. Gamble, son of the founder of Proctor & Gamble Co., and Thomas White of the White Sewing Machine Company agreed to underwrite her efforts. Later, she merged the school with the Cookman Institute and turned the school into a teacher-training institute. Now affiliated with the United Methodist Church, Bethune-Cookman is a coeducational

liberal arts college with more than 2,500 students, of whom 96% are black. It awards bachelor's degrees in a wide range of arts and sciences, as well as in education.

Bethune went on to found the National Council of Negro Women in 1935, and she served as President Franklin D. Roosevelt's special advisor on minority affairs and director of Negro affairs in the National Youth Administration in 1936. She attended the founding conference of the United Nations in San Francisco as a U.S. State Department special emissary.

Bial-Dale College Adaptability Index A highly controversial test developed in 1999 involving Lego blocks and in-depth interviews to identify such noncognitive skills of culturally and academically deprived college applicants. Noncognitive skills measured include leadership, social interaction and ability to work in groups. Designed to help predict success in college, the test was developed by Harvard University doctoral student Deborah Bial. The index evaluates about 100 students at a time, dividing them into groups of 10 to 12 and asking each group to perform a dozen tasks. One such task requires members of the group to study a robot built of Lego blocks and move to a second area, out of sight of the model, and reconstruct it, conferring with each other as they do. In addition to testing skills and abilities to interact with peers, each applicant is interviewed, with interview results counting one-third of the final score. Administered by the EDUCATIONAL TESTING SERVICE, the index was developed as part of a \$1.9 million grant from the Andrew W. Mellon Foundation to help colleges and universities achieve greater racial diversification than they have with conventional college admissions tests.

Bible, the The sacred scriptures of Christians. Until its translation into English in the 16th

century, the Bible was almost exclusively read aloud in Latin by the English clergy to their parishioners. It was the King James version of the Bible in 1611 that made it accessible to literate people (primarily the nobility), and in the solitude of the American colonies, the Bible and related devotional texts accounted for 50% of the books printed in 17th-century America.

It was the single most important cultural influence in colonial New England, pervading every thought of many Puritans, who read it, recited it, quoted from it, committed it to memory and consulted it from day to day. They believed it held the answer to every question, along with the rules of daily conduct, for formula for personal salvation and clear expositions of good and evil.

Aside from its uses as a spiritual guide, the Bible was also a basic textbook for teaching children to read. The earliest education in the colonies was in the home, where individual reading, responsive reading and communal reading were daily activities in many households. After teaching their children the alphabet, parents routinely used a primer to teach their children to read and recite elementary religious texts such as the Lord's Prayer, the Apostles' Creed and the Decalogue. The next step in their education was a catechism of questions and answers on fundamental religious beliefs and, eventually, the reading of the Bible.

As Puritan ministers expanded the functions of their churches to include weekday instruction, the Bible was their basic text in what they called the "school of Christ," and the primary purpose of "learning one's letters" was to read the Bible. Minister-operated church schools expanded their curricula and evolved into the grammar schools of the late 17th century, where the study of Greek, Latin and Hebrew was essential for the study of scriptural and related texts in their original forms. The Bible remained a central text in grammar schools, academies and colleges of the 18th

century, although somewhat less time was devoted to theology as the curriculum expanded to include the sciences, modern literature and modern foreign languages. Although Congress amended the Constitution in 1791 with a provision that "Congress shall make no law respecting an establishment of religion . . ." (see ESTABLISHMENT CLAUSE), the Bible's importance to the curriculum did not diminish until the mid-19th century, after states had severed their official ties to the church and gradually stripped churches of their role in education by building state-run, secular public school systems. Connecticut did not sever its ties to the church until 1818. Massachusetts waited until 1833. Even after Massachusetts and Connecticut built state-run public school systems in the late 1830s and 1840s, rural America continued to depend on local churches and their ministers to educate the young until the beginning of the 20th century.

Despite numerous U.S. Supreme Court decisions banning its use in public schools, the Bible remains an explicit or implicit text in many American public schools—especially in rural Christian and Mormon communities where teachers routinely inject scriptural materials into classroom discussions. With the growth of Christian fundamentalist influence in the 1980s, many publishers started issuing—and trying to introduce into public school curricula—a number of quasi-academic texts designed to incorporate Bible studies into high school literature, history and social studies courses, using titles that refer to the "influence" rather than the content of the Bible.

Bible Institute An alternative college for orthodox evangelical Christian education, founded in Chicago by revivalist preacher Dwight L. Moody in 1889. A leader of the most powerful Christian evangelical movement of

the late 19th century, Moody conceived of the institute as a training school for a new army of missionaries whose education would be less classical than that of ordained ministers and would require no training in Latin or Greek. It was, in effect, the first trade school for missionaries, lay preachers and, later, evangelical teachers—a forerunner of the hundreds of religiously oriented nondegree-granting institutions of today. The Bible Institute pioneered the use of correspondence courses, radio courses and a host of other innovative education methods and eventually developed a broad curriculum of materials for Bible study and Sunday schools.

bilingual/bicultural education A controversial program using two languages to teach a curriculum that includes studies of the cultures from which the two languages are derived. Formally introduced for the first time in U.S. public schools in 1965, bilingual and bicultural education represents a sharp break with the American public school tradition of forcing all children, regardless of their national origins, to accept and adopt English as their native tongue and assimilate into American culture.

A wave of Puerto Rican migration northward in the 1950s and 1960s, however, forced American educators—and legislators—to rethink the AMERICANIZATION process in public schools. Unlike non-English-speaking immigrants of the past, who could not become citizens without learning English, Puerto Ricans were American citizens and had the constitutional right not to speak English. Failure to learn English, however, often interfered with the abilities of some young Puerto Ricans to graduate from mainland public schools with marketable skills. More than 35% of Hispanic students dropped out of high school, compared with 10% for whites, and those who remained in school scored 10% to 15% below white students of the same age in language and mathematics proficiency tests. Nevertheless, a

growing Hispanic population demanded the right to have their children taught in their native Spanish, and Congress passed the so-called Bilingual Education Act—Title VII of the ELEMENTARY AND SECONDARY EDUCATION ACT OF 1965, as amended in 1974.

The act authorized establishment of programs of bilingual education “designed for children of limited English-speaking ability in elementary or secondary schools.” Although such programs do include instruction in and study of English, they allow the rest of the child’s instruction “in all courses and/or subjects of study” to be in his or her native language “to the extent necessary to allow to allow a child to progress effectively through the educational system. . . .” Moreover, all instruction must be “given with appreciation for the cultural heritage of such children. . . .”

Administered by the Office of Bilingual Education, and designed to provide students with bilingual instruction in any or all of their subjects, bilingual education has produced few of the results envisioned by its proponents. In the first 30 years of the program’s existence, the rate of Hispanic high school dropouts increased nearly 30%, while language and mathematics proficiency in relation to that of whites have remained relatively unchanged. Meanwhile, the program has produced little bilingualism. Indeed, large enclaves have emerged in major cities such as New York, Miami and Los Angeles where Spanish is often the only language spoken.

Adding to the problem was the surge in the number of immigrants—both legal and illegal—at the turn of the century. By 2000, limited-English students made up nearly 4% of the elementary and secondary school population in the United States, but in high-immigration states such as California, Texas, New York, Florida and Illinois, the percentage of limited-English students in public schools climbed as high as 25%. California alone harbored 40%

of the nation's limited-English students, with about 1.5 million. Limited-English students number about 500,000 in Texas schools, 250,000 in New York, nearly 200,000 in Florida and more than 100,000 in Illinois. As California's costs of bilingual education rose to more than \$300 million a year, and federal spending on such programs touched \$250 million, grassroots rebellions began erupting across the nation. In 1995, California and Arizona passed laws establishing English as the official state language. In 1996, a group of economically deprived Hispanic parents voted to boycott local elementary schools in Los Angeles until authorities agreed to teach their children in English and thus improve their children's long-term chances of attending college and getting jobs. "They need English here," proclaimed one of the parent leaders, a Mexican mother who worked as a dyer in a blue jeans manufacturing plant. "They can't get a job if they don't speak English." In June 1998, California voters flocked to the polls in a referendum and overwhelmingly approved a measure that banned bilingual education in public schools and replaced it with a year of intensive English instruction—in effect, the traditional, age-old immersion programs for learning foreign languages. Arizona followed suit in 2000. In 2002, Massachusetts and Colorado voters approved measures that placed all non-English-speaking students in English immersion classes for a year and then mainstreamed them into conventional classes. Parents were given the right to apply for waivers to keep their children in bilingual classes, but districts were given the discretionary right to reject such applications without explanation.

Such initiatives have gradually eroded bilingual education as a curricular staple in some high-immigrant states. Nationally, only 850,000 limited-English students are enrolled in bilingual education programs, compared with 976,000 in English-only immersion pro-

grams. More than 2 million others are in programs that combine the two approaches.

The need for fluency in English is incontestable. More than 400 million Internet users around the world use English for 95% of all Internet transmissions. Ninety-five percent of the more than 1 million scientific articles published in thousands of major periodicals around the world are written in English. English has become the official language of higher education and science—indeed, the lingua franca of academia throughout the world—much as LATIN once was the common language that scholars of different nationalities used to communicate with one another. All graduate science and engineering courses in the Scandinavian countries, in Holland, in Greece and in dozens of other countries are now taught in English—largely because so many students cross international frontiers to study, and professors invariably have to use a common language understood by all to teach a polyglot audience. That language is now English.

bilingual instruction Teaching methods designed to facilitate education of non-English-speaking students in American elementary and secondary schools by teaching them in their native language as well as in English. An outgrowth of the federal government's official sanction of bilingual education in 1968, there are two basic methods of bilingual instruction in use in American public schools: the native language method and ESL, or English as a second language. In the native language method, bilingual teachers teach basic language skills in the student's native language and eventually reteach those same skills in English. ESL uses *immersion* in English language instruction to force the student to listen and speak nothing but English. The theory behind bilingual instruction is that forcing children to study such subjects as mathematics and science in a language they do not speak fluently will impede their progress in

those subjects. However, a study of bilingual education in New York City in 1994 found just the opposite—namely, that even the most recent immigrants who took most of their classes in English fared better academically than students in bilingual programs where they could speak their native tongues. The study found that only 51% of students who entered bilingual classes in kindergarten were able to test out within three years and join conventional classes. In contrast, 79% of students who entered ESL classes were able to test out within three years. Only 7% of the students who entered bilingual programs in sixth grade were able to test out within three years. The reason for the slow academic progress was traced to the need to repeat everything in both English and a second language, thus allowing only half as much material to be taught in a given time. In addition, the study found that even students who tested out of bilingual education displayed inadequate English-speaking skills compared to ESL students. New York City offers bilingual education in Spanish, Chinese, Haitian Creole, Russian, Korean, Vietnamese, French, Greek, Arabic and Bengali, at a cost of more than \$400 million a year.

In Los Angeles, where immigrant children make up 84% of the more than 600,000 students in public schools, bilingual education has produced even more disastrous results than in New York. Indeed, nearly 50% of immigrant students drop out without completing their high school education, while two-thirds of those who complete their schooling graduate without a command of English. Los Angeles teachers have to cope with a pupil population speaking 81 different languages. Bilingual education in any language is required by law in any elementary school class with 10 or more children who speak that language but have little command of English, and in any secondary school class with 15 or more such students. Unfortunately, Los Angeles has fewer than 2,000 teachers qualified to teach in any of the 81 languages. With some 6,400

classrooms requiring bilingual education under the law and 12,000 new immigrant students entering the system annually, thousands of students are growing up illiterate in both their own language and English. Fourteen percent of the student body at one Los Angeles junior high school was Samoan one year, but the principal of the school—himself a Fijian—was unable to find a qualified teacher to instruct students in Samoan.

Bill and Melinda Gates Foundation The world's largest philanthropic organization and America's largest privately funded FOUNDATION, with more than \$60 billion in assets in 2006. Founded by William H. Gates III, cofounder of MICROSOFT CORPORATION, and his wife, the Gates Foundation has invested hundreds of millions of dollars in projects ranging from environmental protection to health care. In 2006, the legendary Nebraska financier Warren Buffett more than doubled the foundation's previous assets of \$30 billion with a \$31 billion contribution.

The Gates Foundation has invested more than \$1 billion to improve the quality of American secondary education—especially in disadvantaged neighborhoods—by developing small high schools, either starting them from scratch or restructuring existing ones. By 2005, the foundation had invested in 850 new schools, including \$110 million in EARLY COLLEGES and millions more to transform existing schools in nearly 275 school districts. Among the school-district investments were \$2.3 million to Chicago public schools and \$1.4 million to Atlanta public schools. The theory behind small-school development is to lower teacher-student and counselor-student ratios to build strong relationships among teachers, students and students' families.

The results of the Gates' efforts have been mixed, however, according to the foundation's own exhaustive follow-ups. Although quality

Bill and Melinda Gates on a visit to a San Diego high school (Bill and Melinda Gates Foundation)

of teaching and student attendance rates have improved dramatically, students have displayed little or no improvement in their academic work: Reading and English language arts achievement have improved only slightly, and math proficiency has remained unchanged or actually declined to “alarmingly low” levels. Most students, however, begin the Gates schools academically behind students in other schools in the same districts, and the foundation’s school evaluators are encouraged that the “close interpersonal relationships” in the

new schools will eventually translate into academic gains.

In 2005, the year before the Buffet gift, the Gates foundation spent about \$1.36 billion of its income on a wide variety of projects, allocating 62% to global health, 21% to education, and 17% to fighting poverty. Buffett’s personal interests seemed to favor more spending in the poverty sector.

Billings, John Shaw (1838–1913) Physician and librarian, who developed the plans for

the physical plant and the operating philosophy for the Johns Hopkins (University) Hospital. In drawing up the plans for the hospital, Billings envisioned a new role for hospitals: They were to operate as medical centers offering the full range of health and health-related care and research and to serve as centers for teaching and training medical practitioners.

Born in Indiana, Billings entered the army as a surgeon at the beginning of the Civil War. In 1864, he was assigned to the office of surgeon general in Washington, D.C., where, over the next 10 years, he organized the world's first comprehensive central medical library, with more than 50,000 volumes. After helping found the Johns Hopkins Hospital in 1873, he joined the American Public Health Association. In 1890, he became professor of hygiene and hospital director at the University of Pennsylvania. One of the most widely honored physicians of his day, Billings became the first director of the New York Public Library in 1896. He designed the central building, organized the classification of books, established branch libraries throughout the city and obtained a \$5 million gift from Andrew Carnegie to pay for it all. While continuing his work at the New York Public Library, Billings also spent the years from 1902 until his death helping to organize the Carnegie Institution of Washington.

Binet, Alfred (1857–1911) French psychologist whose research with Theodore Simon to identify the ineducable retarded produced the first reliable test of intelligence and spawned the vast 20th-century intelligence, aptitude and achievement testing movement. Entitled "New Methods for Diagnosing Idiocy, Imbecility, and Moronity," the original Binet-Simon research was done for the French government in 1905 to identify children too retarded to go to conventional schools. They developed a scale—the Binet-Simon Scale—of 30 problems of graded

difficulty, each corresponding to the norm of a different level of mental abilities.

They expanded and revised the Binet-Simon Test and Scale in 1908 and again in 1911 to measure other levels of intelligence. The Binet-Simon Scale capped several decades of intense interest in child development studies and provoked a frenzy of activity by educators and psychologists in the United States and elsewhere who had been searching for years for reliable instruments to measure intelligence and educability. It set off a flurry of new norm-based tests to measure every conceivable element of mental function and thus predict the educability of every child. EDWARD L. THORNDIKE at Columbia University Teachers College and Charles Hubbard at the University of Chicago developed scales to measure achievement in arithmetic, penmanship, spelling, drawing, reading, language and a host of other skills. At Stanford University, LEWIS M. TERMAN revised the Binet Scale in 1918 to measure what he called Intelligence Quotient, or I.Q.—a new concept based on the mathematical relationship between an individual's mental and chronological age. The revised test, called the STANFORD-BINET INTELLIGENCE TEST, has been revised several times since, but has largely been replaced by the Otis-Lennon School Ability Test, which now measures intelligence of individuals from the age of two years into adulthood.

biology education A curriculum of studies of the classification, physiology and interrelationships of all living organisms. Originally designed as a secondary school and university curriculum, biology education now begins in kindergarten with the identification of familiar, everyday plants, animals, parts of the body, sense organs and functions. First grade adds the study of growing plants, experiments showing how variations in water, soil and sunlight affect growth, and the use of the experimental method. The study of animal characteristics and habitats also begins in first grade.

Second grade biology studies usually include life cycles, seasonal changes of various organisms, the maturation of seeds into plants, the production of new seeds, and the study of broad classifications of organisms. Third grade studies cover the growth stages of animals, the food chain and the interdependency of various forms of life. Biology studies of the later elementary school years include study of the scientific method, anatomy, life cycles, behavior, reproduction, instinct, learning and evolution.

Middle school raises biology studies to a new level, with a complete survey of cells, organisms and larger life systems. Studies include a survey of the plant and animal kingdoms; the classification of bacteria, fungi, plants and animals; the structure of cells; the functions of cellular organelles; elementary genetics; the role of DNA; embryology and fetal development; the function, structure and interaction of various organ systems; the major ecological systems and the structure and interrelationship of communities within.

High school biology covers most middle school studies in greater detail and depth and adds the study of such processes as photosynthesis, respiration, cell division, reproduction and heredity, along with required laboratory and field work involving the gathering, recording and assessment of data that demonstrates materials studied in the classroom.

The American Institute of the Biological Sciences has, over the years, prepared various textbooks and curricular materials it deems appropriate for elementary and secondary school students and advanced high school and college students.

Birney, Alice McLellan (1858–1907)
Cofounder and president of the National Congress of Mothers, which eventually grew into the NATIONAL CONGRESS OF PARENTS AND TEACHERS, or the national PARENT-TEACHER ASSOCIATION. Born

in Atlanta, Georgia, she earned her college degree at Mount Holyoke in Massachusetts and married a prominent Washington lawyer, with whom she had three children. As a young mother, Birney was appalled by the absence of any literature to guide mothers in raising their children. In an effort to educate American mothers and make the nation “recognize the importance of the child,” she organized a “Mothers’ Congress” of more than 2,000 mothers in Washington, D.C., in 1897. From that meeting emerged the National Congress of Mothers, with Birney as president, and its three major goals: the organization of mothers into groups to engage in child study; the support of local child-welfare agencies; and the encouragement of parent-teacher cooperation.

From the first, the congress was open to all, regardless of race, religion or social status—a radical step at the time of its founding. It was an immediate success. By 1899, it had grown to 50,000 members. In 1902, Birney resigned due to ill health, but she continued writing on matters relating to child-rearing. In 1924, the Congress changed its name to the National Congress of Parents and Teachers.

black codes Two sets of laws enacted by southern states in the 19th century, abrogating the individual liberties of African Americans. The first set was enacted at various times between 1790 and 1830 to control the black population and forestall slave rebellions. A second set of codes was enacted immediately after the Civil War, relegating former slaves to inferior legal status. Also called slave codes, the earlier laws prohibited blacks from assembly, self-defense and education. Blacks were forbidden to cross state lines or to move from county to county within a state. Even the movement of freed blacks was restricted unless they had white patrons to post bonds guaranteeing good behavior. The codes also prohibited voting by freed slaves and made it illegal

for them to testify against white people in court. It was likewise illegal for blacks to buy liquor or to work as clerks or typesetters, lest they use their skills to produce materials that might provoke rebellion. In 1831, the education and teaching of literacy to blacks in the South became a felony, punishable by fines, imprisonment or both.

Immediately following the Civil War, President Andrew Johnson restored self-rule to the South, thus putting state governments back in the hands of the aristocratic slaveowners who had been responsible for secession. In the next two years, they imposed new black codes, allegedly to protect former slaves from their own ignorance. In fact, the new codes forced blacks to go back to work on their former plantations by banning them from most other jobs. The codes also imposed literacy tests that deprived almost all former slaves of the vote. The codes were set aside in 1866, when Congress ordered resumption of military rule in the South, with a Union general assigned to govern each of five military districts and guarantee the civil rights of blacks, including the right to an education and the right to vote. Each general was also ordered to establish a system of public education for former slaves of all ages.

black colleges Institutions originally established for the education of African Americans. Originally, the products of northern white abolitionist missionaries, the first three black colleges were founded before the Civil War: Cheyney College (now Cheyney University of Pennsylvania) in 1837; Lincoln University near Chester, Pennsylvania, in 1854; and Wilberforce University, in Wilberforce, Ohio, in 1856. Immediately after the Civil War, other colleges and secondary schools for blacks sprang up throughout the South under the auspices of Union-imposed military governors (see **BLACK CODES**), white northern missionaries, indepen-

dent philanthropists and, in one case, a black educator.

Union General SAMUEL C. ARMSTRONG founded the HAMPTON INSTITUTE, now Hampton University, in Hampton, Virginia, while his student and protégé, black educator BOOKER T. WASHINGTON, founded TUSKEGEE INSTITUTE, now Tuskegee University, in Tuskegee, Alabama, in 1881. Other black colleges founded after the Civil War included ATLANTA UNIVERSITY, Atlanta, Georgia; HOWARD UNIVERSITY, Washington, D.C.; and Fisk University, Nashville, Tennessee. By 1895, there were 27 such colleges, including 13 black LAND-GRANT COLLEGES founded, along with white colleges, under the second Land Grant (Morrill) Act of 1890. Unlike the first Land Grant Act of 1862, which provided federal lands for use by states to build public colleges, the second act tacitly recognized the South's post-Reconstruction laws segregating the races.

With the exception of Tuskegee Institute and two or three other institutions with all-black faculties and administrators, almost all black colleges at the turn of the century had predominantly white faculties and white presidents. While Booker T. Washington saw Tuskegee's role as that of training skilled black craftsmen who could earn a living, the white-run black colleges were designed to train future black leaders. Indeed, a study of 1,252 black college graduates in 1900 by W. E. B. DuBois found that 54% were teachers and 17% clergymen.

By the start of the 21st century, the number of black four-year and two-year colleges had grown to more than 100, with total enrollment of about 29,000, but 40 years of desegregation and affirmative action, which changed the complexion of formerly all-white schools, had done the same to black colleges. Of student enrollment in formerly all-black colleges, 18% were nonblacks, and the blacks who had enrolled constituted only 15.6% of the total number of black college students in America. Clouding the outlook for black colleges was

the loss of many of the most academically (and athletically) gifted students to the most prestigious formerly all-white colleges and universities. The result has been a distressingly low graduation rate of 38% at black colleges, compared with a 51% graduation rate for blacks at all colleges and a 78% graduation rate for black students at academically selective colleges. Making matters still worse for black colleges, the loss of the most gifted black students has often meant the loss of students destined to emerge as the wealthiest black alumni. Indeed, the best-endowed historically black institution, Howard University, has an endowment of only \$371 million, compared with endowments in the billions of dollars at Yale, Harvard, Princeton, Stanford and nearly 50 other colleges. Howard's endowment ranked 132nd in the nation in 2004. The few other black colleges that have any endowments, such as Texas Southern, in Houston, Texas, can usually count less than \$10 million, at a time when tuition costs are rising and these institutions' student pool is made up increasingly of children from families in poverty. Indeed, more than 25% of Texas Southern students in the 2004–05 academic year came from families with annual household incomes of less than \$20,000.

(See also UNITED NEGRO COLLEGE FUND.)

Black English A variety of NONSTANDARD ENGLISH spoken by many African Americans. A subject of some controversy, Black English is sometimes described as a dialect, shaped by slavery and modern American culture, but with roots in 15th- and 16th-century Africa. Others, however, contend it is a primitive form of English, embellished by slang from sports, jazz and other music, television, comic books, advertising, the world of drugs, street crime and other areas of American life.

Sometimes called "Ebonics," Black English is characterized by a number of unique grammatical features, particularly in the use and

temporal reference of the continuous present (e.g., *I be going, you be going, he be going . . .* etc.). Most conjugations are leveled, and adverbs are often substituted for verb tenses to indicate temporal relations (e.g., *we be here yesterday . . . today . . . tomorrow*, etc.). The relative simplicity of Black English vernacular would appear to be a logical result of 200 years of slavery, during which it was a crime, punishable by imprisonment and fines, to teach literacy or standard American English to African Americans. Many black English mispronunciations such as "ax" for "ask" and "chimbley" for "chimney" date back to the colonial era before the Revolutionary War, when illiteracy reigned in white as well as black communities and mispronunciations were the rule.

Black English became the center of a controversy at the end of 1996, when the school board in Oakland, California, declared Ebonics to be a separate language with African roots, rather than a dialect. Critics charged the move was a ruse to obtain federal bilingual education funds that would not be available to improve English-language skills of the district's impoverished 28,000 black students, who made up 53% of the city's elementary and secondary school enrollment and a startling 71% of the students enrolled in special education. The U.S. Department of Education immediately rejected the Oakland move, saying, "Elevating black English to the status of a language is not the way to raise standards of achievement in our schools and for our students. The [Department's] . . . policy is that Ebonics is a nonstandard form of English and not a foreign language."

Black Muslims An amorphous, quasi-religious organization with vague, shifting tenets that stress black supremacy and the establishment of an African-American homeland in the United States. With schools in nearly four dozen cities, they represent a major educative organization that reaches beyond their membership

to millions of African Americans. Various called the American Muslim Mission, the World Community of al-Islam in the West and the Nation of Islam, the Black Muslims have borrowed and continue practicing a handful of Muslim rituals, but are otherwise tenuously connected to the Muslim faith and practices of the rest of the world. Preaching a confusing mixture of militancy and pacifism, Black Muslim leaders have, at times, called the white man "the devil," who enslaves all nonwhites, and they have blamed Jews, Italians and other American minority groups for the poor economic conditions of African Americans. The same leaders have also urged their followers to adhere to nonviolence, promising that Allah, or God, will eventually establish an independent African-American homeland in the United States. In the meantime, they urge members to adhere to strict codes of moral behavior, personal cleanliness, proper and conservative dress and Muslim rules of diet. In addition, followers are expected to cooperate economically, buying and selling from one another and avoiding, as much as possible, all trade with whites.

The origins of the Black Muslims date to the period before World War I, when blacks stepped up their demands for equal rights. In 1913, Noble Drew Ali founded the Moorish Science Temple of America. A year later, Jamaican-born Marcus Garvey founded the Universal Negro Improvement Association in Jamaica and brought it to the United States in 1916. Calling for a return of African Americans to Africa, Garvey founded the Black Star Line to provide steamship service for the anticipated black emigrants. He also founded the Negro Factories Corporation to give African Americans economic independence.

Ali died in 1929, and Wallace D. Fard took control of the Moorish Temple and founded the sect's first mosque in Detroit, where he preached, using such titles as Walli Farad and Master Farad Muhammed. Some Black Mus-

lims continue to refer to him as "Gad," "Allah" and "the Great Mahdi." Garvey, meanwhile, had been sent to prison for fraud and then deported to Jamaica. Many members of his sect joined Fard's movement, bringing with them their beliefs in black economic independence and the back-to-Africa movement. In 1933, the merged sects became the Nation of Islam, with headquarters in Chicago. A year later, Fard disappeared mysteriously, and Georgia-born Elijah Poole, who had changed his name to Elijah Muhammed, took control, with the title "the last Messenger of Allah."

With the exception of one short-lived challenger, Elijah Muhammed remained the unquestioned leader of the Nation of Islam until his death in 1975. The one challenge was that of exconvict Malcolm Little, who, after converting to the Black Muslims in prison, changed his name to Malcolm X and took charge of the Detroit mosque. In 1965, he was assassinated in New York City, allegedly by Black Muslim supporters of Elijah Muhammed. Under Muhammed, the Black Muslims grew to an organization of about 250,000 that combined the faith of Ali and Fard with Garvey's self-help principles and his vision of an African-American homeland in the United States. In an effort to convert that vision into reality, the Black Muslims rehabilitated thousands of black convicts, drug addicts and alcoholics during the 1960s and 1970s. They bought more than 15,000 acres of farmland to produce their own food and established a truck and air transport system to distribute it to members nationwide.

The Black Muslims also established religious ethnic private schools for students aged three to 18, in nearly four dozen cities across the United States, including Atlanta, Baltimore, Chicago, New York, Los Angeles and Washington, D.C. The oldest is the University of Islam No. 1, which was founded in 1932 in Detroit, the site of the original mosque. Although the schools

teach an abbreviated and Americanized version of the Islamic faith, they are far more race-oriented than religious. Using a quasi-militaristic form of discipline, with strict regulations for dress and personal grooming, the schools attempt to imbue students with self-esteem and "black pride," frequently by coloring their academic curriculum with antiwhite teachings. In addition to conventional academic offerings, the schools require black and African studies, and some schools offer Arabic.

In 1975, Elijah Muhammed died and was succeeded as supreme leader by his son Wallace D. Muhammed, who eschewed black nationalism and admitted nonblack members. In the late 1970s, a dissident faction led by Louis Farrakhan (1933–) usurped the original name Nation of Islam and reasserted the principles of black separatism.

black studies A university-level curriculum of African and African-American history, art, literature, sociology, psychology and languages. Born of the black protest movement that followed the assassination of Martin Luther King, Jr., in April 1968, black studies programs emerged after black students at predominantly white college campuses across America staged strikes that all but paralyzed school activities. Among their demands were that colleges increase efforts to recruit and enroll black students, offer more scholarships to black students, and begin expanding their curricula to demonstrate the role of blacks in American and world history. Because of its novelty—and the passions generated by the civil rights struggle of the 1960s—black studies drew thousands of nonblacks as well as blacks.

Taught, in many cases, by black activists, the programs on many campuses were grounded in politics as much as academic methodology, and as affirmative action programs increased the number of blacks on formerly all-white

campuses, the novelty of black studies began to wear thin, along with the interest of many, if not most, black as well as white students. Although 450 colleges continued to offer programs in black studies in the academic year 2005, the number of courses offered had diminished substantially, and the number of full-time professors in AFRICAN-AMERICAN STUDIES had dropped by 40% or more at many campuses. Across the nation, only 668 undergraduates earned bachelor's degrees in black studies in 2002, according to the U.S. DEPARTMENT OF EDUCATION.

Aside from the oppressive and often obsolete political content of many black studies courses, other factors have eroded much of the interest. For one thing, other departments have incorporated much of the black studies curriculum. English, music and art departments are careful to include works by blacks in survey courses, and history departments are equally careful to delineate the role of blacks in the history of the United States and the Western world. Even women's studies departments devote courses to African-American women's art, literature, history, sociology and psychology. Other departments, in other words, have left the black studies department with little to teach that is original. Dimming the future of black studies still more is the growing perception by students—black and white—that far more careers await college graduates who major in business administration or the professions than those who major in black studies.

Blair, James (1655–1743) Scottish-born churchman who, in 1693, founded and was first president of the College of William and Mary, the second college in the American colonies and the first outside New England. Educated at the University of Edinburgh, Blair was ordained in the Church of England and, after a rectorship in Scotland and three years in London, he went to Virginia as a missionary.

In 1689, the bishop of London, whose diocese included Virginia, appointed Blair his commissary, or deputy, with authority to supervise the clergy. At a clerical conference, Blair called for “the better encouragement of learning by the founding [of] a college in this country [Virginia],” which would include a grammar school, a philosophy school and a divinity school. He returned to London to present the proposal to the head of the church and to King William and Queen Mary, all of whom approved the project. On February 8, 1693, a charter was granted for the new college, and Blair was named president for life.

Fearing that the college would tempt planters away from their fields and reduce the colony’s tobacco revenues, various Virginia governors interfered with construction, and the first building, designed by Sir Christopher Wren, was finally completed in 1695—only to burn down in a disastrous fire in 1705. It was rebuilt, and by the time of Blair’s death, there were three buildings at what was, by then, a well-established institution.

Blair imposed a Scottish university curriculum at William and Mary, requiring two years for a bachelor’s degree and four for a master’s degree. As in Scotland, he allowed students to live off-campus to save costs. He also banned the English university practice of professors’ accepting fees from students.

block grants Sums of money usually given by the federal government to states, municipalities or individual organizations or schools to spend as they wish to implement a broad federal policy or program. Block grants are also awarded by state governments to municipalities and by private foundations to individuals or institutions. Although application for block grants is usually as complex as for any other grant and requires a detailed explanation how the money will be used, the grants nevertheless give grantees enormous discretion over how and whether to spend the funds.

Federal block grants in education are usually awarded under appropriations measures to implement broad policies, such as encouragement of higher education for poor students. The landmark ECONOMIC OPPORTUNITY ACT OF 1964, for example, authorized grants for college work-study programs for students from low-income families. Although the federal government set upper limits on what colleges could pay recipients, it left the dispensing of each grant to the discretion of each institution, which selects recipients and determines the type of work available and the amount paid for each job.

block scheduling The replacement of traditional 40- to 55-minute high school classes with fewer classes lasting 80 or 90 minutes. Designed to generate more classroom discussion and develop higher-order thinking skills, block scheduling has long been a standard practice in many colleges. Usually imposed on alternate days at the high school level, block scheduling has met with resistance—even strikes—by high school teachers, who face the necessity of formulating longer, more imaginative and more complex lesson plans to sustain student interest over a longer period. Moreover, teachers are also forced to display their own knowledge (or lack thereof) of the subject they teach. Block scheduling, however, invariably increases the number of students who participate in classroom discussions, with a net increase in student grade-point averages and standardized test scores.

(See also MODULAR SCHEDULING.)

Bloom, Allan (1930–1992) University of Chicago educator and harsh critic of progressive education. A colleague of Mortimer Adler, Bloom was the author of the controversial *The Closing of the American Mind: How Higher Education Has Failed Democracy and Impoverished the Souls of Today’s Students*. Bloom’s book decried excessive open-mindedness on Ameri-

can college campuses, where, he claimed, students and faculty are no longer able to make moral judgments and distinguish between good and evil, culture and barbarism. Bloom contended that unrestricted tolerance and a belief that all beauty is in the eye of the beholder has destroyed criticism, good taste and the ability to recognize genuine worth.

Bloom, Benjamin (1911–1998) University of Chicago psychology professor and educator whose pioneer research in 1956 produced a taxonomy, or classification, of children's learning processes. The thinking process, he said, begins with the material or knowledge that must be considered, and then progresses through various stages of increasing complexity—for example, comprehension, application, analysis, synthesis and evaluation. Presenting the information is usually the easiest step and making sure a child understands it is only slightly more difficult. Application of the new knowledge is far more challenging for the child, as is analyzing the information, extracting the principle behind the new knowledge and conceiving its implications.

Each stage is assigned a numerical value: knowledge, 1.00; comprehension, 2.00; and so on. Each stage is also subdivided, and each subdivision assigned a numerical value in the hierarchy of importance. Comprehension, for example, is subdivided into translation (2.10) and interpretation (2.20).

The entire thinking process, or **COGNITIVE DOMAIN**, became one of three domains of learning that Bloom and his colleagues analyzed and classified as part of what eventually became known as Bloom's taxonomy of educational objectives. The other two are the affective and psychomotor domains. The **AFFECTIVE DOMAIN** consists of learning that is controlled by feelings, emotions, attitudes, beliefs, ideals, perceptions, values, interests, appreciations and adaptations.

Bloom, David Krathwohl and Bertram Masia classified the taxonomy of affective behavioral objectives in 1964 as receiving (1.0), responding (2.0), valuing (3.0), organizing (4.0) and characterizing (5.0), with the child reacting to a stimulus by either rejecting it or perceiving it to have some value and then incorporating it into his or her own values.

Although Bloom and his colleagues recognized the existence of the psychomotor domain, it was left to Robert Kibler, Larry Baker and David Miles to classify it in 1970. They divided it into four categories: gross bodily movements (1.00), finely coordinated movements (2.00), nonverbal communications (3.00) and speech behaviors (4.00).

In addition to his work in developing Bloom's taxonomy, Bloom's research in other areas of education proved that when conditions are right, all children can learn more than they usually do in conventional school settings. By providing a group of children with one-on-one teaching and teachers who tailored instruction to each child's needs, Bloom found that 80% of his group achieved at a level reached by only 20% of the students who remained in conventional classrooms. His research disproved the conventional theory that because a few children do well at a school, conditions exist for all children to succeed and that those who fail are themselves to blame.

boarding school An elementary or secondary school where students live on campus during the school year. Often called preparatory, college prep or, simply, prep schools, the vast majority are private, although a few states maintain centrally located, public boarding schools (sometimes called "governors schools") to serve a widely dispersed rural population that might not otherwise have access to adequate school facilities. North Carolina's Governors Schools, for example, are public boarding schools for gifted students.

The nearly 300 private boarding schools in the United States are high schools, although some have middle school programs and more than 30 have junior boarding programs—some for children as early as fourth grade.

American boarding schools were a late-19th-century outgrowth of the ACADEMY movement, although the evolution of individual schools depended largely on the philosophy of the individual founder or founders. Some were modeled after English “public schools,” which had evolved from public endowed schools for the poor into strict boarding institutions for the sons of the elite. Still others emulated the U.S. Military Academy, which had been founded in 1802, and the U.S. Naval Academy, which was founded in 1845. The military boarding schools based their educational programs on the ancient Greek classical tradition combining mental and physical disciplines.

Still others traced their philosophies to the Round Hill School, a private, experimental school, founded in Northampton, Massachusetts, in 1823 by JOSEPH COGSWELL and GEORGE BANCROFT. Round Hill was the first true boarding school in the United States and the first to incorporate physical education into its curriculum. Its founders were imitating Swiss educator EMANUEL VON FELLEBERG, who had founded a boarding school in an isolated rural setting and practiced the “art of education,” which, he said, consisted of “knowing how to occupy every moment of life in well directed and useful activity of the youthful powers, in order that . . . nothing evil may find room to develop itself.” Although Round Hill ended in failure after eight years, it served as a model for hundreds of boarding schools that opened in the half century that stretched from the end of the Civil War into the beginning of the 1900s.

Some began as sectarian institutions, founded by churchmen and parents who feared that secular public schools, with their mixture of students of different religious and ethnic

backgrounds, would erode the faith of their children in their own churches. Other boarding schools, however, were the result of the increasingly high academic demands of colleges such as Yale, Harvard and Princeton, where the industrial revolution had transformed the curricula from a theological orientation to one that stressed mathematics, science, mechanics, economics, law, history, medicine, English and modern languages. As a result, such colleges began demanding better academic preparation from their applicants, and some took steps to assure such improvements by helping to found schools to prepare students appropriately. Thus, Yale president TIMOTHY DWIGHT helped found Hotchkiss School in Connecticut, while Princeton administrators were responsible for founding Lawrenceville School. Such “feeder schools” attracted students from the wealthiest American families, who sought to assure their children’s admission into the most prestigious colleges and, ultimately, into the top echelons of business and government.

At the turn of the 20th century, more “feeder schools” opened. Many established close ties to one of the elite colleges and universities of the Northeast by designing curricula geared to prepare students for those colleges. Although boarding schools opened in other parts of the United States, those of the Northeast—most of them with ties to the Congregational, Episcopal or Presbyterian Churches—were the ones that gained national reputations for maintaining the highest academic standards. Most of these schools pointedly restricted admission to children from families of wealth. None admitted students of color, and all maintained strict quotas on the number of Catholic and Jewish students they admitted—usually well under 10% of their student bodies.

Boarding schools went into a temporary decline, however, in the decades following World War II. The vast postwar industrial

expansion dispersed the American population, including many of the elite families of the Northeast that had traditionally sent their sons to boarding schools. The civil rights movement of the 1950s wrought still more changes, as activists—many of them graduates of elite eastern prep schools—embarrassed their former schools into ending racial and religious discrimination. In 1970, moreover, the Internal Revenue Service began denying tax exemptions to private schools that practiced racial discrimination. Coeducation in the 1960s forced the boarding schools to broaden their student population still further, while the growth of academically equal private day schools gave parents educational options other than sending their children away for several years.

As the academically and financially weakest boarding schools either closed or merged with stronger institutions, however, the surviving schools saw a resurgence of applications, which restored them to their former financial and academic health. Almost all are now non-sectarian, coeducational schools, and, although the feeder-school concept has disappeared, the dozen most selective boarding schools of the Northeast, which limit admission to the academically gifted, continue to send as many as half their students to the most selective colleges and universities.

Many have physical plants larger than many colleges, with academic programs that also extend beyond the scope of some colleges. No longer limited to the social elite, today's boarding schools attract students for a variety of practical reasons. The lack of adequate public educational facilities for gifted students is one reason. Another is the original Fellenbergian benefit of the isolated rural setting, where students of similar talents can devote their entire energies to school activities and not be distracted by conflicting peer pressures or conflicts at home. Still another is the opportunity to

develop special skills for which day schools may have no facilities. Many boarding schools have athletic plants that include indoor hockey rinks, tennis courts and tracks that make day-school facilities pale by comparison. Some boarding schools have extensive facilities and trained faculty for intensive instruction for students with special learning disorders such as dyslexia. Other schools have faculties trained in harboring children who have experienced family traumas associated with separation, divorce or death in the family—or the transfer of a parent to an isolated or dangerous overseas post.

Board of Cooperative Education Services (BOCES) An intermediate school organization unit in New York State to provide specialized services on a shared-cost basis to two or more school districts that cannot afford to provide such services on their own.

In some instances, BOCES may simply send its specialists to a school or, if the numbers of students needing its services are large enough, it may operate its own specialized schools, institutional facilities or programs. BOCES functions vary widely according to the districts served and their needs and include programs for the educable retarded, the retraining of learning-disabled students, education of students unable to function in an academic setting, and vocational education.

board of education The elected or appointed group with responsibility for establishing policies for and supervising schools within its jurisdictional area. Most states have two types of boards of education, a state board and a local board.

STATE SCHOOL BOARD

Depending upon the state, a state board of education (or board of regents, in some states) may have responsibility for all public school

education in the state, or for all schools of a certain type, such as primary and secondary academic schools, vocational education or higher education. Board size varies widely, with some members serving *ex officio* (the governor, for example) and the others by appointment or general election. Depending on the provisions of the state constitution and the powers of the state legislature and governor, a state board may have partial or total policy-making powers over state education, along with the power to appoint the state superintendent of schools or the head of the state department of education and to adopt the budget and personnel policies for the state department of education. State board members often represent the state in educational affairs involving the federal government.

LOCAL SCHOOL BOARD

As in the case of state boards of education, the authority of local boards of education depends on the state constitution and powers delegated to them by state authorities. In general, however, local school boards are the agents of the state in their district and they determine educational policies and budgets for their districts within the framework of state education policies. They also establish the school calendar and hire and fire and set salary schedules for the school district superintendent, school administrators, teachers and school staffs. In some states, they have the power to impose taxes on district residents to raise funds for schools. More than 95% of the school boards in the United States are elected by local residents. Most boards whose members are appointed are in major cities and in the South. Some major cities also have a city school board to serve as an intermediary between local district boards and the state board.

Qualifications for election or appointment to school boards are usually minimal. Some states fail even to require literacy to serve, while

others insist on a minimum education, taxpayer status, district residency, minimum age, and good character or parenthood.

Board of Education of Central School District v. Allen A 1968 U.S. Supreme Court decision upholding a New York State law requiring local school boards to purchase textbooks and lend them free of charge to students in private and parochial schools. The case was one of a confusing series dealing with the use of public funds in private education, including *Cochran v. Louisiana State Board of Education* (1930), *EVERSON v. BOARD OF EDUCATION* (1947), *AGUILAR v. FELTON* (1985) and *Grand Rapids v. Ball* (1985). The Court upheld the use of public funds for religious schools in the first two cases but denied them in the last two, saying they violated the ESTABLISHMENT CLAUSE of the FIRST AMENDMENT TO THE CONSTITUTION mandating separation of church and state.

Citing *Everson* as a precedent, the Court ruled that lending textbooks to students was a secular act that “neither advances nor inhibits religion,” because no funds were actually granted to the schools themselves. In *Everson*, the Court had upheld a New Jersey law under which parents were reimbursed with state funds for expenses of busing their children to private and religious schools; this was allowed because the funds were spent directly on students and not on schools.

Board of Education v. Rowley A 1982 U.S. Supreme Court ruling that reversed a lower court order to a Westchester County, New York, public school to provide a free sign-language interpreter for 11-year-old Ann Rowley, who was deaf. The Court held that the Federal EDUCATION FOR ALL HANDICAPPED CHILDREN ACT OF 1975, mandating “free appropriate education” for all disabled public school children, only required schools to make public schools accessible to the handicapped. The law did not require schools to

provide individual services “to maximize each child’s potential commensurate with the opportunities provided other children.”

board of overseers Depending on the institution, either a synonym for a board of trustees, with authority to govern a school or college, or an honorary board made up of major financial donors, with no administrative authority.

board of regents A state board of education, which, depending on the state, may be appointed to govern an individual state university, a group of state universities or the state’s entire system of higher education.

Board of Regents of State Colleges v. Roth A 1972 U.S. Supreme Court ruling that a publicly employed teacher only has the right to a hearing when discharged if formal or de facto tenure has been conferred. The case involved David Roth, who had been hired for a fixed term of one year and was discharged without a hearing at the end of that year by Wisconsin State University.

Board of Regents v. Southworth A unanimous U.S. Supreme Court decision in 2000, giving public colleges and universities the absolute prerogative to impose and collect mandatory student extracurricular activity fees from all students, regardless of whether they agree or disagree with the goals of any of the student groups or activities supported by such fees. All college students are obliged to pay student activities fees amounting to several hundred dollars annually, in addition to charges for tuition, room and board. The universities and colleges use about 80% of such fees for non-controversial purposes, such as intramural sports and student health services. The remainder covers costs of a wide variety of student organizations, ranging from student publications to social or political action groups. Three law stu-

dents at the University of Wisconsin claimed—and the lower courts agreed—that mandatory fees required students to provide support for political and other activities to which they objected and which were a form of “compelled speech”—in effect compelled indirect participation—and represented a violation (albeit, in an inverted way) of their FIRST AMENDMENT rights of free expression.

Conservative student groups across the United States have long resented what they perceive as the dominance of liberal discourse on college campuses and have long claimed a constitutional right not to contribute money to such campus activities as gay rights, animal rights and other causes. The University of Wisconsin hosts about 200 student activities ranging from the International Socialist Organization to the Future Financial Gurus of America. Such organizations apply for funds from the pooled activities fees to cover cost of printing and posting flyers and leasing university space and facilities.

In ruling against the three students, the Supreme Court held that the purpose of the university is to facilitate and expose all its students to a wide range of speech. Indeed, “its mission is well served,” said the majority opinion, “if students have the means to engage in dynamic discussions of philosophic, religious, scientific, social and political subjects in their extracurricular campus life outside the lecture hall.” The university is, therefore, “entitled to impose a mandatory fee to sustain and open dialog to these ends.” The Court imposed a “cast-iron viewpoint neutrality requirement” in the way the university allocated student fees, thus giving groups representing the entire range of viewpoints equal access to activities fees.

board of trustees The governing body of a private school, college or university. Equivalent to the board of directors of a corporation, most trustees are elected from among alumni, parents or major contributors to the institution, although

the chief administrator of the institution usually serves *ex officio*. Depending on the by-laws of the institution, the board has responsibility for appointing the president or headmaster/headmistress of the institution, setting long-term policies, approving the budget and supervising fund-raising and institutional investments. Like corporation boards, boards of trustees delegate almost all administrative functions to their appointed school administrators.

Bobbitt, John Franklin (1876–1956) A University of Chicago professor of educational administration who pioneered school survey techniques and curriculum development based on social utility. Operating on the principle that a curriculum should prepare a student for real-life activities, Bobbitt used job analysis and identification of specific job skills and behavior to develop specific curricula. In the years before World War I, he helped conduct curriculum planning surveys in Cleveland, San Antonio and Denver, and prior to that helped develop a curriculum for schools in the Philippines.

Bob Jones University v. United States and Goldsboro Christian Schools Inc. v. United States A landmark 1983 U.S. Supreme Court decision that extended the principle of racial integration to private schools. In its decision, the Court ruled that the Internal Revenue Service had the power to deny tax exemptions to private schools that practiced racial discrimination. Although the federal tax code provided tax exemptions for nonprofit “religious, charitable or educational” institutions, the IRS had started denying such exemptions to racially biased schools in 1970. The all-white Bob Jones University of Greenville, South Carolina, and Goldsboro (North Carolina) Christian Schools, a group of fundamentalist private schools that denied admission to blacks, both challenged the IRS. Writing for the majority, Chief Justice Warren Burger explained, “Entitlement to tax

exemption depends on meeting certain common law concepts of charity—namely, that an institution . . . must serve a public purpose and not be contrary to established public policy.

“There can no longer be any doubt,” he went on, “that racial discrimination in education violates deeply and widely accepted views of elementary justice. It would be wholly incompatible with the concepts underlying tax exemption to grant the benefit of tax exempt status to racially discriminatory educational entities.”

Bode, Boyd Henry (1873–1953) A disciple of John Dewey who, in his influential book *Fundamentals of Education* (1921), attempted to translate Dewey’s philosophy of education into practical terms. “Progressive” education, he contended, did not mean capitulation to self-indulgence as some progressivists, in a total misinterpretation of Dewey’s theories, claimed.

Bode countered strongly that children could not, as some pseudoprogressivists contended, be left to follow their own interests “without sufficiently . . . directing the activities of pupils towards a preconceived end.” Children, he said, are ignorant of the vast amounts of available knowledge, and the job of the school is to direct them toward it.

Like Dewey, Bode believed that development of individual creative intelligence, knowledge, thought and problem-solving skills should be the primary goals of schools in a democratic society. Moreover, he believed (as did Dewey) that the school should be an “agency for (social) progress and reform” that teaches its students democracy. Teaching nationalism rather than democracy, he warned, might prepare children for “intolerance and heresy hunting.”

Born in Illinois, Bode taught philosophy at the Universities of Wisconsin (1900–09) and Illinois (1909–21), but spent most of his career,

from 1921 to 1944, as professor of education at Ohio State University.

Boehm Tests of Basic Concepts A test to determine mastery of common abstract concepts deemed essential for early school achievement. Designed for students in kindergarten through second grade, the test is usually administered by classroom teachers, special education teachers and speech/language clinicians to measure a child's grasp of basic relational concepts such as more-less, first-last and same-different, as well as concepts of space, quantity and time.

Bond, Horace Mann (1904–1972) African-American educator and pioneer researcher in black educational history. His studies on the origins of black Ph.D.s in the United States established the essential connection between a stable family-church-school social configuration and academic achievement. He found that a statistically significant high percentage of black Ph.D.s had come from communities where a tightly knit configuration of black family, black church and local schools had provided consistently high expectations for the community's youngsters and specifically encouraged academic achievement. Bond's studies meshed with other studies showing an exceptionally high number of juvenile delinquents emerging from neighborhoods characterized by poverty, broken homes, churches with declining memberships, elevated rates of student school-absenteeism and peer groups that denigrated academic achievement while engaging in profitable illegal activities.

bookmobile A 20th-century mobile library on a truck or van that served as a branch of a public library in areas too distant for residents to avail themselves of regular library services. The earliest bookmobile may have been Mr. Joshua Thomas's horsedrawn book wagon, which started carrying books to outlying areas of

Washington County, Maryland, in 1905. Jeeps carried books to servicemen at camps across the United States during both World Wars. The increase in car ownership after World War II decreased the need for bookmobiles, and the development of the Internet rendered them all but obsolete by the end of the 20th century.

There were two standard types of bookmobiles: One was a tractor-trailer unit with 5,000 to 7,000 volumes that could be detached and left parked in an area for a fixed time. These also served as temporary replacements for libraries undergoing renovation. The second, smaller type of bookmobile was in a van with 1,500 to 4,000 volumes that visited one or more different communities every day.

Book of Common Prayer A book of rites and ceremonies constituting the official liturgy of the Church of England. The original *Book of Common Prayer* (1549) also established a uniform system of instruction to be conducted by the clergy throughout the realm. Besides rites and ceremonies, the *Book of Common Prayer* included an authorized catechism, an authorized book of homilies and an authorized primer. The Long Parliament of the 1640s ended its use, but Charles II restored it to official use in 1660. Although unacceptable to the Puritans of New England, it was a part of the curriculum in Virginia and in other colonies where the Church of England predominated.

Boston Latin School The first school founded in the American colonies. While the Plymouth colony left education to the home and the church, the Massachusetts Bay colony asked Philemon Pormont to open a Latin grammar school in Boston on April 13, 1635. Latin grammar schools accepted only boys of nine or 10 who could read and knew English grammar and basic mathematics. The Latin grammar school curriculum was designed to prepare boys for college and required four to five years

of study of Latin and Greek, coupled with history, geography, geometry, algebra and trigonometry. The founding of Boston Latin School was followed in quick succession by the founding of similar schools in Ipswich and Charlestown in 1636, in Cambridge in 1638 and Dorchester in 1639. By the end of the first decade of settlement, Massachusetts had schools in 22 towns, and schools in New Haven and Hartford quickly followed in 1642.

Boston Latin became one of New England's most renowned schools, eventually helping to educate some of the foremost American colonialists, including BENJAMIN FRANKLIN. Franklin, however, found the curriculum stifling and left after a year to study a more "American" curriculum, and Boston Latin and other schools eventually became the center of a bitter debate over how much schools should teach of life in ancient times and how much of life as it was and would be in the American colonies. The debate over the merits of a classical and practical curriculum continues to a certain extent to this day at many private educational institutions. Boston Latin, however, is now a public school with a conventional public school curriculum.

Boston Manufacturing Company of Waltham An early 19th-century yarn-making factory that organized a new form of apprenticeship training designed for mass production factory work rather than individual craftsmanship. Until the organization of the Boston Manufacturing Company in 1813, most New England textile mills were small shops with simple equipment that children could operate. Mills either hired children by themselves or entire families, with parents expected to supervise and train their children.

The Boston plant, however, introduced more complex power looms that required adults to operate them. The company hired agents to comb the countryside, recruiting young women aged 18 to 22 and willing to

come to Waltham to work in the plant and live in carefully supervised "family-style" boarding houses, which were owned and operated by the company. For the era, the company offered attractive wages that the young women could save toward a dowry or send home to help their families. Although the Boston mill did not have a formal system of training, beginning workers simply tended the machinery and gradually gained more knowledge from older workers.

Boston Museum of Fine Arts One of the first public museums in the United States to dedicate itself primarily to the education of the public at large. Regardless of their stated purposes, the first museums in the United States were profit-making, proprietary enterprises that cloaked education with entertainment. The first public museums to rise in the U.S. after the Civil War did little more in terms of education. Their curators saw themselves as preservers, custodians and researchers rather than as educators, and they often charged entrance fees that discouraged public entry. The museums became, in effect, warehouses and laboratories guarding materials they believed too complex for the average citizen.

Like the ART INSTITUTE OF CHICAGO, the Boston Museum of Fine Arts was an exception. It was created by an act of the Massachusetts legislature "for the purpose of . . . affording instruction in the fine arts." Founded in 1870, it opened in 1876, and its trustees worked immediately to "elevate the public taste." In addition to operating a School of Drawing and Painting, it granted free admission to the public two days a week to encourage their use and appreciation of the museum.

Boston Public Library The first urban public library in the United States and a model for hundreds of others that were built in the ensuing 25 years. It was not, however, the first pub-

lic library, the first free library having opened in Peterboro, New Hampshire, in 1833, followed by 25 others in other small communities. The Boston Public Library's trustees, however, were the first to propose building a major city institution that would rival the various college libraries reserved for scholars and students. Harvard College Library, for example, was the largest library in the United States at the time, with close to 150,000 volumes, and Yale College had more than 50,000, but neither shared either its facilities or books with the public.

Saying that the progress of education required each American to "be mainly his own teacher," the Boston library trustees asked that the city "extend some reasonable aid to the foundation of a noble public library, to which the young people of both sexes, when they leave the schools, can resort for those works which pertain to general culture, or which are needful for research into any branch of useful knowledge." The opening of the Boston Public Library in 1854 marked the beginning of the "library movement" that saw 275 major public libraries built between 1850 and 1875.

bottom-up model of reading A system of reading instruction based on the theory that the learning of reading takes place by piecing together small parts, or phonic sounds, to form, first, a letter sound, and, eventually, a word sound. Learning takes place, in other words, from the bottom up, from sound to symbol to meaning. The model is in contrast to the TOP-DOWN MODEL, in which children learn entire words by sight, by the distinctive shape of the word, rather than individual letters. Such children must then gradually take the word apart to learn each letter and its sound. Experienced teachers recognize, however, that all children use both methods to some degree. Some children learn sight words more easily than others and instinctively distinguish words

by the total shape of the word—*pizza*, for example, as opposed to *cat*. Other children, however, seem unable to distinguish entire words when first learning to read and are almost totally dependent on "sounding out" the word, letter by letter.

(See also PHONICS; WHOLE LANGUAGE.)

Boyer, Ernest L. (1928–1995) American educator, researcher and administrator who, as president of the CARNEGIE FOUNDATION FOR THE ADVANCEMENT OF TEACHING, wrote *High School: A Report on Secondary Education in America*, a landmark study published in 1983. *High School* called for sweeping reforms of public school education in the United States, and recommended specifically "that the current three-track system—academic, vocational and general—be abolished. It should be replaced by a single-track program, one that "provides a core education for all students . . . , keeping options open for both work and further education."

Boyer defined "a core of common learning" as a high school program of required courses in writing (1 year), rhetoric and speech (½ year), literature (1 year), the arts (½ year), foreign languages (2 years), United States history (1 year), Western civilization (1 year), Nonwestern studies (½ year), civics (1 year), physical science (1 year), biological science (1 year), mathematics (2 years), technology (½ year), health (½ year), a seminar on the world of work (½ year) and a senior independent project of original research and study (½ year). Boyer's core curriculum would expand the number of required courses in high school from one-half to two-thirds of the total units required for graduation and end the "cafeteria-style" curriculum (see CURRICULUM, CAFETERIA-STYLE) in many high schools that gives students almost total freedom of choice about their courses of study. As a result of granting such broad freedom, physical education and health education, work experience outside school,

remedial math and English and “personal service and development courses” accounted for 25% of the credits of American high school students at the time of Boyer’s report.

Boy Scouts of America One of many organizations for children formed at the beginning of the 20th century by members of the PROGRESSIVE EDUCATION movement to provide educational experiences that would supplement the work of schools during the days and weeks when school was not in session. Founded in 1910, adult leaders of the Boy Scouts of America sought to channel and shape the “play” instincts of young boys and the “gang instincts” of adolescent boys into educationally enriching and socially constructive activities that would ultimately produce socially responsible adults. Geared to the needs of rural children, the founding of the Boy Scouts followed by four years the founding of the Boys’ Clubs of America for urban youngsters. In 1912, two similar organizations for girls were founded—the Camp Fire Girls and the Girl Scouts.

All four groups were secular models of organizations such as the Young Men’s Christian Association, the Young Women’s Christian Association and the Cadets of Temperance, which religious groups had set up for youngsters in the previous century. Like those predecessor organizations, the Boy Scouts, Girl Scouts and other secular groups provided adult leaders with handbooks on how to operate local chapters, and they published informative, entertaining periodicals such as *Boys’ Life* and *The American Girl* for the youngsters.

Scouting for boys actually began in England in 1907 as a result of the writings and efforts of Lord Baden-Powell, but the American organization’s rules differed substantially from those of comparable overseas groups, which did not permit racial and religious discrimination. Many local scout groups in the United States were formed by church groups that limited

membership to children of families in that church. Such discrimination caused a sharp decline in Boy Scout membership, as new activities such as Little League baseball and other nondiscriminatory after-school recreational activities attracted children from middle- and upper-middle-income families away from scouting. To halt the decline, the Boy Scouts launched an outreach program in 1991 to attract boys they had previously rejected—sons of sharecroppers in disadvantaged rural areas; disadvantaged children from urban slums; and immigrant children. As part of the “Scoutreach ’91” program, *The Boy Scout Handbook* was translated into 14 different languages. In addition to ending racial and religious discrimination, Scoutreach also modernized career exploration programs by substituting computing and family life for blacksmithing and beekeeping as activities leading to merit badge rewards. By 2000, Scoutreach had rebuilt enrollment to more than 4 million—still far short of the more than 6.5 million members it boasted in 1972, however.

Boys Town Originally, a pioneering residential institution for homeless, abandoned, neglected and emotionally troubled boys. Now called Girls and Boys Town, Boys Town was founded in 1917, when a Roman Catholic priest, Father Edward J. Flanagan (1886–1948), opened his own home in Omaha, Nebraska, to homeless boys. He expanded those initial accommodations into a campus of 1,400 acres, with 65 buildings, a 1,000-acre farm, a middle school and high school and a Vocational Career Center. Now coeducational, the institution houses about 400 children of all races and ethnic and religious backgrounds in cottages of about 10 children each, with husband-wife teams of cottage parents. From its founding until 1977, when it turned co-ed, Boys Town had accommodated about 20,000 boys. Off campus, the institution maintains a national

hotline for troubled children to call to discuss their problems and a network of homes in cities and suburban communities, where cottage parents supervise groups of up to about a half-dozen children, who attend local schools and lead otherwise normal lives.

Bradley v. Richmond School Board The last of three U.S. Supreme Court decisions between 1963 and 1965 that effectively ended resistance to school desegregation in the South. The *Bradley* decision applied all previous desegregation rulings to public school teachers as well as students. Prior to *Bradley*, the Court had ruled in *Griffin v. County School Board* (1964) that Prince Edward County, Virginia, had violated the law by closing its public schools to avoid desegregation and then giving white parents grants and tax credits to help them pay tuition in all-white private schools. In 1963, in *Goss v. Board of Education*, the Court ruled a Knoxville, Tennessee, scheme that allowed pupils to transfer out of schools

where their race was a minority to schools where they were a majority. Each of the local ordinances that the Court struck down in the three cases represented a decade-long effort of “massive resistance” by white officials in the South to bypass the sweeping DESEGREGATION order of the 1954 *BROWN V. BOARD OF EDUCATION OF TOPEKA*.

braille A system of reading for the blind, using raised dots as symbols for each letter. Developed in France in 1824 by Louis Braille (1809–52), the characters were derived from a “point writing” system, using embossed dots and dashes for coded army messages.

Blind at the age of three, Braille was sent as a foundling to the National Institute for the Young Blind in Paris. After developing into an accomplished organist and cellist, Braille returned to the institute to teach. At the time, only 14 books existed for the blind, all of them in embossed alphabetical characters that few blind people ever learned to master.

1	2	3	4	5	6	7	8	9	0
a	b	c	d	e	f	g	h	i	j
⠠	⠡	⠢	⠣	⠤	⠥	⠦	⠧	⠨	⠩
k	l	m	n	o	p	q	r	s	t
⠪	⠬	⠭	⠮	⠯	⠰	⠱	⠲	⠳	⠴
u	v	x	y	z	w				
⠵	⠶	⠷	⠸	⠹	⠺	⠻			

Braille alphabet and numbers (*TeleSensory, Mountain View, Calif.*)

Braille characters are based on a configuration of six large raised dots referred to as the braille cell. To help children learn the system, he numbered each position of the cell as follows:

- (1) . . (4)
- (2) . . (5)
- (3) . . (6)

Each character in the alphabet is formed by removing one or more dots from the basic configuration, thus allowing the reader to distinguish each from the others by the number and position of the remaining dots. The first 10 characters serve as both letters and numerals—that is, a, 1; b, 2; c, 3; etc., through j, 0. In addition to the 26 letters of the alphabet, a separate character serves to indicate a capital or upper case letter and a second separate character indicates whether the character that follows is a numeral or a letter. In 1942, a machine called a braille writer was developed to produce braille mechanically.

Brainerd Mission The first educational institution designed to assimilate Indians into white, Protestant, American society. Founded in 1817, in Chickamauga, Georgia, the school served as a model for almost all 19th- and early 20th-century schools built by the federal government on Indian reservations.

Named after David Brainerd, an 18th-century Presbyterian missionary to the Seneca and Delaware Indians, the Brainerd Mission was a joint venture of the American Board of Commissioners for Foreign Missions, the U.S. government and the Cherokee Nation. Under the Treaty of Holston in 1791, the federal government had provided funds to the Cherokee to help them convert from a hunting to an agricultural economy. In response to a 1796 invitation by President Washington, about 15,000 to 20,000 Cherokee settled in about 40 villages in a region covering parts of Georgia, Tennessee and the western Carolinas. Although Moravian

and Presbyterian missionaries had set up a few elementary religious schools, they were of little practical value in helping the Cherokee become successful farmers. In 1817, the Cherokee sent a delegation to Washington to ask governmental help in providing more advanced education to Cherokee children.

Washington agreed to build a schoolhouse and living facilities for a teacher and to provide plows, hoes, spinning wheels and other equipment to teach children agriculture and the domestic arts. The American board provided teachers, and, within a year, the school not only boasted a schoolhouse and living facilities for teachers, but five student dormitories, a kitchen, dining hall, gristmill, sawmill, barn, stable and 50 acres under cultivation. A fully self-sustaining institution, Brainerd teachers taught exclusively in English and gave each student an English name to replace his or her Indian name. The school used the LANCASTERIAN SYSTEM of instruction, developed by Quaker educator Joseph Lancaster to teach large groups of students by drilling older students in their lessons and assigning the best as monitors to teach younger students. The school day at Brainerd Mission extended from 5:30 A.M. to 9 P.M., with its 180 students either in class or working throughout the day. Boys did manual labor, and girls practiced all the domestic arts. Evenings were spent at prayer or in religious studies. Within 10 years, eight other Brainerd-type schools had arisen among the Cherokees, and, as the Indians were expelled from the East into the western territories, the Brainerd model went with them and remained the standard school for Indians for more than a century thereafter.

Bray, Thomas (1656–1730) English-born Anglican priest responsible for establishing the first lending libraries in the American colonies. He also founded the Society for Promoting Christian Knowledge (SPK), which grew into

the influential SOCIETY FOR THE PROPAGATION OF THE GOSPEL IN FOREIGN PARTS (SPG).

Bray only spent three months in the colonies as commissary, or chief representative of the Church of England in Maryland, and, in effect, the clerical ruler of the region. Prior to his arrival, however, he had developed what he considered an ideal library of about 1,000 books that he described in his own work *The Country Curate's Library* (1699). Designed partly to propagate Anglicanism, the library was heavily weighted with religious texts, but also included a large number of books on politics, law, history, mathematics, medicine, trade and commerce, carpentry and home building, poetry and other practical and entertaining works.

Bray formed SPK to raise funds to establish libraries in the colonies and encourage education and conversion to the Anglican church of the children in the colonies. Bray's first library—and indeed the first lending library on the American continent—was established in Annapolis, Maryland, in 1696, with 1,095 volumes. By the time Bray arrived in America in early 1700, more than 30 similar libraries had been established in Boston, New York, Philadelphia and other major cities, as well as in rural areas of Maryland.

By then, many of the libraries had also assumed parallel functions as schools. Recognizing the need for missionary teachers, he returned to England in the summer of 1700 to form the SPG, with the archbishop of Canterbury as its head. The SPG won the full financial support of both the church and the crown and, in the ensuing seven decades, it established about 170 schools stretching from the northern reaches of New England to Georgia and South Carolina and westward into Pennsylvania. More than 80 teachers and 18 religious instructors helped teach thousands of children to read, write, calculate and pray in English and assured the place of English as the dominant

language in colonies peopled by French, Dutch, German, Native Americans and African slaves, as well as English. The SPG remained a major force in education until the end of the Revolutionary War, when American colonists severed their official ties to the mother church as well as the mother country.

Bread Loaf School of English A degree-granting graduate summer school of literature studies and writing courses for teachers of English. Founded in 1920 at Bread Loaf Mountain on the campus of Middlebury College, in Vermont, the school was designed to provide English teachers with an in-depth knowledge of composition, literary criticism, expression and techniques for teaching writing skills. At the time, nearly half the English teachers in American public schools lacked college degrees, and almost all lacked the knowledge and skills to teach writing skills and literary interpretation. (Even today, many English teachers with teaching certificates and degrees in pedagogy and educational psychology lack skills in creative writing, rhetoric or literary criticism.) The original Bread Loaf curriculum offered courses in creative writing, dramatic production, English and American literature, public speaking and debate and methods of teaching English. Today's Bread Loaf curriculum has expanded to include a wide range of courses leading to master of arts and master of letters degrees in English and a master of modern language degree in French, German, Italian, Russian and Spanish. Held at St. John's College in Santa Fe, New Mexico, and Lincoln College, Oxford, England, as well as at Middlebury, Bread Loaf enrolls several hundred students each summer, from the end of June to mid-August. Thirty fellowships for rural teachers from Alaska, Arizona, Mississippi, New Mexico, South Carolina and Vermont are available from the DeWitt Wallace-Reader's Digest Fund. Bread Loaf has spawned similar projects across the United

States to expand the writing skills of English teachers.

(See also NATIONAL WRITING PROJECT.)

Briggs v. Elliot One of four separate cases consolidated by the U.S. Supreme Court into the single landmark case known as *BROWN V. BOARD OF EDUCATION OF TOPEKA*. In the decision it handed down in 1954, the Court overturned an earlier Court ruling that allowed states to segregate the races in so-called separate but equal schools and other public facilities.

Brinsley, John (d. 1633) English preacher-schoolmaster and author of *A Consolation for Our Grammar Schooles* (1622), which became a standard pedagogical guide for Puritan schoolmasters in the colonies. Brinsley's thesis was that the primary obligation of schoolmasters was to promote piety. They were to do this in two ways: directly, by teaching all children to read Scripture, and indirectly, by training a select group of gifted children for the ministry so that they would carry the word to parishes throughout the colonies. Brinsley, who designed his book for use in "all ruder countries and places," warned that Jesuits were already training the most gifted children for missionary work and that the only way to save the English from being "consumed by their [Jesuit] furnace" was for schools "to prepare the way."

British Infant School A British primary school that uses play as the central activity for teaching children between the ages of five and seven or eight. Developed in the late 1960s, British Infant Schools sparked the expansion of so-called OPEN EDUCATION in the United States. Somewhat loosely based on the theories of Swiss psychologist JEAN PIAGET, the British Infant School proceeds on the theory that children cannot learn a specific activity until their physical, intellectual and emotional develop-

ment permit. Thus, rather than grouping children by age, ability or other conventional basis, British Infant Schools allow children to group themselves instinctively. Groups are usually small and tend to have children whose ages may differ, but whose reasoning abilities tend to be similar. Learning activities are self-directed, with teachers simply suggesting a general theme as a play activity and serving as informal guides to help children learn whatever they need to know to play successfully. Unlike the methods prevailing at conventional schools, student learning is never segregated into distinct times for learning to read, write or calculate. Instead, students learn many skills simultaneously. Instruction is informal, and students learn at their own pace in a nonthreatening environment.

Brookwood Labor College One of several pseudo "colleges" established by American labor unions and the Socialist Party during the years between World Wars I and II. Modeled after England's Workingmen's College in London, Brookwood was a noncredit institution organized in Katonah, New York, about 50 miles north of New York City, by Socialist leaders. The school offered a limited curriculum in social history and philosophy as well as practical classes in union organizing, striking and other labor tactics. The college also recruited writers and actors to produce prolabor dramatic and literary works. The college closed in 1937.

Brougham, Henry Peter, first Baron Brougham and Vaux (Lord) (1778–1868) Scottish-born jurist, political leader and social and educational reformer whose innovations revolutionized British and, eventually, American education. A founder of London University, he was a member of Parliament for 16 years and author of the sweeping Public Education Bill to extend schooling to the poor as well as rich. Arguing against the common notion of

divine determination of a person's station in life, he insisted that the poor were as educable as the rich and that the question was "no longer whether to educate commoners but how to do it."

Brougham encouraged development of public libraries, public forums and vocational schools, which were the forerunners of the state school system in England. He was a cofounder of the London Institute for the Diffusion of Science, Literature, and the Arts, which offered lectures on each of those subjects, as well as philosophy, to audiences of mechanics, artisans and other commoners. Brougham's article in the *American Journal of Education* about the institute and other, similar ANDERSONIAN INSTITUTIONS for workingmen inspired Josiah Holbrook to found the AMERICAN LYCEUM. His theories on education also inspired the founding of schools in Switzerland by PHILIPP EMANUEL VON FELLENBERG and JOHANN HEINRICH

PESTALOZZI, who proved that all normal, healthy children had equal, almost unlimited capacities to learn.

Brown University The earliest American college to abandon religious affiliation as a requirement for admission. Founded in 1764 as the College of Rhode Island, the school adopted the name of Brown in 1804, in recognition of a large gift by Nicholas Brown, an alumnus and son of one of the school's founders.

From its beginnings, Brown has been one of the most liberal institutions in the United States. Like other early American colleges, Brown was founded as a training school for ministers—a Baptist answer to Congregationalist Harvard and Yale, Presbyterian Princeton and Anglican (later Episcopalian) Kings College (later Columbia). Unlike those other colleges, however, Brown's original charter banned "religious tests" for entry into the college and

Brown University, in 1770, when it was still called the College of Rhode Island and had just moved to Providence from Warren, where it had been founded six years earlier. It was renamed in 1804 in honor of a benefactor, alumnus Nicholas Brown. (*Library of Congress*)

declared “that the Sectarian differences of opinions shall not make any Part of the Public and Classical Instruction.”

In 1827, FRANCIS WAYLAND became Brown’s fourth president and, over the next 28 years, introduced innovations that revolutionized American college education by modifying curricula to serve “the wants of the whole community.” Until then, major colleges in the United States and Europe had only prepared men for the “learned professions”—law, medicine, divinity and teaching. All students studied the same curriculum—the classics, mathematics and natural and moral philosophy—with each student studying four years of each subject and no others. Wayland expanded the curriculum to embrace a wide variety of other courses of varying lengths, including chemistry, physics, geology, English language and rhetoric, political economy, history, law, pedagogy, agriculture and the arts. Moreover, the curriculum was reorganized so that “in so far as it is practicable, every student might study what he chose, all that he chose and nothing but what he chose.” Instead of the standard, general bachelor’s degree, Brown now offered the first bachelor’s degrees in specific subjects.

As Brown expanded its campus in the last half of the 19th century and added intercollegiate sports, it joined seven other northeastern colleges to form the “IVY LEAGUE” intercollegiate sports group. In 1891, Brown established Pembroke College as a coordinate undergraduate college for women, but the two merged into a single university in 1971.

As the Vietnam War provoked student uprisings on college campuses across the United States in the late 1960s, Brown joined other colleges in abandoning its role as *in loco parentis* and turned responsibility for student conduct and curriculum planning to the students themselves. The result was the so-called New Curriculum, which eliminated traditional distribution and course requirements and majors, as well as

traditional grading. At the time, the number of courses a student had to pass to receive a degree was reduced from 36 to 26, all of which could be taken on a pass-fail basis. Brown was not unique in making such changes, but while most other private colleges eventually restored some semblance of traditional course distribution and grading requirements, Brown held relatively firm to its student-centered policies. Even in 2000, the university required only that students pass 30 of 32 courses to graduate (including 8 to 21 courses in the major), and there were no distribution requirements or specific required courses.

Brown v. Board of Education of Topeka The landmark 1954 U.S. Supreme Court decision that outlawed racial segregation in American public schools and signaled the end to racial segregation in all public facilities in the United States. Although popularly referred to as one case, *Brown* was actually a consolidation of four different cases, each of which was, by itself, the culmination of 16 years of litigation involving five additional cases heard before the Supreme Court. Moreover, there were actually two *Brown* cases, usually referred to as *Brown I* and *Brown II*. In *Brown I*, handed down in 1954, the Court declared racial segregation in schools a violation of the Fourteenth Amendment of the U.S. Constitution. The ruling stated, “In the field of public education, the doctrine of ‘separate but equal’ has no place. Separate educational facilities are inherently unequal.” A year later, *Brown II* held local school districts responsible for implementing *Brown I* and ordered them to desegregate schools “with all deliberate speed.”

Brown v. Board of Education of Topeka was a consolidation of lawsuits brought by the National Association for the Advancement of Colored People against school boards in South Carolina, Virginia and Delaware, as well as Kansas. The other cases were, respectively, *BRIGGS v. ELLIOT*, *Gebbart v. Belton* and *DAVIS v.*

COUNTY SCHOOL BOARD. All four cases and *Brown II* had their origins in the mid-1930s, when a group of NAACP legal strategists headed by THURGOOD MARSHALL devised a long-term strategy for ending segregation. At the time, race riots were breaking out in cities across the United States. Marshall, who later became a U.S. Supreme Court justice, recognized that neither the legal nor social system in the U.S. was prepared to sweep away centuries of racial segregation. Rather than attempt the impossible, Marshall and his colleagues devised a long-term scheme to lay a legal groundwork of court decisions that would undermine the "separate but equal" doctrine, which had been established in the historic *PLESSY V. FERGUSON* decision in 1896. In that decision, the Court had ruled that states had the constitutional right to segregate the races as long as it provided "separate but equal" facilities. The result was the passage of laws in 17 states and the District of Columbia that segregated blacks from whites in all public facilities, including schools. The states that passed such laws were Alabama, Arkansas, Delaware, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, Missouri, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, and West Virginia. Although they passed no laws mandating segregation, eight states (Illinois, New Jersey, Pennsylvania, Arizona, Indiana, Kansas, New Mexico and Wyoming) permitted it at the discretion of local communities. By the end of World War II, only 12 states had banned segregation.

Marshall began the campaign to undermine *Plessy* in 1938, with *MISSOURI EX REL GAINES V. CANADA*. In that case, the Court held that when a state provides legal training to any of its citizens, it must do so for all, and that providing tuition assistance to black students to attend law school out of state did not meet the same standard. In 1940, the case of *ALSTON V. SCHOOL BOARD OF THE CITY OF NORFOLK* produced a ruling that different salary schedules for

equally qualified black and white teachers with the same job assignments was a violation of the due process and equal protection clauses of the Fourteenth Amendment. In 1948, the NAACP won *SIPUEL V. BOARD OF REGENTS OF THE UNIVERSITY OF OKLAHOMA*, in which the Court ruled that Oklahoma had to provide legal education to blacks as well as to whites and to do so for blacks as soon as it offered such education to whites. Two years later, the NAACP won a decision in *Sweatt v. Painter* that a separate law school for blacks in Texas did not provide the same legal education as that given to whites at the University of Texas Law School, where black entry was prohibited. And in the same year, 1950, the Court also ruled in favor of the NAACP in *McLaurin v. Oklahoma State Regents*. In that case, the Court held that the state had denied equal protection under the law to a black student whom a graduate school in education had segregated from white students.

Recognizing that the *Sweatt* and *McLaurin* decisions had both held segregation to be a denial of equal rights under the Fourteenth Amendment, Marshall and his NAACP legal team believed they had enough precedents to overturn *Plessy*. To help them do so, KENNETH B. CLARK, a distinguished sociologist who, like Marshall, was a graduate of the all-black HOWARD UNIVERSITY, documented the harmful social and educational effects of segregation on black children. On May 17, 1954, the all-white U.S. Supreme Court ruled unanimously: "Separate educational facilities are inherently unequal."

(See also SEGREGATION.)

Bruner, Jerome Seymour (1915–) American psychologist and theorist noted for his research and writings on the learning process. A successor to Swiss psychologist JEAN PIAGET as a leader in the field of cognition, Bruner depicted learning and the acquisition of knowledge as a three-part process involving "enactive knowledge," "iconic knowledge" and

“symbolic knowledge.” Enactive knowledge is acquired by doing; iconic knowledge by picturing it in one’s mind; and symbolic knowledge by organizing it with abstract symbols such as words. A graduate of Duke and Harvard universities, he was a professor of psychology at Harvard from 1956 to 1972. He founded the Harvard Center for Cognitive Studies in 1960 and headed it until 1972, when he accepted a professorship at Oxford University.

Bryan, William Jennings (1860–1925)

American lawyer, editor, syndicated columnist, congressman, presidential candidate, secretary of state and a prosecuting attorney in the famed **SCOPES MONKEY TRIAL**. A political and social liberal, Bryan was an intellectual and religious conservative who could recite the Bible verbatim and believed in its infallibility. A firm supporter of the growing Christian fundamentalist movement in the early 1920s, he declared Darwin’s theory of evolution an effort to subvert Christianity and American democracy. When Tennessee and other southern states banned the teaching of evolution, he joined the prosecutorial team in charging Dayton High School science teacher John Thomas Scopes with violating the law. In a surprising end to the trial, defense attorney Clarence Darrow called Bryan to the stand and humiliated him by forcing him to reconcile his literal interpretations of scriptural metaphors with scientific facts that even many fundamentalists had, by then, accepted. Bryan died a week later.

Bryn Mawr Summer School for Women Workers in Industry

One of several “colleges” established by socialists, labor union leaders and intellectuals attempting to establish egalitarian educational facilities for American workers during the years between World Wars I and II. Unlike the **BROOKWOOD LABOR COLLEGE**, which was designed to teach union

organization and strike-management techniques, the Workers’ Summer School was modeled after England’s Ruskin College at Oxford and was designed to teach working women such nonvocational subjects as literature, history, hygiene, science and other courses that would make their lives, rather than their work, more pleasant. Bryn Mawr College president Martha Carey Thomas (1857–1935), who was also a prominent suffragist, founded the Workers’ Summer School in 1921. A former Bryn Mawr English professor and dean, Thomas had been president of the college since 1894 and, although she retired in 1922, the summer school continued in operation until 1938.

Buckley Amendment A federal law giving adult students and parents of minors access to, and certain rights to, amend all files related to their school, college and university records. Formally known as the Family Educational Rights and Privacy Act of 1974, the law was designed to prevent inclusion of inaccurate or prejudicial entries in confidential school records that might damage a student’s chances of obtaining a job or gaining admission to a college or graduate school. The law only applies to items inserted since January 1, 1975.

The law not only allows full access to such files, it gives parents and students the right to delete irrelevant, out-of-date materials, such as a ninth-grade behavioral problem for a 17-year-old college applicant whose subsequent behavior proved impeccable. In addition, adult students and parents of minors may insist on the inclusion of any extenuating circumstances or a different interpretation of some element of a student’s record that might otherwise prove prejudicial.

Budd, Thomas (d. 1698) Author of the first proposal for public education in the American colonies. A Quaker convert, Budd was a member of the provincial assembly who

believed that Pennsylvania's natural resources and deep water port in Philadelphia could make it one of the world's most prosperous centers of international trade—if the state provided its people with the proper education. To that end, he published the widely read pamphlet *Good Order Established in Pennsylvania & New-Jersey in America* (1685), in which he called for all children to have seven years of schooling in “all the most useful arts and sciences that they in their youthful capacities may be capable to understand.” The curriculum was to have combined reading and writing in English and Latin with arithmetic, bookkeeping and at least one trade for boys, such as joinery, weaving and shoe making, and one for girls, such as spinning, knitting or sewing.

He called for “all towns and cities” in Pennsylvania to raise taxes to support a system of “public schools,” which would serve children of all denominations, Indians as well as colonists, rich as well as poor. Rich families, he agreed, would probably continue sending their sons to “private” schools. He asked for new taxes to support the public schools and proposed letting students work to raise additional funds. He suggested that girls could produce and sell cloth, while boys grew flax for the girls to spin and weave.

Although widely discussed, Budd's plan was ignored by the Assembly and came to nought.

building blocks A basic pedagogical device for converting play into effective learning by preschool, kindergarten and many elementary school children. Swiss psychologist JEAN PIAGET was among the first to describe the connection between play and intellectual development in early childhood. In effect, play teaches, without children being aware that they are indeed being taught. Building blocks, especially unit blocks made up of small blocks and increasingly larger multiples thereof, are especially

effective in encouraging individual creativity even as they teach the mathematical realities of how fractional parts make up a whole.

Unlike conventional toys, which are designed to entertain, building blocks are important as pedagogical devices because they engage the child's direct rather than indirect participation. In so doing, they teach children gross muscular control and manual dexterity; intellectual, intuitive and aesthetic skills in planning, designing and building a structure; self-control and perseverance in planning and fulfilling what for preschoolers is a long-range project that postpones gratification until the task is complete.

bullying The browbeating or physical victimization of a youngster by one or more other more powerful youngsters. One of the most prevalent types of student misbehavior in almost every elementary, middle and high school, bullying is largely ignored by teachers and administrators, often because they do not know how to prevent it and actually believe it to be a relatively harmless, normal part of the maturation process. The few available studies of bullying dispel this and the many other myths that cloak the problem.

Most children are victimized by bullies at least once, and the majority emerge relatively unscathed. Boys usually suffer extortion and physical abuse, while girls usually suffer social alienation and intimidation, such as teasing about appearance or dress. About 10% of all children attending school are afraid during the entire school day because of bullying. As a result, many avoid lunch, recess and playtime for fear they will be humiliated or physically abused by bullies. Some routinely feign illness to avoid attending school and, as a result, often suffer academically. Long-term victims suffer low self-esteem, fear, anxiety, poor academic performance, lack of interest in school, lack of trust, and difficulties establishing and sustaining friendships. Many need counseling

to overcome the traumas of victimization. Failure to provide such counseling has led to tragic consequences. On April 20, 1999, two Colorado teenagers exploded with rage after years of victimization and, armed with automatic weapons, they burst into their high school in Littleton, Colorado, intent on killing 250 of their schoolmates. They killed 12 students and a teacher and wounded two dozen others before turning their guns on themselves and committing suicide. In March 2001, bullying provoked two students at Santana High School, in Santee, California, to shoot and kill two students and wound 13 others.

Bullies, too, however, suffer long-term consequences of their antisocial behavior. According to a study by Dr. Dan Olweus, a psychologist at the University of Norway, who followed thousands of boys from grade school to adulthood, 65% of boys identified as bullies in the second grade had felony convictions by the time they were 24 years old. Olweus found that bullies tend to become delinquents during their teenage years and develop "serious antisocial and criminal behavior in adulthood." Most remain bullies throughout their lives, enjoy their power and control over others. They often drop out of school, have difficulties holding jobs and fail to sustain close, intimate relationships. They achieve less academically, socially, economically and occupationally than their nonbullying peers. They have more arrests for felonies, convictions for serious crimes, are abusive toward their spouses and are more likely to have highly aggressive children of their own.

Despite the traumatic effects of bullying on both bully and victim, teachers and administrators seem at a loss to handle this widespread problem. Many victims are afraid to report bullying for fear of retaliation by the bullies and alienating their nonbullying peers by reporting a fellow student to school authorities. Teacher and administrator discipline of bullies seldom

solves the problem. Indeed, bullies usually respond to discipline such as isolation or suspension with rage reactions against their victims—regardless of whether their victims were responsible for having provoked the discipline. Nor does a nondisciplinary counseling approach seem to have much of an effect, because the typical bully lacks empathy and has little or no concern how much he or she hurts another youngster.

Like most student social problems, chronic bullying seems immune to solutions at the school level—largely because it is a deep-seated dysfunction with its roots in the home during early childhood. Bullies are usually the children of bullying parents who not only cannot control their own behavior, but are unwilling to control their children's behavior, despite exhortations from teachers and school authorities. Many bully-type fathers are quite proud that their bully sons are "tough." One solution that was tested effectively at 12 elementary schools is a comprehensive "bully-proofing" program in which the entire school faculty, staff and, most importantly, the student body are enlisted to support victims and shun bullies. "No Bullying Allowed" posters adorn the walls, and "no-bullying rules" are taught to every child and distributed to every parent. The approach has yet to be tested at the middle school and high school level, where teachers and administrators seem at a loss to deal with the problem.

Bureau of Indian Affairs (BIA) A controversial agency in the U.S. Department of Interior charged with helping AMERICAN INDIANS and Native Alaskans govern themselves and develop their resources. To that end, the bureau funds more than 200 educational facilities for about 50,000 Indian children who live in areas where public schools are not available. These include more than 100 BIA-run, on-reservation day and boarding schools; about five dozen tribally contracted schools; and more than a

dozen BIA-operated dormitories to permit Indian children to enroll at public schools too far from their homes for them to attend as day students. The BIA also provides college and graduate school scholarships to more than 25,000 Indian students.

Originally a part of the U.S. War Department, the BIA was founded in 1834 as part of the Indian Act, to regulate trade with the new Indian territories that had been formed west of the Mississippi. It assumed a more patriarchal role after it was transferred to the Department of the Interior in 1849. As whites emigrated westward after the Civil War, they came into increasing conflict with Indians over rights to farm, hunt, mine for gold and otherwise exploit natural resources. In 1871, Congress ended the fiction of Indian nationhood and ceased dealing with tribes as if they were foreign nations. Twenty years later, Congress mandated compulsory education for all Indian children, with the Bureau of Indian Affairs in charge. The results were less than noteworthy. Of more than 560,000 Indian children, only about 60% were enrolled in schools in 2002. They scored between 17% and 18% lower than white students in reading and mathematics proficiency and about 11% lower than white students on the verbal and mathematics college admissions tests. Passage of the Indian Self-Determination and Education Assistance Act of 1975 and the Indian Education Act of 1978 transferred some of the BIA's decision-making powers to Indian school boards and encouraged local hiring of teachers and staff. Since then, academic proficiency has improved dramatically, with scores in reading and mathematics proficiency tests now only 11% below those of white students and 6.5% below the national average. Scores on college admissions tests were only 9% below those of white students and only 5% below the national average.

Headquartered in Washington, the BIA operates about 100 offices across the United

States, the majority of them in the West. In addition to education, it is responsible for collecting and managing royalties from oil and gas on Indian lands, cattle and sheep grazing fees and other income not directly distributed to tribes or individuals under 19th-century laws that made the federal government "trustee" over all Indian lands and resources. Under pressure from Indians, who demanded more control over their own lives and resources, and equally fierce pressure from whites to cut government spending, the secretary of interior began an experimental project in 1988 that transferred almost all the bureau's power to the members of 30 tribes. The experiment has led to demands for passage of a new federal law to grant all tribes autonomy and, in effect, deactivate the BIA.

(See ROUGH ROCK DEMONSTRATION SCHOOL.)

Burr, Aaron, Sr. (1716–1757) American minister and educator who cofounded the COLLEGE OF NEW JERSEY, which later became Princeton University. Father of Aaron Burr, Jr., the third vice president of the United States, Burr was born in Connecticut and graduated from Yale College, then a conservative Congregationalist divinity school. Like many young ministers, he founded a secondary school as an integral part of his first parish in New Jersey, where he trained young aspirants to the ministry. A split between Presbyterian conservatives ("Old Light") and reformers ("New Light") in the 1730s and 1740s led to the establishment of the College of New Jersey by the New Light Synod of New York. Founded in 1746, it was first located in the home of Jonathan Dickinson of Elizabethtown, New Jersey. After Dickinson's death in 1747, Burr succeeded to the presidency and moved it to his parsonage in Newark. In 1748, he presided over its first commencement exercises in his Newark church. Burr addressed the six graduates in Latin. Five became Presbyterian ministers and the sixth,

Richard Stockton, a lawyer and signer of the Declaration of Independence.

Burr served for three years as president and pastor without salary. He drew up the first entrance requirements, the first course of study and the first set of rules and regulations. In 1756, he led the move to Nassau Hall in Princeton, where Jonathan Edwards and other trustee/ministers joined him in directing what was then the largest college in the colonies, with space for a classroom, dormitory, chapel, library and refectory.

business school Various, a degree-granting undergraduate or graduate school at a university, or a vocational or trade school offering instruction in basic clerical skills required in most businesses. The latter includes office work, bookkeeping-accounting, secretarial work and office management. Public high schools also offer business skills training as part of their vocational education programs. Public schools also offer students general business education courses, including consumer education and broad studies of the American economic system. At a higher level, more than 1,500 colleges offer bachelor's degree programs in business administration, while 900 offer master's degree programs and about 130 have doctoral programs. More than 100 business schools offered degree and nondegree programs in the booming new field of EXECUTIVE EDUCATION. Depending on the program, courses may range from basic accounting to international management. Among the basic topics covered in executive education by most business schools are marketing, finance, risk management, e-commerce and Internet business strategies, personnel management, and internal operations and administration. Most business schools require applicants to take the GRADUATE MANAGEMENT ADMISSIONS TEST (GMAT).

Annual tuition and mandatory fees for a two-year program leading to a master of busi-

ness administration (MBA) range from about \$5,000 (or less) to \$10,000 for state residents at state universities and from \$30,000 to \$40,000 a year at private universities and for out-of-state residents at public universities. With living expenses, medical insurance, books, materials, computers and transportation, total costs of attending business school range between \$25,000 and \$75,000 a year—and are increasing by about 10% annually. Distance learning programs cost about \$10,000 but allow students to remain at home and continue working full or part time. For full-time students, lost job income and ancillary costs during two years at graduate school can raise total costs to about \$100,000 a year at Harvard University's business school, according to estimates by *Business Week* magazine. Graduates, however, can count on starting salaries in the \$60,000-a-year range, or about 63% higher than they would have commanded without MBAs, along with all-but-certain 10% annual salary increases for five years thereafter. MBA graduates with previous business experience often command starting salaries of \$100,000 or more.

Although college-level business studies date back to 1881, with the founding of the Wharton School of Finance and Commerce at the University of Pennsylvania in Philadelphia, graduate business education did not become popular until after World War II. The number of graduate programs doubled from 1970 to 1990, when a record number of more than 300,000 business school applicants took the GMATs. The following year, however, business schools began experiencing a sharp—and surprising—decline in the number of applicants, with the total falling below 140,000 a year by 1995 and dipping below 75,000 by 2000. There were several reasons for the decline. One was the new requirement at many business schools that applicants have at least two years of business experience. Designed to reduce alarmingly high drop-out rates, the require-

ment barred the door to students who had only just completed their studies for bachelor's degrees and were not certain they would pursue careers in business. Another cause of the decline in enrollments, however, was the growth of Internet-related commerce and technology firms, which were snapping up the most talented young men and women before they entered graduate school—some before they even entered or finished college—at salaries (and often stock options) that made the starting pay of business school graduates seem paltry.

To compensate for the drop in enrollments of younger students, dozens of business schools expanded their offerings—and appeal—to include “executive education,” with one-to-two-year MBA and nondegree programs designed for midcareer executives and, in many cases, custom-designed for executives of specific companies that cover all costs. Some schools charge \$100,000 or more for such two-year customized programs. Typical programs require students to meet on alternating Fridays and Saturdays and for two weeks during the summer, but some programs are available over the Internet. Many business schools have also expanded their offerings to corporations to include one- and two-week intensive courses and seminars in specific subject areas (doing business in China, for example). Such courses are usually held on company premises at a fixed cost contracted with the company.

busing The free transportation of school children to and from their homes and their school and school activities. Included as part of the annual school budget, busing became a necessity when passage of state compulsory education laws required students in even the most remote rural areas to attend centrally located schools. Busing expanded during World War II as gasoline rationing made it impossible for most children in rural areas to get to school

by car. The school consolidation movement of the 1950s and the mass migration to the suburbs made busing the standard method of school transportation for the vast majority of students in the United States.

Busing became a center of controversy in the 1970s, following the U.S. Supreme Court's ruling in *SWANN V. CHARLOTTE-MECKLENBURG BOARD OF EDUCATION*. In its decision, the Court ordered the board to bus students out of their districts, if necessary, to carry out Court-ordered racial desegregation of public schools. Although integration-related busing affected less than 10% of the school population, it met considerable opposition from both black and white parents. Black parents protested busing young children as much as an hour or more each way to white suburban schools, partly because the distances to such schools made it difficult both for their children to participate in after-school activities and for poor parents to involve themselves in school affairs. Some white parents, meanwhile, protested their children being transferred from excellent suburban schools to mediocre or substandard inner-city schools. In reaction, many transferred their children to all-white private schools. The results were all-but-total de facto segregation of black students at inner-city schools and a net deterioration in academic quality in all-black neighborhoods, and, one by one, the school districts under court edict to bus children to out-of-district schools applied for—and obtained—relief from busing orders. By the beginning of the 1999 school year, Charlotte, Boston and other cities had abandoned their busing plans, and busing as a vehicle for desegregation all but came to a halt across the United States.

Butler, Nicholas Murray (1862–1947) Educator, Nobel Prize laureate and an architect of the modern American university. Born in New Jersey, he received his undergraduate and

Columbia University president and Nobel laureate Nicholas Murray Butler (Library of Congress)

graduate degrees at Columbia College and, after studying in Europe at universities in Berlin and Paris, he returned to teach philosophy at Columbia, where he remained for the next 60 years, more than 40 of them as president. Butler built Columbia into a university of 7,500 students and helped establish schools of journalism, business, social work, library science, dentistry and public health; he also added the School of General Studies for adult education and a summer session.

Appointed professor of philosophy and education in 1890, he plunged into the study of theories of learning, education, teaching and curricular organization. He made extensive reports on state and local teaching methods and founded the journal *Educational Review*. He organized and became the first president of Colum-

bia's New York College for the Training of Teachers, which, in 1898, became Teachers College of Columbia University. In 1902, Columbia University named him its 12th president.

Butler's ambitions for Columbia meshed perfectly with those of his two immediate predecessors. FREDERICK A. P. BARNARD had added the first graduate schools and expanded Columbia enrollment from 100 to 2,000 students. The wealthy former merchant Seth Low personally paid for the addition of Columbia's huge library and presided over the addition of the medical school and Butler's new Teachers College. Building especially on the foundation laid by Barnard and Low, Butler transformed Columbia into the international center for learning it remains today. By 2000, Columbia had more than 2,000 faculty and offered more than 100 baccalaureate, 160 master's and 80 doctoral programs to about 19,000 students from around the world.

Butler's influence reached far beyond the Columbia campus. He helped his home state of New Jersey organize its public library system and vocational schools and reorganized the state's teachers colleges. On the national scene, he helped organize the College Entrance Examination Board and the CARNEGIE FOUNDATION FOR THE ADVANCEMENT OF TEACHING. Butler was also deeply involved in American politics and campaigned actively for women's suffrage and against prohibition. An advisor to Presidents Theodore Roosevelt and William Howard Taft, he was a last-minute replacement as Taft's vice-presidential candidate in 1912 and an unsuccessful candidate for the 1920 Republican nomination for president. A consummate internationalist who devoted much of his off-campus life to the cause of world peace, Butler led five international conferences on international arbitration between 1907 and 1912 and helped organize the Carnegie Endowment for International Peace, serving as its president from 1925 to 1945. He was instrumental in the drafting of the Kellogg-Briand

Pact of 1928, which 62 nations eventually signed, agreeing to outlaw war as a means of settling international differences. (While in Rome to obtain the support of Pius XI for the pact, he helped the pope reorganize and modernize the Vatican Library.) In 1931, he shared the Nobel Peace Prize with American social reformer JANE ADDAMS.

Butler published more than 3,000 books, articles, essays, reports and speeches, including 17 volumes of correspondence with presidents of virtually every nation. He received honorary degrees from more than 40 colleges and universities around the world and served as president or trustee of more than two dozen cultural, educational and political organizations.

C

Cabell, Joseph Carrington (1778–1856)

Virginia legislator who sponsored the legislation for THOMAS JEFFERSON to create the UNIVERSITY OF VIRGINIA in 1818. Often called Jefferson's "right hand man" at the university, Cabell helped obtain the original legislative charter of the university and the financial appropriations for its first three decades of operation. A strong advocate of universal education, he was responsible for legislation that extended primary and secondary school education to girls as well as boys.

cadet teacher program A high school tutoring program in which gifted children provide slower students with special help. Although formal peer tutoring dates back to the late 18th century, a corollary object of modern cadet teacher programs is to improve teaching quality by allowing gifted students to experience the rewards of teaching and encouraging them to consider it as a possible career. The program was a response to the deteriorating academic performance of men and women entering teaching in the 1960s, when higher-paying professions lured the highest-ranked college graduates. Meanwhile, those who became public school teachers tended to have graduated from the lower halves of their college classes. Average SAT scores for high school seniors planning to become education majors are about 4% below the national average for all college-bound students on the verbal tests and

6.3% below the national average on the mathematics test.

Peer teaching was first developed by British educator Joseph Lancaster as a way of teaching large numbers of children while keeping teacher salary and other school costs at a minimum (see LANCASTERIAN SYSTEM). In 1798, he educated 1,000 boys at a Society of Friends (Quaker) free school by first tutoring the oldest most responsible boys and appointing the most qualified as monitors to supervise and instruct younger students. In 1818, he emigrated to the United States and founded Lancasterian schools in Philadelphia, Baltimore, Boston and Washington, D.C.

Today's peer tutoring programs have gained widespread acceptance in selective private secondary schools, but teacher-union opposition has hindered their growth in many public schools.

cafeteria, school An increasingly complex self-service restaurant where students and faculty purchase food and beverages at a central counter and carry their own trays to tables to eat. Often less supervised than classrooms, school cafeterias are sometimes the site of student conflicts and violence. In addition to behavior problems, cafeteria management is further complicated by the unpredictability of student (especially adolescent) eating habits. For whatever reasons, a student may skip lunch one day, bring lunch from home on another,

or eat out at a nearby foodstand or restaurant on another. Spoilage of purchased foods is a major problem for many schools and a reason few commercial caterers are willing to assume cafeteria management at the primary or secondary school levels.

Complicating cafeteria management still further has been the federal NATIONAL SCHOOL LUNCH PROGRAM, which makes free or inexpensive lunches available to needy school children. Based on studies showing that well-nourished children perform better in school, a National School Lunch Act was enacted in 1946 to ensure lunch for every American child in school. Although all public schools must provide students with lunch, they do not necessarily participate in the National School Lunch Program. Schools that do participate are required to provide lunches that meet specific federal government nutritional requirements, including a half-pint of milk, two ounces of lean meat, poultry, fish or alternative food, vegetables and fruit, bread, and one teaspoon of butter or margarine. Only 1% of school lunches meet dietary guidelines for total fat and hardly any meet guidelines for saturated fat. The federal government's dietary guidelines call for no more than 30% fat in school lunches, while total fat content is actually 38%. The dietary guidelines restrict saturated fat to 10%, while actual content is 15%. The difficulty in controlling such elements of the program is the limited number of suppliers in any given community. Schools have little choice but to use their limited budgets to purchase whatever is available. To purchase better quality food elsewhere would simply add transportation costs.

Some costs of the program are defrayed by state aid and fees charged to parents who can afford them, but the vast majority of the costs are financed by about \$9 billion a year in federal funds. In 1966, the School Lunch Program was expanded with passage of the Child Nutrition Act, or "school breakfast program," to pro-

vide breakfasts for economically deprived children who might not otherwise obtain enough food at home before they left for school. The 1966 amendment has forced thousands of schools to open cafeterias early in the day and maintain additional staffing.

Because of increased costs associated with the program, schools often purchase government surplus foods, which usually consist of high-fat, high-calorie cheeses and comparable dairy products that contribute to the growing problem of obesity among American children. Complicated by an equally contentious problem of television-related inactivity, obesity among school-aged children reached epidemic proportions in the later 1990s and early 2000s, with estimates of the percentage of overweight children varying from 35% to 50%, depending on definition. Responding to growing national concerns, former president Bill Clinton led a campaign to obtain agreements with producers, bottlers and distributors of soft drinks to curb or halt distribution of high-calorie soft drinks and beverages. By 2006, the soft drink industry had agreed voluntarily to try to limit distributions in public elementary and middle schools to bottled water, fruit juices, and low-fat milk and to limit the products distributed in high schools to low-calorie "diet" sodas, teas and soft drinks. The agreement, however, does not prevent individual school boards or schools from stocking their cafeterias and beverage machines with whatever beverages they choose.

calculator An electronic device which, depending on its complexity, automatically performs a variety of mathematical operations. Calculators remain a center of some controversy among elementary school teachers and authorities on early education. Although there is universal agreement that the ability to use a calculator is an essential skill, some educators fear that premature use can make some chil-

dren so dependent on the calculator that they never learn enough mathematical skills to function without one or to check its accuracy. Some educators believe calculators should not be introduced in school until the third or fourth grade, after children have mastered all basic mathematical operations, including fractions and decimals. They can then use the calculator to perform tedious, repetitive operations and concentrate on applying mathematical functions for solving complex problems.

Caldecott Medal An annual award presented by the AMERICAN LIBRARY ASSOCIATION to the finest illustrated book for children, as selected by a committee of librarians. Introduced in 1938, the medal was named for British picture book artist Randolph Caldecott (1846–86), who illustrated Washington Irving's *Old Christmas* (1876) and *Bracebridge Hall* (1877) and a variety of other children's books, including *The House That Jack Built* (1878) and *Aesop's Fables* (1883).

Calderone, Mary Steichen (1904–1998) Quaker physician, pioneer crusader in sex education and birth control and cofounder of SIECUS, the Sex Information and Education Council of the United States. Born in New York, Calderone was the daughter of photographer Edward Steichen and the niece of poet Carl Sandburg. She was educated at Vassar College, the University of Rochester Medical School and the Columbia University of Public Health. In 1941, she married Dr. Frank Calderone, deputy commissioner of health of New York City and later chief administrative officer of the World Health Organization.

Calderone was a physician to the public schools of Great Neck, N.Y., until 1953, when she became medical director of Planned Parenthood Federation of America, a post she held until 1964. In January 1965, she helped found SIECUS, became its executive director and

began years of campaigning to introduce sex education as a standard element of the curriculum in every grade from kindergarten through high school. Calderone defined sex education as including appropriate discussions of sexual and mating behavior, psychological factors, the institution of marriage, birth control, abortion and the pleasurable and relational aspects of sex. An ubiquitous presence on the high school and college lecture circuits for many years, Calderone denounced the cultural denial in the United States of the "gift of sex . . . [as] an attribute of life. Our youth throws this gift away recklessly, when we have at hand ways and means of making life more meaningful in the realm of sex and its part in our lives." Her efforts to bring sex education into the classroom spurred hate campaigns against her and her organization.

California The most populous state in the United States, with 13% of the nation's school children. First explored by Europeans in 1542, it was occupied by U.S. forces during the Mexican War in 1846, and Mexico ceded the province to the U.S. in 1848, the same year gold was discovered at Sutter's Mill.

California became the 31st state in 1850, a year after the gold rush of 1848–49 had begun and the territorial government had adopted the state's first constitution. Although that document provided for establishment of a public school system, free public schools were not established in California until 1866, when the legislature passed the Revised School Law. Despite the fact that California had more than a century of educational tradition in the Spanish missions that dotted the state, the largely non-Catholic American settlers of the 19th century shunned most of them. The Revised School Law of 1866 only provided funds for the most basic elementary school education, and in districts with fewer than 100 students schools only remained open three months a

year. In 1903, the state voted to fund public high schools and, in 1917, it extended its funding to junior colleges.

California has nearly 6.9 million students, of whom 65% are minority students, 44.5% Hispanic. About 15.5% of school-aged children live in poverty. The state's more than 8,900 public elementary and secondary schools have long ranked among the five worst school systems in the nation in academic quality, despite the highest average teacher salaries in the United States. The schools have the second-highest average student-teacher ratio in the nation, 20.5 students per teacher, and the eighth highest drop-out rate, 17.5%. Student academic proficiency languished at or near the bottom 10% for decades, driven lower with each passing year by mandatory bilingual education for immigrant children, whose educational progress all but grinds to a halt with the need to repeat everything in both English and their native tongues. Enraged California voters, led by impoverished Hispanic mothers who recognized the economic necessity of their children's attaining English fluency, banned bilingual education from public schools in a 1999 referendum. The results have yet to produce any substantial results in student academic performance. Only 21% of students at all grade levels are proficient in reading, and only 22% to 28% are proficient in mathematics.

Public dissatisfaction with schools first became evident in 1993, when taxpayers demanded a referendum on whether parents should have the right to choose their children's schools and to receive VOUCHERS annually from their local school districts redeemable toward tuition at private schools. Although Californians defeated the proposal, it encouraged the formation of an active reform movement among the state's educators.

California's system of public higher education also dates back to the 1849 territorial constitutional convention, which expressed "hope"

that a university might be established in the state. In 1851, Methodist ministers established the state's first college in Santa Clara. The College of the Pacific (now the University of the Pacific, in Stockton) gave the West Coast its first medical school in 1858. The roots of public higher education go back to 1853, when the Contra Costa Academy opened in Oakland. Two years later, the state legislature issued a charter to the College of California, which absorbed the academy. In 1868, the state legislature chartered the UNIVERSITY OF CALIFORNIA, a nonsectarian institution created under provisions of the federal Land Grant (Morrill) Act. It opened the following year with 40 students and 10 faculty and, five years later, moved to its present site in Berkeley. Although Berkeley remains its flagship campus, the University of California now has nine campuses across the state, with more than 7,000 faculty serving more than 160,000 students. Moreover, they are but a small part of the state's higher education system, which, with nearly 2.4 million students, is the world's largest. Developed as a result of master plans prepared in 1948 and 1955, the California system of state-sponsored higher education was the first in the United States designed to provide universal higher education, and it prompted similar attempts in other states.

The system has three tiers: The nine University of California campuses, with more than 160,000 students, are at the top tier; 22 CALIFORNIA STATE UNIVERSITY campuses, with 350,000 students, are in the second tier; and more than 100 California Community College campuses, with nearly 2.5 million students, are in the third tier. Each tier originally had distinctly different missions, but there has been some overlapping in certain areas. In principle, the lowest tier of two-year colleges accepts all graduates of accredited California high schools, and the focus of their curricula is on technical and preprofessional subjects leading to associ-

ate in arts degrees. The four-year California State colleges accept members of the top one-third of graduating high school students and offer liberal arts and professional programs (accounting, etc.) leading to bachelor's and master's degrees. In theory, the nine University of California campuses accept students from the top 12.5% of graduating high school seniors and offer traditional liberal arts programs and preprofessional, graduate and professional curricula leading to bachelor's, master's and doctoral degrees.

Until 1996, between 40% and 60% of all students admitted into the University of California gained admittance solely on academic merit, with the remaining freshmen admitted on the basis of a variety of factors, such as athletic abilities, extracurricular activities, socioeconomic status, gender and, because of affirmative-action programs, race. In 1996, however, the people of California voted overwhelmingly to force the state to abandon affirmative action in hiring and in education, and the University began admitting 50% to 75% of all freshmen on academic merit alone. In 2000, the University began experimenting with an admissions policy that offered a compromise between affirmative-action and merit-based admissions by granting automatic admission to students finishing in the top 4% of their high school classes, regardless of the academic quality of their schools or their scores on standardized college admissions.

The year 2000 also saw a sharp turnaround in California's higher education fiscal policy. During the early 1990s, soaring government deficits forced sharp budget cutbacks at both the University of California and California State University systems. The University of California's budget shrank to about \$1.75 billion from more than \$2 billion a year, while California State University's budget shrank from \$1.75 billion to less than \$1.5 billion. Cal State cut its full-time faculty from more than 12,000

to about 10,000 and the number of classes from 50,000 to about 35,000, thus eliminating many courses and majors and cutting the number of sections in each course. The scheduling of required courses at the same time forced many students to extend the time needed to obtain a degree from four to five or six years. Other students were forced to enroll in out-of-state colleges to find the courses and majors they wanted. By the end of the century, California's voters reversed course, and from 2000 to 2006 their legislators were voting 5% to 10% increases in annual budgets for the state's three public college systems, raising budgets to \$2.8 billion for the University of California, \$2.6 billion for California State University, and \$5.5 billion for the state's community colleges. In addition to its 34 public four-year institutions of higher education, California has 194 private four-year colleges and universities, of which 48 are for-profit. The state has six private two-year colleges (47 of them for-profit) to supplement the state's 110 public two-year colleges. Total enrollment at four-year colleges is more than 2.2 million—more than 55% of them women and more than 51% minorities. The graduation rate is above the national average at 58.8%—55% for men and 62% for women.

California Achievement Test (CAT) One of the most widely used basic educational skills tests for measuring reading, mathematics and language skills of children from the middle of first grade through high school. Separate tests are available for five different ranges of grade-levels: 1.5–2, 2–4, 4–6, 6–9, and 9–12. The total score in each of three areas is broken down into subsections: vocabulary and comprehension, for reading; computation, concepts and problem solving, for mathematics; and mechanics, usage and structure, and spelling, in the language section. For first and second graders, the language test includes a special component—auding, or the ability to hear,

recognize and interpret spoken language. It is published by California Test Bureau/McGraw-Hill, Rosemont, Illinois.

California Educational Reform Act of 1983

An attempt to improve public school education by offering budgetary cash incentives to schools whose student achievement scores improved. The law also created the first official career ladder plan for teachers, as well as the first MENTOR teacher program in the United States. Subsequently adopted in varying forms by many other states, the California career ladder plan was designed to provide specific career goals and appropriate rewards in the form of higher salaries and greater authority for successful teachers. Most ladders begin with probationary periods apprenticeships at the lowest rungs and culminate with such designations as "MASTER TEACHER" at the highest.

The California Educational Reform Act provided an elevated rung for mentor teachers, selected by their peers because of their knowledge and teaching skills, to work with other, less experienced teachers. A highly paid position, mentor teaching requires spending at least 60% of one's time instructing other teachers in a specific school or throughout the district. The Reform Act failed, however, to produce any substantial improvement in student academic performance—possibly because of the surge in the number of impoverished immigrant children with little prior education.

California Preschool Social Competency Scale A standard PERFORMANCE TEST to measure the intellectual abilities and school readiness of preschool and kindergarten of children too young to read.

California State University A system of 18 four-year colleges and four two-year colleges established in 1961 as the middle tier of the three-tier California public higher education

system designed to provide universal higher education. The largest public college system in the world, "Cal State" has about 350,000 full-time and part-time students of all ages and more than 19,500 full-time and part-time faculty. It offers 965 baccalaureate and 600 master's degree programs, along with a handful of doctoral programs that were not part of the system's original mandate. When created, the system was to have served students from the middle one-third of the graduating high school population seeking bachelor's and master's degrees in liberal arts and professional studies. Depending on the campus, Cal State now accepts between 50% and 85% of all applicants, including many from out of state, and it has extensive adult education programs.

California Test of Mental Maturity (CTMM)

A wide-ranging group of intelligence tests that measure academic skills essential for school, such as learning, problem-solving and responding to new situations. Designed as a contrast to I.Q. tests that measure genetically predetermined intelligence, CTMM measures five academic skills: logical reasoning, spatial relationships, numerical reasoning, verbal concepts and memory. CTMM tests yield a score for each skill, an overall score for nonlanguage skills, a second overall score for language skills and a total score for the entire test. Separate tests are given for each of six school-grade ranges, from kindergarten through senior year of college. A short version of the test—the California Short-Form Test of Mental Maturity—is also available.

Calvinism An early Protestant religion out of which arose Puritanism, Congregationalism, Presbyterianism and the Dutch, French and German Reformed churches. The basis of almost all education in the early American colonies, Calvinism was one of four major religious groups that emerged from the Protestant Reformation of the 16th century, along with

Lutheranism, Anabaptism and Anglicanism. Calvinism was the doctrine of the French priest Jean Chauvin (1509–64), whose name was anglicized to John Calvin. Like Martin Luther, Calvin rejected papal supremacy and infallibility, but, unlike Luther, he believed the state should remain subject to the church. He believed strongly in the doctrines of original sin and predestination—that is, that man is born evil and predestined by God for either salvation or eternal damnation. He believed that thrift, industry and hard work were essential moral virtues and that monetary success was a sign of God’s blessing.

Calvinism became an integral part of education after Calvin fled France to Geneva, Switzerland, where he helped reform both the secular and religious life of the city. He helped write the city’s new constitution, which not only made the church supreme, but established a municipal school system for all children, with the Geneva Academy as its central institution, for the very brightest students who would later become ministers.

Calvin’s followers carried his principles and precepts with them to the American colonies during the century that followed. Wherever they settled, Puritans and other Calvinist sects were quick to establish “common” schools, along with academies for the very brightest students, who almost invariably became ministers. Calvinism formed the core of the curriculum in almost all such schools—even after the United States had declared its independence from England and her church at the end of the 18th century. Indeed, it was not until 1833 that the last state—Massachusetts—threw off the last vestiges of Calvinist influence in American education by disestablishing the church as its official religion.

Cambridge Plan An 1893 elementary school TRACKING system adopted in Cambridge, Massachusetts, to permit the brightest students

to complete elementary school education two years sooner than the rest of their class.

Cambridge Platform An agreement signed in 1648 by the synods of four New England colonies (Massachusetts, Plymouth, Rhode Island and Connecticut) to try to unify the various Protestant reform movements into a single Puritan/Anglican church. At the time, the Protestant church was responsible for all education, in keeping with St. Paul’s words to the Corinthians: “And God had appointed in the church first apostles, second prophets, third teachers. . . .” Although the Cambridge Platform had little lasting effect in unifying the various Protestant splinter groups in the colonies, it did have long-lasting consequences for colonial education by unifying the offices of pastor and teacher and ensuring church control over education during the remainder of the colonial era.

Camer v. Eikenberry A 1983 case in which a public school pupil claimed school authorities had denied him due process and equal protection under the Fourteenth Amendment of the Constitution by excluding him from an honors program, denying him adequate instruction and otherwise hindering his progress in school. A trial court dismissed the suit, saying it lacked jurisdiction over the subject matter taught in public school. A federal appeals court upheld the dismissal and the Supreme Court refused to review the decision. The importance of the case lay only in the right of public schools to establish minimum academic standards for entry into special programs such as honors programs. In so doing, schools essentially removed certain programs from the “public” sector, in that they were reserved for a specific, academic elite and thus no longer open to all. The *Camer* case challenged that right and lost.

Camp Fire Girls One of several CHILDREN’S ORGANIZATIONS started in the early 20th century

by members of the progressive education movement to supplement embryonic efforts by public school systems to work with adolescents. Now known simply as Campfire, the organization was founded in 1910 by Dr. LUTHER GULICK and his wife as a recreational, educational and service organization for girls. Plagued by ill-health throughout his life, Gulick became a strong advocate of physical education as a source of good health and pioneered its introduction into the school curriculum as director of physical education for New York City public schools.

In 1910, fewer than 10% of American adolescents attended high school. Most worked in factories and mines or in the fields, and progressive educators such as Gulick were concerned that adolescents were growing up with few moral values. They responded by forming a variety of clubs that would channel youthful energies into worthwhile activities. Now coeducational, Camp Fire operates three major programs for more than 750,000 members. Its Club Programs are small groups similar to BOY SCOUT and GIRL SCOUT troops, under the supervision of adult volunteers. Outdoor Programs offer day camping, overnight group camping and field trips. Response Programs offer a variety of social services, including day-care centers, delinquency prevention work and tutorial-reading programs.

campus jobs Part-time work opportunities offered by colleges and universities as part of their overall financial aid packages to students unable to afford the full costs of tuition, room, board and other expenses of higher education. Of more than 17 million college undergraduates attending college, about 5% have part-time jobs on campus, paying an average of about \$1,400 per school year. About 80% of on-campus jobs are part of the federally funded COLLEGE WORK-STUDY PROGRAM (CWSP) created by the Economic Opportunity Act of 1964 to fight poverty. Under CWSP, the federal government

pays 80% of student wages and the college pays 20%. CWSP also permits students to work for nonprofit organizations off campus, with the federal government still paying 80% of the student's wages and the nonprofit organization paying the rest.

Although campus jobs once entailed active, daily indoor or outdoor labor—waiting tables, buildings and grounds maintenance, etc.—most campus jobs are now limited to “passive” activities that permit students to read or do homework while peripherally attending to their work duties. Usually involving only two to three hours, three or four days a week, campus jobs now include serving as receptionists or answering switchboards. About 12% of the nearly 2 million university graduate students earn on-campus wages either as research or TEACHING ASSISTANTS.

campus visits Organized tours of and overnight stays at college and university campuses by prospective applicants. Almost all college and universities offer guided tours to the public. Usually led by student guides, such tours offer prospective applicants an opportunity to learn about each college without making personal commitments or going through the time and expense of filing formal applications. Tours also give applicants an opportunity to ask informal questions about social concerns such as crime and drugs on campus, campus security, food quality, student morale, percentage of courses taught by full-time faculty as opposed to graduate-student teaching assistants, etc.

Another form of campus visit is the overnight stay, which is most appropriate for applicants who have been accepted by several colleges and are undecided about which they prefer. Usually arranged by admissions offices, overnight stays allow applicants to stay in a freshman dorm with volunteer student hosts and, for 24 hours, sample all aspects of campus

life, including classes, meals and extracurricular activities.

Cantabs A nickname for students and graduates of HARVARD COLLEGE, the first college founded in the American colonies. Derived from Cantabrigia, the Latin name of Cambridge, England, Cantabs is short for Cantabrigians, or the resident of Cambridge and students at Cambridge University. First used in 1540, the name was accorded to students at Harvard after its founding in Cambridge, Massachusetts, in 1636, when Latin was still the language of instruction.

capacity reading level The highest percentage of material that a student understands from material that is read aloud. To remain at the appropriate grade level in most basal reading programs (see BASAL READERS), a student should have a capacity reading level of at least 75%, or an understanding of three-quarters of basal reading materials read aloud.

(See also READING LEVELS.)

capitation grant In the case of educational institutions, sums of money given by a government agency or private foundation according to the number of individual students enrolled in the particular recipient institution or district. Thus, a capitation grant of \$100,000 awarded to a school district with three schools and a total enrollment of 1,000 students would not be divided equally among the three schools but on the basis of the number of students in each school. If the schools had respective enrollments of 200, 300 and 500 students, for example, the \$100,000 grant would be divided on a per capita basis of \$100 per student, or \$20,000, \$30,000 and \$50,000, respectively, for the three schools. Many states now have career-incentive programs that offer college students attractive grants to pursue specific careers in areas faced with acute labor

shortages. The grants usually require recipients to remain in the state for a minimum number of years after graduation, while pursuing the career for which they trained at college. Long used by poor and rural states to recruit teachers, nurses and doctors, career-incentive programs have spread across the nation to entice residents to pursue careers in science and technology. The goal of each state is to lure new industrial investments by building a technologically skilled workforce. Pennsylvania offers SciTech Scholarships worth \$3,000 a year to students enrolled full time in one of 64 baccalaureate programs in science and technology. Recipients must begin working in the state in an appropriate field within one year of completing their studies and must work one year for every year of scholarship support. Otherwise, each grant is considered a loan, to be repaid at a hefty 10% interest. Illinois, Maryland, Missouri and West Virginia have similar career-incentive programs in science and technology. Texas offers grants worth \$5,000 a year to prospective teachers who remain in the state and teach in Texas public schools for five years. Kansas has career incentive scholarships for prospective nurses, while Mississippi has programs for both teachers and health care professionals.

card catalog Once traditional library files containing alphabetical listings on uniformly sized cards of every book in a library, by title, author, subject or other pertinent reference. Each card also contains the class or call number, indicating the section and shelf where the book can be found. Often, a card will also include a short description of the book. Cards are usually 3" × 5" index cards, stored vertically on their broad edges and fastened by horizontal rods running along the length of the bottom of each drawer. Drawers are normally stacked in vertical rows by alphabetical contents. Librarians, however, have now made

card catalogs virtually obsolete by transferring card data to computer databases.

(See also LIBRARY.)

Cardinal Principles of Secondary Education A statement of broad policy goals for American public high schools, issued in 1918 by the Commission on the Reorganization of Secondary Education. As waves of poor immigrants from Europe thronged to the United States in the 1890s, American urban public high schools were unable to cope with ever increasing numbers of unruly, illiterate, unskilled adolescents. In addition to teaching the rudiments of English, high school English teachers were forced to teach youngsters basic hygiene, nutrition, the obligations of citizenship and moral and ethical behavior.

Until then, the official goals of American secondary schools had been to teach students, regardless of national origins, a core of basic academic subjects, including English, mathematics, science, history and foreign languages. In the 19th century, when fewer than 10% of all children attended high school in the United States, that task was relatively simple. As late as 1910, about 90% of American children older than 12 worked in mines and factories and on farms.

Overwhelmed by the sudden influx of adolescents, high school teachers asked for new teaching guidelines from their national organization, the NATIONAL EDUCATION ASSOCIATION. In 1913, the NEA appointed a blue-ribbon panel to recommend reforms and, five years later, it issued a policy statement that listed seven new teaching goals for American high schools: health, command of fundamental processes, worthy home membership, citizenship, ethical character, vocation and worthy use of leisure. The report signaled the end of the academic core curriculum as the sole basis for universal public school education in the United States. The commission's report led to the introduc-

tion of vocational training in U.S. public schools as a viable educational alternative for adolescents. It also led to the introduction of guidance departments to help adolescents make intelligent choices between academic and vocational education.

The commission report also ended the traditional eight-year elementary school. Elementary education was thereafter cut to six years and JUNIOR HIGH SCHOOLS were built for seventh, eighth and, in some communities, ninth graders. The junior high school not only eased severe overcrowding of elementary schools, it also allowed teachers to deal more effectively with the special problems of early adolescents.

career colleges/schools Any of a wide variety of FOR-PROFIT COLLEGES OF PROPRIETARY SCHOOLS, offering courses and practical training in career skills for the workplace—office management, cooking or drafting, to cite only a few examples. Sometimes called “commercial school” but better known as ENTREPRENEURIAL, or proprietary schools, career schools tend to offer a narrow set of courses to train students for a specific career (office management, security services, paralegal work and so on) or single-skill jobs such as keyboarding, bartending and so forth. Depending on the institution, career schools may offer high school equivalency diplomas under the GENERAL EDUCATIONAL DEVELOPMENT program or certificates in a trade and even two-year associate degrees to students who successfully complete their course work. Students tend to be a mix of working adults, with or without high school diplomas or other academic credentials, who are seeking a new career direction. Teachers tend to have practical experience rather than academic credentials. Career schools often turn to the disadvantaged for clients, luring high school dropouts with promises of steady earnings after only a year's training—at costs fixed according to federal and state tuition loans and grants. When permissible federal and

state loans and grants totaled \$9,000 in 2006, career schools universally adjusted their tuition and fees to \$9,000. Government funds are paid directly to the schools once a student enrolls and are retained by the schools whether or not the student completes the course. Students, however, remain responsible for repaying all loans, and the federal government has accused many schools of using false advertising and high-pressure sales techniques to lure unqualified applicants to enroll, knowing they have little promise of completing the work. In addition, many schools routinely accept students who have not graduated from high school, although they make such applicants sign statements that they had graduated from high schools in other countries and were unable to obtain their records.

The alarmingly high drop-out rates that resulted—often 90% or more at some schools—forced the U.S. DEPARTMENT OF EDUCATION to curtail the flow of federal aid to schools that fail to administer entrance examinations and reject applicants who cannot demonstrate an “ability to benefit” from higher education and thus qualify for financial aid. Although drop-out rates have declined to about 80%, career schools have continued to be the targets of state and federal government investigations into such practices as falsifying federal student loan applications, recruiting students with no academic qualifications and routinely providing applicants with test answers to ensure their academic standing and continued eligibility for federal student loans and subsidies.

(See also COMMERCIAL SCHOOLS.)

career counseling and placement A complex educative program to teach students about the “WORLD OF WORK” and help match them with appropriate career opportunities. At the secondary school level, career counseling begins with a multistep instructional program over four years. Included are a close examina-

tion of career descriptions in such guides as the U.S. Labor Department’s 500-page *Occupational Outlook Handbook*. Many schools also offer a one-semester, prevocational course often called “The World of Work.” Field trips to various factories, businesses and professional institutions and enrollment in elective vocational courses complete the instructional elements of career counseling. Students often take a battery of tests to help determine their occupational aptitudes and interests. Individual counseling then helps direct students to the proper advanced training and education for the careers they seek. Effective high school career counseling offices also maintain close ties to local industry and help graduating seniors who do not intend to go to college to get job interviews.

At the college and university level, most major institutions have extensive placement bureaus that offer formal instruction in writing resumes and cover letters, applying for jobs, taking job interviews and placing advertisements. The most effective college placement offices also have extensive dossiers on thousands of American companies—especially those with a particular affinity for graduates of that particular college. Placement offices also arrange for corporate recruiters to come to the campus and interview college seniors, and they help seniors obtain off-campus interviews with prospective employers.

career education A vaguely defined term encompassing any and all education that prepares an individual for a career. In broadest terms, it includes everything about the world of employment that a person studies, from kindergarten through high school, college and graduate or professional school. More specifically, educators use the term *career education* to refer to four broad areas of the primary, secondary and higher education curricula: career awareness, career exploration, career understanding and career preparation and specialization.

Although career education varies from state to state, career awareness is injected into the primary school curriculum by taking children from kindergarten through sixth grade on field trips to various businesses and institutions and by inviting representatives from various professions to visit classrooms and describe their work. Career exploration for seventh, eighth, ninth and tenth graders continues field trip experiences, at least two formal, one-semester courses often called "The WORLD OF WORK." The first of the two courses explores a dozen or more "job clusters," such as agriculture, manufacturing or health care, and explains the functions of and required training for individual jobs within each cluster. The second "World of Work" course teaches older students how to look for jobs, write resumes, fill out job applications, have job interviews and handle other details of looking for, finding and keeping a job. It also teaches basic job skills such as promptness, proper behavior and on-the-job relationships with coworkers, employers and clients.

Career understanding is also fostered by the social studies and history curriculum, which should provide students with a knowledge of the working of the U.S. economic system and job marketplace. Career preparation and specialization begins with high school vocational education or college, professional or graduate schools.

career ladders for teachers A vertical scale of teacher job classifications offering increased pay, authority and professional recognition as the teacher progresses from trainee or apprenticeship level to master teacher. Depending on the state, career ladders may have as few as three or as many as 15 classifications, with teachers progressing up the ladder on the basis of formal examinations, peer reviews and observation by school administrators. Designed to attract and keep more gifted teachers in the

profession, career ladders have been adopted by about half of the states.

Carnegie, Andrew (1835–1919) Self-made steel magnate and the first of the great philanthropists in American public education. Raised in poverty, Carnegie's family emigrated from his native Scotland to the United States in 1848 and settled in Allegheny (now Pittsburgh), Pennsylvania. He took a job as a bobbin boy in a cotton mill at \$1.20 a week, and compensated for his lack of formal schooling by spending his spare time in a local public library. There, he taught himself to sight-read telegraphic messages and parlayed his knowledge into a job with the Pennsylvania Railroad, where after 12 years, he became superintendent of the Pittsburgh division. His work with the railroad and subsequent service in the Civil War convinced him of the future importance of steel. In 1865, he formed the Keystone Bridge Company to build steel railroad trestles. Gradually absorbing other, smaller steel companies, he built Keystone into the giant Homestead Steel Works which, in 1889, he consolidated with other holdings into the Carnegie Steel Company, with control of 25% of American iron and steel production.

In that year, however, he also published his startling article entitled "Wealth," in the *North American Review*. Better known as "The Gospel of Wealth," Carnegie shocked his "robber baron" peers by charging that the rich had a duty to distribute their surplus wealth to better the lot of mankind and civilization. Carnegie referred to his own salary of \$50,000 a year: "Beyond this," he said, "never earn, make no effort to increase fortune, but spend the surplus each year for benevolent purposes." His own first public gift was made in 1873, when he provided funds for baths in the town of his birth, Dunfermline, Scotland. During the 1890s, Carnegie distributed more than \$39 million to more than 1,400 communities to

build 2,500 library buildings, first in communities where Carnegie had company holdings and later to communities throughout the United States. Having benefited from such a library himself when he was a boy, he stipulated that his gifts be used only to establish community libraries that would be "the property of all" and open to all and that they be maintained by community taxes. "I do not think that the community which is not willing to maintain a library had better possess it. It is only the feeling that the Library belongs to every citizen, richest and poorest alike, that gives it a soul, as it were. The Library Buildings which I am giving are the property of all the members of the community which maintains them."

At the time, there were about 4,000 libraries in the United States, but only about 1,000 were truly "public"—that is, open to all and maintained by the communities. A few private libraries, endowed by benefactors who saw the role of their institutions as "people's colleges," were also open to the public. The rest, however, were usually repositories, designed to preserve the world's knowledge. Open only on weekdays during hours convenient for scholars, most were virtually inaccessible to workers and other people with jobs.

Carnegie's gifts not only allowed communities to erect buildings for existing collections, they permitted communities in many rural areas without books to buy collections for the first time. In 1900, he carried his work a step further by endowing the Carnegie Institute of Technology, which became one of the premier engineering schools in the United States. In 1967, it merged with Mellon Institute to become Carnegie-Mellon University.

In 1901, Carnegie sold his steel holdings to the United States Steel Company for \$250 million and retired from business to devote the rest of his life to philanthropy. In 1902, he founded the Carnegie Institution in Washing-

ton, which helped endow other colleges. In 1904, he financed the construction of the Palace of Peace in The Hague, the Netherlands, which now houses the United Nations International Court of Justice. In 1910, he established the Carnegie Endowment for International Peace to abolish war. In 1911, he set aside \$125 million to form the CARNEGIE CORPORATION OF NEW YORK to manage all his future philanthropic gifts. Among these were endowments to libraries throughout the English-speaking world, including 300 in Britain and gifts to many colleges, including such black colleges and universities as TUSKEGEE INSTITUTE.

Carnegie Commission on Educational Television A group of leading Americans whose study of the television industry in 1967 led to the creation of the first public television network in the United States. Made up of leaders from higher education, business, labor, politics and the arts, the commission was appointed by the CARNEGIE CORPORATION OF NEW YORK in 1965 to study the potential of noncommercial television as an educative institution. Funded by a \$500,000 grant, the study led to congressional passage of the Public Broadcasting Act of 1967 and creation of the CORPORATION FOR PUBLIC BROADCASTING, the first federally chartered, publicly owned (but non-governmental) national educational radio and television broadcasting network in the United States.

At the time, growing public dissatisfaction with the quality of commercial programming had led to demands for action from Washington to create a competitive public network comparable to the British Broadcasting Corporation and Canadian Broadcasting Corporation. Although there were about 100 local, independent nonprofit educational television stations in some 35 states, they were not interconnected in a network, and because they were funded locally, most were struggling to survive

the competition from well-financed commercial networks.

The commission urged Congress to establish the Corporation for Public Broadcasting to develop a network of noncommercial stations and underwrite production of appropriate programs by public and private producers. Passed in 1967, the law was hailed as the most significant federal legislation in the history of American education since the Land Grant (Morrill) Act of 1862.

Among the commission members were James R. Kilian, chairman of the Massachusetts Institute of Technology Corporation (or board of trustees); James B. Conant, former president of Harvard; Lee A. DuBridge, president of the California Institute of Technology; newspaper publisher Oveta Culp Hobby, former secretary of the Department of Health, Education and Welfare; Polaroid Corporation chairman Edwin H. Land; Governor Terry Sanford of North Carolina; United Automobile Workers vice president Leonard Woodcock; and concert pianist Rudolf Serkin.

Carnegie Commission on Higher Education A 19-member group formed in 1967 by the CARNEGIE FOUNDATION FOR THE ADVANCEMENT OF TEACHING to study and propose reforms for higher education, which seemed in turmoil in the wake of student rioting that had disrupted campuses across the United States. Made up of leaders in the field of higher education and funded by the CARNEGIE CORPORATION OF NEW YORK, the commission prepared 22 reports over six years. The reports discussed a wide range of problems, including federal aid to higher education, college access, education costs, tuition, medical schools, black colleges and electronic technology.

The commission issued its first report in 1968, urging adoption of a federal Civilian Bill of Educational Rights guaranteeing higher education to all qualified students regardless of

their ability to pay. In 1970, the commission reported, "the most serious shortages of professional personnel in any major occupational group . . . are in the health services." It urged construction of more medical schools and a shortening of the required training time for doctors from eight to six years and from four to three years for dentists.

In 1971, the commission called for tripling federal aid to the 105 black colleges and universities because formerly all-white colleges and universities were absorbing the most gifted black students and leaving black colleges with the neediest and most educationally ill-prepared students, who often required costly remedial training.

Other commission reports warned American colleges and universities to trim spending because they were "reaching a ceiling in the amount of money [they] can expect from society."

Carnegie Commission on the Future of Public Broadcasting An ineffectual group put together in 1977 by the CARNEGIE CORPORATION OF NEW YORK to propose means of making public broadcasting financially and politically independent. Although the CORPORATION FOR PUBLIC BROADCASTING (CPB) had scored notable successes as an educative institution during its first decade, production costs had soared to levels that required constant, on-the-air fund-raising appeals, the frequency and tone of which were indistinguishable from advertisements on commercial stations. Moreover, public television had become susceptible to political influence because its board members were appointed by the president of the United States.

The Carnegie Corporation of New York, whose Commission on EDUCATIONAL TELEVISION had helped create the CPB, formed a new commission in 1977. Headed by Columbia University president William J. McGill, the commission issued a report called *A Public Trust*, suggesting

that CPB be replaced by a Public Television Trust that would, in effect, make public broadcasting operations independent of financial and political influence. Neither Congress nor the White House paid any attention to the report.

Carnegie Corporation of New York Largest of industrialist ANDREW CARNEGIE'S philanthropic foundations. Established in 1911 with a capital gift of \$125 million, the corporation centralized and managed Carnegie's far-reaching philanthropic work. Dedicated to "the advancement and diffusion of knowledge and understanding," its earliest gifts helped establish public libraries throughout the English-speaking world. He arranged to build some 300 public libraries in Scotland (including one in Dunfermline, his birthplace), Britain and the other Commonwealth countries. The foundation also underwrote education of African Americans in the South.

After World War I, when the public library movement in the United States made private funding less essential, the corporation turned its attention to colleges, universities, professional associations and other educational organizations such as museums and, much later, educational television and a much broader range of educational needs.

Carnegie Foundation for the Advancement of Teaching A private foundation founded in 1905 by American industrialist-philanthropist ANDREW CARNEGIE as a free, nonprofit pension fund for American and Canadian college teachers. A group of university presidents led the foundation after Carnegie's death and shifted its focus to elevating educational standards in the United States. In 1918, the foundation converted its pension fund into the independent Teachers Insurance and Annuity Association, a nonprofit company which, together with the College Retirement Equities Fund, is the world's largest such pen-

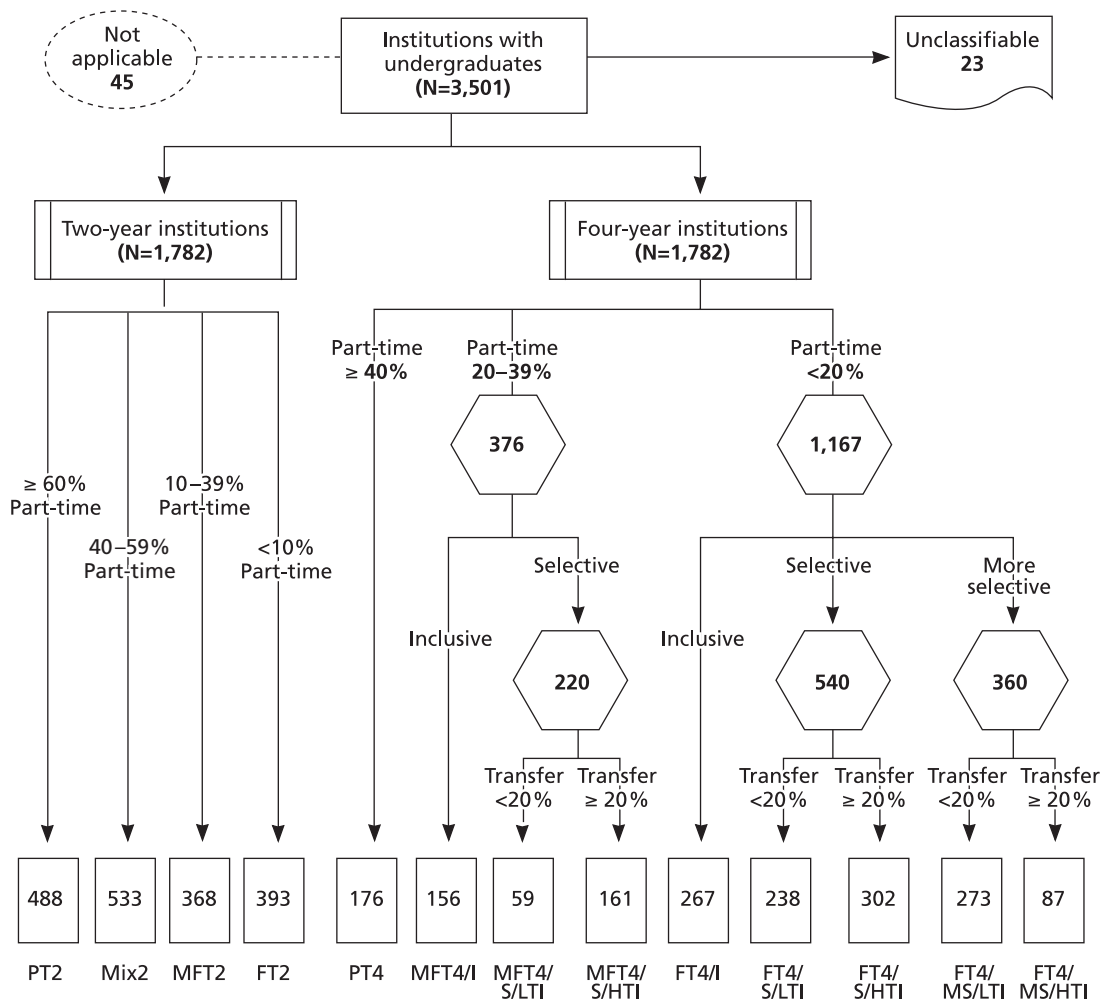

sion fund, with assets of more than \$125 billion, providing pensions to teachers at all levels of education.

The Carnegie Foundation, meanwhile, has grown into the largest private organization monitoring educational quality and trends in the United States. In 1988 alone, its studies led to such landmark reports as *The Condition of Teaching: A State by State Analysis*; *An Imperiled Generation: Saving Urban Schools*; and *Report Card on School Reform: The Teachers Speak*. In 1981, the foundation published *Higher Learning in the Nation's Service* by foundation president ERNEST L. BOYER and former *New York Times* education editor Fred M. Hechinger, who warned, "Unless we find better ways to educate ourselves as citizens, we run the risk of drifting unwittingly into a new kind of Dark Age. . . ." Two years later, the foundation published Boyer's book *High School: A Report on Secondary Education in America*, one of the most scathing criticisms ever directed at the American educational community.

The foundation also publishes a classification system for the more than 4,300 U.S. colleges and universities—a system designed to discourage the practice of "ranking" colleges by characteristics other than educational offerings and related activities. Universities offering doctoral programs, for example, are classified according to the amount of research activity on campus, while colleges and universities offering master's degree programs are classified by the number of degrees awarded each year. Revised five times since its development in 1970, the latest Carnegie classification system was released in 2006 and includes six categories (see table on page 195).

Carnegie unit A unit for measuring the amount of high school academic work by the number of classroom hours spent in one subject. Developed in 1899 by a committee of the NATIONAL EDUCATION ASSOCIATION, one Carnegie

Undergraduate Profile

unit in a subject equals 120 classroom hours lasting 40 to 60 minutes each and meeting four to five times a week, 36 to 40 weeks during each school year. Most high schools require 16 Carnegie units per subject for graduation, including required courses such as English, mathematics, American history and science.

The Carnegie unit came into being after the National Education Association sought to reduce the confusion over the meaning and

value of course credits at high schools with varying class lengths, academic years and academic standards. The Carnegie unit attempted to standardize all three.

carrel An isolated, desk-type work area in a library or school resource center, where a student may work alone, undistracted by visual or aural contact with others. Often called study carrels or individual study carrels, they may be

simple or complex. The simplest, so-called dry carrel, consists of a surface work area, usually with an undershelf to store books, and three vertical partitions along the right, rear and left sides of the desk to block peripheral vision of the surrounding area. Complex, or wet carrels, may include electrical outlets, audiovisual equipment and links to central computers to permit data retrieval.

Carter, James G. (1795–1849) Educational reformer, teacher, journalist and legislator who spearheaded the establishment of public schools and teacher training colleges in Massachusetts. After graduating from Harvard in 1820, Carter spent 10 years teaching at private schools, where he developed the inductive method of teaching, whereby students learn by induction instead of rote memorization. He also wrote several textbooks. Carter gained statewide attention and influence with a series of pamphlets he published detailing the decline in common school education in Massachusetts. In 1826, his *Essays upon Popular Education* warned that education would become extinct if the state legislature continued to “shift the responsibility upon the towns, and the towns upon the districts, and the districts upon individuals. . . .”

Elected to the state House of Representatives and named chairman of its Committee on Education, he called for the state to take control of education and establish public teacher training institutes. In 1836 and 1837, he proposed and won passage of laws creating a state board of education headed by a superintendent of schools. Unfortunately, the law gave the board little authority and few funds. But Governor Edward Everett, himself a staunch supporter of public education, appointed such influential men as Harvard president JARED SPARKS and leading industrialists to the board, along with Carter, and he named the popular and powerful state senator HORACE MANN to head it.

Carver, George Washington (1864–1943) African-American educator and scientist, whose work and influence helped the largely trade-oriented black colleges of the South evolve into universities for the study of the arts and sciences. Born of slave parents in Missouri, Carver remained illiterate until he was almost 20, when he left the farm where he was born, to work his way through high school. Enthralled by the educational experience, he enrolled at the Iowa State College of Agriculture and Mechanic Arts, earned his bachelor’s degree in 1894 and won appointment to head the college’s greenhouse and bacterial laboratory in botany.

After earning his M.A. at Iowa State in 1896, Carver was named director of the department of agricultural research at Tuskegee Institute, an all-black vocational college that BOOKER T. WASHINGTON had founded and still headed. Carver introduced university-level science education and research at Tuskegee, where he remained the rest of his life. In addition to helping transform the institute into a university and training several generations of black scientists, Carver conducted pioneer research in soil management and crop production and directed an experimental farm. He developed commercial uses for peanuts, sweet potatoes and soy beans and helped transform southern agriculture from a single-crop (cotton) to a multicrop economy. He discovered that rotating peanut and sweet potato crops with cotton replenished soil nutrients that cotton alone had depleted. His discovery allowed the South to renew its exhausted lands at a time when the economy had badly deteriorated.

Carver also developed more than 100 by-products from peanuts, sweet potatoes and soy beans. From peanuts, he derived milk and coffee substitutes, cheese, flour, ink, dyes, soap, bleach, wood stains, metal polish, shaving cream, linoleum, synthetic rubber and plastics. Sweet potato by-products included

George Washington Carver (front, second from left) at his laboratory bench at Tuskegee University (*Library of Congress*)

flour, vinegar and molasses, while soy bean by-products included cooking oils, lubricants, medicines and face creams. He also developed a new variety of cotton plant called Carver's Hybrid—a hardy cross between short-stalk and long-stalk cotton.

case conference A formal, on-the-record meeting between two or more professionals to discuss a student with whom they are associated in or out of school. In the most common case conference, one or more teachers

and a supervising administrator or guidance officer simply discuss and evaluate a student's past performance and agree on a strategic plan for encouraging improvements or continuing success. More complex conferences may require participation of the school nurse, remedial teaching specialists, disabilities specialists, school or visiting psychologists or social workers.

In all cases, conferences are run as formal meetings, and notes are taken to assure the legal rights of the student, or "client," and to assure

agreement among all participants about the specific results they seek and about the strategies to help produce those results. Depending on the circumstances, case conference reports may be presented later to the student's parents, administration officials, psychiatric or social workers, court officials and others concerned with a student's educational and social activities.

One classic model for case conference developed by Michael Tracy and other researchers at Indiana University's Department of Public Instruction suggests a seven-step process of client referral: appointment of conference committee members, collection of client data, data discussion, development of an individualized educational plan for the client, placement decisions, and review and follow up.

case history The confidential file containing a student's entire school record, including notes by teachers, counselors, school psychologists, administrators and others who have had direct or indirect contacts with the student. Under the Family Educational Rights and Privacy Act, or BUCKLEY AMENDMENT, case histories are now subject to inspection, review and emendation by students who have reached the age of majority or by parents of students who are minors.

case study In education, a classical approach to understanding the possible causes of behavior by a student or student groups. Case studies consist of three elements: a description of the behavior under examination, a complete case history (often coupled with the results of current data from questionnaires, interviews, personal observations, tests, etc.) and a hypothesis of the cause of the current behavior and prediction of future behavior.

Because of the subjective nature of much of the researcher input, case studies by teachers can prove unreliable unless they are conducted in a highly controlled environment—difficult, at best, in a typical school situation—and over

a long enough period of time to produce the same results in statistically significant numbers. Most educational researchers agree that a case study only approaches reliability if a statistically significant number of other case studies have demonstrated the same cause-and-effect connections and the same results from appropriate remedial actions.

Castiglione, Baldassare (1478–1529) Italian diplomat and writer, whose classic work, *Il Cortegiano* (*The Book of the Courtier*, 1528), was one of the basic texts carried to the American colonies by educated English settlers. A basic element of the then-current "literature of civility," it served as guide, along with works from the "literature of piety," in the conduct of daily life and in the education of the young in early America. In effect, *The Book of the Courtier* describes the ideal European man: noble, gallant, virtuous, witty, fashionably dressed; a counselor of state with high regard for the arts and history and an active participant in physical education, athletics and dancing. Castiglione's ideal man was eventually Anglicized and Americanized in comparable literature produced in England and the colonies.

catalogs, school and college A broad range of brochures that usually include "VIEWBOOKS" and COURSE CATALOGS, a booklet of school rules and regulations and a yearbook-type brochure with pictures and backgrounds of school administrators, faculty and staff. Typically, viewbooks are designed to give applicants a broad picture or overview of the institution. Often somewhat self-serving, viewbooks are handsomely illustrated brochures with broad descriptions of the physical plant, curriculum and faculty quality. Secondary school brochures usually include a PROFILE of the previous year's graduating class, while college viewbooks give a profile of the latest incoming freshman class. Course catalogues

offer brief, one-paragraph descriptions of every course.

catechism A fixed list of questions demanding rote answers and, where appropriate, explanations. Used for centuries to teach the Scriptures and Christian church doctrine to the young, catechisms entered American education during the early colonial era as ministers and lay preachers assumed responsibilities for teaching the young. Colonial laws actually required parents to teach their children one or more of the 500 Christian catechisms from the Bible, the *Book of Common Prayer* and other religious texts. Because of the heavy burden of work in the colonial wilderness, most parents left the task to their parish clerics.

In 1669, Massachusetts passed a law formalizing the obligation of the clergy in all towns “to catechize and instruct all the people (especially youth) under your charge in the orthodox principles of the Christian religion, and that not only in public, but privately from house to house.” Connecticut followed suit a year later, and as ministers roamed from house to house, they assumed more and more general teaching obligations. They were, for example, gradually forced to teach the young how to read, for there was little hope in ever teaching them the Christian catechism if they could not read the Bible.

Catechetical teaching soon reached into mathematics and other nonreligious subjects and remained the basic method of instruction in colonial schools until the eve of the Revolutionary War, when lay instructors began introducing more imaginative and intuitive methods of instruction.

categorical aid Government funds provided to support a specific type or category of education or educational service, such as remedial education or bus service. Categorical aid is one of three types of government funding for education, along with BLOCK GRANTS and general or

standard funding of schools through budget-based taxes. Just as block grants give recipients more discretion over spending than they have with budget-based general funds, categorical aid gives the donor—the federal or state government—more than the usual power to influence and even override local educational policies. Thus, categorical aid for remedial education has led to the introduction of remediation in many schools that had been reluctant to pay for such programs themselves. Categorical aid for busing has been used to force recalcitrant communities to integrate schools.

Like block grants, categorical aid has been a center of controversy. Some legislators, for example, succumb to pressure by paid lobbyists to “ earmark ” for a specific college or university aid that might otherwise be distributed to large groups of more qualified institutions. Thus, one bill earmarked \$50 million in categorical aid for the University of Alaska to study the aurora borealis. The National Aeronautics and Space Administration, which had requested funds for the study, was left no choice in assigning the funds. Similarly, another NASA request for \$8 million for a planetarium was earmarked for Delta College, a two-year Michigan college without a science major at the time. Institutions typically pay \$10,000 to \$50,000 a month to lobbying firms to coax legislators into earmarking categorical aid.

Catholic schools Schools operated by or affiliated with the Roman Catholic Church or its representatives. Currently the largest group of religious schools, Catholic schools were slow to develop in the American colonies because of the predominance of Protestants and their pervasive, often violent prejudice against Catholics. Even the oldest continuously operated Catholic schools can trace their origins no further back than the 19th century. Although some Spanish Franciscans, Dominicans and Jesuits had settled in the southeastern

and southwestern portions of what is now the United States, only nine of the 260 churches in the English colonies in 1689 were Roman Catholic. The rest were Protestant. The first Catholic see was not established in the United States (or the American colonies, for that matter) until 1790, when John Carroll was named the first American Catholic bishop in Baltimore. The first two Roman Catholic schools opened in New York at St. Peter's Church, in 1801, and St. Patrick's Church (now Old St. Patrick's Cathedral), in 1815.

At the time, New York State was funneling public funds into common (public) schools run by Protestant churches, and New York's Catholic schools sought their share of those monies. Their request, however, caused a furor among Protestant legislators, who feared Jewish congregations might request similar educational financing. The legislature solved the problem in 1841 by denying all public funds to any school "in which any religious sectarian doctrine or tenet shall be taught, inculcated or practiced. . . ." Although other states followed suit, the new laws were less than effective at the classroom level, where teachers, usually Protestant, integrated their version of Christianity into the American history curriculum.

Fearful that the public school AMERICANIZATION process would Protestantize Catholic immigrant children, the Third Plenary Council of Baltimore decided to establish a Catholic school system. In 1884, it issued a mandatory and universal policy ordering every Catholic church in the United States that did not already have one to build a parochial school. Other decrees called for the construction of Catholic high schools, academies, colleges and the creation of diocesan boards of education to run the schools. To crown its new educational system, the council ordered construction of a Catholic University of America, which opened in Washington, D.C., in 1887. The council also

ordered all Catholic parents in the United States to send their children to Catholic schools unless specifically released from that obligation by the diocese. The order remained in effect until 1960.

The inevitable process of Americanization, however, made the goal almost impossible, and even where Catholic parents ardently favored sending their children to Catholic school, lingering ethnic hatreds from Europe often made it impossible for them to do so. Lithuanians, for example, refused to put their children in the hands of Polish priests. The Irish wanted their children taught by Irish priests, the Germans by German priests, and so on. By 1887, when the decrees of the Plenary Council were to have become law, there were 35 different ethnic parishes in Chicago alone. In addition, the issue of educating girls was also creating bitter differences in the church and, in turn, in the Catholic educational system. Rather than cope with these conflicts, many devout Catholics turned to non-sectarian public and private education and restricted the church's role in the upbringing of their children to spiritual education.

Nevertheless, the Catholic education system remained a powerful force in American education. By 1960, the Catholic population had climbed to 42 million. The school system had almost 13,000 elementary and secondary schools, with a student population of about 5.25 million students. In addition, the church boasted nearly 400 colleges, ranging from small institutions for sisters and brothers to giant universities such as Notre Dame, Fordham and the Catholic University of America. Since its peak in 1960, however, the Catholic educational system has contracted. For one thing, millions of urban Catholics joined Protestants and Jews in the mass migration to the suburbs, where there was a dearth of religious schools. Moreover, high suburban property taxes made it more economical to send chil-

dren to local public schools rather than incur duplicate costs of paying school taxes and Catholic school tuition.

As Americanized urban Catholics abandoned their city parishes and parochial schools, a new wave of Catholic immigrants arrived from abroad—mostly semiliterate, usually Spanish-speaking and too poor to support local Catholic churches and parish schools. Many schools simply closed. Others suffered declines in academic standards because they were no longer able to pay high enough salaries to attract the most qualified teachers. By 2005, fewer than 6,600 Catholic elementary schools and just over 1,200 high schools remained, and the student population had dropped to about 2,420,000—13.6% of them non-Catholics. Only about 10% of Catholic children in the United States still attend Catholic schools. In many inner-city neighborhoods long since abandoned by white Catholics, the few remaining Catholic schools often have student populations that are 65% or more non-Catholic. Nationally, minorities make up more than 27% of students—nearly three times the number 30 years ago. Hispanics make up nearly 12% of students, blacks nearly 8%, and Asians nearly 4%.

There are four types of Catholic schools: parochial (usually elementary) neighborhood schools run by the local parish priest; interparish schools cooperatively run by several parishes; diocesan schools (usually high schools) run by a school board appointed by the diocese; and private schools (usually college preparatory, academy-type schools) run independently of the church by a devoutly Catholic board of trustees. In almost every category of achievement, students in Catholic schools outperform their counterparts in public schools, although costs per pupil are about the same. Catholic high school drop-out rates average less than 2%, compared with 10.7% for public schools. About 97% of Catholic school children go on

to college, compared with only 65.9% of public school children. Traditionally, Catholic school students have scored an average of 5% to 10% higher than same-age public school students on proficiency tests for most academic disciplines and about 20% higher on college admissions tests, but state and local governments, as well as college admissions testing organizations, have stopped breaking down and reporting such results on the basis of religion.

There are several reasons for Catholic-school educational successes. Like all private schools, they refuse to admit unruly, disruptive children. Unlike public schools, with “cafeteria-style” curricula of 200 or more courses for a wide range of students, Catholic schools offer only a basic core curriculum of required courses such as English, mathematics, science, social studies and foreign languages.

Besides Catholic University of America, which is under direct control of the church, there were 237 Roman Catholic colleges and universities in 2001, all of them directed by Catholic clerics or Catholic laymen but with no direct, official ties to the church. All offer a broad enough range of secular studies to compete with comparable nondenominational institutions of higher learning. With 650,000 students—many of them non-Catholic—such universities and colleges offer a mixed curriculum, whereby secular studies are taught in an atmosphere of academic freedom, while theology courses are dictated by the church and the colleges must certify that all theology courses teach “authentic Catholic doctrine.”

Catholic University of America The national university of the Catholic Church in America. Founded in Washington, D.C., by American bishops in 1887, Catholic University was conceived as a graduate and research center for the study of “all branches of literature and science both sacred and profane.” There are now

seven undergraduate and 10 graduate schools offering the full range of courses in the liberal arts, sciences and professions. The faculty numbers about 230, for a coeducational population of more than 5,700 from all 50 states and more than 33 countries. Minorities make up more than one-quarter of the student population.

Cattell, James McKeen (1860–1944) Pioneer in experimental psychology and psychological testing and editor of five scholarly journals and two biographical directories. A cofounder of the AMERICAN ASSOCIATION OF UNIVERSITY PROFESSORS, Cattell developed such important intelligence tests as the Cattell Culture Fair Intelligence Test to disassociate intelligence measurement from educational and cultural influences, and the Cattell Infant Intelligence Scale to assess the development of infants and young children under two and one-half years old.

Born in Easton, Pennsylvania, the son of the president of Lafayette College, Cattell was educated at Lafayette and the Universities of Göttingen, Leipzig, Paris and Geneva. He lectured at Cambridge University from 1886 to 1888 before accepting an appointment as professor of psychology at the University of Pennsylvania. Three years later, he went to Columbia as professor and chairman of the department of psychology, where he remained 26 years. While there, he developed tests of reaction times, intelligence, judgment and other mental processes and became the first psychologist to use the term “mental test.” Equally important to the world of education was his work as an editor of scholarly journals. He founded and edited *Psychological Review* from 1894 to 1904 and *School and Society* from 1915 to 1939. He was also editor of *Science* (from 1894), *Scientific Monthly* (from 1900) and *American Naturalist* (from 1907). *Science* became the official publication of the American Association for the Advancement of Science in 1900. Cattell

also founded the biographical directories *American Men of Science* in 1906 and *Leaders in Education* in 1932.

His involvement in the founding of the American Association of University Professors stemmed from his continuing personal conflicts with the autocratic president of Columbia University, Nicholas Murray Butler. In 1917, the Columbia University Board of Trustees fired him for his opposition to U.S. entry into World War I. In 1921, he founded The Psychological Corp., to develop and publish tests for education and industry. In 1924, he was elected president of the American Association for the Advancement of Science.

ceiling budget A spending plan whose annual percentage increases are limited by law. Introduced during the depression of the 1930s, ceiling budgets were imposed on school boards to limit increases in property taxes and, in turn, the rate of personal bankruptcies and mortgage foreclosures. Different states adopted a wide variety of ceiling budget laws. Some simply specified the maximum percentage by which any school district could increase its budget each year. Others put ceilings on tax rates, while others required public referenda to approve budget increases that exceeded specific percentages. Still other states forced school districts to obtain state approval for any budget increases or bond issues. Ceiling budget laws have had mixed results. In some areas, they promote efficiency and discourage wasteful spending, but in others they have hurt educational standards by preventing needed spending on costly programs such as computer education and special education.

ensorship The alteration, suppression or eradication by governmental or other authorities of materials and ideas they deem inappropriate. Although long a source of conflict and

mixed feelings among Americans, censorship has been an integral part of American education at every level since colonial times, when Protestant churchmen controlled schooling and censored all materials considered heretical and, therefore, either an affront or a threat to the church and its beliefs.

Traditionally, censorship in every land has been designed to protect the integrity of three basic institutions: the church, the state and the family. Heretical, pornographic and unpatriotic or antigovernment materials have, therefore, been the prime targets of censors. The First Amendment of the Constitution of the United States was the first official document ever to deny government the right of censorship. "Congress," it says, "shall make no law . . . abridging the freedom of speech or of the press. . . ." The Constitution did not, however, deny individual states the right of censorship. Until the Civil War, every southern state banned abolitionist literature. After the Civil War, schools throughout the South and in many areas of the North banned books that taught the theory of EVOLUTION or denied any but the most literal interpretation of the Bible as the true history of the world and the development of man.

Until recently, both the U.S. Post Office and Customs Service as well as local and state police actively seized books and other materials they considered obscene or seditious. Local police continue to do so in many areas of the United States. It was not until the 1920s that the U.S. Supreme Court ruled that the First Amendment applied to state governments as well as the federal government. The Court did not, however, hold censorship to be unconstitutional. Indeed, the Court has ruled that the government has broad rights to prevent publication of a wide variety of materials during wartime if it deems those materials to be of danger to national security. It has upheld the government's right to suppress free speech

when such speech might "create a clear and present danger that . . . [the government] has the right to prevent"—as in the classic cases of someone falsely and maliciously shouting "fire" in a crowded room or, more recently, making a reference to bombs or weaponry while approaching or on board an airplane.

As for printed materials, the first federal court decision to curtail government erosion of First Amendment rights came in the 1930s, when it ruled that federal authorities did not have the right to ban importation of James Joyce's novel *Ulysses*, because it contained obscenities. The use of "dirty words" in "a sincere and honest book," said the court did not make the book "dirty." Although the *Ulysses* decision cleared the way for students at some independent colleges and universities to gain access to erotic works, state and local authorities continued to deny the public at large the same right, and the Supreme Court has never explicitly forbidden such authorities the right to do so. In the 1970s the Court issued a series of sweeping decisions that gave government the constitutional right to enact laws to censor "works which, taken as a whole, appeal to the prurient interest in sex, which portray sexual conduct in a patently offensive way; and which, taken as a whole, do not have serious literary, artistic, political, or scientific value." It also allowed any government at any level to apply "contemporary community standards," instead of national standards, in determining what constitutes obscene materials.

The net result of the Court's vague decisions has been to allow school boards, local government, local church leaders and parents to censor many materials used in American elementary and secondary schools. Apart from erotic books, many public schools in some parts of the United States have banned such socially provocative literature as John Steinbeck's *The Grapes of Wrath*, J. D. Salinger's *The Catcher in the Rye* and Mark Twain's *Huckleberry*

Finn. Nor have the courts interceded to prevent such censorship—except when it crossed the line into the area of religious freedom. Thus, the U.S. Supreme Court has consistently ruled that public schools may not teach “CREATION SCIENCE,” “creationism” or any other biblical interpretations of world history or the evolution of man and the Earth. In almost every other area, however, the Court has granted local school authorities, school boards and state educational authorities wide latitude to censor and otherwise control the materials used in elementary and secondary schools, and, indeed, denied minors attending such schools rights to free speech and publication that are routinely granted to adults.

Indeed, the Court ruled in the case of *CAMER V. EIKENBERRY* in 1983 that it lacked jurisdiction over subject matter taught in schools. Other court decisions have granted school authorities broad rights to censor student newspapers and other in-school publications, to regulate student speech and conduct and even student dress.

At the college and university level, however, the question of censorship becomes as murky as it remains for the rest of American adult society. Since 1971, when the age of majority was lowered to 18, and turned most college and university students from children into adults, those students have had the same constitutional rights in public facilities as adults everywhere. Even the most selective, private colleges are “public” if they receive any public funds, directly or indirectly, in the form of government awards to students or scholars. Only a handful of religious colleges remain so private that they can arbitrarily impose rules that limit a student or professor’s right to free speech and the right to publish.

Ironically, unfettered freedom from censorship has produced turmoil on some campuses, where hate groups have used their freedoms to intimidate fellow students and, indeed, impose

a form of reverse censorship on those who would oppose them. Many campuses have seen faculty and students join together to shout down the president of the United States and other speakers whose views differed from theirs, and faculties at Yale and Harvard, among other universities, banned Army and Naval RESERVE OFFICERS TRAINING CORPS programs and associated studies of military science.

In the guise of eliminating censorship, some colleges and universities appointed political activists to their faculties to preach instead of teach in their classrooms. In some cases, the results have been courses that have distorted, exaggerated or even invented historical facts, while others have simply taught outright racism.

To try to combat racism, some colleges have introduced strict rules against “hate talk.” The courts, on the other hand, have handled the problem on a case-by-case basis that has yielded a series of often vague and conflicting decisions. One court gave a university the right to suspend a student who, while drunk, shouted racial epithets in a college courtyard for all to hear. But another court forced City University of New York to reinstate a black studies department chairman who taught his students that blacks were a superior race, that whites were inferior and that Jews and Italians were responsible for the economic and social problems of the black community in the United States. Although a federal appeals court later reversed the decision, the university was forced to retain the professor on its faculty, along with a white Jewish professor who claimed as adamantly as his black colleague that blacks were an inferior race.

The indecision of the courts, however, may reflect the indecision of Americans themselves over the censorship question. Throughout history, no society and no educational communities have been as free from censorship as those in the United States. Such freedom can inflict pain and hurt on others, who may well respond

by attempting to restrict the right to speak and publish freely—until their own rights are curtailed. Censorship, like any other curtailment of individual rights, may simply be a part of the American dilemma over which individual rights are indeed inalienable. The Declaration of Independence declared only “certain” rights to be inalienable, but not all. The American educational community, like the courts and the rest of the American community, is still trying to define those rights. Most likely, the definition will continue to change from era to era.

Center for Death Education and Bioethics A section within the University of Minnesota Department of Sociology which provides educational programs on dealing with death, grief and bereavement. The first and only institution devoted exclusively to research on public attitudes toward and responses to death, the nonprofit center holds graduate and undergraduate classes on the subject and sponsors conferences and provides speakers. It also sells and rents audio and video tapes on such topics as “Death and the Family,” “Adolescent Suicide,” “Talking to Children about Death” and “Death and the Child.” The center also helps educate teachers and school administrators who must help students cope with the problem of death. In 2001, suicide—mostly by gunshot wounds—was the fifth most frequent cause of death among children under 15 and the third leading cause of death among young people 15 to 24, after accidents and homicides. According to the U.S. DEPARTMENT OF EDUCATION, 8.9% of America’s 16.2 million high school students—more than 1.4 million—were threatened or injured with a weapon on school property in 2001. Youngsters too young to be prosecuted as adults were the most likely to carry weapons, and indeed 12.7% of ninth graders and 9.1% of tenth graders report being threatened or injured by weapons on school property, compared with rates of about 6% for eleventh and twelfth grad-

ers. Only about 8.5% of white and Asian school children reported being threatened or injured by weapons at school, while 9.3% of black children filed such reports, 11.3% of Hispanic children, 15.2% of American Indians and native Alaskans and nearly 25% of Hawaiian and other Pacific island children.

Center for Educational Renewal A research organization founded in 1985 to study and improve the education of professional teachers in the United States. Founded by JOHN I. GOODLAD and two associates, the center has conducted comprehensive studies of teacher training to develop new methods of professional training and, in turn, to help improve quality of education in American public schools. The primary result of the center’s research has been the development of a new approach to teaching education through school/university partnerships, whereby future teachers divide their time between theoretical studies at college and practical training in working elementary and secondary schools. Akin to programs leading to degrees in medicine, law and other professions, training in a school/university partnership requires future teachers to spend their first two years at university studying the humanities, social sciences and other conventional college courses of direct and indirect value to the future teacher. The second part of the preeducation curriculum is school-based, using actual schools in the same way that teaching hospitals teach future doctors in actual hospital situations. Financed by continuing grants from the Exxon Foundation, the Ford Foundation and Southwestern Bell Foundation, the center established its initial pilot school/university partnerships at eight colleges and universities in California, Ohio, Massachusetts, New Jersey, South Carolina, Texas, Washington and Wyoming. By 2000, it had expanded to 40 institutions of higher education in 20 states and was serving 750 schools in more than 100 school districts.

Center for Research Libraries Chicago-based consortium of several hundred university libraries that make their collections available to scholars and researchers through interlibrary loan services. The center was founded in 1949 by 10 universities, with funds granted by the CARNEGIE FOUNDATION FOR THE ADVANCEMENT OF TEACHING and the ROCKEFELLER FOUNDATION. In addition to books and periodicals, scholars and researchers may tap each member library's collection of dissertations, archival records, government documents, periodicals and scholarly journals, monographs and other research materials.

cerebral palsy A vague term for nonfatal and nonprogressive brain damage and a wide range of associated symptoms. The latter vary widely with the degree of brain damage and may include various degrees of limb paralysis, involuntary spasms, lack of coordination, muscular weakness, seizures and mental insufficiencies. Some sufferers have imperceptible and virtually undetectable symptoms. Others may require braces or wheelchairs, physical or speech therapy, remedial and other special education, hearing aids, drugs and even surgery. Educational potential varies just as widely, with some palsy sufferers able to blend completely into the mainstream of conventional education and others requiring special educational and treatment facilities.

certification, professional The licensing, by a state, state-approved agency or professional organization, of teachers, school administrators and other school professionals. All states require certification of public school professionals before they are allowed to accept paid positions in public schools. Requirements for certification vary widely from state to state and may include American citizenship, proof of good health, minimum or maximum age, completion of a bachelor's degree, including successful

completion of specific education-related courses, completion of an approved teacher-training course or program, completion of a teaching apprenticeship and a minimum grade on a state-prepared teacher-competency test.

The types of certificates issued vary from state to state as well, some states issuing general certificates, others limiting the validity to specific subjects, grade levels, range of grade levels (elementary or middle school, for example) or area of competence, such as remedial reading or special education. Different certificates are usually issued for teaching, administrative and staff functions.

Certification became a center of national controversy in the 1980s and 1990s, as education reformers exposed low teacher certification standards as one source of poor public school educational quality. Most state certification examinations set low passing grades, allowing those who left as many as half the questions blank to pass. Indeed, standards were often so low that few states trusted the value of any out-of-state certification and refused to accept teachers with out-of-state credentials. A 1999 report by the Education Trust, a nonprofit Washington, D.C., organization that studies teacher preparation, found that most state certification tests for elementary school teachers required only ninth- or tenth-grade knowledge to pass and only about an eleventh- or twelfth-grade education to pass the tests for high school teachers. Moreover, the U.S. Department of Education found that one-third of all public school teachers lacked a major or minor in the subjects they taught.

By 2005, 48 states had responded by implementing higher teacher-certification standards as required under the federal NO CHILD LEFT BEHIND ACT OF 2001. All but seven states required prospective teachers to pass subject-knowledge examinations, and five required prospective teachers to have majored in the subject or subjects they were to teach. The new

state standards, however, still failed to meet federal requirements that all teachers be “highly qualified” in core teaching fields, and, by the beginning of the 2006 academic year, not a single state had met the deadline for qualified teachers. The AMERICAN FEDERATION OF TEACHERS favored universal adoption of a national standardized test that would certify teachers for all states. The National Board for Professional Teaching Standards offers such an examination for teachers seeking master status, while the EDUCATIONAL TESTING SERVICE administers the Praxis examination used by many states for basic certification.

certification, school The legal approval to operate a school. Unrelated to ACCREDITATION, certification is akin to a certificate of occupancy and, depending on state laws, is usually granted after a building has been found to be in compliance with fire safety laws and other regulations governing construction of and use of public buildings.

chaining The sequential behavioral process that underlies PROGRAMMED INSTRUCTION. Chaining occurs when a stimulus or question produces a response that automatically provokes a second question, the response to which will reinforce the original response. Thus, in programmed instruction, the information that must be learned is broken down into the smallest possible units or “frames,” each of which serves as a stimulus for a response that reinforces learning and allows the learner to progress to the next frame. Psychologists call the stimulus-response-stimulus-response sequence a “chain”—homogenous if the responses are related and heterogeneous if the responses are unrelated.

chalkboard A once-ubiquitous, four-foot-high, black or green slate panel affixed to classroom walls to permit teachers (and students) to write instructional materials in chalk for stu-

dents to copy into their notebooks. Of variable lengths, but often as long as a classroom wall, chalkboards began disappearing with the development of new DRY-ERASE BOARDS made of porcelain-coated steel that eliminates the problem of chalk dust—often a serious health problem for students with chalk-dust allergies and an equally serious problem for classroom computers if the dust invades the inner workings. Often called marker boards, dry-erase boards are easy to clean with any soft cloth, and they permit inscription of materials with ordinary felt-tipped marker pens in a range of colors that increase the instructor’s ability to categorize or emphasize different materials.

More recently, both chalkboards and dry-erase boards have been replaced with electronic screens called INTERACTIVE WHITEBOARDS on which teachers can write electronically, either with a stylus or with a keyboard, and project graphics and illustrations, thus dispensing with projection equipment.

chancellor Usually the president of a university or institution. More commonly used in-British universities, the word *chancellor* is derived from the Latin *cancellorius*, or “gatekeeper,” who guarded the gates that separated the public from the clergy in the chancel of Roman Catholic churches and from judges in the chancery of English law courts. Because Latin was the language in which classes were conducted in the early British universities, most administrative titles were given Latin names. In the United States, the last years of the 1900s saw the title reserved for the chief executive officer of multicampus state university systems, such as the 22-campus California State University, with 337,000 students and 18,000 faculty members, or the 34-campus University of Georgia system, with 200,000 students and 8,000 faculty members. Chancellors are the highest paid administrative officers in American education. The chancellor at the

California State System earned \$436,000 in the 1999–2000 academic year—the highest in the nation. The chancellor of the University of Georgia system earned \$324,000 and the State University System of Florida (10 campuses, 215,000 students; 12,000 faculty) paid its chancellor \$330,000.

Channel One A privately owned television network that began beaming news and current events programs to 8 million students in 12,000 schools in 47 states in 1990. Developed by publisher Christopher Whittle and his company Whittle Communications, of Knoxville, Tenn., Channel One provided 10 minutes of news and 2 minutes of commercials. The commercial, which cost \$200,000 a minute and generated revenues of more than \$100 million a year, paid for program costs as well as free installation of television sets and videocassette recorders in each classroom and all necessary wiring and satellite dishes in each school, if the school agreed to require students in sixth through twelfth grade to watch the entire 12 minutes of the program.

From its inception, Channel One met with opposition from many educators. Some were angered by the company's violation of its contracts with schools in the spring of 1993, when the company surreptitiously increased advertising time to two and one-half minutes on certain days of the week. When confronted, the company apologized and cut advertising to two minutes. Critics also cited a 1992 report, commissioned by Whittle Communications itself, which found that despite widespread popularity among students and teachers, the program had done little to increase student knowledge of current events. The majority of teachers and the boards of regents in both California and New York, the states with the largest student populations in the United States, adamantly opposed introduction of Channel One into their schools, and relatively few schools in either state introduced it into their classrooms.

By 1994, opposition to Channel One combined with high installation costs to curtail expansion while the company focused on increasing advertising sales. Whittle finally ceded ownership of Channel One to K-III Communications Corp., now known as Primedia, a media company with sizable interests in education-related properties such as the *Weekly Reader*, a newspaper for students, and *Funk & Wagnall's New Encyclopedia*. Partially owned by Time-Warner, Phillips Electronics of the Netherlands and Associated Newspaper Holdings in Britain, Primedia all but stopped expanding Channel One television in favor of Channel One Interactive, an Internet-based program that could bypass many of the controversies with school authorities and reach the American school-age population directly over the World Wide Web—and cost far less than installing television sets in every classroom.

Channing, William Ellery (1780–1842) American Unitarian clergyman who led the revolt against Puritan/Congregational dominance in U.S. education in 1820 and was a driving force behind the development of universal education. Born in Bennington, Vermont, Channing graduated from Harvard College in 1798. Five years later, he was ordained and installed as minister in the influential Federal Street Church in Boston and remained there the rest of his life. An eloquent speaker and prolific writer, he rejected the Puritan/Congregationalist doctrine of original sin and the innate depravity of man. Known as the “Apostle of Unitarianism,” he became the acknowledged leader of American Unitarians and other Protestants eager to escape the spiritual burdens of Puritanism. Channing preached a gospel of goodness, love, human dignity, moral responsibility and perfectibility of man—a doctrine that eventually replaced Puritanism as the central Protestant tenet in the United States.

In 1820, he called a meeting of liberal ministers in Boston that led to the formation of

the American Unitarian Association. Because of his deep belief in man as the child of God, he believed in the limitless possibilities of children to learn. He became an advocate for expansion of common, or public schools, and helped improve teacher training. He also advocated benevolent teaching methods that eschewed the use of the whip and ferrule to spur student learning. Channing was a patron of the progressive school in Boston started by A. BRONSON ALCOTT, and was a major influence in helping his parishioner HORACE MANN formulate his philosophy of education, which led to the founding of the first compulsory universal public school system in the United States.

“Chapter 1” (Title 1) The U.S. government’s main effort to improve basic academic skills of poor children by means of remedial programs in basic subjects. The \$12-billion-a-year program was the largest component of the ELEMENTARY AND SECONDARY EDUCATION ACT OF 1965. Reauthorized in 1994 and renamed title 1 under the Improving America’s Schools Act, it reaches nearly 8 million in two-thirds of the nation’s schools. About 75% are elementary school students. From its inception, the program was a target for criticism because its standard technique of pulling students out of class for 30 minutes of remedial work left the children behind in the classes they missed.

(See also COMPENSATORY EDUCATION.)

character development A broad area of education designed to teach students self-discipline, responsibility and good citizenship. Character development has provoked controversies in many public school districts between parents who prefer schools to be value-neutral and those who believe schools have an obligation to help shape their children’s characters.

The first group believes character development is the responsibility of parents and that schools should limit their work to academics.

Many fear some teachers may indoctrinate children in religious or moral codes that differ from their own. Their opponents point out that teachers see more of children during their waking hours than the average parent and that more than 20% of the children in the United States live in single-parent homes where character development is often at a minimum. Under such circumstances, a teacher’s role in character development becomes inevitable. One source of controversy over character development, say some educators, is public confusion over differences between teaching children how to make sensible value judgments and moral or religious indoctrination.

Schools with well-developed programs to encourage character development are specific in listing the values and attitudes they expect teachers to impart to students. Most stress the use of democratic government in the classroom as the basis for teaching self-discipline, responsible citizenship and student willingness to take responsibility for their own actions in their relations with teachers and other students. Other elements of character development in the classroom include teaching the benefits of civic behavior and cooperation, the harm to the community of careless or thoughtless behavior, the need for patience (waiting in lines, for example), the importance of obeying rules and the benefits of majority rule and respect for dissenting opinions.

Prof. Roe Christenson at Miami University produced a list used by many schools for teaching character development: “Acknowledging the importance of self-discipline; being trustworthy; telling the truth; being honest in all aspects of life; having the courage to resist group pressures to do what we would refuse to do if alone; being ourselves, but being our best selves; using honorable means that respect the rights of others; conducting ourselves in a manner that does not fear exposure; having the courage to say, ‘I am sorry. I was wrong.’; practicing

good sportsmanship; maintaining courtesy in human relations; treating others as we would wish to be treated; recognizing that behavior that may seem purely private often affects others; doing work well, whatever that work may be; showing respect for the property of others; giving obedience to the law; respecting democratic values of free speech, a free press, freedom of assembly, freedom of religion and due process of law; and developing habits that promote good health and refraining from those that don't."

The U.S. Department of Education sets aside more than \$5 million a year to subsidize character development, and 28 states are using the funds either to train teachers to bring in outside organizations to teach moral values. In the South, Character First!, a Christian organization, teaches morality in more than 600 public elementary schools, although it is careful to steer clear of all discussions of religion—as does "The Curriculum Initiative" started by a Jewish organization. The latter focuses on such "earthly" topics as "how you treat a stranger"; "gossip and slander"; and "relationships with parents, friends and teachers." A secular organization, the Concerned Businessmen's Association of America" says it has reached 12 million elementary school children since 1983 with its "Set a Good Example Contest," which teaches "honesty, trust, competence."

charitable giving A source of nearly \$250 billion in revenues a year for educational institutions and a wide variety of other organizations, including emergency aid to the needy, religious groups, arts and cultural organizations, human services groups and environmental causes, among others. Religious groups receive the largest percentage of charitable giving each year—about 35.5%—followed by educational institutions and affiliated organizations (13.6%); foundations (9.7%); health

organizations (8.8%); human services (7.7%); arts and cultural organizations (5.6%); public-benefit organizations such as veterans' groups, consumer protection groups, and so on (5.2%); environmental and animal organizations (3.1%); and international-affairs organizations (2.1%). The Salvation Army received the largest total in 2005—\$1.32 billion. The American Cancer Society and Gifts in Kind International each received \$760 million, and Lutheran Services in America received the fifth largest total of \$720,000. The most generous donors were the BILL AND MELINDA GATES FOUNDATION (\$3.4 billion), Susan T. Buffett Foundation (\$2.6 billion), John M. Templeton, (\$550 million), Caroline Weiss Law (\$450,000), and George D. Cornell (\$200,000). Individuals accounted for 76% of charitable giving, while foundations provided 12%, bequests 8% and corporations 5%.

Charles E. Stuart and Others v. School District No. 1 of the Village of Kalamazoo and Others A precedent-setting case in 1874 that not only established the right of town officials to raise taxes to pay for a public high school, but allowed them to offer all children in their district a free classical as well as practical education.

The Kalamazoo case, as it is usually called, had its origins in 1858, when the local school district in Kalamazoo created a district high school that not only taught practical subjects for those children bound for careers as tradesmen, but also classical languages, mathematics, natural sciences and other subjects required for entry into university. Until then, Michigan, like most other states, had two separate systems of education: a practical system of free primary and secondary schools that taught just enough to produce literate working people, and a small, academically oriented academy-type primary and secondary school system that fed its graduates—usually the sons of the wealthiest families—into the university. The unification of the two systems along with the possibility that

children of common families might enter the university outraged Kalamazoo's prominent citizens and wealthiest taxpayers.

In 1873, they sued to restrain the school board from spending public funds on a new, unified high school. The local circuit judge ruled against them and, when they appealed the verdict a year later, the Michigan Supreme Court upheld the lower court and stated unequivocally that the school board had the right to operate a public high school with tax funds and to put "the elements of classical education . . . within reach of all the children of the state. . . ." Chief Justice Thomas M. Cooley then admonished the plaintiffs, saying, "education, not merely in the rudiments, but in an enlarged sense, was regarded as an important practical advantage to be supplied . . . to rich and poor alike. . . ."

The Kalamazoo case set a precedent for other states. As a result, American public schools in every state became single systems in which poor as well as rich could prepare for university or the practical crafts, according to their own desires and ambitions.

charter school An autonomous public school created and operated by teachers, parents, foundations or profit-making businesses, independently of state and local school boards. First introduced in Minnesota in 1991, the charter school concept was developed as part of the nationwide effort to reform public school education by freeing it from control by huge, unresponsive bureaucracies and unleashing the creative energies of teachers and those in closest contact with students. The hope was that innovative teaching methods developed in charter schools would have a ripple effect on conventional public school education and breathe fresh life into what much of the general public considered a moribund system.

By 2005, 40 states had passed charter school laws and, by then, about 3,300 such

schools had opened their doors to an average of 300 students each. About half were elementary schools. Although the laws varied from state to state, they typically allowed parents, teachers or just about anyone else, including private, for-profit organizations and companies to establish publicly funded charter schools, with the approval of the local school district and/or state education authorities. The state and local school districts, in turn, paid each charter school the same per-student funds they dispensed to conventional schools. In addition, it waived most state and local academic rules and regulations, along with union rules and teacher pay requirements. Each charter school agreed, however, to produce specific academic results within a specific time period or be reabsorbed into the conventional public school system.

By 2003, many charter schools seemed to be failing in their broad academic mission. According to an analysis of scores from the 2003 NATIONAL ASSESSMENT OF EDUCATIONAL PROGRESS, 33% of charter school fourth graders displayed below basic proficiency in math, compared with 24% of fourth graders at conventional public schools, and 45% showed less-than-basic proficiency in reading, compared with 38% at conventional public schools. At the eighth grade level, 42% displayed less than basic proficiency in math, compared with 33% in conventional public schools, and 33% scored below basic levels of proficiency in reading, compared with 25% in traditional public schools.

Trumpeted by opponents of charter schools as clear evidence of their failure, the lower achievement scores seemed less significant after examination of the characteristics of the schools and their students. Almost one-third of the charter schools studied were less than two years old and, therefore, in unsettled, start-up condition. Moreover, 60% of the schools were in central-city minority areas, compared with only about 30% of conventional public schools.

Half the students in the charter schools studied were living in poverty, compared with 15.8% of students in conventional public schools, and even more telling, fewer than 50% of charter school students were white, compared with about 60% at conventional schools. African Americans made up about 35% and Hispanics 15% of the charter school student population, whereas each group made up only about 17% in conventional public schools.

In practice, many charter schools—indeed nearly 25%—evolved into special-purpose schools. Some absorbed high-risk students. At least one teaches only deaf children, using sign language exclusively. Still another, near a Dakota Indian reservation, teaches the Dakota language to Indian teenagers. Some charter schools accommodate gifted students in areas with no private schools or private schools too costly for most families to afford, while a large segment of schools opened in low-income urban neighborhoods to offer undereducated minority children alternatives to failing local public schools.

Teacher unions and entrenched administrators at conventional schools have opposed the concept of charter schools since their inception—in some cases with good reason. For one thing, a charter school had no obligation to recognize the local school board's contract with teacher unions—and, indeed, most charter schools do not. In siphoning students from conventional public schools, charter schools reduce the need for teachers and staff at the public schools, and although teachers can fill new positions created at charter schools, the charters have no collective bargaining agreements with teacher unions, and teachers invariably sacrifice all union benefits. For former public school nonfaculty staffers, charter schools offer few new job opportunities, because they operate much as private schools, with a minimum of administrative employees. Still another criticism of the charter schools is that

they siphon badly needed public funds from the public school system—funds that might be used more efficiently and effectively improving education in existing facilities rather than starting a new and unproven type of school from scratch.

Apart from reduced job opportunities, charter schools have been an embarrassment to entrenched public school interests. By successfully absorbing high-risk, special education and, in some cases, gifted students, they have spotlighted the inadequacies of many public school systems, including the inability to provide students with adequate individual attention—along with the waste of public financial resources by huge, nonproductive and unnecessary, non-teaching school-district bureaucracies. Most charter schools offer a simple, back-to-basics curriculum that leaves students little choice but to focus on learning academic fundamentals.

Charter schools, however, have not been without financial problems. Indeed, California Charter Academy, which operated about 60 storefront charter schools for more than 12,000 students, shut its doors and declared bankruptcy in 2004, after only five years of operation and apparently gross financial mismanagement. Indeed, since the first charter school opened in 1992, about 350 charter schools, or nearly 10% of all the schools that have opened, have declared bankruptcy and closed. For that reason, many charter schools across the nation have turned to so-called charter management organizations (CMOs), non-profit management groups that oversee each school's administration, finances, personnel and educational delivery programs. Backed by such private foundations as the New Schools Venture Fund of San Francisco, and the BILL AND MELINDA GATES FOUNDATION, of Seattle, CMOs now serve 35 charter schools (28 in California), with 9,000 students. Like the charter schools they serve, however, CMOs have been the target of critics who claim the CMOs are simply sub-

stituting themselves for the nonproductive, nonteaching school-district bureaucracies charter schools were designed to eliminate.

Chautauqua Literary and Scientific Circle

An adult education program that grew into one of the most important educational movements in American history, with more than 1 million members and 15,000 local "circles" across the United States.

Founded in 1878, at Chautauqua Lake, New York, CLSC was a systematic program of "home reading" developed by JOHN HEYL VINCENT, a Methodist minister who had been a leading reformer of Sunday school curricula and teaching methods. Vincent described the programs as a "school at home, a school after school, a 'college for one's own house'" for a "company of pledged readers." Vincent and his associates originally formed CLSC to provide a somewhat informal mixture of lectures, concerts, courses and recreation on the lake shore. Its popularity spread so rapidly, however, that he systematized the program so that Americans everywhere could participate in their own communities. He founded the Chautauqua Press to provide required readings, and he developed a formal curriculum of courses that included nature studies, art, science, and secular and sacred literature. He designed it as "a college for one's own house . . . (for) those whose educational advantages have been limited, so as to secure to them the college student's general outlook upon the world and life. . . ."

The program required regular "study by textbooks"; the formation of "local circles for mutual help and encouragement in such studies"; attendance at "summer courses of lectures and 'students' sessions' at Chautauqua"; and "written reports and examinations." William Rainey Harper, later president of the University of Chicago, directed the Chautauqua summer school from 1883 to 1897, giving courses in

music, speech, physical education, domestic science, theater and theology. The curriculum expanded into a four-year program that included texts on American, English and Roman history, astronomy, human physiology, political science and economics, social problems, and even one entitled "Good Manners: A Few Hints about Behavior." Students also received the monthly Chautauquan magazine, which gave them study tips, texts of various study materials, questions for them to answer or discuss at their local study circles and news about other circles.

Those who finished the program successfully were awarded diplomas on "Recognition Day" each summer at the general assembly at Chautauqua Lake. A special correspondence course designed by Rainey was also available for those seeking bachelor's degrees. More than 8,000 men and women enrolled the first year, and 1,718 earned diplomas four years later. Annual enrollment reached nearly 200,000 in the early 1890s and more than 300,000 by the end of World War I. Circles attracted college graduates and professionals as well as many people who had never completed high school. Indian tribes formed their own circles, as did prisoners in penitentiaries. And small towns everywhere formed them—not only to educate themselves but to provide a welcome relief to the stifling church socials that often provided the only other source of adult social intercourse. Some circles drifted into specialized studies such as astronomy, while ethnic groups conducted circles in their native languages. Some shifted their emphasis to the teaching of practical trades and crafts, while others metamorphosed into civil organizations or women's or men's clubs. Many build their own libraries, and all tried to lure guest speakers.

During the 1880s, Chautauqua became a household word, as its summer sessions grew into a national forum that attracted such prominent speakers as Ulysses S. Grant, Alexander

Graham Bell, Jane Addams, John D. Rockefeller, Susan B. Anthony and Victor Herbert to lecture and discuss ideas in politics, economics, science, religion, social reform, literature and the arts. When Chautauqua Lake could no longer contain the crowds, 100 other sites sprang up across the United States. In the early 1900s, tent Chautauquas began touring the nation with their troupes of popular authors, explorers and political leaders.

The movement peaked in 1918 and began a slow decline as motion pictures, radio, book clubs and mass communications media made other forms of adult education more widely available. The original Chautauqua Lake facility, however, continues to draw nearly 10,000 residents to its nine-week summer programs. Called the Chautauqua Institute, the campus includes a Hall of Education, activities center, library, gymnasium, music studies center, art center, dormitories and alumni hall. About 300,000 attend performances of the institution's symphony orchestra, opera, drama and dance troupes, and more than 2,000 students enroll in summer courses in the arts, music, dance, theater and the humanities. Recreational facilities include a golf course, tennis courts, sports club and exercise classes.

cheerleading An organized student activity originally designed to rally vocal spectator support for secondary school and college sports teams. Originated in Britain during the 1860s, cheerleading had its origins in the United States at Princeton University, which formed the first "pep club," in 1865, and created the first known cheer:

*Tah rah rah;
Tiger, Tiger, Tiger;
Sis, Sis, Sis;
Boom, Boom, Boom;
Aaaahhhh!
Princeton! Princeton! Princeton!*

Organized cheerleading began in 1898 at the University of Minnesota, which hoped collective student cheering would spur its football team to victory over the heavily favored University of Wisconsin at Madison. It did not, but, by the 1920s, University of Minnesota cheerleaders were first in the nation to convert cheerleading into a sport by adding gymnastic and tumbling routines that made cheerleading more entertaining. Originally an all-male activity, it became virtually all-female during World War II. By the end of the 20th century, cheerleading had evolved into complex gymnastic performances, which, in turn, spawned state and nationwide competitions by cheerleading squads, with some squads training 11 months a year. As cheerleading evolved into an organized sport, however, interest waned in traditional cheerleading, aimed at encouraging spectator support of school teams. By the 1998–99 school year, the number of middle school and high school students participating in traditional cheerleading had dropped to 130,900—a 10% decline in only five years. In contrast, participation in competitive squads had more than doubled to almost 60,000.

Cheever, Ezekiel (1614–1708) The most renowned of the early colonial teachers and the first to make teaching a full-time job rather than part-time adjunct of ministerial duties. Born and educated in England, he originally came to the Massachusetts wilderness in 1637 "for the pure evangelical . . . worship of our Great Redeemer." A year later, however, he joined John Davenport and Theophilus Eaton in founding a colony in New Haven, where he established the first school and helped found and occasionally preached in the settlement's first church.

In 1650, he left New Haven to become headmaster at a grammar school in Ipswich, Massachusetts. During his 11 years there, he made Ipswich the most renowned school in

New England, drawing the finest scholars from New England as his students. Conflicts with town officials, however, forced him to leave, and, in 1671, he assumed the headmastership of the Boston Free School for the then-princely sum of 670 pounds a year. He remained there for 38 years, until his death at the age of 93. While there, he attracted some of the nation's top young scholars, including COTTON MATHER, whose elegy described Cheever's renowned school as a place where "We came to work, as if we came to play." Cheever's teaching methods were codified in *Cheever's Accidence*, a widely used textbook compiled by his grandson, who worked at the school during Cheever's last years.

chemistry education An outgrowth of ancient alchemy, chemistry entered modern school curricula in the 18th and early 19th centuries as part of the training required for medicine.

Two special-purpose institutions, however, pioneered its introduction into the standard secondary school and college curriculum: the UNITED STATES MILITARY ACADEMY at West Point and the RENSSELAER INSTITUTE (now Rensselaer Polytechnic Institute), which taught science and engineering technology. As the industrial revolution increased the importance of and interest in chemistry, liberal arts colleges turned to West Point and Rensselaer for model teaching programs in chemistry, physics, advanced mathematics and engineering, as well as laboratory instruction. In recent years, secondary school chemistry education has experienced several major revisions, including those of the Chemical Bond Approach Committee and those of the American Chemical Society in 1963.

Chicano education An ill-defined adaptation of the conventional American school curriculum to meet the needs of Spanish-Mexican

students and American students of Spanish-Mexican descent. (Chicano is derived from a dialectal pronunciation of the last three syllables of the word *Me-ji-ca-no*.)

Largely confined to schools in the U.S. Southwest, where the majority of Chicanos live, Chicano primary and secondary education may include bilingual instruction, a social studies curriculum specifically reflecting the history, cultural heritage and accomplishments of Chicanos and an arts curriculum emphasizing Chicano literature, music, art and dance. At the adult education level, Chicano educational programs may combine bilingual instruction with training in marketable skills or adult compendia of the standard American primary/secondary school educational program.

child abuse A catch-all crime defined in the U.S. Child Abuse Prevention and Treatment Act (1974) as "the physical or mental injury, sexual abuse, negligent treatment or maltreatment of a child under the age of eighteen by a person who is responsible for the child's welfare under circumstances which indicate that the child's health or welfare is harmed or threatened thereby." States, however, have widely differing definitions of child abuse, although all agree that it falls into two broad categories: Actual abuse, or injury inflicted to the child by others; and negligence, or failure by others to meet the child's needs. Depending on the state, abuse may be physical, sexual or verbal; negligence may be physical or emotional.

Since 1961, all states have enacted laws requiring physicians to report suspected cases of child abuse, and the majority of states require teachers to do the same. Teachers, however, have been reluctant to do so in states where laws fail to protect them from possible legal consequences of reporting suspected child abuse. Relatively untrained (in comparison, for example, to a registered nurse or a physician), teachers may be uncertain, in some cases, whether an

evident injury is indeed the result of abuse. An incorrect report can result in charges of slander. Even where abuse is responsible for a student's injury, the burden of proof would rest with the teacher in libel suits in many states.

In inner-city schools, some teachers ascribe their reluctance to report suspected child abuse to fears that a student's parents may retaliate violently—either against the teacher or the student. Although child abuse statistics are somewhat unreliable, the widespread belief that the incidence of child abuse was underreported and that child abusers were going unpunished led to a groundswell of public outrage in the mid-1970s.

In 1974, Congress responded by enacting the Child Abuse Prevention and Treatment Act. The act created a National Center on Child Abuse and Neglect to compile and conduct research on child abuse and neglect, to compile statistics on the incidence and severity of child abuse and to compile and publish training materials and serve as a clearinghouse for child abuse programs. The National Committee for the Prevention of Child Abuse and Neglect, in Chicago, collects similar data. In 2002, child protective services agencies of the various states reported a total of about 900,000 cases of substantiated and indicated child abuse; nearly 60% were the victims of neglect, 18.6% were victims of physical abuse, 10% were victims of sexual abuse, 6.5% were victims of emotional maltreatment, and 2% were victims of medical neglect. Some 16% of victims were infants one year old or younger, 24.3% were two to five, 23.2% six to nine, 21% 10 to 13 and 15.1% 14 to 17.

child advocates Organizations and individuals who legally represent or protect children against abuse, neglect or exploitation. Because minors have little or no legal status and, in many cases, no legal or constitutional rights, they must have adults to represent them

in legal proceedings. Advocates not only represent children in court; they may represent them in situations involving parents, teachers, employers or educational, governmental or other institutions. Advocates act in a wide variety of such situations as preventing child abuse, obtaining a child's rightful inheritance, protecting retarded or mentally ill children against institutional abuse, protecting the rights of dependent, neglected or delinquent children in the courts and assuring proper disposition of their cases by governmental agencies. Among the many organizations that serve as child advocates are the American Civil Liberties Union's Child Advocacy Project, the Juvenile Justice Project of the Center for Public Representation; the Child Health Advocacy Program of the Children's Hospital National Medical Center; and the Save the Children Federation.

child benefit theory A legal doctrine that emerged from a series of U.S. Supreme Court decisions in church-state conflicts. The cases all involved the spending of public funds to provide services to children enrolled in parochial schools. Although the Court has consistently ruled that government may not use public funds to support a religion or a religious school, under the child benefit principle, government may provide aid to children in religious schools if the aid only benefits the children and not the school or its religion.

As early as 1930, the Court ruled in *Cochrane v. Louisiana Board of Education* that a Louisiana school district had not violated the Constitution by purchasing textbooks for the teaching of secular subjects and lending them to students in parochial schools. The unanimous decision stated that the books were of benefit only to the students and not the parochial schools or the religions that they espoused. In 1947, the Court issues a similar ruling in *Everson v. Board of Education*, upholding a New Jersey law that reimbursed parents with state

funds for expenses of busing their children to private and religious schools, because the funds were spent directly on students and not on schools. Twenty years later, in *Board of Education of Central School District v. Allen*, the Court upheld a New York State law requiring local school boards to purchase textbooks and lend them free of charge to students in private and parochial schools. Citing *Everson* as precedent, the Court ruled that lending textbooks to students was a secular act that “neither advances nor inhibits religion,” because no funds were actually granted to the schools themselves.

child-centered education A theory of education that adapts the curriculum to the needs of the child rather than forcing the child to adapt and learn a prescribed curriculum. Originating in FRIEDRICH W. A. FROEBEL’s kindergarten movement of the 1870s, child-centered education was developed in the United States by G. STANLEY HALL, a pioneer in the experimental study of child development. Considered by many the “father” of both child psychology and educational psychology, Hall asked women’s clubs across the United States to enlist their members in a massive project to gather all imaginable data on the emotional, moral, physical and intellectual development of their children. The results were analyzed by teams of scientists he gathered at CLARK UNIVERSITY, which had opened in Worcester, Massachusetts, in 1889, as a graduate research university, with Hall as its first president.

The result was a new science of child development and a revolution in American education, based on Hall’s findings that children were not, as most parents and teachers had previously believed, miniature adults, carrying the original sins of Adam and Eve and bent on evil inspired by the devil. Children, he said, were entirely different beings, who reacted differently from adults to various stimuli. Their emotions—fear, anger, joy, and so on—were different

from those of adults as were their ideas of truth and falsehood and their ability to distinguish between imagination and reality.

Hall said parents and teachers were threatening the health of children by blocking their natural development with constraints, prohibitions, threats and punishment. “A pound of health, growth, and heredity,” he said, “is worth a ton of instruction. The guardians of the young should strive . . . to keep out of nature’s way, and to prevent harm, and should merit the proud title defenders of the happiness and rights of children.” Hall said childhood “comes fresh from the hand of God, is not corrupt . . . nothing else [is] so worthy of love, reverence, and service as the body and soul of a growing child.”

In effect, Hall told American parents to give children free rein to play at home and told teachers to abandon strict classroom formalities in favor of play-oriented teaching in which the curriculum was adjusted to children’s interests and needs. Hall called his new system of education “pedocentric,” as opposed to traditional scholastic education.

Hall’s new theory of education set off waves of educational reform that permanently changed American schools. Ardent believers in his theories introduced art, music and physical education in school curricula. Others formed public committees to build parks and playgrounds for children. And still others, including such philosopher-educators as JOHN DEWEY, used Hall’s ideas to develop new types of schools and new systems of pedagogy that would eventually become models for schools around the world.

child development The progressive changes in the physical, mental, emotional, functional and behavioral characteristics of children as they mature. Child development stretches through six life periods, beginning with the prenatal period, from conception to birth; the neonatal period, during the first month after

birth; infancy, from about four weeks to two years; preschool, from two to six years; middle childhood, from six to nine; and preadolescence, from nine to adolescence. Each of these periods sees significant changes in personality, self-perception, language skills, cognition and learning skills, peer and family relationships, relationships with adult authority, family influences and external cultural influences.

Child Find An annual census by states and local school districts to locate and evaluate handicapped children under 18, who are either

not being served or being served inadequately by their schools. Child Find was created under the provisions of the EDUCATION FOR ALL HANDICAPPED CHILDREN ACT OF 1975.

child labor The use of minors (in the United States, children under the age of 18) to perform adult work on farms and in factories and mines. Ironically, child labor has helped as well as hindered development of universal public education in the United States. Historically, child labor did not become a controversial social issue until the beginning the industrial revolu-

Children, ranging in age from five to 11, working a cotton field in Bells, Texas, in 1913. Children under 10 provided much of the manpower in southern tobacco and cotton fields. (Library of Congress, from Lewis Hine, *Photographs of Child Labor in the New South*)

tion in the late 18th century. After a spate of foreign wars produced a shortage of adult male labor in Britain, cotton mill owners rounded up orphans and children of indigent families and gave them free room and board in company-owned dormitories in exchange for their labor. Government authorities were delighted to get homeless children off the streets, and poor families were relieved of the burden of having to feed more children than they could afford. For the mills, introduction of child labor proved one of the most profitable innovations of the industrial revolution. Tens of thousands of children, some as young as five, worked up to 16 hours a day, with no out-of-pocket wage costs to the mills.

The practice spread to the American colonies, which also faced a shortage of adult male factory workers because of the need for farmhands to produce food and tobacco, the staples of the new nation's trade. At the time, most schools were reserved for the children of the landed gentry. Puritan America, then, gladly welcomed child labor as a legitimate way to keep idle children from falling prey to Satan's mischief. By the 1830s, however, an entire generation of child laborers had grown up illiterate. As the quality of goods they produced deteriorated and overseas sales of American goods declined, many of the very industrialists who had exploited child labor at the turn of the century joined social reformers, who wanted to end such exploitation, in demanding universal compulsory education to ensure that their future workers would be able to read, write and calculate.

Many of New England's most conservative industrialists offered political and financial support to liberal reformer HORACE MANN's efforts to establish compulsory, universal free education in Massachusetts. A state senator at the time, Mann not only created the nation's first public school system, he put teeth into the state's compulsory education law by winning

enactment of the first child labor law in the United States. The law prohibited employment of any child under 15 who had not attended school for at least three months during the previous twelve months. Pennsylvania was next to reform child labor practices with a law that set a minimum age of 12 for work in silk, cotton and woolen mills. By the beginning of the Civil War, a few other states had passed laws limiting working hours for children under 12 years old to 10 hours a day.

The end of the Civil War, however, created an unprecedented manpower shortage which combined with a vast industrial expansion to force 90% of all children between the ages of 12 and 18 into the factories, mines and fields. Where state laws required children to attend schools, factories set up makeshift classrooms in plants and required youngsters on afternoon shifts to report at 6 A.M. for six hours of classroom work before beginning their noon-to-six jobs on the factory floors. Children on the morning shifts did their classroom work in the afternoons.

By the 1890s, however, a small army of journalists, educators, settlement house workers and other social reformers cried out for an end to industry despoliation of the nation's children. They succeeded in winning congressional passage of a law in 1916, setting a national minimum age of 14 for workers in nonagricultural industries. In 1918, however, the U.S. Supreme Court ruled the law an unconstitutional infringement on personal liberties, namely, a child's right to work. An outraged Congress immediately passed another, similar law, but again, the Court overruled the legislation. In 1924, Congress tried bypassing the Court with a new constitutional amendment giving Congress "the right to limit, regulate and prohibit the labor of persons under eighteen years of age." Only 28 state legislatures approved the amendment, however—eight less than required—and the amendment died. In

1933, Congress again tried passing a child labor law, setting a minimum age of 16 for most workers and a minimum age of 18 for workers in hazardous industries. The Court declared this, too, unconstitutional.

By 1938, however, Democratic president Franklin D. Roosevelt had “packed” the Court with social progressives, and Congress passed the Fair Labor Standards Act, with age limitations similar to those in the 1933 legislation. In 1941, the Court declared constitutional the first national child labor law in the United States. Amended in 1949, the law limits the number of hours a child of 14 and 15 may work on school days and during vacations. It does not, however, protect children working on farms or employed as performers, newspaper sales boys or part-time workers at home.

Since then, most states have passed relatively strict labor laws that complement the federal law and usually prohibit employment of youngsters under 18 in hazardous work and minors under 16 in all factories. In general, such laws protect children’s right to an education by banning employment of children under 16 during school hours and for more than 40 hours a week during vacations. Most states also prohibit children from working at night, and all require permits as proof of age.

Neither the child labor nor the compulsory education laws, however, have eliminated child labor in the United States. An estimated 400,000 or more children of migrant workers who follow the planting and harvest seasons from state to state are exempt from child labor and compulsory education laws because they are not residents of any states. Many communities refused to admit nonresident children in local schools. Similarly, uncounted thousands of children of illegal aliens—likewise nonresidents—are also employed as child laborers and are unable to benefit from compulsory education laws.

Ironically, just as involuntary child labor produced generations of adult illiterates in the

19th century, voluntary child labor has interfered with the delivery of quality education to children in the late 20th and early 21st centuries. Almost 25% of all high school students hold full-time or part-time jobs during the school year, including 68% of high school seniors. Almost 2 million high school seniors work more than 20 hours a week. At least as many younger children also work long hours during the school year, and educators agree that after-school jobs are preventing many students from fulfilling important educational obligations, such as library research and homework. A 10-year study of 20,000 high school students in California and Wisconsin by Temple University psychologist Laurence Steinberg found that nearly one-third of those who had jobs were too tired to do their homework. Those who worked more than 20 hours a week earned lower grades and cut classes more often than their nonworking schoolmates.

Ironically, 75% of working high school students do so to earn spending money—about half to buy something expensive, according to the Massachusetts Occupational Health and Surveillance Program. Only 33% work to save for their future education, and only 23% work to help support their families. About 2% work to support themselves. Although federal and state laws limit the types of work adolescents can do, job injury rates for teenagers are the same as for adults, according to the National Institute for Occupational Safety and Health, which estimates that 70 youths are killed on the job each year and more than 210,000 injured.

Child Nutrition Act A 1966 federal law “to safeguard the health and welfare of the Nation’s children.” Extended and expanded in 1970 and 1977, the act provides federal funds to states to supply nutritional breakfasts and milk to economically deprived children in public and nonprofit schools and in preschools, day-care

centers, settlement houses, summer camps and other children's institutions.

child-referenced test A type of test that compares the child's knowledge after instruction to what the child knew before. The child-referenced test is one of three broad types of tests that include the NORM-REFERENCED and CRITERION-REFERENCED TESTS. The norm-referenced test compares the child's knowledge to that of other children, while the criterion-referenced test compares the child's knowledge to what the teacher or school expects him to know. Each type has its advantages and disadvantages. Proponents of child-referenced tests say they adapt the testing procedure to each child's abilities. Critics point out that it is largely used in inner-city schools, where schools can claim enormous student improvements each year, while their absolute achievement levels remain low in comparison to culturally advantaged students.

Children and Their Primary Schools (Plowdon Report) One of the most influential studies in the modern history of English education and of considerable influence on American public school education. Chaired by Lady Plowdon, the study was conducted in 1967 and the report that followed had 197 recommendations, including expansion of preschool education, introduction of multicultural and multilingual education for immigrant children and the development of middle schools to deal with the particular educational, developmental and emotional peculiarities of early adolescents.

Children's Aid Society An organization founded in 1853 by philanthropist Charles Loring Brace (1826–90) to provide homeless children in New York City with a lodging house and training in industrial skills. At the time, an estimated 10,000 homeless children roamed the streets of New York, many of them abandoned immigrant children who slept on steam

grates, under bridges or in garbage piles, and survived by selling newspapers, picking pockets or becoming prostitutes. Like similar organizations founded in the first half of the 19th century, the society's original mission expanded as flocks of abandoned or orphaned children appeared on its doorstep. Eventually, Brace created a network of lodging houses for boys and girls, with reading rooms and Sunday religious instruction. In addition, he set up a full-scale educational program of industrial schools and organized so-called orphan trains that carried some 100,000 abandoned children to live with families in rural areas of the nation—in some cases as cherished adoptive children but in others as exploited farm laborers. Like many other, similar organizations, the society was an outgrowth of the widespread evangelical movement that swept the United States between the end of the War of 1812 and the Civil War.

As missionaries combed the country for converts, their travels inevitably took them into city slums, where many remained to work with the unchurched poor. Out of that work sprang such organizations as the ORPHAN ASYLUM SOCIETY (1807), the NEW YORK SOCIETY FOR THE PREVENTION OF PAUPERISM (1816), the NEW YORK ASSOCIATION FOR IMPROVING THE CONDITION OF THE POOR and the Children's Aid Society. Today's Children's Aid Society provides a host of services that include adoption services and foster care, group homes, family counseling and sex and drug education. It operates a wide range of educational services, including Head Start facilities and a network of community and day-care centers, and it provides schools with social work and health services.

children's book clubs Membership organizations similar to adult book clubs but offering selected juvenile and young adult books to their members at prices below those of retail book stores. Children's book clubs have more than 20 million members to whom

they circulate monthly bulletins listing available books. Some clubs distribute directly to their members, while other clubs work exclusively through teachers or librarians, through whom children must place all their orders. As with adult clubs, there are two kinds of children's book clubs—hardcover clubs and paperback clubs.

Children's Book Council A New York City association of children's book publishers founded in 1945 to encourage interest in reading and enjoyment of children's books by distributing promotional materials such as posters and bookmarks to libraries and schools.

children's intelligence The ability of children to acquire and retain concrete and abstract knowledge and understanding to deal with new situations and acquire more knowledge. French psychologist ALFRED BINET was first to define children's intelligence in 1905, when the French government asked him and Theodore Simon to develop a test that would identify children too mentally retarded to benefit from normal school programs. The result was the first children's intelligence test, with a scale of 30 characteristics that distinguished between idiocy, imbecility and moronity.

Administered on an individual basis, the test was eventually adapted for use with all children and included verbal and pictorial problems and questions that measured vocabulary and understanding of social and other situations. In 1916 and again in 1937, LEWIS TERMAN revised the test to take age-associated child development into consideration. The result was the STANFORD-BINET INTELLIGENCE TEST and, subsequently, the Stanford-Binet Intelligence Scale, which can be administered to groups and yields scores representing the ratio of mental age to chronological age multiplied by 100—namely, the Intelligence Quotient, or I.Q.

children's literature A body of literature written expressly for children. Generally divided into *juvenile* books for elementary school children and *young adult* titles for middle school and high school students, children's literature usually falls into two classifications: trade books, sold through bookstores and designed for independent reading, and trade texts, with more carefully controlled vocabularies, sold to teachers and schools for use in classrooms.

Until the early 18th century, there was little literature specifically developed for children in the Western world, although a large body of entertaining oral literature had developed, based on folk tales, fables, legends, and so on. In England and the British Isles, these included the tales of Robin Hood, King Arthur, Jack the Giant Killer, Little Red Riding Hood and other popular stories. Those children who could read and attend school, however, studied only the Bible and other scriptural texts.

The invention of the printing press in the 15th century expanded the body of children's literature to include Sir Thomas Malory's *Le Morte d'Arthur* and Aesop's *Fables*, but most literature written for children consisted of serious works such as the *Book of Curtesye*, published in 1477 by the first English printer, William Caxton.

Little changed in the American colonies. The widely used *NEW ENGLAND PRIMER*, printed in Boston in 1690, for example, contained a rhymed alphabet, tables of syllables, the Lord's Prayer, the Apostles' Creed, the Ten Commandments, methods to prepare for death and departure into the next world, and a graphic description of the burning of a Protestant martyr at the stake.

The Czech-Protestant educational reformer JOHN AMOS COMENIUS may have been responsible for the first children's picture book, which he issued in Latin in 1658. It appeared in English in England and in the colonies a year later. In 1697, Charles Perrault published the first book specifically designed to amuse chil-

dren—a collection of traditional French folk tales, *Histoires ou contes du temps passé*. Better known as *Comtes de ma mere l'Oie*, it was translated into the *Tales of Mother Goose*, which included "Sleeping Beauty," "Cinderella," "Red Riding Hood" and "Bluebeard." Mother Goose provided the impetus for other writers to create more amusing children's literature. Among the most notable were Germany's Wilhelm Carl and Jacob Ludwig Carl Grimm, whose *Grimm's Fairy Tales* ("Hansel and Gretel," "Snow White and the Seven Dwarfs," "Rapunzel," etc.) were published between 1812 and 1815, and Denmark's Hans Christian Andersen, whose *Fairy Tales, Told for Children* ("The Princess and the Pea," "The Ugly Duckling," etc.) were published variously from 1835 to 1861.

English publisher John Newbery (1713–1867) was the first publisher in the English-speaking world to devote a significant portion of his production to children's books, printing attractive, inexpensive books with stories, puzzles, riddles and some lessons. The AMERICAN LIBRARY ASSOCIATION still honors Newbery by awarding its annual Newbery Medal to each year's outstanding new children's book.

With universal public education, children's book publishing mushroomed into the huge industry it remains today, with thousands of new titles published each year. In 1945, an association of American publishers of children's and young adult trade books formed the Children's Book Council to encourage children to read independently, outside of school, and to promote adult understanding of children's literature.

Despite the Book Council's continuing efforts and a steady increase in the juvenile population of reading age, sales of juvenile literature have declined steadily in the face of competition from other media such as television, electronic listening devices for popular music, computer games and other electronic entertainment. Although the juvenile popula-

tion of reading age increased nearly 10% from 2000 to 2005, juvenile book sales declined more than 11%, despite the phenomenal success of specific titles such as the Harry Potter and Lemony Snicket books. Although both series experienced huge worldwide sales, their popularity in the United States—like that of many juvenile titles—was largely limited to the most literate children, largely from families in middle, upper-middle and upper economic groups. Much of the increase in the juvenile population resulted from a surge in immigration by largely poor families whose children lack reading skills. By 2006 the U.S. Office of Immigration estimated the number of illegal immigrants in the United States at more than 11 million, including about 1.5 million school-age children. By mid-2006 about 49% of all American high school seniors were unable to read at the level required by college freshman texts, according to the ACT ASSESSMENT PROGRAM—a condition not likely to bolster book sales at any level.

Still another factor in the decline in consumption of children's literature has been a sharp fall-off in demand for nonfiction books. New teaching methods in primary and secondary schools have substituted selections and readings for complete books in social studies, history, the sciences and other academic areas. The practice has seriously reduced the demand for nonfiction books in the juvenile market.

Children's Literature Center The Library of Congress collection of children's books and other materials relating to children. The library began receiving children's literature in 1870 as copyright deposits, but it didn't gather them together in a special collection until the 1970s, after the AMERICAN ASSOCIATION OF UNIVERSITY WOMEN and the Association for Childhood Education International lobbied for the establishment of a special Children's Literature Center.

children's organizations Voluntary fraternal and sororal organizations founded largely in the late 19th and early 20th centuries to supplement the work of schools in shaping the characters of American youngsters. Among the most notable were the YMCA (1851), YWCA (1866), the Playground Association of America (1906), Boys' Clubs of America (1906), the Boy Scouts of America (1910), the Camp Fire Girls (1912) and the Girl Scouts (1912). Various founded by progressive educators, social reformers and missionaries, all had as their primary purpose the channeling of youthful energies in socially desirable directions.

At the time, American city streets were swarming with homeless children, some abandoned by parents who could no longer afford their care, others dismissed from jobs because of crippling injuries that made them useless, and still others simply orphaned and on their own. New York City alone had an estimated 100,000 street urchins who slept in doorways, discarded boxes or barrels and survived by begging or engaging in thievery or prostitution.

The Playground Association of America launched a national campaign to provide free playgrounds for city children. The Boy Scouts, Girl Scouts and YMCA and YWCA opened summer camps to provide summer vacations in the fresh country air for slum children. The thrust of the Boys' Clubs in the cities and Boy Scouts in the country was to convert adolescent "gang instincts" into activities that combined education and recreation.

The YMCA had been founded in 1844 and introduced in the United States in 1851 as an evangelical missionary society for young men. The YWCA was founded in 1866 to provide improved living conditions for young working women by providing boardinghouses for them. But the plight of America's homeless children forced both organizations to become educative and social service organizations in the 1890s, as children began showing up at lecture series

for adults to warm themselves and, as often as not, to curl up asleep in hidden corners.

By the end of that decade, big city "Ys" were routinely holding elementary school classes for youngsters who had left school to take full-time jobs. Their activities expanded to include counseling, guidance and vocational education. Later, they opened summer camps and vacation schools where children could escape the city slums and combine study with recreation. By 1913, there were more than 70,000 students enrolled at the Y, studying courses ranging from accounting to wire telegraphy.

As universal public education took hold after World War I and more states enforced child labor laws, the educative roles of children's organizations shrank substantially. By the end of World War II, public schools had wrested formal education out of the hands of most children's organizations, although all continue to offer camping and recreational opportunities for children, while the Ys continue to offer informal courses and cultural enrichment opportunities for both children and adults.

See the index for articles on individual children's organizations.

children's rights The privileges, protection and other entitlements granted to children under the law. Because of their status as dependents, minors traditionally have had few, if any, legal "rights." The U.S. Constitution granted them none, and they remained chattel throughout most of the 19th century, with indigent parents able to sell them virtually at will in many areas of the United States. Children's rights remain a morass of conflicting federal, state and local statutes and court decisions. One Florida state judge, for example, gave an adolescent boy the right to "divorce" his natural parents in 1992 so that he could be adopted by foster parents.

On the other hand, federal courts, including the U.S. Supreme Court, have consistently

ruled that minors do not have unrestricted rights to free speech in school and that school authorities can impose a wide variety of requirements and restrictions on student behavior. Schools can bar pregnant girls from some school activities in some states. They can impose dress and grooming codes and require students to serve as volunteers in community service programs as a requirement for graduation. School authorities can also censor what students write in school publications.

Public school authorities cannot, however, totally ignore the Constitution. They cannot deny students Fourteenth Amendment rights to "due process," for example, or force children to engage in any religious activities. The courts have ruled, in other words, not that minor students have constitutional rights, but that school authorities must obey constitutional restrictions on themselves as government agents.

Almost all the states have granted children certain universal rights. They are guaranteed the right, for example, to protection against abuse of any kind and neglect—even by their own parents. Most states and the federal government have passed laws to provide children with food, to prevent hunger and malnutrition, and medicines and sera to prevent disease. Most states and, again, the federal government provide handicapped children the right to attend school and to gain access to all other public facilities. Children, however, cannot usually demand their rights or obtain their just due on their own. As dependents, they do not have the "right" to represent themselves and are, therefore, forced to rely on appropriate adult, children's advocates to obtain protection or privileges due them under the law.

Children's Television Workshop A television production company of the 1960s, now known as Sesame Workshop and owned by Time Inc., and 1970s that produced the first educational television programs for children.

Founded by broadcast journalist Joan Ganz Cooney and Lloyd N. Morrisett of the Carnegie Corporation of New York, the workshop produced three of the most important and influential educational programs for children ever aired: *SESAME STREET*, *The Electric Company* and *Feeling Good*.

Financed by the CARNEGIE CORPORATION OF NEW YORK, the FORD FOUNDATION and the federal government, the three programs were the first to incorporate the school curriculum into entertainment broadcasting. They succeeded in luring millions of children away from commercial television programs, which, at the time, were targets of criticism for enveloping young viewers with violence and erotica.

Sesame Street was the first workshop production to be aired. Designed for preschoolers, it first appeared in 1969 on the then-new network of the CORPORATION FOR PUBLIC BROADCASTING and made reading exercises sound like television commercials that youngsters of that age loved imitating. Indeed, a typical show might have announced, "This edition of Sesame Street has been brought to you by the letters C and O and by the number 3."

Sesame Street's inventive, socially conscious producers believed firmly in the theory that more than half the lifetime intellectual skills are formed by the age of five, and they made special efforts to appeal to socially and educationally deprived preschoolers without preschool education and, therefore, with limited development of school-related skills. Although middle- and upper-income children also grew addicted to *Sesame Street*, the program reached 90% of inner-city children and, according to schools in those neighborhoods, produced remarkable results in improving reading readiness of deprived children. *Sesame Street* lessons were delivered by showing, not lecturing, and the various puppets and children who mixed easily on the show represented all colors of the rainbow.

In 1971, the workshop produced *The Electric Company* to teach and improve reading techniques of slightly older children. In 1974, the workshop brought health education to teenagers via its program *Feeling Good*.

child study movement A massive effort by educators and psychologists who in the 1890s began to document all elements of CHILD DEVELOPMENT. CLARK UNIVERSITY psychologist and founding president G. STANLEY HALL originated the child study movement in 1897, when he enlisted women's clubs across the United States in gathering data about every element of their children's moral, intellectual and emotional development. His goal was to develop a science of child development and, in turn, a science of education that mothers and teachers alike could use to ensure the proper upbringing of American children. His colleagues at Clark University examined every aspect of children's development—from the roots of loyalty, lying and sexual behavior, to fluctuating interests in literature, history, geography and arithmetic. Their conclusions produced a revolution in the way parents raised their children and the way they and their children's teachers approached education.

Young children, Hall's studies found, were fundamentally and *naturally* different from adults, with different ideas about truth and untruth and an inability to distinguish clearly between imagination and reality. Rather than interfere with what Hall called natural development—by punishment, constraints and prohibitions—parents and teachers should limit their interference in children's development to protecting them from harm. Parents were urged to love, nurture and encourage children's natural propensities and give them free rein rather than forcing them to meet adult standards which they were not capable of understanding. Children were born innocent little animals, "in the hand of God," said Hall. They were not evil or

corrupted by original sin, as many Protestant church leaders had contended for centuries.

Hall urged schools to establish more kindergartens and teachers to extend the informality of kindergarten into the elementary grades. He urged reformulation of elementary school curricula to meet the needs, interests and developmental patterns of children—to make schools *pedocentric* rather than *scholastic*, as they had been for centuries. As the child study movement gained momentum, it produced untold numbers of pamphlets and books designed to educate mothers and teachers on proper methods of caring for, raising and educating children.

Child Welfare League of America A child advocacy organization that sets standards for and accredits a wide range of child care facilities and agencies, including child protective services and adoption and child-placement services. Formed in 1920, the league also sponsors research on child care, child welfare and foster care.

choral speaking A pedagogical technique to help youngsters of any age learn to appreciate and enjoy poetry, free verse and dramatic prose. Choral speaking may be formal or informal. Students engage in informal choral speaking each morning when they recite the Pledge of Allegiance. Formal choral speaking, however, requires almost all of the same techniques used for choral singing, with voices grouped by pitch and assigned different parts. As with choral singing, formal choral speaking requires a choral director to direct the tempi and sonorities. Choral speaking has also been used to good effect in teaching adults ENGLISH AS A SECOND LANGUAGE (ESL) to convey intonation patterns and speech rhythms.

Christian schools Private, fundamentalist Protestant, or evangelical, schools that are usu-

ally members of one of four associations: the American Association of Christian Schools, National Association of Christian Schools, Association of Christian Schools International or Christian Schools International. In 2000, there were an estimated 10,000 such schools claiming a combined enrollment of about 825,000 children. The vast majority of the schools were less than 25 years old and the result of a resurgence in Christian fundamentalism in the United States.

The term *Christian school* is, however, confusing. Just as the word *Christian*, by itself, has several meanings, so does the term *Christian school*. In the universal sense, a Christian is a follower or believer in Christ, but in the United States, a Christian may also be a member of either of two specific sects: the Christian Church (Disciples of Christ) or the Christian Churches and Churches of Christ, the latter a fundamentalist group that separated from the former in 1906. Both groups operate “Christian schools,” and the Christian Church (Disciples of Christ) operates two colleges. Christian schools may, therefore, refer to schools operated by these two sects or, more universally, to religiously oriented schools offering some religious education. Unlike the term *Christian*, which includes Roman Catholics, the term *Christian school* does not include Roman Catholic schools. Christian schools are always schools affiliated with Protestant denominations. Those identifying themselves as conservative are often associated with evangelical Christian sects but may include schools associated with Southern Baptists, Pentecostals and even nondenominational Christian groups. All require the teaching of CREATIONISM in their history and science courses—that is, that God created the world in six days. Although some discuss and even teach the theory of EVOLUTION, conservative Christian schools emphasize its contradictions of what they consider to be biblical truths about creation.

The term *Christian school*, however, may also refer to one of the many all-white private Christian academies—mostly in the South—that opened in the 1970s and 1980s for white families to evade federal laws and court rulings that desegregated public schools.

church Usually, the religious organizations made up of believers in Christ, but used in a more general sense in the secular United States to mean all organizations whose members engage in religious worship.

Throughout the history of the New World, the church has been central to education, and while the Declaration of Independence severed the ties of American colonists to England, it did little to sever their ties to the churches their English forbears had founded in the colonies. After the Revolutionary War, all 13 states continued the colonial practice of maintaining official religions, and they routinely tailored their laws to conform to church laws. In 1783, however, seven states responded to demands from members of other Christian sects for greater religious freedom by disestablishing the church. In 1786, Virginia followed suit, and, in 1791, the federal Constitution was amended to prevent Congress from making any laws “respecting an establishment of religion. . . .” Connecticut, however, waited until 1818 to sever its ties to the state religion, and Massachusetts became the last state to do so in 1833.

In the absence of state-operated schools, however, the church remained responsible for virtually all formal education in the United States. The U.S. Constitution made no mention of education and, by default, the federal government and, in turn, the individual states often left questions of education to local communities and the parents therein. In the early United States, the central institution in most communities was the church, whose minister, more often than not, was also one of the few college-educated men. Trained to instruct their

congregations in the beliefs and rites of their church, clerics were teachers as well as ministers. It was natural for them to assume the role of secular as well as spiritual teachers in most communities—if for no other reason than to insure the ability of children to read and learn the key tenets of the church.

It was not until the mid- to late 19th century that secular public schools began competing with churches as providers of education. Although secular public schools filled the educational needs of American-born children, they often proved inadequate for many children of semiliterate, non-English-speaking immigrants arriving from Europe.

To fill those needs, many Catholic churches and Jewish synagogues converted their religious schools into ethnoreligious, bilingual institutions that not only provided education, but a wide range of social services that had never before been available in the United States: child care services for working parents, nursery schools, food baskets for the hungry and the ill and all the other “welfare” functions that government would assume in the mid-20th century.

By the end of World War I, as government replaced the church as the primary provider of education, the number of children attending church schools began declining, and with that decline came a subsequent decline in church membership. To reverse the trend, many churches moved into political activities that not only bonded church members in common causes, but taught them the working of the American political system. In the 1920s, many Protestants found common cause in supporting and obtaining passage of the Eighteenth Amendment to the Constitution banning the manufacture or sale of intoxicating liquors. In the 1950s and 1960s, many churches supported the movement for civil rights and racial desegregation. In the 1970s and 1980s, other churches went to battle over such questions as nuclear disarmament,

world peace, legalized abortion, prayer in public schools, and many other issues.

In addition to political and social activities, many churches and religious institutions held their congregations together by expanding into educative social activities, such as lectures, adult education, men’s, women’s, parents’, singles’, senior citizens’, boys’ and girls’ clubs. Many offered retreats and summer camps, travel opportunities, concerts, plays, movies and other entertaining programs. Some religious organizations broadcast services over radio and on television to a larger pool of potential members.

The net effect on American life has been to make the church an integral part of daily life. For more than a century, more than 60% of Americans have remained members of churches, synagogues and other religious organizations. Those ties have made it difficult for many Americans to understand and, indeed, adhere to constitutional separation of church and state—especially when that separation affects education, with which the church has always been so closely tied.

Church of England The third of the Protestant churches to emerge during the Reformation, after Lutheranism and Calvinism. Originally Roman Catholic, England first broke with the papacy in 1534, after Pope Clement VII refused to annul the marriage of Henry VIII to Catherine of Aragon. Asserting the right of a Christian prince to control church affairs in his domain, Henry forced Parliament to pass the Act of Supremacy, which made the king supreme in matters spiritual as well as temporal and stripped the pope of his control over the church in England.

English translations of the Bible followed, and in 1549, the clergy published the first English *BOOK OF COMMON PRAYER* containing the rites of the church. After Elizabeth I succeeded to the throne in 1558, Parliament approved a

new Act of Supremacy, reasserting the supremacy of the English Crown over the church, and an Act of Uniformity requiring the use of the English-language *Book of Common Prayer* in all English churches. As a university degree became a prerequisite for obtaining a license to preach, better, more broadly educated men ascended church pulpits in England and, because of their education, extended their priestly duties into teaching. The Anglican Church of Christ became the “school of Christ,” to cite English minister Hugh Latimer. They continued those duties in the American wilderness when they arrived with the first settlers in Virginia and New England.

Although the early American colonies included French and Spanish Catholics, Swedish Lutherans, Dutch and Scottish Calvinists, French Huguenots and Spanish Jews, the English Protestants made up the majority of settlers and both their language and their religion predominated. Intent on maintaining that predominance, England sent an army of soldiers, persuasive politicians and religious missionaries to assure colonist loyalty to the mother country and the mother church.

The number of missionary minister-teachers grew from no more than 40 in the early colonial days to several hundred a century later. In New England, many churches had both a minister to preach and a lay instructor to teach children the Scriptures. Virginia law required the minister to do both and, indeed, “upon every Sunday . . . shall half an hour or more before evening prayer examine, catechize, and instruct the youth and ignorant persons of his parish. . . .”

As the Age of Reason swept across western Europe and England, Anglican ministers expanded their readings to include philosophy, sciences, mathematics, foreign languages and other subjects that reached beyond the spiritual. They added these to the curricula they taught in church schools and in an ever grow-

ing network of private academies and colleges they had founded.

A combination of factors in the mid-18th century, however, began to weaken the hold of the Church of England on the minds and hearts of many colonists—just as those same factors eroded colonist loyalty to the Crown. For one thing, many non-Anglicans of non-English blood set up their own churches and church schools to educate their young. For another, the sheer isolation of many communities kept them out of touch with the orthodox ideas of central church and political authorities in such cities as Boston. Over the years, life in the wilderness reshaped those ideas into religious and secular teachings that were no longer in accord with the mother church.

In addition, the Age of Reason itself was producing new liberal philosophies that changed the thinking and religious beliefs of many New World Anglicans. Coupled with the informal, egalitarian way of life in the colonies, the new philosophies not only produced new religions, they eventually produced a new nation, free of the notions of divine rights of kings and predestined social status.

With political independence, Americans in Anglican congregations broke their ties to the Church of England, which required prelates to swear allegiance to the British crown. After changing the name of their religion at first to Protestant Episcopal, they petitioned the Archbishop of Canterbury to obtain permission from Parliament to consecrate American bishops. Early in 1787, Parliament acceded, and the bishops of the Church of England began consecrating the first bishops of the Episcopal Church in America. Two years later, all congregations sent delegates to the first general convention in Philadelphia and formally organized the Episcopal Church. Although the Church of England declined in religious importance in the United States, the educational traditions it established have

remained a permanent fixture of American society.

church-related schools Educational institutions that integrate religious instruction into their curricula and are operated either directly by religious authorities or lay authorities associated with a religious sect. More than 19,000 of the nearly 28,000 private schools in the United States are church related. Until the public school movement got under way in the mid-1830s, virtually all schools in the United States and, before that, in the American colonies, were church related. Even the most secular institutions included prayer and instruction in the Scriptures in their daily routine. The early private academies were all church related.

Although the first public schools had no official ties to any church, they displayed a distinct Protestant bias in the daily prayers and, as often as not, the biblical studies they required. As waves of non-Protestant, European immigrants arrived in the United States, many rebelled against the Protestant bias in public school education. Catholics were the first. In 1884, the Third Plenary Council of Baltimore issued a decree establishing a system of CATHOLIC SCHOOLS to educate children of Catholics from primary school through university. Catholic schools remain the largest group of church-related schools in the United States, with about 8,250 primary and secondary schools, compared to about 13,000 for all other religions combined.

As the number of Catholic immigrants swelled in the 1880s, so did the number of Jews. Most of them also refused to abandon their ethnoreligious heritage to the protestantized Americanization process of public schools. Instead, they established TALMUD TORAH SCHOOLS and YESHIVAS that combined Hebrew studies and religious education with the academics taught in public schools.

Public schools, meanwhile, responded to complaints of religious bias toward immigrant

children by secularizing their curricula. Although they succeeded in luring more children of the foreign born, they drove away some American Protestants. By the turn of the 20th century, many Protestant sects had established their own church-related schools. The wealthiest families sent their children to elite Protestant boarding schools in New England—many of them successor institutions of the colonial-era academies. As the number of religious schools expanded, supporters of compulsory public schooling laws challenged the right of church-related schools to exist. In 1922, Oregon passed a law requiring all children between the ages of eight and 16 to attend secular public schools. In 1925, however, the U.S. Supreme Court declared the law unconstitutional in the case of *PIERCE V. SOCIETY OF SISTERS* and opened the way for a vast expansion in the number of parochial schools.

Although that growth slowed during World War II, it accelerated in the 1960s and 1970s, when a wave of Protestant fundamentalist fervor set off attempts to reintroduce prayer and religious studies into public schools. After the U.S. Supreme Court issued a series of definitive rulings barring all religious studies and practices from public schools, fundamentalists responded by establishing new church-related christian schools. Of America's more than 54,600 elementary and secondary schools, more than 21,300, or 39%, are church-related schools—more than 8,000 of them Catholic. About 60%—more than 16,500—are elementary schools. About 8.2% of American elementary and secondary school children—about 4.35 million—attend religious schools.

(See also PAROCHIAL SCHOOLS.)

church-state conflicts In education, those conflicts centering over government prohibition against the teaching or practice of any religion in publicly funded educational institutions. Few, if any, church-state conflicts affected edu-

cation during the colonial era or even during the first 80 years of American independence, when local churches and their parishioners controlled most education. Even the enactment of the Bill of Rights produced little conflict between church and state in education. Although the First Amendment's ESTABLISHMENT CLAUSE prohibited Congress from passing any law "respecting an establishment of religion, or prohibiting the free exercise thereof . . .," it did not prohibit states from doing so. Indeed, Massachusetts did not sever its official ties to the church until 1833, and churches remained the only schools in most American communities.

In the 1830s and 1840s, Massachusetts, Connecticut, Rhode Island and New York established the first public school systems funded with public monies. Most routinely incorporated Protestant religious instruction as part of their day-to-day curricula until 1868, when passage of the Fourteenth Amendment to the Constitution extended federal restrictions to state governments and in effect barred them from imposing a religion on citizens. Nevertheless, Protestant church doctrines and rites, ranging from the singing of Christmas carols to actual teaching of Christian Scriptures, remained an integral part of education in the vast majority of American public schools. As waves of non-Protestant immigrants arrived, their children either accepted such education or transferred to schools founded by their own churches and sects.

The explosive growth of sectarian schools and the siphoning of non-Protestants from public schools created more church-state conflicts. In 1922, Oregon passed a law requiring all children between the ages of eight and 16 to attend public schools. In 1925, however, the U.S. Supreme Court declared the law unconstitutional in the case of *PIERCE V. SOCIETY OF SISTERS*, and opened the way for a vast expansion in the number of parochial schools. Mean-

while, church-state conflicts expanded in a new direction in the South during a surge of Protestant evangelical fervor. Outspoken evangelists demanded that the teaching of evolution be banned in public schools and colleges. Bitter political battles erupted in Kentucky, North Carolina, Texas, Oklahoma, Florida and Tennessee. The fundamentalists lost in the first three states, but Oklahoma outlawed the public school use of books with Darwin's theory of EVOLUTION. Florida made it "improper and subversive" for public school teachers to teach atheism, agnosticism, Darwinism, or "any other hypothesis linking man in blood relationship to other forms of life." In 1925, Tennessee passed the Butler Bill, making it a crime for teachers in public schools and colleges "to teach any theory that denies the story of the Divine Creation of man as taught in the Bible, and to teach instead that man has descended from a lower order of animals." When Dayton, Tenn., science teacher John Thomas Scopes used a textbook that explained the theory of evolution, he was arrested, tried and convicted in the most celebrated church-state conflict ever to affect American public school education. The SCOPES MONKEY TRIAL, however, made American Protestant fundamentalism—and, indeed, American rural public schools—the target of worldwide mockery. The movement to ban the teaching of evolution seemed to die, but the conflict behind the movement did not. At the heart of the conflict was the question of parents' rights to prevent schools they support with their taxes from teaching their children facts that conflict with their religious beliefs. The conflict flared up again after World War II, as another wave of evangelistic fervor swept the United States. As fundamentalists gained control of school boards and state legislatures, schools once again introduced religious instruction and prayer into the school curriculum. As it had in the *Scopes* trial, the American Civil Liberties Union led the legal opposition to

force state and local governments to abide by First Amendment restrictions against state imposition of religion. In a landmark reaffirmation of the First Amendment in 1962, the U.S. Supreme Court ruled in the case of *ENGEL V. VITALE* that New York State had violated the Establishment Clause of the First Amendment by giving public school officials the option to mandate a daily prayer in school. In the subsequent case of *SCHOOL DISTRICT OF ABINGTON TOWNSHIP V. SCHEMPP* the following year, the Court reaffirmed *Engel* in ruling that the Abington (Pennsylvania) School District had violated the First Amendment by allowing prayers and Bible readings in public schools—even when it excused unwilling students from such activities.

Meanwhile Louisiana passed a law that entitled the Louisiana Balanced Treatment for Creation-Science and Evolution-Science in Public Instruction, which prohibited the teaching of the theory of evolution in public schools unless “CREATION SCIENCE” was taught at the same time. In 1987, in the case of *EDWARDS V. AGUILLARD*, the Court struck down the Louisiana law as a violation of the First Amendment. The Court said that the law had been designed to discourage the teaching of accepted scientific theories while promoting a specific religious belief.

Many state education boards have not ceased trying to bypass the Court’s rulings, however. Although it reversed its decision in 2001, the Kansas Board of Education ordered schools to delete all mention of evolution in science curricula in 1999. Kentucky ordered schools to delete the word *evolution* in favor of the phrase *change over time*, and Oklahoma officials ordered all science textbooks to carry a disclaimer about the certainty of evolution. In addition to officially mandated changes in the curriculum, a growing number of teachers committed to “the inerrant word of God” have organized so-called creation clubs in several hundred public schools across the nation. The creationist

thrust, however, is not without stiff opposition. The National Science Teachers Association, with 53,000 member-teachers, and the National Center for Science Education, with 4,000 members, continually sponsor seminars to prepare teachers to lead their communities in defending evolutionary theory as essential to proper science education. New Mexico’s Board of Education responded to these efforts late in 1999 by barring creationism from the public school science curriculum and overwhelmingly endorsing the teaching of evolution theory.

Undeterred, Christian fundamentalists re-packaged creationism into what they dubbed INTELLIGENT DESIGN—and again placed the teaching of evolution in jeopardy in many areas. A theory that an as-yet-unidentified guiding force directed the development of all living organisms—including humans—intelligent design was developed as an alternative to Charles Darwin’s theory of evolution. Intelligent design proponents claim that living organisms are too complex to have evolved from common ancestors through natural selection and random mutation. Underlying the argument for intelligent design is the concept of “irreducible complexity,” which holds that the interdependent parts of most organisms make it impossible for them to have existed in any other earlier, more primitive form. Unlike creation science, or creationism, the theory of intelligent design carefully avoids all references to religious beliefs, which, by injunction of the United States Supreme Court, the public schools are prohibited from teaching or disseminating. Nonetheless, a Federal District Court in Harrisburg, Pennsylvania, ruled in December 2005 that intelligent design was as much a religious viewpoint as creationism and that public schools injecting it into the science curriculum were in violation of the First Amendment of the Constitution.

As controversial as the evolution question has been the question of PRAYER IN SCHOOL. The U.S. Supreme Court declared prayer in public

schools unconstitutional in its 1963 decision in the case of *School District of Abington Township v. Schempp*. Tennessee, Alabama, Oklahoma and many other states, however, subsequently enacted laws that bypassed the Supreme Court ban on teacher-led or school-directed prayer by permitting student-led, nonsectarian, nonproselytizing, noncompulsory prayers on public school grounds at noncompulsory student assemblies, sporting events and graduations. The issue has yet to be fully resolved. The federal courts have upheld student rights to pray independently of school authorities. Aside from banning prayer and religious instruction in public schools, the Supreme Court has also consistently ruled that government may not provide tax-funded materials or services to religious schools or do anything that might promote any religion.

Although the Supreme Court has remained firm in banning prayer and religious instruction in public schools, it has been less zealous in guarding against the use of public funds to support secular education in religious schools (a) when nonreligious schools routinely receive such funding and (b) if the funds are not paid directly to any religious organization. As early as 1947, the Supreme Court ruled in *EVERSON v. BOARD OF EDUCATION* that the state of New Jersey could reimburse parents for the cost of transporting students to and from religious schools. Such benefits, said the Court, merely duplicated benefits already provided to parents of public school students and was of no direct benefit to any religious organization. In *Committee for Public Education v. Nyquist* in 1973, however, the Court struck down a New York State law providing a tax deduction for tuition paid to private schools. The Court ruled that the law had not been neutral and provided parents of students attending religious schools a benefit not available to parents of public school students. Ten years later, on the other hand, the Court's ruling in *Mueller v. Allen* upheld a

Minnesota tax deduction for *expenses* incurred at any school—public or private, including religious—for textbooks and other strictly secular teaching materials that the local school district would normally provide free of charge to students in public schools. In 1996, the Court went a step further, ruling in *Agostini v. Felton* that it was constitutional for public school districts to send teachers to parochial schools to teach federally financed classes.

citizenship education The study of the rights and responsibilities of United States citizens and the mechanics of government. Once incorporated in required secondary school civics courses, citizenship education was gradually absorbed by social studies courses. Citizenship education began to reemerge as a separate topic following national surveys in the 1970s and 1980s that showed the majority of American school children to be ignorant about government operations.

City University of New York The public system of higher education operated by the City of New York in the city's five boroughs. Made up of 20 campuses, CUNY includes 11 four-year colleges, six community colleges, a graduate school, a law school and a school of biomedical education, with a faculty of 6,000 offering more than 1,400 academic programs to 450,000 students.

The oldest of the university's campuses are City, Hunter, Brooklyn and Queens Colleges. City College was founded in Manhattan in 1847 as the Free Academy to give free higher education to New York's poor but intellectually gifted men, especially the sons of immigrants. Once called the "Harvard of the Poor," the Free Academy produced eight Nobel laureates, two Pulitzer Prize winners and scores of leaders of local, regional, national and international renown—

among them U.S. Supreme Court justice Felix Frankfurter, labor leader A. Philip Randolph and Secretary of State General Colin L. Powell.

Ironically, New York City had no free public schools until 1897, 50 years after the founding of the Free Academy. Therefore, the Academy had to compensate for the lack of free secondary school education by offering a five-year program, with the first year a “subfreshman” curriculum of preparatory studies for academically gifted graduates of the eight-year common school program that constituted the only lower level education then available in New York.

Hunter was founded in 1870 as the Normal College of the City of New York to train young women as teachers. Brooklyn College was founded in 1930 and Queens College in 1937 to fulfill the same roles in those boroughs that City College did in Manhattan. Since then, the university has added colleges in other boroughs, as well as a bilingual college for Hispanic students and colleges specializing in business, criminal justice and other professional areas.

The Free Academy adopted the name City College in 1866, but remained a free institution, even giving its students free textbooks, until New York City’s 1976 budget crisis, when it imposed a nominal annual tuition of several hundred dollars. It remains, however, an educational haven, where New York’s poor can obtain an education at costs far below those of other public colleges in the United States. More than 10% of the student body are economically disadvantaged. Between World Wars I and II, Hunter, Brooklyn and Queens Colleges joined with Manhattan’s City College to form the city’s public system of higher education. It was the city’s explosive growth after World War II, however, that led to the founding of the rest of the huge system in all five New York City boroughs and their administrative unification into today’s City University.

From its inception, the college and then the university was open to all graduates of

accredited New York City high schools, although high school grades and class rankings determined whether students enrolled at the selective four-year colleges or went to two-year community colleges for more academic preparation. The racial and ethnic complexion of the students, however, changed radically. At the beginning of the 20th century, more than three-quarters of the men at City College and more than one-third of the women at Hunter were Jewish, and almost all students at both schools were white. As the 20th century neared its end, and the student population had grown to more than 200,000, two-thirds of the students were members of non-white minorities, with blacks making up about 37%, Hispanics 30%, and Asians more than 11%. Fifteen per cent are foreign born.

About 40% of the blacks and Hispanics traced their origins to the Caribbean, where inadequate educational facilities left them less than prepared to handle college-level studies in New York. The net result was a radical change in the City University curriculum to provide remedial courses in almost every area of basic education.

In 1970, however, minority students protested what they perceived as racially discriminatory admissions policies that tended to send educationally deprived blacks to two-year community colleges and better educated whites to the four-year institutions. Student demonstrations forced the university to adopt open enrollment policies that allowed any New York City high school graduate, by right, to enroll at any branch of the university and receive any necessary counseling and remediation to assure successful completion of the academic program. Originally seen as a breakthrough in academic democracy and an opportunity for financially deprived students to avail themselves of quality higher education, open enrollment perpetuated the de facto ethnic and racial segregation that had ignited the student protests in the first place. Black and Hispanic students tended to make up

the bulk of the students in the boroughs where they lived, and whites filled university buildings in the areas where they lived. In addition to perpetuating de facto segregation, open enrollment sent academic standards at the university plunging. More than 70% of incoming freshmen needed one or more courses in basic or remedial reading, writing or mathematics, and fewer than 25% of students were able to graduate after five years, while only 40% graduated after eight years. As academic standards fell, senior faculty began fleeing the university, along with academically gifted white students, who enrolled in nearby branches of the more academically demanding state university system. Moreover, some of the university's four-year colleges saw an exodus of senior faculty as academic standards were lowered to accommodate academically deprived students. As academic standards dropped, white students fled City University and enrolled in nearby branches of the state university system, where they remained a majority. In 1976, the City University restored the two-tier system in which only the two-year community colleges offered open enrollment, while the four-year colleges offered a university-wide entrance examination that placed students in each of four-year colleges according to academic ability. The changes made little improvement, however. By 1998, only 30% of incoming freshmen graduated after five years and only 42% after eight years. In 1999, the university decided to restore the academic standards that had made it a great university and bar admission of students who could not pass proficiency tests in reading, writing and mathematics. In 2001, the university abandoned all remedial education in its four-year colleges and relegated all applicants who needed such education to the university's two-year schools to upgrade basic skills before attending the four-year colleges. Ironically, the decision to end remedial education at New York City's public four-year colleges came at a time when 80% of public four-year colleges across

America had integrated remedial education into their basic curriculum. Indeed more than 68% of all private four-year colleges were routinely offering remedial education to students who needed such help.

(See also OPEN ADMISSIONS.)

civics A one-year course in American government, its mechanics and methods of functioning. Once a required part of the public and private secondary school curriculum, civics courses included a study of the traditions of democratic thought and philosophies from Plato and John Locke to John Adams and James Madison; an in-depth study of the Declaration of Independence, the U.S. Constitution and the *Federalist Papers*; a study of contemporary federal, state and municipal governments and how they work; and a study of the history and current status of contemporary issues. During the 1950s and 1960s, civics was gradually absorbed into the social studies curricula of most public schools and into American history courses at most private secondary schools. There have been efforts to expand its importance, in the wake of studies in the 1980s showing most American high school students ignorant about government processes and citizen responsibilities. More than one-third of the nation's high school seniors did not understand the fundamentals of American government, according to the U.S. Department of Education's National Assessment of Educational Progress in 1999. Only about 26% of high school seniors had "proficient knowledge" of the workings of government. The rest—39% fell in the middle, displaying understand of civics "at or above a basic level."

Civilian Conservation Corps (CCC) A 1930s, Depression-era program of the U.S. government that pioneered many early techniques in adult education and put more than 2.5 million unemployed young men to work on vital

land and forest conservation projects. Established in the spring of 1933 by executive order of President Franklin D. Roosevelt, the CCC hired men (women were not permitted) between the ages of 18 and 25 from poor, usually welfare families to work on erosion prevention and reforestation projects at military-style camps set up across the country by the Departments of Interior and Agriculture. The men were paid \$30 a month—a relatively generous sum for the time when added to the free living quarters, food and clothing they received.

Initial CCC enrollment of 250,000 men more than doubled within two years. Over the nine years of its existence, CCC enrolled more than 2.5 million. In addition to teaching the men the basics of hygiene and proper nutrition, CCC developed a far-reaching education program that started with camp libraries, but expanded into formal education with the discovery that thousands of enrollees were illiterate.

By 1937, the U.S. OFFICE OF EDUCATION, now the Department of Education, had set up literacy programs at CCC camps that taught more than 35,000 illiterates to read and write. More than 1,000 of them earned high school diplomas and 39 earned college degrees. CCC camps also set up vocational education programs that taught thousands of workers such skills as carpentry, woodworking and metalworking, while their daily work taught them the principles of forestry and agriculture.

After the United States had sent all its able-bodied men to war in 1942, Congress voted to disband the CCC, and its work was never resumed. During its nine-year existence, however, it was responsible for educating hundreds of thousands of uneducated men, who, in return, were responsible for the planting and preservation of literally billions of trees and halting the erosion of millions of acres of land. In so doing, they created hundreds of parks and recreation areas.

Civil Rights Act of 1964 A far-reaching federal law that banned racial and ethnic segregation in American public schools, colleges and universities and all other educational institutions receiving federal assistance. School desegregation was but one of eleven sections or “Titles” in what was the most sweeping federal law ever passed to guarantee equal rights to all Americans. The most important were Title I, which guaranteed every American citizen the right to vote; Titles II and III, which desegregated all public facilities; Title IV desegregated public education; Title VI, which banned discrimination in federally assisted programs of any kind, including construction projects; and Title VII, which outlawed discrimination and segregation in most employment.

The law also strengthened the powers of the CIVIL RIGHTS COMMISSION and gave the U.S. Attorney General the power to take legal action to force schools to desegregate. In an effort to encourage voluntary desegregation, however, it provided for federal financial and other assistance to districts desegregating their schools. In effect, the act translated the various Supreme Court rulings against racial segregation into the law of the land. It also reflected the growing impatience of the Court with the reluctance of many communities to desegregate their schools. Ten years had passed since the court decision in *BROWN V. BOARD OF EDUCATION OF TOPEKA*, declaring segregated schools unconstitutional, but school districts throughout the South were continuing to ignore the ruling. To end such disobedience, the new law promised swift punishment from the attorney general for districts that continued to flout the law, but offered tempting financial rewards to those districts that complied.

Civil Rights Commission A six-member group appointed by the president, with responsibility to investigate racial, religious, ethnic and other types of discrimination. The com-

mission was also empowered to conduct appropriate studies of civil rights in the United States and to recommend changes in government civil rights policies and laws. Created in 1957, the commission remained a relatively ineffectual body until the Civil Rights Act of 1964 broadened its powers. The new law also asked the commission to study “the lack of availability of equal educational opportunity for individuals by reason of race, color, religion, or national origin in public educational institutions at all levels in the United States. . . .”

The result was a 1967 report entitled *Racial Isolation in the Public Schools*, which documented dramatic inequalities between white and black education in American public schools. It found that more than three-quarters of elementary school students in American cities attended schools that were virtually all-black or all-white and that the black schools were inferior in every way, with inferior curricula and less competent, less educated teachers than in white schools. The result was a sharply lower level of academic achievement among black students and a sharply reduced likelihood that they would ever enroll in college. The commission suggested a group of remedies that not only included remedial education, but a form of COMPENSATORY EDUCATION that would include supplementary educational services and city-suburb educational collaboration to bus black students to the better white schools of the nearby suburbs.

The commission’s report confirmed the findings of a similar study the previous year—the Coleman report—and the two reports changed the direction of American policy on race and education. Until then, American policy had been to desegregate schools by combatting *de jure*, or legal segregation. The two reports changed the policy to one of affirmative action bent on integration of schools and the ending of *de facto* segregation produced by the income level and the racial or ethnic

makeup of neighborhood residents. The new policy not only led to court-ordered busing of schoolchildren to schools outside their own neighborhoods. It made it illegal for any district to allow any school to have a student body made up of 85% or more blacks. Despite the new policy, however, more than two-thirds of all black students still attend schools that are 50% to 100% nonwhite—largely because of the failure of most communities to integrate housing on a noneconomic basis.

Civil War The war between the northern and southern states. Fought over four years, from 1861 to 1865, the war had far-reaching short- and long-range repercussions on American education. The immediate effects were the destruction or closure of thousands of schools and colleges. Because of their central locations in most communities, schools were invariably commandeered by the military as lookout posts or headquarters and then destroyed by invading forces. Colleges were converted into hospitals, barracks and training centers. As conditions deteriorated in the South, schools and colleges, like many homes, were looted, purposely destroyed or simply dismantled for firewood.

If the toll on school buildings was high, the toll on students and faculty was even higher. Regardless of how far they were from the fighting, students and teachers by the tens of thousands marched off to war. Colleges and schools as far away as Maine and Michigan barely managed to keep their doors open and offer a scaled-down curriculum to those who remained behind. Many colleges simply closed, and some never reopened.

Although the Civil War heaped women with more than their share of tragedies, it nevertheless had one long-range educational benefit: it opened the doors of the schoolhouse to women teachers. Before the war, only about 10% of American teachers were women. By the

1880s, a shortage of manpower had helped women capture 63% of all teaching positions in the United States generally and more than 90% in cities. As male teachers had marched off to war, women replaced them, and when they returned from war they were paid far higher wages to rebuild the nation's farms and factories than they could earn as schoolmasters.

But the most important educational benefit of the Civil War accrued to the nation's former slaves. As northern armies conquered the South, tens of thousands of blacks flocked to army camps, where Union generals not only had to feed and clothe them, but begin the process of educating them and preparing them to support themselves as free men and women. Initially under the direction of the Army, but later under the direction of the FREEDMEN'S BUREAU, hundreds of northern teachers traveled south to set up schools and colleges to teach blacks. By 1895, they had built or helped build 27 colleges and 62 secondary schools for blacks, where none had existed before.

Another benefit of the Civil War for education was the effort by the Union to open the western territories and lure them into the Union as states. While the Homestead Act of 1863 and other measures encouraged settlement of the West, the Land Grant (Morrill) Act of 1862 offered tens of thousands of acres of free government land to each state (30,000 acres for each senator and representative) to sell and use the proceeds to establish and maintain colleges. The new "LAND-GRANT" COLLEGES were to offer practical education in agriculture, mechanics, mining and military tactics, as well as the traditional arts and sciences. Although some state officials profited handsomely from the sale of the lands, the net result was the construction across the United States of the colleges that spawned the nation's public state universities and colleges.

Clark, Kenneth B. (1914–2005) African-American social scientist, psychologist and edu-

cational reformer, whose pioneer research in education proved crucial to the U.S. Supreme Court's 1954 decision to outlaw school segregation. Born in Panama, Clark grew up and attended public schools in Harlem in New York City. He graduated from all-black Howard University in Washington, D.C., in 1935, with an intellectual elite that assumed the reins of black leadership in post-World War II America and eventually won sweeping legal guarantees for American minorities. After earning an M.S. at Howard and a Ph.D. at New York's Columbia University (see COLUMBIA COLLEGE) he taught at HAMPTON INSTITUTE in Virginia for a year. While there, he worked with Gunnar Myrdal in the preparation of the latter's important study of race relations entitled *An American Dilemma*.

In 1942, Clark became the first black professor at the College of the City of New York and, four years later, formed the Northside Testing and Consultation Center with his wife, psychologist Mamie Phipps Clark. Later called the Northside Center for Child Development, the Clark center studied and treated emotionally disturbed children. Together, the Clarks devised projective tests that used doll play and coloring activities to determine how children felt about themselves and others of the same and different races. Using the results of their studies and comparable work by other psychologists, Clark demonstrated that school segregation had "definitely detrimental effects on the personality of the Negro child." Among the detrimental effects were "confusion in the child's concept of his own self-esteem . . . hostility towards himself, [and] hostility toward whites. . . ." In 1953, Clark published his results in his book *Desegregation: An Appraisal of the Evidence*.

Clark also testified about his results in three of the four landmark cases that the U.S. Supreme Court grouped together in the decision known as *BROWN V. BOARD OF EDUCATION OF TOPEKA*. Citing Clark's study as the basis for its ruling, the Court declared racial segregation of schools

“patently detrimental to black children” and, therefore, unconstitutional. Clark then helped formulate a long-range program for implementing the court’s desegregation order “with a minimum of racial disturbance.” The program called for “a clear and unequivocal statement of policy” by leaders and authorities; persistence in the face of resistance; strong enforcement action; refusal of authorities to engage in or tolerate subterfuge; and an appeal to American traditions of “fair play and justice.”

After his triumph in Washington, Clark returned to City College, where he taught psychology until his retirement in 1972. He also turned his attention to de facto segregation of New York City children in neighborhood schools. In 1962, he founded an organization called Harlem Youth Opportunities Unlimited (HARYOU) to provide COMPENSATORY EDUCATION and instruction to students falling behind in their school work and to provide jobs for unemployed black youth. HARYOU also lobbied unsuccessfully to integrate New York City’s schools by busing children to schools outside their neighborhood and thus drawing children from all over the city to each school. HARYOU was eventually absorbed into President Lyndon B. Johnson’s War on Poverty program, and Clark described his conclusions from his work at HARYOU in the powerful book *Dark Ghetto* (1965). In it, Clark examined ghetto schools and the social dynamics, psychology, pathology and power structure of the ghetto. “Nothing anywhere in the training of social scientists, teachers or social workers,” he concluded, “now prepares them to understand, to cope with, or to change the normal chaos of ghetto communities.”

Clark University The first American institution of higher education started solely for graduate education in the sciences. Clark was founded in Worcester, Massachusetts, in 1887 by Jonas Gilman Clark, a philanthropist who

had made a fortune in mercantile and real estate ventures. Clark named G. STANLEY HALL, the “father” of child psychology and educational psychology, to be the first president. Hall added an undergraduate college for men in 1902. At Hall’s invitation, Sigmund Freud, Carl Jung and other leaders in the new field of psychology gathered at Clark in 1909 to discuss the psychoanalytic movement with American scholars. In 1921, Clark University added what became the most renowned graduate school of geography in the United States. It added a college for women in 1942, which eventually merged with the men’s school. Today’s coeducational institution has more than 3,000 students—more than 60% of them women.

classical education A curriculum that emerged from the clerical and ministerial colleges of the Middle Ages. It has now come to mean a broad-based study of the liberal arts and sciences, as opposed to practical or preprofessional courses of study. The term *classical* generally refers to the literature, art, architecture and ethics of ancient Greece and Rome. As Europe emerged from the Middle Ages and founded its first universities, classical education was based on the study of Greek and Latin. Students learned both languages fluently and studied the works of Aristotle (logic, rhetoric and natural, moral and mental philosophy), Boethius (logic, rhetoric, music and arithmetic), Cicero (rhetoric), Euclid (geometry) and Ptolemy (astronomy). After four years, most went on to study theology, though some studied medicine or law.

The founders of the first colleges in the American colonies were all churchmen who retained the classical curricula of England’s Oxford and Cambridge universities, but added emphasis to religious studies in an effort to train new ministers. As Protestants divided over questions of orthodoxy, so did the curricula of

their colleges. Many opened their doors to nontheological studies and added the areligious, political and philosophical works of Locke, Rousseau and other thinkers who emerged during the Age of Reason in Europe and Britain. By the end of the 18th century, the term *classical education* had gained a far broader meaning and included the study of literature, poetry, drama, rhetoric, logic, philosophy, history, art, music and foreign languages, which included the required study of Latin and Greek and at least one or two modern languages.

In modern universities, so-called LIBERAL ARTS and HUMANITIES curricula (usually literature, philosophy, history, music, art and foreign languages) approach classical studies somewhat, as does the GREAT BOOKS PROGRAM developed at the University of Chicago.

classical languages The languages used in the classical civilizations of ancient Greece and Rome. In early America, most schools also required Hebrew to permit the study of the Scriptures in the languages in which they were written. Until the 19th century, the study of classical languages was required by colleges and universities throughout the Western world, including the American colonies, where most colleges trained students for the ministry.

classical realism A philosophy which holds that all truths—all “realities”—may be found in the great works that have survived throughout history and become eternal. Classical realism is the philosophy that is the basis of the educational theory of PERENNIALISM, which, in turn, formed the basis of the GREAT BOOKS PROGRAM developed at the University of Chicago.

classified personnel Noncertified school-system employees responsible for noninstructional services such as plant maintenance, food preparation and distribution, clerical work, business management, health care and teacher

assistance. Some districts divide classified personnel into two subcategories: special pupil support and noninstructional support. The former refers to those who interact with and provide noninstructional services directly to students. Examples include teachers’ aides, food servers, playground supervisors, and “boarding supervisors,” who supervise students as they board school buses. Noninstructional support staff perform services to the school—plant maintenance, bookkeeping, and so on—and have no direct contracts with students.

Most school districts have written rules and regulations covering classified personnel, including job descriptions, wage scales, fringe benefits, job prerequisites, available training, evaluation procedures, promotion and dismissal policies, grievance procedures and union membership requirements, if any.

class rank The position of a student’s academic grade point average relative to other students in the class. Class rank is often an important factor in the admissions process at academically selective colleges and universities. Class rank, however, has become a source of some controversy in many schools, because of the possible adverse effects on students of publicly disclosing their academic rankings. A low ranking, for example, may cause public humiliation for some students. Other students may become apathetic about their schoolwork if they feel mired at a particular level in the rankings. Class rank disclosures may also produce an excessively competitive school atmosphere that encourages students to put grades and competition ahead of acquiring knowledge. To meet the needs of selective colleges, some schools attempted to compile confidential class rankings, but, under the provisions of the BUCKLEY AMENDMENT, students and their parents have the right to review all materials in any files the school may keep about them. To

bypass the problem, most schools simply stopped compiling such rankings.

classroom The room in which a group of students meet regularly, for an average of 54 minutes at a time in U.S. schools to study the same subject or participate in a common activity. The average American classroom is designed to accommodate 30 or more students, although size varies widely and depends on student population projections at the time each school was built.

On average, four square feet of space is allotted for each student, in addition to the space required by chairs, desks and tables. To

foster an orderly atmosphere, desks are usually placed in rows and may or may not be bolted to the floor. The latter is generally covered with vinyl or carpeting in newer schools and wood parquet in older schools. In the front of the room is the teacher's desk and on the wall behind, and perhaps on one or more other walls, a chalkboard.

Classroom layouts in the two early elementary school years and kindergarten often differ radically from other classrooms. Kindergartens usually have a wide, open central space and a half-dozen or more learning areas—for mathematics, books, geography, plants, and so on—spread around the perimeter of the room. Tables

Row layout remains the standard in most middle and high school classrooms.

and chairs are movable, and light and small enough for five-year-olds to carry and rearrange in clusters, according to the activity. First and second grade classrooms resemble kindergarten classrooms, but are generally smaller and accommodate fewer students. With smaller groups, first and second grade classrooms are designed to be less chaotic and permit more focus on learning than on play. The perimeter of the classrooms, however, are still divided into learning areas, and the chairs and desks remain movable. The fixed desk usually makes its first appearance in third grade, where the classroom takes on the conventional appear-

ance of the traditional classroom described above.

The classroom configuration of fixed desks in rows remains the standard in most middle schools and high schools, except in art, music and science-laboratory classes, where active student participation is required as part of the lesson plans. Some progressive schools, however, recognize that eyes-front seating tends to inhibit discussion by less aggressive students, and, in many classes, such schools have introduced seminar-style seating, whose configuration varies according to the subject, the size of the classroom and the number of students. In one configuration, students in such classrooms may be seated at a single, long, rectangular table, with the teacher either alone at its head or in the middle of the long edge, among students—whichever gives the teacher easier access to the marker board and other demonstration materials. Another configuration sees four long tables arranged in a square, with students seated along the perimeter and the teacher “boxed” within, although with access through an opening in the square to chalkboards and demonstration materials. The advantage of the open-square configuration is the teacher’s ease of movement from one student to another. The elongated, single-table configuration often sees less aggressive students sit as far from the teacher as they might in a conventional fixed-seating classroom.

Since 2000, the vast majority of schools have installed conventionally wired and wireless telecommunications networks to permit students to operate computers at each classroom seat—either school-owned desktop units or student owned laptops. Such “WIRED CLASSROOMS,” as they are called, permit students, individually or simultaneously, to access all but limitless textual and audiovisual instructional and reference materials from sites anywhere on earth. They allow teachers to transfer lecture materials—and examination questions—onto each student computer, and students can

This classroom features a number of high-tech devices, from a ceiling-mounted LCD projector to Palm Pilots for every student. (Associated Press)

take examinations directly on their computers for instant grading before they leave their classrooms—and instant registration in the teacher's and the school's records.

(See also COMPUTERS; DISTANCE LEARNING; INTERNET; TELELECTURE; VIRTUAL CLASSROOM.)

classroom aides Noncertified school personnel, whose duties vary widely from school to school and classroom to classroom, depending on the needs of individual teachers and their students. Some aides offer purely noninstructional support, such as clerical assistance that frees the teacher from paperwork to do more teaching. Others may escort students from one area of the school to another or supervise students in isolated quiet-zones used as disciplinary or study areas. Better trained aides may serve as tutors for slower students or as bilingual tutors for non-English-speaking students. Some colleges offer two-year training programs for educational paraprofessionals.

The use of classroom aides reached a peak in American public schools in the 1960s, when federal antipoverty programs provided grants to inner-city schools to hire them and thus free teachers to do more teaching. Their use increased, despite evidence from the BAY CITY, MICHIGAN, PROJECT, a two-year study of the city's schools, indicating that the addition of aides had not improved student achievement. Aides were the first to lose their jobs in the 1980s, when tax revolts forced widespread cuts in school budgets across the United States.

classroom management The organization and techniques used by teachers to control students and assure desired learning results. A complex group of skills and techniques, classroom management requires a combination of teaching skills, a knowledge of and ability to use various teaching strategies and teaching materials, skill in organizing activities that promote learning, the ability to maintain discipline and the ability

to deal with a wide range of student abilities and backgrounds. Among the many aspects of classroom management are motivating students to learn and teaching them the self-discipline to work independently and assume responsibility for themselves as well as the ability to work cooperatively with others. It also involves teaching disruptive students how to adapt to the classroom and become productive. No single management technique proves successful with all students in all classes. Classroom management courses in teachers colleges, however, do teach a wide variety of pedagogical techniques, theories of learning, children's needs and behavior patterns, effective incentives and theories of group psychology and group dynamics.

classroom noninstructional activities

Activities in classrooms unrelated to the subjects taught. Included are collecting signature cards signed by parents, handing out test blanks or corrected tests, waiting for students to put away unneeded books and materials and find those they need, waiting for students to don or doff their coats or overshoes, cleaning up, discipline, socializing, listening to school announcements and reminding students about school rules.

Although many noninstructional activities are essential to the welfare of students and efficient school operations, many educators believe they have reached the point where they may be interfering with learning in some schools and classrooms. The NATIONAL COMMISSION ON EXCELLENCE IN EDUCATION found that instructional time in U.S. public schools averaged a mere 22 hours a week and often fell to as low as 17 hours a week in some schools. A University of Michigan study found that fifth graders only spend 64% of their school time on academic activities, compared to 87% for Japanese students.

classroom observation A direct method of evaluating teacher performance and CLASSROOM MANAGEMENT skills. Classroom observations may be conducted by trained outside observers, by

other teachers or by school administrators. Generally, observers try to rate various classroom management techniques as objectively as possible, using standardized rating forms such as the FLANDERS INTERACTION ANALYSIS. Developed by Ned A. Flanders and his colleagues at the University of Minnesota, the interaction analysis asks evaluators to note the frequency and duration of each of 10 categories of classroom interactions. Seven are teacher-to-student interactions ("praises or encourages," "asks questions," and the like), two are student-to-teacher or student-to-student interactions and the tenth measures the cause and duration of periods of silence.

class size The number of students in a regularly scheduled class. There is widespread disagreement over the effects of class size on student achievement, although all studies agree that student achievement climbs sharply when student-teacher ratios dip below 1:15 and declines sharply when student-teacher ratios exceed 1:25. A 1985 study of early elementary school students in Tennessee found that a greater percentage of students scored above the national averages in reading and mathematics tests in small classes (13 to 17 students) than students in larger classes (22 to 25 students). Here are the percentage of students that scored above the national averages on the Stanford Achievement Tests in four different grades:

	Kindergarten	First Grade	Second Grade	Third Grade
Reading				
Small class (13–17 students)	59%	64%	61%	62%
Large class (22–25 students)	53	53	52	55
Math				
Small class	66	59	76	76
Large class	61	48	68	69

Average class size in United States public schools dropped markedly from the mid-depression (1930s) level of about 40 pupils to 17.2 in the mid-1990s, before a tide of immigrants sent the average class size rising again in 2002 to 21.1 in the average elementary school classroom and 23.6 in the average high school classroom. Class size, however, can be misleading, skewed as it often is by overcrowded homeroom "classes" devoted to nothing more than daily announcements. Often more revealing are pupil-teacher ratios, which have declined steadily in the United States public elementary and secondary schools, from 26.9 in 1955 to 16.1 in 2002. Private-school pupil-teacher ratios declined from 31.6 to 16.2 during the same period. Pupil-teacher ratios, however, are not without their own flaws, in that esoteric subjects with one teacher for but one or two students can skew a school's overall pupil-ratio downward and obscure disastrously overcrowded classes for required courses in basic subjects.

class trips School-sponsored, off-campus excursions to a variety of educative sites and events. Depending on student age, class trips may include visits to historical sites, museums, businesses, factories, farms, hospitals, firehouses, police stations and other places of interest to the community, or to attend performances at concert halls, theaters and opera houses. In simplest terms, class trips convert textbook materials to real life. Such trips supplement classroom education by converting nonparticipatory textbook descriptions to participatory, first-hand experiences. Visits to museums and historic sites bring history to life and dramatize the way the world once was; visits to businesses and similar destinations show students how the world functions and the wide variety of jobs associated with each place they visit; visits to theaters, concert halls and opera offer cultural enrichment few schools can provide on cam-

pus; and visits to colleges, universities, libraries and other educative institutions show them how much more knowledge awaits them.

clergy Those ordained by their CHURCH to perform sacred rites and provide spiritual and, often, temporal guidance. The Puritan Congregational clergy who came with the earliest settlers to New England were deeply involved in education because of the unique practice their church followed of naming two ministers to each congregation: a pastor in charge of church activities and a teacher to deliver sermons and catechize children. The practice was in keeping with St. Paul's words to the Corinthians: "And God had appointed in the church, first apostles, second prophets, third teachers. . . ." A shortage of ministers in the American colonies made the practice difficult to follow, however, especially in isolated communities. In 1648, the four New England colonies signed the CAMBRIDGE PLATFORM, an agreement that unified the offices of pastor and teacher and ensured the church control over education during the remainder of the colonial era. The clergy maintained that control until the mid-1840s, when the first secular, state-run public school systems began developing in New England and New York. By the end of the 19th century, secular public schools had become the primary provider of education in the United States, and the clergy's role in teaching was relegated to CHURCH-RELATED SCHOOLS. By the mid-20th century, as the number of men and women entering the clergy diminished and pastoral obligations monopolized their time, they gradually ceded their role as teachers to lay teachers.

clerk-of-the-works An employee or consultant paid by an institution or school district to enforce contract specifications on construction projects. Responsible solely to the school district, the clerk's job is to inspect all phases of

construction on a daily basis, to prevent architectural design flaws and spot any fraudulent practices such as the use of substandard materials or the substitution of less costly materials than those called for in the contract.

Clery Campus Security Act of 1990 A federal law requiring American colleges to report to the U.S. DEPARTMENT OF EDUCATION by October 1 each year all data on crimes that occurred on their campuses during the previous academic year and to make the tally available to prospective applicants for admission. The law was passed following intense lobbying by the parents of a girl who was murdered on the Lehigh University campus in Bethlehem, Pennsylvania, in 1986. Hearings prior to the passage of the law revealed that some colleges had concealed crime statistics for fear of adverse effects on enrollments—especially at urban colleges in high-crime neighborhoods. Since the passage of the act, almost every college has intensified campus security efforts, including careful screening at some campuses of every person entering the grounds and buildings. Many colleges have installed security cameras at all entrances; others have ID card swipe systems at residence hall entrances.

Despite its goals, the act has been the target of criticism since its inception, with some critics charging that many colleges continue to underreport crimes by failing to include crimes against students in areas adjacent to but technically not on campus. In addition, many colleges misclassify burglaries as larcenies, which they are not required to report. Thus, the University of Michigan, which reported a mere 25 burglaries on campus in 2004, experienced more than 900 larcenies that went unreported. Other types of misclassification and underreporting result from college counselors' failing to report rapes or other sexual assaults of students who come to them for counseling. Like many other student crimes

on campus, such offenses are often handled as disciplinary problems rather than reportable felonies. Still other critics of the Clery Act argue that raw crime numbers are meaningless—that too many factors can influence such numbers at a particular college at any given time and give the impression that a safe campus with a high number of reported crimes is unsafe and that an unsafe campus with low numbers is safe. In 2003, for example, the number of cases of negligent manslaughter on college campuses across the United States increased by a frightening 900%, but, in fact, the number climbed from 1 case of negligent manslaughter to 10—in effect, a meaningless increase for more than 6,400 campuses with a population of nearly 16.4 million.

(See also CRIME ON CAMPUS; SCHOOL SECURITY.)

Cleveland Board of Education v. LaFleur A 1974 U.S. Supreme Court decision that the Cleveland Board of Education had violated the constitutional rights of women by requiring pregnant teachers to take unpaid maternity leaves several months before and after childbirth. The Court said that the mandatory, uniform cutoff dates were too restrictive and that they violated a woman's basic human right to marry and procreate. The Court found, however, that the school district had the right to require advance notification of plans to take maternity leave and to require a doctor's certificate attesting to the good health of the teacher before she is permitted to return to work.

Cloze procedure A test of reading ability in which the student must guess missing words in a paragraph on the basis of its context. Usually about 250 words long, the test opens and ends with intact sentences, and the remaining sentences contain missing words at regular intervals—every fifth word, for example. The student is then asked to fill in the blanks with the most appropriate words.

coach, athletic A teacher/administrator of one or more sports. Depending on the size of the institution and age of participants, a coach's duties may include teaching rules and methods of play, training and conditioning participants, planning and reviewing team strategies, recruiting new players, scheduling games and matches with other teams, making travel arrangements for non-home games and matches, hiring assistant coaches and staff members such as trainers and equipment managers, awarding scholarships and budgeting expenses for new equipment, uniforms, travel and administration. At the high school, college and university level, a coach of a major sport may also have key public relations duties as principal spokesperson for the team and, often, the most publicly visible representative of the institution. Public relations activities may also include fund-raising for team activities, for new or expanded team facilities and for athletic scholarships.

In many secondary schools and in almost all primary schools, coaches are usually full-time teachers in one or more academic areas, and they work as coaches on a part-time extra-fee basis. At the college level, they are usually untenured full-time coaches. Most secondary schools require coaches to have bachelor's degrees in physical education, most colleges and universities usually waive the requirement for former professional athletes and experienced coaches who have demonstrated organizational, administrative and leadership skills. There are no gender requirements in coaching. In general, men tend to coach male teams and women female teams, but because of the greater number of men in coaching, many of the latter coach female teams, while few women coach male teams.

Coalition of Essential Schools A network of public schools that adopted reforms of educator THEODORE S. SIZER to raise academic standards. Founded in 1984 in response to declining academic achievement by American public

school students, the coalition grew from 12 schools in four states to more than 600 schools across the United States by 2000. Member schools replace traditional administrative and instructional methods with a system that subordinates administration to the academic needs of students and places teachers in control of the curriculum. Member schools also try to increase parental involvement and personalize teaching. Underwritten by large corporate and foundation grants, the coalition spends most of its funds retraining teachers to instruct in such broad topic areas as “the humanities” and “math/science,” instead of traditional courses. Instead of lecturing, teachers pose challenging, “essential” questions to stimulate student debate and then, rather than providing answers, point students in the right directions to acquire the necessary knowledge. In effect, coalition teachers help pupils think and master skills and knowledge rather than force them to digest facts.

Operating in teams to coordinate the curriculum, teachers serve as “coaches” to small groups of students who function under a “student-as-worker” scheme in which group members help each other to master topics under study—the theory being that students learn best when they’re involved in the process. Teachers usually teach more than one subject but cover fewer topics in greater depths in classes lasting two hours instead of the usual 45 minutes. Total student loads are reduced to no more than 80 students per teacher, and teachers work with the same students for two years instead of one. Teacher teams plan and coordinate broad topics to be covered each week and allocate the proportion to be covered in each subject area. In simplest terms, a teaching team (see *TEAM TEACHING*) might, for example, coordinate the study of ancient Egypt in history class with the geometry of pyramids in math class, hieroglyphics and the origins of written language in English class, the physics of moving heavy objects in science

class and the study of Egyptian art forms in art class. Broad topic coverage of this kind is designed to teach students “to learn to use their minds” as well as to learn facts. The goal of teachers is thus student “mastery” of a topic rather than compulsive “coverage” of every item in a textbook or syllabus. All students must prove their mastery of each topic before being allowed to pass into higher grades, and mastery must be demonstrated through in-depth essays and projects rather than multiple choice tests.

Another key goal of coalition schools is universality, with all students obtaining the same complete education in the academic track, regardless of whether they eventually plan attending college. Coalition schools thus eliminate all nonacademic GENERAL EDUCATION courses and almost all vocational courses. “An intellectual education,” Sizer insists, “is every citizen’s right.” Coalition schools also encourage close teacher-student ties, with teachers and administrators sharing teaching, administrative and counseling duties and creating an atmosphere of trust, decency and high expectations for all students.

Although coalition schools scored dramatic successes in reducing high school dropout rates and raising academic achievement and college admission rates, the coalition often ran into opposition from teachers who feared losing their jobs if all students were on a single academic track and schools eliminated the general and vocational education tracks. Parents in many rural areas also opposed the coalition, fearing that a restructured school day, in which academics have top priority, would interfere with extracurricular activities that are taught as “classes” in many schools. Football, for example, is considered a class and is a top high school priority in many communities in Texas, Alabama and other states.

(See also *ACCELERATED SCHOOLS PROJECT*; *COLEMAN REPORT*.)

cocurricular activities The entire range of student activities unrelated to the academic curriculum. A relatively new term, cocurricular activities adds all out-of-school activities—jobs, professional work, community service, recreational pursuits, and so on—to the student’s in-school EXTRACURRICULAR ACTIVITIES, such as sports, student publications and student government.

Code of Ethics of the Education Profession A relatively ineffectual statement of principles for teachers, developed by the NATIONAL EDUCATION ASSOCIATION in 1929 and revised several times since. The code, which carries no enforcement provisions, consists of a preamble and two principles of commitment to the student and to the teaching profession.

PRINCIPLE I

Commitment to the Student

The educator strives to help each student realize his or her potential as a worthy and effective member of society. The educator therefore works to stimulate the spirit of inquiry, the acquisition of knowledge and understanding, and the thoughtful formulation of worthy goals.

In fulfillment of the obligations to the student, the educator

1. shall not unreasonably restrain the student from independent action in the pursuit of learning;
2. shall not unreasonably deny the student access to varying points of view;
3. shall not deliberately suppress or distort subject matter relevant to the student’s progress;
4. shall make reasonable effort to protect the student from conditions harmful to learning or to health and safety;
5. shall not intentionally expose the student to embarrassment or disparagement;
6. shall not on the basis of race, color, creed, sex, national origin, marital status, political or reli-

gious beliefs, family, social or cultural background, or sexual orientation, unfairly

- a. exclude any student from participation in any program;
 - b. deny benefits to any student;
 - c. grant any advantage to any student;
7. shall not use any professional relationships with students for private advantage;
 8. shall not disclose information about students obtained in the course of professional service, unless disclosure serves a compelling professional purpose or is required by law.

PRINCIPLE II

Commitment to the Profession

The education profession is vested by the public with a trust and responsibility requiring the highest ideals of professional service.

In the belief that the quality of the services of the education profession directly influences the nation and its citizens, the educator shall exert every effort to raise professional standards, to promote a climate that encourages the exercise of professional judgment, to achieve conditions which attract persons worthy of trust to careers in education, and to assist in preventing the practice of the profession by unqualified persons.

In fulfillment of the obligations to the profession, the educator

1. shall not in an application for a professional position deliberately make a false statement or fail to disclose a material fact related to competency and qualifications;
2. shall not misrepresent his/her professional qualifications;
3. shall not assist entry into the profession of a person known to be unqualified in respect to character, education, or other relevant attribute;
4. shall not knowingly make a false statement concerning the qualifications of a candidate for a professional position;

5. shall not assist a noneducator in the unauthorized practice of teaching;
6. shall not disclose information about colleagues obtained in the course of professional service unless disclosure serves a compelling professional purpose or is required by law;
7. shall not knowingly make false or malicious statements about a colleague;
8. shall not accept any gratuity, gift, or favor that might impair or appear to influence professional decisions or actions.

coeducation The admission and instruction, on the basis of full equality, of male and female students in the same classrooms and schools. Coeducation dates back at least to Plato's Academy in ancient Greece, although it remained a rare phenomenon until the colonial era in America, when it was impractical to try to educate the small numbers of children in isolated rural communities in separate, single-sex schools. THOMAS JEFFERSON, BENJAMIN FRANKLIN and Dr. BENJAMIN RUSH were all strong proponents of coeducation, and many common, or public, elementary schools practiced coeducation in the 19th century as the United States began its nationhood. However, common school education only lasted about 12 weeks a year for about three years, and attendance was not required. Most parents sent their boys to common school to keep them out of mischief between the end of the fall harvest and the first spring planting. Although girls had equal access to such schools and a few actually attended, most stayed at home to learn the "domestic arts" from their mothers and grow up to become good wives and mothers themselves.

During the first half of the 19th century, women were barred from secondary schools and colleges, although wealthier girls had access to private female academies and seminaries and even college-level schools. But coeducation did not begin at the secondary school level until the emergence of universal public school education

in the 1830s and 1840s, in Massachusetts, Connecticut, Rhode Island and New York. The growth of the AMERICAN LYCEUM movement opened adult education to women, and by 1826 the more than 3,000 lycea in the U.S. were completely coeducational. In 1841, Oberlin College became the first college to admit women with men, although women were not granted the same academic privileges as male students. Oberlin's rules made certain that women "kept silence in public and had their papers read aloud in class by the men students." In 1852, ANTIOCH COLLEGE, in Yellow Springs, Ohio, became the first coeducational college where women shared all but the dormitory facilities with men on a truly equal basis. Antioch also became the first college with a women faculty member. Three years later, the University of Iowa was founded in Iowa City as the first coeducational state university. After the Civil War, coeducation began spreading across the United States as women began replacing men in the teaching profession and attended training institutes with men to obtain teaching credentials.

Although coeducation had spread into primary and secondary public schools by the beginning of World War I, it remained the exception in higher education until after World War II, when public colleges and universities merged women's and men's colleges for budgetary reasons. Gifted women were admitted into graduate programs at the turn of the century, yet most private colleges and universities did not become truly coeducational until the late 1960s and early 1970s. The last barriers to coeducation fell with the acceptance of women into the U.S. service academies and the passage of laws banning gender discrimination in education. By 2006, there were fewer than 50 single-sex colleges in the United States—35 women's schools and five men's schools—but about 30 of the women's colleges admit some men and, in the legal sense at least, are coeducational. (See also COLLEGE).

Ironically, many of the women's rights groups that pressed for coeducation did an about-face in the early 1990s, after a series of studies found that girls often fare substantially worse academically in coeducational settings than they do in single-sex classrooms. Girls, for example, score an average of 50 points lower than boys on the mathematics portion of the College Board SCHOLASTIC ASSESSMENT TEST. A study of higher education found that the most successful women tend to be graduates of single-sex colleges. As a result, some private schools and colleges established single-sex classes within the coeducational social structure. Some public schools have followed suit, and the federal courts have ruled that such classes do not constitute gender discrimination as long as they do not specifically bar male students.

(See also SINGLE-SEX EDUCATION.)

Coffman, Lotus Delta (1875–1938) American educator and pioneer of adult education and education of gifted children. As president of the University of Minnesota in 1932, Coffman founded the landmark GENERAL COLLEGE OF THE UNIVERSITY OF MINNESOTA, which was the precursor of today's community colleges and began the democratization of higher education in the United States. Believing that popularizing learning was the only sure foundation of democratic government, Coffman established the General College to extend higher education to all the people of his state. Coffman's two-year General College admitted all students, although it assigned them to classes according to their abilities as measured by tests and grades. The curriculum, which led to a special, two-year degree, consisted of short, interdisciplinary survey courses in 10 "areas of human living"—the arts, history and government, contemporary affairs, economics, human biology, physical science, psychology, social problems, home and family life and literature, speech and writing.

The college opened with 461 students in the autumn of 1932 and quickly grew to more than 1,000. Although criticized by conservative university faculty members for its "watered down curriculum," the General College became a model for similar schools of general studies at Oregon, Georgia and Washington. Coffman's concept not only continued to thrive, it spread to virtually all state and many private universities after World War II. Coffman was president at Minnesota from 1920 until his death in 1938. During that time, he established many new, model, higher-education programs, including a college for gifted students, an institute of child welfare, an institute of technology, a fine arts department with an art gallery, a school of journalism and a graduate school of business. In addition to his work as a leader in education, Coffman was a prolific author of educational works. He coauthored one of the first textbooks on the teaching of reading and two on the teaching of arithmetic. His works included *Reading in Public Schools* (with T. H. Briggs, 1908); *How to Teach Arithmetic* (with J. C. Brown, 1913); *The Supervision of Arithmetic* (with W. A. Jessup, 1915); *The Social Composition of the Teaching Population* (1911); and *The State University: Its Work and Problems* (1934).

cognition The process by which humans absorb and understand new information. Often called high-level or critical thinking, cognition is defined differently by different learning theorists, but it is, in effect, the "figuring-out" process that takes place between the reception of a stimulus and the subject's response. Put another way, cognition is the process that allows human beings to give meaning to what their senses detect.

Cognition varies widely from person to person. Few individuals give exactly the same meanings or respond exactly the same way to the same stimuli. Cognition varies according to genetic factors, previous experiences, age, devel-

opment and a wide range of other factors. These variations dictate why students at one age can easily understand concepts they were unable to grasp at a younger age. Because cognition often requires accumulating large numbers of small bits of information over an extended period of time, it is a process that can frustrate some teachers and parents because of the patience required to produce the desired results. Many teachers and parents are more receptive to behavioral theories that tie learning to rewards and punishments. Indeed, the traditional pedagogy of centuries past called for striking a child's hand with a ruler until the child provided the correct answer to a problem. In effect, the child was punished for each wrong answer ($2 + 2 = 3$) and rewarded (sometimes only by the cessation of pain) for the correct answer. There is little evidence, however, that such learning produced any understanding of the associated concepts, for example, that two bushels added to a bin with two other bushels yield four bushels or that subtraction and addition are inversely related.

Swiss psychologist JEAN PIAGET explained cognition through the concept of *equilibration*, which involved three basic elements that he called *schemes*, *assimilation* and *accommodation*. Schemes refer to the mental or intellectual framework a student brings to a learning situation. Based on previous learning experiences, schemes allow students to acquire new knowledge that automatically expands or alters the shape of those schemes. Thus, a child with a scheme, or conceptual structure, associated with the word "house," for example, may at first only have knowledge of his or her own house. Each time the child visits or sees a new house, however, the new sensory information expands and alters the original scheme. Once told that igloos or tepees are also houses, the child begins to learn that any houselike structure is probably a house, regardless of its color or shape. Cognitive learning, or equilibration, has taken place. Piaget

called the addition of each new bit of information to a scheme (for example, that igloo equals house) *assimilation*, and he called the altering of the scheme to produce knowledge and understanding *accommodation*. Piaget pointed out, however, that schemes are in a constant state of change in normal children, fluctuating from a state of disequilibrium to equilibrium. Thus, the child whose scheme of a house includes tepees and igloos may be thrown into disequilibrium when confronted with a geodesic dome. When provided with enough added information (assimilation) to understand that the dome is another type of house, the original scheme expands to accommodate the new knowledge, and the scheme is once again returned to temporary equilibrium. One educator described equilibrium as the "that makes sense" response of a student whose eyes light up at a moment of complete understanding. Cognitive psychologists contend that conventional teaching relies too heavily on assimilative techniques that require students to memorize facts without accommodating or understanding their broader meaning. Students may accurately repeat such facts on tests, but without accommodation, they quickly forget them.

cognitive domain Any and all physical, emotional and intellectual activity that permits a human to absorb and understand new information. The cognitive domain includes a wide range of "intelligences," or intellectual abilities, among them problem solving, analytical and critical thinking, creative thinking, mathematical abilities, visual-spatial intelligence and language skills. BENJAMIN BLOOM classified the elements of the cognitive domain as knowledge, comprehension, application, analysis, synthesis and evaluation.

cognitive style The specific method for absorbing and understanding new information used by a specific individual during a specific

stage of development in his or her life. Cognitive style is the way a person thinks and acquires new knowledge, and it will change as the person matures. Thus, the cognitive style of a six-year-old student will differ radically from that of a 12-year-old, and teachers must be aware of these differing cognitive styles and the various stages of development. Swiss psychologist JEAN PIAGET defined four stages of cognitive development: sensorimotor (birth to 18 to 24 months old), preoperational (18 to 24 months to 6 to 7 years old), concrete operational (6 to 7 years old to 11 to 12 years old) and formal operational (11 to 12 years old to adult). Other psychologists have described various developmental stages of cognition as including development of perception, memory, generation and testing of hypotheses and evaluative abilities.

Coleman report Commonly used name for the 1966 landmark study *Equality of Educational Opportunity*, by a team headed by educator-sociologist James S. Coleman, then of Johns Hopkins University, and Ernest Q. Campbell, of Vanderbilt University. Together with a related CIVIL RIGHTS COMMISSION report, the Coleman report was instrumental in redirecting the focus of the civil rights movement from de jure segregation to de facto segregation. Title IV of the CIVIL RIGHTS ACT OF 1964 called for a survey “concerning the lack of availability of equal educational opportunity by reason of race, color, religion, or national origin in public educational institutions at all levels. . . .” The following year, Coleman and his colleagues studied 600,000 children at 4,000 schools. What he found was that most American children attended schools where children of their own race constituted the majority, but that there was relatively little difference in the quality of schooling between white and minority schools. Although white schools tended to have slightly better physical plants, all other measures of “input”—teacher training, teacher

salaries, curriculum, and so on—were relatively equal. The results, however, were not. The report found that the academic achievement of minority children was one to two years behind that of whites in first grade and three to five years behind in the twelfth grade. The report concluded that academic achievement was, therefore, related to family background in the early years, but that going to school not only did nothing to correct the academic differences between whites and blacks, it actually allowed those differences to widen.

A year later, the Civil Rights Commission conducted another study entitled *Racial Isolation in the Public Schools*, which confirmed the Coleman report findings. Together, the two studies changed federal government policy on race and education. From a policy of eliminating de jure, or legal segregation, Washington now embarked on a policy of affirmative action to integrate schools and end de facto segregation produced by income level and neighborhood racial or ethnic composition. The new policy added special COMPENSATORY EDUCATION at racially isolated schools, to close the educational gaps between children of different races. A second result of the new policy was the busing of school children to schools outside their own neighborhoods to try to prevent black enrollment at every school from ever exceeding 60%. The courts later upheld the legal validity of the new policy and made it illegal for any district to allow black enrollment to exceed 85% in any school. Nevertheless, in 2000 about two-thirds of all black children continue to attend public schools whose student bodies are 50% to 100% nonwhite and one-third attended schools with fewer than 10% whites in attendance—largely because of the failure of housing integration in major cities.

college A uniquely American, two- or four-year, degree-granting institution of postsecondary school education offering, respectively,

ASSOCIATE and BACHELOR'S DEGREES in either the arts or sciences. Unlike British and European educational systems, which grant students a baccalaureate after they complete secondary school, the American college spreads the secondary-school curriculum over two additional years, allowing American students time to participate in organized sports and recreational programs that are not part of school or university curricula in other countries. The last two years of American colleges, when students "major," or concentrate their studies in a single subject or related subject areas, are equivalent to the first year of the British and European university model, where students study or "read" in only one area for several years to earn their master's degrees and/or doctorates.

Derived from the Latin *collegium*, or "society," college originally referred to a society of clergymen who lived and studied Scripture together. Colleges evolved from the early medieval universities that developed in western Europe during the 12th and 13th centuries. With Latin as the universal tongue of churchmen and scholars, universities attracted students from across Europe, regardless of each student's native tongue. Nevertheless, students tended to congregate and share living quarters, or *collegia*, on the basis of common nationality.

Although western European universities had introduced secular studies by the time settlers arrived in the New World, the first colleges in the American colonies reverted to the older tradition of a college as a society of clergymen. Calvinists founded the first colleges in the New England colonies as seminaries for training ministers, missionaries and teachers of the gospel. HARVARD was first, in 1636, followed by YALE, in 1701. Students seeking to pursue secular studies were forced to travel to universities in Scotland, England, Holland, France and Italy, if they could afford to do so. With the industrial revolution and the rapid expansion of the U.S. economy, however, colonial Ameri-

can colleges introduced practical, secular education in the middle of the 18th century, and the concept of the modern American college slowly began to evolve.

Because of the backwardness of isolated rural schools and the absence of national standards of primary and secondary education, students with widely differing academic skills found themselves entering colleges at the same time, but unable to cope with the work. Colleges were forced to teach basic courses in English, mathematics, history, foreign languages and science that were (and still are) usually taught in secondary schools in the Old World. After the Civil War, the concept of the American university began evolving, largely for financial reasons. It proved more economical for colleges to merge administrative facilities with nearby medical schools, law schools and other schools of graduate studies. Although some colleges continue to function independently, most American colleges are now part of larger, all-encompassing universities.

ENROLLMENT

A booming economy sent total enrollment in institutions of higher learning climbing 6.4% in the 1980s and 7.74% in the 1990s. By 2006, college enrollment had climbed to more than 17 million men and women, and the total was expected to reach nearly 19 million by 2010. Two-thirds of all public high school graduates and 90% of private high school graduates continue their education at college. More than 75% attend public colleges—60% in four-year schools and the rest in two-year colleges. There are about 4,200 degree-granting colleges in the United States, of which only about 1,700 are public. Of the 2,364 four-year colleges in 2002, only 612 were public, and the rest were private (248 of them for-profit). The reverse was true of two-year colleges, however: About 1,100 of them were public and only were 730 private

institutions, of which 560 were for-profit organizations. The latter represented the fastest-growing segment of the higher-education industry because of its focus on instruction in computer-oriented functions and technology. All but 14 American colleges are coeducational, although 51 others that are coeducational in the legal sense remain primarily for women.

Women make up nearly 58% of total college enrollment. Minorities make up 33% and foreign students 3.5%. Although only 54.4% of students at four-year colleges earn degrees, the completion rate may not be as poor as it seems at first glance. Just over 4% of college students attend part time, nearly 3% of enrollees earn certificates, and about 4% earn associate degrees. Together, these three groups indicate that a considerable albeit undetermined number of students enroll in college only to obtain job-enhancing skills or satisfy a particular interest in a subject area and do not intend to obtain a conventional degree. Nor do low completion rates take into account students who leave college to take advantage of lucrative job opportunities in areas not requiring a degree. Aside from sports and the arts, technology firms provide many opportunities for skilled young men and women without college degrees.

The figures for degree completion rates are even less revealing at two-year colleges geared to offer career-oriented courses that prepare students for direct entry into the workplace after they complete their studies. Large, though undocumented numbers of students enroll in a single course at two-year colleges to enhance job or recreation skills without any intention of obtaining certificates of completion or associate degrees. More than 50% of enrollees at two-year colleges are 30 or older, and only 27% of enrollees obtain degrees.

The low completion rate at four-year colleges, however, remains a center of controversy, given the rising costs of attending. With the vast majority of public colleges admitting stu-

dents on an open-enrollment basis and, indeed, encouraging a “college-for-all” approach to education, millions of students are enrolling—and colleges are accepting them—indiscriminately, without regard to whether their talents may lie outside the academic area. The result has been disastrous for minorities and the disadvantaged, whom colleges lure onto their campuses with promises of the wealth associated with college degrees. American Indians and African Americans have drop-out rates of about 60% each, Latinos 53%, and the disadvantaged 70%. The Department of Education’s National Assessment of Adult Literacy in 2003 found that fewer than one-third of college graduates tested were able to read complex English texts and draw complicated inferences, and, given the soaring, exorbitantly high costs of attending college, a growing chorus of critics is demanding the development of a nationwide system of assessing higher education by standardized testing of college students, using the COLLEGE LEARNING ASSESSMENT TEST developed by the Council for Aid to Education, a former division of Rand Corporation. (See COMMISSION ON THE FUTURE OF HIGHER EDUCATION.)

COSTS

Some 82% of all college students attend institutions in their home states, where costs of tuition, room, board, books and required fees at four-year public institutions in the 2005–06 academic year averaged \$15,600. The average cost for students from other states is approaching \$25,000. Although costs of attending private four-year colleges averaged \$32,000, the costs at most highly selective private colleges are now \$45,000 and approaching \$50,000.

With college costs rising 5% to 10% a year, the U.S. Department of Education estimates that nearly 200,000 qualified students a year can no longer afford community colleges, let alone four-year colleges. Freshmen from the wealthiest 25%

of American families now fill 55% of the seats in the 250 most selective colleges, public and private. At Harvard, where the median family income of undergraduates is about \$150,000, the director of admissions laments the “huge waste of talent” that results from the inability of low-income students to afford college.

Ironically, receipts from tuition, fees and other student payments seldom cover more than 75% of actual costs of educating, housing and otherwise caring for each enrollee—largely because of ever-increasing faculty and administration salaries and soaring capital costs for ambitious building programs to expand athletic plants, research facilities and income-generating commercial activities. Since 2000, American colleges and universities have been spending more than \$14 billion a year on construction projects—often elaborate student centers and recreational facilities such as sports stadia that critics call the “country clubization” of American universities. The federal government pours between \$25 billion and \$30 billion into research at American colleges and universities each year, and the latter collect more than \$1 billion a year from licenses for the more than 15,000 new drugs, agricultural products, technologies and patented inventions and components that emerge from campus laboratory facilities. In 2004, Johns Hopkins University received \$1.23 billion in federal research and development funds, the universities of Washington more than \$625 million, Stanford University more than \$540 million, University of Michigan more than \$520 million and eight others more than \$400 million each. The top 100 recipient institutions received more than \$22 billion. At public universities, research now accounts for 22.5% of total expenditures, compared with 34% for instruction and only 6% for scholarships. Several decades ago, costs of instruction consumed 39% of university spending—at a time when faculty members spent more time teaching for far lower salaries.

FACULTY

The average full-time college faculty member now spends less than 57% of his or her time teaching—about 26 hours a week. The percentage varies from a low of about 46% (24 hours a week) at public, research-oriented universities to nearly 72% (32 hours a week) at two-year colleges. The rest of the time is spent on research and scholarship (an average of 15% at all institutions), administration (about 14%), nonteaching functions (6.5%), professional growth (4.5%) and outside consulting (3.3%). Depending on *ACADEMIC RANK*, salaries in academic 2005–06 ranged from an average of more than \$130,000 a year for full-time professors at private four-year universities to about \$40,500 for instructors at two-year colleges. Salaries of top administrators were far higher, with the median salary for a college chief executive \$180,000 a year. But five college and university presidents earned more than \$1 million each, nine earned at least \$900,000 each and 50 earned at least \$500,000. The median salary for the director of athletics was \$155,000, general counsel \$130,300, director of student health services (physician) \$128,000, the chief academic officer (usually, a dean) \$127,000, chief business officer about \$124,000, chief investment officer \$121,000 and chief development officer \$115,000. Median salaries of deans ranged from \$62,500 (continuing education) to more than \$325,000 (medicine). Median salaries for deans of seven types of graduate schools—architecture, dentistry, engineering, law, medicine, pharmacy and veterinary medicine—are \$150,000 or more, and dentistry, law and medicine were above \$200,000 each.

Ironically, as faculty salaries have climbed, faculty productivity in the area of instruction has declined. Indeed, a 1999 study at Yale University, which charges more than \$45,000 a year for tuition, room, board and other costs, found that tenured and tenure-track professors accounted for only 30% of the classroom hours

of undergraduate instruction. Graduate students—so-called TEACHING ASSISTANTS (TAs)—and ADJUNCT faculty together handled the remaining 70% of undergraduate instruction. In Yale’s foreign-language departments, TAs and adjuncts handled more than 50% of the instruction. Nationally, about one-third of American college faculty spend at least one a week in consultation with off-campus private clients. TAs and adjuncts teach one-third of all undergraduate courses and 46.2% of introductory courses. TAs now account for nearly 25% of college teaching staffs, while part-time, non-tenured instructors account for 21.5%. Apart from their youth and lack of teaching experience, more than one-third of all TAs are foreign born and often cannot speak English well enough to be understood by their students.

PUBLIC UNIVERSITIES

Soaring costs, declining affordability and dimly low student completion rates have provoked widespread reexamination of state university systems. The most comprehensive studies are issued periodically by the National Center for Public Policy and Higher Education, which issued “report cards” in 2000, 2002 and 2004 and found that 37 state systems were less affordable in 2004 than they had been two years earlier. Moreover, it found that high school graduates were less likely to continue their education by enrolling in college than they had been a decade earlier and that those who do enroll are less likely to complete their studies and earn degrees. The 2004 “report card” for state university systems, with the symbols < and > indicating whether a better or worse grade than in 2002, is on p. 257. *Preparation* refers to academic proficiency of entering freshmen, *participation* refers to the percentage of 18- to 24-year-olds enrolled in college, *affordability* is the percentage of family income required to pay for college costs, *completion*

refers to college graduation rates, and *benefits* measures income differences between those with or without bachelor’s degrees in similar industries.

ACADEMIC QUALITY

Omitted from the Center’s evaluation, however, is educational quality—an almost impossibly difficult characteristic to measure. Many COLLEGE DIRECTORIES rank colleges and universities by the degree of selectivity of their college admissions processes, assuming that the best colleges are those that accept only students with the highest high school academic records and college admissions test scores. Indeed, those colleges may be best for those students. Left unasked and unanswered is which colleges are best for students with average or below-average grades and admissions test scores. Various private and public agencies and services use a wide array of statistics to rank the academic quality of colleges and universities—student demographics (median SAT scores, for example), graduation rates, tuition costs, student-faculty ratios, admissions statistics, doctorates granted and hundreds more numbers that individual colleges can slant in ways to make them all but meaningless in final rankings. Academic testing of college graduates, however, has provoked widespread criticism of the academic quality at American colleges. Only 10% of American college graduates have proficiency in foreign languages (see FOREIGN-LANGUAGE STUDY), while fewer than half of all graduates from four-year colleges exhibit mastery of college-level mathematics and science. Some 55% of college seniors fail tests of basic knowledge of history and literature—a reflection, perhaps, of the motives of many American youngsters for attending college. About 27% had selected their colleges because of low tuition, but nearly one-fourth said they had selected their colleges because of “a good reputation for social activities.” More

than 3% enrolled because they had “nothing better to do,” and 40% admitted they were “bored” in college classes.

More than 70%, however, said they had enrolled to “get training for specific careers, get a better job and earn more money.” Most seemed aware that a college degree generates higher wages. (Median annual earnings for workers 25 years old or over with bachelor’s degrees was \$51,272 in 2004, compared with \$29,848 for those with only a high school diploma—a difference of more than \$21,400 a year.) By far the most sought-after degree at four-year institutions is the bachelor’s degree in business and management. Indeed, more than 21% of all bachelor’s degrees awarded in academic year 2002 were in business and management (276,445), and degrees in the social sciences (history, political science, economics, psychology, sociology) ranked a distant second (111,639, or 8.64%). Education ranked third, with more than 106,000 degrees awarded (8.2%); psychology, fourth, with nearly 6%; engineering, fifth (5.7%); and health-related fields, sixth (5.5%).

FACILITIES

Many but not all two- and four-year colleges provide on-campus residential facilities for students. Most, though again not all, also provide facilities for recreation, extracurricular activities and intramural and intercollegiate sports. Extracurricular activities may include student-run radio or television stations; student newspapers, magazines and other periodicals; student theaters, drama societies and performing groups; student orchestras, chamber music groups and bands; glee clubs, choral societies and other singing groups; a political union to debate national and international issues; a student government organization to help govern student life; one or more community service organizations for charitable activities; religious

societies; and a wide range of special-interest “clubs” for students with hobbies and interests such as chess, photography or numismatics.

Depending on the size and wealth of the institution and degree of student and alumni interest, athletic activities may run the gamut of sports and include intramural sports as well as intercollegiate team competition for every level of ability, with as many as four teams in some sports. Among the sports most commonly offered at some institutions are baseball, basketball, cycling, cross country running, diving, equestrian sports, field hockey, football, golf, gymnastics, ice hockey, lacrosse, martial arts, paddle tennis, sailing, skiing, soccer, softball, squash, swimming, tennis, track and field, volleyball and wrestling. Facilities at larger colleges may include indoor basketball and hockey arenas, football stadia, outdoor playing fields, tennis courts and huge, multi-story athletic complexes with swimming and diving pools, basketball and squash courts, indoor tracks, wrestling rooms, dance studios, weight-training rooms and gymnasias.

OUTCOMES

Following passage of the Civil Rights Act of 1964, public colleges that had formerly discriminated on the basis of race ended such practices. Every state system of higher education must now admit every high school graduate to some level of college, according to his or her academic qualification. According to the ACT, however, only 21% of students taking the ACTs have the skills they need to succeed at any college level in the four disciplines measured by college admissions tests. Only 68% of those taking the ACT English test scored what ACT calls its benchmark level—that is, the skill level at which, according to statistical studies, a student has a 70% chance of earning a C or better at college. Only 51% of test takers have the reading skills they need to succeed in col-

lege, and fewer than 25% are prepared for college-level science and math courses. In fact, only 65% of students who enroll in American four-year colleges go on to earn a degree. To help academically inadequate students cope with college-level education, therefore, all public and many private colleges offer some form of COMPENSATORY EDUCATION to provide remediation and tutoring. Critics contend that it is not the function of a college to provide remediation that is normally the function of primary and secondary schools and, indeed, that diversion of college resources into remediation of students who are academically unprepared for college not only deprives academically qualified students of the higher-level education that colleges should be providing but also dilutes, distorts and destroys the very *raison d'être* of higher education.

(See also *ACADEMIC RANK*; *BLOOM, ALLAN*; *COLLEGE ADMISSIONS*; *TUITION*.)

college, preparation for Most two-year and almost all four-year colleges require a high school diploma, GED or equivalent for admission, although enrollment in noncredit courses at some schools may be open to all. The most selective four-year colleges require four years of high school English, three or four years each of mathematics and foreign languages and three years each of science and history or social studies. Somewhat less selective schools also require four years of English, but only three years of mathematics and two each in history or social studies, science and a foreign language. Even the least selective colleges require at least 15 academic units, or *CARNEGIE UNITS*, including 3 in English, 2 each in mathematics, science and social studies and the remaining 6 in electives. Qualifying grade point averages vary according to college selectivity. Most four-year colleges require applicants to take either one or both of the *SCHOLASTIC ASSESSMENT TESTS* or the *ACT ASSESSMENT PROGRAM* tests. As with high school

grade point averages, qualifying tests scores vary according to the selectivity of the individual college. Only about 40% of all students who graduate from high school are academically prepared for college and only 20% of all black and Hispanic students are. About 68% of those taking the ACT English test scored what ACT calls its benchmark level, the skill level of a future C student or better. Only 51% of test takers have the reading skills they need to succeed in college, and fewer than 25% are prepared for college-level science and math courses. In fact, only 65% of students who enroll in American four-year colleges earn a degree.

college admissions The process by which students apply to and get into college. For almost all two-year colleges and the majority of four-year colleges, admission is all but automatic for students with high school diplomas. The process requires filling out a simple application form. All but about 150 to 200 of America's nearly 2,400 four-year colleges accept 50% to 100% of their applicants. State laws require most public higher-education systems to accept all high school graduates into at least a two-year, if not a four-year, college. Although United States college-entry rates are the world's highest—nearly 66% of all high school graduates—the drop-out, or noncompletion, rate is 44%. Of the 150 academically selective colleges with stringent admissions requirements and resultant drop-out rates of less than 2%, many are professional schools (the military academies, engineering schools, schools of music or art, etc.), which base their admission requirements on talent and special interest as well as the student's previous academic record. In many cases, such colleges require auditions, portfolio presentation or some other demonstration or evidence of exceptional competence for admission.

Admissions into nonspecialized selective four-year colleges is a far more complex process,

by which colleges attempt to screen students and admit only those who will benefit most from the education, atmosphere and particular way of life at that college. The goal is not to keep students out but to admit those best suited to each college.

Selective colleges base their admissions decisions on a combination of academic and personal achievement. With a dozen or more applicants for every available seat, selective colleges consider a wide range of factors before deciding which applicants to accept. Secondary school grades are by far the most important of these, although course quality is a mitigating factor in weighing the value of any grade. Thus, a B+ in an advanced "honors" course in a subject would probably weigh more than, say, an A in the less advanced course in that subject.

The number of honors and ADVANCED PLACEMENT courses is another factor in the admissions process, as is class ranking. Scores on SCHOLASTIC ASSESSMENT TESTS, Advanced Placement tests and ACTS are other factors, although many four-year colleges do not require such tests, and some state universities automatically admit all students who finish in the top decile or quintile of their high school graduating classes. Also taken into consideration are a student's extracurricular activities, both in and out of school, and the student's summer jobs. Colleges also try to obtain some measure of each applicant's character. Often this may be evident in the teacher and school recommendation forms that are required with each application.

The application itself is another major factor in the admissions process. Many applications ask students for one or more carefully thought-out essays that reveal their personalities by detailing some deeply personal aspects of their personal lives, experiences, interests, attitudes or feelings. Some colleges also require a personal interview with the student, conducted either on the college campus by an admissions or faculty representative or off cam-

pus by an alumnus/a or other representative of the college.

Beyond these, there are a half-dozen other factors in the college admissions process that are usually beyond the applicant's control, but can affect the chances for admission. All other factors being equal, sons and daughters of loyal alumni have a better chance of gaining admission to a selective college than other applicants, as do children of major financial contributors. Gifted, world-class scholars and athletes also have advantages in the admissions process, and many colleges also give an advantage to members of underrepresented minorities and residents of underrepresented geographic areas.

Almost 70% of college applicants gain admission to the college of their first choice—largely because most four-year colleges have open-enrollment policies. More than 21% of college applicants gain admission to their second-choice colleges and 5.8% to their third choice, and only 3.3% had to settle for their fourth choice or lower. More than 75% of freshmen admitted in 2005 were white, nearly 10% black, nearly 8% Asian, and 7% Latino.

(See also AFFIRMATIVE ACTION; SELECTION AIDS FOR COLLEGES AND SCHOOLS.)

college advisor A high school faculty member trained to help prospective college applicants select colleges best suited to their personalities, talents and academic and social skills. A full-time position in many private schools, the college advisor is usually a member of the guidance staff at most public high schools. In addition to reviewing each student's qualifications, the college advisor helps students assess personal needs and preferences and the appropriateness of each college for the particular student.

Among the factors the advisor helps students consider are: whether to select a preprofessional or a classical education; a large university or small college, in the city, suburbs or country; a coeducational or single-sex school; a day or boarding college; on- or off-campus

living quarters; distance from home; academic and extracurricular opportunities; the social life; and the academic demands of the school and whether the student can meet them.

Another advisor responsibility is to give students access to a variety of college selection aids, including college directories and individual college brochures, catalogues, profiles, video cassettes and descriptive materials. Advisors also arrange for high school visits by college representatives and student visits to colleges. Advisors also help students arrange to take the standardized College Board and American College Testing college admissions tests, and they often provide students with guidance in obtaining and completing college admissions and financial aid applications.

college applications The printed or electronic forms students must fill out as part of the COLLEGE ADMISSIONS process. On-screen applications are identical in appearance to printed forms, but permit automatic insertion of frequently repeated data and allow e-mailing of finished forms to as many colleges as the student selects. Application forms and financial aid forms are available from individual college and university Web sites and from Web sites of organizations such as the COLLEGE ENTRANCE EXAMINATION BOARD and publishers of COLLEGE DIRECTORIES. Applications for admission to the vast majority of colleges range from simple forms requiring little more than the student's name, address and social security number, to complex documents requiring several carefully constructed essays. Most fall somewhere in between and are usually divided into eight parts covering personal data, educational data, admissions test results, family information, extracurricular activities, work experience and a personal statement.

The personal data section includes the student's name, address, telephone number, gender, date of birth, the school term for which the stu-

dent is applying, subject area of greatest interest, career or professional plans and financial aid requirements. The educational data section asks for the name, address and telephone number of the student's current high school, the name of the college advisor, the name of all other high schools the student may have attended and a list of all academic honors and awards. The test information section asks the student to list all college admissions tests (SATs, APs, ACTs) he or she has taken or plans to take. The family information section asks for the names, occupations and higher education of the student's parents and the names of any relatives who attended the college to which the student is applying (see also LEGACY). The student is then asked to list all in-school and out-of-school cocurricular (nonacademic) activities, including hobbies and family activities and the jobs the student has held. Some colleges ask gifted students to support their applications with additional materials, such as copies of art portfolios, tapes of singing or instrumental performances, copies of special awards, and so on.

Finally, many applications—especially for the most selective colleges—ask the student to write at least one essay, or personal statement, that displays elements of the student's personality not evident from the data listed elsewhere in the application or available directly from the student's school. As one application puts it, "The personal statement helps us to become acquainted with you in ways different from course grades, test scores and other objective data. It enables you to demonstrate your ability to organize thoughts and express yourself. Please write an essay about one of the following topics: (1) Evaluate a significant experience or achievement that has special meaning to you; (2) Discuss some issue of personal, local or national concern and its importance to you; (3) Indicate a person who has had a significant influence on you, and describe that influence."

In addition to the documents that the student must complete, forms are enclosed for

recommendations from one or two teachers and for the college advisor on behalf of the school itself. These forms ask for evaluations of the student's personality, creativity, motivation, intellect, academic achievement, ability to write and discuss ideas, self-discipline and potential. The college advisor is also expected to send a transcript of the student's high school grades with the application.

Many applications are so similar that about 200 selective colleges and universities now accept a COMMON APPLICATION, prepared by the National Association of Secondary School Principals. Available from high school guidance counselors, the Common Application permits a student to fill out one form and send photocopies to any of the participating colleges listed on the form. In addition to hard-copy applications, almost all colleges offer applications on computer disks, by e-mail, or over the Internet, and some colleges even waive application fees for applicants who file electronically and eliminate the costs to the colleges of handling paperwork.

College Blue Book, The A five-volume directory available in print or online giving complete descriptions of about 3,000 U.S. and Canadian colleges. Volume I describes facilities, admissions procedures, costs, etc., while Volume II provides all data about each college in tabular form. Volume III cross-references all college courses, majors and degrees with colleges offering them, while Volume IV cross references about 1,000 occupational and professional categories with 8,000 business, trade and technical schools. Volume V lists more than 2,000 sources of scholarships, fellowships and grants.

College Board See COLLEGE ENTRANCE EXAMINATION BOARD.

College Cost and Financial Aid Handbook An annual volume published by the College Entrance Examination Board outlining

most major financial aid programs available to students bound for or already in colleges and universities. It is available in print and online.

college credit A unit for measuring the amount of successfully completed academic work in higher education. The method for measuring credits and the number of credits required for a degree vary widely from college to college. Credits are usually measured, however, on the basis of a combination of classroom (credit) hours for each course and the level of the course work.

Typically, the successful completion of work in a course that meets three hours weekly for a 15-week semester earns a student one credit toward graduation. An upper-level seminar that meets only twice a week, however, might also earn a full credit, while a science course with several hours a week of laboratory in addition to classroom work might earn more than one credit, as would a required thesis. Some colleges award college credits for work experience, life experiences, published works, and scores on college admissions and placement tests.

In general, students must complete 60 semester hours, for about 20 credits, for an associate degree; 78 to 128 semester hours, or 26 to 40 credits for a bachelor's degree; 30 to 40 graduate semester hours, for about 30 credits, for a master's degree; and 70 to 100 total graduate semester hours (including those spent earning a master's degree) for the 60 or more credits required for a doctoral degree.

college directories Publications and Web sites that list, describe, categorize, evaluate and rank American colleges. Available in print and online for both two-year and four-year colleges, college directories range from the objective to the frivolous. Among the most widely used by college advisors are *Barron's Profiles of American Colleges*, *College Admissions Data Handbook*, *The COLLEGE BLUE BOOK*, *The College Board's College*

Handbook and *College Cost and Financial Aid Handbook*, *Peterson's Annual Guide to Undergraduate Study—Four-Year Colleges*, *Peterson's Guide to Two-Year Colleges*, and *Peterson's Guide to Vocational and Technical Schools* (Eastern and Western editions; see PETERSON'S). The NATIONAL COLLEGIATE ATHLETIC ASSOCIATION maintains a Web site for athletes listing graduation rates by year and sport, along with revenues and expenses of teams and gender and race of coaches.

The federal and many state governments also maintain Web sites on colleges. The federal College Opportunities On-Line lists demographics of enrollees, costs, largest academic programs and graduation rates. The Department of Education provides information on financial aid, and state boards of education also maintain sites with data that varies widely from state to state. Google provides the Web sites for each state. Florida's Web site, for example, provides campus-by-campus comparisons of universities in Florida, with degrees awarded, tuition, student demographics and postgraduate job and salary outcomes. The Texas Higher Education Coordinating Board site provides enrollment projections, faculty ages and salaries, size of libraries, state appropriations for each institution and so on.

Typically, directories provide a 2,000-word profile of each institution, including a brief history and description of the college, its size and physical plant, student life and housing and dining facilities, the various extracurricular activities and sports, facilities for the disabled and other students with special needs, counseling services, campus safety and security, programs of study and degrees offered, graduation requirements, admissions requirements and a profile of the average student (SAT scores, high school class ranking, and so on), available financial aid, special facilities and all other information a prospective applicant might need or want. In addition, some directories provide bundled software that matches student career or study interests with appropriate institutions. The Col-

lege Board's *College Explorer* (bundled with *The College Handbook*), for example, permits students to enter their personal selection criteria, after which the software automatically calls up the list of colleges that match those criteria. The student can then call up a full profile of any given college at any time, generate e-mail letters of inquiry to any of the schools or fill out appropriate applications and financial aid and scholarship application forms for e-mailing to each school. Peterson's produces similar software called *Peterson's Interactive*, which is bundled with its guide to four-year colleges. In addition to publishers, a number of nonpublishers have Web sites offering similar search engines.

Most directories also provide some form of college evaluation or rank, based on the ratio of admittances to applicants and average or range of SAT scores and high school class rank of students admitted. Many colleges, however, question the accuracy of directory rankings, contending that they fail to take into account the needs of individual students and the ability of each college to meet those particular needs. Moreover, there are no audits to confirm the accuracy of directory data, which are provided by the colleges themselves. Still another element that can taint the value and validity of directories is the practice of inviting colleges and universities to pay fees—often thousands of dollars—for inclusion of materials about their facilities. Most directories make no mention of that fact to their readers.

College Entrance Examination Board A nonprofit association of more than 2,400 educational institutions that develops standardized college admissions tests. The College Board also maintains a for-profit subsidiary with a full-service Web site that caters to the college applicant's every need, including college applications, financial aid forms, scholarship applications, college counseling and selection, college profiles, tutoring programs for the Scholastic Assessment Tests

and Advanced Placement Tests, and on-line registration for all SAT and AP tests. Founded in 1900 to assist college-bound high school students, the College Board, as it is popularly known, is responsible for College Board Admission Testing Program, which consists of four batteries of tests: the PRELIMINARY SCHOLASTIC APTITUDE TEST/NATIONAL MERIT SCHOLARSHIP Qualifying Test; the SCHOLASTIC ASSESSMENT TEST-I; the Scholastic Assessment Test II; and ADVANCED PLACEMENT Examinations. The National Merit Scholarship Qualifying Test is required for students applying for National Merit Scholarships, while most selective colleges in the United States require one or both of the Scholastic Assessment Tests as part of their admissions processes. The Advanced Placement Tests allow students to earn college credits for work done in special college-level high school courses. The board is also responsible for the COLLEGE LEVEL EXAMINATION PROGRAM, which allows college students to obtain advanced placement at college, and the College Scholarship Service, which helps students apply for and obtain financial aid to pay for college. Based in New York City, the College Board publishes *The College Handbook*, a directory of colleges.

college funding The provision of monies for operating an institution of higher learning. Generally, colleges obtain funds from students, investments, sales and services, private gifts, grants and contracts, and federal, state and local governments. The proportion of funds from each of these sources varies widely, depending on whether the college or university is public or private. The approximate percentage breakdowns of revenue sources for public and private institutions are as follows:

Revenue Source	Public	Private
Student tuition and fees	18.1	38.0
Federal government	11.2	16.3
Appropriations	1.0	NA

Grants and contracts	9.7	NA
Research and development centers	0.5	NA
State governments	35.6	1.4
Appropriations	31.9	NA
Grants and contracts	3.8	NA
Local governments	4.0	0.6
Appropriations	3.2	NA
Grants and contracts	0.8	NA
Private gifts, grants and contracts	5.1	19.4
Endowment Income	0.8	9.3
Sales and services	21.7	23.6
Educational activities	2.8	4.2
Auxiliary enterprises (ticket sales, licensing income, etc.)	9.3	10.7
Hospitals	9.5	8.7
Other	3.7	5.1

Source: U.S. Department of Education

College and university revenues soared to about \$260 billion at the beginning of the 21st century; more than 68% went to public institutions and the rest to private nonprofit institutions, and both sectors scrambled to obtain an ever-widening share of private gifts. The value of such gifts soared to nearly \$26 billion in the 2004–05 academic year, following a healthy rebound in stock market prices. Total private giving a decade earlier had been about \$10 billion, and a decade before that less than \$2 billion. Alumni provided nearly 28% of private gifts in 2004–05, while other individuals accounted for 19.5%; FOUNDATIONS, 27.3%; corporations, 17.2%; miscellaneous sources, 6.8%; and religious organizations, 1.4%. More than 74% of private giving went to research institutions, 55% to public universities and the rest to private universities. Colleges offering only bachelor's or master's degrees received about 22% of all gifts, the vast majority of which was earmarked for private institutions. Specialized institutions of higher education received about 3.3% of total giving, while two-year colleges—almost all of them public—received less than 1%.

(See also ENDOWMENT; STATE EDUCATIONAL SUPPORT.)

College Learning Assessment Test (CLAT)

A standardized test to measure educational outcomes of college students at graduation. Made up of essay questions and complex problems, CLAT was developed by the Council for Aid to Education, a former division of Rand Corporation, in response to growing demands that colleges measure and account for the education they impart to students. While annual costs of attending some colleges have ballooned to \$45,000 or more per student, GRADUATION RATES remain barely above 50% on average, with minority groups dropping out at rates of 60% to 70%. Moreover, the Department of Education's National Assessment of Adult Literacy in 2003 found less than one-third of those tested able to read complex English texts and draw complicated inferences.

(See also COMMISSION ON THE FUTURE OF HIGHER EDUCATION.)

College Level Examination Program (CLEP)

A College Entrance Examination Board program of 90-minute computer-administered tests that allows students to earn college credits and advanced placement in a wide range of subjects at 2,900 colleges. Unlike the more demanding ADVANCED PLACEMENT PROGRAM designed for academically gifted high school students, CLEP is designed to determine the appropriate course levels for adults and former students reentering college. CLEP holds monthly examinations at 1,300 test sites across the United States and overseas. General tests are offered in five broad arts areas (English composition, mathematics, natural sciences, social sciences and humanities). Specific tests are offered in any of about three dozen subjects. Many of the latter are subsidiary areas of the five liberal arts (calculus, for example, in mathematics), but they also include such foreign languages as German, French and Spanish; technical subjects such as nursing, medical technology and dental auxiliary education; and various subjects in education and business.

college of education A degree-granting institution of higher learning specializing in the training of teachers, school administrators and other professionals in the field of education. The college of education is usually a separate college within a university complex. Most such colleges evolved from the NORMAL SCHOOLS of the 19th century and the teachers colleges that replaced them at the beginning of the 20th century. Colleges of education generally offer degrees at both the undergraduate and graduate levels. Although there are more than 750 members of the American Association of Colleges for Teacher Education, only about 600 are accredited by the National Council for the Accreditation of Teacher Education.

College of New Jersey Predecessor institution of PRINCETON UNIVERSITY. The college was founded in 1746 by the New Light Synod of New York, following a split between orthodox and liberal leaders of the then-dominant Presbyterian church. New Light devotees, or popularists, had split with Old Light Calvinists over such issues as the rights of congregations and pastoral powers and the then-raging issue of epistemology, or the theory of knowledge. Scotsmen all, Old Light Presbyterians believed only in the reality of God and the Scriptures and, like philosopher David Hume, denied the objective value of reasoning based on human senses. New Light Presbyterians were adherents of the Scottish "school of common sense," a philosophy best articulated by Thomas Reid, who believed in the validity of judgments based on man's senses. His supporters favored extension of the traditional, religiously oriented curriculum of "moral philosophy" to include the sciences, or natural philosophy. (See also NEW LIGHT-OLD LIGHT CONTROVERSY.)

The debate provoked seven New Light Presbyterians (four ministers and three laymen) to found the College of New Jersey to

train young men as New Light ministers. Later they expanded their mission to include the education of men for other learned professions. They obtained a charter in 1746, and the college opened a year later in the Elizabethtown (now Elizabeth) parsonage of JONATHAN DICKINSON, who became the college's first president and teacher. It eventually moved to the parsonage of AARON BURR, SR., in Newark and, about 10 years later, to Nassau Hall, in Princeton, where Dickinson, Burr, JONATHAN EDWARDS, Samuel Davis and Samuel Finley made it the center of evangelistic New Light Presbyterian studies.

After Finley's death in 1766, the trustees named Scottish minister JOHN WITHERSPOON president, and he reorganized and expanded the curriculum to include politics, history, economics, jurisprudence, literature, modern languages and philosophy. The new curriculum reinvigorated the college and made it one of the nation's preeminent intellectual centers. His graduates included a U.S. president (James Madison), a vice president (Aaron Burr), 10 cabinet members, 60 members of Congress and 3 future Supreme Court justices. Through his students, Witherspoon's presidency helped shape the young nation's political philosophy. Witherspoon's tenure at Princeton also enunciated for the first time the role of higher education as a training field for national leadership. Witherspoon was himself an important philosophy lecturer, who continually reminded his students of their obligations, as scholars, to enter public life and better their nation.

Nassau Hall lay in ruins following the Revolutionary War battles in and around Princeton, but the college was rebuilt and remains the centerpiece of what is now Princeton University, the name it adopted in 1896.

College of Philadelphia The successor school to FRANKLIN'S ACADEMY and predecessor

institution of the University of Pennsylvania. The original academy was an outgrowth of Benjamin Franklin's *Proposals Relating to the Education of Youth in Pennsylvania*, which he published in 1749. Franklin proposed opening an academy to educate young men free of charge in practical courses essential for life in the colonies. He and a group of supporters raised enough funds to buy a building for the school in 1749. Franklin was elected president of the board of trustees, and the new Academy and Charitable School in the Province of Pennsylvania opened in January 1751. In 1755, it added "College" to its name, and, under the leadership of provost WILLIAM SMITH and vice provost FRANCIS ALISON, became the first college in North America to emphasize the sciences and establish a department of medicine. It also was the first college to replace the outmoded tutorial system with European-style professorships that brought talented scientists to lecture. Most colleges at the time assigned a tutor to each class of students for their entire college career, with the college president and one or two colleagues responsible for lecturing in every subject.

Both Smith and Alison were Presbyterians, the products of Scottish education and the Scottish "commonsense" philosophy (although Alison was Irish). Together they adapted and expanded the curriculum to meet the practical needs of colonial era students. The school had two divisions: a Latin school, with a classical curriculum of modern languages, writing, philosophy and mathematics; and an English school, with a more practical curriculum that included writing, merchants accounts, algebra, astronomy, navigation and "all other branches of mathematics."

Closed during the Revolutionary War, it reopened as the University of the State of Pennsylvania in 1770, but changed its name to the University of Pennsylvania in 1779. Besides being the first university to open a department

(and later a college) of medicine (founded in 1765), the University of Pennsylvania was the first North American university to establish schools and departments of botany (1768), business (1881), research medicine (1910) and graduate medicine (1919). Still a private institution, with no relationship to the state-supported Pennsylvania State University in University Park, it was the first university to open a university hospital (1874) and a psychological clinic (1896).

College of Rhode Island Predecessor institution of BROWN UNIVERSITY. Founded in the parsonage of the Rev. James Manning's Baptist church in Warren, Rhode Island, in 1764, it was the first college founded by Baptists, and it served in effect as a Baptist educational answer to Congregational Harvard and Yale, Presbyterian Princeton and Episcopalian Kings College (later Columbia), which tended to limit enrollment to members of their own Protestant denominations.

From its inception, however, the College of Rhode Island was one of the most liberal institutions in the colonies. It was a school "wherein education might be promoted, and superior learning obtained, free of any sectarian religious tests." Its board of trustees was interdenominational, with Quakers, Congregationalists and Anglicans, as well as Baptists, and its doors were open to students of all Protestant denominations. In 1770, it moved to Providence and was renamed Brown in 1804, in recognition of a large gift by Nicholas Brown, an alumnus and son of one of the school's founders.

College of the City of New York The four-year college of liberal arts and sciences at the CITY UNIVERSITY OF NEW YORK. City College, as it is usually called, was founded in 1847 as the Free Academy to provide free higher education to poor, deserving young men, especially

the sons of immigrants, in New York City. Instrumental in its founding was Board of Education president Townsend Harris, who had grown up poor and uneducated himself, but later became the first U.S. minister to Japan. Later still, after he and his family built a successful importing firm, he educated himself and led in planning and founding the Free Academy. The academy was the first free college and, indeed, the first college of its kind in the United States. It changed its name to City College in 1866, about 30 years before New York City's high school offered free education.

College of William and Mary The second oldest institution of higher education in the United States. Founded in 1693 by the Scottish-born churchman JAMES BLAIR, William and Mary, like its predecessor HARVARD, was designed to help alleviate the acute shortage of ministers in the colonies. Fearful that without adequate ministerial shepherding, the colonists and their children would "fall prey to Satan" and grow barbaric, the bishop of London, whose diocese included Virginia, appointed Blair his commissary, or

Sir Christopher Wren Building, College of William and Mary, Williamsburg, Virginia. Built in 1695, it is the oldest academic structure in continuous use in America. (*College of William and Mary*)

deputy, with authority to supervise the clergy in Virginia. At a clerical conference, Blair called for "the better encouragement of learning by the founding [of] a college in this country," which would include a grammar school, a philosophy school and a divinity school. He returned to London to present his proposal to the head of the church and to King William and Queen Mary, all of whom approved the project. On February 8, 1693, a charter was granted for the new college, and Blair was named president for life. Blair imposed a Scottish university curriculum at William and Mary, requiring two years for a bachelor's degree and four for a master's degree. He also adopted the Scottish system of allowing students to live off-campus to save costs, and he banned the English university practice of allowing professors to accept fees from students.

Various Virginia governors interfered with construction, because they feared that the opportunity for betterment through education at the college would tempt planters away from their fields and reduce the colony's revenues from tobacco. Designed by Sir Christopher Wren, the college's first building was completed in 1693; it burned down in a disastrous fire in 1705, but was rebuilt. By the time of Blair's death, there were three buildings at what was by then a well-established institution.

Because of its location at the seat of political and economic power in the colonial South, William and Mary attracted an inordinately large number of young men born to the Virginia establishment who would one day assume power themselves. Not the least of these were THOMAS JEFFERSON, JAMES MONROE, John Marshall and John Tyler. In 1776, students at the college founded PHI BETA KAPPA, the first American intercollegiate Greek letter fraternity.

Damage sustained during the Civil War and lack of money to rebuild forced the school to close in 1868. Although classes resumed a year later, the college closed again in 1881 and did not reopen until 1888, when a small group of

professors attempted to revive the school. In 1906, the Virginia General Assembly assured its permanence by making it a state college. In 1918, William and Mary became coeducational, to train female public school teachers to replace the men lost in World War I. In 1967, the college assumed university status by granting its first graduate degrees. The school has a faculty of about 450 and total enrollment of about 7,750 students, of whom about 5,750 are undergraduates. More than 55% of undergraduates at the once all-male college are now women.

college-operated schools A peculiarly American group of high schools operated by and within a college or university. The origins of college-operated schools go back to the colonial period, when formal secondary-level schooling consisted of only a handful of academies for the children of the wealthy and an even smaller number of colleges to train young men for the ministry. Most students either educated themselves, learned from their parents or the local minister, apprenticed themselves to a master craftsman or engaged a private, entrepreneurial teacher as a tutor. The informal nature of such education all but precluded any clear-cut designation of what constituted the beginning or end of "high school"-level Latin, for example, and "college"-level courses. Students simply studied Latin or any other subject until they mastered it or as long as they could afford the time or money.

The vague line between secondary school and college education persisted as the number of academies grew and the first secular colleges made their appearance. Indeed, Benjamin Franklin's COLLEGE OF PHILADELPHIA began as an academy, or secondary school, in 1751, and only became a college when its provost, William Smith, added the word *college* to its name on a new charter in 1755. Similarly, Baptist minister James Manning's Latin grammar school became the COLLEGE OF RHODE ISLAND by simply allowing

his students to continue their studies to higher, but less than clearly defined levels.

Even in the 19th century, the distinction between secondary school and undergraduate college education remained vague. When MARY LYON founded the first women's college at Mount Holyoke, Massachusetts, in 1837, first-year students were 16 years old and spent their first year studying secondary school subjects to prepare them for college-level studies in their second and third years. And when HENRY BARNARD assumed the chancellorship of the fledgling College of Wisconsin in Madison, in 1859, the college operated what it called a "preparatory department," which was a high school to prepare students for college-level work.

In 1906, City College of New York opened a somewhat different school, the Townsend Harris High School, a free high school to prepare academically talented boys for college. When City College had first opened in 1847 as the Free Academy, New York City had no high schools. Its common, or public, schools offered only an eight-year elementary education program that was inadequate preparation for college. The Free Academy, therefore, opened as a five-year program, with the first, or subfreshman year, offering a preparatory education.

In 1906, as proper high schools began to open, City College expanded its preparatory year into a three-year program in Harris Hall on the City College campus. As New York's public school system developed honors programs and magnet schools to absorb gifted secondary school students, Townsend Harris became redundant, and it closed permanently in 1942. Hunter College, City College's sister school for women went a step further by opening the Hunter College Model School and the Hunter College High School for academically talented girls. Now a coeducational college within City University of New York, Hunter continues to operate both a primary and secondary school.

In contrast to college-run high schools, college-run elementary schools date from the opening of John Dewey's laboratory school at the UNIVERSITY OF CHICAGO in 1896. Designed to study and develop new methods of teaching young children, his school was the forerunner of similar schools at Columbia and other universities. The schools served as important laboratories where educators and educational psychologists studied how children learn and developed the theories of learning and educational psychology that fill many of the standard texts in today's colleges of education.

One outgrowth of the LABORATORY SCHOOLS was an extraordinary secondary school program for young mathematical geniuses at Johns Hopkins University. Started by psychology professor Julian C. Stanley in 1971, the program gave gifted students the opportunity to race through the secondary school curriculum, begin college at 15 or 16 and earn their doctorates by the time they were 20. The program inspired Dickinson College and Franklin and Marshall College in Pennsylvania to open summer sessions for gifted high school students, who often completed two high school years of mathematics in three weeks.

college savings plan A financial vehicle that permits accumulation of tax-deferred savings for eventual payment of college costs. Established by Congress as part of the Internal Revenue Code, a parent, grandparent, friend—indeed, anyone—may contribute funds to the account, which accumulates interest and can grow tax-free. Funds may be withdrawn tax-free if used exclusively for higher education. There are two types of college savings plans:

1. Coverdell Education Savings Account ("Education IRA"). Contributions limited to \$2,000 a year for minor children. Contributions must end and funds must be withdrawn—and spent for college costs—when the child reaches 18. Eligibility is limited to taxpayers filing joint

returns of less than \$100,000 or single returns of less than \$50,000. Contributions are not tax-deductible, but withdrawals, including accumulated income and capital gains, are tax-free.

2. Qualified State Tuition Programs (“Section 529 plans”). Contributions totaling as much as \$100,000 must remain in the account for at least 36 months. Contributions are not deductible from federal income taxes, but withdrawals of accumulated income and capital gains are tax-free if spent on higher education. State-tax consequences differ from state to state; some waive or defer taxes on earnings, and others permit investors to deduct some or all of their contributions from state income taxes. Each state restricts 529 plan investors to a particular menu of investment portfolios, including mutual funds. The result can be costly management fees of more than 2% of assets and sales commissions as high as 6%, depending on the investment portfolio. Investors are free, however, to invest in 529 savings plans in any state, regardless of where they reside or where their children attend college. Assets in 529 plans are considered parental assets, and distributions are not included in calculating student eligibility for federal grants and loans. By 2006, American families had invested about \$65 billion in 529 plans.

(See also EDUCATION TAX CREDITS; FINANCIAL AID; TUITION PAYMENT PLANS.)

college size Usually, the total number of students enrolled part or full time at an institution of higher learning. Nearly 17 million Americans enrolled in two- and four-year institutions of higher learning in the United States in 2006. About 475 institutions had fewer than 200 students and nearly 30 had enrollments of more than 30,000.

The following table lists the number of educational institutions according to enrollment totals in the 2002–03 academic year:

Total Enrollment	All Institutions	Universities	Four-year Colleges	Two-year Colleges
Under 200	459	0	264	195
200 to 499	600	1	293	306
500 to 999	539	1	358	180
1,000 to 2,499	905	6	613	286
2,500 to 4,999	630	20	320	290
5,000 to 9,999	468	45	207	216
10,000 to 19,999	304	87	80	137
20,000 to 29,999	112	65	11	35
30,000 or more	54	34	5	15

college transfer A student who has taken definitive leave of one college institution to pursue the remainder of his or her studies for a degree from a second college. There are a wide variety of reasons for student transfers, ranging from geographic relocation to the pursuit of studies not available to the student’s current institution. No accurate figures are available on the number of transfers each year because of the difficulty of identifying true transfers from those earning additional college credits at other colleges, without actually abandoning their original college affiliations.

College Work Study Program (CWSP)

See CAMPUS JOBS; WORK STUDY.

Collegiate School One of the original 11 Dutch West India Company schools in New Amsterdam (now New York City) and, with HARVARD COLLEGE and BOSTON LATIN SCHOOL, one of the three oldest schools still in existence in the United States. Now a highly selective private primary/secondary day school for gifted boys, Collegiate’s origins date back to at least 1638, although one unconfirmed report traces some foundation stones to 1628. If true, it would be the oldest school on the American continent.

colonial education in America The English tradition of formal and informal instruction of

children in the American colonies. With the exception of the 11 Dutch West India Company schools in New Amsterdam, early colonial education in America was a replica of the English system. That system's origins can be traced to the arrival of Augustine in England in 597 to convert the English to Christianity. His success necessitated a system of schools that he and his colleagues started in their new cathedrals to train a native clergy. As the number of schools proliferated over the succeeding centuries, the church sought secular financial support and, in return, accepted secular students from wealthy families seeking the cultural veneer of a formal education.

The 12th-century rediscovery of the works of Aristotle, Justinian, Galen, Hippocrates, Euclid and Ptolemy set off an explosive expansion

of western European and English education and the construction of the first universities in Paris, Bologna, Oxford and Cambridge. English lower-level education was quickly reshaped into elementary PETTY SCHOOLS that taught basic reading, writing and arithmetic and upper-level grammar schools that prepared students for college. It was this system that the first English settlers took with them to the American colonies. By that time, the development of the printing press had led to the standardization and proliferation of textbooks with which the church and state could control what children read and were taught and grew up to believe.

As in England, colonial-era schools in America remained instruments to preserve religious faith and the existing social and economic order. Although a handful of the

A 19th-century artist's idealized rendering of colonial-era education (*Library of Congress*)

wealthiest children were educated by private tutors, most children who could afford to do so enrolled in petty schools, where seven-year-old boys and girls spent two to three years learning reading, writing and arithmetic. The basic "text" was a HORNBOOK, a small, paddle-shaped piece of wood, with a veneer of horn on which the letters of the alphabet and a short prayer were inscribed. Children learned by reciting the alphabet and syllabarium (see SYLLABICATION) (ba-be-bi-bo-bu, ca-ce-ci-co-cu) and a few simple words. From the hornbook, petty school students progressed to a catechism or primer, which contained simple liturgical prose designed to teach children to read while grounding them in the principles of the Church of England. Petty schools also taught basic writing, arithmetic, good manners and some singing and music.

The few children who did not then begin apprenticeships continued their education in grammar schools lasting seven or eight years, or "forms," which was the name of the long benches on which students sat. Taught by clergymen, they studied Latin grammar, conversation and composition and selected Latin literature (Cato, Aesop's *Fables*, Erasmus, Ovid, Terence, Horace, Virgil, Juvenal, Caesar, Sallust, Cicero and the Vulgate); Greek grammar and literature (Homer, Euripides, Isocrates, Hesiod and the Greek Testament); and Hebrew grammar. The curriculum was quite formalized. Monday through Thursday morning classes, lasting from 6 to 11, concentrated on grammar. Afternoon classes, from 1 to 5 in summer and 1 to 4 in winter, dealt with literature. Reviews and oral examinations were held on Fridays; Saturdays were devoted to essay writing and Sundays to catechizing and other religious exercises.

As in England, however, secularism was working its way into the curriculum of the petty school and grammar school, and causing consternation among upper-class loyalists who

feared popular education as a source of heresy and rebellion. As Virginia governor WILLIAM BERKELEY put it, "I thank God there are no free schools nor printing [in Virginia,] and I hope we shall not have these [for a] hundred years; for learning has brought disobedience and heresy, and sects into the world, and printing has divulged them, and libels against the best government. God keep us from both!" But other colonists feared that life in the wilderness would breed "degeneracy, barbarism, ignorance and irreligion." They saw education as a means of instilling loyalty to crown and church and of giving colonists the intellectual tools to develop the economy.

The Dutch were relatively quick to establish a system of elementary common, or public, schools, and by 1664, 11 of the 12 Dutch communities boasted at least one school each. Sometime between 1635 and 1643, Gov. Berkeley's objections notwithstanding, two private schools were founded in Virginia with bequests from planter Benjamin Syms and surgeon Thomas Eaton. Although the Plymouth Colony in Massachusetts left all schooling to parents, the Bay Colony opened schools in 7 of its 22 towns within 10 years of its first settlement. Boston opened its first school in 1635; Ipswich and Charlestown followed suit in 1636; Cambridge in 1638; and Dorchester in 1639. To spur the expansion of education, New England clerical and lay leaders enacted the landmark School Act of November 11, 1647. Without schools, said the law, "that old deluder, Satan" would "keep men from the knowledge of the Scriptures. . . ."

The act ordered every town with 50 householders to open a petty school to protect children against "the fiery Darts of Satan," and it ordered every town with 100 families or householders to open a grammar school. The law set a standard that spread throughout the colonies, regardless of the religion that dominated a particular region. The shortage of clergy, however,

forced churches to turn much of the elementary-level teaching to the laity. Whoever could teach did so—parents, tutors, clergymen, physicians, lawyers, merchants and craftsmen. Piety, good character and religious orthodoxy were the only prerequisites. Most communities had no funds to build schools, and petty school instruction took place in any available site—kitchens, manses, churches, meetinghouses, sheds and shops and, occasionally, in school-rooms. Among the most common petty schools were the so-called *DAME SCHOOLS*, taught by mothers in their kitchens. Most grammar school instruction, on the other hand, was led by clergymen in their churches.

Although called “free schools,” early colonial schools were free only to the children of parishioners and landed gentry who could afford to pay for school costs and instructor salaries. It would not be until the late 1830s that the concept of free public school education would be introduced. Throughout the colonial era, the vast majority of poor children were bound out as apprentices. The handful of poor children who did attend petty school were almost always servants’ children whose education was paid for by their masters “to prevent the rise and growth of a Barberous, Rude or Stubborn class of servants that would prove Pests instead of Blessings to the country. . . .” Petty school not only taught them to lead religious lives, but to support the existing social and economic order, with its class system and economic inequalities, by pursuing “humble and useful callings.” In addition to the Bible, petty schools taught them the “capital” laws [applying to felonies] of the land and the penalties for runaway servants.

Only the wealthiest children bent on professional lives as clergymen, physicians, lawyers, judges or provincial governors sought instruction beyond the petty school level in grammar or *LATIN GRAMMAR SCHOOLS*, which prepared students for college. The early colonies

had but one: *HARVARD COLLEGE* in Cambridge, Massachusetts. All the others were a long, costly and often dangerous journey away in England. Harvard had been founded in 1636, less than a decade after the settlement of the Massachusetts Bay Colony. As was true at Oxford and Cambridge, upon which it was modeled, Harvard began as a training school for ministers, but nevertheless adapted its curriculum to attract secular students from wealthy families. In the first 50 years of its existence, before any other college would open on American shores, Harvard produced 388 alumni, of whom 180 were clergymen. Of the rest, 42 became public servants, 27 were physicians, 13 were teachers, 10 were merchants, 11 were planters and gentlemen and 5 were soldiers and mariners. The remainder either died young or engaged in unidentified occupations.

Harvard’s curriculum required only three years of study, instead of four, as at Oxford and Cambridge. The curriculum included logic, rhetoric, ethics, politics, history, arithmetic, geometry, astronomy, physics, nature of plants, Greek grammar and literature, Hebrew grammar and Bible readings, Chaldee (Chaldean) grammar and Apochryphal readings, Syriac grammar and New Testament readings, and catechetical divinity. Fluency in Latin was a prerequisite for admission. Instruction was by lecture, declamation and disputation and the constant exchange of philosophical and theological ideas. The constant flow into the colonies of immigrants from a variety of countries, however, brought an equal variety of philosophies, religious beliefs and approaches to theology. By the end of the first century of colonization, what had begun as a reproduction of the English system of education metamorphosed into a new configuration. Liberal Unitarians eventually took over Harvard, and the founding Puritans left Cambridge for New Haven, Connecticut, where they founded Yale to preserve their Calvinist orthodoxy. Appalled by the spread of Puritanism,

the Church of England sent its representatives to the colonies to found the COLLEGE OF WILLIAM AND MARY in Virginia and King's College (later COLUMBIA COLLEGE) in New York. Dissenters from both the Church of England and the Puritans, meanwhile, founded colleges of their own at Princeton, New Jersey, and in Rhode Island, while humanists, led by Benjamin Franklin, founded the secular COLLEGE OF PHILADELPHIA in the belief that practical skills were more important to the survival of the new nation than religious instruction. By the time of the Revolutionary War, there were nine degree-granting chartered colleges in the colonies, with four more about to open and at least a dozen private academies offering college-level education.

Colorado The 38th state, admitted to the Union on the nation's 100th anniversary. The state established its first public university in the same year. The state university system has 14 four-year and 15 two-year public colleges and universities, with a total enrollment of nearly 235,000 students. Colorado also has 30 private four-year colleges and 16 private two-year colleges. The 53.4% graduation rate for all the state's colleges is only slightly below the national average of 54.4%. The academic quality of the state's 1,667 public elementary and secondary schools ranks well above the national average, however, and student reading and math proficiency are among the top 20 states in the nation. More than 33% of Colorado's nearly 750,000 elementary and secondary school students are minority children—the largest proportion, more than 23%, Hispanic. About 10.5% of all schoolchildren live in poverty.

color phonics systems A method of teaching letter sounds and reading by color-coding vowels and various letter combinations. Originally developed for early elementary education, the system has proved useful in a variety

of remedial reading programs, especially with dyslexics. The system uses widely spaced letters, with short vowels printed in red to help children learn to read monosyllabic then polysyllabic words. The red vowels help students distinguish each syllable as a separate sound, and an underlined vowel indicates the accented syllable.

Columbia College The four-year undergraduate institution that was founded in 1754 as King's College and now forms the heart of Columbia University. Like the College of William and Mary in Virginia, King's was founded by Anglican clergy and their supporters concerned with propagating the English faith in the provinces. Despite its sectarian origins, King's College readily adapted its curriculum to the practical needs of students in a major seaport and trading center. Although its first president, Anglican clergyman Samuel Johnson, retained fluency in Latin and Greek as a prerequisite for admission, he expanded an otherwise classical curriculum to include such practical courses as science, mathematics, modern languages, numbering and measuring, surveying and navigation, mining, geography, history, husbandry, commerce and government. Following the lead of the similarly practical COLLEGE OF PHILADELPHIA, Johnson also established a medical department in 1767 and engaged professors in anatomy, surgery, physiology, pathology, chemistry, midwifery and medicine.

After the Revolutionary War, the New York State Board of Regents set about "cleansing" King's College of its royalist Anglican traditions. Renaming it Columbia, the board tried to make it part of a new, planned statewide public school system in which primary and secondary schools would feed students into Columbia and two other colleges (Union and Hamilton) the board created elsewhere in New York State. After the War of 1812, however, the state could no longer fund both the lower-level

Low Memorial Library and Plaza, in the heart of today's Columbia University, in New York City (Joe Pineiro, *Columbia University*)

common schools and the colleges. It set the colleges adrift to raise their own funds and operate independently and privately. To increase its student constituency and revenues, Columbia went on to add a law school in 1857, allied itself with the College of Physicians and Surgeons in 1860 and added a School of Mines in 1863.

Nevertheless Columbia was still a small, old-fashioned college of about 100 men when FREDERICK A. P. BARNARD became its president in 1864. By the time he died in 1889, however, he had built the college into a model modern university of more than 2,000 students. During his tenure, he expanded the undergraduate curriculum and established new graduate and pro-

fessional departments and schools, including the famed Teachers College. Despite fierce opposition from his board of trustees, he established a women's department, which six months after his death was renamed Barnard College in his honor.

His successor, the wealthy merchant and political reformer Seth Low, presided over Columbia's official redesignation as Columbia University during his 12-year tenure. He personally contributed a huge library to the college and reorganized the graduate schools. NICHOLAS MURRAY BUTLER became president in 1902, and for the next 43 years guided Columbia's growth into the gigantic institution it is today, with about 19,000 students, a faculty of

2,100 and graduate schools in business, education, engineering, law, medicine and social work. Coeducational since 1983, Columbia College's enrollment of nearly 4,200 in 2000 was almost evenly divided between men and women. Barnard College remains an affiliated, though independent, women's college, with an additional 2,300 women students who can cross-register at Columbia.

Columbian Agricultural Society for the Promotion of Rural and Domestic Economy A privately funded, early 19th-century organization that taught farmers to become more efficient. Like Elkanah Watson's Berkshire agricultural societies (see BERKSHIRE AGRICULTURAL SOCIETY), the Columbian Agricultural Society was founded when the growth of overseas and domestic markets made it imperative that American farmers convert their properties from subsistence to commercial farms. In 1810, the society's secretary, Rev. David Wiley, a teacher, merchant and scientist who had graduated from the College of New Jersey at Princeton, founded the society's semimonthly technical and scientific journal called *Agricultural Museum*. Although it survived only two years, it was a forerunner of similar journals that, together, became primary educative agencies for American farmers during most of the 19th century.

Comenius, John Amos (1592–1670) Moravian educator, whose *Orbis sensualium pictus* (1659) revolutionized the teaching of Latin and became a standard grammar school text in England and the colonies. A graduate of the University of Heidelberg, Comenius became a minister and preached in both German and his native Czech. Religious wars forced him to flee, and at various times, he found himself trying to preach to congregants and teach their children in Moravia, Bohemia, Poland, Hungary, Sweden, Holland and England. Unable to speak their language, he discovered he could

teach children Latin by illustrating each new word with a drawing. The results were two texts that changed teaching methods throughout the Western world and earned him an invitation to become chancellor at Harvard College in Cambridge, Massachusetts. His *Janua linguarum reserata*, or *The Gate of Languages Unlocked*, abandoned rules of grammar in favor of useful, everyday phrases, while *Orbis sensualium pictus*, or the *Visible World in Pictures*, illustrated each vocabulary word. While living in England, Comenius was apparently asked to come to America to head Harvard in 1641, but nothing is known of his response or the reasons he never came to the colonies.

Comer, James P., M.D. (1934–) American professor of child psychiatry and founding director of the Yale Child Study Center School Development Program, at Yale University. A graduate of Indiana University and the Howard University College of Medicine, Comer pioneered reform of education in inner-city public schools and identified preschool family and social experiences as the sources of most school underachievement in school. "Development that was appropriate on the playground, at home or other places outside of school," he wrote, were "inappropriate in school . . . [and] at variance with mainstream expectations" of teachers, who saw their inner-city students as "bad" and of low academic potential.

Parents, in turn, interpreted their children's failure in school as their own personal failure "or as evidence of animosity from the mainstream. They lose hope and become less supportive of the school," Comer wrote. "Some parents ashamed of their speech, dress, or failure to hold jobs, may become defensive and hostile, avoiding contact with the school staff. The result is a high degree of distrust between home and school." But Comer found schools as unprepared to handle inner-city children as the children were to handle mainstream school-

ing. "School staffs," he said, "lacked training in child development and behavior, and understood school achievement as a function of genetically determined intellectual ability and individual motivation. . . . The staffs usually responded with punishment and low expectations. "Such responses . . . usually led to more difficult staff-student interactions and, in turn, to difficult staff-parent and community interactions, staff frustration, and a lower level of performance by students, parents and staff."

Comer recognized that any improvement in academic and social achievement would depend on schools' providing social and health as well as academic services to students and their families—that is, what he termed a "comprehensive" approach to education.

Comer developed what eventually grew into the far-reaching School Development Program at two inner-city schools in New Haven, Conn., in 1968. The Yale Child Study Center provided each school with the support services of a social worker, psychologist, special education teacher and child psychiatrist.

Comer helped retrain members of the school staff and faculty and develop strong relationships between parents and the school. Over the next 15 years, grade equivalent scores of fourth graders climbed from an average of 3.0 in reading and mathematics to 6.0 in reading and 6.0 in mathematics. At the same time, both schools showed significant declines in student absentee rates, misbehavior and other social problems. The results encouraged about 700 schools across the United States to become so-called Comer Schools, by adopting the School Development Program.

(See also COLEMAN REPORT.)

Command and General Staff School A specialized college in Leavenworth, Kansas, that provides graduate-level military science instruction for prospective U.S. Army colonels. Like the ARMY WAR COLLEGE, the Command and

General Staff School was founded after the Civil War as the Army General Service and Staff School to supplement the education of the U.S. Military Academy, which provided future officers with undergraduate military education.

commencement The act of beginning; a term used since the 13th century for ceremonies in which academic diplomas or degrees are conferred on students graduating to and, thus, commencing a new period of their lives.

commercial schools Any of a wide variety of FOR-PROFIT SCHOOLS OR PROPRIETARY SCHOOLS, offering courses and practical training in specific job skills for the workplace—for example, keyboarding. Usually unregulated and unaccredited by recognized education accreditation agencies, commercial schools differ from for-profit colleges in that they usually offer a narrower range of courses that are skills-oriented and lead to certificates rather than degrees for students who successfully complete their course work. Students tend to be working adults who have not graduated from high school, and teachers tend to be men and women with practical experience rather than academic credentials. Class hours are usually scheduled to be convenient for working students.

(See also CAREER SCHOOLS; ENTREPRENEURIAL SCHOOLS.)

Commission on Academic Freedom A group formed by the AMERICAN ASSOCIATION OF UNIVERSITY PROFESSORS in 1985 to combat censorship in elementary and secondary schools. Believing that censorship in elementary and secondary schools affected the quality of education that students brought to college, the commission issued a report entitled *Liberty and Learning in the Schools, Higher Education's Concerns*. It detailed the history of censorship in elementary and secondary schools and the effects it ultimately had on higher education.

Commission on Country Life A commission of academic leaders, created in 1908 by President Theodore Roosevelt to study the deteriorating quality of life in rural America and recommend ways for remedying the situation. Roosevelt appointed the commission in response to sharp declines in farm production and a mass exodus from rural areas. The commercial and social deterioration of American agriculture had started after the Civil War, as wheat and corn prices plunged by 70% to 75%, while transportation, storage, processing and interest costs soared and drove more than one-fourth of all farmers out of business. By 1910, only 37.7% of Americans worked in agriculture, compared with 51.6% in 1870, and rumors swept the country that huge commercial trusts had bribed federal government officials to drive small farmers out of business and gain control of American agriculture.

The commission surveyed a half-million rural Americans and received 100,000 responses to a 12-item questionnaire about farm life. After numerous public meetings in 24 states, the commission reported in January 1909 that ignorance, lack of decent schooling, poor communication and the absence of effective local leadership were responsible for the plight of American farmers. At the technical level, they knew little or nothing about such basic elements of agriculture as crop rotation, mechanization, pest control or erosion control. The commission called for a massive, coordinated program of education through churches, schools, libraries, agricultural societies, YMCAs and LAND-GRANT COLLEGES to train farmers in modern agricultural techniques. It also called for the building of modern highway systems to help farmers get their goods to market.

Congress, however, not only rejected the commission's recommendations, it refused an appropriation to print and publicize the report and ordered the commission to end its work. Ultimately, its efforts came to naught.

Commission on Higher Education A group established in 1946 by President Harry S. Truman to study the role of higher education in American life. Its report, issued two years later, not only altered the average American's perception of higher education, it converted American institutions of higher learning from halls of esoteric learning for the very rich into corridors of practical learning that could assure the success of the average American, regardless of his or her social or economic background.

Truman established the commission following the unexpected academic successes scored over the previous two years by returning servicemen attending colleges and universities under the Servicemen's Readjustment Act of 1944—popularly known as the G.I. BILL OF RIGHTS. Originally passed to prevent mass unemployment by allowing colleges to absorb some of the demobilized servicemen at the end of World War II, the G.I. Bill surprised both the government and the higher education establishment. Both had expected veterans to attend college for only a few months before boredom with academic life provoked their transfer into the job market. Most, after all, were older, mature men, often with family responsibilities and, just as often, from culturally disadvantaged backgrounds.

Instead, the vast majority of veterans not only performed better academically than their junior classmates, most remained at college to complete their degrees and enter the workforce at far higher salaries than men without college degrees. Their unexpected successes provoked President Truman to appoint the commission. Its astonishing report, *Higher Education for American Democracy*, called on American colleges and universities to abandon their role as a training ground for the intellectual elite and, instead, to become "the means by which every citizen, youth, and adult is enabled and encouraged to carry his education, formal and informal, as far as his native capacities permit." The report found that at least 49% of the American population

had the mental ability to complete at least 14 years of formal schooling—that is, through the first two years of college—and that at least 32% could complete four years of college and professional education and graduate school.

The commission urged American colleges and universities to expand and double higher education enrollments from the 2.3 million in 1947 to 4.6 million by 1960. The commission called on each state to plan and build new institutions of higher learning and to expand junior colleges. It called on the federal government to establish a program of need-based undergraduate and graduate scholarships that would open higher education to all Americans, regardless of social or economic backgrounds. The commission also asked Congress to pass a federal law outlawing historic discriminatory practices of colleges and universities and to outlaw discrimination in higher education on the basis of race, color, gender and income.

The immediate response of the states and Congress was silence and inaction. But the report produced a groundswell of public demand for access to higher education, and over the next five years, states did expand their colleges and universities and build hundreds of new community colleges. Congress expanded the G.I. Bill to include all veterans, regardless of whether they served in World War II or not, and it created a massive program of higher education scholarship and loan programs. In 1954, the U.S. Supreme Court added the stamp of inevitability to the popularization of higher education in its landmark ruling in *BROWN V. BOARD OF EDUCATION OF TOPEKA*, which declared racial segregation in public education unconstitutional. Subsequent passage of federal civil rights law opened higher education in the United States to all citizens.

Commission on Professional Rights and Responsibilities A NATIONAL EDUCATION ASSOCIATION group charged with enforcing the NEA's Code of Ethics of the Education Profession.

Commission on the Future of Higher Education A commission appointed by Secretary of Education Margaret Spellings to determine the skills college students should be acquiring—writing, critical thinking, problem solving and the like—and whether American colleges are succeeding in teaching their students those skills. Spellings created the commission in 2005 in response to years of mounting criticism that colleges are continually charging students more and teaching them less. While annual costs of attending some colleges have soared to \$45,000 and more, GRADUATION RATES remain barely above 50% on average, and minority students drop out at rates of 60% to 70%. For students who do graduate, the Department of Education's National Assessment of Adult Literacy in 2003 found that fewer than one-third of those tested were able to read complex English texts and draw complicated inferences. In addition to parents and students, the federal government and the 50 state governments, which provide more than one-third of college and university funding, are demanding that institutions of higher education be held accountable for the educational outcomes of the students they enroll. Except for graduate school entrance examinations and certain licensing exams, few if any colleges measure what and how much their students have learned during their undergraduate years. Indeed, until recently, no standardized tests existed for such measurements. In 2005, however, the Council for Aid to Education, a former division of the Rand Corporation, developed the COLLEGE LEARNING ASSESSMENT TEST, which asks college students to write essays and solve complex problems. Efforts to introduce the test, however, have met with fierce resistance from college administrators and faculty, who call such tests an intrusion on academic freedom.

(See also COLLEGE: *OUTCOMES*.)

Commission on the Reorganization of Secondary Education A NATIONAL EDUCATION ASSOCIATION group whose 1918 report,

Cardinal Principles of Education, served as a blueprint for reorganizing comprehensive public high schools. Two decades prior to the 1918 report, American secondary schools had been reorganized into comprehensive high schools, a uniquely American institution in which all secondary school students in a geographic area attended a single school, regardless of whether they eventually planned to go to college or directly to work. At the time of the 1918 report, students in each high school were grouped in one of four divisions, two for superior students and two for inferior, but all were obliged to study the same core curriculum of Latin, Greek, English, modern languages, mathematics, physics, astronomy, chemistry, biology, zoology, physiology, history, civil government, political economy and geography.

Devised in 1884 by the NEA's COMMITTEE OF TEN, the curriculum proved too demanding for most high school students. Many had just arrived from foreign lands with their immigrant parents and could not even speak English. The result was that by 1910 fewer than 10% of American adolescents attended secondary school, and a growing number of social and educational reformers began demanding reforms that would increase the "holding power" of high schools by adapting the curriculum to student needs and occupational destinations. Their demands resulted in the formation of the Commission on Reorganization of Secondary Schools and a report that recommended a new, far less academically demanding core curriculum. The new curriculum was to be based on seven "Cardinal Principles" or educational objectives: health, command of fundamental processes, worthy home membership, citizenship, ethical character, vocation and worthy use of leisure.

To achieve these goals, the commission recommended that schools expand curricula to offer a wider choice of subjects; adapt subject matter and teaching methods to student needs

and occupational goals; make academic requirements more flexible; and establish extensive programs of guidance and counseling.

Committee for Public Education and Religious Freedom v. Regan A 1980 U.S. Supreme Court decision that New York State could reimburse private and parochial schools for the costs of state-mandated testing and other activities. In 1974, New York had enacted a law allowing the state to reimburse 2,000 nonpublic schools for such testing, but the ruling was challenged on the grounds that it violated the ESTABLISHMENT CLAUSE of the First Amendment, which prohibits state establishment of religion. As in a battery of similar cases (see CHURCH-STATE CONFLICTS), the Court held that the law had a "secular legislative purpose," accrued only to the benefit of students and did nothing to advance any religion.

Committee of Fifteen A NATIONAL EDUCATION ASSOCIATION group formed in 1893 to study and recommend reforms for elementary school education in the United States. The committee issued its report in 1895, supporting the prevailing eight-year system of elementary schooling, with grammar, literature, arithmetic, geography and history as core subjects. The committee recommended that each be taught as separate subjects, instead of correlated in a single broad subject in which students jumped in and out of each subdivision at random.

Committee of Ten A NATIONAL EDUCATION ASSOCIATION group formed in 1891 to study and recommend reforms for secondary school education in the United States. Formed in response to demands for educational reform by Harvard University president CHARLES W. ELIOT who became its first president, the committee published recommendations in 1894 that changed secondary school education for the next 30 years. The report urged high schools

to adopt a required core curriculum of Latin, Greek, English, modern languages, mathematics, physics, astronomy, chemistry, biology, zoology, physiology, history, civil government, political economy and geography. Art and music were not mentioned.

At the time, American high schools had evolved into institutions in which all students living within a specific geographic area attended the same central, comprehensive institution, regardless of whether they intended to go to college or not. The report recommended that students in each high school be grouped by ability into one of four divisions or tracks, two for superior students and two for inferior, but that every subject in the core curriculum "should be taught in the same way and to the same extent to every pupil. . . ."

Aside from improving the quality of secondary school education, the committee's goal was to standardize the curriculum to allow every college-bound student to begin college studies with the same academic background. For years prior to the committee's formation, Eliot had used his position to attack the quality of American public school education. Stung by his attacks, the NEA organized three important committees: The Committee of Ten, to study secondary school education in 1891; the COMMITTEE OF FIFTEEN, to study elementary school education in 1893; and the COMMITTEE ON COLLEGE ENTRANCE REQUIREMENTS, appointed in 1895.

Committee on Civil Rights A group appointed by President Harry S. Truman to study law enforcement measures "to safeguard the civil rights of the people." The committee's 1947 report, *To Secure These Rights*, represented the first strong federal government stand against racial injustice. It marked the beginning of a 20-year campaign to end racial and religious segregation and discrimination in education and other areas of American life. The committee report said that civil rights had become a national problem requiring federal legislation to guaran-

tee the rights of all Americans, regardless of race, religion or national origins. The report exposed widespread legal and illegal discrimination in housing, education and health care against Jews, Roman Catholics, African Americans, Asian Americans, Hispanics and Native Americans.

"We believe," the report concluded, "that not even the most mathematically precise equality of segregated institutions can properly be considered equality under the law. . . . No argument or rationalization can alter this fact: a law which forbids a group of American citizens to associate with other citizens in the ordinary course of daily living creates inequality by imposing a caste system on the minority group."

The committee urged Congress to enact a Fair Employment Practices Act. It also urged states to enact "fair educational practice laws for public and private institutions, prohibiting discrimination in the admission and treatment of students based on race, color, creed or national origin. It recommended creation of a permanent CIVIL RIGHTS COMMISSION in the Executive Office of the President and urged "elimination of segregation, based on race, color, creed, or national origin, from American life."

Committee on College Entrance Requirements A NATIONAL EDUCATION ASSOCIATION group formed in 1895 to develop a standardized high school curriculum to prepare students for college. Published in 1899, the committee's report standardized college admission requirements by basing them on successful completion of a required number of high school course units. At the time, each college had its own entrance examination based on its particular set of academic requirements. Such requirements varied widely from college to college. Few students could prepare for more than one or two such examinations. Under the committee's new system, students would be eligible for college if they successfully completed four units of foreign languages, two each of English and

mathematics, one each of science and history and a program of approved electives.

common application A standardized college application originally developed by a group of about a dozen midwestern and eastern colleges and universities to ease the clerical burden on college applicants. Used by about 200 colleges and universities, the common application is available from most high school guidance counselors either in paper or electronic format. In either format, it permits a student to fill out a single application and send photocopies to any participating colleges.

common branches An obsolete term referring to the basic subjects of an elementary school curriculum, including such branches as English, arithmetic, science, history, music, art, and so on. Until the mid-1960s, an elementary school teaching certificate was often called a "common branches certificate."

common school The predecessor institution of the modern, tax-supported, American public elementary school, which every child in the school district may attend free of charge. Although the concept of public education was not new when the United States gained its inde-

An artist's rendering of a 19th-century common school

pendence, it was not a popular concept. In the country, parents needed their children to help them work the fields. In cities, children were in demand as inexpensive factory workers and parents needed the extra income their children could earn. By the early 1830s, however, the industrial revolution spawned increasingly complex machinery, and the use of illiterate children to operate such equipment proved counterproductive. At the time, educational reformers such as HORACE MANN were calling for universal free public education. An idealist, Mann feared the demise of democracy in the United States if its citizens were not literate enough to vote and govern themselves intelligently. Ironically, some of the very industrialists who had exploited child labor for the previous half-century suddenly backed Mann's educational reform movement because the operation of the complex machines in their factories required more literate workers. Parents also began supporting public school education when they saw it might give their children more earning power.

In campaigning for public schools, Mann made a blatant appeal to such selfish interests, promising that educated young men and women would make better skilled, more productive workers who could earn more money for their families and employers than uneducated workers. Gradually, Mann won popular support for establishment of free common, or public, schools in Massachusetts and the hiring of trained teachers. Citizens contributed more than \$2 million to build common schools, and an industrialist gave \$10,000 to build the nation's first teacher training institute in Lexington, Massachusetts, which opened in 1839. Other reformers went on to found similar public school systems in Rhode Island, Connecticut, New York, Pennsylvania, Ohio and Wisconsin. The end of the Civil War saw the public school movement spread into the South and the western territories. By the end of the century, every state had a free common school system.

community college A two-year, degree-granting public institution of post-secondary school education, designed to serve the needs of the local area or community. Still evolving, community or JUNIOR COLLEGES, offer one or more of four broad curricula: academic curricula leading to an associate degree in arts or science that serve to bridge the gap between high school and four-year colleges; vocational and occupational education leading to an associate degree or professional certification; remedial programs; and adult and continuing education, which may or may not lead to an associate degree or certificate.

Community colleges evolved out of the vast expansion in the number of public and private colleges, universities and institutes in the half-century following the Civil War. Some were founded for special purpose such as nursing, mechanics and other occupational skills that only required two years of formal classroom training. Others emerged from a process of institutional growth or contraction determined by market demand in particular areas. Thus, some academies (see ACADEMY) grew into colleges, while many of the mostly three-year colleges, either shrank into two-year "junior" colleges or expanded into four-year "senior" institutions. Of the two-year junior colleges most were private institutions, and the term junior college continues to be used to differentiate private from public, or community, colleges.

By the turn of the century, most professional schools required only two years of college education, thus permitting junior colleges offering thirteenth and fourteenth grade education to send their students directly into professional school without spending four years at conventional colleges. After professional schools imposed bachelor degrees requirements for admission, junior colleges became bridges between high school and four-year colleges, serving those students who had not fulfilled their secondary school academic requirements

for admission to four-year colleges. That role expanded after World War II, as returning soldiers took advantage of college scholarships offered under the G.I. BILL OF RIGHTS. Those who had not finished their secondary school education or were otherwise unqualified to enroll directly into four-year colleges, enrolled in junior colleges to obtain the needed academic qualifications. As the demand for such education expanded, state funds were used to build public junior, or community, colleges.

As four-year colleges began adopting OPEN ADMISSION policies in the early 1960s, community colleges faced a loss of their traditional constituencies, and they were forced to turn elsewhere for new students. They expanded into two new areas: the booming adult education market and vocational education, geared to the needs of their communities. The result was an expansion in the number of community colleges from fewer than 600 in 1960 to 980 in 2004. There are also 148 private two-year colleges in addition to the public community colleges, and together, America's two-year colleges now enroll nearly 12 million students—6.6 million in credit courses and 5 million in noncredit courses—compared with only 750,000 in 1960.

Most community colleges try to specialize in one or two areas of vocational training, such as health care, which meets the needs of nearby employers. Many community colleges have cooperative VOCATIONAL EDUCATION programs with local industries, whereby the college and a local company or companies join to provide a "total," integrated vocational education package. The college provides most of the necessary classroom education, often paying company personnel as ADJUNCT instructors, and the company provides students with paid, on-the-job training.

Other community colleges have so-called two-plus-two, or tech-prep programs, which offer students a four-year vocational education

program that begins in the student's junior year of high school and continues through community college.

Community colleges offer students advantages unavailable at most other institutions of higher learning. Aside from low fees, they offer students an opportunity to perfect academic skills while learning a new craft or occupation. They allow students to attend part-time and keep their jobs while continuing their education. They usually set no minimum time to complete the work for a degree or certificate, and students may enroll in as few or as many courses as they want. Because teachers tend to be part-time adjuncts, many are actually professionals in the fields they teach.

Beginning in 2001, some community colleges with extensive two-year associate degree programs in specialties such as teacher training or health care expanded course offerings to permit students to obtain baccalaureate degrees. By early 2006, a dozen states, including Florida, Arkansas, Nevada and New Mexico, had passed laws allowing community colleges to award bachelor's degrees in specific areas. A critical shortage of teachers and nurses motivated the change in Florida, while California and Arizona expanded community colleges to absorb the expanding student population without incurring the costs of building new four-year colleges. Arizona has only three public universities and no room to accommodate the increased numbers of high school graduates demanding entry into four-year degree programs. Because of their more Spartan facilities, community colleges charge only about \$60 a credit hour, or half the cost of four-year colleges.

community education A wide range of educational opportunities sponsored by local government for the entire community, including adults of all ages, as well as children. Communities make such education available through a

wide variety of conduits, including local municipal facilities and public and private schools, colleges and universities. Depending on the size and extent of such programs, some communities have community education councils that employ community education directors and staffs to organize and supervise such programs. Community education programs depend heavily on volunteer participation and contributions, although some state and federal grants are available. Program offerings range widely, from formal academic courses to instruction in crafts and hobbies to outright entertainment.

community school A type of school organized at the beginning of the 20th century to educate as many students as possible in the widest variety of subjects in the least amount of space. Often called a "platoon" school, the community school in each neighborhood used every available space—the art room, auditorium, gymnasium, shop—as classrooms when they were not in use fulfilling their designed functions. The system increased school capacity by 40%, without the need for extra teachers at a time when immigrant families were pouring onto American shores in record numbers and schools were unable to cope with increases in school population.

The community school system grouped students into two platoons, with one studying traditional academic subjects in traditional classrooms, while the other used the specially equipped service rooms to study nonacademic classes such as art, music or shop. The platoons switched rooms to give each platoon an equal amount of time of instruction in academic and creative work.

Superintendent of Schools William Wirt, a student of JOHN DEWEY, organized the first platoon in Bluffton, Indiana, in 1900 and expanded his ideas to every school in the new steel town of Gary, Indiana, in 1907, when he assumed the superintendency of schools there.

In Gary, however, he expanded the platoon system to obtain 24-hour-a-day utilization of school facilities by opening up schools during evening and nighttime hours for adolescents and adults who worked during normal school hours. Called the GARY PLAN, Wirt's community schools were soon teaching more adults at night than they were children during the day.

The plan proved so successful, it spread to more than 200 cities. It ran into opposition in New York, however, when militant teacher associations rebelled against the extra hours and teaching loads and parents objected to what they saw as a reduction in the quality of education. After rioting broke out in schools in Manhattan, Brooklyn and the Bronx, New York abandoned the Gary Plan, and, one by one, other cities returned to traditional school organization in the face of mounting teacher opposition.

Community Schools and Comprehensive Education Act of 1978 A section (Title VIII) of the Educational Amendments of 1978 to provide federal grants to states and COMMUNITY EDUCATION agencies for "educational, recreational, cultural and other related community . . . services, in accordance with the needs, interests, and concerns of the community through the expansion of community education programs." In addition to providing direct grants for community education programs, the act also provides grants to colleges for community education training and research.

community service An elementary and secondary school activity for students to serve in any school-approved volunteer organization that serves the community. Some public and private secondary schools make it a requirement for graduation that students participate in a fixed number of unpaid hours of community service for one school year—usually 60 hours, or the equivalent of a one-semester course. Students in some communities have

challenged the community service obligation in court, charging that it violates their rights under the 13th Amendment, which abolished slavery. The courts have rejected the argument, however.

Company for the Propagation of the Gospel in New England A charitable group formed in 1649 by the Puritan Parliament and London merchants to raise funds to convert New England Indians to Christianity. The Puritans in New England had been less than successful in proselytizing Indians. Conversion not only meant baptism and acceptance of Puritan Christian beliefs and behavior, it meant the experience of "saving grace," which required a knowledge of the Scriptures at a depth not possible without fluency in English.

By 1640, there were few Indian converts, and agents of the (Massachusetts) Bay Colony, led by the Reverend JOHN ELIOT of Roxbury, petitioned Puritan leaders and merchants in England to raise funds to bolster efforts in the colonies to convert Indians. Eliot arrived in New England in 1631 and, for the next 56 years, served as teacher-minister of a new church in Roxbury. During that time, he learned Algonquian, preached to the Algonquians in their own language and, in 1663, translated the Bible into Algonquian.

For nearly 30 years, throughout Puritan rule and well after the Restoration, the society raised hundreds of pounds annually to support Eliot's work, which consisted of buying clothing, building materials and tools for Indians; paying salaries of ministers, teachers and missionaries who worked among the Indians; and paying for the printing of an Indian Library in Algonquian.

By 1675, about 2,500 New England Indians, or about 20% of the native population, had converted to Christianity, and the society decided to finance an Indian College at Harvard. A lack of qualified and committed stu-

dents, however, doomed the Indian college and Eliot's and the society's efforts. Eliot died in 1690, and the society's work ended.

comparative education A relatively limited field of study within the graduate education curriculum that deals with comparison in formal education systems in different countries and societies. In recent years, the United Nations has been compiling comparative education statistics to help researchers in the field and promote international understanding among leaders in education.

compensatory education Instructional programs designed to overcome the effects of poor education associated with poverty and racial segregation. The most renowned of these is HEAD START, a government-sponsored preschool program that has helped provide millions of socially disadvantaged youngsters with learning skills generally lumped together as "school-readiness." In addition to preschool programs, compensatory education is available in many schools throughout the elementary and secondary school years and in most public colleges.

Compensatory education dates back to the passage of the CIVIL RIGHTS ACT OF 1964, which ordered a survey "concerning the lack of availability of equal educational opportunity by reason of race, color, religion, or national origin in public educational institutions at all levels. . . ." Two surveys followed. In 1965, the COLEMAN REPORT studied 600,000 children at 4,000 schools and found that the academic achievement of minority children was one to two years behind that of whites in first grade and three to five years behind in the twelfth grade. A second study by the CIVIL RIGHTS COMMISSION confirmed the Coleman Report findings. On that basis, Congress passed the ELEMENTARY AND SECONDARY EDUCATION ACT OF 1965, which provided funds for compensatory education programs to close

the educational gap between the races and between the poor and rich.

Since then, Head Start alone has served about 20 million children. More than 1 million four-year-olds apply to Head Start each year. At the primary and secondary school levels, CHAPTER 1 of the act provides more than \$6 billion a year to improve the academic skills of poor children by offering remedial work in basic subjects. Chapter 1 reaches about 6 million children in two-thirds of the nation's schools. About 70% of the students are in elementary schools. Although there are no enrollment figures for remedial instruction at the college and university level, about 95% of all four-year and two-year public colleges and 65% of all private colleges offer such programs.

Since its inception, compensatory education has been the target of considerable criticism. Critics of Head Start, for example, point out that the program relies on pulling students from their regular classes for 30 minutes of remedial work. Meanwhile, the students fall behind in the classes they would normally have been attending. Others say that its annual budget of \$4 billion to \$5 billion has yet to produce any lasting results. Proponents insist it results in lower school dropout and juvenile delinquency rates.

Although critics of compensatory education at the primary and secondary school levels agree on the value of standard remediation programs, many oppose bilingual education as a subversion of the historic "AMERICANIZATION" process that teaches immigrant children to become U.S. citizens.

At the college level, compensatory education began in the late 1960s, as colleges compensated for historically discriminatory admissions practices by admitting disadvantaged students whose primary and secondary school education had not prepared them for college-level work. To help such students, the colleges introduced costly compensatory remediation and one-to-one tutoring. Critics, how-

ever, contend that it is not the function of a college to provide education that should be available at the primary and secondary level and that doing so deprived academically qualified students of the higher-level education colleges should be providing.

competency-based education A system of instruction tied to mandatory academic achievement that students must demonstrate before being permitted to progress to the next level. Alternatively called performance-based education or standards-based education, competence-based education is nothing new to American education, despite the furor it caused during the late 1990s and early 2000s. Boston introduced competency-based education in its schools before the Civil War, and New York State introduced required minimum competency tests called Regents Examinations in all public schools at the beginning of the 20th century.

Akin to the more current concept of OUTCOME-BASED EDUCATION, competency-based education governs student progress throughout the school years by requiring each student to obtain a minimum score on competency examinations in each subject before progressing to the next level in that subject. In addition, each student must pass a minimum number of such tests each year before being promoted to a higher grade or graduating. For younger children, minimum-competency tests may simply measure learning readiness or proficiency in basic skills. Minneapolis, for example, once held back 10% of its kindergartners who scored too low on the readiness test for first grade.

Competency-based education may be limited to a specific subject or be imposed throughout a school, a school district or an entire state. Most states and schools use standardized tests such as the CALIFORNIA ACHIEVEMENT TEST, the IOWA TESTS OF BASIC SKILLS and the Terra Nova Comprehensive Tests of Basic Skills to assess

student competency in basic subjects. Although most tests rely on objective questions (true-false, multiple-choice, etc.), some measure competency by asking for students to write original essays.

Proponents of competency-based education insist it is important to measure whether schools are doing their jobs and teaching children the knowledge they need each year to succeed the following year and eventually function in the job market.

Forty-eight states and the District of Columbia administer standardized tests in almost every subject area to determine whether students have achieved competency in each subject and are worthy of promotion or graduation. Although students in about one-third of the states produce relatively high scores, their counterparts in the rest of the nation often score so poorly that many schools are forced to ignore test results and promote or graduate students to the next grade with their age mates (see SOCIAL PROMOTION). In 1999, several dozen New York City public school teachers actually changed their students' incorrect answers on test sheets to assure that the children would pass the tests. Two-thirds of Chicago's third- and sixth-grade students had to attend summer school after the first tests were administered, and half had to repeat their grades in the fall after a full summer of instruction. Only one of 10 Arizona high school sophomores passed that state's math test, while only 7% of Virginia students of all ages passed that state's tests. Wisconsin students did so poorly that the state abandoned testing requirements temporarily. Massachusetts lowered the passing grade on its English and math tests to allow the graduation of 83% of Latino students, 80% of black students, 43% of white students and 41% of Asian students. New York also reduced minimum passing grades. In Los Angeles and San Diego, half the students would have failed California's competency tests had schools not lowered standards for passing.

Critics of competency-based education point out that some ambitious teachers spend more time "TEACHING THE TEST"—that is, practicing questions with students from tests of previous years—than they do teaching students to read, write and discuss ideas and develop higher order thinking skills. A second criticism of competency-based education contends that it does little to address the question of ACADEMIC QUALITY. In effect, competency-based testing penalizes students for the failure of teachers and schools to establish and maintain acceptable levels of academic quality. Rather than investing in costly testing, say critics, legislators should raise academic quality of schools by investing more to relieve overcrowding in classrooms, improve teacher training, modernize and expand school plants and teaching materials.

An even harsher criticism of competency-based education cites the lack of evidence of academic improvement by the majority of children who are left back after failing minimum-competency tests. Indeed, one study (*Flunking Grades* [1988]) found that rigid promotion requirements may retard academic progress. The study found that teenagers who repeated early grades had significantly higher high school drop-out rates than comparably skilled children in schools that promoted them with their classes each year. The correlation between retention and high drop-out rates has harsh social consequences in many communities because of the high failure and retention rates among poor and minority students.

(See also ACADEMIC STANDARD; GOALS 2000; STANDARDIZED TEST.)

competency-based teacher education (CBTE) A system of teacher training that requires teachers to learn and demonstrate a required body of knowledge, teaching skills and teacher attitudes. Also called performance-based teacher education (PBTE), competency-based teacher education is an effort to raise the

level of quality among the nation's public school teachers. SCHOLASTIC ASSESSMENT TEST scores of graduating high school seniors who plan to enter teaching average 5.1% below the average scores for all college-bound students. Moreover, a 1998 study by the AMERICAN COUNCIL ON EDUCATION found that at least half the students in American public secondary schools (grades 7 through 12) received science instruction from unqualified teachers. The study found that fewer than half the teachers in the nation used computer software to buttress classroom instruction. State by state, the study found teacher incompetence at the heart of declining student academic achievement. In Massachusetts, 60% of public-school teacher candidates failed the basic teacher competency test. Thirty percent failed a basic test in reading and writing, while failure rates in various subjects ranged from 63% in mathematics to 18% in physical education. In New York City, 31% of teacher candidates failed the certification test in the liberal arts and the sciences. About 21% failed the English test, 47.3% failed the mathematics test and 48.3% failed the physics test. Failure rates in other areas ranged from about 20% in social studies to 37% in both biology and earth science. CBTE has been slow to take hold, however. Fewer than half the 1,300 teacher-education programs in the United States are accredited by independent ACCREDITATION organizations.

completion test A commonly used type of objective test which asks the student to "fill in the blank" by providing a missing word or phrase in an incomplete sentence.

composition A piece of original student writing, usually an exercise in essay form that is basic to the teaching of writing skills in elementary and secondary schools. Successful instruction of composition begins in kindergarten by encouraging student imagination

and oral skills. As students recount fictional stories or real-life experiences aloud, the teacher writes each story in large bold letters and then asks the author to copy it, thus teaching the correlation between words and written symbols and helping the children acquire the manual dexterity needed for writing. As children progress through the elementary and early secondary school years, compositions lengthen, and students gradually learn the rules of grammar, sentence structure, paragraph construction, essay form and outlining.

comprehension The complex mental process by which a student understands the meaning of written, spoken, visual, emotional or other sensorily transmitted messages. Usually taught through prereading and postreading discussions, comprehension is the primary goal of all formal education, with reading the primary conduit. Like knowledge and memory, comprehension increases with development, maturity and training. The teaching of comprehension begins in kindergarten with analysis of character traits after hearing a story and the mapping of a possible future course of events for those characters.

As they progress, kindergarten and early elementary school teachers encourage children to make up their own stories after seeing a picture and to summarize in a few sentences a story they hear or read. Inviting students to retell stories in their own words, whether orally or in writing, and to pinpoint causes and effects are basic methods of teaching and measuring comprehension in the subsequent elementary and secondary school years. By fourth grade, students with standard comprehension skills should be able to distinguish between the main and subordinate ideas in a reading, to select the climactic statement or event and to describe the feelings and emotions of the characters.

Secondary school comprehension skills include the ability to describe the main idea of

a reading; the unstated ideas, places or settings; and the reasons for character actions. The ability to answer questions correctly, follow directions, paraphrase, assess and recall are all elements of comprehension.

Comprehensive Child Development Act

An act passed by Congress, but vetoed by President Richard M. Nixon in 1971. An outgrowth of the ECONOMIC OPPORTUNITY ACT OF 1964, also known as the WAR ON POVERTY, the Comprehensive Child Development Act authorized federal assistance for health, education and welfare services to all qualified children whose parents applied for such services. The aim of the act was to ensure equity in education, health and other services for deprived children.

Comprehensive Employment and Training Act (CETA)

A 1973 federal law that revised and regrouped various job training programs scattered throughout the Department of Labor and the Department of Health, Education and Welfare after the dismantling of the OFFICE OF ECONOMIC OPPORTUNITY. Most of the program grew out of the federal government's "WAR ON POVERTY" and provided government funds to retrain unemployed workers with obsolete or no job skills. As the escalating war in Vietnam absorbed more of the government's resources, the Office of Economic Opportunity was dismantled, and responsibility for the retraining programs was scattered to what seemed the most appropriate government agencies. The result, however, was an increasing number of conflicts between agencies seeking funds for the same purposes. Passage of CETA sought to resolve those conflicts by placing all the programs under a single controlling agency.

comprehensive examinations A set of written or oral tests to measure a student's total command of a subject—usually the student's major subject at college or graduate school.

Not required at all colleges or universities, comprehensive examinations are normally administered only once, just before graduation and the awarding of degrees. Unlike final examinations, which measure knowledge in a single course, comprehensive examinations are usually graded "pass" (with or without "honors") or "fail." Graduation and the receipt of a degree and cum laude honors are contingent on passing.

comprehensive high school

A uniquely American secondary school that enrolls all students from a geographic area and offers a broad choice of curricula in three general areas: pre-college academic, VOCATIONAL and "GENERAL." Some comprehensive schools have industrial and business education programs as well. Comprehensive high schools developed at the turn of the 20th century to accommodate the varied needs of a widely diversified population of American-born and immigrant students. In recent years, however, such schools have come under harsh criticism for lacking clear goals, offering too broad a curriculum for too wide a variety of students and tolerating a steady decline in the quality of education.

In 1967, former Harvard University president JAMES B. CONANT issued a critical report on the more than 100 comprehensive high schools he evaluated in 26 states, saying that only eight were fulfilling their educational goals. Many communities responded by splitting larger comprehensive schools into smaller specialized units that meet single educational goals for specific groups of students.

(See also ACADEMIC QUALITY.)

comprehensive musicianship

An approach to secondary school musical education that combines the study of history of music, music theory and instrumental music in the elementary school years, to broaden the musical development and interests of students.

Comprehensive Tests of Basic Skills A battery of minimum competency tests to measure student competence in areas considered basic for academic learning—namely, reading, mathematics, language, reference skills, science and social studies. Seven levels of tests are available for students in all elementary and secondary school grades.

compulsory education The legally required instruction of children in government-approved facilities by government-approved teachers. Although the U.S. government has no compulsory education law, all 50 states require children between the ages of 5, 6, 7 or 8 and 14, 15, 16, 17 or 18 to attend school or receive instruction in an approved substitute facility. Many states permit parents to provide HOME SCHOOLING under certain circumstances.

Compulsory education in America dates back to 1642, when the Massachusetts Bay Colony passed a law empowering the selectmen of each town “to take account from time to time of all parents and masters, and of their children concerning their calling and employment of their children, especially of their ability to read and understand the principles of religion and the capital laws of this country.” The law authorized them, with the consent of any court or magistrate, to take any children “as they shall [find] not to be able and fit to employ and bring them up.” Five years later, Massachusetts stiffened its earlier law by passing the famed School Act of 1647. Called the “Old Deluder Satan Act,” it required every town with 50 or more householders to open a PETTY SCHOOL to protect children against “the fiery darts of Satan.” The act required every town with 100 families to open a LATIN GRAMMAR SCHOOL as well.

In 1650, Connecticut passed a law requiring that children and servants be taught to read English, that they be taught the law, that they be catechized weekly and that they learn husbandry or a profitable trade. New Haven, then

Compulsory education laws helped put an end to child labor in factories such as this glass manufacturing plant, where children in their early teens worked near the blast furnaces during the early decades of the 20th century. (*Library of Congress*)

a separate colony, passed a similar law in 1655, New York in 1665 and Plymouth, which did not merge with Massachusetts until 1691, instituted compulsory education in 1671. In 1683, Pennsylvania required that all parents and guardians of children “shall cause [them] to be instructed in reading and writing, so that they may be able to read the Scriptures and to write by the time they attain to twelve years of age; and that then they be taught some useful trade or skill, that the poor may work to live, and the rich, if they become poor, may not want; of which every county court shall take care.” Virginia required parents and masters to send their children and servants to weekly religious instruction at local churches, where they also learned to read.

Although almost universal during the colonial era, compulsory education disappeared

after the Revolutionary War and the dismantling of English controls. Most families needed their children to help them work the fields or otherwise contribute to family income, and the new state governments were not prepared to upset the economic order by forcing children to spend their working hours in classrooms.

Although Massachusetts was the first state to establish free public schools in the 1830s, the only incentive to attend them was a law forbidding any company to hire children under 15 who had not attended school for at least three months during the previous calendar year. In 1852 Massachusetts passed the nation's first true compulsory education law, requiring parents to send their children to school for a minimum of six months a year.

Children remained America's cheapest form of labor into the beginning of the 20th century, and it was not until 1918 that the last of the 48 states then in the Union passed compulsory education laws—over the strong objections of planters, industrialists and parents who depended on low-paid children for their economic survival. These were not fully enforced until 1933, when Congress passed a child labor law making it a federal crime to employ workers younger than 16 in most nonfarming occupations and younger than 18 in hazardous industries.

(See also CHILD LABOR.)

computer-assisted instruction (CAI) The teaching of subject matter with the help of specially prepared computer programs or software. Computer-assisted instruction is available in virtually every academic and many nonacademic subjects. Each program provides a sequence of data, each of which calls for a specific student response. If the student responds correctly, the computer progresses to the next step in the instructional sequence. If the student responds incorrectly, the computer makes the student try again.

CAI is available in a variety of formats, the simplest of which is the unidirectional, computer-based instruction that can only move the student forward along the instructional sequence. The more complex "intelligent computer-assisted instruction" (ICAI) has a variety of instructional paths that vary according to the student's ability as measured by the type of responses made. ICAI analyzes each student response, whether correct, partially correct or incorrect, and chooses an instructional sequence appropriate for that student, altering course as necessary with each response. Its artificial intelligence, in other words, allows it to adapt to the student's needs and abilities in the same way as a human teacher might. ICAI is also used to administer and score many standardized tests, including graduate school entrance examinations.

computer literacy The mastery of storing, retrieving and processing data on computers. Most schools begin teaching some degree of computer literacy in kindergarten or first grade, depending on each child's finger dexterity. Schools expect students to be computer literate when they enter middle school and be at ease using computers and accessing Web sites via the Internet for learning new materials, preparing homework, doing original research and creating useful programs of their own. By 2005, 88% of American college students owned at least one computer, and 27% owned two—usually a laptop and desktop. American colleges deemed computer literacy so essential to academic success in higher education that the Educational Testing Service developed two new tests to measure the facility with information and communication technology (ICT) of students entering junior year of college: the ICT Literacy Assessment Core Level and the ICT Literacy Assessment Advanced Level. Scored from 400 to 700 and lasting 75 minutes, the tests measure students' computer and related tech-

nology skills in seven areas and will be used to determine whether students need remediation and in which areas. California State University was the first to give the exam, to 3,300 students on 23 campuses, insisting that computer competency was as important as math and reading competency.

computers In education, basic tools for learning that not only store, retrieve and process data, as they do for other industries, but can also deliver certain types of instruction more efficiently than teachers. One of the most important teaching tools ever developed, the computer is a multimedia instructional device with the potential of bringing the entire body of world knowledge into the classroom in a variety of formats at the touch of a button and, on screen, transport students to any time period in history almost anywhere on Earth.

Developed in the mid-20th century, computers were slow to be embraced by elementary and secondary school educators, who, indeed, misused the first computers as costly electronic "flash cards" in rote drills or by adding computer usage to the curriculum much as touchtyping had been added to teach an earlier generation how to use the typewriter.

As a learning tool, the computer uses standard text materials, graphics, animation, simulation and audio and visual materials to provide each student with individualized instruction. Working at individual learning stations, students can pace themselves working interactively to master any given topic, exercise or problem. The computer provides instant responses to student input and extra assistance and new instruction when it is most useful, instead of forcing students to wait several days to receive hand-corrected papers from teachers.

The interaction between student and computer allows every student to be an aggressive seeker of knowledge and have a direct hand in his or her own education, instead of sitting pas-

sively in classrooms while more outspoken students dominate classroom discussions. Computers free teachers to serve as mentors rather than conduits of factual information readily available from other sources. In addition to individual instruction, computers also provide students with on-line telephone links via the Internet to instructional Web sites and research facilities across the United States, thus expanding student research facilities beyond the school library. Proponents of expanded use of computers in the classroom also liken them to the games introduced in the late 19th century by such progressive educators as JOHN DEWEY and JEAN PIAGET, who believed that children learn far more through active play than they do as passive recipients of facts delivered in lectures.

Individual student computers equipped with modems can access an infinite number and variety of databases anywhere in the world via the Internet and World Wide Web. In addition to conventional teaching accessories, computers can access an infinite number of options for learning materials, including CD-ROM, DVD and laser disks that display vast amounts of data, including illustrated texts of entire encyclopedias and other reference works, entire library and museum collections, and other extensive databases. CDTV (compact disk television) is akin to the CD-ROM in terms of data storage, but adds motion, which is transmitted in the form of television films. CD-I (compact disk-interactive) and VIS (video interactive system) systems allow students to interact with CD-ROM and CDTV materials by asking questions and receiving answers. Photo CD allows teachers or students to transfer and store permanently hundreds of photographs onto a compact disk for viewing on television screens or on individual student computer screens.

After classrooms were "wired" in the late 1990s and early 2000s to permit computer operations, students were able to access, both

individually or simultaneously with their class, a far greater variety of textual and audiovisual instructional and reference materials than in traditional classrooms. Teachers in wired classrooms can transmit printed materials to each student computer, along with still pictures and videos that display, dramatize and teach almost all aspects of art, history, literature, music, science and the rest of the academic curriculum. In addition, computers in wired classrooms provide students with creative tools to produce literary works, films, graphic or creative art, music, engineering and architectural plans, scientific experiments and a wide variety of other works. With wired-classroom connections to the Internet, teachers can guide their students to Web sites of virtually every great museum in the world, access research materials from every library, visit operas and concert halls, visit historic sites and hold discussions with scientists or other authorities. Teachers can also use computer-connected "WHITEBOARDS," mounted on classroom walls next to marker boards, to display computer-generated instructional materials, which students can download on their computers instead of having to scrawl notes on paper pads.

At the administrative level, wired classrooms with links between school offices and individual student computers may allow students to take examinations on their individual computers and have their tests graded instantly, before the students leave their classrooms. Grades are automatically registered in teacher and school records. The computer has also allowed elementary and secondary schools and colleges and graduate schools to expand curricula and widen every student's educational reach through on-line DISTANCE LEARNING programs that can be delivered to any student with a computer anywhere in the world over the Internet. By 2001, American public schools were equipped with an average of one computer for every five students, and 83% of Amer-

ican elementary and secondary school students were using the Internet at school. More than 50% of all public school students had computers at home to use for homework assignments. More than half the elementary school students under six were using computers both at school and at home; 85% of students six to nine years old were using computers at school, and 62% were using them at home for schoolwork. About 90% of students over 10 used computers at school through the middle school and high school years, and 70% of those students used computers at home for schoolwork. The primary obstacle to such worldwide dissemination, of course, has been the cost of computers. In 2005, however, MASSACHUSETTS INSTITUTE OF TECHNOLOGY (MIT) unveiled the prototype of a laptop costing about \$100 that runs on batteries, can be recharged with a crank, and connects wirelessly to the Internet. MIT created a nonprofit organization called One Laptop per Child to coordinate development and to work with government leaders to distribute the computer to schools around the world.

(See also DISTANCE LEARNING; INTERNET; TELE-LECTURE; VIRTUAL CLASSROOM.)

Conant, James B. (1893–1978) American educator, scientist and statesman, whose criticisms of American schools are generally credited with having started the post-World War II educational reform movement. A renowned chemist, Conant spent 40 years at Harvard University, beginning in 1913. He served as president of Harvard from 1933 to 1953, when President Dwight D. Eisenhower appointed him U.S. high commissioner to West Germany (1953–55) and later ambassador to West Germany (1955–57). Although his book *Understanding Science* was a standard college text, he gained his greatest public renown as a critic of American education and author of the famed Conant Report, a study completed in 1958 of 103 American comprehensive high schools in

26 states. Sponsored by the CARNEGIE CORPORATION OF NEW YORK, the report recommended that high schools offer a general academic education to all students, special elective courses for students who plan to work after high school, and advanced academic courses for college-bound students. He urged schools to establish special programs for slow learners and for the academically gifted, and he urged school districts to reorganize to permit closure of all schools with fewer than 100 students. He called for more individualized instruction, for the hiring of at least one guidance counselor for every 250 to 300 students and for improvements in school–community relations.

concentration In one sense, the ability to focus on the task at hand and ignore distractions. A necessary skill for academic success, concentration is a self-imposed, mental receptivity that is not fully mastered until mid- to late adolescence. Lack of concentration, however, is a serious study problem which teachers attempt to overcome by limiting the time spent on any one task at a given time and gradually lengthening that time by imperceptibly small increments. AUDIOVISUAL AIDS have proved useful tools in teaching concentration, as have the introduction of games and activities that require learning basic skills to participate. (See also LABORATORY SCHOOLS.)

At the college level, the term *concentration* has a second, somewhat less precise meaning that is usually synonymous with the terms MAJOR or MINOR. Concentration may also refer to a specialization within a broad area of studies, as in the case of concentration in accounting.

Conceptually Oriented Program for Elementary Science (COPES) An innovative elementary school science curriculum developed at New York University in 1965 and designed to promote scientific literacy among children, without resort to reading materials.

Divided into five board areas, COPES consists of a series of teacher manuals and newsletters that show how to organize activities that help children learn by personal, hands-on observation, exploration and experimentation. The five COPES categories are entitled the Structural Units of the Universe, Interaction and Change, Conservation of Energy, Degradation of Energy, and the Statistical View of Nature.

concrete materials Three-dimensional objects that young children can arrange and rearrange with their hands to enhance understanding of abstract concepts in mathematics and other subjects. Especially appropriate for six-, seven- and eight-year-olds, concrete materials may include blocks, sticks, chips, beads, raisins or any other easily manipulated objects; the most readily available manipulatives for most children are their fingers. Educators have found that children of eight or younger learn abstract mathematical concepts more easily by handling concrete materials than they do by writing on printed pages. Crossing out one of six objects on a printed page, for example, does not produce the same retention of the mathematical concept of $6 - 1 = 5$ for a child as eating one of six raisins or removing one of six cubes from a set of blocks.

concurrent enrollment The growing practice of enrolling in courses at one or more secondary institutions of higher education while enrolled at a primary, degree-granting institution. About 33% of American college students now take one or more courses either in person or on-line from colleges other than the one from which they will earn their bachelor's degree. About half such students do so to complete their degree requirement sooner, and 17% say they do so because they wanted to take easier courses.

(See also EARLY COLLEGES; SWIRL PATTERN; TRANSFER STUDENTS.)

conditioning theory of learning A theory of learning developed by Russian Nobel physiologist Ivan Petrovich Pavlov, who found he could teach laboratory animals new behavior by associating it to their automatic responses to normal stimuli. Pavlov found that by sounding a bell (conditioned stimulus) every time he sprayed meat powder (unconditioned stimulus) into a dog's mouth to produce automatic salivation (unconditioned response), the dog soon learned to salivate at the sound of the bell alone (conditioned response), in the total absence of any meat powder. Such classical conditioning became the heart of behaviorist learning theory, which ascribes much learning among humans to the forming of similar stimulus-response bonds and chains. PROGRAMMED INSTRUCTION is but one of the pedagogical techniques to emerge from behaviorist theories.

Congregational Church A New England derivative of Puritanism that vests all church authority in the congregation of each church. From their first arrival in the colonies, Congregational churches were deeply involved in education because of their unique practice of naming two ministers to each congregation—a pastor in charge of church activities and a teacher to deliver sermons and catechize children. Congregationalists were responsible for erecting the first schools in the American colonies. In 1647, they enacted the Massachusetts Bay Colony School Act, which required every town with 50 householders or more to open a PETTY SCHOOL and every town with 100 families or householders to open a GRAMMAR SCHOOL. The law set a standard that spread throughout the colonies.

Congregationalism contrasts with Episcopalianism and Presbyterianism less in the area of creed than in church organization. All authority in the Congregational Church rests with each congregation, which has full authority to appoint its own minister and to admit or expel members. Episcopalians, on the other

hand, place church authority in the hands of an order of bishops, while Presbyterians have a hierarchal structure which rises from the local congregation to the presbytery, the synod and the general assembly, with each ascending body made up of representatives from the bodies beneath.

The origins of Congregationalism go back to late 16th-century England, where Robert Browne charged Church of England leaders with corruption and urged true Christians to separate and form autonomous congregations. Called Separatists, his followers eventually took their beliefs to New England, where they founded their first church in Salem, Massachusetts, in 1629; by mid-century Separatists were the dominant element of the settler population. Although scornful of central church authority, New England Congregationalists were conservatives and remained so into the 20th century. Grounded in the belief that all are born tainted with the original sin of Adam and Eve, Congregational teachers introduced the pedagogical use of whips and ferrules to "beat the devil" out of children, whose incorrect answers in class were the result of "Satan's darts."

Congregationalists restricted church membership to those adults who experienced a personal conversion or spiritual communion with God that resulted in a commitment to serve God. The "puritanical" nature of the church beliefs, however, produced dissenters who formed or joined a variety of other Protestant denominations. UNITARIANS disputed the existence of the Trinity; BAPTISTS argued that infants were born innocent of all sin; PRESBYTERIANS and Anglicans (see CHURCH OF ENGLAND) insisted that churches be placed under the authority of trained theologians.

At HARVARD COLLEGE, dissent with Unitarians over the question of the Trinity sent conservative Congregationalists storming out of Cambridge to New Haven, Connecticut, where they established rival Yale College, in 1701.

Conservative Congregationalists founded Yale in Branford, Connecticut, in 1701 as a divinity school to provide Connecticut churches with ministers. Originally called the Collegiate School, it was moved to New Haven in 1716 and renamed in 1718 after its benefactor, Elihu Yale.

In the early 1800s, the Congregationalists split into Unitarian Congregationalists (or, simply, Unitarians) and the conservative Standing Order. Later, as the American population moved westward, liberal Congregationalists cooperated with other Protestant denominations in a variety of missionary and educational efforts. In time, through mergers and assimilation, Congregationalism per se ceased to exist. Although individual, autonomous Congregational churches still trace their origins to the colonial period, the majority of Congregational churches are now part of the United Church of Christ.

Connecticut One of the original 13 colonies to secede from Great Britain and the fifth state to ratify the U.S. Constitution. It was the second state in the American colonies after MASSACHUSETTS to adopt universal public education and, by every standard, retained the best

public school system in the United States, with ceaseless year-to-year efforts to improve by the schools themselves, by parents and by the state legislature and state officials. Academic quality of the state's public schools has slipped badly from 2000, when they were the nation's best. By 2005, Connecticut schools ranked 15th in the nation in academic proficiency, although a series of school reforms—and a drop in poverty from 12% to 9.6%—seemed to be restoring academic quality in the younger classes. Fourth graders ranked fifth in the nation in reading proficiency that year and ninth in math proficiency in the national testing. The slippage of previous years was evident in eighth graders' scores, however, which ranked 23rd in the nation in reading and 21st in math. Moreover, the state had the 16th-highest high school drop-out rate, more than 25%. About 30% of all students are minority children—unchanged since 2000.

The state has nearly 350 private day and boarding schools, with an enrollment of more than 70,000—many of them out-of-staters. The state is the home of 19 private four-year colleges and universities, including Wesleyan and YALE. The state has 11 public four-year colleges and universities and 12 public two-year colleges. The flagship University of Connecticut, the land-grant college at Storrs, has more than 20,000 students, and Connecticut State University has 35,000 to 40,000 students at four campuses in New Britain, Willimantic, New Haven and Danbury. Graduation rates at four-year colleges are exceptionally high: 62.5%

As a colony, Connecticut was quick to establish a system of schooling for its children. In 1647, the Massachusetts Bay Colony had enacted its famous School Act, which required every town with 50 householders or more to open a PETTY SCHOOL and every town with 100 families or householders to open a GRAMMAR SCHOOL. The law set a standard that spread throughout the colonies, with Connecticut passing a similar act in 1650. The Connecticut legislation required children and servants to be taught to read English and to understand the Scriptures and the colony's capital laws. In addition they were to be catechized weekly and taught husbandry or some other profitable trade.

After U.S. independence, Connecticut, like the other colonies, virtually abandoned education for all but the children of the wealthy. Other children were needed to labor in the fields, mills and mines. In 1838, however, HENRY BARNARD, a Whig member of the Connecticut legislature, persuaded the legislature to enact a model school bill. An advocate of practical education for occupations such as bookkeeping, surveying and mechanics, Barnard saw universal education as a means of providing industry and agriculture with skilled workers who would help maintain his nation's parity in international commerce. Enactment

of Barnard's bill made Connecticut the second state to provide public education. Unlike the earlier system in Massachusetts, however, Connecticut's system was not free. Parents had to pay according to their means—a system that evolved into the current system of property taxes.

connectionism theory A theory of learning developed by Columbia University educator and psychology professor EDWARD L. THORNDIKE. Thorndike posited that learning is nothing more than a bond or association based on pleasure or pain. The bonds between behavior patterns and pleasure (satisfiers) are retained, while bonds that bring pain or discomfort are rejected. He applied his theory to education by advising teachers, "Exercise and reward desirable connections; prevent or punish undesirable connections."

conservation education A broad area of study in the science curricula of many schools to promote better management of natural resources. In the primary and secondary school curriculum, conservation education is introduced as an element of social studies and science. At the college level, conservation is integrated into such preprofessional courses as forestry, freshwater management, soil conservation, and so on.

conservatory A specialized school for the fine arts. More often associated with music, conservatories derive their name from Italian orphanages, or conservatorios, where the church conserved, or saved, abandoned children and usually emphasized singing and music as a form of education and recreation.

Constitution Day A national day for American educational institutions to commemorate the final signing of the U.S. Constitution by members of Congress on September 17, 1787.

Although not a national holiday, the law creating Constitution Day requires every American school receiving federal aid—from public elementary schools through university graduate schools—to spend September 17 each year teaching the Constitution. Created in 2005 by Senator Robert C. Byrd (D, W.Va.), the law also requires all federal agencies to provide federal employees with training materials on the Constitution. Known for carrying a copy of the Constitution in his pocket, Byrd won support for creating Constitution Day after citing the results of U.S. DEPARTMENT OF EDUCATION tests that found a dismally low 11% of public high school seniors in America proficient in history. A 1999 survey of 556 graduating seniors from the nation's top 50 colleges and universities found two-thirds unable to identify the American commanding general at the Battle of Yorktown.

The National Archives and Records Administration, the Bill of Rights Institute and the U.S. Department of Education all offer free resources to schools, teachers and students to enhance Constitution Day learning activities.

Despite the poor quality of history education in American schools and colleges, the imposition of federal teaching requirements under the Constitution Day law produced a chorus of protests from state education leaders, who said the Byrd initiative had usurped powers over education from the states and opened the door for federal lawmakers to mandate other lesson plans. The Tenth Amendment of the Constitution specifically cedes to the states all governmental power not specifically assigned to the federal government by the first nine amendments. Education is not mentioned in those amendments.

Constitution of the United States The document ratified in 1788 that provides the philosophic and legal basis for governing the United States and outlines the rights of its people. The Constitution's greatest impact on public education has been its failure to include

education as a basic right of all Americans. Both THOMAS JEFFERSON and Dr. BENJAMIN RUSH had proposed guaranteeing all Americans that right, and the idea also had the support of JAMES MADISON and BENJAMIN FRANKLIN. In his essay *On the Defects of the Confederation* (1787), Rush stated that it was "absolutely necessary that knowledge of every kind be disseminated through every part of the United States."

To that end, he and Jefferson suggested establishing a national, three-tiered system of public schools made up of district or township schools, state colleges and state universities, with students progressing to each tier according to their abilities. District schools would teach reading, writing and arithmetic; colleges would teach mathematics, sciences and foreign languages; and the state universities would teach law, medicine, divinity, philosophy, politics and economics. In addition, Rush proposed that the Constitution establish a federal university open only to graduates of state universities and designed to teach "everything connected with government." He proposed making a degree from the university a prerequisite for service in public office.

Representatives of the southern states rejected such proposals, however, for fear that the education of slaves would provoke their rebellion. Ultimately, it was a coalition of these southern agricultural and northern industrial interests, dependent on a combination of slave and child labor to produce cotton and textiles at prices competitive on the world market, that defeated this proposal. By omitting all mention of education, the signers of the Constitution left the question to the individual states, and, to this day, the U.S. government has no constitutional power to dictate national educational standards for American public schools. Recent laws granting such powers have yet to be tested in federal courts.

One constitutional amendment—the Fourteenth—has had considerable direct influence

on American public education. Ratified in 1868 in the aftermath of the Civil War, the 14th Amendment granted full citizenship for the first time to AFRICAN AMERICANS. When the southern states regained home rule in the 1870s, however, they segregated the races in separate schools, and, in 1896, the U.S. Supreme Court ruled in *PLESSY V. FERGUSON* that they had the constitutional right to do so. For the next 60 years, the separate-but-equal doctrine kept blacks segregated from whites in almost all areas of American life and condemned African-American children to substandard education in the North as well as the South. While the latter subjected black children to de jure segregation, the North subjected them to de facto segregation in equally inferior schools.

In 1954, the Supreme Court reversed the Plessy ruling. In the landmark *BROWN V. BOARD OF EDUCATION OF TOPEKA*, the Court ruled that separate schools, simply by their separateness, cannot be equal, and that segregation was unconstitutional.

consumer education A broad area of education usually incorporated into mathematics, social studies, HOME ECONOMICS and economics courses at the primary and secondary school levels and in economics courses at the college level. On the broadest level, consumer education teaches students how the U.S. economy and marketplace function and the consumer's role in those areas. On a more practical level, consumer education teaches students how to make specific trading decisions and manage personal and family finances. The federal government also provides a wide range of consumer education through its Consumer Protection Agency and the publications of various cabinet departments.

contact hours The number of hours a teacher spends in the classroom with students. Contact hours refer to formal classroom con-

tact only and do not include informal contacts advising or tutoring.

content analysis The evaluation of published educational materials to determine their suitability for a particular group of students. Content analysis may be made on a variety of different levels. One is pedagogical, to determine whether it complements classroom work and presents data in an understandable way. Content analysis may also search for inaccuracies, passages deemed too mature for students or misrepresentation of ethnic, racial and gender groups.

continuing education (See ADULT EDUCATION.)

contract, teacher The formal, binding agreement between a teacher and the school board or other legal representatives of the school in which the teacher is employed. In addition to remuneration, teacher contracts detail the conditions of employment and the duties of each teacher and the circumstances under which each party may terminate the agreement. Like all similar agreements, teacher contracts are governed by federal, state and local laws and cannot violate a teacher's constitutional rights. Depending on the individual school or district, contracts may be negotiated on behalf of all member teachers by a union. Contracts may be finite or continuing; continuing contracts assure teachers automatic reemployment from year to year unless they are notified by a specified date.

contract program An administrative plan prepared for a school district by a consulting group or service association such as the National Academy for School Executives. Contract programs may deal with professional development, collective bargaining or any other aspect of school administration.

control theory A theory of learning and teaching based on five basic human needs: survival, love, power, freedom and fun. According to control theory, students (and all human beings) constantly attempt to fulfill one or more of those needs, none of which is ever fully satisfied. To teach effectively, therefore, teachers should design all instruction to help students fulfill those needs.

convergent thinking A process of reasoning aimed at producing a single incontrovertible response. Most single-response tests require convergent thinking, as opposed to tests that measure creativity, analytical abilities and knowledge. The second group of tests require divergent thinking, which produces a variety of answers.

cooking At the early education level, a useful pedagogical tool to teach measurement, reading, writing, arithmetic, following directions and creativity. A standard part of the kindergarten curriculum at many progressive private schools, cooking is of value in the later primary grades for teaching certain essentials of physics and chemistry—especially changes in various types of matter when combined with heat, air and other substances. Cooking, along with woodworking shop, was an essential element of the kindergarten curriculum in the LABORATORY SCHOOLS inspired by educator JOHN DEWEY. In addition to their practical merits, equal and cooperative participation by boys and girls in both activities effectively impeded development of gender prejudices.

cooperating administrator A school principal, superintendent or director who serves as a mentor/teacher and provides field experience and training to an administrative intern.

cooperating teacher A full-time teacher who serves as teacher/mentor and provides

field experience and training to a student teacher.

Cooperative Agricultural Extension Service A U.S. Department of Agriculture educational division established in 1914 to provide instruction in HOME ECONOMICS, family management, child care, consumer affairs and human relations. The service has a small force of professional home economists, or home demonstration agents, who are employed by LAND-GRANT COLLEGES but who work out of local county offices. They provide on-site instruction to children, adolescents, adults and the elderly at schools, 4-H Clubs, nursing homes and elsewhere.

Cooperative Extension Service A U.S. Department of Agriculture agency established in 1914 by the SMITH-LEVER ACT to provide technical information and guidance to farmers and others living in rural areas. Cooperative Extension Service programs range from formal classes at LAND-GRANT COLLEGES to soil analysis for individual farmers. The service also provides a wide variety of booklets and other information on farming, gardening and HOME ECONOMICS.

(See also HOME DEMONSTRATION AGENT.)

cooperative learning A pedagogy developed in the 1970s that breaks classes up into small teams of students, with members of each team responsible for learning and teaching each other a body of material suggested by the teacher. Teachers try to shape each team so that member strengths and weaknesses complement each other. Team members interact much as they might on an athletic team, helping each other with problems, encouraging each other to achieve and learning by demonstrating. Members can call on the teacher for help at any time.

Cooperative learning frees the teacher to move from group to group and customize the

teaching to individual or group needs. When appropriate, the teacher may call the entire class together to focus on a common problem. Cooperative learning has been found to promote tolerance, interracial friendships, altruism and individual self-esteem—the last being a result of helping others learn and succeed.

Cooperative Project in Educational Administration (CPEA) A program funded by the W. K. KELLOGG FOUNDATION in the 1950s to improve the education and training of school administrators. CPEA originally established eight regional centers at Teachers College, Columbia University; Harvard University; University of Chicago; George Peabody College for Teachers; University of Texas; Ohio State University; University of Oregon; and Stanford University. The programs, which were funded for five years, were designed to make school administrators more aware of social trends and problems in American society and to provide them with the most up-to-date data and materials on education and educational administration.

cooperative vocational education A program of vocational education in which private industry and local colleges cooperate to provide students with a combination of classroom and on-the-job training. About 1,000 public and private colleges and universities have established cooperative education programs, which integrate daily college classroom studies with paying part-time jobs at local companies. About 75% of all community colleges, technical institutes and junior colleges participate in one or more employer-college partnerships to provide students with total learning experiences.

Some cooperative education programs rearrange learning schedules so that students alternate three-month periods of full-time study with three-month periods of full-time work, but most allow students to learn new methodology in morning classes and apply

what they learned on the job that afternoon. About 40% of students in such programs continue working for the cooperative education employer after graduation, while an additional 40% find jobs in other, directly related work. Among the hundreds of major companies involved in cooperative education are American Telephone & Telegraph Co., Duke Power Co. and Walt Disney Co. Programs offered include education in agriculture and natural resources, applied arts and crafts, business, computer science, health care, HOME ECONOMICS, construction and food service.

Cooper Union for the Advancement of Science and Art A unique, private, New York City institution of higher education, founded in 1859 by the inventor/philanthropist Peter Cooper (1791–1883) as a tuition-free academy and college for both women and men. It was one of the first colleges to prohibit racial discrimination. Deprived of a formal education, Cooper was apprenticed to a coach-maker at age 17. Eventually striking out on his own, he invented the first American steam locomotive and built an industrial empire that included iron mines, foundries and factories. In 1859, he founded Peter Cooper Union for the Advancement of Science and Art as an institution devoted to free public education—particularly for adults who, like himself, had been unable to obtain a formal education as youths. His endowment specified that the school was to remain “as free as air and water,” and it remains so to this day.

Open to both men and women—in itself an innovation in higher education of that day—it offered day and night schooling. By day it was both an engineering school and a women’s school of arts and sciences, and by night, a school of arts and sciences for mechanics, apprentices and other working men who lacked formal education. The curriculum spanned the academic and college levels, offer-

ing courses in languages, literature, oratory, telegraphy, design and engraving. It also housed an art gallery, a museum of rare inventions and a reading room, all of which were open to the public. Its public reading room became a popular public forum, where Abraham Lincoln gave his only campaign address in New York.

Now called Cooper Union for the Advancement of Art and Science, it remains the only private American college of its caliber that charges no tuition. The coeducational college has almost 950 undergraduates, of whom 66% are men and the rest women. About 30% of its engineering students are women—twice the average for comparable American colleges. It accepts only about 12% of applicants. Cooper Union offers undergraduate and graduate degrees in architecture, fine arts and graphic design, and engineering. There are fewer than 40 students in its graduate school. Although it remains tuition-free to U.S. residents, tuition for nonresidents is \$26,000 a year, and the school charges all students an annual fee of \$1,400 and, if necessary, \$9,000 for room and board.

Cooper v. Aaron A 1958 U.S. Supreme Court decision that denied the right of the Little Rock, Arkansas, school board to delay racial integration of public schools. After mob activities threatened the safety of black students at Central High School in 1957, President DWIGHT D. EISENHOWER federalized the Arkansas National Guard and ordered it to enforce federal court desegregation orders. The mobs dispersed and the black children returned to school. Several months later, however, the school board asked for a delay in implementing the desegregation order because it had seriously disrupted education at Central High. The Court refused, saying that state authorities could not abridge the right of American citizens not to be discriminated against and that mob actions were no

basis for depriving black children of their constitutional right to go to school.

copybook An elementary school textbook for teaching penmanship. Developed in the late 18th century, copybooks were universally used in American elementary schools until the middle of the 20th century. The typical copybook was a bound tablet of ruled pages, each of which contained a writing sample at the top and blank lines beneath it, on which the student copied and recopied the sample until he was able to duplicate it and exhibit perfect penmanship. ISAIAH THOMAS published the first widely circulated American copybook, *The Writing Scholar's Assistant*, in 1785.

core curriculum A group of courses required for successful completion of an academic program. A standard core curriculum required for graduation at many high schools consists of four years of English, three years each of mathematics and foreign languages and two years each of science and history. A core curriculum required for graduation from college might include freshman English and mathematics, three years of a foreign language and at least 12 semester courses in one's major. The major itself would consist of a core curriculum of at least 12 semester courses in that subject.

About 80% of American four-year colleges and universities claim they maintain a core of required subjects outside the student's major or minor subject areas. These core, or distribution, requirements force the student to study a minimum number of courses in each of a specific number of broad study areas, such as philosophy, science, literature, foreign languages and history.

(See also *CURRICULUM, COLLEGE; CURRICULUM, PUBLIC SCHOOLS*.)

core program A progressive education term referring to an elementary and secondary school system of interdisciplinary instruction in large time blocks, or cores. Thus, studies in a combined English-history course or a mathematics-science course might require a block of two or three class periods. Some schools divide their days into thirds, with each third serving as a core devoted to one interdisciplinary course.

Cornell, Ezra (1807–1874) American capitalist who founded Cornell University. A pioneer in telegraphic communication and founder of the Western Union Telegraph Co., he amassed a personal fortune that allowed him to devote much of his later life to public affairs. In 1863, he built a free library in Ithaca, New York, established a model farm and became a state legislator. In 1865, he became a trustee of the State Agricultural College, a struggling institution founded that year with a Land Grant (Morrill) Act land grant (see LAND-GRANT COLLEGES). A self-made man with lofty, idealistic ideas about human potential, Cornell endowed the fledgling school with \$500,000 of his own funds and decided to move it to a site he had purchased on the edge of Ithaca. It reopened in 1868 as an institution that combined the principles of other land-grant colleges with Cornell's own democratic principles and practical philosophy about the role of higher education.

In addition to the standard agricultural education of other land-grant colleges, Cornell offered, from the start, a liberal arts education and a wide range of practical courses in engineering to prepare its graduates for important roles in American industry. Cornell insisted that the institution be free of all religious ties, and he opened the doors to women and poor students.

Although he never held an official post at Cornell, he was a constant presence on campus, and he was able to lure such leading educators as biologist Louis Agassiz and poet James

Russell Lowell to lecture regularly to Cornell students. Now a university with more than 12,000, Cornell has seven undergraduate and four graduate schools. Its College of Agriculture and Life Sciences is the original land-grant college, while the rest of its divisions are private schools.

corporal punishment In education, physical pain inflicted on the body (or corpus) to discourage misbehavior in school. Although corporal punishment may date back to prehistory, its rationale in American formal education lies in the belief of colonial era clerics that children were born tainted with the original sin of Adam and Eve. Thus any and all misbehavior, ranging from disobedience to the most innocent academic errors, were viewed as the result of "Satan's darts," and it was the Christian obligation of teachers, parents and other authority figures to "beat the Devil" out of children.

Current use of corporal punishment is designed to force children to submit to authority and is based on the pain-pleasure principles inherent in Pavlovian theories of classical conditioning. For that reason, only 22 states still permit corporal punishment in primary and secondary schools, with about 10% of students in those states subjected to such punishment at least once each year, although the threat of lawsuits by parents is gradually doing away with the practice. Only 28 states forbid corporal punishment, while the rest leave the question to local school boards. Most courts have ruled the practice legal when it is "reasonable, not excessive, administered without malice and is understood by the child."

corporation colleges and schools Private schools and colleges operated by profit-making corporations for their employees. Such schools and colleges evolved as a replacement for the apprenticeship system in the 19th century, when machinery overtook manual crafts as the

primary producer of products. At the time, new workers learned their skills by the so-called pick-up method, whereby they started as helpers and learned on-the-job skills by trial and error and by questioning their more experienced peers.

As companies expanded, some instituted so-called vestibule schools, in which helpers were given formal instruction in their work before actually starting the job. Later, as companies grew still larger, vestibule schools grew into training departments, which provided groups of workers with formal, classroom training before they actually assumed their duties. Although vestibule schools taught new workers basic skills, they did little to overcome high rates of worker illiteracy that resulted from the lack of compulsory education in the United States. Moreover, the end of the Civil War saw waves of non-English-speaking immigrants reach American shores, and American companies found themselves inundated by large numbers of illiterate, innumerate workers at the very time when technological changes required better skilled workers. Indeed, worker errors stemming from illiteracy and innumeracy were deemed a major factor in a decline in quality and sales of American products on world markets.

In 1882, the Hoe Company, a pioneer manufacturer of printing machinery, became the first company to establish a formal school to train new employees in job-related skills. A decade later, department store magnate JOHN WANAMAKER went a step further by organizing the John Wanamaker Commercial Institute in Philadelphia to give his workers "a working education in the arts and sciences of commerce and trade." The curriculum included reading, writing, arithmetic, English, spelling, stenography, commercial geography, commercial law and business methods and administration. The institute had 24 teachers, some of them store executives, others Philadelphia school teach-

ers. New employees spent two mornings a week in classes; advanced employees two evenings a week, after a generous, free dinner in the store cafeteria. In addition, younger workers were offered exercise classes to teach them "discipline, organization, precision and obedience" and give them "health lessons of muscular training that give bodily strength without which successful mental work is impossible."

Wanamaker was more than pleased with the results of his institute. "Unintelligent and wasteful labor has lessened. The wisdom of cooperation and mutual helpfulness has been recognized. Knowledge of merchandise, its production, distribution and uses has been increased. Principles of control and government and organization have developed."

The institute was so successful it became a model for other companies. In 1900, General Electric Research Laboratory set up an educational program for its scientific and technical workers. Westinghouse Research Laboratory followed suit in 1903, as did American Telephone and Telegraph Company in 1907. Bell Telephone Company, meanwhile, sponsored a host of vestibule schools to train telephone installers and operators in what was then radically new telephone technology. In 1908, the farm equipment manufacturer International Harvester Company (now Navistar International) started a school for apprentices that soon included courses ranging from mechanical drawing to shopwork. The school willingly taught any course for which five or more employees enrolled. By 1913, there were enough corporation schools to form a National Association of Corporation Schools, whose statement of objectives proclaimed: "Corporations are realizing more and more the importance of education in the efficient management of their business. The company school has been sufficiently tried out as a method of increasing efficiency to warrant its continuance as an industrial factor."

Although World War I stalled the growth of company schools, they proliferated in the 1920s, with some proving far more effective than others. In general, those designed solely to promote worker loyalty, prevent strikes and combat incursions by labor unions proved far less effective than those devoted entirely to improving worker skills. Bell Laboratories, the research arm of American Telephone & Telegraph, expanded its vestibule schools into the mammoth, company-wide Human Resources Department, with an annual budget in the billions of dollars and facilities that ranged from individual classrooms in local telephone company offices to a university-style campus in Lisle, Illinois.

After World War II, General Motors Corporation carried the corporation school concept a step further by building the degree-granting General Motors Institute in Flint, Michigan. The institute enrolled more than 2,500 students in its five-year programs leading to bachelor of science degrees in engineering, with specialties in manufacturing, mechanical engineering, industrial engineering and electronic engineering. Students alternate 12 weeks on campus and 12 weeks on the job; about a quarter of the students are women. Although most courses are in science and engineering, the institute requires 18 credit hours of humanities and a number of communications courses that teach students to write reports and present them orally. Later called the GM Engineering and Management Institute and now Kettering University, the school became independent of General Motors Corporation in 1982, and because it now draws students from many other companies besides GM, it charges annual tuition of nearly \$15,000. Room and board are extra, but earnings during the 12-week working periods usually provide enough to cover costs for the 12 weeks spent on campus. The original GM Institute served as a model for other major corporations, which began establishing degree-granting technical

colleges in the mid-1990s to feed their executive and technical ranks with men and women trained to meet the specific needs of each sponsoring company. Although such institutes offer the same broad technical education available at many conventional universities, they also offer specialized courses related to each company's products or services—semiconductors, for example, or computer software or hardware.

Corporation for National and Community Service A federal agency created by the National Service Trust Act of 1993 as an umbrella organization for related public service organizations then scattered throughout various unrelated government departments. The programs included the Service Learning programs of the Defense Department, VISTA (Volunteers in Service to America), Youth Challenge program, the National Student Volunteer Program, University Year for ACTION, the Literacy Corps, the Student Community Service program and AMERICORPS.

Corporation for Public Broadcasting A publicly supported radio-television network created by the Public Broadcasting Act of 1967 to provide the public with educational and culturally enriching radio and television programs. Funded by a combination of federal government appropriations and voluntary gifts from corporations and private citizens, the corporation provides a wide range of commercial-free educational offerings. In addition to informal educational programs for preschool, elementary and high school students, it pioneered electronic delivery of formal courses—now called DISTANCE LEARNING—with which viewers could earn high school and college credits at home. Subsequently, its Adult Learning Satellite Service began delivering more than 70 courses to about 2,000 colleges to incorporate in their

curricula. The CHILDREN'S TELEVISION WORKSHOP (now Sesame Workshop) created three of the most important and influential educational programs ever aired for children: *SESAME STREET*, *The Electric Company* and *Feeling Good*. Financed by the CARNEGIE CORPORATION OF NEW YORK, the FORD FOUNDATION and the federal government, these programs were the first to incorporate the school curriculum into entertainment broadcasting. They succeeded in luring millions of children away from commercial television programs, which were targets of criticism for enveloping young viewers with violence and erotica.

Sesame Street was designed to appeal to socially deprived preschoolers without preschool education and, therefore, with limited development of school-related skills. Although middle- and upper-income children also became part of the core audience for *Sesame Street*, the program reached 90% of inner-city children and, according to schools in those neighborhoods, produced remarkable results in improving reading readiness of deprived children. The workshop also produced *The Electric Company* to teach and improve reading techniques of slightly older children and it brought health education to teenagers through its program *Feeling Good*.

For adults, the Corporation for Public Broadcasting sponsors public affairs programs, live theater presentations, classic films, concerts, dance recitals, opera, culinary demonstrations, historical documentaries and science documentaries.

corrected test method A common method of teaching spelling by asking students to spell words they have not studied before and giving them a master list with which to correct their own tests. Students must then rewrite all misspelled words correctly.

correlation, subject The simultaneous teaching of two or more interrelated areas of different

subjects, such as the history of ancient Egypt and the history of art and languages, or Elizabethan English and Elizabethan history, or algebra and science. Subject correlation is designed to show students the broad framework within which each element of their studies fits. Subject correlation is a major goal of TEAM TEACHING, whereby all the teachers of a particular grade of students coordinate the curriculum and weekly lesson plans so that materials studied in every subject relate to materials in other subjects. Thus, a study of ancient Egyptian history would correlate with language arts studies of hieroglyphics and the origins of written language. Egyptian history would also tie into the study of plane and solid geometry in mathematics, the study of mechanical advantage in physics and the study of perspective in art.

correspondence course The independent study of a specific topic, subject or vocation by mail, outside a formal school setting, with all course materials—texts, lectures and so on—sent to the student by mail, and all student submissions—essays and examinations and so on—returned to the instructor by mail. Although rendered obsolete by electronically transmitted DISTANCE LEARNING programs, correspondence courses were available from both private and proprietary correspondence schools and accredited colleges and universities. Many correspondence courses offered high school and college credits and were as valid as on-campus courses as credentials in the workplace or admission to graduate school. The quality and value of correspondence courses varied according to the specific course and the school that offered it. Correspondence courses were of particular value to students living in isolated areas far from any school with the particular courses they needed. Such courses were also of value to students whose jobs did not permit attending classes during conventional school hours.

Correspondence courses in the United States originated with the CHAUTAUQUA LITERARY AND SCIENTIFIC CIRCLE, organized in 1878 as a "school at home, a school after school, a 'college' for one's own house." The circle's Chautauqua Press provided the necessary books and study materials to hundreds of thousands of subscribers, and the circle awarded "diplomas" to its tens of thousands of graduates. WILLIAM RAINEY HARPER, who directed a summer program at Chautauqua and would later become president of the University of Chicago, developed a special college-level correspondence course for those seeking bachelor's degrees.

correspondence school Any organization that provides CORRESPONDENCE COURSES. Now largely replaced by Internet-based DISTANCE LEARNING schools, the vast majority of correspondence schools were private, profit-making proprietary schools, although a few renowned institutions such as the University of Oklahoma and California State University offered complete curricula by mail, leading to bachelor's and master's degrees. At their peak, just before the development of electronically delivered distance learning courses, American correspondence schools numbered more than 1,000, serving an estimated 5 million Americans.

cottage system A boarding-school housing arrangement in which students live in relatively small, family-like groups, in separate homes or cottages, with a married couple serving as surrogate parents. In use at some exclusive, private boarding schools, the cottage system is an alternative to the less personal, dormitory-style of living. It has also proved effective in many custodial institutions for juvenile offenders.

(See also BOYS TOWN.)

Council for Basic Education A nationwide association of academic and civic lead-

ers, founded in 1956 to promote the "BACK-TO-BASICS" movement in public school education. The organization's goal is to strengthen teaching of such basic academic disciplines as English (reading, writing, speech and literature), foreign languages, history (including geography and civics), mathematics, science and the arts. The council publishes a monthly bulletin, *Basic Education*, and many books and reports.

Council for Higher Education Accreditation A private agency that accredits institutional and other education ACCREDITATION ASSOCIATIONS.

(See also ACCREDITATION.)

Counts, George S. (1889–1974) A disciple of JOHN DEWEY and author of *Dare the School Build a New Social Order?*, a controversial pamphlet, published in 1932, urging American teachers to change the American social system through student indoctrination. Counts's philosophy was a logical outgrowth of Dewey's: schools must be laboratories for teaching democracy. Counts, however, went a step further by pointing out that the failures of American capitalism had produced the economic depression of the 1930s and were threatening the foundations of democracy. A professor at Teachers College, Columbia University, from 1927 to 1956, Counts called on American teachers to form a militant organization to indoctrinate American students to rebuild the American economy and redistribute American wealth more equitably. He was president of the AMERICAN FEDERATION OF TEACHERS from 1939 to 1942.

Although Counts stirred up considerable debate, the vast majority of American teachers rejected his call for action. A study of teachers at the time found that more than half believed that lack of effort, rather than economic deprivation, was the primary reason economically

poor children performed worse in school than wealthier students. Moreover, more than 80% believed their primary obligation was to indoctrinate their students with a strong faith in the U.S. Constitution rather than work for any changes in the American system. Counts's importance to American education remains a matter of debate.

course catalog A booklet available in print or on-line and published by each high school and college listing every course offered, along with a brief description of the scope of each course, the place and times each course meets, the name of the instructor, the prerequisites for enrollment and the number of credits awarded for successful completion.

(See also CATALOGS, SCHOOL AND COLLEGE.)

course credit A unit of value awarded for the successful completion of a course. At the secondary school level, credits are usually awarded on the basis of CARNEGIE UNITS, with each state determining the specific number required for graduation. Colleges generally award credits on the basis of credit hours, or the number of classroom hours a course meets each week. College course credits, however, vary widely from the basic formula. A seminar meeting twice weekly for two hours at a time may be a three-credit course, and a science course with three one-hour lectures a week and a three-hour laboratory session may be only a four-credit course. On the other hand, a seminar that meets only once a week for two hours might be a three-credit course if it demands a thesis, and an independent studies course with no regularly scheduled class meetings might also be a three-credit course. Regardless of the number of credits granted for each course, each high school and college has a required number of total credits that a student must take each year for promotion to the next grade level and eventual graduation.

course management software Software for disseminating course materials, correcting test papers, evaluating student work and tabulating and recording grades. Course management software also permits two-way communication, allowing students to do course work on-line for either on-campus classes or DISTANCE LEARNING programs. Many colleges are expanding distance learning activities by buying on-line courses from course management firms rather than investing in the costs of developing their own materials—often \$10,000 to \$60,000 for as many as 300 hours of work. Course management firms offer the finished products at prices as low as \$1,000 for a two-credit course and \$1,500 for a three-credit course. Colleges and professors can customize the offerings before enrolling students. Carnegie Mellon University established a for-profit subsidiary called iCarnegie that sells on-line courses to other colleges for their distance learning programs, and the nonprofit Monterey Institute for Technology and Education in California has established a National Repository of Online Courses. A number of community colleges are setting up informal networks to buy and sell courses from one another.

Cramp v. Board of Public Instruction of Orange County, Florida A 1961 U.S. Supreme Court decision that declared a Florida loyalty oath unconstitutional. Florida had been requiring teachers and other state and local government workers to sign, as a condition of employment, an oath not to “lend my aid, support, advice, counsel or influence to the Communist Party.” Filed by Orlando public school teacher Donald W. Cramp, Jr., the suit produced a unanimous Court decision that called the oath vague and an “absurdity.”

creation science A pseudoscientific course basing all biology, zoology, geology and paleontology on scriptural precepts and the teachings

of fundamentalist Protestant churches. Creation science rejects Charles Darwin's theory of evolution in favor of the biblical notion in Genesis that God created the Earth and all its creatures, including man, in six days. Declared an unconstitutional intrusion of the church into state affairs, creation science has been outlawed in public schools by a succession of U.S. Supreme Court decisions. In *EDWARDS V. AGUILLARD* in 1987, for example, the Court declared creation science an attempt to discourage the teaching of accepted scientific theories while promoting a specific religious belief. Undeterred by the court rulings, Christian fundamentalists repackaged creationism into a new religious concept called INTELLIGENT DESIGN and again placed the teaching of evolution in jeopardy in many areas. A theory that an as-yet-unidentified guiding force directed the development of all living organisms, including humans, intelligent design asserts that living organisms are too complex to have evolved from common ancestors through natural selection and random mutation. Underlying the argument for intelligent design is the concept of "irreducible complexity," which holds that the interdependent parts of most organisms make it impossible for them to have existed in any other earlier, more primitive form. Unlike creation science, the theory of intelligent design carefully avoids all references to religious beliefs that the United States Supreme Court barred from the public school curriculum. Nonetheless, a Federal District Court in Harrisburg, Pennsylvania, ruled in December 2005 that intelligent design was as much a religious viewpoint as creationism and that public schools injecting it into the science curriculum were in violation of the First Amendment of the Constitution.

creative dramatics A pedagogical technique used especially among preschoolers and kindergartners to encourage creativity, verbal skills and public presence by asking them to act out

original stories and ideas spontaneously. In effect, creative dramatics is an exercise in "make-believe," such as "playing house," in which students make up their own dialogue and actions instead of adhering to a predetermined script.

credential In education, a document issued to an individual by an accepted authority permitting the individual to perform appropriate teaching or nonteaching services. A credential may be a license issued by a governmental agency, a professional certificate granted by an appropriate professional organization or a diploma or degree granted by an appropriate educational institution.

Cremin, Lawrence A. (1925–1990) American educator, historian and president of Teachers College, Columbia University, from 1974 to 1984. One of the leading historians in the field of American education, Cremin won the 1981 Pulitzer Prize in history for his massive, three-volume history entitled *American Education*, published, respectively, in 1970, 1979 and 1987. Volume I was entitled *The Colonial Experience, 1607–1783*; volume II, *The National Experience, 1783–1876*; and volume III, *The Metropolitan Experience, 1876–1980*. The most comprehensive history of American education ever written, Cremin's work was based on his own broad definition of the concept of education, which he called "the deliberate, systematic, and sustained effort to transmit, evoke or acquire knowledge, values, attitudes, skills and sensibilities, as well as any learning that results from that effort, direct or indirect, intended or unintended."

Among his 16 other important works were *The American Common School* (1951); *The Republic and the School: Horace Mann on the Education of Free Men* (1957); *The Transformation of the School* (1961); *The Genius of American Education* (1965); *Public Education* (1976); and

Traditions of American Education (1977). Born in New York City, Cremin attended Townsend Harris High School and City College of New York and earned his Ph.D. at Columbia. He taught at Harvard and Stanford Universities before coming to Teachers College.

crime on campus The number of felonies and arrests on American college campuses, as reported to the U.S. DEPARTMENT OF EDUCATION under the terms of the CLERY CAMPUS SECURITY ACT. In 2003, the 6,412 campuses reporting acknowledged 7 murders, 10 cases of negligent manslaughter, 2,379 forcible sex offenses, 55 nonforcible sex offenses, 1,420 robberies, 2,218 aggravated assaults, 23,260 burglaries, 6,426 motor-vehicle thefts, 1,046 cases of arson and 71 hate crimes. American colleges reported 30,677 arrests for liquor-law violations, 12,456 arrests for drug-law violations and 1,116 arrests for weapons-law violations. Clery Act reports give no indication of which crimes are committed by college students and which by campus intruders. Of the more than 35,500 crimes reported on American college campuses, nearly 75% occurred at public two-and four-year colleges. Colleges are not, however, required to report the outcomes of on-campus, college-sponsored investigations of each crime, and there is no way of knowing how many reports of crimes were dismissed outright or how many crimes reported as lesser violations were, in fact, more serious. Not included in the tabulation of crimes is high-tech electronic cheating, or e-cheating, which is, at least technically, a crime falling under a wide variety of categories—all of them difficult to pursue in court.

(See also SCHOOL SECURITY.)

criterion-referenced test An examination that measures and compares a student's knowledge to teacher and school goals and expectations for the particular class and grade. The best known criterion-referenced tests are compe-

tency tests that measure each student's basic level of skills in each subject. Criterion-referenced tests are one of three broad types of tests. The others are the NORM-REFERENCED TEST, which compares the student's knowledge to the average knowledge of other children, and the CHILD-REFERENCED TEST, which compares a child's knowledge after instruction with what he knew before. Each of the three has its advantages and disadvantages, depending on the motivation of the schools and individual teachers. Scores of criterion-referenced tests can be artificially elevated, for example, by "teaching the test" and devoting class time to preparing students for possible questions they may face on such tests.

critical thinking The intellectual evaluation of a variety of assumptions and empirical data and the ability to arrive at logical conclusions on the basis of that evaluation. Critical, or high-level, thinking is an essential part of the curriculum from kindergarten through high school and college. It is usually taught by teacher questions that call for lengthy, subjective, oral and written responses. The goal is not only to elicit correct answers to questions but to teach children the reasoning process that leads to correct answers.

A major criticism of American public school education has been its failure to teach high-order, critical thinking. In a scathing report, the U.S. Department of Education found that "students at all grade levels are deficient in higher order thinking skills." The department blamed overuse of short-answer, multiple-choice tests for part of the problem.

Like knowledge, memory and comprehension, critical thinking abilities increase with development, maturity and training. The teaching of critical thinking begins in kindergarten with prereading and postreading discussions to analyze character traits and map a possible future course of events for those characters after the story ends. As they progress, kindergarten

and early elementary school teachers encourage children to make up their own stories from a picture and summarize in a few sentences a story they have heard or read. Inviting students to retell stories in their own words, whether orally or in writing, and to pinpoint causes and effects are basic methods of teaching critical thinking. By fourth grade, students with standard comprehension and critical thinking skills should be able to distinguish between the main and subordinate ideas in a reading, to select the climactic statement or event and to describe the feelings and emotions of the characters. They should also be able to solve mathematical story problems.

Secondary school comprehension skills include the ability to describe the main idea of a reading; the unstated ideas, places or settings; and the reasons for character actions. At MODEL SCHOOLS that teach critical thinking skills, science students are able to describe the atomic, molecular, cellular, tissue, systematic and organic differences between any two organisms, and history students can detail in essay form the differences between the English parliamentary system and the U.S. system of government. In mathematics, a typical seventh-grade test question at schools that teach critical thinking might ask students to measure a U-shaped figure and calculate its area, while writing out the reasoning for each step in their calculations.

cross-disciplinary studies The formal or informal integration of materials from one or more courses into a single, new course. American studies, for example, may, depending on the particular college, integrate into a single course of study the literature, history, sociology and political structure of the United States. At the elementary and high school levels, cross-disciplinary studies, or SUBJECT CORRELATION is a primary goal of TEAM TEACHING. Team teaching coordinates the curriculum and weekly lesson plans in each grade so that the materials studied

in every subject relate to the materials in every other subject. Thus, a study of ancient Egypt in history would correlate with a study of hieroglyphics, the study of the origins of language in language arts, the study of plane and solid geometry in mathematics, the study of mechanical advantage in physics and the study of perspective in art.

cross-registration The enrollment in a course, for full academic credit, at an institution of higher education by a student attending a second, unaffiliated institution. Cross-registration agreements have proved to be profitable for colleges and universities by avoiding and eliminating duplication of a wide variety of courses, without depriving students of access to a broad spectrum of academic offerings.

Crystal Palace Exhibition The first American industrial exhibition designed to display to Americans at all levels the world's technical and scientific advances. An imitation of a similar exhibit that had been held two years earlier in London, England, the American Crystal Palace Exhibition was held in 1853 at 42nd Street and Fifth Avenue in New York City, the current site of the New York Public Library. It brought together 5,000 exhibits, ranging from surgical instruments to military ordnance, from 23 countries. About 1.235 million visitors came to the exhibition and carried its "lessons," in the form of promotional literature, to all parts of the United States. For the era, with its paucity of secondary school and higher education, industrial exhibits such as the Crystal Palace Exhibition served as valuable educative institutions for the general public. "They increase as well as diffuse knowledge," explained William P. Blake, in his book *Great International Expositions* (1872). "By bringing together and comparing the results of human efforts, new germs of thought are planted, new ideas are awakened, and new inventions are born."

Cuisenaire Number-in-Color Plan A multisensory system of teaching basic number concepts that revolutionized mathematics instruction in kindergartens and elementary schools around the world. Introduced in 1952, by Belgian schoolteacher Georges Cuisenaire (1891–1976), the system uses sets of small, colored, one-centimeter-diameter dowels, or “rods,” to facilitate children’s understanding of mathematical concepts. Cuisenaire had studied both music and education as a young man and trained as a composer before becoming a teacher and, eventually, an elementary school principal. Convinced that children could enjoy learning mathematics as much as they enjoyed learning music with him, he first recognized that note recognition by young children was facilitated by their different shapes and by the hollowing out of whole notes and blacking in notes of smaller mathematical values. He decided to apply a similar principle to numbers, using dowels of different, but related, lengths, and assigning each a different color. In effect, he turned the learning of mathematics into play and, as a result, not only simplified it, but made it fun. He never patented or profited from his invention, although it is produced by a company that bears his name but has no relationship to him or his family.

The colors serve two purposes: psychological and mathematical. Bright colors appeal to children and invite them to play, build and manipulate, uninhibitedly. At the same time, they unconsciously and invariably discover mathematical relationships. Now a basic teaching tool in every elementary school of minimal quality in the United States and every other advanced country, Cuisenaire Rods, as the Number-In-Color Plan is usually called, come in 10 different lengths, in increments of one centimeter each, from 1 to 10 centimeters and colored, in order of length, white, red, light green, purple, yellow, dark green, black, brown, blue and orange. The coloring is not haphaz-

ard. The basic unit rod is white, for example, while the 7-cm. rod, which belongs to no number “family,” is black. The 2-, 4- and 8-cm. rods are, respectively, the “hot colors,” red, purple and brown, while 3, 6, and 9 are “cool,” light green, dark green and blue. By attaching and detaching the rods to one another, children are actively engaged in “doing” and quickly “see” and “feel” the meanings of basic mathematical concepts such as “more than,” “less than,” “same as/equals” and rapidly move ahead to counting and simple mathematics involving addition and subtraction and fractions. Use of the rods creates lasting, clearly defined visual, muscular and tactile images for each number and its relationship to other numbers. Each number acquires and retains its individuality, and each number and combination of numbers is the result of each child’s own thought, own manipulations and own senses.

cultural literacy A body of knowledge that is common and essential to the functioning of a people related by language, geography and social customs. A term first used by educator E. D. Hirsch, Jr., in his book of the same name, cultural literacy has been defined variously as the knowledge each person needs both to communicate easily with others and to function independently in his society. Critics such as Hirsch and educator ERNEST L. BOYER claim that American public schools are failing to make their students culturally literate. The basis of cultural literacy, say these critics, lies in reading, writing, speaking, listening and computation skills, acquired through a core of common learning from courses in literature, the arts, foreign languages, history, civics, science, mathematics, technology and health.

Literature, wrote Boyer, provides a “perspective on historical events, telling us what matters and what has mattered to people in the past. Literature transmits from generation to generation enduring spiritual and ethical

values." The arts—music, dance and the visual arts—"transmit the heritage of a people. . . . It is no accident that dictators, who seek to control the minds and hearts of men, suppress not just the written and spoken word, but music, dance and the visual arts as well."

culture deprivation A lack of social, cultural and educational training necessary to participate successfully in society at large. In the United States, culture deprivation is associated with poverty, family break-up, poor health and hygiene, lack of English language skills, substandard housing and life in neighborhoods with high rates of crime, drug and alcohol abuse and other antisocial behavior. Since 1964, the federal government has sponsored a wide variety of COMPENSATORY EDUCATION programs aimed at easing cultural deprivation in the United States.

(See also ECONOMIC OPPORTUNITY ACT OF 1964; HEAD START.)

culture-fair (culture-free) test An examination whose questions are not based on cultural experiences and can, therefore, be answered with equal facility by students of different cultures with the same intelligence. Many nonverbal performance tests requiring no language skills often serve as useful culture-fair tests for measuring manual dexterity and reasoning skills. Culture-fair tests date back to the beginning of World War II, when universal conscription drew into the armed forces hundreds of thousands of illiterate men of otherwise normal or superior intelligence. The need for able-bodied soldiers made rejection on the basis of illiteracy impractical. The Army therefore developed two qualification tests to measure intelligence: the Army Examination Alpha, for literate conscriptees, and the Army Examination Beta, for illiterate and foreign-language-speaking soldiers. In administering the Beta test, examiners and test-takers used gestures, pantomime and demonstrations or drew marks and lines instead of

using language or trying to write words. Culture-fair testing became essential in many American public schools after World War II, when large numbers of Hispanic students of normal and superior intelligence were unable to cope with culturally biased intelligence tests designed for English-speaking American children.

cumulation principle A principle of teaching whereby the simplest materials are presented first, followed by materials of ever increasing complexity, but all based on an understanding of earlier materials. The student thus applies knowledge accumulated in each lesson to the learning of each subsequent lesson. The principle of cumulation is especially effective in teaching arithmetic and foreign languages.

cumulative student record A file containing chronological entries of all data pertaining to a student's progress throughout his or her years in an individual school. In addition to biographical and family data, the cumulative record contains all data on student health, standardized test results, attendance record, academic records, extracurricular activities, teacher comments and any other pertinent information.

current events education An element of the social studies curriculum designed to encourage student interest in local, national and world affairs and their relation to history. Taught at every grade level of social studies, current events relies on student reading of monthly, weekly and daily periodicals. Current events helps students develop reading skills, skills in map reading and skills in the use of periodicals and other reference materials. Current events can be an important pedagogical tool in teaching critical thinking by helping students trace the origins of many current events to a long, complex, interconnected series of historic events.

curriculum A broad term usually referring to the totality of formal courses taught in a school or college. It can, however, have broader or narrower meanings. In a broader sense, it can refer to the total school or college program, including on- or off-campus COCURRICULAR ACTIVITIES, as well as academic offerings. In a narrower sense, curriculum can refer to the formal course offerings within a particular department or subject area, as in the mathematics curriculum or English curriculum.

Curricula at the elementary and secondary school levels are established by the individual states, which may or may not give local school-districts freedom to add courses or otherwise deviate from the state program. At the college level, faculty and administration (which includes state officials in the case of public institutions) generally collaborate in determining the curriculum. The administration (and the state, in the case of public institutions) generally determines the institution's broad academic policies and, therefore, the basic academic requirements for graduation and core curriculum. Beyond that, faculty members generally propose and design courses, which the administration must then approve.

curriculum, "cafeteria style" A term referring to "open" high school curricula offering students a wide choice of electives. The latter may range from core academic subjects such as English, mathematics, science and history, to personal improvement courses on hygiene and grooming, with almost all earning credits toward graduation. Cafeteria-style curricula emerged in the late 1950s, when high-school drop-out rates began climbing above 20%, and school administrators sought ways to retain more students by providing courses more attuned to student interests. The result in many schools was the development of the so-called general studies curriculum, with superficial

courses in standard academic courses and a plethora of personal improvement courses in grooming, interpersonal relations, consumer affairs and home economics.

(See also GENERAL EDUCATION.)

curriculum, college In the United States, an amorphous and continually changing program of postsecondary studies in a virtually limitless range of subjects and topics. The scope of American college curricula depends largely on the philosophy and educational goals of individual colleges. In general, colleges offer curricula of between 1,000 and 3,000 courses, only a few of which are specifically required for graduation or a degree. Graduation requirements usually consist of a specific number of course credits, with a specific number reserved for courses in the student's major.

Originally rigid and designed to prepare young men for the Protestant ministry, American college curricula have evolved into programs that, in general, reflect the demands of the marketplace. With many colleges operating at multimillion-dollar annual deficits and some charging students more than \$45,000 a year, few institutions can afford to ignore the demands of their "clients." The result, on some campuses, has been curricula ranging from esoterica to the most complex advanced studies of major scientific, social, economic and political issues. One report on college curricula called many "little more than secondary school material—warmed over and reoffered at much higher expense." Like course quality, graduation and degree requirements vary widely from institution to institution.

Exactly what colleges should teach and what they should require students to study remain major controversies in higher education, as they have been since the first American college, Harvard, opened its doors in 1636. Founded as a divinity school, Harvard required

all students to study logic, rhetoric, ethics, politics, history, arithmetic, geometry, astronomy, physics, the nature of plants, Greek grammar and literature, Hebrew grammar and Bible readings, Chaldee (Chaldean) grammar and Apocryphal readings, Syriac grammar and New Testament readings, and catechetical divinity. Fluency in Latin was a prerequisite for admission. Based on the Oxford and Cambridge models, Harvard's "classical curriculum" had emerged from the clerical and ministerial colleges of the Middle Ages and was designed to supply the colonies with a force of Puritan ministers to oversee the spiritual and secular lives of settlers.

By the end of the 17th century, the rigid Harvard curriculum had become a source of controversy. Although half its students were indeed training for the ministry, others planned to enter law, medicine, industry and public service, and they sought a broader, more liberal education that included literature, history and philosophy. Intellectual liberals responded by expanding the curriculum to include areligious, political and philosophical works of such Age of Reason thinkers as Locke and Rousseau. Angry conservatives quit Harvard and went to New Haven to found Yale and perpetuate the orthodox ministerial curriculum. By the end of the 18th century, however, the term classical education had gained a far broader meaning, and even at Yale it embraced the study of literature, poetry, drama, rhetoric, logic, philosophy, history, art, music and modern foreign languages needed for international commerce.

Meanwhile, another force had developed in college-level curriculum development, based on the practical needs of the American wilderness and the industrial revolution. Secularists led by Benjamin Franklin envisioned colleges as institutions to prepare young men and women for the task of building a new nation.

Franklin founded the secular COLLEGE OF PHILADELPHIA in the belief that practical skills were more important to the survival of the United States than religious instruction. The debate between the Franklinesque "practicalists" and Harvardian "classicists" has persisted in American higher education ever since. The practicalists gained the upper hand in public education policy after the Civil War, when the need to rebuild the nation's agricultural and industrial plant took precedence. In 1862, Congress passed the Land Grant (Morrill) Act, which offered tens of thousands of acres of free government land to each state to sell and use the proceeds to establish and maintain colleges. The new "LAND-GRANT" COLLEGES were to offer practical education in agriculture, mechanics, mining and military tactics, as well as the traditional arts and sciences. The result was the construction across the United States of the colleges that spawned the nation's public state universities and colleges. For the next century, public university curricula leaned toward the practical, while private universities required students to pursue classical studies; many of the latter required three years of high school Latin as an entrance requirement until shortly after World War II. Moreover, the most selective private colleges of the Northeast required all candidates for bachelor's degrees to complete a core curriculum based on classical studies (over and above the required number of courses in their major) to graduate. Usually, the core curriculum included at least two years each of college English and a modern foreign language and one year each of college mathematics and a laboratory science.

The technological and social changes that followed World War II, however, forced private universities to promulgate vast revisions in their curricula—almost all of them market-driven. The most remunerative job opportunities required technical and scientific skills, not

a knowledge of Latin, and students sought out institutions that would provide those skills. Meanwhile, the federal government and major corporations were offering huge grants to those researchers and institutions that provided the best scientific research. Colleges that failed to expand their science curricula not only risked losing such grants, they also faced the loss of their most brilliant teachers and students. With men circling and landing on the moon, Latin and Greek seemed irrelevant. By 2004, the number of bachelor's degrees in business awarded by American colleges and universities had doubled, to more than 21% of all the bachelor's degrees awarded in the United States. In contrast, the number of degrees awarded in English language and literature fell more than 20%, accounting for a mere 4% of all bachelor's degrees awarded. Interest in foreign languages and literature fell even more sharply, and accounted for only just over 1% of the bachelor's degrees conferred in 2004.

Complicating the debate over classical versus practical studies, however, was a new debate over the cultural orientation of college curricula. The post-World War II era had produced social, as well as technological changes. Passage of two sweeping civil rights laws in 1957 and 1964 ended all forms of segregation in education and brought blacks, Hispanics, Asians and women to formerly all-white, all-male campuses. The new arrivals protested what they perceived as a Western bias to traditional literature, history, social science and other course offerings. They demanded a multicultural curriculum that would expose them to non-Western as well as Western history and thought. Women, in turn, demanded a less male-oriented curriculum. Facing deficits that left them financially dependent on students, most colleges acceded to most of the various demands of the mar-

ketplace. It is an unusual institution that does not now offer courses in African-American studies, for example, or women's studies. Ironically, despite the emphasis on multiculturalism, fewer than 8% of American colleges still require any foreign language study. (See MULTICULTURAL EDUCATION.)

Unfortunately, the broadening and diversification of curricula left many colleges without a common educational focus. A 1989 report by the National Endowment for the Humanities (see NATIONAL FOUNDATION ON THE ARTS AND HUMANITIES) found that the majority of American college students were graduating without knowledge of "basic landmarks of history and thought." Among the multitude of evidence were findings that 25% of college seniors surveyed did not know that Columbus landed in the Western Hemisphere before 1500 and that the vast majority could not identify the Magna Carta. A National Adult Literacy Survey by the U.S. Department of Education found large numbers of college graduates lacking basic reading, writing and computation skills.

The result was a return by more than 80% of American colleges to a required CORE CURRICULUM consisting of a minimum number of courses in one or more broad study areas, such as philosophy, science, literature, foreign languages and history. The number and range of such core curricula varied from institution to institution, however. Only about 12% of American institutions of higher education maintained any mathematics requirements for graduation, and only 34% had any natural science requirements. Only about one-third of American colleges now require English majors to read any of the works by Chaucer, Shakespeare and Milton, the three writers generally regarded as preeminent English authors and, until recently, required reading for all English majors. Two-thirds of American colleges that require English literature courses now base their

offerings on so-called pop culture, with course titles such as “The Gangster Film” or “Melodrama and Soap Opera.” Almost all colleges, however, continue to require students to demonstrate proficiency in writing as a prerequisite for graduation.

In 2004, a committee of HARVARD UNIVERSITY administrators, professors and students proposed a restructuring of college curricula to influence course offerings at other academically demanding American colleges. Harvard proposed, on the one hand, a sharp increase in the number of required science courses and, on the other hand, a broader-based approach to the study of major subjects. In the science sector, Harvard suggested expanding the scope of survey courses to include in-depth laboratory studies. In the arts, it proposed expanding courses to include required field study—abroad, if appropriate, but outside the confines of the student’s own college. Students majoring in Chinese history, for example, would spend at least one semester at a university in China. Before Harvard announced these curricular changes, YALE UNIVERSITY had urged similar changes in its curricular mix, suggesting that students take as many as 60% of their courses in science and technology by 2010—regardless of their major. Yale also suggested a response to cultural and economic globalization by expanding the number of foreign students at major American universities to as many as one-third of total enrollment.

(See also APPENDIX D, UNDERGRADUATE MAJORS OFFERED AT AMERICAN COLLEGES.)

curriculum, public schools The totality of formal academic courses offered in American public schools. These include a broad range of liberal arts, science, preprofessional, vocational and self-improvement courses. Although it has no jurisdiction over public school education, the U.S. Department of

Education occasionally publishes model curricula for elementary, middle and high schools that reflect the broad academic curriculum offered by most American public schools—namely, English, mathematics, science, history (social studies), modern foreign languages, art, music, physical education and hygiene and health education. The number of years required varies widely from state to state and school district to school district, as does the depth of exploration into each subject. Here, however, is the model of an ideal curriculum suggested by Secretary of Education William Bennett for all public school students in two pamphlets issued by the Department of Education in 1985 and entitled *James Madison Elementary School, A Curriculum for American Students* and *James Madison High School, A Curriculum for American Students*.

EARLY ELEMENTARY SCHOOL YEARS (K-THIRD GRADE)

English

Introduction to reading and writing (phonics, silent and oral reading, basic rules of grammar and spelling, vocabulary, writing and penmanship, elementary composition and library skills).

Social Studies

Introduction to history, geography and civics (significant Americans; explorers; Native Americans; American holidays, customs and symbols; citizenship; and landscape, climate and map work).

Mathematics

Introduction to mathematics (numbers; basic operations; fractions and decimals; rounding; geometric shapes; measurement of length, area and volume; bar graphs; and estimation and elementary statistics).

Science

Introduction to science (plants and animals; the food chain; the solar system; rocks and minerals; weather; magnets; energy and motion; properties of matter; simple experiments).

Foreign Language

Optional.

Fine Arts

Music and visual arts (songs, recordings, musical sounds, instruments, painting, craftmaking and visual effects).

Physical Education/Health

Body control, fitness, sports, games and exercises; sportsmanship; safety; hygiene, nutrition and drug prevention education.

*LATE ELEMENTARY SCHOOL YEARS
(FOURTH–SIXTH GRADES)*

English

Introduction to critical reading (children's literature; independent reading and book reports; more advanced grammar, spelling and vocabulary; composition skills).

Social Studies

Grade 4, U.S. history to Civil War; grade 5, U.S. history since 1865; grade 6, world history to the Middle Ages.

Mathematics

Intermediate arithmetic and geometry (number theory; negative numbers; percentages and exponents; line graphs; the Pythagorean theorem; basic probability).

Science

Grade 4, earth science and related topics; grade 5, life science and related topics; grade 6, physical science and related topics.

Foreign Language

Introduction to foreign language (basic vocabulary, grammar, reading, writing, conversation and cultural materials).

Fine Arts

Music and visual art (great composers, musical styles and forms, elementary music theory, great painters, interpretation of art and creative projects).

Physical Education/Health

Team and individual sports, first aid, drug-prevention education and appropriate sex education.

*MIDDLE SCHOOL
(SEVENTH–EIGHTH GRADES)*

English

Grade 7, survey of elementary grammar and composition; grade 8, survey of elementary literary analysis.

Social Studies

Grade 7, world history from the Middle Ages to 1900; grade 8, world geography and Asian history and civilization.

Mathematics

Two of the following one-year courses: general mathematics, pre-algebra, algebra.

Science

Grade 7, biology; grade 8, chemistry and physics.

Foreign Language

Formal language study; two years strongly recommended.

Fine Arts

One semester each of music appreciation and art appreciation.

Physical Education/Health

Strategy in team sports, gymnastics, aerobics, self-assessment for health, drug-prevention education and appropriate sex education.

**SECONDARY (HIGH) SCHOOL
(NINTH–TWELFTH GRADES)**

English

Grade 9, grammar, composition and literary analysis; grade 10, grammar, composition and English literature; grade 11, composition, literary analysis and English and American literature; grade 12, advanced composition and world literature.

Social Studies

Grade 9, anthropology and ancient history; grade 10, medieval or modern European history; grade 11, American history, American government and the U.S. Constitution; grade 12, elective (medieval or modern history).

Mathematics

Grade 9, algebra I; grade 10, plane and solid geometry; grade 11, algebra II and trigonometry; grade 12, elective (statistics and probability [1 semester], precalculus [1 semester], calculus).

Science

One year required each in any of the following courses: astronomy/geology; biology; chemistry and physics; or principles of technology. The fourth year provides for an elective in lieu of science.

Foreign Language

Three years required in a single language from among those offered by the school. The fourth year provides for an elective in lieu of foreign language.

Physical Education/Health

Two years required participation in physical education; health 9 and health 10 required in

ninth and tenth grades. Free periods in eleventh and twelfth grades may be filled with elective courses.

Fine Arts

One year each required in art history and music history. The student may take elective courses in the other two years.

curriculum audit A formal, week-long examination and evaluation of a school's curriculum and teaching methods by a team of examiners from the American Association of School Administrators, to see if the school curriculum meets national standards. Designed to expose the strengths as well as faults of a school's faculty and curriculum, an AASA audit is entirely voluntary and not required for ACCREDITATION.

curriculum coordinator A district or school official charged with development, improvement and supervision of curricula in schools and departments within his or her jurisdiction. The curriculum coordinator may have a variety of alternative titles, such as curriculum director or supervisor; or assistant superintendent or principal for instruction or curricular affairs. Regardless of the formal title, the curriculum coordinator is charged with both closely monitoring the curriculum to see its effects on student performance and working with faculty and school administrators to develop more effective curricular offerings. In addition, the curriculum coordinator must spend time in the field studying curricula in other districts and schools. The coordinator must also examine new curricular offerings from publishers and providers of educational materials to see if they might improve student performance in his or her own district.

curriculum development The design of an educational program that fulfills the edu-

cational goals of the institution. Involved are the selection of academic courses; determination of course content; selection of teaching materials and methods; and establishing levels of expectation for student achievement. In addition to course design, curriculum development also involves designing ancillary activities essential to fulfilling the school's broad educational goals. These may include cultural enrichment programs, special educa-

tion and such extracurricular activities as athletics, performing arts, publishing, hobbies, etc. In 1962, Professor Hilda Taba (1902–1967) published the classic work on the subject.

custodian A school staff member charged with janitorial responsibilities such as cleaning and maintaining the school plant and equipment.

D

Dabney, Charles William (1855–1945)

Southern educator, author and a founder-leader of the Southern Education Board, which helped establish free public school education in the South at the turn of the 20th century. Born in Virginia, Dabney was a chemistry professor whose work in agriculture led to the founding of North Carolina State University as a land grant institution and to his appointment as assistant secretary of agriculture. He served as president of the University of Tennessee, Knoxville, from 1887 to 1904 and was instrumental in expanding that institution into a major university and in obtaining passage of the High School Act, which established public school education in Tennessee in 1908. From 1904 to 1920, Dabney served as president of the University of Cincinnati, which he helped build into a leading municipal institution.

In 1901, he helped organize the Southern Education Board, which sent agents throughout the South to promote free public school education for white children as a means of revitalizing the southern economy. Backed by a consortium of northern foundations, the board propagandized and cajoled local and state leaders, gradually winning their support, despite fierce opposition from industrialists and farmers, who relied on children for cheap labor. A prolific author, Dabney's two-volume work *Universal Education in the South* (1936)

describes the 30-year struggle of the board to which he was so intimately tied. Dabney and the board made no effort, however, to improve education for blacks.

Dalcroze method A widely used system of teaching music developed by Swiss composer-educator Emile Jacques-Dalcroze (1865–1950). Believing music to be an active, rather than passive, participatory experience, the Austrian-born Jacques-Dalcroze designed his *méthode* to help children develop an ear for music and feel its rhythm before they begin instrumental training. The system, which influenced modern ballet as well as music pedagogy, consists of three parts: eurhythmics, solfège and improvisation. Eurhythmics teaches children to “feel” the music by moving their bodies in rhythm to it. Solfège teaches sight-reading by disregarding academic nomenclature in favor of the common sol-fa syllables of the musical scale, from which the word solfège is derived. Solfège names the tonic note of every melody do, regardless of whether it is in the key of C, D or any other. The system helps a child learn to sing virtually any melody in relative pitch and develop an ear for music. The third element of the Dalcroze method is improvisation, which teaches children to create their own music.

Dalcroze first described his method in his book *Méthode Jacques-Dalcroze* (1907–14),

which contained various exercises and suggested musical accompaniments for each lesson. He wrote two later books, *Rhythm, Music and Education* (1921) and *Eurhythmics, Art and Education* (1930) and composed more than 1,000 songs, almost all for children to use in their classes. Founder of the Institut Jacques-Dalcroze in Geneva in 1915, he created 39 musical pageants, 85 chamber works, 125 piano pieces and 275 pieces for chorus, 200 with orchestral accompaniment. In the United States, the Dalcroze School of Music in New York City offers a three- to four-year Dalcroze Teachers Training Course leading to the Dalcroze Teachers Certificate and/or the Elementary Certificate.

Dalton Plan A system of individualized instruction in which the student helps design his or her program of study and “signs a contract” pledging to complete the program within a specific time period. Developed in 1920 by Helen Parkhurst at Dalton High School, Dalton, Massachusetts, study contracts are now widely used in intermediate, or middle, schools to help students develop the self-discipline needed for the transition from teacher-directed elementary schoolwork to self-directed high school and college studies. Although the Dalton Plan can take many forms, the basic student contract usually covers the work the student will be required to complete during one month, including daily assignments. The student is expected to keep a careful chart of his or her progress.

dame school A colonial-era elementary school operated for a modest fee by a neighborhood mother in her kitchen. Designed to teach youngsters the basics of reading, writing and calculating, dame schools appeared in communities where children either had no access to formal schools or, for whatever reasons, chose not to attend.

Dana, John Cotton (1856–1929) American librarian and museum director who pioneered curatorial education and spawned the transformation of libraries and museums into public educative institutions. Although the United States boasted thousands of libraries and museums by the end of the 19th century, they remained a center of a national debate over their roles in American cultural life. Conservatives saw them as repositories to preserve the nation’s historical and cultural treasures. They sought to restrict access to researchers, fearing that regular public access would ultimately lead to overhandling of valuable books and their eventual deterioration.

When the Vermont-born Dana became librarian in Denver, Colorado, in 1898, he found a gated fence separating would-be readers from the bookshelves. Behind the gate a librarian with sole access to the institution’s works sat at a desk, waiting for reader requests to find books and bring them to the gate. The reader then filled out often complex forms before being permitted to read the book at a table in full view of the librarian. Moreover, most libraries opened only during normal working hours, when most readers were themselves at work. Dana immediately lengthened library hours in Denver to make the collection accessible to the entire community. He removed the railings and locked glass doors and placed both the circulating and reference collections on open shelves. He put the most rarely used materials in special annexes and filled the shelves of the main library with those materials most in demand by the general public. He broadened the collection to fill the needs of the entire community, adding children’s books, foreign-language materials for immigrants and specialized materials of interest to those involved in local businesses and industries. Conservatives scoffed at Dana’s innovations, predicting that overhandling would destroy the library’s collection and even

lead to the spread of infectious diseases—an issue of considerable importance at the end of the 19th century. Dana vigorously defended himself: “A collection of books gathered at public expense does not justify itself by the simple fact that it is. If a library be not a live educational institution, it were better never established.”

Dana took the same philosophy to Newark, N.J., where he became librarian and museum director. There, he expanded the museum to include flora, fauna, minerals, craft-work, school-work manufactured products and other artifacts indigenous to the surrounding community, and he loaned collections to local schools and other community institutions. He also organized a curatorial apprenticeship program for college graduates who planned to go into museum work. He also brought in many special exhibits and constantly advertised the museum’s programs to encourage public visits. “A museum,” he explained, “is an educational institution, set up and kept in motion that it may help the members of its community to become happier, wiser and more effective. It can help them only if they use it. They can use it only if they know of it.”

When Dana died in 1929, his transformation of Newark’s library and museum into popular educational institutions was only just beginning to have an impact on libraries and museums elsewhere. In the decade that followed, however, almost every library and museum in the United States adopted Dana’s innovations.

dance An art involving bodily movements according to a planned, rhythmic pattern, usually performed to music. A standard part of the college curriculum in precolonial England, dancing was taught with singing “and all games proper for nobles, as those brought up in the king’s household are accustomed to practice.” In the late 18th century, philoso-

pher John Locke’s work *Some Thoughts Concerning Education* listed dancing, along with music, fencing and horsemanship as important complements to formal education in classical subjects.

Dancing did not, however, find its way into the curricula of schools and colleges in the American colonies, where Puritan ministers in charge of 17th-century education frowned upon and often banned amusements. Formal dancing was, however, taught outside school to the children of the landed gentry by private instructors. At the beginning of the 19th century, when gymnastics was introduced into private academies, dancing, too, was taught. Aside from teaching proper manners, dress and behavior with members of the opposite sex, dancing promoted fitness and helped youngsters develop motor skills, coordination of mind and muscles, and respect for rules.

Dancing remained a standard element of the private elementary school curriculum until the late 1950s, when improvisational dancing to rock-and-roll music replaced formal ballroom dancing.

Darrow, Clarence (1857–1938) One of the most successful trial lawyers in American history and the defense attorney in the SCOPES MONKEY TRIAL in Tennessee. Born in Ohio, Darrow chose the Scopes case with the primary intent of making national headlines and thereby educating the American public to his then-liberal, civil libertarian views. In the Scopes trial, he defended a 24-year-old science teacher at Dayton High School against charges he had violated Tennessee’s Butler Law. The 1925 law banned the teaching of “any theory that denies the story of the Divine Creation of man as taught in the Bible, and to teach instead that man has descended from a lower order of animals.” Darrow, who had been successful in more than 50 capital cases, took the Scopes case for “the purpose of preventing bigots and

Clarence Darrow, leaning with back to the table, at the "Scopes monkey trial" in Dayton, Tennessee, July 1925 (*Library of Congress*)

ignoramuses from controlling the education of the United States. . . ." Although he lost the case, and Scopes was fined \$100, Darrow effectively humiliated and discredited the Christian fundamentalist movement that had sponsored the Butler Law, and in particular, prosecuting attorney WILLIAM JENNINGS BRYAN.

Dartmouth College A private, liberal arts college founded in 1754, in Lebanon, Connecticut, as a school for American Indians. Dartmouth received a royal charter to become a college in 1769, at which time it moved to its

present site in Hanover, New Hampshire. The school was founded by ELEAZER WHEELOCK, a Congregationalist minister intent on converting Indians to Christianity. He started his school in his parsonage in Connecticut, where he tutored a handful of Indian youths along with a few white boys dedicated to becoming missionaries. The royal charter and the move to larger quarters in New Hampshire allowed the school to become a college, where few Indians qualified for admission and colonials soon dominated the student body. Dartmouth today has more than 4,000 undergraduates and more than 1,500

The central green at Dartmouth College, Hanover, New Hampshire (Stuart Bratesman, Dartmouth College)

graduate students in its medical school, school of engineering and Amos Tuck School of Business. Its undergraduate college is in session year-round, operating with an unusual academic calendar of four 10-week terms.

Dartmouth College case A still-controversial 1819 U.S. Supreme Court decision that held charters—even those granted by the British king before U.S. independence—to be binding contracts protected by the Constitution. Officially known as *Trustees of Dartmouth College v. Woodward*, the case had its origins in an 1815 conflict between Dartmouth College president JOHN WHEELOCK and his board of trustees over control of college affairs. Wheelock, who graduated from Dartmouth's first

class in 1771 and succeeded his father, Eleazer, as Dartmouth president in 1779, appealed to the legislature. The board responded angrily by dismissing him.

In 1816, a new, Democratic legislature declared the charter issued in 1769 by King George III invalid and replaced it with a new one, naming a new board and reinstating Wheelock. The old board sued and, after it lost its case in a state court, obtained the services of Daniel Webster and appealed to the U.S. Supreme Court. In 1819, the high court ruled that Dartmouth was a "private eleemosynary corporation" and that its charter was a valid contract. It ruled the New Hampshire law reinstating Wheelock a violation of Article 1, Section 10, of the Constitution, forbidding any

state legislation that impairs a contractual obligation. The decision restored the original board to power.

Those who elevate the importance of the case insist that it represented a clear victory of private over public interests and limited the ability of local and state governments to interfere in the operations of private schools and colleges. However, subsequent legislation has so changed the nature of charters that it is questionable whether the *Dartmouth* case has any application in modern society. Moreover, the acceptance of government grants by any college automatically subjects it to a wide variety of government controls that dictate policies over admissions of minority groups, access by the handicapped and a host of other issues.

Davis v. County School Board One of four cases in Kansas, South Carolina, Virginia and Delaware that the U.S. Supreme Court consolidated into the landmark school desegregation decision *BROWN V. BOARD OF EDUCATION OF TOPEKA*.

day care A widely varying program for tending the physical, emotional and intellectual needs of children two to five years old while their parents work. Day-care programs operate as many as six days a week for up to 12 hours a day, in private homes, churches, social service agencies, independent entrepreneurial “nursery schools,” cooperative, parent-owned centers, public and private schools, university campuses and factories and businesses. Because they do not fall under the jurisdiction of state education authorities in most states, operations and conditions vary widely. Some amount to nothing more than baby-sitting services; others offer comprehensive programs that include carefully planned feeding and nutrition programs, organized play and formal instruction to help each child’s physical, emotional, social and intellec-

tual development. Most states require licensing of day care centers; some require staffers to be trained and certified. Of the nearly 100,000 day-care centers in the United States, fewer than 15% are accredited by the National Association for the Education of Young Children. Accreditation, however, is of questionable value, because it is based largely on self-analysis. Only about two-thirds of accredited day-care centers were rated as offering high-quality care by outside researchers, with the rest providing only mediocre care. The quality of nonaccredited day-care centers was even worse, with about 30% of the care offered to infants and 15% of the care offered to children two and a half to five years old rated as harmful. In the most definitive study of the effects of day care, the *ABECEDARIAN PROJECT* in Chapel Hill, North Carolina, found that, regardless of their economic levels, children who received high-quality day care consistently outperformed children who did not, on both cognitive and academic tests. Children who received high-quality day care were also more likely to attend college and hold high-skill jobs in adulthood.

The principle of day care goes back to the 18th century, when some two- and three-year-olds were sent to rural common schools with older siblings while their parents worked in the fields. The practice disappeared in the early 19th century, however, in favor of family care, either by mothers themselves or neighborhood women. Day care as we know it today has its roots in the post-Civil War industrial expansion and the population explosion that took place with the arrival of millions of immigrants. To survive, few families could afford to leave a parent at home to care for young children. Children either stayed with neighbors or relatives, at home with older siblings or roamed the streets. Journalist-author Jacob Riis estimated in 1892 that New York City had a population of 200,000 children under five, of whom half could be found on the streets, unattended. Churches and

charitable organizations responded by establishing the first organized day-care centers—Riis listed 28—but most limited their activities to what Riis called the “soap cure,” that is, physical care, consisting of feeding and bathing the children and keeping them off the streets.

In 1909, the Conference on the Care of Dependent Children opened with President Theodore Roosevelt’s call for direct financial aid—so-called mothers’ pensions—to widows, to allow them to remain at home to care for their children. In 1911, Missouri and Illinois enacted the first legislation providing for such aid, and over the next seven years, 37 of the 48 states followed suit. To receive such pensions, mothers had to provide proof of poverty and be “a proper person, physically, mentally and morally fit to bring up her children.” By 1931, all but Georgia and South Carolina provided mothers’ pensions, and in 1935, the AID TO FAMILIES WITH DEPENDENT CHILDREN portion of the Social Security Act provided federal funds to underwrite state programs.

Although the mothers’ pension movement reduced the need for day care, it also gave rise to its transformation from a physical-care facility to an educative institution—that is, the nursery school. Designed with much wider social, educational and developmental goals, nursery schools not only housed, cared for and fed their charges, they also provided health maintenance services, mental and emotional services, constructive play, lessons in socialization, and such preschool intellectual activities as storytelling, exploring nature, art, music and dance. By 1930, about 300 nursery schools had opened across the United States, and the number increased fivefold after the Federal Emergency Relief Administration (FERA) provided funds to establish nursery schools for needy children. Designed to put unemployed teachers back to work, the FERA program and, later, the Works Progress Administration, sponsored nearly 1,500 nursery schools with an enroll-

ment of nearly 40,000 children. In 1942, the program expanded to allow mothers to take jobs in World War II defense plants. By the end of the war, 2,800 federally financed day-care centers were caring for about 1.5 million children. Although most of them closed after federal aid was withdrawn, the day-care movement had grown so strong that private operators stepped into the breach to provide what by then had become an essential service for American families. In 1964, the U.S. government once again involved itself in day-care as part of its “WAR ON POVERTY.” Asserting that, without equal educational opportunities, the poor would never obtain equal economic opportunities, the government launched a comprehensive program to provide day-care to economically disadvantaged children. Called Operation Head Start, or more simply HEAD START, the program funded establishment of several thousand day-care centers across the United States to provide preschool education to about 750,000 economically deprived children a year. By 1999, nearly 60% of American children under five years of age, from all economic levels, were attending day-care centers, nursery schools or both.

deaf-blind A multihandicapped individual with debilitating auditory and visual impairments requiring special education programs to develop residual hearing and visual skills. There are an estimated 5,000 deaf-blind children in the United States. Although often congenital, deaf-blindness can also be caused by external factors such as rubella.

deafness For young children, a hearing impairment that prevents normal speech development and interferes with normal daily functioning. Deafness may be congenital or adventitious (caused by accidents or illnesses). Children with partial deafness who are classified as hard-of-hearing may, with proper care,

develop normal speech and learn to function normally in every other way.

About 2.2 million of the 17.5 million Americans with hearing impairments are severely deaf, and their education has been the subject of controversy within and without the deaf community for more than two centuries. Until the mid-1500s, the deaf were considered ineducable, and the first schools for deaf children were not established until the 1700s—by Abbé Charles Michel de l'Épée (1712–89) in France and by Samuel Heinicke (1727–90) in Germany. Since then, educators have debated whether deaf children should be educated by l'Épée's manual method, using hand and finger signs, or by Heinicke's oral method, in which they learn lipreading to understand others and learn to speak vocally. The oralists maintain that deafness is a disability that every deaf person should strive to overcome by every means available: surgery, hearing aids, lipreading and learning to speak by sounding out words—regardless of the psychological costs. Supporters of this view, in effect, want to make the deaf hear. The l'Épée "manualists," on the other hand, maintain that deafness is a culture (Deaf culture), which like any culture, has its own language, and that education should center on mastery of that language. Called AMERICAN SIGN LANGUAGE, the language of the deaf in the United States is not a word-for-word translation of the English language, but an independent language with unique syntactical and other grammatical features. If, for example, the signed version of the English language sentence "People mislabel me as disabled" were translated literally into English, it would read: "Disabled, people label me, wrong." There is, of course, a third school of thought that holds with both points of view and sees no conflict in helping the deaf communicate equally well with both the hearing and deaf worlds. Advocates of this broader approach point out that 90% of

severely deaf Americans were born to hearing parents who delayed their children's intellectual development unnecessarily because they lacked skills in raising deaf infants. Educators now urge parents of the deaf to combine all forms of manual and oral methods in communicating with their infants and to enroll their children in specialized all-day parent-child pre-schools by age three at the latest—preferably earlier. Educators themselves now depend on total communication to teach hearing impaired primary and secondary school students. The first school for the deaf was established in the United States by THOMAS H. GALLAUDET, and the college founded in Washington, D.C., in 1856 by his son remains the only liberal arts college for the deaf in the Western world. The National Technical Institute for the Deaf was founded in Rochester, New York, in 1968, to offer technical education.

(See also BELL, ALEXANDER GRAHAM.)

dean's list An honor roll listing the names of students with the highest grade point averages or academic class rankings for a specific marking period, term or academic year.

death education The formal or informal study of death and dying and its effects on survivors. Although an established element in formal, college-level psychology courses, death education as an informal topic has now been integrated into many primary and secondary school health-education programs, beginning as early as kindergarten. Such programs not only explain dying and death as part of the normal life cycle, they encourage students to express their feelings about death—especially the death of loved ones. Death education has gained importance in recent years as schools have expanded their roles in helping children deal with the trauma of natural disasters and the sudden deaths of friends or family by violence or suicide.

debating societies Extracurricular student organizations formed to argue objectively and dispassionately, under strict rules and procedures, the opposite sides of particular issues. Debates usually begin with a moderator's presentation of the issue in the form of a resolution for action—for example, "Resolved, that 16-year-olds be given the right to vote." One or more members of each team, in turn, argue pro or con, and each debater has an opportunity for a rebuttal, all within specific time limits. The moderator eventually polls the audience to determine which team has presented its argument most successfully.

The origins of debating societies go back to 17th-century Oxford and Cambridge universities, where the lecture, the declamation and the disputation formed the heart of the curriculum. HARVARD COLLEGE, America's first institution of higher learning, instituted a similar curriculum as early as 1642. The lecture was a type of oral textbook, which the "master" (teacher) usually presented as a question, followed by a systematic breakdown of the question into its various elements. After dealing separately with each element, he then related each to the other in a way that either supported or undeniably disputed the validity of the original proposition. The goal of declamation and disputation was to teach students to do the same. Harvard devoted one full day of its five-and-a-half-day week during the 17th century to rhetoric, declamations and disputation. Rhetoric taught students graceful speaking skills, and declamations allowed individual students to display their knowledge orally. Disputations pitted groups of students against each other in debate, while the moderator-master supervised the scene and eventually declared a "winner," in a "dismissal speech" that brought an end to the proceedings.

As colleges added foreign language, scientific and engineering courses in the 18th and 19th centuries, rhetoric, declamation and dis-

putation were soon crowded out of the curriculum, and debating, as we know it today, became an extracurricular activity. When intercollegiate athletic competition began in the late 19th century, intellectuals expanded that competition into the academic sphere with intercollegiate debates.

decentralization In education, the ceding of authority over local schools by a central or regional school board to local boards made up of members of the community served by each school.

Decentralization has been a topic of debate in large urban areas, such as New York City, where huge central bureaucracies attempt to control day-to-day operations with a blanket of universal regulations. Far removed from many of the schools they govern, such centralized boards often have little knowledge of the special needs of individual schools and their students. New York City attempted to meet those needs better in 1969, with a decentralization law that created and gave limited power to 31 local school boards. In addition, parents, teachers, foundations and businesses have, since 1991, established more than 1,700 so-called CHARTER SCHOOLS across the United States—publicly funded schools that operate free of all day-to-day controls by centralized district school boards and school board bureaucracies. After nearly 30 years, however, decentralization produced few noticeable changes in student academic performance. Indeed, some local boards in New York and other cities with decentralized educational authority used their newfound authority to engage in corrupt practices such as hiring relatives for staff positions and demanding kickbacks from suppliers of school materials and services. Where they found evidence of corruption or administrative or academic failures, cities, counties and states abruptly dismissed school boards and, reversing the trend toward decentralization, seized control of

failing schools and placed them under the authority of a centrally appointed superintendent and school board.

decile A division of test scores that contains one-tenth of all scores. Thus, the highest decile would contain the highest tenth of all scores obtained by students; the second decile, the second highest, and so on. The decile has no direct relation to actual scores. Thus, the highest decile of test scores might conceivably contain only failing scores.

decision making A critical element of school and college administration that involves the entire process of problem solving. David Griffiths's classic text *Administrative Theory* (1959) defines decision making as a six-step process that begins with recognizing, defining and limiting a problem, then analyzing and evaluating it and, third, establishing methods for evaluating possible solutions. The last three steps involve collecting data, then developing and selecting the preferred solution and, finally, implementing it.

Declaration of Independence The document that, on July 4, 1776, proclaimed the independence of the 13 British colonies in America from England. After its signing by the Continental Congress, the document lost all legal significance, although its high moral tone would echo throughout the "Age of Revolution" that swept across Europe during the next century. Ironically, the lofty ideals expressed in the declaration had somewhat less impact in the United States, where education was expressly omitted from the "inalienable rights" with which the signers declared their Creator to have endowed all men. Although THOMAS JEFFERSON, BENJAMIN FRANKLIN, BENJAMIN RUSH, John Adams and others favored the inclusion of universal education as a basic right for all Americans, southern delegates and their northern support-

ers feared universal education would represent a first step toward women's rights and the MANUMISSION of slaves, and all mention of it was omitted from the Declaration of Independence and, subsequently, from the Constitution.

Declaration of Rights for Women A statement demanding equal rights and justice for women, issued on July 4, 1876, the 100th anniversary of the signing of the Declaration of Independence. Written by Elizabeth Cady Stanton, Susan B. Anthony and other champions of women's rights in the United States, the declaration demanded for women "all the civil and political rights that belong to citizens of the United States." At the time, girls had yet to obtain equal rights to education at the elementary and secondary school levels, and women were barred from all but a few colleges. Although it did not have an immediate impact on women's education, the declaration marked the beginning of the national debate over women's rights that would continue for a century thereafter. By the end of the 19th century that debate had opened up the doors of almost all public elementary and secondary schools to girls, and two decades later opened the ballot boxes to women.

(See also WOMEN'S EDUCATION.)

Declaration of the Rights of the Child A document adopted unanimously in 1959 by the United Nations General Assembly, declaring every child entitled to certain rights, including a name and nationality, adequate housing, adequate health care and education. The document is similar to the Declaration of Geneva, passed in 1924 by the League of Nations.

decoding The "sounding out" of individual letters and groups of letters to form whole words. Mastery of decoding skills is a basic part of phonics and the translation of printed letters and combinations of letters (graphemes) into sounds (phonemes). The ability to decode a

word, however, does not necessarily produce word comprehension.

(See also PHONEMES; PHONICS.)

deductive approach A system of reasoning or logic that arrives at specific, logical conclusions on the basis of one or more general premises. Based on Aristotelian syllogisms, the deductive approach usually begins with a major proposition, for example, Every human being has a head, two arms, two legs and walks erect, and a minor proposition, The being in the house next door has a head, two arms, two legs and walks erect. From the two propositions, the following conclusion can be logically deduced: The being in the house next door is a human being. Deductive reasoning, however, is only as accurate as the propositions on which it is based, and as in this example, it does not necessarily reach a factual or accurate conclusion. The example cited does not take into account that there are other beings that would fit the description and that not every human being has two arms and two legs.

The opposite of deductive reasoning is inductive reasoning (see INDUCTIVE APPROACH), in which general principles are derived from specific observations, as in laboratory experiments. The teaching of deductive and inductive reasoning are basic to elementary school education.

de facto segregation In education, segregation of students according to race, religion, gender, ethnicity or some other criterion, occurring by custom and not by government fiat or laws. De facto school segregation can occur because of the racial, religious or ethnic makeup of the population in a community whose school draws only children from that community. TRACKING, or grouping students in classrooms according to academic achievement, can produce de facto segregation of classes in an otherwise integrated school. Many American communities have attempted to end de facto

segregation of schools by BUSING children out of their own neighborhoods.

(See also AFRICAN AMERICANS, DE JURE SEGREGATION, DESEGREGATION, SEGREGATION.)

Defense Activity for Non-Traditional Education Support (DANTES) A broad U.S. Department of Defense program that provides support for traditional and nontraditional educational activities for all U.S. military personnel. Created in 1974 as a replacement for the UNITED STATES ARMED FORCES INSTITUTE, DANTES is part of a vast Independent Study Support System that coordinates more than 7,000 independent, off-campus courses offered by accredited colleges and universities to service personnel working toward college degrees. DANTES also coordinates the work of the SERVICEMEN'S OPPORTUNITY COLLEGES that provide special two- and four-year college programs for service personnel. DANTES also administers a wide variety of standard examinations, including ACTs, SATs and GEDs and various examinations for certification in a wide range of specialized trades and occupations, such as medical technicians, computer programming, and so on.

DANTES maintains a complete recording and reporting system, with standard academic transcripts, for all student academic records, and it develops a wide range of nontraditional educational programs for service personnel on duty in isolated areas lacking other educational opportunities.

Defoe, Daniel (1660–1731) English journalist and author, whose *The Family Instructor* (1715; first colonial edition, 1740) was widely used in the colonies by parents to teach their children religious practices and prayers, in areas that lacked such instruction. With the development of academies in the late 17th and early 18th centuries, Defoe's novels (including *Robinson Crusoe*, and *Moll Flanders*) became a standard part of the literature curriculum.

degree A title usually awarded by colleges and universities to signify successful completion of extended studies in a particular subject or combination of subjects. The four types of degrees conferred in American colleges and universities are the associate, bachelor's, master's and doctoral degrees. Unrecognized outside North America, the ASSOCIATE DEGREE is most commonly conferred upon graduates of community and junior colleges, following completion of a two-year course of study, although similar offerings are available at some four-year institutions. Most four-year colleges, however, award BACHELOR'S OR BACCALAUREATE DEGREES, following four years of study in a wide variety of subject areas such as the arts (bachelor of arts, or B.A.), science (bachelor of science, or B.S.), literature (B.LL.), divinity (B.D.), etc. Degree recipients with exceptionally high grade-point averages may receive special commendations representing different levels of "praise": cum laude, "with praise"; magna cum laude, "with great praise"; and summa cum laude, "with highest praise."

The MASTER'S DEGREE is granted after one or two years of graduate school, studies in a subject area or combination of studies and may require the writing of a thesis. Like the bachelor's degree, master's degrees are awarded in the arts, sciences and a wide variety of other subject areas. The DOCTORATE, or highest degree level is awarded after two to five years of post-graduate work and almost always requires the writing of a thesis and completion of comprehensive oral as well as written examinations.

Degrees were first awarded in the earliest, medieval universities in Europe, to differentiate between student novitiates, bachelors or licentiates (with enough knowledge to serve as tutors), masters (who were certified to teach) and doctors (with the highest credentials in their subject area). Only doctors were certified to practice as well as teach their profession. In many European countries where governments

still control universities, a doctorate still entitles its recipient to practice such professions as medicine and law. In the United States, however, a doctorate only reflects academic attainment, and doctors of medicine (M.D.) and jurisprudence (J.D.) and other professionals must pass state or national qualifying examinations to obtain licenses to practice.

Each year, U.S. colleges and universities grant nearly 600,000 associate degrees, more than 1.2 million bachelor's degrees, about 350,000 master's degrees and about 40,000 doctoral degrees. Degrees are awarded in more than 30 broad areas of study from agriculture to zoology and more than 500 specific subjects.

degree (or diploma) mill Any organization that sells diplomas and degrees without requiring completion of standard high school, college or university courses and appropriate demonstration of academic competence. Degree, or diploma, mills usually have no campuses or classrooms and are unaccredited by any of the recognized educational ACCREDITATION agencies. Often run by charlatans working out of temporary offices, degree mills have no admissions requirements and produce "diplomas" available at far less cost at any print shop. Degree mills charge from \$100 to \$5,000 to mail a variety of worthless high school diplomas and bachelor's, master's and doctoral "degrees." Many degree mills claim status as schools of theology and ordain their "graduates" as ministers in nonexistent churches.

Although federal and state agencies have closed hundreds of illegal degree mills and imprisoned many of their operators for fraud, most are difficult to prosecute because their victims are eager participants in the scheme. Only when a victim is accused of presenting fraudulent credentials from a degree mill do authorities ever obtain an opportunity to prosecute the degree mill operator. In 1985, a congressional investigation committee estimated

that at least 500,000 Americans, including 40,000 practicing physicians, held fraudulent diplomas from degree mills. At last count, according to *Bear's Guide to Earning Non-Traditional College Degrees*, there were more than 350 degree mills selling fraudulent diplomas and degrees. The number does not include untold hundreds of fraudulent "Bible" colleges that sell theological degrees and certificates of ordination for as little as \$5.

Although some degree mills are located abroad, the vast majority operate from the United States, many with names similar to those of recognized institutions. Examples have included Clemson College, Colgate College, Columbia School, Dartmouth College, De Paul University (France), Oxford College of Arts and Sciences, Southern California University and Texas University. Most degree mills are difficult to prosecute because few remain at the same location for more than a year or two before moving to a different state and setting up operations under a new name. To prevent fraudulent use of degree-mill "credentials" on job and other applications and on résumés, the U.S. DEPARTMENT OF EDUCATION now maintains a list of nearly 7,000 institutions that participate in federal student-aid programs and are accredited by one or more ACCREDITATION ASSOCIATIONS or agencies recognized by the department.

Degrees of Reading Power A test developed for the College Board and the New York State Education Department to measure critical reading skills of school children. Required in all New York State public schools, the test consists of five- or six-paragraph stories appropriate for readers in each grade level. Each paragraph contains one or more missing words and a list in the margin of the page with possible choices for each missing word. The reader must pick the most appropriate word that fits into the context of the story.

de jure segregation In education, the segregation by law of students according to race, religion, gender, ethnic group, academic achievement or any other criterion chosen by lawmakers or state education officials. Segregation laws of some kind existed in most American states until 1954, when the U.S. Supreme Court declared racial segregation unconstitutional. Subsequently, the federal government and almost all state governments have passed laws ending all de jure segregation except so-called TRACKING, which segregates students on the basis of academic skills.

Delaware One of the original 13 colonies and the first state to ratify the U.S. Constitution. Education was slow to develop in Delaware, although the state appropriated some funds for private charity schools in 1817. The state established a form of public education for white children with the passage of the Free School Act of 1829, with provisions of some state funds to schools in districts that taxed themselves. Black children were excluded, however. Delaware schools remained inadequate until 1897, when a new state constitution created a state public school system for all children, including a "separate but equal" system for black children. Compulsory education laws, however, were not passed until 1907, when the state required all children to attend school three months a year.

Delaware public schools remained far below average until 1921, when a new state code provided for school funding with state taxes and required a college degree for teacher certification. By 1930, compulsory universal education was the rule in Delaware, although black children remained segregated in their own schools. Although separate, blacks were far from equal, and in 1948, only two black

schools had a 12th grade. The 1954 U.S. Supreme Court ruling in *BROWN V. BOARD OF EDUCATION OF TOPEKA* forced Delaware to begin desegregating its schools, but some counties fought integration for more than two decades. In 1978, however, the task was completed when a state court ordered New Castle County, in the northern part of the state, to transport children across former district lines and integrate all its schools. Delaware has about 200 public elementary and secondary schools with about 115,000 students, of whom 40% are minority children and about 8.5% live in poverty. Student academic proficiency is slightly above average for the nation. Delaware has two public four-year institutions of higher education and three two-year public colleges. It has four private four-year colleges and one private two-year college. Enrollment at four-year colleges is 42,000, with an exceptionally high graduation rate of 64.4%.

dentistry education A four-year course of postgraduate study leading to a D.D.S. (doctor of dental surgery) or D.M.D. (doctor of dental medicine) degree. Like other professional degrees, holders of the D.D.S. and D.M.D. must pass licensing examinations before they can practice their profession. Although dentistry itself dates back to ancient Greece and Rome, most practitioners learned their skills through an apprenticeship system until 1840, when the world's first dental school, the Baltimore College of Dental Surgery, was established in Baltimore, Maryland. With the simultaneous founding of the American Society of Dental Surgery, the conversion of dentistry into a profession had begun, and by the end of the 19th century, most leading medical schools had added schools of dentistry. Dentistry education has expanded to include eight specialties: oral surgery, orthodontics (correction of tooth positioning), prosthodontics (replacing missing teeth), periodontics (gum and bone diseases), endodontics (root canal

work), pediatric dentistry, oral pathology and public health dentistry.

In addition to professional work, there are specialized technical areas of dentistry that do not require dental school education. Dental hygiene, for example, requires only a two-year associate degree from one of the nearly 200 schools of dental hygiene accredited by the Commission on Dental Accreditation of the American Dental Association. Graduates must pass a written and clinical examination to obtain a license to practice. A second technical area requiring only an associate degree is the production and repair of dental fittings and appliances.

departmental organization An administrative arrangement of school, college and university academic operations into separate, autonomous departments based on subject areas, for example, English, mathematics or physical education. Each department is usually headed by a department chairperson (large departments may have assistant chairpersons) who, in addition to fulfilling teaching responsibilities, is responsible for curriculum development, class scheduling and promoting intra- and interdepartmental cooperation. A chairperson also serves as a liaison between department faculty members and the school or college administration to whom the chairperson is ultimately responsible.

Although still rare in elementary schools, departmental organization of secondary schools and colleges developed toward the end of the 19th century as curricula expanded to include higher mathematics and sciences and left few teachers competent to teach all subjects to all ages.

Department of Education Organization Act A 1979 act of Congress creating the U.S. DEPARTMENT OF EDUCATION as a cabinet-level department to administer almost all federal

programs relating to education. Prior to its creation, the department had been a part of the Department of Health, Education and Welfare.

dependents' schools A system of elementary and secondary schools maintained by the federal government for minor dependents of U.S. military and civilian personnel stationed overseas. Once operated by the Department of Defense, the schools were turned over to the U.S. Department of Education and staffed by civilian personnel after the creation of that department in 1979.

deregulation In education, the transfer of authority from district and state boards, bureaucracies and political leaders to local school administrators and faculties. School-based authority has been a subject of controversy since the first public schools opened in the early 19th century. The controversy has smoldered or raged, depending on the particular era, and no topic has fired its flames more than the religio-centric issues of prayer in school and the teaching of evolution. The primary issue underlying deregulation centers on the rights of parents and communities to exercise control over the education of their children. Put another way, it concerns the right and obligation of professional educators in tax-supported schools to teach children truths that controvert the beliefs of parents. The issue has been resolved in nearly as many ways as there are states—largely because the U.S. Constitution leaves the conduct of education to the individual states.

The U.S. Supreme Court has interceded in some areas by expressly banning as unconstitutional all prayer in public schools (see PRAYER IN SCHOOL), along with the teaching of "CREATION SCIENCE" based on biblical recounts of the Earth's formation and the creation of man. The executive branch of the U.S. government also interposed itself in local education in 1975,

with passage of the federal Education for All Handicapped Children Act (later renamed the Individuals with Disabilities Education Act), which guaranteed access of handicapped children to all public schools and forced schools and colleges to obtain federal funds and work with federal inspectors to provide BARRIER-FREE CAMPUSES. Apart from introducing religious instruction, however, the states have the right to exercise as little or as much control over schools as they choose. Some states such as Texas allow a central school board in the state capital to determine all textbooks and lesson plans to be used in every classroom in the state. Others give local district school boards those powers.

Under deregulation, district boards with the power to do so delegate to on-site school administrators and to teachers themselves the authority to determine the curriculum, select textbooks, discipline students, promote or retain students and hire and evaluate teachers. In effect, deregulation in the public school sector represents a variation of administrative systems at private schools and colleges, where most administrative authority is vested in professional educators. Boards of directors at private institutions concern themselves primarily with fund-raising and broad policy decisions affecting academic goals and turn education over to professional educators.

In a typical American public school district, an elected board of education has the authority to micromanage operations at every school within the district. It usually does so through a staff of appointed bureaucrats who may or may not have any background in professional education and whose salaries absorb funds that might otherwise flow directly into education. Costs of noneducative, school board bureaucracies often elevate per-pupil public-school education costs to twice the levels of academically superior private schools. According to U.S. Department of Education studies, most academically superior public schools are

now deregulating or have already done so. Most such schools tend to be in districts with populations at the upper end of the economic and academic achievement scales. However, more than 1,700 communities across America—rich and poor—established so-called CHARTER SCHOOLS, which, while remaining public, are free of all day-to-day controls by district superintendents of schools, elected school boards and local department of education bureaucracies. U.S. Department of Education studies indicate that dispensing with central bureaucracies allows school districts to channel more funds into instruction and pay above-average salaries that attract more effective teachers. The department found, however, that most effective teachers insist on participating in decisions that effect their work and on reasonable autonomy in carrying out their responsibilities. In turn, students perform better and are more attentive in schools where they know their teachers have authority and are indeed in charge. Academic quality also improves because authority over education is in the hands of those who know the students best and can tailor educational decisions to individual needs.

derived score A numerical score based on converting raw scores into a more understandable norm that reflects average performances for a larger population group. Examples of derived scores include AGE-EQUIVALENT scores and GRADE-EQUIVALENT scores. If, for example, the average eight-year-old obtains a raw score of 85 correct answers out of 100 on a specific test on the first day of fourth grade, the derived grade equivalent score would be 4.0, and any child who, regardless of grade level, obtains a raw score of 85 on the same test would obtain a derived score of 4.0.

deschooling A philosophy of education enunciated by Roman Catholic educator and cleric Ivan Illich (1926–) in his 1971 work

Deschooling Society. The Austrian-born Illich criticized traditional schooling as a rigid instrument of indoctrination and domination that prepared students for specific places in the social order of their societies without ever opening their minds to the possibilities of uninhibited learning. As founder and head of the Center for Intercultural Documentation in Mexico, Illich was one of a number of Latin American clerics concerned with enlarging and improving national school systems for the poor in less developed nations.

Many of his ideas took hold in the United States, where African-American civil rights leaders saw the same pedagogical forces described in poor nations at work in the failure of American inner-city schools to reach many poor minority children. Those espousing deschooling called for an end to traditionally rigid, institutionalized schools as we know them and the introduction of new approaches to education based on learning from real life and a wide variety of mentors. Among the proposals were an end to obligatory, graded curricula and the establishment of skill centers where useful skills can be learned. At the heart of the deschooling philosophy was the contention that only the rigidity of adult beliefs and teaching conventions stand in the way of a universal need and desire to learn among all children of all ages. Critics contend this is a naive perception of children, who, at every age, may be subject to important drives that are unassociated and may interfere with the acquisition of formal education.

desegregation The abolition of barriers that separate people by race, religion, ethnicity, gender or any other criterion. Until 1954, most American schools and many other public facilities were segregated by race—by law (de jure) in most southern, southwestern and border states and by custom (de facto) in the rest. In 1954, however, the U.S. Supreme Court ruled

in *BROWN V. BOARD OF EDUCATION OF TOPEKA* that segregated schools were inherently unequal and therefore violated the Constitution by discriminating against a particular class of citizens. The decision marked the beginning of the end to de jure SEGREGATION.

Desegregation did not—and, indeed, does not—mean INTEGRATION. Although desegregation removed all barriers to integration, Americans retained and continue to exercise the right of free association, and the vast majority of whites and AFRICAN AMERICANS in the United States continue to live and attend school in communities where their own races make up the majority of the population. Indeed, in 2000, more than 67% of all black children were attending schools where less than half the students were white, and almost 75% of all Hispanic children were attending schools with predominantly minority students. About one-third of all black children attend schools that are all but completely segregated, with fewer than 10% whites in attendance.

(See also CIVIL RIGHTS ACT OF 1964; INTEGRATION; SEGREGATION.)

detention A punishment that forces children to remain in class under supervision during a period when the children would normally be free for nonclassroom activities. Depending on the individual child's availability, detention may be assessed at the end of the regular class period, at the end of the school day or on Saturday morning, for whatever length of time the school authorities deem appropriate penance for the child's misconduct. Children may be told to do schoolwork during detention or assigned special tasks involving extra academic work or school maintenance chores.

Detroit Tests of Learning Aptitude A series of individually administered tests to determine a student's strengths and weaknesses among various learning abilities. Available in

formats for children three to 18 years old, the tests last from 15 to 45 minutes for children three to nine years old and 50 to 120 minutes for older children. Administered on a one-to-one basis by a psychologist, special education diagnostician or speech/language pathologist, the tests help identify weaknesses in a student's intellectual abilities and permit the school to provide appropriate compensatory education.

The tests use 11 subtests to measure each of four domains of learning aptitude: linguistic, cognitive, attentional and motoric. The tests in each domain include word opposites (the student gives antonyms for words pronounced by the examiner); sentence imitation (student repeats sentences of increasing length and complexity pronounced by the examiner); oral directions (students mark pictured objects named by examiner); word sequences (student repeats series of unrelated words pronounced by examiner); story construction (student tells a story about each of three pictures); design reproduction (student reproduces increasingly complex geometric forms from memory); object sequences (student must recall a series of pictured objects in the order of presentation); symbolic relations (student completes a design pattern by selecting the correct pattern from four choices); conceptual matching (student associates a stimulus picture with one of ten other pictures to demonstrate a concept); word fragments (student reads aloud a list of words, each printed with missing letters); letter sequences (student writes from memory a sequence of letters seen and then withdrawn from view).

Detroit X-Y-Z Plan An ability-grouping program introduced in Detroit, Michigan, public elementary schools in 1919, assigning children to one of three classes in each grade according to their scores on intelligence and achievement tests. The program was the first system-wide TRACKING introduced in American public schools.

developmental age The behavioral characteristics associated with a particular chronological age. Somewhat less precise than either mental age or chronological age, ratios of which are used to determine intelligence quotient, developmental age relates strictly to a person's maturity as exhibited in his or her normal behavior. Many five-year-olds behave like six-year-olds and vice versa, regardless of their mental ages, and the developmental age of any given child can change rapidly, especially during preschool and early school years. For that reason, many schools consider and use developmental age as a more effective basis for admitting and placing children in appropriate grades. Because of wide differences and variability of developmental ages during preschool years, many schools offer a prekindergarten or, as it is often called, a DEVELOPMENTAL KINDERGARTEN, for a mixed-aged grouping of four- and five-year-olds not yet developmentally ready for the academic rigors of standard kindergarten. There is a wide variety of tests to measure developmental age and determine developmental deficiencies, including the Gesell Institute's Developmental Examination (New Haven, Connecticut) and the Denver Developmental Screening Test (Ladoga Publishing Foundation, Denver, Colorado). Most tests measure social skills, visual discrimination, visual memory, auditory memory, eye-hand coordination, motor skills and body sense. To measure social skills, most tests use an informal interview in which the child is asked to talk about his age, family, pets, toys and opinions and define words. Visual discrimination is measured by asking the child to match like objects and letters. The tests measure visual memory by asking the child to reproduce a pattern with blocks, and auditory memory by asking him or her to recall and repeat a series of numbers. Auditory memory and ability to follow directions are also measured by asking the child to perform a series of actions, for exam-

ple, clap hands, touch one shoe and walk to the window. Eye-hand coordination is measured by asking the child to copy simple geometric shapes or balance a tower of blocks. The test of motor skills and body sense check the child's ability to identify parts of the body and follow simple commands to hop on one foot, walk along a line and jump five times.

developmental kindergarten A prekindergarten class designed for five-year-olds whose DEVELOPMENTAL AGE is lower than their chronological age and does not permit them to deal with the academic rigors of standard kindergarten classes. Less academically oriented, developmental kindergarten is designed to teach students mature behavior and, by the end of the year, rejoin their more mature peers in first grade.

developmental reading An individualized approach to reading instruction whereby each student is taught to read at his or her maximum ability, regardless of the levels reached by other students. Under developmental reading programs, reading skills are broken down into their essential elements, and each child is taught each skill in sequence. The program provides diagnosis, remediation and appropriate reading materials for students with development deficiencies, while at the same time it provides appropriate materials to allow abler students to accelerate.

(See also READING.)

developmental theories Any of a wide variety of theories that children pass through a fixed series of definable and measurable physical, mental, emotional and behavioral stages as they evolve from infancy to adulthood, with each stage associated with both chronological age and experience. The first and most renowned developmental theorists, whose works continue to influence education, were JOHN DEWEY, Sigmund Freud and JEAN PIAGET.

development office A division of a school or college's fund-raising program specifically concerned with soliciting large capital gifts, as opposed to annual solicitations. Usually headed by an appointed development officer, the development office tends to limit solicitations to the wealthiest graduates, major foundations, corporations and wealthy individuals with interests that relate to the school's or the college's programs. Development officers usually seek multimillion-dollar gifts needed for new buildings, major renovations or endowment funds to provide permanent financing for professorships or scholarships.

deviation I.Q. The amount by which any INTELLIGENCE QUOTIENT score may vary from the mean and remain tantamount to the mean. Thus, 100 is the mean, or average, I.Q. score of test takers on the Stanford-Binet I.Q. test, but on any given test, so many otherwise average test takers obtain scores that vary in both directions from the mean that they may, for statistical and practical purposes, be considered average. The term *deviation I.Q.* is used to express this variability or standard deviation (s.d.) from the mean. In the case of the Stanford-Binet I.Q. test, the mean is 100 and the standard deviation is about 16, which means any score between 84 and 116 may be considered average. The deviation I.Q. would be expressed as: mean = 100, s.d. = 16.

Dewey, John (1859–1952) American educator, psychologist, philosopher and social critic who revolutionized education and teaching methods in the United States. The father of PROGRESSIVE EDUCATION, Dewey discovered that children learned more and at quicker rates when teachers encouraged their natural curiosity instead of subjecting them to the rigid discipline and corporal punishment of traditional 19th-century classrooms. Using games and various forms of play as vehicles for teaching,

John Dewey (Library of Congress)

Dewey produced educational results that brought him world renown and formed the basis of modern 20th-century educational methodology.

Born in Burlington, Vermont, he earned a B.A. at the University of Vermont and a Ph.D. at Johns Hopkins University. He spent the next 10 years teaching philosophy and psychology at the University of Michigan, where he met his future wife, Harriet Alice Chipman, a brilliant social activist who inspired his deep interest in such social reforms as women's suffrage, compulsory universal education and an end to child labor. Dewey combined his teaching at Michigan with advanced studies in philosophy and in the then-new science of child psychology. While many scoffed at the new science,

Dewey found it to be the missing link for his revolutionary new theory of education, namely, that children learn much the same way as adults, absorbing only that information they need to solve problems they face in real life. Education, he said, was thus not an end in itself but a means for solving problems. In 1894, Dewey moved from the University of Michigan to the chairmanship of the Department of Philosophy at the three-year-old University of Chicago. Two years later, he opened the UNIVERSITY OF CHICAGO LABORATORY SCHOOL, where he put his new theories of education to the test. The school, which soon became known as the Dewey School, served as a model for academically superior schools everywhere in the United States and around the world. It opened with 16 students and two teachers, but within seven years, had grown to 140 students, 23 teachers and 10 assistant teachers, in 12 grades, from preschool through tenth grade. The school assigned each group exciting projects appropriate for their age. The youngest “played” house, learning a variety of tasks such as cooking, sewing, and sawing and nailing wood together to make play furniture, but all the while they were learning the basics of mathematics by measuring, adding and subtracting, and of basic reading skills by following recipes, patterns and plans.

Six-year-olds (first grade) used skills and crafts learned in kindergarten to “build” a farm, using blocks for each of the buildings and planting imaginary crops on a large sand table. By dividing the table into separate fields for different crops, they learned fractions—all, while experiencing immense pleasure “playing.” To the astonishment of the world of education, Dewey’s six-year-olds learned to use measuring sticks to divide the fields into halves and quarters and convert inches to feet, yards, acres, and other units of measurements. They learned volume by counting and measuring bushels. They learned addition and subtrac-

tion, as well as the denominations of money by pretending to take their crops to market to sell.

As their mathematical skills reached what were the third-grade levels, their reading and writing skills kept pace because they needed to make signs to label crops in the fields and bushels for market. They drew elaborate plans to build the farmhouse, barn and stable, labeling each element of the house with properly spelled words, measuring each section carefully to be certain they used the right number of blocks. A wrong measurement or calculation often made the house tilt or sent it falling down. But Dewey believed his students learned as much from their errors as they did by solving problems correctly.

Second graders studied prehistoric life by building make-believe caves (with blocks and huge sheets of paper) and pretending to live in them. At every step, students combined what they read in books with “doing.” Third graders studied early civilizations, while nine-year-olds studied local history and geography. Ten-year-olds studied colonial history and built a frontier log cabin. Dewey introduced the “field trip” to modern education as another teaching tool that captured children’s imaginations. Sixth graders and all the older children worked on more complex projects involving politics, government and economics, and scientific experiments in biology, chemistry and physics. In addition to academics, the children also learned useful skills such as sewing, cooking and carpentry. Dewey called his method learning by indirection because teachers taught everything indirectly. The smallest children simply did what all children do naturally—play by building a make-believe farm; but indirectly their teachers taught them to read, write and calculate, and gave them all the other educational tools they needed to build the farm. “If a child realizes the motive for acquiring skill,” said Dewey, “he is helped in large measure to

secure the skill. Books and the ability to read are, therefore, regarded strictly as tools."

In addition to skills knowledge, the Dewey School taught students to work together and cooperate. Again, through indirection, teachers taught children to govern themselves democratically, with each student contributing to the planning and completion of each project, taking turns as leaders and learning to perform every other student's tasks and substituting for one another. Dewey's goal was to prevent development of gender discrimination and what he called the antidemocratic belief that one person is better or more important than another. Boys learned to cook and spin and sew, and girls learned carpentry, and all learned mutual respect. Dewey's teachers imbued their children with the belief that they were indeed created equal and equally important to the smooth functioning of their miniature democracy. "What does democracy mean," asked Dewey, "save that the individual is to have a share . . . and that . . . through the free and mutual harmonizing of different individuals, the work of the world is better done . . . ?"

Teaching at the Dewey School was more difficult than at conventional schools of the day. Teachers had to be trained in Dewey's methods and child psychology and become knowledgeable in every subject they taught, from sewing and carpentry to physics, music and art. They also had to learn to keep their students excited about learning by seeing the world from a child's as well as an adult's viewpoint. "Like Alice," wrote one of Dewey's teachers, "she [the teacher] must step with her children behind the looking glass and in this imaginative land see all things with their eyes . . . [but] be able to recover her trained vision and from the realistic point of view of an adult supply the guide posts of knowledge and the skills of method." Dewey's students invariably finished the laboratory school two years ahead of their peers in conventional school, an

accomplishment for which he heaped generous praise upon his teachers: "The art of giving shape to human powers," he said, "is the supreme art; one calling into its service the best of artists. . . ." The Dewey Laboratory School became internationally renowned, and its teaching methodology was emulated by hundreds of schools across the United States and around the world. Thirty years later, the Progressive Education Association did an eight-year study of nearly 1,500 graduates of progressive schools in the United States and found that they had done far better at college than had graduates of traditional schools.

Progressive education was the target of considerable criticism both during and after his lifetime because of the public misperception that it promoted permissiveness. Such misperception was largely Dewey's own fault. Although a prolific writer, he expressed his ideas in complex and excruciatingly vague language that allowed for much misunderstanding among those in the practical world of teaching. Many teachers, school administrators and educators misinterpreted Dewey's ideas about learning through play by giving students free rein to play in school with inadequate teacher guidance or discipline. Dewey was, however, a firm believer in strict behavioral controls and close teacher supervision—and appropriate punishment when necessary. He also believed strongly that every child should learn "the basics" of good education—reading, writing, arithmetic, grammar, literature, advanced mathematics, history, foreign languages, the sciences, art and music. Dewey's system of progressive education did not, in other words, change *what* children learned, only *how* they learned it. Instead of fear, he substituted personal discovery as the basic method of teaching and learning. He called it "purposeful learning" and "learning by doing."

Dewey taught American teachers to tie knowledge to student interests and needs

instead of forcing students to memorize isolated facts. He taught them to become partners with students in education and to rely on mutual trust instead of fear and intimidation. He led American education into the 20th century and helped it evolve from a cruel form of breaking children's wills into a way for them to grow and reach their full potential.

In 1904, the University of Chicago was unable or unwilling to provide enough money to keep Dewey's school going, and it closed. Dewey resigned and in 1905 he became professor of philosophy at Columbia University, in New York, where he remained for the rest of his life. He was never again so directly involved in elementary or high school teaching, but he nevertheless helped train thousands of teachers at Columbia's Teachers College. In the course of his Columbia career, he also took several leaves of absence to help such nations as Japan, China, Turkey and Mexico establish public school systems and teacher training schools. A tireless worker for social reform, civil rights and the right of workers (including teachers) to belong to labor unions, Dewey wrote hundreds of articles and books on every imaginable subject, including philosophy, psychology, politics, religion and art—enough to fill 37 volumes.

Dewey helped found the New School for Social Research in New York City, in 1919, and, in 1933, the "University in Exile" at the New School, which helped rescue nearly 200 European scholars from the Nazis. It was later officially renamed the New School Graduate Faculty of Political and Social Science. Dewey also helped found the American Association of University Professors and the first teachers' union in New York City. He was honorary president of the National Education Association, the largest teachers' organization in the United States.

His work to promote international peace and outlaw war (Dewey said war killed more children than it did soldiers) led to the 1928 signing of the Kellogg-Briand Pact, which con-

demned war as a way of solving international arguments.

After the death of his wife in 1927, Dewey, then nearly 70, applied for retirement from Columbia. Stunned by the possibility of losing him, the university rejected his resignation and appointed him its first Professor Emeritus, on full salary, with no teaching obligations. Free to come and go as he pleased, he spent most of the next 10 years advising graduate students and busied himself writing about and working for social reform and world peace.

In 1951, he finally retired from Columbia, after 47 years, but public celebrations of his 80th and 90th birthdays kept him in the limelight until his death from pneumonia, in 1952, at the age of 92. His writings, papers and memorabilia are housed in the Center for Dewey Studies at Southern Illinois University at Carbondale.

Dewey, Melvil (1851–1931) American librarian who developed and published *A Classification and Subject Index for Cataloguing and Arranging the Books and Pamphlets of a Library*. Called the Dewey Decimal or Classification System, it was the first logical, comprehensive, easy-to-use system that permitted indefinite expansion of library holdings. It is now used almost universally by libraries throughout the English-speaking world.

Born in upstate New York, Dewey graduated from Amherst College in Massachusetts in 1874. While an undergraduate, he worked in the Amherst library and continued his work there for two years after graduating. In 1876, he published his system and left Amherst for Boston to help found and organize the first meeting of the American Library Association. He remained its secretary until 1890 and later served two terms as president. During his secretaryship, he and publishers Richard R. Bowker and Frederick Leypoldt founded the *Library Journal*, with Dewey as editor. In 1883,

Melvil Dewey (*Library of Congress*)

he was appointed librarian at Columbia College, in New York, where he founded the School of Library Economy, the first training school for librarians in the United States. In 1888, he was appointed director of the New York State Library in Albany. He moved his training school to the state capital, where it eventually became part of the state educational system and was renamed the State Library School. While in Albany, Dewey became secretary and treasurer of the Board of Regents of the University of the State of New York and state director of libraries, which he transformed into the nation's most efficient system. He helped found the nation's first system of traveling libraries and, in 1890, he founded the Association of State Librarians. He was a pioneer in winning for women librarians full and equal status with men. In 1906, he retired from public life and became involved in the development of resort properties in New York and Florida.

Dewey Decimal (Classification) System

The standard, most widely used method for classifying publications in libraries throughout the English-speaking world. First published in 1876 by its creator MELVIL DEWEY, the system divides all knowledge into 10 classes, each of which is assigned a 100-number span, with the first digit referring to the class of books, the second to one of 10 subclasses, or "divisions," and the third to one of 10 subdivisions or sections. The number spans for the 10 classes are 000–099, General Works (chiefly reference works and periodicals); 100–199, Philosophy and Psychology; 200–299, Religion and Mythology; 300–399, Social Sciences; 400–499, Philology and Language; 500–599, Natural (pure) Sciences; 600–699, Useful Arts and Technology (including such professions as medicine, in addition to agriculture, business, industry, and so on); 700–799, Fine Arts (including sports and recreation); 800–899, Literature; and 900–999, History, Biography, Geography and Travel. The second digit of the three-digit span refers to the division. Thus, within the 800–899 Literature classification, 810 refers to American literature, 820 to English literature, 830 to German literature, and so on. The third digit in the three-digit classification span, in turn, refers to the section within each division. Within the 810–819 American literature division, 811 refers to American poetry and 813 American fiction. To each three-digit classification, a decimal point may then be added with one or more digits that further divide, refine and help identify each type of book by chronology, form, geography or author. Thus, 813.4 refers to American fiction from 1861 to 1900, while 813.46 refers to books by or about American novelist Henry James.

Originally published in a 42-page booklet, *A Classification and Subject Index for Cataloguing and Arranging the Books and Pamphlets of a Library*. The Dewey Decimal System was revised and enlarged 19 times in the century after Dewey

created it. The 1979 revision required three volumes. Although public libraries as well as most small school libraries continue to use the Dewey Decimal Classification system, many academic and research libraries began adopting the LIBRARY OF CONGRESS Classification System in the 1920s. Because of its orientation to large research collections, the Library of Congress gradually replaced the Dewey system in most college and university libraries. Although both classification systems continue to provide access to older collections, computerization and access to bibliographic records via the Internet has rendered both the Dewey and Library of Congress classification systems obsolete for newer collections.

(See also INTERNET; LIBRARY.)

diagnostic-prescriptive teaching A teaching strategy designed to meet the individual needs of students with learning or behavioral problems. The diagnostic segment of the program begins with psychological and academic achievement tests and a complete review of the student's case history. Depending on the evaluation that follows, the prescriptive segment may draw on a wide variety of teaching resources and professional and nonprofessional services. At the classroom level, simple physical rearrangement of the classroom to promote more intimate student-teacher interaction, for example, often spurs some children to perform more effectively. Others may require behavior modification, mastery teaching (see MASTERY LEARNING) or other specialized teaching methods.

In almost all diagnostic-prescriptive teaching, the teacher depends on a large team of cooperative professionals and nonprofessionals to work with each individual, including other school staffers, the school or a nonschool psychologist, remedial and resource teachers, and parents.

diagnostic tests Any of hundreds of written or oral examinations that measure and pin-

point a student's intellectual or academic strengths and weaknesses. Designed to help teachers determine whether a student needs remediation, diagnostic tests can prove unreliable with young children because of wide variations in rates of intellectual development. A six-year-old measured as deficient in mathematical skills, for example, may, within three months, "outgrow" such deficiencies through normal development. Diagnostic tests can, however, serve as important warning signals of impending deficiencies and are essential monitoring devices in the average classroom. The most widely used are those that measure reading and arithmetic skills, such as the Iowa Test of Basic Skills and Stanford Achievement Test.

diagramming sentences A once-common method of teaching grammar by breaking down the parts of a sentence and visually displaying them in diagrammatic form to display syntactical relationships. On a central horizontal axis, the student displayed the subject, verb and object of the verb, each separated by a short vertical line. Beneath each, the student listed all modifiers and modifying phrases, as shown below:

boy/	drops	book
<u>/the</u>	<u>/on/floor</u>	<u>/the</u>
	<u>/the</u>	

Widely used during the first half of the 20th century, the practice all but disappeared in the 1960s after research indicated that diagramming did little to improve student writing skills or understanding of syntax.

Dial-A-Teacher A voluntary program designed to encourage parents to help their children with homework by providing a telephone "hotline" at school that parents can call to obtain homework assignments and to get

help in solving academic problems they do not understand.

dialectic method A method of teaching that relies on disputation or argumentation, with one or more students (or the teacher) taking opposite points of view on an issue in an effort to come to a logical conclusion. Derived from the SOCRATIC METHOD found in the works of Plato, the method was refined by German philosopher Georg Wilhelm Friedrich Hegel (1770–1831), who believed that every thesis implies its own contradiction or antithesis, and that their conflict eventually ends in a synthesis, which in turn becomes a thesis that implies its own antithesis. This dialectical process ultimately leads to absolute knowledge, though Hegel, unlike Socrates, did not conceive of the methods as *eo ipso* didactic.

DIBELS ("dibbels") An acronym for Dynamic Indicators of Basic Early Literacy Skills, a set of tests to screen students in kindergarten and grades 1, 2 and 3 for potential reading problems and to monitor reading progress. Developed by researchers at the University of Oregon, the short DIBELS test is administered annually to determine whether schools receiving grants from the \$1 billion-a-year federal READING FIRST program are making progress in raising student reading proficiency to grade level. Test data not only identifies students at risk of failure but also identifies and holds responsible the schools that are putting those students at risk. Easy to use, reliable and valid, DIBELS measures skills such as letter naming, letter-sound recognition, "sounding out" syllables and words, and read-aloud fluency. Some critics contend that speed of reading—especially so-called nonsense words—does not measure comprehension, but researchers insist that students ability to decode and pronounce nonsense words is a valid predictor of whether they will ultimately develop reading difficul-

ties. Adopted under the NO CHILD LEFT BEHIND ACT—itself a 2001 revision and reauthorization of the ELEMENTARY AND SECONDARY EDUCATION ACT OF 1965—the Reading First program is designed to introduce skills-based reading instruction in struggling and failing schools. Although DIBELS is but one of many evaluation tools, more than 8,200 schools in 2,600 districts across the United States—about one-third of all school districts—were using the program in 2005 at cost of \$1 per student.

SOUNDING OUT

(Students in kindergarten and third grade sound out these nonsense words in the DIBELS test to measure their skills in decoding letters and syllables.)

"Dick and Jane" books A series of first readers, almost universally used by American elementary schools during the first half of the 20th century. Written by educator WILLIAM SCOTT GRAY, the Dick and Jane books were a precursor of programmed instruction in that they were made up of simple, progressive "building blocks" of reading and understanding skills: "This is Jane"; "See Jane run"; "Run, Jane, run"; and so on.

Gray was on the faculty of the University of Chicago from 1914 to 1950 and was dean of the College of Education from 1917 to 1931. An active researcher in reading instruction and author of about 500 books, articles and research reports, he was founder of the International Reading Association and coauthored dozens of basic readers for elementary school children. All, however, fell into disfavor after the 1950s because of the sheer boredom they induced. Responding to children's need for more action in the stories they read, teachers turned more and more to children's literature as basic readers, and Dick and Jane have all but passed from the American literary scene.

Dickinson, Jonathan (1688–1747) American clergyman, school master, and founding president, in 1747, of the COLLEGE OF NEW JERSEY, in Elizabethtown. The college later moved to Nassau Hall in Princeton, New Jersey, and eventually became Princeton University.

Born in Massachusetts, Dickinson graduated from YALE College in 1706, studied theology and became minister of the Presbyterian Church in Elizabethtown (later Elizabeth), New Jersey, where he remained the rest of his life. Like many residents of the area, Dickinson was eager to found a "seminary of learning" in the Middle Colonies, and with the help of three fellow pastors and three influential laymen, he obtained a royal charter for the college in 1746. Unlike the charters of its three predecessor colleges in the colonies, HARVARD, the COLLEGE OF WILLIAM AND MARY and Yale, Princeton's founding charter made no reference to any religious faith or denomination. From its beginnings, the college was open to students of all beliefs, so that ". . . those of every religious denomination may have free and equal liberty and advantages of education. . . ." Classes began in Dickinson's parsonage with eight students in May 1847, and he died eight months later of pleurisy.

dictionary A published, alphabetical compilation of words in a language that gives their meanings, spellings, pronunciations, syllabifications and, often, etymologies. Derived from the Latin word *dictio*, or "word," dictionaries date back at least to ancient Nineveh, where the earliest known dictionaries from Assyrian King Ashurbanipal's library consisted of clay tablets with columns of cuneiform.

Dr. Samuel Johnson's great dictionary of 1755 was the standard reference work in the American colonies and the English-speaking world until 1806, when NOAH WEBSTER compiled *A Compendious Dictionary of the English Language*, with 5,000 more words than Johnson's. Although an attorney, Webster had spent several years as a classroom teacher and had written a variety of school textbooks, including a widely used spelling book. A fierce patriot, Webster saw his books—and especially his Americanized dictionary—as a medium with which to bind the people of the new nation together. "As an independent nation," he wrote in 1789, "our honor requires us to have a system of our own, in language as well as government." In addition to the new words—most were American neologisms—Webster's dictionary reformed the English language by creating peculiarly American, phonetic spellings that made it easier for illiterates—adults as well as children—to learn to read, write, spell and speak correctly. He eliminated the *k* in words such as *musick* and replaced Norman-origin spellings in words such as *centre*, *theatre* and *humour*, with phonetic spellings (*center*, *theater* and *humor*).

Webster compiled an even more ambitious dictionary in 1828 to display ". . . a far more correct state of the language. . . ." A massive, two-volume work, *An American Dictionary of the English Language* contained about 70,000 entries and more than 30,000 definitions and descriptions of American laws, customs, ideas and institutions. Webster dedicated his work to the American people, with his ". . . ardent wishes

for their improvement and their happiness; and for the continued increase of the wealth, the learning, the moral and religious elevation of character, and the glory of my country."

In modern education, the published dictionary, while still available for all age groups, is gradually disappearing from most student bookshelves in favor of electronic spelling devices and on-line dictionaries.

didactic teaching A method of instruction that relies entirely on lectures to deliver information in the classroom. Students are expected to listen silently, take notes assiduously and refrain from any classroom discussions. Didactic teaching is usually limited to large college and graduate school classes.

differentiated curriculum A program of instruction that differs from the standard curriculum by including or substituting courses designed to meet special needs. There are seven standard differentiated curricula, each designed for a particular category of student needs: (1) bilingual education (for children without an adequate command of English to cope with the standard curriculum); (2) education for the (economically and culturally) disadvantaged (usually rural); (3) education for the gifted; (4) education for the handicapped; (5) migrant education (for children of migrant workers, who do not settle in a community long enough to provide their children with a continuum of education); (6) urban education (for children of the inner city); and (7) other differentiated curricula. If the differentiated curriculum varies too significantly from the standard curriculum, graduates of such programs are often awarded "differentiated diplomas," in lieu of conventional diplomas, to signify the successful completion of the program in which they were enrolled.

differentiated staffing A faculty made up of teams, whose members have a variety of

skill levels and teaching responsibilities commensurate with those skills. Thus, a typical team would have a MASTER TEACHER as its senior member, responsible for developing broad teaching policy; a regular teacher, skilled in classroom instruction; a student teacher to undertake one-to-one tutoring; and a teacher aide, responsible for supervising students preparing their homework, detained for disciplinary reasons or otherwise isolated from the class.

difficulty index (DI) Any device for measuring the difficulty, and, therefore, the validity of a test question or test. Thus, any question that 100% of test takers answer incorrectly or correctly over an extended period is probably invalid as a question for measuring student academic achievement. In general, where $DI = [LT].10$ (i.e., fewer than 10% of test takers consistently respond correctly) the question may well be an invalid measure of student achievement due to its level of difficulty in relation to accumulated student knowledge. Similarly, if $DI = [GT].90$, the question may be equally invalid because of its simplicity.

Digest of Education Statistics (DES) A massive annual compilation of virtually all statistics relating to American education. Prepared by the U.S. Department of Education's National Center for Education Statistics, *DES* is the most comprehensive reference work of its kind, covering all statistical information on American education from kindergarten through graduate school.

digraph Two contiguous letters pronounced as a single sound, such as *ai*, *ea* and *ie* (vowel digraphs) or *ch*, *ck*, or *gh* (consonant digraphs).

diocesan schools Roman Catholic schools, usually secondary schools, which are governed by the diocese, or bishopric. Unlike PAROCHIAL

SCHOOLS, which are usually elementary schools run by local parish priests, diocesan schools are supervised by school boards appointed by the bishop of the region and his immediate aides.

diorama A three-dimensional representation of a scene, using life-sized or miniaturized sculptured figures, lifelike details and a painted background. Used as a pedagogical device in most elementary and many secondary schools, creation of a diorama not only helps students develop motor skills and artistic creativity, it encourages them to study in depth the life and times surrounding the scene they create.

diploma An official document certifying graduation from an educational institution. Derived from the identically spelled (once transliterated) Greek word meaning "folded paper," diploma refers to the actual document, not the degree it confers.

diploma mill See DEGREE MILL.

diplomate Literally, one who holds a diploma, but usually limited in meaning to holders of advanced professional degrees and licensed by professional societies to practice their professions. Examples of diplomates are physicians who have taken advanced training in a medical specialty and passed intensive examinations administered by a board of senior specialists.

directed reading activity The teaching strategy used in most basal reading programs and consisting of five steps: reading readiness, silent reading, discussion and interpretation, skill development and practice, and follow-up activities. The reading readiness stage consists of providing students with the background to the story about to be read and determining that each student understands the concepts the story will present. After guided, silent reading

and a class discussion of the story, the teacher then helps students with skill development, including ascertaining that each student understands the story and its meaning and has a mastery of the vocabulary in the story and of the decoding skills needed to master that vocabulary. Follow-up activities may include using a workbook or introducing artistic, musical or writing activities that tie into the story.

direct instruction An individualized and highly structured method of step-by-step, pre-sequenced teaching, using materials most appropriate to educational goals and to each student's abilities. Although direct instruction demands intensive student participation, all the work is teacher-determined and teacher-directed. Direct instruction consists of four stages: teacher analysis and definition of goals, with selection of appropriate materials; teacher instruction; teacher demonstration; and student practice, coupled with immediate teacher response and, if necessary, corrective instruction. Most direct instruction programs are explicit and leave little discretion to the teacher.

(See also DIRECT INSTRUCTIONAL SYSTEM FOR TEACHING ARITHMETIC AND READING.)

Direct Instructional System for Teaching Arithmetic and Reading (DISTAR) A highly structured, direct instruction teaching program that leaves nothing to the discretion of teachers. The program dictates virtually every teacher statement, action and reaction to each of the strictly sequenced student practice activities. Created in 1977 with a grant from the U.S. Office of Education (now the U.S. DEPARTMENT OF EDUCATION), DISTAR is designed for children in preschool through third grade and consists of three levels each of programs for reading, language and arithmetic. DISTAR also includes teacher training programs, strategy games, activity kits and mastery tests.

direct methods A broad system of foreign language instruction by which students learn a new language much the way they learned their own native tongue as infants. Instead of traditional textbooks and rote memorization of vocabulary and rules of grammar, students use the foreign language as the sole means of communication and learn to associate word and sentences with actual objects and actions. Actual usage becomes the vehicle of learning instead of rote memorization. Use of the student's native language is discouraged. Long in use by commercial foreign language schools, which can teach relative fluency at an intermediate level in two weeks of six-hour-a-day, intensive courses, direct teaching of foreign languages was introduced into many American elementary schools in the 1960s. Because it is designed to teach only fluency and not literacy, it proved a valuable vehicle for teaching third graders foreign languages at an early age, and, in turn, permitted such students to perform far better when they entered seventh grade and began foreign-language literacy training.

(See also IMMERSION.)

direct reading-thinking activity A teaching technique associated with basal reading programs that encourages students to "think aloud" after reading silently, and thus enunciate the meaning of what they have read and how it relates to their own lives.

Disabilities Education Act See EDUCATION FOR ALL HANDICAPPED CHILDREN ACT; INDIVIDUALS WITH DISABILITIES EDUCATION ACT.

disadvantaged students An imprecise category of intellectually and physically normal students whose economic and cultural circumstances are among the lowest in the United States. Depending upon the community, the ranking may vary from the lowest one-third to the lowest 10%. Regardless of specific rankings,

disadvantaged children tend to be members of minority groups, have a poor command of English, consistently score below average on standardized tests of basic skills, have disproportionately high retention rates and are more likely to be assigned to low-ability classes for the non-college-bound.

The education of disadvantaged children, who should not be confused with HANDICAPPED, LEARNING DISABLED OR MENTALLY RETARDED children, has proved a major problem for American educators, who seldom had to deal with them until after World War II. Before then, compulsory education laws in many states were enforced so laxly that, as late as 1910, only 10% of American children—almost all advantaged, white children—enrolled in high schools. The rest, often as young as 5, went to work in fields, factories and mines. Even by 1940, only 30% of American children completed high school. It was after World War II, with the passage of civil rights legislation (see CIVIL RIGHTS ACT OF 1964), that the idea of universal public education was finally translated into deliberate action by state and local officials across the land. Unfortunately, most school systems had enormous difficulty adapting to the needs of newly enrolled disadvantaged children, who often did not know how to conform to behavioral expectations that differed from those of their homes and neighborhoods.

For the most part, poor black and Hispanic children lacked competitive academic skills and were far less able to understand abstractions than white children. In many instances, schools deemed that poor and minority children were either incorrigible or learning handicapped and often misinterpreted poor language skills, conceptual misunderstandings and cultural differences as the result of "bad attitudes" or learning disabilities. Poor and minority students were, therefore, consistently less likely than whites to be assigned to programs for the gifted and talented and more likely than whites

to be assigned to vocational programs that train for low-paying occupations such as building maintenance, commercial sewing and institutional care. One study by sociologist Jane Mercer found schools 150% more likely to label black children mentally retarded than whites and three times more likely to classify Hispanic children as retarded.

To correct the situation, some states have established strict standards for identifying children as learning-disabled, and both state and federal courts have ruled that all children have the right to due process before a school system can so classify them. In other words, the system must prove, beyond a reasonable doubt, that children are indeed handicapped. California courts even ruled (*Larry P. v. Riles*) that schools can no longer use intelligence tests as proof that minority children are handicapped. To prevent schools from confusing cultural differences with learning handicaps, many major cities with large minority populations have voluntarily abandoned the practice. In addition, many schools have established BILINGUAL EDUCATION programs that permit immigrant children to continue their education in their native language while they learn English. Bilingual education programs, however, have done little to improve the English-language literacy skills needed for integration in the United States economic and cultural mainstream. Indeed, New York City found that 90% of elementary school students in bilingual education classes were unable to pass English language competency tests after three years of such education.

In a broader sense, almost all states have established special programs for poor and non-English-speaking children to help them compensate for educational handicaps born of poverty or cultural differences. The programs are outgrowths of the ECONOMIC OPPORTUNITY ACT (or WAR ON POVERTY) and the ELEMENTARY AND SECONDARY EDUCATION ACT, passed by the federal government in 1964 and 1965, respec-

tively, to fund three categories of aid: nutrition and health (school lunch programs), school readiness (HEAD START, REMEDIATION and COMPENSATORY EDUCATION) and DESEGREGATION. Most aid under these programs were consolidated under Chapters I and II of the Education Consolidation Improvement Act, which was part of an omnibus Budget Reconciliation Act passed in 1981. Chapter I (Financial Assistance to Meet Special Educational Needs of Disadvantaged Children) provided for free or reduced-price lunches for poor children and earmarked funds for extra teachers, instructional aides, remedial programs and special materials for schools with large concentrations of poor children. Although poverty rates have declined from 22.2% of the population in 1960 to 12.5% in 2003, about 15% of American school-aged children (5 to 17) remain in poverty. The only requirement to receive help is for the child to score substantially below grade level on standard mathematics and reading tests. The school readiness programs were designed to prepare disadvantaged children for school. Disadvantaged children typically begin school as much as two years behind white middle-class children. The centerpiece of the school readiness program was Operation Head Start.

The third category of educational compensation for the disadvantaged—namely, school desegregation—has been difficult to implement, despite court orders and often ample funds for Busing children from predominantly minority districts to racially diversified schools. Although Congress and the courts have been able to eliminate DE JURE SEGREGATION, widespread DE FACTO SEGREGATION persists as a central problem for American education in the thousands of neighborhoods where one racial, ethnic or language group predominates. Studies such as the COLEMAN REPORT have shown a clear relationship between poverty and segregation and poor school performance. Poverty rates for blacks and Hispanics are more than

twice as high as the rates for whites—24.4% and 22.5%, respectively, compared with only 10.5% for whites—and black and Hispanic nine-year-olds score about 8.5% and 12%, respectively, below white children of the same age in reading and mathematics proficiency. Other research has proved that desegregation lifts the academic performance of minority students, particularly when they enroll in desegregated schools during their earliest school years. But parental resistance grew widespread, with black parents objecting to their children being bused long distances from their neighborhoods, arriving exhausted at schools too far away for parents ever to participate in school activities. Most white parents were equally upset, objecting to their children being bused from good schools in white neighborhoods to inadequate schools in black neighborhoods. One by one, the school districts under court edict to bus children to out-of-district schools applied for—and obtained—relief from busing orders. By the beginning of the 1999 school year, desegregation plans in Charlotte, Boston and other cities had been abandoned, and busing as a vehicle for desegregation all but came to a halt across the United States.

discipline (subject) A field of study, as in the discipline of mathematics or the discipline of English. Derived from the Latin *disciplina*, “teaching or learning,” the term refers to subject matter in the broadest sense rather than a particular class, such as senior high school English. Many universities offer degrees in interdisciplinary studies that combine study of two or more disciplines, such as economics and history, for example.

discipline, student The control of student internal and external behavior to promote maximum classroom learning. Until the 20th century, classroom discipline was maintained by physically enforcing a strict code of student

silence. Students were expected to remain alert but virtually immobile in their seats, while teachers lectured and students took notes assiduously and answered questions only when asked. Students caught napping or otherwise violating rules of behavior were summarily whipped, either with an actual whip, a stick or a ferule. Intellectual lapses—giving an incorrect answer—earned either physical punishment or the humiliation of sitting on a high stool, in and facing the front corner of the classroom, and wearing a conical “DUNCE” cap.

Although CORPORAL PUNISHMENT remains legal in 22 American states, most teachers refrain from its use—largely because of the risk they run of being accused of and sued for assault. Modern discipline is based on active teaching of self-discipline and on maintaining student interest. Other elements promoting discipline include the teacher’s personality and pedagogical skills, teacher authority, teacher rapport with students, school administrative support, student age and attitudes, student needs, subject matter, student peer culture and parental attitudes and support.

Aside from various forms of direct student-teacher confrontations, the various forms of discipline still in practice are DETENTION, expulsion from the classroom, warnings to parents, suspension from school, and expulsion. Teacher-student confrontations can take many forms, ranging from warm consultative discussions and special help for the students to warnings of harsher consequences if the student does not change his or her behavior. The most serious disciplinary problems in order of frequency, as reported by public school teachers, are: students come unprepared to learn, student apathy, student disrespect for teachers, student absenteeism, verbal abuse of teachers, student tardiness, student use of alcohol and physical conflicts among students. Although only about 5% of teachers cite physical conflicts among students as a serious problem in their schools and fewer

than 1% cite student possession of weapons as a problem, students themselves disagree, with 19% of eighth graders reporting that physical conflicts are a serious problem at school, and 8.5% of all high school students reporting that they themselves carry weapons to school. Nearly one-third of all high school students report having property stolen; nearly 12.5% say they were in physical fights on school property; 9% say they were threatened or injured with a weapon on school property during the current academic year; and 6.6% often feel too unsafe to go to school. Many schools across the United States use metal detectors at their entrances to prevent students from smuggling weapons into school, and some inner-city schools employ armed guards to patrol hallways to prevent violence in school. Nonetheless, 6.4% of public high school students say they carry weapons to school, 5% use alcohol at school, 7.2% use marijuana, and an astonishing 28% say they have been offered, given or have bought or sold illegal drugs on school property.

Hampering efforts to maintain discipline has been the so-called students' rights movement, which, since 1965, has seen students (and their families) turn to lawyers to sue school administrators for disciplining students. Although lawsuits have uncovered instances of probable unfairness (91% of black children have won challenges to expulsion, compared with 38% of whites), many have bordered on the ludicrous, such as some students who have sued schools for violations of First Amendment rights after teachers demanded that they remain quiet in class.

Technology has introduced a new category of disciplinary problems at many schools. Laptop computers, text-messaging machines, cell phones and other devices all have the potential to distract students from classroom assignments. Not only do cell-phone rings cause a din in classrooms and school corridors, but students also often disrupt classroom and school

activities by answering their phones, conversing or sending e-mails while teachers or other students are engaged in academic or other school exercises. Efforts by school administrators to ban cell phones have met with stern resistance by parents who see the devices as tools to keep in touch with and keep track of their children. About half of all high-school-age children have cell phones, and in many high schools the figure is closer to 90%. Although many schools—and some states—tried banning cell phone use in schools, all began relenting after a spate of school shootings in which students were unable to call for help. Although many schools continue to ban cell phones altogether, most have adopted compromise solutions such as banning their use in classrooms, insisting that they be kept out of sight at all times, or requiring students to check cell phones in a school office during the school day.

To combat the high-tech cheating that has become inherent with laptop computers and text-messaging devices, clever teachers have simply converted traditional testing into the equivalent of open book-examinations, allowing students to check the Internet and discuss test answers with one another electronically. Because they involve far more than rote learning, such exercises usually prove far more challenging to students and, of course, to the teachers, who must design far more complex examinations. Schools that have tried the approach—largely private schools—report having all but eliminated cheating as a disciplinary problem.

(See also VIOLENCE.)

discordant education The conflict, or discordance, between what schools have traditionally attempted to teach children and what the parents of those children were trying to teach them. Historically, discordant education in the United States has caused the most conflict for two broad population groups: immi-

grants and evangelical Christian Protestants. The latter, who believe in literal scriptural interpretation of the creation story, have, for more than a century, fought what they consider the heretical teaching of Darwin's theory of EVOLUTION in public schools.

Immigrants first confronted discordant education in the late 19th century, when public schools were committed to a program of Americanization aimed at converting all children into Protestant Americans. The process was designed to strip them of their native languages and cultural traditions and invest in them new standards of behavior, dress, morality, religious beliefs and hygiene, as well as teach them a new language. "Americanization is a spiritual thing," said New York City School Superintendent William Ettinger in 1918. "Broadly speaking, we mean by it an appreciation of the institutions of this country [and] absolute forgetfulness of all obligations or connections with other countries because of descent or birth." The process inevitably produced conflicts between schools, parents, church leaders and organizations that promoted ethnicity and ties to members' former homelands. The result for children was, and, for most Hispanic immigrants and many African Americans, continues to be, discordant education that teaches students two conflicting sets of knowledge and values.

discovery method A teaching method based on permitting a student to acquire knowledge by discovering it directly, usually through experimentation. Most commonly used in laboratory science experiments, the discovery method can be applied to all levels of education and in almost all subjects if the teacher points the student in the proper direction and provides enough materials in correct sequence to permit the inevitable discovery.

discrepancy evaluation The process of assessing educational programs by periodically

comparing the program activities and results with the original expectations and goals. The aim of discrepancy evaluation is to determine whether to continue, discontinue or alter the program. Discrepancy evaluation usually involves at least four phases: reexamination of program design to see that it conforms to the original; examination of actual program implementation for discrepancies with the original plan; assessment of the results to see if they conform to original program goals; and assessment of costs to see that they are within budgetary limits and to determine cost-benefit ratios.

discrimination The act of distinguishing or differentiating, usually to permit an intellectual, physical, emotional or social choice. In the physical sense, sensory discrimination permits an individual to distinguish between various sights, sounds, smells, etc. In the social sense, the term has a pejorative connotation when used to refer to unequal treatment of individuals because of race, ethnicity, religion, gender, age or social class.

discrimination index Any measurement that indicates the extent to which a test item differentiates between those with the ability it is supposed to measure and those without it. A test item measuring fluency in French, for example, would have a positive discrimination index if test-takers fluent in French answer the item correctly more frequently than those who are not fluent. It would have a negative index if nonfluent test takers answered it correctly as often or more often than fluent test-takers. Discrimination indexes are usually expressed in a range from -1.00 to $+1.00$.

discussion method A relatively modern pedagogical technique involving a free exchange of ideas between students and teacher. The method encourages in-depth analysis of complex

concepts, thoughtful interchange of ideas, polite social intercourse, respect for the ideas of others, recognition that concepts are open to a variety of interpretations, with few clear-cut “right” or “wrong” positions. In the discussion method, the teacher must usually present the topic for discussion, moderate student exchanges, remain open to all ideas presented and help the group arrive at a conclusion, without imposing that conclusion or otherwise dampening student enthusiasm for open discussion.

disruptive behavior Any student conduct that interferes with the normal classroom learning process or routine school activities. Disruptive behavior includes unacceptable language; overt defiance of adult instructions or school rules; interrupting school or classroom activities; and dressing or otherwise presenting oneself in a way calculated to draw attention to oneself and distract others from their work and required activities. There are a wide variety of appropriate teacher responses to disruptive behavior, including assertion of teacher authority, one-to-one teacher-student discussion aimed at analyzing the causes of the disruptive behavior, and imposition of punishment.

(See DISCIPLINE.)

dissertation An extended scholarly work, usually longer than 10,000 words, based on independent research, written in fulfillment of requirements for a doctoral or other advanced degree. Dissertations are usually prepared under the direction of and must be approved by a faculty committee. They must display an in-depth knowledge of the subject matter and demonstrate a complete command of research methods. Rules for dissertations vary from institution to institution. In general, dissertations must be presented according to a list of strict guidelines, with a specified number of copies to be published in bound form by any of several specialized publishing firms. They must then be

submitted to the university library for inclusion in its catalogue as a source of data for other researchers. In addition, most major universities require that dissertations be submitted to University Microfilms, Ann Arbor, Michigan, to be listed in *Dissertation Abstracts International* and to be microfilmed and made available for purchase by libraries and researchers.

Dissertation Abstracts International (DAI) A monthly compilation of abstracts of doctoral dissertations submitted to University Microfilms, Ann Arbor, Michigan. First published in 1938, DAI is published in two volumes, the first for dissertations on the humanities and social sciences, the second for dissertations on the sciences and engineering. DAI publishes an annual index and the encyclopedic *Comprehensive Dissertation Index* of abstracts of hundreds of thousands of dissertations dating back to 1861.

distance learning The delivery of formal courses and educational programs to students off-site via the mail, Internet, cable television or other communications media. The fastest growing segment of higher education during the first years of the 21st century—particularly the ADULT EDUCATION sector—distance learning offers thousands of secondary school, college and graduate school courses in almost every subject area to millions of students around the world. Individually or in partnerships and consortia with other institutions, more than 5,000 two- and four-year colleges and graduate schools, as well as proprietary, for-profit colleges and schools, offer distance-learning programs leading to high school diplomas, associate, bachelor’s and graduate degrees, and certificates attesting to skills proficiency. Distance-learning providers train new employees and upgrade business and other job skills of trainees, workers and executives at several thousand corporations in every area of American industry.

Distance learning is usually classified according to delivery system. CORRESPONDENCE SCHOOLS—the oldest form of distance learning—rely on the mails to deliver printed materials and/or prerecorded taped or video courses to their students. With the development of the Internet, most distance learning takes place electronically on the computer, although some courses are delivered by one-way or two-way (interactive) audio or video courses.

Distance learning allows students with computers to attend classes 24 hours a day, without adhering to any rigid schedule, thus completing courses and earning undergraduate and graduate degrees or certificates of course completion at their own pace. Unlike conventional education, which limits individual student assistance to normal office hours, distance learning reaches across time (and ethno-religious) zones around the world, providing 24-hour-a-day instruction and help lines, 365 days a year. The range of academic quality mirrors that of conventional public and vocational school, college and graduate school education. The most demanding distance-learning colleges require enrollees to take the same pre-college entrance examinations, charge the same tuition (upwards of \$500 per credit) for each course, and require students to submit the same demanding theses and pass the same rigid final examinations as students on campus. Most provide students with a syllabus for each course that includes all tests to be taken, the required essay topics and the text materials to be covered. Course materials include complete sets of instructor lectures (either in print form, on videotape or interactively) and copies of tests students must take to pass the course. Some colleges limit enrollment in specific courses (often to as few as 20 students) to permit greater interaction between students and instructors. Other schools offer courses worldwide to almost unlimited numbers of students, either directly or indirectly through outsourc-

Fourth- and fifth-graders watch a distance-learning program on the left screen, while their classroom is on the right screen. (Associated Press)

ing firms that offer a virtually unlimited electronic course catalog with offerings from the entire range of colleges.

Students enrolled in distance learning at accredited colleges and universities have electronic (or physical) access to all college and university services, such as libraries, bookstores and so on, and they can avail themselves of all the standard college and government FINANCIAL AID programs open to students at conventional campuses. Most distance learning colleges allow CROSS-REGISTRATION and accept credits for on-line courses taken at other colleges. Indeed, most colleges participate in consortia that permit students at one college to take an unlimited

number of online courses for credit from other member colleges in the consortia. Such consortia allow member colleges to expand their curricula in logarithmic proportions without adding faculty or building new classroom or laboratory facilities. One group of about 40 colleges in 22 states formed the Western Governors University, with more than 1,000 courses on-line, while the Southern Regional Education Board's Electronic Campus began with more than 3,000 on-line courses and more than 100 degree programs from more than 250 participating institutions in 16 states. In Britain, the government established a gigantic, globe-spanning "e-university" to compete with those of the United States by bringing together on-line institutions in Britain, China, Malaysia, Singapore and the United States. In one of the most far-reaching programs, the U.S. Department of Defense has established a \$600 million distance-learning curriculum that enables any soldier to take distance learning courses on the Internet at little or no cost.

Ironically, the universal reach of distance learning has not produced universal success or universal student acceptance—especially in traditional academic areas, where American universities invested more than \$500 million in the mid-1990s on Web-based course offerings. By 2000, spending on e-learning had dropped to \$17 million, and the University of California, New York University and many other similar institutions had abandoned some distance learning. The 40-college consortium that had formed Western Governors University reduced its offerings to teacher training, while New York's Columbia University was losing substantially from its e-learning venture with the London School of Economics and Political Science, the British Library and the University of Chicago, among others. While e-learning has proved a major success in career and vocational education, it has, apparently, failed to penetrate traditional academe, where most 18-to-

24-year-old students who seek a conventional bachelor's degree in the sciences and humanities seem intent on doing so in traditional campus settings, involving face-to-face contact with professors in conventional classrooms with other students their age.

For all others, however, distance learning has proved enormously successful by providing faster learning at lower costs to both provider and consumer with an ideal combination of self-instruction and instructor-led learning that permits students to continue workday routines while enhancing both the knowledge and the skills they need to expand workplace opportunities and earnings. For e-schools that put together the right courses, distance learning can be profitable for both student and school. It costs about \$50,000 to design and market an on-line course, but, at \$500 a credit, a distance-learning course can begin to yield profits to providers after the first 100 students have signed up—and "virtual classrooms" have virtually no limit to the number of students they can hold. As for students, tuition costs are seldom lower than at conventional colleges, but students reap enormous savings in time, travel and living costs associated with conventional colleges. Distance learning allows them to live at home, hold full-time jobs and continue their education at their own pace in their spare time. Many rural states have tied the branches of their university and community college systems together on the Internet to allow students anywhere in the state to attend school at one campus with limited course offerings and benefit from the diversified course offerings of the entire higher education system in the state.

Distance learning has made it possible for budget-strapped high schools as well as colleges to expand their curricula without adding new faculty. Many smaller rural schools have formed cooperatives with similar schools in other areas to hire a single teacher to provide on-line instruction that would not attract

enough students at any individual participating school to warrant hiring a new teacher—for a foreign language, for example, or physics. One private distance-learning company has contracted to provide **ADVANCED PLACEMENT** courses to hundreds of high schools whose budgets do not permit costly hiring of teachers for such courses.

The distance-learning explosion has also produced a huge on-line education support industry, with many companies offering 24-hour-a-day “e-tutoring,” essay writing and other academic assistance for students in virtually every subject area. Specialized chatrooms at one tutoring service are staffed 24 hours a day by hundreds of tutors prepared to help thousands of students with their schoolwork each day in such subjects as Spanish, math or science. Students simply e-mail questions in advance to speed the process or chat directly with teachers for live help. Another private firm provides high school equivalency courses and examinations under the **GENERAL EDUCATIONAL DEVELOPMENT PROGRAM**, and still other companies offer on-line preparation for college and graduate school entrance examinations.

The pioneer in distance learning among proprietary, for-profit institutions was University of Phoenix Online. Founded in 1976, Phoenix had grown into America’s largest private university by 2005, with 200,000 students and 17,000 instructors at 142 campuses and on the Internet. Operating out of rented offices, with no full-time faculty, library or other conventional college facilities, Phoenix limited its students to adults at least 21 years old and its course offerings for bachelor’s and master’s degrees to areas outside the humanities—e.g., business, information technology, health and education. The profit-making potential of such education, with its worldwide reach, stirred up a number of controversies, however—both in and out of the world of education. The division of the huge—and

quick—profits online courses can generate has been the focus of harsh negotiations and bitter conflicts between college administrators, faculty and outsource providers about who should profit most from such courses—the college that transmits each course as part of an accredited degree program, the faculty member who designs, develops and teaches each course, or the provider who ties the course to the World Wide Web and delivers it to the ultimate consumer. The proliferation of distance learning has also raised concerns about quality controls, with the U.S. Department of Education warning that some Web-based education contains a lot of useless and, indeed, academically unreliable materials. Reacting to the department’s warning, Congress authorized formation of a congressional Web-Based Education Commission to determine whether to establish a national accreditation system for on-line courses.

The most popular on-line disciplines in order of preference are business, education, nursing, information systems and liberal arts. Two-thirds of the students enrolled in distance learning are 25 or more years old, and two-thirds of all students are female. More than 70% are full-time students—that is, they take more than 30 credit hours of courses a week. More than half plan to earn degrees and 22% are on-line to advance their careers. Because of the 24-hour-a-day availability of on-line instruction, 85% of on-line students feel they have more access to their instructors in distance learning courses than in conventional classroom courses.

(See also **COMPUTERS**; **CORRESPONDENCE COURSE**; **INTERNET**; **ONLINE EDUCATION**.)

DISTAR See **DIRECT INSTRUCTIONAL SYSTEM FOR TEACHING ARITHMETIC AND READING**.

distractors The incorrect answers in a multiple-choice test item.

distributive education A vocational education program for retailing, started in the late 1930s with government grants for training teachers to instruct skills needed in distribution (now called marketing) of retail goods. The program was the first to use COOPERATIVE VOCATIONAL EDUCATION, whereby local retail establishments cooperated with nearby schools to give students a combination of classroom instruction and on-the-job training.

District of Columbia A federal district created by an act of Congress in 1790–91, which includes the city of Washington, the national capital. Nearly 60% of its population of more than 550,000 is black. Although an elected mayor, city council and board of education exercise some degree of home rule, Congress has the right to veto any legislation and review the city budget. Because the city cannot collect property taxes from the federal lands and buildings that cover the city, Congress must appropriate an annual sum to supplement the city's revenues. The result of the arrangement has been a disaster for Washington public schools, which rank among the worst in the United States academically, with a high school dropout rate that reached about 40% in the early 1990s. The district established its first public schools for white children in 1804 and for black children in 1862. Schools were desegregated in 1954, but severe educational retardation and poor standardized test scores among black children led to establishment of a TRACKING system the following year. Tracking virtually resegregated students by race and provoked a suit, *Hobson v. Hansen*, and a 1967 ruling that "... ability grouping as presently practiced in the District of Columbia school system is a denial of equal opportunity to the poor and a majority of the Negroes attending school in the nation's capital. . . ." The court ordered tracking ended. In 1971, the plaintiffs in *Hobson* returned to court charging discrimination in

the application of school funds, and the court ruled that per-pupil expenditures in any school should not deviate from the citywide mean by more than 5%. In subsequent lawsuits by other plaintiffs, the recalcitrant school board was forced by various courts to provide special education facilities for handicapped children, disruptive children, to provide free education for all children, to refrain from summary expulsions and to cease violating the civil rights of individual children. The District has about 200 public schools with more than 75,000 students, 96% of them minority children and more than 24% of them living in poverty. Academic quality is the lowest in the nation. Only about 12% of students are proficient in reading and fewer than 10% are proficient in math.

Washington has two public four-year colleges, one of them the University of the District of Columbia, a LAND-GRANT COLLEGE founded in 1975. Two of the 13 private universities, however, are largely funded by the federal government—HOWARD UNIVERSITY, a predominantly black university founded in 1867, and GALLAUDET COLLEGE, a school for the hearing impaired, founded in 1856. The other private four-year colleges include Georgetown, George Washington and American universities and CATHOLIC UNIVERSITY OF AMERICA. Graduation rates at the four-year colleges average a remarkable 68.3%. There are no two-year institutions, private or public. District of Columbia high school graduates are eligible for special federal grants of up to \$10,000 to pay the difference between costs of tuition at D.C. colleges and the costs at public colleges in Virginia and Maryland. They are also eligible for up to \$2,500 in federal grants to attend private colleges in the District and adjoining counties in Maryland and Virginia.

divinity school A college that prepares students for ordination into the clergy. Often called seminaries or theological institutes, divinity schools are usually graduate-level insti-

tutions, although some Catholic seminaries permit students to enroll directly after graduation from high school.

(See also THEOLOGY.)

Dock, Christopher (1698–1771) German-born, Mennonite schoolmaster in Pennsylvania and author of the first book used for teaching in the American colonies. Written in German in 1770, *Schul-Ordnung* was translated into two smaller volumes, *A Hundred Necessary Rules for Children* and *A Hundred Christian Rules for Children*. They became the most widely used guides for teachers and parents of the era.

Dock immigrated to the colonies in 1714 and, four years later, opened a school for Mennonite children in Skippack, Pennsylvania. The author of many Mennonite hymns, Dock was an innovative teacher, who made singing an integral part of the school day and introduced a monitorial system, under which older students helped tutor younger children. Dock also was gentler than other schoolmasters of his day, abandoning the rod and rewarding good work. “[E]xperience teaches,” he wrote, “that a timid child is harmed rather than benefited by harsh words or much application of the rod. . . . Likewise a stupid child is only harmed. . . . If children are to be helped, it must happen through other means. . . .”

doctorate The highest academic degree, usually requiring BACHELOR’S and MASTER’S DEGREES followed by completion of at least two or more years of academic courses, the writing of a scholarly DISSERTATION based on original research, and the demonstration of complete mastery of a particular subject area by oral and written examination. Doctorate entitles bearers to be addressed as “Doctor” and to append their names with the appropriate letters of their degrees—that is, Ph.D. (doctor of philosophy) or M.D. (doctor of medicine). Two types of doctorates are awarded in the United States, research and professional,

with the latter seldom requiring a master’s degree or a dissertation. A professional doctoral degree in the United States, unlike Europe, only reflects academic attainment, and doctors of medicine (M.D.) or jurisprudence (J.D.) must pass state or national qualifying examinations to obtain licenses to practice. (In Europe, where governments control universities, a doctoral degree entitles its recipient to practice medicine, law and other professions.) The research doctorate, or Ph.D., originally awarded for study of philosophy, was in the mid to late 20th century extended to include virtually all areas of the humanities and sciences, with each Ph.D. simply modified to indicate the field of study—for example, Ph.D. Eng. (ineering), Ph.D. Hist. (ory), or Ph.D. Chem. (istry). All require successful completion of an original research project and a thesis thereon. More recently, as the study of many subject areas has become more specialized, doctoral degrees have assumed the name of those specialties, as in doctor of education (D.Ed.), doctor of musical arts (D.D.M.A.), doctor of business administration (D.B.A.), etc.

The number of doctorates awarded by American universities has increased by an average of about 3.5% a year, and 42,155 were granted in 2004—31.1% to non-U.S. citizens. Nearly 21%, 8,819, were awarded in the life sciences, 16.1% (6,795) in the social sciences, 15.7% in education, 14.4% (6,049) in the physical sciences, 13.7% (5,776) in engineering, 13% (5,467) in the humanities, 3.2% in professional fields and 3% in business. Men earned 54.5% of the doctorates awarded, and more than 41% of degree recipients intended to enter teaching, while 31.2% intended to go into research and development. Of the 62.7% of degree recipients who were U.S. citizens, 80.4% were white, 6.6% black, 4.9% Asian, 4.6% Hispanic and 0.5% American Indian or Alaskan native. The remaining doctorates, a startlingly high 37.3%, went either to resident aliens

(3.6%), to nonresident aliens (27.5%) or students whose citizenship was unknown (6.2%).

Dodge, Grace Hoadley (1856–1914)

American philanthropist who founded manual training programs for working girls and boys during the era of child labor and eventually expanded it to include a teacher training school that later became Teachers College at COLUMBIA University. Born to the wealthy and distinguished New York family that founded Phelps, Dodge & Co., she spurned the life of a debutante in favor of religiously inspired charitable work. While teaching Sunday school at the CHILDREN'S AID SOCIETY, she developed a discussion group for factory girls and began teaching them household skills. In 1880, she formalized her activities into the Kitchen Garden Association, which she expanded into the Industrial Education Association (IEA) four years later and broadened it to include manual training for boys. In 1887, Dodge expanded IEA to include a training school for teachers for her growing number of students, and she appointed a young Columbia professor, NICHOLAS MURRAY BUTLER, its director. In 1889, IEA was reorganized into the New York College for Training of Teachers, which, in 1889, was incorporated into Columbia University as Teachers College.

One of the first two women appointed to the New York City Board of Education (1886), Dodge helped found the New York Girls' Public School Athletic League (1906) and, as president of the YOUNG WOMEN'S CHRISTIAN ASSOCIATION of the United States, helped reorganize what was then a splintered organization into the unified association it remains today.

domain In education, a category of either intellectual functioning or curricular content. There are three domains of intellectual functioning: AFFECTIVE, COGNITIVE and psychomotor. In the area of curricular classification, domain refers to

a well-defined set of tasks that constitute the range of expected abilities for a particular subject. Thus, the domain of third grade mathematics would include the range of mathematical skills that a third grade student should be able to perform at the end of the year. Tests that measure such skills are often referred to as domain-referenced (or criterion-referenced) tests.

dormitory A residence hall for students, usually a multistoried facility, with individual rooms or suites (housing one or more students each), opening onto long corridors, with several common bathrooms. Derived from the Latin word *dormitorium*, "large room for sleeping," dormitories may or may not have common rooms, a common dining facility or common study facilities, depending on the layout of the particular school or college. Segregated by gender until the 1960s, college dormitories and many dormitory rooms are now often coeducational and may or may not be staffed by supervising faculty or older students and counselors. In one instance, three institutions joined together to build a single \$150-million "megadorm" to house their students. Called University Center, the new facility is essentially a standard apartment building in downtown Chicago. University of Chicago and DePaul each own 40% of the dorm, or 700 beds, and Roosevelt University owns the remaining 300 beds. Made up of apartments and suites, the facility plans to rent unused beds to students at nearby Illinois Institute of Art, the City Colleges of Chicago, and Harrington Institute of Interior Design, which are within a 12-block radius.

Dormitory residence is usually required at most boarding schools and at military colleges. It is optional at most other colleges and at universities, which charge dormitory fees over and above the costs of attending classes. About 2 million, or nearly 12%, of America's nearly 17 million college students live in dormitories.

Dormitories date back to the earliest European universities of the 12th century, when boys as young as 14 flocked to cities such as Paris to attend lectures. The early universities, however, provided no housing or maintenance, and the boys themselves congregated in rented quarters called *hospitia* (hostels). By the end of the 12th century, many instructors began operating such *hospitia*, endowing some to provide free lodging for the poorest scholars in exchange for work and other services. Endowed *hospitia* whose rooms were reserved exclusively for scholarly colleagues were called *collegia*, or "societies," thus giving rise to the word *college* for institutions of higher learning.

double sessions An extension of the school day that enables a school to accommodate a student body that exceeds school classroom capacity. Double sessions allow a school whose normal school hours run six hours, from, say, 8:30 A.M. to 2:30 P.M., to extend its day to a total of nine hours, from 8 A.M. to 5 P.M. It then schedules classes for half the student body from 8 to 12:30 and the other half from 12:30 to 5. Although double sessions deprive all students of a full day of classes, they represent an accommodation for communities that either do not have or refuse to spend funds for full-time schooling. Double sessions are most commonly used to accommodate kindergartens, whose education is often perceived by the public as less essential than the other elementary grades. Double session kindergartens allow schools to accommodate two groups of kindergartens in a single classroom (one in the morning, the other in the afternoon), thus freeing one former kindergarten classroom for use by older children.

dramatic arts The study and presentation of scripted plays, including acting and stagecraft. An integral part of the curriculum at many academically superior elementary schools, the

dramatic arts are generally relegated to the status of an extracurricular activity in most public schools, except specialized "magnet" high schools (see **MAGNET SCHOOLS**) for the performing arts. At the elementary school level, dramatic arts can be an important pedagogical vehicle for improving children's social, motor and language skills and encouraging creativity.

Dramatic arts at the college and graduate school level are offered as both an extracurricular activity and a formal academic offering leading to bachelor's, master's and doctoral degrees.

"dream" schools A colloquialism of college applicants that refers to those colleges they would most like to attend but whose standards for admission are higher than the students' own achievement levels often called "reach" schools.

dress code Rules and regulations governing student, faculty and staff clothing, personal appearance and grooming, including makeup, hair length and facial hair. With the exception of military schools, most American colleges and universities abandoned dress codes in the late 1960s and early 1970s when Americans generally became more tolerant of nontraditional and informal dress and hair styles, and when the age of majority was lowered from 21 to 18. Many elementary and secondary schools, however, continue to dictate student and teacher dress and grooming styles on the grounds that nontraditional, attention-getting dress or hair styles can prove disruptive in school settings.

Because of their status as private institutions, private schools have had relatively little difficulty imposing dress codes, including dresses for girls and ties, slacks and jackets for boys, with hair trimmed above the collar line. Many schools often ban jeans and sneakers as well. Some public schools, however, have

encountered legal opposition to dress codes from parents, who have challenged the right of a school to impose regulations that raise parental costs for nonschool purposes and infringe on various constitutional rights of children. The courts have been of little help in resolving such challenges. While courts in some states have ruled squarely in favor of school rights to set standards of dress and behavior, others have ruled in favor of students, contending that dress codes violate First Amendment rights of free expression; others have ruled that such codes violate Fourteenth Amendment rights to due process and equal protection under the law. The U.S. Supreme Court has traditionally refused to review any cases relating to the dress-code issue.

drill A learning technique based on constant repetition of the same task until the student has learned it to perfection, without hesitation. Drill generally proves effective in learning spelling, arithmetic and other basic academic skills, as well as in music, drama and artistic skills.

driver education Instruction in the techniques of driving automobiles and the study of traffic rules, regulations and safety. Although available at private, for-profit driver education "schools," most driver education is offered free of charge as an optional course in secondary school for youngsters who have reached the legal driving age in their communities. High school driver education consists of two parts: classroom instruction, often involving simulated driving machines, and on-the-road practice driving in a car. In addition to the schools themselves, insurance organizations, safety councils, car dealer associations and state agencies concerned with traffic safety often contribute to the funding of driver education in secondary schools. As an incentive to take driver education, many insurance companies

offer reduced premiums to drivers who successfully complete such training.

drop-add A college-level, curriculum-alteration policy that defines the procedures and, if appropriate, penalties for dropping or adding courses. Depending on the particular college, students may use so-called drop-add forms to drop or add a course within a specified period after enrollment without paying a penalty or obtaining an "incomplete" on their transcripts.

dropouts Students who withdraw from school or college without completing graduation requirements for reasons other than enrolling in another school or college. More than 10% of American high school students and one-half of all college students drop out every year. Two-thirds of all high school dropouts come from the low-ability, GENERAL EDUCATION track. "Not interested in school," is the most frequently reason cited by students for dropping out. Nearly 43% of those who dropped out from the tenth to twelfth grades said they did not like school, and 38% said they left because they were failing. Nearly 27% of all female dropouts cited pregnancy as the reason; this figure climbed to 34% among black females and 31% among Hispanics but was only 26% among whites. Less than 8% of male dropouts said they left school because they became fathers. Marriage was cited as a reason for dropping out by 15% of white students and 13% of Hispanic students but only 2% of black students.

Drop-out statistics are notoriously inaccurate, however, collected as they are by individual states, whose federal education grants are dependent on the success of their public school systems. Figures compiled from each of the states show the national drop-out rate having peaked at 14.6% in the 1970s and then slipping to 11% in 1992, when about 380,000 students dropped out of high school. In the ensuing years, however, the official

rates remained relatively intractable, with about 400,000 high school students, or 10.7% of total enrollment, dropping out in 2005, according to reports from each of the states. But Texas and Florida fail to count students who drop out, if they say they intend to earn high school equivalency diplomas or to continue their education in adult education courses. Florida nonetheless had the highest drop-out rate in the nation, 44%, followed by Georgia and South Carolina, with rates of 43%. Texas reported a drop-out rate of only 6.2%, but the true figure is estimated to be closer to 36%.

Drop-out rates among Hispanics have long been the highest, ranging, by all counts, between 30% and 35% during the 1970s, 1980s and 1990s and only easing to 27% in 2001. In the meantime, official black drop-out rates dropped from a peak of about 23% to only 10.9% during that time, while drop-out rates of white children fell from a peak of more than 15% to only 7.3%. Drop-out rates present semantic as well as statistical problems, however, because many students who do not physically leave school nonetheless fail to graduate but are nonetheless retained on class rolls, thus minimizing the statistical effect of dropouts. The Manhattan Institute, a policy research group, prefers using the GRADUATION RATE. The institute's studies of state-by-state graduation rates found that only 72% of the nation's female high-school seniors and 65% of males graduated with diplomas in 2003. Only 59% of African-American girls and 48% of African-American boys graduated in 2003, while graduation rates for Hispanics were 58% for girls and 49% for boys—all far higher failure rates than the pure drop-out rates.

Regardless of which statistics are used, the economic consequences of dropping out (or not graduating) were startling. Nearly 30% of all high school dropouts experience periodic unemployment, although long-term unem-

ployment rates during the prosperous years since 2000 hovered between 7% and 10%. The median annual income of those who find work is about \$25,000 for men and \$20,000 for women, compared with about \$35,000 and \$25,000, respectively, for men and women with a high school diploma or equivalent. For the nation as a whole, the cost of the more than 500,000 high school dropouts is nearly \$200 billion a year in economic losses, according to economists. A high school dropout earns about \$200,000 less over a lifetime than a high school graduate, thus depriving federal, state and local governments of about \$60,000 in taxes, or \$50 billion a year for all 23 million of the nation's high school dropouts between the ages of 18 and 67, the average retirement age. Those consequences are not irreversible, however. Every state offers a High School Equivalency Testing Program, or GENERAL EDUCATIONAL DEVELOPMENT (GED) for adults who have not completed a formal high school program. After completing appropriate adult education or home-study courses and obtaining a passing score in each of five tests, the student receives a high school diploma that serves as a valid "equivalent" to a conventional diploma as a qualification for thousands of jobs and for admission to many two-year and four-year colleges. Also ameliorating the impact of dropping out in some communities is the growing willingness of colleges to accept students without high school diplomas. Indeed, many such colleges have established special academic programs for high school dropouts that automatically grant students a high school diploma along with their associates degrees when they complete two years of combined college/high school courses. By 2008, nearly 400,000 students without high school diplomas were enrolled in college, accounting for 2% of all college students, 3% of community college students and 4% of commercial college students. As many as one-third of the students at some

two- and four-year colleges had no high school diplomas.

Many educators trace the drop-out phenomenon to poor reading skills. Indeed, studies show that students beginning high school with low reading proficiency are 20 times more likely to drop out than classmates with average or superior reading skills. As a result, a growing number of schools across America are setting up programs to target middle schoolers—especially those overage for their grades—and group them together with students their own age in classes designed to improve their reading skills. By “reconnecting” them with their age-mates, the programs remove the stigma of sitting in a class with and often performing more poorly than younger students. Once regrouped into a class of their age mates, the students begin an accelerated curriculum that combines classroom work, with no more than 15 students in a class, and after-school tutoring (and emotional support) to help them catch up and eventually finish school. By 2005, drop-out prevention programs were in place in middle schools and high schools in Cincinnati, Cleveland, Dallas, New York and Philadelphia. Cleveland’s pioneering Options Complex worked with 175 overage students in three schools; Philadelphia opened three high schools for overage students; and Cincinnati’s nine-year-old program for overage middle schoolers boasts three classes of 15 to 18 students each, in which 95% complete an accelerated program that allows them to enter high school with students their own age.

The COLLEGE drop-out phenomenon differs substantially from that of the high school, given the entirely voluntary nature of college attendance and the adult status of college students. About 45% of college students drop out of four-year colleges without completing the work required for their degree. Unlike the student abandoning high school, the college drop-out is not precluded from re-enrolling at a later

date—often years later—and finishing his or her work, but the economic consequences of dropping out of college are often as dramatic as those for high school dropouts. The median income of college graduates 25 years or older was about \$56,000 for men and \$41,000 for women in 2001, compared with median incomes of \$41,000 and \$30,400, respectively, for men and women who left college without completing their degree requirements.

One common aspect of the high school and college drop-out phenomena is the failure of the American education system to provide adequate VOCATIONAL EDUCATION for either secondary school students or high school graduates—a lack that forces millions of American youngsters to pursue studies in the sciences, humanities or business for which they have no aptitude. There are other factors driving the college drop-out phenomenon, however, the most far-reaching being the cultural and economic background of students. Lower-income students come from families of poorer educational and cultural backgrounds than upper-income students do, and high schools in low-income areas fail to prepare students for college as thoroughly as high schools in upper-income areas. Indeed, the National Center for Public Policy and Higher Education found entering freshmen at 17 state university systems unprepared for college-level work. A study commissioned by the BILL AND MELINDA GATES FOUNDATION found that 60% of white high school graduates, 78% of black high school graduates and 80% of Hispanic high school graduates were unprepared for college. Even worse, the National Center found 46 of America’s 50 state universities unaffordable for *average* American students and their family, let alone the economically disadvantaged. The result is that 40% of incoming freshmen at the 42 most selective universities in 2004 came from families making more than \$100,000 a year, compared

with 32% five years earlier, though fewer than 20% of American families earned \$100,000 or more. And freshmen from the wealthiest 25% of American families, filled 55% of the seats in the 250 most selective colleges, both public and private. At some state universities, students from families in the bottom half of the income distribution spectrum make up less than 10% of undergraduates.

drug abuse The voluntary use by mouth, injection or inhalation of any substance not prescribed by a licensed physician that may affect an individual's normal physical, intellectual, psychological, social or emotional functions. Drug abuse spans the range of addictive and nonaddictive chemical substances, both legal and illegal, and may include tobacco, inhalants, alcoholic beverages, diet and cold pills, and illegal narcotics, stimulants, steroids and hallucinogens. Tobacco use is cited as the fifth most frequent disciplinary problem faced by elementary and secondary public school teachers, followed by alcohol abuse, vandalism to school property and abuse of drugs other than tobacco and alcohol.

All forms of high-risk behavior by elementary and high school students showed a steep decline during the last few years of the 20th century—a reflection, in part perhaps, of the economic boom of that period, but also the likely result of stepped-up intervention programs and compensatory health and behavior education in schools. In 1994, Congress passed the SAFE SCHOOLS ACT, which forced public schools to expel students found carrying drugs or weapons. Subsequently, drug use among 12- to 17-year-olds fell from a peak of 13.2% in 1985 to about 9% in 1996, while alcohol consumption, which had climbed 30% during the previous 30 years, plunged from 41.2% to 18.8%. Marijuana use dropped from 10.2% to 7.1% and cocaine use fell from 1.5% to 0.6%. Cigarette consumption dropped from 29.4% to 18.3%.

drug abuse education Any of a variety of programs designed to teach students of all ages about the dangers of drug abuse. Although drug abuse education in the most general sense can include therapy for abusers, in the field of education it is limited to that area of the HEALTH EDUCATION curriculum dealing with the physical, intellectual, psychological, social and emotional consequences of drug abuse. In elementary and secondary schools, drug abuse education is integrated into standard health education courses, with the depth of discussion varying according to age. Drug education, like SEX EDUCATION, however, remains a center of controversy in many communities that fear that such instruction may stimulate rather than discourage experimentation. Moreover, there is no consensus among educators on the most effective approaches to drug education. Some programs such as DARE (Drug Abuse Resistance Education) try to frighten children with graphic videotapes and presentations by police officers and former addicts. Founded in the early 1980s, DARE presentations became part of school curricula in 10,000 public school districts in the United States and in schools in 54 other nations. Many health experts and educators oppose DARE-type programs, which focus on the consequences of drug use—the criminal penalties and the physical effects. Drug abuse, say DARE opponents, is purely a health issue requiring a scientific, objective approach to educate children properly. Although there is no clear evidence that any specific program has helped curtail drug abuse, some educators believe any drug abuse education is better than none, and there is little question that student drug abuse has declined sharply from the peak reached in the late 1970s before drug education became a standard part of the health education curriculum.

The Drug Abuse Council lists seven essential goals for elementary and secondary school

programs: to increase student knowledge about drugs; change student attitudes about consuming drugs; change the behavior of drug abusers; increase student participation in alternative activities; help students develop sets of personal values; improve student decision-making skills; and improve student self-esteem.

dry-erase board A porcelain-coated steel panel, usually 42 to 48 inches high and of variable lengths, that permits teachers (and students) to write key learning materials with ordinary felt-tipped marker pens for viewing by an entire class. Often as long as the classroom wall itself, dry-erase boards began replacing once-ubiquitous green and black slate CHALKBOARDS in the 1980s and 1990s. Often called market boards, the dry-erase boards are easy to clean with any soft cloth, and they eliminate the problem of chalk dust—often a serious health problem for students allergic to chalk dust and an equally serious problem for classroom computers if the dust invades the inner workings. Dry-erase boards accept markers in a range of colors that increase the instructor’s ability to categorize or emphasize different materials.

(See also ELECTRIC CHALKBOARD; WHITEBOARD.)

DuBois, W. E. B. (1868–1963) African-American educator, sociologist, author, social reformer and the first African American to demand equal educational equality for American blacks. To that end, DuBois was a cofounder of the National Association for the Advancement of Colored People, which was instrumental in ending racial segregation in American public schools.

Of African, Dutch and French ancestry, DuBois was born to an old, propertied, New England family, in the small farming community of Great Barrington, Massachusetts. His grandfather had fought in the Revolutionary War and his father in the Civil War. An aca-

W. E. B. DuBois (*Atlanta University Archives*)

ademic prodigy, he mingled freely with his white classmates, who paid little attention to his light, tan skin. After he graduated from high school at the head of his class at 16, however, his teachers discouraged him from applying to Harvard because of his race, and he enrolled at Fisk University, an all-black college in Nashville, Tennessee, where for the first time in his life, he found himself in an all-black community, surrounded by hostile whites. The shock changed his life. “No one,” he wrote, “but a Negro going into the South without previous experience of color caste can have any conception of its barbarism.”

The following summer, DuBois went into the backwoods of Tennessee to teach in local schools. There, he saw a level of poverty and ignorance that stoked his anger for the rest of his life. Returning to Fisk, he founded the school newspaper, *The Fisk Herald*, and wrote “An Open Letter to the Southern People,” which warned of racial conflicts to come if the

South did not grant African Americans equal opportunities. It was the first of what would be a lifetime of protests. DuBois graduated from Fisk in three years and earned a scholarship to Harvard, where he graduated cum laude with a second B.A. in 1890. He went on to earn his M.A. and Ph.D., for which he produced a thesis on slave trade laws, which was published by the American Historical Society. DuBois was elected its first black member. He then enrolled in Berlin University for two years, where his studies of socialism convinced him that black equality in the United States would be impossible while whites controlled industry. He linked the struggle for black equality in America with the black African struggle for independence from European colonial powers. At 25, he returned to the United States to teach and lead the struggle for African-American equality.

After two years at Wilberforce College in Ohio, he was appointed the first African-American sociologist in the United States by the University of Pennsylvania, in Philadelphia, where he published *The Philadelphia Negro*. His work was acclaimed as the first study to prove that history and environment, not genetics, were responsible for African-American poverty in the North. In 1897, ATLANTA UNIVERSITY, then a small African-American college in Georgia, invited DuBois to head its sociology department and serve as professor of economics, history and political science. While there, he produced an ongoing study of African Americans that eventually grew into an encyclopedia of black life in the United States. His work earned worldwide attention, and in 1900, a grand prize and gold medal at the World's Fair in Paris, France. The studies embarrassed the United States and the South, however, and the Southern Education Board, which funded black colleges, cut off Atlanta University's funding until DuBois agreed to abandon his work.

Infuriated, DuBois called for a nationwide black protest. He urged blacks to boycott all white businesses and to organize themselves into economic cooperatives. In 1903, he wrote his most successful and most widely read book, *The Souls of Black Folk*, in which he attacked BOOKER T. WASHINGTON's philosophy of "accommodation" with whites. For several decades, Washington had advocated massive programs of vocational education to teach blacks the skills and trades most needed by white employers. DuBois argued that Washington's approach would make African Americans as dependent on whites as they had been during slavery. DuBois demanded nothing less than equal educational opportunity, whereby blacks could obtain the same broad scientific and liberal arts education as whites through equal access to primary and secondary schools and colleges and universities. Less than that, he said, would condemn African Americans to perpetual serfdom.

In 1905, DuBois organized the "Niagara Movement" at a Niagara Falls conference of 29 African-American leaders, who, with DuBois, repudiated Washington's policy of "accommodation" and demanded complete political, educational and social equality for African Americans. After several years of race riots in the South and Midwest raised fears of a new civil war, a group of social leaders of both races met in New York in 1909 to replace the Niagara Movement with the new, interracial National Negro Committee, whose goal was racial peace and justice. In 1910, they changed the name to the National Association for the Advancement of Colored People (NAACP) and named DuBois director of publications and research to write all the organization's pamphlets and magazines.

In 1910, he left Atlanta University to found *The Crisis* magazine, the official publication of the NAACP. He built the circulation of *The Crisis* to more than 100,000 readers

and made it the most influential journal of protest in the United States. *The Crisis* urged African Americans across the United States to abandon Booker T. Washington's policy of "accommodation" in favor of a new protest movement. "If we are to die," DuBois wrote, "in God's name let us perish like men and not like bales of hay." In 1915, Washington died, and, with him, his policy of accommodation. DuBois emerged as the nation's most influential black leader, demanding nothing less than equal education, equal justice and equal rights for African Americans. His magazine was one of the few publications in the United States to report on the thousands of lynchings and other atrocities committed against African Americans. DuBois also reported on the achievements of African Americans, who were largely ignored by the white-owned press. He wrote on African cultures and encouraged African-American authors to submit poetry, fiction and nonfiction articles, thus spawning the so-called Harlem Renaissance of black writers. *The Crisis* encouraged young African Americans to pursue higher education, and he called on the African-American community to support Negro colleges.

The protest movement, however, brought DuBois nothing but bitter disappointment for almost the rest of his life. In 1916, the federal government rebuffed his efforts to allow African Americans to enlist in the Army. Later, more than 80,000 African Americans were drafted into the Army, only to be segregated into separate units from whites. In 1919, when race riots erupted in Illinois, Nebraska, Texas, Arkansas and Washington, D.C., DuBois demanded, in vain, "to have the Constitution of the United States thoroughly and completely enforced."

World War I not only failed to win freedom for blacks in the United States, it failed to win freedom for Africans from European colonial powers in Africa, and in 1919, with the

support of the NAACP, DuBois organized the first Pan-African Congress in Paris, where for the first time African Americans discussed mutual problems with Africans and West Indians. While Africans and West Indians demanded self-rule from European colonial powers, DuBois and the NAACP demanded nothing less than full integration of African Americans into white society.

In 1936, discouraged by the effects of the Depression on African Americans, DuBois left the NAACP and returned to Atlanta University, determined to build black higher education as a vehicle for African Americans to achieve equality. Although he convinced the presidents of 20 African-American colleges to cease competing with each other and cooperate, his voice in national affairs began to fade without *The Crisis* as a medium, and he never again wielded the same influence as a leader of his race.

After more than one million African-American servicemen were forced to serve in segregated units during World War II and after their service failed to earn them new freedom in the United States, DuBois once again raised his voice in protest. At 75, he left Atlanta University in 1944 and rejoined the NAACP. He traveled widely, lecturing, writing articles and stirring African Americans everywhere to protest white injustice, even appealing to the United Nations "to take cognizance of a situation which deprives [millions of African Americans] of their rights as men and citizens. . . ."

Embarrassed by his constant harangues, the federal government arrested him in 1951, accusing him of being an agent of the Soviet Union. He was tried and acquitted, but the government responded by stripping him of his passport and right to travel and voice his views overseas. In 1954, however, his words echoed through the U.S. Supreme Court, which struck down racial segregation of American public

schools in *BROWN v. BOARD OF EDUCATION OF TOPEKA*, the landmark case brought by the NAACP that he had helped found. After the government indicted him as an enemy agent in 1961, DuBois and his wife fled the United States for good, accepting an invitation from Ghanaian president Kwame Nkrumah “to come home” to his forebears in Africa, where he directed the publication of the *Encyclopedia Africana*.

Scorned by white Americans, he was honored by Africans everywhere; he became a Ghanaian citizen in 1963. He died in Accra on August 27, 1963, and was buried on the same day that more than one-half million black and white Americans were assembling for the March on Washington, best remembered for the Rev. Martin Luther King, Jr.’s demand for racial equality in his famous “I Have a Dream” speech. Before the march began, the throng bowed their heads in remembrance of DuBois, whom the NAACP later eulogized this way: “He created what never existed before—a Negro intelligentsia. . . .” His most important books include *The Souls of Black Folk* (1903), *The Negro* (1915), *Black Reconstruction* (1935), *Dusk of Dawn* (1940), *Color and Democracy* (1945), *Encyclopedia of the Negro* (ed., 1933–45) and *Autobiography of W. E. B. DuBois* (posthumous, 1968).

dunce A dull-witted, stupid, incompetent or unmotivated student, whom American teachers routinely punished by ordering the child to sit on an elevated stool, in and facing the front corner of classroom, in full view of other students, with a conical “dunce cap” atop his head. The term is derived from the middle name of John Duns Scotus, the 13th-century Scottish theologian who founded the scholastic system called Scotism, which held theology and philosophy to be intertwined and that truth lay in a combination of philosophy and divine revelation. For centuries

after his death, Scotists, or “Dunses,” constantly debated followers of St. Thomas Aquinas, or Thomists, who ridiculed their challengers as sophists and pedants, for which the title dunce became synonymous. The dunce cap, or clown’s hat for children who misbehave in class, appears to have originated in the early 1800s.

Dunster, Henry (1609–1659) English-born clergyman and teacher and, in effect, the founding president of HARVARD COLLEGE. Although Harvard opened in 1636, its first “president,” the ne’er-do-well NATHANIEL EATON, left the school without funds, faculty or students, and it was closed after one year of his tenure. It reopened in 1640 under Dunster, a graduate of Magdalene College, Cambridge University. He immediately organized Harvard along the lines of English colleges—a form it would retain over the next two centuries. By the time he resigned 14 years later, Harvard could boast of 74 eminent alumni, a library of more than 1,000 volumes, three buildings and a president’s house that Dunster himself had built and which housed a printing press. Although he contributed a tract of land and often donated his small salary to save the college from bankruptcy, he was nevertheless forced to resign when he converted to Baptism in 1654. Espousing the Baptist principle of postponing baptism until a child reached adulthood, he was tried and convicted for refusing to have his infant child baptized. He spent the remainder of his life in Scituate, Massachusetts, where he served as a minister and tried without success to recover the back salary that Harvard owed him.

Dutch Reformed Church The established church of New Netherland, when the Dutch ruled present-day New York, from 1625 to 1664. A derivative of CALVINISM, the church was instrumental in helping establish the first

schools in New York and supervising the licensing of the first teachers. The Dutch first landed in the New World in 1609 when English navigator Henry Hudson led a Dutch expedition that planted the Dutch flag on Manhattan Island and other points northward along what was later named the Hudson River. The first colonists did not arrive until 1614, when the Dutch West India Company dropped off small groups of mostly French-speaking Belgian families, or Walloons, at various points along the coastline of the new province. In 1628, Domine Jonas J. Michaelius arrived to assume the ministry of the Dutch Reformed Church and instruct the young. In 1638, the Dutch West India Company sent schoolmaster Adam Roelantsen to New Amsterdam to open what some maintain is the oldest continually operating school in the New World, the ancestor institution of today's COLLEGIATE SCHOOL.

Despite the advent of British rule in 1664, Dutch colonists were given full freedom of movement and the right to own property, and they spread across the farmlands of southern New York, eastern New Jersey and eastern Pennsylvania, taking their church with them. By the early 1700s, the spirit of revivalism affecting other Protestant sects in North America gripped the Dutch Reformed Church, which not only proselytized whites, but sought converts among Indians.

Like other Protestant sects, the church split between "Old Light" conservatives and "New Light" liberals who sought to adapt church rituals to the practical needs of life in the New World. Fearing that Dutch pastors would join with Anglicans in establishing King's College (later, COLUMBIA COLLEGE) and possibly unite the two religions, Reverend Theodore Frelinghuysen sought to open a traditional Dutch Reformed college to train young ministers. A conference of other ministers and elders in 1755, however, led to the opening of Queen's

College (later, Rutgers College), a more secular institution than Frelinghuysen had sought, in New Brunswick, New Jersey. The Queens charter called for "the education of youth in the learned languages, liberal and useful arts and sciences, and especially in divinity; preparing them for the [Dutch Reformed] ministry, and other good offices."

Dwight, Timothy (1752–1817) American educator, author, religious leader, founder of coeducational schools in Massachusetts and Connecticut, and, from 1795 to 1817, the president of YALE COLLEGE. Born in Northampton, Massachusetts, Dwight was the grandson of New England theologian-educator JONATHAN EDWARDS. He graduated from Yale in 1769 and remained there as a tutor until 1777, when he resigned to become a chaplain in the Revolutionary Army. In 1779, he returned to Northampton, where he combined preaching in several churches with the founding and operation of a coeducational academy. In 1783, he became pastor of the Congregational Church of Greenfield Hill, Connecticut, where he remained 12 years and founded another coeducational academy. In 1795, he replaced EZRA STILES as president of Yale, where he spent the rest of his life, expanding the college from a relatively small theological institute into the nation's preeminent institution of higher learning. Under his leadership, Yale became the new standard for colleges founded elsewhere in the United States.

To attract more mature scholars, Dwight abolished outmoded forms of discipline and modernized the curriculum by establishing a professorship in chemistry, which he invited Benjamin Silliman to fill. Silliman, who fathered and nurtured American science education, collaborated with Dwight in founding the Yale Medical Institution (later the Yale Medical School) in 1813. Dwight was an active teacher at Yale, conducting classes in

rhetoric and metaphysics for seniors. A conservative Congregationalist, he frequently preached at Yale, where he was known as "Pope Dwight." In 1808, he helped found the ANDOVER (Massachusetts) THEOLOGICAL SEMINARY to train traditionalist Congregational ministers. Dwight's grandson, also named TIMOTHY DWIGHT, later became president of Yale as well.

Dwight, Timothy (1828–1916) American theologian, educator and, from 1886 to 1899, the innovative president of Yale University who transformed the then-small college into a major, world-renowned university. Grandson of the first TIMOTHY DWIGHT to be Yale president, Dwight was born in Norwich, Connecticut, and educated at the Hopkins

Timothy Dwight (*Library of Congress*)

Grammar School in New Haven, before getting his B.A. and M.A. degrees at Yale. He tutored at Yale while studying theology at Yale Divinity School from 1850 to 1853. He was ordained in 1861 and became professor of sacred literature at Yale Divinity School. Dwight promoted closer contacts between faculty and students and encouraged students to take more responsibility for their own education by introducing course electives. During the first year of his presidency, YALE COLLEGE was renamed Yale University, and Dwight henceforth presided over a vast expansion of Yale's physical plant.

dyscalculia An inability—often neurological in origins—to perform mathematical operations, including simple arithmetic such as addition, subtraction, multiplication and division and to apply arithmetic in everyday life. Children with dyscalculia cannot perform calculations mentally or memorize basic arithmetic facts such as the multiplication tables. They are also unable to master abstract areas of mathematics, such as algebra, plain and solid geometry, trigonometry and calculus, and they must use calculators to perform simple arithmetic needed for everyday life.

Common dyscalculia often has nothing to do with an inability to calculate, but rather with a reading impediment—DYSLEXIA—that prevents a child from seeing numbers clearly or in their correct order. A child not suffering from dyscalculia who sees 38 as 83 will automatically produce the wrong answer when adding it to or subtracting it from another number. Retraining directed at the reading impediment often solves the child's problem with arithmetic.

Nonneurological dyscalculia can result from inadequate infant education prior to preschool—i.e., a failure to expose the infant to concrete objects such as blocks to manipulate and a failure of parents to teach abstract

concepts using language-based facts such as *more than*, *less than*, and so on. Again, retraining, using blocks and other objects to teach such concepts as adding, taking away and "how many do we have left," can solve such nonneurological dyscalculia.

dysgraphia A learning disability of otherwise normal children characterized by an inability to write conventionally at the appropriate level for the child's age. Often the result of neurological damage, dysgraphia is characterized by letter reversals, incomplete letter formation, telescoping of letters and inability to write along a straight line, producing a wave-like appearance. Some or all symptoms of dysgraphia are common developmental problems for many preschoolers and kindergartners, but such symptoms normally disappear as they mature physically. For those whose symptoms persist, the word processor has proved the most effective method of overcoming the problem.

dyslexia A learning disability of otherwise normal children characterized by an inability to read, write and spell at an appropriate level at any given age. A broad "catchall" term, dyslexia is often misused to include a variety of unrelated learning disabilities. Indeed, dyslexia has developed so many connotations that it has lost much of its connotative specificity except as a broad reference to reading problems. The National Institute of Neurological Disorders and Stroke at the National Institutes of Health defines dyslexia as "a learning disability that alters the way the brain processes written material. The effects of the disorder vary from person to person . . . the only common trait among people with dyslexia is that they read at levels significantly lower than typical people of their age and intelligence."

The American Psychiatric Association's *Diagnostic and Statistical Manual of Mental Disorders* calls dyslexia a developmental reading disorder whose "essential feature . . . is marked impairment in the development of word recognition skills and reading comprehension that is not explainable by mental retardation or inadequate schooling and that is not due to a visual or hearing defect or a neurological disorder." The diagnosis is made only if this impairment significantly interferes with academic achievement or with activities of daily living that require reading skills. "Oral reading is characterized by omissions, distortions, and substitutions of words and by slow, halting reading. Reading comprehension is also affected."

Often found in concert with other LEARNING DISABILITIES, dyslexia cannot be treated medically, but various methods of sophisticated instruction and "retraining" can teach many dyslexics to overcome the most debilitating effects on their reading, writing and spelling skills. There is no correlation between dyslexia and intelligence. I.Q.'s among dyslexics range as widely as that of nondyslexics. Dyslexia affects an estimated 15% of American children, although the range of estimates vary from 2% to 20%. Rates of dyslexia vary from region to region in the United States and from country to country.

Brain imaging studies of dyslexic children have found anomalies in the middle upper portion, or temporoparietal region, of the left half of the brain—an area that converts blocks of sound, or phonemes, to written letters and decodes their connection. Although dyslexia can be a permanent neurological malformation, there is evidence that it is developmental in some children, and, indeed, may appear and disappear. For example, only one of six in a group of 400 Connecticut children who displayed symptoms of dyslexia in the first grade

continued to display those symptoms in the third grade, according to a nine-year study by pediatrician Sally E. Shaywitz, M.D., at the Yale University School of Medicine. The study also

found, however, that some children who showed no symptoms of dyslexia in first grade acquired them by the time they reached third grade.

E

early action A COLLEGE ADMISSIONS procedure whereby a college notifies a limited number of applicants, in advance of most applicants, whether they have been admitted, been rejected or had their applications deferred for review at a later date. Used by a relatively small number of colleges, the early action procedure is similar to EARLY DECISION procedures in that it requires applicants to file two months earlier than conventional applicants—usually by November of their senior year of high school. In turn, the colleges notify applicants of their status by mid-December, as much as four months before the rest of the applicant pool. A student may only apply for early action to one college. All other college applications must be for regular-admission notification.

Unlike early decision procedures, students accepted under early action programs are under no obligation to attend the college that accepts them and need not notify the college of his or her intention until the following spring after receiving decisions from other colleges on conventional applications. The college's decision to accept or reject the applicant is binding, however. A decision to defer an early action application merely transfers the application into the general application pool for consideration with conventionally filed applications and notification the following spring.

early childhood education A broad reference to any and all formal and informal, non-familial, institutional education of children during their PRESCHOOL, prekindergarten years. The term is vague, however, and some psychologists extend the early childhood years through the first three grades of primary school.

early college A school-college partnership program that combines high school studies with college-level courses, allowing students to enroll as early as ninth grade (or earlier for the particularly gifted) and go on to earn both a high school diploma and an associate or bachelor's degree at graduation. Unlike other SCHOOL-COLLEGE PARTNERSHIP PROGRAMS, early-college high schools are separate and independent administrative entities that operate on college campuses and offer a full range of whatever high school academic courses their students need to complete their secondary school education. Many of the high school courses, however, are team-taught by college and high school faculty to ensure a smooth transition from secondary school to college academic levels. Although some early colleges are open to ninth graders—one even starts with middle school students—the majority admit only high school juniors and seniors to reduce costs by limiting the number of courses they offer. Usually studying at their own pace, students can graduate in less time than in conventional

schools. Depending on the particular school, students usually enroll in two college courses per semester their first year, three their second year and as many as four their third year. They attend classes with college students and use the same laboratories, libraries and other academic facilities, and they earn the same college credits, which they may apply toward their future degrees. All early colleges offer academic counseling, along with support classes and tutoring when needed. Although students forgo traditional extracurricular activities such as team sports and proms, they generally have near-perfect attendance and graduation rates. Students at some early colleges can play on school teams at the public schools they would normally attend.

Because of the heavy course load, few early college students graduate high school early, but they tend to complete the combined high school–college program and earn their bachelor's degrees in seven or even six years instead of the usual eight—thus reducing the costs of a college education and, in doing so, replicating the standard European model of education, which offers no equivalent of the American “college.” Instead, students complete the academic course work of four years of American high school and the first two years of American college during their secondary school years and proceed directly to university for concentrated work leading to a master's degree or doctorate in a particular subject—combining the work of the last two undergraduate years at American colleges (the so-called major) with the subsequent years of graduate school.

Often called middle colleges, some of the newer early colleges have shifted focus from gifted students to disadvantaged students, theorizing that the stimulus of more challenging academic work, combined with personalized counseling, may improve student performance and reduce high school drop-out rates. The BILL AND MELINDA GATES FOUNDATION invested \$110

million to create 42 schools serving about 17,000 students—many of them functioning below grade level. The theory guiding the investment was that a combination of personalized attention and challenging work would help students finish school with demonstrated proficiency in most academic areas and accumulate enough college credits for an associate degree. The Gates Foundation grant is expected to increase the number of early colleges to 170 or more by 2010. Guilford County, North Carolina, opened eight of what it calls “Early/Middle Colleges,” with 100 students in each, at eight nearby community and technical colleges and has cut the area's public school drop-out rate from 6% to just over 3%.

The early college concept began with the founding in 1966 of Simon's Rock College in Great Barrington, Massachusetts, by Elizabeth Blodgett Hall, the former headmistress of a private girl's school. Founded for and still devoted to gifted children, Simon's Rock is a part of Bard College in Annendale-on-Hudson, New York, where it allows young high school students to enroll after tenth or eleventh grade and progress academically at their own pace to earn associate and bachelor's degrees as soon as they master the work—no matter how young they are.

Whether the Simon's Rock concept is applicable to disadvantaged students remains under study. The hope is to develop a broad-based curriculum that can be transferred to conventional high schools to stimulate more minority students to finish their education. While 78% of white high school students graduated from American public high schools in 2005, only 56% of black students and 52% of Hispanic students received their diplomas, and only about 20% of black and Hispanic students who graduated were academically prepared for college, compared with 40% of white students. Minority students make up 80% to 95% of the enrollment in the early colleges devoted to the

disadvantaged, and many such schools are tuition-free CHARTER SCHOOLS that admit students no older than 15 who are entering ninth grade for the first time and read at least at the sixth-grade level.

(See also ACCELERATION; GIFTED; PROJECT ADVANCE; TRANSITION SCHOOLS.)

early decision A COLLEGE ADMISSIONS procedure whereby high school seniors file applications in advance of the conventional application pool and receive advance notice of the college's decision to accept or reject their application. A student may only apply to one college for early decision, and applications are usually due by November of the senior year of high school, instead of the usual January or February date for conventional applications. In turn, the college notifies the applicant of its decision by mid-December. If accepted, the student may be legally committed to attend the early-decision college the following autumn and may not apply to any other college. For students, early decision eliminates the chore and cost of filing a host of applications to other colleges, and it eliminates a winter's anxiety, waiting for the day in spring when colleges mail their acceptances to most applicants.

The early-decision application originated at academically selective private colleges in New England in the 1960s and 1970s and was designed to cut administrative costs and assure each college a core of highly motivated students in each incoming freshman class—often more than 50%—who made that college their first choice. Early-decision acceptances left colleges with fewer seats left to fill from the conventional applicant pool and allowed them to be more selective in choosing the rest of the incoming freshman class. Recognizing that some colleges actually lowered acceptance standards for early decision applicants, high school seniors flooded colleges with early-decision applications in the late 1980s and early

1990s. At some prestigious private schools, as many as 70% of the senior classes applied early decision, while 40% to 50% of public high school seniors followed suit. Rather than watch a handful of New England colleges siphon off the brightest students, private colleges—and even public colleges—across the nation set up their own early-decision programs. By 1998, more than 500 colleges offered some form of early decision, compared to only about 120 a decade earlier, and some less selective colleges established two early-decision programs: Early Decision I, with a November 1 application deadline, and Early Decision II, with a January 1 application deadline, that permitted students rejected by Early Decision I colleges to apply “early” to a second institution and still have an edge over those who applied in the general application pool later in the winter or early spring.

Over the years, however, early decision programs have all but locked out economically disadvantaged students from the applicant pool, because they would have to commit to a college long before they learn how much financial aid the college will offer them. Aid packages are usually not revealed until all applications have been received in mid-April. Students who apply for admission at that time receive proposed aid packages with their acceptances and are thus able to compare offering from various colleges before deciding which to attend. Because of their interest in expanding the percentage of students from lower economic groups, HARVARD, PRINCETON, and other academically selective colleges eliminated early decision programs in 2007, knowing they will still receive ten or more times the number of academically gifted applicants that they can accept. For second-tier colleges that fall in the “SAFETY-SCHOOL” category for many students, early decision will continue to be a primary method of attracting motivated students willing to make such schools their first choice.

(See also EARLY ACTION; ROLLING ADMISSIONS.)

early intervention Any remedial program aimed at preventing dysfunction, as opposed to remediation programs to correct dysfunction. A broad range of early intervention programs are available in education, of which Operation HEAD START may be the best known and most widely used. Developed in the mid-1960s, Head Start gives economically and culturally deprived preschoolers the education needed for them to begin school on an equal footing with children who have not suffered such deprivations. Early intervention at the preschool level tends to decrease grade retention rates and the need for remedial services in primary and secondary school, while increasing high school graduation rates.

In 2000, the U.S. Department of Education released the results of a 25-year study that showed early intervention among disruptive preschoolers can reduce the need for special education when they enter school. Called the Regional Intervention Program (RIP), the government-subsidized program followed 40 families whose preschoolers had displayed extreme behavior problems, such as outbursts, temper tantrums, screaming and crying. RIP taught parents to monitor their children's behavior, clarify their expectations for their children, give their children specific choices, reward good behavior and work closely and cooperatively with other child-care providers and teachers to teach their children self-control and ways to interact with others. Although the infants were not diagnosed for ATTENTION DEFICIT DISORDER or ATTENTION DEFICIT HYPERACTIVITY DISORDER, none developed either of these learning disabilities, and, indeed, after 25 years, all the children had completed high school, half had attended college and four were working on doctoral degrees. None had been placed in special education and only one had a juvenile justice offense—for smoking marijuana.

earth science The study of geology, oceanography, meteorology and other sciences dealing with the Earth and its parts. Coined in 1939, the term generally refers to broad-based primary and secondary school geology courses that are less specialized than college-level geology and include nongeological topics related to environmental science.

East India School An early, colonial "public free school" for settlers' children that was to have been built in Charles City, Virginia, in 1624. The school was proposed in 1621 by the Reverend Patrick Copland, chaplain of the *Royal James*, a ship in the East India Company fleet. Seeking to assure the propagation of the Anglican Church among the settlers, Copland raised 70 pounds aboard ship for the project. The Virginia Company, which ran the East India Company's plantations in Virginia, then granted 1,000 acres of land and sent a carpenter and five apprentices to build the schoolhouse. The company also agreed to bring books and supplies from England, but the supplies were lost at sea, and after the mismanaged building project ran out of funds, it was abandoned.

The East India School was one of several such company-sponsored educational projects that came to naught in the early years of the Virginia colony, the most notable being HENRICO COLLEGE. In the end, the company abandoned such efforts and decided to leave education to the settlers themselves.

Eaton, Nathaniel (1609?–1674) English-born theologian who was named first president of HARVARD COLLEGE in 1637. Although he attended Cambridge University, he did not receive a degree and, according to his students, Eaton was "fitter to have been an officer in the Inquisition or master of a house of correction, than an instructor of Christian youth." Eaton had come to the colonies in 1637 with his older brother Theophilus, who was one of the

original patentees of the Massachusetts Bay Company and, with John Davenport, would later found a new colony in New Haven and serve with distinction as governor there for 20 years. It was his brother's influence that earned Nathaniel the appointment as Harvard's first president, but the appointment proved disastrous. A drunkard, the younger Eaton quenched his thirst with embezzled college funds, while feeding his students meatless meals, sour bread and dry pudding. After clubbing his assistant with a cudgel "big enough to have killed a horse," Eaton was charged with assault and fined by the Boston court.

After a year of "beating knowledge" into his nine students, often inflicting "between twenty and thirty stripes at a time," Eaton was dismissed on September 9, 1639, and the college closed for a year until its board of overseers could find a new president. Due for a church trial for his misconduct at Harvard, he fled Boston, eventually returning to England, where he died penniless in debtor's prison.

eclectic reading instruction Any program of reading instruction that combines several different methods, depending on the teacher's diagnosis of student needs. Although most teachers rely on **BASAL READERS** as the core of eclectic reading programs, they may, for example, supplement basal reading instruction with study-skill manuals, children's literature, remedial work and other programs designed to permit faster progress or correct student deficiencies.

Economic Opportunity Act (1964) A landmark federal law that was the centerpiece of the **WAR ON POVERTY**, a far-reaching policy of President Lyndon B. Johnson, who saw education as the key to ending poverty in the United States. The architect of the program, however, was the brother-in-law of the late president John F. Kennedy, R. Sargent Shriver, who had established and effectively directed the Peace

Corps in 1961. The first in a series of antipov-erty measures that Congress passed during the 1960s, the Economic Opportunity Act (EOA) provided for establishment of a range of community action programs, through which local communities could tap federal funds and professional help to combat the causes of poverty in their areas. Under Shriver's direction, the programs offered something for every type of community afflicted by poverty, from health care to loans for needy farmers.

But the heart of the program were four educational programs, the most far-reaching of which was **HEAD START**, a preschool program for economically and culturally deprived children that provided mental and physical health care, welfare, recreation, intellectual and academic training and remediation. During its first summer of operation, the program enrolled more than 500,000 four- and five-year-olds in preschools across the United States. Although professionals paid with federal funds were in charge of each preschool, parents and other community residents participated in the program as paraprofessionals and volunteers.

The other three education-related programs of the Economic Opportunity Act—the National Youth Corps, the Job Corps and Upward Bound—provided for job training to ease inordinately high rates of unemployment among adolescents from low-income families. In designing each program, Shriver and his EOA planners focused on what they believed to be two basic causes of adolescent unemployment: "inherent unemployability" and "lack of salable skills." The former was believed to be a culturally based syndrome, arising from lack of exposure to the world of work and consisting in an inability to take and carry out orders of supervisors, inability to get along with other workers, poor attendance and lack of punctuality, and apathy and lack of motivation. The lack of salable skills was the result of a continuing

decline in the number of unskilled jobs in the face of increasing automation and introduction of technology in industry.

The National Youth Corps subsidized two types of work and training programs for poor high school–age youngsters. One provided and underwrote the costs of part-time jobs for low-income high school students, paying just enough to permit them to remain in school and graduate. The second Youth Corps program provided and paid for work and training experience in nonprofit and public agencies for poor, unemployed, out-of-school adolescents 16 to 19 years old. About 50% of the youngsters went to work maintaining parks or assisting in recreation and welfare agencies, including Head Start. In New York City alone, the in-school program enrolled almost 1 million young men and women from 1967 to 1972, while the out-of-school program put nearly 500,000 to work. Both programs were designed to overcome “inherent unemployability” of the youngsters hired.

The Job Corps also provided jobs and training for adolescents. Unlike the Youth Corps, it was a residential program that transferred economically deprived youngsters, 16 to 21, to residential settings, where they were given free lodging, clothing, meals and health care, along with basic educational and vocational skills, including remedial reading, writing, mathematics and other basic academic skills. Initially a men’s program, it responded to criticism of gender bias by opening residential centers for women as well.

The U.S. Department of Agriculture operated the rural centers and trained youngsters in conservation work. Urban centers were operated by nonprofit organizations, universities and private companies such as International Business Machines Corp. and Westinghouse Corp., which taught the youngsters skills appropriate for job opportunities in urban areas. Because of its residential nature, the Job Corps proved far more costly than the Youth Corps.

Although it enrolled about 750,000 young men and women between 1966 and 1990, it came under a constant barrage of criticism for focusing primarily on “inherent unemployability,” instead of salable skills. Upward Bound, the last of the EOA educational programs, was a catchall of nonresidential basic education, job training and career counseling programs primarily for adults, but also for adolescents.

Though central to the War on Poverty, the Economic Opportunity Act of 1964 was but one of five major pieces of federal legislation based on using education as a vehicle for the disadvantaged to emerge from their low economic conditions. The others were the MANPOWER DEVELOPMENT AND TRAINING ACT OF 1962, the VOCATIONAL EDUCATION ACT OF 1963, the ELEMENTARY AND SECONDARY EDUCATION ACT OF 1965 and the HIGHER EDUCATION ACT OF 1965. All may be said to have had their roots in the reaction to Michael Harrington’s *The Other America: Poverty in the United States* (1962), which shattered the widely believed myth that the United States was an “affluent society.” Indeed, he claimed that between 40 million and 50 million Americans—about 22% to 28% of the nation’s population at the time—lived in poverty, in families earning less than \$3,000 a year.

Substantiated by ample federal government statistics, his data helped mobilize Washington and the American people until their attention was increasingly drawn to the Vietnam War, which siphoned off many of the financial resources that had been dedicated to the programs created during the War on Poverty.

In 1973, many of the job training programs were reorganized and grouped under the COMPREHENSIVE EMPLOYMENT AND TRAINING ACT OF 1973. The Office of Economic Opportunity, which administered the War on Poverty, was dismantled, and by the end of the 1970s, its functions had been scattered throughout the Department of Labor and what was then the

Department of Health, Education, and Welfare (later reorganized into the Department of Education and the Department of Health and Human Services). Of the major programs of the War on Poverty, only Head Start continues to thrive and grow.

economics of education An area of study dealing with the financing of education, the national and community resources invested in education, the kinds of education produced by a society, the allocation of education to various segments of the population, the methods and costs of distributing education and the economic returns of education.

Edison Project A for-profit educational venture founded in 1992 by Whittle Communications L.P., a Knoxville, Tennessee, firm that developed CHANNEL ONE closed-circuit news telecasts to public school classrooms. Created by publisher Christopher Whittle, and headed by former Yale University president Benno Schmidt, the Edison Project initially sought to raise \$2.3 billion for a network of 1,000 technically advanced schools, in which it planned to redesign conventional schooling and develop a new model that would operate at lower costs than public schools, produce better academic results, charge a moderate tuition and yield net profits of about 10%. The theory of the project was to eliminate the administrative costs of conventional public schools by reducing nonteaching staffs to a minimum and invest those funds into higher teacher salaries and educational technology such as WIRED CLASSROOMS, computers for each student and other advanced instructional vehicles. The school day was to be lengthened from the 180 day average of conventional schools to 205 days, with each school day lengthened to eight hours a day. Teachers were to receive month-long training sessions at Edison-operated summer institutes.

Although costs of opening each school—teacher training, computers and books—would average about \$1.5 million, Edison envisioned the costs of educating each child at about the same as public schools. From the outset, however, fund-raising fell far short of expectations, and financial losses forced Whittle to divest himself of Whittle Communications and Channel One and to scale back Edison operations. By 2005, however, Edison had become the nation's largest EDUCATIONAL MANAGEMENT ORGANIZATION of public schools, and, in the 2006–07 school year, it operated 101 schools with 61,000 students in 19 states. About 60% of the schools are regular public schools converted to the Edison system, and about 40% are charter schools. Edison manages the remainder under contract with states. Edison has also diversified into other areas of education, providing after-school tutoring to 250,000 students and managing 175 summer schools with 30,000 students. It also provides student-assessment services and operates a unit in Britain for 20,000 students. A study by Rand Corporation, an independent research organization, found that Edison's intervention had produced less-than-sparkling educational outcomes, however. Average student proficiency climbed 11% in reading and 17% in mathematics from 2002 to 2004, compared with gains of 9% and 13%, respectively, in a matched set of comparison schools with similar student populations. Of all its schools, 84% have registered gains in student performance, 8% have remained unchanged and 8% have seen declines in student performance. Edison disputes the interpretation of Rand figures and claims that its annual gain in "overall student performance" was 5.7% a year over five years—"a rate 2.7 times better than the average-public school system in America."

Edison schools typically divide their faculty into eight "houses." Generalist teachers staff each of three houses—about six teachers

per house—and the remaining five houses are staffed by fine arts teachers, special education teachers, instructional assistants, building services personnel, and office staff members. The “head” of each house meets with members for 45 minutes each day and then joins other heads and the principal to determine overall school strategy. Edison claims that the daily interaction of teachers and consequent sharing of responsibilities in a broad educational plan differentiates its schools from conventional facilities.

educable mental retardation An archaic term referring to a level of retardation that permits a limited degree of training and education. Sophisticated techniques developed in recent years, however, permit some training of almost all but the most profound levels of mental retardation.

education In its broadest sense, the acquisition of knowledge, skills and values that permit an individual to function and make decisions perceived as self-enhancing. In the United States, education usually has a more limited connotation, namely, knowledge acquired through formal instruction. In this limited American sense, education is divided into four stages—preschool, primary, secondary and higher education—with each stage less CHILD-CENTERED than the last.

Preschool education revolves around socialization—teaching two- to four-year-olds self-control, sharing, getting along with others and other social and intellectual skills needed for living and working in school and society. PRIMARY SCHOOL teaches five- to 10-year-olds such basic academic skills as reading, writing and calculating, along with basic concepts of history, geography, the natural and social sci-

ences, music, art, crafts, sports and health and hygiene.

Secondary school generally has two levels, middle school and high school. Although education at both levels progresses through continually advancing levels of traditional academics, MIDDLE SCHOOL instruction is geared to coping with the specific problems of pubescent children, 11 to 14 years old. High school instruction veers sharply from child-centered methods to subject-centered presentations, in which students are expected to have the maturity to sit quietly in class, taking notes, as teachers lecture at greater and greater lengths. There are two forms of traditional high school education in the United States, academic and VOCATIONAL, although a third form of “GENERAL” EDUCATION developed in the decades following World War II to sequester unmotivated students in relatively undemanding tasks until they reach the age when they are legally free to drop out of school.

Higher education—college and graduate school—provides advanced, specialized studies leading to BACHELOR’S, MASTER’S and DOCTORATE degrees in specific academic or professional areas.

The roots of American formal education reach back to the earliest known Western civilizations, where it originally had two goals: to teach the religion and traditions of the particular civilization. The temple schools of ancient Egypt added a third goal, vocational skills, including writing, mathematics, the sciences and architecture. The Greeks added a fourth goal: the preparation of young men for self-government and leadership roles in state and society.

Formal education in North America began about two decades after the arrival of the first European settlers in Virginia, New Netherland (now New York) and New England. Prior to the existence of schools, local churchmen educated the young by preaching and catechizing in an effort to fend off the satanic barbarism

that settlers feared life in the wilderness would inevitably produce.

After an abortive attempt to found a school at Charles City, Virginia, in 1621, the Virginia assembly established the first school in that area sometime in 1643, using a bequest of 200 acres from a planter named Benjamin Syms. To the north, the Dutch West India Company established the first school in New Amsterdam in 1638 (see COLLEGIATE SCHOOL). Within a decade, the company had established other schools in nearby villages of New Netherland. Although financed by the company, all were taught by teachers appointed by the Classis of Amsterdam, the governing body of the DUTCH REFORMED CHURCH.

In New England, the first settlers in the Plymouth Colony eschewed formal education in favor of instruction by the church and by parents. Boston was the first New England community to establish a formal school, in 1635, and Ipswich and Charlestown each opened a grammar school the following year. In 1638, Cambridge set aside three acres for "a public school or college," while Dorchester, Newbury and Salem opened schools the following year. The goal of all these institutions was not, however, erudition. "We in this country," wrote Jonathan Mitchell, a leading New England minister who helped found Harvard, "being far removed from the more cultivated parts of the world, had need to use utmost care and diligence to keep up learning and all helps to education among us, lest degeneracy, barbarism, ignorance and irreligion do by degrees break in upon us." To assure that goal, in 1642 the Massachusetts Bay Colony legislature ordered local governments, under penalty of fines, to ensure that children be taught "to read and understand the principles of religion and the capital laws of this country" (see MASSACHUSETTS LAWS OF 1642 AND 1647). By 1647 Massachusetts boasted at least nine institutions of formal education, including HARVARD COLLEGE.

In that year, however, the legislature passed a stricter law—the famed "Old Deluder Satan Act"—a landmark piece of legislation that established education as a basic, universal human right in the New World and made establishment and administration of formal schools an obligatory function of government. It also established the principle of local taxation to pay for local schools.

Passed on November 11, 1647, the historic legislation read as follows:

It being one chief project of that old deluder, Satan, to keep men from the knowledge of the Scriptures, as in former times by keeping them in an unknown tongue, so in these latter times by persuading them from the use of tongues, that so at least the true sense and meaning of the original might be clouded by false flosses of saint-seeming deceivers, that learning may not be buried in the grave of our fathers in the church and commonwealth, the Lord assisting our endeavors,—

It is therefore ordered, that every township in this jurisdiction, after the Lord hath increased them to the number of fifty householders, shall then forthwith appoint one within their town to teach all such children as shall resort to him to write and read, whose wages shall be paid either by the parents or masters of such children, or by the inhabitants in general, by way of supply, as the major part of those that order the prudentials of the town shall appoint; provided, those that send their children be not oppressed by paying much more than they can have them taught for in other towns; and it is further ordered, that where any town shall increase to the number of one hundred families or householders, they shall set up a grammar school, the master thereof being able to instruct youth so far as they may be fitted for the university, provided that if any town neglect the performance hereof above one year, that every such town shall pay five pounds to the next school till they shall perform this order.

The effect of the Old Deluder Satan Act was dramatic. Within 10 years of its passage, all eight of the 100-family towns in the colony had complied by establishing GRAMMAR SCHOOLS, while about one-third of the 50-family towns had established PETTY SCHOOLS. Connecticut enacted a similar law in 1650, and Plymouth followed suit in 1658. By 1689, schooling had become an established element of life in British North America. Virginia had 6 schools, Maryland at least 1, New York about 11 and Massachusetts about 23.

Communities without formal petty or grammar schools depended largely on private tutoring, either by ministers at church, private lay tutors or literate mothers, who taught children for a fee in their homes—the so-called DAME SCHOOLS. The dame schools and more formal petty schools taught basic reading, writing and arithmetic (along with basic religious studies) to children five to seven years old. They were the forerunners of the modern-day elementary school. The higher-level grammar school extended the curriculum to include the study of Latin, Greek, literature, advanced religion and other studies needed “to prepare such youths for the college and public service of the country in church, and commonwealth.” The grammar school curriculum lasted seven years and was offered on a year-round basis, allowing students to take leaves of absence during planting and harvesting and resume their studies during those seasons when they were not needed in the fields.

The 18th century saw little change in the basic system of education in the colonies, although it did witness a startling expansion in the number of schools and colleges and a slight shift in emphasis in the curriculum from the religious to the practical, with the introduction of courses on mechanics, agriculture, commerce and business. The industrial revolution had begun, and American colonists demanded

that schools teach their children courses needed for survival in the wilderness and success in an increasingly urban economy.

Education, however, was reserved for white males from families who could afford to forfeit the products of their children’s labor and pay the required school fees. Although some girls were allowed to attend petty school, they were not permitted to attend grammar school or college. And, despite efforts of some school reformers such as ANTHONY BENEZET, black children were denied all education other than biblical instruction that reinforced the notion that blacks were inferior beings, descended from Ham and condemned by God to serve the white man in perpetuity. Ironically, independence brought few changes to the American educational system, despite demands from some humanistic signers of the Constitution for a national system of free, universal public education. BENJAMIN FRANKLIN, BENJAMIN RUSH, THOMAS JEFFERSON, JAMES MADISON, John Adams and GEORGE WASHINGTON, all favored establishment of a national school system that would ensure elementary school education for all children and allow all who passed competitive examinations to progress, respectively, to grammar school, college and, for an elite few, to a national university. Successful completion of national university was to have been a prerequisite for service in all federal elective offices, including Congress and the White House.

The proposal was defeated by southerners, who feared education of slaves would lead to manumission, and by northern industrialists, who profited from child labor and indentured female workers. As a result, the CONSTITUTION omitted all mention of education and left the question to the states. The latter, in turn, left education in the hands of local communities, and ultimately to parents. Few of the latter could afford not to take advantage of their children’s earning power, and formal schooling

actually declined in the early decades of the Republic.

Some educational reformers were at work, however. In New England, CATHERINE BEECHER, EMMA WILLARD and MARY LYON were promoting the cause of women's education. In 1821, Emma Willard established the first female academy that offered an educational equivalent to that of men. In 1823, Catherine Beecher opened a comparable academy in Hartford and over the next 20 years helped open the teaching profession to women. And in 1837, Mary Lyon established the world's first college for women at Mount Holyoke, Massachusetts.

Meanwhile, HORACE MANN and HENRY BARNARD established the first statewide public school systems that guaranteed free, universal elementary school education in Massachusetts, Connecticut and Rhode Island. Although children continued to represent the cheapest and most profitable form of labor, some industrialists found work force illiteracy hurting the quality of their products and gradually losing them important shares of international markets. Many now threw their support to Mann and other educational reformers who called for universal public education to guarantee literacy of all American children. In 1852, Massachusetts passed the nation's first law making school attendance compulsory for at least 14 weeks a year for all children between the ages of eight and 14.

By the end of the Civil War, the public school movement had spread to almost all states outside the South, and northern military authorities forced the South to accept the concept as well. The decade following the Civil War also saw the public school movement spread to higher education, with passage of the Land Grant (Morrill) Act of 1862, which granted federal lands to each state to use for establishing agricultural and mechanical arts colleges (see LAND-GRANT COLLEGES) to train young Americans so as to expand the nation's frontiers.

By 1900, 32 states had passed compulsory education laws, but few states intended those laws to provide children with much more than basic literacy and numeracy. In 1910, only 10% of American children attended high school. The rest went to work in mines, fields and factories, and it would not be until the mid-1930s that the federal government would pass a child labor law that prevented exploitation of children and thus permit them to continue their education beyond elementary school. Indeed, as late as 1940, only 30% of American children completed high school. Few of these were blacks, and the few women permitted to obtain higher education were segregated in women's colleges.

It was not until the end of World War II, however, that the concept of universal education envisioned by Franklin, Jefferson, Adams and Madison would become a reality. First, the G.I. BILL OF RIGHTS of 1944 guaranteed every veteran the right to complete high school and obtain a free college education. A decade later, the landmark U.S. Supreme Court decision *BROWN V. BOARD OF EDUCATION OF TOPEKA*, and a decade after that, the CIVIL RIGHTS ACT OF 1964 eventually forced almost all schools and colleges in the United States, private as well as public, to open their doors to all Americans, regardless of race, color, creed, religion, national origin or gender.

With universal education, however, came a distinct shift in the type of education schools were expected to provide. In the 17th century, America's first schools were dedicated to preparing the wealthiest white males for HARVARD and a life in the ministry or public service. Benjamin Franklin and, later, Thomas Jefferson, expanded the role of schools in society by adding instruction in practical skills needed by young men to build and expand a new nation. Latin, Greek, mathematics, philosophy, French, and English were required for those students headed for lives in church and government. Other schools taught business and commercial

subjects such as bookkeeping to those headed into commerce. Agriculture and mining were essential for students moving westward, while sewing, cooking and other “domestic arts” formed the curriculum that prepared women for their futures as wives and mothers.

The late 1880s forced a new role on American schools—industrial and vocational training. Previously taught in APPRENTICESHIP programs by individual craftsmen in their shops, apprenticeships began disappearing when huge factories absorbed most manufacturing work and so divided elements of labor that few individual workers in mass-production plants were able to master an entire craft—only elements of them. As schools took over the training of America’s future industrial workers, the percentage of 17-year-olds attending high school soared from 6.3% in 1910 to more than 75% by 1965. The presence of so huge an adolescent population forced other changes on the educational system. Initially designed to teach a handful of traditional skills such as carpentry, aviation mechanics or printing, VOCATIONAL EDUCATION was forced to expand into teaching an endless number of occupational skills, from cosmetology to car mechanics. By 1976, options for students in American schools were “limited only by the legitimate needs of adolescents and the vivacity of the imaginations of . . . planners,” according to the U.S. Office (now Department) of Education’s National Panel on High School and Adolescent Education.

By 1980, the role of American schools in society had become one of fulfilling every educational need of every American. The very universality of their reach, however, forced schools to assume other, noneducative roles, including inter alia college advisory and job-placement services; career counseling; psychological counseling; sex education; drug and substance abuse education; antiviolence education; family intervention and social work; pregnancy counseling; supervision and education of the handicapped

and learning disabled; and driver education. A soaring divorce rate and an increase in the number of working mothers forced many elementary schools to establish day care facilities after normal school hours. Most recently, some segments of the public have demanded that schools offer morality education and even violate the Constitution by offering prayer in school.

“Today’s high school is called upon to provide the services and transmit values we used to expect from the community and the home and the church,” declared ERNEST L. BOYER, president of the CARNEGIE FOUNDATION FOR THE ADVANCEMENT OF TEACHING in 1983. “And if they fall anywhere along the line, they are condemned. What do Americans want high schools to accomplish? Quite simply, we want it all.”

Three decades earlier, ARTHUR BESTOR, president of the Chautauqua Institution (see CHAUTAUQUA LITERARY AND SCIENTIFIC CIRCLE), had warned, “The idea that the school must undertake to meet every need that some other agency is failing to meet, regardless of the suitability of the schoolroom to the task, is a preposterous delusion that in the end can wreck the educational system.” By the end of the 20th century, many critics of American public schools agreed that the expansion of American public schools into noneducational functions had obscured their educational functions. By the mid-1990s, a growing number of educators and political leaders began calling for a national effort to raise ACADEMIC STANDARDS. In 1994, Congress enacted the GOALS 2000: Educate America Act, which called for establishment of national academic standards to eliminate state-to-state differences in academic achievement, and, in 1997, the National Assessment Governing Board began a five-year program to develop new nationwide tests to measure academic performance levels of American elementary and secondary school students. To counter growing

public criticism of low academic standards, 49 states and the District of Columbia began developing their own higher academic standards for each grade and administering standardized tests in every subject area to determine whether students were meeting those standards and worthy of promotion.

(See also AFRICAN AMERICANS; COLONIAL EDUCATION; HIGHER EDUCATION; TEACHER EDUCATION; WOMEN'S EDUCATION and other related topics.)

education management organization A privately run organization—usually for-profit—that relies on traditional entrepreneurial methods of private industry to open and operate charter schools and/or manage regular public schools under contract. By the end of the 2006 school year, just over 50 EMOs were managing more than 520 schools with a student population of more than 230,000 in 29 states and generating revenues of just under \$2.6 billion. Only five years earlier, there were but 36 companies with about 370 schools and 142,700 students in 25 states, generating revenues of less than \$1.5 billion. Pioneered in 1995 by Edison Schools Inc., in New York City, the concept of the EMO has scored only mixed successes, as many managers grounded in business management techniques failed—or simply did not know how—to estimate accurately the time, skills, energy and money required for operating schools and educating children with a wide range of learning abilities, economic backgrounds and cultural traits. Indeed, Edison, which expanded from four schools in 1995 to 79 schools with 38,000 students in 1999, absorbed losses of \$500 million before registering its first profit in 2003. It now manages 101 schools with 61,000 students in 19 states, and it has diversified its operations to include after-school tutoring, summer schools, and academic assessment services for 250,000 students. It also operates in Britain.

education, philosophy of The overall pedagogical doctrine governing an institution's teaching methods, as opposed to EDUCATIONAL GOALS, which govern the ends those methods are designed to achieve. Educational philosophies span a range from an extreme subject-centered or goal-centered approach to an extreme student- or CHILD-CENTERED approach. In the former, the subject matter or educational goals take precedence over what students may perceive as their individual needs. Thus, 18th- and 19th-century primary school teachers in the United States routinely used a goal-oriented approach by whipping or beating children to encourage proper classroom behavior. Instruction was purely subject-centered (as it is in many university lecture halls today) with teachers determining the curriculum and subject matter and students expected to sit quietly and silently, taking notes, while teachers lectured or presented materials on blackboards.

The child-centered approach, which was first introduced in a handful of experimental schools in the late 19th century, allows student curiosity and individual needs to determine the curriculum, while teachers adapt instructional methods to those needs. At the most elementary level, a teacher might, for example, convert a student's impulse to "play house" by showing the child how to cook and by incidentally teaching the child various measuring and calculating skills. Most modern elementary and secondary schools rely on a practical approach that draws on elements of many educational philosophies and research findings of educational psychologists to achieve each school's stated educational goals.

Education Abstracts A reference book published irregularly from 1949 to 1964 by the United Nations Educational, Scientific and Cultural Organization (UNESCO) in Paris, France, with abstracts on educational research from countries around the world.

Educational Alliance A broadly based educational institution founded in 1889 by the established and assimilated American Jewish community of German background to “Americanize” poor, East European Jewish immigrants. In 1880, the majority of Jews in the United States were of German ancestry. Most had arrived in the 1840s and 1850s from cultured, German market communities in Bavaria and Baden-Wurttemberg and had spread across their new land and become entrepreneurs. By 1880, most were not only successful and well educated, they had also assimilated into the life of their communities as much as the Protestant majority would permit. Even their synagogues had adopted distinctively American-Protestant characteristics, with organs, choirs, hymn singing, sermons and responsive readings in English. Children of Reform Jews, as they called themselves, attended American public schools and spoke only English.

From 1881 to 1914, however, a wave of 2 million Jewish immigrants arrived from Russia, the Austro-Hungarian Empire and Romania. Instead of fanning out across the *goldeneh medina*, or “golden land,” as they called the United States in Yiddish, they congregated in ghettos of their own making in major cities such as New York, Boston, Philadelphia and Chicago. There, they reproduced the living conditions of the shtetls where they had been forced by law to live in the countries they had fled. Congregating according to language groups in ghetto subdivisions, most attempted to re-create and perpetuate the familiar ways of “the old country.” At the time, a wave of violent ANTI-SEMITISM was sweeping Europe, and assimilated, well-to-do American Jews of German background feared the alien image projected by their newly arrived coreligionists would set off similar violence in the United States.

To forestall such an eventuality, three Jewish organizations—the Hebrew Free School

Association, the YOUNG MEN’S HEBREW ASSOCIATION and the Aguilar Free Library, supported by wealthy American Jews of German ancestry—formed the Educational Alliance in 1889 to provide a comprehensive program of social and educational activities on the Lower East Side of New York City for the newly arrived Eastern European Jews. The undertaking was an enormous one, providing kindergartens to teach English and American ways to preschoolers. Hebrew classes for elementary school children provided Americanized Jewish studies, including proper Hebrew (as opposed to Yiddish) and Reform Judaism. The alliance provided reading rooms and formal classrooms for a variety of studies. It sponsored singing groups, English classes and naturalization classes for adults, art exhibits, lecture programs and physical education activities.

In 1899, the alliance opened what it called a Breadwinner’s College in New York, offering a comprehensive program of elementary, secondary and college-level education to unschooled, adult Jewish immigrants. High school and college-preparatory classes were offered in English grammar, composition, literature, U.S. history, geography, mathematics, science and language training. College level courses, taught by eminent American lecturers, included philosophy, cultural history, literature and social science. The Breadwinners’ College served as a model for America’s first degree-granting, evening adult-education programs that the CITY COLLEGE OF NEW YORK established in 1909.

The alliance offered more than formal education, however. It opened a branch of the Penny Provident Fund, a savings organization, to teach thrift. It opened a summer camp for boys, where it taught health and hygiene, as well as sports, crafts and recreation. It sponsored meetings to teach mothers and fathers the American way of raising their children, and it opened a School of Religious Work and a People’s Synagogue to teach the new immi-

grants the Americanized Reform Judaism. The Educational Alliance today operates a nursery school, after-school programs, a Hebrew school, summer camps, counseling services, vocational guidance, residential and nonresidential drug treatment programs, programs for runaways and the homeless, a Parenting Center and Senior Center and a wide variety of other social services for all age groups in New York.

educational attainment The percentages of adult Americans who have completed high school and various levels of higher education. By 2002, the proportion of Americans 18 years old and over who had completed high school or its equivalent reached an all-time high of 85.7%. Sixty years earlier, at the beginning of World War II, only 24.5% of the population had completed high school. More than 86% of adults 25 to 29 years old had completed high school by 2002, compared with only 63% of those 75 years and older.

Educational attainment varied substantially by race and gender. Nearly 89 percent of white non-Hispanics aged 25 or older had completed high school, compared with 79% of African Americans and 57% of Hispanics. The racial gap narrowed dramatically among young adults aged 25 to 29, with 93% of whites and 87.6% of African Americans in that age group having completed high school. Only 62.4% of Hispanics in the 25- to 29-year-old group had completed high school—largely because their ranks continued to be swelled by large numbers of poorly educated immigrants.

A slightly greater percentage of women 25 years or older had completed high school than men—84.4% versus 83.8%—but, in a reversal of trends in the 1990s, when more women went to college than men, a significantly higher percentage of men had completed college in 2002—31.7% versus 27.3% of women.

educational consortium A voluntary combination of resources by two or more educational institutions in the interests of efficiency and financial savings for themselves, their faculty, staff and students. Such consortia may, for example, share a single, central library or permit cross-registration of students who can earn credit at their own college for courses taken at all other colleges in the consortium. The number of such consortia numbers in the hundreds, but among the better known are the Claremont Colleges in California; Swarthmore, Bryn Mawr and Haverford Colleges, near Philadelphia; Amherst, Hampshire, Smith and Mount Holyoke Colleges and the University of Massachusetts, in Amherst; and the University of North Carolina, Chapel Hill, and Duke, North Carolina and North Carolina Universities.

educational consultant Any advisor specializing in educational matters, but commonly used to refer to an educator with particular skills in school and college placement. Although there are no state or federal licensing or certification procedures in most of the United States, all reputable counselors are members of the Independent Educational Consultants Association (IECA), a standards-setting organization based in Fairfax, Virginia. In addition, many belong to the National Association of College Admission Counselors.

Charging fees of \$100 to \$3,000 or more, consultants help students select the most appropriate private schools or colleges to apply to based on each student's personality, interests, academic record and motivation. They then help the student through the complex application process. Consultants cannot guarantee admission for their clients, but by selecting the schools most appropriate for their clients they optimize the student's chances.

educational counselor Any advisor in the field of education, but more commonly a

specialist in learning disorders who can test children for and diagnose specific learning disabilities and prescribe a course of treatment, or "retraining." Counselors may or may not provide such retraining themselves, if the student's school lacks the professional staff and facilities. Although few states require any certification or licensing procedures, all competent educational counselors work closely with pediatricians, and they are almost always members of the Independent Educational Counselors Association (IECA), a professional standards-setting association in Fairfax, Virginia.

educational goals The body of knowledge a school administration seeks to impart to its students. Required in clearly written form for ACCREDITATION by all school and college accreditation agencies in the United States, an institution's educational goals vary according to the makeup of the student body, the institution's sponsors, the demands of parents, the demands of society, the demands and regulations of government and the tenor of the times. Goals may include preparation for admission to academically selective institutions of higher learning, indoctrination in the beliefs of a particular religion, behavior modification, treatment of learning disabilities, political indoctrination, research skills needed for acquisition of pure knowledge, training for the military, training for nonmilitary government service, professional training, vocational and technical training, encouragement of exceptional talents or academic skills or a combination of any of these.

Educational Policies Commission A group formed by the NATIONAL EDUCATION ASSOCIATION and the AMERICAN ASSOCIATION OF SCHOOL ADMINISTRATORS to develop and publish a formal set of specific national goals for American public school education. Although no longer in existence, the commission was the first body to

establish such goals, and it set an example for a myriad of similar bodies formed after World War II. Published in 1938, the commission's objectives consisted of four categories: Self-Realization, relating to academic skills, health and hygiene, cultural appreciation and morality; Human Relationship, relating to human relations, social skills and home and family life; Economic Efficiency, relating to personal finances, consumer protection and occupational information and choice; and Civic Responsibility, relating to justice, tolerance, political obligations and devotion to democracy.

(See also EDUCATION REFORM.)

Educational Products Information Exchange Institute (EPIE) A nonprofit organization chartered by the Regents of the University of the State of New York as a clearinghouse of information on educational products for school districts and state educational agencies nationwide. Together with its Software Evaluation Office, EPIE allows subscribers to identify the entire range of computer and video software, textbooks and other instructional materials by category, along with the publishers and producers of each item.

educational psychology The study of the relationships between psychology and formal instruction in school and the application of learning theories to teaching. Educational psychology attempts to tie and apply all aspects of human psychology to teaching in an effort to develop more effective instructional methods and improve student learning. Among the areas studied in educational psychology are human development, human senses and perception, human personality, attitudes, mental health, behavior modification, learning theories, testing, instructional methods and technology, and school architecture and interior design and their effects on learning.

Educational Research Service A nonprofit organization that provides several thousand subscriber school systems and educational agencies with independent educational research reports, summaries of research reports by other organizations and a broad base of educational information and data. ERS is sponsored by the American Association of School Administrators, the American Association of School Personnel Administrators, the Council of Chief State School Officers, the National Association of Elementary School Principals, the National Association of Secondary School Principals, the National School Boards Association and the National School Public Relations Association.

Educational Resources Information Center (ERIC) The core of a vast network of data collection and dissemination centers that together provide the world's largest educational database. Readily accessible from university and major public libraries, ERIC is supported by the Office of Educational Research and Improvement (OERI), a division of the U.S. DEPARTMENT OF EDUCATION. Sixteen regional clearinghouses, each specializing in specific subject areas, feed the central database.

Located at a variety of universities and educational organizations across the United States, ERIC clearinghouses have specialized databases on adult, career and vocational education; educational assessment and evaluation; community colleges; counseling and student services; disabilities and gifted education; educational management; elementary and early childhood education; higher education; information and technology; languages and linguistics; reading, English and communication; rural education and small schools; science, mathematics and environmental education; social studies/social science education; teaching and teacher education; and urban education. ERIC also maintains eight adjunct clearinghouses for art education, compensatory education, clinical

schools, consumer education, ESL literacy education, law-related education, test collection and United States–Japanese studies.

ERIC also prepares and provides reports, interpretive summaries, reviews and bibliographies, and it provides copies of educational documents at a nominal cost. ERIC publishes its own reference documents, including the *Thesaurus of ERIC Descriptors*, listing terms used in the ERIC system; *Resources in Education*, a monthly journal with abstracts of research reports; the *Current Index to Journals in Education*, with entries from about 932 education periodicals; and the *Directory of ERIC Resource Collections*.

educational specialist The highest level of professional achievement in the field of education, requiring the most advanced study at the graduate school level, leading to the Education Specialist Degree (Ed.S.). Admission to Ed.S. programs requires years of graduate study and training in education, the acquisition of other advanced degrees in education, considerable professional experience and notable achievement in practical education or educational research. Work for the degree itself usually requires 30 to 40 semester hours beyond the master's degree. A reflection of the student's deep interest in a particular area, the Ed.S. can be a valuable asset for professional advancement. Although no dissertation is required, students must complete an original research project and pass comprehensive examinations.

educational television (ETV) Those television stations specializing in the broadcast of formal and informal instruction and culturally enriching materials. Although education television in the United States dates back to the creation of the first television stations, it did not begin to thrive until passage of the Educational Television Facilities Act (1962), a federal law that provided for fifty-fifty matching grants for building and improving educational television

stations. Limited to \$1 million per state, the grants were made available to universities, schools, state and community agencies and nonprofit community corporations and helped triple the number of ETV stations over the next five years to well over 250. In 1981, the system of matching grants was changed to provide three dollars of government money for every one dollar raised by the station. The growth of educational television and the range of offerings expanded dramatically with passage of the Public Broadcasting Act of 1967, which created the publicly supported CORPORATION FOR PUBLIC BROADCASTING, a centralized production enterprise that provides local ETV stations with educational and culturally enriching programs they could not afford to produce on their own.

ETV carries a wide mix of educational and culturally enriching programs, ranging from formal courses for which viewers may earn high school or college credit to entertaining programs that help teach preschoolers to read, write and calculate. Public affairs programs, live theater presentations, classic films, concerts, dance recitals, opera, culinary demonstrations, historical documentaries and science documentaries are just a few of the types of programs available on ETV.

Educational Testing Service (ETS) A private, nonprofit developer and publisher of standardized tests, which include the SCHOLASTIC ASSESSMENT TESTS (SATs), GRADUATE RECORD EXAMINATION (GRE), the COLLEGE LEVEL EXAMINATION PROGRAM (CLEP), the NATIONAL TEACHERS EXAMINATION (NTE) and others. ETS was created after a 1946 study led by Harvard University president JAMES B. CONANT found testing procedures in the United States inconsistent, invalid and unreliable. Scattered among a variety of unrelated organizations such as the College Entrance Examination Board, the Educational Record Bureau, the National Committee on Teacher Examinations of the American Council

on Education, tests were often unrelated to prior education due to the lack of coordination between testing organizations and school and college communities.

Funded by the CARNEGIE FOUNDATION FOR THE ADVANCEMENT OF TEACHING, Conant's report recommended forming a new, private, nonprofit organization, specialized in test research and development, to publish and administer tests for a variety of cooperating organizations. The Carnegie Foundation provided \$750,000 to fund the new organization, and the College Entrance Examination Board immediately turned over development of its widely used battery of college admissions tests, then called the Scholastic Aptitude Tests and Achievement Tests (now the Scholastic Assessment Tests) to ETS. In the ensuing years, ETS grew into the world's largest testing organization—a multinational operation, complete with for-profit subsidiaries and annual revenues approaching \$1 billion. Indeed, its phenomenal growth and expansion beyond the boundaries of its original charter attracted charges of possible anti-trust violations for monopolizing the market for computerized testing. Its profit-making subsidiaries compete directly with private businesses in the thriving areas of professional licensing and certification and government testing. More than 12 million students worldwide take various ETS college and graduate-school admissions tests each year, at costs ranging from \$25 to more than \$200 a test. Some 40% of ETS revenues flow from overseas, where it has large assessment-testing contracts with China and India. As revenues have grown, so have the compensation packages ETS pays to its executives—now well into the mid six-figure range.

educational warranty A special certificate issued to high school graduates assuring prospective employers that the bearer has the basic skills needed to enter the workforce. If the

employer is not satisfied, the warranty provides that the school district will provide the required remedial training at the district's expense. Pioneered during the late 1980s, the educational warranty was a response of some school districts to business community complaints that they were spending enormous sums to provide remedial training to entry-level workers whom high schools had graduated without adequate job skills.

Originally tried in relatively small areas such as Prince Georges County, Maryland, and Plymouth, Massachusetts, the educational warranty was then adopted by the huge Los Angeles Unified School District, where more than half the more than 600,000 students lived below the poverty line and spoke little or no English. At the time, Pacific Bell Telephone Co. had complained that more than half its applicants for entry-level jobs, such as operators, had failed seventh-grade reading and mathematics tests. The school district promulgated a warranty system based on the recommendations of the U.S. Secretary of Labor's Commission on Achieving Necessary Skills, which called on schools to help students develop three sets of skills for the job market: basic skills in reading, mathematics and effective communications; thinking skills, including problem solving, reasoning and mental visualization; and personal qualities such as integrity, self-management, initiative and responsibility.

Implementation meant an overhaul of teaching methodology in some schools. Among the innovations the warranty system produced was early introduction of computer training and rearrangement of classroom instruction to allow students to work in teams, an arrangement that often helped students solve problems and understand the solutions faster than by working individually in isolation.

Education Amendments of 1972 A series of amendments to the Elementary and Second-

ary Education Act of 1965, the most important of which is commonly referred to as Title IX, which banned gender discrimination in public education. "No person in the United States," said Title IX, "shall, on the basis of sex, be excluded from participation in, be denied the benefits of, or be subjected to discrimination under any education program receiving federal financial assistance." Title IX forced formerly all-male institutions to open their doors to women, thus giving women the same educational rights as men for the first time in American history. Title IX not only gave women equal academic opportunities at every level of American education, it forced all schools and colleges receiving any direct or indirect federal funds (even funds from federal loans to students) to provide women with equal extracurricular opportunities and facilities, in varsity and intramural athletics as well as nonsports.

(See also GENDER DISCRIMINATION; NATIONAL COLLEGIATE ATHLETIC ASSOCIATION.)

Education Commission of the States An organization formed under the Interstate Compact for Education in 1966 to help the governors, legislators and educators of member states improve public education. The commission has a full-time staff to provide technical assistance, administer interstate educational projects, develop model education programs and laws, publish materials and research and serve as a liaison with the federal government.

Education Development Center, Inc. A publicly sponsored, nonprofit organization that, among other services, develops curricula and teaching materials in mathematics, science, language arts, social studies, violence prevention, health education and other subjects. Founded in 1958 by scientists at the Massachusetts Institute of Technology who were concerned with the quality of high school physics

instruction, the center proceeded to create an appropriate physics curriculum that was eventually taught to 200,000 physics students, or half the high school physics students in the United States. With the help of other scientists, teachers and psychologists, and funded by the National Academy of Sciences and MIT, the center expanded its work to develop a complete science curriculum called Elementary Science Study, which provides appropriate teaching materials for every age student, from kindergarten through twelfth grade. Based in Newton, Massachusetts, the center subsequently developed curricula and teaching materials for mathematics and other subjects and then diversified its work to include teacher training, publishing and study tours and international educational exchanges.

Education for All Handicapped Children Act A federal law passed in 1975 that reversed the century-long practice of removing physically and mentally handicapped, unmanageable and delinquent children from their homes and communities and placing them in isolated residential facilities. Expanded dramatically and renamed the INDIVIDUALS WITH DISABILITIES EDUCATION ACT (IDEA) in 1988, the 1975 legislation asserted the right of all children to the best possible education in the least restrictive environment, free of charge. The law provided a continuing flow of funds for public schools to provide such education. When the law was passed, only about 1.6 million of the 8 million handicapped children in the United States were attending public schools. Most of the rest were either languishing idly at home or incarcerated in residential facilities. In neither case did they receive any formal or special education that enhanced the possibility of eventual independence.

Called SUPPLEMENTARY SCHOOLS when they first appeared in the early 19th century, residential institutions for the handicapped grew

in number as infant mortality rates declined and as urban life made it difficult for most parents to provide safe quarters for children who could not attend conventional schools. Originally operated by churches and philanthropic organizations, many became public institutions in the 1870s and 1880s. As the lowest on most state government lists of educational spending priorities, many deteriorated into Dickensian hellishness, where ill-paid, untrained workers abused or ignored their charges and offered little or no education. Television exposés of scandalous conditions at a score of institutions in the late 1960s and early 1970s, coupled with spiraling costs of maintaining such ineffective residential facilities, provoked a public clamor for “deinstitutionalization” of all but the most severely handicapped and incorrigible children.

Educators who, by then, had developed a variety of new, effective, educational techniques for formerly uneducable children, supported the deinstitutionalization movement, saying that isolating handicapped and delinquent children was educationally counterproductive. Such children, they maintained, would fare better educationally if placed in the educational “mainstream” of conventional public schools (see MAINSTREAMING) and provided with special education and other services to supplement conventional education. The result was the Education for All Handicapped Children Act of 1975. Commonly called the Disabilities Education Act, the law forced the closure of the most primitive children’s institutions and brought an end to most construction of new residential facilities. It transferred the burden of educating the vast majority of mentally, physically and behaviorally handicapped children to public schools in the communities where the children lived, guaranteeing every handicapped child, three to 21 years old (about 6 million in 2000), equal rights to education

and full protection against discrimination of any kind.

In addition to federal funding for special education, the law provided funding for all necessary construction to make school facilities “barrier free” and accessible to handicapped children and for all special transportation to carry children to and from school. The law was amended and refined in 1983, 1986 and 1988 to expand the role of the federal government in existing programs and extend coverage to the handicapped from birth into adulthood and to expand special education in preschool.

The law was costly, however, with all taxpayers sharing the costs of special education for the handicapped, and parents of handicapped children paying no more than any other taxpayers for their children’s education. Although the percentage of handicapped children ranged between 7% and 12% of the student population in the early 1990s, they absorbed between 20% and 25% of funds spent on public school education. Moreover, those costs began spiraling almost uncontrollably, as state and federal courts consistently expanded school responsibilities under the act to include more severely handicapped students, such as autistic children and the deeply retarded, in regular classrooms. By 2000, the U.S. Department of Education was spending 18% of its annual budget on special education, benefiting about 11.2% of the elementary and secondary school population.

The theory that generated expanded mainstreaming was that even the severely handicapped benefitted more in conventional classrooms than in segregated, special education facilities and that their classmates would learn tolerance. But the expanding, court-imposed doctrine of “full inclusion” so impeded teacher ability to pursue normal teaching activities and so interfered with the education of nondisabled students that the AMERICAN FEDERATION OF TEACHERS called for a halt to the policy.

One by one, state legislatures began setting limits to full inclusion in an effort to maximize the benefits of “mainstreaming” to the handicapped without affecting the quality of education of the nonhandicapped.

(See also INDIVIDUALS WITH DISABILITIES EDUCATION ACT.)

Education for National Security Act A federal law passed in 1984 to improve the quality of American elementary and secondary school science and mathematics education. At the time, a “cold war” had been raging between the Soviet Union and the United States for more than three decades, with each attempting to gain global political and military dominance by using science and technology as key weapons. The act authorized the NATIONAL SCIENCE FOUNDATION to establish institutes to train (and retrain) elementary and secondary school science and mathematics teachers. The law also established Congressional Merit Scholarships for future teachers studying mathematics, science and engineering. It also provided financial aid for state and local agencies to improve teacher instructional skills in mathematics and science and to establish MAGNET SCHOOLS for students gifted in mathematics and science. In addition, the law established Presidential Awards for Teaching Excellence in Mathematics and Science and special recognition for outstanding school mathematics and science programs.

Education Index A publication that has continuously indexed authors and subjects in selected English-language educational periodicals since 1929. Published 10 times a year by H. W. Wilson Co., the index includes references on administration and supervision; preschool, elementary, secondary, higher and adult education; counseling and personnel service; teaching methods; and curriculum—each with a wide variety of subcategories.

Education Professions Development Act

A 1967 federal law that created programs for easing a then-increasing shortage of qualified public elementary and secondary school teachers. The shortage had resulted from 20 years of post-World War II industrial expansion that had left teacher salaries noncompetitive with those for comparable positions in commerce and industry. The act created a variety of programs that encouraged young men and women to enter teaching in exchange for a variety of college-level scholarships. One section of the law created the Career Opportunities Program, TEACHER CORPS and the Urban and Rural School Development Programs to draw teachers into low-income areas. The act also created a network of teacher training and information exchange centers and programs to provide specialized teacher training in bilingual education, preschool education, vocational education and special education. Most of the programs began to disappear as states and local communities raised teacher salaries to make the profession more attractive and as colleges and universities improved their own specialized teacher training programs.

education reform Any change or proposed change in the existing methods or content of instruction in schools and colleges. Education reform may be the result of initiatives from within or without the educational establishment and initiated by teachers, administrators, government officials, students, parents of students or interested citizens. Historically, education reform in the United States has always aimed at expanding the reach of American education to an ever more heterogeneous population. Originally designed for privileged, white, English-speaking Protestant males, American education reached only about 10% of the adolescent population at the beginning of the 20th century, when most children went to work in fields, factories and mines at ages as young as

five. In the 20th century, reformers have forced American public schools to service students of every economic class, race, religion, ethnic background, gender, language group and physical and mental condition. Moreover, the services demanded of schools go well beyond the teaching of academic skills. They include a vast range of psychological and social services that no society on Earth has ever attempted to provide to so heterogeneous a student population. As the student population has increased and grown more diverse, academic assessment scores have necessarily declined from levels when only a privileged few attended schools. Although often interpreted as reflecting a decline in quality of education, the drop in scores has merely reflected the dramatic change in the student population—a change that necessarily requires a reformulation, or reform, of educational methods.

American education has, however, been the target of reform since the first schools opened in the colonial wilderness. Initially designed to teach piety and strict adherence to the Puritan or Presbyterian churches, the earliest colonial schools were beset by demands from parents and leading citizens, including BENJAMIN FRANKLIN, to teach children practical courses more appropriate for life in the wilderness. Reformers such as Franklin forced colleges, all of them originally theological institutes, to add practical and professional education. Early 19th-century reformers such as HORACE MANN and HENRY BARNARD sought to make schools public by opening them to all children, regardless of gender, race and ability to pay. Later, reformers such as JOHN DEWEY sought to force schools to abandon corporal punishment and other forms of classroom brutality and humiliation as basic teaching methods and substitute CHILD-CENTERED EDUCATION. Still other 19th-century reformers introduced citizenship training as a standard part of the public school curriculum and a broad

“Americanization” program to convert millions of immigrant children into “Americans.” Mid-20th-century reformers effected racial DESEGREGATION of American education and “MAINSTREAMING” of handicapped children into conventional schools and classes.

Late 20th-century goals centered on lifting educational standards of American public schools and extending equal educational opportunities to all Americans, regardless of race, ethnicity, national origin or gender. To that end, the federal government enacted a school reform program entitled GOALS 2000, providing federal money to help school districts meet national standards in core subjects and assure that 90% of American high school students graduate and obtain diplomas. To reduce GENDER DISCRIMINATION in coeducational schools and colleges, organizations such as the AMERICAN ASSOCIATION OF UNIVERSITY WOMEN, urged a return to single-sex classrooms. In an effort to reform education of non-English-speaking students and students with poor command of English, some reformers urged adoption of various forms of BILINGUAL EDUCATION, using Spanish, French and even BLACK ENGLISH as a language of instruction. In 1997, the National Assessment Governing Board began still another federal reform program—a five-year scheme to develop new tests to be given nationwide to measure academic performance levels of American elementary and secondary school students, and, ultimately, develop minimum national ACADEMIC STANDARDS. The states, meanwhile, added a reform program of their own. To counter growing public criticism of low academic standards, 49 states and the District of Columbia began developing their own, higher academic standards for each grade and administering standardized tests in every subject area to determine whether students were meeting those standards and worthy of promotion. Although students in 17 states produced startlingly high results,

their counterparts in 24 other states scored so poorly that many schools were forced to ignore test results and to promote or graduate high school students despite their dismal test scores or see entire student bodies retained. Some educators called the testing a national educational disaster, and state after state immediately began resetting acceptable test grades to absurdly low levels until they could develop new educational reforms to raise academic achievement.

Three other major educational reform movements, each led by renowned professors of education, were also under way as the 20th century neared its end: the School Development Program, developed by Yale University psychiatrist JAMES P. COMER to reform inner-city public schools by providing social, health and academic services to students; the ACCELERATED SCHOOLS PROJECT of Stanford University professor of education Henry Levin, to elevate student academic performance and reduce student drop-out rates by making school curricula more demanding and raising teacher expectation levels; and the COALITION OF ESSENTIAL SCHOOLS, which Brown University professor of education THEODORE SIZER developed to subordinate school administrative needs to the academic needs of students and place teachers in control of the curriculum.

education spending The total amount of public and private funds dispensed on formal education. By 2004, the United States was spending nearly \$1 trillion, or almost 10% of the gross domestic product, on education, more than 70% of it on primary and secondary education and the rest on higher education. The United States ranked seventh in the Western world, tied with Canada, in terms of percentage of GDP spent on education, behind Finland (6.0%), France (5.8%), New Zealand (7.0%), Norway (6.7%), Portugal (5.7%) and Sweden (7.4%).

Federal spending on education totaled about \$110 billion, of which nearly 50% (\$54.6 billion) was earmarked for elementary and secondary education, 20.5% (\$22.6 billion) for higher education, 23.5% for research programs at universities and related institutions, and the rest (\$6.4 billion) for a variety of miscellaneous programs such as the National Endowment for the Arts, Library of Congress and so forth. Of nearly \$565 billion in state and local spending on education, nearly 70% went to elementary and secondary education and the rest to higher education.

American public elementary and secondary schools, in turn, spent an average of about \$9,000 per student, of which about 57% was for instruction and another 14% underwrote support services, including special education, food and transportation. About 11.5% of outlays were capital expenses, and 2.5% covered interest on outstanding debts. Only 6.6% of total spending went into administration—which many critics of public education contend absorbs funds needed for improved instruction.

In higher education, public four-year institutions spend an average of more than \$30,000 per student and public two-year colleges spend nearly \$10,000 per student. Private four-year colleges are thought to spend close to \$40,000, while private two-year colleges spend as much as \$15,000 per student. Public four-year institutions of higher education spend only about 30% on instruction and 4.6% on scholarships. They spend about 8% on academic support, which includes libraries, and 5% on student services. More than 10.5% is spent on research; 9.6% on auxiliary enterprises; 9.5% on hospitals associated with the schools; 9% on institutional support, which includes administration; 6.4% on operations and plant maintenance; and 5% on public service.

education tax credits Credits that eligible taxpayers may make against federal income

taxes for qualified expenses of higher education. Beginning in 1998, Congress established two types of higher education tax credits:

- Hope Education Tax Credit, allowing a taxpayer to claim a tax credit up to \$1,500 a year per student during the first two years of undergraduate study. The credit applies to tuition and fees only—not books or room and board—and is only available to taxpayers whose income is under \$100,000 if filing a joint return, or \$50,000 if filing a single return. The student must have a high school diploma, be enrolled in a degree program and attend college at least halftime. The credit is not available to anyone convicted for possession or distribution of controlled substances.
- Lifetime Learning Tax Credit, allowing a federal income tax credit of up to \$2,000 a year per family for tuition and fees for the student, a spouse or dependents. The credit is not applicable for books or room and board, but the student may be enrolled full time, half time or less than half time, and the credit is applicable for an indefinite number of years to undergraduate and graduate studies, as well as a training program to acquire or improve job skills. The same family income limitations as the Hope Education Tax Credit apply to the Lifetime Learning Tax Credit, however, and as with the Hope Credit, it is not available to anyone convicted of possession or distribution of controlled substances.

In 1999, the first year in which the two credits were available, nearly 5 million Americans claimed credits of about \$3.5 billion, with more than half the benefits claimed by taxpayers earning between \$35,000 and \$75,000.

(See also COLLEGE SAVINGS PLAN; FINANCIAL AID; TUITION SAVINGS PLANS.)

Edwards, Jonathan (1703–1758) Colonial theologian-educator and third president of the College of New Jersey (later PRINCETON UNIVERSITY), from 1757 until his death. Edwards is

best known in American history as one of the progenitors of the GREAT AWAKENING, an evangelistic fervor that swept across the American colonies in the 1740s. Born in Connecticut, Edwards was a child prodigy who enrolled in the Collegiate School of Connecticut (later, YALE COLLEGE) and graduated as valedictorian of his class in 1720. After studying theology for two years, he became a lay minister in New York before returning to Yale as a tutor and obtaining his master's degree in divinity. He was ordained in 1727 and, two years later, assumed the pastorate of his grandfather's prestigious church in Northampton, Massachusetts, where his charisma and oratorical skills gripped the townsfolk. Like other evangelists, Edwards preached the possibility of redemption through personal conversion, thus contradicting the class-oriented doctrines of traditional Protestant churchmen. The latter preached that the common man was born tainted with original sin and condemned to eternal damnation and that only the nobility and landed gentry who supported the church could hope for salvation. Edwards's preachings infused his listeners with the belief that all men were indeed created equal. "The spirit of God began extraordinarily to set in, and wonderfully to work," Edwards wrote, and by the summer of 1735 the town "seemed to be full of the presence of God."

As his sermons were published and read elsewhere, the fervor that gripped Northampton swept across Massachusetts and Connecticut and down to New Jersey. Although religiously based, Edwards's message and the movement it inspired had a powerful impact on American education by splitting traditional churches into "New Light" and "Old Light" factions (see NEW LIGHT-OLD LIGHT CONTROVERSY). With churches still the center and source of all acceptable community knowledge and learning, the split produced new churches led by clergy professing the equality of man before God. In so doing, they both expanded education and

eroded the foundation of a class system that had been the basis of ever increasing taxes on the colonies by their parliamentary masters in England. But as colonists redirected the fervor of their rebellion against the English church into political rebellion against England itself and excessive parliamentary taxation, "Old Light" religionists began reasserting themselves against the excessive zeal of "New Light" evangelicals. In Massachusetts, a council representing 10 congregations dismissed Edwards from his Northampton parish in 1750, and he moved to what was then the frontier, in Stockbridge, Massachusetts, to pursue his conversions among the colonists and Indians. Four years earlier, a group of New Light Presbyterians had founded the College of New Jersey, and, in 1757, invited Edwards to serve as president. He was inaugurated in 1758, but died during the smallpox epidemic a year later.

Edwards v. Aguillard A 1987 U.S. Supreme Court decision that, in effect, declared unconstitutional a Louisiana law that prohibited teaching the theory of evolution in public schools unless "CREATION SCIENCE" was taught with it. Louisiana's law, entitled the Louisiana Balanced Treatment of Creation-Science and Evolution-Science in Public Instruction, purposely did not require the teaching of creation science. The lawmakers recognized that creation science was part of a religious doctrine that could not be a required element of the public school curriculum. Indeed, the law permitted schools to omit teaching both creation science and the theory of evolution. But the law required that, in the interests of academic freedom, if the theory of evolution were taught, such teaching had to be accompanied by instruction in "creationism."

In reversing the Louisiana law, the Supreme Court ruled that the law was designed to discourage teaching of accepted scientific theories while promoting a specific religious belief, and,

as such, violated the ESTABLISHMENT CLAUSE of the First Amendment of the Constitution mandating complete separation of church and state.

efficacy An approach to teaching based on the premise that intelligence is learned and not innate and that all children—especially children of color—can learn more than they now do if teachers and schools raise their expectations of their students. Developed in 1985 by African-American social psychologist Jeff Howard, the efficacy program called for all children to complete their K–12 education with a mastery of calculus, mastery of at least one foreign language, and “mastery of written and spoken expression of the English language [as demonstrated] by writing, presenting and defending a literate, cogent, well-researched essay of 25 pages.”

Teachers and school administrators using the efficacy approach were “retrained” at the Efficacy Institute, an organization Howard founded in Lexington, Massachusetts, that also provided racial and gender sensitivity training for corporation personnel. Teacher training included four-day seminars described as “evangelical” and almost “cult-like” in their approach, encouraging teachers “to share soul-searching experiences on . . . assumptions they bring to classrooms that may impede [student] performances.” Seminar leaders urged teachers to change their attitudes about intelligence and, according to the institute, 90% of teachers emerge from the seminars “accepting that intelligence is developed, not innate.”

Howard claims that the poor school performance of African-American and other minority groups is the result of low teacher expectations. “American educators,” he claims, “are . . . paid to decide who can learn at high levels, and who cannot. Norm-referenced tests declare half our children below average by age seven. Ability grouping is the next logical step; we segregate those we believe to be smart and confer on them exclusive access to rich and

challenging curricula. A large percentage of the others, especially in urban settings, are . . . sorted out of math, science and other rigorous subjects because there is no expectation that they are up to the level of learning required.”

Adopted in Tacoma, Washington, in the early 1990s and in many New York City schools in 1996, the efficacy concept produced a 6.4% year-to-year improvement in achievement test scores of eight-year-olds in Detroit public schools during the 1993–94 school year, according to an Efficacy Institute study. The study was ridiculed, however, by critics who pointed out that efficacy teachers concentrated on “TEACHING THE TEST” and that students were unable to repeat those gains on national tests. Called a “pop-psychology movement” by some critics, the efficacy concept fails to take into account the effects of preschool and non-school environment on academic achievement. While critical of teachers, Howard fails to address the learning difficulties of African-American students who begin school illiterate and innumerate—two or more years behind students from economically advantaged communities. Many come from socially, educationally and economically dysfunctional, single-parent families in dysfunctional, anarchic, poverty-stricken neighborhoods, where crime, drugs, premature teenage sexual activity and violence have far greater impact on a child’s ability to learn in school than teacher expectations. As former Assistant Secretary of Education Chester E. Finn, Jr., put it: “Expectations alone don’t yield learning. Successful education also demands . . . [that] the rest of one’s life is in decent enough shape that one can concentrate [on learning].”

eight-four plan The traditional organization of elementary and secondary education in public schools during the first half of the 20th century. Still used in some rural areas, the plan divides childhood education into eight years of

primary school and four years of high school, with each group housed in separate buildings, with separate administrations, staffs and faculties. After World War II, the eight-four plan gave way to 6-2-4 and 6-3-3 plans as population growth forced the construction of separate two- or three-year JUNIOR HIGH SCHOOLS to accommodate the burgeoning student population and to meet the special developmental and instructional needs of early adolescents. Although not included in the numerical title of the various organizational plans, kindergarten is an implicit element of primary school organization.

Eight-Year Study A longitudinal research project started in 1933 by the PROGRESSIVE EDUCATION ASSOCIATION showing that 1,475 graduates from 300 innovative “progressive” schools scored significantly higher academically and socially in college than a group of students from traditional secondary schools who had been matched in every way with the progressive school group. At the time, progressive schools were under attack from conservative educators for failing to impose strict, traditional discipline on students.

Eisenhower, Dwight D. (1890–1969) Thirty-fourth president of the United States (1954–60), whose use of federal troops to enforce the 1954 decision of the U.S. Supreme Court in *BROWN V. BOARD OF EDUCATION OF TOPEKA* marked a turning point in the struggle to end racial segregation of public schools. Although Eisenhower had hoped the South would gradually desegregate schools without prodding from Washington, Governor Orval E. Faubus of Arkansas refused to conform. After the Little Rock school board had adopted a school desegregation plan, Faubus ordered the national guard to prevent nine black students from entering Central High School. When a federal court ordered Faubus to stop interfering, Faubus removed the troops, but their pres-

ence had attracted mobs of white supremacists who threatened the safety of the black students. After the school sent the children home in police cars, Eisenhower moved to prevent mobs from undermining federal court orders by federalizing the Arkansas National Guard and sending units of the 101st Airborne Division to Little Rock to disperse the mobs and ensure the children’s safe entry at school.

(See also *COOPER V. AARON* and *AARON V. MCKINLEY*.)

elective courses Any one-semester or full-year courses not required for graduation and in which students enroll on their own initiative. There are two types of elective courses, restricted electives and free electives. Restricted electives represent a group of courses from which one or more, but not all, must be selected to meet graduation requirements. At the college level, for example, a department might offer 20 courses in a subject and require that all students majoring in the subject complete at least 10. Each student is then free to select any 10 from the list of 20. Free electives, on the other hand, represent any course not required for graduation that the student elects to study out of sheer interest, to broaden his or her education.

electric chalkboard A device that projects images from transparencies onto screens in the front of the classroom and allows the teacher to write directly on the transparency with a grease pencil or felt-tip pen, while the writing is projected in enlarged form. In the early 2000s, electric chalkboards were gradually being replaced by INTERACTIVE WHITEBOARDS, linked to computer networks and able to display a wide variety of computer-generated materials, including handwritten materials from electronic notepads.

Elementary and Secondary Education Act of 1965 (ESEA) An all-embracing, six-part

federal law to improve American public school education by direct federal intervention. A central element of President Lyndon B. Johnson's WAR ON POVERTY, ESEA had six major goals, each of which was described in a separate section or "title."

Title I was the most far-reaching in that it provided funds to local educational agencies (LEAs), including schools, social service agencies and other organizations for such programs as remedial reading, compensatory mathematics and special programs. Funds were apportioned according to the number of low-income children in the LEA's area. By 2005, Title I was providing almost \$15 billion worth of federal funds to almost 10 million children.

Title II provided funds for school libraries and for textbooks in public and private schools (see *BOARD OF EDUCATION OF CENTRAL SCHOOL DISTRICT V. ALLEN*), Title III provided grants and funds for innovative educational programs and Title IV provided funds for educational research and training. Title V provided funds to state educational agencies and Title VI provided funds for ESEA administration.

In 1968, Congress amended the act to include bilingual education and extend its reach to handicapped children and migrant children and to guarantee non-English-speaking children the right to study in their native languages while they learned English. In 1970, Congress learned that local communities were misusing Title I funds to construct swimming pools and make other capital improvements, and it altered the law to require state and local governments to provide matching funds for all federal funds received. In 1972, Congress amended the act to ban GENDER DISCRIMINATION, and four years later it extended the reach of the original legislation to vocational education, higher education and a variety of other programs. In 1978, Congress made its first intrusion into state control of the classroom by

adding a comprehensive basic skills program to ESEA to improve pupil achievement.

In 1993, President Clinton amended ESEA with the Improving America's Schools Act, which tied federal aid to the development of standards by each state to assess all students and ensure that schools make "adequate yearly progress" in improving education standards. A year later, Congress further extended the reach of the original act to include education of the severely handicapped and American Indians.

It was in 2001, however, that Congress imposed the most far-reaching federal controls on American public school education. Signed into law by President George W. Bush in 2002, the \$10 billion NO CHILD LEFT BEHIND ACT OF 2001 (NCLB) amended ESEA by imposing testing requirements on all states and public school districts and requiring every school to demonstrate year-to-year improvements in academic performance—or face loss of federal subsidies. Aimed especially at schools with disadvantaged children, NCLB allows parents in failing public schools to transfer their children to other schools or charter schools, and it allows states to replace the curricula and staffs of schools that make no academic progress for four consecutive years. The long-term NCLB scheme called for spending \$1 billion a year on reading programs built on an agenda called READING FIRST, under which K-3 teachers and reading coaches across the nation are being retrained to use research-based teaching methods designed especially for disadvantaged children. To continue receiving grants, reading instruction programs must show progress in student reading proficiency within two years. But by 2007, nearly 30% of the nearly 62,000 schools that reported had failed to make "adequate yearly progress," thus converting NCLB into one of the most controversial new elements of ESEA. With student academic proficiency ranging from well above national norms in northeastern states such as Massachusetts, New Hamp-

shire and Vermont to abysmally low levels in states such as Hawaii, New Mexico and Mississippi, educators across the nation had long called for establishing minimum national academic standards. Constitutionalists, however, cite the Tenth Amendment of the Constitution, which leaves to the states all powers not expressly conveyed to the federal government by the first nine amendments. The word education does not appear in any of those amendments and has therefore always fallen under state purview.

With the acceptance of federal grants to education, however, school districts have, for many years, tacitly accepted the conditions that come attached to any loan or grant in aid. Indeed, the federal government now provides about \$55 billion, or 10%, of what states and local districts spend on public elementary and secondary education, leaving states with little choice but to accept the conditions of NCLB or forfeit federal aid. A small number of school districts have done just that—in Connecticut, Illinois, Vermont and Virginia, among others. Some states challenged the law on the basis that the federal government underestimated the costs of administering the law and forces states and local school districts to spend local tax dollars to enforce a federal law. A federal court rejected the challenge on the grounds that the states and local districts had the option of withdrawing from NCLB (and, of course, forfeiting federal aid). Some districts, however, have developed ways to pervert the intent of NCLB by transferring the lowest achievers from failing public schools into CHARTER SCHOOLS, which are not covered by NCLB restraints. By shedding their poorest achievers, the public schools can then demonstrate the year-to-year gains in overall academic achievement required to obtain hefty NCLB grants.

elementary certificate A special certificate issued by the Dalcroze School of Music in New

York City, that certifies that a teacher has completed training for and is eligible to teach music using the DALCROZE METHOD.

elementary school An institution that provides the first four to eight years of a child's formal education, including basic reading, writing and calculating and the basic concepts of science, health and hygiene, technology, history, geography, art, music, crafts and the social sciences. An elementary school may also include a preschool and kindergarten. In contrast to secondary schools, where teachers are specialists in specific subjects, elementary school teachers are generalists, expected to have and to be able to impart a broad knowledge covering each area of instruction. The number of years of instruction in elementary school vary from community to community, depending on the size of the school population. Most American cities and towns have introduced the freestanding junior high school or MIDDLE SCHOOL to provide instruction for grades five, six or seven through grades eight or nine, to ease overcrowding in elementary and high schools and to meet the special needs of early adolescents.

The concept of the elementary school dates back to the late 1840s, when the growth of the student population made teaching all age groups in a single school—often a one-room schoolhouse—impractical, especially in major cities. In 1848, John D. Philbrick (1818–86), head of Boston's Quincy Grammar School, was the first to reorganize the single-class school into separate grades, with teachers for each grade, and a desk for each student, instead of two to a desk. His arrangement led eventually to the construction of separate classrooms for each grade.

Elementary Science Study (ESS) A collection of science kits developed by the EDUCATION DEVELOPMENT CENTER, INC. and containing

materials for students to use in science classes from kindergarten through eighth grade. Developed by a group of scientists, teachers and psychologists in the early 1960s, the kits are designed as an adjunct to the formal curriculum. The kits contain materials appropriate for study and observation by each age group, and from which they can make independent discoveries and draw conclusions.

Eliot, Charles W. (1834–1926) American educator who transformed tiny HARVARD COLLEGE into the foremost American university of its day and a model for every other U.S. institution of higher learning. Often called the “founder of Harvard University,” he was born to a wealthy Boston family with close ties to Harvard (his father served as treasurer from 1843 to 1853). Eliot earned his Harvard B.A. in 1853, his M.A. in 1856 and was an assistant professor of mathematics and chemistry there until 1863. After failing to win a promotion, he went to study in Europe for two years. In 1865, he was appointed professor of chemistry at the newly established MASSACHUSETTS INSTITUTE OF TECHNOLOGY. In 1869, the *Atlantic Monthly* published two of his articles, both entitled “The New University,” in which he cajoled the academic world to cease imitating British and European educational models and develop its own uniquely American institutions.

“When the American university appears,” he wrote, “it will not be a copy of foreign institutions . . . but the slow and natural outgrowth of American social and political habits, and an expression of the average aims and ambitions of the better-educated classes. The American college is an institution without parallel; the American university will be equally original.” The articles shook the world of education and earned him the presidency of Harvard College.

When Eliot took over Harvard, it was a small, provincial college with a curriculum that had changed little over the previous century.

Latin, Greek, mathematics, philosophy, history, physics, chemistry, French and German made up its core subjects. In addition to the college, Harvard had four graduate schools that were as archaic as the college. The law school granted an LL.B. to any student who completed its 18-month course of study; no examinations were required. The medical school granted an M.D. to all students who completed two terms of study, served an apprenticeship with a practicing physician and passed 10-minute oral exams in five of nine principal subjects. Harvard also had a scientific school that admitted and graduated all who applied and a Unitarian divinity school that granted no formal degree.

When Eliot was inaugurated in 1869, Harvard was torn by dissent and feuding between reform-minded faculty and traditionalists. In his inaugural address Eliot left no doubt where he stood. His work was swift and dramatic. He broadened the undergraduate liberal arts curriculum and merged the scientific school into the undergraduate college. In 1872, he established a Graduate Department (later the Graduate School of Arts), which granted master's degrees and doctorates. The law, medical and divinity schools were reorganized as proper graduate schools, with sequential curricula requiring extensive written examinations. He opened the divinity school to students of all Protestant sects. He gave students the right to take elective courses, and in 1879 he approved limited faculty instruction of women and the eventual founding of the Society for the Collegiate Instruction of Women. Better known as the “Harvard Annex,” it became Radcliffe College in 1894. He also raised faculty salaries to levels competitive with private industry and recruited and lured the foremost national and international scholars to teach full-time.

After 25 years, Eliot had succeeded in creating the model of the modern American university and made Harvard the most widely acclaimed institution of higher learning in the

United States and, in the opinion of many, the world. It taught all the world's great languages, literature and history; it taught all the social sciences, along with the development and functioning of all major human institutions, and it taught the range of human knowledge about nature and science. Eliot hired the finest scholars in the world to impart that knowledge to carefully screened young men who would benefit most from the experience. Harvard became a center of research and developer of new knowledge as well as a repository of existing knowledge, and it exerted a broad influence on the nation by graduating more than its share of national leaders in virtually every sector of American life.

In addition to his impact on Harvard and higher education, Eliot had a far-reaching impact on American education generally. A Republican-turned-Democrat, he believed strongly that universal education was the primary vehicle for the talented to succeed and that education was essential to the preservation of democracy. He defined education as "progressive acquisition of an elementary knowledge" of five broad areas: the external world—that is, nature, geography, meteorology, botany and zoology; the story of humanity, including "the immense product of the imagination in art and literature"; manual and moral training—occupational skills, along with patience, good judgment and the recognition of the value of productive labor; character training; and training in democracy, by which he meant the "great truths which lie at the foundation of democratic social theory." He defined the latter as the interdependence of individuals, national unity, as well as the need for the "rising tide" of immigrants to be Americanized (see AMERICANIZATION), and service to others and respect for expertise in every area.

During his 40-year tenure at Harvard, he also served as president of the NATIONAL EDUCATION ASSOCIATION and was chairman of the

NEA's Committee of Ten, whose 1893 report standardized secondary school curricula to prepare high school graduates for college-level studies. The report also resulted in the introduction of foreign languages, higher-level mathematics and science courses into the secondary school curriculum.

After his retirement in 1909, Eliot edited the famed "Five-Foot Shelf" of Harvard Classics and Junior Classics, consisting of some 50 volumes he selected as containing a body of knowledge equivalent to a good liberal education. It included works by Homer, Plato, Plutarch, Virgil, Benjamin Franklin, Adam Smith, Charles Darwin, Michael Faraday and Louis Pasteur, as well as classics from literature, history, mathematics and other realms of knowledge. At a time when only 10% of American children enrolled in high school, the Five-Foot Shelf became a runaway best-seller, according to its publisher, Collier, which claimed to have sold 350,000 sets, or 17,500,000 volumes. A prolific writer of magazine articles and books, he was a counsel to virtually every other university president in the United States, a counsel to American presidents and a frequent counsel to congressional committees. Although he was the most important educational visionary of his era, Eliot's vision was clouded by his conception of higher education and universities as reserved for the "better-educated classes," which he defined as white men of Anglo-Saxon Protestant origins. Although his transformation of Harvard encouraged almost every major college to expand into Harvard-type universities, it also led to more than five decades of discrimination which saw virtually every major private university, including Harvard, all but refuse entry to women and blacks and tightly restrict entry to Jews and Catholics.

(See also GREAT BOOKS PROGRAM.)

Eliot, John (1604–1690) English-born minister, teacher and missionary, who emigrated

to New England in 1631. A graduate of Cambridge University, he became pastor of the Boston Puritan Church, a post he held for 56 years. In 1642, he became an overseer (board member) of HARVARD COLLEGE and, in 1645, founded the Roxbury Latin School. In 1642, his concern over the "heathen ways" of the Indians in the area took him to Nonantum (now Newton) to preach. His oratorical skills brought him invitations from the heads of other Indian villages, and by 1651, after a visit to an Indian village at Concord, he was persuaded that Indians would only be able to become true Christians by adopting the English way of life.

Two years earlier, having heard of Eliot's good work among the Indians, Parliament had created the COMPANY FOR THE PROPAGACION OF THE GOSPELL IN NEW ENGLAND, a charitable organization to which Oliver Cromwell himself contributed. In 1651, Eliot used society funds to acquire 2,000 acres along the Charles River, 18 miles from Boston, and founded the first "praying town," Natick, to which Indian converts could move and adopt an English way of life. Over the next 14 years, he founded 12 more, each with carefully laid-out streets, a house and farm lot for each Indian family, and a meetinghouse for prayer and education. He trained Indian teachers, established freestanding schools and, in 1666, wrote an Indian language grammar book and primer. Between 1653 and 1663, he translated the Catechism, New Testament, Old Testament and a Psalter into Algonquian. He continued to teach, preach to and care for the Indians in praying towns until his death. Having convinced his fellow colonists of the necessity of converting Indians to Christianity, he attempted to do the same for Africans. He warned slaveholders not to "imagine that the Almighty God made so many thousands of reasonable creatures for nothing but to serve the lists of Epicures or the gains of mammonists." His appeal failed.

emancipated minor A legal status granted by some states and conferring full adult status (except the right to vote) to minors who can demonstrate they can support themselves and live independently of their parents or other adult guardians. The age varies from state to state, usually depending on the age at which compulsory education is no longer required.

The concept was developed to reduce state and community costs of caring for and housing neglected or abandoned minors whose age and maturity were such that they could care for themselves. It has, however, proved costly to both the federal and state governments and some public school districts, as minors have moved from their parents' homes, established independent residencies and, by declaring themselves emancipated, relieved their parents of all financial responsibility for their education. As a low-income emancipated minor, a college applicant is eligible for grants and scholarship awards to which his combined family income might not entitle him. Moreover, an emancipated minor establishing residency in another state may be entitled to free or reduced tuition available only to in-state residents. An emancipated minor can also establish residency in a different, perhaps superior public school district, which would have no way of obtaining tax funds to cover costs of the child's education.

Emerson, Joseph (1777–1833) American clergyman and first educator to expand women's academic education beyond the traditional "ornamental" and "domestic" arts. Born in New Hampshire to a long line of clergymen, he graduated from Harvard in 1801 and served as a minister in Beverly, Massachusetts, until ill-health forced his retirement in 1816.

Apparently sympathetic to the women's rights movement that emerged following the publication in 1792 of Mary Wollstonecraft's widely read *Vindication of the Rights of Woman*,

Emerson opened a secondary school for young women in Byfield, Massachusetts. From its beginnings, the Byfield Female Seminary attracted students from the most cultured New England families, offering them extensive studies in literature, history and other academic subjects that had been previously reserved for men. Among the young women he educated and influenced deeply were ZILPAH POLLY GRANT, CATHERINE BEECHER and MARY LYON, who would go on to pioneer equal educational rights for women and open the teaching profession to women.

Emerson, Ralph Waldo (1803–1882) American philosopher, author, scholar and “public teacher,” who used his oratorical skills to “educate” Americans in public lectures. A graduate of Harvard, Emerson spent several unhappy years as a schoolmaster before attending and spending several more, equally unhappy years as pastor of the Second (Unitarian) Church of Boston. In 1832, he resigned and went to Europe, traveling through Italy, France and Britain and meeting the likes of Samuel Taylor Coleridge, William Wordsworth, John Stuart Mill and Thomas Carlyle. Their influence convinced him to return to the United States the following year and assume the role of “scholar,” which he defined as “delegated intellect” of all men everywhere and a combination of philosopher, prophet, poet, critic, seer and public teacher. As such, it would be his role not just to impart knowledge but to continue discovering it through self-education in three spheres: nature, poetry and literature, and action.

In 1834, he moved to Concord, Massachusetts, where he spent the rest of life writing and making forays to Boston and elsewhere to lecture. In 1837, his Phi Beta Kappa address at Harvard electrified his listeners but produced a storm of controversy in the academic world and church by calling for intellectual indepen-

Ralph Waldo Emerson (*Library of Congress*)

dence from the church and academic traditions of Britain and Europe. He charged both institutions with using education to enslave their charges rather than as a means of freeing them to achieve their greatest potential. He urged his audience to search out their own knowledge and truths through self-education. Emerson’s words and writing influenced an entire generation of educators and thinkers, including Harvard University president CHARLES W. ELIOT, poet Walt Whitman and others who, in turn, would change the course of American education and letters.

emotional disturbance A vague, often meaningless catchall of behavioral symptoms that can have severe legal and educational

consequences for exceptional children. Students labelled emotionally disturbed are often subject to segregation in separate classes and to other forms of special treatment at school that may not only be unneeded, but may actually be harmful because of the humiliation of being set apart from one's peers. With no specific definition for the term, it can often lead to harsh conflicts between teachers, school administrators, psychologists and parents. In general, many teachers and administrators tend to label as emotionally disturbed children who consistently disrupt school routine or who lack motivation. Many normal children or frustrated, learning-disabled students may periodically exhibit such symptoms. Similar symptoms may result from trauma, cultural differences and individual differences in rates of development. The term emotionally disturbed should not be confused with seriously emotionally disturbed, which is a specific term referring to children unable to function without the care of a mental-health professional and/or medication. Serious emotional disturbance is far more evident and easy to diagnose than the vague term *emotionally disturbed*, which, at times, may simply reflect an inexplicable antipathy between a student and a particular teacher.

employment and education The relationship between the number of years of formal schooling and unemployment rates and earnings. In the decades since World War II, if 10% of those who completed high school are unemployed, the rate of unemployment will average 16.7% for persons with eight years or less education; 21.1% for persons who dropped out of high school and have at least eight but less than 12 years of formal education; 7.7% for persons with one to three years of college and 4.3% those with four or more years of college. Decades of unprecedented prosperity in the United States produced a new mix of statistics by the beginning of the

21st century, however, when unemployment rates dropped into a historically low range of 4% to 6%. Demand for labor—unskilled as well as skilled—even sent unemployment rates for the often unemployable workers without high school diplomas down to less than 7%, while unemployment fell to 5.5% for workers with high school diplomas but no college and 4.8% for workers with some college but no degrees. Only 4% of workers with associate degrees and 3.1% of workers with bachelor's degrees were unemployed.

On the earnings side, for every \$10,000 of earnings for persons who have completed four years of high school, persons with eight years or fewer of schooling could historically expect to earn only \$6,688; persons with one to three years of high school, \$7,877; persons with one to three years of college, \$12,133; persons with four years of college, \$15,294; and persons with five years or more of higher education, \$18,423. Again, the unprecedented prosperity of the 1990s skewed historic comparisons. By 2002, demand for workers had sent the median income of men with less than a ninth-grade education soaring to more than \$21,000. Women with the same education earned about \$17,000, or 19% less. The median annual income for men with some high school education but no diploma was more than \$26,000; similarly educated women earned \$19,000, or about 27% less. High school graduates earned median incomes of \$35,000 if they were men and \$25,300 if they were women—a 27.7% differential. Some college but no degree sent the median income of men to more than \$41,000 a year and that of women to about \$30,500—a 25.6% differential. With associate degrees, men commanded a median income of nearly \$43,000; women just over \$32,000, or 25.6% less. With bachelor's degrees, men earned a median of \$56,000; women, \$41,000, or nearly 27% less. With master's degrees, men earned a median income of \$71,000; women,

\$51,000, or more than 28% less. With professional degrees, men earned \$100,000; women, \$62,000, or 38% less. And with doctorates in nonprofessional (usually academic) areas, men earned a median income of \$87,000; women, \$62,000, or nearly 29% less.

(See also GENDER DISCRIMINATION.)

encyclopedia A published, alphabetized reference work containing information either on all branches of knowledge (a general encyclopedia) or in a specialized area of knowledge, as in the *Encyclopedia of American Education*. Derived from the Greek *enkyklios paideia*, which might be translated as “a circle of learning,” or “range of education,” the concept of the encyclopedia is believed to date from the fourth century B.C. when the Greek philosopher Speusippus (407?–339 B.C.), a disciple and nephew of Plato, is said to have compiled the first such work. Subsequent encyclopedias appeared in ancient Rome, medieval Spain and France and, finally, in 1559, in Germany, when Paul Scalich became the first compiler to attach the word *encyclopaedia* to such a work. A product of the Enlightenment, the modern encyclopedia developed during the 18th and 19th centuries was designed to be read from beginning to end in lieu of a formal education. Indeed, when the *Encyclopaedia Britannica* was first published in Edinburgh in 1768, it was issued in 100 weekly monographs, which subscribers could then bind. The first American encyclopedia, the 30-volume *Encyclopedia Americana*, was the work of German-American educator Francis Lieber (1800–72), who compiled it in 1829. The first encyclopedias specifically compiled for children were the 22-volume *World Book Encyclopedia* in 1917 and the 15-volume *Compton's Pictured Encyclopedia* in 1922. In recent years, printed encyclopedias have started disappearing from student bookshelves, as encyclopedia publishers have compressed their works on compact disks that not only contain the entire

printed contents of the encyclopedia, but integrate text with sound, pictures and animation.

endowment A fund of capital which usually may not be spent but the interest income from which may be used to pay for current expenses. Endowment funds may be restricted or unrestricted, depending on the terms laid down by fund donors. Thus, the use of income from some endowment gifts may be restricted to scholarship grants for students; others to pay the salary of a particular faculty chair; and others to the purchase of books for a library. Unrestricted gifts allow the institution to spend income from the endowment as it sees fit. On average, about 45% of endowment funds are unrestricted and 55% restricted.

Income from endowment funds varies widely from year to year, depending on investment choices by fund managers and financial-market trends. With notable exceptions in Texas and California, public institutions of higher learning have negligible endowments on average and seldom derive more than 1% of their revenues from such funds. Private institutions, on the other hand, have endowment funds ranging into the billions of dollars, and returns in recent years ranged from negative levels (losses) of 5% or more to between 9% and 14%. Despite the high growth rates and income of the funds, fund managers withdraw less than 5% a year on average and are exempt from the law requiring FOUNDATIONS to spend at least 5% of their earnings each year. Indeed, the wealthiest colleges such as Harvard and Yale have come under increasing criticism for continually increasing tuition and student fees—to about \$45,000 in both instances—while reinvesting and hoarding endowment income and paying its investment managers in the most extravagant manner. Harvard paid its fund managers a total of \$75 million to \$110 million a year during the mid-2000s, based on the annual gains they produced for the fund—

an average of more than 16% a year from 1995 to 2005. In response to criticisms, Harvard now uses more than \$930 million of its endowment income to cover about one-third of its operating budget, including financial aid programs that allow the university to admit qualified students regardless of their ability to pay. Although institutions of higher education collect about 10% of all U.S. charitable gifts on average, many fail to disburse much of those donations and, in some cases, misdirect contributor funds to purposes other than those for which the donations were intended (see *ROBERTSON V. PRINCETON*). Of the 400 largest U.S. recipients of charitable donations, 126 are colleges and universities, led by Harvard and Stanford, that receive individual gifts of at least \$1 million a year. Indeed, half of all gifts over \$1 million go to institutions of higher education, which nonetheless continue raising costs of tuition at rates that exceed the rate of inflation. Many alumni have condemned the incongruities of endowment management, and the percentage of alumni-giving has fallen steadily, reaching a low of 12.8% in 2004—especially after the F. W. Olin Foundation disbursed its last \$460 million to found an engineering college, the Franklin W. Olin College of Engineering in Needham, Massachusetts, and offer all its 300 students tuition-free education with an untenured faculty. A few of the most richly endowed colleges took hesitant steps in response: In 2004, Harvard waived financial contributions from families earning less than \$40,000 a year—so minuscule a percentage of the families with undergraduate children at Harvard that the institution raised the family income figure to \$60,000. Yale did the same for families earning less than \$45,000 a year, and Princeton replaced STUDENT LOANS with outright scholarships and grants for students from families with annual incomes of less than \$46,500. Columbia University, Brown University, University of Pennsylvania, Stanford University,

and Massachusetts Institute of Technology, among others, have taken similar steps. The average college student in America graduates about \$20,000 in debt to pay for his or her college education.

In 2006, 62 colleges and universities had endowments of more than \$1 billion: HARVARD UNIVERSITY'S was by far the largest, at more than \$28.9 billion at the end of 2006. Only four other institutions boasted endowments of more than \$10 billion in fiscal 2006: Yale University, with just over \$18 billion; Stanford University, with \$14.1 billion; the University of Texas system with just over \$13.2 billion; and Princeton University, with just over \$13 billion. The next five largest endowments in 2006 were those of Massachusetts Institute of Technology (nearly \$8.4 billion), Columbia University (more than \$5.9 billion), University of California system (more than \$5.7 billion), University of Michigan (\$5.65 billion), and Texas A&M University and its related foundations (\$5.64 billion). The 2006 values of the top 10 college endowment funds represented year-to-year increases ranging from 9.8%, for University of California, to 24.7% for MIT.

On average, colleges and universities invest just under half their endowment funds in U.S. equities, with about 20% in U.S. government and corporate bonds, 10% in foreign equities and 10% in alternative investments such as hedge funds. They retain less than 5% in cash and, somewhat surprisingly, invest less than 3% in real estate. Despite high rates of growth and rates of return, college endowment funds pay out less than 5% of their annual income.

Engel v. Vitale A 1962 decision by the U.S. Supreme Court declaring unconstitutional a New York State law giving public school officials the option to mandate a daily nondenominational prayer in school. The landmark ruling was the first of a battery of court decisions that would strike down efforts by officials in dozens

of states to compel daily Bible reading and prayer in public schools. Indeed, the following year, the Court ruled such laws in Pennsylvania and Maryland to be a violation of the Establishment Clause of the Constitution. None of these rulings declared prayer in public schools to be unconstitutional, however. Rather, the court only struck down government-mandated or required programs of prayer and Bible reading. Indeed, voluntary, individual student prayers are still legal in public schools—so long as such prayers are conducted apart from the student body and out of the classroom and other public areas, where other students might interpret such activity as a form of direct or indirect coercion to participate.

(See also CHURCH-STATE CONFLICTS.)

engineered classroom A carefully structured classroom layout that segregates individual or small groups of students into specific areas, where their behavior can be carefully controlled and from which they are unable to contact or disrupt activities in other areas. Designed originally for emotionally disturbed children, the approach has been modified to some extent and is not an uncommon layout in almost all classrooms for young children, whose energy can be more easily channeled into learning activities. The original engineered classrooms were divided into three basic areas: a mastery center, for mastering basic reading, writing and arithmetic skills; an exploratory center, where children studied science and art; and an order center, where teachers focused on behavioral learning, such as paying attention, responding to directions and social conduct.

By limiting time spent in each section to about 15 minutes and moving the children from section to section throughout the day, the engineered classroom provides highly structured situations where the number of tasks the child is expected to perform are limited, thus making it easier for the child to develop self-control.

engineering A field of study that applies mathematics and the empirical sciences to the efficient use of materials and the forces of nature. Although the term usually refers to a profession requiring various levels of higher education, engineering, in the broadest sense, can also refer to a variety of craftsmen, tradesmen and para-professionals, such as marine engineers or locomotive engineers, who only need to serve an apprenticeship or obtain a two-year associate degree or certificate before entering the trade.

At the professional level, however, engineering requires at least a four-year college degree and, often, a master's degree or doctorate. Originally concerned primarily with construction, modern engineering was an outgrowth of the industrial revolution. The fields of engineering study offered by the more than 300 engineering schools in the United States include aeronautical, aerospace, chemical, civil (construction), electrical, electronics, geological and mining, industrial or management, mechanical, military, naval or marine, nuclear, safety and sanitary engineering—many with their own subspecialties such as the communications, control and computer engineering subspecialties of electrical and electronics engineering.

Prior to the 19th century, engineers learned their skills as apprentices. As a profession requiring formal study, engineering in the United States dates back to 1802 and the founding of the UNITED STATES MILITARY ACADEMY at West Point, New York. Although West Point was established to train officers for the armed services, it also trained the vast majority of American engineers who had not emerged from traditional apprenticeship programs. Most of their work was limited to building fortifications and other military installations, however, and a growing need for engineers to work on civilian projects led to the founding of the RENSSELAER (now, Polytechnic) INSTITUTE in Troy, New York. Both West Point and RPI introduced advanced mathematics, chemistry,

physics and engineering, as well as laboratory instruction into their curricula, which served as models for other institutions of higher learning shortly after the Civil War.

In the years following World War II, the engineering curricula at most undergraduate engineering schools started with two years each of physics, chemistry and mathematics, but then branched off into specialized studies of aerospace, chemical, civil, mechanical or electrical engineering. The development of electronics during the 1970s and 1980s, however, so blurred the differences between engineering specialties that many engineering schools were forced to revamp their curricula to provide their slightly more than 100,000 students with the newer, more inclusive skills that industry required. Thus, in 1994 the University of California at Berkeley introduced a new four-year "mechatronics" program that merged traditionally separate mechanical and electrical engineering. The aerospace department of the MASSACHUSETTS INSTITUTE OF TECHNOLOGY combined structural and propulsion engineering with new courses in statistics and computer science designed for engineering managers. Carnegie Mellon University merged electrical and computer engineering, while Cornell University created a combined civil engineering and geotechnical program and the University of Michigan introduced a new master's degree program that combined engineering and business administration to teach management skills to engineers. Stanford University also mixed business school management and budgeting courses in its engineering program. And dozens of engineering schools ended the age-old practice of forcing first- and second-year students to take a specific number of math and science courses during their first two years of college. Instead, they blended the necessary math and science instruction into their engineering courses, thus allowing students to learn calculus or chemistry in the context of engi-

neering problems instead of requiring them to recall such concepts from earlier courses.

Engineering Concepts Curriculum Project (ECCP) An innovative course designed in 1963 by the Commission on Engineering Education to teach high school students the basics of engineering and encourage them to consider the field as a future profession. Eventually called *The Man-Made World*, the aims of the course were to develop student technical literacy and show how technology and applied mathematics had benefitted society. Put together by a group of secondary school science teachers, engineers, college professors and scientists, *The Man-Made World* was divided into three parts: Logic and Computers, Models and Measurement, and Energy and Control. Funded by the NATIONAL SCIENCE FOUNDATION and such corporations as Exxon, U.S. Steel and McGraw-Hill Publishing Co., the course provided schools with appropriate textbooks, teacher manuals, tests, film strips, transparencies, audiotapes, games and laboratory equipment. Administered by an ECCP staff at the State University of New York at Stony Brook, the course was a precursor of the technology courses that subsequently permeated the elementary and secondary school science curricula across the United States.

English The primary language of the United States and a basic, required element of formal education, from kindergarten through high school. English instruction consists of seven basic elements: speaking (rhetoric), READING, SPELLING, WRITING, GRAMMAR, COMPOSITION and literature. Most American-born children of English-speaking parents have a vocabulary of 1,000 words or more by the time they are three years old and ready for preschool. Most have limited reading skills by the time they finish kindergarten. In the early grades of elementary school, students learn to read and to comprehend the main ideas in a written work of appro-

priate children's literature. During the early elementary school years, children also learn to write standard English sentences, with correct structure, verb forms, syntax, punctuation, word choice and spelling. The early elementary school years also teach students to organize their thoughts and present them orally as well as on paper in logical, understandable sequence. As students master basic reading, writing, spelling and grammar and progress into secondary school, the emphasis in English studies gradually shifts to advanced compositional skills and the reading, interpreting and understanding of increasingly complex literature.

English as a second language (ESL) One of two basic approaches to teaching English to non-English-speaking students in American public schools, without interrupting the normal school curriculum. ESL uses the IMMERSION technique, which limits all classroom language to English during the entire school day. Instead of translating words that students do not understand or allowing students to use words of their native language, teachers trained in ESL use demonstration, charades, drawings and other graphic and dramatic techniques to convey the meaning of English words.

ESL is an outgrowth of the Bilingual Education Act of 1974, which amended the ELEMENTARY AND SECONDARY EDUCATION ACT OF 1965 to establish programs of bilingual education for "children of limited English-speaking ability in elementary or secondary schools." At the time, the total number of U.S. residents five years old or older speaking a language other than English at home was less than 20 million. By 1980, the total had reached more than 23 million, and, by the end of the century, it had climbed to 26 million, or nearly 10% of the U.S. population. At the beginning of 1998, limited-English students made up more than 6% of the total elementary and secondary school student population in the United States. California accounted for 40% of

the nation's 3.5 million non-English-speaking students, with about 1.4 million—about 25% of the state's school population. Texas harbored about 457,000, New York, 236,000, Florida, 154,000 and Illinois, 107,800.

Adding to the non-English-speaking population was a flood tide of illegal immigrants—more than 11 million by 2007, according to U.S. Office of Immigration estimates. Their arrival added about 1 million school-age children. About 60% of the illegals had crowded into four states—California (2.2 million), Texas (1 million), New York (500,000) and Illinois (450,000). Under a 1982 Supreme Court ruling in *PLYLER V. DOE*, all children in the United States are entitled to free elementary and secondary school education, regardless of place of birth or immigration status. By 2000, the states were spending a total of about \$3.5 billion a year to educate non-English-speaking children, which included legal as well as illegal immigrants. The U.S. Department of Education subsidizes state bilingual education with about \$400 million.

The programs authorized by the Bilingual Education Act were to include instruction in English; but all the rest of the child's instruction "in all courses and/or subjects of study" was to be in his or her native language "to the extent necessary to allow a child to progress effectively through the educational system. . . ." Two methods of bilingual instruction have emerged: the native language method, in which basic academic skills are taught in the student's native language and eventually retaught in English, and ESL, which immerses students in English, allowing them to listen and speak nothing but English.

English schools A type of colonial American primary school whose curriculum was a precursor of the modern curriculum stressing reading, spelling, writing, arithmetic, geography and history, rather than religious instruction. Usually housed in a small, one-room

schoolhouse, English schools enrolled children from two or three to 14 years old, with the older children studying Latin, Greek, geometry, algebra and trigonometry. In more populated areas, English schools evolved into age-differentiated units, with a primary division teaching students five or six years old for two or three years, and an English grammar, or intermediate, school for children from between nine or 10 to 14 years old.

enrichment programs Educational programs that supplement the standard school curriculum to meet the needs of *gifted* or exceptionally talented children. Enrichment programs might include instruction in playing chamber music for gifted music students or special research opportunities for gifted science students. In effect, enrichment programs are designed to encourage student creativity and in-depth study by helping them pursue personal interests and obtain knowledge beyond that available from the standard classroom experience. Although there are many special schools for the talented and gifted, enrichment programs are usually associated with conventional schools.

Beyond the in-school enrichment program, a second type of out-of-school program, also called an enrichment program, helps make culturally deprived preschoolers school-ready by providing them with instruction in reading and other skills they would not learn on their own at home. The most notable preschool enrichment program is HEAD START.

enterprise schools Public schools that are operated and administered by any of a variety of private, profit-making organizations instead of by school administrators hired by local SCHOOL BOARDS. Working under contract with school boards, operators of enterprise schools usually have free rein to administer each school independently of the school board. They imple-

ment their own educational programs, manage their own financial resources and physical plant and can contract for materials and services with whomever they choose. The concept developed in the late 1980s, as some school boards found themselves unable to sustain quality education and operate within budgets provided by public funds, which averaged about \$5,500 per student across the United States. Under some plans, school boards hired outside firms to administer one or more schools over a fixed period of years for a specific annual fee based on the number of students.

A second type of enterprise school program involves the hiring of a management consulting firm for a specific fee to take over the day-to-day operations of the superintendent of schools for a fixed period. The firm has *carte blanche* to implement its own educational programs, streamline operations and finances and make any other improvements in the system it chooses. All savings that accrue from such efficiencies belong to the school district.

(See also EDISON PROJECT; PRIVATIZATION.)

entrepreneurial (proprietary) schools Privately owned, for-profit schools that usually specialize in teaching a craft, skill or trade. An outgrowth of the apprenticeship system, entrepreneurial or "trade" schools number in the thousands, ranging from individually operated storefronts to full-scale schools with classrooms and highly specialized equipment. Open to applicants of all ages, entrepreneurial schools obtain most of their students by advertising. Training is quick and concentrated, with students in some schools ready for the job market in as few as two weeks. In many communities, private trade schools are the only organizations that teach certain trades, such as car repair, barbering or bartending. As such, trade schools often serve as valuable supplements to conventional public vocational schools, and before

the era of universal public education they were often the sole source of education.

During the 17th and 18th centuries, parents often signed contracts for master craftsmen or tradesmen to educate their children (most often boys). Such contracts required the youngster to serve and obey the master in all lawful ways over a fixed period of time. In turn, the master contracted to teach the youngster his craft or trade, provide him with food and clothing and teach him his “letters” and “numbers.” (See also APPRENTICESHIP.)

As the industrial revolution began and shops evolved into factories, some craftsmen trained a dozen or more apprentices in their shops. As demand for skilled workers grew, some master craftsmen converted their training facilities into profitable trade schools, and wherever a demand for workers existed, an entrepreneur-craftsman was certain to establish a school to train them.

The growth of entrepreneurial schools reached its peak in the years following the world wars of the 20th century, when demand for workers exploded. In the 1920s, the Delehanty Institute was training thousands of young men and women to take examinations for the New York City civil service. In the 1950s, the Berlitz School of Languages taught thousands to speak foreign languages in preparation for jobs overseas. In the 1960s, the Katherine Gibbs School trained thousands of young women and men for secretarial and business posts. And in the 1980s, the Ultissima Beauty Schools and others trained men and women for careers as hairstylists and cosmetologists. During periods of prosperity, other types of entrepreneurial schools developed to take advantage of public demand for self-improvement, luxury and recreation. After World War II, the Arthur Murray School of Dancing taught thousands of men and women the pleasures of ballroom dancing. Other schools developed to teach physical fitness, sailing, tennis, golf and a

host of other sports. Another large group of unaccredited “Bible” schools purported to prepare students for the ministry.

Because of the lack of government standards or oversight, training at some entrepreneurial schools can be extremely poor, and there is seldom any guarantee of a job after graduation. Indeed, some graduates are often left at a distinct disadvantage, because entrepreneurial schools offer no academic instruction or remediation and limit training to single-level occupations such as bartending or barbering. Unemployment among entrepreneurial-school graduates is 50% higher than students with comparable training from two-year community colleges and two-thirds higher than graduates of two-year technical institutes.

The lack of government oversight has also permitted unethical and criminal operators to infiltrate the industry. One congressional investigation cited a host of unethical and illegal practices ranging from misrepresentation to prospective students and lack of attention to standards through low (student) completion rates and misuse of federal financial aid programs.

Three-quarters of the students enrolled in entrepreneurial schools had not graduated from high school, and half of those who did have diplomas dropped out of the programs in which they enrolled. Moreover, certificates from many proprietary schools were no guarantee of students’ employability or ability. Indeed, some certificates—those issued by so-called diploma mills—were and are worthless, as academic credentials or credentials for obtaining employment. Although some states ban DIPLOMA MILLS, the absence of federal regulations allow fraudulent diploma mills—often masquerading as “Bible schools”—to issue useless “degrees” in states that either fail to regulate entrepreneurial schools or to insist on their accreditation by recognized accrediting associations.

entry behavior The knowledge, skills and behavioral and emotional characteristics that a student brings when beginning a school or class. A term used largely by educational psychologists, entry behavior may be measured by appropriate tests on the basis of which an appropriate educational program and, if necessary, remediation may be recommended. Using the results from tests measuring exit, or terminal, behavior, psychologists can then determine the effectiveness of the program and possible remediation for the individual.

environmental education The study of man's relationship with his surroundings, including the effects of population, pollution, resource allocation and depletion, conservation, transportation, technology and urban and rural planning. In elementary and secondary schools, environmental education is generally taught as a content area of various science courses, although it may also find its way into social studies, history and geography courses. At the college and graduate school level, it is usually an interdisciplinary subject, taught in conjunction with many of the pure sciences, as well as cartography, conservation, ecology, economics, engineering, forestry, geology, mineralogy, mining and resource management.

Formal environmental education is an outgrowth of the Environmental Education Act of 1970, Congress's response to increased concern over air, water and soil pollution and the deterioration of the nation's environment. The act funded development of model programs that introduced environmental education into school and college curricula. The act called for the government to prepare and distribute appropriate teaching materials to schools and the media and to provide environmental education to teachers, public service workers, community business and labor leaders and government employees. The act also funded the creation of outdoor, ecological study cen-

ters and the development of community education programs.

epilepsy A neurological disorder involving electrical discharges in the brain that provoke a variety of involuntary activities, such as seizures. The latter last from as little as five seconds to a half hour or more, depending on whether the seizures are partial or generalized. (These are also known as petit mal and grand mal, respectively.) Symptoms may vary from nothing more than a brief, barely noticeable, localized convulsion with no loss of consciousness, to a generalized convulsion and loss of consciousness. Drugs are the most common treatment. Epilepsy has no effect on intelligence or ability to function in school, although teachers need to be aware of any epileptics in their classes, as they should be aware of diabetic children or any other student with a chronic disorder.

Epperson v. Arkansas A unanimous U.S. Supreme Court decision in 1968 that declared a 1928 Arkansas law unconstitutional for permitting the teaching of the biblical story of man's creation while banning the teaching of any theory that "mankind ascended or descended from a lower order of animals." Considered a landmark case in the history of religious and academic freedom, the case began after administrators at a Little Rock high school gave tenth grade biology teacher Susan Epperson a new textbook containing Darwin's theory of evolution to use in her class. To use the book violated state law, but failure to use it would have constituted insubordination to school administrators and subjected her to disciplinary proceedings. Joined by the father of two of her students, she challenged the law in state court.

Passed during the fundamentalist religious fervor that had swept the South during the 1920s, the Arkansas law was an adapta-

tion of Tennessee's 1925 Butler Law, which provoked the famous SCOPES "MONKEY TRIAL." In that trial, a teacher was found guilty of violating the state's prohibition against teaching Darwin's theory. Although Tennessee eventually repealed its "monkey law" in 1967, Arkansas did not, and in ruling against Epperson the Arkansas state supreme court held that the law was a "valid exercise of the state's power to specify the curriculum of the public schools." She appealed to the U.S. Supreme Court, which declared it unconstitutional, saying,

There is . . . no doubt that the First Amendment does not permit the State to require that teaching and learning must be tailored to the principles of any religious sect or dogma. . . . This prohibition is absolute. . . .

The State's undoubted right to prescribe the curriculum for its public schools," Justice Abe Fortas wrote for the court, "does not carry with it the right to prohibit, on pain of criminal penalty, the teachings of a scientific theory or doctrine. . . .

The ruling was the foundation of a series of subsequent cases challenging the right of public schools to use science courses as vehicles for teaching religious principles.

Equal Access Act A federal law, inserted into the Education for Economic Security Act as Title VII, guaranteeing equal access to meeting rooms in public secondary schools for all student groups. The law specifically stripped public secondary schools receiving any federal funds from denying the use of such meeting rooms to students because of the religious, political, philosophical or other content of the discussions or speeches presented, so long as such meetings are voluntary and student-initiated and do not interfere with the orderly routine and conduct of the school.

equal employment opportunity The absence of job-market discrimination on the basis of race, color, religion, ethnicity, age, physical handicap and all factors other than the qualifications of the individual for the particular job. Discrimination in the American job market was the rule until June 25, 1941, when President Franklin D. Roosevelt signed an executive order establishing an Office of Production Management Committee on Fair Employment Practice. Designed to ease manpower shortages in the face of imminent war, the committee was responsible for opening previously all-male, all-white work forces to women and blacks at many defense contractors. It was not until 1964, however, that Congress outlawed discrimination in the workplace with passage of the Civil Rights Act. The act created an Equal Employment Opportunity Commission to end discrimination in hiring, promotion, firing, wages, testing, training, apprenticeship and all other workplace functions.

In 1971, the Department of Labor strengthened the law by requiring affirmative-action plans to eliminate discriminatory hiring practices at all firms receiving federal government contracts valued at \$50,000 or more. In 1972, Congress passed an Equal Employment Opportunity Act, which strengthened the authority of the Equal Employment Opportunity Commission and extended antidiscrimination provisions of the CIVIL RIGHTS ACT OF 1964 to cover state and local government workers, employees of public and private employment agencies and employees of labor unions with 15 or more workers. The act thus extended to public school teachers the same guarantees against discrimination that applied to major defense contractors and opened the doors of white schools to African-American teachers, who had previously been largely confined to teaching African-American students. It also widened the doors of education to women, who had largely been confined to work in elementary schools

and were invariably paid less than men with the same qualifications for the same work.

Equity 2000 A program established in 1990 by the COLLEGE ENTRANCE EXAMINATIONS BOARD to eliminate public school TRACKING in mathematics in the United States by the year 2000 and ensure that every student masters mathematics, algebra and geometry. Comparable to the ACCELERATED SCHOOLS PROGRAM, Equity 2000 eliminates the various types of middle school and high school mathematics tracks—consumer math, business math, vocational math and college math. Instead, it teaches all eighth graders prealgebra, all ninth graders algebra and all tenth graders geometry. To avoid boring bright learners and overwhelming slow learners, Equity 2000 provides special training that shows teachers how to raise the learning levels of slower students without limiting the progress of quicker students, who are allowed to advance through the program at their own pace. Those who need extra help to achieve minimum Equity 2000 expectations receive after-class help.

Erasmus, Desiderius (1466?–1536) Dutch scholar, philosopher and author, whose humanistic writings on the instruction of the young exerted a profound influence on American education during the 17th and 18th centuries. In many ways, the philosophy of Erasmus presaged progressive education of the late 19th and 20th centuries. His *De Ratione Studii* (On the method of study, 1511) and *De Pueris Satim ac Liberaliter Instituendis* (On teaching children firmly but kindly, 1529) suggested teaching Latin at home in natural conversation—much the way children learn their native tongues, before they begin formal schooling. Grammar, he said could be taught later in school. Erasmus also advocated introduction of physical education in school, and he recommended stimulation of student interest rather

than severe punishment as a basic method of teaching.

essay (college application) An element of most college and university application forms that offer student applicants an opportunity to reveal their personality in a piece of original writing. Often called a “personal statement,” the essay section of many college applications asks the student to “tell us something about yourself.” The essay gives students an opportunity to reveal their personalities, their maturity and their emotional and intellectual depth, as well as display their writing skills, originality and ability to organize thoughts and express themselves.

Most applications ask for essays of about 200 to 500 words. Some ask the student to “evaluate a significant experience or achievement that has special meaning to you” or “write about a person who has had a significant influence on you, and describe that influence.” Still others ask the applicant to “discuss some issue of personal, local or national concern and its importance to you” or, more simply, “Write on a subject of your choosing. We are interested in anything of importance to you that will help us better understand your abilities, your interests, your background, your aspirations.”

In addition to the personal statement, some applications ask for additional essays designed to display academic and intellectual depth, for example, “If you were a journalist with an opportunity to interview any person living, deceased or fictional, whom would you choose? What questions would you ask and why? What is the most important lesson you feel you could learn from this person?”

The importance of the essay in applications to selective colleges and universities has grown enormously in recent years, as the number of applicants has increased to levels too high to permit the admissions staff to interview all applicants. In many cases, the essay has thus

replaced the interview as the only vehicle for students to display qualities not evident from the statistics and facts listed in the rest of their applications. It is, in effect, the only way admissions officers can get to know the unique characteristics of each applicant; as such, the student's essay can be decisive. It is also a leveling element, completely under each applicant's control and giving all students an equal chance to be open and honest about themselves.

essay test Any subjective examination requiring the production of thoughtful prose to demonstrate command of a particular topic or subject. A difficult type of test both to take and to evaluate, the essay question requires students to demonstrate critical thinking as well as a wide breadth of knowledge and accurate recall of facts and figures. Unlike objective tests, it permits little or no guesswork. For teachers, however, the essay test can present scoring problems because of the subjective nature of answers and the possibility of teacher prejudice toward individual students. Accurate scoring of essay questions requires four basic procedures: Submission of papers without student names (there are various coding devices to accomplish this); the listing, in advance, of specific facts or answers the teacher expects to elicit and the assignment of point values to each; dual grading, with a fixed percentage of the final grade awarded for content and a fixed percentage for spelling, grammar, syntax, penmanship, compositional skills, etc., with grading for content done separately and unaffected by grading for writing skills; and the independent evaluation of each test by two or more readers.

essentialism A "BACK-TO-BASICS" educational movement started in the late 1920s by Teachers College Columbia University professor WILLIAM C. BAGLEY in response to growing neglect of traditional fields of study in public elemen-

tary and secondary schools. Formalized in 1938 by the Essentialist Committee for the Advancement of American Education, the essentialist doctrine called for restoration of strict classroom discipline, high achievement standards and a required core curriculum of basic skills. These included reading, writing, spelling and calculating, along with thorough command of grammar, arithmetic, mathematics, algebra, geometry, the natural sciences, history, geography, fine arts and hygiene. "It is true that the world of today is a different world from the world of 1913 and from the world of 1929," Bagley wrote in 1934, "but this does not mean that everything has changed. . . . The winds that blow still follow the law of storms; *Huckleberry Finn* and *Treasure Island* still delight youth; and the Sistine Madonna is just as beautiful as of yore."

Bagley and the essentialists he led were reacting to an educational trend fostered by overenthusiastic followers of JOHN DEWEY, who had misinterpreted his theories of progressive education. Dewey had urged the use of play as an instructional tool in a highly disciplined setting, but some teachers had started using play as the key element of children's education. As one Los Angeles school superintendent wrote: "The principal business of the child is to play and to grow—not to read, write, spell, and cipher. These are incidental in importance. If they can be made a part of this play, it is well to use them; if not, they should be handled sparingly."

Bagley and his associates countered by ridiculing the progressivists and calling for restoration of traditional methods of mental discipline such as memorization and drill. He called on teachers to take the initiative in the classroom, leaving nothing to students. "The freedom of the immature child to choose what he or she will or will not learn," Bagley wrote, "is utterly insignificant in comparison with . . . a type of freedom which is won only by a

system and effortful mastery of the lessons that man has learned as he has traversed his rough road upward from the savage and the brute." He and his colleagues Michael J. Demiashkevich and Isaac L. Kandel called the traditional curriculum "the tried and tested heritage of skills, facts, and laws of knowledge that have come down to us through civilization."

Essentialist influence grew throughout the 1940s, ebbed during the 1950s, all but disappeared during the two decades that followed, but revived strongly during the 1980s and 1990s as an updated "back-to-basics" movement.

Establishment Clause An abbreviated label for the first 10 words of the First Amendment of the Constitution: "Congress shall make no law respecting an establishment of religion. . . ." The restrictions imposed on the federal government by the First Amendment were extended to apply to state governments in the Fourteenth Amendment, which was ratified in 1868. The Establishment Clause has been a center of controversy throughout the history of American education, as public schools across the United States, often with the support of state legislative mandates, have attempted to introduce PRAYER IN SCHOOL as well as religious teachings such as the biblical story of the creation of the world. Dozens of court decisions, including many by the U.S. Supreme Court, have consistently declared such efforts unconstitutional on the basis of the Establishment Clause, but the efforts nevertheless continue. (See especially *AGUILAR V. FELTON CHURCH-STATE CONFLICTS*; *ENGEL V. VITALE*; *EPPERSON V. ARKANSAS*; *EVERSON V. BOARD OF EDUCATION*; *MCCOLLUM V. BOARD OF EDUCATION*; *SCOPES MONKEY TRIAL*.)

ethics A branch of philosophy concerned with principles and norms of human behavior. Once called moral PHILOSOPHY, it was a required part of the basic curriculum at every colonial college from the opening of the first such insti-

tution, Harvard, in 1638. A key element of the curriculum that was studied over a student's entire college career, moral philosophy dealt not only with man's relationship to man, but his relationship to God, as interpreted by the churchmen who ran and ruled the colonial colleges. Moral philosophy was also a core element of the curriculum for older boys in most academies and LATIN SCHOOLS and was used to indoctrinate them in Protestant beliefs and various political points of view—usually those of the academy head. As the colonial era drew to a close and secular leaders replaced churchmen as college presidents, they gradually replaced theology as the basis of the curriculum with practical studies in the liberal arts and sciences. Moral philosophy, a theologically oriented course, was relegated to divinity schools and replaced in the liberal arts curriculum with secularized studies in ethics. Ethics is now a series of courses within the philosophy and theology departments of most liberal arts colleges.

(See also MORALITY EDUCATION.)

Ethnic Heritage Program A federal program of grants to educational organizations for developing and distributing materials that teach about the contributions of different ethnic groups to the United States. Approved by Congress in 1972, the program was designed to aid in the development of MULTICULTURAL EDUCATION programs to reduce or prevent racial and ethnic tensions in American schools in the aftermath of racial INTEGRATION.

(See also SEGREGATION and listings for various racial, religious and ethnic groups.)

Evangelical Alliance for the United States

The American branch for an international, interdenominational organization formed in London in 1846 to unite Protestant sects in a common war against free thought and Roman Catholicism. Business leader William A. Dodge, who founded the Young Men's Christian Asso-

ciation (as well as the Phelps, Dodge Co.), formed the American branch in 1867, but it did not become powerful until the alliance named JOSIAH STRONG its leader in 1886. Determined “to save American civilization” by turning it into a Protestant Kingdom of God, Strong reached out to the millions of unchurched and unschooled immigrants inhabiting the slums of major American cities. He sent a small army of missionaries, social workers and teachers to teach them academic as well as social skills, while indoctrinating them in Protestantism. Alliance members permeated public school systems and were instrumental in influencing the passage of laws in some states, mandating the teaching of biblical interpretations of the creation of man and the universe, while banning the teaching of Darwin’s theory of evolution. The influence of the alliance waned after the 1925 SCOPES MONKEY TRIAL, in which those who claimed a scientific basis for the biblical theory of creation were ridiculed. The erosion of church membership, attendance and contributions during the economic depression of the 1930s virtually ended alliance influence in American education.

evangelism (evangelicalism) A relatively modern Anglo-American Protestant Christian proselytization movement that relies on the literal interpretation of the Bible, more than church hierarchy, as sole authority in religious matters. Evangelical differences with Protestant church hierarchy surfaced in the New World during the 18th and 19th centuries. Those differences centered on the doctrine of original sin and Christ’s role in removing man’s burden of original sin. Traditional “Old Light” Protestants believed that the fall of man from God’s grace in the Garden of Eden taints every human being with original sin from birth. With the exception of an unspecified elect (often dues-paying members of organized churches) for whom Christ died, original sin leaves the rest

of humanity eternally damned to moral depravity. “New Light” evangelicals, on the other hand, believed that Christ died to remove the burden of original sin from everyone. In effect, New Light evangelism was a democratized Protestantism that promised salvation to all who repented, laid aside all pride and humbled themselves before the Lord. The route to such salvation, said the evangelist preachers, lay in constant study of the Bible and a personal religious experience, or conversion, leading to a deep commitment to Christ.

Derived from the Greek *euangelion*, meaning “good news,” the term dates from the Reformation, whose leaders emphasized biblical writings and rejected the official pronouncements of the Roman Catholic Church. Evangelist practices of free-lance proselytizing go back to pre-Reformation European dissenters such as Peter Waldo and the Waldenses in 13th-century France, 14th-century English theologian John Wycliffe and the 14th-century Czech religious leader Jan Hus.

In the New World, evangelism began with the arrival of the first settlers—the Puritans, Dutch Reformed and Presbyterians, many of whom were evangelist rebels from the mother churches of England and Holland. Although its influence has waxed and waned from decade to decade, Evangelism has been a perennial element of and a profound influence on American life and, in turn, on American education ever since.

Evangelism as a mass movement reached its first peak in the colonies with the GREAT AWAKENING, which lasted from the 1720s to the 1740s. Led by such theologians as Theodorus Jacobus Frelinghuysen, William Tennent, George Whitefield and JONATHAN EDWARDS, the Great Awakening swept across the East and left few Americans untouched by evangelistic fervor. Although a religiously based movement, the Great Awakening had a powerful impact on American society by undermining the notion of

a divinely determined class system and imbuing it with a spirit of religious, political and social equality. Evangelism split communities and their churches and created a plethora of “New Light” and “Old Light” sects and divisions in each church. Because the church remained the center and source of all acceptable community knowledge and learning, the new, democratic, evangelist churches of the Great Awakening expanded the reach of education. They also taught an entire generation of American-born colonists that they were equal to their governors in England—a notion that eventually helped fuel the American Revolution. The Great Awakening might have converted the future United States into a fundamentalist Christian nation had dissent not erupted within the various Protestant sects over the question of original sin. Decrying the excessive zeal of some evangelists, dissidents rejected the notion of spending their lives on Earth burdened with guilt until they experienced conversion. Although egalitarian in concept, the evangelism of Edwards and others demanded a conversion prior to the promise of salvation. Dissenters introduced an even more egalitarian concept of the child being born as innocent as the Christ Child and, therefore, warranting immediate baptism. In addition to dissent within churches, practical considerations of day-to-day life also helped erode the religious strength of the Great Awakening. During the 1750s, political problems such as excessive parliamentary taxation of the colonies seized the attention of colonists. More and more, they spent their Sundays plotting against royal instead of religious authority and ignoring the call to prayer.

In addition, the exigencies of frontier life and the industrial revolution made the learning of agricultural techniques and mechanical skills more important than the need for salvation. Gradually, theology had to share the school day with mathematics, the sciences and foreign languages. At the college level, it all but

disappeared from the core curriculum and became a specialty reserved for those studying for the clergy.

Although secularists dominated the writing of the Constitution of the United States, independence did not bring an end to evangelistic influence on American life. Indeed, it was not until 1791 that secularists were finally able to push through the First Amendment provision, “Congress shall make no law respecting an establishment of religion. . . .” Nevertheless, evangelists were responsible for maintaining official state religions in six of the original states all of which mandated collection of taxes for the support of “public teachers” of the Christian religion. It was not until 1833 that Massachusetts became the last state to end its ties to an official state religion and cede control of common schools to secular teachers.

As secular public school systems were established in Massachusetts, Connecticut and Rhode Island, evangelists turned westward where no schools existed. The Rev. LYMAN BEECHER sounded the call in 1835, with the publication of *A Plea for the West*, writing, “The conflict which is to decide the destiny of the West will be a conflict of institutions for the education of her sons. . . .” He warned that waves of Roman Catholic immigrants from despotic European monarchies were flooding the West, threatening the foundations of American democracy. He said American democracy could only be preserved if Protestant missionaries fanned out across the West, establishing a vast network of common schools and colleges to indoctrinate American children in American Protestantism. A Beecher rival, CHARLES GRANDISON FINNEY, transformed evangelism into the movement we know today by completely democratizing Protestantism and opening it to all. Finney contended that Christ had died to remove the burden of original sin from everyone. Proclaiming a “universal amnesty,” Finney invited all his listeners to repent, accept Christ

and, as a result, salvation. Finney's appeals created an evangelistic fervor that swept across the nation and even reached Britain, where he twice went to preach. A lawyer by training and an electrifying orator, Finney might well have become the nation's most powerful figure had the Civil War not forced Americans from revival tents and onto the battlefield.

Within a decade after the Civil War, evangelist missionaries had nevertheless been responsible for establishing the vast majority of common, or public, schools in the South and West. Even as the public school movement spread and states acquired control of common schools, Protestant teachings were so integrated into elementary school education that the Roman Catholic Church decided to establish its own private, religious school system in 1884, lest public school education convert Roman Catholic children to Protestantism. Evangelistic influences in public school education diminished somewhat in the late 19th and early 20th centuries, when, just as it had in the late 18th century, the practical requirements of an expanding industrial nation made the study of engineering, mining, physics, chemistry, agriculture and other sciences and vocational skills seem more important to students than salvation. Moreover, the influence of new scientific theories such as Darwin's theory of evolution, cast doubt on the practical value of Bible studies in secular schools. Indeed, most universities abandoned theology as a requirement and relegated it to a separate department for those preparing for lives as clergymen.

Evangelists nonetheless continued their efforts to control education. Indeed, during the 1880s and 1890s they sought nothing less than the creation of a Protestant Christian United States. Feeling threatened by the arrival of growing numbers of non-Protestant immigrants, they sought to resolve the conflicts that had divided them since the aftermath of the Reformation. To that end, a number of major

groups united to secure "a larger combined influence for the Churches of Christ in all matters affecting the moral and social condition of the people, so as to promote the application of the law of Christ in every relation of human life." The International Sunday School Union, the Federal Council of Churches of Christ in America and the YMCA/YWCA joined in common cause, each with a specific mission. The first unified the Sunday school curriculum to ensure that every Sunday school was using and teaching the same scriptural materials every Sunday of the year. The second organization developed a common creed for its 33 denominations. Based on what it called "social Christianity," the council's creed called for "equal rights and complete justice for all men in all stations of life." The YMCA carried out missionary work among the idle and the poor in slum districts. They distributed tracts in boardinghouses, hospitals and jails, conducted Bible classes for businessmen, trained Sunday school teachers and set up formal programs of education that included evening classes that mixed secular education with religious indoctrination. Referred to as the "college of the people," the YMCAs offered courses of all levels for youngsters and adults of all ages, including reading, writing, literature, citizenship, civics and vocational skills. Despite these far-reaching efforts, evangelists lost ground during World War I, as public agencies, including the new public high schools rising in cities across America, usurped educational functions, while secular settlement houses competed in the area of social services by offering a variety of enjoyable activities—without sermons. Toward the end of World War I, however, a new wave of evangelistic fervor swept the nation, and many formerly moderate evangelists joined efforts of the more fervently conservative movement of FUNDAMENTALISM to ban the teaching of evolutionism in public schools. A number of southern states responded in the 1920s by passing

laws that not only banned evolutionism from the classroom, but mandated the teaching of the biblical version of the origins of man. The last two such law remained in force until 1967 and 1968, respectively, when Tennessee voluntarily repealed its so-called monkey law, and a year later, the U.S. Supreme Court ruled a similar law in Arkansas unconstitutional.

Waves of evangelistic fervor have continued to sweep the nation from time to time since World War II, and evangelist leaders have managed to coax a number of state legislatures into passing laws that would force schools to teach "CREATION SCIENCE" in public schools. The U.S. Supreme Court has been firm in declaring such laws unconstitutional attempts to impose religious teachings in the science classes of secular schools. Protestant evangelists responded by founding their own evangelical schools or CHRISTIAN SCHOOLS—about 10,000 in the 30 years from 1975 to 2005, with an estimated total enrollment of one million students.

Everett, Edward (1794–1865) American Unitarian clergyman, educator, orator, statesman and governor of Massachusetts, in which post he was responsible for helping establish the nation's first state public school system. A professor of Greek at Harvard from 1819 to 1825, he was elected to the U.S. House of Representatives, where he served for 10 years before being elected Massachusetts governor in 1836. As governor, he established the first state board of education in the United States. Headed by state senator HORACE MANN, the board was charged with establishing a system of public schools throughout the state. After one term as governor, Everett was named U.S. minister to Great Britain in 1841. He served until 1846, when he became president of Harvard—a post

he held until 1849. He was appointed U.S. secretary of state in 1852–53, served as a U.S. senator from 1853–54, and on November 19, 1863, owing to his reputation as a stirring orator, delivered the little-known, two-hour oration that accompanied Lincoln's Gettysburg Address.

Everson v. Board of Education A landmark 1946 U.S. Supreme Court ruling that the Ewing Township (New Jersey) Board of Education had not violated the ESTABLISHMENT CLAUSE in the First Amendment of the Constitution by reimbursing parents of parochial, as well as private, school children for school bus costs. The court ruled that the program had provided no funds to the schools themselves and, therefore, had done nothing to promote establishment of a religion. The case was the first application of the establishment clause of the Constitution to education, and it became the core of a series of legal cases based on the child benefit theory, which holds that universally available aid provided directly to children and benefiting only them cannot be construed as being of any benefit to the schools which they attend.

(See also *AGUILAR V. FELTON*; CHURCH-STATE CONFLICTS; *MEEK V. PITTINGER*; *MITCHELL V. HELMS*; *WOLMAN V. WALTER*.)

evolution The concept that all living organisms develop continuously through a series of metamorphoses that progress from lower and simpler to higher and more complex forms, based on a process of adaptation to their external environment. Although the concept dates back to ancient Greece, Charles Darwin offered the first successful explanation in his celebrated work *On the Origin of Species by Means of Natural Selection*, published in 1859. Darwin's theory caused consternation among American Christians, who believed that God had created all living things in their present forms.

Although Darwinism worked its way into the science curriculum of most schools and colleges, a surge of fundamentalist Christian fervor after World War I led to proposals in various state legislatures that the teaching of evolution be banned in public schools and colleges. After bitter, protracted debate, the efforts failed in Kentucky, North Carolina and Texas. In 1923, however, Oklahoma passed a law prohibiting the use in public schools of any books that discussed Darwin's theory of evolution. Florida passed a joint resolution declaring it improper and subversive for any public institution to teach atheism, agnosticism, Darwinism or any other theory that links man in blood relationship to any other form of life. Two years later, Tennessee passed the Butler Law banning the teaching of "any theory that denies the story of the Divine Creation of man as taught in the Bible, and to teach instead that man has descended from a lower order of animals." The Tennessee law was challenged by a high school science teacher in the famed SCOPES MONKEY TRIAL and, after the Tennessee supreme court found in favor of the state, Arkansas passed a similar law. After World War II, however, the U.S. Supreme Court issued a series of rulings banning the teaching of "creation science" on the grounds that it was a religious doctrine and, therefore, a violation of the ESTABLISHMENT CLAUSE of the First Amendment mandating separation of church and state. It ruled that any ban on teaching evolution represented an infringement on First Amendment rights of free speech.

Many states with large Christian fundamentalist populations, however, have continued introducing laws that skirt outright bans on teaching of evolution but nevertheless encourage skepticism about evolution by teaching so-called CREATION SCIENCE. State education boards call the approach "balanced" instruction about the origins of mankind. Although it reversed its decision in 2001, the Kansas Board

of Education went a step further by ordering schools to delete all mention of evolution in public school science curricula in 1999. Kentucky followed suit by ordering schools to delete the word "evolution" in favor of the phrase "change over time," and Oklahoma officials ordered all science textbooks to carry a disclaimer about the certainty of evolution. In addition to officially mandated changes in the curriculum, a growing number of teachers committed to "the inerrant word of God" have organized so-called creation clubs in several hundred public schools across the nation. The creationist thrust, however, is not without stiff opposition. The National Science Teachers Association, with more than 50,000 member-teachers, and the National Center for Science Education, continually sponsor programs to prepare teachers to lead their communities in defending evolution theory as essential to proper science education. New Mexico's Board of Education responded to these efforts late in 1999 by barring creationism from the public school science curriculum and overwhelmingly endorsing the teaching of evolution theory. Public ridicule forced the boards of education in Kansas, Kentucky, Oklahoma and other states to do the same, but the emergence of a repackaged form of creationism called INTELLIGENT DESIGN again placed the teaching of evolution in jeopardy in many areas. The Kansas Board of Education mandated introduction of intelligent design in the state's public school science curriculum in 2005. Theorizing that an as-yet-unidentified guiding force directed the development of all living organisms, including humans, advocates of intelligent design claim that living organisms are too complex to have evolved from common ancestors through natural selection and random mutation. Underlying the argument for intelligent design is the concept of "irreducible complexity," which holds that the interdependent parts of most organisms make it impossible for them to have

existed in any other earlier, more primitive form. Unlike creationism, the theory of intelligent design carefully avoids all references to religious beliefs, which, by injunction of the United States Supreme Court, public schools are prohibited from teaching or disseminating. Nonetheless, a Federal District Court in Harrisburg, Pennsylvania, ruled in December 2005 that intelligent design was as much a religious viewpoint as creationism and that public schools injecting it into the science curriculum were in violation of the First Amendment of the Constitution. Early in 2006, the Ohio Board of Education responded by reversing a previous order that tenth grade biology classes include a critical analysis of evolution. Later in 2006, Kansas voters ousted the conservative majority on the state Board of Education and installed a new, moderate board that pledged to restore a traditional science curriculum that does away with all mention of intelligent design and restores straightforward teaching of evolution.

Excellence in Education programs A series of programs established in 1982 by the U.S. Department of Education "to identify and publicly recognize unusually successful public schools and, through publicity and other means, encourage others to emulate their successful programs, policies and practices." Originally limited to junior high and high schools, the program was extended in 1985 to include primary schools. Directed by the Office of Educational Research and Improvement, the program sends teams of educators and other authorities in education to examine each school for two days. The 14 key "attributes for success" that the teams search for in each school are clear academic goals, high expectations for students,

order and discipline, rewards and incentives for students, regular and frequent monitoring of student progress, opportunities for meaningful student responsibility and participation, teacher efficiency, rewards and incentives for teachers, concentration on academic learning time, positive school climate, administrative leadership, well-articulated curriculum, evaluation for instructional improvement and community support and involvement. The teams then examine each school's educational outcomes, including achievement test, attendance rates, drop-out rates, suspensions and other exclusions and awards for recognition of outstanding programs and individual performance.

exceptional children Children who require special education because of characteristics that so deviate from the norm as to handicap them in the conventional school situation or prevent them from reaching their full intellectual potential. There are three broad categories of exceptionality: physical, emotional and mental. Among the physically exceptional are children with sensory (speech, hearing, seeing, etc.) disorders, learning disabilities, developmental disorders or any of a variety of bodily dysfunctions, including orthopedic and neurological impairments, birth defects or health impairment. Emotionally exceptional children include those with behavior disorders or emotional handicaps requiring psychological or psychiatric therapy. The mentally exceptional include both mentally retarded and mentally gifted. **GIFTED** children represent the only category of exceptional children who are not handicapped. They require special education nonetheless to help them move ahead of their peers academically while keeping pace socially and emotionally.

exchange program Any of a variety of programs involving the temporary transfer of a student or teacher to a school, college or uni-

versity in another country. Exchange programs are designed to broaden the student or teacher's experience and promote international understanding. Exchange student programs vary according to whether students are in secondary school or university and whether they attend boarding or day schools. In both cases, students earn credit in their home schools for all academic work they successfully complete abroad. Secondary school students not attending boarding schools usually live full-time with host families in the foreign country. Most American-run student exchange programs are operated by private, nonprofit organizations financed by private and public donations.

Almost all teacher exchange programs, on the other hand, are financed by public grants under a variety of U.S. State Department programs created by the Fulbright Act (1946), the Smith-Mundt Act (1948) and the Fulbright-Hays Mutual Education and Cultural Exchange Act (1961). Under these acts, countries that wish to participate in teacher exchange programs must sign an agreement with the United States, designating the framework for future teacher exchanges. Some agreements call for the United States to send and underwrite the costs of a visiting teacher in a school or college in the foreign country. Others call for a mutual exchange of teachers, with varying degrees of financing from both countries, with both the State Department and U.S. Department of Education facilitating the exchange. There are some private teacher exchange programs sponsored by individual colleges and universities and a few private secondary schools, involving mutual teacher exchanges with comparable institutions overseas. In all cases, teachers assume similar duties in the foreign school or college.

(See also AMERICAN FIELD SERVICE; EXPERIMENT IN INTERNATIONAL LIVING.)

executive education A formal graduate school curriculum for midcareer executives.

Although most executive education courses do not lead to degrees, the graduate BUSINESS SCHOOLS at dozens of major universities, including Columbia, Duke, Northwestern, Stanford and University of Pennsylvania, do offer two-year programs leading to the executive M.B.A. In addition, a number of major business organizations such as the American Management Association in New York City and the Brookings Institution in Washington, D.C., offer nonuniversity executive education. Among the offerings in executive education are courses in general management, leadership, marketing and sales, finance and accounting, risk management, operations, business strategy, human resources, global concerns, technology management, e-commerce nonprofit management and the humanities. Most programs are open to all applicants on a first-come, first-served basis, with enrollment limited by class size. The typical student enrolled in executive education is in his or her mid-thirties and earns between \$75,000 and \$150,000 a year; more than 90% are in middle and upper-middle management. Although average costs of executive education are about \$60,000 a year per student, total program costs can range up to \$200,000 per student for a full-time, two-year, degree-granting program. Many intensive, two-week programs cost \$50,000 or more per student. Despite savings in residency costs, the growing number of on-line executive-education programs are equally costly, with some costing as much as \$100,000.

Of the roughly \$20 billion that American industry invests in executive education each year, about 70% is invested in in-house programs, but the \$8 billion spent with American business schools for executive education now represents about half the annual revenues of such schools. Although popular periodicals peddle rankings of such schools, the rankings are specious in that each tends to specialize in specific areas, depending on the demands of its

client companies. Companies that hire university business schools for their executive education tend to prefer Harvard for its courses in general management, for example, but they prefer the University of Pennsylvania's Wharton business school for finance, Northwestern University's Kellogg business school for marketing, and the Massachusetts Institute of Technology's Sloan business school for studies in information systems and management of research and development.

Although companies often send executives to attend regular classes at business schools, most contract with business schools for customized executive-education programs to meet the needs of the particular company. Indeed, nearly half of all business school revenues from executive education flow from customized programs—often held on company premises. Executive education is far more flexible than conventional business school education. Often, several business schools work together to design a customized program for a particular company, while in other cases, a number of companies engaged in a common project unite to contract with a business school to provide specialized executive education in a specific area needed to ensure the success of a joint project (e.g., doing business in China).

executive session A legitimate meeting of a public body, such as a school board, which is closed to the public. To minimize the possibility of corrupt practices, many states and communities have enacted so-called sunshine laws that force most public bodies to conduct business openly, before the public. Even the strictest sunshine laws, however, permit school boards to hold executive sessions if public discussion could hurt the public interest or unduly harm an individual. Certain types of personnel matters fall into the last category, while open discussion of site selection for a new school might not be in the public interest if it unduly

inflated land values and raised costs of school expansion beyond the reach of the community.

exempted child A child of compulsory school age who is not required to attend school—usually because of severe handicaps.

exit examination See GRADUATION EXAMINATION.

experience-based (experiential) learning Knowledge acquired by direct observation or participation in an event. A standard element of virtually every element of the primary school curriculum, experience-based learning diminishes in all but the laboratory sciences as students progress through secondary school and college, where a SUBJECT-CENTERED CURRICULUM, based on lectures, note-taking and textbooks, becomes the basis of most learning.

Experiential education is, however, available at all levels through specialized schools, organized in nonconventional environments such as mountains, forests, deserts, archaeological sites, animal sanctuaries, botanical gardens, scientific observatories, athletic facilities and ships at sea. Experiential education at such specialized institutions can last from several weeks (many are organized as summer camps) to a full semester and even a complete academic year. Some sail-training programs, for example, carry students to foreign countries or for long-term study at sites of interest to marine biologists. Although the focus is always on the study of a specific subject area or, in the case of sports academies, the learning of a specific skill, full-semester experiential academies for secondary school students usually provide a full curriculum of conventional academic studies.

(See also SCIENCE EDUCATION CENTERS.)

experience chart A display, in early primary school, on which teachers record, in large, easy-to-read letters, the experiences of or stories dic-

tated by children just learning to read and write. By immediately displaying in writing a sentence dictated by a young child on a large chart or wall display, the teacher encourages the child and the rest of the class to read back the words just spoken. The process also encourages subsequent writing of words and phrases.

Experiment in International Living (EIL)

A cultural exchange program that takes groups of eight to 10 students for a semester of studying and living in a foreign country. Now called World Learning, EIL was founded in 1931, the privately financed organization arranges for students to live with host families for a semes-

ter and participate in intensive study of foreign languages and cultures. Although EIL has programs for individuals, the heart of the program is its group programs, with each group headed by an EIL-trained academic director to oversee study activities. In 1964, EIL established a School for International Training that awards master's degrees.

expositions Large, extended exhibitions of industrial, commercial and artistic products to educate the public and promote increased local, regional, national and international trade. An outgrowth of regional market fairs, the first formal exposition is believed to have

A Currier & Ives engraving of the Centennial Exhibition at Philadelphia, to mark the 100th anniversary of the signing of the Declaration of Independence. Expositions of this sort were a prime source of education for Americans in the 19th century, when few could afford the luxury of school. (*Library of Congress*)

been held in England in 1756–57 by the Society of Arts, which exhibited and awarded prizes to the best English manufactured products. A similar exhibition took place in Paris in 1798, again in 1802, and every three years thereafter. The Franklin Institute of Philadelphia sponsored the first American exhibition in 1824, and the American Institute followed suit in 1828.

In the second half of the 19th century, three types of expositions developed, each of them an important educative institution for the masses at a time when 10% or less of the population attended secondary school. Almost all featured exhibits of the latest industrial and scientific developments, with in-depth explanations of the functions and mechanisms of each. Many also featured fine-art exhibits, while others had entertainment halls where visitors could hear and see the latest works of theater and music. And all featured the latest in new architecture to house their exhibits. One type of exhibition was the industrial exposition of products from one industry or of one country's industries. The first was the leather products exhibition in Berlin in 1877. The second was the printing industry exposition in New York City in 1900. Such exhibits not only generated business but also generated employment. Another form of exposition that developed in the late 19th century was a purely American concept—the regional exhibition to commemorate a historical event. The most memorable were the Tennessee Centennial Exposition, Nashville (1897); the Trans-Mississippi Exposition, Omaha, Nebraska (1898); the Lewis and Clark Centennial American Pacific Exposition and Oriental Fair, Portland, Oregon (1905); and the Jamestown Tercentennial Exposition, Norfolk, Virginia (1907). The third type of 19th-century exposition to develop was the universal exposition, or “world's fair,” sponsored by national governments and featuring pavilions with exhibits from around the world.

The first of these was held in London in 1851 in the Crystal Palace, which was built for the occasion. The Crystal Palace Exhibition was so successful that New York City and Dublin each held similar expositions in 1853, and Paris followed suit in 1855.

The next great American exposition was the 1893 World's Columbian Exposition to celebrate the 400th anniversary of Columbus's discovery of America. The \$31 million extravaganza attracted 27.5 million people to its 65,000 exhibits and was the first to feature an area of amusements designed solely to entertain rather than educate the public.

extension programs Originally, any educational program that extends the reach of an educative institution beyond the formal curriculum and the walls of a school, college or educative agency. Usually associated with agricultural education, extension programs first appeared in the United States in the early 1800s, when huge stretches of land across the eastern United States turned barren because of overplanting and overgrazing. A group of successful agricultural entrepreneurs organized the BERKSHIRE AGRICULTURAL SOCIETY to teach farmers crop rotation, proper fertilization techniques and other methods to help them preserve and restore the soil. The passage of the Morrill Act of 1862 created LAND-GRANT COLLEGES, or public colleges, to offer “practical education,” which included courses in agricultural methods. As the colleges grew, most offered a variation of extension programs whereby interested farmers could obtain the specific knowledge they needed without formal enrollment in classes or any loss of time from the work in the fields. Many teachers actually traveled into the farm lands to provide such instruction and information to farmers and their neighbors.

Although establishment of the Department of Agriculture provided still more informal education, it was not until 1914, with the pas-

sage of the Smith-Lever Act and the creation of the department's COOPERATIVE EXTENSION SERVICE, that these programs were organized into formal extension programs. Working out of the land-grant colleges and universities, Department of Agriculture experts began offering a wide variety of formal and informal extension programs, ranging from informal advice to formal college classes for credit. Extension programs provide plant and soil analysis, a wide range of information, studies, pamphlets, books and training in agriculture, animal care and breeding, construction, home economics and any other subject pertinent to farm management. In nonrural areas, extension programs at private as well as public colleges and universities have expanded to include a wide range of nonagricultural instruction for adults at far lower costs than conventional higher education—and with none of the admissions requirements or time constraints. Of the nearly 100 million Americans participating in some form of adult education, about 10% are enrolled in postsecondary extension courses—often at the nation's most prestigious, academically selective institutions. HARVARD University Extension School, for example, awards well over 100 bachelor's degrees a year, while University of Maryland's extension school, University College, counts well over 4,000 students. Extension schools usually hold classes on weekday evenings and weekends. Harvard Extension School charges about \$550 per lecture course, compared with about \$4,000 for the same course for conventional undergraduates attending Harvard College. Students must earn at least 52 of the 128 credits to qualify for a degree at Harvard Extension School.

More than 86% of students enrolled in extension programs are 25 years old or more, two-thirds are 30 or older, almost 55% are 35 or older and 44% are 40 or older. The vast majority (83%) have some college, 17.4% have an associate degree, 11.2% have a bach-

elor's degree and 21% have attended graduate school without obtaining their graduate degrees. A surprisingly high number have graduate degrees: 12.5% have master's degrees, 8% have doctorates and 11% have professional degrees.

(See also ADULT EDUCATION.)

external degree A college degree awarded to students who successfully complete a prescribed course of study off campus, usually online or by correspondence at an accredited college or university. Hundreds of community and four-year colleges and universities offer a range of external associate, bachelor's and master's degrees with DISTANCE-LEARNING programs that require no class attendance or on-campus examinations. Although some require short on-campus residencies of two weeks a semester, many have no residency requirements and allow students to take each course by simply studying the required texts and mailing required papers to the appropriate instructor. The course credits, degrees and transcripts under external degree programs are no different from those earned in conventional, on-campus programs and, if earned at accredited institutions, are valid at most other accredited institutions. External degrees differ from those offered by fraudulent "degree mills" which have no academic requirement and whose degrees are academically worthless.

An outgrowth of the ADULT EDUCATION movement, external degree programs began in New York and New Jersey in the early 1970s, with the establishment of Empire State College (1971) in Saratoga Springs, New York, and Thomas Edison State College in Trenton, New Jersey. Both are branches of their respective state universities and were established as external, degree-granting institutions for students too busy with jobs, families or other concerns to attend classes on traditional campuses. Housed in a simple office complex in Trenton,

Edison has no campus, no classrooms, no library or any other facilities of a traditional college; yet it serves more than 10,000 students with an average age of just under 40, offering more than 130 courses leading to associate, bachelor's and master's degrees in 100 areas of study. Its 300 "mentors" are faculty members of nearby traditional colleges who serve part-time, charting the direction of each course, determining reading and writing assignments, answering questions and evaluating student progress. All work can be done by e-mail or conventional mail, at the student's own pace, with few time limits. As at Empire State, enrollees are given credit for "life experience," whereby a student's nonacademic accomplishments are evaluated and awarded college credits. Life-experience credits, however, are not routinely transferrable to other accredited institutions of higher education.

extracurricular (extraclass) activities

Planned activities organized and sanctioned by a school or college that bear no direct relationship to the academic curriculum. Depending on the school or college, extracurricular activities may include the range of individual and team athletic games and sports, cheerleading, the fine arts, crafts, music performance, drama societies, student publications, debating, hobbies, academically oriented discussion and study groups, vocation-related discussion and study groups, religious organizations and student government. Also called cocurricular activities, they provide enormous experiential learning opportunities unavailable in traditional classrooms and laboratories. Usually teacher-supervised at the primary and secondary school levels, most extracurricular activities at the college and university level are student organized and oper-

ated and, depending on the institution, may be independently financed or underwritten by the college's reserve of student fees. Some schools and colleges award course credits for participation in some instructor-supervised extracurricular activities. Extracurricular activities became centers of controversy in some high schools and colleges during the last decades of the 20th century as students began forming groups that mirrored the political and religious controversies raging across the nation. Initially, they were ethnically and racially oriented and then expanded into sexually oriented groups, with gay and lesbian students forming organizations that met little resistance at the college or university level, where their peers were legally adult. Such groups, however, provoked storms of public protest at the high school level, where tax dollars supported extracurricular as well as academic activities. Some public high schools responded by abolishing all nonsport extracurricular activities rather than permit sexually oriented clubs on campus.

(See also COCURRICULAR ACTIVITIES.)

eye-voice span (EVS) The number of words which the eye perceives in advance of their evocation by the voice when a subject is reading aloud. Normally about four words for the average adult reader, the EVS is used by some teachers to measure reading progress of primary school children. EVS can be measured by asking a student to read aloud from words projected on a screen and suddenly turning off the projector. The number of words the student continues to recite before stopping is the EVS, representing the number of words the student's eyes perceived before he could express them vocally. Building EVS through measurement sessions helps develop silent reading skills and speed.

factory education Instruction of vocational and academic skills in factories by factory-hired teachers. During the late 18th and most of the 19th century, factory education was the primary source of instruction for a large proportion of American children. The practice began in New England in the 1790s, when production of cotton yarn moved from the household into the factory. Before then, most cloth manufacturing had taken place in homes, where girls and women (“spinsters”) produced yarn manually on spinning wheels and then wove the yarn into whatever cloth they needed. The introduction of the spinning jenny at Samuel Slater’s mill, a plant powered by a local waterfall in Pawtucket, Rhode Island, refined, simplified and speeded the process to levels that made household production obsolete. Indeed, the spinning jenny was less complicated to operate than the manual spinning wheels it replaced. To keep costs at a minimum, therefore, Slater’s mill hired children of eight, nine and ten. Although the cheapest and most common form of factory labor, they were often counterproductive because of their inability to read or write. Indeed, leading New England industrialists complained that work force illiteracy was hurting the quality of their goods and destroying their competitive positions in international trade.

Although establishment of public schools and passage of compulsory education laws

helped ease the literacy problem, it created labor shortages, because school hours conflicted with factory hours. The result was the establishment of formal teaching facilities in factories. Children who worked in the afternoon shifts from 12 noon to 6 were required to report for instruction in the factory school from 6 A.M. to 12 noon, while those who worked the morning shifts reported to class at 12 noon and remained there until 6 in the evening. In addition to basic academic skills, such schools also trained children in vocational skills. For many communities, the factory classrooms became the primary sources of formal education.

By the end of the 19th century, however, 30 states had built extensive public school facilities and passed compulsory education laws requiring children to attend. Formal academic education disappeared from the factory, and with passage of federal CHILD LABOR legislation in the 1930s, child labor all but disappeared as well.

Factories did not, however, disband their schools altogether, and many expanded them in an effort to improve academic and vocational skills of adult employees. By 1913, CORPORATION SCHOOLS were offering employees a broad range of education in the arts, sciences, commerce and trade, as well as training in simple job-related skills. After World War II, General Motors Corporation expanded the concept to include a degree-granting institution in Flint,

Michigan. Aside from the formal corporation schools such as the GMI Engineering and Management Institute, factories continue to serve as a primary source of vocational education in the United States. Thousands participate in cooperative VOCATIONAL EDUCATION programs with nearby secondary schools and community and four-year colleges, providing part-time on-the-job instruction that coordinates with classroom instruction at the schools and colleges. Hundreds of corporations are also providing workers with free or low-cost computers—and appropriate instruction—to permit them to participate in on-line education via the Internet.

(See also DISTANCE LEARNING.)

faculty The teaching staff of a school, college or university. Derived from the Latin *facultas*, “ability or abundance,” the term faculty also refers to any innate or acquired ability. A school faculty is, presumably, made up of men and women with abilities in the subjects they teach.

(See also ACADEMIC RANK.)

faculty advisor A member of the school or college faculty assigned as personal counselor to one or more students. Usually a function reserved for private school faculty members, the faculty advisor generally acts as the student’s advocate in school matters such as academic affairs, student-teacher relations, curriculum selection or parent-school and parent-teacher relations. Unlike public school GUIDANCE COUNSELORS, faculty advisors seldom have any special training in counseling and, therefore, are not equipped to handle student social, emotional or psychological problems or college guidance. The faculty advisor, who may, from time to time, have a dual role as the advisee’s teacher, is more an adult friend than a formal counselor.

faculty meeting An official conference of a school’s entire faculty or the members of a sin-

gle department. Usually chaired by the school principal, the dean of the faculty or the department head, faculty meetings may be held on either a regularly scheduled or ad hoc basis. Regardless of scheduling, they are conducted according to standard rules for formal conferences, with an agenda distributed in advance and all matters discussed in a civil, businesslike manner.

faculty senate An elected body representing faculties too large to participate in productive faculty meetings. Usually found at institutions of higher learning, faculty senates are elected by all members of the faculty and may be composed of senior faculty, representatives of each department or a combination thereof. The faculty senate’s role at each meeting is the same as that of faculties that can meet as a body at smaller institutions. The powers of the faculty senate—like the power of the faculty itself—varies from institution to institution and may include faculty-administration relations, setting academic standards, institutional policy making and decision making, tenure granting and hiring and firing of faculty members.

family resource education A segment of home economics education dealing with all aspects of the family and the home, including financial management, consumer education, housekeeping, parenthood, child development and family roles.

Farmers’ Alliances A loosely knit group of cooperative organizations aimed at furthering the educational, financial and political interests of southern and western farmers during the 1880s and 1890s. An outgrowth of the eastern Grange movement of the 1870s, the alliances were a national collection of local farmers’ cooperatives that organized local programs to improve farming with new technology. Often calling themselves “schools” and

"universities," local alliances organized lectures, often by professors from nearby agricultural colleges, on crop diversification, improvement of livestock lines, propagation of fruit trees, restoration of worn-out soil and the comparative advantages of deep and shallow plowing. Alliances also held lectures for farmers' wives on cooking, canning and gardening, and they organized visits to various farms to encourage mutual instruction and assistance. Like the Grange, the alliances also held district and county fairs to permit farmers to see demonstrations of the newest machinery.

Ironically, the improvement in crop production that resulted from alliance educational programs led to surpluses and lower farm income, and as income declined, alliance members turned their wrath on bankers for charging high interest rates and railroads for high costs of transportation. Eventually, the alliances evolved into a political organization that took a leading role in organizing the People's, or Populist, Party and in managing its campaign in 1892. Although its presidential candidate, James Baird Weaver, lost, he received more than 1 million popular votes and 22 electoral votes, and several Populist candidates were elected to Congress. In 1896, Populists gained control of the Democratic National Convention in St. Louis and named WILLIAM JENNINGS BRYAN their candidate for president. After his defeat, the national influence of the Populist Party and the alliances ebbed. The party ceased to exist after the 1908 elections, and the alliances reverted to their original educative functions.

Federal Art Project One of six projects within the Works Progress Administration, a major agency formed under the 1935 Emergency Relief Appropriation Act, to provide jobs for the millions of workers left unemployed by the Great Depression of the 1930s. (In 1939, the agency was renamed Works Projects Admin-

istration.) The Federal Art Project was designed to provide unemployed artists, writers, performers and musicians with modest incomes in government jobs and to use their skills to disseminate knowledge and help educate Americans of all ages. By 1943, when the Second World War obviated the need for it, the WPA had spent \$11 billion and employed more than 8.5 million on more than 1.4 million individual projects; workers were paid the prevailing hourly wage for 120 to 140 hours a month.

Although most of the projects involved manual labor, the Federal Art Project, or "Federal One," as it was called, was specifically aimed at helping educational, professional and clerical workers, and it proved one of the most far-reaching educative programs ever launched in the United States. Its four divisions were the Federal Art Project (a division with the same name as the parent agency), the Federal Music Project, the Federal Theatre Project and the Federal Writers' Project. Together they employed about 110,000 writers, artists, musicians, librarians and others associated directly or indirectly with the arts, thus developing a truly American school of art and preserving the talents of a generation of American artists who might otherwise have been forced to abandon their professions. Moreover, Federal One introduced millions of Americans in the most remote areas of the nation to concerts, plays, books and other cultural experiences to which they had never before been exposed. Federal One artists traveled the nation, teaching men, women and children in community art centers, libraries, hospitals and schools. They held classes in writing, painting, music and drama. Federal One also employed 15,000 librarians and clerical workers to establish libraries in small communities and to catalog or recatalog collections in existing facilities. They engaged in book-binding and book repairs and helped extend library services to more than 2 million people,

mostly in the South and other rural areas, where no libraries existed. In all, they established about 2,500 new libraries and about 2,000 traveling libraries. The Federal Art Project helped such artists as Ben Shahn and the three Soyer brothers, Moses, Raphael and Isaac, develop their talents, and it left thousands of public buildings enhanced with magnificent murals and sculptures.

The Federal Music Project spent \$50 million to employ 15,000 musicians and underwrite 225,000 performances in communities that had never heard classical music. In 1935, the Federal Music Project established the Composers' Forum-Laboratory to encourage living American composers. The Federal Theatre Project restored the theater of the road, initially sending low-priced productions of *Macbeth*, *Murder in the Cathedral*, *Doctor Faustus* and other plays across the United States. As the Theatre Project began producing plays of social protest, however, it came under investigation by Congress, which deemed it to be under Communist influence and abolished it in the Relief Bill of 1939–40. The other three projects continued until 1943, when the entire WPA was abolished.

Federal Committee on Apprentice Training A group created by President Franklin D. Roosevelt in 1934 as part of the National Recovery Administration. The committee's goal was to develop training standards that would safeguard the welfare of apprentices (see APPRENTICESHIP) and assure their proper training and eventual absorption into the work force. Although some enlightened companies had established CORPORATION SCHOOLS to train workers, the vast majority of American companies exploited entry-level workers, paying them substandard wages long after they were functioning as journeymen. The Committee on Apprentice Training acquired legal authority to combat such exploitation after Congress passed the 1937 Fitzgerald Act (1937), directing the

secretary of labor "to formulate and promote the furtherance of labor standards necessary to safeguard the welfare of apprentices . . . [and] to cooperate with state agencies engaged in the formulation and promotion of standards of apprenticeship. . . ." The committee was made a permanent entity within the Department of Labor, which then created a Bureau of Apprenticeship that drafted a model voluntary state apprenticeship statute and persuaded most states to adopt it. The result was a strong federal-state partnership that controls apprentice training to this day.

Federal Council of Churches of Christ in America A body formed by 33 Christian Protestant denominations in 1908 to reverse the secularization of American public schools by introducing Protestant instruction into the curriculum. Later reorganized as the National Council of Churches, the original organization sought to obtain special arrangements in public schools to permit released-time or shared-time religious instruction. Protestantization of public education was but one thrust of the council's overall goal of obtaining "a larger combined influence for the Churches of Christ in all matters affecting the moral and social condition of the [American] people, so as to promote the application of the law of Christ in every relation of human life."

In addition to public school religious instruction, the council launched an ambitious political program aimed at establishing "equal rights and complete justice for all men in all stations of life." Although the council was careful not to tread on interracial relations of the South, it lobbied for abolition of child labor, a minimum wage, suppression of sweat shops and conciliation and arbitration of industrial labor disputes. The council established a powerful religious press, produced religious radio programs, supported a host of denominational colleges and standardized the Sunday school

curriculum in thousands of Protestant churches across the United States.

Federal Family Education Loan See STAFFORD LOANS.

Feinberg Law A 1949 New York State law allowing the state's Board of Regents to compile a list of organizations it deemed subversive and to disqualify members of such groups from teaching in the state's public schools. The U.S. Supreme Court upheld the constitutionality of the law in *Adler v. Board of Education*, in 1952. In 1967, however, the Court reversed itself in *Keyishian v. Board of Regents*, ruling that the law violated the First Amendment guarantees of free speech.

Fellenberg, Philipp Emanuel von (1771–1844) Innovative Swiss educator and social reformer whose experimental educational institution at Hofwyl, an estate near Berne, was the first to infuse pedagogy with kindness and tolerance and the first to mix students of different social and economic classes. An agriculturalist, Fellenberg combined mental, moral and manual education at Hofwyl and promoted a "natural" pedagogy that encouraged the formation of warm, mutually tolerant relationships between children of different social classes. Fellenberg also eliminated punishment as a basic teaching method. Although he punished children who misbehaved, he abandoned flogging children when they made academic errors and encouraged them to learn for the sake of learning.

Fellenberg's work, along with that of his colleague and fellow countryman JOHANN HEINRICH PESTALOZZI, profoundly affected education in the United States. Hofwyl served as a model for English reformer ROBERT OWEN's school in New Harmony, Indiana, and, with farther-reaching consequences, for the state public school systems founded by HENRY BARNARD in Connecticut and Rhode Island. It was a visit to Fellenberg's school in 1835 that convinced Bar-

nard that children of all social classes were equally educable—a revolutionary concept for that era—and that the future of American democracy lay in establishing universal public education.

fellowship A nontaxable financial award, usually to graduate school students, for educational costs and some living expenses. Awarded on the basis of merit rather than financial need, fellowships fall into three broad categories: research fellowships that require the fellow to participate in formal research; sponsored fellowships provided by agencies outside the educational institution (e.g., NATIONAL SCIENCE FOUNDATION); and teaching fellowships that require the fellow to spend a specific amount of time teaching (usually undergraduates in the same field of study). The first formal university-related research fellowships were offered in 1876, by Johns Hopkins University founding president Daniel Coit Gilman, to all 20 students who enrolled in the first class.

Fernald Method A remedial reading instruction method that relies on as many of the child's senses as possible to reinforce learning. Developed at a University of California laboratory school in the 1920s by Grace Fernald and others, the method calls for a student to trace the letters of a word he or she has copied, while saying the word aloud, thus bringing into play visual, tactile, motile, oral and aural senses. After several repetitions, the student is then asked to write the word without using the copy. Eventually, the student learns to write the word without the tracing procedure and can begin recognizing parts of new words that contain elements of the first words learned. Now often called the V-A-K-T (visual-auditory-kinesthetic-tactile) method, the Fernald Method was described in detail in Grace M. Fernald's classic text, *Remedial Reading Techniques in Basic School Subjects*, in 1943.

Field Columbian Museum An institution created after Chicago's World Columbian Exposition of 1893 to provide a permanent display of the exposition's natural history exhibits. Created by a group of philanthropists, the museum was one of many similar museums emerging as educative centers designed to supplement the work of schools and colleges by bringing education to the unschooled. Indeed, the philanthropists who created the Field and other Chicago museums envisioned making Chicago the Florence or London of the American Midwest.

field experience education An element of a student's formal education that is conducted off-campus and that may or may not be supervised by school personnel. Of the many types of field experience education, the most common are: cross-cultural, providing studies of cultural environments other than those of participating students; preprofessional, such as student teaching; career exploration; and cooperative work experience, with on-the-job training tied to formal classroom studies.

field house Any large indoor enclosure with enough unobstructed space to conduct sports and activities normally held outdoors, such as track, baseball, soccer, band practice, etc.

field trip Teacher-led student excursions to sites such as museums, historical restorations, government buildings and other destinations tied directly to some unit of study. Although entertaining and diverting, effective field trips require careful planning and classroom follow-up by the teacher to link each student's practical, visual and aural experiences to textbook and classroom learning.

(See also DEWEY, JOHN.)

financial aid Any of a variety of monetary loans, grants, tax credits, employment opportu-

nities, scholarships, fellowships and stipends offered by public and private agencies, organizations and educational institutions to help students pay the costs of their education. Although the vast majority of financial aid is reserved for higher education, private primary and secondary schools also offer financial aid to some students. Students convicted for sale or possession of drugs are ineligible for federal financial aid for one year from the date of the first conviction, two years from the date of the second conviction and indefinitely after the third conviction.

About 72.5% of America's more than 17 million college undergraduates receive about \$125 billion a year in financial aid of some sort. Nearly 19% receive institutional scholarships from colleges, foundations and so on; nearly 15% receive state grants and loans; and about 46.5% receive some form of federal aid in the form of grants (27.6%), loans (33.7%) and/or work-study programs (5.6%). Indeed, low-cost federal loans to college students account for nearly half the total financial aid to college students. Nonfederal loans account for about 9.2% of total financial aid, federal government PELL GRANTS more than 10%, and other federal grants (by the military, for example) 3.7%. State grants provide about 5% of direct student financial aid, although the percentage is misleading because it ignores the indirect state aid in the form of reduced tuition at public colleges and universities. Such public systems charge state residents only about 40% of what they charge out-of-state residents and often as little as 15%. Receipt of nonfederal aid does not disqualify a needy student from receiving federal grants or vice versa. Indeed, most students cover all or part of their college costs with a combination of state, federal and private aid.

FAMILY CONTRIBUTIONS

In general, college students and their families must contribute a percentage of their income

before becoming eligible for federal aid—usually between \$6,000 and \$8,000 a year, depending on family income and assets and the amount of state aid they receive. Families with assets less than \$50,000 and incomes of less than \$25,000 usually need contribute nothing. On the other hand, families with assets of \$100,000 and annual income of \$100,000 would, on average, be expected to contribute about \$40,000 a year to their child's college education before becoming eligible for aid.

EDUCATION TAX CREDITS

1. Hope Education Tax Credit. Allows middle-income families a credit of \$1,500 a year against taxes during the first two years of a student's undergraduate study. Limited to incomes of under \$100,000 on joint returns and \$50,000 on single returns.
2. Lifetime Learning Tax Credit. Allows middle-income families a lifelong credit of up to 20%, but no more than \$2,000 a year, on higher education or vocational training and job-skills improvement courses.

EDUCATION SAVINGS ACCOUNTS

1. IRAs. Taxpayers may withdraw funds from existing IRAs to pay for college tuition costs without incurring the otherwise mandatory 10% penalty imposed for early withdrawal.
2. Coverdell Education Savings Accounts. Anyone—parent, grandparent, friend—may contribute up to \$2,000 a year in an interest-bearing custodial account for a child that can grow tax-free until the child turns 18. The child must then begin withdrawing the funds—again, tax-free, if used for education expenses. Contributions are not tax deductible.
3. Qualified State Tuition Programs (Section 529 Plans). Although specifics vary from state to state, in general, anyone may establish a 529 account for as much as \$100,000, which must remain in the account for at least 36 months but can grow and be withdrawn tax-free if used for educational expenses. Though not deductible from federal taxes,

contributions can be deducted from taxes of some states.

WORK-STUDY PROGRAMS

Before becoming eligible for financial aid, most students must exhibit a willingness to contribute to the costs of their higher education by working full time during their summer vacations and a reasonable number of hours during the school year. Although many students are able to find suitable employment on their own, those who cannot can turn to other sources:

1. Federal Work-Study Program. The U.S. government provides more than \$1.2 billion a year to help underwrite on-campus and off-campus jobs for needy college students. Jobs range from clerical work to tutoring and pay no less than the federal minimum wage for an average of 10 to 15 hours a week (no more than 40). The government pays 80% of the wages, and the college or off-campus employer pays the remainder.
2. Cooperative education. A program of vocational education in which private industry and local colleges cooperate to provide students with a combination of daily classroom instruction and on-the-job training in part-time, paying jobs. About 1,000 private and public colleges—indeed 75% of all community colleges, technical institutes and junior colleges—participate in COOPERATIVE VOCATIONAL EDUCATION programs.
3. Fellowships. Offered by graduate schools to more than 82% of students, fellowships offer reduced or free tuition and a stipend for living expenses in return for teaching undergraduate courses or participating in university research projects while pursuing graduate studies.

GRANTS AND SCHOLARSHIPS

Direct financial aid of more than \$40 billion a year in the form of outright grants (with no repayments due) is offered on the basis of merit

or need—either as outright government grants paid directly to the college on behalf of a student or as scholarships awarded by private organizations or colleges in the form of tuition reductions.

1. Government grants.
 - a. Federal Pell Grant. The largest need-based student-aid program, through which more than 5 million students a year receive annual awards of up to \$4,500 each.
 - b. Federal Supplemental Educational Opportunity Grant. Distributed by colleges, FSEOG grants in unspecified amounts are awarded in addition to Pell Grants on the basis of demonstrated student financial need.
 - c. Military. Apart from free education at the three service academies—UNITED STATES MILITARY ACADEMY, UNITED STATES NAVAL ACADEMY and UNITED STATES AIR FORCE ACADEMY—the U.S. Army, Navy and Air Force each offer partial or full scholarships for participation in RESERVE OFFICERS TRAINING PROGRAMS at more than 400 colleges and universities across the United States. Veterans are also entitled to various scholarships.
 - d. State grants. Every state has merit or need-based college scholarship and grant programs available to legal residents of the state, usually available only for attending colleges or universities within the state.
 - e. College scholarships. Every public and not-for-profit college and university in the United States offers need-based and merit scholarships, with merit-based scholarships approaching \$10 billion a year. Unrelated to student financial need, merit-based scholarships are awarded by colleges for a wide variety of reasons ranging from a student's academic, athletic, musical, literary, scientific or other skills and achievements to the individual college's need to fill its class. Indeed, fewer than 20% of American college students pay full tuition anywhere, and colleges, on average, reduce listed tuition by about 40%. Some smaller, midlevel private colleges routinely offer thousands of merit scholarships to

all incoming freshmen to lure them from costly "brand-name" private colleges and inexpensive state schools.

- f. Private-source grants and scholarships. An almost endless variety of private organizations—religious groups, corporations, unions, foundations, civic and fraternal organizations, charities and so forth—offer an equally wide variety of grants and scholarships based on high school academic achievement, ethnic or racial background, community activities, athletic ability, proposed field of study and so forth. Most are listed on the Internet.

LOANS

More than one-half of America's college undergraduates obtained loans to pay for all or part of their education—a total of nearly \$67 billion in 2003–04, of which 83% is backed by federal guarantees of one form or another to protect the lender. The average college student graduates \$20,000 in debt from student loans. There are two broad types of higher education loans:

1. Federal Loans.
 - a. Federal Plus Loan. Credit-worthy parents may borrow up to the total cost of a child's college education, less the amount of all student aid. Loans are available through banks, credit unions and savings and loan associations and through special programs such as those sponsored by the COLLEGE BOARD. Interest rates reached 8.5% in 2006 but are subject to change. Loans are based solely on credit rating, not need. Repayment begins 60 days after the funds are disbursed.
 - b. Federal Perkins Loan. A need-based loan from colleges and universities at the lowest available interest rates, with repayment deferred until the student graduates or leaves school. Repayment is deferred still longer if the student serves in the military, the Peace Corps or similar organizations, and the debt is cancelled if the student becomes totally disabled or dies. Perkins

Loans are available to any student enrolled in college at least half-time.

- c. Federal Stafford Loan. Subsidized by the federal government, low-interest Stafford Loans are available through banks, credit unions, savings and loan associations and private organizations such as the College Board. Interest rates reached 6.8% in 2006 but are subject to change. Repayment of interest and principal is deferred until six months after graduation, and payments are stretched over 10 years. The government pays private lenders all interest due during the student's undergraduate years and guarantees both principal and interest against student default.

Unsubsidized Stafford Loans require students to begin repayment immediately after the funds are disbursed.

- d. Federal Direct Student Loan Program. A limited program by which students may borrow directly from the U.S. government through their college financial aid offices.
2. Private Loans.
- a. Student Signature Loans. The College Board and the STUDENT LOAN MARKETING ASSOCIATION ("Sallie Mae") lend up to \$25,000 to students at lower-than-market interest rates. They are repayable in 25 years, and repayment is deferred while students remain in school.
 - b. CollegeCredit Private Parent Loans. Offered through the College Board, these lower-cost loans are offered to parents, who may borrow up to the full cost of their child's education and have 15 years to repay.
 - c. Bank loans. Participating banks, savings and loan associations and other financial institutions offer a variety of long-term, lower-interest loans for college costs based on family savings.
 - d. Tuition-payment and guaranteed tuition plans. Many colleges allow students to pay college costs on a monthly basis, interest-free, with payments beginning about six months before the student begins school—in effect giving the college the interest on the funds during that time. Many col-

leges offer to protect parents and students against all increases in tuition and other charges if they prepay college costs for the full four years when the student enrolls as a freshman.

(See also COLLEGE SAVINGS PLAN; EDUCATION TAX CREDITS; STAFFORD LOANS; STUDENT LOANS; TUITION PAYMENT PLAN.)

fine arts Those arts concerned with the creation of works whose function is primarily aesthetic, as opposed to the practical or utilitarian arts. The fine arts include painting, print making, sculpture, music, literature, poetry and dance and are designed to teach students creative expression and appreciation of beauty, good taste and cultural differences. A relatively new academic discipline in historical terms, most of the fine arts were taught through APPRENTICESHIPS prior to the 19th century, when they were added to the curriculum of women's academies. At the time, men's studies focused on philosophy, religion, the natural sciences, classical and modern languages, history, political science and other practical arts.

Originally called AESTHETICS, the fine arts gradually entered the men's curriculum in the mid-19th century as men's colleges and universities concerned themselves more with development of the "complete" gentleman. Toward the late 19th and early 20th centuries, the evolution of educational goals to include development of the "total child," including the child's creative abilities, helped make fine arts an integral part of elementary school education in the United States.

The growth of the MUSEUM as an educative institution in the late 20th century spurred popular interest in the fine arts and led to an explosive growth in studies of fine arts at every level of education, from kindergarten through graduate school. At the same time, however, soaring school budgets and consequent

increases in property taxes produced widespread taxpayer revolts against spending on what the public perceived as unnecessary luxuries. The result was a sharp cut in school spending on the fine arts to the point where, by 1994, nearly half of all U.S. public schools had no full-time arts faculty members. In New York City, one of the world's centers for the creative arts, two-thirds of the public schools offered no art instruction. Nationwide, art instruction ranged from sophisticated programs, in states such as Minnesota, to virtually none in areas of Los Angeles, Chicago and New York.

In an effort to reverse the decline, the U.S. Department of Education issued a set of voluntary national educational standards for the fine arts. The standards were part of the far-reaching GOALS 2000 of the federal government to raise educational standards of American public schools. The Goals 2000 standards for the fine arts applied to dance, music, drama and the visual arts and sought to ensure that elementary school students understood how to use symbols and ideas in visual arts; that middle school students mastered improvisation and harmony; and that high school students were proficient in identifying and analyzing cultural influences in dramatic work. The standards were drawn by representatives from the Department of Education, the National Endowment for the Arts, the National Endowment for the Humanities and the Music Educators National Conference, with input from a wide variety of artists, musicians, dancers, actors, teachers, parents and business leaders. Each discipline has achievement levels tied to various grade levels. The standards in music, for example, call for fourth graders (9–10 years old) to be able to sing on pitch and in rhythm; for eighth graders to know breath control and how to sing in small and large ensembles. High school graduates should be able to sing music written in more than four parts and be able to perform a varied repertory. Schools adopting the stan-

dards use a test approved by the National Assessment Governing Board to test student proficiency at the end of fourth, eighth and twelfth grades.

finger painting A creative type of free play in preschool and kindergarten that permits children to dip their fingers in nontoxic paint and create often beautiful, albeit haphazard designs. In addition to its creative aspects, finger painting also serves as a relief from the discipline of organized classroom activities.

finger play An early, primary school activity in which children use finger movements, rather than their full bodies, to act out stories and feelings. Often useful for shy children, finger play can also be used to teach certain number and language concepts, such as "big," "bigger" and "biggest."

finger spelling A system of communication for the deaf, using finger configurations to represent each letter of the alphabet and actually spelling out each word letter by letter. Unlike sign language, or SIGNING, which uses arm, hand and finger configurations to represent whole words, finger spelling requires the spelling out of each word. Although slower than sign language, it is more accurate, and experienced finger spellers can spell at a rate of as many as 60 words a minute. When combined with some speech, the system is called the Rochester Method and becomes even faster.

finishing school An obsolete term referring to one- and two-year proprietary and postsecondary schools to teach females the domestic and ornamental arts. The term dates back to the mid-1830s and the development of female seminaries, where young ladies obtained a veneer of cultural education in literature, music and art, but focused largely on learning such ornamental arts as dress, conduct and the social

graces. In addition, finishing schools taught all the domestic arts required for running a proper household among the landed gentry, including everything from placement of flatware and crystal ware at the formal dinner table to the direction of household servants and the raising of children. Finishing schools were a primary source of “higher” education for many American women for much of the 19th and early 20th centuries, and a few such schools survived until the late 1960s.

(See also WOMEN’S EDUCATION.)

Finney, Charles Grandison (1792–1875)

Theologian, educator and father of modern American evangelism. Educated as a lawyer, he experienced a “conversion”—that is, he was “born again”—while preparing briefs in which he related the origins of American legal principles to Mosaic law. Abandoning law, he studied theology, was ordained as a Presbyterian minister in 1824 and promptly denounced not only the teachings of organized Protestant churches but those of his predecessor evangelists, including the Rev. LYMAN BEECHER.

Gifted with near-hypnotic oratorical skills, Finney preached a thoroughly democratized Protestantism, asserting that Christ had died to remove the burden of original sin from everyone. His preachings contradicted those of the traditional, or “Old Light,” Protestants who claimed that original sin left all mankind tainted from birth and eternally damned, with the exception of an unspecified elite (presumably, the dues-paying members of organized churches). Most “New Light” evangelicals had preached that man can free himself of the burden of original sin and find salvation through personal “conversion,” a religious experience produced by intense Bible study and a personal revelation leading to total acceptance of Christ (see NEW LIGHT–OLD LIGHT CONTROVERSY). A firm believer in New Light doctrines, Finney declared that Christ’s death had removed the

burden of sin from every newborn and that he, Finney, was therefore declaring a “universal amnesty,” which offered salvation to all people willing to repent their previous sins on Earth and proclaim their belief in Christ. Finney’s offer of universal amnesty electrified the nation. From everywhere, Americans flocked to hear him and accept his offer. Although his teachings horrified traditionalists, hundreds of would-be evangelical ministers came to learn his revival techniques, which he codified in his *Lectures on Revivals*. These were published as a text for revivalist student-ministers and contained a variety of instructions on design and management of prayer meetings.

Finney was invited to preach across the United States and even in Britain. New York City adherents appointed him minister of the Second Free Presbyterian Church in 1832. His success in conversion led to the formation of several other churches, and in 1836, he organized his own independent Broadway Tabernacle. Meanwhile, publication of his theological lectures brought him an invitation to establish a department of theology at the two-year-old Oberlin College, where he served as professor of theology from 1835 to 1866 and as college president from 1851 to 1866. While there, he developed the evangelical doctrine called “Oberlin perfectionism,” or Oberlin Theology, which became the basis for modern evangelical thought. He also established teaching methods and curricula that not only set standards for evangelistic theological colleges but also influenced the curricula of many American public schools for the rest of the 19th and much of the 20th centuries and virtually Protestantized American public schools for several generations.

First Amendment to the U.S. Constitution The first of 10 Amendments added to the CONSTITUTION in 1791 and collectively known as the Bill of Rights. Although the Constitution was sent to the states for ratification

in 1787, people quickly noticed that it did not list many of the personal liberties and individual rights they assumed they had won in the Revolutionary War. Before ratifying the Constitution, a number of states insisted on passage of a Bill of Rights. Of 12 original such Articles of Amendment, as they were officially called, 10 were passed, of which the First has had the greatest impact on education because of its so-called Establishment Clause: "Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof. . . ."

Initially, the ESTABLISHMENT CLAUSE had little effect on education because it did not prevent individual states from establishing official religions, and six (New Hampshire, Massachusetts, Connecticut, Maryland, Virginia and South Carolina) maintained them well into the 19th century. Massachusetts was last to disestablish the church in 1833. Even after disestablishment, the First Amendment had little effect on education until 1868, when passage of the 14th Amendment barred the states from making any laws that "abridge the privileges or immunities of citizens of the United States. . . ." In effect, the 14th Amendment extended the Establishment Clause to all state governments, as well as the federal government. Passage of the 14th Amendment triggered a church-state confrontation that continues to this day, with many state legislators, chiefly Christian-Protestant Evangelists, attempting to introduce prayer and religious instruction in public schools and the federal courts continually forbidding them to do so.

(See also CHURCH-STATE CONFLICTS.)

First International Mathematics Study A 1964 study of eighth-grader and twelfth-grader mathematics achievement in 12 countries, conducted by the INTERNATIONAL ASSOCIATION FOR THE EVALUATION OF EDUCATIONAL ACHIEVEMENT. The study found that U.S. students ranked below average, and it set off a vast reform of

the mathematics curriculum in U.S. public schools. Although the study provoked national alarm and calls for public elementary and secondary school reforms, the mathematics proficiency of American public school children failed to improve substantially over the next three decades. In 2000, American 15-year-olds still ranked below average for 15-year-olds in the 28 member nations of the Organization for Economic Cooperation and Development. Made up of the most advanced, industrialized nations of the world, OECD counted 24 nations whose students outscored American students in mathematics literacy and 23 nations ahead of Americans in problem-solving skills. American students outscored students from only five OECD member nations in mathematics: Portugal, Italy, Greece, Turkey, and Mexico. In an even wider test of students from 40 countries, American students ranked 28th; students from Hong Kong finished first, followed by students from Finland, South Korea, Netherlands, Liechtenstein, Japan and Canada.

Fitzgerald Act A 1937 federal law passed unanimously by Congress directing the secretary of labor "to formulate and promote the furtherance of labor standards necessary to safeguard the welfare of apprentices." The act gave legislative force to a 1934 executive order by President Franklin D. Roosevelt that created the FEDERAL COMMITTEE ON APPRENTICE TRAINING. At the time, the vast majority of American companies exploited apprentices, paying them substandard wages long after they were functioning as journeymen. The Fitzgerald Act marked the beginning of reforms to safeguard the welfare of apprentices and assure their proper training and eventual absorption into the work force. The law made the committee a permanent entity within the Department of Labor, which then created a Bureau of Apprenticeship. The latter drafted a model voluntary state apprenticeship statute and persuaded most states to

adopt it. The result was a strong federal-state partnership that controls apprenticeship training to this day.

five-day boarding school A private school that offers students the opportunity to live on-campus on school days and return home on weekends, thus allowing them to experience traditional boarding school life without entirely giving up home and family life. Five-day boarding is particularly helpful for children who live too far away to commute to school each weekday, but near enough to return home on weekends. Five-day boarding is also helpful for working parents who return home too late each night to provide a fulfilling home life for their children and for working parents who have transferred to out-of-town jobs, but can return home on weekends. Five-day boarding facilities, with evening study halls and faculty supervision, can also provide stability for children from families experiencing structural or emotional tensions or trauma that might interfere with a student's ability to focus on academics.

flag salute requirement A rite at many public schools that requires every student to salute the flag as it is raised every morning before the beginning of classes. Although not a federal requirement, a number of states and individual communities and school districts have imposed flag salute requirements. Lawsuits by various religious groups have challenged such requirements over the years and produced a variety of controversial court decisions. A 1940 challenge of the Minersville (Pennsylvania) School District's flag salute requirement by the Jehovah's Witnesses produced a U.S. Supreme Court ruling that the requirement did not violate student First Amendment rights. The children were thus forced to salute the flag. In 1943, another group of Jehovah's Witnesses challenged a West Vir-

ginia state law imposing the flag salute requirement in all public schools, and the Supreme Court reversed itself, saying the law violated First Amendment protection of an individual's "sphere of intellect and spirit." Subsequent Court decisions have reversed and reversed those decisions, depending on the wording of the particular flag salute requirement.

Flanagan, (Rev.) Edward J. (1886–1948) Irish-born Catholic priest who migrated to the United States at the age of 18 and eventually founded BOYS TOWN, a pioneering residential institution for homeless, abandoned, neglected and emotionally troubled boys. After earning an A.B. degree at Mt. St. Mary's College, Maryland, in 1906, Flanagan went to study in Europe and qualified for ordination in Austria in 1912. Returning to the United States, Flanagan worked in Omaha, Nebraska, where, after establishing a workingman's hotel, he opened his own home to homeless boys, many of them exploited child laborers. Flanagan believed strongly that environment influenced children's behavior more than heredity. Convinced that "there is no such thing as a bad boy," he purchased a farm near Omaha and eventually expanded his initial accommodations into a campus of 1,400 acres, with 65 buildings, a 1,000-acre working farm, a middle school and high school and a vocational career center for 400 boys. Since its founding, Boys Town has accommodated about 20,000 boys. It now offers out-treatment services to girls as well as boys and operates group homes in cities and suburban communities across the United States.

Flanders Interaction Analysis One of many methods of registering, analyzing and evaluating teaching effectiveness in the classroom and helping teachers improve their style. Developed in the late 1950s by researchers at the University of Minnesota, the system calls for recording all classroom activity and

teacher-student interaction at three-second intervals. Classroom activity is then classified according to a 10-category system of classification, of which seven refer to teacher interaction with students ("praises or encourages," "asks questions," and so on), and two involve student interaction with the teacher. The last category is reserved for periods of silence.

flannelboard An early elementary school classroom device featuring a large piece of flannel stretched over a plywood or other hard surface that can be hung on the classroom wall. Used for dramatic visual displays, the flannelboard allows the teacher and students to place letters or numbers made of differently colored flannel pieces onto the flannelboard, to which they readily adhere.

flash cards A visual aid made up of a deck of cards, each of which has an appropriate question printed on one side and the answer on the back. Designed to increase student speed and accuracy, flash cards are a useful and often entertaining way to improve memorization. Used in a wide variety of drills, flash cards can be used to learn definitions (English, foreign language, science), spelling, mathematics (e.g., $5 + 3 = ?$; $8 \times 4 = ?$; etc), science formulas, rules and definitions, and musical notations. Flash cards are especially useful for quickly separating what a student already knows from what he or she needs to study.

flexible schedule An organization of the school day that allows each class to adjust to the curriculum by meeting for varying amounts of time and varying frequencies. Flexible scheduling allows the faculty to take advantage of innovative instructional methods such as team teaching, cooperative learning, INDIVIDUALIZED INSTRUCTION and ACCELERATION. Flexible scheduling contrasts with traditional fixed scheduling, with, for example, six rigidly timed 50-minute

classes a day. Under flexible scheduling, a class may meet for 40 minutes one day and 120 minutes the next, depending on curricular needs as determined in advance by teachers. Computers have made flexible scheduling a relatively simple task by breaking down the school day into relatively short time modules of 10 or 20 minutes. To determine each week's schedule, teachers need only assign the appropriate number of modules they need for each class.

(See also MODULAR SCHEDULING.)

Flexner Report A catalyst in the reform of medical school education in the United States, the Flexner Report was prepared in 1910 by Abraham Flexner (1866–1959) for the Carnegie Foundation for the Advancement of Teaching. An educator on the staff of the foundation, Flexner proposed raising standards of the medical profession by limiting access to the profession. He proposed reducing the number of medical schools in the United States from 155 to 31, upgrading medical school training and tightening the standards for graduation. Most of Flexner's reforms were adopted and led to significant improvements in the quality of medical education in the United States.

Florence County School District v. Carter A 1993 U.S. Supreme Court decision upholding the right of handicapped children to "free, appropriate public education" and the obligation of local public school districts to pay for such education under the 1975 EDUCATION FOR ALL HANDICAPPED CHILDREN ACT. The decision upheld a successful suit in 1985 against a South Carolina school district by parents of an illiterate 16-year-old. The school had proposed giving the youngster three hours a week of personal instruction, with a goal of helping her make four months of progress during the next school year. Deeming the instruction inadequate, the parents challenged the school in local adminis-

trative hearings and lost. They withdrew their daughter from school and sent her to a specialized boarding school, where she progressed far more rapidly and graduated with a high school diploma three years later. The parents sued the school district for the \$35,700 they had spent for three years of tuition, room and board. The court ruled in favor of the plaintiffs, and in reaffirming the district's obligation to provide "an education that is both appropriate and free," it warned that its decision was not a *carte blanche* for parents to sue whenever they felt a school's program for the handicapped was inadequate. In the Florence County case, the court pointed out, the proposed program was clearly inadequate and the private school program was just as clearly "appropriate" under federal law.

Florida The 27th state admitted to the Union, in 1845. Little is known about early education in Florida. The Spaniards, under Ponce de Leon, first explored the Florida coast in 1513, but St. Augustine (the oldest permanent European settlement in the United States) was not founded until 1565. There is little question that the Spaniards planted families, churches and schools in Florida during the century that followed, but the area was a constant battlefield for Spanish, French and British forces, and none of the Spanish educational heritage was ever handed down to the Florida that eventually became part of the United States.

In 1763, the Spanish ceded Florida to Great Britain following the Seven Years War, but regained control under the Treaty of Paris in 1783. After repeated skirmishes between American and Spanish forces, Spain finally ceded Florida to the United States in 1819, and in 1845, the state was admitted to the Union. Florida did not begin building a public school system until it had passed a constitution in 1868.

In 2005, overall academic proficiency of Florida public school students ranked 35th among the states—just a point or two below national averages. Forty percent of the state's students were minority students, with blacks and Hispanics each making up 17% of the student population. An extraordinarily high 17.5% of students lived in poverty. Because of the large immigrant and migrant-labor population, only 75% of Florida's adults have high school diplomas. The state's public schools have managed to reduce the high school dropout rate dramatically—from 12% in 1995 to only 4.4% in 2001—but the graduation rate was only 85%.

Minority students make up about one-third of the students at the state's huge college system, which counts 15 public and 90 private (38 for-profit) four-year colleges and 25 public and 39 private (37 for-profit) two-year colleges. Graduation rates are 51.7%, slightly below average for the nation.

flow chart A graphic representation of a set of operations, as in the classic "How a Bill Becomes a Law," used by social studies teachers. Most flow charts consist of a simple line connecting a series of triangles, circles or rectangles, each of which symbolizes a step in the process depicted. In addition to its pedagogical uses, flow charts can be used to encourage individual students to fulfill long-term projects or obligations.

Follow-Through Programs A series of federal programs to build on the academic gains of disadvantaged children enrolled in special preschool programs such as Operation HEAD START. Authorized by amendments to the ECONOMIC OPPORTUNITY ACT OF 1964, the Community Services Act of 1974 and the Human Services Reauthorization Act of 1986, Follow-Through Programs were a response to studies of children who had completed Head Start and

other preschool programs for the disadvantaged. Those studies showed that many children emerged from Head Start and similar programs with academic advantages over children who did not participate in such programs. Most of those advantages apparently disappeared, however, by the time children entered third grade. The Follow-Through Programs were designed to offer continuing, comprehensive support from kindergarten through third grade. Support included supplementary and remedial instruction, free medical and dental care, psychological counseling, social services, free breakfasts and lunches, and parent training.

Ford Foundation A private philanthropic organization established by the family of auto magnate Henry Ford in 1936 to build and improve a variety of educative institutions and to influence public policy. In its first 50 years, the foundation's three divisions spent more than \$5 billion. The National Affairs Division helped underwrite a wide variety of programs, ranging from the establishment of EDUCATIONAL TELEVISION to the efforts of the NATIONAL ASSOCIATION FOR THE ADVANCEMENT OF COLORED PEOPLE to desegregate American public schools. The International Division helped establish a wide range of educative institutions in Africa, Central and South America and South Asia, including demonstration farms, educational broadcasting stations and schools of business and management. Its Education and Research Division financed programs to promote equity in public school financing, equal educational opportunity for minorities and women, special programs to meet the needs of adolescents and improved higher educational facilities. In 1979, the foundation began a Fellowships for Minorities program to increase the numbers of minority scholars in university education and research. The program awards about 2,000 grants ranging from \$14,000 to \$30,000 a year to minority scholars for travel and research.

(See also FUND FOR THE ADVANCEMENT OF EDUCATION.)

Foreign Language Assistance Program A U.S. Department of Education initiative to promote expansion in the study of foreign languages in public schools by generating a corps of 1,000 new foreign-language teachers. In addition, the initiative has granted \$1 million each to 24 school districts to form partnerships with local colleges to establish programs for so-called critical languages, such as Arabic, Farsi and Chinese, from nations and geopolitical areas that the U.S. government considers critical to national interests.

(See also NATIONAL SECURITY LANGUAGE INITIATIVE.)

foreign-language study In U.S. education, the study of any language, ancient or modern, other than English. Until the 17th century, the formal study of foreign languages in schools was tied to the study of theology and limited to Latin, Greek, Hebrew and several other ancient scriptural languages such as Aramaic and Chaldean. The formal study of modern languages in the United States evolved as 18th-century college curricula began to emphasize more practical courses appropriate for the industrial revolution and surging international commerce. As the secondary school curriculum expanded during the late 19th and early 20th centuries, foreign-language study gradually became a part of high school and junior high school studies. At the time, most colleges required at least three years of foreign-language study for admission. In 1915, 36% of American high school students studied foreign languages.

After World War II, when the United States assumed the status as a "superpower" in commercial as well as military affairs, foreign language study began seeping into the elementary school curriculum. In the mid-1960s, however, there was a massive student/parent rebellion

against “irrelevant” courses—that is, courses without evident, immediate practical value in day-to-day work and social life. The result was a sharp drop in the number of students enrolled in foreign-language courses, from 31.5% in 1965 to 22.2% in 1976.

Since then, interest in foreign languages has increased dramatically, reflecting, in part, increased travel abroad, increased enrollment of foreign-born students, television transmission of American involvement in foreign affairs, and Internet transmission of “virtual” tours to almost any tourist destination in the world. In addition, the Department of Education has supported the FOREIGN LANGUAGE ASSISTANCE PROGRAM with grants to promote teaching of foreign languages in public schools. The result has been an appreciable, albeit far from dramatic, increase in the number of students of foreign languages, with nearly 45% of American public high school students now enrolled in foreign languages. Thirty percent study Spanish; 8% French, 2% German, 0.5% Italian, 0.4% Japanese, 0.1% Russian, and 1.3% other foreign languages. Only 1.3% still study Latin, compared with nearly 8% in the 1940s, when many private colleges required at least two years of Latin for admission.

Enrollment in foreign-language courses has also increased at the college and university levels, though far less dramatically and often spurred only by reimposition of foreign language study as a requirement for graduation. Nearly 17,000 students earned bachelor’s degrees in foreign languages and literature in 2003—a mere 1.25% of all bachelor’s degrees awarded and well below the more than 20,500 foreign-language degrees awarded in 1971, when they represented about 2.5% of all degrees. Just over 3,000 students earned foreign-language master’s degrees—about 0.6% of master’s degrees awarded. The 1,042 doctorates in foreign languages and literature represented 2.25% of all doctoral degrees awarded. Only

111 of the bachelor’s degrees, eight of the master’s degrees and none of the doctorates were awarded in Latin.

A serious defect in the teaching of foreign languages in the United States has been a shortage of native speakers—especially of African, Middle Eastern and Asian tongues. The U.S. State Department’s NATIONAL SECURITY LANGUAGE INITIATIVE has created summer immersion programs to train more than 250 students in so-called critical languages, such as Arabic, Farsi and Chinese, from areas of the world that are critical to American foreign-policy initiatives. The department also brings about 300 native speakers of critical languages to the United States each year to teach in school and college foreign-language programs.

Language instruction techniques vary widely, depending on the goals of the particular course. At the elementary school level, there are three basic approaches: Foreign Language Experience (FLEX), Foreign Language in Elementary School (FLES) and Immersion. A supplement to the regular curriculum, FLEX is designed simply to give elementary school children a taste of the language and culture of another land. Devoid of reading and writing, FLEX teaches only a basic vocabulary and the rudiments of conversation. Sessions meet 20 or 30 minutes twice or three times a week and are led by the students’ regular teacher—a cost-saver, because it does not require the hiring of a teacher fluent in the foreign language being taught.

FLES, on the other hand, requires a trained foreign language teacher to provide at least five hours a week of instruction. Standard in elementary schools of most other nations, FLES aims at teaching fluency, along with reading and writing skills. FLES instruction usually begins in third grade (eight-year-olds), with students listening to songs and simple dialogues on tape and responding by singing songs and asking and answering questions.

Reading and writing begins with labeling every object in the room with its foreign name and eventually using workbooks to label pictured objects.

IMMERSION is the most intense of the foreign language instructional techniques at the elementary school (or any other) level. Similar to going to school in a foreign country, immersion forces all students to speak nothing but the foreign language throughout the school day. Immersion does not permit the introduction of the children's native tongue as a medium of instruction until the students have become fluent in the foreign language—usually after completing kindergarten and first grade. Schools using the immersion technique may then introduce an hour of reading in English in the second grade, a little more in the third grade and then conduct about 40% of the curriculum in English in grades four through six.

Foreign-language education at the elementary school level remains controversial—largely because of the extra costs entailed in hiring specialists and the questionable value of foreign-language instruction in a nation in which English is the only language ever heard or spoken in many areas and in a world in which English is the international tongue and represents 95% of all Internet transmissions. The same controversy surrounds foreign-language instruction at the junior high and high school level. Fewer than half the junior high schools in the United States offer any foreign-language instruction. The availability of foreign-language instruction in high schools correlates with the size of the school and with the economic level of the community it serves. High schools in the most affluent, cosmopolitan areas offer the richest mix of foreign-language instruction. Some high schools in isolated or disadvantaged communities offer none.

Vocabulary development and the ability to carry on simple conversations are the primary goals of most junior high school language

instruction, with grammar a secondary goal. Instructional devices include textbooks, CD-ROMs and computer software. In contrast, conversational fluency, developed by listening, speaking, reading and writing, is the primary goal of most high school programs. Although high school students also rely on textbooks, computer equipped language laboratories play a far greater role in day-to-day instruction than they do in junior high schools. The language laboratory allows a student to sit in a booth equipped with recording devices and computers and listen to the language, record themselves and listen again. Instruction at the highest levels of high school and at college makes greater use of language laboratory facilities and, with each succeeding year, places ever increasing emphasis on the study of literature and writing of essays.

(See also NATIONAL SECURITY EDUCATION PROGRAM.)

foreign students in the United States

Nonresident aliens who have been granted temporary visas to study at accredited schools and colleges in the United States. Although there are a number of exchange programs that send foreign secondary school students to American high schools, the vast majority of foreign students in the United States attend institutions of higher learning, where they made up more than 3.5% of the total college and university student population in the 2001–02 academic year.

The percentage of nonresident aliens is highest in American graduate schools, where they earned 14% of the more than 500,000 master's degrees awarded in academic 2002–03 and an astonishing 37.3% of the 46,000 doctorates. In contrast, they earned a mere 3% of the 1.35 million bachelor's degrees, which, for most foreign students, represent secondary school work. (See COLLEGE.) To the dismay of many American leaders in education, science,

business and political affairs, nonresident aliens earned 64% of doctorates in engineering, 47% of doctorates in the physical sciences, 46% of doctorates in business and 35% of doctorates in life sciences awarded by American universities.

The increase in the numbers of foreign graduate students has been accompanied by a comparable decrease in graduate degrees awarded to U.S. citizens. Because many nonresident alien students returned to their homelands after receiving their degrees, the shift in the composition of the graduate school student population raised fears that American technology would suffer as fewer American students emerged from doctoral programs to fill jobs as scientists in industry or as researchers and professors in universities. Some educators also contended that noncitizens received financial aid in the form of fellowships that might otherwise go to hard-pressed American graduate students. Massachusetts lawmakers responded with a 1987 law requiring foreign students to pay much higher tuition than Americans, but the law was quickly repealed. Other states tried barring foreign students from sections of research libraries containing sensitive scientific information.

Between 500,000 and 600,000 foreign students attend American colleges and universities each year, about 54% in undergraduate programs and 46% in graduate schools. About 100,000 attend two-year colleges. Some 66% were enrolled in public institutions and the rest in private institutions. About 68% were men. Students from Asia made up the majority—55.7%; Europeans made up 14%, Latin Americans 11.7%, Middle Easterners 6.6%, Africans 6.5% and North Americans 4.6%. India sends the most students—more than 80,000—followed by China, which sends more than 60,000 students; South Korea, which sends just under 60,000; and Japan, which sends nearly 40,000 students to America. In the 2005–06 academic year, University of Califor-

nia had the largest contingent of foreign students (6,881), followed by Columbia, Purdue and New York universities and University of Texas (Austin), with about 5,500 students each. Foreign students make up more than 20% of total enrollment at Carnegie Mellon University, Massachusetts Institute of Technology, Columbia University, University of Southern California, City University of New York Bernard M. Baruch College and Stanford University. Foreign students contribute more than \$13 billion a year to American colleges and universities and the U.S. economy, because they usually pay all costs of attending school and spend heavily on transportation, tourism, leisure and so forth. Indeed, the wealth of foreign students has been enticing enough for many American colleges and universities to establish permanent overseas offices to recruit foreign students. To further exploit the rich Asian market, some colleges have opened campuses abroad, usually offering single-degree programs such as MBAs or engineering degrees. Cornell, Johns Hopkins and Stanford universities, Massachusetts Institute of Technology and University of Chicago have campuses in Singapore; Northwestern University is in Hong Kong. Many American universities have long operated small, specialized schools in Europe for studies in art or history.

(See also AMERICAN UNIVERSITIES ABROAD.)

for-profit colleges A profit-making, commercially operated segment of higher education, generating \$20 billion a year from 3,000 actual or on-line campuses for nearly 1.6 million students, or 10% of America's college students and untold students overseas. The largest for-profit college system is the Apollo Group, Inc., with annual revenues of more than \$2.5 billion in fiscal 2006 and more than 200,000 students at its flagship PHOENIX UNIVERSITY and 132 campuses in 34 states, Canada, Mexico, Brazil, the Netherlands and India. Often

operated as divisions of corporations, the other large for-profit college groups include Career Education Corp. (\$2 billion in revenues from 81 colleges in 26 states and 100,000 students), Corinthian Colleges Inc. (\$966 million from 128 colleges in 24 states and 66,000 students), De Vry Inc. (\$843 million from 72 campuses in 21 states, Canada and the Caribbean and 50,000 students), Education Management Corp. (18 colleges, 24 states, more than 30,000 students), ITT Educational Services Inc. (\$688 million from 70 campuses, 30 states and more than 30,000 students), Laureate Education Inc. (\$875 million from colleges in one U.S. state and 11 foreign countries in South America, Europe and Asia), and Strayer Education Inc. (\$220 million from 17 campuses in eight states and D.C., with more than 20,000 students).

The fastest-growing segment of higher education, for-profit colleges have limited their academic offerings to career-oriented courses leading to degrees in business or associated areas. Tuition and fees range approximate those of conventional, nonprofit institutions, ranging from \$7,000 a year to more than \$20,000. Unlike conventional colleges and universities, however, most for-profit colleges operate without accreditation from traditional ACCREDITATION ASSOCIATIONS and leave thousands of students unable to transfer costly credits to accredited, degree-granting institutions, which do not recognize credits from unaccredited institutions. The result is often a mountain of debt from student loans and years of work that prove worthless for pursuing education toward advanced degrees.

(See also AMERICAN UNIVERSITIES ABROAD; CAREER COLLEGES/SCHOOLS; COMMERCIAL SCHOOLS; ENTREPRENEURIAL SCHOOLS; PROPRIETARY SCHOOLS.)

for-profit education industry A \$100-billion-a-year, broad-based industry made up of corporations and organizations engaged in the production, distribution and sale of educational

products and services for profit. There are four basic segments of the for-profit education industry: educational services, with just under 40% of total industry revenues, derived from corporate training programs, tutoring, test preparation and language instruction; operation of for-profit, OR PROPRIETARY, SCHOOLS, with about one-third of industry revenues, derived from child-care facilities and for-profit pre-primary, primary and secondary schools; production and sale of learning products, with nearly 12% of total industry revenues, derived from textbooks, educational software and school supplies; and electronic services, made up of Internet education portals and Web sites—basically outsources—offering internal and external content-based software, search capabilities, on-line education from schools and colleges and educational e-products sales sites. Electronic services was the fastest growing segment of the for-profit educational products industry in 2000.

foundation A not-for-profit organization or institution established by endowment to provide a regular source of income for philanthropic purposes over an extended period of years. There were nearly 65,000 foundations in the United States at the beginning of the 21st century, with assets totaling more than \$435 billion. With assets swelled by a decade of unprecedented prosperity and roaring bull markets for stocks, America's foundations were making nearly 130,500 individual grants of \$10,000 or more a year, for a total of nearly \$16 billion in annual grants. By law, most foundations are required to give away at least 5% of their assets each year or face the loss of their tax-exempt status.

Of total foundation grants in 2002, about 37%, or \$5.9 billion, went to educational institutions and 4.2%, or \$670 million, went to the arts and cultural projects that could, in broad terms, be described as educative. Foundations contributed more than \$3.2 billion to colleges

and universities in 2002, nearly \$800 million to schools and the rest to educational support services and miscellaneous education projects. In academic 2003–04, the foundations nearly doubled contributions to colleges and universities with gifts of \$6.2 billion, which accounted for about 25% of all voluntary support for higher education.

Until the last half of the 20th century, only three great foundations contributed substantially to education in the United States: the CARNEGIE, FORD and ROCKEFELLER FOUNDATIONS. In 1989, publisher Walter H. Annenberg added his name to the list with the ANNENBERG FOUNDATION, which contributed more than \$1 billion to public and private education. In the 1990s, an astonishing period of unprecedented prosperity and record corporate profits gave rise to the establishment of an exceptionally large number of new foundations, many of them devoted to education. By far the largest—and by then the world’s richest foundation—was the \$30 billion BILL AND MELINDA GATES FOUNDATION, Seattle, Washington, launched by William H. Gates 3d, cofounder and chairman of Microsoft Corporation. The foundation created a \$1 billion scholarship program for disadvantaged minority students and made a variety of grants to enhance public school education across the nation: \$100 million to improve training of school administrators, \$70 million for teacher training and \$150 million to improve education in 30 specific school districts.

In 1998, the Albertson Foundation, in Boise, Idaho, with assets derived from a supermarket fortune, pledged \$110 million in grants to Idaho’s public schools, and, a year later, Eli Broad, chairman of Sun America, a Los Angeles-based financial services company, set aside \$100 million to help train superintendents, principals and staffs of urban school systems. In New York, billionaire Wall Street financier Theodore J. Forstmann, chairman of Forstmann, Little & Company, established a \$200

million Children’s Scholarship Fund to send 40,000 low-income children to private schools, while Goldman, Sachs & Company, the huge Wall Street investment firm, established a corporate foundation bearing its name, with an endowment of \$200 million. Other, similar foundations included the Milken Family Foundation, created by Wall Street financier Michael Milken; the George Lucas Educational Foundation, established by film producer George Lucas, the creator of *Star Wars*; and the Frederick and Sharon Klingenstein Fund, founded by the Wall Street financier and his wife to establish an institute of laboratory and clinical research at Mount Sinai School of Medicine in New York and to provide scholarships.

foundation program A state-operated funding scheme to ensure a minimum level of instruction and educational facilities—a “minimum foundation”—for every school district in the state. Designed to raise the educational quality of poorer school districts to minimal standards and to ensure every student equal educational opportunities, foundation programs provide supplementary state funds for any district whose revenues do not permit maintaining those standards on its own. The effects of foundation programs, however, vary widely from state to state, depending on the standards set by each state and the per capita funds allocated for each student. In addition to per capita funding, foundation programs usually consider class size, number and kind of teachers and administrators, school facilities, number of students in the district, wealth of the district’s population and the district’s effort to collect the amount of taxes appropriate to its needs.

foundation school An independent Jewish elementary day school that combines religious and academic studies, usually under the sponsorship of Conservative or Orthodox Jewish trustees. Operating from preschool through

sixth grade, foundation schools differ from other types of Jewish religious elementary schools in that they give equal emphasis to secular education.

(See also JEWISH EDUCATION.)

4-H Clubs An educative organization for nearly 7 million youngsters 9 to 19, founded in Iowa in 1906 to help farm youth "learn by doing." Expanded into a national organization in 1914, 4-H was a rural counterpart to the YOUNG MEN'S CHRISTIAN ASSOCIATION, YOUNG MEN'S/YOUNG WOMEN'S HEBREW ASSOCIATION and urban settlement houses of that era in that it was a response to growing fears that idle adolescents in America were out of control. Only 10% of American children attended high school while the rest went to work in factories, mines and fields. Jessie Field Shambaugh (1881-1971), the Page County, Iowa, superintendent of schools, founded the first clubs in 1906. At the time, agricultural employment was seasonal work that left tens of thousands of adolescents roaming the roads of the American countryside.

After the U.S. Department of Agriculture established the COOPERATIVE EXTENSION SERVICE to provide agricultural education for adults, the extension of such educational services to youngsters was a natural outgrowth, and the 4-H Clubs served as a conduit for those services. Although suburban and urban youngsters now outnumber rural members, 4-H continues to function under the Cooperative Extension Service, in cooperation with state and county governments, various agricultural colleges and county extension agents. Each club has a volunteer adult, trained by a county extension agent. The emblem of 4-H is a four-leaf clover, designed by Shambaugh, with an H on each leaf, representing the words *Head, Hands, Heart and Health*. Each member participates in one or more appropriate career-oriented projects such as raising and selling livestock, raising and canning vegetables and fruit, conducting scientific

experiments, participating in an engineering project and participating in some citizenship or leadership project. Educational television provides special programs for 4-H members, teaching electronic work, automotive care and safety, animal care and preparedness in emergencies. 4-H expanded into Canada in 1931 and has now spread to some 85 other countries.

Fourteenth Amendment to the U.S. Constitution An 1868 addition to the Constitution forcing all state governments to abide by the federal constitution. Until the Federal victory in the Civil War, individual states had claimed sovereignty over all matters not specifically covered by the Constitution. Thus, while the Constitution prevented Congress from establishing an official religion, it did not prohibit individual states from doing so. New Hampshire, Massachusetts, Connecticut, Maryland, Virginia and South Carolina did just that and maintained official religions well into the 19th century, with Massachusetts the last state to disestablish the church in 1833. Moreover, the original Constitution did not define American citizenship, thus allowing individual states (and Congress) to deprive African Americans of citizenship and all constitutional rights. Thus, under the Constitution, southern states were able to make it a crime, punishable by fines and/or imprisonment, to teach African Americans literacy.

The Fourteenth Amendment changed the situation by declaring, "All persons born or naturalized in the United States, and subject to the jurisdiction thereof, are citizens of the United States and of the state where they reside. No state shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States; nor shall any state deprive any person of life, liberty, or property without due process of law; nor deny to any person within its jurisdiction the equal protection of the law." The amendment opened the way for the establishment of a vast system of

public schools and colleges for African Americans throughout the South and North alike.

Fourth Amendment to the U.S. Constitution One of 10 Amendments to the Constitution passed in 1791 and known collectively as the Bill of Rights. Although the Constitution was sent to the states for ratification in 1787, the majority of citizens protested that it did not list many of the personal liberties and individual rights they assumed they had won in the Revolutionary War. The states responded by making ratification subject to eventual passage of a Bill of Rights. Of 12 original Articles of Amendment, as the Bill of Rights was officially called, 10 were passed. The fourth of these guaranteed the right of people to be safe from unreasonable searches of their person or property and seizure of themselves (arrests), their houses, their papers and other property. The Fourth Amendment had little effect on education, however, until after World War II, when growing student use of drugs and alcohol and weapons prompted some school authorities to conduct searches of individual students as well as their lockers, desks and bags.

The courts have left the question of a minor's constitutional rights vague, however—a reflection, perhaps, of Congress's reluctance to define those rights. Nevertheless, the parents of some students have sued and won some cases (and lost some) against school authorities for violating student Fourth Amendment rights. The U.S. Supreme Court has yet to produce a decision to clarify the Fourth Amendment rights of minors and has left the question to state courts to decide on a case-by-case basis.

In general, state courts have upheld the right of school authorities to conduct unannounced searches of student desks and lockers, which are the property of the school and not of the student. Searches of students, however, clearly violate student Fourth Amendment rights, and the courts have generally upheld stu-

dent rights not to be searched unless school authorities believe the situation to be so dangerous to the health and safety of other students and to school property as to warrant such a search. In other cases, the courts have held that school authorities can only search a student's person with the student's and/or the student's parents' permission. The courts have unanimously denied the right of school authorities to search students off school property. In all Fourth Amendment cases, the courts have generally found in favor of school authorities who have a published policy that clearly states their right to search the contents of desks, lockers and any other school property and the conditions that might provoke searches of individual students.

Franklin, Benjamin (1706–1790) American-born statesman, author, scientist, political and cultural leader, educator and one of the most important influences on education in American history. One of the most versatile leaders in an era teeming with versatile leaders, Franklin was the earliest symbol of the quintessential American—the self-made man. He was self-made in every sense. Except for a year at Boston Latin when he was eight and a year of private tutoring in writing and arithmetic, he was totally self-educated and pursued his quest for knowledge throughout his life. The youngest son of a Boston candlemaker, he began a series of unsuccessful apprenticeships at the age of 10, first in his father's shop, and the following year, at his cousin Samuel's cutlery shop. His last apprenticeship—at his brother James's print shop—proved far more successful. Indeed, he thrived learning the printing trade, devouring books and eventually writing regularly for his brother's newspaper, the *New-England Courant*.

Eager for independence, he broke his indenture in 1723 and ran off to Philadelphia for several months and then to London, England, where he worked as a printer for nearly two

Benjamin Franklin (Library of Congress)

years. He returned to Philadelphia, and three years later, he and a partner organized their own print shop and bought *The Pennsylvania Gazette*, which Franklin published until 1750. In 1730, he bought out his partner and expanded his publishing ventures. He built what for his day was a huge enterprise, publishing many of the classics of the day, along with his own books, including the famed *Poor Richard's Almanack*, which he published annually for 25 years, beginning in December 1732.

Although his wealth permitted him to participate in public affairs as early as 1736, by 1748 he was able to retire from business and devote the rest of his life to public service, writ-

ing, scientific experimentation and a variety of intellectual projects including education. *Poor Richard's Almanack* was the first of his educational projects. "I endeavored to make it both entertaining and useful," he wrote in his *Autobiography*, "and it accordingly came to be in such demand that I reaped considerable profit from it, vending annually near ten thousand. And observing that it was generally read, scarce any neighbourhood in the province being without it, I considered it a proper vehicle for conveying instruction among the common people, who bought scarce any other books. I therefore filled all the little spaces that occurred between the remarkable days in the calendar, with proverbial sentences, chiefly such as inculcated industry and frugality, as the means of procuring wealth. . . ."

The "proverbial sentences" were drawn from what Franklin considered the world's great books and literature, rephrased in Franklin's own easy-to-understand Americanisms, which themselves became standard proverbs. His proverbs aimed at teaching industry, frugality and prudence in the conduct of life and man's potential for success through hard work and the application of one's skills to a useful trade or profession. Obsessed with the idea that self-education through reading and practical experience was the key to success, he advocated reading and an endless search for knowledge. "The doors of wisdom are never shut," he wrote.

To that end, he organized the "junto" in 1727, a group of friends and, later, selected members, who for 40 years shared ideas and literally educated each other. His *Proposal for Promoting Useful Knowledge Among the British Plantations in America*, published in 1743, led to the founding of the AMERICAN PHILOSOPHICAL SOCIETY, a still-functioning organization for "ingenious and curious men" to exchange ideas and information. In 1731, he carried the junto's activities a step further with a proposal "to render the benefit from books more common

by commencing a public subscription library." His Library Company of Philadelphia became the first subscription library in the colonies. Initially stocked with books contributed by junto members, the library solicited subscribers, who contributed 40 shillings for the initial purchase of books and 10 shillings a year for subsequent purchases. Although stocked with classics such as Homer's *Iliad* and *Odyssey* and Plutarch's *Lives*, the library was largely a practical library with atlases, histories and handbooks on everything from husbandry to mechanics. It contained not a single book on theology, which was the primary course of study at most colleges of the day.

In 1743, Franklin also began devising a plan for educating the common man. Published in 1749 and entitled *Proposals Relating to the Education of Youth in Pennsylvania*, it raised the hackles of the educational establishment, which had hitherto reserved formal academic and college education for the sons of the elite. Franklin's *Proposals* called for establishing a residential school taught by "a man of good understanding, learned in languages and the sciences, and especially versed in English." He proposed a curriculum that would include "everything that is useful, and everything that is ornamental: but art is long, and their time is short. It is therefore proposed that they learn those things that are likely to be most useful and most ornamental, regard being had to the several professions for which they are intended."

He then detailed the specific subjects to be taught: handwriting, drawing, arithmetic, accounts, geometry and astronomy; English grammar; the writing of essays and letters; rhetoric, history, geography and ethics; natural history and gardening; the history of commerce and principles of mechanics. Instruction was to include "visits to neighbouring farms and opportunities for natural observations, experiments with scientific apparatus and physical exercise."

With the support of friends, Franklin raised enough funds to open and support the Public Academy in the City of Pennsylvania, with Franklin as president, or chairman, of the board of trustees. In 1751, he added more details to his original proposal in a new work, *Idea of the English School*, which called for a curriculum lasting six years. Its goal, he said, was not to produce scholars, poets or scientists, but "youth . . . fitted for learning any business, calling or profession, except such wherein languages are required." His students, he said, would be qualified "to pass through and execute the several offices of civil life, with advantage and reputation to themselves and country." In effect, it was the first proposal for the modern liberal arts education and, more important, it was the first call in the New World for universal, publicly supported education.

FRANKLIN'S ACADEMY, as it was called, opened its doors and began classes in 1751, after it obtained a charter as the Academy and Charitable School in the City of Philadelphia. Four years later, it expanded its curriculum and obtained a new charter as the College, Academy and Charitable School of Philadelphia in the Province of Pennsylvania, or, more simply, the COLLEGE OF PHILADELPHIA, whose name was changed in 1791 to the University of Pennsylvania.

Franklin never ceased his personal crusade to educate himself, continuing his voracious reading throughout his life and adding to his education by maintaining a voluminous correspondence with the world's great thinkers on an enormously wide range of topics—on slavery with Anthony Benezet, orthography with Noah Webster, electricity with Peter Collinson, the English language with David Hume, constitutionalism with the duc de La Rochefoucauld d'Enville, and printing and publishing with William Strahan. To add to his knowledge he conducted endless experiments, out of which came the 1746 discovery of the Leyden jar, a type of electrical condenser, and the proof that

lightning was an electric phenomenon. Though entirely self-educated, he received honorary degrees from Harvard, Yale and William and Mary Colleges, the first three colleges established in the New World, and from the Universities of Oxford and Edinburgh.

In the midst of all these activities, Franklin was a tireless public servant, serving, at various times, as deputy postmaster general to the colonies; colonial agent for Pennsylvania in London; delegate to the Continental Congress and signatory of the Declaration of Independence; as the diplomat who assured the new republic of victory in the Revolutionary War by obtaining recognition (and tacit military support) of France, England's most powerful enemy; and as the delegate who negotiated peace with Great Britain. He was appointed the first postmaster general by the Continental Congress and established the U.S. postal service. He was also a Pennsylvania delegate to the Continental Congress, which drew up the Constitution.

Along with THOMAS JEFFERSON, JAMES MADISON, BENJAMIN RUSH and several other delegates, Franklin called for guaranteeing every American the right to free education and establishing a national system of public schools. The proposal was defeated by the opposition of industrialists, who relied on children as their cheapest form of labor, by parents, who relied on their children either to work the fields or bring in extra income working in nearby factories, and by southerners, who feared that the education of slaves would incite rebellion and could lead to their manumission (see CONSTITUTION OF THE UNITED STATES). Franklin nevertheless signed the Constitution on September 17, 1787. He died three years later, at the age of 84, honored by his countrymen and universally acclaimed as one of the most learned and civilized men of his times.

Franklin's Academy The academy founded in Philadelphia, in 1751, by Benjamin Franklin and his supporters, who espoused his idea of

practical, free, universal public education. Chartered as the Academy and Charitable School in the City of Philadelphia, classes began with about 145 boys. The school was unusual (and was the source of some controversy) because it was the first academy open to boys other than the sons of the elite and because it all but eliminated theology as the central course of the curriculum.

The six-year curriculum was unique for the era, in that had it had three departments: English, Latin and Mathematics. English was initially given equal weight with Latin and Greek, the original scriptural languages and, therefore, central to all studies of the Bible and theology at elitist academies. The curriculum also included vocational courses on gardening, mechanics, commerce and science, and studies of history and government. Although Franklin later called his academy "a failure" because of traditionalist modifications to the curriculum, his innovations formed the basis of the modern, practically oriented liberal arts education that became the heart of curricula at most 19th- and 20th-century colleges. Five years after it opened, Franklin's Academy expanded its curriculum and changed its name to the COLLEGE OF PHILADELPHIA. In 1791, the year after Franklin died, the college assumed its present name, the University of Pennsylvania.

fraternity A quasi-secret society of college students organized for any of a variety of reasons, including social or professional comradeship, the provision of living accommodations, the bestowing of academic or other honors or the performance of social service. Originally for men only—*fraternitas* is Latin for "brotherhood"—fraternities can be traced back to the University of Bologna in the late 11th century, where student societies, usually organized on the basis of nationalities (and called "nations") provided the only collective living quarters at or near their schools. Those original societies

are still evident at such universities as Uppsala, Sweden, where student groups continue to arrange member housing, administer scholarships and provide other student services, as they have since the university's founding by Sten Sture the Elder in 1477. As universities took over the obligation of housing students in some countries, student societies evolved into social, political or recreational groups such as Germany's infamous dueling societies.

Although rooted in medieval European and English traditions, modern college fraternities in the United States are a uniquely American institution, dating back to the DEBATING SOCIETIES and literary societies formed at Yale University in 1753 and, soon thereafter, at Princeton and Harvard. The first fraternity bearing a Greek letter name was PHI BETA KAPPA, founded at the COLLEGE OF WILLIAM AND MARY on December 5, 1776, primarily as a debating and literary society, although it extended its functions to enrich the social lives of its members. Like earlier literary societies, Phi Beta Kappa represented an attempt by students to assert their rights of assembly, free speech, independent decision and other newly won individual and political freedoms of which they had been deprived by autocratic tutors at strict, British-style colonial schools and colleges. To distance themselves from their tutors, members of Phi Beta Kappa and the Greek-letter societies that followed adopted a variety of secret rites, including secret oaths, secret codes of laws, secret initiation ceremonies, Greek and Latin seals and mottoes and even secret handshakes. Phi Beta Kappa also adopted a badge or key, which elected members wear to this day.

In 1781, two years after granting charters to Yale and Harvard Universities, the original Phi Beta Kappa was forced to dissolve after British troops invaded Tidewater, Virginia, and disrupted life at William and Mary. The chapter was not revived until 1851. In 1875, the University of Vermont chapter admitted the first

two women, thus converting it from a social fraternity into an honor society for students graduating college with high academic honors, outstanding character and other achievements.

In the meantime, other Greek-letter societies had developed along entirely different lines. Beginning in the early 1800s, when few colleges offered boarding facilities to students, fraternity houses sprang up as boarding houses for groups of compatible students, seeking off-campus comradeship, recreation and relief from campus discipline and an alternative to boarding with local families, who might impose restrictions stricter than those of the college. In the late 1800s, as millions of poverty-stricken immigrants crowded into American cities, many fraternities adopted social-service functions. As the number of colleges expanded in the early 1900s, so did the number of national fraternities, with chapters on campuses across the United States. Still the primary source of student boarding facilities, fraternities continued growing as centers of campus social life. By 1940, there were nearly five dozen national fraternities, with tens of thousands of members on campuses across the nation.

The end of World War II and the routine construction of dormitories on college campuses cost some fraternities their role as boarding houses, but their function as social centers increased, as students sought a respite from the sterile atmosphere and uniform appearance of dormitory corridors. Although the number of fraternities remained relatively constant, with about six dozen men's and three dozen women's social fraternities, the number of national fraternity chapters nationwide doubled to more than 5,000, on more than 800 campuses. Membership climbed to about 400,000 members, or about 5% of the population at four-year colleges.

Fraternities suffered a decline in number and membership during the civil rights protests of the 1950s and 1960s and the national

revulsion at discriminatory practices at colleges that depended on public funds. Some colleges and universities banned fraternities entirely. From 1965 to 1972, fraternity membership and, as a consequence, the number of chapters, plunged about 40%.

The 1970s and 1980s, however, saw a revival in the number of fraternities, as civil rights laws ended discrimination. Also spurring the revival of fraternities was the passage of state laws banning the sale of alcoholic beverages to persons under 21, thus forcing student parties off campus into private facilities. By the mid-1990s, an estimated one-third of American college students belonged to residential and nonresidential social fraternities. By then, too, many fraternities had become co-ed.

After reaching record membership levels of about 400,000 in 1990, fraternity membership once again began plunging, as the number of students on financial aid increased and left fewer undergraduates able or willing to afford the hundreds of dollars in annual membership costs. Many students were also repelled by an ever-increasing stream of ghastly headlines about alcohol and drug abuse—and occasional accidental injuries and deaths arising from fraternity pranks and initiation rites. A 1997 study of more than 25,400 students at 61 colleges by the *Journal of Studies on Alcohol* published at Rutgers University found that fraternity leaders exhibited the highest incidence of so-called binge drinking (five or more drinks per sitting) at college, with nearly 74% having engaged in such drinking within two weeks of the survey, compared to 42% of students not belonging to fraternities. Fraternity leaders consumed an average of 14 drinks a week. Although binge drinking by females was lower than males, 55% of sorority leaders admitted to binge drinking, compared with only 26% of non-sorority students. With grade-point averages of fraternity members well below the average of the general student population, serious scholars shunned

the fraternities, and membership dropped precipitously. By 2000, membership had declined 30%, with some campuses experiencing declines of more than 50%. In the eight years ending in 1998, the average chapter size dropped from 54 men to 38. Some fraternities vainly tried stemming the decline by establishing alcohol-free chapters and waiving fees for needy students.

Membership in most fraternities is decided by member voting, following a week in which prospective members “rush” the fraternity by attending parties and meeting members. Those elected to membership—so-called pledges—receive instruction in fraternity history, customs and laws. During a final “Hell Week,” pledges are expected to participate in humiliating and often dangerous initiation rites, and it is this aspect of fraternity life that has repelled a growing number of students. By 2000, there were about 150 men’s and women’s residential and social fraternities, of which 64 were all-men’s organizations and 25 were all-women’s sororities, which have not been associated with the dangerous antics of men’s fraternities. Although sororities on some campuses experienced membership declines, average chapter size across the nation actually rose over the last two decades of the 1900s, from 46 to 54 in the 1999–2000 academic year.

In addition to the more than 150 men’s and women’s residential and social fraternities, there were nearly 90 professional fraternities in 2006 whose members were engaged in the study or practice of specialized professions or vocations such as journalism, law, medicine, music and engineering. There were also about 40 recognition societies for students with high academic achievements in specific subjects and almost six dozen honor societies, such as Phi Beta Kappa, for students who achieved distinction in scholarship, social contributions, character or academic achievement. By 2000, more than 125 fraternities had ceased to exist, although their names remained on record, and, as housing shortages began developing on

some college campuses, students began to revive them—often with financial support from fraternity alumni. Embarrassed by the antics at some chapters, many of the 4 million fraternity alumni have insisted on a ban on alcohol as a condition to their financial contributions.

(See also HAZING; SORORITY.)

Freedmen's Bureau An agency created by an act of Congress in 1865 to provide a variety of assistance to needy blacks in the South after the Civil War. Officially called the Bureau of Refugees, Freedmen, and Abandoned Lands, the bureau was established within the U.S. War Department, which governed the South during Reconstruction. With most former slaves left destitute and flocking by the thousands to Union army bases for help, the bureau's initial responsibility was to provide food, clothing and medical supplies. It then undertook the task of teaching literacy and numeration and eventually was responsible for establishing a system of free public schools for blacks throughout the South and staffing them with white teachers usually from the North. Prior to the Civil War, southern states had made it a crime, punishable by fines and imprisonment, to teach blacks to read. The bureau also founded such institutions of higher education as ATLANTA, Fisk and HOWARD UNIVERSITIES.

In addition to its role in establishing public schools for former slaves, the bureau also regulated wages and working conditions of blacks throughout the South, handled legal trials involving blacks, and controlled and distributed confiscated southern properties. Except for its educational program, which lasted until 1872, most of the bureau's activities ended in 1869, when, to the disappointment of blacks, it returned most confiscated lands to their former owners.

freedom of speech A vague, constantly shifting and highly controversial concept, under

which citizens are free to express themselves orally and in print, without government interference. Protected to a certain extent by the FIRST AMENDMENT OF THE CONSTITUTION, freedom of speech in the United States is not and never has been unlimited. Oral or written expression is not constitutionally protected if it violates laws against libel, slander, incitement to riot or if it creates an imminent danger to the public welfare, promotes crime or constitutes obscenity, sedition, perjury or bribery. Like other civil liberties, freedom of speech is limited by the extent to which that freedom may infringe on the rights of or inflict harm on others. But all such limits are vague and have shifted dramatically from generation to generation throughout the history of the United States.

Closely tied to ACADEMIC FREEDOM, freedom of speech in schools, colleges and universities remains a controversial and unresolved question. Although protected by the Constitution, minors do not have the right of free speech in elementary and secondary schools if those schools have clearly stated policies outlining acceptable and unacceptable student conduct. Similarly, elementary and secondary school teachers are also restricted by their terms of employment, which usually provide lesson plans outlining what they may and may not teach.

At the college and university level, however, the question of freedom of speech is a far vaguer concept because students are legal adults and because so many institutions of higher learning publicly pledge to present students with all sides of every issue. The result at some institutions has been the occasional stifling of free speech, with students shouting epithets at or shouting down fellow students, faculty and visiting speakers—all in the name of "free speech." Meanwhile, faculty members at some schools have presented specious research and distorted, exaggerated or even false historical facts to support their points of view—again, in the name of free speech.

The courts have been of little help in resolving the problem. Different courts, including the U.S. Supreme Court, have issued a wide range of confusing and often conflicting rulings on the clashes between the right of free expression and the right to live free from fear of humiliation and physical threat. New York courts, for example, deemed it unconstitutional for the City University of New York to strip a black professor of his department chairmanship in African studies for teaching students that Jews were responsible for black poverty in the United States. The courts also upheld that same professor's right to teach that blacks were genetically superior to whites and a second professor's right to insist that blacks are genetically inferior. On the other hand, the courts upheld Brown University's right to punish a student for shouting obscene, antiblack remarks in a campus courtyard.

freedom schools A group of widely scattered secondary schools established for black children in various southern communities in the 1950s, during the struggle for racial equality. Designed to prepare students for college, the schools offered advanced academic programs unavailable in black schools under racial segregation. Although allegedly offering "separate but equal" education, racially segregated schools deprived black students of the same educational opportunities as whites—a factor that proved central to the 1954 Supreme Court decision in *BROWN V. BOARD OF EDUCATION OF TOPEKA* declaring racial segregation of schools a violation of the Constitution.

Despite the Court's decision and its order to desegregate schools "with all deliberate speed," southern states persisted in delaying integration for more than a decade. Freedom schools were an element of the civil rights activism that followed *Brown*, with groups of northern teachers and black southern parents collaborating to establish alternative educa-

tional programs to provide gifted black students with the education needed to qualify for college. Although organized as "integrated" schools, they remained largely black, with the few white students usually limited to the offspring of the largely white, northern teachers who staffed the schools. As public school systems gradually integrated during the 1960s, southern freedom schools disappeared. Never a major factor in southern education in terms of numbers of students, they served more as a symbol of the civil rights movement in education than as a force for change in the quality of southern education.

free schools Most recently, a short-lived group of pseudoeducational institutions that was established in California and a handful of major cities in other states in the late 1960s by political and social activists and counter-culture groups. Allied only by their rejection of governmental and other forms of authority, the various founding groups ranged from civil rights activists to Vietnam War protestors to those favoring legalization of marijuana and other drugs. Designed for both children and adults, free schools did away with central authority, traditional rewards and punishment and other characteristics of traditional schools. Schools for minority children focused on teaching the history of injustice to African Americans; those for adults dealt with legal and consumer problems and taught protest skills.

An earlier, 19th-century use of the term *free school* referred to privately operated, charitable elementary schools—usually in cities—for orphaned, impoverished and otherwise neglected children.

Friends, Society of (Quakers) A relatively small Christian sect that believes that there is "that of God in every one" and that all individuals receive and perceive the word of God.

That being the case, Quakers need no formal creed or paid clergy to direct them as individuals or as a group. Friends' traditional weekly services consist of a gathering in a meeting house, with no leader or clergyman, no prearranged service and no sermon. Members may sit in silence for the entire meeting or instruct each other or simply announce personal thoughts, feelings or revelations. They believe strongly in universal education for their children and founded one of the strongest school networks in colonial America.

The society was one of many Protestant groups that appeared after the Reformation. It stressed individual responsibility, lay leadership of independent congregations and complete separation of church and state. The first known Quakers were followers of George Fox, an English lay preacher who, in 1647, began preaching the doctrine of "Christ within"—a concept that later evolved into the Quaker belief of an "inner light" within each individual. Believing that divine revelation is immediate and individual, Quakers often trembled as they experienced moments of divine revelation and thus earned a label that was originally meant to mock them.

Known originally as Children of Light and Friends of Truth, the Society of Friends interpreted Christ's words literally by refusing to take oaths and refusing to participate in war or violence or even resist attack. Because they refused to recognize any organized church, they also refused to pay tithes to the Church of England. Perceived as unpatriotic and atheistic, they suffered persecution and emigrated to the American colonies in the 1660s, settling first in New Jersey. After William Penn was granted the Pennsylvania colony, some 7,000 Friends migrated into that area to escape persecution in other states. Encouraged by Penn, they established schools wherever they settled. "There is scarcely any one thing," Penn wrote in 1679, "that so much needs the wisdom of the nation

in the contrivance of a new law as the education of our youth. . . ."

Starting with the Friends' Public School in 1689 (now the William Penn Charter School), the society opened more than 40 schools in the next 70 years, giving Pennsylvania the largest school system of any American colony. William Penn Charter, Friends' Central and German-town Friends all survive as Quaker schools in Philadelphia. Among the notable colleges established by the Society of Friends are Swarthmore College, founded in 1864 in Swarthmore, Pennsylvania, and Bryn Mawr College, founded in 1885, in Bryn Mawr, Pennsylvania. Both are now independent, secular schools.

No longer limited to Quaker students, they continue to apply traditional Quaker teaching methods, eschewing authoritarian methods, discouraging competition and encouraging students to learn for the sake of learning in a spirit of mutual cooperation. The commitment to noncompetitiveness and equal opportunity guarantees the least gifted equal opportunities to participate in athletics and other activities. Friends' schools are, however, private, with high academic standards and, therefore, highly selective in their admissions policies. In addition to fostering a rich educational system, the Quakers of the 18th century were pioneers in social reform, protesting slavery and opening the first schools to African Americans.

"friends of education" A referential title usually given to a coalition of mid-19th-century educational reformers who were responsible for spearheading the public school movement throughout most of the United States. Led by HORACE MANN in Massachusetts, the friends of education included amateurs, semiprofessionals and professionals associated with schooling in every state. They included attorneys, clergymen, teachers, editors, political leaders and industrialists. Besides Mann, the most notable were JAMES G. CARTER in Massachusetts, HENRY

BARNARD in Connecticut, J. Orville Taylor in New York, CHARLES FENTON MERCER in Virginia, CALVIN H. WILEY in North Carolina, CALVIN STOWE and CATHERINE BEECHER in Ohio, John Mason Peck in Illinois, JOHN D. PIERCE in Michigan and JOHN SWETT in California. They organized associations such as the American Institute of Instruction and the AMERICAN LYCEUM, and they published important periodicals such as the *American Journal of Education*, which allowed them to communicate with one another and share political techniques of successfully promoting public education by mobilizing public opinion and organizing political coalitions to enact enabling legislation.

Their task was not easy. As Horace Mann discovered in Massachusetts in the 1830s, most voting blocs opposed public education. Industrialists depended on children as the cheapest form of labor. Parents depended on children to help work their farms or to contribute to family income by working in factories and mines. The wealthy, who sent their children to exclusive private schools, saw no reason to pay taxes to educate other people's children. The clergy, who operated most private schools, feared state-run schools would cost them control of education.

Mann and the friends of education eventually convinced enough of their opponents that literate, educated children would earn more, bring more money home to their families, produce higher quality products in factories, produce more wealth for the nation (including the wealthy) and, as productive citizens, more likely become regular church-goers. Together they spread public education across the United States. Appearing in every state, they helped establish public school systems in every northern and western state.

With the exception of North Carolina, southern states refused to establish "northern-style" school systems that might eventuate manumission. After the Civil War, the FREED-

MEN'S BUREAU, an agency of the Department of War, imposed public schooling in the South as part of the military occupation. Because of its "northernness," southerners refused to give their wholehearted backing to public education for the remainder of the 19th and much of the 20th century. The result was a debilitating effect on academic quality in southern public schools that persisted until the end of the 20th century.

Froebel (or Fröbel), Friedrich Wilhelm August (1782–1852) German educator and founder of the kindergarten system, which allowed children to learn through play instead of formal lessons. A student and disciple of Swiss educator JOHANN HEINRICH PESTALOZZI, Froebel opened the world's first kindergarten in Griesheim in 1816. His "kindergarten movement" did not gain momentum until 1837, when he opened another kindergarten in Blankenburg, Thuringia, and established training courses for kindergarten teachers. His disciples opened kindergartens throughout Germany.

The first kindergarten did not open in the United States until 1873, when Susan E. Blow (1843–1916), a St. Louis teacher who had taken a kindergarten training course with a student of Froebel's widow, offered to open a kindergarten class and instruct a teacher in kindergarten methods free of charge if the St. Louis school system provided the teacher, the room and the equipment. WILLIAM T. HARRIS, the farsighted superintendent of schools, agreed. The kindergarten proved such a success that the concept rapidly spread elsewhere. Susan Blow devoted the rest of her career to training kindergarten teachers, and, by the end of the century, more than 225,000 American children were attending kindergartens. Most were based on Froebelian principles, with teachers engaging children in a variety of play routines, including story reading, singing, games and manipulative activities using col-

ored forms and shapes that allowed children to learn geometric and mathematical concepts intuitively.

Fulbright Exchange Program A program originally created under the Fulbright Act of 1946, which used the proceeds from the sale of surplus U.S. government property abroad to pay for the international exchange of professors and students. Developed by Senator J. William Fulbright (1905–95) to foster mutual understanding, the program was expanded in 1961 with passage of the Mutual Education and Cultural Exchange Act. The Fulbright-Hays Act, as the second law was called, provided for fellowships for American scholars and educators to study and teach overseas and for foreign scholars and educators to do the same in the United States. The program supports doctoral dissertations, group study and research projects, curriculum study projects and individual research.

In its first 50 years, the number of Americans sent abroad and foreigners brought to the United States by the Fulbright Program totaled about 250,000. Among the many American Fulbright scholars who rose to prominence were composers Aaron Copland and Philip Glass, writers Joseph Heller, John Updike and Eudora Welty, economist and Nobel Prize winner Milton Friedman, Harvard University president Derek Bok, and Senator Daniel Patrick Moynihan. Foreign Fulbright scholars have included United Nations secretary general Boutros Boutros Ghali, Brazilian president Fernando H. Cardoza, Greek prime minister Andreas Papandreu and Swedish prime minister Ingvar Carlsson.

A five-term senator from Arkansas, Fulbright became interested in foreign affairs during his student days at Oxford University in England. Much later, he became the long-time chairman of the powerful Senate Committee on Foreign Relations. Although an attorney by

training, he had spent four years teaching at George Washington University and the University of Arkansas, from 1935–39, and then served as president of the University of Arkansas from 1939–41. He was elected to the U.S. House of Representatives in 1942 and spent the rest of his career in public service.

In 2005, about 3,000 foreign students from more than 130 countries came to the United States under Fulbright auspices, and some 1,200 American students, out of more than 2,100 applicants, won Fulbright scholarships to travel overseas to study, teach English or engage in research. The majority of Fulbright scholars (and applicants) emerge from academically selective universities, with more than 20 scholars each from the University of Michigan (Ann Arbor), Harvard, Yale, Columbia, and University of California at Berkeley.

full-state assumption A policy whereby the state government assumes all funding for public schools. Attempted for the first time in Michigan in 1994, full-state assumption ended reliance for school funding on local property taxes, which produced funding inequities between rich and poor school districts. Although full-state assumption was first proposed in New York State in 1972, it remained only an interesting theory until the mid-1980s, when two populist revolts converged: opposition to soaring property taxes and outrage over what was perceived as a decline in the performance of public schools. Nearly half the funding for public school education in the United States is derived from property taxes, with most of the other half provided by the state and about 7% provided by the federal government. But per student spending ranges from less than \$2,000 in the poorest districts, with the lowest property values, to almost \$50,000 in the richest districts, with the national average just over \$6,000 in 2000.

Such inadequacies provoked lawsuits by civil libertarians in more than half the states during the 1980s. They were joined by taxpayers from the richest school districts, where some 70% of property owners had no children and protested excessive taxation to provide what they deemed to be luxurious facilities for children from a relatively small group of families. Both groups were joined by educational reformers who saw full-state assumption as a way for the state to establish higher, statewide educational standards and strip local district bureaucracies and elected school boards of control over education. By the end of 1993, courts in eight states had ruled that unconstitutional inequality did indeed exist in public school funding between wealthy areas, with high property values, and poor areas, with needier people and low property values.

To avoid costly court battles, Michigan's legislature agreed to provide more than two-thirds of all public school funds from higher state sales and cigarette taxes, leaving local property owners responsible for providing less than one-third of school costs through property taxes. (The situation had been reversed.) Moreover, the state agreed to guarantee every district in the state the same amount of annual funding per student, with a minimum guarantee of \$5,000 per student, regardless of the flow of revenues into state coffers. Despite the high hopes of its originators, full-state assumption did not eliminate discrepancies between rich and poor districts in spending per pupil, although it did improve the lot of some poor school districts. While average spending per pupil across the state climbed to about \$7,000, or about 13% above the national average, the dollar gap between the richest and poorest districts in Michigan remained at an astonishingly high \$2,500 per pupil after five years of full-state assumption.

full-time equivalent (FTE) An important calculation in higher education to convert the

number of part-time students or faculty into an equivalent number of full-time students and faculty. Because of the huge number of part-time students, especially at two-year colleges and four-year state colleges, college administrators need to calculate an FTE to obtain maximum utilization of school facilities. FTE is calculated by dividing the total number of credit hours being earned by part-time students by the number of credit hours in a full-time course load. Thus, if part-time students are enrolled in a total of 15,000 credit hours and 15 credit hours is a normal full-time course load, the full-time equivalent enrollment is 1,000 students. In other words, the college has the equivalent of 1,000 full-time students. Similarly, colleges need to convert the number of part-time faculty into an FTE to budget faculty salaries and to control faculty-student goals.

functional illiteracy A vague and often misleading term, usually defined as an inability to read, write or calculate well enough to function as an independent adult. Some definitions are more precise than others, variously pinpointing functional illiterates as adults who have not had eight years of formal education; adults who have not gone beyond the eighth grade; adults who cannot read, write or calculate above the eighth grade level; 16-year-olds who cannot read, write or calculate above the sixth grade level; adults who cannot read a bus schedule, order from a menu, understand newspaper articles, order from shopping catalogs or use want ads correctly.

The U.S. Department of Education's National Adult Literacy Survey conducts periodic studies of what it calls "prose literacy," "document literacy" and "quantitative literacy" of adults 16 and over. Its survey in the late 1990s found 21% of adults at the lowest level of prose literacy, that is, unable to write a simple description of the type of job they would like to have and able to do no more than locate

a single piece of information in a short text with no “distracters.” It found 23% at the lowest level of document literacy and, thus, unable to locate and use information from documents such as indexes, tables, paycheck stubs and order forms or even match money-saving coupons to a shopping list of several items. About 22% of the American population scored at the lowest levels of quantitative literacy, which required them to perform single, relatively simple numerical and arithmetic operations of daily life, such as adding two entries on a bank deposit slip. Rates varied widely according to age, race, ethnicity and levels of education. Only about 15% of whites demonstrated the lowest levels of literacy, while 40% of blacks were functionally illiterate and 46% functionally innumerate. Well over 50% of Hispanics were functionally illiterate and innumerate. About 75% of those who had dropped out of school before attending high school were illiterate and innumerate, and about 45% of high school drop-outs were functionally illiterate and innumerate.

(See also ILLITERACY.)

functional skills Skills essential for students or adults to function independently. Taught in special education, functional skills are broadly defined as those that require the assistance of others if students cannot learn them themselves. Essentiality for independent life management is the key to categorizing a skill as functional or nonfunctional.

fundamentalism An archconservative form of evangelism that developed in the late 19th century as evangelistic fervor seemed to dissipate with the spread of universal, secular public education. Spawned by DWIGHT L. MOODY, a charismatic leader of 19th-century revival meetings, fundamentalism was Moody’s response to the perception spreading among many Americans of the day that society was “a sink-

ing ship.” That perception may have been an outgrowth of several late 19th-century trends.

First, scientific explanations for phenomena ranging from electricity and telegraphic communications to the origin of man were threatening biblical authority. Second, popular interest in evangelism was declining in the face of the practical requirements of an expanding industrial nation. The study of engineering, mining, physics, chemistry, agriculture and other sciences and vocational skills grew far more important to the ordinary man than salvation. A third factor was the arrival of millions of non-Protestants—Catholics, Jews and others—who threatened the philosophical as well as political sway over American life that Protestants had held for more than 250 years. Even more threatening to evangelists was a growing ecumenical movement that sought to unite a number of sects. And another factor was the threat of integration of the races following the Civil War.

To halt what he perceived as America’s descent into Hell, Moody carried the fundamentalist message to college campuses, where he held revival meetings, organized libraries of evangelical literature and tried to convert secular campuses into religious institutions. Central to fundamentalist beliefs, however, was the absolute acceptance of the literality of the Bible—a concept that found less than universal acceptance on campuses where students were studying the most exciting new developments in electricity, mechanics, engineering, law and medicine. Moreover, many schools of theology were graduating a new breed of “modernist” clergyman who sought to reconcile Christian beliefs with contemporary knowledge and experience.

Rebuffed, the fundamentalists formed their own institutions and Bible institutes and adopted an even more aggressive approach. In 1909, the publication of the first books of a 12-volume work called *The Fundamentals* served to stir fundamentalist spirit to a fever pitch. When the last of the books was published in 1915, 3

million sets had been sold worldwide. In 1919, fundamentalists formed the WORLD'S CHRISTIAN FUNDAMENTALS ASSOCIATION, and in 1920–21, fundamentalists carried their doctrine of biblical infallibility in scientific and historical matters into public school classrooms and state legislatures across the United States. By 1925, four states had prohibited the teaching of Darwin's theory of evolution or any other theory that "denies the story of the Divine Creation of man as taught in the Bible. . . ." Three other states had only narrowly defeated such legislation. Although the laws passed in the 1920s were eventually repealed or declared unconstitutional by the U.S. Supreme Court, fundamentalist efforts to introduce biblically inspired "creation science" into the public school curricula of American public schools continue to this day.

Although interest in fundamentalism suffered a decline during the economic depression of the 1930s and the war years of the 1940s and early 1950s, it experienced a stunning revival during the 1960s and 1970s in response to civil rights legislation and the racial integration of public schools. Throughout the South, fundamentalists established private, all-white CHRISTIAN SCHOOLS to bypass court-ordered desegregation of the races in public schools.

Fund for the Advancement of Education An experimental FORD FOUNDATION division that sought to improve teacher training, promote citizen interest in education, introduce new technologies into classrooms, support civil rights in education and promote national assessment and school ACCOUNTABILITY in education. After spending \$65 million over 16 years, from 1951 to 1967, the fund became the Education and Research Division of the Ford Foundation.

Fund for the Improvement of Post-Secondary Education (FIPSE) A U.S. Depart-

ment of Education division created in 1972 to award grants for eight types of educational programs to reform postsecondary education by improving career training, introducing new methodology and modern equipment in classrooms, and reforming administrative procedures.

Future Farmers of America (FFA) A national organization of high school students, aged 14 to 21, preparing for careers in agriculture or occupations related to agriculture. Established in 1928, FFA has hundreds of thousands of members in thousands of chapters in every state and in Puerto Rico. Supported by funds from its own foundation and by business, industry, private organizations and individuals, FFA provides educational materials and programs, sponsors member meetings and conventions and publishes the bimonthly *Future Farmer*, which it distributes to all members.

Future Homemakers of America (FHA) A national, vocation-oriented organization for high school students enrolled in home economics and related courses. Founded in 1945 as a sister organization of the FUTURE FARMERS OF AMERICA, FHA's primary goal is "to help youth assume their roles in society through Home Economics Education in areas of personal growth, family life, vocational preparation and community involvement." Sponsored jointly by the American Home Economic Association and the U.S. Department of Education, FHA has more than 10,000 chapters in middle, junior and senior high schools in every state, but its membership has dropped steadily from a peak of nearly 550,000 in 1965 to fewer than 250,000 today. There are two types of chapters: one for consumer education, homemaking and family life education; the other to prepare students for jobs and careers.

Future Teachers of America A defunct national organization founded by the National Education Association in 1937 to generate interest in teaching careers among high school

and college students. It was “disestablished” in 1975, when the NEA decided to turn responsibility for career development over to state and local educational associations.

Gallaudet, Thomas H. (1787–1851) Pioneer educator of the hearing-impaired and founder of the first U.S. school for the deaf. Born in Philadelphia, he was a graduate of Yale University and Andover Theological Seminary, but gave up the ministry in favor of education after becoming deeply interested in teaching the deaf-mute child of a family friend. This friend, with the help of others interested in education of the deaf, sent Gallaudet to study methods of teaching the deaf in England and France. After studying at the Institut Royal des Sourds-Muet in Paris for several months, he returned to the United States in 1816, bringing with him Laurent Clerc, a brilliant young teacher from the Institut. He spent the following year raising funds from private sources and from the Connecticut state legislature, and in 1817 he opened a free school for the deaf in Hartford—the first such school in the country. He served as principal of the Connecticut (later American) Asylum until his retirement in 1830, gradually enlarging the school and training teachers who went on to establish similar schools elsewhere. Among the latter were two of his sons: Thomas (1832–1902), an Episcopal priest, opened Saint Ann’s Church for Deaf-Mutes in New York City and founded the Gallaudet Home for elderly deaf-mutes in Poughkeepsie, New York; Edward helped found what later became GALLAUDET UNIVERSITY, the world’s first institution of

higher education for the hearing impaired, in Washington, D.C.

After his retirement from the Connecticut Asylum, the elder Gallaudet spent the rest of

Statue of Thomas H. Gallaudet, at Gallaudet University
(Gallaudet University)

his life promoting progressive educational causes, including educational opportunities for women and for blacks, the establishment of teacher training schools, and the establishment of vocational schools.

Gallaudet University The world's only liberal arts university for the hearing-impaired. Founded in 1856 as a school for the deaf and blind, the Washington, D.C., institution has nearly 1,700 students enrolled in its four-year college, which offers B.A. and B.S. degrees in the full range of liberal arts, fine arts, business, engineering, sciences and education. The graduate school offers master's degrees in audiology and education and doctoral degrees in special education to about 400 students. Subsidized a \$400 million annual grant from the federal government, Gallaudet is named for pioneer educator THOMAS H. GALLAUDET, whose youngest son, Edward M. Gallaudet (1837–1917), helped found the school and served as the institution's first president. The young Gallaudet was teaching in his father's school for deaf children in Hartford, Connecticut, when a group in Washington, D.C., asked him to help

Entrance to Gallaudet University, the world's only institution of higher education for the hearing impaired (*Gallaudet University*)

organize and run a school for the deaf. In 1857, he organized the Columbia Institution for the Deaf, Dumb, and Blind and served as principal, pioneering the combined system of speech and lip reading to educate the deaf. He then established the world's first college curriculum for the handicapped, and in 1864 he obtained financial support from Congress and the right to grant college degrees. In that year, the college was renamed Gallaudet, with Edward Gallaudet as president, a post he held until 1911.

games A pedagogical tool used in elementary, secondary and higher education, with significantly different meanings for each. In higher education games, students often assume specific "real-world" roles and play either in competition with or in cooperation with other students. Most games are extremely complex, mathematics-based procedures set up with predetermined rules, decision-making procedures and techniques for meeting player goals. Such games are often used in military, business and economics education.

At the elementary and secondary school levels, games with the more traditional childhood meaning are generally used to excite student interest and enthusiasm in various courses, particularly math. In 1992, 40% of almost 250,000 students in the fourth, eighth and twelfth grades failed to meet basic math standards, according to the U.S. Department of Education's National Assessment of Educational Progress. One result was the massive introduction by elementary school teachers of games designed to eliminate the fear of math that many children harbor and to make math more fun. In some classes, students spent 50% of their mathematics study time engaged in games, and some teachers claimed a 10% increase in student scores. Among the most popular games was "24," in which student players compete to see who can first analyze how to add, subtract, multiply and/or divide four given numbers and arrive at a result

of 24. Critics of games fear their excessive use and question the long-term academic benefits and emotional effects of associating "fun" with every academic exercise.

Garden, Alexander (?–1791) Scottish-born naturalist (after whom the gardenia was named), physician and missionary who in 1743 established a school for black children in Charleston, South Carolina—the first such school in the South. Named area representative of the SOCIETY FOR THE PROPAGATION OF THE GOSPEL IN FOREIGN PARTS (SPG), Garden opened a school in 1743 to teach black children to read and, in turn, to teach other blacks. The SPG's two broad goals were to perpetuate Anglicanism among Christian-born immigrants to the wilderness and to teach and Christianize the heathen. It was to the second end that Garden founded his school and persuaded SPG to purchase the freedom of two young slaves named Harry and Andrew, whom he trained as schoolmasters for his school.

Despite a South Carolina law banning the teaching of slaves, the school lasted 20 years and is known to have taught at least 60 black pupils, both freedmen and slaves, to read, write and calculate. Ironically, Garden had no training as, and did not set out to be, either a missionary or pioneer educator. A friend of Linnaeus, the Swedish scientist and father of modern botany, Garden had migrated to South Carolina as a naturalist to collect botanical, mineralogical and zoological specimens. A staunch British loyalist, he was banished from the United States to England in 1782.

Gary (Indiana) Plan A controversial school-reorganization program conceived in Gary, Indiana, in 1907 and adopted by more than 200 other American cities in the succeeding two decades. Devised by Gary's superintendent of schools, William Wirt (1874–1938), the plan was intended to accommodate a swelling

population of uneducated immigrant children and to expand the role of the school into a community center to educate adults, children and immigrants.

A student of JOHN DEWEY and a proponent of Dewey's philosophy that democracy must be taught in the classroom, in 1907 Wirt arrived in the newly created steel town of Gary determined to expand the curriculum and offer a combination of general, vocational, academic and moral education in each school. He converted an appropriate number of classrooms into laboratories, machine shops and other vocation-oriented "instructional stations." To ease overcrowding and reduce the need for traditional classrooms, he introduced a two-platoon system that put one-half the children into traditional classrooms in the morning to learn traditional academic subjects, while the other half learned specialized subjects in the various instructional stations. The platoons switched places in the afternoon. He expanded the teaching and recreational capabilities of each school still further by establishing ties to neighborhood libraries, playgrounds, parks and gymnasias, thus allowing children to spend part of their school days in each of these other facilities. He also lengthened the school day to permit working adolescents and adults to take advantage of the school program. Some schools remained open 24 hours a day to fill the educational needs of the immigrant population.

In the end, a Gary school could accommodate twice as many students as a traditional school, with fewer classroom teachers, and it was this aspect of the Gary Plan, with its obvious economic advantages, that enticed other cities to adopt it. Although some communities hailed it as "a synthesis of the best aspects of the progressive 'schools of tomorrow,'" others rebelled. Rioting erupted at Gary Plan schools in Manhattan, Brooklyn and the Bronx in 1917, when New York labor unions, teacher unions and immigrant groups protested that the plan

represented a cheapened, contracted and inadequate form of education. The protests helped Republican candidate John F. Hyland sweep Fusion Mayor John Purroy Mitchel out of office, and the Gary Plan out of New York City schools.

Gates, Arthur I. (1890–1972) American educational psychologist who pioneered techniques for teaching reading and language skills to young children and developed a variety of tests to measure reading skills. Born in Minnesota and educated in California, he was the author of more than 300 books and articles on education and psychology. He was a member of the Columbia University Teachers College faculty in New York from 1917 to 1956, served as director of the Institute for Educational Research at Columbia (1921–30) and headed the department of educational research in Columbia's Advanced School of Education (1933–37).

In 1928, Gates developed the "Intrinsic Method" for teaching reading, a method that translated theoretical findings on how children learn to read into practical classroom teaching techniques. The Intrinsic Method defined the basic skills needed for reading, identified problem areas and provided systematic, graded teaching materials that allowed teachers to lead students step-by-step through the learning process.

Gates also developed a variety of diagnostic tests, including the widely used Gates-MacGinitie Reading Tests and the Gates-MacGinitie Reading Readiness Test. The former measures vocabulary, comprehension, speed and accuracy for students in grades 1–12. The Reading Readiness Test is designed for students about to begin reading and measures listening comprehension, auditory and visual discrimination, ability to follow directions, letter recognition, visual-motor coordination and word recognition.

Gates Foundation See BILL AND MELINDA GATES FOUNDATION.

gaudeamus igitur The first words of a university-students' song, variously said to have been composed as early as 1267 (*Bartlett's Familiar Quotations*) and as late as 1700 (*Yale University Song Book*) or somewhere in between (15th-century France, according to the *Oxford English Dictionary*). Of obscure origins, "Gaudeamus" appears to have been a poem first. It was written in the late Latin that was spoken by students and faculty in English and European universities from the Middle Ages through the 19th century. Its melody may date back to 15th-century France (*Oxford Dictionary*) or 18th-century Germany (*Yale University Song Book*). Whatever its origins, "Gaudeamus" has been a universally popular students' song at festive occasions throughout the Western world for several centuries. Indeed, Johannes Brahms (1833–97) used it as the central theme in his *Academic Festival Overture*, composed in 1880 for festivities at the University of Breslau. Still sung by many college glee clubs, its opening measure, "Gaudeamus igitur, Juvenes dum sumus," calls to students: "Then let us be merry while we are young." The student singers go on to wish their teachers long life ("Vivat academia, Vivat professores") and pray that the school that educated them will flourish ("Alma Mater floreat, Quae nos educavit"). Throughout the 18th and 19th centuries, the word *gaudeamus* was routinely used as a noun connoting merrymaking, as in "at our *gaudeamus* this year, we drank wine *more majorum*" (Sir Walter Scott's *Family Letters*).

gender discrimination In education, the denial of equal educational opportunities because of a student's sex. Despite the existence, since 1972, of federal and state laws making gender discrimination in education illegal, de facto gender discrimination per-

sists—a result, perhaps, of the unconscious as well as conscious prejudice of educational authorities, including female teachers. Two landmark research projects revealed ample evidence of such discrimination over the last decades of the 20th century, when gender discrimination had been banned by law and a myriad of court decisions: One was a 20-year study by Myra and David Sadker of American University, and the other was a 1992 study by the AMERICAN ASSOCIATION OF UNIVERSITY WOMEN (AAUW).

The two studies found that both male and female teachers called on boys more often than girls, asked boys harder questions, gave them more time to answer, gave boys more praise

and criticism than girls, and gave boys more extra help. Teachers directed two questions to boys for every one directed to girls, and they allowed boys to shout out answers but reprimanded girls for doing so, with the result that boys were eight times more likely to shout out answers than girls. Many science and mathematics teachers tended to ignore female students altogether, with the result that girls tended to abandon the study of mathematics and science as soon as they fulfilled their minimum requirements for high school graduation. At the end of the 1900s, when more than 50% of American homes had at least one personal computer, girls made up only 17% of high school students taking the College Board's

American women of the colonial era engage in one of the most popular domestic arts—quilting. Women's education was limited to the domestic and ornamental arts. (*Library of Congress*)

Advance Placement examination in computer science. When confronted with the findings, teachers often excused their conduct by asserting that boys tend to get rowdy if teachers don't keep them actively involved: Asking boys more questions was seen as a way of controlling student behavior.

The study also found that many schools and teachers continued to use textbooks in early grades that perpetuated gender discrimination with stories depicting boys as doctors and girls as nurses. The studies found that female academic performance declined as girls progressed through primary school, secondary school and college. Although their grades averaged higher than those of males during primary and secondary school, male grade-point averages were 25% higher than those of females in college. The gender gap was especially startling in the sciences and mathematics, where men's scores averaged from 32% to 57% higher than those of women, despite a federal program to encourage women in science and math and a plethora of federal and state laws banning gender discrimination. Women outscored men only in German, English composition and literature—and only by about 4%.

Moreover, as they reached college, women tended to enroll in such academic areas as literature, music and art, the traditional "ornamental arts" that women were forced to study in the 19th century, and to shy away from studies in science, mathematics and engineering, which would give them far more options in the 20th-century job market after graduation. The result, as the study pointed out, was that women with four years of college did not exceed the average earnings of men with high school diplomas. In contrast, a U.S. Department of Education study that tracked more than 12,000 men and women from high school graduation until they were 32 found that women who took more than two college-level mathematics courses achieved pay equity with men.

In addition to uncovering gender discrimination in teaching practices and textbook publishing, other studies revealed unsettling differences in male and female performances in a variety of standardized tests used for college admission and scholarship awards. It is not clear whether the tests were themselves biased or whether they simply reflected the bias of the school and classroom. For example, girls scored only about 1% lower than boys in the verbal Scholastic Aptitude Test (now SCHOLASTIC ASSESSMENT TEST) used prior to 1994 by many colleges as a college admission test and widely seen as a gauge of future academic performance at college. In the mathematics Scholastic Aptitude Test, however, girls' scores averaged more than 9% below those of boys. Girls with three or more years of high school mathematics obtained about the same math SAT scores as boys. Moreover, a study of 47,000 students, published in the *Harvard Educational Review* in 1992, paired men and women in college math courses on the basis of each member of the pair getting the same grade in the same course. The study found that women taking the same college math courses and getting the same grades as men had nevertheless averaged 33 points lower on their SAT mathematics tests, which were used in determining whether or not to admit them. The SATs are designed to predict how well students will do academically during their first year at college, but, despite lower SAT scores among girls, they consistently outperform boys in all subjects during their first year at college. Such findings have convinced many academically selective colleges and universities to reduce the importance they give to SAT scores in the college admissions process. Harvard, for example, now accepts the ACT ASSESSMENT PROGRAM's college entrance examinations in lieu of SATs, because ACT tests seem to reflect student in-class academic performance more accurately. Despite repeated, intensive efforts by the College Board to root out the sources of gender dif-

ferences in SAT performance, average male verbal scores remain stubbornly fixed at more than 1% above those of females, while average mathematical scores remain more than 7% above female scores—about the same as they have been for the past 30 years. In contrast, average female scores on ACT English college entrance examinations are more than 4% *higher* than those of males, while female math scores are only about 5.6% below those of boys.

The gender differences in SAT scores provoked a successful 1989 lawsuit by the National Organization for Women that forced the New York State Board of Regents to abandon its use of SAT scores to award Regents Scholarships. At the time, girls won only 43% of the scholarships. When the state was forced to change its policy and use high school grade-point averages as a determining factor, girls won 51% of the scholarships.

The American Civil Liberties Union (ACLU) and the National Center for Fair and Open Testing, of Cambridge, Massachusetts, filed a similar lawsuit against the EDUCATIONAL TESTING SERVICE and the College Board, which administer and sponsor the Scholastic Assessment Tests and the PRELIMINARY SCHOLASTIC ASSESSMENT TEST. The latter is a “practice” test for the SATs taken by high school juniors, a year before they begin the college application process. Although never seen by colleges, it is used by the NATIONAL MERIT SCHOLARSHIP Corporation to award college scholarships. Every year, more than 1 million high school juniors take the PSATs. Although 55% of those who took the test were girls at the time of the 1994 ACLU lawsuit, more than 60% of the scholarship winners were boys, and the ACLU charged that reliance on what it alleged were gender-biased PSATs for scholarship awards constituted a violation of federal equal-opportunity laws. In 1997, the College Board agreed to augment the PSAT with a multiple-choice test on writing, and subsequent results showed that girls had narrowed the gap with boys on the ver-

bal portion to 2.7 points from 4.5 points. Although girls traditionally score higher on such tests than boys, the addition of a similar test to the SATs has done little to equalize relative gender performance.

Although most American educational institutions have attempted to eliminate overt gender discrimination, its traces are hard to erase. They appear to date from the earliest human societies and man’s assumption of the role of hunter and fighter, while woman remained behind to bear and raise children and care for the home. God centered religions indoctrinated their followers in the belief that women were naturally weaker and inferior to men. In the Christian Bible, St. Paul urged Christian wives to be obedient to their husbands. Hinduism promised virtuous women the reward of rebirth as men. Ancient Greece and Rome reserved education for men, while women’s education was limited to learning domestic skills. Gender discrimination in the United States goes back to the arrival of the first settlers. English common law was clear: “husband and wife are one, and man is the one.” Girls (and boys) were the property of their fathers, and women were the property of their husbands, with no control of their persons or their children, no right to own land or money and no right to an education other than to learn the domestic and ornamental arts. The former were those required for raising children and running the household; the ornamental arts included singing, dancing and other skills needed to amuse husbands and “ornament” their households.

The accumulation of wealth in the colonies sowed the seeds of change, however, as families of means began sending their daughters to private academies where they learned to read literature other than Scripture, as well as writing, calculating and other skills. One of the books they read in the wake of the American Revolution was Mary Wollstonecraft’s *Vindication of the Rights of Woman*.

Written in 1792 at a time when popular demands for greater individual liberties were provoking uprisings throughout the Western world, it inspired such academy graduates as Catherine Beecher, Emma Willard and Mary Lyon to launch the women's educational rights movement. Beecher and Lyon opened academies that offered women college-level education, and in 1837 Lyon founded the world's first college for women in Mount Holyoke, Massachusetts.

Many far-sighted men supported the women's education movement, recognizing that women, as mothers, served as the first teachers and caretakers of America's children. As such, their education would determine the early education of future generations. Those propounding what was known as "Republican Motherhood" argued that if any free, white boy could someday become president, then all male citizens needed the proper moral and intellectual training to become informed voters, and women would have to be properly educated to give them this training.

By the end of the 19th century, women had taken control of the teaching profession in elementary schools across the United States, and outstanding women's colleges had been founded throughout the country. Although coeducation remained the exception, both Harvard and Columbia had established affiliated, subsidiary colleges for women.

The state-by-state passage of compulsory education laws and the federal granting of woman suffrage after World War I provoked a vast expansion in women's education, but gender discrimination in education was not outlawed until 1972, with the enactment of Title IX of the Education Amendments of 1972 prohibiting discrimination on the basis of sex in educational institutions receiving federal aid. Title IX forced formerly all-male institutions to open their doors to women, thus giving women the same educational rights as men for the first

time in American history. By 1994, more than half of all college students were women, and their numbers had grown dramatically in medical, law, business and other traditionally male graduate schools.

By spring of 2007, women accounted for nearly 62% of all associate degrees and more than 59% of bachelor's degrees awarded at American colleges, compared to 55% and just under 50%, respectively, 25 years earlier. At the graduate school level, the gains were even more dramatic. In 2007, women accounted for more than 60.5% of all master's degrees, almost 52% of all professional degrees and 48.5% of research doctorates in 2007, compared to 50%, 26.6% and 31.1%, respectively, 25 years earlier. The ascent of women to virtual parity with men in higher education had disastrous effects on SINGLE-SEX EDUCATION, where the role of all-women's colleges as springboards to success in previous all-male occupations in the workplace all but disappeared. Prior to parity, coeducational colleges and universities had been male-dominated environments, with huge stadia and arenas for hundreds of thousands of paying spectators watching male sports—and a handful of scantily clad female cheerleaders jumping frantically along the sidelines. Serious female scholars tended to attend single-sex women's colleges, which represented fewer than 5% of all American institutions of higher education, but graduated disproportionately large numbers of women entering professional fields such as engineering, medicine, law and the sciences. Indeed, five all-women's colleges—Barnard, Bryn Mawr, Mount Holyoke, Smith and Wellesley—accounted for 43% of the math doctorates and 50% of the engineering doctorates earned by women in the 1970s and 1980s, and one-third of the female board members of Fortune 1,000 companies were graduates of women's colleges.

Although gender discrimination had disappeared by the year 2000 in terms of college and

university enrollments, the long-term effects of admissions parity had yet to be felt at the faculty and administrative levels in many areas of American education. Although women made up nearly 75% of all public school teachers, they made up less than 35% of the principals and only about 13% of school superintendents. In higher education they accounted for only 33.2% of full-time instructional faculty, less than 18% of full professors and only 16.5% of college presidents. At the administrative level of higher education, however, women had made notable strides by the end of the 20th century, filling nearly 20% of all college presidencies in 1998, compared to fewer than 10% in 1986. More than 15% of the presidents of public, doctorate-granting universities were women in 1998, compared to 4.3% 12 years earlier. They accounted for 9.5% of the presidents of comparable private universities, compared to fewer than 3% a decade earlier. At four-year colleges granting only bachelor's degrees, women accounted for 23.4% of the presidents at public institutions and 20% of the presidents in the private sector. At the two-year college level, women made up 22.1% of the presidents in the public sector and 25% of the presidents at private two-year colleges.

Nonetheless, gender discrimination continues to pervade American academia and women faculty earned from 7% to 13% less than their male counterparts in identical positions in the 2005–06 academic year:

Rank	Men	Women	Differential
Instructors	\$41,692	\$40,431	3.1%
Lecturers	48,776	44,573	9.4%
Assistant professors	58,296	54,052	7.85%
Associate professors	68,990	64,436	7.1%
Professors	97,642	85,747	13.9%

IVY LEAGUE colleges and universities—among them the oldest, most academically prestigious

and costliest private institutions of higher education in the world—seem particularly prone to gender discrimination. Once all-male institutions, the eight “Ivies” were among the first single-sex institutions to end gender discrimination in admissions, but their progress in ending it in faculty hires has been the slowest in higher education, women making up only 38% of these institutions' faculty and only 25% of their tenured faculty in 2003.

Gender discrimination remains rampant, as well, in the general marketplace, where myths persist about the innate inferiority of women in mathematics and technology-related fields, despite identical mathematics proficiency scores between girls and boys at every age in nationwide testing of elementary and secondary school students by the U.S. Department of Education. The University of North Carolina confirmed the results with its own study of 20,000 math scores of students between the ages of 4 and 18. Nonetheless, women make up only 19% of the science, engineering and technology workforce, and they earn only 19% of bachelor's degrees in engineering and 11.5% of bachelor's degrees in engineering-related technologies.

General Aptitude Test Battery A group of 12 tests developed by the U.S. Department of Labor's Employment Service and useful in vocational education to measure intelligence, form perception, motor coordination, clerical perception, finger dexterity, manual dexterity and verbal, numerical and spatial aptitude.

General College of the University of Minnesota An experimental two-year program started in 1932 that proved to be the precursor of the modern community college. A source of enormous controversy at the time, the program was the idea of university president LOTUS

COFFMAN, who believed that the state had an obligation to extend education to all people, regardless of age. Considered an eccentric experiment in progressive education, the General College offered a two-year degree-granting program of survey courses in 10 "areas of human living": human biology; home and family life; the arts; history and government; literature, speech and writing; physical science; psychology; social problems; and contemporary affairs. Segregated from the rest of the university, the college opened its doors to all applicants and assigned them to courses according to their scores on tests and their previous academic records, if any. Starting with 461 students in the autumn of 1932, the college rapidly expanded to more than 1,000.

Although ridiculed by professors and some university students as a "dumbbell college" with a "watered down curriculum," the General College generated enormous public enthusiasm, along with considerable financial support from such foundations as the GENERAL EDUCATION BOARD and the CARNEGIE FOUNDATION FOR THE ADVANCEMENT OF TEACHING, which were eager to promote universal education in the United States. The General College became a model for similar schools of general studies at state universities in Oregon, Georgia and Washington. Eventually, virtually all state and many private universities opened similar schools. And, as the student population expanded in the 1950s, state universities built community colleges to offer general studies programs in smaller communities throughout each state.

general education Usually a reference to a peculiarly American, public high school, curricular program or "track," offering a variety of "self-improvement" courses and rudimentary courses in English, mathematics, science and social studies. The term general education was first used and defined in a landmark 1945

report by the Harvard Committee, *General Education in a Free Society*. The report defined a core curriculum that all students, whether pursuing vocational or academic education, should, "as citizens and heirs of a joint culture," study. It consisted of three years each of English, mathematics and science and two years of social studies. Students would then be left with about one-third of their high school hours for electives in business courses, the arts, agriculture, home economics "and a thousand other practical fields."

The term lost its meaning as many public high schools adopted ability-grouping programs that segregated students into so-called tracks, with the highest academic achievers in the college-bound or honors track. Those uninterested in academics but with adequate manual skills were placed in the vocational or business track, and the rest were placed in an undemanding "general" track, loosely based on the original Harvard Committee general education concept, but made up of courses with only the rudiments of English, mathematics and science and no homework or assigned, off-campus reading.

Recognized by leading educators as "the academic and vocational desert of American education," general education has proved the worst failure in the history of American public education. "It relates to nothing, leads to nothing and prepares for nothing," warned Dale Parnell, the long-time president of the American Association of Community and Junior Colleges. About 25% of American high school students enroll in general education programs, but more than 60% of them drop out without completing high school. Of the more than 1 million general education students who dropped out of school in 1993, 37% remained unemployed a year after leaving school, and those with jobs earned an average of just under \$8,000 a year. Two states then outlawed general education programs, and the governors of

the 50 states unanimously condemned such programs at various conferences. Twenty states have since adopted standards that require all students to achieve at least a 10th grade level of competence in English, math, science and social studies to graduate.

In 1994, Congress tried to end general education by passing the SCHOOL-TO-WORK-OPPORTUNITIES ACT, a federal law requiring states to establish education programs in all public schools to prepare students either for continuing education or provide them with the skills necessary for gaining entry into the job market after graduating from high school. In effect, the law ended all federal funding for general education, which provides neither of these outcomes, and it forced schools to begin developing effective new curricula for work-related vocational education to guarantee each student either a high school diploma (or equivalent), a nationally recognized skill certificate or an associate degree that will lead to a first job or further education. Funded with more than \$1.5 billion in federal monies, the School-To-Work Opportunities Act provided financial and legislative impetus to the specialized "VO-TECH" and COOPERATIVE VOCATIONAL EDUCATION programs already functioning in about 500 forward-looking public school districts.

General Educational Development (GED) Program A group of standardized examinations that anyone of any age may take to obtain a high school diploma, without attending formal classes. Open to persons who, for whatever reasons, never obtained a high school diploma, the GED program is offered and administered in every state by the G.E.D. Testing Service, a part of the nonprofit AMERICAN COUNCIL ON EDUCATION in Washington, D.C.

Also called the High School Equivalency Testing Program, the seven-and-one-half-hour GED examination consists of five tests, each made up of multiple-choice questions that

measure writing skills, reading comprehension, and understanding of social studies, science and mathematics. Test 1 measures spelling, punctuation and grammar skills and requires a 200-word essay to demonstrate ability to organize ideas in clear, correct sentences. Test 2 measures understanding of social studies and asks for the interpretation of a series of passages dealing with social, political, economic and cultural problems. Test 3 tests knowledge of the natural sciences, and Test 4 deals with understanding literature and the ability to interpret various selections of poetry and prose. Test 5 measures abilities in mathematics and covers ratios, percentages, decimals, fractions, measurement, graphs, plane geometry and algebra.

To pass and receive a high school diploma in most states, test-takers must obtain a minimum of 35 points (out of 100) on each test, but earn a total score of at least 225 points for all five, or an average of 45 points per test. GED courses to prepare for the test are available (often free of charge) at many public high schools and community colleges, and various GED home-study books are available in major bookstores. Although the Council on Education sets its own minimum pass-fail standards, each state may establish its own standards above the national minimum. Each of the tests is scored within a range of 20 to 80, with the national standards requiring test takers to score a minimum of 40 on each of the five exams and obtain a total overall score of at least 225 points to earn a GED diploma. Among the states requiring higher scores, New Jersey, for example, demands a 42 in writing and 45 in math for a student to pass. Candidates can take the test up to three times in any given year. About 65% of the 500,000 to 1 million men and women who take the GED each year pass the tests and receive high school diplomas.

GED originated in 1942, when the Veterans Testing Service designed an accelerated program for service personnel whose high

school education had been interrupted by the draft and World War II military service. After a half-century, some studies now indicate that the quality of GED education is far below that of standard secondary school education. One study found that average earnings of holders of GED diplomas are no higher than those with no high school diplomas and considerably below high school graduates. Indeed, the U.S. Armed Services stopped accepting recruits with GED diplomas in the early 1990s because they consistently failed basic training and were dismissed from the military at twice the rate of recruits with traditional high school diplomas.

Although many GED students are adults compensating for previous decisions to abandon formal schooling (the vast majority completed 11 years of formal education), some surveys of GED diploma holders found significant numbers who had purposely abandoned traditional high school studies to enroll in the GED program because it was less demanding. About 40% of GED test takers are 19 years old or younger, 26% are 20 to 24, 11% are 25 to 30 and 22% over 30. GED programs account for about 25% of all high school diplomas in the United States, and more than 25% of GED holders go on to earn associate degrees or higher.

General Education Board A philanthropic organization for education, founded and funded by John D. Rockefeller in 1902. Although strongly supportive of segregated, "separate-but-equal" schooling of blacks and whites, the board nonetheless promoted the concept of universal education in the South and attempted to make black schools equal academically to those for whites. To that end, it funded major improvements and expansions of black schools and colleges. The board also supported the development of the GENERAL COLLEGE OF THE UNIVERSITY OF MINNESOTA, a two-year program founded in 1932 that was the precursor of American COMMUNITY COLLEGES.

General Electric Co. Perennially one of America's and the world's largest private corporations and a pioneer in vocational education and the development of CORPORATION COLLEGES AND SCHOOLS. As early as 1900, General Electric Co. had established four-year apprenticeship programs at its plant in Lynn, Massachusetts, where the company provided both academic and shop instruction during working hours. Designed to provide each apprentice with the knowledge and skills to "reach the top" of the company, the program began with two years of classroom instruction, with courses in arithmetic, elementary algebra and trigonometry, mensuration, elements of machines, power transmission, strength of materials, mechanics, elementary electricity, mechanical drawing, machine designing, and jig and fixture designing. Following completion of their studies, apprentices ran errands and performed unskilled labor until the foremen in charge decided they were ready to move up to simple bench work such as chiseling and filing, cleaning small tools, and materials handling in stockrooms. When deemed ready, the majority of apprentices moved to a special part of the plant to begin training as tool and die makers or machinists under the supervision of a mechanic gifted with teaching skills. The rest of the apprentices moved into pattern making and foundry work.

general languages A once-common junior high school course that prepared students for the study of foreign languages by studying the etymology and construction of English words and the history of language and language development. Students learned the alphabets and basic words and sentence construction of ancient languages such as Latin and Greek, from which many modern European languages evolved. General language courses usually also included a brief study of the rudiments of various modern foreign languages.

General Motors Institute The first degree-granting corporation-owned college. Founded in 1919 as a training school for apprentices and other new employees, the institute became a degree-granting college in 1945, offering bachelor of science degrees in engineering, with specialties in manufacturing, mechanical engineering, industrial engineering and electronic engineering. Later called the GMI Engineering and Management Institute and since renamed Kettering University, the college has more than 2,500 undergraduate students who must complete a five-year program, alternating 12 weeks on campus and 12 weeks on the job. Nearly 20% of the students are women.

Although most undergraduate courses are in science, engineering and computer science, Kettering does offer a business administration program, and it requires 18 hours of humanities and communication courses that teach students to write reports and make oral communications. Kettering also has a graduate school with 700 students, offering master's degrees in engineering. The school became independent of General Motors Corporation in 1982, and it now draws students from many other companies. GMI changed its name to Kettering University to honor Charles Franklin Kettering, the long-time president and research director at General Motors Corporation, whose heirs continue serving on the Kettering/GMI board of trustees.

(See also CORPORATION COLLEGES AND SCHOOLS; FACTORY EDUCATION.)

genius A vague and often misused "catchall" term referring to any person of exceptional talent or intellectual ability. Sometimes defined as anyone with a measurable INTELLIGENCE QUOTIENT (I.Q.) of 140 or more, the word genius dates back to Roman mythology and the belief that every individual, family and city had a protecting spirit or *genius*. The word is not unlike *genie*, which is derived from the Arabic *jinniy*, meaning a demon or supernatural spirit

that may take human form and serve its human summoner. Often depicted as a winged youth, the Roman *genius* was a household god worshiped in the hope that he would bestow intellectual powers and success on his believers.

LEWIS TERMAN, the Stanford University professor of education and psychology who pioneered intelligence testing, also pioneered the study of genius. Beginning with 1,000 12-year-old California boys and girls with high I.Q.'s in 1922 and adding another 528 students in 1928, Terman and his associates measured all aspects of their physical, intellectual and social characteristics. They also measured similar traits of the children's parents, teachers and other mentors (and eventual spouses); examined their environments and genetic histories; compared them with children with normal and low I.Q.'s; and then arranged to monitor them throughout their adolescence, adulthood and maturity. In-depth studies of the original students were made in 1922, 1927–28, 1936, 1939–40 and 1955. Although Terman died in 1956, others continued the studies until 1972, eventually resulting in a massive five-volume work that all but erased most popular myths about geniuses.

(See also GIFTED.)

geography The science that delineates and describes the physical and cultural characteristics of the world. Taught for centuries as a separate subject in elementary and secondary schools, it has been absorbed into the social studies courses of most American public schools since the early 1960s and has all but disappeared from the curriculum as an independent subject. As a result, 30% of American high school seniors had a substandard knowledge of geography at the beginning of the 2000s. About 40% had a basic knowledge and only 30% demonstrated what the Department of Education described as proficiency.

As late as the mid-20th century, a thorough knowledge of geography was required for

admission to most selective colleges, and most junior high schools required students to study geography as a full-year course, complete with textbooks and homework assignments. Geography courses included the study of the physical characteristics of the Earth, including its climate, land and water formations, plant and animal life and its geological history and evolution. Cultural geography included the study of the evolution of animals and man, and the development of artificial geological entities such as settlements, cities, nations and other modifications imposed by man on the physical geographic environment. Then, as now, geographical concepts were also integrated into conventional elementary and secondary school history and social studies courses.

At the university level, geography remains a separate and distinct science, usually broken down into seven categories: systematic geography (the classification and broad study of the spatial aspects of geographic phenomena); physical geography (the study of the Earth's geology, climatology, plant and animal life, soil and water, and the methods of mapping each); cultural, human or economic geography (the study of the world's resources, labor supplies, manufacturing facilities and transportation and communication facilities in relation to the human population's social life and distribution); regional geography (the differences and similarities of the Earth's various regions and the specific geographic characteristics that make each region unique); historical geography (the geological and cultural changes that history has wrought); data collection; and cartography, or mapping (the study of the methods required for a career as a professional geographer or cartographer).

geology The study of the history, shape and physical and chemical makeup of planets, but especially of the Earth. It includes the study of all forces that shape the Earth's exterior and

interior—rocks, soils, waters, atmosphere, life forms, other bodies in the solar system, and so on—and the interaction between them. Thales of Miletus is believed to have been the first person to ponder scientific geological questions in sixth-century B.C. Greece. Later contributors to geologic thought ranged from Aristotle, in the fourth-century B.C., to Leonardo da Vinci, in the 15th century A.D. But the first geoscientists, in the modern sense, did not emerge until the 16th and 17th centuries, with the development of studies in so-called natural philosophy.

Geology gradually entered the curriculum of American colleges in the late 17th and early 18th century, as the colleges evolved from theological to secular institutions. As mining developed into a major industry in the century that followed, geology became an integral element of the secondary school and college curricula, a position it retains today. Usually called "earth science" at the secondary school level, geology is divided into two broad categories: historical and physical. The former deals with the evolution of the Earth's surface and life forms and includes paleontology, stratigraphy, paleogeography and geochronology. Physical geology examines the forces that shape the Earth and includes geophysics, petrology and mineralogy.

geometry A mathematical system for measuring lengths and areas of two-dimensional figures and the linear dimensions, surface area and volume of solids. Derived from the Greek word meaning to measure the Earth, geometry has been an essential branch of mathematics since ancient Egypt, Sumer and Babylonia, where engineers relied on it to design and build their mammoth temples and palaces. The Greek mathematician Pythagoras began the systemization of plane geometry in the sixth-century B.C., Euclid completed the work a century later, and Archimedes developed solid geometry two centuries after that. But like many other sciences,

geometry advanced little between the Greek era and the beginning of the Age of Enlightenment, when secularists began challenging the power of the church for control of the 17th-century educational establishment. By developing the links between algebra and geometry, the French philosopher and mathematician René Descartes created analytic geometry, which forms the basis of the modern subject.

Taught in secular schools since the first settlers arrived in the New World, geometry today is a standard, required element of the secondary school curriculum. Although touched on in basic elementary and middle school mathematics courses, plane geometry is usually offered as a full-year course in the second year of the required three-year, secondary school mathematics curriculum, sandwiched between a year's study of elementary algebra and a year's study of advanced algebra, trigonometry and analytic and solid geometry.

George Acts A succession of four laws, enacted, respectively, in 1929, 1934, 1936 and 1946, initially to provide federal funds to support home economics and agricultural education, but eventually expanded to provide funds for vocational education in industrial trades and crafts. Named after long-time Georgia Democrat and congressman Walter F. George (1878–1957), who cosponsored the laws, each of the acts was passed to replace the previous, expiring one. The initial George-Reed Act provided \$7.5 million for home economics and agricultural education for a five-year period. When it expired, it was replaced by the George-Ellzey Act, which extended the scope of the funding to trade and industrial education, but only through 1937. The George-Dean Act (1936) expanded the scope of its predecessors, providing \$12 million in annual appropriations indefinitely and broadened coverage to include U.S. territories. The George-Barden Act doubled those appropriations in 1946.

Georgia One of the original 13 states and the fourth to join the Union, in 1788. Georgia planned to build state-supported schools in each county when it drafted its first constitution in 1777, but the legislature refused to provide funds for the system and only a handful of wealthy communities managed to establish common schools. The state was among the first to establish a university, chartering the University of Georgia in 1785. The Civil War destroyed virtually all of Georgia's schools. Although an 1870 law called for development of a state system of public schools, the law left funding of each school to the discretion of local communities. As before, only a handful of wealthy communities established schools, leaving the state bereft of public education until 1877, when a new constitution was adopted. That document established a statewide public school system, but, to prevent blacks from obtaining more than a rudimentary education, it limited the new system to elementary schools and restricted the curriculum to the basic elements of reading, writing, arithmetic, grammar and spelling.

The Georgia constitution specifically prohibited establishment of public secondary schools, and all secondary schools that were established were private and restricted to white children. Moreover, the state enacted legislation granting such schools exclusive monopolies over secondary school education in their localities, thus eliminating the possibility of establishing any secondary schools for blacks. The constitution did not prevent the opening of a number of black colleges, however, and these offered students the equivalent of secondary school as well as higher education.

In 1912, after a study by the University of Georgia delineated the economic need for a state system of secondary schools, the state passed a constitutional amendment extending state support to public secondary schools. The new constitution, however, left control of

schools to local communities, which systematically deprived blacks and most poor white children of adequate education and almost universally defied the 1954 ruling of the U.S. Supreme Court in *BROWN V. BOARD OF EDUCATION OF TOPEKA* to desegregate all public educational institutions. Georgia was slow to comply with the Court ruling and did not act to modernize its public schools until 1985, when the legislature passed the Quality Basic Education Act, which called for a required, statewide basic curriculum, quality education programs for gifted students, improved school performance standards and higher teacher salaries. By 2005, the act had produced minimal effects on the quality of Georgia's public schools, where student academic proficiency ranks 40th among the 50 states. Of the state's 1.5 million schoolchildren, more than 46% are minority students (38% African American), and 18% live in poverty. Georgia has 22 public four-year and 52 public two-year colleges. It has 43 private four-year colleges, 10 of them for-profit institutions, and 9 private two-year colleges, 6 of them for-profit schools. The state's landmark Hope Scholarship program provides free tuition and fees at every public college and partial tuition at private colleges in Georgia for Georgia students who graduate from a state high school with a 3.0 grade point average or better. Funded by the state lottery, the program has spurred high school students to improve their grades and lured ever-increasing numbers of the state's highest academic achievers to the University of Georgia system instead of out-of-state institutions. Graduation rates at the state's colleges, however, are an abysmal 42.2%–38.5% for men and 45% for women.

German Americans American citizens of German birth or ancestry. Although a handful of Germans had arrived among early colonial settlers, they did not migrate to the New World in appreciable numbers until the Thirty Years'

War (1618–48) had turned their native land into a political and religious battlefield. Luckily, William Penn had turned his vast holdings into a haven for any group seeking religious freedom. In the years following 1682, German Protestants—primarily Mennonites, Dunkers, Amish and Schwenkfelders—organized communities in Bucks County, near New Jersey, and Lancaster County, near the Maryland border, where they could preserve their language, customs and religious practices. Later, they were joined by Lutherans and members of the German Reformed Church, along with a startling variety of other German Christian sects: Labadists, Zion's Bruder, Ronsdorfer, Gichtelians, Depellians and others. They expanded their initial settlements across a wide arc of fertile farmlands that their descendants—the Pennsylvania Deutsche (corrupted into Pennsylvania Dutch)—still occupy, from Easton, on the Delaware River, southwest to the Susquehanna and across the Cumberland Valley.

By the mid-18th century, German immigrants were arriving in such large numbers that BENJAMIN FRANKLIN feared, "This will in a few years become a German colony." In a letter to a friend in 1751, he wrote, "Instead of learning our language, we must learn theirs, or live as in a foreign country. Already the English begin to quit particular neighborhoods [of Philadelphia] surrounded by Dutch [corruption of Deutsche], being uneasy by the disagreeableness of dissonant manners . . ." Franklin's fear that the colony would ultimately be Germanized provoked the introduction into Parliament and the provincial assembly of bills to suppress all German printing houses, prevent importation of German books, restrict immigration of German nationals, introduce an English literacy requirement for suffrage and require establishment of English schools.

Although the laws were not enacted, the fear of Germanization prompted the establishment in London of a well-financed philan-

thropic organization, the Society for the Propagation of Christian Knowledge Among the Germans in Pennsylvania, which established English schools to Anglicize German children in the colonies in 1755. During their many years of existence, the schools never managed to educate more than a few hundred German children a year, and their work provoked the majority of Germans to redouble their efforts to preserve their own language and culture—a legacy evident in many rural “Dutch” communities of Pennsylvania to this day. The Germans did, of course, adapt somewhat to their new land, adopting English speech and many cultural characteristics necessary for successful trading in nearby markets and for establishing commercial ties. Many also abandoned pacifism in the face of Indian attacks.

As discontent spread over excessive taxation by the British Parliament, Benjamin Franklin, the consummate diplomat, traveled the country to reconcile differences among various immigrant groups. After he appealed to their fierce love of individual liberty, the majority of Pennsylvania Dutch enthusiastically joined Franklin and those favoring American independence from the British, thus completing reconciliation, if not assimilation, with their English-speaking countrymen. Although they retained separate schools and churches (and do so to this day), they organized Franklin College (now Franklin and Marshall) in Lancaster in 1787, named in honor of their former adversary.

The second major wave of German immigrants—in the 1830s, 1840s and 1850s—did not flock to the earlier settlements. Made up primarily of well-established, middle-class Catholic or Lutheran families, they came to the New World, not to find a secluded haven in which to perpetuate the ways of the Old World, but to assimilate as quickly as possible and share in the wealth of an expanding new nation. A measure of their success is the fact that 12% of all immigrants to the United States

between 1820 and 1992 came from Germany—more than from any other country, including Italy (9%), the United Kingdom (9%) and Ireland (8%). They settled in major cities such as New York and Milwaukee, where they sent their children to English-language public, parochial or secular private schools and helped reinforce what was just developing into the world’s first system of universal public education.

Gesell, Arnold L. (1880–1961) Wisconsin-born physician and psychologist, whose pioneer research in child behavior and development produced widespread adoption of more permissive approaches to training and education of infants and children, both at home and in schoolrooms. In 1911, he was appointed the first director of the Yale Clinic of Child Development, which he headed until his retirement in 1948, when the clinic closed. Interested in the origins and development of individual differences in children, Gesell launched an extensive study of more than 12,000 children by filming their behavior in natural settings.

At the time, educators and psychologists were endlessly debating whether child behavior was the result of environmental or genetic influences. The former believed that training in the home and classroom were the primary determinants of child behavior, while the latter insisted biological change determined most child behavior and that normal, healthy children simply adopted and then abandoned various forms of appropriate behavior according to their level of development. Gesell’s studies provided an enormous body of then incontrovertible evidence to support the maturational theorists. The result of his studies was a series of widely used and respected books that established developmental norms and created new concepts in child training and education. Entitled *The First Five Years of Life* (with others, 1940), *The Child from*

Five to Ten (with Francis Ilg, 1946) and *Youth, The Years from Ten to Sixteen* (with Francis Ilg and Louise Bates Ames, 1956), his books outlined the normal, healthy behavior that parents and teachers can expect every normal, healthy child to exhibit at any given age.

Gesell also developed many tests to measure infant and child development, intelligence and school readiness. Two sets of tests, the Gesell Developmental Schedules, now the Gesell Maturity Scale, measure the motor skills, adaptive abilities, language and personal development and maturation of young children. One set is designed for infants four weeks to five months old, the other for preschoolers aged 1½ to 6. In 1950, three prominent psychologists founded the Gesell Institute of Child Development (now the Gesell Institute of Human Development), naming it in his honor and appointing him consultant. A prolific author in the field of child development, Gesell also wrote a number of books on handicapped and retarded children.

Gesell School Readiness Screening Test A widely used method of determining whether to admit children to kindergarten or allow them to spend another year in preschool. One part of the test is made up of various geometric shapes that the child is asked to copy freehand. A second part of the test is called the Incomplete Man and consists of a small circle for a head and, below it, a larger, incomplete circle representing the trunk, with one stick arm and one stick leg protruding. The head has one ear, some hair, a mouth and a nose, but is missing both eyes, one ear, some hair, an arm and leg and various connecting elements, which the child is expected to provide. Although some children readily complete the test neatly and thoroughly, critics of the test contend that many five-year-olds who may be developmentally ready for kindergarten respond to the stress of test-taking with poor results.

G.I. Bill of Rights The popular name for the Serviceman's Readjustment Act, a law passed in 1944 that marked the beginning of the popularization of higher education and its transformation from a privilege for the wealthy elite to a basic right of all Americans, regardless of economic class. The bill provided all World War II veterans with a complete educational allowance to attend any accredited school, college or university. Included were all costs of tuition, student fees and books, which the government paid directly to the institution, and a monthly stipend paid to the veteran for living expenses along with home-loan guarantees. Benefits extended over a period of time determined by each veteran's length of service.

The irony of the G.I. Bill was that its enactment was not motivated by any desire to popularize higher education. Indeed, the primary purpose was to prevent a repetition of the mass unemployment of demobilized servicemen that had plagued the United States following the end of World War I. The G.I. Bill was expected to create a temporary bulge of college and university enrollments and a gradual return to normal as veterans—usually older men, often with family responsibilities—found jobs and returned to civilian life. To the astonishment of the U.S. government and the higher-education establishment, the veterans—many of them from impoverished backgrounds, but nonetheless far more mature than typical undergraduates—not only completed their higher education, they also performed better academically than anyone had expected. As they emerged with degrees, the expanding U.S. economy absorbed them at such unexpectedly high salary levels that public perception of higher education changed from that of an esoteric pastime for the rich into a means of achieving success for the average American. Indeed, the academic successes of former G.I.s at college inspired President Harry Truman to establish a COMMISSION ON HIGHER EDUCATION,

in 1946, and its report, two years later, confirmed that American colleges and universities would have to open their doors to every citizen and cease reserving their classrooms for an intellectual elite.

In 1952, the G.I. Bill was extended to cover Korean War veterans, but the government changed its procedures. Direct payments to institutions were stopped, but veterans received larger direct payments from which they were to pay their own tuition and educational costs. By 1960, the G.I. Bill had provided educational benefits to more than 10 million veterans, whose education had either been delayed or interrupted by military service. Legislation in 1966 and 1967 extended coverage to Vietnam War veterans, and subsequent legislation provided educational benefits to all service personnel, regardless of whether they had served in any armed conflicts.

Most recently, all G.I. Bill benefits are contingent on the servicemen or -women contributing \$1,200 from their military salaries during their first year of service. Then, after completing their three-year minimum enlistment terms, they become eligible for up to \$36,144 toward education expenses. An additional \$600 contribution adds \$5,400 to those benefits. Although the Department of Veterans Affairs claims that the amount covers 70% of the average costs of attending a four-year public institution, the COLLEGE BOARD estimates that the benefits, which total just over \$9,000 a year, cover only about 60% of college costs, which average \$14,600 for tuition, books, fees and living costs at a four-year residential public college. Although nearly 95% of service personnel sign up for the G.I. Bill and 70% use at least some portion of their benefits, the rest fail to do so and forfeit their initial investments.

gifted A quality of above-average intelligence, aptitude, cognitive ability, creativity, social skills or talent, usually identified either

by direct observation or standardized testing. Specific "gifts" may range from the intellectual to the physical. Intellectually gifted children tend to read earlier, show greater curiosity, speak in more complex sentences and recognize cause-and-effect relationships earlier than most children their age. Once in school, gifted children have longer attention spans and learn faster than their peers.

Generally defined as those who score above 145 on I.Q. (INTELLIGENCE QUOTIENT) tests, gifted children constitute about 3% to 5% of the student population in the United States, although percentages range widely from state to state, from as low as 1% to as high as 15%. Variations, however, may reflect quality of education and environment as well as genetically determined intellectual makeup of the student population. Nearly one in five American children live in poverty, with limited educational opportunities and few opportunities to display any talents. Because schools serving the poorest areas focus on the academic deficiencies and the social and emotional maladjustments and other problems most children bring to school, the talents of the gifted are often unnoticed or ignored.

Even schools in economically healthy areas ignore special education for the gifted, often, according to some educators, because of a historic prejudice against the gifted in a nation that bases its demands for independence on the belief that "all men are created equal." According to some educators, the result has been a cultural bias against gifted students. "In America," according to the minutes of the 1993 annual conference of the National Association for Gifted Children, "we often make fun of our brightest students, giving them . . . derogatory names. As a culture, we seem to value beauty and brawn far more than brains."

Whatever the reasons, neither funding nor public enthusiasm for such programs has ever matched that for programs for the retarded and

handicapped, and one-third of all school districts in the United States continue to deny gifted children special education. Gifted children often master 35% to 50% of the elementary school curriculum before the start of a school year, and therefore require special educational programs geared to satisfy their need to explore the limits of their own potential. But in 1978, three years after Congress had provided funds to educate the handicapped and the retarded, growing public pressure for equal treatment of gifted children forced enactment of the Gifted and Talented Children's Act authorizing federal funds for specialized education for gifted children.

Although fewer than 40 states actually implemented such specialized education, every state government did appoint at least one functionary in the office of the state superintendent or commissioner of education to oversee programs for the gifted. About two-thirds of American public schools initiated programs of special studies for gifted students, but most averaged only about two to three hours a week and left gifted students languishing in classes that require little effort for the rest of the week. Only two cents of every \$100 spent on K-12 education supports special education for gifted students, compared to more than 15 cents for the handicapped and 17 cents for the disadvantaged. Few publishers offer textbooks designed for above-average students.

Some educators contend that gifted children, along with mildly retarded and handicapped children, benefit more by remaining in regular classes with average students. Such educators maintain that, while gifted students may have above-average abilities in some sectors, they need to develop normally in other areas by remaining with their peers. Moreover, such "mainstreaming" allows other students to benefit from the special talents of gifted students, who can serve as intellectual role models for their slower peers. Proponents of special edu-

cation for the gifted mock such arguments for mainstreaming as a self-serving policy aimed at keeping costs of education as low as possible.

Despite the arguments in favor of mainstreaming, a wide variety of special education programs for the gifted have emerged across the United States. Even before World War II, many individual schools routinely allowed students to "test-out" of courses whose materials they already had mastered and move on to higher-level courses. Testing-out has now expanded in many areas, in the wake of so-called compacting, in which materials of traditional one-year courses are literally compacted to permit gifted students to complete the work in relatively short periods of time. Students who have completed all the work available in a particular secondary school course can then take college-level courses (for full credit) at nearby colleges or universities, while continuing secondary school courses at their high school. Some colleges send instructors to conduct advanced courses at high school campuses, while others train high school teachers to conduct such courses. A few colleges pioneered programs that allow gifted high school students to matriculate and begin their college education at an early age. Among the most renowned of these programs are the following:

- Mary Baldwin College, Staunton, Virginia, primarily a women's college, accepts between 60 and 70 13- to 15-year-olds, houses them in their own dorms for the first two years, although they enroll in and attend regular college classes with older students.
- California State University, Los Angeles, accepts about 100 11- to 16-year-olds in its Early Entrance Program. Students live at home but enroll as full-time students and attend the same classes as regular students.
- JOHNS HOPKINS UNIVERSITY, Baltimore, Maryland, admits 11- to 16-year-olds to take a science, mathematics or humanities course as part of a residential summer program sponsored by a network of 17 colleges. The university's Center for Talented Youth offers a distance-learning

program in mathematics and writing during the regular academic year.

- Simon's Rock College of Bard, Great Barrington, Massachusetts, was founded in 1966 as an "EARLY COLLEGE" for gifted students, who can enroll full time after tenth or eleventh grade. Affiliated with Bard College in Annandale-on-Hudson, New York, Simon's Rock awards associate degrees after two years and bachelor's degrees after four years of courses, some of which are taken at Bard. Enrollment fluctuates between 250 and 350.
- University of North Texas, Denton, houses the Texas Academy of Mathematics and Science, where 350 to 400 gifted 16- and 17-year-olds (mostly Texans) complete four years of schoolwork—the last two years of high school and first two years of college—in two years of accelerated studies. Considered college juniors when they complete the academy, the graduates usually go on to larger universities, although they may remain at Denton if they choose.
- University of Washington, Seattle, accepts about a dozen or so gifted 12- to 14-year-olds at its Transition School, where they take classes together but live at home. After one year, they can enroll as regular freshmen at the university.
- Dozens of colleges and universities offer online courses designed for gifted children of various ages in math, English literature, history and the social and physical sciences. Offered at relatively low cost, the courses allow the colleges to identify and recruit exceptional students. Students, in turn, can earn academic credits toward high school graduation and often college credits as well. Among colleges that pioneered such programs are Stanford, Johns Hopkins, Duke, Northwestern and the universities of Missouri, Washington and Iowa.

Some school districts have established separate high schools for gifted students. Often called MAGNET SCHOOLS, they range from all-purpose schools, with a broad curriculum of arts and science courses, to specialized schools that concentrate on mathematics, science or the performing arts. Some states have established

residential schools for the gifted to accommodate students from widely scattered rural areas. North Carolina created the state-supported North Carolina School for the Arts in 1965 to provide special education for gifted students in music, drama and the visual arts. In 1980, the state established a second residency school for the gifted, the two-year North Carolina School of Science and Mathematics.

Some corporations have also established special educational programs for gifted high school students. These include sending skilled personnel into high schools to teach gifted students and bringing such students to their plants and laboratories where they can participate in advanced study and research under the guidance of an assigned mentor.

Gilman, Charlotte Perkins (1860–1935)

American author, sociologist and feminist who developed the concept of gender equality as a valid sociological phenomenon. The great-granddaughter of firebrand preacher Lyman Beecher, Gilman was born in Hartford, Connecticut. Poverty permitted only a limited education, although she did manage to spend a term at the newly opened Rhode Island School of Design during a short residence in Providence. She managed to support herself as a commercial artist, teacher and governess; after an unsuccessful marriage, she began championing women's rights with a series of books that called for radical reforms in child-rearing and educational practices as a means of ending GENDER DISCRIMINATION. After studying the works of LESTER FRANK WARD, a long-time champion of women's rights and the "father of sociology," Gilman became one of the outspoken leaders in the fight for woman suffrage and equal educational rights for women. After women won the right to vote in 1919, the feminist movement receded and, with it, Gilman's influence.

But the sociological concepts she developed eventually spawned a revival of the struggle for gender equality after World War II. In 1932, she discovered she had contracted breast cancer. After years of treatment failed to arrest the disease, she committed suicide.

Gilman, Daniel Coit (1831–1908) American educator who, as first president of Johns Hopkins University, introduced the concepts of separate, freestanding GRADUATE SCHOOLS and research-oriented universities. Born in Connecticut, he graduated from Yale University, where he remained for 17 years as professor of physical and political geography and organized plans for the new Yale Scientific School (later the Sheffield Scientific School). In 1875, after a less-than-satisfying three-year term as president of the University of California, he accepted the presidency of a new university being built in Baltimore under the terms of a \$7 million bequest from financier Johns Hopkins.

Gilman envisioned the embryonic university as a center for research by the world's greatest "seekers of truth," and he spent the next year traveling across the United States and Europe in search of the most talented researchers and lecturers. Free from the theological restrictions of older universities and the political pressures he had endured at the state-operated University of California, Gilman built Johns Hopkins as a center of original research and a training ground for graduate students. In 1889, in accordance with Hopkins' original bequest, the Johns Hopkins Hospital opened, with Gilman as director. Four years later, Gilman opened the Johns Hopkins Medical School, with what seemed like impossibly high admission requirements at the time—namely, a four-year college degree. The requirement quickly became standard at all other major American universities.

When he retired in 1901, Gilman had created the first model of a great research univer-

sity—a model that was immediately copied by Harvard, Yale and other major universities. Following his retirement, Gilman became the first president of the Carnegie Institution, which steel magnate ANDREW CARNEGIE had founded to fund a variety of educational enterprises. Gilman also served on the General Education Board, a philanthropic organization with similar goals, founded by John D. Rockefeller.

Girl Scouts of the U.S.A. One of many organizations founded at the beginning of the 20th century as educative institutions for the benefit of adolescents when schools were closed. Founded in Savannah, Georgia, in 1912 as an American version of Britain's Girl Guides, the organization changed its name to Girl Scouts the following year and moved its headquarters to New York City. Like comparable organizations for boys, the Girl Scouts prepared handbooks for local adult leaders on how to operate chapters, and it published a monthly periodical, *The American Girl*, for members. The founding philosophy behind organizations like the Girl Scouts was to channel the "gang" and "play" instincts of adolescents into activities that would shape them into responsible adults and "inspire them with the highest ideals of character, conduct, patriotism and service that they may become happy and resourceful citizens." The Girl Scouts also organized summer camps and a variety of programs for younger girls: Brownie Girl Scouts (ages 6–8), Junior Girl Scouts (ages 9–11) and Cadette Girl Scouts (ages 12–14). Total membership is now 3.5 million.

Gladden, Washington (1836–1918) Liberal, evangelical American clergyman who attempted to reconcile biblical teaching with "modernism," namely, the theory of evolution and other scientific concepts that undermined the veracity of biblical tales.

Gladden set himself at odds with fundamentalist preachers who believed in biblical

Washington Gladden (*Library of Congress*)

infallibility and called the theory of evolution and other scientific discoveries sacrilege. Gladden agreed that the Bible was an inspired book containing supernatural elements but believed that it was not a work of science, and indeed did not contradict modern science, which he considered as much a product of Christianity and divine inspiration as the Bible itself.

Born in Pennsylvania, Gladden was largely self-educated, although he eventually graduated from Williams College. After ordination, Gladden spent 22 years (1860 to 1882) as minister of a series of Congregational churches in New York and New England, where he tried to influence capital and labor to abandon strikes and industrial violence in favor of compulsory arbitration. In 1882, he became minister of the First Congregational Church of

Columbus, Ohio, where he remained the rest of his life. By then, he had written a number of widely read books and developed a large and influential following in the northeast, where his socially liberal Christian views proved decisive in fending off efforts by FUNDAMENTALIST Christians to control education by imposing Bible studies in public schools and banning teaching of scientific theories that contradicted scriptural texts.

glee club A choral group popular as an extracurricular activity at colleges and some secondary schools. Although some glee clubs occasionally include sacred music in their repertoires, glee clubs have always been associated with popular song. The glee is a peculiarly English form of song that reached its peak of popularity in the 75 years between the middle of the 18th century and the end of the first quarter of the 19th, after the Age of Enlightenment had stripped away some of the church's control over everyday behavior. Many Englishmen, both at home and in the colonies, began spending leisure time engaging in amusing activities, such as singing, instead of prayer.

The glee differed from previous types of songs, such as madrigals, in that it was simpler, shorter and far easier for amateur voices to sing in unison or in improvised harmony. Despite its association with joy and entertainment, the glee may be serious and even mournful as well as cheerful. Its distinguishing feature is its tonal simplicity, a quality not found in the complex, fugue-like qualities of madrigals and other songs requiring trained (church) choirs. The earliest known and, in his own life, premier composer of glees was Samuel Webbe (1740–1816), who in 1783 organized the world's first men's group devoted to singing glees. Made up of 13 amateur and eight professional male voices, it met at members' homes until 1787, when it obtained a formal charter as a society called, not surprisingly, the Glee Club. It held its first public

meeting at the Newcastle Coffee House on Saturday, December 22, 1787, moving thereafter from tavern to tavern and opening every performance with the singing of Webbe's famous "Glorious Apollo." Although the world's original Glee Club dissolved in 1857, its traditions, including the singing of "Glorious Apollo" as a performance opener, spread to the United States. By the end of the century, after churchmen had relinquished control of student life, the glee club became a standard form of extracurricular activity on many American college campuses. Admission of women to formerly all-male colleges in the late 1960s and early 1970s forced many college glee clubs to become coeducational.

Glorious Revolution The bloodless revolution (actually, a series of covenants) of 1688 that replaced the Catholic James II as English king with the Protestant William of Orange and his wife, Mary, James's daughter. Parliament gave William and Mary the Crown jointly. In return, William and Mary issued a Declaration of Rights listing Parliament's grievances against James and affirming the "ancient rights and liberties" of Parliament and the implicit limitations of royal powers. In addition, the Glorious Revolution, which was "glorious" because it was bloodless, produced the Toleration Act of 1689, which gave Protestant dissenters the right to worship. The effect on education in America was instant, as swarms of ministers of every variety of sect migrated to the colonies to establish churches, where they served as secular, as well as spiritual, teachers to their communities. Their diverse efforts proved the foundation of public opposition to standardized, universal education in the colonies and, later, in the United States.

goal-free evaluation The examination and assessment of the positive and negative "side effects," or unintended results, of an educational program. Goal-free evaluation specifi-

cally ignores the stated and projected goals of an educational program to determine whether the unanticipated effects are productive or counterproductive.

Goals 2000 A program of voluntary national education standards provoked by the startling 1983 report *A Nation at Risk*. Compiled by the National Commission on Excellence in Education, the report detailed widespread educational failures of American public schools and frightening gaps in educational achievement between American children and their counterparts elsewhere in the industrialized world. The standards were codified in the "Goals 2000: Educate America Act," a 1994 law that established national academic standards for students completing the fourth, eighth and eleventh grades in math, science, history, geography, foreign languages and the arts (dance, music and the visual arts).

Goals 2000 began as a governmental policy enunciated in 1990 by President George H. W. Bush, who won approval of the 50 state governors for eight national goals to raise the standards of American public schools and make American students "first in the world" in mathematics and science by the year 2000. After he assumed office in 1993, President Bill Clinton adopted and expanded Bush's policy into the Goals 2000 legislation, called the Educate America Act, which carried no enforcement provisions but did set these goals for American public schools—all of them to be reached by the year 2000:

- All children will start school ready to learn.
- The high school graduation rate will be 90%, compared to less than 75% at the time Goals 2000 was created. Although the graduation rate for white non-Hispanic students was already above 90%, the rate for Hispanic students was only 75%, while the rate for students with disabilities averaged less than 45% and ranged as

low as 30% and only as high as 65%, depending on the disability.

- All students will leave grades 4, 8 and 12 showing competence in core subjects, namely, English, history, geography, foreign languages and the arts.
- Teacher training is to be significantly improved, with all teachers having access to professional development to help them prepare students for the next century. At the time, government studies found that more than one-half of all public school math, science and English teachers were unqualified to teach those subjects, and 20% of American teachers admitted they had been assigned to teach subjects they were not qualified to teach. Fewer than one-third of public high school physics courses were being taught by qualified teachers.
- The United States will be first in the world in math and science.
- All adults will be literate.
- Schools will be free of drugs, violence and weapons.
- Every school will promote partnerships to increase parental involvement.

Goals 2000 also provided more than \$2 billion in annual, federal grants to spur “systematic” state education reforms. Although the standards were voluntary, states and school districts that failed to adopt them found it increasingly difficult to attract new industry and foster job growth without evidence that their educational systems were competitive with the finest American and foreign school systems. Moreover, those who ignored the standards also forfeited millions of dollars in badly needed federal funds for education.

The first set of standards incorporated into the Goals 2000 program had been established in 1989 by the National Council of Teachers of Mathematics, which had responded on its own to *A Nation at Risk*. Within five years, these standards had been adopted by 40% of American public schools. In 1994 standards for all aspects of art education—dance, music, drama and the

visual arts—were established by representatives of the U.S. Department of Education, the National Endowment for the Arts, the National Endowment for the Humanities and the Music Educators National Conference. Standards for history and English were developed in 1996, but the English standards were later revised after critics attacked them for being too vague.

Although Goals 2000 failed to achieve any of its broad goals entirely by the year 2000, the program did spur major advances in American public education. Thirty-five states had indeed increased their high school graduation rates to 90% or better, and 48 states and the District of Columbia had introduced standardized tests in every subject area to determine whether students had achieved competency in each subject and were worthy of promotion or graduation. Students in about one-third of the states scored at or above national proficiency levels in core subjects.

American schools made giant strides in other directions as well, for the Goals 2000 program provoked Congress into passing a number of supplemental education improvement acts, including the IMPROVING AMERICA'S SCHOOLS ACT and the SCHOOL-TO-WORK OPPORTUNITIES ACT. The former provided massive funds to improve vocational education, and the latter provided equally massive funding for educating disadvantaged children.

Goodlad, John I. (1921–) Educator/founder and longtime director of the CENTER FOR EDUCATIONAL RENEWAL, a major force for educational reform in the United States during the last two decades of the 20th century. Based at the University of Washington's College of Education in Seattle, the center was founded in 1985 to implement Goodlad's premise that reform of U.S. public schools hinged on reform of teacher education.

“We have treated teacher education shabbily for 150 years,” said the Canadian-born

Goodlad, who earned his Ph.D. at the University of Chicago, where his mentors and colleagues included such pioneers in education as BENJAMIN BLOOM and MORTIMER ADLER. The author of the monumental and highly acclaimed study of American schools *A Place Called School* (1984), Goodlad contended that American society viewed teachers “more as baby-sitters than as pedagogical experts.” The study, which took eight years and was based on more than 27,000 interviews, was considered the most comprehensive examination of American public schools ever made.

Assisted by 43 researchers, Goodlad found a “gap between the rhetoric of individual flexibility and creativity” in American educational goals and “the cultivation of these in our schools. . . .” He determined that American schools and classrooms actually “condition them [students] in precisely opposite behaviors—seeking ‘right’ answers, conforming, and reproducing the known. . . .” Goodlad proposed several reforms, including smaller schools, with no more than 300 students and a dozen teachers. Where small schools were impractical, he called for division of large schools into “houses” of 100 elementary pupils or 160 high school students. He called for children’s primary education to begin one month after their fourth birthday and for secondary education to end at 16—an age range he described as a “very stable period.”

He condemned ability grouping and the “prevailing wisdom that mixed classes sink to the lowest common denominator. What we found was the mixed classes were more like the high track than the low track in terms of content, teaching practices, student enthusiasm and teacher expectations.” He urged high schools to require all students, even those in vocational education, to take a core curriculum in the humanities and sciences, and he recommended that schools adopt TEAM TEACHING as a standard approach to education.

Goodlad’s study was published just as the U.S. Department of Education was releasing a shocking study entitled *A Nation At Risk*, in which the NATIONAL COMMISSION ON EXCELLENCE IN EDUCATION had concluded, “If an unfriendly foreign power had attempted to impose on America the mediocre educational performance that exists today, we might well have viewed it as an act of war.” Goodlad’s study went beyond a mere confirmation of the commission’s findings. It proposed a program of remediation that, along with proposals from a study entitled *HIGH SCHOOL: A REPORT ON SECONDARY EDUCATION IN AMERICA*, by the CARNEGIE FOUNDATION FOR THE ADVANCEMENT OF TEACHING, became the core of a nationwide educational reform movement that continues to this day.

A teacher at every grade level from first grade through advanced graduate work, Goodlad served as professor of education and dean of the Graduate School of Education, University of California, Los Angeles, before founding the Center for Educational Renewal in 1985. Author of 20 books and more than 200 articles in journals and encyclopedias, Goodlad proposed reforming teacher education in much the way medical school education was reformed early in the 20th century, by moving it from the university campus into teaching hospitals that meshed theory and practice. Outlined in his book *Teachers for Our Nation’s Schools* (1990), Goodlad proposed establishing “centers of pedagogy” for teacher education. Such centers would use carefully selected practice schools, operated jointly by the school of education and the school district, to train future teachers, to develop teaching innovations and to study learning processes. Goodlad laid out 19 postulates as essential for first-rate programs. After completing a prescribed preeducation curriculum, comparable to premedical education, prospective teachers would enter a three-year teacher-education program, culmi-

nating with a year of semester-long internships in two practice schools.

Within five years of its founding, Goodlad's Center for Educational Renewal had grown into a major force for education reform in the United States, having received applications from 260 teacher-training institutions—about one-fifth of all those that prepare teachers—to become pilot “centers of pedagogy” along the lines he prescribed. Almost every state was considering Goodlad-suggested reforms in state university-based teacher training programs, most of which had remained relatively unchanged since the 19th century.

(See also EDUCATION REFORM.)

Goodrich, Samuel Griswold (1793–1860)

One of the first major American publishers and a pioneer in the development of children's textbooks. Born in Connecticut and equipped with only an elementary school education, Goodrich started his publishing venture in 1816, after serving in the Connecticut militia in the War of 1812. His early publications were such staples as the *Family Bible* and classics by popular authors. In 1827, remembering the difficulties he had experienced struggling through uninteresting elementary school textbooks, he began to write a series of readers, textbooks and anthologies for children, presenting them in the form of simplified tales recounted by a fictional old storyteller named Peter Parley. Starting with *The Tales of Peter Parley About America*, he eventually published more than 100 Peter Parley books on history, geography, science, biography and morals, all written in easy-to-understand language for children. By 1856, he had sold more than 7 million copies of the highly popular books. Although he wrote some himself, he hired authors—including Nathaniel Hawthorne, once—to write most of the books. He also edited and published two periodicals for children, *Parley's Magazine* (1832–34) and *Merry's Museum* (1841–54).

Google Print Library Project An on-line library providing access to all the information in millions of books in digital form. The library is an ongoing, long-term project of the huge search engine Google, in partnership with Harvard University, Stanford University, the University of Michigan at Ann Arbor, Oxford University of England and the New York Public Library. The project is scanning more than 30 million books from the five libraries and then millions more books at other libraries. Although it plans to scan books still under copyright, it will limit access to such materials, revealing only specific information in limited amounts before referring searchers to publishers, booksellers and libraries that can provide the complete book. Thus, searchers seeking information on a particular person, for example, would be able to call up references in a myriad of books and download the entire contents of books in the public domain but could only access specific references from books under copyright. Harvard and the New York Public Library have limited the books they contribute to items in the public domain—about 100,000 between the two of them—but Stanford is allowing Google to scan all 7.6 million of its books, and the University of Michigan is letting Google scan all 7.8 million books in its collection. Oxford is limiting its contributions to books published before 1900.

As part of its project to become the world's all-encompassing source of data, Google has also invested \$3 million in the WORLD DIGITAL LIBRARY, an on-line repository of cultural artifacts from the world's national and international archives. First proposed by James H. Billington, the librarian of the Library of Congress, the project has the support of the United Nations Educational, Scientific and Cultural Organization. Far from alone in its efforts to digitize books, Google faces competition from the search engine Yahoo, which has teamed up with the University of California system, the

University of Toronto, Adobe, the European Archive, the National Archives of England and several commercial partners in the Open Content Alliance, to scan at least as many books as Google but limit its offerings to materials that are out of copyright and in the public domain.

Goss v. Board of Education A 1963 U.S. Supreme Court decision that struck down a Tennessee law intended to obstruct the progress of DESEGREGATION. Although desegregation had made substantial progress in most border states in the eight years following the Court's original desegregation orders in 1954 and 1955, the South continued to resist desegregation. Mississippi, Alabama and South Carolina had not desegregated any of their schools, while Texas, Georgia, Virginia, North Carolina, Arkansas, Florida and Tennessee had instituted only "token" desegregation at a handful of highly visible schools in major cities where "massive resistance" to desegregation might have hurt commercial relations with the rest of the United States and many foreign countries.

To block full-scale desegregation, however, the city of Knoxville, Tennessee, instituted a "minority to majority" transfer scheme that allowed students to transfer from schools where their race was a minority into schools where their race was a majority. In effect, the law encouraged students of both races never to enroll in schools where they might be a minority. White parents thus kept their children from enrolling in formerly all-black schools, while black parents, fearful that their children might suffer harassment in white schools, kept most of their children in all-black schools. The Supreme Court decision to strike down the plan was one of three that effectively ended all legal subterfuges by states and school districts seeking to resist desegregation. The other two decisions, *Griffin v. County School Board* and *Bradley v. Richmond School Board*, followed in 1964 and 1965, respectively.

Goss v. Lopez A 1975 U.S. Supreme Court decision reaffirming a lower court affirmation of a public school student's constitutional right, under the FOURTEENTH AMENDMENT, to due process in school disciplinary actions. The case involved nine Columbus, Ohio, students suspended in 1971 during demonstrations arising from racial disorders. State law permitted the school to suspend students summarily for up to 10 days without any discussion with them.

The lower court had held that suspended public school pupils had the right to notice of charges against them and an opportunity to defend themselves against such charges. Writing for the majority in the Supreme Court's 5-4 decision, Justice Byron R. White stated that "Young people do not shed their rights at the schoolhouse door." The Court added that pupils had an "entitlement" to education in states that guaranteed their residents free primary and secondary education and that states "may not withdraw that right on grounds of misconduct, absent fundamentally fair procedures to determine whether the misconduct has occurred." It held that suspension without a hearing deprived the students of their property (the statutory right to an education) and liberty (slurring their school records without proof). However, in ruling that the students were entitled to "rudimentary precautions against unfair findings of misconduct and arbitrary exclusions from schools," the Court stopped short of giving students, who had been suspended for short periods, the right to counsel and formal hearings.

government role in education The degree of legal authority that elected government officials or their appointees exert, directly or indirectly, over public and private education.

Unlike most foreign nations, where central governments or official religious authorities control education, the powers of government over education in the United States have been limited since the nation's beginnings. Indeed, the federal government abdicated all influence over education when the republic was formed following independence from England. Prior to that, the colonies had left all education to parents and local churches. The only interference by the state, whose monarch also headed the Church of England, was to certify the teaching qualifications of clerics and ensure their loyalty to the Crown.

At the time of independence, a handful of secular secondary schools had emerged in Philadelphia, New York and Boston, and some socially liberal framers of the Constitution—notably BENJAMIN FRANKLIN, THOMAS JEFFERSON, JAMES MADISON and BENJAMIN RUSH—had sought to include universal public education in the CONSTITUTION as a basic right of all Americans. Indeed, they proposed a national, federally controlled system of public education, with elementary schools in each community, regional secondary schools in each county, a college in each state and a national university. Competitive examinations were to have determined progression to each level, and graduation from the national university was to have been a prerequisite for government service.

The proposal was defeated by northern industrialists and southern planters who feared schools would deprive them of their cheapest form of labor—children and slaves. The Constitution made no mention of education and thus left the question to the states. The latter, in turn, largely left education to parents, who perpetuated the colonial system of either educating children themselves or, if they could afford to, sending them to local, church-run “common schools.” The landed gentry sent their children to independent private schools, also

usually under the direction of churchmen. The only active state control over education was through the issuance of charters of incorporation, which determined a school's right to operate.

In 1837, Massachusetts was the first state to intervene directly in local education. It established what, in effect, was a state board of education, which encouraged local communities to establish locally controlled public schools. State intervention came in two forms: The state government issued voluntary guidelines for teaching methods and curricula, and it established the first teacher-training school in the United States. By providing uniformly trained teachers from a state-run teachers college to man local schools, the state thus exerted indirect control over what was taught in public schools and how it was taught. In the decades before and after the Civil War, other states established variations on the Massachusetts model, with state governments exerting more or less control over local schools, either directly through legislative action or indirectly by controlling the flow of state funds.

Direct state intervention began in 1852 with passage of the first COMPULSORY EDUCATION law—again, in Massachusetts. By 1918, all states had passed similar laws, although they were not all enforced until 1930, when the economic depression created a labor surplus and state governments had to enforce the laws against child labor to provide job opportunities for unemployed adults. With these laws, additional state intervention in education emerged, as legislatures were forced to supplement funds raised from local property taxes to pay for the education of the poor. Property taxes, paid by property owners, usually covered the costs only of educating their own children. Compulsory education forced poor children of non-property-owners into the schools, and state governments had to cover the costs of their education.

Where state governments provided such funds, they used the power of the purse to impose a wide range of standards, ranging from autocratic imposition of textbooks and even teacher lesson plans to the establishment of statewide educational standards. New York, for example, adopted state-administered competency-based examinations to determine whether students would be permitted to proceed to the next grade. Although such statewide standards remain nettlesome for many local school officials and parents, control of elementary and secondary public school education in most areas of the United States remained firmly in the hands of the citizenry until the last decades of the 20th century. Exercising all the rights of a citizen democracy, separate from the ones governing community, state and nation, local voters held separate elections for SCHOOL BOARDS, in which they vested control over local education, including the power to determine the curriculum, hire and fire faculty and school administrators, and admit or dismiss students.

These near-autocratic powers began to recede in the 1950s and 1960s, when the U.S. Supreme Court declared as unconstitutional all discrimination in education on the basis of race, religion, ethnic or national origins and gender. Local school boards were thus stripped of the right to determine who could attend local schools and the right to hire or fire on any basis other than teaching qualifications. While eroding local school board powers, the Court's various anti-discrimination rulings strengthened and indeed added vast new state and federal powers over schooling. To reinforce the Supreme Court's decisions, the federal government passed a series of civil rights and education-entitlement laws. These laws forced public schools to accept learning disabled, mildly retarded and physically or emotionally disabled children and provide them with the same education as other students—and also what-

ever special education such children might need. In effect, such laws imposed open-enrollment policies on all public elementary and secondary schools. Many states reinforced the federal policies by passing laws that extended open enrollment to the public college and university level.

Prior to passage of such civil rights and educational entitlement laws, the federal government had largely limited its involvement in education. Its first, tentative intervention came, with the passage of the first Morrill Land Grant College Act (see LAND-GRANT COLLEGE), in 1862, granting federal lands to the states to establish state-run colleges. A second Morrill Act in 1890 pledged federal funds on an annual basis to help support those colleges. Both acts left state governments with direct control over public higher education but gave the federal government some indirect control through its power to limit or expand the funds it granted to the state colleges.

The federal government began expanding its use of the "power of the purse" to influence education during World War II, when it financed enormous research projects at many public and private universities. These projects continued and, indeed, expanded during the succeeding 40-year cold war with the Soviet Union. Washington further expanded its role in higher education with passage of the G.I. BILL OF RIGHTS, under which the government provided all World War II veterans with comprehensive educational allowances to attend accredited schools, colleges and universities. The G.I. Bill was the forerunner of a complex series of programs under which Washington subsequently financed upwards of half the university students in the United States with a combination of outright grants, loans and job subsidies.

Over and above the fiscal sway the federal government held over higher education, the same anti-discrimination laws that applied to

lower levels of education also applied to higher education. Thus, colleges and universities were forbidden to discriminate in their student admissions and faculty and staff hiring and firing policies, and they were forced to make their campuses barrier-free to accommodate the handicapped.

In the 1980s and 1990s, the federal government extended its influence on public elementary and secondary education by gradually establishing “voluntary” standards of achievement for students. Provoked by the startling 1983 report, *A NATION AT RISK*, which detailed widespread educational failures of American public schools, the federal government established goals 2000 to raise the standards of American public schools and make American students “first in the world” in mathematics and science by the year 2000. The program set standards of achievement in eight academic areas and provided \$1.2 million for the National Assessment of Educational Progress to test students in the fourth, eighth and eleventh grades to see how many reached those standards. The initial legislation also provided hundreds of millions of federal dollars in annual grants to spur “systematic” state education reforms. Although the standards were voluntary, those states that ignored the standards would forfeit millions of dollars in badly needed federal funds for education. Proponents of local control over education opposed what they deemed unconstitutional federal government interference with public school education. Those opponents had little success in blocking the Goals 2000 program, which, in fact, presaged the most massive, direct federal intervention in public school education in American history.

In 2001, Congress imposed the most far-reaching federal controls on American public school education with the NO CHILD LEFT BEHIND ACT OF 2001 (NCLB). An amendment to the ELEMENTARY AND SECONDARY EDUCATION ACT,

NCLB imposed, as a prerequisite for federal aid to public school districts, testing requirements that force every school to demonstrate year-to-year improvements in academic performance—especially schools catering to disadvantaged children. With student academic proficiency at abysmally low levels in parts of the nation, many educators had long called for establishing minimum national academic standards. The Tenth Amendment of the Constitution, however, leaves to the states all powers not expressly conveyed to the federal government by the first nine amendments, and the Founding Fathers purposely omitted education from those amendments to keep education under state purview. Because federal grants provide 10% of their education budgets, however, most school districts have little choice but to accept the conditions that come attached to those grants. A few districts refused in Connecticut, Illinois, Vermont and Virginia, among other states, where they preferred to do without federal aid rather than change their systems of education. Some states even challenged the law on grounds that the federal government failed to cover costs of administering the law and forced states and local school districts to spend local tax dollars to enforce a federal law. A federal court rejected the challenge, saying the states and local districts had the option of withdrawing from NCLB and, of course, forfeiting federal aid as well as federal interference in local education.

(See also Appendix: Federal Programs for Education and Related Activities, listing major federal education legislation, 1787–1993.)

grade A somewhat confusing term in American education, variously used to refer to a general level of education (as in grade school); a specific GRADE LEVEL of education in primary or secondary school (as in first grade or second grade); or an individual or cumulative score, based on a student’s academic performance, as

in a grade of A, B or C (letter grades), 75% or 85% (percentage grades) or pass/fail.

graded school A primary or secondary educational institution whose students are grouped in classes according to chronological age and progress from grade to grade after mastering the materials of each grade. Prior to 1848, students of all ages were grouped in one-room schoolhouses, with a single teacher attempting to provide appropriate work for each student, according to his (almost all students were boys) abilities and level of achievement. The result in most one-room schoolhouses was bedlam, tempered only by the threat of whippings.

After student disorders had closed a number of Massachusetts schools in 1848, the Quincy Grammar School became the first to group its students on the basis of age, assigning one teacher to each grade. Five years later, Oswego, New York, school superintendent Edward A. Sheldon refined the concept by organizing students in separate primary, junior and senior schools.

Accepted as a standard form of school organization for more than a century, the concept of graded schools became the subject of some debate among educators during the mid-20th century. Traditionalists argued that graded schools permitted teacher specialization, thus allowing teachers to acquire and impart a greater depth of knowledge to grades they taught. Curriculum compartmentalization, traditionalists argued, provided a logical sequence through which students progressed as they moved from grade to grade. Critics, on the other hand, called graded schools inflexible and educationally and socially harmful to many students—especially students at extreme ends of the intellectual spectrum. Slower students were often unable to keep up with the pace of learning and were subjected to the humiliation of failure and the necessity of repeating the same grade with younger stu-

dents. Gifted students, on the other hand, grasped materials so quickly that they were easily bored by repetitive drills that average students needed to retain the standard body of knowledge. The debate was eventually resolved by some schools by adding varying degrees of flexibility to their programs, providing remedial education for slower students in elementary schools, and by permitting gifted students to accelerate at their own pace.

At the secondary school level, the majority of schools introduced controversial TRACKING schemes that divided students within each grade according to their academic ability, with slower students placed in a less demanding “general education” track and higher achievers in a more demanding “academic,” or “honors,” track. Tracking, too, came under fire for depriving many students of equal educational opportunity. Some secondary schools subsequently introduced “COOPERATIVE LEARNING” programs that grouped students of varying abilities into small learning teams, with students responsible not only for their own learning and progressing at their own pace, but also for helping each other and encouraging each other to achieve.

grade-equivalent scales A somewhat controversial measurement system that converts raw test scores into a numerical school-grade achievement level. Thus, if the average score of students beginning the sixth grade on a test of 100 questions is 70, any score of 70 would be recorded as 6.0. Any student scoring 70, whether in the fourth, sixth, tenth or any other grade, would still receive a grade-equivalent score of 6.0.

Similar in concept to AGE-EQUIVALENT SCALES, grade-equivalent scales can easily be misused or misinterpreted. For example, gifted students might score below appropriate grade levels on a test if, for whatever reason, they have not had access to the information required for that test. Similarly, slower students with a specific fund

of information might obtain inappropriately high scores on a test but not be able to function at that grade level on a sustainable basis.

grade inflation The elevation of grades and raw scores to levels not commensurate with actual academic achievement. Documented in a number of studies comparing student scores in school with their scores on standardized achievement tests, grade inflation is commonly used to prevent low grades from affecting the academic futures or career opportunities of students.

Grade inflation can be overt or covert. Covert grade inflation involves reducing the academic demands of a course or the difficulty of a test to levels that permit students to obtain higher raw scores. Covert inflation occurs when teacher bias produces higher scores for preferred students or classes and lower scores for students and classes in disfavor. Overt grade inflation simply involves the consistent elevation of raw scores to artificially praiseworthy levels, either by "GRADING ON THE CURVE" or eliminating all mediocre or failing grades and arbitrarily assigning the lowest passing grade to what might have been failing grades.

Grade inflation may occur on individual, classwide or schoolwide levels. One study found that grade inflation is more prevalent in small classes, where personal contact and knowledge of each student is the greatest. Grade inflation is also more evident in humanities courses, where grading is more subjective, than in science and mathematics courses. Many instructors reduce the possibility of subjective grading in the humanities by listing in advance specific points they expect students to mention and the specific degree to which they want each point covered (along with subtopics that must be mentioned and/or discussed) and grade points to be awarded for each.

At the college level, widespread grade inflation began in the 1960s during the Vietnam War, when sympathetic professors raised grades

to prevent mediocre or poor students from flunking out of school and losing their student deferments from the draft. Stanford actually eliminated the F in the 1970s and refused to flunk any student it had admitted, and the percentage of students receiving As and Bs rose to 92%. By the end of the Vietnam War, grade inflation became an ingrained practice, as students, facing rejection by graduate schools or loss of job opportunities, pressured teachers into assigning artificially high grades, often threatening to give teachers poor student evaluations or even threatening lawsuits charging teachers with damages for depriving the students of career opportunities. One study by Dr. Arthur Levine, president of Teacher's College Columbia University, found that the percentage of A grades at four-year colleges had climbed from 7% of all grades in 1969 to 26% by the end of 1994. A U.S. Department of Education survey of 21,000 transcripts from 3,000 colleges found that As and Bs constituted 56% of all grades between 1982 and 1992. A report by the dean of Princeton University showed that 83% of the grades awarded between 1992 and 1997 fell between A+ and B-, compared with 69% between 1973 and 1977. C+s fell from 5.8% to 3.7% and Cs dropped from 6.1% to 3.6%. At Harvard, the mean grade was above B+, compared to B- at the start of the Vietnam War. Some 90% graduated with honors in some courses. At Rutgers, New Jersey's state university, 13% of students earned As in 1950, 29% earned Bs, 34% Cs, 12% Ds and 6% Fs. In 1971, about one-quarter of Rutgers grades were As and about one-third were Bs. By the end of the 1991 academic year, As and Bs made up two-thirds of all grades awarded.

Another source of grade inflation at the college level was the introduction of courses atypical to the traditional, conventional liberal arts and science curriculum. Thus, Stanford offered a course on windsurfing in the early 1990s, while New York University offered an

introductory course in “circus techniques, for which no previous experience is required. The fundamentals of various circus skills, including juggling, trapeze and tightrope, are explained, demonstrated, taught, practiced and coached.”

Defenders of grade inflation insisted that the higher grades represented tighter admission standards that had produced higher levels of scholarship. However, in courses with the greatest grade inflation, surveys of 3,000 IVY LEAGUE students found startling gaps in student knowledge of history and current events. Forty-four percent of students surveyed could not name the Speaker of the House, 59% could not name four U.S. Supreme Court justices and 35% did not know the name of the British prime minister.

Critics of grade inflation contend it is a disincentive for academic effort. Surveys of student course selections indicate that many students purposely avoid empirically graded courses in science and mathematics in favor of courses where grade inflation can enhance their chances of admission to graduate school or of obtaining a better-paying job after graduation. In 1993, Williams College “found the low grades in the sciences were actually discouraging enrollments in those disciplines, and the high grades [in the humanities] were attracting students.” Studies at Duke and Harvard Universities, the University of Wisconsin, and at Amherst and Pomona colleges confirmed the findings. Harvard found that grades were so inflated that “appropriate distinctions among levels of [student] performance can no longer be made,” and in 1993 the dean of undergraduate education urged Harvard’s 400 faculty members to reinstitute the C “as a viable letter grade.” Citing its right to control grade policies as essential to academic freedom, the faculty refused. Stanford faculty, on the other hand, agreed to restore the failing grade in the 1995–96 academic year, although students who failed were listed simply as having “not passed.” In 2004, a survey by Princeton University found

that As made up between 44% and 55% of undergraduate grades at 11 academically prestigious universities—the eight IVY LEAGUE colleges, Stanford, Massachusetts Institute of Technology and the University of Chicago. As a result, Princeton promulgated a program to reduce grade inflation, and by the end of academic 2004–05, only about 45.5% of undergraduates received As, compared with 56.2% the previous year. In engineering, the figure dropped from 48% to 43.2%.

grade level One of the numbered classes, ranging from first grade to twelfth grade, in American elementary and secondary schools. Sometimes called by the English term “form,” the grade level is determined by a combination of age and academic accomplishment. Many schools allow students who lack academic qualifications to progress from one grade to the next on the basis of age alone—a so-called SOCIAL PROMOTION. Traditionally, grade levels are numbered one through six in most ELEMENTARY SCHOOLS, seven and eight in MIDDLE SCHOOLS and nine through twelve in HIGH SCHOOLS. Many high schools also use the terms freshman, sophomore, junior and senior, respectively, to designate ninth, tenth, eleventh and twelfth grades.

Used as grade-level designations at all four-year colleges, the terms freshman, sophomore, junior and senior have varying origins, freshman being the most obvious—literally, a fresh man, or first-year novice student and newcomer. Sophomore may be derived from the Greek *sophos*, “wise,” and *moros*, “foolish” or “moronic.” Thus, the sophomore, or second-year student, is viewed as a wise fool, with more knowledge than a freshman, but nonetheless relatively uninformed, immature and foolishly overconfident. *The Shorter Oxford Dictionary* claims the term was first used around 1795 at the University of Cambridge. The term junior, used to designate a third-year college

student, originates from the juniorate, or first of a two-year course in the Society of Jesus, or JESUITS, leading to the priesthood, with those in the final year called seniors because of their superior knowledge and, usually, age.

grade point The numerical equivalent of a letter grade and a particular level of academic achievement as indicated below:

A	=	4.0	(Excellent)
A-	=	3.7	
AB	=	3.5	
B+	=	3.3	
B	=	3.0	(Very Good)
B-	=	2.7	
BC	=	2.5	
C+	=	2.3	
C	=	2.0	(Satisfactory)
C-	=	1.7	
CD	=	1.5	
D+	=	1.3	
D	=	1.0	(Barely Passing)
F	=	0	(Failure)
U			(Unauthorized Incomplete)
I			(Incomplete)

The total number of grade points accumulated by a student during a semester or school year is divided by the number of credit hours for each course to arrive at the student's grade-point average (GPA) for that period. The cumulative GPA represents a student's grade-point average for all the work completed during the student's entire career at a particular institution. GPAs and cumulative GPAs determine student dismissal, promotion, academic probation and eligibility for graduation, honors and admission to higher-level educational institutions.

grading on the curve A controversial system of inflating or deflating student scores on a particular examination to match the normal

distribution of student grades as represented by a bell-shaped "curve" on a graph. Thus, the majority of student grades normally fall in the C+ to C- range, with decreasing numbers of students obtaining grades ranging as high as A+ and as low as F. But if, on a particular test, the majority of student grades fell in a range from C- to D-, a teacher might inflate class grades to match the normal distribution curve, raising each D to a C, each D- to a C-, on the assumption, perhaps, that the test was too difficult and inappropriate for the level of knowledge of the particular group. Conversely, a teacher might use the normal distribution curve to deflate grades if the majority of student grades fell in the A- to B range, by lowering them to C+ and C- and lowering all other grades to their appropriate level on the normal distribution curve. Critics of the practice of grading on the curve contend it permits teacher subjectivity to alter objective measurements of student achievement.

(See also GRADE INFLATION.)

graduate assistant A university graduate school student hired and paid for teaching, administration or research. Unlike students with FELLOWSHIPS, whose work obligations are secondary to their studies, graduate assistants incur all the obligations of regular employees, and most are unable to handle more than a part-time graduate school program. Moreover, their work assignments may or may not have any relationship to their studies or research. Their work assignments are usually chosen arbitrarily by the university and the professor to whom they are assigned. Graduate assistants are assigned to teach either lower-level college courses or work in tandem with full-time faculty members, correcting student papers and examinations or offering guidance in laboratories. Most work under annual contracts and face automatic dismissal if they withdraw from graduate school. Salaries vary according to the

particular institution and job responsibilities, but usually average about 50% of the average starting salary for public school teachers and serve merely as a way for graduate students to help finance their education. More recently, graduate assistants assumed so great a share of undergraduate teaching at many universities that they demanded union recognition and wages commensurate with full-time teachers. At Yale University, for example, teaching assistants were teaching almost 40% of all undergraduate courses, including about 30% of social science courses, 34% of humanities courses, 52% of foreign-language courses, and more than 65% of natural science courses. At the University of California's three largest campuses at Berkeley, Los Angeles and San Diego, teaching assistants taught almost all freshman-level courses. Nationally, teaching assistants represented 23.3% of faculty members at undergraduate institutions of higher learning; they taught 13.9% of all courses and 19.8% of introductory courses.

Graduate Management Admission Test (GMAT) A standardized test developed by the EDUCATIONAL TESTING SERVICE in 1954 as a qualifying test for admission to almost all graduate schools of business. Originally called the Admission Test for Graduate Study in Business, the GMAT is administered year-round by computer and consists of five parts, four of which measure skills in reading comprehension, sentence correction, critical reasoning, quantitative problem solving, and logic and reasoning. A fifth part measures writing skills and requires two essays.

Graduate Record Examination (GRE) A standardized two-part testing program developed by the EDUCATIONAL TESTING SERVICE, the GRE is required for entry into most graduate school programs in the arts and sciences, education and journalism. The first part—a general

test offered in both computer-adaptive or paper-based formats—lasts three hours and 40 minutes and consists of three sections that measure verbal skills, quantitative reasoning ability and analytical writing skills. The subject section lasts nearly three hours and is offered in any of the following areas: biochemistry, cell and molecular biology, biology, chemistry, computer science, English literature, mathematics, physics and psychology. About 500,000 students—20% to 25% of them foreigners—take the test each year. After the introduction of the computer-adaptive test, an outbreak of cheating over the Internet across time zones spurred ETS to reduce the frequency with which it administers GREs from almost daily to 30 times a year, and questions are changed on each test.

graduate school An institution of higher learning, usually a part of a university, offering courses in the entire spectrum of arts and sciences at levels higher than those available at four-year colleges. Successful completion of graduate school studies usually leads to the award of a MASTER'S OR DOCTORATE degree in the arts, sciences and a variety of professions. The origin of graduate schools in the United States dates back to colonial-era apprenticeship systems that provided the standard training for physicians, attorneys and other professionals. Apprenticeships consisted of two phases. In the first, the apprentice would "read" theology, medicine, law, etc., studying all appropriate texts and performing routine duties in the office and household of his mentor (professional apprentices were all male). In the second, the apprentice participated actively in his mentor's practice, learning the practical aspects of his profession "on the job" and eventually learning all procedures.

The formation of local and state professional societies during the late 18th and 19th centuries led to licensing procedures to assure

professional standards and deter the untrained from competing with the trained and possibly sully the reputation of the profession. Concurrently, established professionals recognized the value of organizing courses and eventually schools to provide classroom instruction during the reading phase of professional education. Such instruction relieved practicing professionals of those responsibilities, thus freeing them to earn more money in private practice. It also systematized and standardized the formal education portion of professional training. Initially, those professionals most interested in teaching organized their own private schools for profit. Thus, the distinguished lawyer and jurist TAPPING REEVE built the first law school in the United States in 1784—a small frame building in his backyard that he called the Litchfield Law School. With the help of a fellow jurist, he operated the apparently profitable private school until 1833, when competing law schools at Yale, Harvard and Columbia left it wanting for students, and it closed.

The first colleges in the American colonies were theological schools for training ministers and, as such, merit classification as professional schools. As they added secular courses, members of other professions broadened the colleges' curricula. The first colleges to offer courses in law were the COLLEGE OF WILLIAM AND MARY in 1779, the University of Pennsylvania in 1789 and Columbia College in 1794. The University of Pennsylvania was first to offer courses in medicine, and King's College followed suit in 1767.

The UNITED STATES MILITARY ACADEMY was, from its beginning in 1802, an engineering school of sorts, because of the Army's need for bridges and roads. Rensselaer Polytechnic Institute, however, was the first pure engineering college, founded in 1824. As increasing complexity transformed other trades into professions requiring formal classroom education,

colleges expanded professional education to include agriculture, business, dentistry, education, pharmacy, veterinary medicine and other subjects. The Morrill Land Grant College Act of 1862 created a plethora of state agricultural and engineering colleges, and as state after state established public school systems, they also established specialized "NORMAL" SCHOOLS to train teachers.

As the curriculum expanded, colleges were forced to departmentalize their courses. Harvard was first to do so in 1828. The University of Virginia carried departmentalization a step further by dividing its students into eight specialized schools. And the lack of preparation of many students forced colleges to expand the number of basic courses in the liberal arts and sciences needed as a foundation for professional education.

Until the end of the 19th century, college and professional training remained amalgamated in a single four- or five-year course of study. In 1893, however, DANIEL COIT GILMAN, the first president of Johns Hopkins University, established the Johns Hopkins Medical School as the first pure graduate school in the United States, separate from the university but requiring a four-year college (bachelor's) degree as a prerequisite for admission. Harvard University quickly followed suit, and the emergence of the modern graduate school had begun. Of the nearly 17 million students enrolled in institutions of higher learning in the United States, about 12% are in graduate schools and about 2% in professional schools.

(See also individual entries for law school, medical school, engineering and other professions.)

graduate university A university devoted exclusively to graduate school education, with no affiliated undergraduate colleges. Although Johns Hopkins and Clark Universities and the UNIVERSITY OF CHICAGO all opened as graduate

universities, they eventually added undergraduate colleges to assure themselves a broader student base; the undergraduate colleges also provided a stronger cash flow and, initially, a larger pool of potential graduate students. Rockefeller University in New York remains a premier example of today's graduate university, with extensive scientific and medical research facilities and a medical school.

graduation The formal completion of a prescribed course of study at an educational

institution, as attested by the award of a certificate, diploma and/or degree. Such awards are usually made at formal ceremonies, whose origins date back to ordination ceremonies of the theologically oriented European universities of the Middle Ages. Modified only somewhat by such individual institutional traditions as the singing of the school alma mater or the national anthem and the recital of prayers, most graduation ceremonies feature processions of faculty and students dressed in traditional academic robes,

As in the procession shown here at Southern Methodist University, in Dallas, Texas, Graduation Day at schools and colleges across the United States sees students and faculty in full academic regalia. (*Library of Congress*)

the formal award of certificates to individual students and a recessional.

graduation examination A comprehensive examination administered by public high schools in twenty-five states to determine whether graduating seniors qualify for a high school diploma. Because such “exit exams” ignore classroom achievement, grades and other measurable performance in school, state authorities have been the targets of legal challenges for withholding diplomas from students who fail the test after successfully completing all their required classroom work. Some states grant “certificates of completion” to students who successfully complete their high school courses, but fail the state graduation examination, and many colleges—especially community colleges—ignore the results of graduation examinations when considering applicants for admission. Indeed, about 400,000 college students in 2006—about 2% of all college students and 3% of community college students—lacked high school diplomas.

graduation rate The percentage of students who successfully complete their academic programs at an educational institution and receive formal attestation thereof in the form of a certificate, diploma or degree. Often used as a measure of academic quality, the high school graduation rate in the United States has remained at a disgracefully low 69% for the past decade, despite billions of dollars in federal, state and local investments in education reform. The rates for some minorities are even worse—55% for Hispanic students, 53% for black students and 49% for American Indian students, compared with 76% for white students and 78% for Asian students.

At the college level, only 63% of full-time students graduate from American four-year colleges within six years, and only slightly more than 50% graduate in four years. Again, the rates for minorities are lower: 46% for black students

and 47% for Latinos. The graduation rate for low-income students is 54%. Fifty colleges have six-year graduation rates below 20%.

Both college and high school graduation rates can be misleading, however—each for different reasons. College graduation rates range from more than 98% at academically prestigious, private colleges with the strictest admission standards and the wealthiest student bodies in America, to less than 25% at schools with open enrollment, relatively impoverished student bodies and curricula laced with vocational education. Untold thousands of students attend college not to graduate or receive degrees but to study and complete specific courses or groups of courses of particular interest or of value to their trade or career. Moreover, COLLEGE dropouts, unlike high school dropouts, are adults, enrolled voluntarily, and at liberty to leave and re-enroll later—sometimes years later. The longer any student remains at college, the more debt he or she incurs—a situation that can be intolerable for some who are forced to leave and go to work, fully intending to return when they are more solvent. In fact, more than 20% of college students are 25 to 29 years old, 26% between 30 and 40 years old, and 19.5% between 40 and 50—an indication in part that many younger men and women who leave college without graduating do return to complete their degree requirements. Still another factor clouding the significance of overall college graduation rates—and helping to lower those rates—is the low graduation rate for academically unqualified athletes recruited to play on revenue-generating varsity teams. Twenty-three of 56 college teams that played in postseason football bowl games in 2005–06 failed to graduate 50% of their athletes within six years. Indeed, only 34% of the players at the University of Texas campuses at Austin and El Paso managed to complete their studies. Moreover, low college graduation rates may not reflect the educational quality of colleges so much as that of high schools. A study commissioned by the BILL AND MELINDA GATES

FOUNDATION found that 60% of white high school graduates, 78% of black high school graduates, and 80% of Hispanic high school graduates were academically unprepared for college-level work.

High school graduation rates can, therefore, be as misleading as college graduation rates. Any school or district can raise graduation rates by simply lowering academic standards so that they graduate students who might fail at other schools. School officials can also raise graduation rates by including on their rolls student dropouts who sign letters of intent to resume their education at a later date. Because federal aid is dependent on enrollment, such students are merely listed as “on temporary leave” and continue to entitle the school district to federal funding on their behalf.

On a national scale, the low average high school graduation rate may also reflect statistical changes in the school population rather than a failure to improve teaching quality. In the decade from 1991 to 2001, the percentage of black students enrolled in American public schools climbed from 16.4% to 17.2%, while the percentage of Hispanic students leaped from 1.8% to 17.1%. Given the sharply lower graduation rates of the two minorities, the increase in their number necessarily offset a four-point gain in the graduation rate of the shrinking percentage of white students, from 71% to 76%. Also helping to stagnate high school graduation rates was the INDIVIDUALS WITH DISABILITIES EDUCATION ACT, which shifted the burden of educating the majority of children with learning disabilities to public schools. During the 1990s, such “mainstreaming” doubled the number of children with learning and other disabilities in public schools from 1.6 million to more than 6.5 million, or 13.5% of the school population.

grammar The study of the structural and syntactical rules of a language. The ancient Greeks were the first to organize and system-

atize language structure, and the Romans refined the process with the development of syntactical rules. Together, the Greek and Roman rules formed the basis of grammar studies in use to this day. The study of grammar has been an integral part of primary education since the arrival of the first settlers in the American colonies. Grammar became equally integral to secondary school education with the development of academies and secondary schools in the 18th and 19th centuries. Two schools of teaching grammar developed in the late 20th century: the descriptive, or structuralist, school and the universalist school. In the former, which dominated traditional grammar studies throughout the first half of the 20th century, students learn a set of strict rules describing the relationships of speech elements in words and sentences. The latter dispenses with the learning of most rules in favor of simply speaking the language and developing competence by understanding the logic of word relationships and sentence structure.

In simplest terms, descriptive grammar stresses the why as well as the how, while universalists dispense with much of the why, concentrating instead on the how. Universalist methods won increasing favor as public schools decreased the amount of required homework in the decades following World War II. Structuralists contended that the universalist approach to teaching grammar was partially responsible for the decline in national averages in a variety of standardized tests measuring command of grammar and the English language. The decline may equally well have reflected the sharp increase in the percentage of non-English-speaking students in the school population.

grammar school A term in American education that now denotes an elementary or primary school, but originally meant a school that emphasized the study of Latin grammar in preparation for intensive study of the scrip-

tures. The first grammar schools were offshoots of cathedral schools, the very first formal schools of England. Cathedral schools were originally organized by Saint Augustine, along with 40 monks whom Pope Gregory I sent as missionaries to the English in 596. Founder of Christ Church, Canterbury, and consecrated the first archbishop of Canterbury, Augustine established formal schools at the cathedrals and churches he and his disciples founded to introduce education and culture to England. The original curriculum consisted of grammar, rhetoric, logic, arithmetic, geometry, astronomy, music and Latin.

As universities emerged as centers of theological education after the 12th century, the church and cathedral schools concentrated their efforts on Latin grammar and the study of basic Latin texts to prepare youngsters in their late childhood and early adolescence for higher-level theological studies at university. Meanwhile, "PETTY SCHOOLS" developed to prepare younger children for service as choir and altar boys by teaching them "to say, to sing, and to read" and to provide them with elementary instruction in the arts and languages. It was the dual system of petty schools and grammar schools that English churchmen brought with them to the American colonies. Initially conceived as agencies for recruiting and training the parish clergy, these institutions were adapted to ensure the perpetuation of Christianity and still later to prepare young men (women were not admitted) for college and for "public service in church and commonwealth."

Like its English counterpart, American grammar school education lasted seven years, with year-round instruction that permitted youngsters to withdraw temporarily for planting and harvesting. The school day ran from 6 A.M. to 11 A.M. and from 1 P.M. to 4 P.M. in winter and to 5 P.M. in summer. As in England, the curriculum emphasized Latin, but it added an

introduction to Greek and, occasionally, Hebrew, to permit closer reading of Scripture in its original languages. The first grammar school was established in Boston on April 13, 1635, "for the teaching and nurturing of children with us." Boston's Latin Grammar still operates as a public school. Within a decade, at least nine other communities had founded grammar schools. In 1647 the Bay Colony passed the famed School Act, which was the second of the two Massachusetts laws of 1642 and 1647 ordering all communities with 100 or more families or householders to establish a grammar school (and towns of 50 or more families or householders to establish a petty school) to prevent "that old deluder Satan [from keeping] . . . men from the knowledge of the Scriptures." The grammar school began to disappear as an institution in the 19th century, when the more advanced elements of its curriculum were expanded and absorbed into secondary school education, while the petty school curriculum and the elementary grammar school curriculum became the basis for primary school education.

grammar-translation method A traditional method of teaching foreign languages by translation of word lists, sentences and written passages, followed by repeated drill and oral and written practice. Based on traditional techniques of teaching "dead languages," such as Latin and Greek, the grammar-translation method has given way to a variety of teaching methods that emphasize conversational fluency, developed by listening, speaking, reading and writing rather than by mechanical, word-for-word translation.

Grant, Zilpah Polly (1794–1874) A pioneer in women's education and one of the first educators to expand the women's curriculum beyond the range of the so-called domestic and

ornamental arts that prepared women for lives as wives and mothers. Born in Connecticut, Grant lost her father when she was two and began teaching in nearby schools when she was 15. After her mother remarried in 1820, her family was able to afford to send her as both a student and teacher to Byfield (Massachusetts) Female Seminary. Founded by the Rev. JOSEPH EMERSON, Byfield was the first school in the United States to teach its students more than the ornamental arts. In addition to Grant, Byfield's alumnae included such pioneers in women's education as CATHERINE BEECHER and MARY LYON, who went on to found the world's first college for women at Mount Holyoke, Massachusetts.

After two years of teaching, Grant took over as head of the newly founded Adams Female Academy at Londonderry, New Hampshire, in 1824. She left in 1828, following a series of quarrels with the trustees over her attempts to expand secular instruction beyond the ornamental and domestic arts into the liberal arts that were then taught only to men. Declining an offer of \$1,000 a year to serve as principal of Catherine Beecher's world-famous Hartford Female Seminary, she moved to Ipswich, Massachusetts, where she opened the Ipswich Female Seminary in collaboration with Mary Lyon, her former schoolmate and friend from Byfield. With Grant as principal and Lyon as a teacher and assistant principal, Ipswich became one of the first schools to train women for careers as teachers. In 1839, Grant resigned due to poor health, and her failure to raise funds for an endowment to sustain the school eventually led to its closing. It was a financial lesson not lost on Lyon, who, after raising funds to found Mount Holyoke, went on to raise an endowment that helped assure its survival to this day. Grant never returned to teaching. In 1841, two years after her retirement, she married a prominent Massachusetts lawyer, William Bostwick Bannister, whose family

name she assumed and by which she is sometimes referred to in educational references.

grant (grant-in-aid) An outright cash gift tied to specific performance obligations of the grantee. In education, there are two broad categories of grants: from the federal government to states, local agencies, educational institutions and individuals to support educational or research programs; and from government agencies, private organizations and educational institutions to individual students to underwrite part or all of their education.

(See also FINANCIAL AID.)

gratification, delay of A not uncommon error of primary and secondary schoolteachers, particularly in their occasional neglect to return graded papers soon enough to serve as effective reinforcement for student academic behavior. Immediate reward is deemed essential reinforcement for children in childhood and early adolescence, and such delays only weaken the relevance of the reward to the behavior it is designed to reinforce.

Gratz v. Bollinger A landmark U.S. Supreme Court decision in June 2003 banning the University of Michigan's use of a "point system" that arbitrarily awarded a wide range of values to different elements in college applications—SAT scores, high school grades, extracurricular activities, gender and so forth—and gave undue weight to race and membership in nonwhite minority groups. One of two class-action suits against the university's president by groups of white applicants, *Gratz v. Bollinger* produced a victory for the plaintiffs, with the Supreme Court ruling against the university's use of a point scale in evaluating undergraduate admissions applications. Under the university's 150-point system, applicants needed an accumulation of 100 points to win admissions, and minority status as

a black, Hispanic or American Indian was worth a disproportionate 20-point “race” bonus—the same amount awarded for a 4.0, or perfect, high school grade point average. Although the Court did not disallow consideration of race in the evaluation of admissions applications, it banned the university—and, by inference, all colleges and universities—from giving it more weight in admissions considerations than any other “personal characteristics,” such as being an Eagle Scout, president of the class or captain of the football team.

Gray, William S. (1885–1960) American educator, best remembered as creator of the ubiquitous “DICK AND JANE” BOOKS that served as first and second readers for children in almost every American elementary school from the 1920s until shortly after World War II. Thereafter, the development of more advanced (and entertaining) methods of teaching reading sent Dick and Jane into oblivion. A pioneer in the development of modern methods of teaching, Gray was born and educated in Illinois. Trained as a teacher, he earned his Ph.D. from the University of Chicago, where he was a faculty member from 1914 to 1950 and dean of the college of education from 1917 to 1931. He introduced a course in the teaching of reading at Chicago and organized the first of what would become annual reading conferences there. A prolific author of books and articles on methods of teaching reading and writing and the training of teachers in those methods, he also wrote many basic readers for children and helped found the International Reading Association.

Great Awakening (The) A massive, 18th-century eruption of evangelistic fervor that swept the American colonies, provoking a social and political, as well as religious, awakening that eventually fueled the American Rev-

olution. The Great Awakening began in the 1720s, when such charismatic clergymen and evangelists as Theodorus Jacobus Frelinghuyzen, William Tennent, George Whitefield and JONATHAN EDWARDS developed an entirely new and liberating religious philosophy based on the simple, literal biblical precept that God created man in his image.

As Whitefield, Edwards and their fellow evangelists toured the East with their revolutionary message of equality before God, huge throngs crowded to hear them and receive assurances of universal salvation. The Great Awakening promised to the poor and the rich, the landed and the unpropertied and the unchurched as well as church members, redemption through personal conversion, that is, a deeply emotional, personal acceptance of and commitment to Christ.

The Great Awakening split communities and their church congregations into traditional “Old Light” and radical “New Light” groupings that propagated logarithmic increases in the number of churches and sects in the United States. Because the church remained the center of all spiritual and secular instruction, the new churches, with their all-encompassing democratic embrace of all who would join them, produced a popular lust for education among those who had previously considered schooling reserved for those of higher social stations. The sheer number of new churches expanded the reach of education and taught an entire generation of American-born children and their parents that they were the equals of their parliamentary rulers.

Although it created widespread discord and, in effect, destroyed the religious harmony and unity that the Puritans, Presbyterians and Anglicans had established, the Great Awakening produced a fervor that unified many colonists in rebellion against an oppressive class system. The burden of ever-increasing parliamentary taxes helped solidify that unity and

eventually convert the fervor of the Great Awakening and the rebellion against the Church of England into a rebellion against England itself.

Great Books Program (The) A curriculum based on the study of an arbitrarily selected group of classic works of philosophy, literature, history and science that some educators consider the foundation of all worthwhile human knowledge. Developed in 1947 by Robert M. Hutchins, president of the UNIVERSITY OF CHICAGO, and his assistant, philosophy professor MORTIMER J. ADLER, the Great Books Program is a modern variation of the traditional CLASSICAL EDUCATION curriculum developed from the 15th through the 18th century. To the earlier works of the great writers of ancient Greece and Rome, the Great Books Program added works by modern writers and philosophers that the program's editors deemed worthy.

Hutchins and Adler were concerned that the PROGRESSIVE EDUCATION movement was eroding the value of American education by converting the primary and secondary school curriculum from classical to utilitarian subjects that would deprive Americans of the collected wisdom of the Western world. Ironically, both concepts—progressive education and the Great Books curriculum—had their roots at the University of Chicago, where John Dewey fathered progressive education at the university's Laboratory School at the same time that founding president WILLIAM RAINEY HARPER, Dewey's patron, was helping to select and edit the World's Great Books. Arguing that all Americans should be schooled in the classic disciplines of grammar, rhetoric, logic, mathematics and the great books of the Western world, Hutchins and Adler redirected the focus of the university, abolishing football and reorganizing the curriculum into one that emphasized reading and discussion of the classics of the Western tradition. They also

instituted a four-year liberal arts program that began in junior year of high school, thus extending their concept into secondary school education. At the same time, they founded the Great Books Foundation to produce a series of books containing classical works of literature, poetry and essays. The works were selected to provide a fundamental education for adults whom the Great Depression of the 1930s and World War II had deprived of secondary school education and exposure to the classics.

In 1952, Hutchins and Adler produced and edited the 54-volume Great Books of the Western World, which provided libraries, schools and individual families with what Hutchins and Adler considered the collected wisdom of the ages. By the early 1960s, the foundation had saturated the market with its encyclopedic work and began to produce a short series of paperbacks for youngsters, with short stories, poetry, essays and other works designed for students from second grade through high school. In addition to works by modern writers, the Junior Great Books Program, as it was called, also helped improve teacher skills as discussion leaders. Still used in many programs for gifted students, the Junior Great Books Program emphasizes story interpretation based on shared inquiry and on freewheeling classroom discussions that encourage student understanding and love of literature.

Greater Cleveland Mathematics Program (GCMP) A system of teaching mathematics to elementary school children based on logic and abstract concepts rather than rote memorization of tables. More popularly called "NEW MATH," GCMP was developed in 1959 by the Educational Research Council of Greater Cleveland for grades K–6, to serve as the foundation for the secondary school new math curriculum that had been developed earlier by the School Mathematics Study Group.

The underlying principle of new math was to teach young children mathematics the same way they learn language in infancy, by gradual accumulation of logical concepts. Based on theories of how primitive man may have developed mathematical concepts, GCMP eschewed rote learning of number tables in favor of the set theory. In simplest terms, primitive man could not read, write or count, but he could recognize the concept of equal sets and maintain tight inventory controls of, say, his herd of sheep. Thus, if he released his herd of sheep to graze, he could accumulate a set of pebbles on the ground, equating each pebble for each animal released and then removing each pebble at the end of the day for each sheep that returned. Despite his inability to count, the herdsman knew that an unretrieved pebble was equal to a missing sheep and that a set of pebbles had to equal a set of sheep.

Although of great interest to theoretical mathematicians, GCMP and the new math generally had to be modified radically and in many cases abandoned as it became clear from standardized tests that many children were growing up understanding set theories but unable to count or calculate accurately. New math concepts continue to be taught, but only in conjunction with (or after) traditional methods have provided students with a firm foundation in computational skills.

Greek (classical) The language of ancient Greece, the study of which was required, along with Latin and Hebrew, in 17th-century English and colonial American schools and colleges, so that ancient literature, philosophy, logic and rhetoric, and Scripture could be examined in their original languages. Designed to prepare young men for the clergy, grammar schools and colleges required fluency in the three scriptural languages: Latin, Greek and Hebrew. Even with the 18th-century secularization of American schools and colleges, the study of Greek (and

Latin) grammar and literature remained a requirement in the classical curriculum of most private secondary schools and colleges until the end of the 19th century, when the sciences and utilitarian courses gradually squeezed Greek out of the curriculum. By the end of World War I, it had disappeared from the curriculum of most secondary schools and was available only as an elective in a relatively small number of American colleges. In 2002, American colleges and universities awarded only 33 bachelor's degrees, 8 master's degrees and 1 Ph.D. in classical Greek.

Green v. County School Board of New Kent County A 1968 U.S. Supreme Court decision that struck down a desegregation plan allowing black and white students in New Kent County to choose whether or not they wanted to attend formerly all-black or all-white schools. The case was the first of three that effectively ended widespread local resistance in the South to the 1954 Supreme Court decision in *BROWN V. BOARD OF EDUCATION OF TOPEKA*. That decision had declared racial segregation of schools unconstitutional and ordered schools throughout the South to desegregate with "all deliberate speed." Despite the Court order and others from a plethora of federal district courts, hundreds of southern school districts developed plans that seemed to provide for desegregation, on paper, but in practice produced no actual change in the racial makeup of local schools. The New Kent County "freedom of choice" or "free transfer" plan was one of these.

By 1968, however, Congress had passed the Civil Rights Act of 1964 and the education acts of 1965, which reinforced the *Brown* decision, and the Court was losing patience with school districts that were flouting its authority as well as the laws of the United States. In *Green* and two cases the following year, the Supreme Court crushed all remaining efforts to resist desegregation with three sweeping decisions

that left no loopholes for any school in the nation to violate the law. In *Green*, the Court charged school boards "with the affirmative duty to take whatever steps might be necessary to convert a unitary system in which racial discrimination would be eliminated root and branch." The Court said it would hold in contempt any school in which 85% or more of the students were black. New Kent County and all other school boards were ordered to "convert promptly to a system without a 'white' school and a 'Negro' school, but just schools."

The two cases that followed in 1969 were equally forceful and far-reaching. In *Alexander v. Holmes*, the Court angrily defined the word "promptly" in its *Green* decision as meaning "at once," and it ordered every school district in the South "to terminate dual school systems at once and to operate new and hereafter only unitary schools." In *United States v. Montgomery County Board of Education* later that year, the Supreme Court established racial ratios for teachers, while reaffirming its 85% rule for students from the *Green* decision.

Griffin v. County School Board of Prince Edward County A landmark decision by the U.S. Supreme Court in 1964, affirming the right of federal courts to levy taxes and raise funds to reopen public schools when local school boards fail to do so. Prince Edward County had been involved in one of the four original cases that were grouped together in *BROWN V. BOARD OF EDUCATION OF TOPEKA* in 1954, when the Court declared racial segregation of schools unconstitutional and ordered all school boards to desegregate schools "with all deliberate speed." Prince Edward County, however, closed its public schools rather than permit racial integration, but it then used public moneys to support a group of private schools that white parents had opened for their children. Black children, in the meantime, had no schools until 1963, when a privately financed

group opened a few inadequate emergency schools. In affirming the right of lower federal courts to assume all school board functions, the Court held that "the time for mere 'deliberate speed' has run out . . . There has been entirely too much deliberation and not enough speed in enforcing constitutional rights which we held [in 1954] had been denied Prince Edward County Negro children." The Court effectively barred local officials from giving any financial aid to pupils in private schools, and it barred the flow of state funds to any public schools elsewhere in the state until Prince Edward County public schools reopened as racially integrated schools.

group counseling (guidance) The simultaneous dispensing of universally applicable advice by a trained professional to groups of usually no more than 10 students. Group counseling and guidance may touch on as wide a range of topics as personal problems, intersocial problems, college selection, improvement of study skills, and techniques of taking job interviews. With public school GUIDANCE COUNSELORS responsible for counseling an average of more than 600 students per year, group counseling permits efficient distribution of universally applicable advice and information to groups small enough to permit ample student responses and questions to and interaction with the counselor. In addition to distributing information and advice to more students in a shorter period of time, group counseling has several advantages over one-to-one counseling in that it permits students to meet and talk with other students with similar problems, to obtain group support and develop new interpersonal relationships.

group dynamics The individual, interpersonal social responses peculiar to individuals functioning in small groups, usually defined as 10 people or fewer. Group dynamics, or group

psychology, which differ dramatically from individual or mob psychology, were first studied as a separate psychological concept in the 1920s by social psychologists such as Kurt Lewin (1890–1947), who focused on such phenomena as group structure, group atmosphere and goals, and group leadership characteristics (democratic, autocratic and so on). Later studies of group social processes such as group decision making and development of strategies for leading and persuading groups provided essential pedagogical materials for teachers of all age groups.

Grube Method An obsolete but once widely used method of teaching mathematics developed in 1842 by A. W. Grube, an otherwise obscure mathematics instructor. Instead of teaching one arithmetical process at a time—for example, by learning all combinations of adding numbers from 1 to 10—the Grube Method taught all four processes simultaneously for each successive number in combinations with smaller numbers. For example, students would learn all processes for the number 2 by writing and memorizing $2 = 1 + 1$; $2 - 1 = 1$; $2 - 2 = 0$; $2 = 2 \times 1$; $2 = 1 \times 2$; $2/1 = 2$; $2/2 = 1$. Each successive number produced more and more combinations—10 for the number 3, 13 for 4, and so on. The method was abandoned by the end of the 19th century in favor of more effective and less boring methods of instruction.

Grutter v. Bollinger A U.S. Supreme Court decision in June 2003 upholding the principle of affirmative action in the University of Michigan Law School admissions process. Filed by a group of white applicant against the university's president, the suit sought to force the law school to evaluate applicants on a race-blind basis, but the Court upheld the right of the school to take race into consideration so long as it did not weight race more heavily in the application

process than any other characteristics, such as being a class officer or team captain.

(See also AFFIRMATIVE ACTION; GRATZ V. BOLLINGER)

Guam An island territory of the United States in the western Pacific Ocean, midway between the International Date Line and the Philippine Islands and at about the same latitude as the Philippines. It was ceded to the United States by Spain in 1898, following the Spanish-American War. Captured by the Japanese in 1941, it was recaptured in 1944, and in 1950 citizenship was granted to the indigenous Guamanians, or Chamorro, who now constitute less than half the population. Micronesian in origin, they speak their own language, although English is the official language taught in schools. The majority of the nearly 150,000 inhabitants in 1998 were U.S. Army, Navy and Air Force personnel and support staffs. Guam has more than 33,000 students enrolled in its three dozen elementary and five secondary schools. Guam has two institutions of higher education, which serve both the local and military communities: The University of Guam, a four-year liberal arts university with more than 5,000 students and more than 300 faculty, and Guam Community College, with more than 2,000 students and nearly 200 faculty.

guidance In education, the proffering of advice and counsel to students by trained specialists with a minimum of one or two years of graduate study in counseling and state certificates as guidance counselors. Guidance may be proffered on a one-to-one or group (see GROUP COUNSELING) basis, depending on the student's particular needs. In broadest terms, guidance services are designed to help students adapt successfully to their school environment, academically, socially and developmentally. Individualized, one-to-one counseling may, depending on the student, cover a wide range of personal problems

such as academics; college selection; school or class transfers; study skills; career choices; job-application skills (interviews, resumes, etc.); emotional, physical or developmental problems; peer relations; teacher relations; or home- or neighborhood-related problems.

Until 1950, teachers routinely served as student advisers, but as educators recognized the need for special training to cope with student counseling, the guidance counselor began appearing in schools as a full-time, nonclassroom instructional staff member to provide one-to-one counseling of individual students and to consult with teachers and parents about individual student problems. As the number of guidance counselors increased, guidance departments assumed increasingly important administrative functions such as maintaining cumulative student records; providing school recommendations for college admission and job applications; coordinating standardized testing programs such as the Scholastic Assessment Tests for college-bound students; providing career counseling services; arranging school appearances by outside advisers and counselors from colleges and companies; and developing working relationships with outside counseling, welfare and law enforcement agencies that might affect the lives of students.

In the 1960s and 1970s, the guidance counselor's role began to expand still further, as American families became more dysfunctional and gradually left half the children in the United States in single-parent homes. The result was a surge in the number of troubled children who turned to guidance counselors for help in dealing with such problems as parental negligence, parental physical or sexual abuse, hunger and malnutrition, drug and alcohol abuse, teenage pregnancy, the threat of peer violence and survival in gang-infested neighborhoods ablaze with gunfire.

By 2001, the number of full-time guidance counselors in American public schools

had climbed to more than 100,000, or 2.5% of the nation's public-school instructional staff. Each guidance counselor had an average of about 140 students to counsel, with understaffed schools often assigning as many as 1,000 students to each counselor. Although an increasing number of guidance counselors are appearing in elementary schools, more than 90% of all guidance counselors work with adolescents in middle schools and high schools.

guide words The first and last bold-faced "keywords" on each page of a dictionary, encyclopedia or other reference work; usually printed on the top left and right corners of each page. Also known as running heads, these are an important element in teaching children how to use reference works.

Gulick, Luther (1865–1918) Physician, educator and "father" of physical education as a standard element of the public elementary and secondary school curriculum in the United States. Born in Honolulu to a family of Congregationalist missionaries, the deeply religious Gulick was plagued by a lifelong series of illnesses from which physical exercise, learned in 1885 at the Sargent School of Physical Training (now Sargent College of Boston University), provided the only respite. Imbued with the missionary spirit inherited from his family, he joined the YOUNG MEN'S CHRISTIAN ASSOCIATION in 1886 to teach physical education and train gymnasium instructors at the Training School in Springfield, Massachusetts (now Springfield College). He remained there for the next 17 years, developing a philosophy of education that placed physical training at the heart of the YMCA's expanding educational program. He designed the association's triangular emblem, representing the three elements of the whole man: physical, spiritual and social.

Luther Gulick (Library of Congress)

Little by little Gulick developed what would later become the modern physical education curriculum of American public schools. With Robert J. Roberts, YMCA worker who invented the ordered series of exercises he called "body building," Gulick put together a program of "safe, easy, short, beneficial and pleasant" exercises and games that he introduced at the Training School in Springfield and then at YMCA branches across the nation. Among the games that Gulick developed was one that his Canadian-born student James Naismith invented—basketball. Like other elements of the program, it was designed as a physical education activity that was easy to learn for all age groups, playable indoors and out, free of violence and conducive to all-around development. By the time Gulick retired from YMCA work in 1903, he had inspired the

construction of gymnasiums, swimming pools, physical education programs and athletic leagues in YMCAs across the United States.

In 1903, Gulick became director of physical education of the New York City public schools for three years, during which time he introduced and integrated physical education and hygiene instruction into the curriculum and organized the Public School Athletic League. In 1906, he helped found the Playground Association of America, which made public playgrounds a nationwide objective and, eventually, a ubiquitous element of every public park in the United States. In 1910, he helped found the BOY SCOUTS OF AMERICA, and two years later, he and his wife founded the CAMP FIRE GIRLS, a recreational, educational and service organization for young girls. A graduate of New York University Medical School (1889), he was a member of the American Medical Association and other medical societies, and he was a member of Olympic Games committees in 1906 and 1908.

gymnasium A large, peculiarly American room or building in which students may participate in either formal or informal physical exercise, games, sports and dance. Usually equipped with a variety of equipment for GYMNASTICS and such sports as basketball and volleyball, gymnasia began to be added to school, college and university plants at the end of 19th century, after LUTHER GULICK developed formal physical education programs for elementary and secondary school curricula.

The word *gymnasium*, however, has other meanings in other parts of the world. Derived from the ancient Greek *gymnos*, meaning "naked," the Greek *gymnasion* was an outdoor exercise ground, where as early as 500 B.C. free Greeks and their children socialized and participated in physical and intellectual exercises deemed essential to the unity of the total being. Exercises were also deemed important for

keeping young men fit for service in wartime. The most famous examples of the Greek *gymnasia* were the ACADEMY, which Plato (428–348? B.C.) founded in Athens in 387 B.C. and where he spent the rest of his life as a teacher, and the LYCEUM, where Aristotle (384–322 B.C.) taught from 335 to 323 B.C.

Transferred to Rome the institution went the way of the Roman Empire and was not revived until the 16th century, when German humanists emancipated education from church control by building their own schools, which they called *Gymnasien*, in reference to the traditional secular arts taught in ancient Greece. The word became the standard German word for any secular, nontechnical secondary school specializing in the traditional liberal arts. It had no association with physical education. Indeed, gymnastics in Germany is practiced in *Turnvereins*, or gymnastics clubs, and the only exercises practiced in *Gymnasien* are academic.

The gymnasium's association with physical exercise was not reestablished until Americans adopted the word as meaning a room for the practice of gymnastics, which was introduced in the United States in the 19th century by German and Swedish immigrants (perhaps graduates of *Gymnasien*, whose meaning Americans may have misinterpreted). Today's *gymnasia* range from relatively small, sparsely equipped, all-purpose playrooms in elementary schools to enormous, multi-sport college facilities, with space and equipment for basketball, volleyball, gymnastics and other sports and grandstands for spectators. Because of their small physical size and student populations, elementary school *gymnasia* are usually multi-

ple-purpose facilities, with collapsible equipment that allows them to be converted into school cafeterias, auditoria, conference rooms and classrooms.

gymnastics A systematic grouping of physical exercises designed to improve student strength, rhythm, balance, flexibility and agility. Although used in informal physical fitness programs at both the elementary and secondary school levels, gymnastics is also a competitive sport, consisting of a prescribed set of dance-like, tumbling routines and acrobatics on special equipment such as suspended metal rings, parallel bars and other devices. Gymnastics probably dates back to the circus acrobatics of ancient Egypt. Teachers in the *gymnasia* of ancient Greece refined gymnastics into three systems of prescribed exercises to develop physical fitness appropriate for soldiers, athletes and the general citizenry, respectively. Although the Romans adopted the Greek system for training soldiers, acrobatics all but disappeared until the early 1800s, when the so-called father of gymnastics, Friedrich Ludwig Jahn (1778–1852), developed a series of planned exercises using rudimentary stationary devices to help practitioners develop self-discipline and physical strength. Meanwhile, Pehr Henrik Ling (1776–1839) was developing a system in Sweden, using hoops, clubs and small balls, and designed to develop rhythm and coordination. Although Swedish and German immigrants brought both systems to the United States after the Civil War, the two were merged in the first physical education programs introduced in American schools at the end of the 19th century.

halfway house A home or other living facility that serves as a transitional residence for youngsters or adults following their release from an institution and prior to their return to a stable, permanent residence. Often called a “bridge” between institutional and conventional community life, the halfway house is designed to provide the support services and structured environment of a residential institution (including personal counseling and strict rules and regulations governing conduct) in a noninstitutional environment that approaches normal home life as much as possible. Usually run by trained cottage parents, or couples who serve as foster parents, halfway houses attempt to recreate the stability of conventional family life and teach youngsters how to cope with the stresses as well as joys of that environment. Although most halfway houses serve adult populations, many shelter preadolescent and adolescent (as well as adult) students who, once settled into the halfway house routine, enroll in local public or private schools.

(See also COTTAGE SYSTEM.)

Hall, G. Stanley (1844–1924) American psychologist, educator, philosopher, college president, pioneer in the field of child psychology and founder-leader of the child study movement that revolutionized and modernized American primary and secondary education. A towering figure in the history of

American education, Hall was born in Massachusetts and graduated with a B.A. and M.A. from Williams College. He did not earn his Ph.D. until 1878, after an abortive period of study for the clergy and a stint as a reporter of the Franco-Prussian War for American newspapers and periodicals. Returning to the United States, he taught literature and philosophy at Antioch College and then at Harvard, where he also earned his Ph.D. and developed a deep interest in psychology. After a year’s study in Germany, he returned to Massachusetts as a lecturer in the new field of educational psychology at Harvard for the 1880–81 academic year. His work earned him a professorship in psychology at the recently founded Johns Hopkins University, along with a special lectureship in pedagogics and a \$1,000 grant to establish one of the first psychology laboratories in the United States. He remained there seven years, applying the ideas of Charles Darwin and emerging European theorists in psychology to develop entirely new theories of child development, child psychology and educational psychology.

By 1888, his work had gained international attention, attracting such students as James Cattell and JOHN DEWEY to his laboratory. In that year, millionaire hardware king Jonas Clark decided to found a world-renowned graduate research university in the developing science of psychology, and he named Hall

founding president of Clark University, in Worcester, Massachusetts. Hall also served as professor of psychology and created a new science of child development that gave rise to a new science of education. Basing his work on massive, never-before-attempted empirical studies of children's behavior, Hall electrified the world of education and forever changed the way Americans raised and educated their children. The transformation he effected in the world of education eventually transformed American society. Enlisting women's clubs across the United States, Hall organized a national crusade of mothers who eagerly noted and reported to Hall's researchers every aspect of their children's physical, moral, intellectual and emotional behavior and development. Hall and his researchers transformed the raw data into reports that explained the origins of every aspect of child behavior at every given age: lying, loyalty, sexual activity, imagination, fear, anger, and rises and falls of interest in various school subjects from literature and history to geography and arithmetic.

Hall's inescapable conclusions startled educators, parents, clergymen and the entire thinking of adults regarding children. Contrary to universal beliefs of the day, children were not little adults, Hall said. Rather, they were fundamentally different beings, with different fears, angers, ideas of truth and falsehood and abilities to distinguish between reality and imagination. Like Darwin's earliest humans, children had to evolve and develop naturally into adulthood, virtually recapitulating the evolutionary experience of the human race in the course of their infancy, childhood and adolescence. As Hall summarized it, "Ontogeny recapitulates phylogeny." The traditional efforts of teachers, parents and clergy to "meddle, constrain, prohibit and punish" was, in effect, to defy the laws of nature and threaten the emotional, intellectual and physical health of children.

A pound of health, growth and heredity is worth a ton of instruction. The guardians of the young should strive first of all to keep out of nature's way, and to prevent harm, and should merit the proud title defenders of the happiness and rights of children. They should feel profoundly that childhood, as it comes fresh from the hands of God, is not corrupt, but illustrates the survival of the most consummate thing in the world; they should be convinced that there is nothing else so worthy of love, reverence, and service as the body and soul of the growing child.

The tens of thousands of mothers who had contributed to his research formed an army of zealous converts who abandoned the traditional Puritan belief in the need to "beat the devil" out of children, whom clerics believed were born tainted with original sin. Instead, Hall called on parents to treat children as the young animals they were and give them enough free rein to develop and evolve into adults instead of prematurely imposing adult standards that children cannot possibly meet. Schools, in turn, were urged to extend the informalities of kindergarten into the elementary grades and to adjust pedagogical methods and curricula to children's natural development, interests and needs. His earlier works, *The Contents of Children's Minds* (1883) and *Hints Toward a Select and Descriptive Bibliography of Education* (with John Mansfield, 1886) became essential texts for teacher training everywhere.

The result of Hall's work was one of the most stunning transformations in the history of American education. After three centuries of schooling that forced the child to adapt to the demands of the institution, Hall's findings ushered in a new era of pedocentric schooling in which schools adapted to the needs of children. The change was swift, as schools across the United States introduced art, music, gardening, manual training, domestic science and physical education into the school curriculum

and added playgrounds and other recreational facilities that introduced a measure of recreation as a temporary respite to the tedium of a long day of academics.

Hall's work made child study a national movement, with Clark University its headquarters where, years later, such leaders in the field as Sigmund Freud and John Dewey came to lecture. Hall founded the Child Study Association of America in 1888 to encourage further studies of child development and teaching methods, and he published the results of those studies in *Pedagogical Seminary*, the national journal he founded and edited. Thousands of the mothers who had been inspired to provide the research for Hall eventually formed the National Congress of Mothers (later, the National Congress of Parents and Teachers, or PTA).

In 1904, Hall once again electrified parents and educators with a two-volume work: *Adolescence: Its Psychology and Its Relation to Physiology, Anthropology, Sociology, Sex, Crime, Religion, and Education*. With hundreds of thousands of homeless adolescents wandering the streets of major cities, unable to find work and dependent for survival on crime and prostitution, Hall's book, together with the equally stunning *Youth—Its Education, Regimen, and Hygiene* the following year, mobilized the growing national movement for educational, social and penal reforms. States raised the ages covered by compulsory education laws, extended the length of the school year and built huge networks of secondary schools to provide for the education of adolescents, only 10% of whom attended schools at the time of Hall's books.

Voluntary groups established huge new social service organizations such as the Boys' Clubs of America (1906), the Boy Scouts of America (1910), the Camp Fire Girls and Girl Scouts (both in 1912) to meet other out-of-school needs of adolescents through recreation, camping and education in hygiene and thus

get them off the streets. Hall's work inspired social reformers to demand enactment of child labor laws and changes in the penal system that would lead to the establishment of juvenile courts.

A prolific writer with more than 500 works to his credit, Hall coined more than 300 new words now standard in the vocabulary of education and child psychology. He was a founder and first president of the American Psychological Association, and he was editor of the *American Journal of Psychology* (1887–1921), the *American Journal of Religious Psychology and Education* (1904–15) and the *Journal of Applied Psychology* (1917–24). During his tenure at Clark, from 1888 to 1920, he established the first institute of child psychology in the United States. His other important works include *Educational Problems* (2 vols., 1911) and his autobiography, *Life and Confessions of a Psychologist* (1923), which appeared the year before he died.

halo effect A distortion of test results and ratings, based on observer bias in assessing test results and in making observations. Halo effect distortions may be positive or negative and may be eliminated by objectivizing scoring to eliminate bias. The halo effect is most evident in the administration of nonwritten tests, ranging from intelligence tests for preschoolers to oral examinations for doctoral candidates. In both instances, observer bias can result from nothing more complicated than a child's smile or frown or a doctoral candidate's personality. In the area of written tests, the halo effect increases in direct proportion to the degree of subjectivity in scoring. Thus, it is more evident in humanities courses than in science and mathematics courses. It can be reduced by objectivizing grading procedures as much as possible, i.e., by specifically listing topics and subtopics students must mention and/or discuss in each paper or examination.

Hampton Institute The original name of Hampton University, founded in 1868 by SAMUEL CHAPMAN ARMSTRONG “to train selected Negro youth . . . [to] lead their people . . .” Now a private, coeducational liberal arts university, with more than 4,500 students (95% black), Hampton Normal and Industrial Institute, which was its official original name, opened as an all-purpose school in a converted mansion on an antebellum estate near Hampton, Virginia. After the Civil War, tens of thousands of freed slaves flocked to Union Army camps for food, clothing and work opportunities. Formerly a colonel in command of the

Ninth Regiment, U.S. Colored Troops, Armstrong was appointed superintendent of education for the FREEDMEN’S BUREAU after the war and took charge of a huge encampment of several thousand illiterate and destitute former slaves near Hampton.

Born and raised on Maui, in the Sandwich Islands (Hawaii), Armstrong had helped his missionary parents develop the Hilo Manual Labor School for native Hawaiians, and he used this as a model for developing Hampton. With funds and teachers from the American Missionary Association, Armstrong combined academic and manual training in a three-year

An African-American student learns weaving at Hampton Institute, Virginia. (*Library of Congress*)

curriculum that included reading, writing and language skills, mathematics, history, natural science, an agricultural course, a commercial course and a course in mechanics. Hampton became a model for dozens of similar schools throughout the South, including the TUSKEGEE INSTITUTE, founded by Hampton graduate Booker T. Washington.

(See also HAMPTON-TUSKEGEE MODEL.)

Hampton-Tuskegee Model A system of education developed after the Civil War to provide social, vocational and academic training for former slaves. First introduced in Virginia at the HAMPTON INSTITUTE, it was refined at TUSKEGEE INSTITUTE by its founding president, BOOKER T. WASHINGTON. Confronted with the task of educating thousands of destitute, illiterate and unskilled former black slaves, SAMUEL CHAPMAN ARMSTRONG, the superintendent of education for the FREEDMAN'S BUREAU, converted an antebellum mansion in Hampton, Virginia, into a school that combined social, academic and manual training in a three-year curriculum that included reading, writing and language skills, mathematics, history, natural science, an agricultural course, a commercial course and a course in mechanics. It also taught all the basics of hygiene and the living customs of white homes, such as the use of beds, sheets and other linens, which were unknown in slave quarters. After completing his education at Hampton in 1878, Booker T. Washington served on the faculty at Hampton until 1881, when he founded Tuskegee Institute in Tuskegee, Alabama. Starting with the basic social, academic and hygiene instruction of the Hampton model, Washington added a teacher-training program and an expanded program of industrial training that covered the range of agricultural, construction and textile manufacturing skills.

The Hampton-Tuskegee Model of education that emerged, with industrial training at

its core, came under sharp criticism from northern black academics such as W. E. B. DuBois, who claimed it failed to prepare young blacks for professional careers and leadership roles. Industrial education alone, they contended, would never win civil and political equality for blacks. Supporters of the Hampton-Tuskegee Model scoffed at the notion that academic education alone would have any value to backward, illiterate former slaves of the South. "The plow, the anvil, the hammer, the broom, the frying pan and the needle must be used to supplement the customary instruction," wrote Thomas Jesse Jones, educational director of the African Education Commission and a former member of the Hampton faculty. Writing of Armstrong's original scheme in a 1922 commission report, Jones declared, "He [Armstrong] saw that . . . education must be vitally related to the needs of the people as they took up their work as freemen. . . . He saw that the training in agriculture, in industry and in home economics could not only be made to subserve a useful end, but the processes used in acquiring skill as a farmer, as a mechanic, or as a cook . . . have large educational value, both mental and moral." Jones's report was used by the British Colonial Office and several North American and European mission societies as standard educational policy in the countries of east, west, south and equatorial Africa.

Handbook of Trade and Technical Careers and Training A complete directory of careers that do not require degrees from four-year colleges for entry-level positions and eventual progression to the highest level of each field. Published every two years by the U.S. Department of Labor Bureau of Labor Statistics, and better known as the *Occupational Outlook Handbook*, the directory lists job descriptions for each career, entry-level and potential earnings after five years, specific training required, outlook for each industry and all other relevant

information a job applicant might want to know. The *Handbook* is available in print or electronic format at all public libraries, many high school guidance offices and libraries and from either the Superintendent of Documents, Washington, D.C., or the U.S. Labor Department Bureau of Labor Statistics Publication Sales Center.

handedness The consistent use of one hand by itself or in dominance of the second hand in the performance of manual tasks. Handedness can be important in the elementary and secondary school classroom, where almost all equipment is designed for right-handed people and can cause difficulties for left-handed students. Historically, left-handedness, or sinistrality, was considered a bad omen in ancient Rome, and later as the work of the devil among some Christians. The word *sinister*, or evil, remains a synonym for “left” in Italian, and the French word for “left,” *gauche*, remains a synonym for “clumsy” or “ill-mannered.”

As late as the mid-20th century, teachers theorized that left-handedness was an abnormality and routinely forced left-handed students to convert to right-handed writing to avoid penetrating the paper with pen tips and writing in what appeared to be a contorted position. Until psychologists pointed out the damaging emotional and, often, academic effect of such enforced practices, only 2% of American children learned to write with their left hands. However, there are no measurable differences in the intelligence, academic performance or social and athletic skills of left- and right-handed students. Determined by cerebral dominance, which, in turn, is genetically determined, handedness, or laterality, varies in degree from extreme right-handedness (dexterity) to extreme left-handedness (sinistrality). About 75% of humans are right-handed and 90% predominantly right-handed. The remaining 10% fall somewhere between each

extreme, exhibiting varying degrees of lateral or mixed dominance, performing a variety of activities with opposite hands—e.g., throwing right-handed but writing left-handed. Another form of mixed dominance is ambidexterity, which allows the individual to perform any activity equally well with either hand. The cerebral dominance that affects handedness also affects leg action, seeing, hearing and other bodily functions, although the dominant side of one function may not coincide with the dominant sides of other functions.

handicaps For educational purposes, any physical, emotional or intellectual disability that so interferes with classroom achievement as to require special education or equipment. The percentage of handicapped children in American public schools is about 13% to 14%. Among the most widely seen handicaps in the classroom are various degrees of LEARNING DISABILITIES, speech impairments, MENTAL RETARDATION and EMOTIONAL DISTURBANCES. About 45% of handicapped children—by far the largest portion—fall into the broad and sometimes vaguely defined area of the learning disabled, who require some form of special education and related services. In general, learning disabilities show up as an inability to understand or use spoken or written language—that is, to listen, read, write, spell or calculate. Learning-disabled children are not necessarily slow learners, and vice versa, but both may need special education, albeit in different forms. Evaluation procedures for learning disabilities have come under some criticism because of their subjective nature. In some schools, evaluators conclude that more than 50% of students are learning disabled. Critics who question evaluation methods contend that every child has some problem that can be elicited if an evaluator is obsessively determined to do so. Of the remaining categories of the handicapped, about 17% are speech-impaired—again, a vaguely defined disability,

which, depending on evaluator prejudices, can range from a true, physical speech impairment to a pronounced regional, ethnic or racial accent. About 9% to 10% of handicapped students are mentally retarded, and 7.5% are seriously emotionally disturbed. The deaf, hearing impaired, visually impaired, orthopedically disabled, multiply disordered and autistic each constitute about 1% of handicapped students enrolled in federally supported special education programs.

Until 1975, most handicapped children who were unable to cope with the normal classroom routine were denied admission to most public schools. Under pressure from parents and others seeking to extend the scope of civil rights laws, Congress passed the landmark EDUCATION FOR ALL HANDICAPPED CHILDREN ACT OF 1975. The law gave all handicapped individuals, aged 3 to 21, the right to the best possible education, free of charge, in the least restrictive environment, and it provided federal funds for public schools to provide such education. When the law was passed, only about 1.6 million of the 8 million handicapped children in the United States were attending public schools. Most of the rest were either incarcerated in residential facilities or languishing idly at home. In both cases, they rarely received adequate academic or compensatory education that contributed to their potential for eventual independence.

Television exposes of scandalous conditions at a score of institutions in the late 1960s and early 1970s, coupled with the spiraling costs of maintaining such ineffective residential facilities, provoked a public clamor for "deinstitutionalization" of all but the most severely handicapped and incorrigible children. Educators, who by then had developed a variety of new and effective educational techniques for formerly uneducable children, supported the deinstitutionalization movement, saying that isolating handicapped and delinquent children

was educationally counterproductive. Such children, they maintained, would fare better educationally if they were placed in the educational "mainstream" of conventional public schools and provided with special education and other services to supplement conventional education.

The result was the Education for All Handicapped Children Act, later renamed the INDIVIDUALS WITH DISABILITIES EDUCATION ACT (IDEA). It transferred the burden of educating the vast majority of mentally, physically and behaviorally handicapped children to public schools in the communities where the children lived. It guaranteed every handicapped child equal rights to education and full protection against discrimination of any kind. In addition to federal funding for special education, the law provided funding for all necessary construction to make school facilities "barrier free" and accessible to handicapped children and for any special transportation to bring children to and from school. Initially, the law was costly, however, with all taxpayers sharing the cost of special education for the handicapped and parents of handicapped children paying no more than any other taxpayers.

In the early 1990s, IDEA spending encompassed huge capital projects to make schools accessible or "BARRIER-FREE" for the handicapped. These costs ranged from \$20,000 to \$200,000 per school, depending on the age, size and layout of the school. Many of the costs of making schools barrier-free absorbed special education funds that might otherwise have gone to retraining the learning disabled. Moreover, costs began spiraling uncontrollably, as state and federal courts consistently expanded school responsibilities under the act to include more severely handicapped students such as autistic children and the deeply retarded in regular classrooms. Such court-ordered "full inclusion" was based on the theory that even the severely handicapped benefited more from conventional classrooms than from segregated,

special education classrooms. By “demystifying disabilities,” schools also taught tolerance to nondisabled students.

But the expanding, court-imposed doctrine of full inclusion so impeded teacher ability to pursue normal teaching activities and so interfered with the education of nondisabled students that the American Federation of Teachers, the powerful teachers’ union, called for a halt to the policy. One by one, state legislatures began setting limits to full inclusion—not just to avoid adverse effects on the quality of education of the nonhandicapped, but also to ensure that mainstreaming did indeed have beneficial effects for those handicapped children included in such programs. Ironically, there was considerable evidence that mainstreaming had harmful effects on some handicapped children. While almost all the mainstreamed disabled made more friends and fitted better into groups, the longer they spent in regular classrooms, the more likely they were to fail. Indeed, more than 60% of learning-disabled high school students failed at least one class when placed in regular education classes, compared to only 14% of those who remained in special education classes.

Regardless of the degree of inclusion of the handicapped in mainstream educational programs, almost all public schools are legally bound to follow certain common, basic procedures for dealing with handicapped children. The first of these is evaluation by psychologists and other experts who test and assess students to determine whether there is indeed a handicap or simply a temporary developmental problem. Evaluations that outline the parameters of handicaps are followed by conferences with parents to describe the findings and implications thereof, to discuss the appropriateness of special education and, if required, to provide a written INDIVIDUAL EDUCATION PROGRAM (IEP) for each student.

IEPs detail the student’s current level of achievement, the potential level of achieve-

ment and the services the school will provide to achieve that potential. Parents have the right to refuse an IEP, and the school must follow due-process legal procedures and obtain state permission to override such objections. Normally, parents must give written permission for implementation of an IEP. The school must write a new IEP at least once every three years, and parents are entitled to meet with school representatives at least once a year to review the child’s progress. At any time, parents are entitled to appeal all aspects of their child’s IEP, and the school is then obligated to obtain new, independent evaluations. Parental objections can include appeals to the U.S. Department of Education and even the U.S. Supreme Court. IEPs may include the services of a nurse, psychologist, physical therapist, speech therapist, audiologist or counselor—all at school expense. As much as possible, the curriculum of special education students should be equivalent to the regular educational curriculum, and handicapped children should participate in regular classes as much as possible.

IEPs also include extracurricular services, such as specially outfitted vehicles for transportation to and from school, construction of special facilities such as elevators and ramps for students of limited physical mobility and audible and visual signals and braille signs for students with auditory or visual impairments. Schools must also eliminate all physical or other barriers on school premises that might interfere with a child’s participation in regular education or a handicapped teacher or staffer’s access to the school facilities. Federal law prohibits the construction of a separate facility for the handicapped to avoid the cost of retrofitting existing school facilities.

(See also MAINSTREAMING.)

hands-on lessons A teaching method in which the student is an active rather than passive participant. Cognitive psychologists con-

tend that children learn and retain more when they are active agents, using real-life experiences to create and understand knowledge. JOHN DEWEY was the first educator to introduce active learning into the teaching process at his Laboratory School at the UNIVERSITY OF CHICAGO. Children at the Laboratory School learned to measure and calculate by actively engaging in such entertaining activities as cooking, carpentry and construction projects. The hands-on lessons of active learning contrast with passive learning, characteristic of college and graduate school lecture halls, where teachers impart information that students record passively.

(See also COGNITION.)

handwriting The skill of writing letters, words and sentences. Usually taught in kindergarten through second or third grade, two forms of handwriting are taught in most schools: manuscript writing, with each letter printed separately, and cursive writing, with the letters of each word connected to each other in a flowing, sustained writing motion. Beginning in kindergarten, students learn to use manuscript writing first, with cursive taught in second or third grade, during four to six weeks of special instruction. Handwriting was better known as penmanship before World War II, when classroom desks were equipped with inkwells and children learned to write with stub pens.

Harlem Youth Opportunities Unlimited (HARYOU) An organization founded in 1962 by KENNETH CLARK, the African-American psychologist and educational reformer, to provide compensatory instruction for impoverished ghetto children who were falling behind in basic school subjects. HARYOU also provided job opportunities for unemployed black youth. HARYOU was less successful in fulfilling one of Clark's other treasured goals—integration of New York City schools by busing

black children outside their neighborhoods and drawing children from all over the city to each school. Parents of both races opposed the program. White parents opposed sending their children to inferior schools in black ghettos, while black parents opposed forcing their children to travel an hour or more to and from outlying white neighborhood schools.

HARYOU was eventually absorbed in President Lyndon B. Johnson's WAR ON POVERTY, and Clark described his conclusions from his work at HARYOU in a powerful book, *Dark Ghetto* (1965). In it, he explained the social dynamics, psychology, pathology and power structure of the ghetto and ghetto schools. "Nothing anywhere in the training of social scientists, teachers or social workers," he concluded, "now prepares them to understand, to cope with, or to change the normal chaos of ghetto communities."

Harper, William Rainey (1856–1906) Scholar, linguist, educator and founding president of the UNIVERSITY OF CHICAGO. Born and educated in Ohio, he earned a B.A. at 14 and Ph.D. (at Yale) in Indo-Iranian and Semitic languages just before his 19th birthday. By then, Hebrew had become a passion, and, after teaching at several small colleges, he accepted a professorship of Hebrew at the Baptist Theological Seminary in Chicago, Illinois, in 1880. In 1886, he was appointed professor of Semitic languages at Yale, where he also developed a deep interest in adult education and became principal of the Chautauqua Institution's college of liberal arts (see CHAUTAUQUA LITERARY AND SCIENTIFIC CIRCLE), a nationwide correspondence school supplemented by a Sunday lecture series and summer-camp courses for adults.

He held both posts until 1891, when he and John D. Rockefeller formulated plans to build a great university in the west—a "Harvard" of the west. Backed by a \$35 million Rockefeller gift, Harper set out to create one of

the world's most diversified institutions of higher learning. His vision of the university, generally, and of the University of Chicago, specifically, seemed limitless. First, he gathered together a brilliant faculty of divergent views, guaranteeing them complete academic freedom to teach what they wanted, how they wanted. Then, he broadened the reach of his faculty by arranging cooperative affiliations with four existing liberal arts institutions: Des Moines College, Kalamazoo College, John B. Stetson University and Butler College. He also established ties with Bradley (Polytechnic) Institute and Rush Medical College.

Harper was looking to expand in other directions when the great liberal educator Col. FRANCIS W. PARKER approached him about merging his own newly created Chicago Institute, an outstanding teacher training school (with an attached elementary school), into the university. JOHN DEWEY had already established an undergraduate department of education at the University of Chicago, making it the first university with such a department. Harper decided to accept Parker's offer and create a graduate school of education. He took over three schools—the Chicago Manual Training School, a college preparatory school called the South Side Academy and the University Elementary School, which Dewey and his wife had founded—and merged them with Parker's institute to form the University of Chicago School of Education, the first such graduate school in the United States. He named Parker as its first director.

Harper also tried to extend the university's reach into arts education and social service training by absorbing the Chicago Art Institute, the Field Columbian Museum and JANE ADDAMS'S HULL-HOUSE. After temporary affiliations, both museums severed their ties because of disputes over control of the awarding of degrees. Addams, on the other hand, refused to cede any control over her institution, and Harper decided to establish his own University

of Chicago settlement as a site for social service research. A prolific writer in his beloved sphere of the Hebrew language, Harper extended the university's education reach still further with the creation of the University of Chicago Press, which became America's leading publisher of scholarly works and learned journals at the beginning of the 20th century.

Not content with educating scholars, Harper insisted on opening the university's educational program to all citizens. In the tradition of the Chautauqua Institution, he talked of the university as the "keeper" and "high priest" of democracy, with an obligation in a democratic society to teach truths to the widest possible audience. Using experiments in adult education in England as models, Harper organized a huge, autonomous, degree-granting extension division, with its own department for specialized teacher training in extension education. The program provided education to thousands throughout the Chicago area and, through correspondence courses, across the Midwest. It eventually served as a model for similar programs at the University of Wisconsin, the University of Kansas and comparable institutions, which for the first time began serving the educational needs of the general public as well as their own in-house scholars.

The diversity of activities he brought to the University of Chicago made it the target of ridicule by conservative educators who called it "Harper's Bazaar," but it also lured hundreds of administrators from other universities to study which elements they might incorporate into their own expanding institutions. Harper's ideas for innovative higher education were endless. He divided the academic year into four quarters, with the summer quarter an integral part of the school year. He expanded graduate studies into new academic areas and pressed his faculty to expand research, all the while continuing to serve as professor of Hebrew and assuming the editorship of *The Biblical World*,

The American Journal of Theology, and *The American Journal of Semitic Languages and Literature*. He was also a member of the committee that selected and arranged the editing of the series the Great Books but died of cancer at 49 before he could achieve all his remaining goals.

Harris, William Torrey (1835–1909)

Teacher, philosopher and, above all, developer and disseminator of a new, “American” philosophy of education that helped Americans embrace universal public education as essential to their survival as a free people. Born in Connecticut, he was educated at the famed Phillips Academy at Andover, Massachusetts, but then resigned from Yale University after less than three years, saying he was disappointed and disillusioned by an elitist education that seemed to offer no grander ideal for the individual and the nation. In 1857, he abandoned his ties to the past and, like many young men of his day, moved westward, eventually settling in St. Louis, Missouri, where in 1858 he became an assistant teacher in the public school system.

At the time, St. Louis was a booming, “northern” city in a “southern” slave state—a city that remained fiercely loyal to the Union because of an industrial economy that thrived as a supplier to federal armies in the West. After working his way up through the system as teacher, school principal and assistant superintendent of schools, Harris was appointed superintendent of St. Louis schools in 1867. By then, the city’s economic success had produced a vision of its becoming the future “Capital of the Nation” and “Future Great City of the World.” Helping to encourage these visions was the St. Louis Philosophical Society, which Harris founded in 1868, along with the *Journal of Speculative Philosophy*, the first American periodical devoted entirely to philosophy and one that influenced educators across the United States.

Harris was strongly influenced by the philosophy of Georg Friedrich Wilhelm Hegel (1770–1831), who had proclaimed America to

William Torrey Harris (Library of Congress)

be the land of the future, even proclaiming it as “God’s Chosen Nation.” Harris saw the reunification of North and South, along with competing ethnic, religious and political interests, as the vehicle for establishing a prosperous, smoothly functioning society of the kind Hegel had envisioned. Education, Harris believed, would form the basis of such reunification and national growth. Harris saw education as emanating from five basic institutions: family, during the first five or six years of life; schooling, during the next eight to 10 years, as the child became curious about the world outside the family; civil society, to encourage the young person in the vocational pursuits; the state, to

educate the citizenry about and enforce the laws; and the church, to provide spiritual education.

Families, churches and civic institutions trained over the years, he said, by offering continual education that individuals absorbed unconsciously. Schools, on the other hand, instructed by using the printed and spoken word to encourage ACTIVE LEARNING by the individual. Harris believed that development of active learning—as opposed to the passive learning of earlier education—lay at the heart of democracy and enlightened self-government. He also believed that the school should be the “great instrumentality to lift all classes of people into a participation in civilized life.” A firm believer in universal public education, he called on educators to open schools to all young people, including women, and to provide them with a general, cultural, humanistic education that would train the character and intellect of young people instead of preparing them to be obedient workers. However, he was less enthusiastic about the education of emancipated blacks, although he believed they deserved “separate but equal” schools that would combine intellectual and industrial education.

Harris called for wholesale changes in traditional curricula and methods of instruction to permit development of active learning. To that end, he revolutionized the curriculum of St. Louis public schools and convinced thousands of educators across the United States to do the same. He introduced new subjects, such as art, music, science and manual arts to the St. Louis public school curriculum. He also added the KINDERGARTEN, an innovation at the time, to all elementary schools, to permit children to learn actively by participating in play and games. He expanded high school education, which had been reserved for college-bound students only, to permit study by all who could afford the time off from work.

Harris based his curriculum on what he called the “five great divisions” of the life of

man: arithmetic and geography, related to man’s comprehension and conquest over nature, and history, language and literature, related to the comprehension of human life. From this philosophical basis, he created five coordinate groups of study for the curriculum: mathematics and physics; biology, including botany; literature and art; grammar and the scientific study of language, leading to logic and psychology; and history, including sociology and politics. He believed that students should study each of these coordinate groups at every level of schooling, from kindergarten through college, by topics appropriate to the age and previous training of the students. In effect, his curriculum was designed to promulgate a philosophy of universal public education, which he hoped would create a truly democratic community in the expanding urban, industrial nation of his day. His greatest achievement as an educator was less in introducing that philosophy in his own community, than in convincing his generation of educators that a philosophy of education was applicable universally, to every American child.

After serving as superintendent of schools for 13 years, Harris left St. Louis in 1880 to join RALPH WALDO EMERSON and BRONSON ALCOTT in an unsuccessful effort to establish the Concord School of Philosophy in Massachusetts. In 1889, he was appointed U.S. Commissioner of Education, a post he held until 1906 and that he used to convince educators and enlightened Americans that universal public education was the single most effective means of solving the nation’s social, political and technological problems.

Hartford Female Seminary One of the first American schools to offer advanced educational opportunities to women. Opened in 1823 by CATHERINE BEECHER, the Hartford school taught grammar, geography, rhetoric, philosophy, chemistry, ancient and modern history, arithmetic, algebra, geometry, moral

The only remaining rendering of Catherine Beecher's Hartford Female Seminary, taken from an old diploma (*Stowe-Day Foundation*)

philosophy, natural theology and Latin—all subjects previously reserved for men. In her autobiography, Beecher later recalled that the idea of teaching such subjects to women “surprised and almost dismayed” Hartford’s “leading gentlemen.”

Although other female seminaries existed, they concentrated on teaching girls the domestic and ornamental arts in programs designed to prepare students for marriage, motherhood and household obligations. Only EMMA WIL-LARD had dared teach women other subjects, when she opened her Middlebury Female Seminary in Vermont in 1807. The Hartford Female Seminary did not ignore the domestic and

ornamental arts, but it also prepared its students for professional work as teachers. Indeed, the school turned out the first generation of women teachers in the United States and, in effect, became the nation’s first teacher training school.

Harvard, John (1607–1638) English-born philanthropist and, perhaps, minister, whose bequest ensured the survival of what was later renamed HARVARD COLLEGE. Born of a wealthy London family, Harvard graduated from Emanuel College at the University of Cambridge in 1632 and earned his master’s degree three years later, by which time he had

There being no likeness of John Harvard, the famed statue at Harvard Yard is actually a likeness of an early 20th-century Harvard student. (*Library of Congress*)

inherited a large estate. In 1637, he sailed to America and settled in Charlestown, in the Massachusetts Bay Colony, where he became a teaching elder in the church. He died a year later of consumption and left half his estate, about £780, along with his library of 400 volumes (representing 329 titles) in the classics and theology, to the struggling new college, which had started instruction the previous summer. The following March, the General Court ordered “that the college agreed upon formerly to be built at Cambridge shall be called Harvard College.” Although a statue of John Harvard sits prominently in Harvard Yard, there were no surviving images of the man, and the handsome young face contem-

plating the shady walks of the campus today is that of a Harvard student at the beginning of the 20th century (see illustration under Harvard College.)

Harvard College America’s first and oldest college, founded in 1636 as a school of theology and now a premier four-year college of liberal arts and sciences at Harvard University with more than 11,000 students. The founding of Harvard was unquestionably one of the most remarkable and uncharacteristic achievements in the history of the American colonies, coming as it did less than two decades after the arrival of the first settlers. “After God had carried us safe to New England and we had builded our houses, provided necessaries for our livelihood, reared convenient places for God’s worship, and settled the civil government: one of the next things we longed for, and looked after was to advance learning and perpetuate it to posterity,” according to the account of the settlers as written in *New England’s First Fruits*, published in 1643 by unknown authors identified only by the initials “R.O.” and “G.D.” and cited in Morison’s *The Founding of Harvard College* (1935). Accordingly, on October 28, 1636, the General Court, or legislature, of the Massachusetts Bay Colony appropriated £400 to build a college at Newtowne, whose name was later changed to Cambridge, at the behest of the large number of colonist leaders who had attended Cambridge University in England.

That the founding of a college should have been so high a priority for a group of settlers so hard-pressed by the exigencies of life in the wilderness probably reflects the high level of education of the colonial leaders. At least 100 had studied at Cambridge and 32 at Oxford. Of these, almost all were part-time farmers by necessity, but three also practiced medicine, 15 taught, 27 were public officials and 98 served in the ministry, which also entailed instructing the young and training clerical aspirants to the

clergy. The founding of a theologically oriented college to advance piety, civility and learning was a natural outgrowth of the need to build a strong, literate clergy to succeed the original clerics in the New World.

Harvard acquired its name after the death in September 1638 of the Reverend Mr. John Harvard, who bequeathed half his estate to the college, along with his library of 400 volumes. Instruction had just begun that summer, and in March of the following year the General Court ordered that it be given its benefactor's name. Unfortunately, the college closed the following September because of the vicious behavior of its first president, NATHANIAL EATON, a brutal teacher "fitter to have been an officer in the Inquisition or master of correction, than an instructor of youth." The college did not reopen until a year later, on August 27, 1640, when HENRY DUNSTER, an alumnus of Magdalene College, Cambridge, was appointed president, and the history of Harvard College as a continuously operating institution began. By the time Dunster resigned 14 years later, he had graduated 74 alumni, obtained a charter from the General Court, expanded the library to more than 1,000 volumes and was responsible for completing construction of the original, turreted "Old College" and two additional buildings—a second college building and a president's lodging, which also housed the college printing press.

Little is known about Dunster's background except his birth in Lancashire in 1609 and his graduation from Magdalene College with an M.A. degree in 1634. After serving as teacher and curate in his home town of Bury for six years, he immigrated to Boston and was elected president of Harvard three months after his arrival. He not only designed the first three-year curriculum, he also taught it all during the first year, lecturing to each class for an hour each morning, Mondays through Thursdays, and meeting for an additional hour with each

class every afternoon for disputations, recitations and tutorials. Dunster met with the entire student body on Fridays and Saturdays for work in rhetoric and divinity. The table on page 508 shows the Harvard College curriculum of 1642, its third year of existence.

Admission to Harvard required fluency in Latin, an elementary knowledge of Greek grammar, an understanding of Cicero, a pledge to read Scripture twice a day, and a recognition that the main goal of each student's studies and, indeed, life was "to know God and Jesus Christ. . . ." Class attendance was mandatory, as was strict obedience of all college rules and regulations, including a ban on the use of profanity, association with "dissolute company" and any travel outside the community without the consent of one's tutors, parents or guardians.

Instruction was based on the lecture, the declamation and the disputation, with Dunster providing the lecture as an oral textbook and the declamation as a rhetorical demonstration of knowledge and varying points of view, based on a broad range of quotations from the classics. Students then engaged in disputations or formal debates (see *DEBATING SOCIETIES*), in which they drew upon their accumulated knowledge to argue for or against any important issue. During Dunster's administration, Harvard was not dissimilar to colleges at Oxford and Cambridge. It housed 20 to 50 students in a collegial atmosphere presided over by the president and two or three tutors and served by a steward, cook, butler and several servants. Student median age varied from 15 to 17, and, while the first students were New England Puritans, the student body quickly became far more cosmopolitan, with the arrival of students from Virginia, New Netherland, Bermuda and England. As in England, most students were sons of magistrates, professionals or landed gentry.

Dunster resigned in 1654 after a dispute with students, the board of overseers and the

General Court over the addition of a fourth year to the curriculum and the issue of infant baptism, which Dunster claimed had no scriptural basis. His declaration was deemed heresy. He was succeeded by Charles Chauncy, another Cambridge alumnus, from 1654 to 1672. Then followed a succession of four Harvard gradu-

ates, including INCREASE MATHER, who headed the college from 1685 to 1701.

Although Harvard's original purpose was to train a literate clergy to lead the colonies, many students attended solely to obtain an education the prestige of which would enhance their careers in the secular world. Of the nearly

400 students who had attended Harvard by the end of the 17th century, 180 were indeed clergymen, but 42 had become public servants and 27 had become physicians, while the college produced 13 teachers, 11 planters and gentlemen, 10 merchants and five soldiers and mariners. Nearly 70 failed to graduate and 27 died young. Although students paid for the privilege of attending Harvard, more than 50% of its support came from the government, and the result of that investment was the imposition of

unorthodox social and cultural obligations such as the education of Indians. In 1654 or 1655, Harvard's second president, Charles Chauncy, reluctantly agreed to build the two-story Indian College to educate a half-dozen promising young Indians, who, the government assumed, aspired to the same social and cultural goals as whites. Only about four students ever attended, and only one, Caleb Cheeshahteumuck, actually completed the work for the B.A. He died a year later, however,

Engraving of original buildings at Harvard College, the first college built in colonial America, in 1636 (*Library of Congress*)

and the Indian College became a housing facility for white students.

Like all educational institutions, Harvard responded to the 18th-century Age of Enlightenment and its rain of scientific discoveries and new political and social philosophies with a vast expansion of its curriculum, particularly in the sciences and in the study of secular philosophies. Although its chief rival, Yale, was the great innovator in higher education in the first part of the 19th century, the appointment in 1869 of 36-year-old CHARLES ELIOT as Harvard president signaled the return of the nation's first college to its position as the nation's premier college. Often called the "founder of Harvard University," Eliot came to Harvard when it was a small, provincial college with a curriculum that had changed little over the previous century and a faculty split by dissent between traditionalists, who wanted to maintain the curricular status quo, and modernists, who wanted a more practical curriculum.

At the time, Latin, Greek, mathematics, philosophy, history, physics, chemistry, French and German remained Harvard's core subjects. Its law school granted an LL.B. to any student who completed its 18-month course of study; no examinations were required. Its medical school granted an M.D. to all students who completed two terms of study, served an apprenticeship with a practicing physician and passed 10-minute oral exams in five of nine principal subjects. Harvard also had a scientific school that admitted and graduated all who applied and a Unitarian divinity school that granted no formal degree.

Eliot acted swiftly and dramatically to modernize the college. He introduced written examinations as a prerequisite for admission, with students selected on the basis of intellectual promise and strength of character. He broadened the undergraduate liberal arts curriculum and merged the scientific school into

the undergraduate college. In 1872, he established a Graduate Department (later, the Graduate School of Arts), which granted master's degrees and doctorates. The law, medical and divinity schools were reorganized as proper graduate schools, with sequential curricula requiring extensive written examinations. He gave students the right to take elective courses and in 1879, approved limited faculty instruction of women and the eventual founding of the Society for the Collegiate Instruction of Women. Better known as the "Harvard Annex," it became Radcliffe College in 1894 and a century later was absorbed into Harvard after the latter became coeducational. He also raised faculty salaries to levels competitive with private industry and recruited and lured the foremost national and international scholars to teach at Harvard full-time.

Within 25 years, Eliot had created the model of the modern American university and made Harvard the most widely acclaimed institution of higher learning in the United States and, in the opinion of many, in the world. It taught all the world's great languages, literature, history, all the social sciences, and the range of human knowledge about nature and science. It had hired the finest scholars in the world to impart that knowledge to carefully screened young men who, in the college president's opinion, would benefit most from the experience. Harvard University became a center of research and developer of new knowledge as well as a repository of existing knowledge. With 10 graduate schools, including preeminent schools of medicine, law, business and education, it has continued to exert a broad influence on education and on the nation, by graduating more than its share of national leaders in virtually every sector of American life. Harvard's endowment in 2005—more than \$25 billion—was the largest of any college or university in the world.

Haskell Indian Junior College A two-year college for Indians, founded in 1884 in Lawrence, Kansas, in fulfillment of the federal government's treaty obligations to the Indian people. One of the oldest colleges of its kind and one of the few federally supported colleges, Haskell is operated by the BUREAU OF INDIAN AFFAIRS and is limited to students who can certify their Indian ancestry, with preference given to students who are at least one-fourth Indian. Almost evenly divided between men and women, the student body draws between 800 and more than 1,000 Indians from more than 100 tribes in more than 30 states and territories. Once free, the college continues to hold costs of tuition, room and board at affordable, token levels.

Hatch Experiment Station Act of 1887 A federal law appropriating funds to improve agricultural research at LAND-GRANT COLLEGES. Established as state colleges with funds realized from the sale of surplus federal lands, the land-grant colleges had already established extensive departments of education, but their research efforts had failed to stem the growing deterioration of once-rich farmlands from overplanting and years of persistent dust storms. Not to be confused with a later, similarly named law limiting political activities of federal employees, the Hatch Act of 1887 simply provided \$15,000 in federal funds each year for research and experiments at land-grant college agricultural experiment stations. For the most part, these amounted to model farms, worked by land-grant college agricultural students under the direction of their professors. To prevent academic theoreticians from deterring such stations from achieving any practical results, the Hatch Act specified that the funds were to be used for research and experiments that might have economic benefits for American agriculture.

Hawaii The 50th state admitted to the Union, in 1959. A 1,500-mile-long chain of islands, the state has one of the poorest public education systems in the United States. In 1999 its schools ranked in the lowest quintile of American state school systems in terms of student achievement scores in mathematics and verbal skills, spending per pupil, pupil-teacher ratios, teacher quality and school spending as a percentage of total government spending.

American missionaries brought the first formal schooling to Hawaii in 1820, when it was still an independent nation. King Kamehameha is said to have established the first public schools in 1840, but Princess Bernice Pauahi Bishop established Hawaii's most celebrated school in 1884, when she set aside 434,000 acres in a perpetual trust for the education of native Hawaiian children. With a current value of more than \$8 billion—more than the combined endowments of Yale and Harvard universities in 1990—the estate supports a free school for 3,200 children, from kindergarten through twelfth grade. Stressing Hawaiian culture, the school also supports related community programs, including preschool programs, reading tutorials and adult education classes.

Hawaii was originally known to the West as the Sandwich Islands, in honor of the fourth earl of Sandwich, patron of the English explorer Capt. James Cook, who landed on Kauai in 1778. Within a decade, Westerners of all nationalities had settled on the idyllic beaches, bringing with them Western diseases and alcohol that decimated the native population. A native king, Kamehameha, united the eight main islands into a kingdom whose aim was to perpetuate native rule. But as the number of American missionary families increased and their sons acquired large landholdings, control of the islands fell into the hands of Americans, who convinced Washington to seize the islands on July 4, 1893, and create the Republic of

Hawaii. Sanford B. Dole, the builder of the great pineapple plantation, was named its first president. In 1898 the United States ceased its charade and annexed the islands.

About 24% of the island group's population of 1.26 million were under 17 in 2005, and 74% were minority students, with 42% of Asian ancestry. About 12.5% of elementary and secondary school students lived in poverty. Some 15% attended private schools rather than the state's 260 public schools, which rank 47th in the nation. Academic proficiency of high school students is the lowest in the United States except for students in the District of Columbia. Elementary school students score only slightly higher—about eighth lowest in reading and sixth lowest in math. The state has three public and eight private four-year colleges and seven public and two private two-year colleges. The University of Hawaii, a public LAND-GRANT COLLEGE founded in 1907, has 10 campuses, with a total of about 45,000 students and 3,100 faculty. Its two four-year campuses at Hilo and Honolulu (Manoa), the latter its major installation, have nearly 13,000 undergraduates and almost 6,000 graduate students. The state's colleges have a graduation rate of only about 46%.

In 2004, one of the many financial scandals racking American colleges and universities engulfed the 10-campus University of Hawaii, when the Board of Regents dismissed its president "for cause." In addition to inappropriate public conduct and political activism, the regents charged the president with "questionable, even abusive, expenditures" on travel and other personal outlays and inappropriate spending from a discretionary fund.

Hawley, Gideon (1785–1870) The first superintendent of common schools in New York State; usually referred to as the "father" of the state's public elementary school system. Born in Connecticut and by 1812 a successful

practicing lawyer in Albany, New York, his work as both a lawyer and a tutor at Union College brought him to the attention of leading proponents of public education among the lawmakers at the state legislature. It was in 1812 that the legislature created the first state educational office, and in 1813 it named Hawley the first superintendent of common schools "to digest and prepare plans for the improvement and management of the common school fund, and for the better organization of common schools."

For the next eight years, Hawley laid the foundation for the public elementary school system in New York State, organizing schools and creating public interest in public education. Although his office was abolished by legislators demanding more local and less state control of local schools, he left behind him a thriving, if fledgling, network of public schools that, with the help of famed educator EMMA WILLARD, expanded into the largest in the United States by the time of his death. In 1814, Hawley was named secretary of the board of regents of the University of the State of New York, a post he held until 1841, when he was named a permanent member of the board. Two years later, again with Willard's help, he was able to establish the first teacher training, or "normal," school in New York State, at Albany.

Hazelwood School District v. Kuhlmeier A 1988 U.S. Supreme Court decision that gave a Missouri high school principal the right to delete from the student newspaper student articles he deemed inappropriate. The case proved another in a continuing series of confusing and constantly shifting decisions over FIRST AMENDMENT free-speech rights of minors—in this case, the rights of students who wrote and edited the school newspaper as part of a journalism class. Because the newspaper was school owned and operated and used as a pedagogical tool, the Court found that the principal (and, by infer-

ence, other educators) did not violate student free-speech or free-press rights by controlling style and content of student expression. Such controls were deemed an effort to teach students better techniques of writing and evaluation, much as style and content are teacher-directed in literature or history essays.

The Court distinguished between the Hazelwood School District and the 1969 case of *Tinker v. Des Moines Independent School District*, in which it ruled that students had the right to wear antiwar armbands in school. Pointing out that the "Constitution does not stop at the public school doors," the Court nevertheless left educational authorities with the right to curtail student free speech when it "materially and substantially" disrupted the educational process. Neither case clarified the issue for colleges, where students have not only reached the age of majority, but also often operate school newspapers independently.

hazing An American schoolboy initiation rite dating back to about 1850 and characterized by various pranks on initiates that can range from mockery and humiliation to sadistic physical distress or injury. A traditional part of college FRATERNITY and SORORITY initiations, hazing gradually spread into athletics during the 20th century as part of the "welcoming" ceremony for newcomers to college teams. Akin to adolescent rites of passage into adulthood in traditional societies, hazing in the United States spread to high school athletics in the 1970s and 1980s. Ironically, just as rates of random criminal violence by juveniles were declining during the 1990s (see JUVENILE DELINQUENCY), hazing rites changed from adolescent foolery to increasingly dangerous bullying and brutality, with some high school initiates to school teams suffering beatings and sexual assaults. About half the high school students in American report having been subjected to hazing, according to a survey conducted by Alfred

University, in New York, in April 2000. Defined as "any humiliating or dangerous activity . . . to join a group regardless of your willingness to participate," hazing included drinking contests, stealing, inflicting pain on themselves, physical abuse, dunking someone's head in a toilet, being yelled or cursed at, eating or drinking disgusting substances and piercing or shaving one's body. In the most surprising finding, about one-fourth of the high school respondents had faced hazing when joining church youth groups. In other categories, 76% reported hazing as a requirement for joining fraternities or sororities, 35% reported hazing for joining athletic teams and 34% for joining cheerleading squads. At the college level, several students died from alcohol poisoning as part of fraternity hazing that required initiates to consume entire bottles of undiluted spirits. As rates of injuries increased, parents across the United States began suing school and college officials, and many schools and colleges responded by banning hazing and, in a number of cases, calling police to arrest students who had injured younger students by hazing.

headmaster/headmistress A title equivalent to principal in nonsectarian private schools; now replaced by the gender-neutral term *head*. Most commonly used in England, the name derives from degrees awarded in the earliest medieval universities in Europe, to differentiate between student novitiates, bachelors or licentiates, and masters who were certified to teach. Many private, nonsectarian schools in the United States and schools and colleges throughout the English-speaking world continue to call male teachers masters and the head teacher or principal the headmaster.

Women did not make their appearance in American teaching until the early 19th century, when almost all "COMMON SCHOOLS," or local elementary schools, were taught exclusively by men. The first female teachers usually headed

their own small, private academies or seminaries for girls where they served as the sole teacher and as the headmistress. As women took over common, or public, elementary school teaching from men during the Civil War, they were simply called teachers, but never assumed the formal female equivalent of master because none had equivalent degrees.

Head Start A comprehensive, federally sponsored program to improve academic achievement of economically disadvantaged children by giving them the same PRESCHOOL learning opportunities available to the economically advantaged. Created as part of the ECONOMIC OPPORTUNITY ACT OF 1964, Head Start translated into formal legislation the American belief that education (not birth) was the key to individual success and that, without equal educational opportunities, the poor would never obtain equal economic opportunities.

Better known as the WAR ON POVERTY, the Economic Opportunity Act provided a wide range of other help for the poor such as legal assistance, health care and economic opportunity loans. At the heart of the program was federal sponsorship of community action programs in which the poor themselves, along with supportive institutions such as local churches, settlement houses and other volunteer groups, attacked poverty. Of all such programs—and there were many—the one that caught the imagination of poor and rich alike, professionals as well as nonprofessionals, was Head Start. After the Office of Economic Opportunity was dissolved, Head Start not only survived but also expanded with bipartisan support. It was eventually incorporated into the Department of Health and Human Services, which allocates more than \$5.6 billion a year for the program.

For years, leading educational psychologists such as BENJAMIN BLOOM of the University of Chicago had claimed that the first few years of life were the “critical period” in human

development and that intervention in those early, preschool years was vital to intellectual development. Intervention through remedial and special education during the school years came too late, they claimed. Head Start gave them the opportunity to prove their theories by enriching the intellectual lives of poor children with the same strategies and activities that higher-achieving children from higher-income families received routinely. These included a variety of adult-to-child contacts, including reading to children, conversing with them, playing games with them, undertaking collaborative tasks with them and taking them on mutually enjoyable outings to entertaining and culturally enriching events.

Head Start, whose name has varied over the years from Operation Headstart to Project Head Start, has proved one of the most successful government-sponsored educative programs in American history. After enrolling about 500,000 in its first summer of 1965, the program expanded by between 200,000 to 300,000 children a year, offering mental and physical health care, child welfare, recreation facilities, remedial services and intellectual development. In addition to professional workers, Head Start involved parents in planning and also in serving as paraprofessionals and volunteers. Over the next three decades, Head Start mushroomed into a multibillion-dollar-a-year program, with 1,400 units in poor areas across the United States supporting half the nearly two million eligible children. By 2005, it had grown into America’s largest provider of health care services to poor children and had enabled about 20 million poor children to enter school better prepared than their economic peers. Of the more than 800,000 children enrolled in Head Start, 6% are five years old or older; 60% are four years old; 30% are three years old and 4% are under three years old. About 13% fall into the broad category of handicapped children. About 36% of Head Start enrollees are African

Americans; 28% are Hispanic; 31% are white; 4% are American Indian or Native Alaskans and 3% are Asian Americans.

Despite its recognized achievements, Head Start became a center of controversy over the years, with opponents questioning its overall success. Several studies purported to have “proved” that gains in intelligence scores and learning in preschool disappear after two years at school. One study found an unacceptably wide variability in the quality of Head Start programs, with only about half having a noticeably beneficial effect on their children, while about one-quarter were “marginal” and the other quarter were run so poorly that they had no beneficial effects. One study charged Head Start officials with “doctoring” records by claiming that 88% of enrolled children had been immunized, when evidence indicated that less than half that number had received complete immunizations. Opponents of Head Start in the U.S. House of Representatives also hurled accusations of “financial abuse, mismanagement, impropriety or outright theft” at some of the organization’s programs, citing indictments of Head Start operatives in Maryland and South Dakota. But officials of the National Head Start Association counter that financial abuse was rare in the organization and that reviews had found “serious problems in only fifteen percent of cases or fewer.”

Respected researchers subsequently found that every dollar spent on Head Start produced \$3 to more than \$7 in savings on the average expenditures for welfare, remedial education and criminal justice that are eventually spent on the average child emerging from a poor environment without the benefits of Head Start. One landmark study by the High Scope Educational Research Foundation, a nonprofit research organization in Michigan, collected some of the most convincing data in favor of Head Start and similar programs. Its continuing, 20-year study of groups of students who did or did not receive

preschool services before kindergarten found that those with preschool experience were far higher achievers in every respect. As they grew up, they scored higher academically than students with no preschool, had a higher percentage of high school graduates, needed less special education, produced fewer teenage pregnancies, obtained better paying jobs and had fewer encounters with law enforcement officials.

Proponents of Head Start do not deny the imperfections of the program, but they insist most can be remedied with more funding to make classes smaller and make pay scales competitive with those in public schools. Pay for public school teachers averages 60% higher than that of Head Start teachers. The result is that many teachers in Head Start have no bachelor’s degrees. Academic qualifications of Head Start teachers, however, has become a moot question, as more states establish preschool programs in public schools. As late as 2000, only 26 states offered such programs, but by 2005, spurred by the NO CHILD LEFT BEHIND ACT OF 2001, all but one state had opened public prekindergarten classes.

head teacher An archaic term referring to a full-time elementary school teacher who also served as school principal. Because elementary school teachers did not require master’s degrees, they seldom qualified to become HEADMASTERS, even when they assumed similar administrative duties. Head teachers are now called principals.

health education The formal classroom instruction of children, from kindergarten through high school, in matters concerning the care of their bodies, dietary and sleep needs, eating disorders, birth, death and dying, suicide, disease prevention, sexuality and sexually transmitted diseases, abortion, substance abuse (tobacco, alcohol, drugs, etc.), violence, gangs, cheating and lying, exercise and AIDS.

Required in more than 30 states as of 1995, health education remains a source of controversy in many school districts. Many parents contend that the role of schools should be limited to instruction in traditional academic subjects and that health education encourages children to experiment in practices they (the parents) deem objectionable. Those favoring health education insist that experimentation is a natural and inevitable aspect of maturation and that youngsters equipped with accurate knowledge are less likely to experiment in self-destructive activities and are better equipped to handle peer pressures and temptations to engage in illicit behavior.

Often couched as “mini-courses” within traditional biology, home economics or PHYSICAL EDUCATION courses, health education has its roots in the GYMNASIA of ancient Greece, where physical and intellectual exercises were deemed essential to the unity of the total being and essential for conditioning young men as warriors. In 1823, CATHERINE BEECHER may have been the first teacher to introduce health education in an American school when, in one of the great innovations of her day, she introduced calisthenics and exercise as part of the regular curriculum at her famed HARTFORD FEMALE SEMINARY in Connecticut. In an article entitled “Letters to the People on Health and Happiness” in 1856, Beecher described the sickly condition of a large proportion of American women and children and warned teachers that the “two grand causes of ill health and physical deterioration so common are, first, a want of *knowledge* [her italics] of the construction of the body and the laws of health; and, next, a want of *thought* and *conscience* on the subject.” She then urged “every school” to adopt a planned system of physical exercises that she had invented and that contained

all that either sex needs for the *perfect development* of the body. . . . For this purpose it

ought to be the official duty of one person to take charge of all that relates to the health and physical training of every collection of the young for education. . . . The teacher who has charge of the Health Department might give out one lesson a week from this [Beecher’s] book to the whole school. This should be preceded by a familiar lecture on the subject, *illustrated by specimens*.

Few schools other than women’s academies followed Beecher’s suggestions until after the Civil War, when secular educators began taking charge of men’s schools and replacing the clerical teachers who had frowned on exercise and sports as sinful amusements. By the late 19th century, gymnasias began to be added to school, college and university plants, following the development by LUTHER GULICK of a formal physical education program that was eventually integrated into elementary and secondary school curricula.

The classroom elements of health education seem to have emerged as an outgrowth of intensive student questioning of teachers in physical education, biology, home economics and like subjects. Formal classroom courses in health education average one hour a week for two years. For that reason, few teachers specialize in health education, which, in most schools, is a part-time position. Most health education courses are traditionally assigned to physical education teachers, many of whom have limited formal training in health education and its pedagogy.

health-occupations education The training and formal instruction required for a variety of health-related jobs that usually do not demand a professional degree. Required instruction may range from on-the-job training to certificates or associate degrees from junior or community colleges and technical institutes. Among the many health occupations requiring only a high school diploma are dispensing opticians, emergency

medical technicians (paramedics) and licensed practical nurses. Among occupations requiring an associate degree are electrocardiograph technicians, dental hygienists, medical laboratory technicians, medical record technicians and radiological (X-ray) technicians.

Training to become a registered nurse is available in both two-year associate degree programs at community colleges and three-year diploma programs at hospitals. Pressures are growing, however, to make the R.N. a four-year bachelor's degree program because of the expanding patient-care responsibilities doctors are ceding to registered nurses. In all areas of health care, registered nurses must graduate from one of the approximately 1,500 accredited programs and obtain licenses available only after passing a national examination administered by each state.

health services In education, the provisions of a school or college for treating students, faculty and staff for a wide variety of illnesses and injuries. Limited by individual state laws, health services may range from first aid, administered by a part-time practical or registered nurse at a small elementary school, to the operation of a hospital or infirmary at many boarding schools and colleges. State laws usually restrict public school health services to minor first-aid and the dispensing of drugs prescribed by the student's own physician. Where permitted by state laws, some school districts may also have consultancy contracts for the services of a physician, psychologist or psychiatrist, and several hundred public schools, most of them in low-income school districts, have clinics staffed by full-time nurse practitioners. Such clinics have been a center of controversy for offering sex-counseling services to teenagers unable to gain access to or afford primary health care services. Indeed, 10% of the services provided by such clinics relate to reproductive health and sexually transmitted diseases. Treat-

ment of acute illnesses, however, accounts for the largest percentage of services—29%—with mental health accounting for 18% and physical examinations for 15%.

Healy v. James A unanimous 1972 U.S. Supreme Court ruling that Central Connecticut State College (CCSC) could not prevent students from forming a chapter of the STUDENTS FOR A DEMOCRATIC SOCIETY (SDS), nor could the college deny students the use of campus facilities without evidence that they intended to disrupt the local campus. Although the national SDS organization was originally formed to give students more control over university affairs, and although the CCSC president was personally opposed to SDS, the Court held that

among the rights protected by the First Amendment is the right of individuals to associate to further their personal beliefs . . . There can be no doubt that denial of official recognition, without justification, to college organizations burdens or abridges their associational rights. . . . The mere disagreement of the college president with the group's philosophy affords no reason to deny it recognition. . . . If there were an evidential basis to support the conclusion that CCSC-SDS posed a substantial threat of material disruption . . . the president's decision should be affirmed.

(See also STUDENT RIGHTS.)

hearing impaired Any person with a hearing loss, whether mild, moderate, severe or profound. "Deafness" is simply one degree of impairment among the hearing impaired, whose hearing capabilities range from 95 to 150 decibels, with zero being an imperceptible sound, 70 decibels the sound of a normal conversation and 120 decibels the sound of a jet airplane. A sound of 130 decibels is painful to the normal ear, while 150 decibels is

equivalent to the loudest air-raid siren. With proper care, the majority of the hearing impaired can develop normal speech and learn to function normally in every way, both in and out of school. Routinely “MAINSTREAMED” in traditional classes with children without handicaps, the hearing impaired may or may not require special in-class help, depending on the degree of their disability. Usually, personal hearing-aid devices are sufficient for mainstreaming, although some younger children may require additional help from teacher’s aides—to repeat a teacher’s remarks to the class, for example, by either close-up, face-to-face repetition of the words with more visible lip movements or by simplifying a teacher’s inaudible remark with simple noun-verb summaries.

Hebrew The language of the Old Testament and a required subject, along with Greek and Latin, in the curriculum of the early, theologically oriented colleges in the American colonies. An outgrowth of the Tudor educational revolution in England, Hebrew language studies began in grammar schools, where boys were expected to become fluent in Latin and gain an elementary knowledge of Greek and Hebrew during their seven years of preparation for college. Colleges of that era were theological schools where students training for the clergy were expected to be able to study Scripture in its original languages and subsequent translations: Hebrew, Greek and Latin. The Tudor educational revolution had started with Henry VIII’s break with the Catholic Church over the question of his divorce. A consequence of that break was the creation of the Anglican Church and the translation of the Bible into English, a development that offered literate Englishmen access to scriptural texts to which only the Roman Catholic clergy had hitherto been privy.

With that access, however, came the necessity of “careful education of the young,” according to Bishop Aylmer’s proclamation in *A Booke of Certaine Canons* (1571), and the need to supervise their “religion, life and conversation,” their church attendance and their partaking of Holy Communion, their use of the authorized catechism and their private activities, particularly with respect to popish teaching or the delivery of lectures preaching “innovations.” By teaching students to read Scripture in its original languages, English schoolmasters contended they “protected” their charges from “popish interpretations of mysterious tongues.”

So long as theology was the primary course of study at colleges in the American colonies, Hebrew remained a required course. Its importance gradually diminished in the 17th century, however, as the Age of Enlightenment and the Industrial Revolution saw the growth of secular studies. By the end of the Civil War, Hebrew had disappeared as a required course, and secular studies began dominating college curricula, leaving theology as a specialized course of study within a broad-based liberal arts education.

Hebrew Free School Association A 19th-century organization that countered efforts of Christian missionaries by founding a group of free schools for New York City’s Jewish immigrant children. In 1864, Christian missionaries had opened a school on the Lower East Side that offered to teach Hebrew to Jewish children, but the offer proved only a lure to convert Jewish children to Christianity. Outraged, a dozen Reform and Orthodox congregations opened a Hebrew free school nearby, with a complete Hebrew studies program that supplemented the standard curriculum of secular public schools. The school was so successful that the organizers formed a Free Hebrew School Association that opened branches in other Jewish neighborhoods.

Aside from turning back the threat posed by Christian missionaries, the association, which was made up of successful, Americanized Jews of German origin, became a major instrument for helping newly arrived Jews—mostly from impoverished shtetls and ghettos of eastern Europe—to adapt to their new country. In addition to traditional secular education and studies in the Hebrew language and Jewish religion and history, the schools taught the new arrivals hygiene and other American ways unknown in their homelands. The schools began closing in the 1870s, as the New York public school system expanded and as those Jews who had learned their lessons well emerged from the slums and moved elsewhere to assimilate with other Americans.

Hebrew school Any of a variety of schools that teach the Hebrew language and Jewish religion and history. At one end of the spectrum, a Hebrew school may be a full-scale, fully equipped school that combines Jewish education with the secular studies of public and private schools. At the other end is the part-time program of education conducted for children of the congregation by a Jewish temple or synagogue. Classes may be held once-a-week on Sunday mornings or on several afternoons during the week, after the end of conventional secular schools. Regardless of the breadth of the program, the curricular centrality of every Hebrew school is the teaching of the Hebrew language, both ancient and modern, of Jewish history and culture, and of the rituals and beliefs of Judaism.

Hebrew Union College—Jewish Institute of Religion (HUC-JIR) The oldest seminary in the United States dedicated to Jewish scholarship and the training of Reform Rabbis. The Hebrew Union College (HUC) was founded in Cincinnati, Ohio, in 1875 by Rabbi Isaac Mayer Wise to offer “general rabbinical

instruction . . . for the Jewish ministry.” Wise was convinced that “Judaism would have no future in America . . . unless . . . it would become reconciled with the spirit of the age” and the Jewish community found it possible to “educate American rabbis for the American pulpit.”

At the time, more than 200,000 Jews had already settled in the United States. Most had come from Germany in the 1840s and 1850s, had fanned out across the country, risen to middle and upper-middle economic status and had completely assimilated American ways. Their synagogues, however, lacked rabbis, and lay leaders adopted that role.

Seeking acceptance by their Protestant countrymen, few lay rabbis maintained the traditional Jewish orthodoxy of Europe. Indeed, little by little, there emerged a peculiarly American form of Judaism—Reform Judaism. Imitating many of the ways of liberal Protestantism, Reform Jewish congregations added organs, choirs, hymn singing, sermons and responsive readings in English. Many traditional prayers were recited in English.

Often called the “founder of American Reform Judaism,” Rabbi Wise was first to codify American Reform Judaism, which remains unlike any form of Judaism practiced in Britain or Europe. (Britain’s “Reform Judaism” is akin to American Conservative Judaism.) Rabbi Stephen S. Wise (unrelated to Isaac Mayer Wise) founded a similar school in New York City, the Jewish Institute of Religion. Motivated by financial difficulties, they merged in 1950, added a new campus in Los Angeles in 1954 and established their first campus in Jerusalem in 1963. Preparation for the rabbinate at the American campuses is equivalent to a doctoral program. The Jerusalem campus includes a postdoctoral school of archaeological and biblical studies. HUC-JIR also offers postbaccalaureate programs in sacred music for cantors, Jewish education and Jewish communal service, as well as Ph.D.

programs in Hebraic and cognate studies. All four college campuses serve secular students as well as students for the rabbinate.

Hegge-Kirk-Kirk Method A multisensory, remedial-reading instructional technique developed in the 1970s, emphasizing repetitive drill and practice with sounds of individual letters and letter combinations. Designed for the mentally retarded and older, reading-disabled children functioning at the first-, second- or third-grade level, the method helps children learn by having them see, sound, hear, trace and touch letters and letter combinations.

Henrico College A college that was to have been founded in Henrico, Virginia, originally "for the education of the children of those American Indian barbarians," but later for both Indian and English children. The school was originally proposed by James I in 1617, after he was charmed by the converted Indian princess Pocahontas during her visit to England. The Henrico project was backed by contributions of more than £2,000 and a large tract of land from the Virginia Company. The college had even appointed a rector, the Reverend Patrick Copland, chaplain of the Royal James and East India Company Fleet, and the owner of a fine library. In 1622, however, Indians raided Henrico, massacred settlers and left the Virginia Company—and the proposed college—ruined.
