reconquest of territory controlled by the Moors in the course of the 15th century also made scholarly texts available to Europeans. The development of printing by the German goldsmith and printer Johannes Gutenberg about the same time also contributed to the dissemination of knowledge. Shipbuilding was being revolutionized, with the development of the CARAVEL, which combined the sturdiness and roominess of European ships with the maneuverability of Arab vessels (see SHIPBUILDING AND EXPLORATION). Methods of navigation became more modernized with the growing use of the ASTROLABE, which the ancient Greeks had invented and Arab Muslims had used, as well as the recently invented CROSS-STAFF (see NAVIGATION AND EXPLORATION).

Along the West Coast of Africa

The date 1492, when CHRISTOPHER COLUMBUS first reached the Americas, is sometimes cited as the start of the European age of exploration. Yet it can be more accurately said that the Portuguese initiated this cultural period, and that HENRY THE NAVIGATOR, prince of Portugal, more than any other individual, inspired it. In 1416, he decided to make his home at Sagres near Cape St. Vincent, the southwesternmost point in Portugal, and there founded a naval depot. He also soon founded an observatory and a school of navigation, bringing together astronomers, mapmakers, and mariners. Among the projects was developing the caravel and studying navigational equipment. One of the scholars was MARTIN BEHAIM, who would contribute to technology, working on the astrolabe and cartography, and making the oldest extant GLOBE.

In 1418 and 1419, Henry, who would become known as “the Navigator,” even though he never made a voyage of exploration himself, sent out his first two expeditions, which explored the Atlantic islands of Porto Santo and Madeira. Many more expeditions would follow, reaching farther and farther southward along the Atlantic coast of Africa. The AZORES, about 900 miles out to sea, were located and colonized by GONÇALO VELHO CABRAL in the early 1430s. GIL EANNES’s rounding of Cape Bojador (the “Bulging Cape,” which, as far as Europeans knew, was the southernmost limit of the African coast) in 1434, dispelled many superstitions and misconceptions about sailing into southern waters. Two years later, AFONSO GONÇALVES BALDAYA reached the TROPIC OF CANCER. In 1444–45, DINÍS DIAS reached Cape Verde, Africa’s westernmost point. The Portuguese soon established a presence along the African coast and began developing the SLAVE TRADE. In 1455, Italian ALVISE DA CADAMOSTO, sailing for Portugal, became the first known European to observe the constellation known as the Southern Cross. The next year, he reached an island group directly to the west of Cape Verde, which was called by the same name—the Cape Verde Islands. Soon after Henry’s death in

1460, his mariners reached Cape Palmas, where the African coast turns eastward.

John II, who became king of Portugal in 1481, sponsored a new round of expeditions southward. In 1482–84, DIOGO CÃO headed an expedition in which he reached the CONGO RIVER (Zaire River). In a subsequent expedition of 1485–86, he traveled as far southward as present-day Namibia, almost reaching the TROPIC OF CAPRICORN. In 1487–88, BARTOLOMEU DIAS finally determined the southern extent of Africa, sailing around the tip of the continent and locating the CAPE OF GOOD HOPE.

Early Transoceanic Voyages

By the 1480s, Italian mariner and map dealer Christopher Columbus had devised a plan to sail westward across the Atlantic Ocean to the Orient. He presented the idea to King John, whose geographers proclaimed it unfeasible. King Ferdinand II and Queen Isabella I of Spain, however, were eventually convinced to give backing to such an expedition, and, in August 1492, Columbus set sail, reaching the Americas the following October. Between 1493 and 1502, Columbus led three more transatlantic expeditions, insisting until his death in 1506 that he had reached Asia. Others, some of whom had sailed with Columbus, also explored the Americas for Spain in the late 15th century and early 16th century, with most of their activity in the Caribbean Sea. These included AMERIGO VESPUCCI (an Italian), VICENTE YÁÑEZ PINZÓN, FRANCISCO MARTÍN PINZÓN, ARIAS MARTÍN PINZÓN, PÁNFILO DE NARVÁEZ, ALONSO DE OJEDA, JUAN DE LA COSA, and RODRIGO DE BASTIDAS. Spain was now fully engaged in world exploration as well as colonization. In 1493, Pope Alexander VI established a Line of Demarcation, defining the spheres of Spanish and Portuguese claims in the Americas; it was modified the next year in the Treaty of Tordesillas. It ran due north and south about 1,110 miles west of the Cape Verde Islands. All lands lying east of this line were to belong to Portugal, which verified their claim on Brazil; all those to the west were considered Spanish possessions.

England also soon dispatched ships, which reached the Americas. Italian mariner JOHN CABOT, who had unsuccessfully sought backing from Spain for an Atlantic crossing in the 1480s, presented his plan to King Henry VII of England, who, in defiance of the Line of Demarcation, offered his support. In 1497, Cabot reached Newfoundland and the east coast of Labrador in northeastern North America, the first documented European voyage to North America since the Vikings crossed the North Atlantic centuries before (Amerigo Vespucci may have explored northward from the WEST INDIES that same year). On a second expedition in 1498, Cabot may have traveled southward along the coast as far as the Chesapeake Bay before being lost at sea.

Meanwhile, the Portuguese had continued seeking a water route to the Orient. In 1497–98, VASCO DA GAMA proved the practicality of an eastward route by rounding the Cape of Good Hope, entering the Indian Ocean and reaching India. Other voyages along this route would soon follow, establishing a Portuguese presence along coastal East Africa as well as in the EAST INDIES. Moreover, the international spice trade now became a maritime enterprise. And, in 1501, Portuguese GASPAR CÔRTE-REAL, after reaching the west coast of GREENLAND the year before, made the second documented voyage to North America, exploring coastal Labrador and Newfoundland in the hope of finding a NORTHWEST PASSAGE to the Pacific Ocean.

It was an exciting time in Europe, with ships setting on new quests and others returning with information of exotic lands, along with proof of landings in the form of people, wildlife, and plants. And cartographers culled information from the returning mariners to create new representations of the world. In 1507, German MARTIN WALDSEEMÜLLER published the first world map depicting South America as a distinct continent; he chose the name America after a Latinized version of Vespucci's first name, based on the Italian mariner's accounts of his voyages.

In the meantime, Spanish colonization of the Americas was under way, leading to more sea traffic and more explorations. In 1513, JUAN PONCE DE LEÓN, who had been the governor of Puerto Rico, explored northward to Florida, and VASCO NÚÑEZ DE BALBOA, who had founded Santa María de la Antigua del Darién on the Isthmus of Panama, the first permanent European settlement on the mainland of the Americas, became the first European to see the Pacific Ocean from the west coast of the Americas.

Another defining moment in European consciousness and in world history—similar in impact to Columbus's and Vasco da Gama's expeditions—was the first CIRCUMNAVIGATION OF THE WORLD completed in 1522 by one of a fleet of five ships that had set out three years earlier under FERDINAND MAGELLAN, a Portuguese mariner sailing for Spain.

The French soon began pursuing maritime exploration. In 1524, Italian mariner GIOVANNI DA VERRAZANO, while looking for a Northwest Passage to the Orient, explored North America's east coast from present-day South Carolina to Newfoundland. In the 1530s–40s, JACQUES CARTIER, also seeking a Northwest Passage, explored the St. Lawrence River system and surrounding areas in what is now eastern Canada.

Inland Expeditions

More and more inland expeditions were launched as well in the first half of the 16th century, especially by Spain in the Americas. In 1519–20, HERNÁN CORTÉS explored parts of what is now Mexico for Spain and conquered the Aztec Indians. In 1531–33, FRANCISCO PIZARRO led a Spanish expedition to Ecuador and Peru and conquered the Inca. The

resulting riches obtained, along with the development of mining, made Spain the richest nation for years to come and helped create the Spanish Empire, the largest empire since the fall of the Roman Empire centuries earlier. In 1540–41, FRANCISCO DE ORELLANA traveled down South America's AMAZON RIVER, from the Napo River to the Atlantic coast. Also in the early 1540s, HERNANDO DE SOTO led the first extensive expedition in the American Southeast, and FRANCISCO VÁSQUEZ DE CORONADO explored much of the American Southwest and southern plains. Some of these expeditions were spurred on by legends of wealthy lands, such as EL DORADO in South America and the Seven Cities of CIBOLA in North America (see TREASURE AND EXPLORATION).

European and Canadian Arctic

Private companies, typically with government support, were formed to develop trading and colonization. The express purpose of one of these, the MUSCOVY COMPANY, founded in 1551, was to locate a NORTHEAST PASSAGE, a shorter eastward water route to Asia than around Africa. The first expedition outfitted by the company was that of SIR HUGH WILLOUGHBY; in 1553–54, it explored the waters of the European Arctic.

The Dutch also became active in maritime exploration. In 1584–85, OLIVIER BRUNEL made two voyages in search of the Northeast Passage, reaching Novaya Zemlya. In 1596–97, WILLEM BARENTS, also searching for the Northeast Passage, reached Bear Island and Spitsbergen (present-day Svalbard).

Continuing expeditions by the English led to new European knowledge of the Canadian Arctic. In 1576–78, MARTIN FROBISHER led three expeditions to the Arctic in search of the Northwest Passage, locating Frobisher Bay on southeastern Baffin Island. In 1585–87, JOHN DAVIS, who designed the Davis Quadrant, also led three English expeditions to the Arctic seeking the Northwest Passage and locating the eastern entrance of Hudson Strait.

Pacific Coast of the Americas

Another region reached by Europeans in the 16th century was the Pacific coast of the Americas, the European exploration of which had started with Magellan's journey around the world. In 1542–43, JUAN RODRÍGUEZ CABRILLO and BARTOLOMÉ FERRELO reached the present Oregon-California border of North America. SIR FRANCIS DRAKE, during the first English circumnavigation of world in 1577–80, reached as far north as Vancouver Island in present-day Canada.

West and South Pacific

This period of activity saw the increasing exploration of the West and South Pacific as well. In 1564–65, MIGUEL LÓPEZ DE LEGAZPI founded the first permanent Spanish settlement in the Philippines. In an expedition of 1567–69, ALVARO DE

MENDAÑA and PEDRO SARMIENTO DE GAMBOA made the European discovery of the Solomon Islands.

Cartography

As exploration flourished in the latter part of the 16th century, so did cartography. Spanish cartographer DIEGO GUTIERREZ produced the first map detailing the inland river systems of South America. Flemish cartographers GERARDUS MERCATOR and ABRAHAM ORTELIUS produced world atlases. Englishmen SIR HUMPHREY GILBERT and RICHARD HAKLUYT wrote about geography, and MARTIN LLEWELLYN published the first English atlas of the Far East.

17th Century

It is even harder to fix a date for the end of the European age of exploration than for the beginning. The end of the 16th

century is sometimes given, probably because of convenience. But perhaps the subsequent half-century mark, 1650, is a better date. There had been a belief in a GREAT SOUTHERN CONTINENT, known in Latin as Terra Australis, since the time of the ancient Greeks. The existence of Terra Australis proved to be a fable. Yet Dutch mariners in the first half of the 17th century did make the European discovery of Australia in the Southern Hemisphere and chart many of its coastlines. Early coastal explorations were carried out by Dutch mariners, including WILLIAM JANSZ in 1605, DIRK HARTOG in 1616, FREDERICK HOUTMAN in 1619, FRANÇOIS THYSSSEN in 1627, and ABEL JANSZON TASMAN in 1644. The Dutch were active in North America as well in the early 17th century. Englishman HENRY HUDSON, sailing for the Netherlands in 1609, explored New York Bay and the Hudson River in search of the Northwest Passage. In

The Americas are flanked by images of Christopher Columbus, Amerigo Vesputius, Ferdinand Magellan, and Francisco Pizarro in this replica of a 1596 map. (Library of Congress, Prints and Photographs Division [LC-USZ62-89908])

1610–11, on an expedition for his native country of England, he made the European discovery of HUDSON BAY.

It was Hudson's expedition to the Hudson River region that led to a Dutch claim and the eventual founding of New Netherland. By that time, SAMUEL DE CHAMPLAIN was already colonizing New France in present-day Quebec. In 1607, the English under JOHN SMITH had founded the colony of Jamestown in Virginia; in 1620, the PILGRIMS, among them EDWARD WINSLOW, founded the Plymouth colony in Massachusetts. There had been earlier attempts at colonies in the 16th century by both French interests under JEAN RIBAUT in present-day South Carolina and British interests sponsored by SIR WALTER RALEIGH in present-day North Carolina, but they had failed. By the mid-17th century, however, all the European nations that had sent maritime expeditions around the world were developing colonies. The slave trade was well under way as well. Millions of Africans would be transported across the Atlantic to the Americas.

A Continuum of Exploration

Perhaps a way to think of the subsequent European period of exploratory activity is an age of European COLONIZATION AND EXPLORATION. Many of the ensuing important European expeditions around the world were land based; parts of Asia, the Americas, Africa, and Australia would not be charted until the 19th century. Yet European mariners continued to contribute to world knowledge as well. In the 18th century, another European country, Russia, launched maritime expeditions. One of them, in 1740–41, under Danish mariner VITUS JONASSEN BERING would lead to a Russian claim on and a colonial presence in Alaska. A good number of the expeditions sent out by the British later in the 18th century—such as those headed by England's JAMES COOK—were scientific in nature, many of them to the Pacific Ocean and part of the mission to find the Great Southern Continent. In the course of his voyage of 1772–75, Cook made a circumnavigation of Antarctica, demonstrating that no other continent existed in southern waters. Cook did not sight Antarctica himself. The discovery of the last known continent on Earth occurred in the early 19th century, the first sightings in 1820–21, by British naval officer EDWARD BRANSFIELD, American sealer NATHANIEL BROWN PALMER, and Russian naval officer FABIAN GOTTLIEB BENJAMIN VON BELLINGSHAUSEN. Arctic regions also were further charted in maritime expeditions of the 19th century.

The European age of exploration changed the world in terms of geographic knowledge, commerce, and colonization. It led to the diffusion of technologies and agricultural products as peoples of different continents learned from one another. It resulted in the development of European empires

and the exploitation of native peoples and their resulting depopulation and cultural dispossession from disease, warfare, and slavery.

European Space Agency (ESA)

The European Space Agency (ESA) is an organization of European nations dedicated to the development of space research and technology for peaceful purposes. ESA was formed in 1975 from the merger of the European Space Research Organization (active since 1962) and the European Launcher Development Organization (active since 1964) and presently has 15 members: Austria, Belgium, Denmark, Finland, France, Germany, Ireland, Italy, the Netherlands, Norway, Portugal, Spain, Sweden, Switzerland, and the United Kingdom. Canada participates as an observer. ESA promotes programs for launchers, science, telecommunications, Earth observation, and piloted spaceflight. Member nations are obliged to invite ESA's participation in any space project. And a nation's financial contribution is determined by the extent of involvement in various projects.

ESA headquarters are in Paris, France. The European Astronaut Center, located in Cologne, Germany, is responsible for the selection and training of ASTRONAUTS. The European Space Research and Technology Center, in Noordwijk, the Netherlands, conducts research and directs artificial SATELLITE projects. The European Space Operations Center, in Darmstadt, Germany, controls, monitors, and retrieves data from satellites. The European Space Research Institute, in Frascati, Italy, documents information and manages data obtained from remote sensing satellites. There is also a meteorological office in Toulon, France. Launching facilities are found in Norway, Sweden, and French Guiana, and tracking stations are located in Belgium, Germany, Italy, and Spain.

ESA has contributed greatly to SPACE EXPLORATION since its founding. The Ariane ROCKET, developed in the 1970s–80s, has been a mainstay in satellite launching. Arianespace, a division of ESA, is the first commercial space transportation company and launches a large portion of commercial satellites. ESA developed *Spacelab*, a module for scientific and medical studies, which first flew on the SPACE SHUTTLE in 1983. ESA ASTRONAUTS (the French call them *spationauts*) spent time on the *Mir* SPACE STATION of the Union of Soviet Socialist Republics (USSR; Soviet Union), since its first module was put into orbit in 1986. In 1986, ESA launched the *Giotto* SPACE PROBE, which studied Halley's Comet, and, in 1990, participated with the United States in the *Ulysses* probe, which flew over the poles of the

Sun. In 1995, ESA placed the Solar and Heliospheric Observatory and Infrared Space Observatory into orbit. The joint U.S.-ESA space probe *Cassini*, launched in 1997, is intended to explore Saturn, its rings, and some of its moons on arrival in 2004. The probe *Mars Express*, launched in 2003, will study the planet Mars into 2005. ESA is also involved in the ongoing construction of the International Space Station.

ESA has proven itself as a model of international cooperation while furthering knowledge of space and creating a successful commercial venture in the launching of satellites. It has also helped promote the idea of developing space programs around the world.

Everest, Mount

Mount Everest is a mountain peak in the central HIMALAYAS of Asia, located on the border between Nepal and the Tibet region of China. According to a survey by SATELLITE, Mount Everest's summit is 29,035 feet above sea level. (An earlier survey by the Indian government had determined 29,028 feet.) The Tibetans call the peak *Chomo-Lungma*, for "mother goddess of the land"; the Chinese (see CHINESE EXPLORATION), who claim it as part of China, use *Qomolangma Feng*, for "sacred mother of waters." The English name, *Everest*, was given in 1856 by Englishman Andrew

Waugh in honor of fellow Englishman SIR GEORGE EVEREST, under whom he had worked as a surveyor in India. As the highest elevation in the world, summitting Mount Everest came to symbolize a long sought-after goal in the history of world exploration and the ultimate challenge in MOUNTAIN CLIMBING.

The British, with assistance from Nepalese SHERPAS, made pioneering attempts on Mount Everest in the 1820s. In a climb via the north side in 1924, GEORGE HERBERT LEIGH MALLORY and Andrew "Sandy" Irvine lost their lives. Attempts continued the following years, falling short. In 1933, two British airplanes flew over the peak for the first time.

The summit was finally reached by Nepalese TENZING NORGAY and Englishman SIR EDMUND PERCIVAL HILLARY via the southeast side on May 29, 1953. Four Swiss mountain climbers repeated the achievement three years later. In 1963, an American team completed an ascent via the west; in 1975, a British team did so via the southwest; and, in 1980, a Japanese team did so via the north.

More than 600 climbers of many nations have now climbed Mount Everest. Nearly a third of that number have lost their lives on the mountain. As recently as 1996, eight climbers died in a blizzard on the descent after having reached the top. Many bodies have remained on the mountain. Mallory's remains were not located until 1999.

F

fool's gold (pyrite, iron pyrite)

Fool's gold, a mineral composed of iron sulfide, FeS_2 , is known by the technical name pyrite, or iron pyrites. Brassy yellow in color with a metallic luster, it often occurs in cube-shaped crystals. Its resemblance to gold led to its playing a part in the history of exploration.

In 1542, JACQUES CARTIER, exploring northeastern North America for France, in his search for the mythical Native American land of SAGUENAY, found what he believed to be gold and precious stones near the St. Lawrence River of present-day Canada. When tested in France, the minerals turned out to be pyrite and quartz.

In 1576, SIR MARTIN FROBISHER, exploring for England, brought a sample of pyrite back from Baffin Island in Frobisher Bay in what is now northern Canada, believing it to be gold. His rock was initially analyzed by two scientists, who reported it to be nothing more than worthless pyrite, but an Italian alchemist by the name of Aquello claimed he had found a speck of gold in the samples.

The CATHAY COMPANY was founded to develop mining interests, with London merchant Michael Lok a principal investor. Frobisher carried out two other expeditions, with mining operations the financial incentive, in 1577 and 1578, and returned with some 200 tons and 1,350 tons of ore respectively, which yielded nothing of value to the investors.

Fountain of Youth

The first known mention of a Fountain of Youth, the water of which would supposedly give the drinker eternal youth, relates to the legend of PRESTER JOHN, a fabled Christian monarch who was believed to rule territory in either Asia or Africa in the 12th century or afterward. Yet, the search for such a fountain is most associated with the explorations of the Spanish conquistador, JUAN PONCE DE LEÓN, as reported by Spanish historians Gonzalo Fernández de Oviedo and Antonio de Herrera.

By 1509, Ponce de León had been given the right by King Ferdinand of Spain to subjugate the native population of Puerto Rico and to take four-fifths of the spoils for himself, turning over the remaining fifth to the king. He had quelled Native American resistance and, over the next three years, ruled Puerto Rico as its governor, becoming wealthy from gold on the island. From the Carib Indians, Ponce de León heard reports of a land to the north, known as "Bimini" or "Boyuca," where there was supposedly gold in abundance and where a spring gushed with a magic water that gave perpetual youth to those who drank it or bathed in it. On losing his position as governor for political reasons in 1512, he was granted, as partial compensation, the commission to search for Bimini and colonize it.

In March 1513, Ponce de León left Puerto Rico in search of his new territory and the so-called Fountain of Youth. He sailed among the islands of the Bahamas and

briefly explored the coastlines. On April 2, he landed on the coast of Florida, near present-day St. Augustine. The next day was Easter, and he named his discovery *Pascua Florida*, after the Spanish tradition of celebrating Easter with flowers. Ponce de León believed this new land to be an island and spent seven weeks exploring its coast. He was frustrated in his search for gold and the restorative waters by Indian resistance. In September, after resupplying his ships in Puerto Rico, Ponce de León returned to the Bahamas, where he spent six weeks looking for the fabled fountain without results.

The search for the Fountain of Youth was delayed while Ponce de León fulfilled military obligations for the king. In 1521, at his own expense, he departed for the west coast of Florida with two ships and 200 men and landed near modern-day Tampa. It was his intention to establish a base from which to bring the land under control and to find the mythical fountain. Once again, the Indians were not welcoming, and they killed many of his party and wounded Ponce de León himself. The expedition sailed back to Cuba, where he died at age 61.

The legend of the Fountain of Youth faded with time. Two of the islands of the Bahamas became known as the Bimini Islands after the fabled land.

French East India Company

In 1664, Jean-Baptiste Colbert, a statesman in the employ of French king Louis XIV, organized a joint-stock company, known as the French East India Company. The following year, the company established a base of operations on the island of Bourbon (present-day Réunion) in the Indian Ocean, which had been settled by France earlier in the century. In 1675, the company began trading at the port of Surat in northwestern India; the following year, at Pondicherry on the Coromandal coast of India. The latter became the company's most important port.

The company was profitable, trading from the EAST INDIES to Iran and China, but suffered from the extravagances of the French king. Drawing against the company's holdings, Louis XIV not only lavished his court with luxuries, he also engaged his nation in expensive wars. In 1719, facing bankruptcy, the French East India Company merged with several other French trading companies active in North America and Africa, including the Mississippi Company. The new concern was known as the *Compagnie des Indes*. Scottish financier John Law formulated a plan for the colonization and commercial exploitation of the Mississippi Valley and other French holdings in the Louisiana, known as the Mississippi Scheme. The company was heavily promoted, leading to a great inflation in its stock, and many French migrated to Louisiana. In October 1720, however,

due to overexpansion of its activities and the lack of assets, the company's stock crashed. Law fled from France.

The French East India Company regained its independent status in 1723. It suffered continuing losses. In 1730, it gave up participation in the transatlantic SLAVE TRADE. The next year it ceased all trade activities in Louisiana. And in 1736, it ceased the coffee trade in other parts of the Americas. The company henceforth concentrated its efforts on promoting trade with India. It established sugar plantations on Île de France (present-day Mauritius) and imported slaves to work the plantations. The company prospered for a time under the leadership of the governors in India, including Benoît Dumas, who oversaw its interests in 1735–41, and Joseph François Dupleix, who came into increased competition with the BRITISH EAST INDIA COMPANY in 1742–54. In 1751, British military leader Robert Clive captured Arcot in southern India. In 1761, other British forces captured France's premier port, Pondicherry. As a result, the French East India Company went into a rapid decline. By 1769, the company had ceased operations and had turned its possessions over to the French government.

fur trade

The fur trade, the commerce in animal skins and pelts, has played a significant part in world exploration and development. Trade in furs has taken place since ancient times in all hemispheres and among various peoples. Yet it is most directly tied in with the history of exploration in the Northern Hemisphere, especially in northern parts of North America and in SIBERIA in eastern Asia. Europeans of all the colonial powers, especially in the 16th through 18th centuries—the French, Dutch, English, Russians, and, to a lesser extent, the Spanish—bartered trade goods, such as iron tools and utensils, cloth, glass beads, firearms, and alcoholic beverages, with indigenous peoples in order to fulfill a demand for furs in Europe, especially beaver pelts for felt for the making of hats with brims, a fashion style that first caught on in the 1580s. But the pelts of other animals, such as muskrat, mink, marten, fox, sea otter, and seal, were also sought. After the founding of the United States, Euro-Americans continued working the fur trade. Some became hunters and trappers themselves. And some native peoples acted as middlemen between other tribes and the European or Euro-American traders. The fur trade involved the capture of fur-bearing animals through hunting and trapping, skinning them, then transporting the skins for processing into fur clothing and felt.

French Trade

In early colonial times, the French most thoroughly exploited the fur trade. Whereas mining and the raising of live-

stock had a greater economic bearing on the development of Spanish colonies, and farming dominated the economy and land use of the English colonies, commerce in furs determined French expansion. The French and Indian fur trade began with JACQUES CARTIER in 1534 along the St. Lawrence River. His original intent had been to find a NORTHWEST PASSAGE from the Atlantic Ocean to the Pacific Ocean and gain maritime access to the Orient, but he found instead an untapped source of furs among Native Americans, who were eager to trade for European goods. SAMUEL DE CHAMPLAIN began colonizing New France in 1604, with trade with Native Americans central to the colony's economy. Over the next years, Champlain explored the northern woods and established trade agreements with various tribes to deliver their pelts to French trading posts. Port Royal in Acadia (now Annapolis Royal, Nova Scotia), Quebec City, and Montreal all became thriving centers of commerce.

Eastern Algonquian-speaking tribes, such as the Cree, Algonkin, Montagnais, Naskapi, Abenaki, and Micmac, were all involved in the French fur trade. Yet the Iroquoian-speaking Huron (Wyandot) became the foremost suppliers. From the years 1616 to 1649, the Huron, in conjunction with the Algonquian Ottawa and Nipissing, developed a trading empire among Native Americans from the Great Lakes to the HUDSON BAY to the St. Lawrence. Each of the three main trading partners had its own river and portage route for travel by CANOE, plus a yearly schedule, linking them up with each other and other tribes as well. Acting as middlemen, the Huron traded agricultural products to other tribes for pelts, which they then carried to the French in Quebec city or Montreal, to trade for European wares. In their flotillas of canoes, now laden with goods, they then completed the trade circle, returning to other peoples to exchange some of the European trade goods for still more furs.

This complex trade relationship lasted until the mid-17th century, ending with the military and economic expansion from the south by the five Iroquois (Haudenosaunee) nations—Mohawk, Oneida, Onondaga, Cayuga, and Seneca—who at the time were trading partners of the Dutch working out of Fort Orange (present-day Albany) in New Netherland. The Dutch also carried out some trade for furs with the Algonquian-speaking Lenni Lenape (Delaware) and Wappinger Indians out of New Amsterdam in present-day New York City. In the meantime, many Frenchmen, some of them sponsored by de Champlain and others by the Catholic Church, were venturing along lakes and rivers into the wilderness in search of new sources for furs. Many more would follow. The men who earned a livelihood by paddling large canoes into the wilderness in quest of furs for licensed traders came to be known as VOYAGEURS; the independent, unlicensed entrepreneurs who defied regulations, many of them living among the native popula-

tion, became known as COUREURS DE BOIS. Both voyageurs and coureurs de bois would propagate a group of people associated for years with the fur trade—the Métis—mixed-bloods of predominantly French and native descent, or of Scottish and native descent, especially Cree, Chippewa, and Assiniboine.

The fur market varied in profitability, one crash occurring in 1696. Yet the French fur trade expanded into new regions. Under royal management, New France extended its territory from the Great Lakes across the MISSISSIPPI RIVER into the Louisiana Territory. PIERRE-ANTOINE MALLET and his brother Paul as well as PIERRE GAULTIER DE VARENNES DE LA VÉRENDRYE helped open the trans-Mississippi region in the first half of the 18th century. French traders also expanded their markets in the south, from settlements along the Gulf Coast northwestward along the Mississippi and Red Rivers—parts of present-day Louisiana and Texas. New Orleans, founded in 1718, became a bustling center of commerce. And during the 18th century, the French established a special trade relationship with the Taovaya in the Southwest, the French name for both Wichita and Caddo Indians, who acted as middlemen for them as the Huron had done for the French the century before.

British Trade

England, after the takeover of New Netherland from the Dutch in 1664, inherited a trade relationship with the Iroquois. They also developed trade relations with tribes in the fur-rich untapped Hudson Bay region. Claim to the area was based on the voyage of HENRY HUDSON in 1610. The fur-trading expedition of MÉDARD CHOUART DES GROSEILLIERS and his brother-in-law PIERRE-ESPRIT RADISSON to the region in 1668–69 led to the founding of the HUDSON'S BAY COMPANY in 1670. The English, rather than sending traders inland to collect furs as the French did, established trading posts for barter with the Indians—especially the Cree and Chipewyan—at the mouths of the large rivers that drained into the bay. Ships could come and go in the summertime when the northern waters were free of ice. At this time, England did not know the extent of Rupert's Land, as its northern holdings were called, after Prince Rupert, the Hudson's Bay Company's chief backer and first governor. The French also claimed the Hudson Bay region and sent out various military expeditions against British posts, with some successes, and continued to play a dominant role in the fur trade until England's ultimate victory in the French and Indian Wars and the Treaty of Paris in 1763.

Starting in the 1780s, the Hudson's Bay Company also encountered fierce competition from the NORTH WEST COMPANY, founded by Scottish interests in Montreal. The rivalry spurred a period of extensive exploration in which new Indian contacts were established, especially among the tribes of the Canadian West. A "Nor'wester," SIR ALEXANDER

MACKENZIE, became the first non-Indian to cross the North American continent north of Mexico in the early 1790s. DAVID THOMPSON, who worked for both companies at different times in his career, mapped much of the Canadian West in the late 18th and early 19th centuries. The two companies merged in 1821 under the name of the older company, and the Hudson's Bay Company thrived in the fur trade for years to come.

Russian Trade

During the period of conflict between France and Great Britain, Russia also began developing its fur trade. Russia had been a world source of furs for centuries, especially luxury furs. With fur-bearing animals depleted in western parts, the *promyshlenniki*—Russian fur traders and hunters—pushed eastward into Siberia. Early traders, such as YEROFEY PAVLOVICH KHABAROV, who explored the Amur River in southeastern Siberia in the mid-17th century, conducted some trade in the region. In the mid-18th century, EMELIAN BASOV, one of the Cossacks who explored eastern Russia, developed the fur trade as far as the Kamchatka Peninsula.

In the years after Danish VITUS JONASSEN BERING's and Russian ALEKSEY ILYICH CHIRIKOV's voyage of exploration to Alaska on behalf of Russia in 1741, the *promyshlenniki* extended operations to North America, reaching the Aleutian Islands and the Alaskan mainland, where the sea otter was plentiful. In the early years, the traders formed ad hoc companies, with no rules governing their operations or their exploitative treatment of the Aleut, the native peoples on the Aleutian Islands, and the Inuit (Eskimo), on the mainland. The typical early Russian method of acquiring furs was to enter a native village, take hostages either by means of violence or with the threat of violence, pass out traps to the men, then demand furs in exchange for the lives of the women and children. If the men failed to deliver furs, hostages would be executed. Then, when the furs were collected, the Russians would depart until the next season.

By the 1780s, British and American traders also worked the Pacific coast, especially in Nootka Sound in present-day British Columbia. But they also extended their activity to Alaska in the north and in California in the south. Ships would sail from Boston around South America to fur country, then transport the sea otter skins to China, where there was a great demand.

To protect their territorial claims and economic interest, the Russians, under the impetus of GRIGORY IVANOVICH SHELIKOV, and his employer, Ivana L. Golikov, who had set up a base at Okhotsk in Siberia, began establishing permanent colonies, the first at Three Saints on Kodiak Island in 1784. Because of Shelikov's efforts and those of ALEKSANDR ANDREEVICH BARANOV, in his employ, in 1799, the RUSSIAN-AMERICAN COMPANY was chartered, with a monopoly in all Russian territory in North America. By 1812, that terri-

tory extended to northern California, where Fort Ross was founded near Bodega Bay.

American Trade

During colonial times, U.S. interests participated only minimally in the fur trade. The deerskin trade flourished in the Southeast, however. In 1808, JOHN JACOB ASTOR founded the AMERICAN FUR COMPANY, having various subsidiaries to follow, such as the Pacific Fur Company, with a trading post at Astoria, Oregon, and the South West Company, operating near the Great Lakes. The next year, a group in St. Louis on the Mississippi River founded the ST. LOUIS MISSOURI FUR COMPANY. Among the partners were JEAN PIERRE CHOUTEAU, his son AUGUSTE PIERRE CHOUTEAU, MANUEL LISA, WILLIAM CLARK, ANTOINE PIERRE MENARD, and ANDREW HENRY.

Both enterprises sponsored numerous expeditions into the western wilderness. In 1816, the American Congress enacted a law excluding British traders from the United States. Another American entrepreneur, WILLIAM HENRY ASHLEY, became a powerful force in the fur trade with his ROCKY MOUNTAIN FUR COMPANY, founded by him and Andrew Henry in 1822. Many of the men who worked for and traded with him came to be known as the MOUNTAIN MEN. Among the most famous of them were THOMAS FITZPATRICK, JEDEDIAH STRONG SMITH, and WILLIAM LEWIS SUBLETTE. In the 1820s–1830s, they traveled the Native American trails and passes of the West as hunters, trappers, and traders, and like the voyageurs and the coureurs de bois of French Canada, they learned wilderness survival skills from Native Americans.

During these same years, the U.S. government also played a part in the fur trade, through a system of federal trading houses, called the “factory system.” From 1790 to 1799, the U.S. Congress passed four Trade and Intercourse Acts pertaining to Indian affairs and commerce. Among other regulations, the acts provided for the appointment of Indian agents and licensing of federal traders, who could barter with the Indians for furs. In 1802, a follow-up Trade and Intercourse Act codified the four earlier ones. And, in 1806, an Office of Indian Trade was created within the War Department to administer the federal trading houses. The “factory system” was abolished in 1822, at which time provisions were made for the licensing of independent traders, who were better able to operate in the wilderness.

The international fur market experienced a decline starting in the late 1830s, partly because the beaver hat went out of style in favor of the silk hat. Other factors contributed to the end of the centuries-long fur boom: the depletion of fur-bearing animals and the advance of farming settlements. As for the mountain men and other counterparts, many of

them stayed active in the American West long after the fur decline, as soldiers, scouts, and guides. In 1867, Russia gave up its North American venture and sold Alaska to the United States, and in 1869, the Hudson's Bay Company sold off its vast territorial holdings to the Canadian government. Yet the fur trade had made its mark in the history of exploration; the traders had pioneered routes, mapped vast

regions, and opened up vast areas to non-Indian settlement and other types of commercial development. Nowadays, the fur trade is still carried out in the far north, mostly by indigenous peoples.

galleon

The term *galleon* refers to a large ship with three to four decks and three square-rigged masts, except typically for the third (mizzen) mast, which had a triangular sail to help control direction. It was developed by the Spanish from the smaller CARRACK starting in the 15th century, with refinements throughout much of the 16th century. While the carrack started at around 80 tons, the galleon ranged from 500 to 1,400 tons displacement.

The galleon, too large for exploring uncharted coastlines, was designed for carrying cargo and for warfare. The Spanish used it to haul treasure and other resources from the Americas, taken from the Aztec and Inca Indians (see TREASURE AND EXPLORATION). They also used it to defend against fighting ships of other nations, notably the English. The size of the galleon not only made it harder to sink, but also allowed it to carry more guns, which were located in batteries on its broadsides.

As the flow of goods from their principalities increased, the Spanish devised a convoy system where 10 or more ships sailed together, guarded by galleons. In order to counter these measures, the English created smaller and faster fighting vessels, able to dodge the galleon's formidable firepower.

See also SHIPBUILDING AND EXPLORATION.

galley

The term *galley* or *galley ship* refers to a variety of vessels that were powered mainly by oar. The term is primarily as-

sociated with the vessels of ancient civilizations surrounding the MEDITERRANEAN SEA. The ancient Egyptians used galleys for transportation and trade on the NILE RIVER, RED SEA, and Mediterranean. By 1500 B.C., Egyptian ships were as large as 130 feet long and 16 feet wide. The Minoans also used galleys. Other ancient mariners, the Phoenicians, invented an early form of the galley, constructing it from cedar planks and using caulk to seal the seams. If the Phoenicians did make the journey around Africa in about 600 B.C., as fifth-century B.C. Greek historian HERODOTUS recorded, it would have been a galley that they used. Other Mediterranean peoples, the Greeks and the Romans, built later versions of the galley.

It is believed that most ships were constructed hull-first. Planks were fashioned and held together end to end with dovetail joints. On the edges, holes were drilled, and dowels of a hardwood were used to connect the planks along their length. The preferred woods for the planks were cedar, cypress, and pine. The ribs, which were inserted later, were made of a hardwood such as oak. Caulking was also necessary and was accomplished with a variety of fibrous materials and additives such as pitch and lime. Later shipbuilders began making the frame of their vessels first, then attaching the planking. Metal nails were used to hold the hull and frame together, copper being favored for its resistance to rust. In addition to caulking, a sheath of lead might also be added to prevent leaking and add to a ship's durability.

Galleys came to be as long as 150 feet with 50 oars, typically one man to an oar. Designers learned to build the

ships seven to eight times as long as they were wide for maximum speed. The oarsmen, often slaves, prisoners of war, or convicts, sat on benches to which they were chained. There would be decks built on either end of the ship for officers and passengers. Cargo and supplies would be stored in containers at the open center of the boat. Some galleys had sails, but typically more for decoration than for taking advantage of wind power.

As galleys advanced in design and size, more levels were added. The bireme was a version with two levels of oarsmen; the trireme had three levels. A galley containing five levels of oarsmen, was first recorded as being produced in the Italian city of Syracuse in 398 B.C., and galleys with as many as six levels of rowers have been recorded.

The galley was not suited for long trading voyages on the open ocean. To provision a crew that expended as much energy as the required number of oarsmen would not have been economical. The standard practice was to pull the ship on to shore at the end of the day and make camp. Cooking was done on the beach, not in the ship.

The galley was the primary warship of ancient civilization. The Greeks introduced the ram—a sharp projection on the front of a ship—for the purpose of ramming into and sinking an enemy vessel. The Romans made hooks to pull

enemy vessels to theirs and used planks as bridges to board them. After A.D. 395, when the Roman Empire was divided into the Western Roman Empire and the Eastern Roman Empire (the Byzantine Empire), the Byzantine navy came to use a type of fast galley, known as the dromon, or racer, with one or more banks of oarsmen to accompany and protect the larger cargo galleys.

At the beginning of the 14th century, the development of the galley reached its pinnacle. The *galea grossa*, designed and built for the needs of the traders of Venice, could be as large as 250 tons and complemented rowing with sail power. These ships, launched from the great cities of the eastern Mediterranean, through the Strait of Gibraltar (see GIBRALTAR, STRAIT OF) and north to England, were active into the 17th century. Yet, after Portugal established a trade route around Africa in the 16th century, and sail power was made more efficient, use of galleys dropped off. The design of boats in northern Europe during the Middle Ages came to rely predominantly on wind power, but in order to survive the unpredictable winds, they too would have a bank of oars. By the 15th century, most oceangoing ships were too heavy to row.

The LONGSHIP of the Vikings is a type of galley. In modern usage the term *galley* refers to the kitchen of a ship.

Ganges River

The Ganges, the most important river of the Indian subcontinent, flows 1,560 miles from the HIMALAYAS in northern India, over the area called the Gangetic Plain, through Bangladesh to the Indian Ocean. Formed by the confluence of the Bhagirathi and the Alaknanda Rivers, the Ganges River's annual discharge is rivaled only by the AMAZON RIVER in South America and the CONGO RIVER (Zaire River) in Africa. The Bhagirathi River, originating in an ice cave of the Gangotri at a height of 13,000 feet, is considered the source of the Ganges, later met by the Alaknanda River, fed by melting snow and glaciers. The Yamuna River is a main tributary. The Ganges changes names as it passes through India and Bangladesh. The main course of the river flows south and is joined by the Brahmaputra River and then by the Meghna River (the name by which it is known thereafter), as well as numerous other tributaries, before entering the Bay of Bengal. The delta region is referred to as the Ganges Delta or the Ganges-Brahmaputra Delta.

Of significant religious importance to the Hindu population, which composes a majority of India, the river is named after the Hindu goddess Ganga, daughter of Meru, the mountain god Himalaya. Hindus consider drinking from and bathing in the waters of the Ganges a sacred act, and the ashes of deceased persons are scattered in the river. Along the river and in the mountains by its headwaters are many holy sites visited by Hindu pilgrims, for the Lord Vishnu is said to have bathed there. The Ganges, with its snow-fed waters, is economically significant in addition, providing irrigation waters and fertilizing important foodcrops including rice, sugarcane, lentils, oil seeds, potato, and wheat.

Ancient Contacts

After the early Indus Valley civilization disappeared from India, replaced by Aryan tribes migrating from central Asia, the Gangetic Plain became a center of civilization. Starting in the sixth century B.C., the kingdom of Magadha grew in power and was later called the Mauryan Empire as it expanded into central India. By this time, the Persian Empire to the west had conquered as far east as the INDUS RIVER. In the fourth century B.C., Greek historian HERODOTUS wrote his account of the wars between the Greeks (see GREEK EXPLORATION) and the Persians, using his own travels, reports from traders, and earlier accounts to describe the geography of the known world. In Herodotus's account,

the lands east of the Indus River were unpopulated and the home of giant birds and other fantastic animals.

From 420 to 400 B.C., a Greek by the name of CTESIUS OF CNIDUS, in service as court physician to Darius II, emperor of Persia, traveled through Persia and east into India. Ctesius was the first Westerner to report about the Ganges River, and he discredited Herodotus's descriptions of the lands east of the Indus. Ctesius reported things no less fantastic than Herodotus, telling of men with giant feet, or dog-like faces, as well as huge worms in the Ganges that devoured camels and oxen. The latter, however, could be a description of the crocodiles that inhabit the river.

In 334 B.C., after ALEXANDER THE GREAT of Macedonia consolidated his rule over the Greek city-states, inspired by the writings of Herodotus and other accounts of the East, he made a military assault on the Persian Empire. Alexander advanced onto the Anatolian plateau, the Asian part of modern-day Turkey, conquering all of Asia Minor. After consolidating power over the countries on the Mediterranean coast as far west as Egypt, Alexander defeated Darius III of Persia, continued east through Afghanistan, and finally crossed the Hindu Kush range into India. Alexander's goal was to conquer India as far as the Ganges River, but his soldiers mutinied, fearing the strength of the Mauryan kings.

Alexander's empire collapsed into smaller kingdoms after his death in 323 B.C., while the Mauryan Empire continued to flourish around the Ganges. The ruler of a kingdom in ancient Syria sent a Greek diplomat, MEGASTHENES of Ionia, in about 302 B.C., as ambassador to the Mauryan Empire. Megasthenes traveled throughout northern India, making observations of Hindu culture and the natural history of the region. He was the first Westerner to make accurate observations of the Ganges River and to surmise its source correctly. Somewhat later in the middle of the third century B.C., a Hellenistic kingdom was established in Bactria, covering modern-day Afghanistan, Uzbekistan, and Tajikistan, and which, by about 150 B.C., had expanded to meet the Ganges River in the east. This kingdom collapsed under internal and external pressure. By that time, however, the Ganges had ceased to be a place shrouded in mystery for the Western world.

Chinese Buddhists

Contact between India and the lands to its east, including the flourishing Chinese Empire, was made extremely difficult by the high mountains and rugged terrain separating the two regions. But Buddhism, an offshoot of the ancient Hindu religion, spread slowly from the Ganges River Valley to the north and east. In the late fourth century A.D., a Buddhist monk called FA-HSIEN traveled into northern India by way of Afghanistan to retrieve ancient Buddhist texts and to visit Buddhist shrines. It was a long and arduous journey

through deserts and high mountains, and Fa-hsien returned without seeing the Ganges. In the seventh century, another Chinese Buddhist monk, HSÜAN-TSANG, conscious of the continued need for Buddhist texts from India to solve disputes and fill in gaps in religious knowledge, made his own journey into India. Hsüan-tsang eventually reached the valley of the Ganges, followed the river, and reached the Buddhist university in Baragaon.

Another famous Chinese pilgrim, I-CHING, inspired by the journeys of Hsüan-tsang, made his own trip to the Ganges River and the Buddhist holy sites there in A.D. 671. He traveled overland initially, but because of political turmoil in Tibet and the presence of Muslims (see MUSLIM EXPLORATION) in Afghanistan, I-ching boarded a Persian ship. He sailed to the mouth of the Ganges, then trekked overland, visiting holy sites before finally settling to study in Magadha, the ancient birthplace of Buddhism.

Charting the River

Although there had been parties of exploration sent by Indian rulers during periods of stability during the turmoil following the invasion of Islamic Turks in the 11th century, the river remained uncharted. In 1624–25, ANTONIO DE ANDRADE, a Jesuit missionary (either Portuguese or Spanish), who traveled from northern India across the Himalayas into Tibet, reported finding waters feeding the Ganges. Yet it was not until the British gained control of the Indian subcontinent in the 18th century that systematic exploration of the river was made. A British survey team, inspired by the tradition of expanding scientific knowledge of the Age of Enlightenment, as well as more practical political and tactical considerations, determined that the Bhagirathi River issuing from the foothills of the Himalayas was indeed the source of the Ganges, confirming the deduction of Megasthenes more than 2,000 years prior.

Gemini program (Project Gemini)

The Gemini program was one of a series of programs carried out by the United States for the purpose of SPACE EXPLORATION. Following the creation of the APOLLO PROGRAM in 1961 for the purpose of placing humans on the Moon, the NATIONAL AERONAUTICS AND SPACE ADMINISTRATION (NASA) instituted a number of programs to help accomplish such an undertaking: the manned MERCURY PROGRAM of 1961–63 to launch the first Americans into space; the manned Gemini program of 1964–66 to help develop the necessary techniques for a lunar mission; and the unmanned Surveyor program of 1966–68 to probe the lunar surface. The Gemini program competed with the VOSKHOD PROGRAM of the Union of Soviet Socialist Republics (USSR; Soviet Union).

Gemini missions were designed to keep two ASTRONAUTS in space for extended periods of time, perfect rendezvous and docking techniques, conduct experiments on equipment and human adaptation to conditions in space, and make accurate landings. All the missions were launched from Cape Canaveral (now Cape Kennedy), Florida, with a Titan II intercontinental ballistic missile (ICBM) as the propelling ROCKET. The Mission Control Center (MCC) was based in Houston, Texas.

The Gemini spacecraft had two modules: the adaptor module for orbital and docking operations, and the reentry module to return to Earth. Gemini spacecraft were controlled by the pilot, unlike those of the Mercury program. Landings were by parachute into the Atlantic Ocean or Pacific Ocean.

Twelve Gemini flights were conducted, the final 10 piloted. The most famous of these was *Gemini 4* in June 1965, during which EDWARD HIGGINS WHITE II became the first American to participate in extravehicular activity (EVA), more popularly known as “walking in space.” (ALEXEI ARKHIPOVICH LEONOV was the first human to walk in space, for the Soviet Union, in March of that same year on *Voskhod 2*.) *Gemini 4* set a record of four days in space; *Gemini 5*, seven days; and *Gemini 7*, 14 days. *Gemini 6* and *7* were in orbit at the same time and accomplished a rendezvous of within a few feet. A variety of rendezvous and dockings, with differing target vehicles, were accomplished from *Gemini 6* on. In the entire Gemini program, astronauts logged about 2,000 hours in space and about 12 hours in EVA.

geography and cartography

Geography is the science of Earth’s surface form. The first-known use of the term, literally meaning “earth description,” is by third-century B.C. Greek scholar ERATOSTHENES. Geographic studies encompass both physical and cultural features, that is, both the natural environment and the human environment.

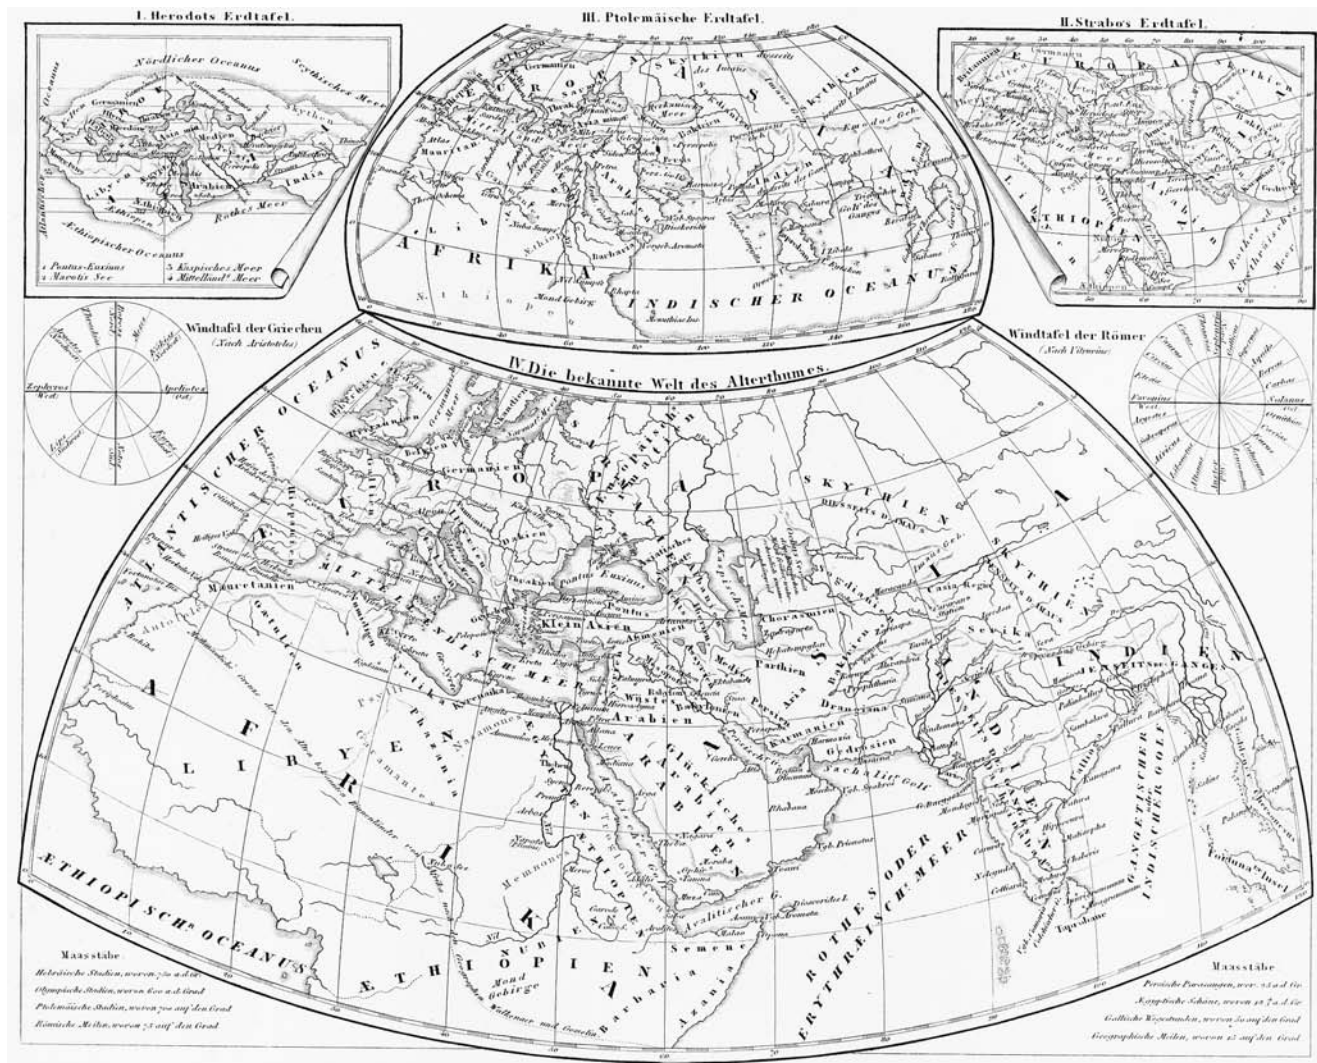

The two broad classifications of geography are physical geography—including geomorphology, climatology, biogeography, soils geography, HYDROGRAPHY, and oceanography (see OCEANOGRAPHY AND EXPLORATION); and cultural geography, also called human geography (and formerly anthropogeography)—including historical geography, political geography, military geography, economic geography, ethnography, historical geography, urban geography, demography, and linguistic geography. Geography is thus an integrating discipline, bridging earth sciences and social sciences. There are two general approaches to geographic studies: “systematic geography,” focusing on an individual feature; and “regional geography,” focusing on relationships among differing features or regions.

Geographic studies necessitate the collection of data through a variety of means in the field, such as surveys, photography, or geological investigations; through a quantitative study of collected data using mathematical and statistical analysis; or by studying historical sources (see PHOTOGRAPHY AND EXPLORATION; SURVEYING AND EXPLORATION). The results of such studies can be presented in various ways, the most practical being a combination of words and images in maps and charts. (Those two terms—*map* and *chart*—have been used interchangeably for any representation of the surface of Earth or of the heavens; yet the latter term, when used with regard to exploration, most often refers to a navigator's map relating to the marine environment or an aviator's chart for flying—see MAPS AND CHARTS.) Cartography is the art and science of making maps and charts. The history of the gaining of geographic information and representing that information cartographi-

cally by geographers/cartographers is parallel to the history of exploration.

Ancient European Geographers

The first geographers were those ancient travelers or scribes who recorded information about lands. The earliest existing maps, clay tablets inscribed by Akkadians of ancient Mesopotamia—showing settlements, cultivated plots of lands, streams, and hills—dates to about 2300 B.C., at the time of the ruler SARGON. Other early maps of the region, dating as far back as 2000 B.C., show plans of properties for the purpose of taxation. Another Mesopotamian people, the Babylonians, carved what is considered the earliest extant world map—a clay tablet from the sixth century B.C.—on which the city of Babylon is depicted, flanked by Assyria to the east and Chaldea to the southwest, and surrounded by oceans and what are thought to be islands.

A number of maps by ancient cartographers were re-created in the 1851 *Iconographic Encyclopaedia of Science, Literature, and Art* by Johann G. Heck. (Library of Congress, Prints and Photographs Division [LC-USZ62-115363])

Early mariners, such as Minoans, Egyptians, Phoenicians, and Greeks, who traveled throughout the MEDITERRANEAN SEA, especially for purposes of trade, helped spread and record geographic information. Most of the sea's shorelines were known to the various seagoing peoples by about 1400 B.C., and, in ensuing centuries, ancient mariners explored other waterways. An extant Egyptian map drawn on papyrus, which shows Nubian gold mines between the NILE RIVER and RED SEA, dates to 1300 B.C. By at least the sixth century B.C., Egyptians and Phoenicians were venturing along the Red Sea and into the Indian Ocean (see EGYPTIAN EXPLORATION; PHOENICIAN EXPLORATION). By the fifth century B.C., the Carthaginians—predominantly of Phoenician ancestry—had also navigated past the Strait of Gibraltar (see GIBRALTAR, STRAIT OF) and explored the Atlantic coastlines of Europe and Africa (see CARTHAGINIAN EXPLORATION).

The ancient Greeks made geography a scientific and philosophical study. In the sixth century B.C., Greek philosopher Anaximander drafted the first known map to represent a concept of the world, with the Aegean Sea off Greece represented as the center, encircled by Mediterranean lands and oceans. A form of ancient geographic text thought to have originated about the same time and associated with Greek mariners was the PERIPLUS, an account of a sea voyage, describing landmarks and waterways. Also in the sixth century B.C., HECATAEUS OF MILETUS published a work called *Periegesis* (Tour Around the World) about his travels in Asia Minor and Egypt. In the fifth century B.C., another Greek historian, HERODOTUS, chronicled the history and geography of the Mediterranean world, drawing on the writings of Hecataeus and other ancient travelers. In the fourth century B.C., a scholar, PYTHAEAS, also an accomplished navigator, traveled along the Atlantic coast of Europe and perhaps even reached the ARCTIC CIRCLE.

The Greeks also first made the case that Earth was round, as put forth, in the fifth century B.C., by a philosopher, Parmenides. In the fourth century B.C., Greek philosopher Aristotle recognized that all matter tends to fall toward a common center; that, in traveling from north to south, new constellations become visible while others disappear; and that, during an eclipse, Earth casts a circular shadow on the Moon. A scholar, Eratosthenes, who served as head of the library at Alexandria in North Africa in the third century B.C., is cited as the first systematic geographer. He drew a map of the known world, representing parts of Europe, Asia, and Africa, which was the first to use grid lines, an early version of lines of LATITUDE AND LONGITUDE. He also first accurately calculated the circumference of Earth. A second-century B.C. astronomer and mathematician, HIPPARCHUS, further developed the concept, making the east-west lines parallel and the north-south lines at right angles to them. A

Greek geographer, Crates of Mallus, made the first known GLOBE in the second century B.C.

With the rise to power of the Romans and the expansion of the Roman Empire around and beyond the Mediterranean region, geographic knowledge became even more organized—for military and trade purposes. Early in the first century A.D., Greek STRABO published the 17-volume *Geography* in Rome, summarizing his own travels and accounts of others' travels. Later in the century, PLINY THE ELDER, a Roman, published *Historia Naturalis* with geographic accounts of Europe, Asia, and Africa. The last greatest classical geographer—as well as mathematician and astronomer—was hellenized Egyptian PTOLEMY of the second century A.D. Like Eratosthenes, he worked out of Alexandria. His eight-volume work, *Geographia*, or *Introduction to the History of the Earth*, summarized the geographic and cartographic knowledge of his time—including a compilation of 8,000 places and their coordinates of latitude and longitude. The work influenced Western thought for centuries.

Other Cultures

It is a mistake to ignore the geographic accomplishments of other peoples around the world, such as the Chinese, with regard to geography and cartography (see CHINESE EXPLORATION). Mention is made of the use of maps in ancient China as far back as the seventh century B.C. The earliest extant Chinese maps—drawn on silk—date to the second century B.C., showing highly developed cartographic techniques including representations of topography. The ancient Marshall Islanders (see OCEANIA) made charts from cane sticks lashed together to indicate wind and wave patterns, with shells and corals attached to depict islands. The Polynesians used palm sticks for similar charts. By the time the Spanish arrived in Central and South America in the 16th century, the Inca, Maya, and Aztec Indians were also making maps on calico and other materials. Some Native North Americans drew maps on rawhide. The Inuit of Arctic North America carved coastal maps in ivory.

The Middle Ages

After the collapse of the Roman Empire, among Europeans of the Middle Ages, the Vikings were the most active voyagers (see VIKING EXPLORATION). They were also geographers in that they passed on their geographic discoveries, such as voyages to North America, in written accounts. (The VINLAND MAP, visually depicting these voyages, turned out to be a forgery.)

Most European mapmaking of the medieval period was carried out by Christian monks—such as sixth-century Egyptian-born COSMAS INDICOPLEUSTES and eighth-century Spaniard BEATUS OF VALCAVADO—whose religious beliefs affected content as much as did accurate geographic knowledge. On early world maps, from about the fourth to

the 14th century—known by the Latin term *MAPPA MUNDI*—there is no attempt to represent true scale or latitude and longitude. The PORTOLAN CHART—a navigational chart similar to the periplus of the ancient Greeks—containing accurate geographic information, although without latitude and longitude, was common by at least the beginning of the 14th century.

The greatest geographers and cartographers of the Middle Ages were the Arab Muslims, who maintained the cartographic principles of Ptolemy and the Greeks (see MUSLIM EXPLORATION). In the 11th century, scholar ABU AR-RAYHAN MUHAMMAD IBN AHMAD AL-BIRUNI made observations on Earth's circumference and latitude and longitude. In the 12th century, ABU ABD ALLAH MUHAMMAD ASH-SHARIF AL-IDRISI produced an influential work, *The Book of Roger*, which contained 70 accurate maps making use of a grid system, as well as accounts of his and others' travels in Europe, North Africa, and the Middle East. In the 13th century, SHIHAB AL-DIN ABU ABD ALLAH YAQUT AL-RUMI, a Greek-born Muslim, published a gazetteer-type geographic study. And, in the 14th century, ABU ABD ALLAH MUHAMMAD IBN BATTUTAH traveled more than any other known individual to date, as far as the edge of SIBERIA in Central Asia and across the SAHARA DESERT in Africa, and wrote detailed descriptions of the lands he visited. In the meantime, the Chinese recorded information on distant lands. In 1311–20, cartographer CHU SSU-PEN produced a world map with accurate information on Africa.

By the late Middle Ages, Europeans were again looking eastward. The CRUSADES of the late 11th century to the late 13th century took them to the Near East. Also in the 13th and 14th centuries, a number of diplomats, missionaries, and merchants, such as Venetian merchant MARCO POLO in the 1270s–90s, traveled to regions of the Far East as well. Marco Polo wrote descriptions of places he had visited. Much of this information was incorporated by Spaniard ABRAHAM CRESQUES in his *Catalan Atlas* of 1375, a world map based on geographic information obtained from Marco Polo and other travelers.

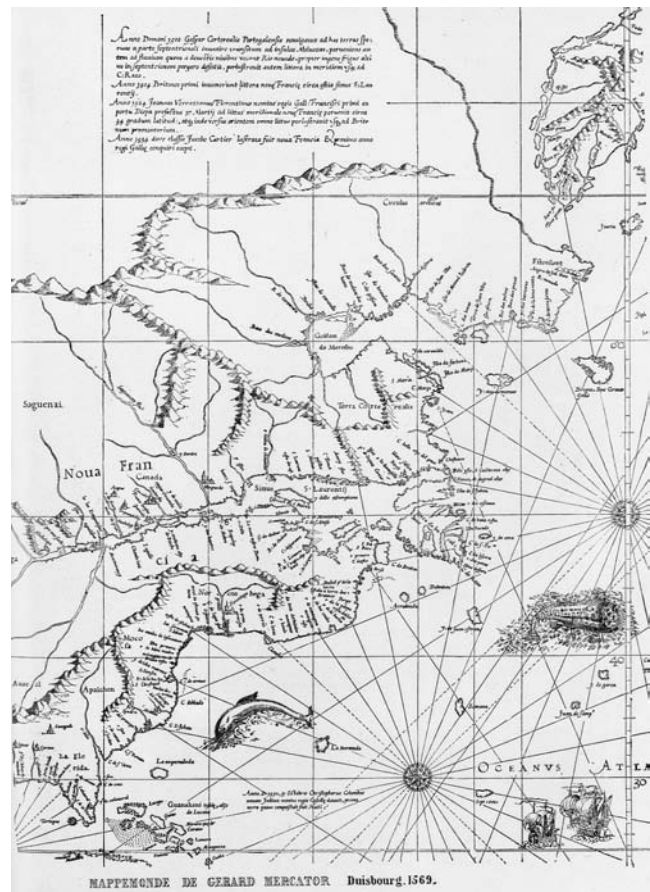

The European Age of Exploration

The 14th century is cited as the beginning of the RENAISSANCE in Europe, a time of an expanding worldview, and the 15th century as the start of the EUROPEAN AGE OF EXPLORATION, initiated by the Portuguese voyages of exploration along the west coast of Africa. In 1492, the same year that CHRISTOPHER COLUMBUS made the post-Viking European discovery of the Americas, German cartographer MARTIN BEHAIM, working for the Portuguese, developed a globe of the world depicting islands in the Atlantic Ocean.

The 16th century experienced a burst of cartographic creativity in Europe, as mapmakers recorded the abundance of new geographic information from the voyages of exploration

to the Americas and beyond. The rediscovery and translation into Latin of Ptolemy's *Geographia* in about 1410 helped set the stage. The development of printing via German Johannes Gutenberg's invention of the movable type printing press, as well as advances in engraving in the mid-15th century, made cartography more practical. (The earliest European printed maps were made from woodcuts.) The printing press also made books on geography available to the general public. And the extent of the Earth came to be understood finally with the first CIRCUMNAVIGATION OF THE WORLD for Spain under FERDINAND MAGELLAN in 1519–22.

Among the many cartographic breakthroughs were the first world map depicting the Americas and showing a coastline from present-day Newfoundland to Argentina by German MARTIN WALDSEEMÜLLER in 1507. Spanish cartographers active in mid-century, such as GONZALO FERNÁNDEZ DE OVIEDO Y VALDEZ and DIEGO GUTIÉRREZ, depicted explorations in the Caribbean and South America. In 1569, Flemish cartographer GERARDUS MERCATOR created the first map accurately depicting latitude and longitude through his mapmaking techniques known as the MERCATOR PROJECTION, one method of representing

Gerardus Mercator published this world map in 1569. (Library of Congress, Prints and Photographs Division [LC-USZ62-92883])

Earth's curve on a flat surface. Because of its accuracy, this cartographic technique revolutionized navigation (see NAVIGATION AND EXPLORATION). The next year, another Flemish cartographer, a friend and associate of Mercator, ABRAHAM ORTELIUS, produced a world atlas. In his annual editions through the end of the century, he stayed abreast of new geographic discoveries.

A number of Englishmen also contributed to the field of geography and cartography during this period. In 1576, SIR HUMPHREY GILBERT published a work furthering the idea of a NORTHWEST PASSAGE across North America. Although some of his ideas were based on fable, the work contributed to the continuing European fascination with world geography. In the 1580s, RICHARD HAKLUYT published three influential books on exploration and geography, including *The Principal Navigations, Voyages, and Discoveries of the English Nation*. In 1598, MARTIN LLEWELLYN published the first English atlas to show sea routes to the Far East.

An Organized Field of Study

Geography and cartography became more organized as a field of study in the 17th and 18th centuries. In 1625, Nathaniel Carpenter advanced geographic methodology by emphasizing spatial relationships among Earth's physical features. In 1634, Dutch cartographer WILLEM JANSZON BLAEU published a comprehensive atlas detailing world explorations up to that time, carrying on the tradition established by Ortelius. A German geographer by the name of Bernhardus Varenius became influential in theoretical geography. He defined three branches of the science in his work *Geographia generalis*, published in 1650: one studying the form and dimension of Earth; another studying variables depending upon the position of Earth, such as climate, seasons, and tides; and a third studying relationships of different regions.

Yet many erroneous geographic concepts persisted, such as that of a GREAT SOUTHERN CONTINENT, the legendary Terra Australis, first conceived in ancient times and still promoted in the mid-18th century by French scholar CHARLES DE BROSSES. English mariner JAMES COOK, who brought an appreciation of the sciences to his seamanship and explorations, finally put that particular notion to rest in his voyage of 1776–80 by circumnavigating Antarctica. By the late 18th century, science was typically an official adjunct to exploration. Many maritime expeditions of that period and the early 19th century, like those of Cook and that of Frenchman ANTOINE-RAYMOND-JOSEPH DE BRUNI, chevalier d'Entrecasteaux, in the 1790s to the South Pacific Ocean, included naturalists and geographers (see NATURAL SCIENCE AND EXPLORATION). Mapping new regions became the incentive for many overland expeditions, such as those of British fur trader and cartographer DAVID THOMPSON, starting in the 1780s, in western Canada.

Modern Geography

German naturalist ALEXANDER VON HUMBOLDT, who traveled widely, especially at the turn of the 19th century, is sometimes cited as the “father of modern geography.” His great contribution was the classification and comparative description of geographic features observed in the field, the approach known as systematic geography, as put forth in his five-volume work *Kosmos*, published in 1845–62.

Another German, Carl Ritter, promoted the comparative study of particular areas, the approach known as regional geography, as presented in his 19-volume work *Geography and Its Relation to Nature and the History of Man*, published in 1822–59. The German geographer, Friedrich Ratzel, helped develop the field of cultural geography—the study of the distribution of people and their cultures in particular regions of Earth—in his work *Anthropogeographie*, published in 1882.

Many other geographers of the 19th and 20th centuries helped shape the discipline as it has come to be practiced today. And a number of geographic societies founded in the 19th century—such as England's ROYAL GEOGRAPHICAL SOCIETY; the United States's AMERICAN GEOGRAPHICAL SOCIETY and National Geographic Society; and France's Société de Géographie—helped further interest in the field and promote the gathering of information through the sponsorship of expeditions.

Expanding Technologies

Modern technology has revolutionized geographic studies and cartographic representations. Photography, including infrared photography and AERIAL PHOTOGRAPHY, some of it by SATELLITE, along with specialized sensors, such as multispectral scanners, has aided in the recording of geographic information and computers in the quantitative analysis of it. Computers are also used in mapping. The Geographic Information System (GIS), a computer system introduced in the 1960s, processes huge amounts of data and can create two- or three-dimensional images of an area. The vast majority of Earth's surface has now been accurately mapped.

Many different processes are utilized in modern mapping, among them photoengraving, wax engraving, lithography, or modeling in clay, plaster of paris, or plastic.

Gibraltar, Strait of (Bab al-Zakak, Gaditan Strait, the Straits, Straits of Gibraltar)

The Strait of Gibraltar (or the Straits of Gibraltar, or simply the Straits) is a narrow passage connecting the MEDITERRANEAN SEA to the east with the Atlantic Ocean to the west, situated between Europe to the north and Africa to the south. About 30 miles long and eight to 24 miles wide, the strait has a continuous current flowing easterly from the Atlantic, and a westerly undercurrent carrying salty outflow

from the Mediterranean. The term *Gibraltar* is derived from the Arabic *jebel* for mountain and *Tariq*, the name of a Moorish general who invaded Spain in 711. Another name is Gaditan Strait from the Latin *Fretum Gaditanum*. The Arab name is Bab al-Zakak.

The eastern entrance to the Strait of Gibraltar is flanked by two promontories, known since ancient times as the Pillars of Hercules (or the Gates of Hercules). The European promontory, the Rock of Gibraltar (also Calpe, a name given by the Romans), a limestone formation, is situated on a British-ruled peninsula connected to the Iberian Peninsula and Spain; the town of Gibraltar lies at the peninsula's northwestern end. The African promontory, known as Jebel Musa (also Abyla), lies to the west of Ceuta, a Spanish town surrounded by the nation of Morocco. A Greek myth holds that Hercules, the son of the god Zeus, wrenched apart a mountain range to join the seas; another is that he left the pillars there during his travels.

The narrow strait served as a barrier to ancient peoples navigating the Mediterranean. It is not known which mariners of the ancient world first ventured through it into the Atlantic. Artifacts crafted by Minoans from the island of Crete in the eastern Mediterranean have been found as far west as the Balearic Islands off the east coast of Spain. The Phoenicians from the Mediterranean east coast also traveled the entire sea in their GALLEY ships. The writings of the fifth-century B.C. Greek historian HERODOTUS indicate that, sailing for the pharaoh NECHO II in about 600–597 B.C., Phoenicians followed the RED SEA southward from the

Gulf of Aqaba to the Indian Ocean and possibly circum-navigated Africa, returning to the Mediterranean by way of the Atlantic and Strait of Gibraltar. It is known from other Greek and Roman writings that, in the fifth century B.C., Carthaginians—Phoenicians from the city of Carthage in North Africa, in particular HANNO and HIMILCO—navigated past the Strait of Gibraltar and explored the Atlantic coastlines of Europe and Africa. The Carthaginians, in order to control trade with Atlantic coastal regions, guarded the strait and promoted the idea of sea monsters and other hazards beyond. The Greeks eventually managed to pass through it, the mariner and scholar PYTHEAS for one, in the fourth century B.C. It came to offer a regular route for trading ships between lands of the Mediterranean and of the Atlantic coasts of Europe and Africa.

globe

The term *globe* refers to a round body. It also is applied to a spherical map, or model, of Earth or the heavens. A model of Earth, known as a terrestrial globe, represents Earth without the typical distortion of flat maps. A model of the heavens, known as a celestial globe, is a representation of the nighttime sky as seen from Earth. Both types of globes, like flat maps, are tools of navigation.

Globes have been made from wood, metal, plaster, or papier-mâché. The cartographic information is engraved and sometimes drawn on the sphere, or on printed parchment or paper sections with the information—known as gores—glued over it. For modern globes, plastics are also sometimes used. Some terrestrial globes show relief features of Earth. Globes are often attached to a rod running from the NORTH POLE to the SOUTH POLE, which represents the axis around which the Earth rotates, and are tilted at an angle of about 23.5 degrees, indicating the tilt of Earth away from the axis of the Sun.

The primary advantage of a globe is accuracy regarding the shape and curvature of Earth (although most do not show the flattening of Earth at the Poles or the bulge below the EQUATOR). Globes have the added advantage over flat maps of representing long routes, such as by air or sea, as well as natural events that follow the curvature of Earth, such as earthquake shocks and tidal waves. The disadvantages of globes for navigators are their bulkiness and their limitation in showing detail for portions of the Earth.

The ancient Greeks first scientifically made the case that Earth was a sphere. In the fifth century B.C., Greek philosopher Parmenides hypothesized that Earth was round. In the fourth century B.C., Greek philosopher Aristotle recognized that all matter tends to fall toward a common center; that,

in traveling from north to south, new constellations become visible while others disappear; and that, during an eclipse, Earth casts a circular shadow on the Moon. The first known globe dates from about 150 B.C., reported to have been constructed by Greek geographer Crates of Mallus. In the second-century A.D., Greek-Egyptian PTOLEMY wrote about the accuracy of globes as well as their limitation in scale. Yet, the view that Earth was flat persisted among many peoples for centuries to come. In 1230, an English mathematician and astronomer, JOHN HOLYWOOD, published *Treatise on the Sphere*, presenting the idea that Earth might be spherical. It was not until the 14th century and the RENAISSANCE, however, that geographic theories of the ancient Greeks and the Muslims became widely known in Europe and changed long-held views. In any case, by the 15th century, European scholars generally accepted the notion of Earth's roundness.

The oldest extant globe was made in 1492 by German cartographer MARTIN BEHAIM—Behaim's *Erdapfel*, or "earth apple," as it was called. Behaim used a plaster mix over a spherical mold and pasted strips of parchment to the surface; he then mounted it on a wooden tripod. The 15th–16th-century Italian artist and scientist Leonardo da Vinci also made globes. GERARDUS MERCATOR, famous for the MERCATOR PROJECTION, a type of mapmaking with a practical depiction of LATITUDE AND LONGITUDE, constructed a world globe in 1541 and, 10 years later, a celestial globe. The earliest known English globes were made by Emery Molyneux in 1592, much of the geographic information for them provided by English mariner JOHN DAVIS.

gnomon

A gnomon is any device used to tell time by the shadow it casts. The term is also applied to the specific part of a sundial that casts the shadow. Gnomons have been made in a variety of forms throughout the ages. The gnomon was possibly the first scientific instrument and one of the earliest devices—along with the sounding pole for measuring water depth—used for the purpose of navigation. From the length of a shadow cast, an approximation of latitude could be made. Gnomons were produced as portable objects, and there is mention of them being taken along on ancient sea voyages. Early mariners would have taken them ashore to determine relative location.

Poles and large stones have been used as gnomons. The ancient Egyptians told time by the shadows cast by pyramids and obelisks. Some gnomons had notches in their side to provide readings. In the Middle Ages, the Vikings made use of a type of sundial known as a sun-measuring disk, or

shadow board, which floated in a tub of water to level it. The gnomon—in this case, an adjustable center pin—could be raised or lowered based on the height of the sun at different times of the year. The shadows cast on concentric circles on the disk on which were marked directional points would help determine latitude.

Gobi Desert

The Gobi Desert, located in present-day Mongolia and northern China, with an area of about 500,000 square miles, is one of the largest deserts in the world. Shaped like a crescent and extending about 1,000 miles from east to west and 600 miles from north to south, it sits on a plateau from 3,000 to 5,000 feet above sea level and is mostly surrounded by steppe land and high mountains. These include the Da Hinggan Ling to the east, the Altun Shan and Nan Shan to the south, and the Altai, Hangayn Nuruu, and Yablonovy to the north. The far western region of the Gobi, from the foot of the Pamir Plateau, through the Tarim River basin to Lop Nor, the dried-up bed of an immense salt lake, is often considered separately and called the Takla Makan.

The name *Gobi* is Mongolian for "waterless place," while the Chinese refer to the desert as Yintai Shamo, meaning "sand desert," and Han-hai for "dry sea." Only the southwestern quarter of the desert, however, is entirely without water; the remainder is covered with sparse vegetation, mostly grass, shrubs, and thorns. Most of the Gobi is covered with a shallow layer of gravel; only a small percentage consists of sand dunes.

Nomadic peoples inhabit the Gobi, their flocks surviving on what vegetation there is. Frequent high winds lead to dangerous sandstorms. Violent late-summer thunderstorms create large shallow lakes, but the only reliable sources of water for inhabitants of the plateau are wells and springs. The temperature in the Gobi varies from the extremes of minus 40 degrees Fahrenheit in the short winter to 113 degrees in the summer.

Mongols and Chinese in the Gobi

The Mongols, who inhabited the Gobi Desert and surrounding steppe country, were a nomadic people who hunted and maintained herds of horses and sheep and lived in tents (see MONGOL EXPLORATION). They were divided into warring tribal groups until GENGHIS KHAN united them in the early 13th century. He founded his capital—Karakorum—in the northern Gobi.

The main east-west trade route, called the SILK ROAD, ran along a narrow band called the Hexi Corridor, skirting the southern edge of the Gobi Desert. But the desert itself contained several important caravan trails, carrying goods

from Partizansk in Russia to Hami in China, and from Zhangjikou in China to Ulaanbaatar, a major city of Mongolia. The Gobi proved a dangerous place for Chinese traveling westward (see CHINESE EXPLORATION). HSÜAN-TSANG, a Chinese Buddhist monk hoping to reach India to obtain original Buddhist texts and visit holy sites, denied passage by the T'ang emperor, set out in secret, in about A.D. 629, from the western end of the Great Wall of China, and entered the Gobi. Abandoned by his guide, Hsüan-tsang wandered through the desert strewn with the bleached bones of animals. He was saved when his horse, smelling water, carried him to an oasis. From there, nomadic tribesmen escorted him out of the Gobi, and he resumed his travel to the west.

Europeans in the Gobi

The earliest European reports of the Gobi Desert come from the travels of MARCO POLO. Polo, a native of Venice, was the son of NICCOLÒ POLO, a merchant who along with Marco's uncle MAFFEO POLO had traveled across Asia to the court of the Great Khan in the East. In 1271, at age 17, Marco accompanied his father and uncle on their second journey to the East. After failing to find acceptable passage by sea, the Polos decided to travel overland. They traveled through Afghanistan, along the edge of the Takla Makan desert, to the city at Lop Nor on the edge of the Gobi. They joined a camel caravan crossing the desert and were met in Inner Mongolia by a representative of Kublai Khan. After 24 years in service to the kahn, the Polos returned to Venice. Marco Polo recorded his voyages, which were met with intense skepticism.

There was relatively little western travel through the Gobi Desert, and, when there was, it followed the pattern of the Polos, staying on traditional caravan trails. As a result, the desert remained mostly uncharted through the 19th century, despite visits by a number of Europeans of varying nationalities. A French Jesuit priest named Jean François Gerbillon traveled across the desert in the 1680s. The first significant exploration of the Gobi was undertaken by NIKOLAY MIKHAILOVICH PRZHEVALSKY, a Russian Cossack and career military officer. Przhevalsky volunteered in 1867 for service along the Russia-China border, writing a report about the region's natural history and the culture of its native peoples. Afterward, he formulated a plan for exploring the interior of Mongolia and China, which was sponsored by the Russian Imperial Geographic Society. In 1870, Przhevalsky and two Russian companions obtained camels and crossed the Gobi Desert to Peking (Beijing) in China. Przhevalsky later explored the Takla Makan desert, and became the first European to visit Lop Nor since Marco Polo.

In 1872–73, Englishman NEY ELIAS traveled from China across the Gobi Desert, the Altai Mountains, SIBERIA, and the Ural Mountains into Europe; he later led a number

of other exploratory expeditions to central Asia. In 1923, during one of his many expeditions to central Asia, Swede SVEN ANDERS HEDIN headed a scientific survey of the Gobi. American paleontologist Roy Chapman Andrews carried out a scientific expedition to the Gobi on behalf of the American Museum of Natural History that year and four others over the next years until the Chinese Civil War ended his travels in 1930. In addition to expanding geological understanding of the Gobi, he found there the first fossilized dinosaur eggs.

A highway now crosses the Gobi Desert. A railroad, the Trans-Mongolian, links the city of Ulan Bator, Mongolia, with Jining, China.

Gonneville's Land

In 1504, a French seafarer named Binot Palmière de Gonneville (also cited as Palmier, Paulmier, or Paulmyer de Gonneville) returned to his hometown, the seaport of Honfleur in northwestern France, and claimed that, in the course of a voyage to the Americas the year before, his ship the *Es-poir* had been driven off course into the southern Atlantic Ocean by a storm, and that he and his men had located a land where the inhabitants lived in peace and contentment and with plentiful resources. Gonneville and his crew claimed to have stayed there six months. As evidence of this paradise—an Eden, as he described it—he displayed furs and feathers from unknown species as well as exotic pigments. He had also brought 24 “savages” back to Europe, one of them the son of a ruler, named Essomeric.

Gonneville's Eden became known as Gonneville's Land, and the story of it endured for centuries. At the time, many Europeans were convinced of the existence of a GREAT SOUTHERN CONTINENT, or Terra Australis, and Gonneville's Land became associated with it. More than two centuries later, maps showed a “Terre de Gonneville” in the South Atlantic as part of Terra Australis. In 1738–39, JEAN-BAPTISTE-CHARLES BOUVET DE LOZIER carried out an expedition in search of the fabled continent, locating what became known as Bouvet Island in the South Atlantic in the process. Moreover, noted French scholar CHARLES DE BROSES, in his work *Histoire de la navigation aux terres australes* (History of Navigation to Southern Lands), published in 1756, cited Gonneville's 16th-century expedition as one of several voyages indicating the existence of Terra Australis.

Given that Gonneville's return to France is documented, and that Essomeric was known to be baptized and to have started a family in Normandy, the fact of

Gonneville's expedition is not disputed. It is likely that Gonneville's Land was actually somewhere in South America, probably Brazil. That would make Essomeric and the other visitors the earliest Native Americans to visit France.

Great Dividing Range

The Great Dividing Range, or Great Divide, is a mountain chain along the eastern edge of Australia, from Cape York Peninsula in the north to TASMANIA, an island off the southeast coast, in the south. The range as a whole is also called the Eastern Highlands. Sections of the range are known by various names, including Atherton Plateau, Australian Alps, BLUE MOUNTAINS, Clarke Range, Drummond Range, Expedition Range, Grampians, Gregory Range, McPherson Range, New England Range, Snowy Mountains, and War-rumbungle Range. The mountains not only divide the fertile east coast from the grasslands to the west, but also separate the rivers that flow into the Pacific Ocean from those that enter the Indian Ocean. The daunting terrain of the Blue Mountains kept early colonists from venturing very far from their coastal settlement at Sydney for several decades. Other parts of the Great Dividing Range proved just as difficult. Some plateau regions became productive grazing lands, however. Mount Kosciusko, Australia's highest peak at 7,310 feet above sea level, is located in the Australian Alps.

Early Expeditions

After GREGORY BLAXLAND, WILLIAM CHARLES WENTWORTH, and William Lawson succeeded in penetrating the Blue Mountains to Mount York in 1813, the exploration of the Great Dividing Range began in earnest. The energetic governor of New South Wales, Lachlan Macquarie, sent George William Evans to survey the new territory later that year. He came across lands that could be developed for grazing. By order of the governor, a road was quickly built using the supply of convict labor. The laborers, many of whom were sent to Australia for petty offenses, earned their freedom for their efforts. Bathurst, a new settlement, became a launching point for many subsequent expeditions.

Hopes for the discovery of more productive lands were high, but finding usable routes for transportation were also a priority. In 1817, Macquarie sent JOHN JOSEPH WILLIAM MOLESWORTH OXLEY from Bathurst to follow the course of the Lachlan River. He was accompanied by Evans and botanist ALLAN CUNNINGHAM, who would go on to make significant discoveries of his own. Oxley was stopped when the Lachlan became marshland, but he then circled around to the Macquarie River and explored new territory in the range. His expedition the following year was more successful, but more difficult. In April 1818, he led a party to the upper Macquarie River, also hoping to find it a useful means of transportation. They encountered heavy rains, and much

of his party stayed behind. Making his way downstream via boat, he came upon thick reeds towering seven feet above the waterline. After slogging through this second stretch of marshland and crossing mountains, which he called the Arbuthnot Range, Oxley came upon the Liverpool Plains, another region ideal for grazing. The problem of transportation had yet to be solved, however. Oxley and company headed east through the mountains, touching the southern border of the New England Range and reaching the east coast at Port Macquarie.

There were finally some results in finding transportation for people and their livestock in 1823. In June of that year, Allan Cunningham started out from the Hunter River Valley to the north of Sydney on an arduous journey of 500 miles. His efforts were rewarded with the European discovery of Pandora's Pass in the Liverpool Range, connecting Bathurst with the Liverpool Plains. The migration of farmers to the mountains took on new dimensions.

The expedition in 1824 of HAMILTON HUME and WILLIAM HILTON HOVELL led to the European discovery of the Australian Alps. From the Lake George region to the south of Bathurst, they trekked along the western side of the Great Dividing Range, first crossing the Murrumbidgee River. Heading on a southwest course, they encountered the beginnings of the Murray River, then crossed the Ovens and Goulburn Rivers as well. They located more farmland before crossing the Alps on their way to Port Phillip Bay at the location of present-day Melbourne, a suitable place for settlement. But Hovell misidentified the geographic coordinates of that site as Western Bay, where the soil is poor. A contingent of colonists who attempted to settle Western Bay by mistake were compelled to abandon the spot, delaying the settlement of what would become the state of Victoria for a number of years.

In 1827, Allan Cunningham carried out his most important expedition farther to the north in the Great Dividing Range than had been attempted before. He set out in May of that year with a guide named Macintyre, six men, and 11 horses across the Liverpool Range. He skirted the western border of the New England Range and located several rivers along his path—the Naomi, Gwydir, Dumaresq, and Macintyre. On June 8, he encountered a vast expanse of grassland from a hill near the Macintyre. He named it Darling Downs after the governor of New South Wales, Sir Ralph Darling. Darling Downs would prove to be the best farmland in the state of Queensland. The following year, he found a route from the Downs to the Pacific coast through the mountains, known as Cunningham's Gap, which made development of the region practical.

Post-Settlement

As the country was preoccupied with the settlement of the new grazing lands, interest in new explorations waned for a

period. In 1840, Polish geographer SIR PAUL EDMUND DE STRZELECKI explored the Australian Alps and climbed the tallest peak in the Great Dividing Range and all of Australia, naming it Mount Kosciusko, after Polish national hero and military leader Tadeusz Kościuszko. The next great explorer of the Great Dividing Range was Prussian naturalist FRIEDRICH WILHELM LUDWIG LEICHHARDT. After traveling by foot along Australia's east coast from Sydney to Moreton Bay in 1843, he found private sponsorship for a larger expedition north through the mountains, much to the consternation of SIR THOMAS LIVINGSTONE MITCHELL, who had intended to lead a party along the same route. In October 1844, Leichhardt led his 10 men—among them two Aborigine guides—from Darling Downs through the mountains to the north, always keeping within 10 miles of a supply of water. The journey was beset with problems, as pack animals escaped and food was consumed at too rapid a rate, but Leichhardt did not lack for courage. On June 25, 1845, the party succeeded in crossing the range to the north and came upon the Mitchell River, where they were attacked by Aborigines. John Gilbert, an ornithologist in the group, was killed; others were injured. On Leichhardt's insistence, the expedition continued westward, arriving at Port Essington, the site of present-day Darwin, on December 17. Leichhardt was given a hero's welcome and received a large cash prize. He would later disappear on his attempt to cross Australia from east to west in 1848, generating one of the great unsolved mysteries of Australian exploration.

Sir Thomas Mitchell organized his own expedition through the Great Dividing Range in 1845. With a large contingent of 28 men, plus 250 sheep, horses, and oxen, he left the interior near Bourke in December. A messenger soon informed him of the successful conclusion of the Leichhardt expedition, but Mitchell continued on his own route. As he and his group curved to the northeast, they explored new territory. Heading westward, they traversed the Chesterton Range and Warrego Range, then came to the start of the Grey Range. Mitchell's quest for new land was satisfied when he reached the productive grazing lands of the Maranoa region.

The exploration of the Great Dividing Range was largely motivated by a need for new pasture to support the herding industry. England had become a lucrative market for the fine wool that Australia produced, and migrations from the British Isles increased as the passage became less expensive. Newly explored lands were settled at a rapid rate.

In the 20th century, some mountain areas themselves have been settled. The Australian Alps are now known for their skiing resorts.

See also AUSTRALIA, EXPLORATION OF.

Great Southern Continent (Terra Australis, Terra Australis Incognita)

The Great Southern Continent, also known as Terra Australis (Latin for “southern land”) or Terra Australis Incognita (“unknown southern land”), was an imaginary land thought to exist in the Southern Hemisphere. The first to conceive of its existence were the ancient Greeks (see GREEK EXPLORATION), who had realized that the Earth was a sphere and devised a geographic theory based on balance and symmetry, including a southern region to mirror the lands of the known world. They maintained that the south must contain a similar ratio of land to sea as the north and must be located in similar temperate zones, thus capable of producing a similar abundance of flora and fauna. In the second century A.D., hellenized Egyptian geographer PTOLEMY proposed that such a continent connected the southern tips of Africa and Asia, which would make the Indian Ocean an inland sea.

An Enduring Legend

The concept of Terra Australis proved to be enduring. The publication in Latin of Ptolemy's writings in about 1410 gave new impetus to it among Europeans. Terra Australis was depicted in numerous ways by the mapmakers of the 15th century and afterward during the EUROPEAN AGE OF EXPLORATION. It was sometimes presented as rather featureless, used to fill space where lands were unknown; or it was presented with rivers and detailed coastlines, offering cartographers a chance to exercise their imagination, as in a map by Flemish ABRAHAM ORTELIUS in 1570, part of the first atlas of modern design. In some instances, the fabled continent was drafted as occupying the entire southernmost portion of the world and contiguous with the southern portions of Africa and South America.

Aside from the ancient idea of balance, there were two other reasons why the belief in Terra Australis persisted in the European mind. One was the failure to grasp the size of the Pacific Ocean. Although astronomical measurements had determined the size of Earth, the integration of this knowledge with knowledge of explored lands was slow to be realized, largely due to the lack of a dependable way to measure longitude (see LATITUDE AND LONGITUDE). Indeed, many earlier geographic discoveries in the Pacific had to be rediscovered during the 17th and 18th centuries since their locations were poorly understood. The other reason Europeans believed in Terra Australis's existence was simply wishful thinking. Terra Australis might yield untold riches to a nation laying claim to it. The dream of such a prize spurred on many expeditions to the South Pacific. One French mariner who perhaps reached southern waters while driven off course in a storm—Binot Palmière de Gonneville—reported locating a paradise in 1504. Although he probably landed in South America, perhaps Brazil, his

reported Eden became known as GONNEVILLE'S LAND and helped drive the myth of an unknown southern continent.

16th Century

The scientific search for Terra Australis began with the first CIRCUMNAVIGATION OF THE WORLD by FERDINAND MAGELLAN, a Portuguese mariner sailing for Spain, in 1519–22. Having traveled through the Strait of Magellan (see MAGELLAN, STRAIT OF) between the continent of South America and Tierra del Fuego, Magellan disproved the notion that Terra Australis was connected to the greater landmass, and, although he believed Tierra del Fuego to be an island, he did not have enough data to convince the mapmakers of the day. The theories of Magellan would not be confirmed until Englishman SIR FRANCIS DRAKE's journey in 1577–80, when he rounded the southern tip of CAPE HORN and navigated through Drake's Passage.

In 1567, ÁLVARO DE MENDAÑA and PEDRO SARMIENTO DE GAMBOA were sent by Spain to discover and claim the Great Southern Continent for their homeland. They found the Solomon Islands of Melanesia in the West Pacific, which they believed to foreshadow the continent itself. On a second journey of colonization in 1595, de Mendaña sailed with four ships. He came upon the Marquesas Islands of Polynesia, but the natives were not welcoming, and he pressed on. De Mendaña died at sea, and his wife, nicknamed "the Governess," succeeded to command and steered the expedition to the Philippines.

17th Century

The Spanish continued to be interested in Terra Australis. In 1605, PEDRO FERNÁNDEZ DE QUIRÓS, a Portuguese mariner sailing for Spain, was outfitted with three ships and sailed westward into the Pacific from Lima on the coast of Peru. He had accompanied de Mendaña on his journey a decade earlier and had persisted in his faith of finding the fabled land. His travels were marked by a lack of leadership, and although he came upon several previously unknown islands, his contributions were overshadowed by those of LUIS VÁEZ DE TORRES, who captained one of the ships in the Spanish fleet. He had been separated from Fernández de Quirós, and, continuing to follow the orders he had received in Peru, sailed on a northwestward course. Following the south coast of New Guinea, he passed through the Torres Strait without seeing the southern tip of modern-day Australia. He had demonstrated, however, that New Guinea was an island, and that, if Terra Australis did exist, its size was smaller than expected.

Unknown to Váez de Torres, the continent he had barely missed had been located some months earlier by a Dutchman. While exploring the same region, WILLEM JANSZ sighted Australia's Cape York Peninsula. Having missed the gap, which would become known as Torres Strait, he believed Australia to be a southern extension of

New Guinea, which he named New Holland nonetheless. The Dutch had extended their claims in the region but were slow to capitalize on their findings. The waters along the west coast of Australia were hazardous, and the prospect of profitable activity seemed remote. Consequently, Europeans failed to appreciate the size of the new land (which, although it was almost 3 million square miles, was significantly smaller than the theorized Terra Australis).

FREDERIK HOUTMAN explored the coast near the present-day city of Perth in 1619. In 1629, a ship sailing for the DUTCH EAST INDIA COMPANY, the *Batavia*, was wrecked on the west coast of Australia, and archaeological evidence shows that survivors had made a settlement there, the first of its kind.

The next major journey of exploration in search of the Great Southern Continent was also sponsored by the Dutch East India Company and was headed by ABEL JANSZON TASMAN in 1642. Sailing from west to east, he came upon Van Diemen's Land (present-day TASMANIA), the large island to the south of Australia. Continuing westward, he also made the European discovery of NEW ZEALAND. Next, he explored the Fiji Islands.

As the century progressed, the English began their explorations in the South Pacific. Initially motivated at the prospect of raiding Dutch and Spanish vessels in the region, WILLIAM DAMPIER became the first Englishman to set foot on New Holland during his CIRCUMNAVIGATION OF THE WORLD in 1679–91. Sir Francis Drake was also active in the region at the time.

18th Century

The failure to find a "Great Southland" that fit the expectations of the European imagination did not stop expeditions from being sponsored. In an expedition financed by the DUTCH WEST INDIA COMPANY, JAKOB ROGGEVEEN sailed from Europe in 1721 to continue the quest. His efforts were rewarded with the European discovery of Easter Island and Samoa in the Pacific. His findings eliminated a number of theories about the location and size of Terra Australis, and, after his travels, the Dutch committed considerably fewer resources to the finding of such a land. In 1739, Frenchman JEAN-BAPTISTE-CHARLES BOUVET DE LOZIER made the European discovery of Bouvet Island in the South Atlantic Ocean near the ANTARCTIC CIRCLE while looking for the fabled southern landmass.

In the latter half of the 18th century, England and France began to take the lead in Pacific exploration. With improved techniques in navigation, a mania for natural science, and a growing hunger for land, these two countries transplanted their historic rivalry to the uncharted regions in the south. French scholar CHARLES DE BROSES, who published *Histoire de la navigation aux terres australes* (History of Navigation to Southern Lands), continued to promote the

equilibrium theory of land in the Southern Hemisphere to counterbalance the Northern Hemisphere.

The 1764–66 expedition of JOHN BYRON is called by some the first scientific voyage of exploration. After claiming the Falkland Islands for Great Britain, he traveled extensively in the South Pacific. In 1766–69, Frenchman LOUIS-ANTOINE DE BOUGAINVILLE, a soldier with an analytical mind, explored the region. He sought Terra Australis along the east coast of New Holland and among the New Hebrides Islands, of which he made the European discovery. Although he did not find Terra Australis, his expedition collected a wealth of plant and animal specimens, giving support to the practice of scientific exploration.

Also in 1766, SAMUEL WALLIS and PHILLIP CARTERET were sent by England to find the Great Southern Continent. In April 1767, they were separated by bad weather. Wallis went on to make the European discovery of Tahiti, where the natives proved to be exceptionally hospitable, while Carteret came upon Pitcairn Island. Carteret also filled in the map with the Santa Cruz Islands, rediscovered since Fernández de Quirós's voyage for Spain, and helped define the geography of the Solomon Islands. In 1772–73, Frenchman YVES-JOSEPH DE KERGUÉLEN-TRÉMAREC continued the search on behalf of France and came upon an archipelago in the southern reaches of the Indian Ocean, which he believed to be the coast of Terra Australis and which he called "La France Australe"; they later became known as the Kerguelen Islands.

James Cook

The man who finally laid to rest the idea of the Great Southern Continent was Englishman JAMES COOK. Cook had acquired superior skills as a surveyor and mapmaker while serving in the Royal Navy during the Seven Years War in Canada. He was meticulous and innovative in his work, producing accurate charts. He also had the advantage of a CHRONOMETER on his second journey, a tool necessary for the accurate determination of longitude. His was one of the first voyages to test the instrument. The purpose of Cook's first journey to the South Pacific in 1768 was ostensibly to time the transit of Venus across the Sun as a means to learning the distance between Earth and the Sun. After this task was accomplished, he opened a letter with additional orders, which sent him on a search for Terra Australis. At this stage of his expedition, he sailed as far south as 40 degrees south latitude, beyond where the continent was thought to exist. He then sailed around the two islands that make up New Zealand, making a high-quality map of it in the process. Next he charted much of the east coast of New Holland. Cook's next expedition in 1772–75 compelled Europe to abandon the dream of the fabled land. His instructions were to circumnavigate the southern polar region as closely as possible. The trip was not easy, with the bitter cold freezing the

rigging of his vessels, dense fog, and dangerous PACK ICE. Nonetheless, he succeeded in his mission. He is given credit for being the first to cross the ANTARCTIC CIRCLE, which he did three times. The southernmost latitude he attained was 71 degrees. He did not sight the mainland of Antarctica on this trip, however, since his ship was blocked by ice.

There was still important knowledge to be gained of southern waters. Since New Holland had not yet been circumnavigated, most assumed it to be a collection of islands rather than a single continent. MATTHEW FLINDERS accomplished its circumnavigation in 1802–03. He is also responsible for lobbying heavily to rename the continent Australia (see AUSTRALIA, EXPLORATION OF). Early sightings of the land that came to be known as Antarctica were made by Englishman EDWARD BRANSFIELD, American NATHANIEL BROWN PALMER, and Russian FABIAN GOTTLIEB BENJAMIN VON BELLINGSHAUSEN, all in 1820. It would take some years to grasp the extent of the Antarctic continent (see ANTARCTIC, EXPLORATION OF THE).

In the course of the search for the Great Southern Continent, two new continents were brought to the world's attention. One of them, Australia, came to bear a name derived from *Terra Australis*.

Great Victoria Desert

The Great Victoria Desert is the vast, arid region located in southwestern Australia to the north of the Nullarbor Plain, which separates it from the Great Australian Bight, an inlet of the Indian Ocean. Some 450 miles long from east to west and with an average altitude of 500 to 1,000 feet, it consists mostly of hilly sand country with some salt lakes and grasslands. It was the last region of Australia to be explored, with the exception of the smaller Simpson Desert in the center of the continent.

This barren area was originally visited by various groups of Aborigines. By the time Europeans turned their attention to it, most of the good grazing land in Australia had been charted. There was a sense among geographers that little of value would be found in the extensive tracts of sand. Still, with the lure of the unknown beckoning, a minor rivalry began among a handful of explorers in the early 1870s. JOHN FORREST had led an expedition in 1869 from Perth on a search for the remains of the FRIEDRICH WILHELM LUDWIG LEICHHARDT expedition, which had vanished 20 years before. On this trip he had gone as far east as Mount Weld on the western edge of the desert, finding some new grasslands suitable for grazing.

On an unsuccessful attempt to make an east-to-west crossing of the continent, WILLIAM CHRISTIE GOSSE traveled deeper into the desert in 1873. He passed through the end

of its northern region, below the Musgrave Ranges to the north. It was on this journey that he came upon Ayer's Rock, one of Australia's most distinctive geological features, a block of sandstone rising 2,845 feet above the surrounding flatlands.

In 1874, John Forrest returned to the western desert regions with his brother ALEXANDER FORREST, hoping to make the first west-to-east crossing of Australia. Traveling across the southern portion of the Gibson Desert, he succeeded in reaching the Peake telegraph station after five and a half months. His success led ERNEST GILES to form his own plan of exploration.

On a journey in 1872–73, Giles had attempted to cross the Great Victoria and the Gibson Deserts, but had failed to do so, losing his companion, Alfred Gibson, in the process, for which he named the region. Giles had gained valuable experience on this trip, however, and proved the worth of camels for traveling through the brutal conditions of the desert. In May 1875, he left Port Augusta with Henry Tietkins, an Afghani camel driver named Saleh, and 24 camels. The land they crossed in the southern portion of the desert was desolate. Relief was found midway through the trip when they crossed a northern projection of the Nullarbor Plain and were able to replenish their water supplies. In November, after traveling 2,500 miles, the party reached Perth, having made the first successful east-to-west crossing of Australia.

Ernest Giles named the region the Great Victoria Desert after Queen Victoria of Great Britain. A subsequent explorer to help map it, David Lindsay, took a different diagonal route in 1891. The Great Victoria Desert became part of the states of South Australia and Western Australia.

Greek exploration (ancient Greek exploration)

The geographic region referred to as ancient Greece was centered on the Balkan Peninsula and the Peloponnesus, a large peninsula connected to the southern end of the Balkan Peninsula, and on Crete and other nearby islands in the western MEDITERRANEAN SEA. But ancient Greeks, or Hellenes, as they called themselves, came to inhabit much of the northern Mediterranean and Black Sea coastal regions, during the first millennium B.C. Greek civilization has been called the cradle of Western civilization because of achievements in science, mathematics, philosophy, literature, and art, as well as the introduction of the political system of democracy. The Greeks also played a significant role in the history of exploration.

Pre-Hellenic Greece is referred to as Aegean civilization, with three highly developed Bronze Age cultures—Minoan, Mycenaean, and Cycladic. The Minoan culture thrived on the island of Crete; the Mycenaean culture on the mainland; and the Cycladic culture on the Cyclades island group. The

Minoans, as wide-ranging traders, were some of the earliest explorers of the Mediterranean until their decline toward the end of the second millennium, at which time the rival Phoenicians of present-day Lebanon became the most active mariners.

Beginning about 1400 B.C., various peoples speaking related Greek dialects reached the Greek peninsula from the north—Achaean, Aolian, Ionian, and Dorian. From about 1000 to 750 B.C., after the Mycenaean collapse, the region was in a political vacuum with warfare and poverty rampant—the Greek Dark Age, as it is sometimes called. During what is known as the Archaic Age, from about 750 to 480 B.C., independent city-states formed and eventually united against the threat from Persia (present-day Iran). The Persian Wars began in 512 B.C., when the revolt of Greek colonies in Asia Minor against their Persian landlords led to an unsuccessful Persian invasion of Greece—with Greek victories at Marathon, Salamis, and Plataea—and lasted until 449 B.C.

During the Classical Age, from about 480 to 323 B.C., Greek civilization reached its pinnacle. From 480 to 359 B.C., Athens was the most powerful city-state and led an alliance of almost 150 city-states in the creation of the Athenian empire surrounding the Aegean Sea. The Peloponnesian War between Athens and the city-state of Sparta, situated to its south in Peloponnesus, in 431–404 B.C., led to the decline of Athens. The Macedonians, a people living to the north of Greece, became a dominant military power first under Phillip II and then under his son, ALEXANDER THE GREAT, leading to their supremacy from 359 to 323 B.C. Although not Greek-speaking, the Macedonian rulers came to think of themselves as part of the Greek tradition and furthered Greek culture through conquest of the Egyptians of northern Africa and eastward into Asia as far as India. After Alexander's death, his generals ruled in what is referred to as the Hellenistic period, which lasted until 31 B.C. and the ascendancy of the Romans.

The Minoan mastery of navigation was passed to the Greeks, who carried out the tradition of trade throughout the Mediterranean region and into the Black Sea, which is connected to the Aegean Sea by the Bosphorus, the Sea of Marmara, and the Dardanelles. By about 500 B.C., the Greeks had colonized parts of Asia Minor, Mediterranean coastal regions of present-day Italy and France, the Iberian Peninsula, and even the present-day coastal Libya in northern Africa. They came to have some 700 settlements, some of which evolved into independent city-states. Transported items in the complex trading network of the Mediterranean and Black Sea regions included silver, copper, tin, amber, obsidian, ivory, timber, dyes, grains, salt, fish, wine, olive oil, pottery, and glass. The Greeks also may have ventured into the Atlantic Ocean as early as the sixth century B.C. Their commercial activity contributed to the diffusion of cultural

traits and geographic knowledge. The Greek invention of the ASTROLABE in the third or second century B.C. helped further maritime exploration.

The names of certain Greek individuals have endured in the historical record as explorers, historians, and cartographers, in some cases in the employ of other peoples. In about 520–494 B.C., historian HECATAEUS OF MILETUS ascended the NILE RIVER. In 510–507 B.C., mariner SCYLAX descended the INDUS RIVER for Persian emperor Darius I and sailed from the Arabian Sea to the RED SEA. In about 440–420 B.C., historian HERODOTUS traveled throughout eastern Mediterranean Sea and Black Sea lands and chronicled much about ancient history and exploration. He also traveled up the Nile. In about 420–400 B.C., physician and writer CTESIAS OF CNIDUS traveled in Persia and India.

One great journey was actually a military retreat. In 401 B.C., soldier and historian XENOPHON led Greek mercenaries on a great retreat from Persia through present-day Iraq, Turkey, Armenia, and Georgia to Greece. Macedonian Alexander the Great's remarkable trek into Africa and Asia in 334–323 B.C., exploration by conquest, brought new awareness of Asia to European cultures. NEARCHUS, a Greek serving under Alexander, explored the coasts of Pakistan and Iran from the Indus Delta to the head of the Persian Gulf in 325–324 B.C. MEGASTHENES, a Greek diplomat, traveled from Syria to northern India in 300–290 B.C., reaching the GANGES RIVER.

In the meantime, the maritime expedition of PYTHEAS in about 325 B.C. along the coasts of Spain, France, and Britain as far as the Baltic Sea brought knowledge of northern Europe to the Mediterranean peoples. The water route between Africa and India was explored in 120–115 B.C. by EUDOXUS, a Greek navigator in service to Egypt, who made two trips across the Arabian Sea to India. On the second, he landed on the coast of East Africa; he later unsuccessfully tried to circumnavigate Africa. In A.D. 45, HIPPALUS, another Greek in service of Egypt, at that time under Roman domination, navigated a direct sea route across the Arabian Sea from Africa to India. And, in A.D. 50, DIOGENES, a Greek merchant, explored inland on Africa's east coast, possibly as far as Lake Victoria and Lake Albert.

Some of the knowledge of these ancient travels was recorded by ERATOSTHENES, a Greek scholar heading the library at Alexandria in northern Africa. In 240–195 B.C., he wrote what is considered the first systematic treatise of geography. STRABO, another Greek scholar, published an important work on geography in Rome in about A.D. 18. The *Periplus of the Erythraean Sea*, written in about A.D. 100 by an anonymous Greek trader who lived in Egypt, provided information about East Africa, including commercial activities in the region (see PERIPLUS). PTOLEMY, a hellenized Egyptian, published a description of world geography in A.D. 127–147.

Greenland

At about 840,000 square miles, Greenland is the largest island in the world. From northernmost Cape Morris Jesup to southernmost Cape Farewell, it is about 1,650 miles long; its widest point from east to west is about 800 miles. The coastline, deeply indented with fjords, runs an estimated 27,000 miles. Most of Greenland lies north of the ARCTIC CIRCLE. The Arctic Ocean lies to the north; the Greenland Sea to the east; the Nares Strait to the northwest, separating it from Ellesmere Island; the Denmark Strait to the southeast, separating it from ICELAND; the Davis Strait and Baffin Bay to the west, separating it from Baffin Island; and the Atlantic Ocean to the south. Disko Island in Davis Strait is the largest of the many offshore islands. The Danish name is Grønland; the name in Greenlandic (Inuit, with some Danish words) is Kalaallit Nunaat.

More than three-quarters of Greenland, a high plateau, is covered with an ice cap, the maximum thickness of which is 14,000 feet. Coastal regions and islands are mainly ice free, although some smaller ice caps and glaciers can be found locally near the coasts. The east and west coasts are flanked by mountain chains; Mount Gunnbjørn in southeastern Greenland, at 12,139 feet above sea level, is the highest peak. Greenland produces many of the world's icebergs and ice floes, with ice moving outward from the island's center and calving on reaching the sea (see DRIFT ICE), making the Davis Strait to the west and the Greenland Sea to the east especially hazardous to navigation. The south coast has the warmest climate, moderated by the North Atlantic Drift, a continuation of the GULF STREAM. Vegetation, like much of the Canadian Arctic to the west, consists mostly of mosses, lichens, grasses, and sedges. Some dwarf trees can be found in the south. Greenland also has similar fauna to that of the Canadian Arctic, such as reindeer, musk ox, polar bear, wolf, fox, and hare.

Greenland's indigenous peoples are ancestrally related to the Inuit (Eskimo) of Canada and Alaska and are grouped together as Greenland Inuit. A number of bands traditionally lived along the west coast, including a group north of Cape York on the Hayes Peninsula known by non-natives as Polar Eskimo; a band known as the Anmagssalik (now also the name of a town) traditionally lived along the east coast.

The Vikings

ERIC THE RED is considered the European "discoverer" of Greenland. The account of his journey there in about A.D.

982 is preserved in the literature of the Vikings known as *Eiríks saga*, or the *Saga of Eric the Red*. He may not have been the first Viking to reach or see Greenland since a mariner by the name of Bjarni Gunnbjörn supposedly reported lands to the west of Iceland. Eric the Red established a settlement at an inlet he called Ericsfjord, where present-day Julianehaab is located. From Greenland other Vikings—such as his son, LEIF ERICSSON—explored farther westward, eventually reaching the North American mainland in about 1000. The Norse settlement endured until the early 15th century, when the outbreak of the bubonic plague cut off communication with Scandinavia.

Early Arctic Expeditions

The history of further exploration of Greenland is tied in with that of Arctic Canada. Many European ships navigating the Davis Strait in search of the NORTHWEST PASSAGE explored Greenland’s west coast as well as Baffin Island’s east coast. Italian mariner JOHN CABOT possibly explored southwestern Greenland in his voyage for England in 1497. In his voyage of 1500, Portuguese mariner GASPAR CÔRTE-REAL is known to have sailed along the west coast of Greenland before being turned back by PACK ICE. In 1576,

Englishman SIR MARTIN FROBISHER stopped at southern Greenland and claimed the region for England—the first confirmed stopover since the Vikings—calling the land “West England,” although the claim was not maintained. Davis Strait is named after Englishman JOHN DAVIS, who carried out three expeditions to the waters west of Greenland in the 1580s. Englishman HENRY HUDSON navigated along Greenland’s east coast for London’s MUSCOVY COMPANY in 1607. Englishman JAMES HALL carried out three expeditions to western Greenland for Denmark in 1605–07, hoping to locate Scandinavian colonists, and made a number of landings and drafted charts of the region. Contact was made with Inuit, but not colonists. In 1612, Hall also headed an expedition to the region for England. In 1616, Englishmen WILLIAM BAFFIN and ROBERT BYLOT explored along Greenland’s west coast, reaching Baffin Bay.

In 1721, a Norwegian missionary named HANS EGEDE gained Danish support for a colony to Greenland. It was still hoped that descendants of Viking settlers would be found there. Egede, who landed at present-day Nuuk (formerly known as Godthaab), failed to find Scandinavian survivors there but founded the first permanent European settlement

Below an early map of Greenland appear four vignettes of native life. (Library of Congress, Prints and Photographs Division [LC-USZ62-77699])

and preached to the Inuit until 1736. A number of trading posts were soon established. Denmark increased the population by deporting undesirable subjects there, much as Great Britain shipped convicts to Australia.

Mapping Greenland

As of 1800, much of Greenland had yet to be mapped. In 1806–13, a German mineralogist named Karl Ludwig Giesecke studied the southeast coast by umiak, a type of Inuit boat (see CANOE). In 1822, Englishman WILLIAM SCORESBY, JR., explored the east coast in the region of Scoresby Land and Scoresby Sound. Many other explorers of varying nations contributed to growing knowledge of the huge island over the years. In 1853–55, American ELISHA KENT KANE, while leading an expedition in search of SIR JOHN FRANKLIN, explored Greenland's Humboldt Glacier on the northwest coast, one of the largest glaciers in the world. In 1869–70, German KARL CHRISTIAN KOLDEWEY and Austrian JULIUS VON PAYER explored the east coast.

The Danish Committee for the Geographical and Geological Investigation of Greenland was founded in 1876, leading to a methodical program of research. In 1902–04, Danish LUDWIG MYLIUS-ERICHSEN, accompanied by Danish-Inuit ethnologist KNUD JOHAN VICTOR RASMUSSEN, explored the northwest coast. In 1906–07, Mylius-Erichsen explored the northeast coast, locating the peninsula known as the Northeast Foreland. Rasmussen, who continued his studies of the Inuit people into the 1920s, founded the settlement of Thule, named after the legendary land of ULTIMA THULE, on North Star Bay in the northwest, in 1910. In 1900, American ROBERT EDWIN PEARY reached Greenland's northernmost point—Cape Morris Jesup—and demonstrated conclusively that Greenland was an island and not a landmass extending to the NORTH POLE. American LOUISE ARNER BOYD contributed to the growing geographic and scientific knowledge of Greenland with her studies along the east coast in 1931 and 1933.

Into the Interior

In the meantime, expeditions had begun to venture into Greenland's interior. During his attempt to reach the North Pole in 1860–61, American ISAAC ISRAEL HAYES undertook an inland voyage from the northwest coast and measured the Greenland ice cap at a point where it was some 5,000 feet thick. In 1888, Norwegian FRIDTJOF NANSEN and five others, among them OTTO NEUMANN SVERDRUP, made an east-to-west crossing of southern Greenland on snowshoes and skis, reaching a maximum altitude of 9,000 feet on the ice cap. Rasmussen made a west-to-east crossing in 1912. In 1924–25, American aviator RICHARD EVELYN BYRD carried out the first flights over the Greenland ice cap and charted some 30,000 square miles of territory. In 1929–30, the

German Greenland Expedition under German geologist ALFRED LOTHAR WEGENER established the first permanent weather stations on the ice cap. And in 1930–31, Englishman AUGUSTINE COURTAULD spent the winter alone at about the geographic center of the ice cap, collecting meteorological data, as part of the British Arctic Air Route Expedition of 1930–32 under HENRY GEORGE WATKINS (Gino Watkins). The University of Michigan sponsored a similar American expedition simultaneously. After World War II, scientific expeditions were carried out on a larger scale.

Denmark made Greenland a crown colony in 1924. In a 1979 referendum, Greenlanders voted for home rule, and the island, although still considered part of Denmark, is presently self-governed. The capital and largest city is Nuuk.

Gulf Stream

The Gulf Stream is one of many OCEAN CURRENTS. A warm water current in the Atlantic Ocean, it greatly affects the climate of North America and Europe and has played an important role in routes used by ships. It is created by easterly winds putting pressure on the Atlantic Ocean, a pressure built up in the Gulf of Mexico. Warming caused by proximity to the EQUATOR also contributes to higher pressure. The water seeks an outlet and forms a northward flowing current, past Florida and along the east coast of North America. At Cape Hatteras, as it runs into the southern branch of the cold Labrador Current, the current takes an eastward course. Farther east it splits into two branches, one passing western GREENLAND, the other passing western ICELAND. The current then continues north to Scandinavia and England, circling around to Spain and Portugal, where it cools down and dissipates. The Gulf Stream has been called "the great river within the ocean."

The Gulf Stream may be observed as it crosses the Atlantic. Its water is a dark gray-blue whereas other water surrounding it is gray-green. This results from the relative lack of minerals and plankton. For great stretches, the Gulf Stream is about 100 miles wide and a mile deep. As it leaves the Gulf of Mexico, its temperature is 80 degrees. The average speed of the Gulf Stream is four knots, which decreases as it branches and widens. It makes the climate milder along its course and creates the unique patterns of rainfall in eastern North America.

Italian mariner CHRISTOPHER COLUMBUS, exploring for Spain, was one of the first Europeans to use the Gulf Stream in navigation. The winds and other ocean currents that propelled him to the Caribbean Sea in 1492 presented an obstacle for his return trip to Spain the next year. Rather

than sail back into them, he headed northward and rode the Gulf Stream. In 1513, Spanish conquistador JUAN PONCE DE LEÓN explored the regions where the current originates. In the northeast, the Gulf Stream worked against sailing ships traveling westward from Europe to the northern reaches of North America, delaying extensive exploration of those regions, even as it aided them on their return Atlantic crossings. Whaling captains in colonial New England knew of the Gulf Stream as an area of no whales.

gyrocompass (gyroscopic compass, gyrostatic compass)

A gyrocompass—or gyroscopic COMPASS or gyrostatic compass—is an electronic device used to determine true north as opposed to magnetic north. The device, if properly maintained, is highly accurate and has a variety of applications

aboard a modern ship, such as providing a reference for the interpretation of celestial observations and directing automatic steering mechanisms.

The basic gyroscope is a balanced mass, usually a disk, which is able to spin in any direction about its axis. Once the rotational element is set in motion, its spin axis maintains its direction. This principle is called gyroscopic inertia. In the gyrocompass the axis of the gyroscope is set to run parallel with Earth's north-south axis, or meridian.

The modern version of the gyroscope was developed by French physicist Jean-Bernard-Léon Foucault by 1852. Its uses were multiplied when electric motors were added. The gyrocompass was invented in the early 20th century by American and European scientists and subsequently refined. SUBMARINE navigation benefits from the gyrocompass because of its immunity from the magnetic effects of the steel hull. The gyrocompass is a key component of navigation in modern commercial ships.

Hakluyt Society

The Hakluyt Society is a London-based charity organization, founded in 1846, dedicated to the advancement of knowledge and education regarding world history, especially from the point of view of world exploration, geography, and navigation. It is named after RICHARD HAKLUYT, the 16th–17th-century English geographer, who, through his writings, helped chronicle important expeditions and spread geographic knowledge to a wide public.

The Hakluyt Society's main activity, still vital today, has been publishing primary sources on exploration in English, including the writings of explorers of many different nationalities, such as Russian FABIAN GOTTLIEB BENJAMIN VON BELLINGSHAUSEN, Englishman JAMES COOK, Russian Cossack SEMYON IVANOVICH DEZHNEV, Englishman SIR FRANCIS DRAKE, Portuguese VASCO DA GAMA, Arab ABU ABD ALLAH MUHAMMAD IBN BATTUTAH, Frenchman JEAN-FRANÇOIS DE GALAUP, comte de La Pérouse, German FRIEDRICH WILHELM LUDWIG LEICHHARDT, and many more. The society's published works—about 200 editions, in about 350 volumes—relate to travels on or around all the continents and oceans and cover the last 2,000 years.

Hanseatic League

The Hanseatic League was a commercial union of German cities and towns and their merchants during the Middle

Ages and the RENAISSANCE. The league was the most successful trade association of its time. It grew out of smaller unions of merchants conducting business in foreign lands, known as Hansas. The date of inception is unknown, but it was active by the mid-12th century, created by merchants to establish favorable trade conditions. By the 13th century, the Hanseatic League had evolved into an alliance of cities and towns, which came to number, by the 15th century, as many as 180. Its legislative assembly was known as the Hansetag.

Sharing resources and developing new markets together, league members were able to generate greater profits. Moreover, without a strong centralized government to offer merchants protection from attacks on land and at sea, they had to defend themselves, which was facilitated by banding together. The city of Lübeck in northern Germany was the first permanent Hanseatic trading center. Activity of the Hanseatic League extended throughout Germany, northward to Scandinavia via the Baltic Sea, and eastward to Russia. Members controlled the trade in copper and iron from Sweden, fur from Russia, and, most important, herring and cod caught in the region. But they conducted trade with interests in western Europe as well, including the British Isles. Members of the Hanseatic League even founded franchises in foreign lands.

The COG, a small dependable ship dating from about 1200, enabled extensive trade by sea, even as far as the MEDITERRANEAN SEA. All the commercial activity increased geographic knowledge among league members, created regular routes of travel, and helped unite distant lands.

The Hanseatic League declined in effectiveness by the mid-17th century, largely because of growing English and Dutch power and political strife and warfare in Germany. The Hansetag met for the final time in 1669, with only six municipalities represented.

Hawaiian Islands (Hawai'i)

The Hawaiian Islands are a group of eight major islands and a number of small islands in the Pacific Ocean, between 19 and 22 degrees north latitude and 155 and 161 degrees west longitude. The islands are of volcanic origin. The largest of them is Hawaii, while the most developed and populous is Oahu. The other primary islands are Kahoolawe, Kauai, Lanai, Maui, Molokai, and Niihau.

The peoples who lived on the Hawaiian Islands prior to the arrival of Europeans were of Polynesian ancestry. Although darker-skinned than Polynesians to the south in the other parts of OCEANIA, they spoke the same basic language, had many religious and cultural traits in common, and used a similar type of boat, the OUTRIGGER. The best estimate of the time of their migration is about A.D. 750.

Although it was later claimed in Italy that the Hawaiian Islands were visited in 1555 by Italian Juan Gaetano, who had been a chronicler on the 1542 voyage of Ruy López de Villalobos to the SPICE ISLANDS (the Moluccas), the story remains unconfirmed. As a result, the credit for the European discovery of the island group goes to Englishman JAMES COOK. On his third Pacific expedition, after sailing in the South Pacific he was headed northward to find the western outlet of the NORTHWEST PASSAGE. On January 18, 1778, he came upon the western half of the islands, which he named the Sandwich Islands, after the Earl of Sandwich. The inhabitants proved friendly. It was Cook who noticed the similarity in their language with that of other Polynesians and thus defined the wide boundaries that constitute Polynesia. He and his crew stayed for 12 days before continuing northward.

After his explorations to the north, Cook returned to the islands in January 1779. On this second stopover he discovered Maui and the largest island, Hawaii. His reception on these other islands was hospitable, but, on the expedition's departure in February, the chiefs made no secret that they were glad to see him go. When his ship, the *Resolution*, suffered a damaged foremast, and he returned a week later, relations deteriorated. One of his auxiliary boats was stolen and the next day Cook went ashore with 10 marines to take a chief hostage until the boat was returned. A melee broke out after Cook fired his gun, and Cook, along with four marines and several native people, was killed. His dismembered body was returned to the crew by the tribespeople, and CHARLES CLERKE assumed command of the expedition.

The island of Maui was visited for one day by Frenchman JEAN-FRANÇOIS DE GALAUP, comte de La Pérouse, in May 1786, as part of his scientific exploration of the Pacific. GEORGE VANCOUVER, who had been a member of Cook's second and third Pacific voyages, returned to the islands on his 1791–95 voyage and charted their location. He also made the first accurate map of the islands.

At the time of Cook's discovery, the tribes of the islands were engaged in warfare. During Vancouver's visit, king Kamehameha I acknowledged rights of the British to settle in the territory. In 1810, the islands were unified, and Kamehameha became the sovereign. Agriculture was developed, and the islands became an important provisioning station for whaling fleets. British, French, and American interests were established, and, by the 1830s, a thriving sugar industry was in operation. In 1893, with the instigation of the American population and with the help of the American companies on the island, Queen Liliuokalani was deposed. The U.S. minister to Hawaii, John L. Stevens, set up a provisional government, which sought annexation of the islands. President Grover Cleveland refused, due to the nature of the change in government, but his policy was reversed under William McKinley, who annexed the territory in 1898. Hawaii became the 50th state of the United States on August 21, 1959.

Himalayas

The Himalayas are the highest mountain range in the world. Located in a strip between 200 and 250 miles wide on average, they separate the Indian subcontinent from Tibet and China and the rest of central Asia to the north. The Himalayas form a broad arc of 1,600 miles from the INDUS RIVER in the northwest to the Brahmaputra River on the east and are buttressed on the west by the Hindu Kush mountain range, and on the east by the Assam range, rising up from India's flat Gangetic plain. The mountain range leads into the high Tibetan plateau. The Himalayas, whose name means "abode of snow" in Sanskrit, are one of the world's geologically young mountain ranges, which contains nine of the world's 10 highest peaks, including Mount Everest (see EVEREST, MOUNT), K-2, and Mount Kanchenjunga. They developed between 30 and 50 million years ago, as the Indian tectonic plate collided with Asia. There continues to be tectonic activity as the mountains are slowly uplifted, with earthquakes that strike eastern Pakistan and northern India.

Composed of a series of parallel ridges, the Himalayas can be divided into three main regions: Great Himalayas, Middle (or Inner or Lesser) Himalayas, and Outer (or Sub-Himalayas). The Great Himalayas are a snowy range containing the highest peaks, the average height exceeding

20,000 feet. This region runs in a narrow band of about 15 miles the length of the Himalayas, projecting erratically into the Middle Himalayas to the south. The Middle Himalayas, roughly 50 miles wide, are composed of peaks of a regular height of about 6,000 to 10,000 feet. The Outer Himalayas (including the Siwalik range), averaging about 3,000 to 4,000 feet, slope gently into the northern plains of India and Pakistan, beginning at a width of 30 miles in the west, and narrowing to nothing in East India.

The Great and Middle Himalayas are also divided, along with the other mountains around the Tibetan plateau, into a series of mountain chains: the Kunlun, which forms the northern edge of the Tibetan Plateau; the Trans-Himalayan chain of Muztagh, also called Karakoram, which ends at the source of the Indus River; the Ladakh chain, broken into two parts by the Indus River; the Zaskar chain, containing the majority of snowy peaks; and the Middle Himalayan Nag Tibba, Dhaola Dhār, Pir Panjal, and Mahabharat ranges.

The Great Himalayas are mostly snow covered and harsh, containing a few high valleys, where the scattered inhabitants, largely Tibetan Buddhists, remain isolated. Travel is extremely difficult and often impossible. The hidden valleys have inspired countless tales of lost paradises, such as Shangri-La, a mythical land of well-being and long life.

The peaks in the Himalayas, as the tallest in the world, are significant in the history of MOUNTAIN CLIMBING. Inhabitants of the Himalayan regions of Nepal and Sikkim called *SHERPAS*, familiar with the terrain and skilled in mountaineering, are often called upon as mountain guides and climbers. The Middle Himalayas contain fertile valleys and high forested mountains and are modestly populated, along with the Outer Himalayas, with Hindus of Indian ancestry. Travel in the Middle Himalayas is made difficult by frequent gorges and jagged mountains.

Mapping the Himalayas

The first systematic attempt to map the Himalayas was made in 1590 at the command of Akbar, a Mogul (Mughal) emperor of India. In what had been an Islamic state, while expanding his empire, Akbar allowed freedom of religion and accepted Hindus, Buddhists, and even Christian missionaries at his court. In 1590, he sent an expedition into the mountains to the north.

It was not until the British controlled India in the 19th century that the peaks of the Himalayas were mapped and their heights obtained with great accuracy. In 1806, a British officer, Colonel William Lambton, began what would be called the Great Trigonometrical Survey, sponsored at first by the BRITISH EAST INDIA COMPANY, then headed by the British government. He planned to survey a one-degree swath of India along a straight meridian line from the base of the subcontinent through the Himalayas. Lambton

worked until his death in 1823, succeeded in his job by SIR GEORGE EVEREST. In 1841, the peak now known as Mount Everest was recorded. Everest was succeeded as Surveyor General of India by Andrew Waugh, who helped complete much of the later work on the Great Trigonometrical Survey, measured the heights of the highest peaks in the Himalayas, and named Mount Everest for his predecessor. The PUNDITS, trained Indian emissaries for the British government, carried on the survey in the work in the second half of the century. Meanwhile, in 1854–57, German brothers ADOLF VON SCHLAGINTWEIT, HERMANN VON SCHLAGINTWEIT, and ROBERT VON SCHLAGINTWEIT explored and surveyed the Himalayas and adjoining ranges for the British East India Company.

Mountain Climbers

In the late 19th and early 20th centuries, the challenge of the Himalayan peaks drew more and more climbers. American FANNY BULLOCK WORKMAN made a number of climbs; Swiss mountain climber MATTHIAS ZURBRIGGEN served as her guide on some of them. In 1909, LUIGI AMEDEO DI SAVOIA D'ABRUZZI attempted to climb K2; he did not reach the summit but set an altitude record to that date. British climber GEORGE HERBERT LEIGH MALLORY lost his life in 1924 during an attempt on Mount Everest.

By mid-century, May 1953, Nepalese TENZING NORGAY and Englishman SIR EDMUND PERCIVAL HILLARY reached the highest point of the world, the top of Mount Everest. Since that time, the Himalayas have continued to be a focus of international mountain climbing.

In addition to mountain climbers and visitors to Tibet and its city of LHASA, the Himalayas have also attracted painters, such as 20th-century Russian painter NICHOLAS KONSTANTINOVICH ROERICH. Travel through the Himalayas is still difficult, accomplished for the most part by pack animal.

Hudson Bay

Hudson Bay, along with James Bay at its southern end, is an inland sea of North America. Linked to the Atlantic Ocean via Hudson Strait and to the Arctic Ocean via the Foxe Channel, it can be considered an arm of either one. Just south of the ARCTIC CIRCLE, it borders, from east to west, Quebec, Ontario, Manitoba, and Nunavut Territory in Canada. Baffin Island, part of Nunavut, lies to the north. Hudson Bay has an area of some 475,000 square miles, at about 850 miles long and 650 miles wide. The bay's average depth is about 330 feet; its maximum depth, about 2,846 feet. The 15,700-square-mile Southampton Island in the

northwestern corner is the largest island. Other large islands lie off the east coast: Coats Island, Mansel Island, and the Belcher Islands. Akimiski Island is situated in James Bay. Lands to the west of Hudson Bay are generally barren and rocky; to the east are found mostly low-lying marshlands. Many rivers—among them the Rupert, Nottaway, Albany, Nelson, and Churchill—drain into the bay. The bay is covered by ice from October to mid-July, but open to navigation from mid-July to October.

Hudson Bay played an important role in the history of exploration in two ways: first, as the hoped-for eastern entrance to the NORTHWEST PASSAGE across North America from the Atlantic to the Pacific Ocean; and, second, as the base of operations for the HUDSON'S BAY COMPANY and the development of the FUR TRADE throughout much of North America.

Northwest Passage

Native peoples, partners in the fur trade—in particular the Inuit (Eskimo), Cree Indians, and Chipewyan Indians—knew of Hudson Bay since ancient times. It is possible that Englishman SEBASTIAN CABOT entered the Hudson Strait between the North American mainland and Baffin Island and perhaps even reached eastern Hudson Bay, while in search of the Northwest Passage in 1509, not long after the European discovery of the Americas, although there is no definite documentation. Englishman HENRY HUDSON is given credit for being the first European to navigate through the strait in 1610. He lost his life there the next year, after wintering at James Bay; his crew mutinied because he was supposedly hoarding scarce supplies of food and set him adrift with his son and ailing crew members in a small boat. Yet England's claim to the region was based on his voyage, and both the strait and bay were named for him.

In the years after Hudson's voyage, numerous expeditions explored Hudson Bay for England in the continuing search for the Northwest Passage. SIR THOMAS BUTTON reached the mouth of the Nelson River and explored the coast of Southampton Island in 1612–13; WILLIAM BAFFIN and ROBERT BYLOT explored the bay's northwest coast and Foxe Basin in 1615; LUKE FOXE explored western and northern parts of the bay, including Foxe Channel in 1631; and THOMAS JAMES thoroughly explored James Bay in 1631–32. JENS ERIKSEN MUNK, meanwhile, explored Hudson Bay for Denmark, reaching the Churchill River region on the southwest coast in 1619–20.

Fur Trade

Later in the 17th century, in 1668–69, Frenchman MÉDARD CHOUART DES GROSEILLIERS, backed by an English group of merchants, sailed from England to Hudson Bay and founded Charles Fort (Rupert House) on the Rupert River on its east side, from where he traded with Cree Indians for

furs. In 1670, after his return to England with his cargo, the Hudson's Bay Company was granted a royal charter and a trade monopoly over all the lands whose rivers drain into the bay. Later in 1670, PIERRE-ESPRIT RADISSON, *Sieur des Groseilliers's* brother-in-law, led a second trading expedition there and founded a post at the mouth of the Nelson River on the bay's west coast. In 1671–72, French missionary CHARLES ALBANEL, who had traveled with Groseilliers and Radisson on an earlier expedition to the western Great Lakes, traveled overland from the St. Lawrence River to the mouth of the Rupert River on James Bay.

Over the next decades the Hudson's Bay Company sponsored a number of expeditions in the continuing search for the Northwest Passage. In 1719, an expedition under JAMES KNIGHT explored the Marble Island region off the bay's northwest coast. HENRY KELSEY led three other expeditions from York Factory on the Nelson River to the same region in 1719–21. Later expeditions along the west coast included that of CHRISTOPHER MIDDLETON in 1741, during which he explored Wager Bay and Repulse Bay, and that of WILLIAM MOOR, in 1746–47, during which he explored Chesterfield Inlet and more of Wager Bay. The Hudson's Bay Company next turned its attention to overland expeditions west and north, such as those of SAMUEL HEARNE in the 1760s–70s.

Political Claims

During many of these years England and France struggled for possession of Hudson Bay as it did for other Canadian lands. In 1713, France ceded its claim by the Peace of Utrecht. In 1763, in the Treaty of Paris following the French and Indian War, it ceded all its claims to lands in North America. Yet, in 1782, during the American Revolution, French naval officer JEAN-FRANÇOIS DE GALAUP, *comte de La Pérouse*, who went on to explore the Pacific Ocean, commanded a small French fleet that destroyed a number of British trading posts, including Fort Prince of Wales, where he captured Samuel Hearne. Hearne was later released.

Hudson's Bay Company (HBC)

The Hudson's Bay Company was one of two great fur-trading corporations that helped open the West of what is now Canada and northern parts of the United States. It was granted a charter by the English government in 1670, Charles II conferring on his cousin Prince Rupert, count Palatine of the Rhine, and 17 other noblemen a FUR TRADE monopoly as well as near sovereign rights to the region drained by rivers flowing into HUDSON BAY. The vastness of the territory was unknown at the time, but Rupert's Land, as it came to be known, included almost half of present-day

Canada—what is now all of Manitoba, plus large parts of Alberta, Saskatchewan, Ontario, Quebec, Nunavut, and the southeast corner of the Northwest Territories. Moreover, northern portions of present-day North Dakota and Minnesota were also eventually claimed. The Hudson's Bay Company (HBC) is still in existence, but only as a department store retailer.

Groseillers and Radisson

The impetus for starting the Hudson's Bay Company came from two French *COUREURS DE BOIS*, or independent fur traders, *MÉDARD CHOUART DES GROSEILLIERS* and his brother-in-law *PIERRE-ESPRIT RADISSON*. After being arrested for unlicensed trading and having a load of furs confiscated by French authorities in Montreal, the two elicited backing from merchants in London. In 1668–69, on separate ships, they sailed from England to Hudson Bay as part of a fur-trading expedition. Radisson's ship was damaged off Ireland and returned to England. *Sieur des Groseillers* reached Hudson Bay and founded Charles Fort (Rupert House) on the Rupert River on its east side. He successfully traded with Cree Indians for furs. Although that expedition failed to earn a profit because of the damage to Radisson's ship, it proved the feasibility of sailing into Hudson Bay, wintering there, and returning with a cargo of furs, and led to the royal charter for the company and a subsequent expedition by Radisson in 1670. The Gentlemen Adventurers, as the partners were called, also hoped to locate mineral wealth. Still another motivation for investing in such a company was discovering a *NORTHWEST PASSAGE* from the Atlantic Ocean to the Pacific Ocean for access to the Far East, a goal that was included in the company's charter.

The Hudson's Bay Company slowly expanded its operations into the 18th century. Posts were established at the Nelson, Albany, Moose, Severn, Eastmain, and Churchill Rivers. A number of exploratory expeditions by Englishmen were sponsored. In 1690–92, *HENRY KELSEY* explored the Assiniboine and Saskatchewan Rivers, reaching the Canadian prairies and plains. In 1719–21, *JAMES KNIGHT* explored northwestern Hudson Bay in search of the Northwest Passage; after being shipwrecked on Marble Island, Knight and his entire crew perished; Kelsey led a number of expeditions to the region to search for him. In 1754–55, *ANTHONY HENDAY* explored the Canadian plains within 40 miles of the *ROCKY MOUNTAINS*. In the 1760s–70s, *SAMUEL HEARNE* explored inland from southwestern Hudson Bay on three expeditions. He also established the company's first inland trading fort, Cumberland House on the Saskatchewan River. In 1770–72, with the help of Chipewyan Indian guide *MATONABBEE*, Hearne reached the Arctic Ocean and made the European discovery of the Great Slave Lake. In 1772–75, *MATTHEW COCKING* explored from southern Hudson Bay to western Saskatchewan.

During many of these years, France and England vied for control of the region as they did for other parts of North America. The Peace of Utrecht, 1713–14, a series of treaties resolving conflicts in Europe, brought some stability to the fur trade, as did the Treaty of Paris in 1763, which ended the French and Indian Wars and gave England control over formerly French-held territory in North America. Yet, during the American Revolution in 1775–83, French forces were again active in the Hudson Bay area.

Competition with the North West Company

The Hudson's Bay Company faced growing competition in the fur trade in the latter part of the 18th century. Scottish interests organized the *NORTH WEST COMPANY* in the 1780s, and, taking advantage of French expertise in the field, its traders became active over a greater expanse of territory than the Hudson's Bay Company traders. In the 1780s–90s, *DAVID THOMPSON*, a skilled geographer and cartographer of Welsh ancestry, journeyed westward as far as present-day Calgary, Alberta, explored up the Saskatchewan River into the Rocky Mountains, and pioneered a route from Hudson Bay to Lake Athabasca. Without the backing he desired for further surveys, however, he joined the Nor'westers (as the employees of the North West Company were known) in 1797. The *AMERICAN FUR COMPANY*, founded in 1808 by *JOHN JACOB ASTOR*, also proved a formidable competitor to the south. As a result, the Hudson's Bay Company began sending traders farther inland to locate new sources of furs.

After 1808, Thomas Douglas, earl of Selkirk, gained influence within the Hudson's Bay Company, and started a new policy of settling Scottish and Irish farmers on company lands. The founding of the Red River Settlement along the Red River in present-day Manitoba led to violence in 1816 between the colonists and the Métis, the mixed-blood descendants of Native Americans and French and Scottish traders, backed by Nor'westers. That conflict and others led to an amalgamation of the two companies in 1821. Although the North West Company was the more active of the two in the fur trade at that time, the older Hudson's Bay Company controlled many of the favored westward routes, and the name of the latter company was retained. Control of additional lands—all the way to the Pacific and Arctic Oceans—were under the control of the new monopoly. In 1838, the company's license for sole trading rights was renewed for 21 years.

After the Merger

After 1821, Hudson's Bay Company representatives sponsored explorations of a vast region. In the 1820s–30s, *JOHN M'CLOUGHLIN*, based on the *COLUMBIA RIVER* and in charge of operations in the Pacific Northwest, a region subject to joint Canadian and American occupancy at the time, directed traders, such as *PETER SKENE OGDEN* and *JOHN*

WORK, in trading expeditions throughout the region, even as far south as Great Basin in what is now Utah. They thus competed with American MOUNTAIN MEN then working the West. In 1824, ALEXANDER ROSS explored the Snake River from present-day Montana to the mouth of Boise River in present-day Idaho. In the 1830s–40s, SIR GEORGE SIMPSON, head of the vast northern department, sponsored his cousin THOMAS SIMPSON along with PETER WARREN DEASE in surveys of Alaska's and Canada's Arctic coastline; he also sponsored JOHN RAE in a survey of the territory north of Fury and Hecla Strait in the eastern Canadian Arctic. In 1840, ROBERT CAMPBELL located the source of the Pelly River in the Yukon Territory. And, in 1841, JAMES SIN-

CLAIR, leading emigrants westward from the Red River Settlement to the Oregon Country for the company, pioneered a wagon route through the Canadian Rockies.

In 1859, with the expiration of the current license, the Hudson's Bay Company lost its trading monopoly throughout Rupert's Land. After the British North America Act of 1867 and the confederation of the colonies of Nova Scotia, New Brunswick, Quebec, and Ontario into provinces of the Dominion of Canada, property rights were also reevaluated. In 1869, the Dominion of Canada acquired Rupert's Land. The next year, the Red River area became a new province, Manitoba; the rest of Rupert's Land became the Northwest Territories, the southern portions of which became the provinces of Alberta and Saskatchewan. The Hudson's Bay Company retained some lands and its posts.

The Modern Company

In the 20th century, the Hudson's Bay Company diversified into manufacturing and retail, developing a chain of Canadian department stores. During World War I (1914–18), it operated a steamship line, transporting food and munitions for the war effort. In 1930, the company was forced to split up and divest, with Canadian retail interests becoming incorporated as a separate organization, and London interests remaining active in the international fur trade. Many of the remaining lands were eventually sold off. During World War II (1941–45), the Hudson's Bay Company again provided resources in the war effort, including supply vessels for patrols. In 1970, company headquarters were transferred from London to Winnipeg, Manitoba. The Bay, Zellers, Home Outfitters, and hbc.com are the current company divisions.

See also COMMERCE AND EXPLORATION.

hydrography

Hydrography, a branch of geography, is the study of bodies of water and the land that surrounds them. The main purpose of the hydrographer is to survey, chart, and sound bodies of water so that navigation may be conducted with the greatest degree of safety. To this end, the findings of hydrographic surveys are published for those who have practical need of them. Sometimes a distinction is made between hydrography as the study of surface water sources and supplies, and hydrology, the study of underground sources.

In modern practical use, hydrography has come to include the observation of magnetic variations, currents, tides, waves, and weather conditions, although such subjects—at least regarding the world's oceans—are generally considered as part of the discipline of oceanography. Hydrography begins with very precise measurements of locations. These reference points are called origins. From these points, other features are located.

Hydrography became organized as a field of study in England during the reign of Queen Elizabeth I in the second half of the 16th century. An 18th-century Englishman, JAMES COOK, was a noted hydrographer.

See also GEOGRAPHY AND CARTOGRAPHY; OCEANOGRAPHY AND EXPLORATION; SURVEYING AND EXPLORATION.

hypsoneter

A hypsoneter is a device used to measure the altitude of a location (hypsonetry being the measurement of elevation relative to sea level). One of the earliest methods for determining altitude relied on the variation of the boiling point of water with altitude. Since there is less atmospheric pressure the higher one travels, the temperature at which water boils is proportionally lower. A hypsoneter measures the deviation in boiling point from water at sea level (212 degrees Fahrenheit). It consists of a cylindrical vessel in

which water or another liquid is boiled; in the outer partitions of a jacketed column, steam circulates, while in the central one a thermometer gives a reading of the steam's temperature without immersion in the boiling water.

Although comparing boiling times had been used to measure elevation for years, a practical hypsoneter was not designed until 1845. Its inventor was French chemist and physicist Henri-Victor Regnault, who was at that time a professor at the Collège de France.

In addition to the obvious applications in mapping the contours of mountainous regions, the hypsoneter was important to early explorers who sought to understand river systems. By comparing the location and elevation of an unknown river with that which was known about another river in question, a person could trace drainage patterns and thus determine the relationships between a river and its tributaries.

iceberg See DRIFT ICE.

Iceland

Iceland, or Ísland in the Icelandic language, is an island in the North Atlantic Ocean, just south of the ARCTIC CIRCLE, about 180 miles east of GREENLAND across the Denmark Strait, and about 600 miles west of Norway across the Norwegian Sea. Along with tiny neighboring islands, it constitutes the Republic of Iceland, considered the westernmost nation of Europe.

The island of Iceland is about 300 miles from east to west and about 190 miles from north to south. The coastline, with deep fjords, especially in the north and west, is about 3,730 miles long. The total land area including islands is about 39,800 square miles. Iceland consists of a plateau, averaging about 2,000 feet in height. Some 200 volcanoes, many of them still active, such as Mount Hekla, rise up from the tablelands. Because of the warming effect of the North Atlantic Drift—a continuation of the GULF STREAM—southern and western regions have a milder climate. About one-fourth of the island is habitable, with most settlements situated along the southwestern coastal lowlands. Grasslands predominate with few trees. Almost 15 percent of the island is covered by permanent glaciers and snowfields. Numerous lakes and rivers are located throughout the island.

Iceland may have been the legendary ULTIMA THULE visited by Greek scholar PYTHEAS in about 325 B.C. The ear-

liest people known certainly to have reached Iceland were Irish. During the Middle Ages, Irish monks carried out sea pilgrimages, seeking barren islands to find solitude and enlightenment or inhabited islands where they might missionize native peoples. In the course of such expeditions they founded settlements in the Orkney Islands, the Shetlands, and the Faeroes. It is not known at what point they reached Iceland. The legendary ST. BRENDAN'S ISLE, supposedly reached by monk SAINT BRENDAN in the sixth century A.D., may have been Iceland. In any case, Irish settlements existed there by 800.

The Vikings reached Iceland later in the ninth century. Traditional Norse literature holds that, in about 860, NADDOD was blown off course while traveling from Norway to the Faeroe Islands and reached the east coast of Iceland; he named it Snaeland for "Snowland." Another Norse saga holds that, about the same time, GARDAR SVARSSON circumnavigated Iceland, determining it was an island and naming it Gardarsholm, or "Gardar's Island," then building the first Viking house there, on the north coast. There is a possibility that both the accounts are derived from the same actual voyage. Floki Vilgerdarsson, another early traveler, built a house on the east coast. Ingólfur Arnarson, who established a farm at present-day Reykjavík on the southwest coast in about 874, is considered the first permanent settler of Iceland. By that time, the Irish had abandoned the island. During subsequent decades, other settlers flocked to the island from both the British Isles

and Scandinavian countries. In 930, a general legislature called the Althing was established for all the colonies. Iceland became a home for Vikings as well as a stopover for voyages farther west. ERIC THE RED, who settled in Iceland, sailed from there to Greenland in about 982–85. LEIF ERICSSON, who reportedly reached North America, may have been born in Iceland.

In 1262, Iceland came under the rule of Norway. In 1380, Denmark assumed control. In 1918, Iceland became an independent kingdom in union with Denmark. Reykjavík is the capital. The people of Iceland are predominantly of Scandinavian and Celtic ancestry.

ice pack See PACK ICE.

Indian Ocean, exploration of the

The Indian Ocean is the third-largest ocean in the world, after the Pacific Ocean and the Atlantic Ocean, covering more than 23 million square miles. It is bounded by the Malay Archipelago and Australia in the east, the continent of Asia in the north, Africa in the west, and Antarctica in the south.

In its southern regions, the Indian Ocean has counterclockwise currents similar to those of the Atlantic and Pacific. To the north, the currents are dominated by seasonal monsoon winds. In the winter, the winds north of the EQUATOR blow from the northeast, creating a current in the same direction; south of the equator they curl from the northwest. In the summer, the winds reverse general direction, blowing from the south and west.

Among other smaller rivers, the Indian Ocean is fed by the ZAMBEZI RIVER of Africa, the Tigris and Euphrates Rivers of the Middle East, and the INDUS RIVER and GANGES RIVER of the Indian subcontinent. The waters of the Indian Ocean are generally warm, except near Antarctica, where they contain PACK ICE and DRIFT ICE for most of the year.

The Indian Ocean contains several subdivisions, which are important bodies of water in their own right. The Arabian Sea (or Erythraean Sea as it was known in antiquity) in the northwest connects to the Persian Gulf and the RED SEA. The Bay of Bengal in the northeast is also named separately. These waters formed the basis of trade between Africa and Asia. The regularity of the monsoonal wind system, despite the great number of storms, has facilitated navigation over the centuries.

Ancient Travel

The various principalities along the shores of the Indian Ocean did not always know of one another, and their early history is uncertain. Ancient Egyptians were traveling down

the Red Sea to the land of PUNT as early as 2450 B.C. (see EGYPTIAN EXPLORATION). By that early time, in the land of Ur in southern Mesopotamia, buildings were made of teak imported from the Malabar Coast in western India. To the east the history is even more unclear. It is likely that Indians brought goods from Sumatra and Java several thousand years before Christ, but because of the destruction of the Indus River civilizations in about 1500 B.C. by Aryans from the north, knowledge of this time is limited. Buddhist texts from 1000 to 500 B.C. mention lands to the east of great wealth. A trade connection with the SPICE ISLANDS (the Moluccas) at that time has not been proven.

There is some speculation that Arabs were venturing past Africa's CAPE OF GOOD HOPE by the eighth century B.C. to trade with the peoples of East Africa. Moreover, the question of the source of cinnamon among civilizations in the MEDITERRANEAN SEA at this time is interesting, since the spice probably originated in CEYLON (present-day Sri Lanka), indicating extensive early East-West contacts.

There survives an account of Phoenicians making a journey from the Red Sea, through the Indian Ocean, and around Africa through the Strait of Gibraltar (see GIBRALTAR, STRAIT OF) in about 600 B.C. (see PHOENICIAN EXPLORATION). The story, as told by fifth-century B.C. Greek historian HERODOTUS, though impossible to confirm, has details that give it credibility.

ALEXANDER THE GREAT, who began his military conquest of the east from Macedonia in 334 B.C., arrived in the land that is now Pakistan in 325 B.C. On the Indus River, Alexander's army constructed 150 boats. NEARCHUS, one of his generals, was given command of an expedition to explore the coast of the Erythraean Sea on a return trip to the western end of the Persian Gulf. It was Alexander's intention to unite the lands he had conquered, with trade routes by both land and sea. The report of this journey survives through Greek historian Arrian, who wrote of it in his work *Indica* in the second century A.D. The empire that Alexander created fragmented with his death, as did the hoped-for trade routes.

In about 45 B.C., Greek merchant HIPPALUS, seeking a faster route to India and hoping to avoid the pirates along the coasts of Arabia and Persia (present-day Iran), sailed across the Indian Ocean to the Malabar Coast, finding favorable winds. His route became well traveled by traders bringing back exotic goods for the wealthy Romans (see GREEK EXPLORATION; ROMAN EXPLORATION). Meanwhile, the Indians also extended their influence, colonizing the Malayan Peninsula and other lands of Southeast Asia, which came to be known as "Greater India." India's central location gave it its role as the middleman of Indian Ocean traffic. It was at this time that a connection was made with the Spice Islands at the eastern extent of the Indian Ocean.

The Middle Ages

With the breakup of the Roman Empire in the fifth century A.D., Europe again became isolated from India. This was exacerbated with the founding of Islam in the seventh century. Persia came into ascendancy and traded energetically with India as the West languished. The Chinese also made efforts to obtain goods from their southern neighbors. They sent their own ships to Malaysia and India, but were also serviced by the merchants of these countries. The Chinese preferred to have as much control over their balance of payments as possible, which made them inconsistent in their trade policy and often isolationist. In A.D. 758, Arabs ransacked the port of Canton in southeastern China, which led to the city being closed to outsiders for 50 years. Muslims were also sailing farther down the coast of East Africa, settling on the island of Madagascar by the ninth century. Madagascar became an important center of trade with Africa, for ivory, agricultural products, and slaves. It also had a vital seafaring culture.

During much of the Middle Ages, trade was at a minimum between Europe and Asia. What little contact there was grew out of the port city of Venice, which came to dominate the Mediterranean Sea and eventually trade with the East. Venetian trader MARCO POLO traveled through Asia and into China with his father, NICCOLÒ POLO, and uncle, MAFFEO POLO, in 1271–75. In 1292, he made a journey by ship from the South China Sea through the Strait of Malacca into the Indian Ocean. After several stopovers in India, he continued westward to Ormuz, a center of trade at the mouth of the Persian Gulf. He arrived back in Venice in 1295. The published account of his travels opened up a whole new world to Europeans. Arab traveler ABU ABD ALLAH MUHAMMAD IBN BATTUTAH visited much of the civilized world during his lifetime, including Europe, and the stories of his journeys became known there. In 1349–54, he sailed the Arabian Sea, the open waters of the Indian Ocean, and the Bay of Bengal (see MUSLIM EXPLORATION).

Two other figures are important in the history of the Indian Ocean before the route from Europe around Africa was discovered by the Portuguese. The first was Italian adventurer NICCOLÒ DEI CONTI, who sailed from the Persian Gulf to India, Sumatra, Burma, and Vietnam. His travels, from 1414 to 1437, formed the basis of a book by Poggio Bracciolini dealing with the conflict between Christianity and Islam. It also proved a rich source of information on the culture and geography of the east. The second great traveler at this time was Chinese admiral CHENG HO. Between 1405 and 1434, he mounted seven expeditions to the south under the sponsorship of the Ming dynasty. These voyages were on a grand scale, with 62 main ships and 27,000 soldiers. Cheng Ho's efforts took him as far as the Persian Gulf. He exacted tribute from many different peoples and

brought back many luxuries to his homeland (see CHINESE EXPLORATION).

Around Africa

When HENRY THE NAVIGATOR, prince of Portugal, conquered the Muslim port of Ceuta in North Africa at the Strait of Gibraltar in 1415, a new chapter in European exploration was begun, sometimes referred to as the EUROPEAN AGE OF EXPLORATION. Inspired by the richness and vigor of the Islamic culture, and knowing of the profits that could be made by circumventing their hold on the SPICE TRADE, Henry began a concerted effort to sail around Africa to the source of these goods. The ambition was not realized in his lifetime but was pursued by his fellow countrymen. King John II of Portugal sent BARTOLOMEU DIAS on the first European voyage to round the southern tip of Africa into the Indian Ocean, which he accomplished in 1487–88. VASCO DA GAMA embarked on a journey intending to reach India in 1497. On April 14, 1498, he reached Malindi on the coast of East Africa where Kenya is today, and secured the services of an Arab pilot to take his fleet to India. The uneventful trip was made in 23 days. The Hindu leader he met at Calicut was not overly friendly. The Muslim traders, who were well entrenched, were even more antagonistic, realizing that their way of life was severely threatened. After attacking the city, da Gama sailed southward to Cochin, where he managed to form an alliance with the Hindus. A second Portuguese journey in 1500, led by PEDRO ÁLVARS CABRAL, was even more successful, and the time of European ships sailing the Indian Ocean was well under way. With the first CIRCUMNAVIGATION OF THE WORLD by FERDINAND MAGELLAN's Spanish expedition in 1519–22, Europeans first entered the Indian Ocean from the east. A century later, European ships would also sail Indian Ocean waters along Australia's west coast.

Southern Waters

The northern Indian Ocean continued to be a primary route of transportation between four of the world's seven continents—Africa, Asia, Europe, and Australia—over the next centuries. Yet its southern latitudes remained uncharted until the late 18th century. In 1772, Frenchman YVES-JOSEPH DE KERGUÉLEN-TRÉMAREC led an expedition to southern waters in search of the fabled GREAT SOUTHERN CONTINENT, or Terra Australis, during which he located the Kerguelen Islands in the southern Indian Ocean, close to the parallel of latitude referred to as the ANTARCTIC CIRCLE. At about the same time, in 1772–75, Englishman JAMES COOK circumnavigated Antarctica, proving that the fabled land did not exist in southern waters. While encircling Antarctica, he navigated the Pacific, Atlantic, and Indian Oceans and crossed the Antarctic Circle three times. The Antarctic coast

was not sighted until the 19th century—the Indian Ocean side later than the others—and was not thoroughly charted until the 20th century.

The Indian Ocean holds a special place in the history of exploration as the ancient maritime link between three continents, Europe, Africa, and Asia. The arrival of the Portuguese along the route around Africa renewed its significance as a highway of cross-cultural contact and commerce.

Indus River

The Indus River runs some 1,800 miles from its source, glacial streams in the high HIMALAYAS, to the Arabian Sea. It flows northwestward from western Tibet into India, passing between the far western edge of the Himalayas and the northern extent of the Hindu Kush mountain range. Made navigable by a junction with the Kabul River flowing out from Afghanistan, the Indus, after flowing through the Pakistani province of Sind, finally branches into an infertile delta of some 3,000 square miles. Other major tributaries are the Sutlej, Ravi, and Chenab.

Harrapa Civilization

The Indus Valley was the location of one of the oldest civilizations on record. The Harrapa culture flourished there by about 2500 B.C.—at the same time as the highly developed civilizations of Mesopotamia, Egypt, and Crete—and came to encompass one of the largest geographic areas covered by a single Bronze Age culture. Harrapa people built cities reaching a population of 40,000, dug complex irrigation channels, and even had indoor plumbing. There is evidence that they traded with civilizations as far east as Arabia. By 1500 B.C., however, the Indus Valley civilization had disappeared, to be rediscovered by archaeologists in the 20th century.

In about 2340 B.C., SARGON of Akkad consolidated his power over all of Mesopotamia and began looking outward. He sent out expeditions in all directions for conquest and trade. It is known that Sargon established trade contacts with the Harrapa civilization, and the boundaries of the Akkadian Empire perhaps extended as far as the Indus Valley. After only 40 years, the Akkadian Empire contracted under political pressure and finally collapsed.

The Harrapa civilization collapsed about the time Aryan tribes established themselves in the Indus Valley as well as farther east in Persia (present-day Iran). Several empires flourished in the east until about 550 B.C., when Persians from the southern region of the Iranian plateau, led by Cyrus the Great, gained control of the former Assyrian Empire, which had stretched over much of Anatolia and

Mesopotamia. Before long, the Persians also invaded the Indus River Valley.

Greek Travels and Writings

The Greeks had an early knowledge of the Indus (see GREEK EXPLORATION). Greek geographer HECATAEUS OF MILETUS traveled in the eastern Mediterranean between 520 and 494 B.C. He used his observations and information from merchants and mariners to write the first systematic geographic account of the world. With knowledge gleaned from the Persians, Hecataeus described the newly conquered Indus River Valley and first introduced the terms *Indus* and *India* into a European language.

In 510 B.C., Darius I, the successor to Cyrus of Persia, sent Greek mariner SCYLAX to investigate the course of the Indus River in the hope of improving trade and communication with that part of the Persian Empire, as well as providing tactical military information. Scylax traveled overland throughout the Near East, then is thought to have entered the Kabul River, sailing into the Indus and descending it to the Arabian Sea. CTESIAS OF CNIDUS, another Greek, served as court physician to Darius II and traveled throughout the Persian Empire and India on his behalf in the late fifth century B.C. He wrote two accounts of his journeys, *Indicus* and *Persicus*, attempting to discredit the accounts of his contemporary, Greek historian HERODOTUS, who recounted Scylax's expedition down the Indus.

In 331 B.C., Macedonian ALEXANDER THE GREAT, after consolidation of his rule of the Greek city-states and military victories against the Persians in Asia Minor and the Egyptians in North Africa, he marched across into what is now Afghanistan. Informed by the accounts of Herodotus and Ctesias, he descended into India in 327 B.C. After crossing the Indus River and defeating Indians at the Jhelum River, Alexander's army refused to proceed farther east. In 325 B.C., Alexander and his army sailed from the Jhelum to the Indus, following it to the Arabian Sea.

Alexander's empire collapsed into smaller kingdoms shortly after his death in 323 B.C. In about 300–290 B.C. MEGASTHENES, a Greek, and a servant to the king of Syria, one of these kingdoms, traveled as a diplomat making observations of India. With Megasthenes's account, which exists only in fragments, the story of Western travel into the East and through the Indus River Valley, ended for a time.

Chinese Voyages

With the rise of the kingdom of China farther east in the early centuries A.D., the Indus River Valley again became important (see CHINESE EXPLORATION). Due to the imposing central band of the Himalayan mountain range separating the Indian subcontinent from the rest of central Asia, travelers from the east seeking to enter India, or seeking to leave it,

were best served by traveling through the less-imposing Hindu Kush range farther west and following the Indus River Valley southward into India.

One such traveler was FA-HSIEN, a Buddhist monk and scholar from east-central China. In A.D. 399, he set out to India with three other monks in order to locate Sanskrit originals of Buddhist texts, which he planned to translate. Fa-hsien crossed into present-day Afghanistan after a long journey through the deserts of central Asia. He followed the Kabul River and entered the Indus Valley. He returned to China by boat after three years in India. Another Buddhist monk, HSÜAN-TSANG, made a similar journey in 629 A.D., crossing into India through the KHYBER PASS from Afghanistan. After years of study and pilgrimage through India, Hsüan-tsang returned but this time followed the Indus River into Afghanistan, returning to China in an overland trade caravan.

In ancient times, the Indus River Valley served as the cradle of the Harrapa civilization. Afterward it was a line of demarcation between the near east lands hellenized by Alexander the Great's conquest and the rest of the Indian subcontinent. For centuries, it remained an important route for travel from central Asia, but as Europeans developed and exploited routes to India over the Arabian Sea, its importance waned. It now serves as an artery of local traffic and also provides irrigation for surrounding lands.

International Date Line

The International Date Line is an imaginary line extending between the NORTH POLE and the SOUTH POLE, which marks off one calendar day from the next, with a time difference of 24 hours on each side. Situated on the opposite side of Earth from the PRIME MERIDIAN, which is designated as zero degrees longitude, the International Date Line as defined on a map, chart, or GLOBE corresponds most of its length to the 180-degree meridian of longitude, bending eastward around the eastern tip of SIBERIA, westward around the Aleutian Islands and eastward again around various island groups in OCEANIA, thereby avoiding a time change in populated areas.

Throughout history, most localities set their time by the rising and setting of the Sun. By the late 1800s, with increased long-distance communication and travel, a standard time system was needed. By international agreement, Earth's 360 degrees were divided into 24 zones, each measuring about 15 degrees in width, based on Earth's rotation of 15 degrees of longitude per hour. Clocks within a given time zone are set to the same time, with local noon corre-

sponding approximately to the time at which the Sun crosses the central longitude of that zone. Each of the 24 zones is generally one hour later than the zone to its west. A hypothetical eastward traveler from the prime meridian would set a clock ahead one hour for each 15 degrees of longitude, the clock thus gaining 12 hours; a westward traveler from the prime meridian would set a clock back one hour for each 15 degrees, the clock losing 12 hours. The two clocks would therefore differ by 24 hours, or one calendar day, which necessitates a date change.

International Geophysical Year (IGY)

Geophysics is the study of the structure, composition, and dynamic changes of Earth and its cosmic environment, involving a variety of scientific disciplines. The International Geophysical Year (IGY) was an 18-month period, from July 1957 to December 1958, designated for cooperative study of Earth's geophysics. The time frame was selected because it was a period of intense solar activity. Scientists of 66 nations participated. Studies were conducted on solar activity, cosmic rays, auroras, the ionosphere, the upper atmosphere, geomagnetism, gravity, meteorology, glaciers, oceanography, and LATITUDE AND LONGITUDE. Some of the endeavors relate to the history of exploration.

Among the many accomplishments during IGY were the launching into space of *Sputnik 1*, the first artificial SATELLITE by the Union of Soviet Socialist Republics (USSR; Soviet Union) on October 4, 1957. The Soviet Union launched the much larger *Sputnik 2* on November 3, 1957, which carried a dog, Laika. The first U.S. satellite, *Explorer 1*, launched on January 31, 1958, discovered the Van Allen belts, a zone of trapped radiation surrounding Earth; subsequent satellites performed additional tests. In the field of oceanography, soundings were made of the floor of both the Pacific and Atlantic Oceans. The surveys led to the discovery of seismically active rifts in submarine mountains and furthered knowledge of plate tectonics. More than 300 observation stations were set up in Arctic regions. Knowledge of Antarctic geography was furthered in the Commonwealth Trans-Antarctic Expedition of 1957–58, headed by Englishman SIR VIVIAN ERNEST FUCHS and New Zealander SIR EDMUND PERCIVAL HILLARY. (The U.S. Navy's Operation Deep Freeze to Antarctica, involving aviator RICHARD EVELYN BYRD, was carried out in 1956 in preparation for IGY.) The spirit of cooperation generated around IGY led to the Antarctic Treaty, declaring the continent a nonmilitary area to be used only for scientific study and used to govern Antarctica since 1961.

IGY was followed in 1964–65 by the International Years of the Quiet Sun (IQSY) to obtain data for comparison

of a time of minimum solar activity with that of the earlier studies. IGY has led to continuing research and monitoring of geophysics, partly because of a growing sense of urgency among scientists regarding the effects of human activities on Earth, such as increasing levels of carbon dioxide in the at-

mosphere resulting from the burning of fossil fuels, the so-called greenhouse effect.

junk

The junk, a type of ship designed by the Chinese, has several unique features. Among them are a broad and square bow and a raised poopdeck—a partial deck at the rear of the boat above the main deck—on which is mounted a center long rudder for steerage. The rudder can be lowered in deep water to act as a centerboard, or raised in shallow water where necessary; it is controlled by a long tiller, which enables it to be moved quickly for fast maneuverability. This rudder design was achieved centuries before Europeans also adapted it. The bottom of the boat is flat, sometimes with a small keel. The junk has two or more masts with battened four-cornered sails, known as lugsails. The battens, or bamboo rods dividing the sail into sections, make the sail stiffer than single-section sails and more efficient in using wind. Moreover, the sections can be raised or lowered depending on condition. The junks of today use cotton sails, but in the past they were made with various types of fiber matting. The Chinese compare this type of sail to an ear, which “listens for the wind.”

Chinese have used junks for millennia. The earliest known reference to the boat is from the time of emperor Fu Hsi, in about 2800 B.C. They were used for fishing, transportation, trading, and warfare. Junks would sail the oceans, traveling southward from China to the Malay Peninsula, India, CEYLON (present-day Sri Lanka), and even to the east coast of Africa. The recovery of ancient Chinese coins is ev-

idence of these journeys. In writings by Muslims are found descriptions of junks on the Euphrates River in the seventh century A.D.

The great age of the seafaring junks lasted from the 12th to the 15th century. At this time the Chinese were active in trade with the merchants in the EAST INDIES and India. One of the first known Europeans to see a fleet of junks was Italian MARCO POLO in the 13th century. He described them in some detail, with their watertight compartments, helping to prevent sinking in case of a puncture (and able to carry liquid cargoes), iron nails to secure its planks, and dovetailed joints for strength. He was in awe of their size and related how a junk might have 50 to 60 cabins, each one occupied by a trader and his goods, and supporting him in comfort. By the 15th century, junks had become colossal in size, some of them 400 feet long and 160 feet wide. CHENG HO, a Chinese admiral and explorer of that century, commanded a vast fleet of large junks.

The ease of control and dependability in poor conditions have made the junk useful in the modern coastal waters and in the rivers of the Far East—especially in China, Japan, and Indonesia—for fishing and commerce. Some seen in seaports are 70 feet long, displacing some 100 tons. Some families live on their junks.

Shown here, in a photograph from the early 20th century, is a Chinese junk in the harbor of Hong Kong. (*North Bennington, Vt.: H.C. White Co., c1907; Library of Congress [LC-USZ62-118818]*)

keelboat

The term *keelboat* refers to a long, slender, shallow boat with a keel and a covering to protect cargo and crew. It was principally powered by poles or oars, although some keelboats had hand-cranked paddle wheels or sails to take advantage of useful winds. The design of the keelboat made it suitable for use on rivers, especially the moving of freight. A large keelboat could carry 80 tons of goods. But they were also used as early passenger vessels, especially on the MISSISSIPPI RIVER and MISSOURI RIVER. Early U.S. expeditions up the Missouri, such as those under MERIWETHER LEWIS and WILLIAM CLARK in 1804 and ZEBULON MONTGOMERY PIKE in 1805, made use of the keelboat. It was also an essential craft in the Missouri River FUR TRADE of the early 1800s.

When steamships came into use (the first one on the Mississippi in 1811), they generally replaced the keelboat (although, in 1825, Colonel HENRY ATKINSON used keelboats for a second military expedition along the Missouri and Yellowstone Rivers after steamships broke down on the first). Two-way traffic on the river, with and against the current, was accomplished more efficiently by steam power. In modern usage, the term *keelboat* refers to a sailing vessel with a ballasted keel giving stability in ocean racing.

Khyber Pass

The Khyber Pass is the most important mountain pass in western Asia. Connecting modern-day Afghanistan and Pa-

kistan, it runs just more than 30 miles through the Safed Koh mountain range, extending to the south from the Hindu Kush mountain range. Of the five passes that connect Afghanistan to Pakistan through these mountains, the Khyber Pass is favored because it is the shortest route. Winding through the mountains, it varies in width from 450 to 15 feet. Before modern improvements, travelers could touch both walls with outstretched hands while passing the narrowest region of the pass. Near Kabul, Afghanistan, the altitude of the pass is about 1,404 feet; on its opposite end near Peshawar, Pakistan, it reaches a maximum elevation of 3,517 feet. Two streams run through the pass, and on either side rise sheer shale and limestone cliffs between 600 and 1,000 feet high.

Because of the many mountain ranges surrounding the Indian subcontinent, the Khyber Pass, before air travel, provided the best route from central Asia into India, and played an important part in trade along the SILK ROAD, linking the major route between China and the MEDITERRANEAN SEA with India. It also provided easy access to the INDUS RIVER, which merchants could use to sail into the Arabian Sea. Many travelers to India followed the trade routes through the Hindu Kush, including the first Chinese explorers of India. The Khyber Pass was also a convenient route for invasion, and Darius I of Persia (present-day Iran), part of Macedonian ALEXANDER THE GREAT's army, and people of the Islamic Mughal (Mogul) Empire all traversed it, attempting to invade India.

In the 19th century, as Britain and Russia vied for superiority in central Asia, Afghanistan and the Khyber Pass

became a contested area. In the course of shoring up their defense of its Indian possessions and later during the Anglo-Afghan wars, there were many skirmishes between the British and Afghan natives. In January 1842, some 16,000 British and Indian soldiers were killed fighting in the pass. The British made modifications to the pass, constructing a road in 1879, and expanding that road in the 1920s as well as building a railroad.

The importance of the Khyber Pass was greatly diminished with the advent of air travel, but it is still used today. During the Afghan civil war of the 1980s, 3 million refugees fled through the pass into Pakistan.

Kilimanjaro, Mount

Mount Kilimanjaro, part of Africa's Eastern Highlands, is a mountain located in northeastern Tanzania, near its border with Kenya. The highest mountain on the continent, it actually consists of two peaks, seven miles apart and connected by a ridge. Kibo is the higher peak at 19,341 feet above sea level; Mawensi is 16,893 feet.

Greek merchant DIOGENES perhaps viewed Mount Kilimanjaro in the first century A.D. Hellenized Egyptian

PTOLEMY produced a map the next century showing the MOUNTAINS OF THE MOON, most often associated with the Ruwenzori Mountains, but possibly representing Mount Kilimanjaro and the second-highest peak in Africa, Mount Kenya, at 17,057 feet. German missionaries JOHANN REBMANN and JOHANN LUDWIG KRAPF are known to have seen Kilimanjaro in 1848. Krapf also sighted Mount Kenya.

Kibo was first scaled in 1889 by German geographer HANS MEYER and Austrian mountain climber Ludwig Purtscheller. Meyer had made two earlier unsuccessful attempts, in 1887 and 1888. On his 1889 expedition, Meyer explored the ice-covered crater at the top and determined that the mountain is a dormant volcano. Since that time, numerous other expeditions have reached the summit of both peaks. Tourism related to MOUNTAIN CLIMBING, as well as farming along the mountain's lower southern slopes, provide income for inhabitants in the region.

King Solomon's mines See OPHIR.

land bridge

A land bridge is a stretch of land connecting two landmasses, such as islands or continents. In the history of exploration, the term is applied to the land bridge across the **BERING STRAIT**, once connecting Asia and North America. It is theorized that over it came the Paleo-Indians, Stone Age peoples from Asia, the real discoverers of the Americas.

Earth's most recent ice age, referred to as the Wisconsin glaciation with regard to North America and the Wurm glaciation with regard to Europe, lasted from about 90,000 or 75,000 to 8000 B.C. It is theorized that at various times during the Wisconsin glaciation, enough of the planet's water was locked up in ice to lower the oceans and expose what is now submerged land. The narrowest part of the Bering Strait, between Cape Dezhnyov in Russia and Cape Prince of Wales in Alaska, is 51 miles. During the ice age, along with more coastal lands revealed, there would have been a stretch of land, possibly as much as 1,000 miles wide, bridging the two continents. The Bering Strait land bridge, or Beringia, would have consisted of the treeless plains of the tundra; the islands of today in the region, such as the Diomed Islands, would have been mountains.

Based on archaeological evidence, it is known that Mongolian peoples of Asia hunted large mammals, such as big game, including woolly mammoths, mastodons, and saber-toothed tigers. The big game of the ice age could have migrated across the land bridge. And the human hunters and their families could have followed them. The time of the

first such travelers is not known. The estimated time frequently cited by scholars has been before 11,200 years ago. More recent archaeological finds have led scholars to an estimated time of before 12,500 years ago. Other archaeological evidence in both North and South America, along with DNA and linguistic evidence, has resulted in an estimated time of before 33,000 years ago. Possibly other Paleo-Indians reached the Americas by boat. Descendants of all these ancient explorers spread throughout the Americas over subsequent generations. Later voyagers, in particular Inuit (Eskimo) and Aleut peoples of the Arctic region, were known to have traveled by boat from **SIBERIA** after the land bridge had been flooded again.

It is thought that Aborigines on the island of **TASMANIA** reached there by way of a land bridge before 35,000 years ago. When waters rose and the land was covered, they became isolated from Australia's Aborigines. The Isthmus of Panama in **CENTRAL AMERICA** is sometimes discussed as a current land bridge.

lateen rig

The term *lateen rig* refers to the triangular sails used by boats and ships that optimize speed and control in adverse winds, in contrast to square-rigged sails. A lateen-rigged ship had sails attached to a long yard and pivoted skyward on a relatively short mast. Although this arrangement was not as sturdy as square rigging in strong, favorable winds, it was

Shown here, in an early 20th-century engraving, is a sailboat with a lateen rig. (Library of Congress, Prints and Photographs Division [LC-USZ62-105524])

ideal for lighter, contrary winds, where sailing close to shore was desired. Lateen-rigged ships would often have two or three masts, and the sails could be turned to catch the best wind. This is also known as a fore-and-aft rig. Another advantage of the lateen-rigged ships was their ability to make the most efficient use of tacking when sailing windward. Large square-rigged vessels came to use a triangular sail on their mizzenmast (mast behind the main mast) for added maneuverability.

The lateen rig was imported from the Arab *DHOW* and employed by shipbuilders, who worked for 15th-century sponsor of expeditions *HENRY THE NAVIGATOR*, prince of Portugal, in the making of the *CARAVEL*. With a small but robust hull, stern-mounted rudder, and lateen rig, the *caravel* proved a major advance in ship design. It was used to

great advantage in navigating the difficult and unpredictable African coastal waters at the beginning of the *EUROPEAN AGE OF EXPLORATION*.

latitude and longitude

The term *latitude*, used geographically, is the angular distance of any point on the surface of Earth north or south of the *EQUATOR*. *Longitude* refers to the angular distance on Earth's surface measured along the equator east or west from its intersection with a designated north-south line known as the *PRIME MERIDIAN*. Latitude and longitude together provide a grid—a system of geometrical coordinates—which can be used in identifying any location on the Earth's surface.

Parallels of latitude, imaginary east-west parallel circles around Earth, enable one to locate a place north or south of the equator. The equator is the longest of the parallels, with the length of the others decreasing the farther north or south they are represented; they are measured in angles from zero degrees at the equator to 90 degrees at the NORTH POLE and the SOUTH POLE. Meridians of longitude, imaginary parallel half-circles running through the North Pole to the South Pole, enable one to locate a place east or west of the prime meridian; they all are the same length. They are measured in angles from zero degrees at the prime meridian to 180 degrees at the INTERNATIONAL DATE LINE. Each degree of latitude and longitude is divided into 60 minutes, and each minute, into 60 seconds, to allow for precise numerical designations.

In most current cartographic representations—either a GLOBE, map, or chart—parallels of latitude are indicated in multiples of five degrees. In addition, most representations show four fractional parallels, which have special meanings, based on the Sun's relation to Earth and climate: They are, north to south, the ARCTIC CIRCLE, TROPIC OF CANCER, TROPIC OF CAPRICORN, and ANTARCTIC CIRCLE. The equator, tropic of Cancer, and tropic of Capricorn were the first three reference lines on maps.

Greek Scholarship

The ancient Greeks determined these lines based on the Sun's movement. The tendency of Greek scholars was to focus more on the abstract and theoretical than on the empirical; they believed that the most important goal of philosophy was to discover the Ideal Forms, of which the forms we perceive with our senses are but imperfect imitations; the study of mathematics was the high road to such knowledge. Thus, it was natural for them to try to discover mathematical principles underlying everything in the universe, including the shape and size of Earth and its relationship with the heavenly bodies. The generally accepted idea about this was that Earth, a perfect sphere, lay in the exact center of a much larger sphere on the surface of which were fixed the heavenly bodies. As noted elsewhere, for the Greeks physical existence was nested, as it were, firmly within metaphysical existence, as the spherical Earth nested within the concentric celestial sphere, beyond which, so Plato believed, lay heaven itself, the abode of the gods.

The celestial sphere rotated around Earth on an axis running through the poles; thus the different heavenly bodies as they moved described imaginary lines around Earth's surface that were parallel to one another, the largest of these being the equator. The best way to define or fix the position of any locality on Earth lay in finding its relationship with the celestial sphere, which was eternal, perfect, and divine. This was done by determining, at any given locality, the angle between a line drawn from the observer through a point on the horizon and a line through the North Pole and South Pole, the

axis of rotation of the celestial sphere. This angle would be exactly the same for all localities along a line parallel to that of the equator, running east and west, and perpendicular to the celestial axis. A system of parallel lines running around Earth, called *klimata*, which means inclination, began to be devised, sometime before third-century B.C. Greek astronomer and geographer ERATOSTHENES himself worked on these matters, adding other lines. A second-century B.C. Greek astronomer and mathematician, HIPPARCHUS, further developed the concept, making the east-west lines parallel and the north-south lines at right angles to them.

By the second century A.D., these lines were referred to as latitude and longitude. Hellenized Egyptian PTOLEMY made the system of coordinates more accurate by choosing lines so that the longest day of the year differed from one to the next by a quarter of an hour. In 1569, the publication of a map accurately depicting latitude and longitude—the technique created by Flemish cartographer GERARDUS MERCATOR known as the MERCATOR PROJECTION—revolutionized mapmaking.

Early Navigational Instruments

For the purposes of navigation, instruments were needed to determine latitude and longitude. Early devices, such as the ASTROLABE, CROSS-STAFF, and Davis QUADRANT, gave readings of latitude. For centuries, finding longitude depended on DEAD RECKONING—a system of collecting information involving the use of a magnetic COMPASS, an hourglass, a measuring line, and a TRAVERSE BOARD for recording the information, in order to estimate distance traveled east or west. The inaccuracy of this method is illustrated by Italian mariner CHRISTOPHER COLUMBUS's famous error in believing, when he made landfall in the Americas on behalf of Spain, after traveling only 66 degrees, that he had arrived in the islands of the China Sea, some 230 degrees from Spain. The solution of the "longitude problem" awaited the invention of an accurate way of keeping time since comparing the time of day at any location with that of the current time at one's point of departure will give the number of degrees traveled east or west from that point. (Since Earth revolves once in 24 hours and each horizontal circle of latitude measures 360 degrees, a difference in time of one hour between two points means they are 15 degrees apart.) This method, in principle, was first proposed in the 17th century by Italian scientist Galileo after he made his discovery of the moons of Jupiter. He realized that they could be used as an extraterrestrial clock by observing and noting the times at which each passed behind Jupiter and then reappeared; using a diary of the timing of their movements compiled at one's home port, observations made on board a ship would give the current time back home. However, it proved impractical to make accurate enough sightings of Jupiter's moons at sea.

The Longitude Problem

During the 18th century, the French and British governments were engaged in an equivalent of the 20th-century space race between the United States and Union of Soviet Socialist Republics (USSR; Soviet Union) as they strove to solve the longitude problem; on the accurate determination of location at sea depended supremacy in trade, naval warfare, and world dominance. For this reason, the two governments built observatories at Greenwich in England and in Paris, since it was assumed that longitude would be able to be determined by celestial observation as latitude was. Isaac Newton, a 17th- to 18th-century English physicist and mathematician, was the principal proponent of this theory; he insisted that no timepiece could be accurate enough to be relied upon. (Newton's strength as a theorist, able to comprehend universal laws of nature, perhaps tended to blind him to practicality.) The idea was to take Galileo's idea a step further and use the whole sky as a clock; if the Moon's movements among the stars were tracked and compared to the "sun time" for any locality, this information could be used to tell the time for that locality from anywhere on Earth. Astronomers of the time realized that current knowledge about star and Moon positions was insufficiently accurate for this purpose; thus the principal reason the British and French observatories were built was to gain more precise astronomical data. In this way the search for better navigational techniques contributed to the advancement of science in general.

However, the ultimate solution to the "longitude problem" turned out to be more humble—the invention of a very accurate timepiece, or CHRONOMETER. John Harrison, a carpenter in Yorkshire, England, became interested in clock design while serving as a bell ringer in his church and watching the pendulumlike swing of the bells. In 1714, the English Parliament in conjunction with the ROYAL SOCIETY had offered a prize of £20,000 to whomever succeeded in making the accurate determination of longitude possible. The Longitude Prize was a result of a naval disaster that took place in 1707, in which a large proportion of the nation's navy was wrecked, killing thousands of sailors, when the fleet crashed into a reef off the Scilly Islands because of uncertainty over their position. Realizing that an accurate timepiece might be the solution, Harrison engaged in extensive experimentation using different materials, beginning with woods, then different metals. He compared his clocks to star movements to assess their accuracy and to each other. In 1735, he completed his first model, which made use of different metals in the mechanism to adjust to temperature differences; it was tested at sea in 1736 on a particularly stormy voyage and proved to be accurate to within five to 10 seconds a day. Only after many years of work, in the 1760s, were his chronometer clocks accurate enough to win the Longitude Prize. Meanwhile, in the early 1730s, various inventors developed the SEXTANT, an im-

provement on earlier instruments used to measure the angular elevation of celestial bodies. English optician John Hadley built a version (based on Newton's notes), and American Thomas Godfrey constructed one in Philadelphia, both of which could determine latitude but not longitude. John Campbell designed a sextant that could measure longitude as well in 1757.

The concept of latitude and longitude, in addition to its terrestrial application, is used in various celestial coordinate systems. One of these is the ecliptic coordinate system, based on an imaginary ecliptic, or great circle of the celestial sphere, with the imaginary plane with coordinates passing through the centers of both Earth and Sun.

legends and exploration

Mythology has helped inspire world exploration from ancient to modern times. Explorers have set out on numerous expeditions in search of wealthy lands, lost peoples, hoped-for routes, or cures. Geographic misconceptions have endured over the centuries, and exploration can be regarded as an empirical method to confirm or disprove myths. Some of these myths have endured to present times. And some unconfirmed exploratory journeys have also taken on legendary status.

Enduring Myths

An example of a geographic myth that still endures in some circles is the sunken island of ATLANTIS. First mention of Atlantis is found in the fourth-century B.C. writings of Greek philosopher Plato. He spoke of a Western Ocean, where the great civilization of Atlantis had thrived. The location has been identified with various locations in the MEDITERRANEAN SEA and the Atlantic Ocean, and new theories still crop up.

Another Greek myth, this one associated with the voyage of scholar PYTHEAS to the Arctic Sea in the fourth century B.C., is that of ULTIMA THULE, reputed to be the northernmost land, six days travel north of the British Isles. Since Pytheas's writings on the voyage have not survived, details are from later sources, one from Roman scholar PLINY THE ELDER of the first century A.D., who coined the name for the land. Varying theories hold that the northernmost land described by Pytheas was Norway, ICELAND, or Jan Mayen Island in the Arctic Ocean. The question surrounding this myth, unlike the story of Atlantis, is not whether such a place existed, but what the place attached to the myth really is.

This hypothetical world map shows the empire of Atlantis; it appeared in Ignatius Donnelly's book *Atlantis: The Antediluvian World*, published in 1882. (Library of Congress, Prints and Photographs Divisions [LC-USZ62-90566])

Disproved Myths

An example of a geographic myth that has been disproved is that of the GREAT SOUTHERN CONTINENT, also known as Terra Australis or Terra Australis Incognita, a continent supposedly located in the Southern Hemisphere. This myth also originated among the ancient Greeks (see GREEK EXPLORATION), who, on determining that the Earth was a sphere, theorized that, based on a concept of balance and symmetry, the south must contain a similar ratio of land to sea as the north. The story lasted through the Middle Ages and RENAISSANCE, with ships of various nations searching for Terra Australis in the southern oceans. It came to be associated with another fabled land supposedly reached by Frenchman Binot Palmière de Gonville in 1503, GONVILLE'S LAND. It was not until the late 18th century, when Englishman JAMES COOK journeyed far enough south to determine that Terra Australis did not exist. Other continents, not quite fitting the theories, were discovered, however—Australia and Antarctica.

Truth in Legends

Truth often blends with myth, as in the case of the supposed voyages of sixth-century Irish monk SAINT BRENDAN and an island known as ST. BRENDAN'S ISLE. Historical evidence indicates that, in the course of his sea pilgrimages, Brendan

visited Wales on the British Isles, Brittany, in what is now northwestern France, and the Hebrides Islands west of Scotland. But, in some medieval literature, he is also purported to have visited an island somewhere in the Atlantic, hypothesized as Iceland, GREENLAND, the CANARY ISLANDS, the AZORES, the Madeira Islands, or the Bahama Islands. If Saint Brendan did in fact reach the Bahamas, he would have been the European discoverer of the Americas, even before the Vikings, a theory that, without any archaeological evidence, has to remain as myth as do theorized transatlantic voyages—by DRIFT VOYAGE—of other seagoing peoples of the Mediterranean region.

The writings describing Viking journeys at the turn of 11th century—the *Saga of Eric the Red* and the *Saga of the Greenlanders*—regarding the travels of ERIC THE RED, LEIF ERICSSON, and other Norsemen, were long considered largely myth until archaeological evidence in Newfoundland indicated a Viking presence in North America. Both Irish and Viking accounts, mythical or not, reportedly influenced later explorers to look for lands across the Atlantic. A map, supposedly from the mid-15th century and found in 1957—the so-called VINLAND MAP—which cartographically confirmed the Norse voyages to North America, turned out to be a forgery—in effect a legendary map—but, because of the archaeological evidence, did not do anything to

detract from the truth of the Norse discovery of North America.

KUPE, a 10th-century Polynesian, as legend has it, pursued the Squid King in the South Pacific Ocean, leading to the discovery of NEW ZEALAND. It is known that the Polynesians did in fact migrate to New Zealand and became ancestral to the Maori, another case of truth blending with myth.

Venetian merchant MARCO POLO, who traveled extensively in the Far East in the late 13th century, described CIPANGU as an island containing palaces with roofs of gold and streets paved in marble, one of more than 7,000 islands in an archipelago in the Sea of China, off the Pacific coast of Asia. Two centuries later, both CHRISTOPHER COLUMBUS, an Italian sailing for Spain, and JOHN CABOT, an Italian sailing for England, sought this fabled island, thought to be a major source of spices, which has come to be associated most with Japan.

Another example of a legend with some truth is that of the Strait of Anian (see ANIAN, STRAIT OF), a mythical version of a NORTHWEST PASSAGE through North America from the Atlantic Ocean to the Pacific Ocean. Such a strait supposedly extended from the Atlantic coast somewhere north of Labrador to a more southerly latitude on the Pacific coast. Although a concept of the 15th century until late 18th century, its name was gleaned from the writings of Marco Polo, one of the texts that explorers studied in the hope of finding a practical water route from Europe to Asia. No such waterway fitting that description was located, although, in 1903–06, Norwegian ROALD ENGELBREGT GRAVNING AMUNDSEN did navigate a water route in the Arctic Ocean north of North America. Unlike the legendary Strait of Anian, supposedly a year-round route, the real Northwest Passage proved impractical because of annual freezing.

Legends out of History

Theories surrounding the LOST COLONY—part of the story of the first attempt at an English colony as sponsored by SIR WALTER RALEIGH in the late 16th century—demonstrate how legends evolve out of historical fact. The story of the colonists and how they struggled to survive along the coast of what is now northeastern North Carolina is known up to the point that their leader JOHN WHITE departed for England in 1587. When he returned to the region three years later, there was no trace of the colonists—who included his daughter, Eleanor White Dare, and his granddaughter, Virginia Dare—other than the word “CROATOAN” written on a stockade post. Since no evidence has been found to prove or disprove speculation regarding what happened to them, various myths endure, such as that they became ancestral to certain area tribes, some of whom have non-Indian blood. Reports of blue-eyed or bearded Native Americans passed down over the years often were associated with the Lost Colonists. Much folklore and literature surrounds Vir-

ginia Dare, the first English child born in the America, one of the most fantastic fables of which is that she was transformed into a white doe.

Wealthy Kingdoms

Among the most persistent myths are those involving wealthy lands. South America has the legends of the City of LOS CÉSARES and of EL DORADO, which set in motion numerous expeditions by various European nations in the 16th and 17th centuries. North America has the Seven Cities of CIBOLA and the related QUIVIRA, sought by FRANCISCO VÁSQUEZ DE CORONADO in the 16th century. Real encounters with native peoples—in particular the Aztec and Inca—who did possess quantities of gold, silver, and gemstones—helped further legends of such lands. The legend of the Seven Cities of Cibola has its origins in that of the Seven Cities of Antillia from centuries before, more evidence of the endurance of myths. Meanwhile, the French—JACQUES CARTIER in the 16th century and SAMUEL DE CHAMPLAIN in the 17th century—sought the legendary land of SAGUENAY in Quebec. FOOL’S GOLD, another name for iron pyrites, was mistakenly thought to be real gold by a number of explorers, including Jacques Cartier, as he searched for Saguenay.

The location of another wealthy land, OPHIR, referenced in the Bible in connection with the Hebrews—where King Solomon’s mines are supposed to have been located—has been debated over the years: lands in Africa or Asia; or as far away in Asia as India, the Ural Mountains, or Japan; or on other continents altogether, in the Americas, Australia, or New Zealand.

Individuals and Myth

Some legends involve specific people. A “White King” was reported to rule a kingdom somewhere in South America, which was absorbed into the legends of Los Césares and El Dorado. Surrounding a real-life Welsh prince MADOC of the 12th century, there arose a legend that he had made a voyage in the Atlantic Ocean to a faraway land where there were human inhabitants and, after his return to Wales, set out on a colonizing expedition, never to be heard from again. It is not known whether geographer RICHARD HAKLUYT and others who promoted the idea in the late 16th century actually were convinced the story was true or were using it as propaganda on behalf of Queen Elizabeth I of England to make a claim for the discovery of North America more than three centuries before Italian Christopher Columbus’s voyage for Spain. In any case, the legend persisted into the 19th century, when some travelers tried to establish a connection with the Mandan Indians of the upper Missouri and a lost Welsh people. The story resembles that of the 10 Lost Tribes of Israel, who supposedly, on being conquered by the Assyrians, were exiled from their

homeland in the eighth century B.C. Since the ultimate fate of these people is unknown, there has been speculation over the centuries regarding where they settled, leading to theories that they ended up in various places in Asia, Africa, Europe, or the Americas.

PRESTER JOHN is one of the most famous of all legendary individuals. Numerous texts and maps from the 12th to the 17th centuries refer to a Christian ruler and his wealthy kingdom in Asia or Africa. Numerous explorers, such as Italian Marco Polo, who traveled to Asia in the 13th century, and Portuguese PÉRO DA COVILHÃ, who visited East Africa in the 15th century, hoped to find such a person. The start of the legend, which became ever more fantastic over the centuries, may have been based in truth since a community of Nestorian Christians were thought to have migrated from Constantinople (present-day Istanbul) somewhere in Asia east of territory controlled by Muslims. (Nestorianism—the name taken from Nestorius, the fifth-century patriarch of Constantinople—was a theological position maintaining the human nature of Christ was independent from the divine nature.) One of the writers on Prester John is legendary himself. *Travels of Sir John Mandeville*, a work originally written in Norman French and published between 1357 and 1371, with some 300 total translations in English and most European languages, is thought to have been written by a citizen of Liège in present-day Belgium under the pseudonym of SIR JOHN MANDEVILLE. That the work is obviously a compilation of other medieval explorers' travels—such as Marco Polo and Italian missionary ODORIC OF PORDENONE of the 14th century—has led scholars to this interpretation of “Mandeville” as a pseudonym, although some maintain he was a real person who borrowed from other travel accounts.

The FOUNTAIN OF YOUTH, a water source that supposedly gave eternal life, was a concept associated with Prester John, who supposedly drank from it. It later became a primary motivation for JUAN PONCE DE LEÓN—who had heard about such a phenomenon while Spanish governor of Puerto Rico—in his explorations of the Bahamas and Florida in the early 16th century.

The history of cartography demonstrates the evolution of myths and their debunking as voyages of exploration defined the world map. Some of those myths—such as sea or land monsters—although partly based on ignorance, were actually a kind of misinformation purposely passed to prevent other peoples from traveling the same routes.

Levant

The term *Levant*, in its historical usage, referred to the countries along the eastern MEDITERRANEAN SEA, especially in

the Near East, but also Egypt, Turkey, and Greece. The name is derived from the Italian word *levante*, which means “rising,” as with regard to the Sun—the French verb *lever* means to rise. It came to be applied to the concept of east and was originally applied to all of the Orient. People of the Levant have been referred to as Levantines by other Europeans. The Arabic equivalent of *Levant* is *Mashriq*, for “the country where the sun rises.”

Italy was the dominant European power in the Mediterranean during the second half of the Middle Ages and into the RENAISSANCE, acting as the middleman for trade between the Levant and the rest of Europe. In 1581, the LEVANT COMPANY was chartered in England to develop trade with the region. In recent times, Syria and Lebanon have been called the Levant States.

See also ASIA, EXPLORATION OF.

Levant Company

The Levant Company—also known as the Turkey Company—was one of the first of the English-chartered trading companies. It formed a commercial bridge between East and West in a way that had not been previously developed.

In 1579, Queen Elizabeth I sent her ambassador William Harburn to Murad III, the sultan of Turkey, to request permission to trade on terms equal to those then existing between Turkey and other Europeans, such as the Venetians of northern Italy. The request was granted, and in 1581, Elizabeth chartered the Levant Company for a period of seven years, and with limited membership. To accommodate this new opportunity, larger, stronger ships were built (see MERCHANT SHIP). Soon the English were trading wool and tin, abundant in England, with the region of the LEVANT, flanking the eastern MEDITERRANEAN SEA, for dates, figs, hemp, coffee, and medicines. The Venetians, who had previously enjoyed a monopoly on this traffic, objected. The Spanish attacked English vessels, as did the pirates of the BARBARY COAST. The company agreed in short order to pay the tribute demanded by these pirates. Still, the price of Eastern goods decreased substantially in England, and the company was profitable.

In 1605, James I, Elizabeth's successor, revised the Levant Company's charter as a joint-stock venture. Any English person with £25 could buy a share in the concern. Along with those of the investor community, the interests of the government became increasingly entwined with that of the company, with customs duties and payments made for the continuation of its privileges. Profits continued to soar, however, and the Levant Company's rate of return was about 300 percent at this time.

The company's trade was relatively stable for much of the 17th century. In 1680, after an ongoing dispute with the BRITISH EAST INDIA COMPANY over the importation of

raw silk, Parliament agreed to hear the Levantine's grievances. The Levant Company accused the British East India Company of sending weavers to India to teach them their skills, thus attempting to destroy the Lancashire industries. The British East India Company countered by accusing the Levant Company of exporting too much bullion. Without gaining satisfaction from Parliament, the Levant Company responded by sending ships on "the Cape Route" to India, that is around the CAPE OF GOOD HOPE of Africa. They eventually gained the right to trade in India as well.

With increased competition from home and abroad, the Levant Company experienced a steady decline throughout the 18th century. The French, who had established a Levant Company of their own, were more conveniently located and paid more attention to the Eastern market than did the British. They exported lighter and fancier cloth, which was better suited to the climate, and undercut the British company's profits. The Treaty of Paris in 1763 between France and England marked a turning point from which the company never recovered because of growing French competition. In 1780, Parliament earmarked £10,000 to keep the company afloat, a noteworthy change of circumstances. In 1825, the Levant Company closed its doors, as trade in the Mediterranean became increasingly deregulated.

Lhasa

Lhasa is a city located near the Lhasa River, a tributary of the Brahmaputra, in the southeastern end of the Tibetan HIMALAYAS. Surrounded on three sides by mountains, Lhasa receives little rain and has sparse vegetation. Temperatures vary from 85 degrees Fahrenheit during the day to minus two degrees at night. The city is the capital of Tibet, part of present-day China, as well as the center of Tibetan Buddhism.

Lhasa enters recorded history in the seventh century A.D., when Songtsen Gampo, a Tibetan born about A.D. 608, united Tibet through conquest and made Lhasa his capital. After conquering Nepal in 640, Gampo married a Nepalese princess, and, the following year, in a display of his power, took the daughter of the Tang Emperor in China as his second wife. Under the influence of his two wives, Gampo converted to Buddhism, then established it as the state religion. Gampo built the first palace of Potala and the temple of Jokhang. In 836, the kingdom of Tibet collapsed as Lang Darma captured the throne through fratricide and outlawed Buddhism. With the dissolution of the kingdom, Lhasa dwindled in importance.

Gradually, Buddhism reasserted itself through the influence of missionaries from India and China. In the late

14th century, Tsung-Khapa established the Yellow-Hat sect of Buddhism, which dominated Tibetan Buddhism. The chief abbot or lama of the Yellow-Hat sect was revered by the Mongols, who called him Dalai for his great wisdom. It was during the reign of the fifth Dalai Lama, in 1641, that Lhasa again became the capital of a unified Tibet.

Early European Visitors

The first Europeans to arrive in Lhasa, in 1661, were two Jesuit missionaries, JOHANN GRUEBER of Germany and ALBERT D'ORVILLE of Flanders (although Italian missionary ODORIC OF PORDENONE may have reached it in the 14th century). Grueber and D'Orville remained in Lhasa for a month, reporting that the "common people" ate raw meat and never washed. They were most impressed, however, by the great Potala palace, which had originally been built by Songtsen Gampo. The currently standing Potala palace was built to replace the original palace between 1645 and 1693. The palace contains over a thousand rooms, stands 330 feet, or 13 stories, high, and stretches 1,310 feet east to west and 1,150 feet from north to south.

The next Westerners to visit Lhasa were an Italian Jesuit, IPPOLITO DESIDERI, and a Portuguese Jesuit, Emmanuel Freye. Desideri had spent several months in India studying the Persian language before he set out from Delhi, India, in September 1714. He continued north to Lahore, making his way with a native caravan through the mountains before setting foot in Lhasa in March 1716. Desideri remained in Lhasa for five years, studying the Tibetan language and preaching. He was recalled abruptly from Tibet by Rome, and the account of his travels remained unpublished for 200 years. After Desideri, Capuchin monks of the Franciscan order stayed and preached in Lhasa, the last leaving in 1745. By the end of the 18th century, Tibet had become closely allied with China, and, under Chinese influence, closed its borders to all foreigners with penalty of torture and death. Lhasa became known to Europeans as the "Forbidden City."

In 1811, THOMAS MANNING, a British scholar in the service of the BRITISH EAST INDIA COMPANY, attempted to reach Lhasa but was refused entrance. Manning, however, disguised himself heavily and rode up to the Potala palace. He was recognized as a European but was allowed a five-month stay and an audience with the seven-year-old Dalai Lama.

Two French-Canadian Lazarists, ÉVARISTE-RÉGIS HUC and Joseph Gabet, who had been serving as missionaries in China, joined a Tibetan caravan that was returning to Lhasa from Peking (Beijing). Huc and Gabet traveled 18 months with the caravan and reached Lhasa in January 1846. They remarked on the incredible commercial activity and noise in the streets of the city. After only two months, they were expelled at the urging of the lead Chinese official in Tibet.

Huc and Gabet were the last Europeans to enter Lhasa for more than 50 years.

The Pundits

Throughout the 19th century, the British trained and equipped native Indians to perform survey missions. These Indian surveyors, known as PUNDITS, ventured into the Himalayas and Tibet under disguise for the British and took instrument readings in secret. In this way, the British acquired knowledge of Lhasa and its environment. Meanwhile, a famous Russian explorer, NIKOLAY MIKHAILOVICH PRZHEVALSKY, as he explored central Asia, made four attempts to reach Lhasa. In 1879, Przhevalsky crossed Sinkiang, entering Tibet from the north. He was within 125 miles of Lhasa when Tibetans forced him to turn him back.

20th Century

In 1900, a young Russian student, GOMBOZHAB TSYBIKOV, entered Lhasa disguised as a Buddhist. He remained there two years and visited a number of monasteries. He was soon followed by another Russian, Agran Dorjien. Dorjien became the Dalai Lama's teacher and his political adviser. This worried the British, who, at the time, were vying with Russia for economic control of central Asia; in 1904, they sent SIR FRANCIS EDWARD YOUNGHUSBAND with 1,000 troops into Tibet. Younghusband advanced on Lhasa until the Tibetans relented and agreed to sign the Treaty of Lhasa, which forced them to pay an indemnity to the British and opened up trade between India and Tibet. The British, who had established influence over China, convinced the Chinese to take control of Tibet. In 1910, Chinese troops occupied Lhasa. After the Chinese revolution of 1911–12, Tibet again became independent.

The last famous Western visit to Lhasa was that of the Frenchwoman ALEXANDRA DAVID-NÉEL. A student of Eastern philosophy and frequent traveler in India and China, she learned Sanskrit and Tibetan. In 1912, she moved to Sikkim, a province of India very near to Tibet. David-Néel made several trips into Tibet, never reaching Lhasa. In Japan, she met Ekai Kawaguchi, a Japanese philosopher and monk who had managed to spend 18 months in Lhasa disguised as a Chinese Buddhist monk. In 1924, after more than three years traveling through China and Mongolia, David-Néel, disguised as a beggar at Kawaguchi's side, finally reached Lhasa. She remained two months in Lhasa, visiting all the holy sites.

In 1951, Tibet again lost its independence with the invasion by Communist China. Many temples and Buddhist holy sites were destroyed to make way for a modern city in Lhasa, in order to house the new Chinese officials. The Dalai Lama fled and continues to live in exile. In the early 1980s, China again allowed pilgrims to visit holy sites. The Potala is presently a state museum.

longship

The longship was a type of GALLEY ship used by the Vikings (see VIKING EXPLORATION) in the fjords of their homeland in Scandinavia and for their travels to other parts of Europe and North America from about A.D. 800 to 1100. Two types of Viking ships have come to be called by that name: the *drakkar* for "dragon ship," or *langskip* for "longship"; and the *knörr*, or *hafskip* for "half-ship," also called a *kautskip* for "merchant ship." The drakkar, or longship proper, was long and sleek, as its name would indicate, and had a shallow keel, with pointed ends, curving upward in the shape of a serpent. The knörr, shorter and broader and with a much higher freeboard (height of a ship's sides that ride above water) and wider keel, was deeper in draught; it two had a pointed bow and stern but without the dragon symbol. It also was sometimes decked at bow and stern, offering some shelter. The longship was the warship of the Vikings; the knörr was the ship used for long voyages and carrying cargo. Both types of Viking ships had a single bank of oars, the primary source of propulsion, although a single square sail, made of *wadmal*, a coarse woolen cloth, was also employed. The knörr sails could be close-hauled so they could beat to windward.

The drakkar were typically about 70 feet in length, but it is believed some reached a length of 100 feet. The knörr was about 50 feet. Withies (lashings) of a variety of materials, such as hide or baleen (the horny substance from the mouths of baleen whales used in feeding), and small iron plates and iron nails were used to secure the rib-style oak frameworks of Viking ships. They were clinker-built, meaning the planks, typically of pine, overlapped, providing multiple places for caulking by twisted animal hair soaked in tar. Such construction, with ribs that were not directly attached to the keel, allowed the ship the flexibility to twist in the waves without leaking. Keels were also typically made of oak. Steering was accomplished with a rudder mounted to the right side of the stern, the steerboard (which gave its name to the term *starboard* for the right side of a boat). A generally three-foot right-angled tiller enabled good control in poor conditions. Riggings and anchor cable were typically made of walrus hide.

The drakkar, long and low with fearsome serpentine heads on the prow and stern, was built for speed and

Shown here, in an 1893 photograph, is a replica of a Viking drakkar, or dragon ship. (*Library of Congress, Prints and Photographs Division [LC-D4-21183]*)

maneuverability in war although its flexibility made it durable in relatively rough seas. With its shallow draught, it could negotiate coastal regions and rivers. Its light weight made it easy to drag upstream and even overland when necessary. It is estimated that it was capable of speeds of 10 or 11 knots and more in short bursts. The drakkar carried crews of 25 to 60 men who were all also free warriors, in contrast to the galley slaves of the Romans; thus, they were able to forgo carrying extra provisions for nonfighters. They sat on benches in the open and hung their shields along the side for extra defense when fighting. An awning in the front offered a measure of shelter, but the drakkar was basically an open shell. Most often it was used for a day trip and beached on shore at night. When a voyage lasted longer without land in sight, the sailors would sleep in leather sleeping bags wherever they could find room. The Vikings used the drakkar in their raids on European coastal settlements and inland wa-

terways. Sea battles between fleets of opposing peoples were rare; the method of fighting in these cases was for ships to rope themselves together and send a barrage of arrows and other missiles against the enemy. After this, individual ships would come together, and each war band attempted to board and take the other's ship; the aim was not to destroy the enemy's ship but to take the precious commodity.

The even more seaworthy knörr was used to carry people and cargo over long distances. Such ships could carry three or four dozen men, livestock, and the timber for building a new farmstead. With its robust construction, some have speculated that it was the knörr that Vikings such as NADDOD, ERIC THE RED, and LEIF ERICSSON used to cross open waters of the Atlantic and colonize the Faeroe Islands, ICELAND, GREENLAND, and North America.

The Vikings' personal attachment to their ships was more than a little mystical. The ship was often highly dec-

orated on the sides, the prow, and especially the sail. Women participated in the decorating. Vikings saw their ships as the means to their worldly achievements, as well as their reward in the afterlife. Young men would be given command of a longship to establish their manhood and prove their viability as leaders. These ships would be well cared for and given lyrical names like “Snake of the Sea.” The stories of these vessels—both drakkars and knörrs—being carried overland by their crews from river to river inside Russia also gives testimony to the value they placed on them. Much is known about the Viking ships, since they were often buried with their captains. Many have been excavated and reconstructed for exhibition in museums around the world.

Both the drakkar and the knörr design elements were incorporated in other European ships, such as the ROUND-SHIP, which evolved during the latter part of the Middle Ages and the RENAISSANCE and facilitated the EUROPEAN AGE OF EXPLORATION.

See also SHIPBUILDING AND EXPLORATION.

Los Césares (City of the Caesars, City of los Césares, Ciudad de los Césares)

Los Césares, or the City of los Césares, also appearing as Ciudad de los Césares and City of the Caesars, was one of the early legends concerning kingdoms in South America wealthy in precious metals and jewels. The name was taken from Francisco Cesar, who explored for Italian SEBASTIAN CABOT in his Spanish expedition of 1526–30 to Río de la Plata and other inland waterways of present-day Brazil, Uruguay, Paraguay, and Argentina, and who probably reached the edge of the ANDES MOUNTAINS. Los Césares eventually was thought to be in the Andes in the present-day Arauco province of Chile.

The discovery and appropriation of Inca Indian gold in the 1530s under FRANCISCO PIZARRO helped create a fervor around the idea of other such civilizations and riches. Any rumors of such places heard from native peoples, or perhaps created by nonnative explorers themselves to justify expeditions, led to new expeditions. Reports of the adventures of ALEJO GARCÍA, a shipwrecked sailor of the 1515–16 expedition of JUAN DÍAZ DE SOLÍS, and of a “White King” who ruled over mountains of silver also spurred on Cabot and his men. Reports of a kingdom to the north that came to be known as EL DORADO led to a similar legend.

The legend of Los Césares endured for decades. It was at least part of the incentive for the 1535–37 expedition of DIEGO DE ALMAGRO and the 1540–41 expedition of PEDRO DE VALDIVIA from Peru southward into Chile, as well as the 1580 expedition of JUAN DE GARAY south from present-day Buenos Aires, Argentina.

See also LEGENDS AND EXPLORATION; TREASURE AND EXPLORATION.

Lost Colony (Roanoke Island)

Lost Colony is the name applied to the first English colony in the Americas in what is now northeastern North Carolina. The people who disappeared are called the “Lost Colonists.”

First Expedition

In July 1584, an English exploratory expedition under captains Philip Amadas and Arthur Barlowe, sponsored by SIR WALTER RALEIGH and with the support of Queen Elizabeth I, reached the Outer Banks, or Barrier Islands, and explored Roanoke Island as well as parts of the neighboring mainland. Amadas and Barlowe and their men had friendly contacts with native peoples. It was decided that two Native Americans would return to England with the expedition—Manteo, a Hatteras Indian of the village of Croatoan on the Outer Banks, and Wanchese, a Roanoke Indian, cousin to the brothers and chiefs Granganimeo and Wingina. They departed the Americas in August, reaching England in mid-September.

First Roanoke Colony

In London, Manteo and Wanchese met Raleigh and Queen Elizabeth I. Their presence helped Raleigh raise funds for a permanent colony, granted as a part of the original Virginia patent. Roanoke Island, sheltered from the ocean by the Barrier Islands, seemed a favorable site to establish a presence in the Americas, from where PRIVATEERS could carry out raids on Spanish ships. In April 1585, Raleigh’s fleet of seven ships, commanded by his cousin SIR RICHARD GRENVILLE, set forth with some 600 men, among them intended colonists. The ships reached Pamlico and Albemarle Sounds by June. The colonists under Governor Ralph Lane built Fort Raleigh on Roanoke Island and explored the region, having contact with many of the area’s Algonquian-speaking tribes.

Scientist THOMAS HARRIOT studied the native peoples and catalogued the wildlife and resources. (His work was published on his return to England as *A Briefe and True Report of the New Found Land of Virginia*.) Also among the colonists was JOHN WHITE, who, in addition to serving as the cartographer, made watercolor drawings of peoples, animals, and plants, which were published in Europe. Meanwhile, the Algonquian showed the English methods of farming and fishing.

Relations between the English and area Native Americans deteriorated over a variety of issues. In one incident, in summer 1585, the English burned a village on the mainland because a Secotan Indian had stolen a silver cup. A

subsequent series of events led to more hostilities. To assure the cooperation of the upriver tribes in offering supplies to his men during their search for gold and pearls, Lane had Skyco, son of the Chowanoc Indian sachem Menatonon, taken hostage in spring 1586. The deaths from European disease of Granganimeo and his father, Ensenore, who headed the pro-English faction of Roanoke Indians, further hurt relations. Wingina, taking a new name, Pemisapan, turned militant and attempted to starve out the English. Wanchese, his cousin, who had traveled to England, turned against the English as well. Manteo, the Hatteras, remained pro-English.

Using rumors of a planned Indian attack as his excuse and pretending to seek council with Wingina, Lane led an attack on a mainland coastal village of the Roanoke on June 1, 1586. Wingina was shot and beheaded. Less than three weeks later, the colonists, no longer receiving any help from local tribes in acquiring food, departed Roanoke Island with the visiting fleet of SIR FRANCIS DRAKE. Manteo again

accompanied them, this time with an Indian by the name of Towaye.

Second Roanoke Colony

In May 1587, another fleet set sail from England for North America. The 150 colonists in Raleigh's second attempt at a colony, with John White as governor, included women and children. Manteo returned with them. (Towaye's fate is not known; he may have died in England.) Although the intended place of settlement was Chesapeake Bay to the north, Simon Fernandes, the pilot of the fleet, on reaching the Roanoke Island region in July, refused to take the colonists any farther. They were forced to rehabilitate the former settlement and reestablish tenuous relations with area tribes. An attack soon followed: Roanoke warriors, now led by Wanchese, killed a colonist while he was fishing away from the fort.

That August, White christened Manteo and made him Lord of Roanoke and Dasamonquepeuk, thus attempting to

John White created this map of the coast of Virginia in 1585. It was published by the Flemish engraver Théodore de Bry five years later. (Library of Congress, Prints and Photographs Division [LC-USZ62-54020])

usurp Wanchese's power. Also that month, the first English child was born in the Americas—Virginia Dare—to John White's daughter Eleanor White Dare and son-in-law Ananias Dare.

At the end of August, with supplies dwindling and winter approaching, the colonists convinced White to return with Fernandes to Europe for supplies. In England, at White's request, Raleigh organized a relief expedition under Grenville for March 1588, but it was ordered not to sail because of warfare with Spain. White lined up two small ships for a crossing, but his ship was intercepted and looted by French pirates. The invasion of the British Isles by the Spanish Armada in July–August 1588 further delayed his return. When White finally reached Roanoke Island in August 1590, the colonists had dis-

appeared. The only clue White found was the word *CROATOAN* carved on the stockade post, probably indicating that at least some among the settlers had relocated to Manteo's village on the Outer Banks. Others may have built a boat in an attempt to reach Chesapeake Bay. It is possible all were killed in attacks by Roanoke, Powhatan, or other area tribes. Some may have intermarried with native peoples. Theories on the fate of the Lost Colonists have led to much speculation over the centuries and an entire literature.

Less than two decades later, in 1607, the English would found their first permanent settlement in the Americas at Jamestown to the north among the Powhatan Indians.

See also LEGENDS AND EXPLORATION.

Madoc

Madoc was a legendary Welsh prince of the 12th century, son of King Owain Gwynedd of North Wales. He reportedly had a love of the sea and some skills as a sailor. Legends indicate that, in order to escape family tensions, he sailed to the south of Ireland in 1170 and, after a long time traveling in the Atlantic Ocean, came upon a land with human inhabitants, from which he returned. Upon his return, he gathered up a group of companions to colonize the land and set out on a second journey, after which he and the emigrants were not heard from again.

In 1583, Sir George Peckham published a pamphlet, which made the case that England had a claim to the Americas because of Madoc's discoveries. In his *Historie of Cambria* of 1584, Dr. David Powell, drawing on earlier work of the geographer Humphrey Llwyd, made the claim that Madoc had reached either Mexico or Florida, giving to England rights over those regions rather than to Spain. In the same period, geographers RICHARD HAKLUYT and John Dee promoted the notion of the English discovery of North America more than three centuries before CHRISTOPHER COLUMBUS, sailing for Spain, had reached the WEST INDIES. Hakluyt divined that Madoc had landed somewhere in the Caribbean Sea. There were obvious nationalistic incentives for the English to expand the exploits of Madoc beyond any solid evidence. England was beginning to explore these regions, and any basis for sovereignty over new territories could have geopolitical consequences.

The legend was promoted in numerous ways, even to the point at which explorers returning from the North American continent would falsely claim to have encountered Welsh-speaking Indians. In 1795, a Welshman named John Evans accompanied a Spanish fur-trading expedition headed by Scotsman James Mackay up the MISSOURI RIVER to the villages of the Mandan Indians in search of evidence to verify the legend of Madoc. None was found. The legend endured, however, continuing to inspire literature and poetry over the centuries, including Robert Southey's poem "Madoc" from 1805. Frontier painter GEORGE CATLIN, who spent time among the Mandan Indians in the 1830s, theorized that the tribal name might be derived from *Madawgwys*, for "followers of Madoc." As late as 1953, the Daughters of the American Revolution placed a plaque at Mobile Bay in Alabama, where Madoc made a supposed landing.

Although it is thought that Prince Madoc was a real person, any claims to his accomplishments in the Americas, as vague as they are, were made by others on his behalf. The phenomenon of his legend is thus of more interest for its political content than as an expansion of geographic knowledge.

Magellan, Strait of (Estrecho de Magallanes)

The Strait of Magellan (or Estrecho de Magallanes in Spanish) is a narrow passage at the southern extremity of South America between the Atlantic Ocean and Pacific Ocean. About 350 miles long and two to 15 miles wide, this

submerged valley follows a winding course between the mainland of South America to the north, and the Tierra del Fuego Archipelago to the south. The southernmost island in the archipelago contains CAPE HORN, beyond which is Drake Passage between South America and the South Shetland Islands off the Antarctic Peninsula of the continent of Antarctica. Dungeness Point on the north and Cape Espiritu Santo on the south mark the entrance of the Strait of Magellan on the Atlantic side; Cape Pilar at the northwestern end of Desolación Island marks the entrance on the Pacific side. Except for a few miles of the modern nation of Argentina on the Atlantic end, the strait passes through lands belonging to Chile. The Chilean city of Punta Arenas is located along the strait on Isla Grande de Tierra del Fuego.

The strait is named after Portuguese mariner FERDINAND MAGELLAN, the first European to navigate it over 38 days in October–November 1520 while sailing for Spain in the first CIRCUMNAVIGATION OF THE WORLD. He also named the large island to the south Tierra del Fuego, Spanish for “Land of fire”; the westernmost cape, Cape Deseado, for “Desired cape” (also known as Cape Pilar); and the Pacific Ocean itself for its apparent calmness. Over the next decades, the Strait of Magellan became the favored route for Spanish ships entering the Pacific. Although often foggy, it offered protection from the frequent ocean storms in Drake Passage.

In 1578, Englishman SIR FRANCIS DRAKE passed through the strait, the first English ship to do so. Blown off course, he ended up in the waters of Drake Passage before sailing west and north again. Along the coasts of Peru and Mexico, he successfully raided Spanish settlements and ships. The next year, Spanish mariner and scientist PEDRO SARMIENTO DE GAMBOA attempted to intercept Drake in the Strait of Magellan, his likely route back to the Atlantic and Europe. Drake sailed westward across the Pacific, however, and eventually completed the second voyage around the world in 1580. In the meantime, Sarmiento de Gamboa conducted a 16-month survey of the strait, returning to Spain in 1580.

With the construction of the Panama Canal in Central America in the early 20th century, the Strait of Magellan no longer served as the main passage between oceans. Yet it still serves as a sea lane for southern commerce.

Mandeville, Sir John

It is not known whether Sir John Mandeville was a real person or a made-up name, a pseudonym attached to a 14th-

century book. The book attributed to him was originally written in Norman French and translated into Latin and other European languages in some 300 different volumes. Its English title appears as *The Voyages and Travels of Sir John Mandeville, Knight*; as *The Travels of Sir John Mandeville*; or simply as *Mandeville's Travels*. Published between 1357 and 1371, the work consists of a first-person narrative describing travels in Africa and Asia, including Egypt, Jerusalem, Persia (present-day Iran), India, and China, and lands in between. It is obvious from comparative studies of medieval texts that the work is a compilation of other people's travel accounts, including those of Italians MARCO POLO and ODORIC OF PORDENONE.

The author has been variously theorized as being Jean de Bourgogne (also Jean à la Barbe), a physician, or as Jean d'Outremeuse, a historian, both from Liège, in what is now Belgium. Some scholars maintain that Mandeville was in fact a real person from St. Albans in England, who spent much of his life in other parts of Europe, and who drew on other writers to create a travel guide for pilgrims to the Holy Land and beyond. Many of the descriptions in the work are fantastic. One section describes the kingdom of legendary figure PRESTER JOHN. Travel accounts written for entertainment were a popular genre in England. The work is said to have influenced subsequent English writers, such as Geoffrey Chaucer, William Shakespeare, and John Milton. Milton himself proclaimed that Mandeville influenced a generation of explorers, including Italian CHRISTOPHER COLUMBUS.

mappa mundi (mappemonde)

Mappa mundi (plural form, *mappae mundi*) is Latin for “cloth of the world,” as the first world maps were drawn on pieces of cloth. Sometimes the word is written as one. The French version is *mappemonde*. A medieval term, it still appears in discussions of early cartography, referring to early world maps. Almost 600 *mappae mundi* are still in existence, having been produced in Europe from the years 300 to 1300. One map is known specifically by the name Mappa Mundi, or the Hereford map, dating from about 1290 and housed since that time in a cathedral at Hereford, England, and depicting Hereford on it.

Mappae mundi demonstrate the limited geographic knowledge of the Middle Ages. No attempt was made to represent true scale or LATITUDE AND LONGITUDE. They are now considered works of art and religious and philosophical statements as much as cartographic representations. Their most common shape is circular, with a *T* in the center, hence the descriptive name “T-O maps.” Around the *O* is the world's ocean. Within the *O* are the three continents known at the time—Asia, Europe, and Africa. Since east is shown at the top, Asia is depicted above the *T*, with Europe and Africa flanking the base. The top of the *T* represents

the NILE RIVER and the Don (Tanais) River. The bottom of the *T* is the MEDITERRANEAN SEA. The T-O design probably originated among the ancient Greeks and was also used by Arab cartographers. In maps drawn by Christian cartographers, Jerusalem typically appears at the center.

The Hereford map also reveals religious themes and is thought to have served as an altarpiece. Its English cartographer, Richard of Haldingham, reportedly based much of the content on the writings of Orosius, a religious scholar of the fifth century A.D. and a pupil of Saint Augustine. It is drawn within a circle 52 inches in diameter, on a 64-by-54-inch sheet of vellum supported by an oak frame. Most of its writing is black ink, with red and gold leaf used for emphasis, and blue or green for rivers and seas, except red for the RED SEA. Scalloped designs indicate mountain ranges, and walls and towers indicate towns. The map shows Jerusalem at its center, as well as routes there. Other religious images include angels, Jesus Christ, the Apostles, the Garden of Eden, the Tower of Babel, and Noah's Ark. Biblical inscriptions accompany the images. Non-Christian themes, such as a dragon, unicorn, and mermaid, also appear. An inscription cites Roman general JULIUS CAESAR of the first century B.C.: "The measurement of the world was begun by Julius Caesar. All the East was measured by Nicodoxus, the North and West by Theodoxus, the southern parts by Policlitus." Irish monk SAINT BRENDAN of the sixth century A.D. is also mentioned in association with six islands near the CANARY ISLANDS.

Two other types of maps came into use in the Middle Ages. The road map and the sailing chart served practical purposes and were less decorative.

See also GEOGRAPHY AND CARTOGRAPHY; GREEK EXPLORATION; MAPS AND CHARTS.

maps and charts

A map is any graphic representation of Earth's surface, or some part of it, according to some given scale or projection. The related term *chart* is sometimes used interchangeably with *map* but most often refers to a navigator's map, relating to the marine environment, or an aviator's map, for flying. A GLOBE is a spherical map, although the terms *map* and *chart*, with regard to exploration, are generally used for representations drawn on flat surfaces. Cartography is the art and science of making maps and charts. An atlas is a book containing a collection of maps or charts (after mythological Greek deity Atlas, who was often depicted supporting Earth on the title pages of early map collections).

Maps are used for a variety of purposes and show quantitative and qualitative facts, such as physical features, boundaries, sites, patterns, and distribution. The information communicated might relate to geography, geology, physiography, meteorology, politics, economics, or demography. Maps are typically aligned with north at the top and

south at the bottom. Pictures as well as a conventionalized system of symbols are used along with words to convey natural and cultural features.

Among the symbols utilized are a circular compass rose indicating the four primary directions. True north and magnetic north are often both indicated (see NORTH POLE; SOUTH POLE; NORTH MAGNETIC POLE; SOUTH MAGNETIC POLE). Another common map element is a geographic grid for accurate determination of location, the most common being intersecting lines of LATITUDE AND LONGITUDE. A scale shows the ratio of the distance between two points on Earth's surface and the distance between the two corresponding points on a map. Drawings of physical features, contour lines, hachure marks, shading, and coloring are different ways to indicate relief, the varying elevations and depressions on Earth's surface. Dots are typically used to indicate towns and cities. Lines—continuous or broken—indicate boundaries. Specialized maps have an array of other symbols. A key or legend, often set off graphically in a box, gives their meaning.

One of the great challenges in mapmaking is the representation of Earth's curvature on a flat surface, known as projection. Different kinds of map projections have been devised, using geometry and mathematical analysis. An early technique, known as orthographic projection, was conceived by Greek HIPPARCHUS in the second century B.C. Earth is presented as seen from an observer high above it; the center is true to scale, but the scale contracts with greater distance from the center. In the MERCATOR PROJECTION, named after the 16th-century Flemish cartographer GERARDUS MERCATOR, Earth is represented as a rectangle on which lines of latitude and longitude appear as straight lines intersecting at right angles. Many modern maps use azimuthal projections of one kind or another, in which true direction from the center of the map is preserved.

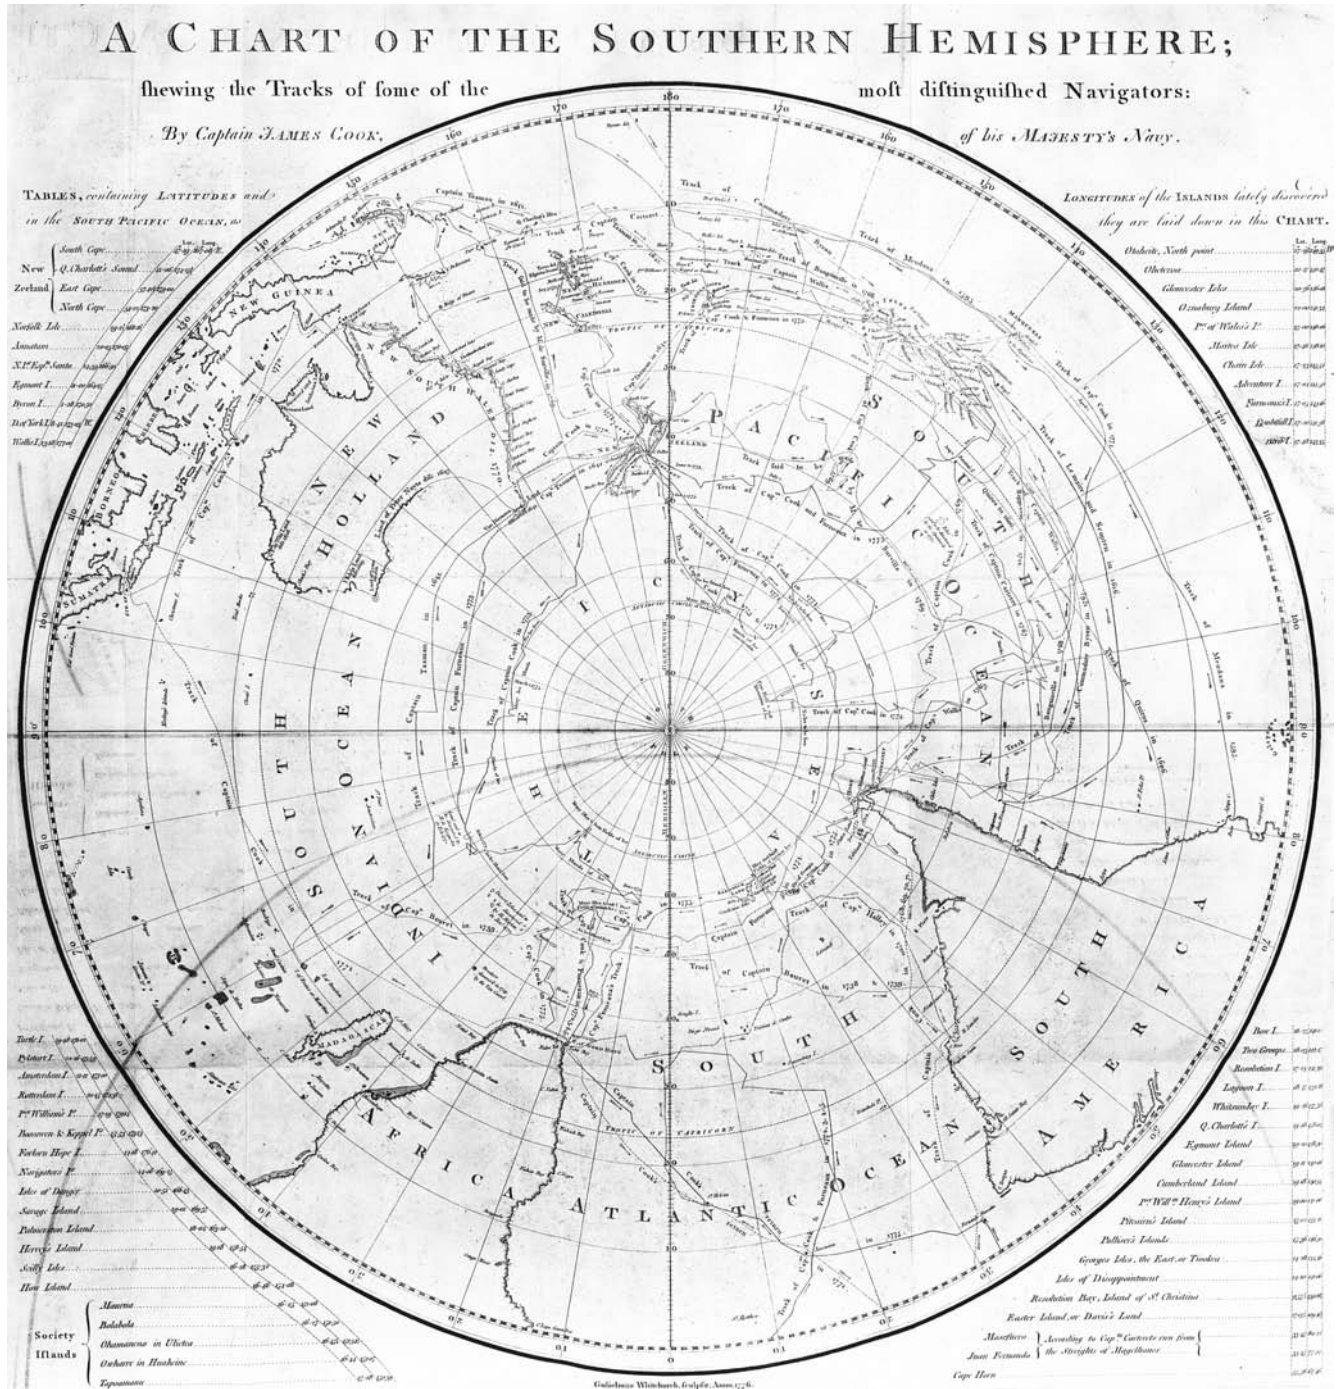

There are many different kinds of maps. The two general categories are topographic maps and thematic maps. Topographic maps show both natural and cultural features, such as lakes, rivers, mountains, and various political entities, including nations, states, and municipalities, along with borders. A thematic map is any map used for special purposes, such as to show an explorer's route. Thematic maps might include some of the same information as topographic maps. A relief map is the three-dimensional model of the terrain of an area. Another type of thematic map is the navigator's chart, also called marine chart or hydrographic chart (see HYDROGRAPHY). Such charts are used for the navigation of ships and show features of bodies of water. Information includes coastlines and harbors (with landmarks, natural and human-made), channels, winds, tides, currents, undercurrents, depth, bottom features (sand, mud, rock), hazards (rocks, bars, reefs, shoals, shipwrecks), and signals (lighthouses, lightships, buoys, beacons). The PERIPLUS and PORTOLAN CHART were early navigation charts. Aeronautical

charts, also called aviation charts, give similar information as topographic maps, along with elevations, flight paths, forbidden fly zones, radio-navigation stations and their areas of coverage, and radio communication channels.

Many different materials were used in early map-making, among them clay, papyrus, silk, calico, rawhide,

ivory, and cane. Many maps were drawn by hand on paper. Early printed maps were made from woodcuts. Photoengraving, wax engraving, lithography, or modeling in clay, plaster of paris, or plastic are some modern processes.

This chart of the Southern Hemisphere by James Cook appeared in his book *A Voyage towards the South Pole*, published in 1777. (Library of Congress, Prints and Photographs Division [LC-USZ62-77400])

Marianas Trench (Mariana Trench)

The Marianas Trench is a depression in the Pacific Ocean located east of the Mariana Islands, formed by the collision of two tectonic plates. It is also spelled as Mariana, without the s.

The arc-shaped trench or valley extends generally northeast to southwest for 1,580 miles at an average width of 40 miles. Near its southwesternmost point, about 210 miles southwest of Guam, the Marianas Trench has the deepest point in the oceans of the world, at a depth of 36,198 feet, known as the Challenger Deep, named after the ship of its discovery in 1948, the HMS *Challenger II*.

The Marianas Trench and the Challenger Deep were explored by Swiss scientist JACQUES ERNEST-JEAN PICCARD and U.S. Navy lieutenant Donald Walsh in 1960, using the BATHYSCAPH *Trieste*.

See also PACIFIC OCEAN, EXPLORATION OF THE.

McKinley, Mount (Bulshia, Denali, Doleyka, Dunsmore's Mountain, Gora, Tenada, Traleika)

Mount McKinley is a mountain in the Alaska Range of south-central Alaska. At 20,320 feet above sea level, it is the highest mountain in North America. Its twin peaks rise some 17,000 feet above the timber line. It also has one of the steepest vertical rises in the world. Year-round snowfields cover more than half the nonvolcanic mountain. Although it is not as high as some of the other mountains that challenge explorers around the world, Mount McKinley's harsh weather conditions and difficult terrain make its peaks especially dangerous to summit.

Mount McKinley was named after President William McKinley, the 25th president of the United States, in 1897. It has been known variously as Doleyka, Traleika, Bulshia, Gora, Tenada, and Dunsmore's Mountain. Its Native American name in local Athapascan dialects is Denali, which translates as "The High One" or "The Great One." There have been unsuccessful attempts over the years to make Denali the official name.

The first attempts at scaling Mount McKinley's summit began in 1903. FREDERICK ALBERT COOK claimed to have reached the summit of the north peak in 1906, although his claim (along with that of reaching the NORTH POLE in 1908) was later discredited. Peter Anderson and William Taylor, Alaskan gold prospectors, who, along with Charley McGonagall were known as the Sourdough Party, made the first successful climb of the north peak in 1910, which until that time was considered the higher peak. Anglo-American clergyman HUDSON STUCK, along with Harry Karstens, Robert Tatum, and Walter Harper, accomplished the ascent up the 850-foot taller south peak in 1913. Four years later, Harry Karstens became the first superintendent of Mount McKinley National Park, now known as Denali National Park and Preserve.

Climbers scale Mount McKinley, as shown in an early 20th-century photograph. (Library of Congress, Prints and Photographs Division [LC-USZ62-62301])

Mediterranean Sea

The Mediterranean Sea takes its name from the Latin for "in the middle of the land." Almost entirely landlocked, the Mediterranean is bordered by three continents—Europe, Asia, and Africa—and connected to the Atlantic Ocean by the Strait of Gibraltar (see GIBRALTAR, STRAIT OF). It occupies an area of 969,000 square miles, extending east-west about 2,400 miles and achieving a maximum width of about 990 miles. Due to a shallow coastal shelf stretching from

Spain to Morocco, the circulation through the Strait of Gibraltar is highly restricted. This makes for a small tidal range and, in concert with high rates of evaporation, makes the water saltier than that of the Atlantic. The Mediterranean is divided into smaller seas, including the Aegean and Ionian Seas off Greece, the Adriatic Sea between Italy and the Balkan Peninsula, and the Tyrrhenian Sea off the west coast of Italy. The Black Sea, connected to the Aegean by the Bosphorus Strait, the Sea of Marmara, and the Dardanelles, is also an arm of the Mediterranean. Large islands in the Mediterranean include Malta, Sicily, Sardinia, Corsica, and Cyprus. The world's longest river, the NILE RIVER, drains into it from Africa.

The Mediterranean was formed about 30 million years ago, as tectonic activity, caused by the collision of the continental plates for Eurasia and Africa, shrunk the much larger Sea of Tethys. The Strait of Gibraltar, the only remaining connection to the Atlantic Ocean, at 40 miles long, with a width varying from eight to 24 miles, separates northeastern Africa from the southern tip of Spain. The eastern entrance to the Strait of Gibraltar is bordered by two rocks, called in ancient times Calpe (the modern-day Rock of Gibraltar) and Ceuta, also called the Pillars of Hercules.

The Mediterranean Sea was the barrier and ultimately the link of many ancient civilizations that rose to dominance along its various shores. It offered trade and military routes among them. The Minoans, Egyptians, Phoenicians, and Greeks were early seafaring peoples who explored parts of the Mediterranean, starting in eastern regions. As seafaring technology and knowledge increased, they were able to overcome the limitations of their natural resources, reaping the benefits of shipping and trade. The Phoenicians and Greeks eventually established colonies on islands and coasts throughout the Mediterranean region. Without the SEXTANT and other mechanical means for navigation, early mariners originally depended on the stars. It was thought that ancient mariners hugged the coasts, not crossing open waters for centuries. This conclusion disagreed with reports in ancient myths and legends and accounts by later ancient historians, which were written off as exaggeration. New archaeological evidence, however, is beginning to change scientists' opinions of ancient seafaring skill, and it is probable that the ancients were excellent navigators and had trade routes across open ocean.

Ancient Voyages

The earliest voyages of exploration and trade can be gleaned from myths, such as the voyage of Odysseus (Ulysses), an account of which, the *Odyssey*, is attributed to ca. ninth-century Greek poet Homer. Odysseus's legendary destinations have been equated to islands and coastal regions throughout the Mediterranean. The travels of Odysseus, the voyage of Jason and the Argonauts and other myths show a knowledge of the African coast, Sicily, smaller is-

lands, and even the Strait of Gibraltar and the Pillars of Hercules. By about 1400 B.C., the Mediterranean was fairly well charted by ancient mariners. By about 500 B.C., the Greeks had established colonies not only on the islands in the eastern Mediterranean but throughout southern Italy, while the Phoenician colonies including Carthage were prospering on the North African coast.

The quest for domination of Mediterranean trade sparked the Punic Wars between Republican Rome and Carthage. Carthage originated as a colony of Phoenicia, but grew into an empire controlling nearly all of North Africa from western Libya to the Strait of Gibraltar. Carthage also controlled much of southern Spain and the islands of Sardinia and Corsica. The Carthaginians came to dominate most Mediterranean trade, and some of their mariners, in particular HANNO and HIMILCO, even reached the Atlantic waters in the fifth century B.C. The first of three wars was started in the middle of the third century B.C. The Romans had extended their influence over southern Italy and fought the Carthaginians over control of the island of Sicily. With no decisive winner, Carthage maintained most of its control of Mediterranean trade. As Rome grew in power, however, two more wars were fought, the final war ending in 146 B.C. with the utter destruction of Carthage and Rome in total control of Mediterranean trade.

Muslim Use

After the fall of the Roman Empire, and the rise of the Islamic Arab empire, the Mediterranean became a place of curiosity again. The Arabs invented superior methods of seafaring, using the sextant for navigation. The Mediterranean was a desirable route for Muslims in the western part of the empire, including southern Spain, to aid them in traveling to Egypt then over the RED SEA to take part in the hajj, the required pilgrimage to the Islamic holy cities of Medina and Mecca in Arabia. Many pilgrims, such as ABU AL-HASAN MUHAMMAD IBN JUBAYR of Spain of the 12th century, recounted their voyages across the Mediterranean, including visits to Sicily and Malta, which were at the time Arab possessions.

Even before the digging of the Suez Canal in the mid-19th century, the Mediterranean was the starting point for many expeditions of exploration, allowing explorers from Europe to reach Africa, the Middle East, and the far Eastern coast of the Black Sea from which they could continue their journeys to far-off destinations. Once the canal opened up a passage from the Mediterranean to the Red Sea, ships could sail directly from Europe to Arabia, the east coast of Africa, India, Southeast Asia, and Australia. The Mediterranean continues to provide an important path for global shipping, especially of oil from the Middle East. It is also a popular tourist destination, where tourists cruise through

the islands immortalized in the myths and legends of the ancient Greeks.

Mercator projection

Mercator projection is a mapmaking technique named after 16th-century Flemish cartographer GERARDUS MERCATOR. Drawing on the work of other mapmakers of his day, he used Mercator projection to create a map of the world, the publication of which in 1569 revolutionized cartography and facilitated navigation.

A GLOBE is the most accurate means of depicting relationships of location, distance, and direction on Earth but is not as convenient as a map. Projection addresses the problem of creating a flat representation of a curved surface, and many different types of projections have been developed mathematically, resulting in varying types of distortion. A cylindrical projection is obtained by projecting the surface of Earth on a cylinder tangent along the EQUATOR and then rolling the cylinder out along the plane around the globe. Meridians of longitude, which on the globe converge at the NORTH POLE and SOUTH POLE, are thus represented as parallel to one another. In a Mercator projection, a variation of a cylindrical projection, parallels of latitude, although equidistant on a globe, are drawn with increasing separation as their distance from the equator increases. As a result, the equatorial regions appear normal, but the high latitudes appear distorted. GREENLAND, for example, is exaggerated in size and appears larger than even South America, which in reality is eight times Greenland's size.

Mercator projection maps are practical for purposes of navigation in that directions are represented accurately. Meridians of longitude and parallels of latitude appear as straight lines intersecting at right angles. Since any line intersecting two or more meridians at the same angle also appears as a straight line, it is possible to plot a course by drawing such a line (known as a rhumb line) between two points and determining its COMPASS direction from the map. Mercator's projection maps were favored by both cartographers and navigators for centuries.

See also GEOGRAPHY AND CARTOGRAPHY; LATITUDE AND LONGITUDE; MAPS AND CHARTS; NAVIGATION AND EXPLORATION.

merchant ship

The term *merchant ship* is used in two distinct ways. In the general usage, a merchant ship is any ship whose main pur-

pose is to carry cargo for trading purposes. The ancient Egyptians, Greeks, and Romans all used various forms of the GALLEY as merchant ships. The trading ship used in the Far East was the JUNK; the Arabs had the DHOW. In Scandinavia around A.D. 1000, the knörr, a variety of the LONGSHIP, was the standard merchant ship, and the COG was the merchant ship of the north coast of Europe during the Middle Ages. For trading in the MEDITERRANEAN SEA, the galley continued to be used as the primary merchant ship by the Venetians through the RENAISSANCE. The giant East Indiamen, the large, armed cargo ships built by the East India companies in the 17th century—the BRITISH EAST INDIA COMPANY, DUTCH EAST INDIA COMPANY, and FRENCH EAST INDIA COMPANY—were a type of merchant ship.

A more specific use of the term is as a synonym for ROUNDSHIP, a tubby vessel awkward to maneuver, but economical for the quantity of freight it could hold. The roundship developed in northern Europe in the latter half of the Middle Ages.

Merchant ships are relevant to the history of exploration in that they are part of the history of international trade (see COMMERCE AND EXPLORATION). But they were also sometimes used specifically for exploration. Rarely was an individual ship built to an explorer's specifications. There are notable exceptions in Arctic exploration, but, for the most part, an explorer had to take the available craft of his day and, in many cases, it turned out to be what had previously functioned as a merchant ship. Moreover, the process of trial and error in the use of merchant ships helped lead to the development of more specialized craft, such as the CARAVEL.

Mercury program (Project Mercury)

The Mercury program of 1961–63, named after the speedy messenger of Greek and Roman mythology, was the first manned space program carried out by the United States. One of a series of programs run by the NATIONAL AERONAUTICS AND SPACE ADMINISTRATION (NASA), it worked in conjunction with the APOLLO PROGRAM of 1961–72, the goal of which was to put the first human on the Moon, and was followed by the GEMINI PROGRAM of 1964–66. The goal of the Mercury program, in addition to putting humans into space and developing technologies for future SPACE EXPLORATION, was to investigate their ability to survive and work in space over a period of time.

On May 5, 1961, ALAN BARTLETT SHEPARD, JR., became the first American in space, when the Freedom 7 made a 15-minute suborbital flight. (YURI ALEKSEYEVICH GAGARIN had become the first human in space less than a

month before on April 12, 1961, as part of the VOSTOK PROGRAM of the former Union of Soviet Socialist Republics). There were five other Mercury flights. On July 21, 1961, Virgil I. (Gus) Grissom also made a suborbital flight, only 15 seconds longer than the first Mercury flight. On February 20, 1962, JOHN HERSCHELL GLENN, JR., became the first of the U.S. ASTRONAUTS to orbit Earth, in a flight of three orbits. On May 24, 1962, Malcolm Scott Carpenter orbited Earth in a flight lasting almost five hours. On October 3, 1962, Walter (Wally) M. Schirra, Jr., orbited Earth six times on a flight of more than nine hours. On May 15, 1963, Leroy Gordon Cooper, Jr., circled Earth 22 times over a period of more than 34 hours.

The first two Mercury missions made use of one of the U.S. Army's Redstone ROCKETS to launch capsules beyond Earth's atmosphere in a suborbital flight. In subsequent missions the U.S. Air Force's more powerful Atlas rocket was used to put the capsules in orbit. A retro-rocket system was used to bring the capsules back to space. Parachutes slowed

their descent into the ocean, where they were designed to float until they were recovered by a ship. Although the Mercury flights were controlled from the ground, experiments were carried out to develop the piloting of spacecraft.

migration and exploration

Migration is the movement of groups of people from one region to another, resulting in settlement in a new location. In earliest times, the migrations of peoples were tied in with the hunting and gathering of food. Migrating groups of peoples tracked herds of game or sought new hunting grounds or sought new land to farm. A catastrophic event in one's homeland—change of climate, drought, flood, earthquake, volcanic eruption, fire, soil depletion, invasion—and resulting

In this 1961 photograph, workmen assemble Mercury program space capsules for American astronauts at McDonnell Aircraft Corporation, St. Louis, Missouri. (Library of Congress, Prints and Photographs Division [LC-USZ62-121450])

lack of water, food, shelter, or safety might have precipitated the move. Some people migrated as a way of life—nomads, who wandered with their herds of domesticated animals or who preyed on other peoples. In historical times there were other social causes of migration, such as overpopulation, defeat in war, and ethnic or religious persecution.

The drive toward looking beyond one's homeland plays a part in travel of all kinds, whether exploratory or migratory. Implicit in the notion of exploration as it has come to be studied is that information about the new lands explored is passed back to one's original home—through word of mouth, writings, or charts—which is not necessarily the case in migration. Yet migration in prehistory and early history can be said to be a form of exploration in that migrating people came to experience a new land. The concept of migration in modern times is distinct from exploration in that the lands where migrants traveled are well known.

However they are defined, studies on exploration encounter the theme of migration time and time again. In some cases, it can be said that exploration precedes migration and settlement; in some cases, exploration and migration are simultaneous. Conquest and commerce and searches for riches are often part of migration. Colonization results from and causes more migration. Spreading a religious doctrine and obtaining religious freedom—part of the history of exploration—are also related to both exploration and migration. Moreover, the subject of migration is part of the philosophical debate regarding exploration as in discussing what it means to “discover” a new land. For example, the use of the word *discovery* of North America by Europeans has been questioned since Paleo-Indians arrived to the continent millennia earlier. A subject related to both migration and exploration is geography. Certain geographic features—bodies of water, mountain ranges, deserts, ice formations—slowed exploration and impeded migration. Exploratory routes and migratory routes were often one and the same. The spread of culture is another theme central to both concepts as well: The movement of peoples over the ages, whether by migration, exploration, or conquest, inevitably has been accompanied by the movement of ideas and beliefs, such as agriculture. And since it is now known through archaeological and genetic studies that ancestral humans and early humans moved about considerably in their migrations, it has become apparent that exploration is deeply rooted in human ancestry.

Minoan exploration

The Minoans, so-named in modern times after the legendary king Minos, were an ancient people of the island of

Crete, in the MEDITERRANEAN SEA, who flourished from about 3000 to 1000 B.C. They are associated with the Greek myth of the Minotaur, a creature with a bull's head, very likely derived from the Minoan sport of bull-leaping. Minoan origins are not known, although it has been theorized that they were related to peoples of what is now mainland Greece (Crete is a part of present-day Greece). Their culture, known as the Minoan civilization, was one of three known highly-developed Bronze Age cultures of pre-Hellenic Greece, the other two being the Mycenaean culture on the mainland and the Cycladic culture on the Cyclades island group. All three are treated as the Aegean civilization, distinct from the civilization of the Greeks.

Minoan civilization is organized into three phases: Early Minoan (ca. 3000 B.C.–2200 B.C.), Middle Minoan (ca. 2200 B.C.–1500 B.C.), and Late Minoan (ca. 1500 B.C.–1000 B.C.). The Minoans were at their most powerful in the Middle Minoan period. From Knossos, where a great palace was built, and other population centers on Crete, they became a maritime power on the Mediterranean Sea and, as such, were among the earliest explorers of the region.

By about 1580 B.C., Minoan civilization is known to have spread northward to neighboring islands in the Aegean Sea and to the mainland of Greece. The dispersion of artifacts, as determined archaeologically, indicates that the Minoans developed extensive trade contacts. They are thought to have traded for grain with farming peoples on the shores of the Black Sea. Minoan artifacts themselves have been found as far west as the Balearic Islands off the east coast of Spain. They traded at least as far south as Egypt and as far east as Mesopotamia.

Tin was central to Minoan trade. The island of Cyprus, east of Crete, became part of the trading network, with copper mined there and alloyed with imported tin to produce bronze. Isotopic analysis of the tin in some Mediterranean bronze objects from the period indicates that it came from as far away as Britain, although, without confirmation that the Minoans traveled there, the tin very likely passed through the hands of many different peoples on its way to the Mediterranean region. In any case, the Minoans crafted objects of bronze that they used to barter for other goods. In addition to bronze ax heads and other metalwork, they traded stone and ivory carvings, pottery and other objects for agricultural products, and raw materials, such as obsidian, copper, gold, and silver.

The Minoan culture is known for its hieroglyphic writing and a complex system of weights and measures, both of which enabled its efficient mercantile bureaucracy. With their wide-ranging travels, it can be assumed the Minoans were proficient mariners, having a mastery of navigational techniques necessary for Mediterranean travel. Images on stone reveal that they traveled in a type of GALLEY ship, with high sterns and forecastles.

It is not known what caused the decline and eventual disappearance of Minoan civilization. Archaeological evidence indicates that earthquakes damaged some of their buildings, as did fire. Another theory maintains that as iron tools became common in the region, the tin trade network ended, leading to a decline in the Minoan economy. The Mycenaeans flourished in the years after the Minoan decline, and it has been theorized that they attacked Minoan centers. The Minoans themselves were remarkable in that they apparently thrived in that time without developing a sizable military. During the Late Minoan phase, the Phoenicians replaced them as the greatest of maritime traders. Over the centuries, some writers have hypothesized that knowledge of Crete and Minoan civilization among later ancients led to the myth of the lost continent of ATLANTIS.

Mississippi River (“Old Man River”)

The Mississippi River is the second-longest river in the United States; only the MISSOURI RIVER, which feeds it, is longer. It travels 2,340 miles from Lake Itasca in northern Minnesota to the Gulf of Mexico; from the headwaters of the Missouri River to the Gulf of Mexico, the distance is 3,680 miles, making the combined rivers the fourth-largest river system in the world, after the NILE RIVER, AMAZON RIVER, and YANGTZE RIVER (Chang). The Mississippi has the largest drainage area in North America and the third-largest in the world. It drains some 1,247,300 square miles between the Great Divide of the APPALACHIAN MOUNTAINS and the Continental Divide of the ROCKY MOUNTAINS. It varies in depth from nine to 100 feet. Its name is Native American-derived, an Algonquian term meaning “big water.” A prevalent nickname is “Old Man River.”

From its source in Lake Itasca the Mississippi flows slightly northward before flowing eastward through a series of small lakes to Grand Rapids, Minnesota. From there, it travels southward. Along its route it is joined by the Minnesota and St. Croix Rivers. The Mississippi River forms the lower boundary between the states of Minnesota and Wisconsin. As it travels southward, it forms most of the eastern borders of Iowa, Missouri, Arkansas, and Louisiana, and western borders of Illinois, Kentucky, Tennessee, and Mississippi.

The Illinois River and the Missouri River next join the Mississippi. The muddy Missouri in turn makes the Mississippi River mud-colored. At its confluence with the Ohio River, the geographic point designated as separating the Mississippi into upper and lower sections, it doubles in vol-

ume; south of the juncture with the 975-mile-long Ohio River, its width extends up to 50 miles, and its valley becomes wide and fertile. Through this section the river loops back and forth and is joined along its route by the Red and Arkansas Rivers. In the loops, lakes—known as oxbow lakes—are formed. In Louisiana one quarter of the river follows the Atchafalaya River.

Near the Gulf of Mexico large deposits of sediment have formed the extensive Mississippi Delta—some 13,000 square miles. The river is divided into several channels known as distributaries, which enter the Gulf of Mexico, including Main Pass, South Pass, North Pass, and Southwest Pass, known locally as the Passes.

Spanish Exploration

In the 16th and 17th centuries, the river served as a route for French and Spanish explorers. Later in the 1800s the river became a major transportation and trade route for steamboats. It was already home to many Native American tribes along its course, including bands of Chippewa (Ojibway), Santee Sioux (Dakota), Winnebago (Ho-Chunk), Fox (Mesquaki), Sac, Illinois, Kickapoo, Missouriia, Quapaw, Chickasaw, Choctaw, Tunica, Natchez, and Chitimacha.

The first Europeans known to have seen the Mississippi were the Spanish. In May 1539, HERNANDO DE SOTO and 600 men landed in Florida and headed northward along the Gulf of Mexico. During the four-year expedition, they covered some 350,000 square miles of what is now the southeastern United States. On May 8, 1541, they came upon the Mississippi River—probably south of present-day Memphis, Tennessee. They constructed barges in order to cross it and explored westward into present-day Arkansas and Oklahoma. The expedition eventually returned to the Mississippi. De Soto died there a year later, on May 21, 1542, at its confluence with the Red River. In order to keep secret the knowledge of their leader’s death from the Indians of the region, the CONQUISTADORES weighted his body with rocks so that it would sink in the Mississippi. After traveling southwest into Texas in the hope of reaching Mexico by land, the new leader, LUIS DE MOSCOSO, led the survivors back to the Mississippi, where they spent the winter of 1542–43. The Spanish built seven barges and, when the river flooded on July 2, 1543, they embarked on them, reaching the Gulf of Mexico on July 18, from where they followed the coastline to Mexico, arriving at the settlement of Tampico the following September.

French Exploration

The Mississippi remained the domain of only Native Americans for more than a century. It was the French who next came to frequent it, using it as a highway from the region of the western Great Lakes. In 1654–56, French fur trader MÉDARD CHOUART DES GROSEILLIERS, while developing rela-

tions with the Indian tribes of the region, explored the rivers to the west of Lake Michigan, including the Fox and Wisconsin as well as a stretch of the Mississippi. In 1659–60, he returned to the region with his brother-in-law PIERRE-ESPRIT RADISSON and explored Lake Superior and the upper eastern Mississippi Valley.

Yet the extent of the great river was still not known to Europeans. The French hoped that the Mississippi flowed westward to the Western Sea—the Pacific Ocean—and would thus prove a good trade route to the Far East. In 1673, Governor General Comte de Frontenac of New France sent LOUIS JOLLIET, a fur trader, to trace its course. JACQUES MARQUETTE, a missionary who knew several languages, accompanied him. Jolliet, Marquette, and a party of five Miami Indians and VOYAGEURS traveled by CANOE from Green Bay on the west shore of Lake Michigan, along the Fox River to Lake Winnebago. They then crossed to the Wisconsin River and descended it to the mouth of the Mississippi, which they reached on June 17. The expedition then descended the Mississippi, passing the mouth of the Missouri River, to the junction of the Arkansas River. They soon concluded, however, that the Mississippi flowed southward and probably emptied into the Gulf of Mexico rather than westward to the Pacific. On the return trip they branched off into the Illinois River, which took them near the south shore of Lake Michigan.

Over the next decades, French fur traders continued to be active in the upper Mississippi region. In 1679, RENÉ-ROBERT CAVELIER DE LA SALLE and his lieutenant HENRI DE TONTI founded Fort Crèvecoeur on the Illinois River. In spring 1680, La Salle sent trader MICHEL ACO and Jesuit missionary LOUIS HENNEPIN on a mission northward to explore the Mississippi, Wisconsin, and Minnesota Rivers and perhaps determine the source of the Mississippi. They descended the Illinois to its mouth on the Mississippi, then proceeded northward. At some point, probably along the Mississippi, they were captured by a party of Sioux. In the course of his travels, perhaps while in captivity, Hennepin saw and named the Falls of St. Anthony near present-day St. Paul, Minnesota. They eventually were taken to a Sioux village in central Minnesota. In the meantime, in search of a route to the Western Sea, trader DANIEL GREYSOLON DULUTH, Tonti's cousin, followed the St. Croix River—the upper portion of the present boundary between Wisconsin and Minnesota; he reached its mouth on the Mississippi near present-day Prescott, Wisconsin. On learning of the capture of Aco and Hennepin, he returned north and negotiated their release.

In February 1682, La Salle and Tonti set out from the Illinois River on a journey down the Mississippi and completed the first known European journey from the river's northern regions to its mouth on the Gulf of Mexico on April 9. During this journey, he claimed the entire Missis-

issippi Valley for France, naming the region Louisiana in honor of the French king Louis XIV. On the return journey, he and Tonti founded another post on the Illinois—Fort St. Louis. Tonti was left in charge, while La Salle returned to Montreal. In France La Salle raised backing for a colonizing expedition to the Mississippi Delta in 1684. However, he misjudged the location and ended up at Matagorda Bay on the Texas coast, about 500 miles to the west. Starting in 1685, he led several attempts to reach the Mississippi from the Gulf Coast. During one in 1687, La Salle was killed by one of his own men in a quarrel. HENRI JOUTEL led the survivors to the lower Arkansas River, where they met with Tonti, who had traveled the length of the Mississippi in search of the colony the year before as well.

In 1698, Tonti led Jesuit missionary ALBERT DAVION to the lower Mississippi and helped him found a mission to the Tunica near the confluence of the Yazoo River. Tonti would later join the colonizing efforts along the lower Mississippi of PIERRE LE MOYNE, Sieur d'Iberville and JEAN-BAPTISTE LE MOYNE, Sieur de Bienville's colonizing expedition to the lower Mississippi in 1698–99. Over the next years, Sieur de Bienville founded a number of posts in the region, including Fort Rosalie among the Natchez Indians in 1716, which would become modern-day Natchez, Mississippi, and New Orleans in 1718. In 1700, trader PIERRE-CHARLES LE SUEUR, in the service of Sieur d'Iberville, ascended the Mississippi from the Gulf of Mexico all the way to the Minnesota River, where he established a post, Fort L'Huillier, among the Sioux.

Other important early settlements in the FUR TRADE were Cahokia, to the south of the mouth of the Missouri River, founded by missionaries in 1699, and Kaskaskia to the south near the mouth of the Kaskaskia River, founded in 1703, also by missionaries. Both were named after Illinois Indian subtribes. In 1720, French historian PIERRE-FRANÇOIS-XAVIER DE CHARLEVOIX traveled from the Illinois down the Mississippi to New Orleans, writing about his journey in the *History of New France*, published in 1744.

St. Louis, named after the French medieval king Louis IX, canonized as a saint, was founded in 1764 on the west bank in what is now Missouri, where the river makes a great bend to the east, a short distance downstream from the mouth of the Missouri River and opposite Cahokia, by French fur traders PIERRE LIGUESTE LACLEDE and RENÉ AUGUSTE CHOUTEAU. It further added to the commerce along the river.

U.S. Interests

France ceded its North American holdings to Great Britain and Spain at the end of the French and Indian War in 1763. The United States gained Great Britain's holdings, other than Canada, at the end of the American Revolution two decades later. France again gained control of the western

Mississippi Valley in 1800, but sold it to the United States in the Louisiana Purchase of 1803. The Mississippi became for the United States, as it had been for colonial powers, a primary transportation route. Early trade was by RAFT, flatboat, and KEELBOAT; the first steamboat on the Mississippi was the *New Orleans* in 1811. St. Louis served as a gateway to the West, with many exploratory, trade, and military expeditions organized and launched from there. WILLIAM CLARK, while recruiting the Corps of Discovery for his expedition with MERIWETHER LEWIS, set up camp opposite the settlement in winter 1803–04.

Despite all the activity along the Mississippi in the 17th and 18th centuries, its true source was not known. In 1805, General James Wilkinson of the U.S. Army chose ZEBULON MONTGOMERY PIKE to search for the Mississippi's headwaters. He followed the river northward until he found the Red Cedar Lake (Cass Lake) and Leech Lake in Minnesota. He wrongly believed these to be the headwaters of the Mississippi. In 1823, Italian GIACOMA COSTANTINO BELTRAMI, traveling with a U.S. military surveying expedition under STEPHEN HARRIMAN LONG, traveled up the Minnesota River and located what he mistakenly cited as the source, Lake Julia. In 1832, in an expedition sent out by Michigan territorial governor Lewis Cass, geologist and ethnologist HENRY ROWE SCHOOLCRAFT was led by a Chippewa Indian from Cass Lake to a lake known to the French as Lac la Biche (Elk Lake), which he determined to be the source. He renamed it Lake Itasca, from the Latin words *veritas*, "truth," and *caput*, "head."

A major route of transportation, the Mississippi is presently navigable by ship for 1,800 miles from St. Paul, Minnesota, and the Falls of St. Anthony to the Gulf of Mexico. It is still a principal artery for commerce, with more freight transported on it than any other inland waterway in North America.

Missouri River

The Missouri River is the longest river in the United States. From its source at the confluence of the Gallatin, Jefferson, and Madison Rivers in the mountainous terrain of southwestern Montana, through the grasslands of the northern plains, to its mouth on the MISSISSIPPI RIVER, it extends some 2,540 miles. It first flows northward along the edge of the ROCKY MOUNTAINS, where it passes through the Gates of the Mountains, a gorge. It then turns northeast-

ward past the Great Falls before heading eastward across Montana. It flows first westward and then curves south-eastward in North Dakota, continuing in that direction across South Dakota, forming a section of the border between South Dakota and Nebraska. It then flows southward and forms the border between Nebraska and Kansas on the west and Iowa and Missouri on the east, then heads eastward across Missouri. Its course follows what once was the edge of the ice sheets extending down from the north during the ice ages.

The Missouri can be divided into three sections: the upper where it is clear and swift-moving; the middle where it crosses the plains and begins to live up to its nickname of the "Big Muddy"; and the lower that is slower and muddier still than the midsection. Among its tributaries are the Marias, Musselshell, Milk, and Yellowstone Rivers in Montana; the Knife River in North Dakota; the Grand, Cheyenne, White, and James (Dakota) Rivers in South Dakota; the Niobrara and Platte Rivers in Nebraska; the Kansas River in Kansas; and the Osage River in Missouri. It in turn is the largest tributary of the Mississippi River, turning the Mississippi mud-colored. The river has a drainage basin of 529,000 square miles and drains areas of 10 states and two Canadian provinces.

Before Europeans began to explore the Missouri River, it was home to bands of a number of Indian tribes, including the Missouria (who gave their name, probably meaning "people with dugout canoes," to the river), Omaha, Ponca, Arikara, Mandan, Hidatsa, Nakota Sioux and Gros Ventre. Bands of other tribes, such as the Osage, Kaw (Kansa), Ioway, Otoe, Pawnee, Assiniboine, Lakota Sioux, Northern Cheyenne, Northern Arapaho, Crow, Shoshone, and Blackfeet, were centered on the Missouri's tributaries, yet frequented and camped along the Missouri itself.

French Exploration

French-Canadian explorers LOUIS JOLLIET and JACQUES MARQUETTE were the first known Europeans to reach the mouth of the Missouri River during their descent of the middle stretch of the Mississippi River in 1673. The lower Missouri became an important route for the FUR TRADE with Indians. The earliest traders in the region, such as Frenchman HENRI DE TONTI, a lieutenant of RENÉ-ROBERT CAVELIER DE LA SALLE, who together descended the Mississippi in 1682, passed the mouth of the Missouri numerous times on subsequent expeditions, but did not follow it on its course northwestward. French trader ÉTIENNE-VENIARD BOURGMONT is known to have explored much of the lower portion of the river in 1712–17, possibly exploring as far north as the mouth of the Platte River in eastern Nebraska. In 1738, French-Canadian trader PIERRE GAULTIER DE VARENNES DE LA VÉRENDRYE and his son LOUIS-JOSEPH GAULTIER DE LA VÉRENDRYE reached the Mandan villages,

where the river makes its big bend westward in North Dakota, overland from their post, Fort Rouge, on the Red River of the North near the site of present-day Winnipeg, Manitoba. His sons, Louis-Joseph and François, headed southwestward across the Missouri onto the northern plains possibly into northeastern Wyoming, circling back by way of South Dakota and a stretch of the Missouri.

Out of St. Louis

The founding of St. Louis in 1764 on the Mississippi's west bank, a short distance downstream from the mouth of the Missouri River in what is now Missouri, by French traders PIERRE LIGUESTE LACLEDE and RENÉ AUGUSTE CHOUTEAU led to increased activity in the region. In 1792, a Frenchman named Jacques d'Église made the first known European journey upriver from the Missouri's mouth, reaching the Mandan villages. In 1793, St. Louis merchants formed the Company of Explorers of the Upper Missouri (the Missouri Trading Company). In 1794–95, French-Canadian JEAN-BAPTISTE TRUTEAU traveled up the Missouri River on its behalf as far as the Black Hills in what is now western South Dakota. In 1795, a Welshman named John Evans accompanied a Scottish fur trader, James Mackay—formerly of the NORTH WEST COMPANY, now in the employ of the Spanish—on an expedition up the Missouri River to the Mandan villages. Evans hoped to verify the legend of Welsh prince MADOC, who had supposedly colonized some foreign land, but found no evidence among native peoples. Soon afterward, in 1802, Frenchman FRANÇOIS MARIE PERRIN DU LAC, accompanying a fur trader, traveled up the Missouri as far as the mouth of the White River in south-central South Dakota.

Lewis and Clark

The Missouri River was included as part of the Louisiana Purchase from France by the United States in 1803. The following year, President Thomas Jefferson sent out an expedition under MERIWETHER LEWIS and WILLIAM CLARK to explore the newly acquired lands, and they chose the Missouri as their route westward, organizing their expedition at a camp opposite St. Louis. They hoped to find a manageable water route all the way to the Pacific—the NORTHWEST PASSAGE. The Corps of Discovery set out on May 14, 1804, by KEELBOAT and other small craft, over the stretch of river well known to traders, reaching Mandan country in present-day North Dakota on October 27, where they built a post, Fort Mandan, and wintered. On April 7, 1805, they proceeded to the upper Missouri, now accompanied by Shoshone Indian woman SACAJAWEA. On June 2, they reached the mouth of the Marias in present-day Montana and were unable to determine whether that river was the Missouri, but accurately chose the Missouri. On June 13, they reached the Great Falls, which the Mandan claimed marked the end

of the river. On July 27, however, they reached the true source of the river—the Three Forks of the Missouri, which Lewis named the Gallatin, Jefferson, and Madison. After crossing the Rockies and traveling along the Snake River and the COLUMBIA RIVER, the expedition reached the Pacific Ocean on November 15, 1805, where they built Fort Clatsop in present-day Oregon and spent the winter. In June 1806, on their return journey, the party split up: Clark explored the Yellowstone River, and Lewis, the Marias to the north. They met up at the mouth of the Yellowstone and returned to St. Louis by way of the Missouri, arriving September 23. Some of the men who were part of the Corps of Discovery remained active in the Missouri River region, such as JOHN COLTER.

Traders, Painters, and Writers

The Missouri River remained the primary route west for a number of years, especially for the continuing fur trade up the river and beyond in the Rockies. In 1808, JOHN JACOB ASTOR founded the AMERICAN FUR COMPANY, with various subsidiaries to follow. The next year, a group of traders in St. Louis founded the ST. LOUIS MISSOURI FUR COMPANY. Among the partners were JEAN PIERRE CHOUTEAU, his eldest son AUGUSTE PIERRE CHOUTEAU, MANUEL LISA, WILLIAM CLARK, ANTOINE PIERRE MENARD, and ANDREW HENRY. People and goods were transported by keelboat and later by steamboat, the first voyage by the *Independence* in 1819. That same year, the U.S. army established a presence on the river with the founding of Fort Atkinson by Colonel HENRY ATKINSON at Council Bluffs in northeastern Nebraska (where Lewis and Clark had met with Sioux tribal leaders in 1804). Another American entrepreneur, WILLIAM HENRY ASHLEY, became a powerful force in the fur trade with his ROCKY MOUNTAIN FUR COMPANY, founded by him and Andrew Henry in 1822. Many of the men who worked for and traded with him came to be known as the MOUNTAIN MEN. Among the most famous of them were THOMAS FITZPATRICK, JEDEDIAH STRONG SMITH, and WILLIAM LEWIS SUBLETTE.

Men of other callings used the river to explore westward. In 1811, for example, American writer HENRY MARIE BRACKENRIDGE and Scottish naturalist JOHN BRADBURY traveled up the Missouri River to the Mandan villages with a trading expedition headed by Manuel Lisa. In 1832, American frontier painter GEORGE CATLIN traveled from St. Louis to the mouth of the Yellowstone, seeking out Native American subjects along the way. In 1833–34, German naturalist ALEXANDER PHILIPP MAXIMILIAN and Swiss artist KARL BODMER also traveled upriver to the mouth of the Marias River. By this time, there were a number of army posts along the Missouri.

With the advent of the railroads in 1858, the Missouri saw fewer travelers. Nowadays, for the most part, the lower river is used commercially for shipping, while the upper river is used for recreation. In 1844, with the Missouri River Basin Program, a series of locks, dams, and reservoirs were constructed for the sake of navigation, irrigation, flood control, and hydroelectric power.

Mongol exploration

The Mongols are a people of east-central Asia, distributed in the country of Mongolia as well as contiguous parts of Russia to the north and China to the south, east, and west. They originally consisted of nomadic tribes inhabiting steppe and desert country, with an economy based on herds of horses and sheep, and living in tents. The various tribes, who competed for territory, organized at times into loose alliances. In the early 13th century, a chieftain of the Yakka Mongols, GENGHIS KHAN, defeated his rivals and united the various tribes, founding a capital at Karakorum in the northern GOBI DESERT, establishing codes of law and creating a powerful army, masters of the use of cavalry for the swift attack; every adult Mongol male in fact was a mounted warrior.

Under Genghis's leadership and the leadership of subsequent khans—the most powerful after him being his sons Ogadai and Guyuk and his grandsons Mangu and Kublai—the Mongols invaded much of Asia and eastern parts of Europe, penetrating as far as present-day Hungary and Germany. Their armies came to include other peoples, such as Turkic peoples who became known collectively as the Tartars or Tatars (the name *Tartars* has been applied to the Mongols by Europeans as well, who did not distinguish between invading tribes from the East). And the Mongols came to adapt many of the customs of peoples they conquered, in particular the Chinese (see CHINESE EXPLORATION), whose capital Yen-King (present-day Beijing) Genghis occupied in 1215. Genghis's son Ogadai succeeded him as supreme khan, while Ogadai's brother Juchi was granted territory comprising much of present-day Russia. In 1235, Batu Khan, Juchi's son, along with his chief general Subutai, campaigned in the west. In 1238, Batu's warriors—referred to in Russia as the Golden Horde because of Batu's golden tent—captured Moscow (in present-day Russia) and, in 1240, Kiev (in present-day Ukraine). His razing of Kiev, at the time ruled by the Rus—a people of Viking and Slavic descent—led to the rise of Muscovite Russia.

The Mongols proceeded westward and, within two years, had also conquered present-day Hungary and Poland and made military incursions into Germany. Batu laid the

groundwork for the founding of the Kipchak Khanate (also known as the Empire of the Golden Horde) between the Volga and Danube Rivers in 1243, with a capital first at Sarai Batu, near present-day Astrakhan, on the lower Volga and later at Sarai Berke also on the Volga, near present-day Volgograd. This had been territory of a Turkic people known as the Kipchak or Cuman. The death of Ogadai in 1241 led to Batu's recall to Karakorum in 1242, and the Mongols therefore did not proceed into western Europe.

By 1260, the Mongol Empire was subdivided into four khanates, that is, territories ruled by khans, descendants of the royal line founded by Genghis Khan. The subdivisions included the Great Khanate, comprising all of China and most of East Asia; the Jagatai Khanate in Turkistan; Il-Khanid Khanate in Persia (present-day Iran); and the Kipchak Khanate in western Russia.

The geographic extent of the Mongol Empire was the greatest ever known to human history, reaching for part of its existence from the Pacific Ocean west to the Adriatic Sea and from Mongolia to the Indian Ocean in the south. The Mongol age of expansion led to a new age of exploration within Asia and between Asia and Europe. The movement of the armies and subsequent occupation led to the passing of knowledge between cultures. Routes became secure, leading to increased travel. The khans maintained a system of mounted couriers for communication throughout the empire. The SILK ROAD, which had been controlled by the Muslims, now was open to other entrepreneurs. Moreover, the khans encouraged exploration for better understanding of peoples under their domain as well as for military reconnaissance. In 1221–22, for example, Genghis sent out an expedition under Chinese Taoist CH'ANG-CH'UN to explore central Asia, from China to Afghanistan.

With the Golden Horde in eastern Europe, Europeans became more aware of and concerned with Asian issues. Papal and political diplomatic missions were sent out, such as that of Italian GIOVANNI DA PIAN DEL CARPINI in 1245–47 and Flemish WILLIAM OF RUBROUCK in 1253–55. European traders followed. In 1271–75, Italian merchants MAFFEO POLO, NICCOLÒ POLO, and MARCO POLO traveled across central Asia to Cambaluc (present-day Beijing), the new Mongol capital founded by Genghis's successor Kublai Khan. Marco Polo, in 1275–92, explored on behalf of the khan, visiting other parts of China, Tibet, Southeast Asia, Indonesia, Mongolia, and possibly SIBERIA. His book, *The Travels of Marco Polo*, with descriptions of Mongol customs, was influential in Europe over the next two centuries and influenced CHRISTOPHER COLUMBUS in his 1492 attempt to reach the Orient by way of the Atlantic Ocean.

By the 14th century, however, the far-flung Mongol Empire had weakened due to internal conflicts as well as resistance from conquered peoples. By 1382, the Mongols were completely expelled from China back into their origi-

nal homeland. The Mongols of today are still a pastoral people, maintaining sheep, horses, cattle, camels, and goats and living much as their ancestors did. In addition to shamanism, many of them practice Lamaism, a branch of Buddhism.

Mont Blanc See BLANC, MONT.

mountain climbing

Mountain climbing, or mountaineering, is the practice of climbing to Earth's most elevated points for exploration, scientific research, or sport. The three types of mountaineering are trail climbing (also called scrambles or walkups), which involves hiking on trails to the tops of some mountains; rock climbing, the scaling of steep mountain faces using technical climbing gear, like ropes and pitons; and ice

climbing, the ascent on snow and ice of the world's highest mountains, whose peaks soar above the timber line.

Trail climbing requires proper attire and food and water, but no special climbing equipment. For rock climbing, in which the hands are used as well as the feet, climbers use special footwear, ropes, hammers, and steel spikes, known as pitons, driven into the rock for support, or, in more recent times, hardware placed into cracks. In ice climbing (or ice and snow climbing), additional equipment includes ice axes and attachable boot spikes, known as crampons. Mountaineers sometimes carry bottles of oxygen for high-altitude climbing. Naturally, warm clothing, as well as tents and blankets or sleeping bags, are also needed for overnight survival on mountains.

The history of mountain climbing, in particular ice climbing, is closely tied to the history of world exploration. The high peaks were some of the last areas explored on the planet. The first recorded climb of a high-altitude mountain

Climbers ascend Mont Blanc in the Alps, as shown in this late 19th-century photograph. (*Library of Congress, Prints and Photographs Division [LC-USZ62-108854]*)

was in A.D. 633, with the ascent of Mount Fuji (or Fujiyama), the highest peak in Japan at 12,387 feet above sea level.

Alpinism

Modern mountain climbing took its early shape in the European Alps. The ascent to the summit of France's Mont Blanc (see BLANC, MONT), the highest alpine peak, by Frenchman Michel Gabriel Paccard and guide JACQUES BALMAT in 1786 was the crowning moment of early mountaineering attempts. Their accomplishment, without rope or ice axes, but with alpenstocks—long wooden staffs with iron tips to poke for crevasses and cut steps in the ice—was widely publicized. As a result many Europeans, especially the British, began climbing other alpine summits, often with the help of local guides from Savoy (now part of France) and Switzerland. Mountaineering thus became for some climbers a calling and for others a hobby; still other climbers were geologists and topographers. The goal of being the first to “summit” various peaks spurred on many climbers, and the growing elite class of professional guides, like Jacques Balmat, took many of the firsts.

In 1858, the Alpine Club was founded in London; in 1863, the *Alpine Journal* began publication. The mid-1800s are sometimes referred to as the golden age of mountain climbing because of widespread interest in the activity and the number of alpine peaks conquered. The golden age is said to have ended with EDWARD WHYMPER's 1865 ascent of the Matterhorn in Switzerland, the last high alpine peak to be scaled.

During this period of great activity, an approach to mountain climbing known as alpinism (or alpine climbing) was developed. The techniques, equipment, and safety measures of alpinism are still in use today in both ice and rock climbing. In alpinism, climbers work in teams, of typically two to four climbers, who are attached by ropes and who carry all the equipment they need; in addition to ice axes and crampons, food, and water, they haul a camping stove and fuel, sleeping bags, sleeping mats, a tent or bivouac sacks, and first aid gear onto the mountain. If the climbers cannot reach the summit and return in a single day, they bivouac, or spend the night on a mountain ledge, before continuing. Slings and other specialized equipment are used for glacier routes, where crevasses—deep fissures in the ice—are a danger.

Mountain Topography

Much had been learned about mountain topography in other parts of the world by the mid-19th century. Italian poet Petrarch climbed Mont Ventoux in France in the 14th century, and Italian scientist Leonardo da Vinci climbed Monte Bo in Italy in the 15th century; both men passed on their experiences in writings. Some early explorers who

helped gather information about mountain ranges were seeking passes through these ranges; others, such as the MOUNTAIN MEN in North America's ROCKY MOUNTAINS, were working in the mountains, trapping for furs. Some early explorers climbed mountains simply to reach the top, as Spaniard DIEGO DE ORDAZ did in climbing Mexico's Popocatepetl in 1520, and American JOHN CHARLES FRÉMONT did in the climbing of Fremont Peak in Wyoming's Wind River Mountains in 1843. In the 18th and early 19th centuries, naturalists and geologists hiked up mountains and even climbed difficult peaks for purposes of scientific study. In 1740, for example, French naturalist CHARLES-MARIE DE LA CONDAMINE, and, in 1801, German naturalist ALEXANDER VON HUMBOLDT, accompanied by French botanist Aimé Bonpland, attempted to climb Mount Chimborazo in the ANDES MOUNTAINS of Ecuador in South America, but failed to reach the top. In the 1860s–70s, American naturalist JOHN MUIR and American geologist CLARENCE KING hiked and climbed much of the Sierra Nevada of California in North America. The Great Trigonometrical Survey of India of the 19th century, headed for a time by SIR GEORGE EVEREST and carried on by the PUNDITS (trained Indian emissaries), led to the mapping of the HIMALAYAS and a calculation of the heights of the main peaks. In 1854–57, German brothers ADOLF VON SCHLAGINTWEIT, HERMANN VON SCHLAGINTWEIT, and ROBERT VON SCHLAGINTWEIT explored and surveyed the Himalayas, the Karakoram Range, and Kunlun Mountains for the BRITISH EAST INDIA COMPANY.

The Challenge of the High Peaks

Mountain climbing as an end in itself continued to increase in popularity. By the end of the 19th century, many more climbing clubs besides the Alpine Club had been organized in Europe and North America, and many climbers were ascending peaks without guides. With no more firsts to be accomplished in the Alps, many climbers turned their attention to other ranges. In 1868, Englishman Douglas Freshfield and French guide François Devouassoud, along with two other team members, climbed two of the main peaks—Kasbek and Elbrus—of the Caucasus Mountains of Georgia, Armenia, Azerbaijan, and southwest Russia (the Caucasus is considered a boundary between Europe and Asia). Other expeditions followed, in particular from Great Britain, Germany, Italy, and, in the 20th century, the Union of Soviet Socialist Republics (USSR; Soviet Union).

The HIMALAYAS of central Asia, which boast many of the world's highest peaks, lured professional mountain climbers as did the Andes Mountains of South America and the Southern Alps of NEW ZEALAND. Italian guide MATTHIAS ZURBRIGGEN, who had developed his mountaineering skills in the European Alps, participated in expeditions in all three ranges. In 1897, he became the first

person to climb ACONCAGUA, the highest peak in the Andes and the entire Western and Southern hemispheres. Tanzania's Mount Kilimanjaro (see KILIMANJARO, MOUNT), Africa's tallest peak, was first scaled in 1889 by German geographer HANS MEYER and Austrian mountain climber Ludwig Purtscheller. In 1899, Englishman Sir Harold Mackinder climbed Africa's second-highest peak, Mount Kenya, located in Kenya. Anglo-American clergyman HUDSON STUCK, along with Harry Karstens, Robert Tatum, and Walter Harper, climbed North America's highest mountain, Mount McKinley (see MCKINLEY, MOUNT), in 1913.

In the late 19th and early 20th centuries, Italian LUIGI AMEDEO DI SAVOIA D'ABRUZZI (duke of Abruzzi) was an active mountaineer. He made the first ascent of Mount Saint Elias in Alaska and of various peaks of the Ruwenzori Mountains in East Africa—associated with the MOUNTAINS OF THE MOON as described by second-century hellenized Egyptian geographer PTOLEMY. He also attempted the world's second-highest peak, K2 (formerly known as Mount Godwin-Austen after the explorer Henry Haversham Godwin-Austen), at 28,250 feet, in the Karakoram range of the western Himalayas. The duke of Abruzzi began the tradition of mountain climbers putting their skills to work in polar exploration. Also at the turn of the century, Americans FANNY BULLOCK WORKMAN in the Alps and Himalayas, and ANNIE PECK SMITH in the Alps and Andes, competed for altitude records and, in the process, helped develop a tradition of women mountain climbers.

The ascent of Mount Everest (see EVEREST, MOUNT) in the Himalayas, the world's highest peak at 29,035 feet above sea level, remained an elusive prize well into the 20th century. In the 1920s, the British, with assistance from Nepalese SHERPAS as guides and porters, made attempts to climb it. During an attempt in 1924, GEORGE HERBERT LEIGH MALLORY and Andrew "Sandy" Irvine lost their lives. Nepalese TENZING NORGAY and Englishman SIR EDMUND PERCIVAL HILLARY finally reached the summit on May 29, 1953. The next year, Italians Achille Compagnoni and Lino Lacedelli, part of Ardido Desio's expedition, summited K2. Other Himalayan mountains were conquered in the 1950s–60s, including the third-highest peak in the world, Kangchenjunga (or "Kang" or "Kanch"), as well as Annapurna, Nanga Parbat, Cho Oyu, Makalu, Lhotse, Manaslu, Gasherbrum II, Broad Peak, Hidden Peak, Dhaulagiri, and Shisha Pangma (or Gosainthan). With the highest peaks conquered, the challenge of Himalayan mountaineering has evolved into a pursuit of specialized assaults—by especially difficult routes, in wintertime, without oxygen bottles, solo, or in a series of related climbs. For example, in 1978, Italian Reinhold Messner and Austrian Peter Habeler climbed Mount Everest for the first time without bottled oxygen. Two years later, Messner accomplished a solo climb of Everest. In the course of 17 years, ending in 1986, Messner completed his goal of climb-

ing the 14 highest mountains in the world, located in Nepal, Pakistan, China, and Tibet. Climbs in other Asian mountain ranges—Tien Shan, Pamir, Kunlun, and Hindu Kush—as well as other ranges around the world have also been undertaken by climbers of many different nationalities. In 1985, American Dick Bass became the first to climb the "Seven Summits," the highest peak on each of the seven continents. Because of the difficulty of such assaults, mountain climbers continue to lose their lives in falls, storms, and avalanches.

Modern Climbing

In recent times, new technologies have helped refine mountain-climbing clothing for warmth, waterproofing, and evaporation of perspiration. Equipment has also been developed to allow for climbing vertical and overhanging rock faces. Such equipment includes chocks, cams, and nuts to wedge into rock crevices; carabiners to attach ropes to the chocks; and loops of nylon webbing used as ladders. Cellular telephones make communication while mountain climbing easier. Another recent development is a new environmental awareness. Some countries now require climbing permits and even environmental bonds to ensure the removal of waste from expeditions. The placement of pitons and other hardware is also regulated in some locations. Rock climbing, which started as a method of training for ascents of high mountains, has grown as a sport in its own right. Climbers today are able to train in indoor rock-climbing gyms and to compete in rock-climbing tournaments. Many climbing clubs and organizations have formed around the world for both rock and ice climbing.

The history of mountain climbing is a rich saga unto itself, apart from other kinds of exploration. Each high peak has its story, and many other individuals not mentioned above have contributed to their conquest. Mountaineering, despite all the accomplishments from the past and the advancements in its technology, remains one modern-day activity offering the thrill of exploration in some of the most remote places on Earth. As such, mountain climbing represents a continuum of exploration from ancient times to the present.

mountain men

The mountain men were frontiersmen active in the FUR TRADE in the ROCKY MOUNTAINS and surrounding regions of the American West. The term is most often applied to fur hunters, trappers, and traders working the northern and central Rockies in U.S. territory, seeking especially beaver furs and active in the 1820s and 1830s, but is sometimes also used in reference to those active in the southern or Canadian Rockies, and in other decades. Most mountain

men operated at a time when there were no permanent posts in that region and lived off the land, adopting Native American customs, including the wearing of leather and deerskin clothing. Some lived among tribes and married Indian women.

Many of those who became known as mountain men began their careers in the fur trade in the employ of the ROCKY MOUNTAIN FUR COMPANY, founded by WILLIAM HENRY ASHLEY and ANDREW HENRY in 1822. The earlier ST. LOUIS MISSOURI FUR COMPANY, also involving Henry, had been active along the MISSOURI RIVER. The AMERICAN FUR COMPANY, founded by JOHN JACOB ASTOR, had been working the country west of the Rockies. The Canadian HUDSON'S BAY COMPANY, which merged with the NORTH WEST COMPANY in 1821, had built most of its posts in the northern forests. And the RUSSIAN-AMERICAN COMPANY

Frederic Remington, known for his works on the American West, painted these mountain men, probably in 1904. (Library of Congress, Prints and Photographs Division [LC-USZ62-107676])

had developed the fur trade in Alaska. But some of the more difficult mountainous terrain and the routes through them were still virgin territory to non-Indians, and the activities of the mountain men opened much of the West to non-Indians.

Early in his operations, Ashley instituted the “brigade system,” in which trappers were sent out in numbers to defend against Indian attacks, especially by the Blackfeet Indians who were hostile to outsiders crossing their territory. Many of the mountain men developed friendships that would endure over the next decades. JAMES PIERSON BECKWORTH, JAMES BRIDGER, ROBERT CAMPBELL, JAMES CLYMAN, HUGH GLASS, THOMAS FITZPATRICK, HENRY FRAEB, CALEB GREENWOOD, DAVID E. JACKSON, ÉTIENNE PROVOST, EDWARD ROSE, JEDEDIAH STRONG SMITH, WILLIAM LEWIS SUBLETTE, WILLIAM HENRY VANDERBURGH, LOUIS VASQUEZ, and JOHN WEBER all worked for Ashley. The annual rendezvous—the first, in July 1825, organized by Ashley at Henrys Fork of the Green River in what is now northern Utah—was an essential part of the fur-trading economy. There would be 15 more such gatherings. At these meeting places, the mountain men delivered their furs to their employers, received their year’s wages, obtained new supplies, and socialized. Native Americans also brought their catch to barter for supplies.

In 1826, Ashley sold out his fur-trading interests to three of his former employees, David Jackson, Jedediah Smith, and William Sublette. They maintained a loose company over the next years, as did other mountain men. Some came to work for the American Fur Company, which also began working the Rockies. BENJAMIN LOUIS EULALIE DE BONNEVILLE, a U.S. military man on leave who led a number of fur-trading expeditions west of the Rockies in 1832–35, employed mountain men JOSEPH REDDEFORD WALKER, ZENAS LEONARD, and JOSEPH L. MEEK. Not all the mountain men were white. Edward Rose was part Cherokee and part African American. Jim Beckwourth was part African American. Another trapper from the same period who has been referred to as a mountain man is CHRISTOPHER HOUSTON CARSON (Kit Carson).

Following the change in fashion with the beaver hat going out of style in favor of the silk hat and the drop-off in the international demand for furs in the late 1830s, the mountain men put their wilderness skills to work as guides and interpreters, leading many of the early exploratory expeditions of the West, such as those under JOHN CHARLES FRÉMONT, as well as wagon trains, especially along the Oregon Trail and the branching California Trail, which mountain men had pioneered. Others became soldiers and scouts, proving effective against the native peoples from whom they had learned so much. After working as a trapper and a guide for Frémont, Kit Carson went on to become an Indian agent as well as brigadier general against tribes of the Southwest.

Many former mountain men settled in California. A number wrote accounts of their exploits.

Mountains of the Moon

The concept of the Mountains of the Moon, as associated with Africa, originated with **DIOGENES**, a Greek merchant who, in about A.D. 50, traveled inland in East Africa and reportedly sighted a range of snowcapped mountains feeding two large bodies of water. The next century, **PTOLEMY**, a hellenized Egyptian living in the North African city of Alexandria and a renowned geographer, produced an early map of Africa on which a group of mountains south of the EQUATOR were identified as *Lunae Montes*, or “Mountains of the Moon,” and wrote about them as the source of the NILE RIVER.

The source of the Nile was not determined for centuries. In 1613, **PEDRO PÁEZ**, a Spanish missionary sent out by Portugal, reported that the source of the Blue Nile, one of the two branches converging into the great river, was Lake Tana in the mountains of Ethiopia, a discovery corroborated by Scotsman **JAMES BRUCE** in 1770. Then, in 1858, Englishman **JOHN HANNING SPEKE** theorized that the source of the White Nile, the main branch, was Lake Victoria, confirmed by Anglo-American **SIR HENRY MORTON STANLEY** in 1875. A decade later, in 1889, Stanley and **MEHMED EMIN PASHA** explored the Ruwenzori Mountains on the border of present-day Uganda and the Democratic Republic of the Congo. It was determined that the Ruwenzori were at least part of the watershed feeding the Nile, some streams flowing southward through Lake Edward and Lake George to Lake Victoria and to the Nile, and others flowing northward to Lake Albert and to the Nile. The range thus came to be associated with the fabled Mountains of the Moon.

The Ruwenzori Range consists of six mountains, including Mount Stanley, named after the explorer, with Margherita Peak, at 16,762 feet above sea level, the third-highest summit in Africa. Mount Speke is named after John Hanning Speke; Mount Emin, after Mehmed Emin Pasha; Mount Baker, after **SIR SAMUEL WHITE BAKER**; and Mount Gessi, after Italian Romlo Gessi, who explored the Nile to Lake Albert in 1876. In 1906, **LUIGI AMEDEO DI SAVOIA D’ABRUZZI** completed the first ascent of Margherita Peak, naming it for Italy’s queen mother; he climbed five of the six peaks in the range as well. Mount Luigi di Savoia is named after him.

There is no way to prove that the Ruwenzori were in fact Diogenes’s and Ptolemy’s mountains. It is possible that Mount Kilimanjaro (see **KILIMANJARO, MOUNT**), Africa’s highest mountain, and Mount Kenya, the second-highest, both closer to the Indian Ocean, were the mountains viewed

by Diogenes and represented on Ptolemy’s map. Yet the name is widely used for the Ruwenzori.

Mount Everest See **EVEREST, MOUNT**.

Mount Kilimanjaro See **KILIMANJARO, MOUNT**.

Mount McKinley See **MCKINLEY, MOUNT**.

Muscovy Company (Company of Merchant Adventurers; Merchant Adventurers of England for the Discovery of Lands, Territories, Isles, Dominions and Seignories Unknown; Mystery and Company of Merchant Venturers for the Discovery of Regions, Dominions, Islands and Places Unknown; Russia Company)

The Muscovy Company, a joint-stock corporation, was created in England to discover a **NORTHEAST PASSAGE** eastward from Europe to Cathay (present-day China), and to profit from the exclusive trade along such a route. It was referred to at different times by a number of other names, such as the Russia Company; the Company of Merchant Adventurers; the Merchant Adventurers of England for the Discovery of Lands, Territories, Isles, Dominions and Seignories Unknown; and the Mystery and Company of Merchant Venturers for the Discovery of Regions, Dominions, Islands and Places Unknown.

English merchants became interested in alternative trade routes as they saw their fellow European nations grow rich from their arrangements. Robert Thorne, a Bristol merchant in the mid-16th century, was especially enthusiastic about finding a passage to China by sailing past the northern border of Scandinavia, along Russia’s north coast, and around the northeastern edge of the Asian continent. The Company of Merchant Adventurers was founded on December 18, 1551, with Italian-born **SEBASTIAN CABOT** as first governor. The son of the even more renowned explorer **JOHN CABOT**, Sebastian Cabot had had an eminent career in his own right, including a search, in 1509, for an alternative **NORTHWEST PASSAGE** westward through the Americas. Although Cabot was elderly at the time of his appointment, with no plans to accompany an expedition, his knowledge and wisdom were considered vital to the company’s mission.

The waters to the east of Scandinavia and north of Russia were well known to native peoples inhabiting northern European shores at the time. Many made their living by fishing and hunting. Russia had had regular conflicts with their northern native neighbors, but cooperation was poor. In addition, most of the seafarers plying these waters were

illiterate, so reliable records of their knowledge was difficult to attain. Thus, the expeditions of the Muscovy Company took on a diplomatic element, as well as unifying the geographic understanding of the regions.

Trade Links

The first expedition outfitted by the company was to be headed by SIR HUGH WILLOUGHBY, an English soldier; RICHARD CHANCELLOR, an English mariner, was to serve as pilot general; and STEPHEN BOROUGH, another English mariner, was to captain one of the ships. Their task was to sail to China and establish trade links with the rulers of distant lands, and they carried letters from the king for this purpose. Setting out in May 1553, they rounded the northern border of Norway, where the ships were separated by a storm. Willoughby continued eastward, where he sighted Novaya Zemlya, although he was unable to land due to ice. He turned back, coming ashore on the Kola Peninsula, where he and his crew perished during the winter. Meanwhile, Borough had turned back prematurely because of icy conditions. Chancellor had proceeded southward and entered the White Sea. He dropped anchor at the mouth of the Dvina River, where the trading port of Archangel was located—later to become an important point of contact with England—and traveled overland. Learning of his presence, Czar Ivan IV (Ivan the Terrible) invited him to Moscow, where he and his party were well received. The following summer, Chancellor and his men returned to their ship and sailed back to England.

With friendly contact made between Russia and England, the newly christened Muscovy Company was granted a royal charter in 1555 and given a monopoly in trade between the two countries. Chancellor made a second journey that same year to clarify agreements with the Russian government, but lost his own life on the return trip.

Another voyage in search of the Northeast Passage sponsored by the company was made in 1556 by Stephen Borough, who had captained a ship in the Willoughby expedition. With a crew of only eight and a small vessel named the *Searchthrift*, they made their way along Norway's coast to the Barents Sea. Along the way, they discovered Vaigach Island, and then came upon Novaya Zemlya. Here they encountered the Samoyed (now known as the Nentsi), a nomadic people. Turned back by ice from entering the Kara Sea, his descriptions of the unfavorable conditions that lay ahead discouraged the English from further exploration for several decades.

The Muscovy Company then turned its attention to capitalizing on trade links, exchanging English textiles for Russian furs. In 1561, Englishman ANTHONY JENKINSON was given the task of pushing farther south to open up relations with Persia (present-day Iran). Passing through Russia, he took a boat down the Volga River to Astrakhan. From there, he managed to navigate the rough conditions on the Caspian

Sea, eventually reaching the court of the shah in the capital of Kazvin. He was rebuffed, but did manage to reach an agreement with the ruler at Shirvan. On another British expedition in 1564, Thomas Alcock, the leader, was killed. Four more trips, taking place from 1565 to 1580, were unsuccessful.

New Attempt at a Northeast Passage

The next English expedition in search of the Northeast Passage sponsored by the company was headed by Arthur Pet and Charles Jackman. They set sail in separate ships in June 1580: a 40-ton vessel, *George*, was commanded by Pet, and the 20-ton ship, *William*, was under Jackman's command. These were small boats, but their captains had experience from earlier expeditions—Pet with Chancellor, and Jackman under SIR MARTIN FROBISHER in the western Arctic. They found the strait between Vaigach Island and the mainland (currently called the Yugor Strait) but were stopped by the ice on the Kara Sea, having penetrated only a few more miles than Borough's expedition.

In 1607, the Muscovy Company hired Englishman HENRY HUDSON to find the Northeast Passage. He sailed westward to GREENLAND, then returning east and north, he came upon Spitsbergen (present-day Svalbard), a collection of islands situated to the north of Norway, visited in 1696 by a Dutch expedition under WILLEM BARENTS. Hudson's progress farther eastward impeded by ice, he returned to England. His reports of whales in northern waters led to the development of the English whaling industry, with some participation of the Muscovy Company. On a second trip in 1608, he took the more conventional route used by his predecessors and explored Novaya Zemlya, but was again forced back by ice.

Enduring Legacy

Despite their failure to accomplish their original objective of a Northeast Passage to China, the Muscovy Company left an enduring legacy. They were the first major joint-stock trading company in England, paving the way for numerous monopoly ventures to follow. Their trade with Russia was lucrative and continued for centuries, being interrupted only from 1646 to 1660, when English merchants were banned from Russia. Their monopoly privileges were long a subject of controversy, but these they were able to maintain until 1698, when the political pressure became too strong for the English monarchy to resist. The company remained active over the next centuries, however, finally closing its books in 1917.

Muslim exploration

The term *Muslim*, also written *Moslem*, is Arabic and translates as "one who submits," referring to a believer in the religion of Islam. Islam, the youngest of the three monothe-

istic world religions after Judaism and Christianity and evolving out of them, was founded by the Prophet Muhammad (or Mohammed) in the seventh century A.D. Muhammad was born in about 570, a native of Mecca in what is

now western Saudi Arabia. After experiencing a vision at age 40, he began preaching his revelations about the one god, known as Allah in Arabic, to the polytheistic Meccans. He eventually recorded his beliefs in the Qur'an (Koran). In

This photograph from the 1880s shows Muslims gathered at a sacred shrine in Mecca during the hajj. (*Library of Congress, Prints and Photographs Division [LC-USZ62-99278]*)

622, on alienating that city's political and religious rulers, he fled with his followers in a migration known as the *hegira*, the event from which the Islamic calendar is dated, and settled in Yathrib (later known as Medina) to the north. His influence and power grew as more and more Arab tribes declared their allegiance to him. In 630, he and his followers conquered Mecca.

At the time of Muhammad's death two years later, the new religion was spreading rapidly, largely through military conquest, as directed by the first three caliphs, Abu Bakr, Omar, and Othman. In 637, Jerusalem fell to Arab armies. Muslims also conquered Mesopotamia, Persia, and Syria. Under later rulers, Muslims came to control lands in central Asia to the edge of the Chinese Empire, all of North Africa, as well as territory in Spain, which they first invaded in 711 under Moorish leader Tariq. They were active traders even beyond these regions and came to dominate commerce along the SILK ROAD among other trade routes.

In later years, other Islamic peoples besides the Arabs came to dominate extensive regions. At the beginning of the 11th century, the Seljuk Turks under Togul began consolidating their power, conquering much of Asia Minor and surrounding areas. It was their ascendancy and harassment of Christian pilgrims to Jerusalem and their threatening Constantinople (present-day Istanbul, Turkey), the seat of the Eastern Roman Empire (Byzantine Empire) that helped prompt the CRUSADES, the military expeditions by European Christians to the Near East through the late 13th century. After proclaiming their independence from the Seljuks in 1290 under Osman I, the Ottoman Turks rose to power in the region and established the Ottoman Empire, which at the height of its power in the mid-16th century under Suleiman the Magnificent included much of southeastern Europe, western Asia, and northern Africa.

The Middle Ages, from the ninth to the 14th century, was a time of inquiry in the Muslim world, and comparisons can be made between this period of Muslim intellectual activity and the earlier Classical Age of the Greeks, and with the later RENAISSANCE in Europe (and the related EUROPEAN AGE OF EXPLORATION). There was a new mobility among its population. People traveled for religious purposes, with pilgrimages to Mecca, the holiest city of the Islamic faith as the birthplace of Muhammad (travel to which became regarded as an essential act of faith, known as the *hajj*). Religious research was part of devotion, and Islamic scholars journey throughout Muslim lands to research the *hādith*, oral teachings attributed to Muhammad and his followers. People also traveled for economic reasons, with Muslim merchants developing new markets. And people traveled for scientific reasons, even beyond the Muslim world, seeking knowledge of foreign lands. There resulted a wealth of Muslim literature: cosmographies, world geographies, regional geographies, geographies of

particular routes, chronologies of nations, and astronomical studies. The Arabs designed the DHOW, a craft with a LATEEN RIG, which became a common sight in the MEDITERRANEAN SEA, RED SEA, Arabian Sea, Persian Gulf, and Indian Ocean. The Muslims became proficient in navigation in oceans. They used the sundial, QUADRANT, ASTROLABE, and magnetic COMPASS. As early as the 10th century, they recorded nautical data in texts known as *rahmānī*, similar to the periplus of the Greeks and Romans (see PERIPLUS).

Many of the Muslim travelers were Arab, but not all, some descended from other peoples and venturing forth from other homelands. In some instances their exact nationality is not known. One of the most renowned early travelers was Arab merchant SOLEYMAN, also known as Sulaimen el Tagir, who, in about 850–51, traveled from the Persian Gulf by sea to India and China, visiting en route the Maldiv Islands and Laccadive Islands, CEYLON (present-day Sri Lanka), and the Andaman Islands. He wrote a book that came to be known as *Sequence of Historical Events*, with geographic as well as cultural information about the places he visited. In the early part of the 10th century, another Arab merchant, ABU ALI AHMAD IBN RUSTA, traveled throughout the lower Volga region of eastern Europe as well as to Malay in Asia. In his writings he describes both European and Asian peoples.

Two scholars traveled in the early 10th century as well, ABU AL-HASAN ALI AL-MASUDI, an Arab historian who reportedly visited every country in the Islamic world, and AHMAD IBN FADLAN, a non-Arab scholar who traveled from Baghdad into the Volga region of European Russia. Another individual who traveled throughout the Islamic world was merchant and scholar ABU AL-QASIM IBN ALI AL-NASIBI IBN HAWQAL. He also reportedly traveled across the SAHARA DESERT. His travels, beginning in 943, lasted about three decades. The next century, in about 1017, Arab scholar ABU AR-RAYHAN MUHAMMAD IBN AHMAD AL-BIRUNI traveled to India from Afghanistan; he later wrote a book on Indian customs and geography.

In 1145–54, after extensive travels in northwestern Europe, Arab ABU ABD ALLAH MUHAMMAD ASH-SHARIF AL-IDRISI, working for Roger II, the Norman king of Sicily, revolutionized cartography in *The Book of Roger*, which contains accurate geographic information based on his travels and the use of a grid system. In 1182–85, a son of a prominent Muslim family of Spain, ABU AL-HASAN MUHAMMAD IBN JUBAYR, explored the lands of the Mediterranean on pilgrimage from Spain to Arabia. His writings in a travel account known as a *Rihla* for "Journey" include a description of the holy places in Mecca. Another cartographer, SHIHAB AL-DIN ABU ABD ALLAH YAQUT AL-RUMI, was a Greek-born Muslim who traveled throughout the Middle East for a Baghdad merchant. In 1228–29, he published *Mu'jam al*

Buldan (Dictionary of Countries), a gazetteer-type geographic study.

The most famous of all the Muslim travelers was ABU ABD ALLAH MUHAMMAD IBN BATTUTAH, an Arab born in Tangier, Morocco. In 1325–50, as a pilgrim and scholar, he traveled throughout Egypt, Arabia, central Asia, Africa, and Spain. In Africa, he reached the city of TIMBUKTU in the kingdom of Mali, south of the Sahara. He, too, recorded his experiences in a *Rihla* travel account, published in 1357. At the time of his death in 1378, he was considered the most widely traveled person in history.

There are many other Muslim individuals who contributed to the growing body of knowledge of the medieval period and afterward and who are a part of the history of exploration.

The Muslim tradition of wide-ranging travel—both for religious purposes and for commerce—continued after the Middle Ages, and Islam continued to spread to new peoples, especially in Africa and Asia. Moreover, Muslim individuals continued to play a part in world exploration, even as part of other traditions, their religious affiliation not necessarily the motivation for travel. CHENG HO, who carried out seven maritime expeditions to the Indian Ocean on behalf of the Ming rulers of China in the early 15th century, was the son of Chinese Muslims. Muslims were hired for their expertise as navigators during the EUROPEAN AGE OF EXPLORATION of the 15th, 16th, and 17th centuries. It is widely

believed that Italian mariner CHRISTOPHER COLUMBUS used Muslim navigators in crossing the Atlantic Ocean for Spain in 1492. At the very least, he made use of Arabic navigational techniques and charts. (Based on ancient documents which, for example, tell of Muslims of African origin sailing from Spain across an ocean of “darkness and fog” and returning with evidence of a “strange and curious land,” it is theorized by some that Muslim mariners even reached the Americas before Columbus, as early as the ninth and 10th centuries.) ESTEVANICO, a slave out of North Africa who participated in Spanish explorations of the American Southeast and Southwest in the first half of the 16th century, is assumed to have been Islamic. Many other Muslims were taken to the Americas as slaves and contributed to European expansion into new territory. The fact that they were Islamic has rarely been documented. (One exception is Omar Ibn Sayyid, a West African slave in North Carolina, known to be Muslim from a letter he wrote in 1831.) There is also a legacy of a Muslim presence in Australia predating European settlement: It is thought fishermen and traders from the Indonesian archipelago reached Australia’s north shore as early as the 16th century. Afghan Muslims are known to have traveled to Australia in the 19th century to help with the exploration of the interior as camel drivers. Yet Muslim exploration as a subject of study generally relates to the Middle Ages, which might be called the Age of Muslim Exploration (as well as the Golden Age of Muslim Travel Writing).

National Aeronautics and Space Administration (NASA)

The National Aeronautics and Space Administration, better known as NASA, is an agency of the U.S. government, established by the National Aeronautics and Space Act of July 1958, for the purpose of SPACE EXPLORATION. In managing the U.S. space program, NASA conducts research in aviation and in ROCKET design, as well as related communications. It also directs scientific experiments in space. Moreover, it works in organizational aspects of space exploration, including the selection and training of ASTRONAUTS and the development of alliances between nations and partnerships between government and business or academia.

NASA was founded in response to the early success of the Union of Soviet Socialist Republics (USSR; Soviet Union) in its space program. In October 1957, the Soviets put the first artificial SATELLITE, *Sputnik 1*, into space, the start of the “space race.” To coordinate all space-related activities in one agency, NASA replaced the National Advisory Committee for Aeronautics (NACA), which had been founded in 1915 and had been geared toward research, and

absorbed some of the responsibilities of other government agencies as well.

NASA is based in Washington, D.C., and is overseen by the U.S. president, who helps plan policy and determine budget. Moreover, the administrator of NASA, a civilian, is appointed by the president, with the advice and consent of the Senate; under him is a staff of thousands of scientists, engineers, and technicians. The five NASA branches are the Office of Aero-Space Technology; the Office of Earth Science; the Office of Space Flight; the Office of Life and Microgravity Sciences and Applications; and the Office of Space Science. Facilities include the John F. Kennedy Space Center at Merritt Island, Florida; the Lyndon B. Johnson Space Center in Houston, Texas; the Goddard Space Flight Center in Greenbelt, Maryland; the George C. Marshall Space Flight Center in Huntsville, Alabama; and the Jet Propulsion Laboratory, operated under contract by the California Institute of Technology, in Pasadena.

NASA directed the MERCURY PROGRAM of 1961–63 to launch the first Americans into space; the manned GEMINI PROGRAM of 1964–66 to help develop the necessary techniques for a lunar mission; the unmanned Surveyor Program of 1966–68 to probe the lunar surface; and the APOLLO PROGRAM of 1961–72 to land a human on the Moon. Other projects include the unmanned exploratory flights to Mars. Since 1981, NASA has been directing flights of the reusable space vehicle, the SPACE SHUTTLE. Although originally conceived as a civilian agency, NASA has been

increasingly involved in aiding military research, carried out through space shuttle flights. NASA teamed up with the EUROPEAN SPACE AGENCY (ESA) to launch and maintain the *Hubble Space Telescope*. NASA has also been involved with the development of an international SPACE STATION.

native peoples and exploration

The history of exploration from ancient to modern times is not just about travel in uncharted lands, but also about contacts among peoples. The exploration of any continent, except Antarctica, cannot be discussed without relating the role of and impact on indigenous peoples. Since studies on exploration and explorers involve the stories and viewpoints of individuals who traveled from their homelands to foreign lands and helped diffuse knowledge, the related stories of indigenous peoples are sometimes neglected. The long-term use of the word *discover* as applied to already inhabited lands is an obvious example of how native peoples have been historically minimized in accounts on exploration. Moreover, there has been until recent years a tendency to glorify “discoveries” without offering a balancing account of the negative impact contacts with outsiders had on aboriginal populations—through disease, conquest, slavery, displacement from lands, and dispossession of culture. There also has been a minimizing of the role many indigenous individuals had in the success of specific expeditions as guides, interpreters, canoeists, and carriers, as well as the fact that some were explorers in their own right, opening up regions for their own people.

Conquest and Colonization

Some expeditions were launched with conquest and colonization of native peoples as the express purpose. The explorations of Macedonian ruler ALEXANDER THE GREAT in the fourth century B.C. in Africa and Asia, of Roman general GAIUS JULIUS CAESAR in the first century A.D. in Europe, and of Mongol leader GENGHIS KHAN in the 13th century A.D. in Asia involved the conquest and colonization of peoples. So did the early 16th-century Spanish expeditions of HERNÁN CORTÉS and FRANCISCO PIZARRO in the Americas. The very name applied to such Spanish explorers—CONQUISTADORES—implies conquest of indigenous peoples. Such military ventures had a direct impact on the history of peoples, and, in some cases, entire civilizations. The highly organized civilizations of the Aztec and Inca collapsed under the Spanish invasion.

Varying Contacts

Other expeditions were initiated having peaceful contacts with native peoples in mind. Italian mariner CHRISTOPHER COLUMBUS, exploring for Spain, hoped to find a new trade route to the Orient with the SPICE TRADE in

mind when he set out westward across the Atlantic Ocean in the late 15th century. Russian fur traders journeyed to Alaska in the mid-18th century to develop the FUR TRADE with native peoples. The religious conversion of native peoples provided incentive for many voyages into the wilderness, such as those of Frenchman CLAUDE-JEAN ALLOUEZ in the western Great Lakes country of North America in the mid-17th century. Knowledge of native peoples, as well as knowledge of geography, was a motivating factor in other expeditions, such as the U.S. government-sponsored expedition headed by MERIWETHER LEWIS and WILLIAM CLARK to the Pacific Northwest of North America in the early 19th century.

Part of the story of these expeditions, however, like those undertaken in the name of conquest, is the negative impact on peoples. When Columbus failed to reach the wealthy civilizations of Asia, he sought to obtain enough gold from Native Americans of the WEST INDIES to satisfy his sponsors. When that endeavor failed, he turned to the SLAVE TRADE as a means of profit. Colonization of the region followed, as did the eventual extermination of local tribes. The exploitation of native labor became central to the operations of the early Russian fur traders, who took Aleut hostages to force the delivery of furs. Allouez’s work among a reported 22 tribes—as that of other missionaries throughout the world—altered traditional ways of life. And the Lewis and Clark Expedition, despite peaceful contacts with more than 50 Native American tribes, can be seen as the start of the similar pattern for those tribes of nonnatives entering the native domain and beginning the process of destructive change.

The outcome of some expeditions involving native peoples as the primary motivation can be viewed in a positive light. For example, American GEORGE CATLIN, who traveled in North, South, and Central America in the mid-19th century, helped preserve knowledge of native peoples. In the early 20th century, American historian HIRAM BINGHAM helped preserve the Inca legacy in his studies of their ruins in Peru.

In the case of many other expeditions, the interaction with native peoples is incidental to the undertaking, but central to the story. Most accounts of expeditions to uncharted lands include mention of encounters with native peoples, both friendly and hostile. The explorations along the coast of Australia, such as those carried out by Englishman WILLIAM DAMPIER in the late 17th century, and in the interior by Scotsman SIR THOMAS LIVINGSTONE MITCHELL in the first half of the 19th century, resulted in engagements with Aborigines, some of them violent. In many instances, native peoples determined the outcome. Some of the most famous explorers were killed in confrontations, such as Spanish JUAN PONCE DE LEÓN, who made the European discovery of Florida in North America in the early 16th

Jacques Le Moynes painted a watercolor of the French, led by René de Laudonnière, encountering Native Americans in 1562 at St. Johns River in Florida. It was published by the Flemish engraver Théodore de Bry in 1591. (*Library of Congress, Prints and Photographs Division [LC-USZ62-380]*)

century, and Portuguese FERDINAND MAGELLAN in the course of the first CIRCUMNAVIGATION OF THE WORLD soon afterward.

Benefactors, Guides, Interpreters, and Porters

In other instances, native peoples were essential to the success of expeditions. In the Americas, Arawak (Taino) Indian chief GUANCANAGARI helped Columbus in the West Indies as a protector, guide, and interpreter. Aztec Indian woman MALINCHE helped Cortés in the same role. Huron (Wyan-dot) Indian DONNACONNA aided Frenchman JACQUES CARTIER in his 16th-century explorations along the Gulf of St. Lawrence and the St. Lawrence River in what is now northeastern Canada. Native American TURK and Ysopete served as guides, also in the 16th century, to Spanish FRANCISCO VÁSQUEZ DE CORONADO in the American Southwest. The PILGRIMS, who sought a new life in northeastern North America in the early 17th century, would not have survived without help from Native Americans—a course of events leading to the American holiday of Thanksgiving. The Wampanoag Indian SQUANTO was invaluable to them

as both a diplomat and interpreter, as well as a guide on their later coastal explorations. The Chipewyan MATONABEE was central to the survival and success of Englishman SAMUEL HEARNE's 18th-century voyages west of HUDSON BAY in Canada. Shoshone Indian woman SACAJAWEA (Sacagawea) deserves as much credit for the success of the early 19th-century Lewis and Clark Expedition as anyone, as a guide and interpreter, as well as a diplomat since the presence of a Native American woman provided safe passage through tribal lands. Ioway Indian woman MARIE DORION played a similar role for the Astorians, who traveled to the Pacific Northwest under WILSON PRICE HUNT several years later. In the mid-19th century, Mojave Indian IRATEBA served as a guide for several U.S. military topographic expeditions. At about the same time on South Island in NEW ZEALAND, a Maori named Ekuhu proved essential as a guide in the explorations of Englishman THOMAS BRUNNER.

An example of an Asian native offering assistance is NIKOLAY DAURKIN of the Chukchi tribe of northeastern SIBERIA. He served as an interpreter under Russia's Northeastern Secret Geographical and Astronomical Expedition of

the late 18th century, headed by Englishman JOSEPH BILLINGS.

The history of African exploration is also filled with the stories of native participants. HUGH CLAPPERTON and RICHARD LEMON LANDER, explorers of West Africa in the early 19th century, traveled with WILLIAM PASCOE, a Hausa tribesman and freed slave who acted as a servant and cook as well as a guide and interpreter. European explorers of Africa would not have been able to venture into the interior of Africa without the help of African porters—the *pagazi*—to carry their supplies. The porters' leader—the *kirangozi*—helped organize day-to-day life of an expedition. The Yao tribal member SIDI BOMBAY was critical to the success of a number of 19th-century British expeditions, including those of SIR RICHARD FRANCIS BURTON, JOHN HANNING SPEKE, SIR HENRY MORTON STANLEY, and VERNEY LOVETT CAMERON, as a caravan leader, guide, and interpreter.

In the 20th century, SHERPAS have been essential to the success of numerous MOUNTAIN CLIMBING expeditions in the HIMALAYAS as guides and porters. One of them, TENZING NORGAY, who accompanied Englishman SIR EDMUND PERCIVAL HILLARY in an assault on Mount Everest (see EVEREST, MOUNT) in 1953, became the first human to summit the world's highest mountain. There are numerous other native individuals known to have led foreigners through their lands and beyond. The names of many others, however, have been lost to history.

Native Explorers

Native peoples carried out their own travels to new lands. Most books about exploration do not discuss ancient migrations as exploratory expeditions, however. If the history of world exploration is perceived as the record of diffusion of geographic and cultural knowledge—with the mapping of the world, as a result of particular expeditions, at the heart of the saga—then ancient migrations determined through archaeological investigation are not part of the story. Yet, in the case of the Americas, so much is made as to their discovery, with 1492 as one of the best-known dates in history and Christopher Columbus as the most famous explorer, that it becomes necessary to discuss the migrations of Paleo-Indians across the LAND BRIDGE formed in the BERING STRAIT during the last ice age and attribute to them the true discovery of the Americas by humankind.

Accounts of some native explorers have been passed down orally. For example, the tradition of the Maori people holds that KUPE, a chieftain of the Polynesians, reached New Zealand in the mid-10th century. The legendary story contains some fantastic elements—such as the pursuit of a Squid King—yet the fact of a Polynesian migration to New Zealand is considered fact.

The PUNDITS, native peoples of India or neighboring countries working for the British in the 19th century, are

central to the story of the mapping of the Himalayas. Men such as NAIN SINGH, KISHEN SINGH, and KINTUP were able to disguise themselves as Buddhist merchants and pilgrims to travel in Tibet, a land forbidden to Europeans.

Some explorers were part native, their ancestry playing a part in the success of their accomplishments. EDWARD ROSE, who worked as a guide for a number of fur-trading expeditions, as well as interpreter and negotiator among Native American tribes along the MISSOURI RIVER and to the west in the early 19th century, had Cherokee ancestry along with European and African. Another part-Cherokee, JESSE CHISHOLM, similarly worked as a guide and interpreter in the American West; in 1865, he blazed the Chisholm Trail from Texas to Kansas, which soon became a major cattle drive route. Anthropologist KNUD JOHAN VICTOR RASMUSSEN—who studied GREENLAND and its Inuit (Eskimo) peoples in the early 20th century—had an Inuit mother and a Danish father.

One other point should be made regarding indigenous peoples and exploration. From the native point of view, some among them “discovered” lands foreign to them just as Europeans are said to have “discovered” other places. For example, when Squanto was taken to Europe as a slave in the early 17th century, then managed to return to North America, in relating his experiences to his people, he no doubt was perceived as an explorer who had lived a remarkable adventure. Omai, the Tahitian man who returned to Europe with TOBIAS FURNEAUX in 1774, and who, as a guest of SIR JOSEPH BANKS, made a splash in London society, can be said, as the first South Pacific native to visit England, to have “discovered” Europe for his people.

natural science and exploration

The precursor of a wide range of sciences—from the study of life-forms, such as biology, zoology, botany, paleontology, and anthropology, to the earth sciences, such as geology, geography, and oceanography—was the discipline of natural science. Also referred to as natural history, the discipline was practiced over the centuries by naturalists who studied “nature,” the natural world both animate and inanimate. In ancient times, such studies related to other scientific studies as well: mathematics, physics, and astronomy. Even in the golden age of natural history, the 17th to 19th centuries, European naturalists as part of others' expeditions or on their own, would conduct studies in a wide range of subjects: animal and plant species, native peoples, rock formations,

Earth's magnetic fields, OCEAN CURRENTS, and so on. The scope of their study must be hard to imagine for scientists today who have become increasingly specialized.

Foundations of Natural Science

It is difficult to separate out natural history from a general quest for knowledge in ancient times. The ancient Egyptians, for example, sent out expeditions—such as that of Queen HATSHEPSUT in about 1492 B.C., to the land of PUNT to the south—in order to collect among other things exotic plants and animals (see EGYPTIAN EXPLORATION). Many different peoples around the world, such as the ancient Chinese and Native Americans, also developed a remarkable body of knowledge about herbs for healing (see CHINESE EXPLORATION).

It can be said, however, that the philosophical foundation of modern science, empiricism and the objective observation of phenomena without reference to the observer, was developed by the ancient Greeks (see GREEK EXPLORATION). Thales of Miletus, who was active in the seventh to sixth century B.C., established some of the earliest principles of natural science, in astronomy, geography, and hydrology. In 585 B.C., he accurately predicted an eclipse of the Sun. Aristotle of the fourth century B.C. considered him the father of Greek philosophy. The philosophers of the ancient world thought in terms of a metaphysical “first cause,” which created the world and set it in motion toward an appointed end or “final cause,” and tended to denigrate the material world perceivable to our senses in favor of abstract ideas and theories. The fifth- to fourth-century B.C. Greek philosopher Plato, for example, maintained that the forms we see are but shadows of ideal forms. Yet the ancient Greeks placed much more emphasis on empirical observation and experimentation than did philosophers of the Middle Ages, and the Greeks traveled the known world observing and describing what they had observed.

CTESIAS OF CNIDUS was drawn to the fantastic, however. A Greek physician who traveled in Persia and India from 420 to 400 B.C., he later wrote accounts of his experiences, which, he claimed, discredited earlier accounts by fifth-century B.C. Greek historian HERODOTUS. Yet most of his information was based on hearsay from Persian courtiers; he wrote down everything he was told, no matter how incredible. Ctesias serves as an example of the importance to the Greeks of factual reporting, for as soon as Macedonian ALEXANDER THE GREAT traveled the same regions in the fourth century B.C., Ctesias's work was superseded by eyewitness accounts, some of them by scientists and surveyors traveling with Alexander's army. His scientists even sent back specimens of wildlife to Greece. The difference in worldview of the ancient Greeks from that of medieval Europeans is clearly shown by the latter's credulous acceptance of everything Ctesias wrote. For example, his account of a race of

men with a single huge foot, which may have originated from tales of Indian holy men who would spend hours meditating while standing on one foot, resulted in medieval depictions of big-footed men.

Ctesias's importance may derive more from the effect his writings had on others; his books were read by many educated Greeks including Aristotle, a fourth-century B.C. Greek philosopher, as well as Alexander, who studied under Aristotle. It is likely that, during his travels in Persia and India, Alexander sought confirmation of Ctesias's information. Moreover, Alexander sent back to Aristotle multitudes of natural specimens and reports on the natural phenomena. Aristotle was thus a naturalist-explorer by proxy; one of his assistants may actually have accompanied Alexander's army and worked to systematize their findings before sending them home. Aristotle differed from Plato by insisting that ideal form, the ultimate object of study for philosophers, was inherent in concrete individual things, resulting in his preoccupation with observable nature.

Natural Science during the Middle Ages

For all the profound influence Aristotle's writings had on European beliefs about the natural world, Plato's philosophy became the essential framework for medieval Christian theology and philosophy, with a belief in the dualism of matter versus spirit or soul and a profound mistrust of the physical. It is ironic that the basic beliefs of scholars of the Middle Ages led them to study Aristotle's works rather than studying nature for themselves as he had done.

Science in the Middle Ages combined the physical with the metaphysical; the precursor of chemistry was alchemy, that of astronomy was astrology. The aim was to discover evidence of a preconceived order in the world; thus, early maps showed landmasses arrayed in the perfect symmetry that God must have bestowed on them, with Jerusalem at the center of Earth (see GEOGRAPHY AND CARTOGRAPHY). Also, during the Middle Ages, animals were studied not by direct observation but as they appeared in bestiaries, books with depictions and descriptions that used animal lore to teach Christian values. The core material of most medieval bestiaries came from *Physiologus*, a text written by an anonymous author, possibly a contemporary of Saint Augustine, the bishop of Hippo in north Africa, who lived in the fourth to fifth centuries A.D. This writer took the assertions of earlier authors as undeniable fact without making any attempt at independent verification. Stories such as that of the mythical bird known as the phoenix, which burns itself to death and rises on the third day from the ashes, had symbolic value, this particular one representing Christ's resurrection.

Stirrings of a new way of regarding nature began to be discernable in the 13th century. Italian friar Saint Francis of Assisi deposed man from the dominion over all nature given him in the Bible; this dominion had long been reinforced by

the belief that man with his soul and his reasoning mind was highest of all creatures on Earth in the hierarchy from matter to spirit. To Saint Francis, however, nature consisted of a harmonious democracy of all creatures.

Saint Francis's contemporary, Friederich I of Hohenstaufen, king of Germany and Holy Roman Emperor, an avid falconer, wrote *De Arte Venandi cum Avibus* (The art of hunting with birds), using his own careful observations, and displayed a different attitude toward textbook natural history than had predominated for so long. "No certainty comes by hearsay," he declared, and carefully tested as many of Aristotle's facts as he could, writing only about what he had observed himself; he refuted many of the tales of the bestiaries. German scholar Albertus Magnus, the patron saint of natural scientists, translated into German Aristotle's *Historia animalium*, making it more accessible for confirmation or refutation. During his travels, Venetian MARCO POLO, who traveled to the Far East in the latter part of the century, was able to refute many bestiary "facts," such as that of the rhinoceros, which he described were not very likely "to be taken by maidens" (a reference to scholars' confusion of the rhinoceros with the unicorn, which in legend could be captured only by a virgin). Italian monk Rufinus of Naples wrote a treatise on plants in 1287, which presented them as a subject worthy of study on their own, aside from any moral lessons they might tell and without reference to their medicinal uses.

Natural Science during the Renaissance

With the humanists of the Italian RENAISSANCE of the 16th century came a more widespread return of interest in the classical approach to science, instead of simple acceptance of the facts of the ancients. An example is English naturalist William Turner, who, in 1544, printed a small book devoted entirely to birds; he included the descriptions of Aristotle and Roman writer PLINY THE ELDER of the first century A.D., but added many accurate descriptions based on his own extensive studies.

Artists at this time of the great flowering of Italian Renaissance painting were as devoted to the ideal of close observation and exact depiction of nature as many naturalists; the science of perspective drawing allowed for a realism never seen before. Italian artist, architect, and poet Michelangelo risked criminal prosecution to dissect corpses in an effort to study the muscular structure of the body. Italian artist and architect Leonardo da Vinci, also a talented scientist and inventor, dissected cadavers as well and studied other aspects of natural history, such as the flight of birds. German painter Albrecht Dürer, who made woodcuts for Konrad Gesner's enormously influential encyclopedia, *Historia Animalium* (1551–58), brought scientific drawing to new heights of accuracy.

By the end of the century 16th century, the struggle between the old and new attitudes was in full swing. The latter found its major champion in Italian mathematician, astronomer, and physicist Galileo, an early practitioner of modern science. He, too, explored the physical aspects of the natural world to better understand the theoretical world.

A contemporary of Galileo's was Englishman THOMAS HARRIOT, a geographer, surveyor, and naturalist for the expedition of SIR WALTER RALEIGH to North America in 1585. Harriot helped locate the site for the Roanoke colony and designed its fort. He identified more than 86 species of birds and many trees and shrubs unknown to Europe; in 1588, he wrote the first critical study of the flora and fauna of North America. Harriot was also an astronomer and independently discovered some of the same sunspots as Galileo. He even preceded Galileo (by a few months) in making the first telescope-based drawing of the Moon in 1609; he made the first drawing of sunspots in 1610.

Naturalistic study of lands discovered in the first wave of exploration in the 16th century was mostly carried out by clerics, especially Jesuits such as JOSÉ DE ACOSTA, a Spaniard who traveled to Peru and Mexico in the 1570s–80s. Yet the Protestant Reformation caused the Catholic Church to retreat into an increasingly defensive posture on all fronts, especially intellectual. Heresy was suspected and found everywhere, and in this atmosphere of suspicion Galileo ran afoul of Church authority. His affair had a chilling affect on intellectual endeavor within the church, and, by the 18th century, it had become more common for lay naturalists to accompany exploratory expeditions.

From Descartes to Darwin

A modern approach to science fully came into play only in the 17th century, largely as a result of the work of French mathematician and philosopher René Descartes, who promoted the rigorous separation of the realm of the mind, *res cogitans*, from that of material phenomena, *res extensa*. In 1660, the ROYAL SOCIETY was founded in England by a number of intelligentsia. Its full title—Royal Society of London for Improving Natural Knowledge—indicates how natural science had become an impassioned cause.

In the 18th century—culturally defined in Europe as the Age of Enlightenment, when for many human reason displaced religion as the source of truth and the primary force for good in the world—the stream of discoveries of new species of plants and animals became a flood. Naturalists now were traveling to many areas of North and South America, Africa, Asia, and the Indian and Pacific Oceans, and the lands they found, vastly different from those of Europe, were profoundly changing Europeans' worldview, enlarging their sense of the scope and variety of the life-forms of Earth. There was a pressing need for a truly universal system of classification of species. Carl Linnaeus, a Swedish

physician and botanist, was one of those in the forefront of carrying out and promoting expeditions of naturalistic study. In 1731, he mounted a solo botanical and ethnographic expedition to Lapland. He became a professor at the University of Upsalla in 1741; during his tenure there, he arranged for many of his students to accompany voyages of discovery. Perhaps his most famous student, fellow Swede DANIEL CARL SOLANDER, was assistant to British naturalist SIR JOSEPH BANKS on Captain JAMES COOK's CIRCUMNAVIGATION OF THE WORLD in 1768–71. The expedition, backed by the Royal Society, brought back the first plant collections from Australia and the South Pacific to Europe. Solander introduced the Linnaean system into Britain and was a pioneer in its use to classify new species. Banks and Solander recognized that the kangaroos, wallabies, and other marsupial mammals were fundamentally different from and more primitive than placental mammals. JOSEPH-PHILIBERT COMMERSON, a French physician, studied for many years with Linnaeus; he later accompanied LOUIS-ANTOINE DE BOUGAINVILLE on the first French circumnavigation of the world in 1766–69 and sent back to France more than 5,000 specimens of plants and animals, most of them hitherto unknown to science.

Early on, Linnaeus had seen the need for an improved system of classification and, in 1735, he had published the first slim volume of his *Systema Naturae*, which later would grow to many volumes. Paradoxically, since his system would ultimately facilitate 19th-century British naturalist CHARLES ROBERT DARWIN in his development of the theory of natural as opposed to divine selection, Linnaeus's basic conception of the study of nature was that it furnished a natural theology whereby one could learn about God's wisdom by studying His creations. But his system of classification was based not on moralistic judgments about species but on their physical characters; beginning with plants, he used the number and arrangement of their reproductive organs to classify them. In the end, this approach proved unworkable, and his lasting contribution was to group organisms not only as species sharing common characteristics, which Aristotle had done, then species into genera, but also into higher groupings: genera were grouped into orders, orders into classes, and classes into kingdoms. Formerly, species had been grouped as, for example, those which lived in water, or domesticated species; thus, fish and whales had been considered to occupy the same grouping. The use of common physical characteristics to organize species on all taxonomic levels shifted the focus to familial relationships and inheritance. Based on this concept, Darwin—in the mid-19th century, after his trip around the world on the *Beagle* captained by ROBERT FITZROY—would make his controversial identification of humans, apes, and monkeys as belonging to the same order, Primates, all sharing a single common ancestor. British naturalist ALFRED RUSSEL WALLACE, who had

traveled to South America with fellow naturalist HENRY WALTER BATES and later to Southeast Asia, developed a theory of natural selection independently of Darwin. In the meantime, Darwin's cousin SIR FRANCIS GALTON traveled to Africa and carried out studies in a variety of fields relating to natural science.

An Expanding Field

A listing of some other early observations of phenomena that are now common knowledge—and some of the names of other naturalists involved in making them—gives an idea of the Europeans' enlargement of vision and the shift in sense of their place in the world.

During the same period in which Linnaeus created a new classification system, British naturalist MARK CATESBY studied wildlife in Virginia, the Carolinas, Bermuda, and Bahamas and wrote a two-volume study beginning the practice of interpretative ornithology, published serially in 1731–43. German physician and naturalist DANIEL GOTTLIEB MESSERSCHMIDT, on a 1719 expedition to SIBERIA, found a complete mammoth skeleton, evidence of an extinct species that challenged the creation story of Genesis, which told that all species had been created at one time; for a long time theologians had explained such finds as remnants of creatures destroyed during Noah's Flood. In the 1730s–40s, during Danish VITUS JONASSEN BERING's explorations of Siberia, the Kamchatka Peninsula, the Aleutians, and Alaska on behalf of Russia, Germans JOHANN GEORG GMELIN and GEORG WILHELM STELLER and Russian STEPAN PETROVICH KRASHENINNIKOV participated as naturalists and conducted organized studies of the wildlife and indigenous peoples of those regions for the first time. In 1735, French scientist and cartographer CHARLES-MARIE DE LA CONDAMINE went to South America as near to the EQUATOR as possible to make measurements that would help ascertain whether Earth was flattened there or at the NORTH POLE and SOUTH POLE, as adherents of 17th- to 18th-century British mathematician and physicist Sir Isaac Newton insisted; a simultaneous expedition to Lapland proved the latter. La Condamine also became one of the first Europeans to encounter the material now known as rubber. German naturalist JOHANN REINHOLD FORSTER, who accompanied James Cook on his second voyage to the Pacific in 1772–75, pioneered the study of comparative anthropology in studying South Pacific islanders. He also collected specimens of king and emperor penguins, a type of bird utterly unknown in Europe and worthy of inclusion in the medieval bestiaries for their strangeness, and carried out some of the earliest oceanographic studies, measuring differences in surface and subsurface temperatures (see OCEANOGRAPHY AND EXPLORATION).

In the 19th century, before Darwin's great accomplishments, German naturalist GEORG HEINRICH RITTER VON

LANGSDORFF, during a Russian expedition to the Pacific headed by ADAM IVAN RITTER VON KRUSENSTERN in 1803–08, discovered that ocean phosphorescence was caused by tiny microorganisms. German botanist CARL FRIEDRICH PHILLIPP VON MARTIUS was the first European to see the giant rain forest trees of the upper AMAZON RIVER in his South American expedition of 1817–20. French naturalist ALCIDE-CHARLES-VICTOR DESSALINES D'ORBIGNY's study of micro-fossils in South America in the 1820s–30s laid the foundations for stratigraphic paleontology. German naturalist and geographer ALEXANDER VON HUMBOLDT, active at the same time, was notable for going beyond simply collecting and observing natural phenomena, applying his knowledge of physical processes to interpret what he found. He was among the first to use isotherms, lines on a map connecting locations with the same temperature at a given time, comparable to lines on a topographic map, to get a larger picture of climate patterns and their relationship with altitude. He made important studies of ocean currents and of magnetic intensity in relation to proximity to the equator.

A number of painters contributed to natural history and exploration both (see PAINTING AND EXPLORATION). Some of them were part of expeditions, assigned the task of creating visual representations of native peoples, flora, and fauna; British painter JOHN WEBBER, for example, sailed with James Cook in 1776–80. Others, such as American GEORGE CATLIN, who painted Native Americans in North America and South America in the mid-19th century, traveled alone.

With explorations of the most remote regions of Earth—such as the interior of the Antarctic continent starting in the early 20th century, and the ocean depths in the mid-20th century—new natural science studies were undertaken using ever more sophisticated instruments and techniques. Moreover, in the 20th century, natural science became a cooperative venture. During the INTERNATIONAL GEOPHYSICAL YEAR, for example, an 18-month period from July 1957 to December 1958, designated for cooperative study of Earth's geophysics, scientists from 66 nations participated. Part of the effort was in SPACE EXPLORATION, humankind's latest exploratory endeavor, which also combines physical and scientific exploration.

navigation and exploration

Navigation is the art, science, and technology of finding the position of a craft and charting a course for that craft from one point to the other. The term originally referred to directing the course of watercraft, but it has come to be applied to maneuvering aircraft as well. The history of navigation reflects the history of science and technology from ancient times to the age of SPACE EXPLORATION.

Early Navigational Techniques

Much of ancient navigation was in sight of land, that is, “coastal navigation.” Ancient seafarers in oceans, seas, and lakes around the world used coastlines and their landmarks—mountain peaks, rocks, trees, or waterways—to determine location. They gave these landmarks colorful names to help remember them. Yet they used other methods as well. When out of sight of land, they could use the position of the Sun in the daytime and the stars at night to help steer a course, an early form of “celestial navigation.” They measured the depth of water with sounding poles, perhaps the earliest navigational tool. They also used “adventitious aids,” as they are called, based on knowledge passed from generation to generation of seafarers: knowledge of winds, water depth, tidal streams, currents, reefs, shoals, and the habits of birds, fish, and sea mammals. The kind of waves, long and rolling or short and sharp, could give them an idea of direction based on knowledge of how, for example, westerly or northerly winds in a given region affect the sea as a result of the water depth and the positions of surrounding landmasses. The color of water could indicate to them when they were in a current or particular sea channel or over a fishing bank.

Navigators of the Mediterranean

Peoples of varying civilizations became skillful navigators of the MEDITERRANEAN SEA and adjoining waterways, the NILE RIVER, the RED SEA, and the Black Sea. Some among them reached the Indian Ocean and Atlantic Ocean as well. The Minoans and Egyptians and later the Phoenicians, Greeks, and Romans all developed a seagoing tradition and made use of the type of oar-propelled boat known as the GALLEY (see EGYPTIAN EXPLORATION; MINOAN EXPLORATION). They followed coastlines when convenient but also came to venture into open waters. The Phoenicians and their offshoot, the Carthaginians, were the most wide-ranging of the ancient travelers and were even hired by other peoples for their services at sea (see CARTHAGINIAN EXPLORATION; PHOENICIAN EXPLORATION). They traveled into the Red Sea and may have even circumnavigated Africa. Historical record indicates that the Carthaginians passed through the Strait of Gibraltar (see GIBRALTAR, STRAIT OF) into the Atlantic Ocean. It is known that they navigated by the NORTH STAR, the most basic technique of celestial navigation. But there are references to constellations as aids to navigation in ancient writings. As early as about the ninth century B.C., according to Greek poet Homer, who may have lived then, in his epic poem the *Odyssey*, Odysseus was instructed by the gods to “keep the Great Bear on his left” when sailing from Calypso's Island.

The Greeks created the PERIPLUS as early as the sixth century B.C., and the Romans continued to use it (see GREEK EXPLORATION; ROMAN EXPLORATION). Periplus began as accounts of voyages, then evolved into sailing guides, describing

landmarks, harbors, anchorages, watering places, winds, and currents of waterways. Through them, knowledge could be passed among mariners from generation to generation.

The Greeks are also credited with founding the science of geometry, the principles of which came to be applied to navigation, and inventing the *ASTROLABE*—a device for determining the angle of celestial bodies and latitude—possibly in the third or second century B.C. *HIPPARCHUS* of the second century B.C., who cataloged about 1,000 stars, may have been the inventor. It used a sighting arm to point toward a given celestial body and a plumb line to determine the horizon plane, which would be perpendicular to the plumb line. However, it was used more for theoretical studies and did not become widespread as a navigational tool for centuries, after being reinvented by the Arabs.

Navigation During the Irish Age of Saints

The earliest transoceanic voyages of exploration by Europeans were carried out by Irish monks beginning in the sixth century A.D. Written accounts of *SAINT BRENDAN* perhaps attribute to him collective sea experiences of a number of Irish mariners, and the actual location of *SAINT BRENDAN'S ISLE* is not known. There is more reliable information about the travels of Saint Columba, the founder of Iona, and the monks of the many monasteries he and his followers founded. Abbot Adamnan of Iona, writing in the next century, documents some of these journeys, including four ocean pilgrimages. One of these was led by a monk named Cormac, who was searching for a deserted island on which to settle; Cormac sailed in his *CURRAGH* for 14 days and nights straight out to sea with a south wind until, it seemed to him, he had traveled “beyond the limit of human wanderings.” Another monk, Baitan, reportedly traveled a great distance in stormy seas. It may have been during such a voyage as these that the Faeroe Islands were reached, perhaps in the seventh century. The Faeroe Islands were the first overseas landmass unknown to the Greco-Roman world reached by Europeans. Irish monks eventually traveled even farther into the Atlantic and reached *ICELAND*, possibly as early as A.D. 795. Once these islands were colonized, traffic was carried on between them and the British Isles, which obviously required considerable navigational skills. The fact that the monks were out of sight of land for two weeks implies that they steered by Sun and stars. According to Faeroese tradition, the monks avoided sailing during the months with “luminous nights”—that is, during summer when at high latitudes the stars are invisible in the nightlong twilight.

According to some accounts, Irish seamen listened for the roar of breakers to tell them of land nearby or watched for land birds such as falcons; they may have guessed at the existence of Iceland by observing migratory land birds flying out to sea beyond the Faeroes. Certain peaks could serve as landmarks for the starting point of a voyage, with traditional

sea lore to tell them what to expect when sailing in a given direction from that point.

Vikings

The techniques practiced by the Irish were also practiced by the Vikings, who began raiding the coasts of Europe toward the end of the eighth century in a type of galley ship known as the *LONGSHIP* (see *VIKING EXPLORATION*). In later centuries, they navigated westward, eventually reaching North America. It is possible that the Vikings learned much about the waters to the west from the Irish whom they displaced. Accounts of the earliest Viking voyages to the Faeroes and Iceland say nothing about their discovery, indicating that they were already known to mariners.

Vikings used the shorelines of Scandinavia as an approximate north-south reference for bearing, with east-west determined by sunrise and sunset. They referred to lands to the east as “Land-North” or “Land-South,” corresponding to northeast and southeast; and seas to the west as “Out-North” and “Out-West,” corresponding to northwest and southwest. They also used a type of sundial known as a Sun-measuring disk or shadow board, which floated in a tub of water to keep it level. It was marked with concentric circles and had an adjustable center pin—a *GNOMON*—which would be raised or lowered based on the height of the Sun at different times of the year. The shadows cast on the circles on which were marked the above directional points helped determine latitude.

Adventitious aids included patterns of fog in relation to landmasses. Moreover, a luminous white sky could indicate the presence of snow-covered land or *DRIFT ICE* below. Another phenomenon of Arctic regions that may have shown them lands far out to sea is the Arctic mirage, which occurs when an air mass rests on an ocean surface of colder temperature, causing the image of objects viewed through it to be displaced optically upward, so that distant lands or ships normally below the horizon can be seen. They also released ravens to determine distance. Whether a bird flew back in the direction of the starting point, or to the ship, or in the direction where they were heading helped determined distances to landmasses.

Polynesians

The Polynesians, inhabitants of the islands of Polynesia in the South Pacific, are thought to have originated in the Malay Peninsula of Southeast Asia. Sometime after the second century B.C., invasion of the peninsula by Malays drove the proto-Polynesians out to sea. Over a period of many centuries until about A.D. 1000, they settled on many Pacific islands, including the *HAWAIIAN ISLANDS* and *NEW ZEALAND* (see *POLYNESIAN EXPLORATION*).

Polynesians utilized celestial navigation and adventitious aids. Their techniques, which they referred to as

“wayfinding,” made use of the horizon, using the rising points of the stars and terrestrial markers, supplemented by observations of the Sun, Moon, and ocean swells. They had knowledge of the “houses of the stars” (some 220 known and named). Certain stars were “on-top” stars to them, in that they were directly above certain landmasses, such as Sirius over Tahiti or Arcturus over Hawaii. They had sidereal compasses, devices with a pointer that could be aligned to a particular star to set a course. They also judged direction by the Sun’s rising and setting, using the color of the Sun’s path on the water to gauge how long it was after sunrise—as the Sun rose its usefulness as a direction finder diminished. At sunrise the direction of waves would be noted and used to determine bearing after the Sun had risen too high. Even when it was too dark to see and clouds hid the stars, skilled navigators could tell the run of the seas by feeling the impact of waves on their vessels (a CANOE, or a canoe with a float or double canoe known as an OUTRIGGER). Like the Vikings, the Polynesians used a known point of departure with information about their subsequent course, which they had memorized. They stayed aware of their speed and took into account each change of course. The Polynesians also made charts from palm sticks tied together with coconut fiber, with shells threaded on the sticks to represent islands.

Arabs

During the Middle Ages, Arabs sailed the waters of the Mediterranean Sea, the Red Sea, and the Indian Ocean in a type of LATEEN RIG craft known as the DHOW (see MUSLIM EXPLORATION). They used the age-tested techniques of mariners before them. Yet they developed new methods of determining location, some of it for navigating desert regions. They gathered significant knowledge in the science of astronomy. In about A.D. 700, Arab Muslims reinvented the astrolabe to measure the angle of celestial bodies and thereby determine latitude. But since it had to be stabilized, they used it primarily on land.

At sea, Arabs were more likely to use a device they called the *al-kemal*, for “the consummation,” also known as a “guiding line.” A rectangular piece of horn was held at arm’s length with its bottom lined up to the horizon. It was then moved toward the user until the North Star was aligned with the top. A cord from the center of the rectangle was then placed on the user’s nose. The knots, which represented points of latitude, were then counted.

Chinese

Since ancient times, the Chinese also practiced coastal and celestial navigation in their boats of the JUNK design and came to know the waterways of Asia’s coastlines, along both the Pacific and Indian Oceans (see CHINESE EXPLORATION). The Chinese are credited with inventing the magnetic COMPASS. Sometime before A.D. 1040, they discovered that an iron needle rubbed on a lodestone (a variety of magnetite

with natural magnetism), if allowed to float freely on water on a piece of straw, would always point to the same direction (the Chinese aligned their compasses to the south). But the Chinese themselves did not use the compass for navigation but for feng shui, a practice which assigns spiritual properties to the four different directions; the compass was used to align buildings in the most propitious direction. It is thought that they first introduced the compass to Arabs, who in turn passed it to Europeans, who developed it in the 13th and 14th centuries.

Application of Mathematics to Navigation

The crucial and fundamental difference between the navigational methods of European explorers and those of their predecessors lies in the use of mathematics and, in particular, geometry to describe Earth and the movements of celestial bodies. The word *geometry* means the measurement of Earth; the study of geometry began with the ancient Greeks. The tendency of Greek philosophers and later European navigators trying to fix their position, rather than amassing large amounts of particular data on winds, currents, and landmarks of a given region, as the Irish, Viking, and Polynesian navigators had done, was to resort more to general principles. The concepts of geometry freed European navigators from the limitations experienced by early practitioners of celestial navigation, that is, of only being able to use the Sun’s position at sunrise and sunset (since the angle in relation to the horizon that the Sun travels through on its daily cycle is different at each latitude and in each season). The principle that its course describes a circle parallel to that of the EQUATOR allowed Europeans to calculate their position in terms of latitude at any time of day. The concept of LATITUDE AND LONGITUDE, in effect, allowed navigators to view Earth from a vantage point above the celestial sphere and predict with precision the flight of Sun and stars as they revolved around Earth.

The European Age of Exploration

The RENAISSANCE—the cultural period beginning in the 14th century and marking the end of the Middle Ages—in Europe saw great advances in navigational methods and technology and helped inspire the EUROPEAN AGE OF EXPLORATION from the 15th century to 17th century. In the early 1400s, HENRY THE NAVIGATOR founded an observatory and a school of navigation at Sagres near Cape St. Vincent in southwestern Portugal, bringing together astronomers, mapmakers, and mariners. Among the projects was the development of the type of ship known as the CARAVEL—which combined elements of European and Arab ships—studying navigational equipment and making maps and charts, improvements on the PORTOLAN CHART first made in the Middle Ages. During the reign of Queen Elizabeth in England in the second half of the 16th century, navigation as practice became organized. New laws of navigation were

established. Trinity House, a guild that had been created in 1514 for the piloting of ships and the regulation of English navigation, was given more powers. HYDROGRAPHY, the studies and charting of bodies of water, received governmental support. Mariners came to have a good understanding of TRADE WINDS and OCEAN CURRENTS.

Meanwhile, navigational instruments were making long-distance sea travel a possibility. The introduction of the compass enabled mariners to determine direction accurately. They used a method of navigation known as DEAD RECKONING, a system of collecting information involving the use of a compass, a sandglass, a measuring line (a chip log—a float with a knotted line attached to it), and a TRAVERSE BOARD (for recording the information), in order to estimate distance traveled east or west. Regarding celestial navigation,

the first instrument used to measure celestial bodies and to determine latitude according to Greek principles was the astrolabe, which was reinvented by Arabs and passed back to Europeans, who further developed it for use on ships. In the early 15th century, the CROSS-STAFF—a staff of wood with a sliding crossbar—was invented in Europe. In the late 16th century, English mariner JOHN DAVIS created a version known as the backstaff—with a reflector enabling the user to take readings of the Sun. He also developed the DAVIS QUADRANT, which incorporated elements of both the astrolabe and the cross-staff.

Developments in geography and cartography, with more and more accurate maps and charts being drafted, also facilitated transoceanic voyages. In the mid-16th century, Flemish cartographer GERARDUS MERCATOR used a new

This lithograph, published by the American Sunday School Union in the mid-19th century, shows a ship and nautical equipment of that era. (Library of Congress, Prints and Photographs Division [LC-USZC4-1942])

cartographic technique to facilitate navigation—the MERCATOR PROJECTION—with directions represented accurately, with lines of latitude and longitude appearing as straight lines intersecting at right angles. By the end of the 16th century, charts showed compass variation and ocean currents.

18th and 19th Centuries

During the 18th century, sometimes defined as the Age of Enlightenment, a growing scientific approach to navigation developed. In the 1730s, the invention of the SEXTANT, a complex device with a mounted telescope and mirror system, made readings of latitude more precise. Its refinement, along with the invention of an accurate timepiece—the CHRONOMETER—also enabled mariners to take readings of longitude, solving the last great challenge of navigation. The 1767 publication of a *Nautical Almanac and Astronomical Ephemeris* (or the *Nautical Almanac*) by the British Royal Observatory at Greenwich, providing astronomical data to aid in navigation also aided mariners (see EPHEMERIS). Englishman JAMES COOK, who traveled in all the world's oceans in the second half of the 18th century, exemplifies the skilled navigator and hydrographer of the period. His expeditions were scientific as well as geographic endeavors, with scientists participating and conducting a variety of experiments.

In the 19th century, existing navigational methods and equipment became more and more refined. An example of a technological improvement was the patent log—a small rotor towed behind the ship's stern, the revolutions of which were counted—to replace the chip log. Also, in the 19th century, the discipline of oceanography, which, like techniques of navigation, had been developed over centuries, was coming into its own as a scientific and organized field of study (see OCEANOGRAPHY AND EXPLORATION).

Electronic Navigation

In the 20th century, new navigational systems were developed making use of electronic technologies. Radio direction finding—determining location by sending out radio beacons—was the first form of electronic navigation, for ships in 1911 and for airplanes in 1924. Another major breakthrough was radar (for *radio detecting and ranging*), developed simultaneously in several countries in 1935–40. Radar detects the position, motion, and nature of a distant object by means of radio waves reflected from its surface. In addition to navigation, radar has been used in geographic, astronomical, and meteorological studies, as well as in military applications. Sonar (for *sound navigation ranging*), a form of electronic depth sounding, is based on the reflection of underwater sound waves. Loran (for *long-range navigation*) is a specific radio navigational system used to guide ships and aircraft to their destinations. It measures the time-of-arrival difference between two electronic pulses broadcast from two different ground stations. The system became

widespread in the 1960s–1970s. The more recently developed inertial guidance systems allow navigation without contact with a ground station by means of an inertial navigator device consisting of a GYROCOMPASS (to measure direction), an accelerometer (to measure changes in speed and direction), and a computer. Such systems are often used in a SUBMARINE, aircraft, or spacecraft. Another development has been computerized electronic charts and electronic plotting tools.

SATELLITE technology has further revolutionized navigation. The U.S. Department of Defense initiated what was originally known as the Navstar Global Positioning System (GPS) in 1973 and still manages it. But GPS—and similar systems, such as GLONASS (the Global Orbiting Navigation Satellite System), developed by the former Union of Soviet Socialist Republics (USSR; Soviet Union)—has been used for many applications besides military and, in fact, has become the primary system of navigation. As 24 satellites orbit 10,000 miles overhead, their atomic clocks are monitored for almost perfect accuracy. With a GPS receiver, it is possible to determine one's exact position anywhere on Earth, at any time and in any weather. The ancient Greeks' metaphorical view of Earth from beyond the celestial sphere, which enabled them to devise their latitude and longitude system, has thus become a reality.

New Zealand

New Zealand is a country in the South Pacific Ocean to the southeast of Australia, part of the region referred to as OCEANIA. It is composed of two main islands—North Island and South Island—as well as numerous smaller islands in surrounding waters, including Great Barrier Island in the north and Stewart Island to the south. The total land area is 104,454 square miles. The Chatham Islands, 536 miles to the east, are also New Zealand territory. Both North Island and South Island are mountainous, with some active volcanoes and hot springs. The Southern Alps on South Island extend nearly the entire length of the island. Seventeen peaks in that range exceed 10,000 feet; Mount Cook is the highest at 12,316 feet above sea level. North Island contains New Zealand's largest lake, Lake Taupo, 234 square miles, from which flows the country's longest river, the Waikato. Much of New Zealand's coastline is irregular, especially that of North Island; South Island has deep fjords in the southwest, however. With its temperate climate, New Zealand is hospitable to a variety of plant and animal species, some of which are unique to the island due to prolonged isolation from other landmasses.

The Maori

The oldest human inhabitants of New Zealand are the Maori, a subgroup of the Polynesians (see POLYNESIAN EX-

PLORATION). They call their homeland Aotearoa. According to Maori legend, their original ancestors arrived by *OUTRIGGER*, a type of *CANOE*, in New Zealand in around A.D. 950, led by a mariner, *KUPE*. Legend also holds that, several generations later, Maori arrived in a fleet of outriggers and colonized Aotearoa. The legends are impossible to authenticate, but it has been proven archaeologically that Maori reached New Zealand by about 1200. The majority settled on the coasts and rivers of North Island, but spread to South Island as well. A second wave of migration, probably from Tahiti, occurred in the 1300s.

Early European Explorers

Dutchman *ABEL TASMAN* is credited with the European discovery of New Zealand, sighting the west shore of South Island on December 13, 1642. He named the land *Staten Landt*, believing he had reached the coast of South America explored by fellow Dutchman *WILLEM CORNELIS SCHOUTEN* several decades earlier. The Dutch were attacked by Maori tribesmen, who rammed their scouting boats with war canoes. Four crew members were killed. Unable to obtain fresh water, Tasman continued his journey, locating the Fiji Islands to the north.

The next European visitor to the islands was *JAMES COOK*. In October 1769, on his first expedition to the Pacific for England, he came upon North Island and spent some time exploring its coastline. Sailing from the east to the west shore, he conducted the first mapping of the island. In January, after entering what became known as Cook Strait, he realized that New Zealand was made up of two large islands, a fact unknown to Tasman. Cook then circumnavigated South Island, but came to some false conclusions of his own. He believed Banks Peninsula to be an island and Stewart Island to be a peninsula. The Maori were hostile to him as well, and expedition members spent little time on shore. Cook would make three more visits to the islands between 1769 and 1777.

The coastlines were charted by various British mariners in the early 19th century. Owen Folger Smith charted the Foveaux Strait, between South Island and Stewart Island, in an expedition of 1803–04. Then, in 1809, William Stewart charted Stewart Island's coasts. A Captain Chase of the *Pegasus* corrected Cook's error concerning Banks Peninsula on trying to sail around the supposed island.

As Australia came to be settled, interactions between that continent and New Zealand increased. The Maori recognized the advantages of European technology, trading food, water, and labor for guns and powder from whaling vessels, which would stop for repairs and provisions at the Bay of Islands on the northeast coast of North Island. Their relations with Europeans continued to be volatile, however. In 1809, a British ship named the *Boyd* arrived in Whangaroa Harbor to collect timber. A Maori boy reported to

tribal members that he had been treated harshly while visiting the ship. In retaliation, the Maori lured the captain and crew of the vessel to their *pa* (a fortified village) to share in a harvest and attacked and killed 70 men in all. The crew of a British whaling ship exacted revenge, destroying the *pa* and killing all the villagers.

Other nations launched scientific expeditions to the Pacific, stopping at New Zealand, such as a Spanish expedition under *ALESSANDRO MALASPINA* in 1789–94. During his expedition of 1826–29, Frenchman *JULES-SÉBASTIEN-CÉSAR DUMONT D'URVILLE* made a study of New Zealand wildlife along Cook Strait, becoming the first known European to see the kiwi bird in its native habitat. D'Urville Island to the north of South Island is named for him. Frenchman *ANTOINE-RAYMOND-JOSEPH DE BRUNI*, chevalier d'Entrecasteaux, during his expedition of 1791–93, also sailed along New Zealand's west coast. A British expedition to southern waters in 1839–43 under *SIR JAMES CLARK ROSS* stopped over at the Bay of Islands, where naturalist *SIR JOSEPH DALTON HOOKER* collected more than 1,700 plant specimens.

Missionaries

The exploration of much of New Zealand's interior, especially on North Island, was undertaken by British missionaries. In December 1814, *SAMUEL MARSDEN*, the chaplain of New South Wales in Australia, arrived at the Bay of Islands with a handful of followers and two Maori chiefs. Marsden explored the interior of North Island on foot, traveling between Bay of Islands and Waitemata Harbor, covering some 400 miles and preaching to the Maori. Duties in Australia interrupted his mission work, but he had a great impact on the Maori with the force of his personality. He also inspired other missionaries, such as *WILLIAM COLENSO*, Thomas Chapman, and Henry Williams, who braved the rugged terrain and treacherous rivers to reach remote villages. *WILLIAM WILLIAMS*, the brother of Henry Williams, made the first south-to-north crossing of the North Island. On this journey, he located the hot springs near Lake Taupo.

Colonists

After a number of unsuccessful attempts to establish permanent colonies in New Zealand, a new effort was undertaken by Edward Gibbon Wakefield. He had founded the New Zealand Company in order to apply the principles of "scientific colonization," which had been useful in the settlement of southern Australia. Purchasing large tracts of land from the Maori in the southern part of North Island in 1840, he founded the town of Wellington on Cook Strait, which would prove to be New Zealand's first permanent settlement. Also in 1840, Wakefield signed the Treaty of Waitangi with 50 Maori chieftains, agreeing that they could keep possession of their lands if they acknowledged the colonial

sovereignty of Great Britain. Wakefield was dedicated to exploration as well as profits and sponsored expeditions by Ernst Dieffenbach, a professional naturalist. Among Dieffenbach's achievements was the scaling of the 8,260-foot-high Mount Egmont (*Taranaki* to the Maori) on the western end of North Island, a feat he accomplished without Maori guides, who considered the peak sacred.

The search for the best farmlands had begun. Working for the New Zealand Company, Charles Kettle and Alfred Wills found an ideal expanse of grazing land around Lake Wairarapa northeast of Wellington in 1842. Colonists soon established large sheep ranges in the area. On South Island, that same year, the settlement of Nelson was founded. The best land was located along the Wairau River flowing into Cook Strait. As more and more British colonists arrived and violated Maori land rights, the Maori offered resistance. In 1843, after their protests were ignored, they attacked the colonists of South Island, killing 22 of them and suffering the loss of five of their own, beginning the First Maori War, which lasted until 1848. The Second Maori War took place in 1860–70.

Thomas Brunner

The best-known explorer of South Island was THOMAS BRUNNER, also in the employ of the New Zealand Company. In 1843, he carried out the first European explorations of the island's interior, heading southward from Tasman Bay to the Richmond Range. In 1845, Brunner, Charles Heaphy, and William Fox were sent to find arable land to the south of Cape Foulwind. With the help of Maori guide Ekuhu, they pushed through dense forest and negotiated steep mountains to reach Lake Rotoroa. Brunner began his most arduous trek in 1846. This time, with Ekuhu and another Maori and their wives, he set off to follow the Buller River to its mouth, to continue southward along the west coast of the island, and then to return by another route. The expedition began at a promising pace, but then, heavy rains, fog, and a paucity of game brought great hardship. After reaching the end of the Buller, Brunner explored the little-known coastline to the Grey River. He followed the Grey upstream, then crossed the Southern Alps. Brunner suffered a twisted ankle, blindness, and paralysis, causing the party to stop for rest on several occasions. The explorer rallied his forces, however, and returned to the west coast, where he continued southward to Tititira Head. The trip, which came to be known as "The Great Journey," took 550 days. Soon afterward, the region was colonized and became productive farm country.

Late 19th Century

In the latter part of the 19th century, sheep raising and gold mining provided income for most colonists. During the 1890s, after many of the farmlands had been settled, the

most intimidating regions of South Island were explored by Charles Douglas. In the province of Westland, to the west of the Southern Alps, is an area of New Zealand's highest mountains and glaciers. Douglas, who had been born in Scotland, spent 40 years of his life exploring these mountains and sometimes doing surveying work for the government.

New Zealand's colonial status was formally terminated in 1907. Like its neighbor, Australia, it is now a self-governing member of the Commonwealth of Nations. Its capital, Wellington, is located on the southern end of North Island. Auckland, also on North Island, is New Zealand's largest city. Christchurch is South Island's largest city. Most New Zealanders live in coastal cities.

Niger River

The Niger River is the great river of West Africa, 2,600 miles in length, the third-largest river in all of Africa. From a plateau in the Republic of Guinea, it flows northeastward into Mali, where it forms an inland delta of channels, lakes, and swamps. Just past the city of TIMBUKTU, the Niger bends to the east, and then to the southeast in the Republic of Niger. It meanders on its course through Nigeria, where it forms the largest coastal delta in Africa, spanning almost 120 miles, emptying into the Atlantic Ocean at the Gulf of Guinea. The Niger's drainage basin is about 808,000 square miles.

Due to its length and the nature of its course, the Niger held long-term mysteries for explorers of Africa. Not only was its source unknown, its direction and even its delta were obscure. Answering these questions involved many, largely English, expeditions, and the untangling of much misinformation. These expeditions were undertaken from the late 1700s to the mid-1800s. The exploration of the Niger was largely a matter of geographic curiosity, for trade had been carried out in the surrounding regions by other means for centuries.

Riddle of the Niger

The Niger was known to Europeans as early as the fifth century B.C. Relating the stories of travelers in North Africa who saw a river flowing to the east, Greek historian HERODOTUS speculated that this was the source of the NILE RIVER. The name Niger can be traced to the writings of PLINY THE ELDER, a Roman of the first century A.D., and hellenized Egyptian PTOLEMY of the second century, who called it the *Nigris*, Latin for "black river." During the Middle Ages, Arab geographers described the river as forming the southern border of the SAHARA DESERT. They, too, confused the Niger with the Nile. They also helped to create the confusion concerning its direction. ABU AL-QASIM IBN ALI

AL-NASIBI IBN-HAWQAL had correctly stated the general direction from west to east in the 10th century, but ABU ABD ALLAH MUHAMMAD ASH-SHARIF AL-IDRISI contradicted him several hundred years later. LEO AFRICANUS, who actually visited the Niger in the early 1500s, perpetuated the error in his book, *Description of Africa* (see MUSLIM EXPLORATION).

As information on the Niger filtered into Europe, so too did descriptions of the places surrounding the river. In 1352, Arab traveler ABU ABD ALLAH MUHAMMAD IBN BATTUTAHA ventured from Fez in North Africa, across the Sahara, to visit the kingdom of Mali when it was at its peak. His writings included information on gold as well as educational systems. Leo Africanus, during his visit to the region, made a trip to Timbuktu and described in enthusiastic terms the variety of trade goods, the bustle of activity, and the high value placed on books in the city. Europeans had known of the gold trade, conducted by the camel caravans of the Sahara, but the origin of the gold was a carefully guarded secret. News from the Niger Basin focused attention on such riches. Still, Europe could not hope to challenge the entrenched Muslims of the western Sudan. If they were to take a share of the gold trade, another approach would be necessary. The Portuguese, who began exploring the West African coast in the 15th century, with expeditions sponsored by HENRY THE NAVIGATOR, prince of Portugal, did succeed in gaining access to gold through the Gambia and Senegal Rivers, and on the Gold and Ivory Coasts. Other countries, such as England, Spain, France, and the Netherlands would soon launch expeditions to the region.

18th Century

Geographic theories concerning the Niger abounded in England in the late 18th century during the Age of Enlightenment. English geographer James Rennell postulated that the river must empty into a large inland lake. Others continued to support the idea that it was the western tributary of the Nile, including the high-ranking British navy officer SIR JOHN BARROW. Another popular theory of the day, held by Scotsman MUNGO PARK among others, was that the Niger formed an estuary that emptied into the CONGO RIVER (Zaire River). Park theorized a series of lakes along the Niger's route, based on the massive quantity of water flowing in the Congo.

Active measures to solve the puzzle of the Niger began with the founding of the AFRICAN ASSOCIATION in London in 1788. The association's first expedition of significance was led by DANIEL HOUGHTON in 1790. He ascended the Gambia River, working westward through hostile territory. In 1791, he sent word of his progress back to England but was never heard from again. Subsequent investigations revealed he had reached a point 160 miles from the Niger, the far-

thest-known European journey into the interior of Africa at that time.

The first European to see the Niger and return to tell about it was Mungo Park. In another African Association expedition, carried out in 1795–97, he set out along the same route and encountered the same intertribal rivalries that Houghton had described. On July 21, 1796, Park came upon the Niger at Segou. Observing its flow from west to east, he settled the question of its course. After a lengthy journey home, during which he was given up for dead, he became an instant celebrity for his findings.

German FRIEDRICH CONRAD HORNEMANN developed a plan to approach the Niger from the Arab enclaves in North Africa and succeeded in also gaining the sponsorship of the African Association. Disguised as a Muslim, he arrived in Cairo in 1797, traveled westward to the oasis at Murzuk, and later southward to Lake Chad. He died of dysentery while on his way to the Niger, having underestimated the size of Africa's interior and misjudging the location of the river.

19th Century

In 1805, Mungo Park returned to Africa to test his theory that the Niger was connected to the Congo. With a group of soldiers, carpenters, and companions, he sailed up the Gambia and trekked overland to Mali. Disease proved devastating to the company, and by the time he had reached the Niger, most of his contingent had died. With the few survivors, he followed the flow of the river. It was later learned that, after much struggle with hostile tribes along the river, his remaining party was finally overwhelmed at the Bussa Rapids.

Because of the regular loss of life on their journeys, the African Association became discouraged and more conservative in backing expeditions. In 1815, the British government sent out two expeditions with the hope of tracing the Niger. The first, under the command of Captain James Kingston Tuckey, was to sail up the Congo, mapping the river and locating its confluence with the Niger. The second, directed by Major John Peddie, was to follow Park's route, taking the Niger to its end. Both expeditions were disasters, with many men dying and little information gathered.

One of the triumphs of this period of exploration was accomplished by RENÉ-AUGUSTE CAILLIÉ. He was a working-class Frenchman with a long-held fascination with Africa. He had traveled there previously with a British expedition in search of Mungo Park. In 1825, he heard that the Geographical Society of Paris was offering 10,000 francs to the person who visited Timbuktu, then returned to report on his findings. Determined to win the prize, Caillié set off eastward from Freetown in Sierra Leone on his quest in March 1827. Arriving at the Niger, he took a CANOE to a point near Timbuktu and reached the city. After spending

two weeks there, he returned to France via a caravan heading northward and was awarded the prize.

There were still many unanswered questions about the Niger. In 1818, the British began a series of expeditions out of Tripoli. The first was led by JOSEPH RITCHIE and GEORGE FRANCIS LYON. After completing the first leg of the journey, from Tripoli to Murzuk, Ritchie died. Lyon gathered information from the area and learned falsely that the Niger emptied into Lake Chad before joining the Nile. The Bornu Mission of 1820–25 failed to accomplish its goal of tracing the Niger but did visit a large section of previously unexplored territory. In 1824, as part of the Bornu Mission, Englishman DIXON DENHAM debunked the notion that Lake Chad was connected to the Niger. In 1826, Scotsman ALEXANDER GORDON LAING reached Timbuktu but was murdered as he returned to the north.

Among the more renowned Englishmen to seek the Niger was HUGH CLAPPERTON. As part of the Bornu Mission, he had been among the first to make a north-south crossing of West Africa and to see Lake Chad. In 1825, he made a novel approach to the river from the Bight of Benin in the Gulf of Guinea. Traveling northward, he found the Niger at Bussa within two months. Continuing to Sokoto, to the northwest of Bussa, Clapperton had the intention of reaching Timbuktu and tracing the course of the Niger to its mouth. This plan was cut short when he died of dysentery in 1827. His cause was taken up by a member of his expedition. In 1830, RICHARD LEMON LANDER returned to the Niger at Bussa and, with his brother John Lander and Hausa guide WILLIAM PASCOE, followed its course southward. They discovered the Niger's major tributary from the east, the Benue, where they were held for a time by natives. On being released, they continued downriver, eventually reaching the Bight of Benin and solving the riddle of the mouth of the Niger.

There were to be many more British expeditions to and along the Niger, for scientific purposes, to promote commerce, and to discourage the SLAVE TRADE, among them one headed by Macgregor Laird in 1832, and one headed by Henry Dundas Trotter in 1841. Both teams traveled up the lower Niger by ship and both suffered a great number of casualties. In a British expedition in 1850–51, headed by JAMES RICHARDSON and ADOLF OVERWEG, only one man survived, HEINRICH BARTH. He explored along much of the Niger's course and studied the tribal societies in the region. In a journey in 1854 to find Barth, WILLIAM BALFOUR BAIKIE explored the Benue River 150 miles beyond the point charted by other explorers.

Today, the Niger River offers a supply of fish and regional transportation to peoples of varying nations.

Through irrigation projects, it also provides water for farmlands.

Nile River

At 4,160 miles in length, the Nile River of northeastern Africa is the world's longest river. It has two main branches, the Blue Nile and the White Nile. The source of the Blue Nile, the shorter branch to the east, is Lake Tana in the mountains of Ethiopia. The White Nile, the longer branch, originates in Lake Victoria, which sits on the EQUATOR and is bordered by Kenya, Tanzania, and Uganda. The two Niles meet at the city of Khartoum in the center of the country of Sudan, some 1,857 miles from the sea. From there, the Nile winds its way into Egypt, where it forms Lake Nasser, with the help of the Aswan Dam. From the former rapids at Aswan, the river is navigable for 550 miles to the sea. The Nile's outlet to the MEDITERRANEAN SEA is a delta 100 miles long and more than 100 miles wide. This delta represents the majority of the cultivated land in Egypt, the location of one of Earth's oldest civilizations. Carvings dating to between 6000 and 5000 B.C. depict boats on the Nile River, but, until less than two centuries ago, the source of the Nile waters remained a mystery. The search for the source of the Nile is one of the most famous stories in the annals of exploration.

Riddle of the Nile

The Nile was the starting point for the first voyage of exploration in recorded history. In about 2450 B.C., HANNU traveled up the Nile on a trading mission for Egyptian pharaoh Sahure. Near where the Nile becomes impassable, he left the river and traveled overland, eventually coming to the land known as PUNT, where many of Egypt's luxury goods were produced. Trade between the nations was already well established, and Hannu was able to obtain gold, silver, ebony, and incense, and to have boats built to convey these goods back to Egypt via the RED SEA. It is believed the Egyptians used the Nile extensively for internal trade and communication and to learn the art of seamanship (see EGYPTIAN EXPLORATION).

The Greeks would have known of the Nile through their trade with the Egyptians (see GREEK EXPLORATION). When the Romans replaced the Greeks as the preeminent world power, they used Greek middlemen in their trade with the region (see ROMAN EXPLORATION). In 30 B.C., the Romans conquered Egypt and made it part of their empire and, before long, visited parts of the upper Nile in Ethiopia and Sudan while on military campaigns. Also in the first century A.D., Nero commissioned an expedition to find the source of the Nile. His party is believed to have reached the swamplands of the White Nile, the Sudd, where pa-

pyrus grows thick and decaying vegetation makes passage difficult.

Nero's men were the last known Europeans to visit the region until the 1800s. The accounts of both these expeditions and those of Greek merchant DIOGENES, who explored overland into East Africa from the Indian Ocean, are thought to have influenced hellenized Egyptian PTOLEMY. In the second century A.D., the astronomer and geographer described the source of the Nile as the MOUNTAINS OF THE MOON, possibly the Ruwenzori Mountains.

During the Middle Ages, the lands of Ethiopia contained a black Christian community which became isolated from the Arab Muslims to the north (see MUSLIM EXPLORATION). This isolation effectively obscured the origin of the Blue Nile. To the west, the White Nile went on for such a length and disappeared into the equatorial jungle that Arab traders had little inducement to track its source. The next mention of the Nile's sources comes from the 17th-century Portuguese. They came to establish friendly relations with Christians in Ethiopia, whom they associated with the legend of PRESTER JOHN. Spanish Jesuit PEDRO PÁEZ, who was working for the Portuguese, made the European discovery of Lake Tana in the mountains of Ethiopia in 1613. He correctly determined Lake Tana to be the source of the Blue Nile, although the Portuguese policy of secrecy meant his findings were not disclosed.

Growing Knowledge

For much of modern history, credit for the discovery of Lake Tana went to 18th-century explorer JAMES BRUCE, although even he had a hard time convincing skeptical Europeans. He began his search for the source of the Nile by first taking the river to Aswan, then crossing the desert to the east and sailing down the Red Sea to Ethiopia. He reached Gondar, the capital city, in February 1770. It took some time for Bruce to receive permission to travel farther, but, after helping to save the royal family from a smallpox epidemic, it was granted. In November 1770, he located the Springs of Geesh emanating from Lake Tana and named them the "Fountain of the Nile." The following year, he followed the Blue Nile to its convergence with the White Nile, then continued to Cairo. On his return to England, he published his adventures in a five-volume work, *Travels to Discover the Source of the Nile*, but not until after his death in 1794 were his achievements properly recognized.

The first half of the 19th century saw regular explorations along the Nile, but no great breakthroughs. The approach was always the same: Follow the river upstream. Such a strategy became a test of stamina, and the traders and missionaries who made these journeys either lost interest or ran out of supplies. The most successful expedition was conducted by Mehemet Ali, the viceroy of Egypt. Seeking to develop commercial interests in the southern Sudan, Mehemet

Ali led trips in 1839 and 1841, along the Nile, reaching as far as Gondokoro, the last navigable point between the river and its source.

Burton and Speke

The most famous names associated with the search for the Nile's source are SIR RICHARD FRANCIS BURTON and JOHN HANNING SPEKE, both British army officers. After collecting and studying the information from previous expeditions, Burton devised a unique plan to approach the source of the Nile from the east coast of Africa. He surmised that the large inland lakes (supposed to be located over the mountains from the coast of Tanzania), might hold the key to the age-old mystery of the source of the Nile. After recruiting porters and outfitting the expedition in Zanzibar, a small island off the coast of Tanzania, Burton and Speke began their journey in June 1857. SIDI BOMBAY accompanied them as guide and interpreter. Following slave-trading routes, they crossed the mountains and reached the commercial hub of Ujiji on the shores of Lake Tanganyika in February 1858. They were the first Europeans to visit that region. But both men had come down with malaria. Speke recovered sufficiently to explore the lake, but his results were inconclusive. They decided to return to the coast in the summer and agreed to rest in Tabora. Weary from his illness and fed up with Speke's company (the two never did get along), Burton agreed that Speke should search for the other great lake in the region. When Speke reached Lake Victoria in August 1858, he believed he had found the source of the Nile. Because of Lake Victoria's immense size, Speke decided to return to Burton rather than try to bolster his theory with geographic evidence. Speke and Burton reunited in Tabora and then continued on to the coast. According to Burton, Speke promised to keep his findings secret until they both returned to England; nonetheless, Speke, on reaching England several weeks before his leader, announced his theory.

In England, Speke had both champions and skeptics. In 1860, in an effort to resolve the issue of the source of the Nile once and for all, the ROYAL GEOGRAPHICAL SOCIETY sent Speke and JAMES AUGUSTUS GRANT to explore Lake Victoria. In 1860–63, the two men traveled along the western side of the lake to its outlet at Ripon Falls and into Lake Kyoga. From Lake Kyoga, they continued northward overland, crossing the Nile only once on their way to the cities of Juba and Gondokoro. His failure to keep the Nile in sight meant that once again, Speke did not come up with conclusive proof.

Burton and Speke were scheduled to debate the source of the Nile, but a day before their encounter was to take place, in September 1864, Speke was killed in a hunting accident. He left behind a legacy as a careless scientist, yet history proved him correct: Lake Victoria is the true source of the Nile.

Continuing Exploration

While on their own journey of exploration, SIR SAMUEL WHITE BAKER and his wife, FLORENCE BAKER, had come across Speke and Grant. Disappointed that others had already found Lake Victoria's outlet, the Bakers continued on their travels. In March 1864, they came upon Lake Albert and discovered it was fed by Lake Victoria, which in turn fed the Albert Nile section of the White Nile. Returning to England in 1866, Baker was given the ROYAL GEOGRAPHICAL SOCIETY's gold medal and was knighted by Queen Victoria.

Although the major discoveries of the source of the Nile had been made, there was still enough uncertainty to warrant further explorations. German GEORG AUGUST SCHWEINFURTH explored the separation of the Nile and CONGO RIVER (Zaire River) watersheds on his 1868–71 journeys. Scotsman DAVID LIVINGSTONE was convinced that the Lualaba River was part of the Nile River system, and was working on the problem when he died in 1873. (It was later discovered that the Lualaba is actually a tributary of the Congo River.) Anglo-American SIR HENRY MORTON STANLEY tied up many of the loose ends of the Nile watershed during the first half of his 1874–77 expedition. During this trip, he circumnavigated both Lake Tanganyika and Lake Victoria, discovered Lake Tanganyika joined the Congo, and confirmed Speke's assertion that Lake Victoria was the primary source of the Nile. On his mission to relieve the MEHMED EMIN PASHA in 1887–89, Stanley explored Lake Albert and corroborated the discoveries of the Bakers. He also explored the Ruwenzori Mountains, part of the Nile's watershed, which came to be associated with the Mountains of the Moon.

With its great length, variety of terrain it traverses, and long history, the Nile has inspired the human imagination for millennia. As in the past, when seasonal flooding replenished the soil of its banks in Egypt, the Nile continues to sustain life. Today, irrigation systems increase the Nile's productive capacity, and hydroelectric dams generate power for African nations.

North America, exploration of

North America is the world's third-largest continent. Situated entirely in the Western Hemisphere and Northern Hemisphere, it is linked to South America by a region referred to as Central America, which is defined by geographers as being part of North America. The Arctic Ocean and HUDSON BAY (which can be considered either an inlet of the

Arctic Ocean or the Atlantic Ocean) lie to its north; the Atlantic Ocean (including the Gulf of St. Lawrence, Gulf of Mexico, and Caribbean Sea, arms of the Atlantic) to its east; and the Pacific Ocean (including its inlet, the Gulf of California) and Bering Sea to its west. The largest of the many offshore islands or island groupings are GREENLAND, the Canadian Arctic Archipelago, the Aleutian Islands, the Alexander Archipelago, Vancouver Island, Newfoundland, and the WEST INDIES. Three modern-day nations occupy North America: the United States, Canada, and Mexico. Mexico and Central America are sometimes discussed as Middle America with regard to their history, and sometimes the West Indies are grouped with them as well.

North America, extending from near the NORTH POLE to near the EQUATOR, embraces every climate zone. Much of the continent has temperate climates suited to human settlement and agriculture. Yet there are extreme desert regions as well, where mountain ranges block rain-bearing westerly winds, such as Death Valley in the western Great Basin in California, the lowest point in North America, at 262 feet below sea level. Mount McKinley (see MCKINLEY, MOUNT) in the Alaska Range of Alaska is the highest point, at 20,320 feet above sea level. The APPALACHIAN MOUNTAINS and Laurentian Highlands of eastern North America are old and eroded ranges; the ROCKY MOUNTAINS extending along much of the western part of the continent are younger and taller. Much of the central part of the continent is prairie country, with the Great Plains sloping up to the Rocky Mountains. Lake Superior is the largest lake in North America, part of the five Great Lakes, which include Lake Michigan, Lake Huron, Lake Erie, and Lake Ontario. The longest river is the MISSOURI RIVER; the MISSISSIPPI RIVER, which it feeds, is the third longest; their waters drain into the Gulf of Mexico. Other major North American rivers include the Rio Grande, which also drains into the Gulf of Mexico; the COLORADO RIVER, which drains into the Gulf of California; the COLUMBIA RIVER and Snake River, which drain into the Pacific Ocean; the Delaware River, Hudson River, and Susquehanna River, which drain into the Atlantic Ocean; the St. Lawrence River, which drains into the Gulf of St. Lawrence; the Mackenzie River—the second-longest river in North America, if the Slave, Peace, and Finlay Rivers are considered part of it—which drains into the Arctic Ocean; and the Yukon River, which drains into the Bering Sea. The wide variety of landscape and climate leads to a wide variety of flora, from tundra to rain forest, with evergreen trees growing on much of the continent, and a wide variety of fauna.

Native Peoples

As is the case with all the continents—except Antarctica, uninhabited until modern-day expeditions—both North America and South America were inhabited by indigenous

peoples in ancient times long before 1492, when they became part of documented world exploration. The migrations of Mongolian peoples out of Asia across a LAND BRIDGE between Asia and Alaska at the BERING STRAIT during the last ice age are sometimes discussed as the first explorations of the Americas. Based on archaeological evidence, it is theorized that Mongolian peoples tracked big game across the land exposed because of lower oceans. The latest estimated time based on archaeological evidence in America, along with DNA and linguistic evidence, is between 15,000 and 18,000 years ago. Possibly other Asian peoples reached the Americas by boat. Descendants of all these travelers—Paleo-Indians—spread throughout the Americas over subsequent generations and became known to peoples of other continents as Indians, or Native Americans, and by their native names or adaptations of native names. Later voyagers, in particular Inuit (Eskimo) and Aleut peoples of the Arctic region, arrived in North America by boat after the land bridge had been flooded.

What is known about Native Americans before the arrival of Europeans in their homelands is based primarily on archaeological and linguistic evidence, with some information gleaned from legends passed down through oral traditions. Regarding population levels in pre-Columbian times, estimates vary considerably, from an approximation of 15 million for the entire continent of North America to as much as 60 million, with Middle America having the majority. The population for the region north of Mexico is estimated at a native population of one to 1.5 million to 10 to 12 million. Aboriginal populations were generally densest where agriculture was highly developed or along coastal areas with marine resources. And rivers and lakes also supported denser populations, in particular the St. Lawrence, the Great Lakes, the lower Mississippi, the upper Missouri, the upper Rio Grande, and the Little Colorado. Conversely, population densities were lowest in extreme environments, such as the Arctic, Subarctic, and Great Basin.

It is also impossible to determine the number of tribes, even for the early post-contact period. The fact that different social groupings are under discussion as “tribes” (i.e., tribe, band, village, city-state, confederacy, and culture) makes such a determination inexact to begin with. Moreover, some peoples perhaps died out before Europeans even reached them, since the first tribes having contact with Europeans may have carried European diseases to them—coastal tribes, for instance, trading with inland tribes (see DISEASE AND EXPLORATION). In any case, native peoples in thousands of different political groupings lived a variety of lifestyles, determined by environment. Subsistence patterns, dwellings, clothing, belief systems, rituals, and social organization all varied significantly. Each group had worked out stable adaptations to their local environments and available resources. Language varied significantly as well. It has been

estimated that there were as many as 2,200 distinct native languages in all the Americas, with as many as 650 in North America, about 350 of those in Middle America.

Scholars have devised a system of culture areas to group the various peoples and tribes together for purposes of study. One such system speaks of the Northeast, Southeast, Southwest, Great Basin, California, Plateau, Northwest Coast, Subarctic, Arctic, Great Plains, Mesoamerica (Mexico), and Circum-Caribbean (West Indies and Central America).

Algonquian-speaking woodland peoples, many of whom were the first Indians to have contact with explorers along the coasts, and Iroquoian-speaking peoples, such as the tribes of the Iroquois (Haudenosaunee) League of Six Nations, lived in the Northeast. In the Southeast, Muskegean-speaking peoples—such as the Chickasaw, Choctaw, and Creek—made up the largest group; the Cherokee, an Iroquoian-speaking people, as well as Siouan-speaking and Timucuan-speaking tribes, also lived in this region. Peoples of both these woodland regions were farmers as well as hunter-gatherers.

What is defined as the Southwest Culture had Athapascan-speaking nomads—the Apache and Navajo (Dineh)—as well as the village-dwelling and farming Pueblo Indians, who spoke a number of different languages. The Great Basin Indians, such as the Ute, Paiute, and Shoshone, were primarily Uto-Aztecan-speaking hunter-gatherers, eking out a living in the harsh, arid landscape.

The densely populated California, Northwest Coast, and, to a lesser degree, Plateau regions had tribes of many different language families and peoples; they were hunter-gatherers, many of who depended heavily on fishing. Northwest Coast peoples were also known for hunting sea mammals. Plateau Indian subsistence involved fishing salmon along the Columbia River.

In the sparsely populated Subarctic region were found Algonquians in the east—the Cree, for example—and Athapascans—the Chipewyan, for example—in the west. The Arctic culture area was the home of the Aleut on the Aleutian Islands, and the Inuit in Alaska, northern Canada, and Greenland; they spoke related languages grouped together as Eskimaleut.

The Great Plains culture area is different from the others in that the typical nomadic way of life of its tribes developed in the 18th and 19th centuries, long after Europeans had reached North America and brought horses with them. Peoples from other regions, speaking many different languages—such as the Siouan-speaking Sioux (Dakota, Lakota, Nakota); the Algonquian-speaking Blackfeet, Cheyenne, and Arapaho; and the Uto-Aztecan-speaking Comanche—took to the use of the horse and, living in portable hide tipis, tracked the buffalo herds. Some tribes classified as part of the Great Plains culture area were a semisedentary people, living in villages for much of the year, but leaving

them to track buffalo; the Arikara, Hidatsa, and Mandan, for example, had villages along the Missouri River with permanent earth lodges as dwellings.

The most powerful people in the densely populated Mesoamerica culture area when Europeans first arrived were the Nahuatl-speaking Aztec. They had developed a complex civilization centered in the Valley of Mexico with cities, the largest being Tenochtitlán, the site of present-day Mexico City, and a class system supported by agriculture. Their extensive empire, which had begun to take shape in the 14th century and which followed the earlier Toltec Empire, included an elaborate trade network and tributary of peoples. The Mayan-speaking Maya, centered on the Yucatán Peninsula, also had developed a highly organized system of city-states supported by farming. They were also found in Central America. Most of the peoples in Central America had more in common with the Arawak (Taino) and Carib of the West Indies, with whom they are grouped in the Circum-Caribbean Culture Area. They lived in autonomous bands united politically and religiously under chieftains. For subsistence, they farmed as well as hunted and fished.

By the time Europeans reached the Americas, some highly organized societies had declined long before. In the Southwest, for example, the Anasazi civilization had fragmented, its peoples becoming ancestral to the Pueblo Indians. The Mound Builders of the east—peoples of the Adena, Hopewell, and Mississippian cultures located along the Ohio and Mississippi Valleys—had also dispersed. The Natchez living at the mouth of the Mississippi are thought to be direct descendants of Mississippian peoples, showing some of the cultural traits by the time Europeans settled among them.

In post-contact times, through all the stages of exploration of North America, Native Americans are part of the story not only with regard to the impact Europeans—and Euro-Americans in later generations—had on them, but also as guides and interpreters. (See NATIVE PEOPLES AND EXPLORATION.)

The Vikings

The Vikings are now credited with being the first Europeans to reach both Greenland and mainland North America (see VIKING EXPLORATION). The traditional Norse literature from the Middle Ages—the “sagas,” as they are known—refer to the discovery and temporary settlement of a place west of Greenland known as VINLAND. Such accounts were treated as legend until 1960, when archaeological evidence at L’Anse aux Meadows in the north of Newfoundland verified a Viking presence. Because knowledge of this land was not passed to other Europeans, there would be still another “discovery” five centuries later.

BJARNI HERJULFSSON is considered the first European to see North America. On a trip from ICELAND to visit his

father in Greenland, in about A.D. 985 or 986, he was blown off course, to the southwest. Although he reported spotting land, some of it wooded and some of it ice-covered—indicating any number of locations along northeastern North America—he did not claim to have made landings before returning to Greenland.

On a follow-up voyage of exploration, LEIF ERICSSON, the son of ERIC THE RED, the first Viking colonizer of Greenland—sailed westward from his new home in about 1001. He came upon and named three different regions: Helluland, after its extreme flatness; Markland, referring to a land of woods; and Vinland, the third, and most southerly. At Vinland, the Vikings built shelters and explored the area. The location might very well have been L’Anse aux Meadows in Newfoundland, or possibly a location in Labrador or Quebec. Ericsson also perhaps reached Nova Scotia, the St. Lawrence Seaway, or even other regions to the south, such as Cape Cod or Chesapeake Bay. In any case, he eventually returned to Greenland, where he lived out his life.

Some years later, in about 1005–07, Leif’s brother, THORVALD ERICSSON, led a colonizing expedition to North America’s east coast and perhaps settled at the same Vinland site. His time in North America was noted for the first contacts with indigenous peoples, whom the Vikings called Skraelingar or Skraelings. These may have been either Indians or Inuit depending on location. THORFINN KARLSEFNI, in about 1010, led still another colonizing expedition to North America’s east coast; the colony lasted until about 1013. The next year, Leif’s half sister, FREYDIS EIRÍKSDOTTIR, who had been part of Karlsefni’s group, joined her husband, Thorvard, in another attempt at a colony, supposedly at the same Vinland site, taking over previously built houses, returning to Greenland the next year after fighting broke out among the colonists.

The various accounts of these voyages vary in different Norse sagas. Nor is there any way to determine the exact location of the various colonies, despite the known Viking site at L’Anse aux Meadows.

European Awareness of the Americas

It is not known if the Vikings had a sense of the vastness of the lands they reached. If they followed the North American coastline southward, they may have conceived of Vinland as even larger than Greenland. However, no such information survived in Europe, and, if it had, later mariners would very likely have believed that the Vikings had reached Asia. Italian mariner and map dealer CHRISTOPHER COLUMBUS was one of several Europeans to devise a plan to sail westward across the Atlantic Ocean to the Orient, and King Ferdinand II and Queen Isabella I of Spain were eventually convinced to sponsor him on such an expedition. In August 1492, Columbus set sail, reaching the West Indies in the Americas the following October 12. Between 1493 and

1502, Columbus led three more transatlantic expeditions, and he explored many of the region's islands and eventually reached the mainland of South America. Although he never saw or made landfall in North America and he insisted until his death in 1506 that he had reached Asia, he began the process that made Europeans aware of the landmasses in the Western Hemisphere and the size of Earth.

On June 24, 1497, another Italian, JOHN CABOT, sailing for England, became the first known European since the time of the Vikings to see North America. Cape Breton Island, the eastern part of present-day Nova Scotia, is thought to be the likely location of a landfall, although he may have landed first on the coast of Newfoundland or even Labrador. He explored parts of northeastern North America and may have navigated as far south as Maine. That same summer, Italian AMERIGO VESPUCCI may have explored along coastal North America from Mexico to Cape Hatteras in present-day North Carolina, but his claim is unsubstantiated. In 1501–02, Vespucci later traveled to South America. In his account of his travels, he was the first to suggest that the lands he had visited were a continent previously unknown to Europeans and applied the term “New World” to the great landmass for the first known time. In 1507, German cartographer MARTIN WALDSEEMÜLLER, using Vespucci's account as a source, applied the Latinized version of Vespucci's first name to the continent of South America.

A Rush of Nations

Soon after John Cabot reached northeastern North America for England, so did GASPAR CÔRTE-REAL for Portugal. He probably reached the west coast of Greenland in 1500. Then, the next year, he navigated as far as the coast of Newfoundland and Labrador. In 1509, John Cabot's son SEBASTIAN CABOT explored North America's east coast from Newfoundland to Long Island, in search of a water route to the Orient—the NORTHWEST PASSAGE.

The Spanish established colonies in the West Indies and fanned out from there, overrunning native lands and expanding their knowledge of both South and North America. In 1513, JUAN PONCE DE LEÓN explored northward to Florida, exploring both its Atlantic and Gulf coasts. That same year, in Central America on the Isthmus of Panama, VASCO NÚÑEZ DE BALBOA became the first European to see the Pacific Ocean from the west coast of the Americas. In 1517, FRANCISCO FERNÁNDEZ DE CÓRDOBA explored the Yucatán, and JUAN DE GRIJALVA explored the east coast of present-day Mexico, which he called New Spain. In 1519–21, Spanish CONQUISTADORES under HERNÁN CORTÉS invaded the Valley of Mexico and conquered the Aztec Indians, establishing a permanent presence in their homeland. The extent of the Americas and the Pacific Ocean beyond became known to Europeans with the Spanish expedition under Portuguese mariner FERDINAND

MAGELLAN in 1519–22. After sailing southward along the coast of South America, he passed through the Strait of Magellan (see MAGELLAN, STRAIT OF) into the Pacific, then followed South America's west coast for a time before crossing the Pacific. After Magellan's death in the Philippines, one of his ships completed the first CIRCUMNAVIGATION OF THE WORLD. In 1528, PÁNFILO DE NÁRVAEZ led a colonizing expedition to Florida. Nárvaez was lost at sea in the Gulf of Mexico, but four survivors, including ÁLVAR NÚÑEZ CABEZA DE VACA and ESTEVANICO, a former slave from North Africa, landed in Texas and proceeded westward, eventually reaching Mexico in 1536, in what is considered the first extensive overland voyage by Europeans in what was to become the continental United States.

Other overland expeditions were soon organized. In 1539, ANTONIO DE MENDOZA, the viceroy of New Spain, sent out Franciscan missionary MARCOS DE NIZA, along with Estevanico, northward from Mexico. They reached as far as the Zuni Indian pueblos in present-day New Mexico, where Estevanico was killed by the Zuni. The Spanish hoped to locate wealth on a par with that of the Aztec as well as that of the Inca Indians of Peru, who had been conquered by FRANCISCO PIZARRO in the 1530s, and, based on Marcos de Niza's reports, believed that the Zuni pueblos were in fact the fabled Seven Cities of CIBOLA. In 1540, a much larger expedition under FRANCISCO VÁSQUEZ DE CORONADO entered the region. Various of his lieutenants explored throughout what was to become the American Southwest and made contact with various Indian peoples. Coronado himself led a contingent onto the southern plains as far as present-day Kansas, but failed to locate the hoped-for riches.

During the same period, starting in 1539, another Spanish expedition under HERNANDO DE SOTO, after landing on Florida's west coast, traveled throughout the American Southeast, crossing the Appalachians and reaching the Mississippi River. On de Soto's death, LUIS DE MOSCOSO assumed command and explored into present-day Texas. The survivors eventually built barges and descended the Mississippi to the Gulf of Mexico and the Spanish settlement of Tampuco in northern Mexico by 1543.

The Spanish also explored by sea northward along the Pacific coast. In 1539–40, FRANCISCO DE ULLOA, sent out by Hernán Cortés, explored the Gulf of California, the mouth of the Colorado River, and the Pacific coast of the Baja Peninsula. In 1540–41, HERNANDO DE ALARCÓN, the seaward portion of Coronado's expedition, organized by Antonio de Mendoza, also explored the Gulf of California and traveled a good distance up the Colorado. In 1542, JUAN RODRÍGUEZ CABRILLO headed a Spanish maritime expedition, sponsored by Antonio de Mendoza, along North America's west coast, reaching what is now northern California. On his death, BARTOLOMÉ FERRELO assumed command and is thought to have reached as far as the

present-day Oregon-California border in 1543. SEBASTIÁN MELÉNDEZ RODRÍGUEZ CERMENHO, in 1595, and SEBASTIÁN VISCAÍNO, in 1602–03, continued Spanish explorations along the California coast, exploring Monterey Bay and elsewhere.

The English explored the Pacific coasts of North and South America as well. In the course of the first English circumnavigation of world in 1577–80, SIR FRANCIS DRAKE reached as far north as Vancouver Island.

In the meantime, the French had also launched expeditions to the Americas. Once again, as was the case with Spain and England, it was an Italian mariner who carried out the first explorations in this part of the world for them. GIOVANNI DA VERRAZANO explored North America's east coast from present-day South Carolina to Newfoundland in 1524. Then, in the 1530s–40s, in the course of three expeditions, JACQUES CARTIER explored the St. Lawrence River system and surrounding areas in what is now eastern Canada. Both explorers, like other mariners before them, sought a Northwest Passage to the Orient.

The outlines of North America and parts of the interior were becoming known. European cartographers were recording information reported to them by various explorers. In 1585–94, Flemish cartographer GERARDUS MERCATOR published a comprehensive world atlas in which he applied the name *America* to both North and South America.

First Colonies

Although a number of permanent Spanish settlements were founded in the West Indies, Central America, and Mexico in the 16th century, a number of attempts to do so to the north failed. The French under JEAN-FRANÇOIS DE LA ROQUE DE ROBERVAL, in conjunction with Jacques Cartier's third expedition, founded a settlement on the St. Lawrence River in 1541. Because of hardship, the colonists returned to France the following year. In 1562, JEAN RIBAUT attempted to found a French Huguenot colony on Port Royal Sound in present-day South Carolina. When a relief expedition failed to arrive, the French abandoned the site. RENÉ GOULAIN DE LAUDONNIÈRE, in 1564, attempted to build a settlement on the St. Johns River in Florida. The next year, a Spanish military expedition under PEDRO MENÉNDEZ DE AVILÉS defeated the French, and that site was also abandoned. Artist JACQUES LE MOYNE DE MORGUES was one of the colonists who escaped along with de Laudonnière. His images of wildlife and Timucua Indians were the earliest known such images by a European in what is now the continental United States. On his expedition, Menéndez de Avilés founded St. Augustine 40 miles to the south of the French site, the first permanent European settlement in the continental United States.

Spanish expeditions out of Mexico eventually led to colonies in the American Southwest as well. In 1582–83,

ANTONIO ESTEVAN DE ESPEJO headed an expedition to western New Mexico and eastern Arizona, exploring the upper Rio Grande, upper Pecos River, and Little Colorado River. His reports helped lead to a subsequent colonizing expedition in 1598 under JUAN DE OÑATE, who founded a settlement, San Juan de los Caballeros, near an Indian pueblo and present-day Santa Fe, eventually moving to a new site, near another pueblo, San Gabriel de Yungue-Ouinge. From there, over the next years, he launched exploratory expeditions, leading some himself.

The English attempted a number of failed colonies along the Atlantic seaboard in the 1580s. In 1583, SIR HUMPHREY GILBERT led a colonizing expedition to Newfoundland, having been granted a commission by Queen Elizabeth I. Gilbert took formal possession of the island, although he decided to abandon the colony after only one month because of loss of life at sea, illness, and food shortages. Gilbert himself perished on the return journey. His half brother, SIR WALTER RALEIGH, received the commission to settle North America instead and, in 1584–87, sponsored three voyages to the Outer Banks region of present-day North Carolina. The second two were attempts at colonies. The first colony on Roanoke Island failed, in large part because of conflicts with Native Americans. The second colony, originally planned for Chesapeake Bay to the north, was headed by JOHN WHITE, who became known for his paintings of Native Americans. It, too, failed and, after White's return to England for supplies, the colonists were never seen again, resulting in the name the LOST COLONY.

Just to the north, in present-day Virginia, the English founded another colony. CHRISTOPHER NEWPORT commanded the fleet carrying colonists, and JOHN SMITH was military leader of a colony founded at Jamestown in 1607, the first permanent English settlement in the Americas. In 1620, the PILGRIMS, an English religious breakaway group, among them EDWARD WINSLOW, founded Plymouth Colony in present-day Massachusetts.

The French, after other failed attempts at colonies on the St. Croix River, the present border of Maine and New Brunswick, and at Port Royal in southeastern Nova Scotia, founded their first permanent French settlement in the Americas at Quebec City (the Huron Indian settlement of Stadacona) in 1608 under SAMUEL DE CHAMPLAIN. The Dutch, following the 1609 exploration by Englishman HENRY HUDSON of the Hudson River in present-day New York on their behalf and the follow-up expedition to the region under Dutchman ADRIAN BLOCK, founded the colony of New Amsterdam on the island of Manhattan in 1621.

The Swedish also maintained a colony in North America for a time, laying a claim in 1638 to some of the original Dutch holdings along the Delaware Bay. In 1655, with a stepped-up military effort, the Dutch ousted them and reclaimed the territory.

These various colonies served as launching points for exploratory and trading expeditions and led to further colonial development.

Early Explorations of Arctic North America

European maritime expeditions continued to seek the Northwest Passage—and a version of the same known as the Strait of Anian (see ANIAN, STRAIT OF), thought to exist along a more southerly route. In the 1570s–80s, Englishman SIR MARTIN FROBISHER headed a series of expeditions to the Arctic region, seeking an all-water northern route. The English especially were active in northern waters. In the first half of the 17th century, Henry Hudson, now sailing for his country of birth, and others, including SIR THOMAS BUTTON, WILLIAM BAFFIN, ROBERT BYLOT, LUKE FOXE, and THOMAS JAMES, explored Hudson Bay and surrounding waterways. English claims to the region were based on Hudson's 1610–11 journey. (See ARCTIC, EXPLORATION OF THE.)

Land, Furs, and Converts

With increasing numbers of settlers, new land was sought and new settlements were established in the 17th and 18th centuries during the colonial period. The French, located along the St. Lawrence River, developed their colonial economy around the FUR TRADE with Native Americans. They traveled along the Great Lakes and Mississippi River and onto the eastern plains to develop trading contacts. They eventually settled the mouth of the Mississippi as well. Many of the English traveled to North America as families and farmers, in the hopes of staking a claim and working a homestead. They settled along the Atlantic coast and, over time, pushed westward into and beyond the Appalachians. Soon after the founding of the HUDSON'S BAY COMPANY in 1670, the English built trading posts on Hudson Bay for the fur trade and began exploring westward in search of fresh supplies of furs. The Spanish also sought land for economic development, in particular mining, ranching, and farming, and pushed out of the Southwest west and east into California and Texas. The Dutch came to North America originally as traders under the auspices of the United New Netherland Company and the DUTCH WEST INDIA COMPANY but settled more and more farms along the Hudson Valley until losing their territorial claim to the English in 1664 (when the Dutch colony of New Netherland became New York). In the meantime, missionaries—especially of the Jesuit and Franciscan orders of the Catholic Church—traveling with traders or soldiers or on their own sought North American converts (see RELIGION AND EXPLORATION). All the activities of the various nationalities had impacts of one kind or another on native peoples—if not loss of life from disease or warfare, then displacement from lands and cultural dispossession.

Numerous explorers played a part in explorations of the colonial period, opening up new regions to subsequent settlement. In 1659–60, French fur traders MÉDARD CHOUART DES GROSEILLIERS and PIERRE-ESPRIT RADISSON explored Lake Superior and traveled to the headwaters of the Mississippi River. In 1668–69, they headed a maritime expedition to Hudson Bay, leading to the start of the fur trade in that region. In 1665–69, CLAUDE-JEAN ALLOUEZ served as a French missionary to peoples of the western Great Lakes and explored the south shore of Lake Superior and the Fox and Wisconsin Rivers. He is said to have preached to 22 tribes and to have baptized some 10,000 Indians. In 1673, French fur trader LOUIS JOLLIET and missionary JACQUES MARQUETTE explored from the western Great Lakes southward along the Mississippi River. In 1682, RENÉ-ROBERT CAVELIER DE LA SALLE and his associate, Italian HENRI DE TONTI, led a French expedition along the Mississippi River all the way to the Gulf of Mexico. During this journey, he claimed the entire Mississippi Valley for France. The next century, a number of French traders ventured onto the Great Plains. These included LOUIS-JOSEPH GAULTIER DE LA VÉRENDRYE and one of his brothers, François, who, in 1742–43, explored the northern plains as far west as the Black Hills of western South Dakota and eastern Wyoming (or possibly even the Bighorn Mountains in western Wyoming, part of the Rocky Mountain system); and PIERRE-ANTOINE MALLET and his brother, Paul Mallet, who, at about the same time, explored the central plains.

Early English colonial expeditions included that of German-born physician JOHN LEDERER in 1669–70; he explored the Piedmont and Blue Ridge of Virginia and North Carolina on behalf of the Virginia colony. His trip was soon followed, in 1671–73, by other explorations westward to the Appalachian frontier of Virginia and North Carolina, sponsored by ABRAHAM WOOD. In 1685, physician HENRY WOODWARD explored from Charleston, South Carolina, beyond the Savannah River into Georgia. In 1701–08, JOHN LAWSON explored the interior of the Carolinas northward from Charleston. In 1716, ALEXANDER SPOTSWOOD led an expedition to the Shenandoah Valley of western Virginia. By the mid-18th century, there was increasing activity in the Appalachian and trans-Appalachian regions. Among those involved, in 1750, another physician, THOMAS WALKER, explored and named the CUMBERLAND GAP through the Blue Ridge of the Appalachians, crossing it into what is now eastern Kentucky. DANIEL BOONE led hunting and colonizing expeditions through the mountain pass in the 1760s–70s.

Far to the north, Hudson's Bay Company employees began mapping lands to the west. In 1690–92, HENRY KELSEY explored the Assiniboine and Saskatchewan Rivers. In 1754–55, ANTHONY HENDAY explored the Canadian plains within 40 miles of the Rocky Mountains. In the

1760s–70s, SAMUEL HEARNE, with the help of Chipewyan Indian MATONABBEE, reached the Arctic Ocean and the Great Slave Lake. In 1772–75, MATTHEW COCKING explored what is now western Saskatchewan.

For the Spanish, in 1689, ALONSO DE LEÓN, born in Mexico, headed a Spanish military expedition from Coahuila, Mexico, across the Rio Grande to the Gulf Coast of Texas and founded a number of settlements in the Neches River region of eastern Texas. In 1748–50, JOSÉ DE ESCANDÓN led a colonizing expedition from Mexico to the lower Rio Grande in southeastern Texas. In 1698–1706, Italian Jesuit missionary EUSEBIO FRANCISCO KINO explored the Gila and Colorado Rivers in present-day Arizona, the latter of which he is credited with naming. He also explored the Gulf of California. The Spanish settled California after the 1769–70 expedition of GASPAR DE PORTOLÁ and Franciscan missionary JUNÍPERO SERRA. Serra stayed on to found a string of missions to the Indians, from present-day San Diego to San Francisco. The route between New Mexico and California was pioneered by colonial official JUAN BAUTISTA DE ANZA and Franciscan missionary FRANCISCO TOMÁS HERMENEGILDO GARCÉS in the 1774. Soon afterward, in 1776–77, Franciscan missionaries FRANCISCO ATANASIO DOMÍNGUEZ and FRANCISCO SILVESTRE VÉLEZ DE ESCALANTE, in an unsuccessful effort to create a route between the Spanish settlements of Santa Fe, New Mexico, and Monterey, California, explored parts of central Utah.

In the 18th century, Russia joined the other European nations in staking a claim in North America, based on the exploratory expedition of Danish mariner VITUS JONASSEN BERING in 1740–41 to the Aleutian Islands and Gulf of Alaska.

New Nations

The colonial phase of North American exploration can be said to have ended with the Declaration of Independence in 1776, or the Treaty of Paris of 1783—when Great Britain conceded defeat in the American Revolution—or the drafting of the first constitution of the United States of America in 1787. Yet there was still colonial activity. France, although it had ceded its North American holdings to Great Britain and Spain in an earlier Treaty of Paris at the end of the French and Indian War in 1763, for a brief period, from 1800 to 1803, controlled land in North America with the retrocession from Spain of the region stretching from the Mississippi River to the Rocky Mountains, known as the Louisiana Territory. The United States purchased these vast holdings in 1803 in what is known as the Louisiana Purchase. Canada remained under British control until the British North America Act of 1867 created the Dominion of Canada. Mexico achieved independence from Spain in 1821. Russia also maintained a North American presence until 1867 and its sale of Alaska to the United

States. Present-day boundaries among the three North American nations—the United States, Canada, and Mexico—were not decided until well into the 19th century. Yet, with the birth of the United States, came a new stage of exploration and settlement, which came to be called “Westward Expansion.”

In the decades after the American Revolution, much of the exploratory activity was in the Old Northwest, a region north of the Ohio River, west of the Appalachians, east of the Mississippi River, and south of Canada.

In 1776, British naval officer and accomplished navigator JAMES COOK explored the Pacific Northwest coast in search of the western opening of the Northwest Passage and reached as far north as Bering Strait. By the 1780s, British and American traders also regularly worked the Pacific coast, especially in Nootka Sound in present-day British Columbia. But they also extended their activity to Alaska in the north and in California in the south. A number of maritime expeditions increased geographic knowledge of the Pacific coast. American fur trader ROBERT GRAY, who had earlier commanded the first circumnavigation of the world in a U.S. vessel, explored the coast of the Pacific Northwest, including the mouth of the Columbia River in 1792. A British expedition under GEORGE VANCOUVER and WILLIAM BROUGHTON, which also circled the world in 1791–95, explored the same region.

Meanwhile, the Hudson’s Bay Company and a rival out of Montreal, the NORTH WEST COMPANY, sent out expeditions to map the Canadian West and what would become part of the American West. Its representatives included American-born PETER POND and SIMON FRASER and Scotsman SIR ALEXANDER MACKENZIE.

The Lewis and Clark Expedition

In early 1803, while the Louisiana Purchase was being finalized between the United States and France, MERIWETHER LEWIS, an army captain and private secretary of President Thomas Jefferson, won the appointment to head a government-funded expedition to explore the region. Lewis requested a former army comrade, WILLIAM CLARK, to be his coleader. The Corps of Discovery of just under 50 men (not all would complete the journey and others would join later) departed St. Louis by boat in May 1804. After wintering among the Mandan Indians at the confluence of the Missouri and Knife Rivers, during which time Shoshone Indian woman SACAJAWEA was hired as a guide and interpreter, the Corps of Discovery continued upriver, crossed the Rockies and reached the Columbia River, which carried them to the Pacific. They spent the winter of 1805–06 at the mouth of the Columbia in present-day Oregon. On the return trip Lewis and Clark separated for a time: Lewis explored the Marias River, which branched off from the Missouri to the north; Clark and his contingent, including

Sacajawea, explored the Yellowstone River to the south, another branch. The Corps of Discovery returned triumphantly to St. Louis in September 1806.

The Lewis and Clark Expedition, the first government-sponsored expedition across the uncharted western portion of North America, covering some 8,000 miles, established an overland route to the Pacific Ocean. Its contact with more than 50 Indian tribes—all peaceful except for one incident with the Blackfeet—contributed to the knowledge of North America's indigenous peoples. The expedition also made studies of wildlife, as requested by Jefferson, and brought back a large number of botanical species. Its geographic determinations led to subsequent expeditions, some relating to the western fur trade and others, government-sponsored. Former members of the Corps of Discovery continued to play a part in western exploration.

Dunbar, Freeman, and Pike

President Thomas Jefferson sponsored other expeditions to explore the newly acquired Louisiana Territory, including one under Scottish surveyor SIR WILLIAM DUNBAR. The expedition intended to ascend the Mississippi to its confluence with the Red River and attempt to find the Red River's source. Because of the threat of Spanish action against them, they decided instead to explore the Ouachita River northward into present-day Arkansas. In 1806, an Irish-born surveyor named THOMAS FREEMAN again attempted to explore the Red River for Jefferson, making it as far west as present-day Texarkana, Texas, before being turned back by Spanish authorities.

Meanwhile, in 1805–06, when the Lewis and Clark Expedition was on its return trip, army officer ZEBULON MONTGOMERY PIKE led a military expedition with a contingent of soldiers up the Mississippi from St. Louis by boat and sled as far as Leech Lake in present-day Minnesota. In 1806–07, Lieutenant Pike led a contingent of soldiers by boat from the Missouri River to the Osage River, then overland by horseback across the plains to the Republican River and southward to the Arkansas River, exploring it westward into present-day Colorado. In the Rocky Mountains Pike attempted to climb Pikes Peak, which is named after him. On the return trip, the expedition crossed the Rio Grande into Spanish territory; Pike and his men were captured by the Spanish and held for a time in Santa Fe. Pike's subsequent report discouraged settlement on the arid southern plains but led St. Louis traders to develop commerce by way of the Santa Fe Trail.

Traders West

The city of St. Louis, on the Mississippi River near the mouth of the Missouri, served as gateway to the West. Most travel westward from there in the early 19th century related to the fur trade. In 1808, American businessman JOHN

JACOB ASTOR founded the AMERICAN FUR COMPANY, and its subsidiaries soon afterward—the Pacific Fur Company and the Southwest Fur Company—with the plan of building a string of trading posts along the route Lewis and Clark pioneered. In order to create a western terminus, Astor sponsored a seaward expedition under ROBERT STUART, from New York City around South America, in 1810, to build Fort Astoria at the mouth of the Columbia River; the next year, he sent an overland expedition out of St. Louis—the Astorians—under WILSON PRICE HUNT.

In 1809, the ST. LOUIS MISSOURI FUR COMPANY was founded by William Clark, MANUEL LISA, JEAN PIERRE CHOUTEAU, AUGUSTE PIERRE CHOUTEAU, ANTOINE PIERRE MENARD, ANDREW HENRY, and others. The company eventually established a number of posts upriver.

With time, traders became familiar with the lands along the Missouri and its tributaries and in the Rocky Mountains as well. In 1822, another American entrepreneur, WILLIAM HENRY ASHLEY, along with Andrew Henry, founded the ROCKY MOUNTAIN FUR COMPANY. Many of the men who worked for and traded with Ashley came to be known as the MOUNTAIN MEN. They included legendary figures such as JAMES PIERSON BECKWOURTH, JAMES BRIDGER, JAMES CLYMAN, HUGH GLASS, THOMAS FITZPATRICK, EDWARD ROSE, JEDEDIAH STRONG SMITH, and WILLIAM LEWIS SUBLETTE. In the 1820s–1830s, they traveled the Native American trails and passes of the West and passed along geographic knowledge to others. Jed Smith, the “Knight of the Buckskin,” as his peers called him, traveled more than 16,000 miles in his career and pioneered the westward route via SOUTH PASS across the Rockies and from the Great Basin into California.

The fur traders came from many different places and many different walks of life. In 1832–35, BENJAMIN LOUIS EULALIE DE BONNEVILLE, a French-born former U.S. army officer led a fur-trading expedition across the Rocky Mountains and into Oregon. Mountain men JOSEPH WALKER, ZENAS LEONARD, and JOSEPH L. MEEK worked for him and helped pioneer the California Trail.

Working out of Alaska, in the meantime, Russian interests, organized as the RUSSIAN-AMERICAN COMPANY in 1799, developed the fur trade southward under the leadership of ALEKSANDR ANDREYEVICH BARANOV. By 1812 company fur traders had established a post in northern California.

In 1821, the Hudson's Bay Company and the North West Company merged under the name of the Hudson's Bay Company. It would continue as formidable opposition to the American fur companies. Other merchants developed the trade in buffalo hides as well as providing goods along routes west. In 1833, CHARLES BENT, born in Virginia and raised in St. Louis, established Bent's Fort as a trade center on the Arkansas River in southeastern Colorado.

In the late 1830s, the international fur market went into decline, partly because the beaver hat went out of style in favor of the silk hat. The depletion of fur-bearing animals and the advance of farming settlements also contributed to a changing way of life in the West. Many of the mountain men stayed active as soldiers, scouts, and guides in the subsequent period of expanding settlement.

Continuing Government Expeditions

The U.S. government continued to sponsor westward explorations long after Lewis and Clark. In 1819, Colonel Henry Atkinson led the first Yellowstone Expedition up the Missouri River, reaching as far as Council Bluffs in present-day Nebraska, where he founded Fort Atkinson. Other expeditions embarked from there, including that of Major STEPHEN HARRIMAN LONG of the U.S. Army Corps of Topographical Engineers, which crossed the Great Plains and reached the Rockies. In his report on the expedition, Long referred to the Great Plains as the “Great American Desert,” unsuitable for agriculture, which supported the earlier findings of Zebulon Pike. In 1825, Colonel Atkinson headed the second Yellowstone Expedition, which did in fact manage to navigate up the Yellowstone into present-day Montana, where he negotiated with Indian tribes.

The next decade, in 1834, General HENRY LEAVENWORTH, who for a time had been the commander at Fort Atkinson, and Colonel HENRY DODGE headed an expedition to the southern plains in order to negotiate treaties with tribes of the region—a region designated as the Indian Territory, where eastern tribes would be relocated—and explored the Arkansas and Red Rivers. The next year, Dodge explored from Oklahoma to the Rockies and explored the eastern portion of the Oregon Trail.

In the 1840s, as the army built more and more posts west of the Mississippi, the most active explorer for the federal government was JOHN CHARLES FRÉMONT. In 1838–39, after receiving a commission as second lieutenant in the Corps of Topographical Engineers, he joined Frenchman JOSEPH NICOLAS NICOLLET in a survey of the region between the upper Mississippi and Missouri Rivers. In 1841, Frémont led an expedition in a survey of the Des Moines River in Iowa. In 1842, Frémont headed his own expedition to the Oregon Territory, during which he mapped most of the Oregon Trail and determined the longitude of the South Pass. CHRISTOPHER HOUSTON CARSON (Kit Carson) served as guide for part of the expedition. In 1843–44, Frémont, again with Carson and with Thomas Fitzpatrick also as a guide, explored the Great Basin, more of the Rockies, and the eastern Cascade Range, and reached the mouth of the Columbia. Part of his mission was to complement the findings of the maritime expedition of Lieutenant CHARLES WILKES along the Pacific coast, part of the U.S. South Sea Surveying and Exploring Expedition. Frémont led his party

south and then east and crossed the Sierra Nevada in mid-winter. Frémont’s reports on the Great Plains—in particular the fertile regions of present-day Nebraska, Kansas, and Oklahoma—helped dispel the notion of a “Great American Desert.”

Other expeditions explored westward onto lands previously known only to Native Americans. In 1845, Colonel STEPHEN WATTS KEARNY led an expedition from Fort Leavenworth in Kansas to the upper Platte and Arkansas Rivers; Thomas Fitzpatrick again found work as a guide. JAMES WILLIAM ABERT led a party, under Kearny’s command, to western Oklahoma and the Texas Panhandle. Frémont led a party under Kearny in explorations of the Great Basin and Sierra Nevada, as well as northern California and southern Oregon; during and after this expedition, Frémont became involved in the Bear Flag Revolt of American settlers against the Mexicans in northern California and helped secure California for the United States in the U.S.-Mexican War of 1846–48. Kearny also participated in the war. Serving under him, Lieutenant WILLIAM HEMSLEY EMORY created the first scientific map of the Southwest, from the Gulf of Mexico to the Pacific Ocean.

In 1848–49, Frémont led a privately funded expedition from the plains into the mountains of northern New Mexico, in the hope of locating a practical central route for a proposed transcontinental railroad. He headed one last expedition in 1853, another privately funded one, exploring the Wasatch Mountains of northern Utah and the Sierra Nevada for another proposed railroad route.

Over the next decades, especially in the 1850s, the U.S. army conducted a number of topographic and surveying expeditions for wagon roads and railroads (see SURVEYING AND EXPLORATION). One of the last such exploratory and surveying expeditions was under the command of Lieutenant HENRY TUREMAN ALLEN to the Yukon, Koyok, and Copper Rivers of eastern Alaska in 1885.

Many Callings

In addition to the fur traders and military men, people of many callings helped increase awareness of the geography and natural science of North America in the 19th century and helped pioneer routes leading to non-Indian settlement. In the 1830s, a number of painters followed the fur traders and the military men on their expeditions: artist GEORGE CATLIN traveled on an American Fur Company ship up the Missouri, and later with General Henry Leavenworth and Colonel Henry Dodge to the southern plains; and Swiss artist KARL BODMER, along with German naturalist ALEXANDER PHILIPP MAXIMILIAN, also traveled on a fur company boat up the Missouri, in order to paint and study Native Americans. In the same period, another painter, JOHN JAMES AUDUBON, ventured from settled areas into the wilderness on his own—from Florida to Texas to

Labrador—to paint wildlife, becoming one of the foremost authorities of North American birds. Other frontier painters traveled to wilderness lands in the 1840s–50s: Canadian PAUL KANE, across Canada, from Toronto to Vancouver; and Swiss RUDOLPH FRIEDERICH KURZ, up the Missouri into the Dakotas.

Pioneers in the West also came from a variety of backgrounds. In 1841, Belgian missionary PIERRE-JEAN DE SMET led the first large-scale wagon train migration on the Oregon Trail, another journey for which former mountain man Thomas Fitzpatrick served as guide. That same year, JAMES SINCLAIR, a Métis working for the Hudson's Bay Company, pioneered a wagon route through the Canadian Rockies. In 1843, JESSE APPLGATE, a Kentuckian who had worked as a surveyor in St. Louis, and Presbyterian missionary MARCUS WHITMAN from New York helped lead the "Great Migration of 1843," the largest wagon train of emigrants to date along the Oregon Trail. In 1847, BRIGHAM YOUNG, who was a prominent leader in the Church of Jesus Christ of Latter Day Saints—better known as the Mormons—after journeying from New York, led a party of Mormons from winter quarters on the Missouri River to the Great Salt Lake Valley in Utah, pioneering what became known as the Mormon Trail. In 1863, JOHN MERIN BOZEMAN, who had originally traveled to the West from Georgia as a gold prospector, pioneered the Bozeman Trail, a wagon route from Colorado to Montana along the east side of the Bighorn Mountains and through the Bozeman Pass of the Belt Mountains. In 1865, JESSE CHISHOLM, a trader of Cherokee ancestry, blazed the Chisholm Trail, which became a primary cattle route from Texas to railheads in Kansas.

A number of scientists helped open both the American and Canadian West. In 1832, HENRY ROWE SCHOOLCRAFT, a geologist, ethnologist, and Indian agent, led an expedition to find the source of the Mississippi, which he identified correctly as Lake Itasca in northern Minnesota. In 1857–60, Englishman JOHN PALLISER, originally a sportsman and hunter, led a scientific expedition to western Canada for the British government, which explored the 49th Parallel from Lake Superior to the Pacific Ocean as well as passes in the Canadian Rockies. Geologist HENRY YOULE HIND, also born in England, led a simultaneous government expedition exploring the river systems of Manitoba and Saskatchewan.

In the 1860s–1870s, self-taught naturalist JOHN MUIR conducted studies in the Yosemite Valley and the Sierra Nevada in California. In 1869, in a federally funded expedition, geologist and ethnologist JOHN WESLEY POWELL led the first successful navigation of the Colorado River. He went on to head the U.S. Geological Survey, succeeding its first director CLARENCE KING. Another geologist, FERDINAND VANDEVEER HAYDEN, worked for the government in

the same period in studies of the Great Plains and Rocky Mountains.

West and North

The growing number of military forts and roads linking them enabled travel through and settlement in Native American ancestral lands. By the 1860s, the major routes linking east and west in the United States—the Santa Fe Trail, the Old Spanish Trail, the Oregon Trail, and its offshoots (the Central Overland Route, the California Trail, the Bozeman Trail, and the Mormon Trail)—were well established. The railroads would soon follow. By 1850, they connected the Atlantic coast with the Great Lakes; by 1853, with Chicago; and, by 1856, with the west side of the Mississippi. In the early 1860s, a transcontinental line was begun; by the end of the decade, in 1869, the Union Pacific and the Central Pacific met at Promontory Point, Utah. The 1880s saw another burst of railroad building. To the north, the transcontinental Canadian Pacific Railroad was completed in 1885.

A series of gold rushes affected the course of settlement in North America and accelerated the pace of westward expansion: the California gold rush of 1849; the Colorado (Pikes Peak) Gold Rush of 1858–59; gold rushes in Idaho and Montana in the 1860s; gold rushes in Arizona and Nevada in the 1870s; and the Klondike gold rush (to the Yukon Territory and Alaska) in 1896–98. In 1859, silver was discovered in Nevada, the Comstock Lode as it came to be known, and silver would soon be found in other western states as well.

To the north, Arctic exploration continued over the centuries, with a great number of expeditions—many of them British and many spurred on by the disappearance of Englishman SIR JOHN FRANKLIN in 1845. The first successful navigation of the Northwest Passage above the North American mainland was accomplished by Norwegian ROALD ENGELBREGT GRAVNING AMUNDSEN in 1903–06. In 1904–11, French Canadian JOSEPH ELZÉAR BERNIER charted northern islands in Arctic waters for Canada. To the south, in 1914, the opening of the Panama Canal across the Isthmus of Panama provided a practical passage between the Atlantic and Pacific Oceans and separated the continents of North America and South America by water.

The political map of North America continued to take shape well into the 20th century, with the United States, Canada, and Mexico, as well as the countries of Central America and the West Indies, defining external and internal boundaries. The demographic map continues to evolve as in earlier centuries, with North America a melting pot of peoples from around the world. Growing environmental awareness in the latter part of the 20th century has led many

people to rediscover and appreciate the land, with a sense of curiosity, adventure, and reverence inspired by both Native Americans and explorers from other continents.

Northeast Passage

The Northeast Passage is the sea route between the Atlantic Ocean and Pacific Ocean, from along the north coast of Norway to the eastern edge of SIBERIA at the BERING STRAIT. Many nations sought this passage to use as a trade route between Europe and China, and the quest to find it led to many geographic discoveries.

Europeans had knowledge of the seas to the north and east of Norway since at least A.D. 870, when a Viking by the name of Ottar sailed into the White Sea. Other Vikings later reached as far north and east as Novaya Zemlya. Also, the various peoples who lived in northern parts of much of Scandinavia, Russia, and Siberia over the centuries had extensive knowledge of these northern seas, due to their often nomadic lifestyles and their use of the sea for hunting and fishing. In the history of exploration, the search for the Northeast Passage was thus largely a European venture, motivated primarily by the desire for a predictable, commercially viable waterway between Europe and Asia.

The first attempts at a sea route westward from the Atlantic through the Americas to the Pacific—the NORTHWEST PASSAGE—were made in the late 1490s, following CHRISTOPHER COLUMBUS's first voyage of exploration for Spain in 1492. The interest in a Northeast Passage came later, European countries hoping to find a more direct route past Africa than the long southerly route around the CAPE OF GOOD HOPE.

Early English Expeditions

England was the first country to make a concerted effort at finding the Northeast Passage. Envious of the riches being acquired by the Portuguese and Spanish through commerce with the Orient during the 16th century, and frustrated by expensive and as yet unsuccessful attempts to find a Northwest Passage, the English augmented their search for new trade routes by looking east. They were encouraged in this endeavor by the 1549 publication of *Rerum Moscoviticarum Commentarii* (Notes on Muscovite Affairs). In this book, written by Sigismund von Herberstein, an ambassador from the Holy Roman Emperor to Russia, the author describes his journeys earlier that century and offers reports of regular sea voyages between the north coast of Russia and the west coast of Norway.

The first expedition in search of the Northeast Passage was sponsored by the MUSCOVY COMPANY. In 1553, under the directorship of SEBASTIAN CABOT, the company outfitted a fleet of three ships under SIR HUGH WILLOUGHBY, with RICHARD CHANCELLOR as second in command. Dur-

ing a storm off the north coast of Norway, their ships were separated. Willoughby continued to the east, where he sighted Novaya Zemlya, making the first known European sighting of this island group since the Vikings. Icy conditions kept him at a distance, however. Heading back westward, his ship became trapped in ice at the northern end of the Kola Peninsula, and he and his crew perished there during the winter. Chancellor, meanwhile, had managed to reach the port of Archangel at the mouth of the Dvina River, from where he traveled southward. He was invited to Moscow at the request of Czar Ivan IV (Ivan the Terrible). The prospect of trade with England appealed to the czar, and Chancellor returned to England with agreements in hand.

The Muscovy Company sponsored a follow-up expedition in 1556, giving STEPHEN BOROUGH, who had sailed with Chancellor, a small ship and crew. With help from Russian fishermen near the Kola Peninsula, Borough made his way to the north coast of Russia near the mouth of the Pechora River. From there, he continued eastward and eventually located a strait between Vaigach Island and Novaya Zemlya leading from the Barents Sea to the Kara Sea. As with Chancellor, icy conditions forced Borough's expedition to turn back prematurely. His report of the harsh conditions in that region dissuaded others from making further explorations there for 25 years.

In 1580, the Muscovy Company launched another expedition in search of the Northeast Passage: They sent two vessels, one captained by Arthur Pet and the other by Charles Jackman. Their instructions were to follow and then extend Borough's route. Pet succeeded in finding another channel to the Kara Sea, between Vaigach Island and the mainland (Yugor Strait), but ice and fog compelled him to make a swift return. Jackman's ship was lost with all hands.

Early Dutch Expeditions

In addition to the English, the Dutch were interested in a Northeast Passage for the purpose of trade. To compete with the English at Archangel, they founded the White Sea Trading Company in 1565. Their most visible agent was OLIVIER BRUNEL, who explored the region and made successful trading arrangements in Russia. He went farther east than the English had by traveling overland to the Ob River. In 1584, on a voyage of trade and exploration, Brunel fell short of the Kara Sea and drowned after making a landing in Pecora Bay.

Among the more renowned navigators to search for the passage was WILLEM BARENTS, also a Dutchman. In 1594, he reached the northern tip of Novaya Zemlya before ice blocked his fleet of three ships. Barents led a second expedition a year later, attempting to sail around the southern end of Novaya Zemlya. Near Vaigach Island, ice once again prevented progress eastward. Geographer JAN HUYGHEN VAN LINSCHOTEN was part of both expeditions.

The Dutch launched seven expeditions that year, none of which came closer to attaining the passage. With two ships, Barents conducted a third voyage in June 1596. Sailing to the north of Norway in order to investigate conditions in these untested waters, he charted Bear Island and reached the Spitsbergen group (both now part of Svalbard). The seas farther to the north proved inhospitable, and Barents sailed eastward to Novaya Zemlya and rounded its northern tip into the Kara Sea.

His second ship, headed by Jan Cornelizoon Rijp, returned to the west. With the change of seasons, Barents found his vessel trapped in the ice. He and his crew set up camp at the place he called Ice Haven on Novaya Zemlya, fashioning a shelter from driftwood. The group supplemented their dwindling rations by hunting foxes, but this was not enough to prevent the onset of SCURVY, from which Barents and several of his crew died. In July 1597, the surviving crew were aided by two Russian ships; they eventually reached the Kola Peninsula, where they found Rijp, who returned with them to the Netherlands in November 1597.

Henry Hudson

HENRY HUDSON, an Englishman, sailed for both the English and the Dutch in the early 17th century. In 1607, sponsored by the Muscovy Company, Hudson reached the east coast of GREENLAND and Spitsbergen, north of Norway. In 1608, again sailing for English interests, he reached the Barents Sea and Novaya Zemlya and was subsequently stopped by ice. In 1609, in the employ of the DUTCH EAST INDIA COMPANY, Hudson again attempted the Northeast Passage. He approached Novaya Zemlya once again, but, with icy seas beginning to trap his vessel and, under threat of mutiny, he headed westward across the Atlantic to the Americas and investigated the coast of Newfoundland and the Hudson River. As these expeditions seemed to prove the Kara Sea unnavigable, both the Dutch and the English turned their attention to the rich fishing and whaling grounds near Spitsbergen.

Russian Expeditions

The Russians initiated the next phase of exploration for a Northeast Passage. They had had knowledge of the north coast of their continent for centuries, through trade with and collecting taxes from indigenous peoples, but the desire to conduct wide-ranging commerce had been stifled by conflicts closer to home. In 1648, it is possible that SEMYON IVANOVICH DEZHNEV passed the eastern point of Siberia at East Cape (now known as Cape Dezhnev) while on a trading mission, but his account of that region's geography is somewhat confused. It was not understood at this time whether the Asian and North American continents were joined at this location. The lure of the unknown prompted Peter the Great, who became czar of Russia in 1682, to or-

ganize a number of voyages, known as the Great Northern Expeditions, to explore and map the Siberian coastline.

In one of them Danish explorer VITUS JONASSEN BERING set out overland in 1725 through Russia and Siberia to the Kamchatka Peninsula. In 1728, after building a boat, he and his men, including Russian naval officer ALEKSEY ILYICH CHIRIKOV, navigated through enough of the Bering Strait—which is named after Bering—to be satisfied that Asia and North America were separate landmasses. Bering returned to St. Petersburg in 1730, where authorities greeted his findings with skepticism. In 1733, Bering set out again, this time with a much larger expedition, which traced the Arctic coast from Archangel to the east, charting the region section by section, all the way to the mouth of the Kolyma River. In 1741, Bering again navigated the Bering Strait. It was on this voyage that he sighted the south coast of Alaska. After becoming stranded off the Kamchatka Peninsula, Bering and many of his men died of scurvy. Survivors managed to return to Russia, where they delivered a report of their findings. The survey of the Siberian coast was completed with the four-year journey of Baron Ferdinand Petrovich von Wrangel for Russia near the end of the 18th century.

James Cook

In 1776, the HUDSON'S BAY COMPANY backed an expedition to the Pacific headed by JAMES COOK in search of a water route across North America. In 1778, after passing through the Bering Strait and attempting to navigate eastward north of Alaska, it turned back westward because of PACK ICE and tried to locate the eastern outlet of the Northeast Passage, also finding that route blocked by ice.

Through the Northeast Passage

On a voyage in 1878–79, NILS ADOLF ERIK NORDENSKJÖLD, using the combination steamship–sailing ship *Vega*, finally navigated the Northeast Passage. Nordenskjöld, born in Finland of Swedish parents and trained as a chemist and mineralogist, was already a seasoned explorer by the time he attempted this expedition. With backing from the kings of Sweden and Norway and with coal and foodstuffs to last two years, he left Tromsø, Norway, on July 21, 1878. Conditions were favorable in the Kara Sea, and he reached Port Dickson on August 6, thus beginning the exploratory phase of the journey. On August 19, he sailed past the northernmost point of the Asian continent at Cape Chelyuskin and, on September 27, he reached North Cape. The following day, the *Vega* became icebound, and captain and crew made preparations for the winter. Superior planning made their winter at sea relatively comfortable, and Nordenskjöld kept himself and the others busy with numerous scientific projects. With the melting of the ice, the *Vega* was freed. On July 18, 1879, the expedition entered the Bering Strait, having

completed the passage. It later visited Japan and Sri Lanka before making use of the Suez Canal to return to Sweden on August 24, 1880. Nordenskjöld's two-volume account published the following year, *The Voyage of the Vega*, is a classic in the field of exploration as both an adventure story and as a scientific study, with detailed information on geography, climate, and native peoples.

Although the Northeast Passage had been traversed, the prospect of provisioning for a two-season journey made its use commercially unattractive. The Russo-Japanese War of 1904–05, however, awakened the Russians to the benefits of such a route, and the Russian government soon commissioned the construction of a pair of icebreakers to undertake more detailed surveys of these waters. In 1909, the *Taïmyr* and the *Vaygach* were put into service. Between 1909 and 1915, these ships conducted hydrographic studies (see HYDROGRAPHY) in the waters of the Bering Strait and completed the first east-to-west navigation of the passage. In 1932, under the direction of the Union of Soviet Socialist Republics (USSR; Soviet Union), OTTO Y. SCHMIDT made the first single-season passage. The Soviet Union established the Northern Sea Route Administration in that year for the development of Siberia's resources and for regular commercial shipping. Today, use of these northern sea-lanes has become practical and routine because of large fleets of icebreakers, ongoing aerial reconnaissance, and meteorological monitoring stations. The cargoes that pass through its waters are typically timber, ore, and other raw materials en route to processing factories in northern Asia.

North Magnetic Pole (Magnetic North Pole)

The Earth has a magnetic field, an area surrounding the planet in which objects experience an electromagnetic force. In other words, Earth acts as a giant magnet. The exact cause of terrestrial magnetism is unknown; theories relate to the matter and structure of Earth's core, one of which is the dynamo theory involving the interaction of motion and electrical currents in the liquid outer core. At one end of Earth, the northern end, the magnetic force is toward the ground; at the other end, the southern end, the magnetic force is away from the ground. (Earth's magnetic field reverses polarity on an irregular basis, from several thousand years to 35 million years, resulting in the opposite effect; the last such reversal was some 780,000 years ago.) The exact location of these points of magnetic polarity are referred to as the magnetic poles. The magnetic pole at the northern end is known as the North Magnetic Pole (written with or without capitalization). That at the southern end is known as the SOUTH MAGNETIC POLE. The terms also appear as magnetic north pole and magnetic south pole. The angle that Earth's mag-

netic field makes with the horizon is called the magnetic dip, leading to the alternative names dip poles or magnetic dip poles.

The North Magnetic Pole and the South Magnetic Pole do not correspond with the geographic poles of Earth's imaginary axis, known as the NORTH POLE and SOUTH POLE. Moreover, their location varies in the course of almost a century—as they do to a much less degree annually and even daily—a phenomenon known as polar wandering. The present location of the North Magnetic Pole is in the Queen Elizabeth Islands of northern Canada, about 800 miles from the North Pole.

For purposes of study, scientists have also defined Earth's magnetic field as a symmetrical magnetic field, averaging its direction and strength, and the hypothetical poles are known as geomagnetic poles, south and north. The North Geomagnetic Pole is situated near Thule, GREENLAND, about 780 miles from the geographic North Pole.

The effect of terrestrial magnetism had been evident for centuries through use of the magnetic COMPASS. William Gilbert, an English physician and scientist, carried out the first comprehensive study of Earth's magnetic field, publishing his findings in *De magnete* in 1600.

On May 31, 1831, British explorer SIR JAMES CLARK ROSS, as part of the 1829–33 expedition under SIR JOHN ROSS, located the North Magnetic Pole on the west coast of the Boothia Peninsula. During his expedition of 1903–06, in which he made the first successful crossing of the NORTHWEST PASSAGE, ROALD ENGELBREGT GRAVNING AMUNDSEN again measured the location of the North Magnetic Pole, finding it had moved from Ross's calculation. In 1948, Canadian scientists Paul Serson and Jack Clark confirmed that it had moved and determined that its location was 160 miles from Ross's calculation.

North Pole (North Geographic Pole, Geographic North Pole)

The North Pole, a cartographic point in the ice-covered Arctic Ocean, is considered the northernmost place on Earth, at a latitude of 90 degrees north and a longitude of 0 degrees, where all meridians of longitude converge. Its location is determined by the imaginary line, or axis, around which Earth rotates from west to east. The axis is perpendicular to the plane of the EQUATOR and passes through the center of Earth, terminating at geographic points referred to as the North Pole in the Northern Hemisphere and the SOUTH POLE in the Southern Hemisphere. From the North Pole, all directions on the surface of Earth are read as to the south. The North Pole is also referred to as the North Geographic Pole, to distinguish it from the NORTH MAGNETIC POLE, which is determined by Earth's magnetic field. Reaching

the North Pole was one of the great goals of world exploration and is part of the larger story of human activity in the Arctic.

In ancient times, as put forth by Roman scholar PLINY THE ELDER in the first century A.D., based on information from the travels of Greek scholar PYTHEAS, who explored the Arctic Ocean in the fourth century B.C., the northernmost place on Earth was thought to be ULTIMA THULE. It can be assumed that the Vikings, familiar with northern waters in the Middle Ages, came to know the dangers of venturing too far north because of DRIFT ICE and the limits of navigable waters because of PACK ICE. Starting in the 16th century, the European search for a NORTHEAST PASSAGE—a water route from the Atlantic Ocean to the Pacific Ocean, eastward across northern Europe and Asia—and a NORTHWEST PASSAGE—a water route westward through the Americas—led mariners, especially among the British and Dutch, to explore Arctic waters and sail as far north as possible. Even with growing awareness of Earth's true geography, belief in an open polar sea that would provide a route to Earth's northernmost point persisted well into the 19th century despite repeated encounters with the pack ice of the Arctic Ocean.

Concerted efforts to reach the North Pole began in the late 18th century and continued through the 19th century, with northernmost records being broken. In 1773, a British naval expedition under CONSTANTINE JOHN PHIPPS attempted to reach the North Pole by water and came up against impassable ice east of GREENLAND. In 1818, a British expedition, with ships commanded by DAVID BUCHAN and SIR JOHN FRANKLIN, reached European Arctic waters north of Spitsbergen (present-day Svalbard) before being forced back by pack ice. In 1827, another British naval expedition under SIR WILLIAM EDWARD PARRY, along with SIR JAMES CLARK ROSS, made an attempt on the North Pole from Spitsbergen, setting a northernmost record.

Attempts accelerated in the latter part of the century. In 1860–61, American ISAAC ISRAEL HAYES hoped to locate an open polar sea north of Greenland and Ellesmere Island, Canada's northernmost point, but failed. In 1868, the First Swedish North Polar Expedition under NILS ADOLF ERIK NORDENSKJÖLD failed to reach the North Pole from Spitsbergen; he failed again in 1872–73 on the Second Swedish North Polar Expedition. Meanwhile, in 1871, American CHARLES FRANCIS HALL reached as far as the Lincoln Sea from northern Ellesmere Island, setting a new record. In 1875–76, SIR GEORGE STRONG NARES made an unsuccessful attempt, again from northern Ellesmere Island, breaking the record. In 1879–81, in the course of an American expedition headed by GEORGE WASHINGTON DE LONG, into the Arctic Ocean by way of the BERING STRAIT, the ship became trapped in ice north of Wrangel Island, resulting in the eventual death of De Long and 12 others on the Lena River of SIBERIA. In 1893–96, a Norwegian expedition under FRIDT-

JOF NANSEN attempted to approach the North Pole by purposely having his ship become icebound and drift northward from the New Siberian Islands, after which he and his men continued by kayak and sledge, eventually turning back because of ice conditions after setting a new northernmost record. In 1897, Swede SALOMON AUGUST ANDRÉE tried to reach the Pole from Spitsbergen by air, in a BALLOON, perishing in the attempt. At the turn of the century, in 1899–1900, LUIGI AMEDEO DI SAVOIA D'ABRUZZI led an Italian expedition which attempted to reach the Pole from Franz Josef Land, setting the new northernmost record.

American ROBERT EDWIN PEARY, who carried out four Arctic expeditions to Greenland between 1886 and 1900, resolved to reach the North Pole. In his first attempt in 1902, from Cape Hecla on northern Ellesmere Island, he set a northernmost record for the Western Hemisphere. In a subsequent attempt in 1905–06, by way of the Robeson Channel, the north section of the passage between Ellesmere Island and Greenland, he set the new northernmost record in both hemispheres. In July 1908, Peary departed from New York for a third attempt. From Cape Columbia on Ellesmere Island, Peary, his assistant, MATTHEW ALEXANDER HENSON, and four Inuit (Eskimo) set out on March 1, 1909, and, after a monthlong trek across the frozen sea with sledges and dogs, reached the North Pole on April 6 (although there is some evidence he missed the Pole by a couple of miles). In the meantime, another American, FREDERICK ALBERT COOK, claimed to have reached the North Pole by the Ellesmere Island route on April 21, 1908. The controversy on who actually had been first to the Pole lasted for some time. Peary, with more geographic data to support his claim, received official recognition from U.S. Congress in 1911.

American RICHARD EVELYN BYRD and Floyd Bennett are credited with making the first airplane flight over the North Pole on May 9, 1926, although there is also controversy as to whether they missed the mark, which would make Norwegian ROALD ENGELBREGT GRAVNING AMUNDSEN, American LINCOLN ELLSWORTH, and Italian UMBERTO NOBILE, who passed over it by AIRSHIP three days earlier on May 12, the first to do so. In 1931, Australian SIR GEORGE HUBERT WILKINS attempted unsuccessfully to reach the Pole from Spitsbergen by submarine; that feat was accomplished in 1958, when the U.S. atomic submarine *Nautilus* under Commander William R. Anderson passed beneath the polar ice. Another milestone in the history of exploration was the first flight over the North Pole by a woman, American LOUISE ARNER BOYD, in 1955. In 1977, the nuclear icebreaker *Arktika* of the then Union of Soviet Socialist Republics (USSR; Soviet Union) became the first surface ship to reach the Pole. In 1981, British explorers Sir Ranulph Fiennes and Charles Burton reached the North Pole, having traveled there from the South Pole, becoming

the first men to circle the Earth Pole to Pole, having done so over a period of three years.

North Star (Pole Star, Polaris, Stella Maris)

The North Star—also called Pole Star or Polaris, or Stella Maris, for “star of the sea”—is the star located along the axis of the NORTH POLE. It is of value in navigation because its position remains relatively fixed throughout the year.

The North Star is a second magnitude star, meaning it is 1/30th as bright as the brightest star in the sky. For this reason it was not always obvious that it retained its position in the sky as the seasons changed. Located in the constellation Ursa Minor (the Little Dipper) at the end of the handle, the North Star is not presently along the exact polar axis, but rather about one degree off. This causes it to appear to wobble by two degrees throughout the course of a day.

The earliest information we have on the use of the North Star for navigation is from the Phoenicians. Using the North Star as their reference, they were able to sail at night, a competitive advantage for the trading nation. The Greeks learned how to navigate using the North Star from the Phoenicians, and they called it the “Phoenician Star.” The Venetian traveler to the Far East, MARCO POLO, reported use of the North Star in the Indian Ocean in 1290.

Arab travelers used the North Star along with a tool called the *al-kemal*, Arabic for “the consummation,” a rectangular plate made of horn or other material on which a string of knots was affixed to the center. The user placed the bottom of the rectangle on the horizon, and, by moving one’s arm toward oneself or away from oneself, located the North Star at the top of the rectangle. The user would determine a distance from the rectangle to his or her nose by means of the string of knots, each knot representing a previously determined latitude. In this manner, the user determined location along the latitudinal but not the longitudinal scale.

Interestingly, the North Star has not been the same star throughout history, a phenomenon caused by Earth’s rotation very slowly on its axis, like a spinning top pushed slightly off balance, causing the axis to point in a different direction over time. More than 4,000 years ago, the star indicating north would have been located in the constellation Draco. In about 10,000 years, the new North Star will be Vega of the constellation Lyra.

North West Company

The North West Company was one of two great Canadian fur-trading concerns that helped open the West, what is now

Canada and northern parts of the United States. It coalesced in Montreal, Quebec, the center of commerce on the St. Lawrence River, in 1779, then reorganized in the 1780s and was active under that name until 1821, when it merged with its older rival, the HUDSON’S BAY COMPANY. The North West Company’s founders and its traders, known as Nor’westers (or Northwesters), were mostly Scottish.

18th Century

Many Scots moved to Montreal after the British takeover of New France in 1763; other Scots, loyal to Great Britain, took refuge there during and after the American Revolution of 1775–83. With the city being a center of the FUR TRADE, Scottish merchants began investing in their own operations. Some allied themselves with French merchants, or hired French VOYAGEURS, traders who had worked for other firms, as well as the COUREURS DE BOIS, unlicensed traders, to take advantage of their expertise. In the field, however, the competition between traders often led to violence. In 1779, a number of Scots active in the fur trade—Simon McTavish, James McGill, and Isaac Todd—formed a company, which, after other merchants had joined, became organized as the North West Company in the winter of 1783–84. A rival firm, Gregory and McLeod, merged with the North West Company in 1787. It was decided that the various trading companies who invested in the North West Company, some of which had interests other than the fur trade, could maintain their separate identities, working in conjunction with other shareholders known as “wintering partners,” who conducted the trade in the field with Native American tribes.

Much of the activity of the Nor’westers was in Prince Rupert’s Land, or Rupert’s Land, an area of northern and western Canada comprising the drainage basin of HUDSON BAY. The territory had been granted to the Hudson’s Bay Company by King Charles II at the time of that company’s founding in 1670, but much of the fur-rich region remained untapped. Grand Portage on western Lake Superior became the primary meeting place, where goods were exchanged. Traders, traveling by large CANOE, took European trade goods from Montreal to rendezvous with traders, generally in smaller canoes, carrying furs collected in the wilderness. The furs were then shipped to Montreal, then England.

In 1778–79, Connecticut-born PETER POND, who had gone into partnership with McTavish in 1777, led a fur-trading expedition from Cumberland House on the Saskatchewan River northwest to the Athabasca River as far as Lake Athabasca, where he traded with Chipewyan Indians. Pond also made the first map of the region. A decade later, in 1789, SIR ALEXANDER MACKENZIE, who migrated from Scotland to Canada via New York with his father, explored from the Great Slave Lake along the Mackenzie

River (named after him) to the Arctic Ocean. On a subsequent expedition, in 1792–93, in search of a water route to the Pacific Ocean, Mackenzie explored the Peace and Smoky Rivers, followed the Parsnip River into the ROCKY MOUNTAINS, located the Fraser River and descended Bella Coola River to the Pacific Ocean, completing the first overland journey across North America north of the Rio Grande.

19th Century

Among other Nor'westers who made a significant geographic contribution was Vermont-born SIMON FRASER. In 1805–08, exploring west of the Canadian Rockies, he followed the Fraser River (named after him), to its Pacific Ocean outlet in British Columbia. London-born DAVID THOMPSON of Welsh descent, who had started out as a Hudson's Bay Company trader, was in the North West Company's employ during two expeditions, in 1797–99, in which he explored and surveyed a vast region: from Lake Superior to Lake Winnipeg and Lake Winnipegosis; around the upper Red River, the Assiniboine River, and the upper MISSOURI RIVER; perhaps even the source of the MISSISSIPPI RIVER; and around Lesser Slave Lake and the Athabasca River. In 1800, he located the source of the Saskatchewan River in the Canadian Rockies. In 1804, Thompson became a partner in the company. In 1807–11, he carried out additional surveys, locating House Pass and Athabasca Pass in the Canadian Rockies and tracing the COLUMBIA RIVER from its source to the Pacific. Later settling in Montreal, he created the first accurately detailed map of the Canadian and American West, an area encompassing some 1.7 million square miles.

One of the founding partners in the North West Company was New Jersey-born ALEXANDER HENRY (the older). In 1791, his nephew ALEXANDER HENRY (the younger) acquired his shares in the company and began establishing and commanding trading posts along the Red River in present-day North Dakota. Over the next years, he founded a chain of posts for the company all the way to the Pacific Ocean. Similarly, in 1816–19, DONALD MACKENZIE, Alexander Mackenzie's Scottish-born cousin, after working for the Pacific Fur Company, a subsidiary of JOHN JACOB ASTOR'S AMERICAN FUR COMPANY, founded a number of North West Company posts in the Pacific Northwest. From them, he sent out fur-trapping brigades in what is now Washington, Oregon, and Idaho. After 1803, Fort William (present-day Thunder Bay, Ontario) became the primary rendezvous depot, replacing Grand Portage, which by then was American territory.

Relations between the wintering partners and the eastern merchants were not always smooth, with the former feeling that Simon McTavish and other merchants ignored many of their recommendations and were taking more than

a fair share of profits. In 1798, a group of dissatisfied traders broke away from the new North West Company and formed what became generally known as the XY Company because of the identifying marks on the fur bales. Alexander Mackenzie joined them in 1800. After the death of Simon McTavish in 1804, the breakaway group rejoined the North West Company.

The North West Company, meanwhile, with its wide-ranging traders, made significant headway in its competition with its rivals. In the north, it was active even in the region of Hudson Bay, formerly just the Hudson's Bay Company's domain. In the Pacific Northwest, it was active in Oregon Country, claimed by both the United States and England. During the War of 1812 between the United States and England, the North West Company eventually purchased Astoria from the American Fur Company. Astor's Southwest Fur Company, a subsidiary of the American Fur Company, established in 1811, involved some North West Company interests for a short time, until the war.

Meanwhile, in 1811, the Hudson's Bay Company granted one of their stockholders, Thomas Douglas, earl of Selkirk, a small part of Rupert's Land, along the Red River in present-day Manitoba, for an agricultural community. The first settlers, predominantly Scottish and some Irish peasants, arrived on the land patent in the summer of 1812. Their governor, Miles Macdonnell, fearing food shortages, gave notice to the Métis—the mixed-blood descendants of Cree and other Indians and French and Scots—that they were bound to sell their extra meat to his community rather than elsewhere. He also forbade the running of buffalo on horseback. The Métis ignored both edicts. The North West Company, aggravated by this sponsoring of farmers in fur country by their rival, supplied arms to the Métis and incited them to action. Violence broke out in 1816. Robert Semple, who had replaced Macdonnell as the colony's governor, and a number of militiamen were killed. Although the opposing factions agreed to the compromise outlined in the Selkirk Treaty of 1817, ill feelings and harassment lasted. The Selkirk incident and other conflicts led to involvement of the British government, which encouraged a merger of the two Canadian companies. It was realized in 1821, with licensing by the British government of additional territory extending to the Pacific Ocean on the west and the Arctic Ocean on the north. Although the North West Company was the more active of the two in the fur trade at that time, with more partners, the older Hudson's Bay Company controlled many of the favored westward routes, and the name of the latter company was retained.

In 1987, the Hudson's Bay Company, then active in the retail business, sold off some of its department stores in northern Canada. The company that purchased them took

the name of the North West Company and currently operates out of Winnipeg, Manitoba.

Northwest Passage

The Northwest Passage is the sea route linking the Atlantic Ocean and Pacific Ocean, located north of the North American continent. In the course of the search for a Northwest Passage—and a variation on the concept, the Strait of Anian (see ANIAN, STRAIT OF)—explorers came to define the boundaries of North America. The story of this search involves not only the stubborn desire of many individuals to find a profitable trade route but also their refusal to abandon an unproven idea in the face of difficult odds. From the time that Europeans found the Americas blocking their way to the Pacific until the time that the Northwest Passage was successfully navigated by ship, more than four centuries would elapse.

Europeans Reach the Americas

When Italian mariner CHRISTOPHER COLUMBUS, exploring for Spain, came upon islands of the WEST INDIES in the Caribbean Sea in December 1492, he believed that he had reached the SPICE ISLANDS (the Moluccas) of the EAST INDIES in the Pacific Ocean. Over the course of three voyages in 1493–1504, Columbus continued searching for confirmation of his whereabouts. These travels would ultimately take him south and west, to present-day Venezuela and Panama. Other Spanish voyages would begin to reveal the scope of the Americas.

The Portuguese expedition of PEDRO ÁLVARS CABRAL in 1500–01, which made the European discovery of present-day Brazil, also furthered knowledge of South American geography. In a bold attempt to find a passage westward, Portuguese mariner FERDINAND MAGELLAN, in service to Spain, sailed along South America's east coast, eventually passing CAPE HORN and entering the Pacific in 1520. Magellan proved a sea journey westward from Europe to Asia possible but not profitable: Most Europeans were deterred from using this route for trade because it was prohibitively time-consuming and expensive. The need for a passage to the north—a Northwest Passage—would soon take hold in the minds of European geographers, explorers, and businessmen.

First Attempts to Locate a Passage

Italian mariner JOHN CABOT was the first European to begin exploring the North American coast systematically. Sailing

for England in 1497, he made the European discovery of the islands of Labrador and Newfoundland. His expedition had been financed with the hope of his reaching the Orient. On coming upon these islands, Cabot believed, like Columbus, that he was in Asia. His misconception would soon become apparent. Still, the discovery of the rich fishing grounds of the Grand Banks proved a boon to the English fishing industry, and the king rewarded Cabot for his accomplishment. The results of Cabot's follow-up expedition in 1498 also failed to find the hoped-for passage. In 1500 and 1509, Cabot's son, SEBASTIAN CABOT, also made voyages of exploration in that area. The younger Cabot sailed past the northern tip of Newfoundland and possibly some miles into HUDSON BAY as well.

The Portuguese also explored the northern coastal regions of North America in the late 15th century. GASPAR CÔRTE-REAL claimed to have made a 1499 voyage, in which he explored the seas to the west of GREENLAND and found an outlet to the fabled Strait of Anian—another name for a supposed passage, this one thought to angle southwestward and separate North America from Asia. Now in competition with England after John Cabot's voyages, King Manuel I authorized a continuation of his explorations. In 1500, CÔRTE-REAL sailed along the west coast of Greenland, possibly crossing the ARCTIC CIRCLE, but was forced to turn back by PACK ICE. Like his predecessor Cabot, CÔRTE-REAL mistakenly believed that he had reached the northern latitudes of Asia on this voyage. On a subsequent voyage in 1501, he and his crew were lost at sea. In 1502, MIGUEL CÔRTE-REAL mounted an expedition in search of his younger brother, and he too disappeared.

The French began their quest for a westward route to the Pacific in 1524 by sponsoring Italian mariner GIOVANNI DA VERRAZANO. He set off in January of that year for the North American continent and a passage west, expecting initially to find it to the south. Blown by uncooperative winds, Verrazano landed north of his destination along the coast of the Carolinas. Sighting Pamlico Sound near Cape Hatteras, he divined that he had found the Pacific. Continuing northward, he explored New York harbor and the mouth of the Hudson River. On the final leg of his journey, Verrazano sailed along the coast of present-day Maine and on to the southern regions of Newfoundland, making a claim for French possession of the lands he had seen.

France sponsored another search for the Northwest Passage 10 years later with an expedition headed by JACQUES CARTIER. In April 1534, Cartier took two ships to the then well-known fishing grounds of the Grand Banks and sailed around Newfoundland, which he was the first to describe correctly as an island. Entering the Gulf of St. Lawrence, he proceeded westward to the Gaspé Peninsula. There, he made friendly contact with the Huron (Wyan-

dot) Indians, among them chief DONNACONNA, who offered two of his sons as guides. After exploring the shores of Quebec, Cartier returned to France. He was again instructed to find the Northwest Passage and lands of wealth. On a second journey to Canada in 1535, he explored up the St. Lawrence River to the site of present-day Montreal. He mounted a third trip to Canada in 1541, during which his progress up the St. Lawrence was blocked by the Lachine Rapids.

With more and more ships rounding South Africa into the Pacific and with knowledge of the Pacific Ocean growing, European nations began searching for the western outlet of the Northwest Passage, although the search in the west focused on the mythical Strait of Anian with a hoped-for outlet in a warm climate. The Spanish—who, by the first part of the 1520s, had established themselves in Mexico—sought a route by which they could carry Aztec gold and trade goods back to Europe. Hoping to help Spain dominate both sea and land in North America, HERNÁN CORTÉS solicited the cooperation of his king in the exploration and discovery of such a passage. While exploring California's coast in 1535, he mistook Baja California, a peninsula, for an island and assumed that the Gulf of California was the desired passage. In 1539, FRANCISCO DE ULLOA was sent to confirm the findings of Cortés and ventured northward in the Gulf of California. He found the mouth of the COLORADO RIVER instead. A 1542 expedition by JUAN RODRÍGUEZ CABRILLO explored the northwest coast nearly as far north as San Francisco. Cabrillo died the following year, and his pilot, BARTOLOMÉ FERRELO, made a trip farther north, reaching Cape Blanco on the Oregon coast. Failing to find better passage, the Spanish thus had to content themselves with the route around the tip of South America.

A New Round of Expeditions

After a hiatus of nearly 70 years, the English experienced a renewed interest in the discovery of the Northwest Passage and/or the Strait of Anian. Inspired by the geographic theories of SIR HUMPHREY GILBERT, SIR MARTIN FROBISHER organized an expedition. In June 1576, he sailed westward with a complement of three ships “in search of the passage to Cathay,” as China was then known. He thought for a time he had discovered a passage, but it turned out to be a bay on the southern end of Baffin Island, now known as Frobisher Bay. He returned to England with a piece of ore that an assayer of questionable character claimed to contain gold. While Frobisher's two subsequent expeditions to that area were motivated chiefly by the desire for gold, the explorer did manage to penetrate several hundred miles into the Hudson Strait. Frobisher's quest for gold ultimately proved futile: The ore he discovered was nothing more than FOOL'S GOLD, the mineral pyrite.

English ambitions for the passage continued with the voyages of JOHN DAVIS. He was an excellent navigator and the inventor of the Davis QUADRANT, an improved version of earlier navigational tools. Davis's first voyage took place in 1585, during which he continued the English exploration of Baffin Island, including Cumberland Sound. He thought the sound to be the long-hoped-for passage, but pack ice prevented him from confirming this. A kidnapped Inuit (Eskimo) man aided Davis in his second expedition; he guided Davis and his crew northward along the west coast of Greenland. From there, Davis then continued his exploration of Baffin Island and explored Exeter Sound. He also revisited Cumberland Sound. On a third journey the following year, Davis set a new record for northernmost point achieved, nearly 73 degrees north latitude, but was once again turned away by ice. He continued to be confident, however, that the passage lay just beyond, waiting to be discovered when the weather proved satisfactory.

On the North American west coast, the English became a major nuisance to the Spanish treasure ships, largely in the person of SIR FRANCIS DRAKE. As he conducted raids on the Spanish in the Pacific, Drake also sought the western end of the Northwest Passage. A trip in 1579 took him as far as Vancouver Island near the present United States–Canada border without results. The 1602–03 voyage of the Spaniard SEBASTIÁN VISCAÍNO traced a similar portion of coastline, with equally disappointing results.

The 1609 voyage to the North Atlantic by HENRY HUDSON, an Englishman funded by the DUTCH EAST INDIA COMPANY, is notable in that he searched for both the NORTHEAST PASSAGE and the Northwest Passage. He first headed northward along the west coast of Norway. Encountering treacherous ice near Novaya Zemlya and receiving strong criticism from his crew, he turned back. Hudson was a willful captain, however, and asserting his prerogatives, he chose to head westward. On the east coast of North America he investigated both Chesapeake Bay, Delaware Bay, New York Bay, and the Hudson River (named for him) before returning to Europe. The following year, this time in the employ of English merchants, Hudson forged through the strait that now bears his name and came upon Hudson Bay (also named for him). Heading southward, he and his crew entered James Bay. The ship wintered at the southernmost point; the next summer, as they were heading back north, the crew mutinied and set Hudson, his son John, and seven loyal sailors adrift. They were never heard from again.

The western side of Hudson Bay was still unexplored, and, with the belief that it would reveal a passage to the east, a new company was formed in England. The COMPANY OF MERCHANTS OF LONDON DISCOVERERS OF THE NORTHWEST PASSAGE, with some of the same members as the MUSCOVY COMPANY, sent SIR THOMAS BUTTON to the bay on a scouting mission in 1612. He landed on Hudson Bay's west

shore at the mouth of the Nelson River. The expedition wintered there; the following spring, Button sailed northward along the coast as far as Southampton Island. Once again, a promising body of water had yielded no route west. Nevertheless, Button had charted 600 miles of previously unknown coastline.

In 1615, WILLIAM BAFFIN, accompanied by ROBERT BYLOT (who had sailed with both Hudson and Button), again searched for an outlet along the west shore of Hudson Bay. In a second expedition the following year, Baffin and Bylot took a different route in search of the passage. Making for the extreme north along the coast of Greenland, they were determined to go beyond the haunts of the whalers of Davis Strait. Entering the region that came to be known as Baffin Bay, they set a new northernmost record at 78 degrees latitude. On the way home they discovered and named Lancaster Sound, which would later prove to be the opening to the actual Northwest Passage.

Another journey of note was conducted by Danish explorer JENS ERIKSEN MUNK. He embarked in May 1619, winding his way past Greenland to Frobisher Bay, then on to Hudson Strait and Hudson Bay. He and his crew wintered at Churchill River on the west shore of the bay and became severely ill with SCURVY and, perhaps, food poisoning. Only Munk and two others survived, managing to return to Denmark in September 1620.

The last search of this era occurred between two rival English expeditions. In May 1631, LUKE FOXE and THOMAS JAMES left England only two days apart, both bound for Hudson Bay. In August of that year, the two captains had dinner together at James Bay. Foxe returned to England, having been convinced by his observations that no outlet to the west existed in Hudson Bay, while James wintered on Charlton Island. James and his crew suffered horribly through the winter, the weather being severe and scurvy claiming some of his crew. When summer 1632 arrived, James investigated Foxe Channel before returning to England.

Hudson's Bay Company

Over the ensuing decades, the English and the French fought for decades for dominance of Hudson Bay and its lucrative FUR TRADE with the Indians. The HUDSON'S BAY COMPANY, chartered in 1670, was the sole legal representative of England in the area, while a number of French interests attempted to develop the region. Following the Treaty of Utrecht in 1713, which secured its outposts in the region, the Hudson's Bay Company began a new phase of exploration in the area. The newly appointed governor for the company was JAMES KNIGHT. In 1715, he sent William Stuart on a diplomatic mission to the Indians west of the post at Churchill. Stuart's travels lasted nearly a year. He returned with Chipewyan Indians, who told Knight of "Ships in the

Western Seas" and "a Yellow Mettle" to the northwest. Such tales proved irresistible to Knight, who sought support from his company for an expedition. He was close to 80 years old when he and his two ships sailed northward in 1719. It was late in the season, and they became trapped in the ice off Marble Island. In a particularly sad episode in the search for the passage, all members of the group perished. The remains of the ships were not found for another 50 years.

Political heat began to grow against the Hudson's Bay Company. Their royal charter granted the group a monopoly on trade in the region, yet they were lax in fulfilling their duty to explore the area and to expand the power of England, which was still in competition with France. A member of Parliament, Arthur Dobbs, enlisted the help of the Royal Navy and, in 1742, sent an expedition under CHRISTOPHER MIDDLETON to form a basis to challenge the company's monopoly. Middleton chose the warmest time of year for his expedition and achieved the northernmost point of the bay yet discovered. The European discovery of Wager Bay is credited to him, as is the discovery of Repulse Bay, where the narrow seas between Southampton Island and the continent were frozen. Dobbs insisted on a second expedition, which was captained by WILLIAM MOOR in 1746–47. He sailed into Chesterfield Inlet and farther into Wager Bay than Middleton had gone, once again to no avail.

SAMUEL HEARNE's overland expedition of 1770–72 for the Hudson's Bay Company helped dispel remaining myths. With the help of the Chipewyan MATONABBEE, he headed northwestward from Fort Churchill in the employ of the Hudson's Bay Company. At the Great Slave Lake, he turned to the north, eventually reaching the north shore of North America on the Arctic Ocean at the mouth of the Coppermine River. He was fully aware of his achievement on this journey, reporting back the absence of an inland waterway capable of accommodating oceangoing ships and making it apparent that the search for the Northwest Passage would have to concentrate on more northerly regions, counter to prevalent views of the Strait of Anian.

Pacific Northwest

In the 1770s, the Spanish stepped up their activities in the Pacific Northwest, including the search for a western outlet for a passage across North America. JUAN JOSEF PÉREZ HERNÁNDEZ was deployed in 1774 to explore the coast and to claim all the lands attractive for settlement as far north as 60 degrees north latitude. He made it as far north as Queen Charlotte Island, where he traded with the Haida Indians, a tribe that had been previously unknown to the Europeans. Unfavorable winds prevented him from proceeding farther, and he fell approximately 17 degrees short of completing his mission. The next year, two ships were sent north, one under the command of BRUNO HECETA and the other captained by JUAN FRANCISCO DE LA BODEGA Y QUADRA. Heceta

reached as far north as Vancouver Island before turning back, the ship taking on water and the crew beset by scurvy. Bodega y Quadra's ship continued northward. After achieving 58 degrees 30 minutes north latitude, he was turned away by rough seas. The most dramatic results were accomplished by Bodega y Quadra and Ignacio de Arteaga in 1779, when they passed the coast of Canada and explored the islands and bays of the Gulf of Alaska. Arteaga took possession of Hinchinbrook Island in July and sailed westward, grazing the tip of Kodiak Island before returning southward. Arteaga had found no passage and thus confidently reported that there was no chance of the British finding it either. Such an assessment was premature, since Arteaga had not ventured beyond the Alaskan Peninsula, where the sea offers entry among the Aleutian Islands.

The expedition that did go beyond the Aleutians had occurred the previous year, under the direction of Englishman JAMES COOK. After Hearne's discovery of the north shore of the continent in 1771, hope had been renewed for finding the passage. Jacob Stählin published a map that showed a great strait to the north of "Alaschka." In spring 1778, Cook sailed along the shore of Alaska, not realizing how far west he would have to go. He had hopes raised and dashed several times as so many prior expeditions had experienced. He explored Prince William Sound and found it to be a dead end. Cook Inlet, which doubled back to the east for a substantial distance, also proved not to be the desired passage. By August, Cook had found the BERING STRAIT and sailed northward, tracing the coastline as he went. Setting a record for northernmost point in that part of the world on August 18, at 70 degrees 41 minutes, he was turned back by ice as high and solid as a wall.

Trading became more established along North America's northwest coast in the following years, and competition intensified between Spain, England, France, and the United States. The Strait of Juan de Fuca still had not been adequately described, and, from 1786 until the mid-1790s, all four of these nations sent expeditions to stake their claims. The most thorough of these expeditions was conducted by GEORGE VANCOUVER in 1792–94. Sailing for the British, he mapped the coastline, circumnavigated Vancouver Island, and determined that the coastline from California and Alaska offered no outlet.

Meanwhile, others continued to seek a Northwest Passage by exploring westward by land. American-born ROBERT ROGERS, who established his reputation in the French and Indian War of 1754–63, dreamed of locating a water route to the Pacific and dispatched fellow soldier JONATHAN CARVER to the western Great Lakes and beyond to the MISSISSIPPI RIVER. But, because of a lack of supplies, the expedition proceeded no farther, lands to the west remained uncharted, and the issue of a water route west remained unresolved.

19th Century

At the start of the 19th century, there was still a belief that there was a practical water connection through North America. Even American MERIWETHER LEWIS of the U.S. Lewis and Clark Expedition of 1804–06 thought he might determine such a passage as he headed up the MISSOURI RIVER with the Corps of Discovery, eventually coming up against the ROCKY MOUNTAINS. Later exploration for such a passage concentrated on Arctic waters.

As Great Britain entered the second decade of the 19th century, it had a large and powerful navy that was underoccupied in the wake of the Napoleonic Wars. The growth of an interest in natural science, and Russian activity in Alaska ever since the voyages of VITUS JONASSEN BERING in the 1720s–1740s, helped to renew talk of exploration in the polar sea. The event that began this next phase came in 1817, when WILLIAM SCORESBY, JR., returned from a whaling expedition to the North Atlantic with the report of unusually clear seas north of the Arctic Circle. The news reached SIR JOSEPH BANKS who passed it to SIR JOHN BARROW, the head of the Admiralty, who immediately began preparations. An 1818 expedition led by SIR JOHN ROSS, with SIR WILLIAM EDWARD PARRY commanding a second ship, set out to explore east of Baffin Island. The first portion of their journey took them north along Greenland's west coast into Smith Sound. Finding it impassable, they looped to the south along the east coast of Ellesmere Island, where they came upon Jones Sound. This, too, was blocked by ice, and they proceeded southward to Lancaster Sound. Ross believed he sighted a chain of mountains blocking the end of the sound, which he named the "Croker Mountains." No one else had seen them, including Parry, who was greatly dismayed at having to turn back for England. Ross was criticized for this incident for some time to come.

The British navy wasted no time in planning another expedition to the Canadian Arctic for 1819. The navy decided to mount a two-pronged strategy, with a naval component headed by Parry and an overland caravan to the mouth of the Coppermine River led by SIR JOHN FRANKLIN. Parry entered Lancaster Sound, whereupon he soon debunked Ross's mountains as a mirage (and seeming to take some pleasure as he described in his journal the good conditions his ship encountered). After investigating Prince Regent Inlet, he headed westward, passing the NORTH MAGNETIC POLE as he skirted the permanent pack ice to the north. In August 1820, Parry was halted by ice at the northern end of Bank Island and headed back to England. Franklin's expedition traveled eastward, where they mapped more than 500 miles of coastline. They soon ran short of food, however, and the situation quickly deteriorated; murder and cannibalism infected the group. Franklin and a small group of survivors managed to return to Hudson Bay in 1822. Meanwhile, in 1821, Parry made another voyage

from Hudson Strait to Foxe Basin, entering Fury and Hecla Straits on the northern end of Melville Peninsula.

Franklin mounted a second expedition in 1825, this time traveling down the Mackenzie River to its outlet in the Beaufort Sea. Here, his party split: Franklin and GEORGE BACK traveled westward, and SIR JOHN RICHARDSON, also part of the original party, eastward. Franklin had hoped to meet with Captain FREDERICK WILLIAM BEECHEY, coming from the west via Alaska, but Beechey had been stopped by ice buildup. Franklin returned to the east after finding and naming Prudhoe Bay.

More than 10 years after the “Croker Mountains” incident, Captain John Ross was given a chance to redeem himself by the philanthropist Felix Booth, who, in 1829, financed Ross’s next expedition to map the passage. Returning to the region through Lancaster Sound, Ross and his nephew, SIR JAMES CLARK ROSS, sailed southward along the Boothia Peninsula, conducting land excursions as well. The expedition proved to be a long one. In May 1832, with their ship trapped in ice, captain and crew headed northward on foot. After about 300 miles, they came upon the wreck of the *Fury*, a ship Parry had used. They set up camp for the winter, living off the provisions on the abandoned ship. In spring, they made for Lancaster Sound and were rescued in August 1833. Ross was knighted the following year; he was also awarded a prize of £5,000 by Parliament, which he shared with his men.

As of 1837, the mapping of the Northwest Passage remained incomplete. On an expedition for the Hudson’s Bay Company in 1837–38, PETER WARREN DEASE and SIR THOMAS SIMPSON sketched in the northern edge of the continent between the Return Islands and Point Barrow. On a second expedition, from 1838 to 1839, they mapped the coast from Coronation Gulf to Rae Strait. Here they just missed solving the riddle of the passage because the strait, which Ross had navigated just a few years earlier, was frozen.

The most publicized story in the search for the Northwest Passage was the final voyage of Sir John Franklin. Leaving England in May 1845 with two ships, the *Erebus* and the *Terror*, he passed through Lancaster Sound, continuing northward past Devon Island into Wellington Channel. After circling Cornwallis Island and navigating Barrow Strait, he headed southward through Peel Strait and into Franklin Strait. In September 1846, pack ice began to form, and off the coast of King William Island in Victoria Strait the Franklin expedition was trapped. In June the following year Franklin died. Some of his men managed to make it south to the Boothia Peninsula, where they perished in 1848. The lack of news from the expedition was slow to generate a response. No rescue missions went out immediately to find Franklin and his crew, since it was known that they had supplies enough for three years. When it became ap-

parent that Franklin was missing, however, there ensued a great outpouring of effort: Between 1847 and 1878, some 50 expeditions set out to find Franklin and to garner information of his expedition’s fate (see SEARCHES FOR MISSING EXPLORERS).

Through the Northwest Passage

ROALD ENGELBREGT GRAVNING AMUNDSEN headed the expedition that finally succeeded in traveling the whole length of the Northwest Passage in 1903–06. In making this journey, Amundsen used a small Norwegian fishing boat named the *Gjoa*, which proved easy to handle and quite sturdy. Amundsen was a meticulous planner and had provisions on board to last five years; furthermore, he was careful to take measures to provide safety and comfort for the crew of six. In order to avoid having his ship impounded by creditors, Amundsen left Norway in June 1903, under cover of night and in pouring rain. His expedition succeeded in its mission by sailing beyond Greenland into Baffin Bay and Lancaster Sound, then down Peel Strait into Franklin Strait. Along with the completion of the Northwest Passage, it was Amundsen’s objective to locate the North Magnetic Pole. Amundsen wintered at a bay on the south coast of King William Island, and he and his crew made measurements in the area until August 1905. In making the passage, he then proceeded through Rae Strait, staying close to the shore in Queen Maud Gulf, through Dease Strait and Coronation Gulf, into what came to be known as Amundsen Gulf. On September 2, the group became trapped in ice near King Point. While waiting for the thaw, Amundsen made an overland trek through the Yukon. In July 1906, when the ship was finally freed from the ice, he continued along the northern Canadian border, around Alaska, through the Bering Strait, and on to California. Amundsen had been preparing a navigation of the Northwest Passage for years. When he finally accomplished the elusive goal, he made it seem simple.

By the time it had been fully mapped and explored, the Northwest Passage was no longer considered to be the “holy grail” of trade routes. The Panama Canal, completed in Central America in 1914, created a practical water route through the Americas. Activity continued in Arctic waterways, for both trade and military purposes, but not as a passage between oceans. For a time it was thought that the route might be used west to east for carrying oil from the North Slope of Alaska to the eastern United States, but the building of the Alaska pipeline made that notion obsolete. The history of the Northwest Passage and the four-century-long search for it thus has more relevance in the geographic knowledge gained than in pioneering a new water route.

ocean currents

Earth's oceans have patterns of movement known as ocean currents. There are several major factors that contribute to the direction of ocean currents: Earth's rotation; wind friction at the surface of the water; variations in water density resulting from differences in temperature and salinity; and the effect of landmasses.

Surface currents flow in several basic circulatory patterns known as gyres. There are numerous regional exceptions, with many branch and feeder currents helping circulate waters. Surface currents are classified by intensity as "streams," the fastest at two to four miles per hour; the slower "drifts"; or the barely perceptible "creeps." Tidal currents, a type of surface current, are shaped by tide, the alternate rise and fall of waters caused by the gravitational effect of the Moon, Sun, and, to a lesser extent, other celestial bodies. There are also flow patterns in the deep ocean, including immense underwater cascades, or cataracts, that develop when cold water near the ocean floor spills over the edge of one ocean basin into another.

The TRADE WINDS are the basic wind systems in the Atlantic, the Pacific, and the Indian Oceans in both the Northern Hemisphere and Southern Hemisphere. In the Northern Hemisphere, they circulate in a clockwise direction, while in the Southern Hemisphere they move counterclockwise. They contribute significantly to the circular motion of the oceans. Another significant factor is the Coriolis effect (or, Coriolis force or Coriolis acceleration), named for its dis-

coverer Gaspar Coriolis, a 19th-century French civil engineer. This is an apparent force on winds, cloud, and aircraft caused by the rotation of Earth under them, such that their motion is deflected clockwise in the Northern Hemisphere and counterclockwise in the Southern Hemisphere, although speed is unaffected. The Coriolis effect arises from the fact that, because of the higher pressures at higher altitudes of the warm air masses near the EQUATOR relative to those at the same altitudes to the north, an airflow toward the NORTH POLE and the SOUTH POLE occurs. In the Northern Hemisphere this flow is deflected by friction to the right or eastward as Earth's surface rotates from west to east beneath it. The effect is zero at the equator and increases with increasing latitude; it is responsible for the prevailing westerly winds over North America. When winds and the Coriolis effect interact with the continents, the major circular current systems of the ocean, or gyres, are created. It is useful to remember that meteorologists name winds for the direction from which they come, and oceanographers cite the direction in which currents go.

The surface waters of the Atlantic have two large gyres, one in the North Atlantic and one in the South Atlantic. The currents of the North Atlantic, including the North Equatorial Current, the Canaries Current, and the GULF STREAM, flow in a clockwise direction, again caused by heating at the equator, which causes ocean water to move northward at the same time as it is being carried eastward by Earth's rotation. The Gulf Stream is thought to have been

slowed in the past by warming of North Atlantic waters, perhaps contributing to the ice ages. The currents of the South Atlantic, including the South Equatorial Current, Brazil Current, and Benguela Current, flow in a counterclockwise direction.

The North Pacific has a clockwise current system divided into four main sections. In the north is the North Pacific Current. This feeds the California Current, which becomes the North Equatorial Current, and then the Japan (Kuroshio) Current. The South Pacific has currents rotating in a counterclockwise direction, from the Antarctic Drift, to the Peru Current, and the South Equatorial Current, which is split into three parts by Australia and New Guinea.

In its southern regions, the Indian Ocean has counterclockwise currents similar to those of the Atlantic and Pacific. These include the South Equatorial Current, the Mozambique Current, and the West Australian Current. In the north, the currents are dominated by the seasonal monsoon winds.

In the higher latitudes of the Northern and Southern Hemispheres are counter-rotating gyres, one rotating counterclockwise in Arctic regions and one rotating clockwise in Antarctic regions. The Antarctic Circumpolar Current (West Wind Drift) encircles the globe, merging the waters of the Atlantic, Pacific, and Indian Oceans without interference of land.

Just to the north of the equator, in all three oceans, there runs an eastward-flowing equatorial countercurrent. When the two westward-flowing currents from each hemisphere meet land near the equator, water pressure builds up. Some of the water flows north and some flows south. A third current is formed in the middle, encouraged by the band of upwelling air in the region known as the DOLDRUMS. The doldrums are relatively calm and, combined with the slow-moving equatorial countercurrents, have been feared by sailors for centuries.

Once a current system was understood, it could be used to great advantage by the skilled navigator. By taking a route in harmony with a strong current, the sailor can add several knots to the speed of his ship. One of Italian mariner CHRISTOPHER COLUMBUS's accomplishments on his first transatlantic journey was using the Gulf Stream to return to Europe in 1493. The first charts to show ocean currents were drafted in about 1665.

Oceania

The term *Oceania* refers to a vast expanse of islands in the tropical and the subtropical regions of the Pacific Ocean. The islands of Oceania are divided into three main groups—Melanesia, Micronesia, and Polynesia. They are differentiated by the physical characteristics of the islands, as well as by the inhabitants on them. Of the physical characteristics,

the islands of Oceania are of two basic types—volcanic and coral. The volcanic islands are almost always the larger, and the only ones with mountains. They are primarily composed of basalt, a black volcanic rock. The coral islands, also called atolls, have a limestone base formed from the skeletons of the coral animal. These are small, low-lying, and have limited resources, although some are large enough to sustain human populations. The formation of atolls is not completely understood geologically, but it is believed that they, too, have a volcanic origin, their underwater formations offering corals a place to grow. When the volcanic substrate was eroded, or otherwise retreated to the ocean floor, the coral would continue to expand upon its base. In all, the islands of Oceania number some 25,000, only a few thousand of which are named.

In the west, Oceania begins where the Moluccas (SPICE ISLANDS) end. One of the largest of its islands, New Guinea, marks the western extent of Melanesia. The name *Melanesia*—based on the Greek roots for “black islands”—refers to their volcanic origin. Extending east and south, Melanesia includes the Bismarck Archipelago, the Solomon Islands, the Santa Cruz Islands, the New Hebrides, New Caledonia, and the Fiji Island group. To the north of Melanesia, yet forming an arc to the southeast, are the islands of Micronesia. The name *Micronesia* is from the Greek for “small islands.” Micronesia contains the Mariana Islands in the northwest, the Caroline Islands to the south, the Marshall Islands to the east and the Gilbert and Ellice groups. The name *Polynesia* means “many islands.” Polynesia is the most widely scattered group and also the most diverse morphologically. Polynesia forms a triangle to the east of Melanesia and Micronesia. The HAWAIIAN ISLANDS are at its apex to the north; NEW ZEALAND occupies the southwest corner; and Easter Island is situated in the southeast corner. Island groups and islands in the middle of the triangle include American Samoa, Cook Islands, French Polynesia (Society Islands, Marquesas Islands, Tubuai Islands, Tuamotu Islands, and Gambier Islands), Niue, Pitcairn Islands, Samoa (formerly Western Samoa), Tokelau, Tonga, Tuvalu, and the Wallis and Futuna Islands.

First Inhabitants

The process by which the islands of Oceania were settled is the subject of ongoing study. The best information comes from research on those peoples who are alive today—their physical characteristics, their technologies, religions, and arts. This is not a simple task, for there has been much mixing among the various ethnic groups that migrated to the islands. It is widely accepted that Melanesia was the first section of Oceania to be settled. Between 20,000 and 11,000 years ago, as the last ice age was ending, these islands became isolated from one another and the rest of Southeast Asia. It is believed that the first residents of the area at the time

were a group having Negroid characteristics. The stone-age tribes who continue to inhabit the mountains of New Guinea are the best living representatives of these people. As they diffused through the islands, they were met by another strain of aboriginal people, the Negritos, who were shorter of stature and came from the Andaman Islands, the Philippines, and Malaya. These may have been the peoples who also migrated to Africa and became the Mubuti. A third group also figures into the ancient settlement of Melanesia, and these are called the Ainoids; they possess Caucasian features, with lighter skin and hairier bodies. The Ainu people of Northern Japan are a modern incarnation of this stock. There were two or three great waves of migration of these peoples more than 10,000 years ago to the islands of Melanesia, which resulted in the mixing of blood and the creation of a new group. Melanesians of ancient ancestry have dark skin, curly hair, and a strong build. These people were hunter-gatherers and fishermen. They were joined by yet another group, a Proto-Malay people, between 4,000 and 5,000 years ago, who had light brown skin, straighter hair, and broad cheekbones. The Proto-Malays introduced the cultivation of plants and raising animals. They also made more advanced tools from stone.

The settlement of Micronesia was more recent than that of Melanesia, since many of the atolls of the region had yet to be formed when Melanesia was becoming populated. Micronesia was probably settled around 5,000 years ago, as the Proto-Malays swept into Melanesia. As the former Melanesians came upon these smaller, less fertile islands, they adapted their lifestyles to the resources available. They were no longer able to make pottery, and agriculture was more limited, so they became more practiced in the arts of the sea. Boat-building, seafaring, and navigation became the center of the culture in Micronesia.

The islands of Polynesia were populated last, probably starting with the Marquesas. It is generally held that the Polynesians originated in Southeast Asia, although some scholars believe they migrated to the region from the Americas. They show characteristics of a mixture of ethnic groups, with Asian and Caucasian features most apparent.

Arrival of Europeans

The European discovery of Oceania occurred in the early 16th century. The arrival of Europeans to the South Pacific was inspired by the SPICE TRADE, which had been monopolized by Arab merchants. The Portuguese were the first Europeans to arrive in the region, and it may have been Antonio d'Abreu who first saw Oceania when he made the European discovery of New Guinea in 1511. Commercial interests were paramount, however, and, after setting up operations in the Spice Islands, the Portuguese carried out few explorations of islands to the east. The Spanish, who had been excluded from the Portuguese route around Africa, es-

tablished the westward route to the Pacific in 1520, when FERDINAND MAGELLAN rounded South America. He made the European discovery of the Marianas Islands the next year.

In later years, growing commercial competition between Portugal and Spain led to growing knowledge of the South Pacific Islands. The Spanish took the lead. In 1528, ÁLVARO DE SAAVEDRA CERÓN found parts of the Caroline and the Marshall groups. In hopes of finding the GREAT SOUTHERN CONTINENT (*Terra Australis*), ÁLVARO DE MENDAÑA, also working for Spain, came upon the Solomon Islands in 1567. On a later expedition in 1595, he found the Marquesas and the Santa Cruz Islands. De Mendaña died on this journey, and command was assumed by his pilot, PEDRO FERNÁNDEZ DE QUIRÓS, who proved to be one of Oceania's more successful explorers, and, on his voyage of 1605–06, he made the European discovery of islands in the Samoa group, the Cook group, and the New Hebrides.

Other European nations began exploring the region for new markets. The Dutch began to challenge the Portuguese in the Spice Islands and started to reap great profits. WILLEM CORNELIS SCHOUTEN, who sailed for the DUTCH EAST INDIA COMPANY, discovered the Bismarck Archipelago in 1616. ABEL JANSZON TASMÁN, another Dutchman working for the same company, made the European discovery of New Zealand, parts of the Friendly Islands, and the Fiji group on his expedition of 1642–43. The other great Dutch explorer to navigate the waters of Oceania was JAKOB ROGGEVEEN, who located Easter Island and islands in the Samoan chain in 1722.

Growing Knowledge

Though they were late in arriving, the British made important contributions to the exploration of Oceania. Improved navigational technology helped fix the position of islands that had been discovered and rediscovered, names were sorted out, and more accurate maps were made. In his expedition of 1764–66, JOHN BYRON explored previously uncharted islands in the Marshalls and Marianas. SAMUEL WALLIS and PHILIP CARTERET were commissioned by the British Admiralty to journey to the Pacific in 1766; Wallis went on to make the European discovery of Tahiti, part of the Society Island group; Carteret made the European discovery of Pitcairn Island. Their findings were followed up by the most tireless and successful of all the explorers of Oceania and the Pacific, JAMES COOK. Cook visited the Society Islands and New Zealand on his first Pacific voyage of 1768–71. On his second Pacific voyage, in 1772–75, he returned to those islands again and visited New Caledonia and the New Hebrides. Cook's greatest accomplishments were made on his third Pacific voyage of 1776 to 1780. It was then that he made the European discovery of the Hawaiian Islands and charted the Cook and the Friendly Islands.

Modern Oceania

Because of their wide range, and the minute size of some of the islands, the complete cataloging of Oceania did not take place until the advent of SATELLITE technology. Their populations are still in flux, as atolls become depleted of resources, and political boundaries are shifted. Colonization has had a profound effect on the native peoples, because of foreign diseases, slavery, new religions, and other cultural practices. The human population of 1.2 million is still largely indigenous, with only 20 percent Asian and 7 percent European stock. Oceania has exported agricultural products such as copra (from the coconut), fruits, and timber. It has also given up her mineral deposits to the west, including phosphates. Today, tourism presents the best hope for a sustainable economy on many of the islands of Oceania.

oceanography and exploration

Oceanography is the study of the world's oceans and makes use of all the scientific disciplines in studying them and studying their interactions with land and atmosphere. As HYDROGRAPHY—the surveying, charting, and sounding of water bodies—oceanography is a branch of geography.

It is often said that we know less about the world's oceans than we do about space. To deep-sea explorers, the water pressure in ocean depths presents technical challenges that rival those of walking on the Moon. Underwater exploration is also a resource-intensive activity, involving significant risks and uncertain reward. In recent decades deep-sea risks to both life and equipment have been reduced but by no means eliminated. For these reasons, the active environment of the undersea world has yet to be comprehensively explored, and there are still many species of plants and animals yet to be discovered.

Four Oceanographic Specialties

In order to allow for precise study of the world's oceans, oceanography has been divided into four principal specialties. One is physical oceanography, which is concerned with the motion of water in the oceans, from fast-moving OCEAN CURRENTS to the slower mixing processes that take place. The study of winds and temperatures are central to this specialty. Another division of oceanography is chemical oceanography. This field examines the chemical composition of seawater and its local variations, as well as all chemical reactions that occur in the ocean (and between the ocean and the ocean floor). As salinity (salt content) varies with temperature, the disciplines of chemical and physical oceanography intersect frequently. The third type of study, geological oceanography, looks at the changing topography of the ocean floor, in the past and present. The bottom of

the ocean is an active place and at least as varied in morphology as surface land. Finally, biological oceanography is the study of the flora and fauna living in the ocean. Water temperature, nutrients in the water, and conditions on the ocean's floor all influence which species thrive in which seas. For example, in the process of upwelling, winds generate surface currents that draw cool, nutrient-rich water from the ocean's bottom, creating favorable conditions for the development of plankton, which plays a critical part in the food chain for all other ocean life. Perhaps even more than in terrestrial systems, ocean subspecies are interconnected: The study and understanding of a single species is extremely difficult in isolation.

The Foundations of Oceanography

Humankind's study of the oceans began for practical reasons. The ancients traveled on the seas for a variety of purposes, including migration, trade, warfare, fishing, and tourism. To make these activities safer, travelers sought to understand the oceans' weather conditions and hazards. The MEDITERRANEAN SEA, a relatively hospitable body of water, served as an ideal laboratory for ancient peoples, such as the Minoans, Egyptians, Phoenicians, and Greeks, to practice their sea craft and to learn about the oceans, starting with the mariners, but also pursued by scholars, especially among the Greeks. The type of ancient text known as a PERIPLUS (plural form, *peripli*), associated especially with the Greeks and Romans, served as sailing and harbor guides, describing landmarks, harbors, anchorages, watering places, and winds and currents of familiar regions.

In the fifth century B.C., Greek philosopher Parmenides hypothesized that the Earth was round. At that time, there was much speculation concerning what lay at the edges of the world, such as unbearably frigid zones and whirlpools. As it developed, Greek geography became more accurate and detailed. ERATOSTHENES, a mathematician, astronomer, and geographer, calculated the circumference of Earth with good precision in about 250 B.C. The ratio of land to ocean and the geography and geology of coastlines were of interest to later Greek scholars such as STRABO, who, in about A.D. 18, theorized that one could circumnavigate the globe (see CIRCUMNAVIGATION OF THE WORLD) and wrote the work known as *Geographia*. The Greeks also began to classify living things into groups and subgroups and recognized the difference between oceanic mammals, such as whales, dolphins, and fish.

One aspect of oceanic exploration that has always depended more on the courage and fortitude of the individual than on the precepts of science and technology is the art of free diving. Archaeological evidence from Mesopotamia (in the form of shells that could only have been collected from the ocean floor) demonstrates that man has been free diving since at least 4500 B.C. Decorative objects made from

mother-of-pearl were popular in Egypt starting about 3200 B.C., which indicates that harvesting the oysters from which these decorative objects were made was an industry in its own right. Collecting sponges from the ocean bottom for various practical uses has been an activity of many ancient peoples. The Greeks are perhaps the most famous for their sponge diving, an endeavor that continues to this day.

Superstitions of the Middle Ages slowed the advancement of all the sciences, including oceanography. When HENRY THE NAVIGATOR, prince of Portugal, developed the CARAVEL to navigate the waters along the west coast of Africa in the 15th century, oceanography underwent a resurgence, again for practical reasons. Trade with the East was the goal, and maritime transportation, the means. Inclement weather and dangerous coastlines were merely obstacles to overcome. Europeans learned of the monsoon winds of the Indian Ocean from the Arab Muslims, who had been trading in the East for centuries. Ocean currents, which sailors always sought to take advantage of, became more important in navigation. In the late 15th century, Italian CHRISTOPHER COLUMBUS, who was innovative in many areas of seamanship, used the GULF STREAM to return to Spain, the sponsoring country of his expeditions. In the 17th century, on the way around Africa to the SPICE ISLANDS (the Moluccas), the Dutch discovered the “roaring forties,” winds which send a sailing ship speedily on its way eastward.

Pioneers of Oceanography

As trade routes were established, and the hydrography of ports and dangerous waters were mapped, ocean science began to be developed more independently. Englishman JAMES COOK, an excellent hydrographer in his day, is often credited with helping to legitimize study of ocean geography as a scientific inquiry in its own right. In 1759–60, working for his homeland of England, he mapped the lower portion of the St. Lawrence River and its outlets in northeastern North America. He returned to the region in 1763 and spent three years mapping the coast of Newfoundland. Cook is most famous, however, for his three expeditions to the Pacific Ocean, between 1768 and 1780. These voyages included explorations to the northern Arctic and the southern Antarctic regions. A staff of scientists traveled with him to make observations of the physical condition of the seas and to collect specimens of living creatures. JOHANN REINHOLD FORSTER, a German naturalist, made some of the earliest oceanographic studies, discovering differences in ocean temperature at different depths, the key to understanding the genesis of ocean currents and ultimately worldwide weather patterns. Cook was greatly aided in the accurate recording of his data by the use of the CHRONOMETER, which had recently been invented. Using the chronometer, Cook was able to compute longitude accurately, which then enabled him to map

more precisely the location of land, islands, currents, and weather patterns.

Another pioneer in oceanography was Frenchman LOUIS-FERDINAND MARSIGLI. In 1706–08, while living in southern France, he surveyed and studied the Mediterranean's coastline and floor, including the ocean's waves, tides, and currents. He also collected wildlife specimens, especially corals, and examined them under a microscope.

German naturalist and traveler ALEXANDER VON HUMBOLDT had a keen sense of the physical world, and his scientific inquiries led to the development of many of the basic concepts in geography and meteorology. During his extensive travels in South America at the turn of the 19th century, he observed the cool, humid climate of Peru and rightly made the connection between Peru's climate and a low-temperature current generated by the southern winds.

In 1770, Benjamin Franklin published a map of the Gulf Stream, using information he had obtained from whalers. For this he is credited with having originated oceanography in America. His pioneering study of detailed records—that is, ships' logs as an aid to oceanography—yielded the practical benefit of decreasing shipping times for merchant vessels. Another American innovator, MATTHEW FONTAINE MAURY, working for the U.S. Navy, studied the interaction between the weather and currents in the Atlantic Ocean. In 1842, the navy employed him as chart-keeper, which provided him with a wealth of material to study. The routes he designed made sea travel much more efficient. His 1855 book, *The Physical Geography of the Sea*, dealing with currents and depth soundings, is considered the first textbook of modern oceanography.

Englishman EDWARD FORBES took a multidisciplinary approach to the study of the sea. Trained in geology, biology, and paleontology, Forbes described the different layers of ocean and the life that inhabited them. In 1850, he postulated that beyond 1,800 feet below sea level, in what he labeled the Azoic zone, no life could exist. From a sample dredged on the ocean floor and preserved in alcohol, he came to believe in a primordial ooze that gave rise to life as we know it. It was later realized that his gelatinous ooze was a precipitate of calcium sulfate, caused by a reaction between the alcohol and seawater. Despite some of his wrong conclusions, Forbes has been referred to as the “father of marine biology” because of his focus on marine life and his methodology.

The Challenger Expedition

Several factors led the British government, in cooperation with the ROYAL SOCIETY, to sponsor the voyage of the *Challenger* in 1872–76. Though scientists had made oceanographic trips before it, the *Challenger* expedition is considered the beginning of serious ocean exploration. The controversy that Forbes had generated with his theories and

Britain's desire to maintain a lead in ocean science helped bring about the journey's funding. The leader of the expedition was SIR CHARLES WYVILLE THOMSON, a Scottish naturalist who had previous experience in ocean exploration, including dredging the North Atlantic. Among the scientific staff was Scottish chemist John Young Buchanan and Canadian John Murray, who would later play the key role of analyzing data from the voyage.

The *Challenger*, captained by SIR GEORGE STRONG NARES, departed Portsmouth on December 21, 1872. She had equipment on board to make meteorological, hydrographic, and magnetic measurements, as well as to conduct dredging operations. After taking readings in the North Atlantic, the ship proceeded to the South Atlantic and then on to the Pacific. The journey lasted three and a half years, covering 68,890 nautical miles. On its way, the expedition made 492 depth soundings, including one of 26,850 feet off the coast of Guam, a record that surpassed any previously imagined. The crew recorded temperatures at both the ocean's surface and in deep water, and took detailed measurements at 362 points concerning currents, water composition, and marine life. More than 4,700 new species of plants and animals were collected as well. From the dredging operations, Forbes's theory that life did not exist on the ocean floor was debunked. By the journey's end, on May 24, 1876, at Spithead, the ship had circumnavigated the world, but the bulk of the work remained to be done. Twenty-three years later, when the final report was compiled, it contained 29,500 pages bound in 50 volumes. The expedition, for all the knowledge gained, revealed how little humankind actually knew about the world's oceans.

National Expeditions

The *Challenger* expedition inspired other countries to explore the ocean as well. In 1874–76, the German ship *Gazelle* circumnavigated the world for oceanographic studies. The Russian ship *Vitiaz* also sailed around the world in 1886–89. Between 1890 and 1898, the Austrian ship *Pola* did important work on shorter trips in the Mediterranean Sea and RED SEA. One of the leaders in oceanography during this time was Alexander Agassiz, a Swiss-American businessman who used his fortune to pursue an interest in ocean topography. His travels, from 1877 to 1905, took him over 100,000 miles through the Caribbean Sea and the Pacific, mapping the ocean floor. During this time Agassiz developed new techniques in sounding and dredging. Another wealthy patron of oceanography was Albert I, prince of Monaco, active from 1848 to 1922. He was a naturalist and oceanographer who studied currents and topography and gave money to support research in many countries. Norwegian explorer FRIDTJOF NANSEN pioneered navigation in the Arctic Ocean on his expedition between 1893 and 1896. With his design of the *Fram*, with which he intended to drift

across the NORTH POLE, he demonstrated that a ship could survive being frozen in ice as it moves. Other nations that launched oceanographic studies at this time were the Netherlands, France, Japan, and the United States.

Expanding Technologies

Oceanography entered a new era in 1925 with the German ship *Meteor*. This craft was the first to use new electronic technology to take continuous soundings of the ocean floor while in motion. For two years, *Meteor* crossed and recrossed the Atlantic, mapping the bottom. Its studies gave oceanographers a much clearer picture of the varied terrain that exists there. The results of these expeditions also gave Germany an advantage in SUBMARINE warfare during World War II. Other technological developments expanded the scope of oceanography. In the 1930s, Americans CHARLES WILLIAM BEEBE and Otis Barton invented the BATHYSPHERE, a type of SUBMERSIBLE, making the DIVING BELL, nonpressurized and with an attached oxygen supply, obsolete. In the 1940s–1950s, Swiss AUGUSTE PICCARD improved on its design with the BATHYSCAPH. His son JACQUES ERNEST-JEAN PICCARD continued work on the bathyscaph, and, in 1960, he reached the bottom of the MARIANAS TRENCH in the Pacific, the deepest point on Earth. Remotely operated vehicles (ROVs) of varying designs have also become essential equipment in oceanographic studies. Moreover, the evolution of the DIVING SUIT has given divers greater freedom underwater. Developments in oceanography and technology have helped make possible recent advancements in underwater archaeology (see ARCHAEOLOGY AND EXPLORATION).

Oceanographic Institutions

A number of oceanographic institutions have been founded over the years. Among the first was the marine biological station at Naples, Italy, established in 1872. The Scripps Institution of Oceanography at La Jolla, California, was founded in 1901 and later became part of the University of California. The Oceanographic Museum of Monaco was established in 1910, and the Oceanographic Institution of Woods Hole in Massachusetts was founded in 1930.

International Cooperation

In the mid-20th century, a cooperative spirit grew around oceanographic research, with international institutions realizing that the ocean ties mankind to a common fate. Nowhere was this more apparent than in conducting the INTERNATIONAL GEOPHYSICAL YEAR (IGY) in 1957–58. For this project, 37 nations contributed the use of 80 ships to study the world's oceans. Scientists observed currents, tracked ice floes, collected meteorological data, and conducted magnetic surveys. Further, teams tested new oceanographic equipment and performed extensive mapping. The

Jacques Cousteau peers out of a two-person underwater observation chamber on the deck of the *Calypso*, as it docks in New York City for the 1969 International Oceanographic Congress. (Library of Congress, Prints and Photographs Division [LC-USZ62-119520])

IGY accomplished the most thorough investigation of the Indian Ocean done until that time. Members of the project also discovered that water at the bottom of the sea near Antarctica was as old as 2,000 years. French oceanographer and inventor JACQUES-YVES COUSTEAU, who founded the Cousteau Society in 1973, increased awareness of the world's oceans through his writings, documentaries, and television show.

As oceanography enters the 21st century, the main practical questions involve the effects of pollution and the sustainability of fishing stocks. With ever-larger oil tankers plying the world's oceans, the safety of these ships and the long-term damage to the oceans from the regular spills that occur, are debated. With the world's human population increasing, and the technology available to harvest large quan-

ties of marine life, the issue of fish population maintenance has become more important. Regions where cod and whales, for example, were once abundant are now regulated by severe restrictions or bans on harvest due to overfishing. The balanced use of the ocean has led to another field of study, marine policy, which seeks to integrate the acquired knowledge of the past and present to draft sensible international treaties.

Ophir (King Solomon's mines)

Ophir is a city or region or mine mentioned in the Bible's Old Testament, the location of which is not known. It is

the place of “King Solomon’s mines,” the source of great quantities of gold. Solomon, king of the ancient Hebrews from about 972 to 932 B.C., reportedly entered into a contract with Hiram II, the king of Tyre, a city of the Phoenicians in present-day Lebanon, to build and navigate ships for an expedition. From the port city of Ezion-geber on the Gulf of Aqaba, the northeastern arm of the RED SEA, the fleet sailed to the land of Ophir. The expedition is said to have lasted three years and returned with gold as well as silver, gemstones, sandalwood, ivory, apes, and peacocks.

The story of Ophir, as well as Tarshish, another land mentioned in the Bible relating to King Solomon’s mines, proved an inspiration to explorers throughout history. MARCO POLO associated it with Japan; CHRISTOPHER COLUMBUS thought he might find it in the Caribbean Sea; ÁLVARO DE MENDANÍA named the Solomon Islands in the West Pacific Ocean after Solomon because of his belief he had found Ophir and Tarshish.

Ophir’s location has also been theorized as present-day Yemen on the south coast of the Arabian Peninsula; various locations in Africa, such as West Africa (the Gold Coast), Ethiopia, or Zimbabwe; the Indian subcontinent; the Ural Mountains in Asia; and even Australia or NEW ZEALAND. A recent theory holds that the site of Ophir is present-day Saudi Arabia, in the mountainous area, inland from the RED SEA, between Mecca and Medina, known as Mahd adh Dhabab (“cradle of gold”). Geological studies have revealed a large-scale ancient mining operation there with traces of gold remaining. Moreover, the region is along a 4,000-year-old trade route running south from the Gulf of Aqaba.

Orinoco River

The Orinoco River, one of South America’s longest rivers, flows some 1,500 miles from the Serra Parima highlands in southern Venezuela, westward then northward, forming part of the Colombia-Venezuela border with its branch, the Guaviare. It then arcs northeastward to Venezuela’s Atlantic coast. (If the Guaviare branch is included, the Orinoco stretches 1,700 miles.) The chief tributary of the Orinoco is the Apure River, which, like the Guaviare, is part of the watershed of the ANDES MOUNTAINS. The Orinoco’s waters are also augmented by the Ventuari, Arauca, Meta, Mawaca, Caura, and Caroni Rivers. The Casiquiare, a unique river in that it does not have a reversible current but flows over marshland, forms a natural canal between the Orinoco and the Río Negro, a branch of the larger AMAZON RIVER. The Orinoco begins as a thin stream in the mountains, gradually expanding with runoff from rainwater and its many tributaries. It cascades over rocks, down a steep-sided valley, through rain forests and across the Llanos—the plains—of

central Venezuela. The river ends in a wide marshy delta of about 7,800 square miles, bounded by streams, the Corosimi and the Vagre, with the Corosimi considered the main stream of the river. Natural canals cut across the delta, which is made of giant sandbars with islands of fertile soil. The total drainage area of the Orinoco system is some 450,000 square miles. The Orinoco, four miles wide on average, is navigable for ships about 260 miles, and for smaller boats about 1,000 miles.

First Approaches

On his third voyage in 1498, after discovering the island of Trinidad, Italian mariner CHRISTOPHER COLUMBUS, backed by Spanish interests, reached the mainland coast of South America at the Gulf of Paria, near the Orinoco delta. Columbus stopped to explore the coast of present-day Venezuela westward before sailing back to the island of Hispaniola (present-day Haiti and Dominican Republic). The next year, Spaniard ALONSO DE OJEDA, who had commanded one of Columbus’s ships during his second expedition to the WEST INDIES, was given permission to explore the mainland coast Columbus had explored. While Spaniard AMERIGO VESPUCCI, part of Ojeda’s expedition, explored south and east from their landing point five degrees north of the EQUATOR, Ojeda followed Columbus’s track, exploring north and west. He gave the name Venezuela, or “Little Venice” to the coastal region on seeing a Native American settlement built in the water on piers. Ojeda made several attempts to colonize Venezuela, all of which were unsuccessful.

The later colonization attempts by Spanish conquistador DIEGO DE ORDAZ, beginning in 1530, led to a greater European understanding of the Orinoco. Ordaz sailed with Spanish expeditions to the West Indies in his early 20s. He served with Alonso de Ojeda in his conquest of parts of present-day Colombia and Panama in 1509 and with DIEGO DE VELÁSQUEZ in 1511 in his conquest of Cuba. He also served as an officer under HERNÁN CORTÉS in 1519–21, during the Spanish conquest of Mexico. After returning to Spain to report to King Charles I (Holy Roman Emperor Charles V), Ordaz was himself commissioned by the monarch to explore, conquer, and colonize the area of the coast of South America, called Venezuela, from the mouth of the Amazon River to Cape Vela. Ordaz sailed from Spain with three ships and 500 men. While he was able to locate the mouth of the Amazon River, he did not find a suitable landing place and sailed westward, into the Gulf of Paria. Native peoples told him of another great river, the Orinoco and, by June 1531, he had located its delta. Ordaz entered the Orinoco’s main outlet and explored upriver about 800 miles to its junction with the Meta River. He lost many men in the thick jungles, to disease, to the poison-tipped darts of the native peoples, and to the treacherous terrain.

El Dorado and the Orinoco

The native peoples told tales of a land of immense wealth in gold peopled by a white race like the Europeans that the natives called “Guiana,” somewhere in the highlands around the Orinoco. Ordaz searched vainly for this city of gold before returning to the coast. The stories convinced many of the existence of an empire to rival that of the Aztec Indians of Mexico and the Inca Indians of Peru, which supposedly had a capital city, Manoa, paved with gold and which glittered with jewels. This was one of the many tales that came to be associated with the mythical land of EL DORADO, which inspired numerous journeys on the Orinoco, with Spanish and other Europeans penetrating the dense jungles of the interior.

In the 1530s, several Germans who had been sent by Charles I of Spain to colonize Venezuela—AMBROSIUS ALFINGER, GEORG HOHERMUTH VON SPEYER, AND NIKOLAUS FEDERMANN—explored the inland plains and highlands and the Orinoco River system. Spaniard GONZALO JIMÉNEZ DE QUESADA searched around the Magdalena River in Colombia in 1536. In 1541, Jiménez de Quesada’s brother, Hernán Pérez de Quesada, traveled along the plains of the Orinoco. Later, from 1569–72, Jiménez de Quesada himself led a second expedition in search of El Dorado in eastern Colombia as far as the confluence of the Orinoco with the Guaviare River. To the south, in 1560, LOPE DE AGUIRRE, a Spanish conquistador, joined an expedition to search for El Dorado led by PEDRO DE URSÚA in the Amazon Basin. After a dangerous crossing of the Andes and following the Huallaga and Marañón Rivers, Aguirre incited a mutiny and murdered de Ursúa. The mutineers sailed down the Amazon, then crossed at some point somehow to the Orinoco. Aguirre led the mutineers down the Orinoco to the Caribbean coast before he was captured and beheaded.

In 1584, another Spaniard, ANTONIO DE BERRÍO, married to the daughter of the Spanish colonial governor of what is now eastern Colombia, embarked on his own search for El Dorado and ended up searching the Orinoco region for 10 years. In 1595, he was taken prisoner on the island of Trinidad by SIR WALTER RALEIGH, an Englishman who had been granted permission from Queen Elizabeth I to find the riches of Guiana for the English. Based on Berrío’s intelligence, Raleigh embarked from Trinidad to explore the Orinoco. He took 100 men in small boats up the different branches of the river until its confluence with the Caroni, one of the rivers bounding the Orinoco’s delta, about 100 miles from the sea. Raleigh and his men also explored other tributaries and Lake Parime. Shortage of supplies and tropical fever led him to abandon his search, and he crossed the Cano Macareo, one of many natural canals across the delta, and sailed back to England. In 1596, Raleigh published his account of his voyage through the Orinoco called *The Dis-*

coverie of the Beautiful Empire of Guiana, with a Relation of the Great and Golden City of Manoa . . . in the Year 1595.

After James I ascended the throne, Raleigh was implicated in a plot against the king and sentenced to death in the Tower of London. He was released in 1616, after convincing King James to allow him to mount another expedition in search of El Dorado. In Trinidad in 1617, he was stricken with a fever. His son Walter and Lawrence Kemys continued up the Orinoco. Before very long, however, they entered Spanish territory and attacked the settlement of San Thomé. Raleigh’s son was killed, and Kemys committed suicide. Raleigh himself returned to England, without having found Indian riches and having disobeyed the king’s order not to attack the Spanish. In 1618, he was beheaded.

Colonial Boundaries

Raleigh’s last expedition was the last great search for El Dorado, but the Orinoco continued to be explored for more mundane reasons. Of constant difficulty to the European nations was the determination of the boundaries of colonial territories, a source of strife among them. The Spanish established the Boundary Line Commission of Yturriaga and Solano, which surveyed the inland areas of Venezuela and other parts of the Spanish possessions in South America from 1757 to 1763, during which José Solano and Díaz de la Fuente made careful surveys of the Orinoco, especially its upper waters. The investigation confirmed the existence of the naturally formed Casiquiare canal.

In the Name of Science

German naturalist ALEXANDER VON HUMBOLDT and French botanist Aimé Bonpland had planned to travel to Egypt in 1798, but Napoléon’s conquest changed their plans. After the pair made a survey of Spain’s central plateau, Spanish king Charles IV gave Humboldt and Bonpland permission to explore Spanish possessions in the Americas. In November 1799, the pair left Caracas in Venezuela to study the Orinoco. Humboldt studied the fauna of the Orinoco, including the capybara, the largest rodent in the world, as well as the egg-laying habits of turtles along one of the Orinoco’s tributaries. He charted the course of the upper Orinoco and the Río Negro, making a CANOE voyage through the Casiquiare canal.

In 1849, British naturalist ALFRED RUSSEL WALLACE carried out ornithological research along the Río Negro and into the Orinoco by way of the Casiquiare. Still another explorer of the Orinoco was Francisco Michelena y Rojas, a Venezuelan diplomat and journalist. He traveled across the world, through America, Europe, Asia, and Africa from 1822 to 1842. He was commissioned in 1856 to explore the Río Negro. In the course of his expedition, he crossed the Casiquiare canal into the Orinoco and ascended the river 170 miles upstream, and a few miles up the Mawaca, one of its tributaries.

The Orinoco was of lesser importance for trade and transport than the Amazon, and today remains sparsely traveled. An important port city on the river is Ciudad Bolívar—formerly known as Angostura for “narrow,” because it is situated 373 miles from its mouth where the river narrows—founded in 1764 in northeastern Venezuela. Many of the river’s tributaries remained unexplored into the 20th century. In 1944, aerial exploration located the river’s main source in the Guiana highlands, and later explorations discovered small rivulets considered the river’s headwaters.

See also SOUTH AMERICA, EXPLORATION OF.

outrigger

An outrigger is a type of boat with a float attached parallel to the main hull by poles. The term *outrigger* can also refer to the float itself. The attached float or floats gives the craft

greater stability. Outriggers are made in a variety of configurations. They may be sail-powered, oar-powered, or both. The double-hulled CANOE relates to the concept of the outrigger. The double outrigger has floats extending from both sides for maximum safety. The outrigger can be built to quite large dimensions, more than 100 feet long. Some used in Sri Lanka carry as much as 30 tons of cargo.

Outriggers were unique to the Pacific Ocean and Indian Ocean until their concepts were incorporated into modern boats. The Polynesians and other peoples used them to travel among the islands, and they no doubt played a central role in migrations to NEW ZEALAND, HAWAIIAN ISLANDS, Tahiti, and countless other islands. With the proper skill, an outrigger was next to impossible to sink, a trait that would have encouraged the adventurous to explore. The vessel could also be quite fast, with a speed of 20 knots not uncommon.

See also SHIPBUILDING AND EXPLORATION.

Shown here, in a photograph from about 1922, are outrigger canoes in Hawaii. (Library of Congress, Prints and Photographs Division [LC-USZ62-105953])

P

Pacific Ocean, exploration of the

The Pacific Ocean is the largest ocean on the planet, covering nearly a third of Earth's surface, 70 million square miles if adjoining seas are included. It is also the deepest ocean, with an average depth of about 14,000 feet, and contains the deepest point in all the oceans, the Challenger Deep of the MARIANAS TRENCH, at 36,198 feet. The Pacific is bounded by North America and South America in the east; Asia, Indonesia, and Australia in the west; and Antarctica in the south. (Antarctic waters are sometimes referred to as the Southern Ocean.) The BERING STRAIT separates the Pacific from the Arctic Ocean in the north. On rounding South America from the Atlantic Ocean, Portuguese mariner FERDINAND MAGELLAN, sailing for Spain in 1520, gave the waters the name *Pacific*, meaning "peaceful."

The portion north of the EQUATOR, or North Pacific, generally has a clockwise system of OCEAN CURRENTS, such as the Japan (or Kuroshio) Current. The portion south of the equator, the South Pacific, has currents rotating in a counterclockwise pattern.

The Pacific Ocean has more than 25,000 islands of volcanic and coral origin. Many are too small to support human populations, but of those that can, most were settled before the arrival of Europeans. OCEANIA refers to the region where the majority of Pacific islands are found. It is further classified into three groups according to geology and inhabitants: Melanesia, Micronesia, and Polynesia.

The Ancients and the Pacific

There is remarkably little ancient history of Pacific exploration. The Chinese, who bordered the ocean in the west, had large seaworthy ships by about 2800 B.C., which they used to sail into the Indian Ocean for trade with Malaysia, Indonesia, and India, but they were not inclined to venture eastward into the unknown (see CHINESE EXPLORATION). The Romans, who had contact with the Chinese by sea, starting in the first century B.C., had little concept of the vast ocean that lay beyond the Asian shoreline (see ROMAN EXPLORATION). Arab Muslims of the Middle Ages were not known to venture beyond the SPICE ISLANDS (the Moluccas), where the southwestern Pacific Ocean and northeastern Indian Ocean meet (see MUSLIM EXPLORATION). While the Indian Ocean was active with commerce, the Pacific remained largely untested. Even the voyages of CHENG HO for the Ming Dynasty in China in the early 15th century traveled south along Asia's coast to the familiar territory of the Indian Ocean rather than into the open Pacific. The Polynesians became early masters of the Pacific, using a tradition known as "wayfinding" for island-hopping expeditions over great expanses of Polynesia, but they did not document voyages (see NAVIGATION AND EXPLORATION; POLYNESIAN EXPLORATION).

Venetian merchant MARCO POLO, who traveled throughout China in the 13th century, was an early European to bring back word of the Pacific to Europe. He did not see the ocean himself but heard of it from his Chinese hosts. Europeans did not know that continents lay between Europe

and Asia until the late 15th century. Even after reaching the Americas in 1492, CHRISTOPHER COLUMBUS, an Italian mariner sailing for Spain, did not let go of the notion that he had in fact crossed the Atlantic Ocean to Asia.

Early European Sightings

Spaniard VASCO NÚÑEZ DE BALBOA made the first definitive European contact with the Pacific. While exploring present-day Panama in Central America with a small army, he saw the ocean on September 25, 1513. He claimed it for Spain, with no way of knowing its extent, and called it the Great South Sea. In 1516, he retraced his footsteps to the Pacific and explored along the Panamanian coast with boats he had built. At this time, Spain was in a heated rivalry with Portugal. The Portuguese had found the route around Africa to the Indian Ocean with the journey of BARTOLOMEU DIAS in 1487, and consequently they claimed exclusive right to trade with India and the Spice Islands. In order to challenge this monopoly, the Spanish needed to find an alternative route. This was the impetus for sponsoring Christopher Columbus on his 1492 expedition. As Spain was exploring the lands in the western Atlantic, they also hired Ferdinand Magellan away from Portugal to find a route around South America to the lucrative SPICE TRADE. They had little idea of the size of the Pacific at this point.

The epic journey of Ferdinand Magellan, from 1519 to 1521, is one of the most well known in the history of exploration. Departing from Spain on September 20, 1519, he made stops in Madeira and the CANARY ISLANDS before exploring the South American coast for a passage to the Pacific. On October 21, 1520, he finally found what would be named the Strait of Magellan (see MAGELLAN, STRAIT OF). In an incredible feat of seamanship, he managed to navigate the strait and entered the Pacific on November 28, 1520. After sailing northward along the South American coast, he found winds that carried his ships westward. The crossing took more than three months, and many of the crew died of SCURVY, caused by malnutrition. In March 1521, the expedition acquired fresh food and water in the Marianas Islands of Micronesia. Magellan was later killed in the Philippines, and command of the expedition eventually fell to JUAN SEBASTIÁN DEL CANO, who reached the Spice Islands. Continuing westward into the Indian Ocean and around Africa into the Atlantic Ocean, he completed the first CIRCUMNAVIGATION OF THE WORLD.

Continuing Spanish Exploration

After several conflicts with Portugal in the EAST INDIES, Spain negotiated for peace, signing the Treaty of Saragossa in 1529, in which Spain acknowledged Portuguese control of the Spice Islands in exchange for a large sum of money. Spain did have possession of the Philippines, however, and it became important to them to find dependable routes between Spanish ter-

ritories in the Pacific and the Americas. This was done with great difficulty and much loss of life. One such expedition, in 1564–65, under MIGUEL LÓPEZ DE LEGAZPI, westward from Mexico, led to the colonization of the Philippines. Alonso de Arellano, who captained one of the ships under Lopez de Legazpi's command, was separated from the fleet and managed to return to the Americas by way of the north-eastward-flowing Japan Current. ANDRÉS DE URDANETA, a geographer and priest who had accompanied Lopez de Legazpi, was navigator on a return trip to the Americas in 1565, following the same route. By the 1580s, an annual commercial fleet known as the Manila Galleon made the eastward crossing, carrying trade goods from the Orient to the Americas, from where they were shipped to Spain.

The Portuguese and Spanish both are known to have reached Japan in the 1540s. FERNÃO MENDES PINTO, who worked as a diplomat for the Chinese, and FRANCIS XAVIER, a Spanish missionary, both reached the islands of Japan.

The Spanish had by this time navigated Pacific waters northward from Mexico along the North American coast. In 1542–43, JUAN RODRÍGUEZ CABRILLO and BARTOLOMÉ FERRELO reached the approximate latitude of the present-day Oregon-California border. The Spanish also turned their attention to the South Pacific, with Peru as a launching point. In 1567–69, ÁLVARO DE MENDAÑA and PEDRO SARMIENTO DE GAMBOA led an expedition in search of the GREAT SOUTHERN CONTINENT (Terra Australis)—a continent theorized by the ancients to exist in the Southern Hemisphere balancing out landmasses of the Northern Hemisphere—in the course of which they made the European discovery of the Solomon Islands and Marshall Islands. In a 1595 voyage in search of more lands to colonize, Mendaña, on this expedition accompanied by PEDRO FERNÁNDEZ DE QUIROS, made the European discovery of the Marquesas Islands and Santa Cruz Islands.

Early English Exploration

In the meantime, the English had begun exploring the Pacific. SIR FRANCIS DRAKE headed an expedition in 1577–80, in search of the Great Southern Continent, as well as the western outlet of the Strait of Anian (see ANIAN, STRAIT OF), a fabled NORTHWEST PASSAGE from the Atlantic to the Pacific. He became the first European to navigate Drake's Passage, as the waters between the Atlantic and Pacific came to be known, and explored the west coast of North America as far north as Vancouver Island before continuing westward to the Spice Islands and into the Indian Ocean and back to the Atlantic, completing the first English circumnavigation of the world—and the second altogether.

Dutch Exploration

After declaring independence from Spain in 1581, the Dutch began looking to the Far East for trading opportuni-

ties. In 1602, they formed the DUTCH EAST INDIA COMPANY to reap profits from both the Indian Ocean and Pacific lands. In a 1605 expedition for the company, WILLEM JANSZ, while exploring the seas around New Guinea, made the European discovery of Australia, although not realizing they had observed two separate landmasses. (Several months later, LUIS VÁEZ DE TORRES, sailing for Spain, charted the strait, now known as Torres Strait, separating New Guinea from Australia.) In 1611, a Dutch captain named Brouwer used the westerly winds in the high southern latitudes to find a faster route to the East Indies. In 1616, Dirk Hartog made the European discovery of Dirk Hartog's Island and explored Australia's west coast. In 1615–16, JAKOB LE MAIRE and WILLEM SCHOUTEN, sailing for a rival Dutch company, sailed through Drake's Passage around the southern tip of South America, naming it CAPE HORN; they later made the European discovery of the Juan Fernández Islands off the coast of present-day Chile and determined the eastern extent of New Guinea. In 1642, ABEL JANSZON TASMÁN, searching for Terra Australis for the Dutch East India Company, made the European discovery of an island south of Australia, naming it Van Diemen's Land (present-day TASMANIA), as well as NEW ZEALAND, Fiji, and other islands. JAKOB ROGGEVEEN, also in the employ of the Dutch East India Company, made the European discovery of Easter Island and Samoa Island in 1722.

Continuing English Exploration

After Drake's earlier exploits, the next English pioneer in the Pacific was WILLIAM DAMPIER, who had completed a circumnavigation of the world over the years 1670 to 1691. He was chosen to command an ambitious scientific expedition to the Pacific. In 1699–1701, he explored Australia's west and northwest coast (although he had hoped to reach the east coast) and located Dampier Archipelago, then explored New Guinea's east coast and located Dampier Strait between New Guinea and the island of New Britain. His voyage set the precedent for other scientific journeys to the Pacific—one purpose of which was still discovering the Great Southern Continent—including those of JOHN BYRON in 1664–66 and SAMUEL WALLIS and PHILIP CARTERET in 1766–68. Byron explored previously uncharted islands in the Marshall and Mariana island groups. In the course of the Wallis-Carteret expedition, Wallis made the European discovery of Tahiti, and Carteret, of Pitcairn Island.

In the subsequent years, from 1768 to 1780, Englishman JAMES COOK headed three Pacific expeditions, which led to a new understanding of the world's largest ocean. He traveled to both the South Pacific and the North Pacific. Among his accomplishments were charting the coasts of New Zealand, proving that there were in fact two main islands; charting the east coast of Australia; crossing the ANTARCTIC CIRCLE; circumnavigating Earth in southern latitudes

and proving that the Great Southern Continent did not exist; charting islands of Oceania not visited since the earlier explorations of other nations in previous centuries, making the European discovery of New Caledonia; making the European discovery of the HAWAIIAN ISLANDS; charting the coastlines of northwestern North America as far north as the Aleutian Islands; and crossing the Bering Strait. A number of renowned scientists traveled with Cook, among them SIR JOSEPH BANKS on Cook's first Pacific expedition. (Banks went on to become president of the ROYAL SOCIETY and helped found the AFRICAN ASSOCIATION.)

French Exploration

In the late 17th century under the auspices of the FRENCH EAST INDIA COMPANY, the French began trading in the Indian Ocean and all the way to China by way of the Pacific. By 1695, they were making trips to the Spanish ports in Chile and Peru. French scientists sometimes traveled on board French trading ships and recorded information. French interest in the Pacific leaned toward the scientific, with commercial and colonial ambitions secondary, since the British navy was superior to theirs. In 1766–69, the same period Wallis and Carteret were on their journey, LOUIS-ANTOINE DE BOUGAINVILLE commanded the first French expedition around the world. The purpose of the government-sponsored scientific expedition was to locate the Great Southern Continent as well as to chart islands in the Pacific. In the western Pacific de Bougainville explored the Solomons and other island groups. Later French scientific expeditions were carried out by JEAN-FRANÇOIS DE GALAUB, comte de La Pérouse, in 1785–88 in the North and South Pacific, and by ANTOINE-RAYMOND-JOSEPH DE BRUNI, chevalier d'Entrecasteaux, in 1791–95 in the South Pacific.

Russian Exploration

Early Russian expeditions, in the meantime, approached from the west overland through SIBERIA, many of them related to the FUR TRADE. By 1639, Russians were known to have reached the Sea of Okhotsk. The earliest recorded sighting of the Bering Strait was by a party of Cossacks under SEMYON IVANOVICH DEZHNEV in 1648. The next century, in 1725–30, Danish VITUS JONASSEN BERING, in service to the Russian navy, led the First Kamchatka Expedition to Siberia's Pacific coast. In 1740–41, Bering headed Russian naval exploration of the Bering Strait, the Gulf of Alaska, Kodiak Island, the Aleutian Islands, and the Commander Islands. In 1785–93, Englishman JOSEPH BILLINGS headed the Russian naval Northern Secret Geographical and Astronomical Expedition in search of the NORTHEAST PASSAGE from Siberia's northeast coast into Bering Strait and further explored the Aleutians and the Gulf of Alaska. In 1803–06, ADAM IVAN RITTER VON KRUSENSTERN headed

the first Russian circumnavigation of the world, during which he searched for outlets of both the Northeast Passage and Northwest Passage in the North Pacific.

Antarctica

The last Pacific region to be charted thoroughly was that of Antarctica. James Cook had failed to sight the mainland in his voyage of the late 18th century. The earliest confirmed sightings of the Antarctic mainland in 1820 were made by British naval officer EDWARD BRANSFIELD and American sealer NATHANIEL BROWN PALMER, where Pacific and Atlantic waters meet near the Antarctic Peninsula. German-born Russian naval officer FABIAN GOTTLIEB BENJAMIN VON BELLINGSHAUSEN made the earliest extensive exploration of the high latitudes near the coast in the course of his expedition of 1819–21 (and some claim made the first sighting of the Antarctic mainland). In the ensuing decades, explorers of varying nationalities approached Antarctica along different routes from the Pacific, Atlantic, and Indian Oceans. SIR JAMES CLARK ROSS led the first British scientific expedition to the region since Cook, reaching previously uncharted regions along the Pacific coast, while unsuccessfully searching for the SOUTH MAGNETIC POLE. The South Magnetic Pole was located on the Pacific coast in 1909 by Australian scientist SIR DOUGLAS MAWSON. The Pacific coast of Antarctica proved to be the launching point for the successful attempt to reach the SOUTH POLE by Norwegian ROALD ENGLEBREGT GRAVNING AMUNDSEN in 1910–12.

Oceanography

By the mid-19th century, oceanography—the study of the world’s oceans, a branch of geography—had become more scientific in its approach. The English voyage of the *Challenger* under SIR GEORGE STRONG NARES and SIR CHARLES WYVILLE THOMSON in 1872–76 was a breakthrough in knowledge gained. In 1948, during the voyage of the *Challenger II*, the deepest point in the oceans of the world—Challenger Deep in the Marianas Trench—was discovered. In 1960, Swiss scientist JACQUES ERNEST-JEAN PICCARD and U.S. Navy lieutenant Donald Walsh, using the BATHYSCAPH *Trieste*, explored the trench. During the INTERNATIONAL GEOPHYSICAL YEAR (IGY) of 1957–58, 37 nations contributed the use of 80 ships to study the world’s oceans (see OCEANOGRAPHY AND EXPLORATION).

In addition to being a link between continents on exploratory expeditions, the Pacific Ocean, with its some 25,000 islands, became a place of exploration unto itself through much of history. It has also proven a challenge to mariners over the centuries—from the ancient Polynesians, to the first circumnavigators, to early scientific explorers

such as James Cook, all the way to modern times and explorers of the deepest places on earth.

pack ice (ice pack, pack, pack-ice)

The term *pack ice*, also written *pack-ice*, or the *ice pack*, or simply the *pack*, is one of many terms relating to sea ice in both Arctic and Antarctic waters, much of which freezes over in wintertime, then thaws and breaks up to varying degrees in summertime. The term is sometimes used to denote the general ice field, that is, any extensive area of frozen water, such as that which covers much of the Arctic year-round. (One also sees the term *ice sheet* applied to an ice field of frozen water, but it more often is used to denote a permanent ice field on land.) But, more specifically, the term *pack ice* refers to the mixture of ice created by the annual freezing and thawing of water, along with various types of drifting ice, or DRIFT ICE, from the winter or winters before. The various formations of drift ice are squeezed together as the sea freezes over, often creating jagged shapes in the pack ice.

The term *ice island* refers to stretches of pack ice at least 10 times thicker than most of the ice surrounding it, formed from chunks of ice that once adhered to the shore. The term *ice shelf* is applied to a permanently frozen ice field extending from the Antarctic continent, such as the Ross Ice Shelf, Filchner Ice Shelf, Larson Ice Shelf, and Shackleton Ice Shelf.

At the edge of pack ice, where water is whipped up by sea swells, thick fog often forms. When set in motion by a storm, pack ice grinds together, creating noise. The vast winter pack ice extends hundreds of miles from the year-round frozen waters of the Arctic and from the ice-covered Antarctic continent, beyond the North and South Frigid Zones, invading the North and South Temperate Zones.

In the history of exploration, pack ice has played a role in setting the limits of regions explored or in the destruction of ships. A tragic example in the Arctic is the 1845–47 British expedition of SIR JOHN FRANKLIN, whose ships—the *Erebus* and the *Terror*—became icebound, and the crews eventually perished. Another British expedition, in 1914–17, headed by SIR ERNEST HENRY SHACKLETON, lost its ship—the *Endurance*—to the pack ice off Antarctica, although Shackleton managed to lead his men to safety.

Some explorers, such as Norwegian FRIDTJOF NANSEN in 1893–96, attempted to use pack ice to get closer to a goal—in this case an unsuccessful attempt on the NORTH POLE—having a specially designed ship, with a saucer-shaped hull to withstand the pressure of the ice and ride on top of it—the *Fram* (Forward)—purposely become icebound so that it would drift northward.

Icebreakers, ships with specialized hull designs and reinforced bows, first effectively used in the latter part of the 19th century, have become ever more efficient in pushing through pack ice.

In 1915, Sir Ernest Henry Shackleton's ship the *Endurance* was trapped in Antarctic pack ice. This photograph was probably taken by expedition member Frank Hurley. (Library of Congress, Prints and Photographs Division [LC-USZ62-104242])

padrão

Padrão is the Portuguese word for “pillar.” Starting in the late 15th century, Portuguese maritime expeditions carried limestone pillars surmounted by a cross—typically with Portuguese, Latin, and Arabic inscriptions—on voyages of exploration in order to proclaim sovereignty over territory.

DIOGO CÃO was the first to carry *padrões* in his expedition of 1482–84 along the east coast of Africa. He placed a 13-foot pillar with Portuguese, Latin, and Arabic inscriptions at the mouth of the CONGO RIVER (Zaire River). For a time, the great river was known to Europeans as the Rio de Padrao, or “Pillar River.” Cão left a second marker about 500 miles to the south at Cape St. Mary. During a second voyage in 1485–86, he placed a pillar at Cabo Negro in present-day Angola and at Cape Cross in present-day Namibia. In 1487, BARTOLOMEU DIAS passed Cão's pillar and placed one several hundred miles to the south; the next year, he erected one

at the CAPE OF GOOD HOPE. In the course of his expedition of 1497–99, VASCO DA GAMA placed a marker at Mossel Bay in present-day South Africa; a second one in present-day Mozambique; and a third one at Calicut in present-day India. On the return trip, he placed a fourth at Malindi in present-day Kenya, and a fifth one at another location in Mozambique.

Some *padrões* have survived to modern times. One erected by Diogo Cão is housed at the museum of the Sociedade de Geografia in Lisbon; a second, at the Museum für Deutsche Geschichte in Berlin.

painting and exploration

Among artists, especially representational painters, there is a tradition of travel to seek out new subject matter. Before photography, painting, the application of shapes and colors on a surface, and the related drawing, the use of lines to create images, were the only means of documenting scenes. Artists willing to travel to remote places, sometimes referred to as “frontier artists” or “frontier painters,” made a special

contribution to the chronicles of exploration by making pictorial records of past ages. Some traveled on their own. Some were hired as official artists and drafted people on expeditions for pictorial documentation of places, peoples, and wildlife. Without the work of such artists, we would have no visual reference point of the pre-photographic age. Moreover, they further contributed to awareness of geography, anthropology, and natural history through their journals, letters, and travel accounts.

Early North American Scenes

The first known European artist to paint scenes in what is now the United States is Frenchman JACQUES LE MOYNE DE MORGUES, one of the colonists in the short-lived French Huguenot colony on St. Johns River in present-day Florida,

led by RENÉ GOULAIN DE LAUDONNIÈRE in 1564–65. He created watercolors of animals, plants, and Timucua Indians. Similarly, in 1584–87, Englishman JOHN WHITE created a pictorial record of the Outer Banks region of present-day North Carolina as part of SIR WALTER RALEIGH's attempted colonies (one of them the LOST COLONY).

Frontier Painters

American GEORGE CATLIN traveled on his own throughout North America in the 1830s–60s, with a trip to South America as well in the 1850s. He especially sought out images of Native Americans. Other such frontier artists specializing in Native American and western themes were American ALFRED JACOB MILLER, who painted landscapes

This engraving by G. Cook from a painting that Frederick William Beechey completed sometime before 1856 shows an exaggerated attack by walrus in a British expedition to Arctic waters in 1818 headed by David Buchan and John Franklin. Beechey was part of the expedition. (*Library of Congress, Prints and Photographs Division [LC-USZ62-20109]*)

and native peoples along the Oregon Trail in the 1830s; Canadian painter PAUL KANE, active in western Canada in the 1840s; and Swiss RUDOLPH FRIEDERICH KURZ, who sought subjects for his work on the MISSOURI RIVER and western plains in the 1840s–50s. Swiss artist KARL BODMER, traveled up the MISSOURI RIVER with German naturalist ALEXANDER PHILIPP MAXIMILIAN in the 1830s, in a productive collaboration. One individual who is famous as both an artist and naturalist, becoming one of the foremost authorities on North American birds, was American JOHN JAMES AUDUBON, active in the early to mid-1800s.

Military Expeditions

Some artists active in North America in the mid-1800s were part of military land expeditions. For example, in the 1840s,

lieutenant and artist HENRY JAMES WARRE traveled with lieutenant MERVIN VAVASOUR in a British military reconnaissance of the Pacific Northwest. His sketches of Oregon country were later made into engravings and published. American brothers, trained in art and drafting, BENJAMIN JORDAN KERN, EDWARD MEYER KERN, and RICHARD HOVENDON KERN served as naturalists and topographers for JOHN CHARLES FRÉMONT, who headed an expedition for the U.S. Army's Corps of Topographical Engineers in the ROCKY MOUNTAINS in the 1840s.

Maritime Expedition Artists

Many maritime exploratory expeditions had official artists, who often doubled as or worked closely with naturalists. Englishman JOHN WEBBER was part of a British expedition to the Pacific Ocean in search of the NORTHWEST PASSAGE in 1776–80, headed by JAMES COOK. Austrian FERDINAND LUCAS BAUER and Englishman WILLIAM WESTALL served under MATTHEW FLINDERS in the British expedition to Australia of 1801–03. German LOUIS CHORIS was part of OTTO VON KOTZEBUE's Russian naval expedition to the Pacific in search of outlets of NORTHEAST PASSAGE or Northwest Passage in 1815–18. Frenchman JACQUES ARAGO was the official artist and writer under LOUIS-CLAUDE DE SAULCES DE FREYCINET in the French naval CIRCUMNAVIGATION OF THE WORLD in 1817–20. Englishman FREDERICK WILLIAM BECHEY, who went on to become a naval officer, painted scenes while on Arctic expeditions under SIR JOHN FRANKLIN and SIR WILLIAM PARRY in 1818–20.

Travelers and Painters

THOMAS BAINES, an English painter, participated in land expeditions in both Australia and Africa in the mid-19th century. In Africa, he was part of Scottish missionary DAVID LIVINGSTONE's Zambezi expedition. In Asia, also in the mid-19th century, Englishman THOMAS WITTLAM ATKINSON, traveling with his wife, writer LUCY ATKINSON, visited SIBERIA, Mongolia, and central Asia and produced hundreds of paintings. Renowned Russian painter NICHOLAS CONSTANTINOVICH ROERICH, traveled with his wife, writer Elena Blavatsky Roerich, to central Asia in the 1920s, and also produced an enormous body of work.

A more recent example of an artist continuing the tradition of artist/traveler is MARGARET URSULA MEE, a British botanical painter who worked in the Brazilian rain forest of South America from the 1950s to 1980s.

The above are just a small sampling of artists who, throughout the ages, have explored little known parts of the world and re-created what they saw on paper and canvas.

periplus

The term *periplus* (plural form, *peripli*) is the Latin transcription of the Greek *periplous* (plural form *periploi*) for “a sailing around” or “circumnavigation.” In its usage, as associated with the explorations of the ancient Greeks and Romans, it came to refer to maritime voyages in general, along stretches of coasts as well as around entire bodies of water or islands. It also came to be used for written accounts of such voyages, sometimes as a report of newly explored lands and sometimes as sailing guides, describing landmarks, harbors, anchorages, watering places, and winds and currents of familiar regions. Or it was a combination of both. Many of the peripli from ancient times have not survived, or survive only in fragments as quoted in the works of later historians.

Peripli—some existing in whole or in part, or mentioned in other accounts—offer geographic information of the MEDITERRANEAN SEA, Black Sea, RED SEA, Persian Gulf, Arabian Sea, Indian Ocean, and their coastal regions; as well as the Atlantic coast of parts of Africa and Europe, including the British Isles. An early periplus that is not extant but receives mention in later accounts indicates Greek activity along the Atlantic coast of Europe in the sixth century by a Greek sailor from Massilia (present-day Marseille, France). The reported Greek translation, entitled *Periplous*, of HANNO’s account of his journey along the Atlantic coast of Africa in about 470 B.C., as well as the Roman poem relating HIMILCO’s voyages along the Atlantic coast of Africa in about 450 B.C., indicate how the Carthaginians ventured from the Mediterranean Sea to unknown regions for the purpose of exploration and not commerce or colonization. An extant periplus dating from about 350 B.C. and bearing the name Scylax (although certainly not the Greek SCYLAX from the sixth century B.C. who sailed for the Persians) contains information on the Mediterranean Sea, the Black Sea, and a stretch of the African coast. Greek historian Arrian, in his famous work *Indica* of the second century A.D., draws on the periplus of the Greek NEARCHUS about his expedition from the coast of India to the head of the Persian Gulf on behalf of ALEXANDER THE GREAT in 325–324 B.C. Greek STRABO and Roman PLINY THE ELDER, in their writings in the first century A.D., take information from Greek PYTHEAS’s account of his Atlantic journey to northern parts of Europe in about 325 B.C.

A frequently cited periplus, because it provides such a wealth of information about early East Africa, including commercial activities among peoples of Egypt, East Africa, and the Indian subcontinent, as well as about navigation in the Indian Ocean, is the *Periplus of the Erythraean Sea* (also spelled *Erythrean*). It was written in about A.D. 100 by an anonymous Greek merchant who lived in Alexandria, Egypt.

The Italians continued the tradition of the periplus with similar pilot books known as *portolano* (plural form, *portolani*), which evolved into a graphic representation known as a PORTOLAN CHART.

Phoenician exploration

The ancient people known as the Phoenicians lived along the east coast of the MEDITERRANEAN SEA, starting in the third millennium B.C. About 200 miles long and five to 15 miles wide, Phoenicia extended eastward along the coast roughly to the Lebanon Mountains in present-day Lebanon; northward to the Eleutherus River (now known as the Kebir River); and southward to Mount Carmel. The Phoenicians came to be influential as traders throughout the Mediterranean Sea region. In the Bible they are referred to as Sidonians, related to the Canaanites. The Greeks first referred to them as Phoenicians, from the word for “purple,” because of a dye they traded.

The Phoenicians lived in allied city-states. Byblos, a site near present-day Beirut, Lebanon, inhabited since about 5000 B.C., came to be an important Phoenician center by about 2800 B.C. Early in their history, the Phoenicians were under the influence of Mesopotamian peoples, the Sumerians and the Akkadians. The Egyptians, out of northern Africa, occupied their territory from about 1800 to 1400 B.C. The conflict between the Egyptians and Hittites of present-day Syria, starting in about 1400 B.C., led to eventual Phoenician independence and the rise of many city-states. The port cities of Sidon (Sayda) and Tyre (Sour; Sur), 22 miles to the south, came to alternate as the primary seat of Phoenician political power. By the mid-13th century B.C., the Phoenicians had become known in the region as accomplished shipbuilders and mariners and as reliable traders. In later centuries, they established colonies in the western Mediterranean as well, such as Utica and Carthage in North Africa. Each Phoenician city-state had its special deity, referred to as Baal for a god and Baalat for a goddess; temples were centers of political and civic activities.

The Phoenicians are known as the first people to develop an exclusively alphabetic system of writing, that is, creating a standardized system of symbols representing sounds, instead of the hieroglyphics and cuneiform of the other cultures in the region; the Greeks eventually adopted and altered their alphabet. The Phoenicians also devised a standardized system of weights and measures and were known as skillful architects. Their manufactured goods—textiles and dyes, colored glass, metalwork, and ivory carv-

ings—were highly valued as well. They also traded wood from the cedar trees of their homeland.

In later centuries, the Phoenician city-states had to resist peoples from the east, in particular the Assyrians, Chaldeans, and Persians. Although some city-states fell to invaders, the Phoenicians continued to operate as navigators, traders, and artisans, sometimes in the servitude or employ of other peoples. The Greeks came to take over much of the region's trade. With the Greeks evolving into a naval power, the Phoenician traders lost their monopoly. Phoenician culture of the eastern Mediterranean came to be absorbed into Hellenistic culture. In 332 B.C., Tyre fell to Greco-Macedonian forces under ALEXANDER THE GREAT during his push into Asia. The Carthaginians, the predominantly Phoenician inhabitants of Carthage, remained a powerful presence in the western Mediterranean until defeated by the Romans in the second century B.C. In A.D. 64, Phoenicia became part of the Roman province of Syria, and the name *Phoenician* was no longer used.

As wide-ranging seafarers, the Phoenicians are important to the history of exploration in establishing contacts between peoples and gaining and spreading geographic knowledge. They explored the entire Mediterranean, from the Dardanelles to the Iberian Peninsula, in their large boats, GALLEY ships propelled mostly by oarsmen with some wind power, the pilots using stars and landmarks for navigation. It is thought that they established coastal colonies on the southeastern Iberian Peninsula by about 1100 B.C. Among these were Gadir (later Gades, or modern Cádiz, Spain) beyond the Strait of Gibraltar (see GIBRALTAR, STRAIT OF), which perhaps served as a stopover point for expeditions into the Atlantic Ocean.

An early expedition in which the Phoenicians participated, as recorded in the Bible, was to OPHIR in the 10th century B.C. Under a contract between King Solomon of Israel and Hiram II, the king of Tyre, Phoenicians served as shipwrights and navigators for the three-year expedition. The location of Ophir, which is known as the location of “King Solomon’s mines,” the source of gold, is not known, but it may have been in Arabia, which would indicate the Phoenician exploration of the RED SEA. The writings of fifth-century B.C. Greek historian HERODOTUS indicate that, sailing for the pharaoh NECHO II in about 600–597 B.C., Phoenician seafarers navigated the Red Sea southward from the Gulf of Aqaba to the Indian Ocean and possibly carried out the first circumnavigation of Africa, returning to the Mediterranean by way of the Atlantic and the Strait of Gibraltar. It is also possible that the Phoenicians ventured westward through the Strait of Gibraltar long before the historical record indicates. It is in fact recorded by Greek and Roman writers that Carthaginians—HANNO and HIMILCO of Phoenician descent—reached the Atlantic in the fifth century B.C.

photography and exploration

Photography, or “writing with light” as the Greek root words translate, revolutionized exploration starting in the 19th century, much as other technological advancements did in earlier ages. With the means of obtaining permanent images through chemical reaction on light-sensitive materials, explorers could bring back an objective visual record from their journeys and not have to rely on the artist’s eye (see PAINTING AND EXPLORATION).

Origins of Photography

No one individual is credited with inventing photography. The camera obscura of the 16th century was the antecedent of the camera. The optical apparatus consisted of a box into which light passed through a tiny hole or lens and projected an image onto a glass screen; artists use the device to recreate the perspective of three-dimensional space on a flat surface through tracing. An important breakthrough in chemistry was that of the German anatomy professor Johann Heinrich Schulze, who, in 1727, discovered that silver nitrate darkened upon exposure to light. By the early 1800s, British chemists Thomas Wedgwood and Sir Humphry Davy succeeded in producing images of objects on leather treated with silver salts and exposing them to sunlight (now called “photograms”). However, they were unable to halt the darkening and disappearance of the images.

Drawing on other progress in optics (the science of the laws of light) as well as in chemistry, a number of different individuals invented photography in the first half of the 19th century. In 1816, French physicist Joseph Nicéphore Niépce created the first negative, on paper, and, in 1827, the first known photograph, on metal. In 1839, his colleague, French painter Louis Jacques Mandé Daguerre, invented a method of making a direct positive image on a silver plate, which came to be known as the daguerreotype. In the meantime, in 1839, British scientist Sir John Frederick William Herschel had discovered a chemical solution—hyposulfite of soda or “hypo”—which acted as a fixing agent on photosensitive paper, and, by 1841, fellow English scientist William Henry Fox Talbot had refined the calotype, a process in which a paper negative was developed outside the camera and bathed in a chemical solution, enabling an infinite number of paper positives. (His *The Pencil of Nature*, published in 1844, with 24 original prints, was the first book ever to contain photographs.) In 1851, another Englishman, Frederick Scott Archer, invented the collodion negative process or “wet plate” technique, in which a glass plate was coated with silver iodide and exposed while still wet, a process which came to displace the others. The collodion

William Henry Jackson took this photograph of a Manchu shaman in Russia in 1895. It was published in *Harper's Weekly* two years later. (Library of Congress, Prints and Photographs Division [LC-USZ62-78790])

process was used for the ambrotype, a glass negative backed with black material, creating the effect of a positive image, and the tintype, which substituted an iron plate for glass.

The Beginnings of Photojournalism

The daguerreotype, the first photographic process to gain popularity, was especially used for portraits. But early photographers also used it to capture less contrived images of historic events, such as the California gold rush of 1849. French photographer Maxime DuCamp traveled to Egypt in 1849–50 and made calotypes of temples and pyramids. British photographer Roger Fenton's work in the Crimean War of 1853–56 is considered the first work of a photojournalist. Another early photojournalist, American Mathew Brady, who had first taken daguerreotypes, created a photographic corps to document the American Civil War of 1861–65, using equipment for the collodion process, including large cameras, tripods, and portable darkrooms.

Photography and Government Surveys

Photography became an official tool of exploration in the United States after the Civil War. Timothy O'Sullivan, who originally worked under Brady, traveled with CLARENCE KING and GEORGE MONTAGUE WHEELER in U.S. governmental surveys of the American West in the 1860s–1870s; John K. Hillers explored the Grand Canyon with JOHN WESLEY POWELL in the 1870s; and William Henry Jackson accompanied FERDINAND VANDEVEER HAYDEN to the Yellowstone River and ROCKY MOUNTAINS, also in the 1870s.

Images from the Frontier

Other photographers traveled to other continents, such as British Samuel Bourne in India and Scotsman John Thomson in China. Books with photographs of foreign lands, containing the first such views seen by many, became best-sellers for publishers. Starting in 1900, American Edward

Curtis began documenting Native Americans with photographs, much as GEORGE CATLIN had done with painting.

Photography in Arctic and Antarctic Exploration

Photography played an important part in early 20th-century exploration of the Arctic and the Antarctic. Australian photographer and later aviator SIR GEORGE HUBERT WILKINS was official photographer of the Canadian Arctic Expedition of 1913–18 under VILHJALMUR STEFANSSON. Another Australian, James Francis (“Frank”) Hurley, was official photographer for the Imperial Trans-Antarctic Expedition of 1914–17 under SIR ERNEST HENRY SHACKLETON.

An Evolving Technology

With continuing improvements, photography became more and more practical in the 20th century. By 1925, the 35-mm camera had been designed in Germany by Oskar Barnack of the Ernst Leitz company. Black-and-white film became faster, freeing the photographer from such great dependency on the artificial light of the flash. Ten years later, color film for transparencies, or slides, was introduced, and, in 1942, color negative film. Advancements in photography were carried over into motion pictures, which Thomas Alva Edison and his employee William K. L. Dickson helped develop in the United States in the 1880s–90s, and the brothers Auguste and Louis Lumière introduced to the world in France in 1895. Digital photography, the process of recording still images electronically rather than photochemically, and video recording, doing so with moving images, are now widespread technologies.

Modern Uses

Photography has played a part in modern surveying and cartography; the term *photogrammetry* refers to the use of photography in surveying and in making MAPS AND CHARTS (see SURVEYING AND EXPLORATION). AERIAL PHOTOGRAPHY has been used for photogrammetry and, in conjunction with advancements in aviation, has revolutionized exploration; early aviators in the Arctic and Antarctic, such as American RICHARD EVELYN BYRD, first demonstrated the value of taking photographs from the air (see AVIATION AND EXPLORATION). Aerial photography has also given us a visual record of other celestial bodies in SPACE EXPLORATION.

Pilgrims

A pilgrim is a person who travels to foreign lands, generally for religious purposes, such as visiting a sacred place or seeking religious freedom. These journeys are known as pilgrimages. When capitalized, *Pilgrim* refers to any of the group of early English settlers who founded the Plymouth colony in present-day Massachusetts. Established in 1620, theirs was the first permanent English settlement in the Northeast,

founded 13 years after the Jamestown settlement in Virginia. The Pilgrims have also been referred to as the “Forefathers” or “Founders.”

The group originally came together at Scrooby, a village in Nottinghamshire, England. By the early 17th century, they had formed a separatist Protestant church opposed to the rites and the monolithic control of the Church of England; they were part of the general religious movement known as Puritanism. Early leaders included John Robinson and William Brewster. In 1607–08, most of the Separatists (as they became known) emigrated from England to the Netherlands, where the religious laws were more liberal, and settled in Leyden. In their new homeland they worked mostly as artisans and laborers.

Hoping for a better life in the Americas, some members of the group voted to emigrate there. In 1619, William Brewster and William Bradford received backing from the Virginia Company of London, one of two English companies chartered to colonize North America (see VIRGINIA COMPANY). About half the church members—some among those who had moved to the Netherlands and some among those still in England—planned to go. The initial intent was that the Netherlands Pilgrims would sail the *Speedwell* to England and join their English brethren. The *Speedwell* would then cross the Atlantic together with a second ship bearing other émigrés. But the *Speedwell* proved unseaworthy, and 102 men, women, and children crammed onto the *Mayflower*, a ship of 180 tons burden formerly used to carry wine. The vessel sailed under Captain Christopher Jones. The Leyden group of Separatists, who referred to themselves as “Saints,” were only 35 in number; they called the other passengers “strangers.” The *Mayflower* left Plymouth, England, on September 16, 1620. A storm drove it north of its intended landing site, and, on November 21, it reached Provincetown, Cape Cod, in present-day Massachusetts. For a month, the Pilgrims explored along the coast; on

This bank note vignette on American history from the 1870s–80s shows the Pilgrims. (Library of Congress, Prints and Photographs Division [LC-USZ62-96003])

December 21, they entered Plymouth Harbor, territory granted to the Virginia Company of Plymouth.

While still on board ship, the leaders drew up the Mayflower Compact, which was signed by every adult male, Separatists and Strangers alike. The document formed a government based on the principle of rule by the will of majority and promising allegiance to the English king. John Carver was selected as governor of the Plymouth colony (he was succeeded in 1621 by William Bradford). EDWARD WINSLOW was elected to the ruling council. The Pilgrims later obtained patents from the Council for New England that legalized the chosen settlement site at present-day Plymouth, Massachusetts.

The winter of 1620–21 proved difficult for the colonists, and many of them died. The following spring, the Pilgrims were helped greatly by Native Americans of the Wampanoag Confederacy. Under the leadership of the grand sachem Massasoit, and with SQUANTO, who had earlier traveled to Europe, interpreting, the Wampanoag taught the newcomers planting and fishing methods. That fall, the Pilgrims and the Wampanoag shared a bountiful harvest; out of this event there developed the American tradition of an annual Thanksgiving.

Over the next years, the Pilgrims explored the surrounding region. Trade was conducted up and down the coast. In 1622, Squanto led an expedition by ship to Narragansett Bay in present-day Rhode Island. Miles Standish, who had been a professional soldier in Europe, became the Pilgrims' military leader and led a number of expeditions against Native American and rival colonists in neighboring regions. In 1632, Edward Winslow undertook one of the earliest European explorations of present-day Connecticut.

The Plymouth colony was absorbed by the Massachusetts colony in 1691. William Bradford wrote the *History of Plimoth Plantation*, published in 1656. He is credited with the first use of the term *Pilgrims* for the founders of the colony.

Pillars of Hercules See GIBRALTAR, STRAIT OF.

pinnacle

The term *pinnacle* refers to a small ship used for auxiliary duties connected with a larger vessel. It is taken from the Latin root word for “pine,” a wood used in shipbuilding. Among the Romans, a pinnacle was propelled by oarsmen and camouflaged for reconnaissance missions. During the EUROPEAN AGE OF EXPLORATION of the 15th, 16th, and 17th centuries and afterward, it was more often a sailing ship. A pinnacle would usually be transported on the deck of the flagship vessel during a voyage. Sometimes they sailed alongside the fleet, but their small size made them vulnerable to loss in the open

ocean. They were used as tenders for the larger ships, that is, for transporting people and supplies to and from shore. They are also associated with the exploration of coasts, inlets, and rivers.

See also ROMAN EXPLORATION; SHIPBUILDING AND EXPLORATION.

piracy

An act of piracy is a crime on the high seas outside the normal jurisdiction of any nation and without the granted authority of a nation. A pirate—a word from the Greek *peirateia* and Latin *piratia*, the same root of “peril”—refers to a person who commits an act of piracy. They can be thought of as the “highwaymen” or “brigands” of the sea. Piracy is an ongoing story throughout maritime history and, as a result, is associated with world exploration.

Some among the Phoenicians, who, by the mid-13th century B.C., had become the dominant seafaring people of the MEDITERRANEAN SEA, were known to commit acts of piracy, raiding ships without official sanction. They and early mariners among the Greeks were also the victims of piracy. The Romans, who became a naval power in the Mediterranean and into the Atlantic Ocean from the third century B.C. to the fifth century A.D., helped counter piracy. In the Middle Ages, the Vikings raided ships as well as coastal settlements throughout western Europe. Private vessels operated by Arab Muslims raided ships in the Mediterranean. Pirates also preyed on merchant ships in the North Sea and Baltic Sea; one of the purposes of the HANSEATIC LEAGUE, an association of German merchants and communities founded in the 13th century, was to counter this constant threat.

Starting in the 16th century, the tradition of piracy continued with ships based along the BARBARY COAST of North Africa (a region named for the Turkish pirate Khayr ad-Din Barbarossa), following the final Christian defeat of the Muslims in Spain in 1492 and their dispersion there. Barbary pirates came to be known as “corsairs,” a French word for a ship from the Latin root word for “course.” Some of them were in effect PRIVATEERS, independent mariners (and their ships) having been granted the right by a nation to participate in a naval military action against an enemy. Some of them preyed as far north as the English Channel. The corsairs were active into the early 19th century.

Meanwhile, English privateers, such as SIR FRANCIS DRAKE and SIR JOHN HAWKINS of the 16th century, preyed on Spanish trade in both the Atlantic and Pacific Oceans, following the European discovery of the Americas and Spanish plunder of Native American civilizations (see TREASURE AND EXPLORATION). Pirates and privateers of the 17th century—mostly English, Dutch, and French who operated out of the Caribbean Sea against Spanish interests—became known as “buccaneers,” from the French word

boucan, a type of grill used to cook meat plundered from Spanish cattle plantations (see SPANISH MAIN). Another term for pirates is *freebooters*, from the Dutch *vrijbuiter* for “free booty.”

The growth of national navies in the 17th, 18th, and 19th centuries helped decrease piracy, as did the development of new maritime technologies—the steam engine in the 19th century and diesel engines in the 20th century. Yet one still hears of acts of modern piracy.

pirogue (piragua)

A pirogue (also *piragua*) is a type of dugout CANOE, built with a variety of features and in a range of sizes. The pirogue could be shaped by carving and by burning out the center of a log. Often, sections within the boat were separated by bulkheads, to form a place to store cargo and to give the vessel strength. Most commonly the pirogue was propelled by oarsmen, but some used the supplementary power of a sail. Although heavier than other varieties of river craft, and, as a result, less convenient for portaging over land, the pirogue was sturdy and dependable in strong currents.

Dugout canoes have been made and used all over the world where trees grow to a sufficient size. In America, the pirogue was developed for navigating river systems and carrying goods, especially furs. When North America was being explored by Europeans and Euro-Americans, there was an abundance of large trees along the rivers, some six feet in diameter with trunks running 40 feet before the first limbs. Subsequently, the builder was not limited in the size of his craft by the available timber. An average-sized pirogue was eight feet long and two to three feet wide. Cedar, cottonwood, and walnut were the preferred woods for making a pirogue.

The typical crew of a larger pirogue was three—a rower in the front, one amidships, and a steersman at the stern. To construct a raft, two pirogues would be bound together at a distance of eight to 10 feet and planks would be placed on the intervening space to create a deck for the crew and goods.

In addition to the KEELBOAT, early expeditions along the MISSISSIPPI RIVER and MISSOURI RIVER—such as that under MERIWETHER LEWIS and WILLIAM CLARK in 1804—made use of the pirogue.

See also SHIPBUILDING AND EXPLORATION.

planisphere

Planisphere refers to the representation of the circles of a sphere on a plane, that is, a two-dimensional representation of a three-dimensional space. It is a word that was used commonly in antiquity with regard to cartography.

The term has fallen out of use as the variety and sophistication of mapmaking techniques have developed. Modern maps are labeled according to the method used to generate them, such as a MERCATOR PROJECTION, or Lambert Equal-Area Projection.

Today, the term *planisphere* is most often used to refer to a projection of the celestial sphere and the stars on a plane, sometimes with adjustable circles for showing the varying position of the stars.

Polynesian exploration

Polynesians are the peoples of Polynesia, islands in a vast triangular-shaped area of the Pacific Ocean, which along with Melanesia and Micronesia make up the South Pacific Islands, or OCEANIA. In the north, the HAWAIIAN ISLANDS form the top point of Polynesia’s triangle; to the southeast, Easter Island occupies the right-hand corner; to the southwest NEW ZEALAND bounds the left-hand corner. Polynesia consists of American Samoa, Cook Islands, Easter Island, French Polynesia (Society Islands, Marquesas Islands, Tubuai Islands, Tuamotu Islands, and Gambier Islands), Hawaiian Islands, New Zealand, Niue, Pitcairn Islands, Samoa, Tokelau, Tonga, Tuvalu, and the Wallis and Futuna Islands. Fittingly, the term *Polynesia* is derived from a Greek word for “many islands.”

There are many characteristics, both physical and cultural, which make the Polynesians a group unto themselves. There are also variations within the group, which point to a complex ancestry. The questions of where they originated and where they migrated and how they managed to travel great distances by water are still being debated.

Physically, Polynesians are tall, well-proportioned, and strong. They have lighter skin than their neighbors to the west in Melanesia and to the northwest in Micronesia, and their hair is straight or wavy. There is, however, a range of features among these peoples, with very light skin found, people with red hair, and men with beards. In short, they show characteristics of a mixture of ethnic groups, with Asian and Caucasian features most apparent.

The strongest indication of Polynesian common identity is shared language. All speak the same language with different dialects. They have other cultural characteristics in common as well. They typically worship some form of

sun god, produce similar-looking statues and artwork, and before the arrival of Europeans, had no concept of money and did not weave or make pottery.

That a group of people could maintain such changeable features of their culture while spread out over such a wide area suggests a fairly recent migration over a relatively short period of time. On this topic, the questions are far from settled. The earliest estimate for the start of the migrations is about 1000 B.C. Many scholars now agree, based on linguistic and agricultural traits, that Polynesians originated from Southeast Asia. They possibly reached the Marquesas Islands and radiated outward in about A.D. 300. The Marquesas manifest some of the earliest evidence of human habitation in Polynesia (120 B.C.), and are centrally located. Others have suggested that Polynesians came from the shores of North America, South America, or both. The wind and current systems of the Pacific are more favorable for a westward migration than eastward travels from Asia. Norwegian anthropologist THOR HEYERDAHL has supported the view that Polynesians migrated from the Americas, and he conducted his famous voyage of the *Kon-Tiki* in 1947 to prove the possibility.

Whatever the time frame, or place of origin, the feats of seamanship accomplished by the Polynesians were admirable. There are several factors that made transoceanic voyages possible. One was the double CANOE. Arising from the OUTRIGGER, a craft unique to the Pacific Ocean, the double canoe could carry people and cargo in significant quantity and was fairly stable in the open ocean. Another was knowledge of techniques of navigation. Polynesians practiced a rudimentary form of stellar navigation by identifying certain islands with the stars that were found directly above them; for example, Sirius marks the location of Tahiti. By sailing in the direction of a particular star, one could reach their destination. Polynesians also made maps with sticks bound together by coconut fiber, with shells added to represent islands. (See NAVIGATION AND EXPLORATION.)

An ancient Polynesian mariner whose name has endured in the legends of the Maori, New Zealand's native peoples, is KUPE. According to Maori tradition, he traveled across much of Polynesia in the 10th century and reached New Zealand.

portolan chart

The Italian term *portolano* or *portulano* (plural forms, *portolani* or *portulani*) refers to early written descriptions about landmarks, winds, and currents used by pilots in navigating waters, similar to the Greek manual known as a PERIPLUS. With time, the portolani evolved into charts, graphic representations of bodies of water and coastlines, probably first created to be used in conjunction with pilot books for purposes of navigation. The growing use of the magnetic COM-

PASS, or mariner's compass, for multiple readings of a coastline, enabled the making of more accurate charts and resulted in their orientation north-south, not east-west. Although lines showed the bearings between important ports, portolan charts did not depict LATITUDE AND LONGITUDE as devised by ancient Greek cartographers, such as PTOLEMY.

The earliest reports of such charts date from the late Middle Ages. MARCO POLO, an Italian explorer of the Far East in the latter part of the 13th century, mentions a chart of the coast of CEYLON (present-day Sri Lanka). But it is assumed there had been earlier graphic representations. The oldest existing portolan chart—the Pisan Chart by Italian cartographer Petrus Vesconte—represents coastlines and ports of the MEDITERRANEAN SEA and dates from about 1300. Its high degree of accuracy, with distances drawn to scale, indicates that its makers drew on the work of earlier cartographers. Early portolan charts were published individually on single sheets of parchment. In time, they began to appear in atlases. The Laurentian Portolano, for example, published in 1351, includes eight charts and covers territory from the British Isles to India, including parts of Africa.

A French-derived word for a nautical chart is “rutter.”

See also GEOGRAPHY AND CARTOGRAPHY; MAPS AND CHARTS; NAVIGATION AND EXPLORATION.

Prester John

Prester John was a legendary monarch and priest, whose kingdom was believed to exist in Asia and Africa. The myth began in the Middle Ages but endured into the RENAISSANCE and provided incentive for numerous voyages of exploration. *Prester* is an early version of “priest” or “presbyter,” an elder in the early Christian church.

The earliest known reference to the mythic figure of Prester John is found in the writings of Otto von Freisingen, bishop of Freising (Otto of Freising). In his *Historia de Dubabus Civitatibus*, published in 1158, he described how, in about 1145, Hugh, the bishop of Jabala in what is now Syria, in a meeting with Pope Eugenius in Rome, reported that a priest-king named John ruled a Nestorian Christian kingdom beyond lands controlled by Muslims. (The Nestorians were a sect of Eastern Christians who followed the teachings of Nestorius, patriarch of Constantinople, condemned as a heretic by the Council of Ephesus in A.D. 431 for believing in two distinct natures, God as a divine being and Jesus as a man.) According to Hugh, the Christian ruler had defeated an army of infidels and would likely help with further support of the CRUSADES. (The time frame fits a real battle occurring in September 1141 near Samarkand in present-day Uzbekistan in which Yeliutashi, ruler of the empire of Kara-Khitai, defeated Sultan Sanjar, the Seljuk Turk

ruler of Persia; rumors soon reached Europe that Yeliutashi was a Christian, and it has been theorized that his people, the Kara-Khitai, were confused with the Kerait tribe, a Nestorian Christian people of central Asia.)

The second known mention of Prester John is in a letter from about 1165 from Prester John himself—presumably forged by a European—addressed to Emanuel I, the Byzantine emperor of Rome, describing a huge peaceful and wealthy Christian kingdom in India, but one besieged by infidels. Some of the later hundreds of published versions of similar letters are addressed otherwise, such as to the pope or the king of France. In 1177, Pope Alexander III sent out his physician, Magister Philippos, with a reply for Prester John, but there is no record what became of him.

The belief in Prester John's Asian kingdom persisted into the 13th and 14th centuries. Early European travelers to Asia, such as GIOVANNI DA PIAN DEL CARPINI, WILLIAM OF RUBROUCK, MAFFEO POLO, NICCOLÒ POLO, MARCO POLO, JOHN OF MONTECORVINO, ODORIC OF PORDENONE, and GIOVANNI DE MARIGNOLLI, hoped to make contact. Marco Polo heard of a Christian ruler of the Kerait people, who had been slain by the forces of GENGHIS KHAN of the Mongols in the early 1200s and thought perhaps he had been Prester John.

Without any confirmation of the legend in Asia, attention shifted to Africa in the 14th century. Letters appeared as early as 1340, describing Abyssinia (as Ethiopia was then called) as the location of Prester John's illusive kingdom. Because geography of the period was so vague, with eastern lands—from East Africa to India—lumped together in the minds of many Europeans, what now seems such a shift of attention appears less arbitrary. *The Travels of Sir John Mandeville* by SIR JOHN MANDEVILLE (perhaps a made-up traveler), published between 1357 and 1371, was one of the various works describing Prester John's fantastic kingdom.

The hope of finding Prester John was reported as one motivation for the 15th-century voyages along the coast of West Africa, sponsored by HENRY THE NAVIGATOR, prince of Portugal. Prester John was increasingly reported as a “white” Christian king, and his land was becoming ever more exotic in descriptions—a gold-laden kingdom through which a mighty river flowed whose banks were sprinkled with precious stones and where there was a FOUNTAIN OF YOUTH from which he drank. He also supposedly had an army of thousands of warriors who could help in a Christian holy war against Islam. In 1487, King John II of Portugal dispatched PERO DA COVILHÁ to Abyssinia to confirm reports of a Christian emperor there. Covilhá reached the region and became an adviser to the monarch, known as the Negus, but did not return to Europe. In 1520, a Portuguese priest, FRANCISCO ÁLVARES, also spent time with the Negus. He wrote an account of his African experiences, entitled *The Prester John of the Indies*, published in 1540.

Some of the earliest printed maps show Prester John's realm in Africa, and cartographic references lasted into the 17th century. But with more and more European travelers reaching the region, the association of Prester John with East Africa gradually faded as did the legend in general.

prime meridian (Greenwich meridian)

The term *meridian*, also known as a line of longitude, is the name applied to any imaginary line on Earth's surface, running north-south and passing through the NORTH POLE and the SOUTH POLE, and at a right angle to the EQUATOR. *Prime meridian* refers to the meridian designated as zero degree longitude, from which all other points of longitude are measured.

With regard to a line of latitude, the equator, at Earth's widest point of circumference and equidistant from the North and South Poles, is a natural choice for being considered prime, that is, zero latitude. But no one meridian can be so determined, and countries established varying systems for setting the time of day. As a result, early world maps lacked a standardized grid of LATITUDE AND LONGITUDE. In 1884, the Washington Meridian Conference was held to determine an international standard and established that the prime meridian passed through the original site of the Royal Observatory in Greenwich, England. As a result, the prime meridian is also known as the Greenwich meridian. A number of terms have been applied to the standard of time based on the prime meridian: Greenwich Meridian Time, Greenwich Mean Time, Greenwich Civil Time, and Greenwich Time.

privateers

A privateer is a private ship, or the commander or one of the crew of that ship, commissioned by a sovereign nation to take action against an enemy. The commission, known as letters of marque and reprisal (or, more commonly, letters of marque), enabled private individuals to fit out an armed vessel and attack and seize ships, crews, and merchandise. The practice started in the Middle Ages, when European nations hired private merchant vessels to create a navy or help fill out an existing navy. Privateers, in their wide-ranging voyages for military and commercial purposes, played a part in world exploration.

The term *pirate* refers to a person who commits a crime on the high seas, or an act of PIRACY. Some of the men who worked as privateers and whose vessels also became known by that term, began as pirates on pirate ships. (The terms *corsair*, *buccaneer*, and *freebooter* are also applied to pirates,

some of whom were in effect acting as privateers.) But other men were private businessmen and mariners who received authorization from their governments to commit what would otherwise be considered acts of piracy and to keep much of the profits for themselves.

An explorer who may have participated in at least one privateering expedition in his early career was Italian CHRISTOPHER COLUMBUS, who later had the sponsorship of the Spanish government in his expeditions across the Atlantic Ocean in the late 15th and early 16th centuries. In 1522, Italian GIOVANNI DA VERRAZANO, sailing as a privateer on a French ship, successfully raided two of HERNÁN CORTÉS's ships, returning from Mexico with Aztec Indian gold. This led to his commission for a French voyage to the Americas.

Englishman SIR JOHN HAWKINS developed the SLAVE TRADE in the 1560s, between England, Africa, and the Americas, considered at that time a violation of international law, which led to his arrest by the Spanish. He eventually went on to serve in the Royal Navy and helped secure English victory against the Spanish Armada in 1588. His younger cousin, SIR FRANCIS DRAKE, who sailed with him on several occasions against Spanish interests, carried out the first English CIRCUMNAVIGATION OF THE WORLD in 1577–80 as a privateer. SIR JAMES LANCASTER, who was part of the expedition, went on to sponsor and organize expeditions in search of the NORTHWEST PASSAGE. CHRISTOPHER NEWPORT, who also accompanied Drake on raids, carried the first English colonist to Virginia in 1607. SIR MARTIN FROBISHER, another Englishman, also sailed as a privateer in the 1560s, later becoming an Arctic explorer. Englishman SIR ANTHONY SHERLEY, who later became a diplomat, led a privateering expedition in 1596. GEORGE POPHAM, who founded a short-lived colony in Maine in 1607–08, was a part of privateering raids in the WEST INDIES. Englishman WILLIAM DAMPIER, in the late 17th century, served in both pirating and privateering raids in the South Pacific Ocean and Caribbean Sea. With an interest in the natural sciences, he was later commissioned an officer in the Royal Navy and placed in command of the first English government-sponsored expedition to the Pacific, carried out in 1699–1701. In 1703, he embarked on another privateering expedition to the Pacific coast of South America. A Scottish crew member, ALEXANDER SELKIRK, was marooned in the Juan Fernandez Islands. After his rescue in 1709, his story became the inspiration for the 1719 novel *Robinson Crusoe* by Daniel Defoe. It is interesting to note how many of the above were knighted in the course of their careers.

Privateering was practiced on a large scale in the American Revolution in 1775–83 and the War of 1812. In the former, the Patriot navy consisted of almost 1,700 re-outfitted private merchant ships as opposed to 64 official Continental Navy ships. The practice of privateering was

abolished by the Declaration of Paris of 1856, of which the United States, Spain, Mexico, and Venezuela were not signatories. In the American Civil War of 1861–65, only the Confederacy made use of privateers. The United States officially renounced the practice during the Spanish-American War of 1898. At the Hague Conference of 1922–23, the international ban on privateering was extended to aircraft.

pundits

The word *pundit* is a variation of *pandit*, a Hindi term for a “learned expert,” applied especially to scholars, teachers, officials, and clerks. It is derived from the Sanskrit *pandita* of the same meaning. It also came to be applied by the British to native Indian explorers of the 19th century, hired to work on the Great Trigonometrical Survey of India.

The British survey of the Indian subcontinent had begun in the early 19th century, first under the direction of the BRITISH EAST INDIA COMPANY, then under the British government. SIR GEORGE EVEREST participated from 1819 to 1843. During that time most of India was mapped. The British, concerned about the intentions of both Russia and China in the region, wanted geographic knowledge of border countries as well, in particular Tibet to the north in the HIMALAYAS, which had been closed to Europeans since 1792.

In the 1860s, Thomas George Montgomerie, a captain in the Bengal Engineers who had headed surveys in Kashmir, devised a plan to accomplish this task. The British would hire native Indians or inhabitants of neighboring countries, train them as surveyors, and have them travel the countries disguised as Buddhist merchants or pilgrims. Since the surveyors were to enter countries illegally, they were in effect spies and would possibly be executed if captured. The recruits were trained in geography, astronomy, and memorization. They also received medical training. They practiced walking with a consistent stride for purposes of measurement. Each was provided with special instruments, crafted in British India: what seemed like traditional Buddhist prayer beads, but with 100 beads instead of the normal 108 and with every 10th bead larger than the rest, for keeping track of paces; a prayer wheel holding a COMPASS and slips of paper for taking notes; a hollowed-out book concealing plane tables for mapping; a hollow walking stick holding a thermometer for measuring the temperature at which water boils, a way to measure altitude; and a false-bottomed travel chest to carry a SEXTANT for determining latitude.

Each surveyor was given a code name. Some of their names are now famous in the history of exploration, although, for years, even into the 20th century, they were given little recognition. NAIN SINGH, the first native surveyor in the field, was called “the Pundit.” Eventually, all the

native surveyors came to be known as such. In 1864–66, Nain Singh crossed the eastern Himalayas into Tibet and visited the city of LHASA and explored the upper Brahmaputra River. In 1867, he explored the western Himalayas and the upper INDUS RIVER. In 1873, Nain Singh traveled with his cousin, KISHEN SINGH, from northern India to Chinese Turkestan, reaching the Takla Makan desert. In 1878–82, Kishen Singh journeyed as far north as Mongolia's GOBI DESERT. Pundit KINTUP explored Tibet in 1879–84 and determined that Tibet's Tsangpo River is the same as India's Brahmaputra. Another pundit, Hari Ram, explored the region around the world's tallest mountain, MOUNT EVEREST, in 1871–72; later in his career, he crossed northern Nepal from west to east.

Not all the pundits succeeded in their missions, and some were executed or sent back to India. Yet, over the decades, the pundits managed to map many of the lands north of India.

Punt (Pwnt)

Punt, an ancient land, was a source of luxury goods for the ancient Egyptians. The name *Punt*, or *Pwnt*, means “the sacred.” The exact location of Punt, and its cities or villages,

is unknown, but much can be extrapolated concerning it from historical descriptions. It was a fertile land, with a variety of plant and animal species, requiring some days to reach from the head of the NILE RIVER by way of the RED SEA. The most likely locations for Punt are the Horn of Africa, either along the north coast along the Gulf of Aden, or the south coast in the Indian Ocean where Somalia is today. But Punt may have included lands in what is now eastern Sudan, Eritrea, and Ethiopia in Africa, or Yemen on the Arabian Peninsula. Or the name may have referred to all the southern parts of Africa and Arabia, of which the Egyptians were aware.

The first record of Punt is from HANNU's trade expedition for Egypt in about 2450 B.C. Hannu carried back precious minerals and spices to Egypt during the reign of Sahure. In about 1492 B.C., Queen HATSHEPSUT of Egypt organized a mission to Punt to obtain spices, exotic trees, precious metals, ivory, leopard skins, and monkeys. Records of these journey survive as carved reliefs, narrated with hieroglyphics, adorning the walls of her temple of Deir el-Bahari. Some of the inscriptions relate that the people of Punt believed the visitors from the north were supernatural beings who had descended from the sky.

quadrant

A quadrant is an instrument used to measure the angular elevation of a celestial body and thereby determine geographic location for purposes of navigation. The name derives from the graduated arc displaying the reading, which spans 90 degrees, one fourth of a circle. The term *quadrant* is sometimes used interchangeably with other measuring devices based on the same principles. The octant, based on an arc of 45 degrees, and the SEXTANT, based on an arc of 60 degrees, were invented at about the same time in the 18th century. Hadley's Quadrant, invented by Englishman John Hadley in the early 1730s, was actually the first octant. The sextant became the tool of choice in celestial navigation. (The term *sextant* is now the most widely used term and is sometimes applied to all such measuring devices.)

The first quadrant, actually a version of the ancient ASTROLABE, was a simple wooden triangle with a wooden plumb bob on a thread, used to give a reading of the celestial body's altitude in relation to the horizon, which could be compared to tables of figures from earlier readings (see EPHEMERIS). From the computations, the user could determine approximate latitude. Later quadrants were made from brass. The CROSS-STAFF was a T-shaped device, which gave a more accurate reading. In the late 1500s, English mariner JOHN DAVIS added a reflector to the cross-staff so the Sun could be observed without damage to the eyes; that device became known as the backstaff.

Davis went on to invent what is known as the Davis Quadrant, probably during his Arctic voyages of the 1580s–90s; the device was first described in 1595. The Davis Quadrant consisted of two triangles instead of one. The smaller triangle had a mounted lens, which projected an image of the celestial body to a sighting slot aimed at the horizon. The larger triangle had two handles, a big arc with a scale, and an arm that slid along the arc to give measurements.

Quivira (Aguivira, Cuivira, La Gran Quivira, Quebira)

The legend of Quivira, also spelled Cuivira, Quebira, and Aguivira, is part of the story of the legend of CIBOLA, supposedly the location of seven cities, also known as the Seven Cities of Antillia, founded by seven Portuguese bishops, with wealth on a par with that of the Aztec and Inca civilizations. Such legends spurred on European exploration of the Americas, in particular among the Spanish. A 1540 expedition sent out from Mexico by ANTONIO DE MENDOZA, the viceroy of New Spain, and led by FRANCISCO VÁSQUEZ DE CORONADO, sought to determine if the Zuni Indian pueblos in what is now western New Mexico were the kingdom of gold

and jewels. Finding no great wealth here, the Spanish were primed for rumors of another location. A Plains Indian, probably of the Pawnee tribe, the TURK, who had been held captive among the Towa Indians of Cicuye Pueblo (Pecos Pueblo) on the Pecos River, described a wealthy civilization to the northeast on the southern plains to HERNANDO DE ALVARADO, one of Coronado's lieutenants.

In spring 1541, Coronado, Alvarado, and Franciscan friar JUAN DE PADILLA, who was driven by the hope of locating the cities founded by the seven bishops, set out with a large expedition from New Mexico, across the Texas Panhandle, and then north through present-day Oklahoma and into Kansas. The Spanish came into contact with Plains Indians, probably in what is now central Kansas near the great bend of the Arkansas River (although some writers have assigned the location of contact with Plains Indians to be the Canadian River area of the northeast Texas Panhandle), but found no wealthy cities. It is thought that the villages were of the Wichita Indians. The Spanish also encountered a party of Pawnee Indians. Coronado eventually had the Turk executed, because of his deception as well as an attempt to incite the Pawnee against the Spanish. Another Plains Indian

by the name of Ysopete then became the chief guide. The mythic land was never found, but the Spanish returned to Mexico with new geographic knowledge.

It has been theorized that the Turk sincerely believed that the powerful medicine of the Pawnee represented riches. It is more likely that the Pueblo Indians promoted the idea of wealth to be found elsewhere to rid themselves of the Spanish, and that the Turk, as part of the scheme, hoped to be taken back to his homeland.

In the early 1600s, the Spanish colonizer of New Mexico, JUAN DE OÑATE, searched for both Cibola and Quivira in the lands surrounding his settlement near present-day Santa Fe.

The legend of Cibola and Quivira persisted. Quivira became known as La Gran Quivira and, depending on rumors, its believed location shifted, the name appearing on early maps of the southern plains, Southwest, and even California. One of the ruins at the Salinas Missions National Monument, south of present-day Albuquerque, New Mexico, where the Piro Indians once lived, is known as Gran Quivira. Quivira has also endured as a place name in Kansas.

R

raft

A raft is a floating structure, made from a variety of materials attached together, such as logs or bundled reeds. In some instances, certain materials, such as airtight animal bladders, are added to provide greater buoyancy. Rafts have been used from prehistoric times and can be considered the earliest watercraft. With time, ancient peoples devised ways to hollow out a single log or shape materials so that they moved through water with less resistance, making a type of craft generally known as the CANOE.

The balsa raft, or simply the balsa, consists of five or six logs of buoyant balsa wood bound together with cordage or hardwood pins. Propelled by oars or poles in shallow water, it might also have a sail, typically triangular. Some balsa rafts have a tent on deck for shelter and supplies, enabling them to stay at sea for weeks. Drag anchors make them safer than other types of small craft which can be sunk by waves. Some also have centerboards, making them less prone to drift.

In the legends of South American peoples, there is knowledge of the abundant islands of the South Pacific Ocean. Balsa rafts were made by the Inca Indians, who may have used them to colonize Polynesia (see POLYNESIAN EXPLORATION). Norwegian explorer and anthropologist THOR HEYERDAHL set out to prove the possibility of this migration by making a balsa raft and sailing it from Peru. After three months at sea, he landed on the Tuamotu Archipelago in Polynesia. The journey is chronicled in his book *Kon-Tiki* (1948).

According to legend, in the 15th century, Inca ruler Tupac Yupanqui led a fleet of 400 balsa rafts in an exploration of the Pacific, a trip that lasted about a year. In the 16th century, Spanish conquistador FRANCISCO PIZARRO observed Native Americans using balsa rafts to conduct trade along Ecuador's coast. The raft would not have been practical for overseas trade, however, due to the lack of space for cargo. The balsa raft is still in use today in Brazil where it is called a *jangada*.

A type of raft common to Native Americans in present-day California, made from bundled tule reeds, is also sometimes referred to as a balsa.

Red Sea

The Red Sea is an inland sea separating northeastern Africa from the Arabian Peninsula of Asia. Its name results from the color at times cast by dying algae. It stretches 1,200 miles from Suez, Egypt, to the strait of Bab el Mandeb and obtains a maximum depth of 9,970 feet and a maximum width of 220 miles. The northern end of the sea is divided into the gulfs of Suez and Aqaba by the Sinai Peninsula. The Gulf of Suez is connected to the MEDITERRANEAN SEA by the Suez Canal, dug in the 19th century. At its southern end, the strait of Bab el Mandeb, about 20 miles long, connects the Red Sea to the Gulf of Aden, part of the Arabian Sea. The dangers of navigating the strait of Bab el Mandeb led to its name, meaning "gate of tears" in Arabic. The Red

Shown here, in a late 19th- or early 20th-century photograph, is a raft of inflated pigskins in India. (*Library of Congress, Prints and Photographs Division [LC-USZ62-35117]*)

Sea formed some 20 million years ago as tectonic activity along what is called the Great Rift Valley separating the Arabian Peninsula from Africa.

Ancient Trade and Exploration

The Red Sea is first encountered in recorded history with the rise of the Egyptian civilization. As trade with other parts of the world developed, Egyptians developed a taste for spices, incense, and other products from Asia and Africa, which were carried to Egypt by camel caravan arriving from the Arabian Peninsula. The first recorded explorer, HANNU, was sent by pharaoh Sahure in about 2450 B.C. to search for the sources of the riches. He is thought to have traveled to what the Egyptians referred to as the land of PUNT—a land to the south either in Africa or on the Arabian Peninsula—by way of the NILE RIVER and returned by way of the Red Sea. The Egyptians launched other such large expeditions southward over the centuries (see EGYPTIAN EXPLORATION). Hieroglyphics indicate that in about 1492 B.C., HATSHEPSUT sent five ships

to Punt by way of the Red Sea route, which successfully obtained and returned with valuable goods—spices, woods, minerals, and animals. As early as the 13th century B.C., Egyptian rulers had a canal dug from the Red Sea to the Nile River delta and thus a water route to the Mediterranean.

The Phoenicians and Greeks, known as mariners, mastered the waterways of the region (see GREEK EXPLORATION; PHOENICIAN EXPLORATION). The writings of fifth-century B.C. Greek historian HERODOTUS indicate that, sailing for the pharaoh NECHO II in about 600–597 B.C., Phoenician seafarers followed a Red Sea route southward from the Gulf of Aqaba to the Indian Ocean and possibly carried out the first circumnavigation of Africa, returning to the Mediterranean by way of the Atlantic Ocean and Strait of Gibraltar (see GIBRALTAR, STRAIT OF). The first Greek credited with navigating the Red Sea was SCYLAX, a mariner sent by Darius I, emperor of Persia, in 510 B.C., to explore the course of the INDUS RIVER to the east. It is reported that Scylax traveled that river to the Arabian Sea, then around the tip

of Arabia into the Red Sea, on which he reached the Gulf of Suez, from where he returned to Persia.

The importance of the spice and incense trade to the Mediterranean region was immeasurable. Before his death in 323 B.C., ALEXANDER THE GREAT planned an expedition to the southern tip of Arabia to set up a sea route for the trade, but with the dissolution of his empire, it was never undertaken. The Romans gained control of Egypt with the defeat of Antony and Cleopatra. In about 25 B.C., a Roman prefect of newly annexed Egypt, GAIUS AELIUS GALLUS, left the port of Cleopatra in present-day Suez with a large expedition in order to wrest control of the spice and incense trade from the kingdom of Saba. Gallus sailed along the Arabian coast of the Red Sea, then headed inland near the northern border of present-day Yemen. He was, however, unable to overcome the Sabaeans in their principal city of Marib, and he returned unsuccessful to Egypt.

Overland travel was very expensive, and spices, silks, and incense, all at a high demand in Egypt and throughout the Roman Empire, were brought by trade caravans coming to the Romans from the East over Persia or from the south over the Arabian Peninsula (see ROMAN EXPLORATION). To further complicate Roman travel access, Arabs withheld their knowledge of the Arabian Sea. Roman sailors gradually learned to navigate the Arabian Sea and Indian Ocean, using monsoon winds. By the first century A.D., the Romans had established a direct sea route from Egypt to India, sailing through the middle of the Red Sea to avoid the pirates centered on the Arabian coast (see PIRACY).

When the Muslims conquered Egypt in the seventh century A.D., Red Sea traffic became mainly that of transporting Islamic pilgrims to Mecca from western lands, including present-day Morocco and Spain (see MUSLIM EXPLORATION).

Sea Routes

Toward the end of the Middle Ages, as contact and trade between West and East increased, so did interest in sea routes. The Portuguese, who were sending expeditions to try to discover a sea route from the Atlantic Ocean to India by rounding the southern tip of Africa, sent an expedition in 1487 to explore the southeast coast of Africa. PERO DA COVILHÃ, a Portuguese bodyguard to King John II of Portugal, sailed with Afonso de Paiva to Alexandria. The two disguised themselves as Arab traders and sailed with an Arab trading vessel in the Red Sea to the Arabian port of Aden in present-day Yemen. Covilhã continued across the Arabian Sea to India, then along the east coast of Africa.

The Portuguese continued their quest to dominate sea routes to Asia. In 1497–99, VASCO DA GAMA reached India by rounding Africa. Several years later, in 1506, the Portuguese attempted to gain complete control of the trade routes between Egypt and India when AFONSO DE ALBU-

QUERQUE conquered the island of Socotra in the Gulf of Aden. The Portuguese, however, failed to conquer Aden.

By the eighth century A.D., the ancient Egyptian canal between the Nile and the Red Sea was atrophied with misuse. It was not until 1858 that a Frenchman, Vicomte Ferdinand Marie de Lesseps, having obtained the blessings of the Egyptian ruler Said Pasha, formed a company that endeavored to build a canal to connect the Red Sea with the Mediterranean via Suez. The canal, 121 miles long, was completed in 1869.

The British purchased Egypt's share of the canal in 1875, mostly in order to facilitate transport to its colonial possessions in the East and exercise dominance over trade. In 1882, Britain occupied the Sinai Peninsula and the rest of Egypt. In response, the French set up trade agreements and finally established a colony, French Somaliland, on the African coast, at the strategic entrance to the Red Sea.

Today, the Red Sea continues to be an important link between East and West. The Suez Canal was nationalized by the Egyptians in 1956. The canal and the Red Sea serve as an essential route for oil tankers bringing oil from Africa and Arabia to Europe and the United States. There are continued archaeological discoveries in the Red Sea, including ships and their cargoes from prior centuries, bringing to life the richness of ancient trade and travel in the region.

religion and exploration

The movement of peoples, which has occurred throughout history, whether by migration, conquest, or exploration, inevitably has been accompanied by the movement of ideas and beliefs. In some instances, the beliefs themselves have spurred on travel to foreign lands, as in the case of missionaries, purposely sent to propagate religion. Since many of the missionaries followed an academic tradition, many of them were well equipped to record information of their experiences abroad.

The Ancient World

The development of organized “religions” as opposed to tribal cults was completely intertwined with the development of kingship. The first chiefdoms, kingdoms, and cities emerged when agricultural practices improved enough to generate food surpluses. In order to have chiefs and priests who do not themselves produce any food, it is obviously necessary to have surplus food. Though archaeologists disagree as to which came first, food surpluses or chiefs

demanding them, at some point the cycle was set in motion; rulers demanding ever greater production leading to greater concentration of power in a few hands in order to coordinate still greater food production. Rulers—the chief or king—were presented as deities who could influence the supernatural world and ensure rain and a good harvest.

However, the conquests of the ancient world were not accompanied by missionary zeal as we think of it today. Religion in the ancient world was relativistic rather than absolute. The gods of one culture could be adapted to those of another—thus Jupiter and Minerva of the Romans (see ROMAN EXPLORATION) were easily identified with the Zeus and Athena of the Greeks (see GREEK EXPLORATION); Mercury fused with Hermes and also with Lugus of the Celts. When the Hyksos—a Semitic people from Syria—ruled Egypt, their Storm God became one with Seth of the Egyptians (see EGYPTIAN EXPLORATION). Based as they were upon the forces of nature, the essential identity of these gods was clear. Assyrians adopted most of their gods from their rivals the Babylonians even as the two empires competed and warred against each other. Peoples from all over the Near East, including Elamites, Medes, Persians, and Jews, lived in the city of Babylon; yet apparently there were no ethnic or religious conflicts. Most outsiders worshipped both their own gods and those of Babylon. The unification of Upper and Lower Egypt in about 3000 B.C., which might have occasioned the imposition of one region's gods upon another, instead brought about a revision of religious belief in which all gods, both local and regional, were unified into a single scheme or hierarchy. The Greek city-states of the Hellenic world often fought bitter wars with one another, yet they shared belief in the Olympian gods. For the Olympic Games, held every four years, a sacred truce was declared and erstwhile rivals in war, such as Spartans and Athenians, competed on the athletic field.

Conquest typically followed the pattern of initial military subjugation, taking of prisoners, slaves, and booty; imposition of control, tribute, and taxes; decrees to make sacrifices to the conquerors' gods—but then settlement and mutual cultural influence. This was particularly true when the conquerors were nomads. In some instances, nomadic conquest would be preceded by a period of contact between nomads and a civilization during which the former would be strongly influenced by the latter—thus the Goths and Vandals, whose invasions helped cause the breakup of the Roman Empire, were already half-Romanized and, within a century, began rebuilding Rome in a semblance of its old image and constructing elaborate Christian churches.

The Missionary Impulse

In their travels, humans obviously carry culture, technology, and spiritual beliefs with them. The missionary impulse largely appeared first during the period from the fifth cen-

tury B.C. to the seventh century A.D., during which Buddhism, Christianity, and Islam were born. Other major world religions—Hinduism, Confucianism, Judaism, Taoism (Daoism), and Shinto—have shown few missionary tendencies. Confucianism, in part blended Taoism and Buddhism, with its ethics of humaneness and tolerance, did not foster missionary aspirations except within China as its scholars traveled to different cities to converse with their rulers (see CHINESE EXPLORATION). Part of the tenets of Shinto, a religion of and for Japan alone, is the acceptance of the validity of other religions.

Perhaps the earliest expression of the missionary impulse came from the prophet Zarathustra (Zoroaster) in Persia probably in the sixth century B.C. His first convert, Prince Vishtapa of Bactria, was so zealous as to fight several holy wars in defense of his new faith. Missionaries carried word of Zarathustra's doctrine, which because known as Zoroastrianism, throughout the Persian Empire.

The Spread of Buddhism

Although Buddha (Siddhārtha Gautama) lived in the sixth century B.C., significant Buddhist missionary activity only began about 200 years after his death. As a result of the third of four "Major Councils," which explored and codified Buddha's message over a period of several centuries, in the third century B.C., Ashoka, ruler of the Mauryan Empire, sent missionaries to southern and northwestern India and even as far as the MEDITERRANEAN SEA. Between the second century B.C. and the first century A.D., Mahayana Buddhists developed the doctrine of the triple nature of Buddha; one of these was the "body of transformation," in which form the Buddha nature appears on Earth to convert mankind. Buddhism spread to central Asia and from thence to China around the first century A.D. Its missionaries arrived in Korea in the fourth century A.D., in Japan in the sixth century, and came to Tibet by the seventh century. Though not explorers in the European sense, Buddhist missionaries traveled to lands utterly foreign to them, their motivation being the conviction of the rightfulness of Buddha's teachings. Later on in the seventh century A.D., religious fervor led Chinese Buddhist monk HSÜAN-TSANG to travel back to India in search of Buddhist texts, braving a Chinese imperial ban on leaving the country. In the end he traveled more than 40,000 miles through central Asia, bringing back to China a wealth of religious, cultural, and geographic knowledge.

A central characteristic of Buddhism has always been its promotion of freedom of thought. Buddha himself did not seek to impose his ideas on others but instead invited people to investigate them and decide for themselves. One can freely follow Buddha's teachings without abandoning one's own traditions and culture. For example, the Tantric form of Buddhism followed by Tibetans incorporates the many gods and demons of traditional Tibetan belief.

The Spread of Islam

At the time of Muhammad's birth in about 570, central Arabia was the only part of Arabia free of Sassanian Persian domination. Mecca was the principal city-state in this central region; the Meccans were important traders and caravan leaders and had permission from surrounding empires—Persia, Byzantium, and Abyssinia—to conduct trading expeditions through their territories. The culture of the Arabian peninsula had long been characterized by a contradictory mix of rural backwardness and urban sophistication, the large desert interior inhabited by nomads and the periphery having urban centers whose existence depended upon the SPICE TRADE. Rather like barbarian Europe during the same period, Arabia was profoundly influenced by the civilizations of Mesopotamia and later of the Mediterranean without itself developing a cohesive civilization until the rise of Islam, as Europe was to do under the influence of Christianity. Arabian peoples had been trading with southern Mesopotamia since the sixth millennium B.C. The spice trade became important by 1200 B.C.; myrrh and frankincense were traded to Egypt as well as Mesopotamia. Arabia was for millennia a crossroads of the ancient world. Mecca was situated close to a spice route along the Red Sea to Gaza. By the seventh century, as beneficiary of self-destructive wars between the Bedouin of the interior and the Byzantine and Sassanian Persian urban cultures of the periphery, Mecca had inherited from the Roman and Byzantine cities of Petra and Palmyra centrality in the spice trade. Mecca was spared as a result of its unique status as possessing the shrine of the Ka'ba, which attracted pilgrims from all over Arabia. It was in a mountain cave near Mecca that Muhammad, a wealthy merchant, reportedly received revelations from the angel Gabriel in a long series of visitations beginning in A.D. 610.

Though the spiritual primacy of Mecca gave Muhammad his opportunity to gather followers, the presence in the Ka'ba of the shrines of many gods and cults also ensured that there would be many bitter rivals to this new faith whose god aimed to displace all others. The persecution Muhammad and his first followers experienced, so severe that they were driven out of Mecca to Medina in 622, together with their victorious war to recapture Mecca in 630, may have set off the first explosive wave of conquests. By the 640s, the Muslims had overrun most of Syria, Iraq, Persia, and Egypt.

Islam focused the competing energies of the Arabian tribes through a novel type of political consolidation wrought by an elite of sedentary tribesmen from Mecca and Medina, heirs to Muhammad's legacy, a combination of spiritual, political, and commercial influence. The means of consolidation ranged from the ideological to the materialistic. The latter included the granting of gifts and promises of booty and land from conquered territories.

Missionary fervor seems to have been directed more or less exclusively toward Arabs, however. What early Muslims wanted from their new subjects was peaceful acceptance of their rule, one of their main aims being to secure new territories within which to pursue trade.

In many instances, the Arab conquerors encountered sophisticated civilizations far in advance of their own tribal culture. They swept through lands ruled by the Byzantine and Persian Sassanian empires. The Arabs left the apparatus of government and of educational institutions in place, allowing their bureaucracies to continue their activities unimpeded, only reserving the top positions for themselves. Over time, non-Arabs in the conquered lands, wishing to take part in the Arabs' success, began converting to Islam, the only way to rise in government. Only Muslims could serve in the army and this, too, attracted converts who wanted to share in the booty won by the always victorious Arab armies. Arabs thus were missionaries by example; the fantastic success of their enterprise seemed to prove the superiority of their religion. By the eighth century, non-Arab converts were exerting considerable influence on affairs throughout the Arab empire.

Muhammad and his new religion benefited from his connection through his wife, a wealthy spice merchant, with the spice trade. Her status facilitated acceptance of Islam in Arabia and the spice routes acted as conduits for its doctrine to travel. Here, too, conversion was often based on the elevated status accorded Muslims with regard to trading opportunities. Later in the ninth and 10th centuries, the spice networks would be the vehicle for the spread of Islam to southeast Asia, central Asia, and China and sub-Saharan Africa. Later still, when Portuguese explorers arrived in southeast Asia in search of black pepper, Islam became a rallying cry for resistance against the newcomers.

The Islamic requirement to make a pilgrimage to Mecca led some Muslims living in one corner of the Islamic world to continue their travels beyond Mecca. ABU ALI AHMAD IBN RUSTA, for example, in the 10th century, traveled to Europe's lower Volga region and on to Malaya and Indonesia. ABU AL-HASAN MUHAMMAD IBN JUBAYR, in the 12th century, traveled from his native Spain to Mecca, then on to Egypt and Iraq, visiting Sicily on his return journey.

As Christian missionaries were to do, Muslim travelers contributed greatly to the intellectual and scientific aspects of exploration. The tolerance of Islamic culture toward other cultures made it the heir of the intellectual traditions of the Greeks and Romans, rejected by the Christian world as pagan; many Latin and Greek texts were translated into Arabic. This resulted in a flowering of philosophic, literary, and scientific endeavor by Muslims, such as 12th-century Arab author and cartographer ABU ABD ALLAH MUHAMMAD ASH-SHARIF AL-IDRISI, who drafted what were considered the finest world maps of his time.

Early Christian Travels

During Christianity's first centuries, missionary work was largely confined to the Greco-Roman world. With the conversion of fourth-century Roman emperor Constantine, Christianity became the official religion of the Roman Empire, and conversion beyond the inner circle of true believers who had formed the early Catholic Church was at first a largely pro forma affair, as with non-Arab converts to Islam, undertaken for political and economic advancement. The Greco-Roman world was largely an urban culture, and concern for pagans and barbarians in rural areas and beyond Roman control was minimal.

Aside from St. Martin of Tours in the fourth century, who worked in Roman Gaul, the first missionary to venture beyond the periphery of the Roman world was St. Patrick, a Roman Briton who converted the Irish in the first part of the fifth century. His missionary zeal was carried on by Irish monks in succeeding centuries, though at first their urge to wander arose from an extreme asceticism as a substitute for actual martyrdom, a withdrawal from secular society first into hermits' cells and monasteries in the most isolated places and storm-racked islands they could find in Ireland, then out of Ireland altogether. In general in the Middle Ages, religious zeal led people to want to abandon normal life, to loosen the bonds of the ordinary in search of the eternal. Many entered monasteries; many more went on pilgrimages.

The movement out of Ireland, which would lead to Irish missionary work in Scotland, England, on the Continent, and beyond, was led by Saints Columba and Columbanus in the latter half of the sixth century, Columba to the island of Iona off Scotland and Columbanus to Gaul; both founded important monasteries. The half-legendary SAINT BRENDAN, who may have explored the Atlantic Ocean in a CURRAGH, was said to have been ordained a priest in A.D. 512, only some 50 years after Saint Patrick's death. He may have been an early precursor of Columba and Columbanus and in his later years seems to have lived on Iona.

For centuries after the fall of the Roman Empire, European society was focused mainly inward, as the tribal peoples who had overrun the empire struggled to cohere into stable regimes and as the feudal system developed. The main impetus for travel abroad remained religious, and many made pilgrimages to the Holy Land. One of these was ARCULF, a Frankish cleric who traveled to Palestine, Alexandria, and Constantinople (present-day Istanbul) in the 680s. His was the only journey of the time to be documented in writing, because he landed on Iona and described his experiences to the abbot, Saint Adamnan, who wrote a book about them; at this period of widespread illiteracy the Irish monasteries were the center of learning in Europe.

The Crusades

The CRUSADES, a series of military expeditions undertaken by European Christian powers to recover the Holy Land in

the Near East from the Muslims, lasting from the late 11th century through the late 13th century, were religious in inspiration and marked the first attempt at expansionism and colonialism by Christian nations beyond Europe. Alexius I Comnenus, the emperor of the Eastern Roman (Byzantine) Empire, appealed to European nations for help against Islamic invaders. Soon afterward, in 1095, Pope Urban II gave a speech at the Council of Clermont in France encouraging aid to Byzantium against the threat. Peter the Hermit (Peter of Amiens) and other wandering preachers helped spread the message of a "holy war." Over the next year, Europeans from all walks of life joined in the effort, with economic and territorial implications as well as religious. There were nine officially sanctioned Crusades as well as other endeavors to assert Christian rule and worship in the Near East and North Africa.

Christian Envoys to the Far East

During the Crusades, Italy had become the primary launching point for travel from Europe to the Near East and North Africa. As a result, Italian cities prospered, and Italian merchants replaced Byzantines and Muslims as the dominant traders in the Mediterranean. Italian port cities remained the commercial center of activity in the Mediterranean—and the link between East and West—for years to come. Yet significant European expansion to the east in this period was blocked not only by the Islamic empire but also by the rising power of the Mongols. Under GENGHIS KHAN in the early 13th century, the Mongols conquered China, then pushed westward to Russia, eventually reaching eastern Europe. The Mongols allowed local populations to practice their own religions and even adopted Buddhism to a degree. Yet, concerned with their intentions and hoping to develop a political and economic relationship, Christian rulers sent envoys to Mongol-held territory (see MONGOL EXPLORATION.)

In 1245, GIOVANNI DA PIAN DEL CARPINI, a Franciscan friar, traveled as an envoy of the Catholic Church to the current khan of the Mongol Empire, Ogadei. Leaving Lyons, France, he traveled some 3,000 miles across eastern Europe and central Asia to the Mongol imperial encampment in Karakorum. Though his peace overtures were rebuffed by the khan, he was able to assess the Mongols' strength and the danger they posed to the disunified European powers. Del Carpin's mission paved the way for other papal envoys to the khans, such as WILLIAM OF RUBROUCK, a Flemish Franciscan who, in 1253, sailed from Constantinople over the Black Sea and by way of the Volga and Ural Rivers to the Caspian Sea, making the observation that it was not connected with the northern ocean as had been thought in Europe. In his account of his journey, he made the earliest known speculation that silk originated in a land east of Mongolia called Cathay. Less than 10 years later, two Venetian merchants, MAFFEO POLO and NICCOLÒ POLO, trav-

eled to the court of Kublai Khan at Cambaluc (present-day Beijing, China). Thus were the links forged that would enable the diplomatic career of MARCO POLO, who in 1275–92 traveled throughout the Far East on behalf of Kublai Khan.

Meanwhile, the papacy continued in its diplomatic and missionary efforts in China. Kublai Khan was more welcoming to Westerners than his predecessors had been, and he permitted the establishment of a cathedral and church school in Peking (Beijing) by Italian Franciscan friar JOHN OF MONTECORVINO in the 1290s. In 1307, John was named the first archbishop of Peking, though his successor, appointed in 1333, never arrived there. In 1318, ODORIC OF PORDENONE, another Italian Franciscan, perhaps inspired by John's success in converting thousands of Chinese, began an epic 12-year journey through Asia, visiting John but traveling also to CEYLON (Sri Lanka), Borneo, and Java, observing the spice trade there, through Southeast Asia, and later into Tibet, to the city of LHASA and along the northern slopes of the HIMALAYAS. Also in the late 13th century, in the opposite direction, a Nestorian Christian monk born in China, RABBAN BAR SAUMA, during the course of a pilgrimage to Jerusalem, became involved in diplomatic efforts to the West on behalf of the Mongols. Though he never arrived in Jerusalem, he did travel to Constantinople, Rome, and even Paris.

The Black Death, the bubonic plague, which reached Europe in the mid-14th century, slowed down European expansionism for several decades (see DISEASE AND EXPLORATION). When European society finally emerged from this difficult period, it was energized. And the Catholic Church, the authority of which was questioned because of its powerlessness in the face of the epidemic, became opportunistic once again.

Catholicism and Conversion

VASCO DA GAMA, a Portuguese explorer who pioneered the sea route to Asia around the CAPE OF GOOD HOPE in 1497–99, when asked in India what he sought coming so far, replied, "Christians and spices." Spanish and Portuguese expansion received its initial impetus from the Reconquista, or reconquest, of the Iberian Peninsula from the Moors, the Muslims who had originally invaded the region in 711. Over the next centuries, there was close cooperation between the Vatican and the Portuguese crown. During the 15th century, the papacy issued a bull, *Romanus Pontifex*, which constituted a formal charter for Portuguese expansion. Portuguese explorers were instructed to "subdue, enslave or conquer any Pagan or Muslim" they encountered. In 1493, five papal bulls granted to King Ferdinand II and Queen Isabella I of Spain spiritual and material sovereignty over a region vaguely defined as "such islands and lands . . . as you have discovered or are about to discover." The European explorers of the 15th and 16th centuries in Africa and

the Americas believed that they were carrying a superior religion to heathens, and missionaries accompanied many voyages of exploration in order to convert any indigenous peoples they encountered. The very humanity of native peoples was questioned. In 1512, Pope Julius II issued a doctrine proclaiming that Indians of the Americas were after all descended from Adam and Eve.

Another institution that would play a major role in missionary efforts was the Spanish Inquisition, begun in 1483 at the command of monarchs Ferdinand and Isabella. An offshoot of the Reconquista, the Inquisition was fueled by the anxieties and spiritual instability caused by the long presence in Spain of non-Christians, principally Muslims and Jews who had settled in Spain protected by the cloak of Islamic religious tolerance. In its first 15 years, the Inquisition, conducted by the Dominican order, executed 2,000 Spaniards; in the 1540s, its efforts were directed against Protestants in Spain.

The Protestant Reformation

This movement to propagate Christianity abroad had no sooner begun than there arose at the Catholic Church's back in Germany a grave challenge to the supremacy of the universal Christian empire: the Protestant Reformation. In 1517, German monk Martin Luther published his Ninety-Five Theses. The Church had come to seem remote from the needs and sufferings of ordinary people, a perception that must have been strengthened by the trauma of the Black Death and the worsening climate, and Luther based his initial attack on the sale of indulgences to finance the building of St. Peter's Basilica in Rome, perhaps seen as particularly egregious in the midst of such hard times. One of the first results of Luther's work was the Peasants' War of 1524–26, whose proponents justified their actions by invoking (though mistakenly) his ideas. The Catholic Church's Counter-Reformation in response to Luther's movement further spurred the Catholic countries of Portugal, Spain, and France to win new territories for the one true Church.

Jesuits in Asia and Africa

If a large part of the impetus and justification for conquest of new lands derived originally from the Crusades and the struggle against the Moors, a primary mission of the religious order that would be in the forefront of missionary work, the Society of Jesus, known as the Jesuits, was to carry out the Counter-Reformation. The primary focus of its founder, Saint Ignatius Loyola, was conversion of Muslims; the name the order was given in the papal bull, which approved its founding in 1540, "*Societas Jesu*," had been borne a century before by a military order whose mission was to fight the Turks. Yet, although Ignatius may have known little about the schism in the Church taking place in Germany, soon after his order was founded its members

were sent by the pope to southern and western Germany and Austria to win back their people to the fold.

At first the Portuguese were slower than the Spanish to mount a major missionary effort in newly claimed lands. In India, such work only began in earnest with the arrival in 1542 in Goa, a major port on the west coast of India, of FRANCIS XAVIER, one of the seven founding members of the Jesuit order. Xavier established missions and made many converts in India, the Malay Peninsula, and Japan. The Jesuits were soon deeply engaged in exploration of the Asian interior. BENTO DE GÓES, for example, in the early 17th century, journeyed from India to China, the first inland trip there by a European in 300 years. In 1624, ANTONIO DE ANDRADE became the first European to reach Tibet since Odoric of Pordenone three centuries before. Andrade established a mission at Tsarapang and discovered one of the sources of the GANGES RIVER.

The Portuguese conquest of Ceuta in North Africa led to attempts to extend their sphere of influence deeper into that continent. HENRY THE NAVIGATOR, prince of Portugal, perhaps in retaliation for the defeat and death of his brother Prince Fernando in an attempt to capture Tangier in 1437, became obsessed with the desire to find the kingdom of PRESTER JOHN and join forces with fellow Christians in conquering all of Africa. The church granted him spiritual jurisdiction over all lands to the south of Portuguese territories on the north coast. Later, in the late 16th century, PEDRO PÁEZ, a Spanish Jesuit, sought Prester John in Ethiopia, during his journeys discovering the source of the Blue Nile and converting the emperor of Ethiopia, Negus Susenyos, to Christianity.

Franciscans in the Americas

The Franciscan order, born out of a movement inspired by the life of Saint Francis of Assisi in the late 12th and early 13th century, also carried out extensive missionary work. In the early 16th century, as the Spanish engaged in the conquest of Mexico, beginning in 1519 with the expedition of HERNÁN CORTÉS, the Franciscans were convinced that the end of the world was near, which would usher in the final and third age of man, the age of the spirit. This age would be characterized by love, peace, and unity for all mankind. When word came of the presence in the Americas of the Aztec, Franciscans believed that they were one of the 12 Lost Tribes of Israel who were prophesied to appear at the Last Judgment. By 1524, Franciscan missionaries, led by a group called the “Twelve Apostles,” were engaged in conversion of the native Mexicans. The fact that the Aztec had a religion very different from that of Jews and Christians led the Franciscans to conclude that they had been taken over by the devil; in their eyes the destruction that accompanied the Spanish conquest, the victories of Cortés, even the plague of smallpox, which killed many thousands of the native

Mexicans, were miracles that would clear the way for the re-establishment of Christ’s kingdom. Their missionary work among the survivors, however, was relatively benign; they conducted mass baptisms and marriages during the first years of the conquest in the 1520s. They believed that in order to combat the devil in Mexico, they had to learn as much as they could about native culture. As a result, almost all surviving eyewitness accounts of Aztec culture were written by Franciscan monks. When priests of the Dominican order arrived in 1526 with their Inquisition, they were skeptical about the genuineness of these conversions, observing that the native peoples continued to carry on idolatrous practices. By the 1530s, the Inquisition was in full swing in the Americas, with interrogations, torture, and burnings at the stake.

The Spanish CONQUISTADORES were organized into a type of military/commercial expedition with roots both in the Reconquista and in maritime trading ventures; heavily armed troops were led by a “captain” who was very likely the main investor in the expedition; in return for paying most of their own expenses in arms and provisions, the troops could expect a share in whatever wealth the expedition realized. Often such expeditions included a missionary and chaplain, such as JUAN DE PADILLA, a Franciscan who was with Cortés in Mexico in 1528 and later was attached to the expedition of FRANCISCO VÁSQUEZ DE CORONADO, which traveled north to present-day Arizona and New Mexico and onto the southern plains in 1540–42. With a detachment from this expedition, Padilla visited seven villages of the Hopi and also heard about a great river to the west later to be named the COLORADO RIVER. Another participant in this expedition was Franciscan MARCOS DE NIZA, whose report of mistakenly seeing what he took to be one of the legendary Seven Cities of CIBOLA, during an earlier expedition, helped prompt the expedition.

The pattern of a missionary traveling with a military man continued over the centuries in Spanish exploration. In 1768, for example, Franciscan missionary JUNÍPERO SERRA traveled with army officer GASPAR DE PORTOLÁ to California, where, over the next decade and a half, Serra founded a string of missions between San Diego and San Francisco. This was the start of the creation of the so-called Mission Indians, California Indians who were forced to live at or near the missions and became identified by the name of the mission.

Jesuits in the Americas

The Jesuits were in the forefront of missionary exploration in the Americas as elsewhere. JOSÉ DE ACOSTA, for example, ministered to the Inca in Peru and also to the Aztec for 15 years from 1571. Beneficiary of the high academic standards of his Jesuit education, Acosta was a naturalist and engaged in detailed study of the flora and fauna of South

America and also of the languages and customs of the native peoples. On his return to Europe he produced one of the earliest accounts of the natural history of the Western Hemisphere, which included descriptions of the use of the coca leaf and of the experience of altitude sickness in the ANDES MOUNTAINS. CRISTÓBAL DE ACUÑA, a Spanish Jesuit who traveled on the AMAZON RIVER in the mid-17th century, published the earliest known account of that region. This pattern of activity was to be followed many times by missionary explorers all over the world, who often were the most highly educated members of expeditions and wrote detailed accounts of new geographic features, rivers, lakes, seas, and mountains, and of new plants and animals that would have been ignored by their lay companions more interested in discoveries that could make them rich.

In New France to the north and beyond, French Jesuits such as JACQUES MARQUETTE and other missionaries continued to play a leading role in exploration and scientific study of the peoples, flora, and fauna of the new land, and also in consolidation of France's hold on its new territories. The impetus for the establishment of a French presence in Canada came from the burgeoning FUR TRADE, the result of new methods of processing the fur into felt for hats, highly fashionable in Europe. In the 40 years after the founding of New France by SAMUEL DE CHAMPLAIN in 1608, a dozen Jesuit mission posts were built in Huron (Wyandot) Indian territory. FRANÇOIS DOLLIER DE CASSON, a Sepulcian priest, in the 1670s helped to develop Montreal into a major city, laying out plans for streets, public buildings, and churches. He went with several expeditions throughout the Great Lakes region, including to Lake Erie, where he erected a cross to claim the territory for Louis XIV.

The continuing existence of New France soon began to be threatened by incursions by the Iroquois (Haudenosaunee) Indians who, having decimated the beaver populations in their native Mohawk Valley in trading with the Dutch of Fort Orange, the precursor of Albany, New York, had become determined to seize control of the Huron trapping grounds. In 1648, the Iroquois gained a decisive victory over the Huron, destroying the Christian mission posts and killing missionaries. GABRIEL LALEMANT and JEAN DE BRÉBEUF were two Jesuits killed in this war; they were later canonized by the Church as martyrs of North America. For decades after this the Iroquois continued to fight a kind of guerrilla war with the French; in the latter 17th century, Jesuit SIMON LE MOYNE joined with an Iroquois of the Onondaga nation and a Christian convert, Daniel Garakontie, to work for peace. The two organized prisoner exchanges, which helped defuse tensions; Le Moyne established ties with tribal leaders of the Iroquois and obtained permission to send Jesuit missionaries to the region. One of these, JACQUES BRUYAS, lived for several years with the Mohawk and other tribes and subsequently produced a

dictionary of the Mohawk language. In 1665–69, CLAUDE-JEAN ALLOUEZ served as a French missionary to peoples of the western Great Lakes and explored the south shore of Lake Superior and the Fox and Wisconsin Rivers. He is said to have preached to 22 tribes and to have baptized some 10,000 individuals.

Jesuits continued missionary activity among Native Americans well into the 19th century, moving on to new tribes as exploration and emigration shifted west. PIERRE-JEAN DE SMET, a Belgian, studied to become a Jesuit at a seminary near St. Louis, Missouri, in the 1820s. After spending 10 years in Europe raising funds for missions, he returned to St. Louis and traveled up the MISSOURI RIVER to found a mission among the Potawatomi. Over the next decades, he worked and traveled among tribes of the northern plains, including the Sioux (Dakota, Lakota, Nakota), Flathead, Blackfeet, and Nez Perce.

Protestant Missionaries

Protestant denominations also became active around the world. The PILGRIMS, a breakaway group, part of the Puritan movement out of England, founded the second permanent English settlement in North America in 1620. In the ensuing decades, Puritans and ministers of other Protestant denominations ventured onto Native American lands. One of these was John Eliot, a nonconformist influenced by the Congregationalists. He established a number of religious communities in Massachusetts, backed by the Society for the Propagation of the Gospel Among the Indians, created in 1649 by the English Parliament. He became known as the "Apostle to the Indians" and set an example of effectiveness for later Protestant missionaries.

In the early 19th century, JOHN CAMPBELL, a Scot, worked in the interior of South Africa having been sent there by the London Missionary Society, founded in 1795 during the evangelical revival taking place in England. Intended as a nondenominational body, it also had its roots in the Congregationalist movement in England and the United States. ROBERT MOFFAT and MARY MOFFAT, Methodists who worked in South Africa and explored the Kalahari Desert, were affiliated with the London Society, which also sent missionaries to China, where they would become important agents of change. GEORGE GRENFELL, an English Baptist, worked in the Congo region of central Africa in the late 19th century.

Social Activism

Although missionaries helped to bring about European expansion into new lands, in many cases they worked to mitigate the hardships faced by native peoples being displaced by European settlers. Bartolomé de las Casas, a Catholic missionary to the Arawak (Taino) Indians of the WEST INDIES, exemplified a socially active missionary concerned with the

rights of indigenous peoples. English minister JAMES RICHARDSON was an antislavery activist in Africa in the mid-19th century. Part of the impetus for Scottish missionary DAVID LIVINGSTONE's extraordinary efforts to discover the source of the NILE RIVER and his exploration of other important waterways in Africa was to foster the development of a commerce to replace the African SLAVE TRADE. He hoped that water routes would facilitate trade among the many tribes skilled in crafts and farming who inhabited central Africa. SAMUEL MARSDEN worked to reform the penal colony in New South Wales in Australia in the early 19th century and negotiated a peace treaty with the Maori of NEW ZEALAND.

Religion, the means by which humans have tried to come to grips with or comprehend a reality beyond reach of our senses, has always been intertwined with the material, from the first chiefs and kings who, in return for their supposed intercession with the gods, assured the fertility of the land, to the Muslims, whose military prowess and commercial success helped propagate Islam, and to Christian missionaries who aided in European expansion. The role religion should play in worldly affairs has been problematic. The Franciscan order, for example, grew out of a movement advocating a life of poverty and simplicity, modeled on the life of Saint Francis, whose inspiration was Jesus himself. Yet very quickly challenges to this ideal arose among Franciscans, which split into two groups, one adhering to the ideal of poverty and the other modifying this to allow monks to hold property in common. During the Middle Ages, popes wielded great political power and even waged wars. While missionaries aiding in exploration and conquest seems paradoxical, missionary efforts exemplified the best and the worst aspects of expansion.

Renaissance

The term *Renaissance*, French for “rebirth,” is applied to a cultural movement and a time period in Europe in the 14th, 15th, and 16th centuries, and carrying over into the 17th century. It is considered the transitional phase between the Middle Ages and modern times. The concept of rebirth is associated with the Renaissance because of a revival of pre-medieval classical influences, in particular from the civilizations of the ancient Greeks and Romans. Such cultural classifications are of course too pat. It is an oversimplification to regard the Middle Ages as the stagnant Dark Ages. Scholarship and the arts are a continuum, and individuals grew even as societies and institutions stagnated. Moreover, other peoples, such as the Arab Muslims and the Chinese, were breaking new intellectual ground during the medieval period, and some of their learning in geography and other

fields reached Europeans as well. The CRUSADES of the 11th through 13th centuries, in which Christian European armies invaded the Near East, led to increasing cultural contacts. Yet there were events and developments—many of them surrounding individuals—during the centuries associated with the Renaissance that can be regarded as culturally transforming, making the concept of such a period a helpful one in historical studies.

Culture and Transformation

During the 14th century, scholars and writers, especially in Italy, read the classics with a new focus on the power of reason and the worth of the individual. The movement associated with this fresh interpretation has come to be known as humanism, as heralded by 14th-century Italian poet and scholar Petrarch (Francesco Petrarca). The fall of Constantinople (present-day Istanbul) to the Ottoman Turks in 1453—in effect, the end of the Eastern Roman Empire (or Byzantine Empire), which had been centered there—drove Byzantine scholars to western Europe, giving new impetus to classical and Muslim studies and their relevance in contemporary life. Moreover, Spanish victories over the occupying Moors out of North Africa—the final victory in 1492—and the capture of various universities, led to greater access to Muslim scholarship, as well as to Greek scholarship from texts that had been in Muslim hands. The development of the movable type printing press by German goldsmith and printer Johannes Gutenberg, in the mid-15th century, made texts available to a wider audience. A new freedom of expression in painting, sculpture, architecture, and music, as well as in philosophy and writing, emphasizing the contribution of the individual as opposed to the anonymity of many of the artists of the Middle Ages, resulted. In the sciences, intellectual curiosity, a willingness to experiment, and an adherence to reason and objectivity led to new discoveries, such as the telescope early in the 17th century. A 15th–16th-century Italian artist, architect, and scientist, Leonardo da Vinci, is representative of this new approach to intellectual and creative pursuits in the Renaissance. Dutch scholar Desiderius Erasmus, his contemporary, made the case that the study of Christian theology should be open to all, not just the clergy. Such views played a part in the Reformation, led by Martin Luther, another contemporary, whose activities in Germany resulted in the founding of Protestantism. Political and social institutions were also reexamined during these centuries, with a new sense of optimism regarding the lot of humankind and a new emphasis on education.

Age of Exploration

The other great theme running through the Renaissance—and that which relates directly to the history of exploration—is the expanding worldview resulting from geographic

This frontispiece from a 1496 text shows Ptolemy and his Renaissance translator, Joannes Regiomontanus, beneath a sphere representing the heavens. (Library of Congress, Prints and Photographs Division [LC-USZ62-95164])

discoveries. HENRY THE NAVIGATOR, prince of Portugal, who had the vision to sponsor voyages of exploration from Portugal along the coast of Africa in the 15th century, is an important Renaissance figure. Certain expeditions—that of Italian CHRISTOPHER COLUMBUS for Spain across the Atlantic Ocean to the Americas in 1492, of Portuguese VASCO DA GAMA for Portugal around Africa to India in 1497–98, and of Portuguese FERDINAND MAGELLAN for Spain in the first CIRCUMNAVIGATION OF THE WORLD in 1519–21, along with others of the period—were momentous in that they changed cartographic awareness and set in motion the colonizing and commercial endeavors of the great international powers. Portugal, Spain, the Netherlands, France, and England became active around the world over the next centuries. Developments in shipbuilding and in navigation contributed to expanding frontiers (see also SHIPBUILDING AND EXPLORATION; NAVIGATION AND EXPLORATION). The latter part of the Renaissance, starting in the 15th century into the 17th century, when Europeans came to get a closer-to-accurate sense of the extent of the Earth, has been referred to as the EUROPEAN AGE OF EXPLORATION.

rocket

As wind power was to the EUROPEAN AGE OF EXPLORATION, so is rocketry to 20th- and 21st-century SPACE EXPLORATION. A rocket is a conveyance powered by a self-contained supply of fuel and an agent of combustion, usually oxygen. The force of the resulting exhaust gases of the rocket engine propel the rocket, a cylindrical tube, in the opposite direction. The term *rocket* is applied to primitive black-powder devices as well as to giant space launch vehicles.

Jet engines are different from rocket engines in that they are not self-contained, drawing an oxidizer from the surrounding atmosphere; they are also called air-breathing engines. Rocket engines provide the most powerful thrust for their weight. And since they provide their own oxygen, they can operate above Earth's atmosphere. In addition to the launching and maneuvering of a spacecraft carrying people or of an artificial SATELLITE or SPACE PROBE for exploratory and scientific aeronautics, rockets are used for a number of purposes: as projectiles and missiles in warfare; as emergency signaling devices (signal rockets); to carry scientific equipment into the upper atmosphere for collecting data (sounding rockets); to assist in the takeoff of airplanes with heavy loads; and to boost pilots from jet planes in distress. Rockets have also been used for centuries as fireworks. Model rockets are another form of entertainment.

It is believed that the CHINESE (see CHINESE EXPLORATION) invented the rocket, originally paper or cloth tubes filled with gunpowder (an explosive mixture of potassium nitrate, sulphur, and carbon) and attached to long sticks for stabilization, creating "arrows of flying fire." They are men-

tioned in accounts of 13th-century battles involving Chinese, Mongols (see MONGOL EXPLORATION), and Arab Muslims (see MUSLIM EXPLORATION). Europeans tended to use early rockets as signaling devices or as fireworks. Firearms, which were more accurate, became the preferred weapon. In India rockets—iron tubes attached to bamboo sticks—were used in warfare against British forces in the early 1800s. A British inventor by the name of William Congreve developed a rocket capable of traveling two miles and conceived the idea of attaching explosive devices to rockets, the first warheads. England used Congreve rockets against the United States in the War of 1812, leading to "the rockets red glare" in *The Star-Spangled Banner*, the U.S. national anthem. In the mid-1800s, another British inventor, William Hale, invented a stickless rocket that was spin-stabilized, thus improving accuracy. Similar barrage rockets, acting as incendiary devices, were used in other wars of the 19th century, such as the Civil War.

Scientist Robert H. Goddard poses with an early rocket in this photograph, thought to have been taken in 1925. (Library of Congress, Prints and Photographs Division [LC-USZ62-127240])

In the late 1800s, Austrian physicist Ernst Mach theorized the use of rockets to obtain supersonic speeds and German inventor Hermann Ganswindt reached the conclusion that a self-contained rocket would be the only engine able to function in the vacuum of space. In the early 20th century, Russian inventor Konstantin Eduardovich Tsiolkovsky, American physicist Robert Hutchings Goddard, and Rumanian-born mathematics teacher Hermann Oberth, who worked in Germany, independently promoted the use of rocketry in spaceflight, developing ideas of liquid fuel and multistage booster rockets as launch vehicles.

In the 1920s and 1930s, rocket engineers of many different nationalities developed rocket technology. A number of successful liquid-propellant launches were carried out in Germany, the United States, and the Union of Soviet Socialist Republics (USSR; Soviet Union). Germany also began a secret rocket program for military purposes in the 1930s. In 1942, during World War II, the Germans under Wernher von Braun conducted the first successful launch of the A-4 (later called the V-2) rocket, a long-range guided missile (about 200 miles) propelled by liquid fuel. A total of 1,027 V-2s were launched against Allied targets. The Germans also worked on solid-fuel rockets.

After World War II, the United States and the Soviet Union intensified their lagging rocket research, competing over German research and technology. Wernher von Braun, in fact, began working for the Americans. The cold war between the two nations, as well as the "space race," led to the development of intercontinental ballistic missiles, which travel in the outer atmosphere, and multistage launch vehicles, capable of carrying payloads beyond Earth's atmosphere. Other rocket technology was applied to thrusters, small rockets used to steer or change the speed of spacecrafts or satellites, for changing their orbit or sending them back to Earth (retro-rockets).

U.S. rockets have included the Viking, Vanguard, Redstone, Jupiter, Atlas, Titan, Agena, Centaur, Saturn, Athena, Taurus, and Delta. A Saturn-type three-stage rocket, the *Saturn V*, the largest rocket ever built, was used in the APOLLO PROGRAM to launch spacecraft to the Moon. The U.S. SPACE SHUTTLE is a reusable rocket and spacecraft in one. The Soyuz rocket, developed as part of the SOYUZ PROGRAM, has been central to both the Soviet Union's and Russia's space program, replacing the earlier Vostok rocket used in the VOSTOK PROGRAM and the VOSKHOD PROGRAM. A more recent Russian rocket is the Proton, with K and M models. Rockets of other nations include the EUROPEAN SPACE AGENCY's *Ariane 4* and *5*; the Chinese *Long March 2C* and *2E*; the Japanese *H-2*; the Indian *PSLV* (Polar Satellite Launch Vehicle); the Israeli *Shavit 2*; and the multinational, privately owned *Sea Launch Zenit-3SL*, which is launched from a converted oil platform in the Pacific Ocean southeast of Hawaii.

Rocket design has to take into consideration a number of factors: type of propellant; size and shape of exit (exhaust) nozzle; the number of stages required to lift an intended payload; and navigation equipment, such as internal gyroscopes (a device with a spinning disk mounted in a stationary base) to track orientation. Chemical rocket engines are powered by either liquid propellants (typically hydrogen as fuel and oxygen as oxidant) or solid propellants (typically nitroglycerine) burned in a combustion chamber, the gas of which is expelled at supersonic velocities. Rockets with nuclear engines, which heat fuel by radiation from reactor cores, and ion engines, which use thermoelectric power to expel ions rather than gases, have also been built and used experimentally.

Rocky Mountain Fur Company

The Rocky Mountain Fur Company was one of several fur-trading companies established to pursue the North American FUR TRADE, at its peak in the 1820s–1830s. In February 1822, WILLIAM HENRY ASHLEY, a Virginian, and ANDREW HENRY, a Pennsylvanian, formed the company and organized the first expedition up the MISSOURI RIVER to its headwaters in the northern ROCKY MOUNTAINS in present-day Montana. Henry, who been involved with the earlier ST. LOUIS MISSOURI FUR COMPANY, was active in the field the first years of operation, but, on returning to St. Louis with a load of furs in summer 1824, gave up the fur trade to develop lead-mining interests in Missouri.

The Rocky Mountain Fur Company employed many of the men who would become known as MOUNTAIN MEN: JAMES PIERSON BECKWOURTH, JAMES BRIDGER, ROBERT CAMPBELL, JAMES CLYMAN, HUGH GLASS, THOMAS FITZPATRICK, HENRY FRAEB, CALEB GREENWOOD, DAVID E. JACKSON, EDWARD ROSE, JEDEDIAH STRONG SMITH, WILLIAM LEWIS SUBLETTE, WILLIAM HENRY VANDERBURGH, LOUIS VASQUEZ, and JOHN WEBER. In July 1825, at Henrys Fork of the Green River in what is now northern Utah, Ashley sponsored the first annual rendezvous of trappers and Indians, where goods were exchanged.

At the rendezvous the following year, Ashley sold his interests to David Jackson, Jedediah Smith, and William Sublette, who reorganized again in 1830. James Bridger, Robert Campbell, and CHRISTOPHER HOUSTON CARSON (Kit Carson) trapped for the Rocky Mountain Fur Company. Thomas Fitzpatrick eventually became a principal in the company. The company was dissolved in 1834, although the principals remained active in the western trade for some years.

See also COMMERCE AND EXPLORATION.

Rocky Mountains

The Rocky Mountains (also called the Rockies) are the largest mountain system in North America. Although estimates

vary, they extend at least 2,000 miles from central Mexico through Canada to the Arctic. Their borders are not clearly defined; some consider the Yukon, Mackenzie, and Alaskan Ranges in Canada and Alaska as part of the Rocky Mountain system, and the Sierra Madre Occidental in Mexico as well. Geographers do agree the system includes at least 100 distinct ranges. The Rocky Mountains are bordered on the east by the Great Plains, and on the west by the Interior Plateau and Coast Mountains (in Canada) and by the Rocky Mountain Trench (a valley that runs from northwestern Montana to northern British Columbia), the Columbia Plateau, and the Great Basin (in the United States). In Mexico, a central plateau separates the southern continuation of the Rockies. The characteristic jagged peaks and flat-topped elevations of the relatively young Rockies were formed by crustal uplifts reshaped by glaciers.

The Rocky Mountain system is divided into four sections: the southern, central, northern, and Canadian Rockies. The southern Rockies (located in New Mexico, Colorado,

and southern Wyoming) include the Sangre de Cristo, Laramie, San Juan, Sawatch, and Park Ranges. The Colorado Plateau of the Four Corners region (northeastern Arizona, southeastern Utah, southwestern Colorado, and northwestern New Mexico) is sometimes discussed as part of the southern Rockies. The central Rockies, or middle Rockies (located in northeastern Utah, western Wyoming, eastern Idaho, and southern Montana) include the Bighorn, Beartooth, Asaroka, Wind River, Salt River, Teton, Snake River, Wasatch, and Uinta Mountains. The Uinta Mountains are the only range in the Rockies running east-to-west, instead of north-to-south. The northern Rockies (located in northern Idaho, western Montana, and northeastern Washington) include the Sawtooth, Cabinet, Salmon River, Clearwater Mountains, and Bitterroot Range. The Canadian Rockies are located in southwestern Alberta and eastern British Columbia. (To the north the Yukon Territory and Alaska are part of the same mountain system; and the Sierra Madre Oriental in Mexico can be considered a southern extension of the chain.)

Shown, in a 1941 photograph, is a vista of the Rocky Mountains in Glacier National Park, Montana. (*Library of Congress, Prints and Photographs Division [LC-USF34-058094-D]*)

The various subdivisions differ geologically (that is, by origin, ages, and types of rocks) and physiographically (that is, by landforms, drainage, and soils), yet they all have high elevations and great local relief (that is, the vertical difference between the base and the summit of ranges). The highest peak in the Rocky Mountain system is Mount Elbert in Colorado, at 14,433 feet above sea level. More than 100 named peaks measure at least 10,000 feet; these include Pikes Peak (14,110 feet) and Longs Peak (14,255 feet) in the Southern Rockies; Gannett Peak (13,804 feet), Grand Teton (13,771 feet), and Fremont Peak (13,730 feet) in the central Rockies; and Granite Peak (12,799 feet) and Borah Peak (12,662 feet) in the northern Rockies. The highest peak in Canada is Mount Robson, at 12,972 feet.

North America's Continental (or Great) Divide, the highest points of land separating the waters flowing west and south from the waters flowing east and north, runs along the Rocky Mountain ranges. (Early travelers along the Oregon Trail called it "Uncle Sam's Backbone.") Among the largest rivers that are part of this watershed is the longest river in the United States, the MISSOURI RIVER, which originates in the northern Rockies and flows generally east and south to join up with the MISSISSIPPI RIVER near St. Louis, Missouri; the Mississippi feeds the Gulf of Mexico, an arm of the Atlantic Ocean. The Arkansas River begins in the central Rockies and flows south and east to the Mississippi River in Arkansas. The Rio Grande flows from the southern Rockies south and east to the Gulf of Mexico. The COLORADO RIVER flows from the central Rockies south and west to the Gulf of California, part of the Pacific Ocean. The COLUMBIA RIVER flows from the Canadian Rockies south and west to the Pacific Ocean. The Snake River, out of the central Rockies, flows generally west to the Columbia. The Fraser River flows out of the Canadian Rockies first northwest, then south to the Pacific. The Saskatchewan River flows out of the Canadian Rockies generally east into Lake Winnipeg, which is drained by the Nelson River, flowing to HUDSON BAY, an arm of both the Atlantic and Arctic Oceans. The Pace River flows out of the Canadian Rockies generally east and north to the Great Slave Lake, which has an outlet to the Mackenzie, which flows to the Arctic Ocean. And the Liard River, farther north, flows out of the Canadian Rockies generally east and north, also to the Mackenzie River.

Grasslands cover much of the Rockies' lower elevations. Higher up are found extensive forests, mostly of conifers. The forests give way to grasses and scattered shrubs. The peaks have little vegetation up high. Some of the tallest have year-round snow and ice caps.

First Reports

The high peaks, rough terrain, and early winters of the Rockies proved a significant barrier to western movement,

and the Rockies were one of the last regions of North America to be thoroughly explored by nonnative peoples. The earliest European explorers to see the Rockies were Spaniards, and the first sightings were from the south. In 1540, an expedition under FRANCISCO VÁSQUEZ DE CORONADO entered present-day New Mexico and explored some of the country north of present-day Albuquerque, the southern limits of the Sangre de Cristo Mountains. In 1582–83, Spanish merchant and prospector ANTONIO ESTEVAN DE ESPEJO, who traveled north out of Mexico, ventured farther northward in the Sangre de Cristo Mountains. Starting in 1598, JUAN DE OÑATE founded a number of Spanish settlements near the upper Rio Grande, but, over the next decades, the occupants were not known to venture northward into the Rocky Mountain system, instead venturing eastward onto the Great Plains, or westward toward California.

Early Traders

Nearly a century and a half later, in 1742–43, a French Canadian fur trader, LOUIS-JOSEPH GAULTIER DE LA VÉRENDRYE, led an expedition across the Missouri River and northern plains—probably as far west as the Black Hills of western South Dakota and eastern Wyoming. Yet the mountains they later described may have been the Bighorn Mountains in western Wyoming. The next decade, in 1754–55, ANTHONY HENDAY, a British fur trader for the HUDSON'S COMPANY, explored the Canadian plains to territory known to be within 40 miles of the Rockies, although he made no mention of sighting peaks in his journals. In 1776–77, Franciscan missionaries FRANCISCO ATANASIO DOMÍNGUEZ and FRANCISCO SILVESTRE DE ESCALANTE, in an unsuccessful effort to create a route between Santa Fe, New Mexico, and Monterey, California, headed northward and traveled through Rocky Mountain country, including the San Juan Mountains in Colorado and the Wasatch Mountains in central Utah.

In 1793, SIR ALEXANDER MACKENZIE, a Scottish-born fur trader in the employ of the NORTH WEST COMPANY, traveled into the Canadian Rockies of British Columbia and crossed the Continental Divide, eventually descending the Blackwater River westward, then crossing over to the Bella Coola River and descending it to the Pacific, thus completing the first overland journey across North America north of the Rio Grande.

In the ensuing years, other fur traders worked the Canadian and northern Rockies, establishing numerous posts, among them British-born DAVID THOMPSON, who worked for the Hudson's Bay Company and the North West Company in the course of his career and mapped much of the Pacific Northwest. In 1798–1800, he explored the Athabasca and North Saskatchewan Rivers of Alberta. In 1807, he established a route through the Canadian Rockies of British

Columbia by way of Howse Pass and, in 1810, to the north, by way of the Athabasca Pass. Thompson then descended the Columbia all the way to its mouth, reaching it on July 14. Another explorer for the North West Company, American-born SIMON FRASER, thoroughly explored the watershed of the river named after him, the Fraser.

Lewis, Clark, and Pike

The U.S. government had launched the Lewis and Clark Expedition several years prior. After departing from St. Louis in spring 1804 and wintering in the Mandan Indian villages in North Dakota, where the river bends westward, MERIWETHER LEWIS and WILLIAM CLARK and the Corps of Discovery, including their Shoshone Indian guide SACAJAWEA (Sacagawea), set out on April 7, 1805, reaching the Great Falls of the Missouri on June 2. From that point they could have headed directly west and reached the Rockies in four days (as they were later told by Indians) but followed the Missouri to its source—the Three Forks of the Missouri, arriving on July 27. Two weeks later, on August 12, Lewis climbed up to the Continental Divide. He had hoped to look down upon a plain to the west, with a large river that would carry them to the Pacific, but saw only more mountains.

The Corps of Discovery crossed Lemhi Pass on the present-day border between Montana and Idaho. The expedition came upon a Shoshone village and Sacajawea's brother Cameahwait. The Shoshone provided them with horses, which the Corps of Discovery used to cross the rugged Bitterroot Range by way of Lolo Pass into present-day Idaho. The expedition eventually reached the Clearwater River Valley. Nez Perce Indians instructed them in the making of the dugout CANOE that they used to descend the Clearwater out of the mountains. They eventually reached the Snake River, then the Columbia, following it to the Pacific, where they spent the winter before returning eastward. On the return trip, in the eastern Rockies, Lewis took the more direct northern route from Lolo Pass through Lewis and Clark Pass to the Great Falls of the Missouri, while Clark followed the original loop to the south. They met up at the mouth of the Yellowstone and together rode the Missouri back to St. Louis, arriving on September 23.

In 1806, U.S. Army officer and explorer ZEBULON MONTGOMERY PIKE was commissioned to explore the headwaters of the Arkansas and Red Rivers. He followed the Arkansas River to the tablelands in the southern Rockies of present-day Colorado. While there, he attempted to climb Pikes Peak, which was later named for him.

Later Traders

Much of the subsequent 19th-century exploration of the Rockies was motivated by an interest in the FUR TRADE. In 1808, American businessman JOHN JACOB ASTOR

founded the AMERICAN FUR COMPANY, planning to establish a string of trading posts east and west of the northern Rockies. Astor sponsored a seaward expedition under Scotsman ROBERT STUART, from New York City around South America, in 1810, to build Fort Astoria at the mouth of the Columbia River as the westernmost post. The next year, he sent out an overland expedition from St. Louis—the Astorians—under WILSON PRICE HUNT that crossed the southern reaches of the Bighorn Mountains and the Wind River Mountains, then through Teton Pass into the Snake River Valley. In 1812–13, Robert Stuart, still working for Astor, traveled from Astoria in Oregon eastward through the SOUTH PASS through the Wind River Range in Wyoming, then descended the Platte and Missouri Rivers to St. Louis.

In 1809, a number of traders centered in St. Louis founded the ST. LOUIS MISSOURI FUR COMPANY. Among them were William Clark, MANUEL LISA, JEAN PIERRE CHOUTEAU, AUGUSTE PIERRE CHOUTEAU, ANTOINE PIERRE MENARD, and ANDREW HENRY. With time, traders pushed farther and farther into the Rocky Mountains.

In 1822, WILLIAM HENRY ASHLEY, along with Andrew Henry, founded the ROCKY MOUNTAIN FUR COMPANY. Many of the men who worked as trappers and traders for Ashley came to be known as the MOUNTAIN MEN after the Rockies, including THOMAS FITZPATRICK and JEDEDIAH STRONG SMITH. The mountain men traveled the trails, passes, and rivers of the Rockies, especially the northern and central ranges. In 1824, Jed Smith rediscovered the South Pass and spread word of it to other trappers.

Meanwhile, Canadians remained active in the region. In 1816–19, DONALD MACKENZIE, Alexander Mackenzie's cousin, also sent out fur-trapping brigades for the North West Company throughout the Pacific Northwest and the northern Rockies. In the 1820s–30s, JOHN M'CLOUGHLIN, based on the Columbia River, also directed operations in the region for the Hudson's Bay Company. PETER SKENE OGDEN worked a wide area for him, including the northern Rockies.

A number of traders established posts to the south, convenient to work the southern Rockies. ANTOINE ROBIDOUX, an American born in St. Louis of French Canadian ancestry, was perhaps the earliest non-Spanish trader working out of Taos, New Mexico. In 1828, he founded Fort Uncompahgre on the Gunnison River in southwestern Colorado; in 1837, he also founded Fort Uinta, or Robidoux Rendezvous, in northeastern Utah. From 1832 to 1844, he and his five brothers dominated the trade between that region and southern Arizona, providing north-south supply routes along the Rockies' eastern and western slopes. In 1833, brothers CHARLES BENT and WILLIAM BENT, whose parents from Virginia had raised them in St. Louis, along with CÉRAN DE HAULT DE LASSUS DE ST. VRAIN, born in

St. Louis of French ancestry, founded Bent's Fort on the Arkansas River in southeastern Colorado and developed their fur trade in that region. That same year, LOUIS VASQUEZ, another St. Louis native who had worked for Ashley, established a post, Fort Vasquez, on the South Platte River near present-day Colorado and, in the late 1830s, blazed a trail to Bent's Fort. Kentucky-born CHRISTOPHER HOUTON CARSON (Kit Carson), who had trapped in the Rockies in the 1830s, worked as a hunter and guide out of Bent's Fort in 1840–42.

Another fur trader, BENJAMIN LOUIS EULALIE DE BONNEVILLE, born in France but raised in the United States and a former U.S. army officer, led a fur-trading expedition across the Rocky Mountains by way of South Pass to Utah in the early 1830s.

Across the Great Divide

Crossing the Rockies along the Oregon Trail, which included South Pass, became an accepted part of travel west. In 1841, Belgian missionary PIERRE-JEAN DE SMET led the first organized wagon train migration on the Oregon Trail, with Thomas Fitzpatrick serving as guide. That same year, to the north, Métis JAMES SINCLAIR pioneered a wagon route through the Canadian Rockies by way of White Man's Pass in British Columbia for the Hudson's Bay Company.

Mapping the Rockies

Over the years, the U.S. government sponsored expeditions to the eastern Rockies, among them those under Major STEPHEN HARRIMAN LONG in 1820 and Colonel HENRY DODGE in 1835. During the 1840s–50s, JOHN CHARLES FRÉMONT, appointed a lieutenant in the army's Corps of Topographical Corps of Engineers, led a number of expeditions into the Rockies, with Kit Carson as guide for some of them. Frémont crossed the range by way of South Pass twice, climbed Frémont Peak in the Wind River Range, explored the Wasatch, Uinta Ranges, Sangre de Cristo, and San Juan Ranges. Frémont produced accurate surveys including elevations, distances, and LATITUDE AND LONGITUDE that were a boon to pioneers and explorers. In 1845, STEPHEN WATTS KEARNY, again with Thomas Fitzpatrick as guide, explored the Rockies, including South Pass. In the 1860s–80s, the U.S. government sponsored various scientific surveys of the Rockies and other parts of the West under geologists FERDINAND VANDEVEER HAYDEN, CLARENCE KING, and JOHN WESLEY POWELL. In 1857–59, JOHN PALLISER led a British scientific expedition to western Canada, during which he surveyed the passes of the Canadian Rockies.

Nowadays, the Rockies are developed for mining, lumbering, livestock, and recreation.

Roman exploration (ancient Roman exploration)

According to legend, ancient Rome was founded in 753 B.C. on Palatine Hill, a hill on the east bank of the Tiber River in what is now west-central Italy, just inland from the MEDITERRANEAN SEA. The settlement eventually expanded into a city on six other hills. The native inhabitants of the region known as Latium (now part of Lazio) spoke Latin, although, with time, the city became a melting pot of many different peoples and cultures.

In its early stages, the Etruscans, living in the northwest in what is now the region of Tuscany, exerted political influence on the native inhabitants, and Rome was ruled by kings. By 509 B.C., the Romans had rid themselves of outside rule and developed a republican government. In subsequent centuries they gradually expanded their domain into other parts of Italy and neighboring lands. Victory in the Punic Wars against the Carthaginians in 264–146 B.C., and in the Macedonian Wars against the Macedonians and Greeks in 215–168 B.C., as well as other military actions, led to increasing Roman power. Rome assumed control of Egypt in 30 B.C., wresting power from the Greeks. In 27 B.C., the republic collapsed, and Rome was ruled by emperors, the first being Augustus (formerly Gaius Octavius). The Roman Empire reached its greatest extent by A.D. 117, including territory in northern Africa, northern Europe, and the Middle East. Emperor Constantine I (Constantine the Great) recognized Christianity as the official religion and established a new capital, Constantinople (present-day Istanbul, Turkey) in A.D. 330. In 395, the empire was divided into the Western Roman Empire and the Eastern Roman Empire. The Western Roman Empire gradually broke up by the fifth century because of economic decline, internal political unrest, and invasions by Germanic peoples from the north. The Eastern Roman Empire, also known as the Byzantine Empire, endured for another millennium until 1453, when Constantinople was captured by the Ottoman Turks.

Although the Romans took over some of the trading activities of the Greeks, they did not develop a trading culture on a level with other Mediterranean peoples, such as the Minoans, Phoenicians, Egyptians, and Greeks. Much of their trade, especially into Asia for exotic products, such as spices and silk, was carried out by foreigners. As was the case with the great military trek into Asia by Macedonian ALEXANDER THE GREAT, most of the Roman expeditions into unknown lands were for the purpose of conquest. The subsequent building projects of the Romans, including roads and bridges and even entire towns, served to unite lands that had previously been isolated from one another. A great dissemination of ideas resulted as the Roman Empire absorbed other cultures, and eventually there was also a consolidation of geographic knowledge, as recorded by scholars.

Rome's greatest contribution to the history of exploration is the opening of contact between Mediterranean peoples and peoples of northern Europe, including the British Isles. An early expedition by Greek PYTHEAS in about 325 B.C. through the Strait of Gibraltar (see GIBRALTAR, STRAIT OF) along the coast of Spain, France, and Britain as far as the Baltic Sea, brought back some knowledge of northern regions, but it was the Roman military machine and its actions against northern tribes that united Europe. In 58 B.C., general GAIUS JULIUS CAESAR led a military expedition to Gaul (present-day France), and, in 55–54 B.C., he reached Britain. The Roman subjugation of Britain was not completed until the following century. In A.D. 59–61, forces under general SUETONIUS PAULINUS, appointed military governor of Britain, suppressed a Druid revolt. General GNAEUS JULIUS AGRICOLA, also military governor, further explored the British Isles in A.D. 77–84, possibly sailing around them. He also led a military exploration into Scotland in A.D. 80.

The Romans also furthered geographic knowledge of Asia and Africa. In 19 B.C., Cornelius Balbus, a Roman governor of Tunisia, crossed Africa's Libyan Desert in actions against desert tribes. In about 25 B.C., army officer GAIUS AELIUS GALLUS led a military expedition to the Arabian Peninsula. Before his service as military governor of Britain, in A.D. 42, Suetonius Paulinus led a military expedition from the coast of North Africa southward across the Atlas Mountains to the northern edge of the SAHARA DESERT. Eight years later, army officer JULIUS MATERNUS led a military expedition from Africa's north coast across the Sahara, possibly reaching Lake Chad. In A.D. 45, HIPPALUS, a Greek mariner in service of Egypt, then under Roman domination, navigated a direct sea route across the Arabian Sea from Africa to India, furthering earlier knowledge gained by another Greek, EUDOXUS, who had explored the water route between Africa and India in two expeditions between 120 and 115 B.C. Other military expeditions, as the Roman Empire expanded, brought back new geographic information to Rome. By A.D. 29, a Roman military expedition had reached Africa's upper NILE RIVER in Ethiopia and Sudan. The emperor Nero, who ruled in A.D. 54–68, sent out an advance party with an exploratory purpose—to locate the source of the Nile—prior to a planned military campaign. Based on descriptions, the party is thought to have reached the marshes of the White Nile, known as the Sudd.

Many of the discoveries of Roman military expeditions were published in about A.D. 18 by STRABO, a Greek scholar working in Rome. PLINY THE ELDER, who had served as a Roman cavalry officer in both Europe and Africa, also was active as a geographer in the first century A.D. The only one of his works to survive, *Historia Naturalis*, published in A.D. 77, offered a comprehensive study of the known world at that time. PTOLEMY, a hellenized Egyptian living in Alexan-

dria while it was under Roman rule, published a description of world geography in A.D. 127–147.

roundship

The roundship was the vessel typical of northern European countries during the second half of the Middle Ages. Its most direct ancestor was the LONGSHIP of the Vikings. It shared some of the design features of the COG. In the course of evolving from the longship, the roundship took on its own characteristics and was used in warfare as well as commerce.

The first roundships were clinker-built, that is, having overlapping planks. This had been advantageous for the longships due to the integrity of the seams and flexibility in rough seas. With the invention of the saw in Europe, shipbuilders could fashion square planks, which could be laid edge to edge, or carvel-built, thus creating a smoother surface that could pass more easily through water. The shape of the roundship also evolved. The roundship was stouter than the longship, sitting deeper in the water and with more room for cargo. A deck was added on top of the ship's shell, giving the crew more room to work and sleep, while the hull could be filled with supplies and trade goods.

The roundship became a multipurpose vessel, used for both trading and for war. Being the workhorse of its day, it also was referred to as the MERCHANT SHIP. For warfare, additional platforms—castles—were built on the front and back of the vessel allowing better observation and offering additional shelter underneath. As roundships became too heavy to propel by oars, sails were added for propulsion, initially a single square sail, then several larger sails for larger hulls. Eventually smaller sails were added to the bow and stern castles. The masts on which these sails were attached would later be built on the main deck. A spar was sometimes added to the bow to hold a spritsail.

Another innovation the roundship incorporated was the stern rudder. A rudder mounted to the side was adequate for the longship, but to navigate the larger and tubbier roundship, the center-mounted stern rudder proved much more efficient and reliable.

As the design of the roundship became well understood, its length grew beyond the 100-foot mark. The smooth, round hull was stable in the ocean, and made the ship dependable, if not elegant. The roundship predated the EUROPEAN AGE OF EXPLORATION, but many of its features were incorporated into the CARAVEL and the CARRACK, which would carry European explorers throughout the world's oceans.

Royal Geographical Society (RGS)

The Royal Geographical Society (RGS), founded in England in 1830, is an organization dedicated to advancing the science and public knowledge of geography. Now affiliated with the Institute of British Geographers (IBG), RGS-IBG is the largest geographic society in Europe with a membership of almost 15,000, among them academics and professionals in the field of geography and related disciplines as well as lay people. At its central offices in London, a library, picture library, and map room have extensive collections. There are eight regional branches on the British Isles and one overseas in Hong Kong. RGS-IBG holds more than 150 lectures and conferences each year and directs three overseas field research programs. Its Expedition Advisory Centre helps train youth for careers in geography-related occupations. RGS-IBG currently publishes three scholarly journals, a research bulletin, a newsletter, and a popular magazine. It also bestows awards to people around the world for accomplishments in geography and exploration.

The Royal Geographical Society can trace its origins to the founding of the Raleigh Dining Club—named after 16th–17th-century Englishman SIR WALTER RALEIGH—in 1827. Members divided the world into cartographic divisions and became responsible for studying and passing on knowledge of a particular area. SIR JOHN BARROW, second secretary of the Admiralty, and other members eventually decided to establish a more organized institution and, under the patronage of King William IV, the RGS came into being in 1830. The next year, it merged with the AFRICAN ASSOCIATION, which had been founded by SIR JOSEPH BANKS in 1788 for the promotion of British voyages of exploration to Africa. Barrow was the organization's first vice president, then, following the terms of Viscount Goderich, earl of Ripon, and Sir George Murray, served as president in 1835–37.

In the 19th century and early 20th century, the Royal Geographical Society, often working in conjunction with the British government, was active in the sponsoring of expeditions in addition to furthering knowledge of geography. In the 1830s, it offered financial and other support in the explorations of German-born naturalist SIR ROBERT HERMANN SCHOMBURGK to British Guiana in South America. THOMAS SIMPSON, who explored the Arctic regions of Canada, received a medal the first year of the society's existence. Schomburgk received one in 1840. Queen Victoria, who began her reign in 1837, eventually granted the society a Royal Charter for “the advancement of geographical science” and “the improvement and diffusion of geographical knowledge.”

Not all investments in exploratory expeditions paid off, however, and, by the late 1840s, the Royal Geographical Society's activities were limited. Sir Roderick Murchison, who served as president of the society from 1851 to 1870, helped

bring the society to international prominence by sponsoring expeditions, especially to Africa. Among the explorers who received at least partial backing were SIR RICHARD FRANCIS BURTON, JOHN HANNING SPEKE, JAMES AUGUSTUS GRANT, SIR SAMUEL WHITE BAKER, and DAVID LIVINGSTONE.

Many notable explorers were members of, were sponsored by, or received awards from the Royal Geographical Society. To name a few, scientist SIR FRANCIS GALTON received an award in 1853. Pundit NAIN SINGH, who helped survey India, received a medal in 1877. World traveler ISABELLA LUCY BIRD BISHOP became the first woman member of the Royal Geographical Society in 1892, and GERTRUDE MARGARET LOWTHIAN BELL, who explored the Middle East, was the first woman to receive a medal in 1919. During the presidency of Sir Clements Markham in 1893–1905, the Royal Geographical Society made a mark in polar exploration, sponsoring the British Antarctic Expedition under ROBERT FALCON SCOTT among other expeditions. Asian explorer SIR FRANCIS YOUNGHUSBAND served as president late in his career in 1919–22. The society also helped back a British Mount Everest Expedition of 1953, in which SIR EDMUND HILLARY and Sherpa TENZING NORGAY reached the summit of Mount Everest (see EVEREST, MOUNT) in the HIMALAYAS. Hillary received a medal in 1958. French oceanographer JACQUES-YVES COUSTEAU and Norwegian anthropologist THOR HEYERDAHL were awarded medals in the 1960s.

Some of the work of the Royal Geographical Society has been carried out in conjunction with the much older ROYAL SOCIETY (of London for Improving Natural Knowledge), founded in 1660.

Royal Society (Royal Society of London for Improving Natural Knowledge)

The Royal Society is the oldest scientific organization in Britain, and among the oldest in Europe. Founded in 1660 by a group of upper-class and well-educated men in London, it was incorporated in 1662 with the full title, Royal Society of London for Improving Natural Knowledge.

At the time of its founding, European culture was in a period of transition from the RENAISSANCE to the Enlightenment. While the Renaissance had occurred in response to the superstition of the Middle Ages, and placed an emphasis on creative expression and secularism, the Enlightenment sought to foster the gains made in rational thought. With inventions, such as the telescope in the early 17th century, and the beginnings of the scientific method pioneered by philosophers such as Francis Bacon, the European mind began to form a mechanistic view of the universe, with the aim of gaining control over the destiny of human society. The founders of the Royal Society were interested in encouraging the exchange of ideas of natural science, especially

the physical sciences. Physicist Sir Isaac Newton served as its president from 1703 until his death in 1727.

With the prestige and political connections of its membership, the Royal Society has worked closely with the British government to plan and outfit a number of notable voyages of exploration. Among the most well-known was JAMES COOK's first expedition to the South Pacific Ocean in 1768, in order to time the transit of Venus across the Sun. Accompanying Cook on this journey was wealthy naturalist SIR JOSEPH BANKS, future president of the Royal Society and founder of the AFRICAN ASSOCIATION. The society has shown particular interest in polar exploration, aiding in many expeditions, including the 1818 expedition by DAVID BUCHAN to the Arctic Ocean, SIR JAMES CLARK ROSS's search for the SOUTH MAGNETIC POLE in 1840, and ROBERT FALCON SCOTT's first voyage to Antarctica in 1901. In some instances it has cosponsored expeditions with the ROYAL GEOGRAPHICAL SOCIETY, founded in 1830.

The Royal Society continues to operate to this day and continues to have many important scientists on its rolls. Since the society acts as advisers to the British government, members receive annual stipends for their efforts. Among the society's regular contributions to scientific debate is publication of its *Proceedings* and *The Philosophical Transactions*.

Russian-American Company

The Russian-American Company was a colonial trading company, established to develop the North American FUR TRADE for Russian interests. The brainchild of merchant GRIGORY IVANOVICH SHELIKOV and directed in its most productive years by ALEKSANDR ANDREYEVICH BARANOV, it existed from 1799 to 1867.

Promyshlenniki

Soon after VITUS JONASSEN BERING's and ALEKSEY ILYICH CHIRIKOV's voyage of exploration to Alaska on behalf of Russia in 1741, the *promyshlenniki*—Russian fur traders and hunters—who had been active in SIBERIA, reached the Aleutian Islands and eventually the Alaskan mainland, where they found a bountiful supply of furs, especially sea otter, seal, and fox. In the early years, the traders formed ad hoc companies to work the region with no rules governing their operations or their exploitative treatment of the Aleut, the native peoples on the Aleutians, and the Inuit (Eskimo), on the mainland. The royal court in St. Petersburg was primarily concerned with the *yasak*, the 10 percent tax on furs. Nor did the *promyshlenniki* have competition from other colonial powers.

Shelikov's Vision

By the 1780s, however, British and American traders also worked the region. To protect their territorial claims and economic interest, the Russians, under the impetus of Shelikov, and his employer Ivana L. Golikov, who had set up a base at Okhotsk on the Pacific coast of Siberia, began establishing permanent colonies in North America, the first at Three Saints on Kodiak Island in 1784. The efforts of Shelikov and Baranov, in his employ, led to profitable returns. By the 1790s, they had eliminated much of the competition, and the 40 or so ad hoc companies formed each year had become only three and then finally one, the United American Company. During the next several years, while Baranov ran the field operation, Shelikov lobbied for a royal charter in St. Petersburg. Czar Paul I granted the charter in 1799, four years after Shelikov's death, to his widow, Natalia Aleksevna, and son-in-law, Nikolay Petrovich Rezanov, authorizing the formation of the Russian-American Company. The charter granted the company monopoly trading privileges in all Russian territory in North America, including the Aleutians, Alaska, and territory as far south as 55 degrees latitude north. The czar was to receive a third of the profits.

Under Baranov

Baranov served as director of the company from 1800 to 1818. In 1799, he established a settlement at New Archangel (present-day Sitka) on what became known as Baranof Island in the Alexander Archipelago. It was destroyed by Tlingit Indians in 1802, but was rebuilt two years later, becoming the headquarters of expanding fur-trading operations. In 1812, Baranov also founded a southern settlement, Selenie Ross (later known as Fort Ross), near Bodega Bay in northern California. Because of reported involvement with foreign traders as well as complaints by Russian traders regarding abusive treatment of native peoples, the directors of the company retired Baranov in 1818. The new royal charter of 1821, which expanded operations to 51 degrees north latitude, also stipulated that the managers (or governors as they came to be known) of the Russian-American Company had to be naval officers.

Later Years

The Russian-American Company, despite its success in harvesting millions of furs, never established a large colonial population of Russians, partly because of the czar's refusal to allow the presence of serfs in North America. The harshness of conditions and the shortages of supplies also kept the colony small. Other trading companies—the HUDSON'S BAY COMPANY (which had merged with the NORTH WEST COMPANY in 1821) and the AMERICAN FUR COMPANY—offered growing competition. Moreover, the naval officers in charge were more concerned with territorial encroachments than the fur business. The continuing resistance of the Tlingit,

known to the Russians as the *Kolush*, also limited operations. With declining profits in the 1840s, the czarist government took over operations from the merchants.

The Crimean War in 1853–56, in which Russia was defeated by an alliance of nations, including Great Britain, France, the Kingdom of Sardinia (now parts of Italy and France), and the Ottoman Empire (now Turkey), drained resources from other international endeavors. In 1867, Russia sold Alaska to the United States, at which time the Russian-American Company was dissolved.

Trade and Exploration

Considerable exploration was carried out in conjunction with the fur trade as well as under the direct auspices of the Russian-American Company. In the 1780s, Shelikov himself initiated exploratory expeditions along the Gulf of Alaska. DMITRY IVANOVICH BOCHAROV, who explored the Aleutians and coastal Alaska in the 1780s and who, in 1791, located a passage through the eastern end of Alaska Peninsula, connecting Bristol Bay and Gulf of Alaska, worked for Shelikov. GERASIM ALEKSEYEVICH IZMAILOV sailed with Bocharov on some of these expeditions and, in 1791, explored the Kenai Peninsula on the Gulf of Alaska in command of his own ship. GAVRILOV LOGINOVICH PRIBYLOV, who located the Pribilof Islands in the Bering Sea in 1786, was a fur trader.

Baranov explored the Gulf of Alaska and various inlets, such as Cook Inlet, Prince William Sound, and Yakutat Bay in the 1790s, and explored southward along the coast from the Gulf of Alaska to San Francisco Bay in present-day California in 1804–05. GAVRIIL IVANOVICH DAVYDOV of the Russian navy worked for the Russian-American Company for part of his career in the early 1800s. ANDREY GLAZUNOV was in the employ of the Russian-American Company when he explored the Yukon and Kuskokwim Rivers of western Alaska in 1834–35. LAVRENTY ALEKSEYEVICH ZAGOSKIN commanded company ships in exploratory expeditions of

the Yukon, Kuskokwim, and other rivers of the Alaskan interior in 1842–44.

Other expeditions related to the fur trade in that maps and charts were sought to develop commercial interests. In 1768–70, PYOTR KUZMICH KRENITSYN led a maritime expedition charting the Aleutian Islands and the western end of Alaska Peninsula. Other explorations of coastal Alaska were carried out by VASILY MIKHAILOVICH GOLOVNNIN in the course of his voyage of 1807–11; by Swedish-Finnish ARVID ADOLF ETHOLEN sailing for Russia in 1821; and by ALEKSANDR FILIPPOVICH KASHEVAROV in 1832–42.

Still other Russian voyages of exploration sought to establish a water route between Russian America and European Russia to further develop commercial interests in conjunction with the Russian-American Company. Englishman JOSEPH BILLINGS, along with ANTON BATAKOV and GAVRIIL ANDREYEVICH SARYCHEV, led the Russian naval Northern Secret Geographical and Astronomical Expedition of 1785–93 in search of a passage from Siberia's northeast coast into the BERING STRAIT and also explored the Aleutians and the Gulf of Alaska. In 1803–06, the first Russian CIRCUMNAVIGATION OF THE WORLD under ADAM IVAN RITTER VON KRUSENSTERN and YURY FYODOROVICH LISIANSKY sought to find a water route to avoid transport across Siberia. In 1815–18, a Russian naval expedition under OTTO VON KOTZEBUE searched for outlets of the NORTHEAST PASSAGE or NORTHWEST PASSAGE in the North Pacific. Other Russian circumnavigations of the world were carried out by MIKHAIL PETROVICH LAZAREV, in 1822–25, and FYODOR PETROVICH LITKE, in 1826–29.

Through some of these and other expeditions, much geographic and navigational knowledge of North America was accumulated. Mikhail Dmitrievich Tebenkov, governor of the Russian-America Company, compiled it in *Atlas of the Northwest Coasts of America: From Bering Strait to Cape Corrientes and the Aleutian Islands*, published in 1852.

Saguenay

The legend of a fabled land known as Saguenay originated with the Huron (Wyandot) Indians. Frenchman JACQUES CARTIER, who explored along the St. Lawrence River in his second expedition to Canada in 1535–36, visiting the Huron villages of Stadacona (present-day Quebec City, Quebec) and Hochelaga (present-day Montreal, Quebec), was informed by Chief DONNACONNA of a land rich in jewels and precious metals, with white-skinned inhabitants. Supposedly, it could be reached from a branch of the St. Lawrence River.

Cartier took the Huron chief to Europe with him in order to gain backing for a subsequent expedition. Donnaconna, who met King Francis I of France and other members of the royal court, never returned to his homeland, succumbing to disease. Yet Cartier received the backing he desired and returned to North America in 1541.

Cartier and his expedition entered a branch of the St. Lawrence located to the north of Stadacona—now known as the Saguenay—and followed it westward, eventually reaching a region where he found what he thought was gold and precious stones. The French took samples and returned to France with them in 1542. When tested, the minerals turned out to be pyrite (FOOL'S GOLD) and quartz. In 1543, JEAN-FRANÇOIS DE LA ROQUE DE ROBERVAL, who had provided financing for Cartier, also searched for Saguenay along the St. Lawrence and Saguenay Rivers.

Frenchman SAMUEL DE CHAMPLAIN retraced Cartier's route along the St. Lawrence and into the Saguenay years

later, in 1603. He also explored along the Ottawa River in 1613, still hoping to find the fabled land.

Sahara Desert

The Sahara of North Africa is the world's largest desert at some 3.5 million square miles. East to west, it extends more than 3,000 miles from the Atlantic Ocean to the RED SEA, and, north to south, about 1,200 miles from on or near the MEDITERRANEAN SEA to the valley of the NIGER RIVER and the steppes of the Sudan to the south. In western stretches of the north, the Atlas Mountains and steppes lie between it and the sea; and, in western stretches of the south, the Sahel, a semiarid region of sparse grasses and shrubs, lies between arid desert lands and wetter tropical areas. The Sahara's boundaries are ever shifting, with parts of the Sahel, for example, turning to desert in recent years because of drought. The Sahara Desert includes most of Mauritania, Western Sahara, Algeria, Niger, Libya, and Egypt; southern portions of Morocco and Tunisia; and northern portions of Senegal, Mali, Chad, and the Republic of Sudan. The western Sahara is sometimes referred to as the Sahara proper. The eastern Sahara is discussed as three regions: the Libyan Desert, west of the valley of the NILE RIVER in eastern Libya, central and western Egypt, and northwestern Sudan; the Arabian Desert, or Eastern Desert, between the Nile Valley and the Red Sea; and the Nubian Desert in the northeastern Sudan. The name *Sahara* is Arabic for "desert."

The vast Sahara region is not uniform. Terrain varies from regions of sandy wastes and dunes (making up about 15 percent of the Sahara, much of it in the Libyan Desert), to rocky and gravelly plains and plateaus (about 70 percent), to mountains, oases, and transition zones (about 15 percent). The Sahara as a whole is a tableland with an average elevation from about 1,300 to 1,600 feet; some areas in the north, such as the Qattara Depression in Egypt, are below sea level. Mountains include the Ahagger (Hoggar) in southern Algeria, rising to more than 9,000 feet; the Tibesti in northern Chad, rising to more than 11,000 feet; and the Aïr (Azbine, Asben) in northern Niger, rising to more than 6,000 feet. With an average annual total of less than five inches of rainfall during the winter months, with some torrential downpours in the summer, vegetation is sparse and shrubby, with none at all in sand dune country; in the oases can be found some trees, in particular date palm, doum palm, tamarisk, and acacia. There are no permanent rivers in the Sahara; the bordering Nile and Niger Rivers are fed by rains outside the desert. With the rains come wadis, intermittent streams descending from highlands. A number of chotts, or lakes, and boggy salt marshes can be found. Scattered oases are formed by the water table reaching the surface. Winds can be fierce; names for the dust-laden, damaging winds include *harmattan*, *khamzin*, *simoom*, and *sirocco*. Wildlife includes gazelle, antelope, hyena, jackal, fox, badger, hare, hedgehog, chameleon, cobra, and migratory birds.

Inhabitants of the Sahara's interior include the Tuareg, one of the non-Arab Berber tribes, centered in mountainous regions of the central Sahara; the Tibbu (Tébu), another Berber people, in the Tibesti Mountains; and mixed Berber and Arab peoples in western lands.

Ancient Reports

The Sahara has always been a formidable barrier, separating Mediterranean peoples from those to the south. The ancient Egyptians controlled oases in desert regions east and west of the Nile, providing routes of commerce (see EGYPTIAN EXPLORATION). The Carthaginians also traded with peoples to the south. In about 480 B.C., Carthaginian admiral HANNO led an expedition from Carthage through the Strait of Gibraltar (see GIBRALTAR, STRAIT OF) to the open waters of the Atlantic, then southward, exploring Africa's coastal lands to the south, some of them the western extent of the Sahara (see CARTHAGINIAN EXPLORATION). Greek historian HERODOTUS, in his writings later that century, described an expedition of five Berber princes across the Sahara to a great southern river, perhaps the Niger (see GREEK EXPLORATION). The Romans carried out a number of military expeditions to the south between 19 B.C. and A.D. 86, among them those headed by SUETONIUS PAULINUS across the Atlas Mountains to the desert's northern edge in A.D. 42, and by JULIUS MATERNUS, who possibly commanded the first Eu-

ropean crossing of the desert north-to-south as far as Lake Chad in A.D. 50 (see ROMAN EXPLORATION). Earlier that century, Greek geographer STRABO had written of the Sahara in his *Geography*, published in about A.D. 18. Roman geographer PLINY THE ELDER wrote about it in *Historia Naturalis*, published in A.D. 77. Hellenized Egyptian PTOLEMY of the second century A.D. also described desert lands of North Africa.

Berbers and the Arabs

It is thought that the camel was introduced into North Africa in the first century A.D., enabling a greater range of activity for nomadic peoples, first the Berbers, centered in the highlands, then the Arabs. Trans-Saharan trade was developed during the Middle Ages, involving salt from the desert, gold, and slaves from West Africa and cloth, jewelry, and other products from Mediterranean cities. Control of the oases was interdependent with control of commerce. A number of Muslims wrote about the Sahara, including 10th-century merchant ABU AL-QASIM IBN ALI AL-NASIBI IBN HAWQAL, 12th-century scholar ABU ABD ALLAH MUHAMMAD ASH-SHARIF AL-IDRISI, and 14th-century scholar ABU ABD ALLAH MUHAMMAD IBN BATTUTAH. Spanish cartographer ABRAHAM CRESQUES, in his *Catalan Atlas* of about 1375, indicated camel caravan routes across the Sahara, based on information from Jewish traders.

European Interest

In the ensuing centuries, European nations showed increasing interest in the Saharan trade, in particular Italy and Portugal. Mariners sailing along Africa's west coast for HENRY THE NAVIGATOR, prince of Portugal, in the 15th century, such as Italian ALVISE DA CADAMOSTA and Portuguese DIOGO GOMES, sought information about inland trade. Gomes reported of the city of TIMBUKTU on the Niger, part of the great trading network. Meanwhile, Berbers and Arabs continued to control the overland routes. In the 16th century, Arab LEO AFRICANUS, as a diplomat for the sultan of Morocco, crossed the Sahara to Timbuktu.

The extent and limits of the Sahara were not understood by Europeans until the end of 19th century. Much of what was learned resulted from British expeditions seeking to define the course of the Niger and reach Timbuktu. German FRIEDRICH CONRAD HORNEMANN, who entered the Sahara from the northeast out from Cairo in Egypt, is credited as the first modern European to travel there in 1798–1801, soon to be followed by Scotsman MUNGO PARK in 1805–06, who approached from the southwest and the Gambia River. Later expeditions included those of JOSEPH RITCHIE and GEORGE LYON in 1818–19, and WALTER OUDNEY, HUGH CLAPPERTON, and DIXON DENHAM in 1821–25, both British expeditions heading southward from Libya. In 1827–28, Frenchman RENÉ-AUGUSTE CAILLIÉ crossed the Sahara from

This photograph from the late 19th or early 20th century shows merchants in the Sahara Desert. (*Library of Congress, Prints and Photographs Division [LC-USZ62-93064]*)

south to north. Later expeditions to explore and chart the Sahara were headed by Frenchman HENRI DUVEYRIER in the 1850s–60s, German FRIEDRICH GERHARD ROHLFS in the 1860s–70s, German GUSTAV NACHTIGAL in the 1860s–70s, and Frenchman PAUL-XAVIER FLATTERS in the 1880s. In the 20th century, scientific expeditions and surveys from the air were carried out as well.

The Sahara remains a sparsely inhabited region, with few maintained roads. The nomadic way of life continues, with desert inhabitants traveling by camels and maintaining herds of sheep and goats; some peoples still transport salt over the old trade routes. New oases have been created through drilling. The Sahara is rich in metallic minerals such as iron, copper, manganese, tin, nickel, chromium, zinc, lead, cobalt, silver, and gold, resulting in mining activity. Deposits of oil and natural gas are also found.

St. Brendan's Isle

St. Brendan's Isle was a land in the Atlantic Ocean purported to be visited by sixth-century Irish monk SAINT BRENDAN. It has been identified as various actual places by a number of different scholars, but the truth of the past has been mingled with myth to the point where final conclusions are impossible. Accounts of Saint Brendan's voyage demonstrate real knowledge of the waters of the Atlantic, however, and, as a result, are considered worthy of study as possible history and not just legend.

Brendan was born in county Kerry in the Irish town of Tralee, or nearby, in about A.D. 484. Having been ordained in 512, he showed great zeal in propagating the Catholic faith, founding a monastery in Ardfert to the north of Tralee and one at Clonfert in Galway. Reliable evidence credits him with embarking on a number of voyages: to Wales on the British Isles; to Brittany in what is now northwestern France; and to the Hebrides Islands west of Scotland. Whatever the true extent of his travels, he seems to have

been energetic and restless and to have departed his homeland for extended periods of time. Perhaps it was due to these absences that he became the center of tales incorporating the experiences of a number of different missionaries. Known also as Saint Brendan the Navigator, he has continued to be a popular figure and is the patron saint of Kerry. Place names commemorating Brendan throughout the islands and coasts of western Ireland and Scotland attest to his significance; there is even a Brendansvik or Brendan's Bay in the Faeroe Islands, more than 350 miles north of Scotland.

An activity that was performed around the time of Brendan was the sea pilgrimage. This practice, analogous to Christ's time in the desert, entailed an Irish monk traveling out to sea in a CURRAGH, a type of small craft, to search for a barren island where he might obtain solitude and wisdom. Some of these journeys took on a missionary aspect if the lands were inhabited. Monks sometimes led a group of pilgrims on these journeys. In the course of such expeditions, Irish travelers founded settlements in the Orkney Islands, the Shetlands, and the Faeroes. There were also Irish colonies in ICELAND by the ninth century.

After three centuries, Irish colonial activity drew to a close, and many great romantic tales came to be written about the sea pilgrimages. The literature surrounding the travels of the Irish monks, including Brendan, came into popularity about the same time that the English were fascinated with the Arthurian legends. In this way, the Irish came to understand and contend with the politics and morality of their time and to take pride in their heritage. Brendan became the hero in several of these works. One of the earliest surviving accounts is *The Book of Lismore* from the early 10th century. In this work, Brendan hears the voice of God, who tells him that he has been chosen to find a resting place. He collects a number of monks and three currachs and sets out among the islands of the North Atlantic. As a sign from God, a whale visits them every Easter at sea, on whose back they celebrate Mass. The search for land proves futile, however, and, after five years, they return to Ireland.

In the *Navigatio Sancti Brendani* (The Voyage of St. Brendan), written sometime between 900 and 920, the tales become even more fanciful. Hearing of an Eden from a monk, Barinthus, Brendan decides to search for it. For this trip, he builds a large curragh and sets out westward with other monks. After visiting several islands, the geography of which correspond to real places, he and his followers proceed westward. On the way, they encounter a number of fantastic creatures—a race of small people, pygmies, giant sheep, and sea-cats. Fifteen days sailing from an island of strong men, they spot a bird of exotic plumage carrying a cluster of grapes the size of apples. After seven more days, they reach the island from where the grapes had come. They interpreted this as the way station to their paradise, for next

they proceeded through a fog bank and came upon a vast land of sweet-smelling flowers and mild weather. After hiking for weeks, they reached a river, where an angel informed them that this land—the “Land Promised to the Saints”—was reserved for others to Christianize in the future and that it was time to return to their vessel.

The *Navigatio*, despite its embellishments, contains the most cohesive narrative of these early tales, without the large gaps between places visited that other writings have. It also demonstrates a real knowledge of winds and currents that gives the modern reader reason to believe that at least some of the book has a basis in fact.

St. Brendan's Isle has been identified as any number of places. In one of the stories, Brendan observes an island where volcanic activity is taking place. This could only have been Iceland. Other island groups are identified, some of which had Irish outposts. Since GREENLAND is visible from the mountains of Iceland and would probably be found in the course of a circumnavigation of Iceland, it is likely that the Irish knew of it before the Vikings. Some of the legends describe icebergs encountered by the travelers, which also fits the idea of the legendary isle being situated in the North Atlantic.

Other theories associate Saint Brendan's voyages with island groups off southern Europe and northern Africa. The CANARY ISLANDS, the AZORES, and the Madeira Islands all have been put forth as a possible landing place. On his 1492 globe of the world, German MARTIN BEHAIM placed a “Saint Brendan's Island” west of the Canaries. It has also been theorized that Brendan crossed the Atlantic to the Bahama Islands off North America. The description in the *Navigatio* of an extensive land with a friendly climate would apply to the east coast of North America, but whether this had its roots in actual experience or in the wishful thinking of those making a case for the Irish discovery of the Americas even before the Vikings in about 1000 will probably never be known for certain.

St. Louis Missouri Fur Company

The St. Louis Missouri Fur Company, which came to be known as the Missouri Company, was one of the early North American companies established to develop the FUR TRADE up the MISSOURI RIVER to its headwaters in the northern ROCKY MOUNTAINS and beyond. It was founded in St. Louis in February 1809, 10 months after JOHN JACOB ASTOR chartered the AMERICAN FUR COMPANY. Both sought to compete with the HUDSON'S BAY COMPANY and the NORTH WEST COMPANY, Canadian enterprises.

The founding partners of the St. Louis Missouri Fur Company were JEAN PIERRE CHOUTEAU and one of his sons, AUGUSTE PIERRE CHOUTEAU; MANUEL LISA, who had

conducted trade with the Osage Indians in the Missouri region; WILLIAM CLARK of the Lewis and Clark Expedition; Reuben Lewis, MERIWETHER LEWIS's brother; ANTOINE PIERRE MENARD; ANDREW HENRY; Benjamin Wilkinson; Sylvestre Labadie; William Morrison; and Dennis Fitzhugh. Articles of Association and Copartnership were signed in front of Meriwether Lewis.

The first expedition, including all the partners and 172 men, departed St. Louis in spring 1808, traveling up the Missouri with nine barges loaded with trade goods. The company's main outposts were Ft. Mandan at the confluence of the Missouri and Knife Rivers in present-day North Dakota, built during that expedition, and Ft. Manuel (also known as Ft. Raymond) at the confluence of the Yellowstone and Bighorn Rivers in present-day Montana, established by Lisa two years before.

The company was successful in its first few years. Yet, with shrinking profits, it gave up its activity in the northern Rockies, abandoning Ft. Manuel in 1811 and Ft. Mandan in 1812, concentrating its trade along the Missouri. The War of 1812 also interfered with some of its activity. JOSHUA PILCHER became a partner in 1819, then became president the next year after Lisa's death. CHARLES BENT also became involved with the company in its final years. One of the company's fur brigades was wiped out by Arikara Indians in 1823, leading to a punitive military campaign under Colonel HENRY LEAVENWORTH. Meanwhile, Astor's American Fur Company was thriving. By 1825, the partners in the Missouri Fur Company had given up their shared endeavor.

satellite (artificial satellite)

The term *satellite* refers to any natural or human-made object moving in orbit around Earth or around another celestial body. The Moon is thus a "satellite" of Earth. In popular usage, the term has come to be applied primarily to artificial objects. The earliest SPACE EXPLORATION was carried out by artificial satellites before humans were launched into space, by the former Union of Soviet Socialist Republics (USSR; Soviet Union) and the United States.

Both nations began developing their satellite programs in the 1950s, as advances in ROCKET technology made launches possible. The INTERNATIONAL GEOPHYSICAL YEAR (IGY), from July 1, 1957, to December 31, 1958, was the target time for launches by both nations. Project Vanguard of the U.S. Navy was selected as the first official U.S. program. (The U.S. Army meanwhile had a rival plan, Project Orbiter.)

The first artificial satellite, the Soviet Union's *Sputnik 1* (the full name: *Iskustvennyi Sputnik Zemli* for "fellow world traveler of the earth"), almost 23 inches in diameter and about 183 pounds, was launched on October 4, 1957, an event that is considered the start of the "space race" between the Soviet Union and the United States. On November 3, 1957, the much larger *Sputnik 2*, at about 1,120 pounds was launched, carrying the first animal (a dog named Laika) into space.

The rocket that was to carry the first Vanguard into space exploded the following December 6. The first U.S. satellite, *Explorer 1*, was launched on January 31, 1958, with help from the Army Ballistic Missile Agency engineers. It made a significant discovery, the first indications of the Van Allen belts, a zone of trapped radiation surrounding Earth. *Explorer 3*, launched on March 26 of that year, performed tests that proved their existence. In the meantime, *Vanguard 1* was successfully launched on March 17, 1958. The following July, the United States founded the NATIONAL AERONAUTICS AND SPACE ADMINISTRATION (NASA).

Satellite technology was soon applied to specific needs on Earth. Since April 1, 1960, and the launching of *Tiros 1*, the first weather (meteorological) satellite, thousands of artificial satellites have been launched into orbit around Earth—by many different nations and of varying sizes and serving a variety of purposes. In addition to weather satellites, there are application satellites, which test ways of improving satellite technology itself; communications satellites, for television and other systems; navigation satellites, for navigation systems on Earth; reconnaissance satellites, to survey Earth's landforms and resources as well as human activity (some of them specifically "spy satellites" or "military satellites"); and research satellites, which are also called exploratory satellites, for scientific studies of space (the Hubble Space Telescope, launched by the United States in April 1990, is a research satellite). A SPACE STATION is also a type of artificial satellite, although in popular usage it is rarely referred to as such. A SPACE PROBE is not considered a satellite since it leaves the orbit of Earth (yet may become a satellite of another planet or a moon).

Artificial satellites have been placed into orbit mainly through the use of rocket technology. Since 1984, the United States has also used the SPACE SHUTTLE to launch, service, and retrieve satellites. The systems of the satellites are powered in a number of ways: by solar cells; by batteries (in some cases charged by solar cells); by nuclear reactors; and by generators (which produce electricity from the decay of radioisotopes). Satellites, which are computerized, contain control, tracking, receiving, transmitting, information collecting, and storing equipment.

Satellite technology has made possible the Global Positioning System (GPS), which has become the primary system of navigation (see NAVIGATION AND EXPLORATION).

scurvy

Scurvy is a deficiency disease caused by a lack of vitamin C. Failure to satisfy the body's need of the vitamin causes the weakening of capillaries. Hemorrhaging eventually occurs, and a multitude of symptoms may result. These include swollen gums, loosened teeth, internal bleeding, lethargy, difficulty in thinking, and various forms of bodily disfigurement. If left untreated, scurvy results in death.

Scurvy was described in an Egyptian papyrus of 1550 B.C., but its causes remained unknown for centuries. It probably caused more loss of life during the EUROPEAN AGE OF EXPLORATION than shipwrecks. It was a particularly difficult condition to diagnose because the early symptoms resembled those of many other diseases. Once it had taken hold of a crew, the effects would be devastating.

The voyage of Portuguese VASCO DA GAMA around the CAPE OF GOOD HOPE in 1497–99, in which half the crew were lost to scurvy, demonstrated the dangers of long trips without fresh provisions. Among other famous examples of the blight of scurvy occurred on the first CIRCUMNAVIGATION OF THE WORLD, headed by FERDINAND MAGELLAN for Spain in 1519–21. On the first leg of his journey, before reaching the islands of the South Pacific Ocean, he lost a large percentage of his crew to the disease. After his death on the island of Mactan in 1521, his crew straggled home. Of an original complement of 250 men, only 18 remained to complete the voyage, the majority of the dead victims of scurvy. The 1595–97 voyage of Dutchman CORNELIUS HOUTMAN to the island of Java resulted in the loss of two-thirds of his crew to scurvy and fever. Perhaps the largest loss of life occurred on the circumnavigation carried out by Englishman GEORGE ANSON in 1740–44, where he lost more than 1,000 men to scurvy. This extreme number of casualties led the Royal Navy to increasing its efforts to cure the problem.

The problem of scurvy was not limited to long, open-sea voyages. Since the science of the disease was not well understood, scurvy occurred on trips along coastlines and also on dry land. The 1774 Spanish exploration of the Oregon coast by BRUNO HECETA is an example of one such journey cut short by scurvy. Frenchman RENÉ-AUGUSTE CAILLIÉ suffered from scurvy while exploring the upper water of Africa's NIGER RIVER in 1827.

Knowledge of a cure for scurvy was slow to materialize. In winter 1535–36, the French expedition under JACQUES CARTIER to northeastern North America suffered an outbreak of scurvy. The Huron (Wyandot) Indians demonstrated how to make a tea made from evergreen trees, which, because it contained vitamin C, saved many Frenchmen without their recognizing the cure. Among the first Europeans to propose a remedy was Sir Richard Hawkins, who, in 1593, wrote that citrus fruit seemed to help cure the problem. James Lind, a Scottish naval doctor who had suc-

cessfully treated sailors with oranges and lemons, publicized a cure in *A Treatise on Scurvy* years later, in 1753. Understanding was still incomplete, however, and his solution was met with skepticism among experienced seamen, for fruit juices did not retain their vitamin C indefinitely. Attempted antidotes for the disease are many and varied throughout the annals of exploration. They include coconut milk, beans, fresh turtle meat, berries, spruce beer, wild celery, purslane, fresh fish, hops, and watercress.

The man who is given credit for getting the problem of scurvy under control was Englishman JAMES COOK. On his voyage to the South Pacific in 1768–71, he used a variety of foodstuffs to ensure the health of his crew. The biggest breakthrough was in the use of sauerkraut, a preserved food high in vitamin C. He did not lose a single man to scurvy on the voyage. The replacement of sailing vessels with the steamship in the mid-1800s finally solved the centuries-long problem of scurvy at sea. The speed of these new ships allowed for food to retain its vitamin content before going bad. Yet explorers still had to deal with the disease. Examples abound of Arctic and Antarctic expeditions caught short of supplies and suffering outbreaks of scurvy, for example that of Englishmen SIR JOHN FRANKLIN in the 19th century and ROBERT FALCON SCOTT in the 20th century. Scurvy was the first disease to be understood as being caused by a vitamin deficiency. Advances in food preservation such as canning and refrigeration have helped eliminate it as a general problem. The isolation and production of vitamin C has also contributed to reduced risk of scurvy. Today, scurvy may be treated with tablets or syrup and is seen only in the most critical of circumstances.

See also DISEASE AND EXPLORATION.

searches for missing explorers

A recurring theme in the history of exploration is the search for missing explorers, with a number of expeditions prompted, at least in part, by the disappearance of earlier expeditions. In the course of many of these searches, new geographic discoveries were made.

The Lost Colony

The mysteries and failures in the history of exploration have captured the public's imagination as much as the successes. A case in point is the story of the LOST COLONY in North America—the failed attempt of the 1587 English colony sponsored by SIR WALTER RALEIGH in what is now northeastern North Carolina—which still fosters speculation. Part of the power of the story is that the colony's governor, JOHN WHITE, returned to England for supplies, leaving his daughter and newly born granddaughter there, but was unable to return for three years because of the Spanish Armada's invasion of England. White found only a single word of the

colonists' whereabouts—"CROATOAN"—the name of an Indian village. With a storm approaching, the relief ship was unable to investigate further, and White was never able to mount another relief operation. The search still continues, with archaeologists still hoping to turn up some definitive trace.

The La Pérouse Expedition

Well-publicized official French searches for a missing expedition occurred in the late 18th century and early 19th century. The two ships of the expedition under renowned French naval officer and navigator JEAN-FRANÇOIS DE GALAUB, comte de La Pérouse—the *Astrolabe* under his command and the *Boussole* under PAUL-ANTOINE-MARIE FLEURIOT DE LANGLE—went missing in 1788. The comte de La Pérouse expedition had departed France on August 1, 1785. After sailing around CAPE HORN and exploring in the Pacific Ocean, including coastal regions of North America and Asia, the expedition had sailed to Botany Bay, the location of present-day Sydney, on the east coast of New Holland (Australia). On March 10, 1788, the Frenchmen had departed Botany Bay with the intention of exploring the continent's north coast around the Gulf of Carpentaria and had vanished. (Some of the expedition's geographic findings survived, however, because interpreter JEAN-BAPTISTE-BARTHÉLEMY DE LESSEPS, as planned, had traveled overland from the Kamchatka Peninsula on the Bering Sea by way of SIBERIA to Paris with records taken through the fall of 1787.)

In 1791, rear admiral ANTOINE-RAYMOND-JOSEPH DE BRUNI, chevalier d'Entrecasteaux, was given the assignment of finding La Pérouse. The expedition, consisting of two ships, the *Recherche* and the *Espérance*, had other purposes as well. It was to survey the coasts of Australia, Van Diemen's Land (TASMANIA), and New Caledonia (see OCEANIA). Departing France in September 1791, it accomplished many of its goals, including various coastal surveys. It also located new islands west of the Solomons, known as the D'Entrecasteaux Islands. Yet d'Entrecasteaux found no evidence indicating the fate of the La Pérouse expedition, not even in the Admiralty Islands, where rumors placed the lost Frenchmen. Off the east coast of New Guinea, d'Entrecasteaux explored Vanikoro Island, one of the Santa Cruz group north of the New Hebrides. Soon afterward, d'Entrecasteaux died at sea from SCURVY and dysentery.

Another French expedition, this one headed by naval officer JULES-SÉBASTIEN-CÉSAR DUMONT D'URVILLE, set out to the South Pacific in April 1826 to map and study the natural history and native languages of the same region that d'Entrecasteaux had explored; it had the additional assignment of searching for La Pérouse. While the Dumont d'Urville expedition was underway, Peter Dillon, the captain of a British vessel, had seen relics from a shipwreck among the natives of Tikopia Island, also in the Santa Cruz group.

As with all mariners of the day, he was well aware of the missing French expedition. From the locals as well as Europeans living among them from earlier voyages, Dillon learned that a European ship had been stranded on a reef and that the crew had built a small boat from the wreckage and eventually had headed westward. Some accounts told of a second ship destroyed on the reef, the few survivors of which had been attacked and killed by natives. Two castaways from one ship or the other had supposedly lived for a time on Vanikoro Island—one now dead and the other having departed with a group of native peoples. Dillon managed to recover a number of objects from a shipwreck in the region, including a bronze ship's bell, and eventually took them to Paris. In the meantime, Dumont d'Urville, who had named his ship the *Astrolabe* in honor of La Pérouse's vessel, traveled to Vanikoro Island and retrieved other objects. He also erected a monument there to the memory of the lost Frenchmen. In France, Baron de Lesseps, who had left the La Pérouse expedition in Kamchatka in 1787, confirmed that the found relics were indeed from the original *Astrolabe*. In 1964, a search expedition located the remains of the second ship, the *Boussole*, off Vanikoro Island, confirming the native peoples' stories.

The Franklin Expedition

The most famous of missing expeditions—and certainly the one that helped spur on the most subsequent voyages of exploration—was that of SIR JOHN FRANKLIN. Franklin had built a successful career as a British naval officer by charting much of the Arctic coast of the Canadian mainland in expeditions in 1819–22 and 1825–27, of which he had written in two well-received books. In 1828, he received a knighthood. Later that same year, he married Jane Griffin, who became Lady JANE FRANKLIN. In 1836–43, he served as governor of Van Diemen's Land. In 1844, after his return to England, Franklin received a commission from the British Admiralty to lead another expedition to the Canadian Arctic with the goal of navigating east to west through the long-sought NORTHWEST PASSAGE.

The *Erebus* under Franklin's command, along with the *Terror* under Lieutenant FRANCIS RAWDON MOIRA CROZIER, sailed from England on May 29, 1845. The ships were last seen by a Scottish whaling vessel on July 26, 1845, in upper Baffin Bay, west of GREENLAND, near the approach to Lancaster Sound. By 1847, without any word from or of the expedition, concern began to mount. Franklin's disappearance became international news. Over the next decades, some 50 expeditions, involving approximately 2,000 men, were launched to solve the mystery of what happened to the *Erebus* and the *Terror* and, during them, much was learned of the Arctic regions of the Western Hemisphere.

In 1847–49, SIR JOHN RICHARDSON, along with JOHN RAE of the HUDSON'S BAY COMPANY, led a British land-

based expedition which reached Canada's Arctic coastline by way of the Mackenzie River, then proceeded eastward to Dolphin and Union Strait. In 1849–50, Rae continued the search on his own, reaching Victoria Island. In 1848–49, SIR JAMES CLARK ROSS led a British naval expedition, which traveled through Lancaster Sound as far as Barrow Strait and southward from Somerset Island into Peel Strait. In 1850–51, James Clark Ross's uncle, SIR JOHN ROSS, wintered in Barrow Strait on the schooner *Felix*, sponsored privately by Sir Felix Booth, in the hope of finding some trace of Franklin, but to no avail.

The British Admiralty sponsored a number of expeditions in the 1850s to the Canadian Arctic, part of the motivation of which was to determine the outcome of the Franklin expedition. In 1850–54, SIR ROBERT JOHN LE MESURIER McCURE, who had sailed on the earlier expedition with James Clark Ross, led an expedition that entered Arctic waters from the west by way of the BERING STRAIT. While proceeding eastward, he located Prince of Wales Strait between Banks Island and Victoria Island; he also reached a point far enough west—Mellville Island, which had previously been reached from the east—to prove that a Northwest Passage did in fact exist. At about the same time, in 1850–55, SIR RICHARD COLLINSON, also approaching from the west, explored the Arctic coasts of Alaska and Canada as far east as Victoria Island. Spending the winter of 1852–53 there, he retrieved some pieces of iron from Inuit (Eskimo) that had probably come from one of Franklin's ships. Also during this period, in 1852–54, SIR EDWARD BELCHER headed an expedition from the east that navigated west of Lancaster Sound. SIR FRANCIS LEOPOLD MCCLINTOCK, part of this expedition as well as the earlier James Clark Ross's expedition, located Eglington Island and Prince Patrick Island at the edge of the Beaufort Sea.

In the meantime, Lady Franklin, distraught over the disappearance of her husband, had been using her resources and prestige to promote continuing searches. In 1848, she offered a reward for the rescue of her husband or for information as to his fate. She later gained the support of American shipping magnate Henry Grinnell, who, in 1850–51, sent out an expedition under EDWIN JESSE DE HAVEN, a U.S. naval officer. While trapped in the PACK ICE north of Baffin Island and Lancaster Sound and drifting with it for some 1,000 miles, he located Grinnell Land on northern Devon Island. Lady Franklin paid for a number of expeditions from her own funds as well. In 1853–55, ELISHA KENT KANE, another U.S. naval officer, led the Second U.S. Grinnell Expedition in search of John Franklin. On this voyage, expedition members explored Greenland's Humboldt Glacier and Ellesmere Island.

The expedition that located the first irrefutable proof of the missing Franklin expedition was headed by John Rae, who had explored earlier with Richardson. In his expedi-

tion of 1853–54, during which he explored the Boothia Peninsula and located a strait (Rae Strait), thus proving that King William Island was not connected to the Canadian mainland, he interviewed an Inuit who told him of a story of Europeans marching southward from King William Island toward the estuary of the Back River and eventually perishing. Rae also managed to retrieve relics of the Franklin expedition. Yet Rae also reported that expedition members perhaps had resorted to cannibalism in their final days.

Lady Franklin, upset at these reports and determined to find more evidence, hired experienced Arctic explorer Francis McClintock to mount still another expedition in 1857. While in Arctic waters, he erected a monument on Beechey Island commemorating Franklin's Arctic exploits. He also circumnavigated King William Island, confirming that it was an island. On King William Island, a party headed by McClintock found a sledge and several skeletons. Another party led by Lieutenant W. R. Hopson crossed Simpson Strait to the Boothia Peninsula on the Canadian mainland and found letters written by Franklin's men, indicating that Franklin and other expedition members had died while the ship had been icebound and that the survivors under Lieutenant Crozier had perished in an abortive attempt to reach the Hudson's Bay Company's post, Fort Resolution, on the Back River. The expedition returned to England in 1859.

Although the fate of the Franklin expedition had been determined, other expeditions continued to search for clues as to the exact course of events. Two American expeditions found additional remains, skeletons as well as artifacts: One, in 1864–69, again backed by Grinnell and headed by American journalist CHARLES FRANCIS HALL, traveled by ship to King William Island and Boothia Peninsula; another, in 1878–80, sponsored by the AMERICAN GEOGRAPHICAL SOCIETY and a whaling company, and headed by physician and lawyer FREDERICK SCHWATKA, traveled overland by sledge from Hudson Bay to King William Island. Schwatka's expedition covered more than 3,000 miles, the longest sledge journey on record until that time.

Norwegian ROALD ENGELBREGT GRAVNING AMUNDSEN, during the first crossing of the Northwest Passage in 1903–06, located two skeletons of expedition members on King William Island.

Dr. Livingstone

Another famous search that fascinated the general public took place in Africa. After establishing his reputation on earlier expeditions to Africa and receiving acclaim in England, Scottish missionary DAVID LIVINGSTONE had returned to Africa in 1866 to investigate the continent's central watershed and locate the source of the NILE RIVER. After departing from Mikindani on the coast of present-day Tanzania in

East Africa, he lost touch with the outside world. Three years passed without any word. James Gordon Bennett, Jr., publisher of the *New York Herald*, sponsored British-born SIR HENRY MORTON STANLEY to undertake a search for Livingstone. Bennett instructed Stanley to cover other stories first, however, so that he stood a better chance of determining the fate of the missing explorer rather than just report that he was still missing. Eighteen months later, in January 1871, Stanley arrived in Zanzibar, an island off Tanzania, and, with funds provided by the newspaper, he hired *pagazi* (porters), guides, hunters, and armed escorts, along with pack animals. He departed Bagamoyo on the mainland on March 21, 1871, and, based on reports from slave traders, headed for Ujiji on the east shore of Lake Tanganyika, reaching it on November 10. There, he found the missionary and greeted him with probably the most famous words in the history of exploration, “Dr. Livingstone, I presume.”

Livingstone was short on supplies and weakened by disease but did not consider himself lost or missing. He convinced Stanley to explore the northern end of Lake Tanganyika with him but refused in turn to accompany Stanley back to Europe, continuing with his explorations of the great lakes of Africa and their relation to the great rivers. Livingstone succumbed to dysentery in a native village near Tabora on May 1, 1873. Native people working for him transported his body to the coast, from where it was shipped to England. He received a state funeral in London’s Westminster Abbey on April 18, 1874.

In the meantime, Stanley had returned to England and published *How I Found Livingstone* in 1872, which became a best-seller. He also received a gold medal from the ROYAL GEOGRAPHICAL SOCIETY. Stanley’s experiences on his search for Livingstone inspired him to embark on his own African explorations, and he would make a number of important geographic findings through 1889.

Australian Expeditions

A missing expedition in Australia’s interior has remained a mystery. In 1848, German FRIEDRICH WILHELM LUDWIG LEICHHARDT, who had led a number of other successful expeditions, set out from McPherson Station west of Brisbane on the Darling Downs in present-day Queensland with seven others in an attempt to cross Australia from east to west, but was never heard from again.

Over the next 90 years, various expeditions—nine major ones and numerous small ones—searched for Leichhardt’s party. All subsequent explorers of Australia’s interior hoped to solve the mystery. The fact that Leichhardt had set out with plans to cross the continent meant that the search could not be narrowed down. Englishman SIR AUGUSTUS CHARLES GREGORY received sponsorship from the British government as well as the Royal Geographical Society for an 1855 expedition in search of lands suitable for livestock in

what is now the Northern Territory as well as traces of the missing expedition. From the Joseph Bonaparte Gulf, Gregory traveled generally eastward and, on reaching the Pacific at Bustard Head in Queensland, had located thousands of square miles of lands suitable for grazing and had completed the first west-to-east crossing of northern Australia. But he had found nothing of Leichhardt.

Skeletal remains turned up by Aborigines prompted a search from the west in 1869 by Australian-born JOHN FORREST. He set out from the west coast, from Perth in Western Australia. The bones turned out to be those of stray horses from an 1854 expedition. Forrest continued eastward, however, as far as Mount Weld on the western edge of the GREAT VICTORIA DESERT, and he charted much new territory suitable for livestock.

Other expeditions turned up objects—bones, a coin, and a tomahawk—but nothing that could be linked directly to Leichhardt’s party. Various theories have been put forth. One holds that some among Leichhardt’s party mutinied and killed their leader, only to be killed by Aborigines. Rumors persisted that one among them—Adolf Classen—lived among the Aborigines for years. It has also been theorized that the men were caught in one of the frequent flash floods of Queensland, or that they died in bushfires, or simply of thirst in desert lands.

The 1860–61 Australian expedition of Irishman ROBERT O’HARA BURKE and Englishman WILLIAM JOHN WILLS—an attempt to cross the continent south to north, from Melbourne to the Gulf of Carpentaria—cost them their lives. A total of four rescue expeditions were sent out. Camel driver John King was found alive; the remains of Burke, Wills, and expedition member Charles Gray were also eventually found. It was determined that, during the doomed expedition, an advance party of four had separated from a larger party. Of the smaller group, Burke, Wills, and Gray had perished from starvation and exposure. John King had managed to survive on food provided by Aborigines. The relief expeditions furthered geographic knowledge of the region.

20th-Century Searches

In the 20th century, in the Arctic and Antarctic regions as well as in MOUNTAIN CLIMBING around the world, search and rescue operations have searched for the missing. After the British expedition under ROBERT FALCON SCOTT had reached the SOUTH POLE in January 1912, his team was trapped in a nine-day blizzard on the return journey and perished at the end of March. It took another eight months for a search party to locate their remains and records of the expedition, at a point only 11 miles from a depot with food and fuel.

In the Arctic, one famous explorer lost his life while searching for another famous explorer. In 1928, after Italian

UMBERTO NOBILE'S AIRSHIP passed over the NORTH POLE, it was forced to make a crash landing after icing over and in dense fog on its way back to Spitsbergen (present-day Svalbard). Some 1,500 men—from Italy, Norway, Sweden, and the Union of Soviet Socialist Republics (USSR; Soviet Union)—and 16 ships and 21 airplanes took part in search and rescue efforts. One of them was Norwegian ROALD ENGELBREGT GRAVNING AMUNDSEN, who had beaten Scott to the South Pole by a month and who had also flown with Nobile over the North Pole in an earlier airship expedition in 1926. Despite having publicly feuded with Nobile over the use of airships in polar exploration, Amundsen set out by airplane to Spitsbergen, but perished in a crash in northern waters. Nobile was later rescued, but eight men died in his expedition, and he was officially condemned for the disastrous outcome.

In 1924, on Mount Everest (see EVEREST, MOUNT) in the HIMALAYAS, Englishmen GEORGE HERBERT LEIGH MALLORY and Andrew “Sandy” Irvine disappeared when nearing the summit. Despite searches over the years, Mallory's body was not found until 1999.

Seven Cities of Cibola See CIBOLA.

sextant

A sextant is a highly accurate instrument used to measure the angular elevation of celestial bodies and thereby determine geographic location. The name derives from the graduated arc displaying the reading, which spans 60 degrees, or a sixth of a circle. In modern terminology, the word *sextant* is used to refer to a number of instruments based on the same principals, such as the QUADRANT, quintant, and octant. But, in more accurate usage, the quadrant is based on an arc of 90 degrees; the quintant is based on an arc of 72 degrees; and the octant (also called Hadley's Quadrant) is based on an arc of 45 degrees.

The sextant is operated by aligning three reference points: an object in the heavens, the horizon, and the location of the observer. The reading is based on the principle that a reflected ray of light leaves the surface of a plane at the same angle at which a direct ray strikes the surface. The device's frame is triangular in shape, the bottom side being an arc of 60 degrees with a scale written on it (the vernier). An arm—known as the index or image arm—fixed at the top point of the triangle swings along the arc. A small index mirror is mounted perpendicular to the frame near the top. A telescope is attached just below. In front of the telescope is a horizon glass, half transparent and half mirror. The index mirror is used to reflect the celestial body (Sun, Moon, star, or planet) into the mirror half of the horizon glass, then into the telescope. The index arm is then slid along the arc so that

the horizon can be seen through the transparent half of the horizon glass and the reflected image of the Sun lined up with it. The position of the index arm on the arc indicates the altitude of the celestial body. The time of day or night is noted simultaneously by the position of the index arm on the arc. The reading along with navigational tables (see EPHEMERIS) enables a navigator to determine LATITUDE AND LONGITUDE. Multiple readings are often taken to ensure accuracy.

On land, the irregularity of the terrain makes the use of the sextant impractical but not impossible. An artificial horizon can be utilized, consisting of a pool of mercury or another horizontal reflecting surface; by observing both the celestial body itself and its reflection in the mercury, a reading can be obtained.

The sextant, which revolutionized celestial navigation, was developed over the course of several centuries and replaced the ASTROLABE and CROSS-STAFF. Its earliest ancestor was the Davis Quadrant, a variation on the cross-staff, invented by English mariner JOHN DAVIS in the late 16th century. The 17th–18th-century English physicist Sir Isaac Newton articulated the optical principles by which the instrument could operate and even drew a sketch of it, but never made a working model. The sextant was invented independently in England and America in the early 1730s in response to a challenge by England's ROYAL SOCIETY and the English parliament to solve the problem of how to measure longitude accurately.

The proper use of a sextant requires practice and skill. For this reason, its usefulness has always depended on the navigator operating it. The instrument itself has also become more accurate over the years. One variation is the bubble sextant (and bubble octant) used in stormy weather at sea and in aerial navigation. The image of the celestial body under observation is lined up with the edge of the bubble (much like the bubble of a carpenter's level) instead of the edge of the horizon, allowing the observer to find a horizontal plane for the field of view.

See also NAVIGATION AND EXPLORATION.

Sherpas

Sherpas are a people of the HIMALAYAS living on the mountains' southern slopes mostly in Nepal, as well as some in Sikkim, a northern state of India. They are Tibeto-Nepalese, their ancestors having entered the region from Tibet to the north. (Other Nepalese, known as Indo-Nepalese, entered the region from the south.) The Sherpas for the most part practice Buddhism. They are known for their MOUNTAIN CLIMBING skills. In fact, the term, which is derived from the Tibetan *Sharpa*, for “inhabitant of an eastern country,” is also used specifically for Himalayan mountain guides and porters.

In this engraving from the 17th century, a six-foot-long sextant is being used to measure angular distances between pairs of stars. (Library of Congress, Prints and Photographs Division [LC-USZ62-95177])

European climbers, especially the British teams who made attempts on climbing Mount Everest (see *EVEREST, MOUNT*) in the 1920s, recognized the Sherpas as invaluable for their geographic knowledge, physical prowess, and survival skills. The Sherpas participated in many of the 20th-century expeditions in the Himalayas and the Karakoram Range; expedition leaders often teamed the best Sherpa climbers with the best of the Europeans. The partition of the subcontinent into India and Pakistan in 1947 limited some of the activities of the Sherpas, however, because they could no longer travel unimpeded to the Karakoram and other western Himalayan ranges.

TENZING NORGAY, the most famous of all Sherpa climbers, was teamed with Englishman SIR EDMUND PERCIVAL HILLARY in an assault on Mount Everest in 1953, and became the first human to reach the summit. He also became the Sirdar (chief) of a professional association of Sherpa climbers. Other Sherpas became legendary as well: Ang Dawa, Gyalzan, Niyima, Pa Norbu, Pasang, and Pemba, among many others. Many have passed on the tradition of mountaineering to their offspring, who continue to earn their living as guides for modern-day expeditions.

shipbuilding and exploration

People have used waterways for transportation since ancient times and crafted vessels of many different materials, shapes, and sizes to do so. Design was determined by the types of waterways to be navigated, as well as materials available for construction. The evolution of watercraft is also related to the organization of humankind into larger and larger societies, where larger vessels made trade more efficient. Simultaneously, the need to defend a nation's shores or a nation's ships from *PIRACY* or from naval actions of other nations became important. Ships thus became specialized for both commercial purposes and military purposes.

Myriad Watercraft

The earliest craft—any floating structure used to carry people or possessions—can be grouped together under the category *RAFT*. With time, humans began making them more practical out of which came the first true boats. Prehistoric drawings illustrate the use of animal skins sewn together around wooden frames in Europe, and archaeological evidence indicates the use of skin coverings and reindeer antler frames as early as 9000 B.C.

The dugout *CANOE*—the basic design, a hollowed-out log—was one of the earliest forms of watercraft, found in places where trees grew large enough to make them. They were propelled by a paddle or paddles. Other peoples made use of bark for their canoes—especially birch bark—or animal skin as a covering over a wood frame. Reed-bundle canoes were made in other places, such as the *NILE RIVER*

region in Africa (the papyrus boat) and in the *ANDES MOUNTAINS* of South America (the bulrush boat). The round *CORACLE* of northern Europe used skins.

From the simplest designs, more sophisticated and specialized boats evolved. The Inuit (Eskimo) of Arctic regions shaped the double-paddled kayak out of the skin of sea mammals and wood or bone frames. Native Americans of the Pacific Northwest used large cedar trees to make dugouts as long as 100 feet. Some eastern Native Americans began using the light birch bark as a covering over wooden frames to make their canoes practical for inland portages. The Polynesians devised the *OUTRIGGER*—a type of canoe with attached floats or double-hulled to keep it from flipping over in travel among ocean islands (see *POLYNESIAN EXPLORATION*). A type of seaworthy skin boat known as the *CURRAGH* evolved in the British Isles out of the coracle. The *PIROGUE*, which came to be used on the *MISSISSIPPI RIVER* and *MISSOURI RIVER* in North America in the 19th century, evolved from the canoe.

The Ancient Tools of Shipbuilding

The earliest shipbuilding tools were stone and bone. The invention of the metal-casting process dates to the inception of the Bronze Age, in about 3500 B.C., in the Middle East. This was followed by the Iron Age, which began in the second millennium B.C. The adz was perhaps the most basic tool necessary, used for hollowing out logs and shaping wood. Others include the modern equivalent of the ax, chisels, and hammer. Drills were made with a bit, handle, and leather straps for turning the apparatus back and forth. Saws were also made, both small and larger ones operated by two to cut planks. Much of what we know of the early shipwright's tools comes from the recovery of wrecks.

Early Mediterranean Ships

The best representations of early craft come from relief carvings of the ancient Egyptians (see *EGYPTIAN EXPLORATION*). As their society along the Nile River became more unified in the third millennium B.C., the Egyptians expanded their trading and military activities into the *RED SEA* and *MEDITERRANEAN SEA*. They received aid in building their ships from the Phoenicians. The vessel that dominated the region was the *GALLEY*, a vessel of shallow draft, propelled by oars. The Minoans also used early galleys (see *MINOAN EXPLORATION*).

The Phoenicians became known as professional shipbuilders and mariners (see *PHOENICIAN EXPLORATION*). Much of their economy was based on their advantageous position between the East and the West; they could trade for products arriving in the region by land from lands to the east, and transport them by ship to the west. In their homeland in present-day Lebanon, the Phoenicians also had access to cedar trees, which were well suited to produce large

vessels. They eventually imported metals to fashion fittings for their ships. They also produced the finest sailors, who were hired by other area powers, to mount expeditions.

The next great shipbuilders in the Mediterranean region, supplanting the Phoenicians, were the Greeks, who also crafted galleys (see GREEK EXPLORATION). Greece was developed into a maritime power, not only because of her abundance of raw materials, but also because of the great length of her coastline, with hospitable bays and inlets, and the large number of islands off the mainland. Like the Egyptians, Greeks also learned a great deal concerning shipbuilding, navigation, and commerce from the Phoenicians.

Galleys were built as warships as well as cargo ships, leading to design differentiation, with some vessels favoring speed and maneuverability while others sought to maximize cargo capacity. Larger and larger galleys came to be built, with, it is reported, as many as six levels of rowers. As such extravagant ships were ordered, placement of the rowers became a major challenge to the designers.

The Romans, who also utilized galleys, came to control the Mediterranean as their empire grew, and they needed grain and other supplies from their provinces. The Etruscans of the Po River valley in northern Italy were skillful shipbuilders. They also had the most experience in navigation and trade.

Designs of the East

During the third millennium B.C., by about 2800, while the galley was being developed in the West, independently, in China, the JUNK was created, a seaworthy craft that uses battened sails. The Chinese used junks to sail from the East Pacific into the Indian Ocean (see CHINESE EXPLORATION).

The Chinese had an incentive to develop their own ocean-going fleets during the Roman era to bypass the overland SILK ROAD and the monopoly that the Persians had in the silk trade. Reports of direct contact between Rome and China date from 100 B.C. Water routes had been developed by the dawn of the Christian era.

Probably in the first century B.C., Arab boatmakers shaped the first DHOW, a boat high in the stern with a pointed bow and a LATEEN RIG triangular sail. They became common in the Indian Ocean and the Mediterranean and helped the Muslims gain dominance in the Middle East starting in the seventh century A.D. (see MUSLIM EXPLORATION).

The designs of both the junk and the dhow have endured to this day.

Ancient Harborworks

Over the course of its lifetime, a ship would need to use a variety of facilities for repair and storage, in addition to the standard docks for loading and unloading of cargo. These harborworks were more permanent than the ships them-

selves, and their excavation has revealed that large ships were in regular use a long time ago, and that much of our knowledge of them has been lost. The earliest known artificial enclosure for ships was discovered in Lothal, India, on the Arabian Sea. It has an entrance and exit for ships, a sluice gate to control the water level, and was constructed with kiln-fired brick. It dates from the third millennium B.C. In the sixth century B.C., the Greeks built numerous breakwaters to shield their harbors from the abuse of waves. Such investments point to a thriving industry. Today the Mediterranean continues to reveal harborworks of varied design, which were built before the time of Christ.

Viking Longships

The Vikings of Scandinavia also built a type of galley, generally known as the LONGSHIP. The longship proper was actually the Viking warship; they crafted shorter versions with a deeper draught as cargo ships. They made use of sails as well as oars. Their seaworthy ships provided them with a mobility unmatched in the history of Europe, during their years of extensive exploration and colonization, from about 800 to 1100 (see VIKING EXPLORATION). Of major importance was the fact that the Viking ships were clinker- or clincher-built—that is, the planks were fastened to one another instead of to a rigid skeleton of ribs. This gave them a great deal of flexibility—they could flex and give when hit by a heavy sea. As a result, they could withstand a great deal of battering while at the same time being light in weight.

Southern and Northern Europe in the Middle Ages

After the fall of Rome in the fifth century A.D., there was a lull in the construction of large ships in the West. This situation changed later in the Middle Ages—notably in the Mediterranean and the Baltic Sea. In the Mediterranean, the Italian city of Amalfi built trading vessels and became the most important commercial center of its time. It was soon eclipsed, however, by Venice, which displayed great energy and was able to produce more ships. After the Fourth Crusade in the early 13th century (see CRUSADES), Venice obtained a trading monopoly with Constantinople (present-day Istanbul, Turkey), partially as a result of supplying transportation to the invaders. The fleets of Venetian galleys continued to grow, making Venice fabulously wealthy. The city began to decline only with the coming of the RENAISSANCE, when the distribution of resources became more widespread.

On the north coast of Europe, a different type of trade was taking place, and, to withstand the rigorous conditions of the sea, a different type of ship was being built. The Baltic, Germanic, and Scandinavian countries of the region were located near rich fishing grounds and had timber forests. For transport they built sturdy, rounded vessels—the ROUNDSHIP and the COG. The HANSEATIC LEAGUE, which

arose in this area, consolidated its power with a treaty in 1241. It became highly profitable, in no small measure due to its shipbuilding. The center of the shipbuilding industry was Gdańsk (formerly also known as Danzig).

The city of Bruges in the Netherlands rose to prominence in the 13th century as the western edge of the Hanseatic League territories. Its location provided a convenient stopover for ships on their way to the Mediterranean. Its strategic position was not lost on the Dutch, who used their profits to develop their own industries, including shipbuilding. They also improved their waterways by deepening rivers and building canals. Dutch vigor was soon to be eclipsed by the Portuguese, however.

The European Age of Exploration

Much credit for the EUROPEAN AGE OF EXPLORATION, starting in the 15th century and lasting into the 17th century, goes to HENRY THE NAVIGATOR, prince of Portugal. After conquering the port of Ceuta in North Africa in 1415, and being impressed by the cosmopolitan nature of the city, he established a naval college at Sagres the following year and gathered experts in navigation and shipbuilding. His shipbuilders developed the CARAVEL, a ship of moderate size and rounded shape with a LATEEN RIG, a hybrid between ships of northern design with Arab-style lateen rigging. The resulting craft was easy to maneuver and relatively sturdy. The exploration of the African coast was accomplished with caravels, and gave Portugal a head start in shipbuilding. Profits from the trade route to the East around the CAPE OF GOOD HOPE provided resources for further expansion, and the city of Lisbon, at the north of the Tagus River—the Iberian Peninsula's longest river—became Europe's center of ship construction. Lisbon was better suited than Bruges or Venice for this activity, not only for the quality of its harbors, but also because the expansive forests along the Tagus River were easily harvested and logs could be floated down the river to the sea. Lisbon dominated European shipbuilding from the 15th century well into the 16th century. Much of the Spanish Armada was built in its yards.

The wealth that Portugal and Spain gathered from across the seas eventually corrupted their economies through inflation and waste. This allowed England, the Netherlands, France, and the other countries of Europe to increase in importance. Building ships was a key part of their efforts. King Henry VII of England commissioned the *Great Harry*, a CARRACK of large proportions, which was completed in 1515, the first ship of the English navy.

While England focused on warships, the Dutch were more concerned with trading vessels. The “Dutch Merchantman” became a workhorse of world trade. The Dutch were also aggressive in exploiting fisheries in the Baltic and North Atlantic Seas, at one point having more than 3,000 ships in use. The busiest ship-building city came to be Zaandam, surpassing Lisbon in the 1600s.

The Colonial Age

In the struggle to dominate the seas, the Dutch and the English emerged triumphant in the 17th century. In France, economic reforms by King Henry IV and Cardinal Richelieu made shipbuilding a national priority in the late 16th and early 17th centuries. Two war fleets and a merchant marine were built. In Sweden, Gustavus Adolphus, who ruled as king in 1611–33, made special efforts to expand his navy. Peter the Great, czar of Russia from 1689 to 1725, was alarmed that Russia was being left behind by western European nations, and he personally studied the art of shipbuilding. His efforts at bringing his country up to date were highly successful.

With the creation of the East India companies in the 17th century—the BRITISH EAST INDIA COMPANY, DUTCH EAST INDIA COMPANY, and FRENCH EAST INDIA COMPANY—shipbuilders of the various nations built a type of large MERCHANT SHIP known as the East Indiamen, three-masted, armed with cannons, and displacing some 800 tons.

Throughout the history of exploration, countries built ships in their colonies, first to replace those that were no longer seaworthy, and later as an industry unto itself. Mexican shipyards built ships of the GALLEON type for Spain and for trade with the Philippines and the Americas in the 16th century. The French also built ships in North America.

The English colonies in America found abundant timber to build their own vessels. In 1641, Massachusetts took an active role in its destiny by beginning to build its own merchant fleet. The colony had become frustrated by the unfavorable terms that English merchants imposed on it due to its lack of hard currency. With their own ships, they could market their goods independently. They even built metal works to custom-make the fittings for their ships from the raw iron, which they imported. Shipyards sprang up all along the coast of North America, but the Massachusetts industry retained the lead. In 1722, there were 15 yards in Boston alone. In the 1770s, before the Revolutionary War, the colonies produced more than 2,000 ships for domestic use and for lease or sale to other countries.

Ships became more and more varied and specialized. Speed became a primary concern in certain types of commerce, in order to prevent PIRACY and to outrun warships, such as in the Atlantic SLAVE TRADE. The quest for speed led to the development of clipper ships by the 1830s, with streamlined hulls, sharp bows, an overhanging stern to reduce contact with the water, and three tall masts with as many as five sails each.

Working Conditions

As the size of ships grew larger, their construction became more hazardous. Injury and death of workers resulted from two primary causes—falling timber during the plank-cutting process, and falling off the scaffolding during a ship's assembly. The degree to which voluntary labor was used by

an employer varied according to time and place; for example, in colonial America, indentured servitude was a common way for the builder to increase profits. Slavery was used in other parts of the world more extensively. In Europe, however, shipyard workers had above-average status and were paid accordingly.

With Exploration in Mind

The usual situation of the explorer with regard to the ships he could use was dependence on what was available. The stories are many of explorers being promised one thing and being given far less. Also, a ship could deteriorate rapidly from consumption by shipworms and the battering of the sea. Italian CHRISTOPHER COLUMBUS needed to make re-

A descendant of the Inca navigates his bulrush boat with sail on Lake Titicaca in Peru in 1924. (Library of Congress, Prints and Photographs Division [LC-USZ62-106341])

pairs to his ships in the AZORES before crossing the Atlantic in 1492.

Englishman JAMES COOK's *Endeavour*, with which he made his first Pacific voyage in 1768–71, was originally built to carry coal along the English coast but was refitted for a long voyage.

The PACK ICE encountered by polar explorers inspired innovations in design, notably the *Fram*, designed by Colin Archer, a Scot, under the guidance of Norwegian FRIDTJOF NANSEN, for an Arctic expedition of 1893. The *Fram*, with a saucer-shaped hull, was made to sit on top of the ice as it froze, rather than being crushed, and was highly successful in fulfilling its mission.

Much exploration was carried out by PINNACE, an auxiliary boat carried aboard the main vessel—either a rowboat or sailboat—used to navigate coastal inlets and rivers. Other boats played a part in the history of exploration in that they were a primary means of transportation during certain periods of history, such as the KEELBOAT, used in the FUR TRADE on the MISSOURI RIVER in the early 19th century, as well as by MERIWETHER LEWIS and WILLIAM CLARK when they journeyed upriver in 1804.

Into Modern Times

In 1769, Scottish engineer James Watt patented the steam engine, ushering in a new age in water transport. Change was not immediate, with sailing ships being built, and many of the early steamships having both sails and engines. Early steamships had paddle wheels for propulsion. In 1838, regular passage across the Atlantic Ocean was offered by steamship. The introduction, in 1840, of the screw propeller, with submerged rotating blades to propel boats, further revolutionized shipbuilding. With time, ships came to be built of iron and steel. Steam engines also evolved, from coal-fired to oil-fired by the late 19th century. In 1897, a diesel engine—running on petroleum-based liquid fuel—was introduced. These improvements made year-round navigation in the Arctic and Antarctic more feasible, with icebreakers able to break through pack ice. The diesel-powered SUBMARINE was developed by a number of different nations in the early 20th century. Some submarines came to be nuclear-powered. In 1958, the first nuclear submarine succeeded in making an undersea transit of the North Pole.

Siberia

Siberia is a vast area of land stretching over 5,207,900 square miles from the Ural Mountains in the west to the Pacific Ocean in the east, and from the Arctic Ocean in the north to Kazakhstan, Mongolia, and China in the south. Most of it lies in the present-day nation of Russia, with a small part in northern Kazakhstan. Siberia is divided into three

geographic regions: The West Siberian Plain, a swampy and forested area is situated between the Urals and the Yenisey River; from there, the Central Siberian Plateau, at a height between 1,000 and 4,000 feet extends to the Lena River; and, from there, to the Pacific Ocean, often called Far East Russia, lie mountain ranges and uplands.

Three large rivers cross Siberia, all flowing north and draining into the Arctic Ocean: the Lena, the Ob, and the Yenisey. Another major river, the Amur, flows east to the Sea of Okhotsk, which opens to the Pacific. Just southeast of the central Asian Plateau is Lake Baikal. With a maximum depth of 5,371 feet, Lake Baikal is the deepest lake in the world and is estimated to hold one-fifth of Earth's freshwater. Siberia has several mountain ranges, including the Yablonovy and Stanovoy Mountains, which run from the border of Mongolia northeast, to the Sea of Okhotsk. The Altai Mountains, with peaks generally between 10,000 and 13,000 feet, stretch along the bottom of the West Siberian Plain, while the Sayan mountains lie just south of the Central Siberian Plateau. To the northeast, along the Kamchatka Peninsula, which extends into the Bering Sea, is a chain of volcanic peaks, including some active volcanoes, and Siberia's highest peak, Klyuchevskaya Sopka, at 15,584 feet.

Siberia for the most part has long, cold winters and short, moderate summers and is divided into three zones of vegetation. Directly south of the Arctic Ocean is the tundra, a marshy, treeless plain about 270 miles wide covered with permafrost, bearing moss, lichens, and flowers, as well

as small shrubs in the summer. South of the tundra is the taiga, a belt of primarily coniferous forests, followed by more deciduous forests. And finally the steppe, a large grassland, stretches to Siberia's southern limits.

Early Reports

There is evidence that nomadic peoples roamed across Siberia 50,000 years ago, but the first settled communities date from the 11th century B.C. These communities, along southern Siberia, had intercourse with the SILK ROAD, a principal route of trade between the East and the West. The southern steppe of Siberia was the road for the Scythians as they advanced into Europe ca. 700 B.C., the Sarmatians in the third century B.C., and the Hsiung-Nu (Huns) in the fourth century A.D. Conquered by the Mongols in the 13th century A.D., southwestern Siberia became an independent Mongolian kingdom called Siber, with the dissolution of the Mongolian Empire in the 15th century (see MONGOL EXPLORATION). The term *Siber*, from which *Siberia* is derived, is Mongolian for "sleeping land."

It is thought that in the ninth century A.D. people to the west of Siberia began to form states. One of the most prosperous of these was located at Novgorod, subsisting on hunting and trading furs. The earliest recorded voyage into Siberia by a Novgorodian was Uleb in 1032, who reported his voyage to the land called "the Iron Gates," which is probably the region around the Pechora River. Other voyagers visited what they called the "land of Yugra," or the Ural

Mountains; “the country beyond the portage”; and the “land of midnight,” which probably referred to the area around the lower Ob River. In 1363, a large expedition of Novgorodians explored the lower Ob.

Looking Eastward

Another principality arose around this time along the Volga River, called Moscow. Moscow extended its power and fought with people living further east, the Voguls. The Muscovites chased the Voguls into Siberia, in the region of the Irtysh River, a tributary of the Ob. In 1478, Moscow conquered Novgorod, and, by the middle of the 15th century, was receiving tribute from the Tatar rulers of Siberia. A powerful merchant family of Moscow, the Stroganovs, were given title to a large stretch of land up to the Ural Mountains. With their lands harassed by Vogul raiders from over the mountains in Siberia, the Stroganovs sent YERMAK and a band of Cossacks to subdue them. Yermak conquered the Mongolian khanate of Sibir’, as it was known, claiming all of Siberia for the Russian leader or czar, Ivan IV Vasilyevich, or Ivan the Terrible. He was, however, killed in 1584 or 1585, trying to maintain command of the region. The Muscovites moved into Sibir’ and took control, establishing forts along the Ob. The route from Moscow to Siber was long and dangerous because of the warlike Voguls, and Muscovites continued to search for better routes. In 1597, Artemy Babinov discovered a land route to the Tura River, which cut 700 miles from the journey and which remained the principal land route to Siberia for almost 200 years.

By the beginning of the 17th century, the Russians had explored and occupied most of the Ob River Valley. Russian merchants then moved on to explore the Yenisey Basin, sailing down the Yenisey River, and building forts. Fur hunters ventured eastward and reached the Lena River. There, they encountered the Yakuts, a Siberian people with a highly advanced culture who lived in houses, wore Russian-like clothing, and kept horses. The fine quality of furs returned from the eastern reaches of Siberia inspired more expeditions there. In 1639, a small band, broken off from a group exploring the rivers in the east, crossed a pass in the Dzhugdzhur Range and sailed down the Ulya River to the Sea of Okhotsk. The Russians had reached the North Pacific Ocean. Other expeditions soon followed. In the 1640s–50s, MIKHAIL STADUKHIN explored the Arctic coast of Siberia around the Kolyma River and on the Gulf of Anadyr. The earliest recorded sighting of the BERING STRAIT was by a party of Cossacks under SEMYON IVANOVICH DEZHNEV in 1648.

Russian exploration continued in Siberia into the Amur River Valley, much of it also carried out by Cossacks and much of it for the FUR TRADE (see COSSACK EXPLORATION). Cossacks PYOTR BEKETOV and VASILY DANILOVICH POYARKO in the 1630s–40s spread Russian influence eastward.

The Russian fur trader YEROFEY PAVLOVICH KHABOROV established the first Russian settlements along the Amur in the 1650s. Cossacks also soon reached the Kamchatka Peninsula. LUKA MOROZKO and VLADIMIR VASILYEVICH ATLASOV explored Kamchatka in 1695–96. In time, the native Kamchadals had been conquered, and the Russians had founded posts along the length of the peninsula.

Peter the Great

At that time, in 1696, Peter the Great became czar of Russia. Interested in the West, and hoping to assemble a coalition against the Ottoman Empire of the Turks, Peter traveled with a great embassy to Europe. He brought back with him hundreds of skilled Europeans to work and train Russians and tried to learn as much as possible about European navigation. This exposure to the West, combined with the expanding power of what was becoming a Russian empire, under the hand of Peter, spurred the scientific exploration of Siberia in the 18th century. Peter was most interested in the possibility of a water route from the Arctic Ocean to China and India, due to the difficulties and expense of reaching those countries over land.

In 1719, Peter sent an expedition of two topographers, Ivan Yevreinov and Fyodor Luzhin, to explore the Kuril Islands off the southern end of the Kamchatka Peninsula. Later, in January 1725, Peter sent Dutch seaman VITUS JONASSEN BERING to head an expedition to determine once and for all if Asia and America were connected. It was not until 1728, after the czar’s death, that Bering and his expedition were able to set out. Bering was unable to determine conclusively, but surmised that there existed a strait of passage from the Pacific to the Arctic Ocean. A later British expedition under FREDERICK WILLIAM BEECHEY thoroughly explored the Bering Strait in 1828.

DANIEL GOTTLIEB MESSERSCHMIDT, a German scientist, was another European who Peter brought to Russia in 1716. Messerschmidt, trained in medicine, was also acquainted with natural history, geography, and archaeology. From 1720 to 1727, he traveled throughout Siberia, exploring many rivers and steppes, discovering many mineral resources, and collecting specimens. He even discovered the skeleton of a mammoth.

Great Northern Expedition

Meanwhile, Bering’s expedition had failed to satisfy the Russian Admiralty, and a second, much larger expedition was ordered in 1733. Often called the “Great Northern Expedition” for its scope and investigations of the Arctic, it consisted of an unprecedented 977 members. The expedition was divided into parts, reminiscent of the steps in Russia’s eastward expansion over Siberia: surveying the Arctic Ocean from Arkhangelsk to the mouth of the Ob River; from the Ob to the Yenisey; from the Yenisey to the Lena;

and from the mouth of the Lena to the Kamchatka Peninsula. In concert with these divisions, Bering again led an exploration of the strait bearing his name. The expedition included many Western European-trained scientists, who made notes of ethnography, botany, geology, geography, and history.

Later Expeditions

Other Russians continued to explore the coast of Siberia and the Arctic Ocean through the latter half of the 18th century and the first part of the 19th century. Many of them, such as GRIGORY IVANOVICH SHELIKOV and ALEXANDR ANDREYEVICH BARANOV, were fur traders. Others, such as ANTON BATAKOV and GAVRIIL ANDREYEVICH SARYCHEV were mariners (Batakov worked under JOSEPH BILLINGS, an Englishman hired by the Russian government to head the Northeastern Secret Geographical and Astronomical Expedition).

In the 20th century, during the years the territory was part of the Union of Soviet Socialist Republics (USSR; Soviet Union), Siberia became known to the West as a place of exile for criminals and political prisoners, as it had been in earlier centuries. With vast stands of timber and huge deposits of oil, gas, and minerals, Siberia now plays an important role in the Russian economy. Industrialization that started under the Soviet Union has created a serious pollution problem, however.

Silk Road

The Silk Road was not a constructed road but rather the name applied to a collection of overland routes crossing nearly 4,000 miles of Asia and used for about 1,500 years for trade between the East and the West. It was named for silk, the most precious and desired commodity that passed over it, an exceptionally soft fabric made by hand in the East from the cocoons of the silkworm, which was originally native to China and lived on the mulberry tree.

Even before the establishment of the Silk Road in the second century B.C., Chinese goods like silk, jade, and bronzes reached the Near East and ultimately the West on small camel caravans as early as 1000 B.C., ancient traders braving harsh terrain and dangerous brigands on the road. But these caravans were dangerous and few. Silk was worn by Persian nobility and coveted by ALEXANDER THE GREAT, the Macedonian leader of the fourth century B.C., becoming a sign of wealth in ancient Greece and Rome. The Asian goods were bartered for European goods, such as glass, amber, coral, pearls, woolens, and linens.

But the Silk Road was not established because of increasing demand of what were and remained expensive luxury items. Instead, it was the result of a diplomatic mission intending to secure an alliance to defend the nascent Han Empire of China from Mongolian nomads called the Huns (Hsiung-nu, or Xiongnu) who threatened settlements of the Chinese.

Founding of the Silk Road

In 128 B.C., the Han emperor, Wu Ti, sent diplomat CHANG CH' IEN to gain an alliance with people the Chinese called Yue-chi in central Asia (and known in the West as the Scythians). In about 118 B.C., after having been captured and then escaping from the Huns, Chang Ch'ien continued westward, reaching Bactria in northern Afghanistan. He returned to China from there, but received reports of peoples farther to the west, including the Persians, Greeks, and Romans. Chang Ch'ien failed to gain any alliances, but his stories of Western civilizations encouraged a desire to trade. Embarking on a second mission in 115 B.C., he sent envoys to Persia and the eastern Roman provinces, laden with silks and gold. The route that Chang Ch'ien had taken developed into the Silk Road, kept stable and passable by the power of the Chinese Empire and the Parthian Empire of Persia as well as the flourishing Roman Republic (see CHINESE EXPLORATION; ROMAN EXPLORATION).

Roman geographer PLINY THE ELDER of the first century A.D. wrote about the Silk Road in *Historia Naturalis* of A.D. 77. Twenty years later, in A.D. 97, Chinese diplomat KAN YING was sent on a mission to Rome during the Han dynasty in the hope of forming an alliance to secure the Silk Road in the face of central Asian rivals. He failed to reach Rome but did reestablish contacts with peoples in China's western provinces. In about A.D. 120, a Greek merchant by the name of Maës Titanius sent out representatives along the Silk Road; they reached Kashgar. Their reports reportedly were used by hellenized Egyptian PTOLEMY in his writings about the silk trade in his *Geographia*, produced in A.D. 127–147 (see GREEK EXPLORATION).

Traveling the Silk Road

Goods from China were carried by caravan from city to city and oasis to oasis—where water and food, as well as fresh camel and horses, could be obtained. Few caravans or merchants traveled the entire Silk Road. Goods were bartered all along the Silk Road. Moreover, a new caravan might be organized to transport the cargo to the next trade center. Most of the traders were peoples of central Asia or Persians, since for much of China's history, Chinese travel outside its territorial holdings was forbidden. Local residents of the many different ethnic groups along the way served as translators among peoples from many lands. In addition to merchants, other travelers used the routes developed by them, such as

diplomats and missionaries, as well as emigrants seeking out new opportunities. Many travelers from China, such as religious scholars FA-HSIEN in the fourth–fifth century A.D. and HSÜAN-TSANG in the seventh century A.D., used parts of the route to reach India. But travel was dangerous—because of climatic extremes as well as bandits—and corpses and bones reportedly littered the Silk Road.

The caravans would leave first from Chang’an in northern China, heading west along a narrow corridor between the GOBI DESERT and the Nan Shan mountains, before splitting into two routes, one skirting the northern and another the southern edge of the forbidding Takla Makan desert, 360,000 square miles of shifting sand dunes squeezed between the Kunlun range to the south and the Tian Shan range to the north. These two paths rejoined in the foothills of the Pamir range. Other routes crossed the steppes of Mongolia before continuing into Europe, or merged at the forks of the main road, which had split in the Pamirs, part of which headed through the Tian Shan range for Samarkand, part headed for Bactria and Kabul in present-day Afghanistan (where a route connected the road to India through the KHYBER PASS). Routes varied somewhat due to climate, openings and closings of mountain passes, and the drying up of oases, as well as political situations, the rise and fall of empires, and the fortunes of nomadic brigands who preyed on the caravans.

Later Use

Trade was reduced by the fall of the Han Empire in China in the third century A.D., and reignited by the rise of the T’ang (Tang) in the seventh century. Trade declined again, with the fall of the T’ang dynasty in the 10th century, only to be renewed by the vast conquests of the Mongols under GENGHIS KHAN in the 13th century (see MONGOL EXPLORATION). Westerners now ventured over the caravan routes to China, most important was the Polo family of Venetian merchants—MAFFEO POLO, NICCOLÒ POLO, and MARCO POLO—who, upon their return to Europe, brought back stories of Chinese wealth, which fanned the flames of European imagination and the desire for Oriental goods. After the dissolution of the Mongol empire into smaller states, and increased warfare among them, travel and trade became dangerous. The rise of the Islamic Turks who, in 1453, conquered Constantinople (present-day Istanbul), the capital city of Byzantium that sat on one of the most important arms of the Silk Road as it passed into Europe, effectively cut off much of the trade. But because of growing demand and the increasing power of nations in Europe, such as Spain, Portugal, and England, sea routes to the East were sought.

By Sea

With the discovery of routes from the Atlantic Ocean around the CAPE OF GOOD HOPE of Africa into the Indian

Ocean by the Portuguese, and other sea routes to the East, and because sea travel was faster and safer and could transport more cargo quickly, the Silk Road dwindled in importance in the 15th and 16th centuries before falling entirely out of use, while its oases became deserts.

The Silk Road no longer exists as a trade route. But following what once constituted it offers a fascinating view into the past. Modern cities of Bukhara, Kashgar, Khiva, Samarkand, Tashkent, and Turfan are full of history. In 1906–08, Anglo-Hungarian archaeologist SIR MARC AUREL STEIN followed a stretch of the ancient Silk Road into western China and discovered the Caves of the Thousand Buddhas, a series of temples built into caves, at Tunhuang.

See also COMMERCE AND EXPLORATION.

slave trade

Slavery, a practice in which humans are considered property for labor or other services, has occurred in all parts of the world and in all types of societies—from primitive hunting-gathering groups to complex agriculturally based civilizations. It has endured from ancient to modern times, sanctioned by many nations through much of the 19th century. And the slave trade, like other areas of commerce, has played a part in world exploration by providing incentive to reach distant lands and opening up routes of travel.

Slavery in Ancient Times

The Egyptians, Greeks, Romans, and Chinese, known for their explorations, as well as most other ancient peoples around the world, utilized slavery to maintain a labor force. Many slaves were acquired as prisoners of war; others in raids specifically for the purpose of slaving; and others in trade. Those captured or traded might end up as workers on roads or buildings or farms; as concubines and prostitutes; as domestic servants and, in some instances, when educated, as tutors; and as soldiers. Another common use of slaves in the ancient world was as oarsmen on GALLEY ships. The Romans also used slaves in gladiatorial combats. In many societies, the number of slaves and their country of origin were considered matters of prestige. (See CHINESE EXPLORATION; EGYPTIAN EXPLORATION; GREEK EXPLORATION; ROMAN EXPLORATION.)

Slavery in the Middle Ages

Slavery persisted through the Middle Ages. The early forms of Christianity and of Islam did not condemn the practice. Arab and Berber Muslims had developed trade routes across Africa’s SAHARA DESERT and the RED SEA for markets in the Middle East in pre-Islamic times and continued using them; other peoples, seafaring Muslims from Arabia and Persia,

came to use the Indian Ocean as a trade route to East Africa for markets in Asia, especially Arabia, Persia (present-day Iran), and India (see MUSLIM EXPLORATION). During the

same period, the Vikings out of the north raided coastal areas and also took slaves, but mainly for personal use, not in trade for profit (see VIKING EXPLORATION). Meanwhile,

This etching shows deck plans and cross sections of a late 18th-century British slave ship. (Library of Congress, Prints and Photographs Division [LC-USZ62-44000])

in the Americas, pre-Columbian civilizations, such as the Maya, Aztec, and Inca, made use of slave labor in building, agriculture, and warfare on a large scale. Other peoples kept captives among them as slaves.

Slavery in most societies was regulated by custom or law. Various social systems were practiced in which laborers were not considered property themselves, although they were legally bound to their work. Serfdom, involving agricultural laborers in medieval Europe, was one such system. Some societies made provisions for the earning of freedom by slaves.

Early Portuguese Slave Trade

The 1440s are cited as the start of the institutionalized European slave trade. In 1441, an expedition sponsored by HENRY THE NAVIGATOR, prince of Portugal, under NUÑO TRISTÃO and Anton Gonçalves, sailed in the Atlantic Ocean along Africa's west coast. Tristão reached Cape Blanco; Gonçalves landed at the Rio de Oro and captured a number of natives, whom he took back to Portugal and presented to Prince Henry. Three years later, Tristão reached Arguin Island, part of present-day Mauritania. In 1448, he established a fort there, which became the first Portuguese slaving station. With subsequent expeditions along the coast, the Portuguese extended their influence and built more posts.

A thriving and systematized trade developed, with Europeans exchanging trade goods—textiles, beads, tools, alcoholic beverages, and eventually guns—to Africans for African captives. Farther south, Portuguese merchants also came to travel the Senegal and Gambia Rivers into the interior. Meanwhile, Muslim slavers continued to use the trans-Saharan routes as far south as what became known as the Slave Coast—the coasts of present-day Nigeria, Benin, and Togo along the Bight of Benin. The Portuguese reached this region by the 1470s. By the 1480s, they were also slaving as far south as the CONGO RIVER (Zaire River) beyond the Muslim trading territory. At the end of the 15th century, with the voyage of VASCO DA GAMA, the Portuguese had sailed all the way around Africa and reached India by water. Soon afterward, along Africa's east coast, they were raiding Muslim trading centers and establishing their own posts. At the various slave ports would be found slave camps, where slaves were interred after forced marches and before being shipped to markets.

Other Nations Enter the African Slave Trade

Portugal had a head start on other European countries in the large-scale slave trade, but, starting in the latter half of the 16th century, England entered the field. SIR JOHN HAWKINS completed the first successful English transatlantic slave-trading expedition in 1562–63, sailing to present-day Sierra Leone, where he obtained a cargo of slaves from Portuguese traders, then to the Caribbean island of Hispaniola (present-day Haiti and the Dominican Republic), where he ex-

changed the slaves to Spanish colonists for sugar and hides, then back to England. France, the Netherlands, Denmark, Sweden, and Prussia soon entered the trade as well.

Native American Slaves

In the meantime, early European visitors to the Americas—CHRISTOPHER COLUMBUS, an Italian exploring for Spain at the end of the 15th century, being one of them—took Native Americans as slaves, and the enslavement of Native Americans would persist for centuries in a variety of forms, some of them limited slavery or indentured servitude, that is, forced tribute or labor resembling European serfdom. Yet it never reached the scale of the African slave trade, partly because the system surrounding the acquisition of new slaves was already in place in Africa. Another factor limiting the use of Native Americans in the slave trade was that it was in the new colonies themselves where slave labor was desired, and peoples near their homelands were more likely to attempt escape or revolt. Native Americans also proved more susceptible to European diseases (see DISEASE AND EXPLORATION).

Triangular Trade

The colonization of the Americas created new markets for slaves, and the slave trade between Europe, Africa, and the Americas became known as the “triangular trade.” That is to say, the commerce surrounding the Atlantic slave trade moved in a triangle. European ships transported manufactured goods to Africa's west coast, where they would be bartered for slaves. The slaves were then transported to the colonies in North and South America, where they would be exchanged for mostly agricultural goods, especially cotton, tobacco, sugar, and molasses, as well as rum. These products would then be carried back to Europe.

The development of the plantation system—self-contained estates dedicated to farming particular crops on a large scale, especially tobacco and cotton—in the Caribbean and in North America's southern colonies in the latter half of the 17th century led to a growing demand for slaves. Business interests of various American colonies also entered the slave trade, providing their own vessels for shipping. An estimated 12 million slaves were taken from Africa to the Americas in the transatlantic slave trade, with as many as two million perishing from malnutrition and disease on the ocean journeys. The majority of the surviving 10 million ended up in the WEST INDIES, Central America, and South America, with lesser numbers to North America. (It is estimated that some 42 percent of the African slaves were sold to the sugar plantations of the Caribbean; 38 percent to Brazilian sugar plantations and mines; 15 percent to plantations and mines in other parts of Latin America; and 5 percent to North American colonies.) The African Diaspora, as it is known—the dispersion of African peoples resulting from the slave trade—led to the collapse of West African civilizations. Starting in the 17th century, European traders

Possibly engraved in the late 1700s or early 1800s, this slave auction house was in New York City. (*Library of Congress, Prints and Photographs Division*)

also operated in the Indian Ocean, acquiring slaves to work on Indian Ocean island colonies, such as the Mascarene Islands. Some slaves out of East Africa were also transported westward around the CAPE OF GOOD HOPE to the Americas.

Abolitionism

Throughout history, there has been a dedicated opposition balancing and modifying the practice of slavery. Some of the earliest voices speaking out against it were missionaries (see RELIGION AND EXPLORATION). SAMUEL FRITZ, a Jesuit missionary from Bohemia (part of the present-day Czech Republic) who explored the AMAZON RIVER and its tributaries in South America in the late 1600s and early 1700s, attempted to protect Indians from Portuguese slavers. The humanistic precepts of 18th-century French philosopher Jean-Jacques Rousseau and of other individuals associated with the Age of Enlightenment, along with growing democratic ideals in Europe, helped create a climate antithetical to slavery. German naturalist and geographer ALEXANDER VON HUMBOLDT, who also explored northern parts of South America at the turn of the 19th century, was outspoken in denouncing the practice.

The antislavery movement became organized and effective in the 19th century. JAMES RICHARDSON, who participated in a British expedition to West Africa in the 1850s with HEINRICH BARTH and ADOLF OVERWEG, was a leading member of the English Anti-Slavery Society. DAVID LIVINGSTONE, a Scottish missionary who traveled widely in Africa in the 1850s–1870s, hoped to abolish the slave trade by establishing Christian missionary stations and alternative commerce. Before his explorations in Africa in the 1870s–1880s, VERNEY LOVETT CAMERON served as a naval

officer in a British campaign against Ethiopia to end the East African slave trade.

The slave trade was abolished before slavery itself, with Denmark banning it in 1792, and Great Britain in 1807, and other European nations soon afterward. The United States prohibited the foreign slave trade in 1808. By the end of the 19th century, institutionalized slavery itself was abolished in most nations, although various forms of slavery are still practiced on a small scale in some parts of the world.

South America, exploration of

With an area of about 6.8 million square miles, South America is the fourth-largest continent on the globe. It is bordered by the Pacific Ocean to the west, the Atlantic Ocean to the east, and the Caribbean Sea, an arm of the Atlantic, to the north. South America, from the Caribbean Sea in the north to its tip in the south, where the Atlantic and Pacific meet, stretches 4,600 miles, and from east to west, at its widest point, is 3,210 miles wide. The continent is joined to Central America (see CENTRAL AMERICA, EXPLORATION OF), considered the southern extent of North America, by the narrow isthmus of Panama.

Modern-day South America is divided into 12 nations, including Argentina, Bolivia, Brazil, Chile, Colombia, Ecuador, Guyana, Paraguay, Peru, Suriname, Uruguay, and Venezuela. The Galápagos Islands, noted for their unique species of animals, lie 650 miles into the Pacific from the South American coast. The Juan Fernández Islands and Easter Island also lie in the Pacific, while the Fernando de Noronha Archipelago and the Falkland Islands lie in the Atlantic. In the north lie Trinidad and Tobago, the Netherland Antilles, and other islands of the WEST INDIES. The Tierra del Fuego Archipelago sits at the southern end of South America, separated from it by the Strait of Magellan (see MAGELLAN, STRAIT OF), four to 20 miles wide and 200 miles long. CAPE HORN on Horn Island is the continent's southernmost point of land.

The continent is divided into high mountains and plateaus, thick rain forest and jungle, and shallow valleys and long flat plains. The ANDES MOUNTAINS, the second-highest mountain range in the world, rise on the western side of the continent. Its peaks include ACONCAGUA, which is the highest in the Western Hemisphere at 22,834 feet above sea level, as well as Mercedario, Tupungato, Illampu, and Illimani, all more than 20,000 feet. The Andes also includes active volcanoes, especially in Chile, such as Cotopaxi and Tunguragua. In the Andes, between southeastern Peru and western Bolivia, is Lake Titicaca, 12,545 feet above sea level, with an area of about 5,000 square miles, and a maximum depth of 700 feet that never freezes over, making it the

highest navigable lake in the world. Other, shorter highlands lie to the east. One is usually called the Guiana Highlands, a plateau, forest covered on the main, but also with flat grassy plains, which lies in southern Venezuela, Guiana, and northern Brazil. Other South American highlands include the Brazilian and Patagonian Highlands.

South America has three principal lowlands, the largest being the basin of the AMAZON RIVER, followed by the basin of the ORINOCO RIVER to the north, and the Paraguay-Paraná basin to the south, which merges with the valleys and plains of the Pampas and the Gran Chaco of Argentina and Brazil. The three rivers drain an area of about 3.7 million square miles. The Amazon River is the second-longest in the world, at 4,000 miles, but is the largest in terms of volume, discharging a fifth of all the freshwater that drains into the oceans. It flows roughly west to east, rising in the Andes, and drains into the Atlantic Ocean just below the EQUATOR. The Orinoco, at about 1,500 miles (1,700 if a particular branch is considered), flows in an arc through Venezuela, originating in the Guiana Highlands and draining into the Caribbean. The Paraguay-Paraná basin supports the Paraguay and Uruguay Rivers, which enter the Atlantic through the La Plata estuary in Argentina.

The climate of South America is mainly determined by distance from the equator. The area around the equator is hot, with long, wet summers and short, dry winters. The farther away from the equator, the shorter the summer and longer the winter, with the risk of drought. Much of the area around the equator is filled with dense rain forest, supported by the heat and summer rains. The west coast of South America is dryer, and with the high elevations of the Andes, cooler. Past the TROPIC OF CANCER, the winters are cold and the summers cool with higher precipitation to the south.

Animal life displays great isolation and singularity, having many different species from those found on North America. The rain forest in particular has a myriad of species. Large South American mammals include the tapir, jaguar, peccary, coati, giant anteater, spectacled bear, and monkeys, as well as alpacas, llamas, and vicuñas (members of the camel family). Among the larger birds are the condor, flamingo, and rhea. Large reptiles include anacondas, boas, caimans, crocodiles, and iguanas.

Native Peoples

It is estimated that as many as 30 million Native Americans lived in South America when Europeans first arrived. Some of them had developed complex civilizations, many of them centered in the Andes. The various peoples speaking as many as 1,550 distinct languages are sometimes grouped into the following culture areas for purposes of study: the central and southern Andes and adjacent Pacific coastal regions, where complex farming civilizations, such as that of the Inca, developed; northern South America, where the

peoples lived a way of life similar to lower Central America and Caribbean peoples, with small villages and some farming; the tropical forests of eastern South America, which offered a wealth of resources to the hunting-and-gathering peoples also living in scattered villages, many of them along the Amazon River; and the colder regions in the south, to the east and south of the Andes, consisting of nomadic hunter-gatherers.

The Quechua-speaking Inca became the most dominant people on the continent. It is thought that some groups were consolidated as early as A.D. 1000 in what is known as the pre-Inca period; they had evolved out of and had been influenced by earlier dominant cultures of the region, such as Tiahuanacan, Chavin, Chimu, Nazca, Moche (Mochica), and Paracas. Inca legend has it that the Inca lived first around Lake Titicaca in the Andes of southeast Peru and northwest Bolivia, and later moved, in about 1200 A.D., northward into the more fertile valley of Cuzco, where they conquered the inhabitants and established their capital. The name *Inca* is derived from *Ynca* for the prince of the ruling family.

The early Inca period is given as A.D. 1200 to 1440. From 1440 to 1500, the Inca expanded their territory, conquering the Chibcha Indians of present-day Colombia, the Aymara Indians of present-day Bolivia, and the Araucanian Indians of present-day Chile. At its height, the empire of tributary tribes covered about 350,000 square miles centered in the Andes, but stretching to the Pacific coast, and into the Amazon Basin—from what is now northern Ecuador to central Chile. Two emperors, Pachacuti Inca Yupanqui and his son, Topa Inca Yupanqui, developed a state religion and set up a complicated system of administration to govern their lands. The empire was divided into quarters, each governed by a blood relative of the emperor. Each quarter was divided further with an elaborate collection of officials, which at its base had an official to oversee every group of 10 peasants. Peasants throughout the empire were required to provide as a tax a certain amount of labor every year for public works. This facilitated the creation of a system of 10,000 miles worth of stone roads and rope bridges across gorges.

The Inca also built great cities, such as Cuzco and Machu Picchu, with stone palaces, temples, and fortresses, often covered with precious metals. They developed elaborate art forms, especially in metalwork and textiles, as well as writing, calendar, and counting systems.

Inca emperor Topa Inca Yupanqui died in 1493, just as Europeans were arriving in South America, and was succeeded by Huayna Capac. In 1525, both Huayna Capac and his successor died, setting off a civil war between Huayna Capac's remaining sons, Huáscar and Atahualpa, in which Atahualpa triumphed. It was Atahualpa who would face off against the Europeans.

First European Sighting

Italian mariner CHRISTOPHER COLUMBUS, sailing for Spain, was the first European to see South America. The Portuguese had been developing a route to the markets of the Orient south and east around Africa into the Indian Ocean, a program that began under the auspices of HENRY THE NAVIGATOR, prince of Portugal. Columbus proposed to sail west over unexplored ocean, thinking he would circle the globe and reach the east coast of Asia in less than 3,000 miles. King John II of Portugal rejected his plan in 1484, and, again in 1488, after Portuguese BARTOLOMEU DIAS reported reaching the CAPE OF GOOD HOPE, which signaled success in the Indian Ocean route. In 1492, however, Queen Isabella I of a newly united Spain agreed to the small initial bankroll, advised that the cost was slight and the potential for payoff great. Columbus sailed westward from Spain with three ships on August 3, 1492.

With the crew of one ship on the verge of mutiny after over a month sailing in open ocean, land was spied on October 12. The first land is thought to have been a small island of the Bahamas that Columbus named San Salvador. Columbus later found a larger island he called Española—later Hispaniola (present-day Haiti and the Dominican Republic)—and eventually returned to Spain with gold, parrots, and native peoples. He made a second, larger expedition of 17 ships in 1493, with soldiers, colonists, livestock, tools, and seeds. Columbus passed and named many islands in the Caribbean, also exploring along the coasts of Cuba and Jamaica. Still thinking he had reached the outlying islands of Asia—thus the eventual name of WEST INDIES for the islands of the region—he returned to Europe in 1496.

Columbus embarked on his third voyage in 1498. He sent half his fleet of six ships directly to Hispaniola and sailed with others to the Cape Verde Islands off Africa, then followed a more southerly route across the Atlantic. On July 31, 1498, he sighted and named the island of Trinidad. Continuing southward, he entered the Gulf of Paria off present-day Venezuela. He met native peoples there and traded with them for pearls. Although he only sighted islands, he noted the abundance of freshwater flowing into the gulf and surmised he had found a great mainland. He never sighted the delta of the Orinoco River, but sailed westward, examining the coast before returning to Hispaniola.

Coastal Explorations

ALONSO DE OJEDA commanded one of Columbus's ships on his second voyage in 1493 and remained to help establish the settlement of Isabella on Hispaniola, exploring the interior of the island and warring with native peoples. In 1497, he returned to Spain, seeking authority and supplies to mount his own voyage of exploration. Ojeda was granted permission in 1499 to explore the mainland territory that Columbus had discovered the previous year. He set sail with a small fleet in

May 1499, accompanied by JUAN DE LA COSA, a cartographer who had been Columbus's pilot, and AMERIGO VESPUCCI, a Florentine who represented Italian banking interests that had partly financed the voyage. Ojeda's ship reached South America off the coast of present-day French Guiana, five degrees north of the equator. Ojeda sailed northward, stopping at Trinidad and Margarita Island. On August 9, along a coastal inlet on the mainland, he spied a native settlement of houses supported in the water by piers. Reminded of Venice, Ojeda gave the name *Venezuela* to the place, which came to be used for the entire area.

Vespucci's ship reportedly arrived on the coast of Brazil, near Cape São Roque, about five degrees south of the equator. He sailed northwestward and may have explored the Brazilian coast as far as the mouth of the Amazon River, which he explored a short distance upstream. After meeting up with the rest of the expedition in Santo Domingo, Vespucci returned to Spain, arriving in September 1500. By that time, Portuguese admiral PEDRO ÁLVARS CABRAL had reached Brazil and taken formal possession for the Portuguese. Cabral, who had close ties to the Portuguese court but little experience as a navigator, was selected in 1499 to lead a trading mission to India, after Portuguese mariner VASCO DA GAMA reported success in rounding Africa's Cape of Good Hope.

Cabral commanded 13 ships, carrying more than 1,200 men, including merchants, soldiers, missionaries, and some convicts. While earlier voyages had kept close to the coastline of Africa, Cabral followed the advice of Vasco da Gama and sailed due south from the Cape Verde Islands, far into the open ocean to avoid unfavorable winds. Cabral intended to utilize strong westerly winds south and west of Africa to carry his fleet past the Cape of Good Hope and into the Indian Ocean. On April 22, 1500, after sailing southwest into uncharted waters, he sighted the coast of Brazil, at about 17 degrees south of the equator. The fleet anchored there, within sight of Mount Pascoal. Cabral went ashore four days later, taking formal possession of Brazil for Portugal, calling it Terra da Vera Cruz (land of the true cross). He did not know, however, if he had discovered an island or a continent.

A Spaniard had landed earlier that year in northeastern Brazil. The navigator, VICENTE YÁÑEZ PINZÓN, was one of a group of brothers who had served with Columbus on his voyages to the Americas. In 1495, he was given permission by the Spanish crown to lead his own expedition to the Indies. Pinzón did not sail until November 1499, with a fleet of four ships. After reaching the Cape Verde Islands, he sailed southwestward, crossing the equator. On January 20, 1500, he sighted South America, naming the cape Santa María de la Consolación. From that point, Pinzón sailed northwestward and explored the mouth of the Amazon River, which he named La Mar Dulce (the sweet water sea) because of its abundance of freshwater, which was fit to

drink a distance out to sea. He explored the Amazon for about 50 miles, before sailing farther northwest along the coast of the Guianas and Venezuela. In the Gulf of Paria, he sighted the island of Tobago, Trinidad's smaller companion, which he called the Isla de Mayo. Pinzón returned to Spain in September 1500, carrying a cargo of tropical wood, 20 native slaves, and a South American opossum, the first marsupial seen in Europe.

At this time, Amerigo Vespucci, who had just returned from his voyage with Alonso de Ojeda, was taken into service by Portuguese king Manuel I to explore the land of eastern Brazil. After sailing from Lisbon, he landed again at Cape São Roque in August 1501. Vespucci headed southward from that point, hoping to determine the extent of the mainland. He reached a harbor on New Year's Day, 1502, which he named Rio de Janeiro. Continuing southward, he reached the mouth of the Río de la Plata. He followed the Patagonian coast southward and, according to his account, reached a point 50 degrees south of the equator. He returned to Portugal in September 1502.

Vespucci's accounts were published in 1507 by German cartographer MARTIN WALDSEEMÜLLER, along with updated maps of the world based on the most recent explorations. While Columbus continued to imagine he had encountered islands off the Japanese archipelago or off the coast of China, Vespucci referred to the lands using the phrase *New World*. Waldseemüller agreed that the lands were new, and called them "America," using the Latinized version of Vespucci's name. (Later, in 1585–94, when Flemish cartographer GERARDUS MERCATOR published his world atlas, he gave the name to the northern continent as well, and, from that time, the two continents have been called North and South America.)

The Spanish still hoped to find a southwest passage, by which they could sail past the South American continent and reach the Orient. King Ferdinand of Spain commissioned JUAN DÍAZ DE SOLÍS, a Spaniard who had become an accomplished navigator sailing with the Portuguese around the Cape of Good Hope, to search the South American coast for the passage in 1508. Díaz de Solís had sailed with Vicente Yáñez Pinzón in 1506 throughout the Caribbean, and, in June 1508, he sailed with two ships from Spain, joined as commander by Pinzón. They had abandoned their search for a strait in the Caribbean, and sailed southward, as Vespucci had done. But they continued to follow the coast to 41 degrees south, discovering the mouth of the Río Negro. Pinzón and Díaz de Solís disagreed over how to continue the journey, and the expedition returned to Spain and to rebuke from the crown.

Early European Settlements

Years before, in January 1502, Alonso de Ojeda himself embarked on another voyage to South America, in order to es-

tablish a colony in Venezuela. Ojeda established a settlement in Venezuela he called Santa Cruz. It was constantly besieged by native peoples, and when supplies dwindled after nine months, his men mutinied. Ojeda was arrested, and brought in chains to Hispaniola and the Spanish authorities. Spain had established a council, called the Council of the Indies, to direct exploration and settlement in the new territories. Its president, Bishop Fonseca, interceded and obtained Ojeda's release.

In 1505, Ojeda attempted yet again to colonize the Venezuelan coast and was again unsuccessful. Then, in 1508, Ojeda sent Juan de la Cosa to Spain in order to obtain a royal commission to colonize Venezuela. The Spanish crown named Ojeda governor of the area from Cape Vela to the Gulf of Darien, roughly the coast of present-day Colombia all the way to Panama. On Hispaniola, among others Ojeda recruited was FRANCISCO PIZARRO, a Spaniard who was to play the greatest and perhaps most infamous part in the exploration and conquest of South America. Pizarro made his first voyage to the West Indies in 1502, after running away from home as a young man, sailing with the fleet of Nicolás de Ovando, who had been appointed governor of Hispaniola to replace Christopher Columbus's short tenured successor, Francisco de Bobadilla.

From Hispaniola, Pizarro sailed with Ojeda in November 1509. Ojeda's first landfall was at present-day Cartagena, Colombia, but he suffered a disastrous attack by native peoples. Rescued by the forces of another colonizing expedition led by Diego de Nicuesa, Ojeda moved his colony to the west, founding San Sebastián on the east shore of Panama's Gulf of Uraba. Supplies were running dangerously low, however, and Ojeda set sail for Hispaniola, leaving Pizarro in charge. After 50 days, Ojeda had not returned, since his ship had been wrecked off the coast of Cuba. Pizarro was forced to kill the horses for food, and then, with the remaining men, he abandoned the settlement. He encountered Martín Fernández de Enciso, who had financed Ojeda's expedition, and was sailing for San Sebastián with relief supplies. Together they changed course and sailed to the coast of Panama not far from Colombia, where they endeavored to create a new colony.

En route, Fernández de Enciso discovered a stowaway on his ship, VASCO NÚÑEZ DE BALBOA. At this time in his early thirties, he had sailed to the Americas with Rodrigo de Bastidas in 1501, but, by 1510, his career as a conquistador had not been successful, and he found himself in debt, with few possessions other than his sword and his dog, Leoncico. Enciso let Núñez de Balboa, who had experience on the coast of Panama, remain aboard his ship reluctantly. Núñez de Balboa helped Enciso and Pizarro choose a site for the new settlement, which was called Santa María de la Antigua.

In 1511, Enciso incited a mutiny among his men by forbidding them to trade with the native peoples for gold.

Núñez de Balboa took command of the colony. The Spanish crown commissioned him interim governor and captain-general of Panama, known then as Darién, in Central America. Pizarro became Núñez de Balboa's chief lieutenant. In 1513, Núñez de Balboa led an expedition across the Isthmus of Panama. He and his dog ascended the hill, becoming the first European to sight the Pacific Ocean on September 25. Four days later, he and his men reached the coast.

After Núñez de Balboa's sighting of the Pacific, the search for a passage across the continent gained urgency. Juan Díaz de Solís, who had been imprisoned for ending his search for a passage in 1509, was released two years later, and, in 1512, named Spain's Pilot Major, succeeding Amerigo Vespucci in that post. In November 1514, Díaz de Solís was commissioned to again search for a southwest passage to the Pacific, which Núñez de Balboa had named the South Sea. In October 1515, Díaz de Solís sailed from Spain in command of three ships. After reaching Rio de Janeiro on the South American coast, he headed southward and took possession of the lands that now make up much of Uruguay. Díaz de Solís came across an estuary, which he imagined at first to be the opening of a southwest passage.

Díaz de Solís sailed up one of the main tributaries of what he called the Río Solís, which is today the Uruguay River. Near present-day Buenos Aires, he took a landing party ashore to capture Native Americans to bring back to Spain during which he was killed. The expedition was taken over by Francisco de Torres, Díaz de Solís's brother-in-law. Before returning to Spain, he collected a cargo of Brazil wood, which served as a textile dye and was highly prized. As they returned, one ship was wrecked on the Island of Santa Catarina. Eleven men survived the wreck and befriended the native peoples.

Around the Continent

Those who returned to Spain on the second ship of Francisco de Torres reported that the coast of South America appeared to curve southwestward. This gave hope to Portuguese navigator Fernão de Magalhães, who, in 1517, after a falling out with the King of Portugal crossed into Spain, renounced his citizenship, and was called by the Spanish name FERDINAND MAGELLAN. Magellan had sailed with the Portuguese in the EAST INDIES, and it is likely he sailed with his friend FRANCISCO SERRANO to the SPICE ISLANDS (the Moluccas), one of the principal goals of European explorers. He surmised, based on MARTIN BEHAIM's 1492 globe, and data provided by the astronomer and cosmographer Ruy Faleiro, that the Spice Islands really fell within the portion of the world granted to Spain by the Treaty of Tordesillas. Furthermore, the evidence of Díaz de Solís's men combined with secret Portuguese navigational charts he had most likely seen convinced him there was a strait separating South America from the GREAT SOUTHERN

CONTINENT that was believed to exist in the southern latitudes, which would allow him to sail westward and reach the East Indies.

In September 1519, after gaining approval of Spanish king Charles I (Holy Roman Emperor Charles V), Magellan sailed from Spain with five ships and about 250 men. He sailed along the coast of Africa as far as Sierra Leone before crossing the Atlantic. He explored inlets on the Brazilian coast including the Bay of Guanabara and the estuary of the Río de la Plata, which Díaz de Solís had also imagined to be the opening of a southwest passage. Along the southwest coast of present-day Argentina, he entered the bay of San Julián, to wait out the Southern Hemisphere's winter months. He called the area Patagonia, or "Land of Big Feet," after the native peoples he observed who wore large footwear. He quelled a mutiny among his Spanish crew, who resented a Portuguese commander, and, after one ship wrecked on the Patagonia coast, Magellan set out before the end of winter to continue to search for the passageway.

The ships passed 50 degrees south of the equator, and after a few days sighted a strait beyond a cape, named Cape Virgenes. The passage was narrow in places, and winding. One night, a ship mutinied and returned to Spain. The three remaining ships continued to traverse the passage. The southern side of the strait was a rocky land, scattered with strange fires, the camps of native peoples. Magellan called it Tierra del Fuego, or Land of Fire. After 38 days sailing through icy waters, the ships passed into a great tranquil ocean, which Magellan named the Pacific. The 360-mile-long strait was later named the Strait of Magellan. Eventually, the expedition, after Magellan's death in the Philippines, completed the first CIRCUMNAVIGATION OF THE WORLD.

Conquest of the Inca

The east and north coasts of South America had been well charted by this time, but the interior remained relatively untouched, and the west coast a complete mystery. One of the men of Díaz de Solís's expedition left behind on the Island of Santa Catarina, Portuguese sailor ALEJO GARCÍA, married a Native American woman, and together they had a child. With the aid of the native peoples, García explored thoroughly the area of the Paraguay-Paraná basin. Probably in 1524, he ascended the Paraguay River nearly to its source. The next year, García accompanied a band of Native Americans into the Andes. He heard tales of a great civilization located in the mountain range, with great wealth in gold and silver. He obtained several bars of silver himself, and was perhaps the first European man to come to the attention of the Inca.

In 1522, Basque-born Spaniard PASCUAL DE ANDAGOYA, sailing from Panama, began to survey the west coast of South America, after the Spanish conquest of the Aztec in

Mexico. He sailed as far south as Cape Corrientes on the Pacific shore of Colombia and returned to Panama with reports of a highly advanced and wealthy native kingdom called “Biru.” These were the Inca.

In Panama, Francisco Pizarro heard of Andagoya’s report, which bolstered rumors he had heard from native peoples, and decided he would conquer the people of “Biru” and gain their wealth. The next year, Pizarro entered into partnership with DIEGO DE ALMAGRO, a Spanish conquistador of whose life little is known before he arrived in Panama in 1514. In 1524, the two set out to explore the Pacific coast of present-day Colombia. Exploring the Gulf of Buenaventura, Pizarro lost two-thirds of his 80 men to attacks from native peoples and to disease. The Spanish authorities prohibited any further exploration, but Pizarro and Almagro ignored them and, in 1526, reached as far south as the Gulf of Guayaquil on the coast of what is now southern Ecuador. The expedition landed at the Inca town of Tumbes, where the Spanish found evidence of the highly advanced civilization of the Inca and of their riches. Pizarro’s chief mariner, Bartolomeo Ruíz, after sailing farther down the coast, reported the existence of greater Inca cities.

Pizarro sailed for Spain in 1528 in order to seek support from the crown for a large-scale conquest of the Inca. He brought back, among other things, gold and jewels from Peru, captured native peoples, and a llama to show to King Charles I. At about the same time, HERNÁN CORTÉS had returned to Spain with reports of his successful conquest of the Aztec. Pizarro’s expedition received enthusiastic support. He returned to Panama with his half brothers GONZALO PIZARRO, HERNANDO PIZARRO, Juan Pizarro, and Martín Pizarro.

In January 1531, the expedition left Panama with 180 men and 27 horses. Francisco Pizarro landed at San Mateo Bay and occupied the Inca town of Tumbes without opposition. The current Inca emperor, Atahualpa, decided to allow the Spaniards to penetrate deep into the realm, where they would be trapped and easily destroyed.

Pizarro was joined by HERNANDO DE SOTO, who had arrived in Panama in 1514, and took part in exploration and conquest of parts of Central America. De Soto took men and horses from Panama and Nicaragua to the island of Puna off the coast of Peru at his own expense. He was also joined by SEBASTIÁN DE BENALCÁZAR, who had accompanied Columbus in 1498, and later established himself as a military and colonial leader in Central America. Pizarro led the combined forces over the Royal Inca Road, eastward through the Andes and the Piura valley, entirely without Inca resistance. Finally, on November 15, 1532, the Spanish arrived in the deserted city of Cajamarca, where just out of town Inca emperor Atahualpa encamped, with reportedly 50,000 men.

Pizarro sent his half brother Hernando as an emissary to the emperor. Hernando presented Atahualpa with a Bible, which he said would teach him about Christ. When the Bible did not speak to him, Atahualpa cast it to the ground. The Spaniards took it as an insult to their faith and as a good excuse to attack. They charged the Inca with horses, which the native peoples had never seen, and fired upon them with their cannon. The Spanish killed thousands of Inca, and took Atahualpa prisoner, suffering few casualties.

Atahualpa offered the Spanish a roomful of gold for his release. Pizarro agreed, and the Inca began to bring gold from across their empire. During the months of his captivity, Atahualpa learned Spanish and writing, and spent time playing chess with Pizarro. The room was filled with artistic and religious works, which the Spaniards melted down. All told, the Inca brought 1,325 pounds of gold. This did not satisfy Pizarro. The emperor, while in captivity, had ordered his half brother Huáscar killed, lest he make an alliance with the Spanish. Pizarro tried and convicted Atahualpa for conspiracy, and sentenced him to be burned. In deference to Atahualpa’s partial embrace of Christianity, Pizarro baptized him, and had him publicly strangled in July 1533.

While destroying Inca resistance in the surrounding areas, Pizarro and his men learned of another Inca kingdom in Ecuador to the north, based around the provincial Inca capital of Quito. In 1534, Sebastián de Benalcázar set off to capture Quito. Benalcázar gained the support of local Canari native peoples as he traveled northward. He was met by the forces of Inca chief Ruminahui beneath Ecuador’s highest peak, Chimborazo, and he defeated them. He occupied Quito and, in 1535, he established the port city of Guayaquil.

Pizarro marched through Peru on the roads created by the Inca, capturing the Inca capital at Cuzco, enslaving many of its inhabitants and seizing its gold. Diego de Almagro, Pizarro’s erstwhile partner, quarreled with him over their respective positions and power. The conflict was averted in December 1534, when the Spanish authorities appointed Almagro the governor of a new Peruvian province called New Toledo and allowed him to lead an expedition of conquest to the south. Pizarro founded a new capitol called the City of Kings, which he adorned with his riches, at the mouth of the Rimac River. This became Lima, Peru.

Almagro left Cuzco in July 1535 with 750 Spaniards and thousands of native allies. He embarked in the middle of winter, and his men suffered in the severe cold of the high Andes. After traveling through the central Andes, Almagro turned westward and reached the coastal Copiapó Valley, then followed the coastal plain of modern Chile into the Central Valley. Repeatedly attacked by native peoples, and unable to find another civilization like the Inca, Almagro turned back, dissatisfied.

Pizarro had established Manco Capac II, one of Huayna Capac's sons, as ruler in Cuzco for a time, in an effort to maintain the illusion of a continuity of Inca rule. In 1536, during the turmoil that accompanied the rift between Pizarro and Almagro, the Inca ruler escaped from Cuzco and led a revolt against Spanish rule. Pizarro defeated assaults on Lima by four Inca armies. The Inca loss of life from European diseases also helped in the Spanish conquest (see DIS-EASE AND EXPLORATION).

Almagro's men, on their return journey to the north, crossed the Atacama Desert along the north coast of Chile; many died of thirst. In 1537, after crossing the Andes again, they finally reached Cuzco, which, at the time, was besieged by Manco Capac. Almagro succeeded in breaking the siege, but he was soon embroiled in another conflict with Francisco Pizarro, as both claimed Cuzco as part of their dominion. Hernando Pizarro's forces captured Almagro in Cuzco in April 1538, and, with the tacit approval of Francisco, Almagro was publicly executed.

Legendary Kingdoms

Spanish conquests of the Aztec in Mexico, then later the Inca, had fueled the excitement generated by tantalizing hints of another advanced civilization with great wealth.

In 1525, Venetian mariner SEBASTIAN CABOT was commissioned to lead a large Spanish expedition to the EAST INDIES, after report of Magellan's voyage proved the feasibility of an all-water route to the Orient around South America. Cabot was charged with visiting the Spice Islands and to make a geographic survey of the South American coast. Cabot left Spain with four ships and 200 soldiers and colonists in April 1526. He sailed southwestward from the Cape Verde Islands and, the following September, reached the port of Recife, Brazil.

Sailing south along the coast, Cabot sighted and named the island of Santa Catarina. Entering the estuary of the river the expedition of Juan Díaz de Solís had explored 10 years earlier, Cabot discovered and rescued the shipwrecked survivors. The survivors told him of legends of riches in the South American interior, and they gave him the Inca silver that Alejo García had obtained. Cabot named the river Río de la Plata, or the River of Silver, and he abandoned his plans of traveling to the Far East. Instead, Cabot explored the inland waterways of the Paraguay and Barajevo Rivers in present-day Argentina, Uruguay, Paraguay, and Brazil, as well as the Paraná River. Cabot found little gold, however, and returned to Spain in 1530.

Spaniard DIEGO DE ORDAZ, like Pizarro, served with Alonso de Ojeda in 1509, in his efforts to colonize present-day Colombia and Venezuela. Returning to Spain after serving in the conquest of Mexico, Ordaz was given his own commission to explore, conquer, and colonize Venezuela. He sailed with 500 men from Spain, reaching the mouth of

the Amazon, but chose to sail on to the mouth of another great river of which the native peoples had informed him, the Orinoco. He explored upriver about 800 miles and heard tell of a land somewhere in the Guiana highlands around the source of the river ruled by a group of white people like the Europeans, and in possession of wealth in gold and jewels. This was similar to stories Sebastian Cabot had heard from native peoples and survivors of Díaz de Solís's expedition, but with a more definite location to the mythical empire.

Sebastián de Benalcázar in Quito heard tales from a captured Native American in 1535 of a kingdom to the east, toward the Guiana highlands, ruled by a monarch speckled with gold dust, whom Benalcázar called EL DORADO, the gilded one. Benalcázar headed northward into the interior of modern-day Colombia, where he established the settlements Popayán and Cali, then he turned east to search for the city of gold. The same decade, the region was being explored from the east in search for the Guiana empire by Germans involved in a colonizing expedition in Venezuela that had been sponsored by the king of Spain, Charles I (Holy Roman Emperor Charles V). AMBROSIUS ALFINGER, GEORG HOHERMUTH VON SPEYER, and NIKOLAUS FEDERMANN traveled inland in Venezuela and Colombia.

Another mission, led by GONZALO JIMÉNEZ DE QUESADA, was sent from Santa Marta on the Caribbean coast of Colombia to explore the Magdalena River, to search for El Dorado and to locate a passable route to the Spanish in Peru. Jiménez de Quesada heard reports that an advanced civilization existed to his west, on the slopes of the Andes, and took his expedition away from the river. He entered the lands of the Chibcha and, in March 1537, began his conquest. He claimed "New Granada" and founded the city of Santa Fe de Bogotá as its capital. He acquired a fortune in gold and precious stones from the native peoples and finished his conquest in 1539. Around this time, two European expeditions appeared in the area, one led by German explorer Nikolaus Federmann, and the other that of Sebastián de Benalcázar. The three disagreed over who had rights to the territory, and all three sailed in late 1539 or 1540 for Spain to have their dispute arbitrated.

European Inroads

By this time, Francisco Pizarro had appointed his half brother Gonzalo governor of Quito. He, too, had heard stories from the native peoples about riches to the east, including a land that was supposed to contain forests of cinnamon, a very valuable spice, and again of the land of El Dorado, where the bottom of a lake was lined with gold and jewels. Francisco authorized Gonzalo to search for La Canela, the Land of Cinnamon, and for El Dorado. Pizarro took with him 300 Spaniards, about 4,000 native slaves from Quito, as well as a large herd of pigs for food, llamas as pack animals,

and hunting dogs. FRANCISCO DE ORELLANA, lieutenant governor of Guayaquil, joined Pizarro's expedition, which after seven months reached the upper Coca River. He located some cinnamon there, but not nearly as much as he had been led to believe existed. With the men facing starvation, he sent Orellana downriver to locate food.

In late 1541, Orellana and his men improvised a boat, and, along with Native Americans traveling by CANOE, sailed down the Coca, with promises to return within 12 days. After being swept into the Napo River, Orellana discovered a village with plenty of food. He decided then to construct a larger boat and continue sailing downriver into what the Spanish called the Marañón, or tangle of rivers. The Spanish passed into the Río Negro, one of the tributaries of the Amazon, and, on their way, they were attacked by a group of native peoples in which the women fought alongside the men and were likened to the Amazons of Greek legend, thus possibly resulting in the name of the river; the name of the river is more likely probably derived from the native word *amassona* for "boat destroyer." Orellana and his men entered the Atlantic Ocean on August 26, 1542, the first Europeans to sail the length of the Amazon.

At about the same time, Spaniard DOMINGO MARTÍNEZ DE IRALA was exploring the upper Paraguay River in South America's southernmost river basin. Martínez de Irala had first sailed to South America with PEDRO DE MENDOZA in 1535. Mendoza had been appointed the first governor of the territory that had been claimed by Juan Díaz de Solís for Spain, had been explored by Sebastian Cabot, and had had its southernmost extremity fixed by Ferdinand Magellan's passage through the Strait of Magellan. Mendoza's expedition, departing in August 1535, had consisted of 14 ships carrying more than 2,000 colonists to the Río de la Plata, where he had established the city Santa María del Buen Aire (of the fair winds), which later became Buenos Aires.

Mendoza, in addition to colonizing, had been charged with exploring the area, especially the river system, in an effort to find a route to Peru and the riches of which Cabot had reported. He sent two of his deputies, JUAN DE AYOLAS and Martínez de Irala. The two had explored the Río de la Plata up to the Paraná and Paraguay Rivers. Mendoza had died at sea, and Martínez de Irala had succeeded him as governor, serving until 1540, when ÁLVAR NÚÑEZ CABEZA DE VACA, who had explored the Southeast and Southwest of North America between 1528 and 1536, took his place. It was Cabeza de Vaca who had sent Martínez de Irala to explore the Paraguay River in 1542. Martínez de Irala followed the river 250 miles above the settlement Asunción. On his return there, Cabeza de Vaca was deposed by the settlers, and Martínez de Irala regained his place. In 1546, he embarked on another expedition into the interior, reaching the eastern slopes of the Andes.

Gonzalo Pizarro had returned from his failed expedition to search for El Dorado in 1542 to discover his half brother Francisco murdered by followers of the late Diego de Almagro's half-Indian son and heir, Don Diego Almagro, and a Spanish viceroy set in his place. Gonzalo, who had been intended as his half brother's successor, began a rebellion against the viceroy. In 1547, Spaniard PEDRO DE VALDIVIA, who had been an officer under Francisco Pizarro, returned from his explorations in present-day Chile to assist in putting down Gonzalo Pizarro's revolt. He was rewarded with support against Gonzalo for an expedition to colonize Chile to the south of Peru. Valdivia followed the Inca road along the Pacific coast, crossing the Atacama Desert as Almagro had done before. On February 12, 1541, he founded Santiago, Chile, the first permanent Spanish settlement there. He encouraged agricultural settlements in Chile, because it did not possess the mineral resources Peru did. He explored across the Andes into the plains of western Argentina, and, in 1544, reestablished the seaport at Valparaíso.

That same year, the Spanish viceroy of Peru commissioned Spanish adventurer PEDRO DE URSÚA to lead an expedition to search for the legendary wealth of El Dorado and the native peoples of Omagua. Ursúa had set out for Peru in 1552 after spending a handful of successful years as governor of Bogotá (a post he occupied at age 20) and later as the mayor of the coastal town Santa Marta. He left Lima, Peru, in February 1559 with 300 Spaniards as well as native peoples and slaves, and began to cross the Andes. After many delays due to inadequate financing, Ursúa led his men down the Huallaga River, into the Marañón, finally entering the main course of the Amazon in December 1560. On January 1, 1561, one of his men, LOPÉ DE AGUIRRE, murdered Ursúa and his deputy and incited a mutiny. Aguirre hoped to take the mutineers to Panama to rebel against the Spanish authorities. He and his men sailed down the Amazon, crossing into the Orinoco, likely by way of the Río Negro, and they followed it to the Caribbean, laying waste to several native villages along the way. Aguirre and his men attacked and captured the island of Margarita, before they were besieged in the mainland town of Barquisimeto. The Spanish beheaded Aguirre and quartered his body as a warning to rebels.

In 1562, cartographer DIEGO GUTIÉRREZ incorporated the reports of many of these explorations into the interior of South America into a map of the continent. Gutiérrez was employed by Spain's House of Trade for the Indies, an arm of the Spanish government, which licensed sailors and maintained maps of the world. By this time, lusting after gold and other riches, Spanish CONQUISTADORES had visited much of South America's interior, in comparison to North America, the interior of which would not be so well known until the early 19th century.

With much of South America under their sway, the Spanish continued their colonization and exploitation. Spain's other main competitor, Portugal, also had laid claim to a large part of South America. After Christopher Columbus landed in the Americas in 1492, Spain petitioned Pope Alexander VI for a monopoly on trade in the western Atlantic, which resulted in a line of demarcation to the west of which Spain was given trading rights, and to the east of which rights were granted to Portugal. After the 1494 Treaty of Tordesillas, this longitudinal line was fixed at 370 leagues west of the AZORES. The landing of Pedro Álvares Cabral in Brazil in 1500, in territory allowed to the Portuguese, gave them rights to colonize Brazil.

Despite Spain and Portugal's claims to the territory, other European powers attempted to make inroads into the continent as well. In 1598, Dutch sailor OLIVER VAN NOORT was commissioned by a collection of Dutch merchants to embark on an expedition to the Spice Islands and the Far East, through the Strait of Magellan. The expedition sailed from Rotterdam in September 1598, heading for Rio de Janeiro on the South American coast. The ships, driven back by storms, sought shelter on the Brazilian coast, where crew members were lost to attacks from the native peoples. After wintering on the uninhabited island of Santa Clara, the expedition followed the coast of Patagonia and entered the Strait of Magellan in November 1599. Crew members frequented the north shore of the strait, suffering more native attacks and loss of life. They explored three uncharted bays. In early February 1600, the expedition and its ships entered the Pacific and followed the coast of Chile northward, attacking Spanish ships and Spanish settlements. The viceroy of Peru sent a fleet to capture them, but the Dutch escaped, sailing westward into the Pacific.

The English, too, had a capable navy, and it was not long before the stories of El Dorado attracted their attention. In 1595, Queen Elizabeth I approved the plans of English adventurer and explorer SIR WALTER RALEIGH to search for the city of Manoa and the empire of Guiana and its supposed riches. Raleigh sailed with five ships in February, and, after a stormy crossing landed in Trinidad, where he attacked Spanish settlements. Capturing ANTONIO DE BERRÍO, a Spanish official, he heard more reports of El Dorado. He centered his exploration on the Orinoco River, which he explored upstream in small boats. Lacking supplies and afflicted with fevers, Raleigh and his men abandoned their search and returned to England.

In 1610, Englishman SIR THOMAS ROE sailed on a voyage to find gold on the northeast coast of South America. With approval from King James I and the financial backing of Raleigh, Roe left Plymouth with two vessels on February 24. He landed on the coast of the Guianas highlands, and

after locating the mouth of the Amazon, he sailed 200 miles upriver. From there, he explored another 100 miles farther using small boats. Afterward, Roe explored the coastline as far as the delta of the Orinoco before returning empty-handed to England in 1611.

In 1617, Raleigh undertook one more expedition to search for El Dorado. He had been sentenced to death after being implicated in a plot against King James I, but convinced the monarch to let him search for the City of Gold one last time. His ships reached Trinidad, where Raleigh became sick with fever. Raleigh's son, Walter, and Lawrence Kemys entered the Orinoco but soon entered Spanish territory, and fought with Spanish settlers at San Thomé, in violation of orders from the king. Walter was killed, and Kemys committed suicide shortly thereafter. Raleigh also returned empty-handed to England, and, under his original sentence, he was beheaded in 1618.

In 1616, Dutch merchant JAKOB LE MAIRE organized an expedition with navigator WILLEM CORNELIS SCHOUTEN, which departed Holland in June 1615. Early the next year, after passing through what became known as Le Maire Strait, they found South America's southernmost point of land, part of the Tierra del Fuego Archipelago, south of the Strait of Magellan. They named it Cape Horn, not because the area resembled a horn, but after their home port of Hoorn in the Netherlands.

While the Portuguese claimed the area of Brazil east of the line of demarcation set by the Treaty of Tordesillas, French, Dutch, and English trading settlements arose in the territory around the Amazon Basin. In the early 17th century, the Portuguese began to take heightened military action against foreign encroachment. Throughout the 1620s, Portuguese soldier PEDRO DE TEIXEIRA took part in many raids to evict foreign settlers throughout the region, around the Amazon's Xingu tributary and the northern delta near the Guianas highlands. Afterward, the only real threat to the Portuguese hold on its Amazonian territory came from the Spanish, who were slowly pushing eastward from Peru and modern-day Ecuador. In 1637, the Portuguese were spurred into action when two Spanish Franciscans arrived in Portuguese territory after a journey down the Amazon from Ecuador. Teixeira was ordered by the local Portuguese colonial governor to map the length of the Amazon and claim territory for Portugal. He assembled a large expedition, which embarked upstream by canoe in October. In July 1638, Teixeira made the European discovery of the Río Negro and arrived on foot in Quito, Ecuador, in the late summer, to the great astonishment of the Spanish. The alarmed authorities sent Teixeira and his expedition back down the Amazon, with a group of Spanish observers led by Jesuit priest CRISTÓBAL DE ACUÑA. On the return trip, Teixeira marked a point on the Aguarico River, the point at which the river crossed the boundary line, which according

to treaty separated Spanish from Portuguese territory in the New World.

With the Spanish and Portuguese militarily asserting their control of the northern part of the continent, the French turned their attention to the continent's southern portion, which had not yet been settled by Europeans. In 1665, the French sent priest CHARLES-EDOUARD DE LA NOUÉ to explore the territory, which, while nominally belonging to the Spanish since the explorations of Magellan, France hoped to colonize. Traveling in the region of Patagonia and Tierra del Fuego for several years, Noué was captured by native peoples. He learned their language and customs, adapted their form of dress, and was eventually accepted as an equal. After a time, Noué was allowed to escape on a passing ship. In 1675, he published an account of his travels, describing the region's rugged terrain and inhospitable climate and hostile native peoples, which discouraged further French attempts to colonize the area.

In 1675, the Dutch sent another mission to the southern tip of South America, not for purposes of colonization, but, as before, to explore and improve the route to the Pacific, around Cape Horn. The expedition, led by German sailor SIGISMUND NIEBUHR, first sailed to Rio de Janeiro, before heading southward, and entered the Le Maire Strait, off the south coast of Tierra del Fuego. He mapped out navigational hazards and made depth soundings along the strait. Returning to Holland, he published an account and a navigational chart of the Le Maire Strait, which showed it to be a more practical alternative to the Strait of Magellan for a journey around South America.

Scientific Exploration

The first exploration of South America in the enlightenment tradition, entirely without political, pecuniary, or religious motive, was made by French scientist and mathematician CHARLES-MARIE DE LA CONDAMINE in the first half of the 18th century. La Condamine was hampered in his efforts by the Spanish authorities, who continued to suspect the presence of foreigners.

In 1735, after being elected to the French Academy of Science, La Condamine set out for South America as leader of part of an expedition to measure the arc of a meridian of longitude at the equator and near the Poles in order to determine whether English physicist and mathematician Sir Isaac Newton, who had died eight years earlier, had been correct in believing the Earth to bulge out at the equator. The team began their work outside of Quito on the Plain of Yarqui, but due to interference from local authorities, La Condamine was forced to make an eight-month-long journey to Peru. By his return, the results had come in from Labrador, where the other half of the study was being conducted. The results validated Newton.

La Condamine remained in the area around Quito, making inquiries in natural science until 1743, when he decided to journey down the length of the Amazon River before sailing back to France. Before he embarked, he obtained copies of the only map of the entire length of the Amazon, made by SAMUEL FRITZ, a Jesuit missionary from Bohemia who had lived among the native peoples of the Amazon River in the late 17th and early 18th centuries.

In his trip down the Amazon, La Condamine studied the life of the native peoples and made navigational observations. He determined that the Río Negro flowed into the Amazon from the northwest and not the north. But most important, he put his geographic and mathematical skills to use, and finally determined the coordinates of the line of demarcation established by the Treaty of Tordesillas, ending at last the dispute between the Portuguese and Spanish.

A later naturalist, Spaniard FÉLIX DE AZARA, had traveled to South America in 1781 as commissioner of a Spanish government survey. He stayed on in South America until 1801, during which time he studied the natural history of the Paraná and Paraguay Rivers.

German naturalist ALEXANDER VON HUMBOLDT carried out some of the most important natural science studies of South America. Along with French botanist Aimé Bonpland, Humboldt was granted permission to perform scientific surveys throughout the Spanish possessions in the Americas. Humboldt had had a keen interest in natural sciences from an early age, and, in his studies, he gained an extensive knowledge of languages, biology, astronomy, and geology. With his family connections, he was able to obtain the backing of Charles IV of Spain for a plan to explore the Americas. Humboldt and Bonpland sailed from La Coruna in northern Spain and arrived on the Venezuelan coast in July 1799. Over the next year, they pursued various scientific inquiries around the Orinoco River basin. Humboldt made many astronomical observations to clear up discrepancies in maps of South America. He also studied animals, including the capybara, the world's largest rodent; electric eels; and the Arrau turtles who laid their eggs by the millions on the bank of one of the Orinoco's tributaries. Later, Humboldt and Bonpland started from Cartagena and, ascending the Magdalena River, headed toward the eastern slopes of the Andes. Humboldt made observations of the effect of high altitude on the boiling point of water. In Ecuador, the pair attempted to climb Mount Chimborazo, reaching a record 19,000 feet, before lack of oxygen forced them to turn back. Humboldt also plotted the magnetic equator and proved that Earth's magnetic field decreases as one approaches the equator. He studied the climate along the coast of Peru. In his travels, he crossed the Andes five times. He and Bonpland went on to explore Mexico.

The flora and fauna of South America and its islands, the most distinctive after those of Australia and highly

varied, drew many European naturalists in the 19th century. One of these was Frenchman ALCIDE-CHARLES-VICTOR DESSALINES D'ORBIGNY, who collected plant and animal specimens there in the 1820s–30s.

Studies in South America led to one of the most important biological theories ever formulated. In 1831, a young theology student at Cambridge University, who had recently abandoned a medical career, was appointed the official naturalist for a British scientific expedition to the coast of South America after his skills as a naturalist had come to the attention of John S. Henslow, a Cambridge professor of geology and botany. CHARLES ROBERT DARWIN sailed from Devonport in December 1831, aboard the HMS *Beagle*, commanded by ROBERT FITZROY.

The *Beagle* sailed to Bahia, Brazil, where Darwin explored inland, collecting specimens from the Brazilian rain forest. He collected more specimens by traveling with an Irish planter to his coffee plantation 100 miles north of Rio de Janeiro. Later, Darwin explored up the Río de la Plata, discovering fossilized bones in Uruguay. In Patagonia, he followed the Santa Cruz River to within sight of the Andes. He studied the native peoples of Tierra del Fuego, then, after rounding Cape Horn, he made explorations into the interior of Chile. In Chile, Darwin experienced a heavy earthquake and witnessed the eruption of Osorno. Before heading westward, the *Beagle* stopped at the Galapagos Islands, where Darwin noticed similar species on different islands adapted differently to local conditions. The expedition circled the Earth and returned to England in 1836.

Over the following years, Darwin formulated a theory of evolution by natural selection as an explanation for the origin of species, but he was reluctant to publish it until 1858, when he received a paper from ALFRED RUSSEL WALLACE, another British naturalist who had formulated a similar theory. Wallace and fellow self-taught naturalist HENRY WALTER BATES had read Humboldt's accounts of South America, as well as Darwin's own report of the voyage of the *Beagle*, and, in 1848, the two had sailed to the mouth of the Amazon to make their own exploration. They had explored and collected specimens in the Amazon Basin. Wallace had explored the Orinoco River before returning to England in 1852. Wallace next traveled to Southeast Asia, and it was there he wrote the paper that would come into the hands of Darwin in 1858. The two agreed to publish jointly, and, in 1859, with Wallace's supporting text, Darwin came out with his landmark volume, relying on his observations in South America, *On the Origin of Species*. Bates meanwhile had continued his studies in South America, returning to England in 1858.

Darwin and Wallace got together again, along with British botanist WILLIAM HOOKER, to secure a pension for RICHARD SPRUCE. Spruce was a self-educated botanist who, after spending some time in the Pyrenees in France, em-

barked on an expedition to the Amazon Basin in 1849. Primarily an expert in mosses, Spruce was also charged by the British to collect seeds of the cinchona tree to be grown outside of the Amazon and Andes for its bark. In the 17th century, a monk in Peru had observed the native peoples using the tree's ground-up bark to treat fevers. The use spread to Europe, where it was found effective against malaria. The drug isolated from the bark is called quinine and is known to kill some stages of the malaria parasite. Spruce spent a total of 17 years in the Amazon and Andes, during which time he discovered many new plant species. He also investigated the religious use of plant-based hallucinogens by native tribes. (See NATURAL SCIENCE AND EXPLORATION.)

Explorers in the 20th Century

Even after extensive European settlement, parts of South America remained unexplored and a challenge to explorers. One such adventurous traveler was American HARRIET CHALMERS ADAMS, who traveled more than 40,000 miles on the continent and made four crossings of the Andes in 1903–06, writing about the lands she visited for *National Geographic* and other magazines. Another American, historian HIRAM BINGHAM, explored Inca sites in the Andes, also in the early 20th century.

It was not until the advent of airplanes that the most remote places became known, and some tributaries of main rivers remained mysterious and uncharted well into the 20th century. In 1924–25, American ALEXANDER HAMILTON RICE made the first use of aircraft to explore South America. (See AVIATION AND EXPLORATION.)

The Amazon rain forest continues to be a source for medicines and a haven for an amazing diversity of animal and plant life. Outside of the Inca Empire, which methodically expanded through the Andes and even into the rain forest, much of South America was crisscrossed by small bands of native tribes leaving scarce traces. With the coming of the Europeans, first the coastlines were mapped, then conquistadors plunged into the interior, usually with one goal in mind—riches. On a whole, the native peoples were treated ruthlessly, and the lands and forests were pillaged of resources, which included brazil wood, rubber, silver, gold, and diamonds. There were rare exceptions to the rapacity among the European conquerors, mostly rewarded by mutiny, as in the case of Fernandez de Enciso, who refused to allow his Spaniards to engage in predatory trading with the native peoples. Rare, too, was any encouragement to develop sustainable settlements, as Pedro de Valdivia was forced to do in Chile because of a lack of mineral wealth and resources. Much of South America has remained impoverished, its wealth flowing back to Europe, and its own manufacturing and educational institutions left undeveloped.

Today, eagerness to exploit South America's resources combined with the legacy of colonial neglect threatens to destroy much of the continent's natural wealth and native ways of life, which attracted so many biologists, botanists, and anthropologists in the 19th century, and still does today.

South Magnetic Pole (Magnetic South Pole)

Earth has a magnetic field, an area surrounding it in which objects experience an electromagnetic force. In other words, Earth acts as a giant magnet. The exact cause of terrestrial magnetism is unknown; theories relate to the matter and structure of Earth's core, one of which is the dynamo theory involving the interaction of motion and electrical currents in the liquid outer core. At one end of Earth, the northern end, the magnetic force is toward the ground; at the other end, the southern end, the magnetic force is away from the ground. (Earth's magnetic field reverses polarity on an irregular basis, from several thousand years to 35 million years, resulting in the opposite effect; the last such reversal was some 780,000 years ago.) The exact location of these points of magnetic polarity are referred to as the magnetic poles. The magnetic pole at the southern end is known as the South Magnetic Pole (written with or without capitalization). That at the northern end is known as the NORTH MAGNETIC POLE. The terms also appear as magnetic south pole and magnetic north pole. The angle that Earth's magnetic field makes with the horizon is called the magnetic dip, leading to the alternative names dip poles or magnetic dip poles.

The South Magnetic Pole and the North Magnetic Pole do not correspond with the geographic poles of Earth's imaginary axis, known as the SOUTH POLE and NORTH POLE. Moreover, their location varies in the course of almost a century—as they do to a much less degree annually and even daily—a phenomenon known as polar wandering. The present location of the South Magnetic Pole is off the Adélie Coast of eastern Antarctica, 1,600 miles from the geographic South Pole.

For purposes of study, scientists have also defined Earth's magnetic field as a symmetrical magnetic field, averaging its direction and strength, and the hypothetical poles are known as geomagnetic poles, south and north. The South Geomagnetic Pole is situated near Vostok, Antarctica, about 780 miles from the geographic South Pole.

The effect of terrestrial magnetism had been evident for centuries through use of the magnetic COMPASS. William Gilbert, an English physician and scientist, carried out the first comprehensive study of Earth's magnetic field, publishing his findings in *De Magnete* in 1600.

In his Antarctic expedition of 1839–43, Englishman SIR JAMES CLARK ROSS, having located the North Magnetic Pole in an earlier expedition, tried vainly to pinpoint the South

Magnetic Pole. On January 16, 1909, Australian scientist SIR DOUGLAS MAWSON, British geologist T. W. Edgeworth David, and physician Alistair F. Mackay, part of the 1907–09 British Antarctic Expedition under SIR ERNEST HENRY SHACKLETON, reached a point 190 miles inland from the west shore of the Ross Sea, where they determined by their compass readings that they had reached the South Magnetic Pole. Confirmation of the magnetic poles shifting resulted from a 1948 study of the North Magnetic Pole by Canadian scientists, Paul Serson and Jack Clark.

South Pass

The ROCKY MOUNTAINS once presented a formidable obstacle for anyone heading westward. During the 19th century, most western-bound travelers made their way across the Continental Divide via the South Pass. Located in southwestern Wyoming at the southern end of the Wind River Range, the South Pass has an elevation of 7,550 feet. It is not a narrow gorge flanked by rock faces, however, but a 25-mile-wide plateau covered with grass and shrubs. Peaks can be seen in the distance. Originally a Native American trail, the South Pass became known as the easiest way across the Rocky Mountains, with wagon travel possible, and was incorporated into three pioneer routes across Wyoming, the Oregon, Mormon, and California Trails, thus becoming a gateway to the Far West. The climb was so gradual up and over the pass that travelers did not realize they had crossed the Great Divide until they noticed streams flowing the other direction. A number of explorers are associated with it.

Scotsman ROBERT STUART, in the employ of JOHN JACOB ASTOR and his Pacific Fur Company, a subsidiary of the AMERICAN FUR COMPANY, is credited with making the non-Indian discovery of the South Pass. He had traveled by ship to the trading post Astoria at the mouth of the COLUMBIA RIVER in 1810–11. In June 1812, he set out with six companions eastward overland for St. Louis, following the Columbia and Snake Rivers (although one man, John Day, reportedly went insane and had to be sent back to Astoria). Fearing an attack by Crow Indians, Stuart and his party detoured to the north to the valley known as Jackson Hole. They then followed an Indian trail through Hoback Canyon along the western edge of the Wind River Range. On October 23, ascending into the mountain, they located an opening, which would come to be known as the South Pass.

After descending the Sweetwater River, the North Platte River, the Platte River, and finally the MISSOURI RIVER, they reached St. Louis, where Stuart reported the pass through the Rockies to Astor. Both men and the others who traveled with Stuart kept knowledge of it to themselves, apparently

for the transportation advantages it gave them in the FUR TRADE.

In 1823, because the Missouri River route through present-day Montana to the Rockies was cut off by resistance from Arikara Indians, JEDEDIAH STRONG SMITH and a party of MOUNTAIN MEN, including JAMES CLYMAN, THOMAS FITZPATRICK, and WILLIAM LEWIS SUBLETTE, headed southeastward into present-day Wyoming. They crossed the Bighorn Range by way of the Granite Pass to the Bighorn River, but were prevented from proceeding westward to the Union Pass by heavy snows. From Crow Indians, Smith learned of another pass to the south. The party headed for it and, by following the Wind River, then the Sweetwater River, they located the South Pass in February 1824 and crossed over to the Green River near the present Wyoming-Utah border, which would become the location of the first annual fur traders' rendezvous.

From that time on, the South Pass was known to fur traders. The earliest known successful crossing with loaded wagons through the pass was carried out by an expedition under BENJAMIN LOUIS EULALIE DE BONNEVILLE in 1832, heading for a summer rendezvous. In 1836, missionaries MARCUS WHITMAN and HENRY HARMON SPALDING traveled with an American Fur Company caravan from St. Louis, guided by Thomas Fitzpatrick. They became the first non-Indian travelers along that route not involved in the fur trade, and their wives became the first known non-Indian women to cross the Continental Divide. In 1841, Belgian missionary PIERRE-JEAN DE SMET led the first organized wagon train migration on the Oregon Trail, with Thomas Fitzpatrick serving as guide. Other emigrants came to use the pass as well, and it became part of what became known as the Oregon Trail, from Independence in western Missouri across central Nebraska following the Platte and North Platte Rivers and southern Wyoming through the South Pass, then following the Snake River across Idaho to the Columbia River and Oregon. In 1843, JESSE APPLIGATE, Marcus Whitman, and others organized the "Great Migration of 1843," a wagon caravan of some 1,000 emigrants to the Oregon Country.

The year before, JOHN CHARLES FRÉMONT led a U.S. government expedition to the region, one purpose of which was to chart the South Pass. Frontiersman CHRISTOPHER HOUSTON CARSON (Kit Carson) served as a guide. In 1843–44, Frémont headed another exploratory expedition, during which he again traveled the South Pass with Carson. In 1845, STEPHEN WATTS KEARNY led a U.S. military expedition that crossed through the South Pass. More and more emigrants continued to use the pass. In 1847, BRIGHAM YOUNG, who was a prominent leader in the Church of Jesus Christ of Latter-Day Saints—better known as the Mormons—led a party of Mormons along a trail, which for some stretches paralleled and which

for some stretches made use of the South Pass, then headed southwest into Utah.

With the California Gold Rush of 1849, the South Pass saw even more traffic west. What became known as the California Trail branched off from the Oregon Trail at Soda Springs, Idaho, then traversed desert country of Nevada to eastern California. The trail followed the Donner Pass through the Sierra Nevada. Between 1841 and 1866, approximately 350,000 migrants traveled through the South Pass. In 1858, the Lander Road, the first road to be surveyed and built in the Rockies, provided a shortcut from the South Pass to Fort Hall on the Snake River. In 1860–61, the Pony Express made use of the South Pass in carrying mail westward from St. Joseph, Missouri. In 1862, stagecoaches began using Central Overland Trail that branched off from the Oregon Trail at the junction of the North Platte and South Platte Rivers, then ran south of the Oregon Trail in southern Wyoming and bypassed the South Pass.

When gold was discovered on the southeastern end of the Wind River Range in 1867, South Pass City was founded along the pass. The completion of the transcontinental railway two years later limited travel along the South Pass since it followed the Overland Trail through the Rockies.

South Pole (South Geographic Pole, Geographic South Pole)

The South Pole, a cartographic point on the Antarctic continent, is considered the southernmost place on Earth, at a latitude of 90 degrees south and at a longitude of 0 degrees, where all meridians of longitude converge. Its location is determined by the imaginary line, or axis, around which Earth rotates from west to east. The axis is perpendicular to the plane of the EQUATOR and passes through the center of Earth, terminating at geographic points referred to as the South Pole in the Southern Hemisphere and the NORTH POLE in the Northern Hemisphere. From the South Pole, all directions on the surface of Earth are read as to the north. The South Pole is also referred to as the South Geographic Pole or Geographic South Pole, to distinguish it from the SOUTH MAGNETIC POLE, which is determined by Earth's magnetic field. A marker of the precise location of the South Pole has to be set every year because a glacier caps the pole and drifts slightly more than one inch a day. (The Ceremonial South Pole, marked by international flags of nations that signed the Antarctic Treaty of 1961, is allowed to drift with the ice.) The South Pole, like the North Pole, took on great symbolic significance for explorers, and the quest to reach it is part of the larger story of human activity on the Antarctic continent.

The British Antarctic Expedition of 1907–09, led by SIR ERNEST HENRY SHACKLETON, after locating the Beardmore

Glacier and crossing the Polar Plateau, missed reaching the South Pole by only 97 miles. ROBERT FALCON SCOTT led another British attempt on the Pole, with a plan to set out from McMurdo Sound and follow the route across the Beardmore Glacier and Polar Plateau pioneered by Shackleton. In the meantime, a Norwegian expedition under ROALD ENGELBREGT GRAVNING AMUNDSEN planned an approach from the Bay of Whales on the edge of the Ross Ice Shelf and across the Axel Heiberg Glacier. Amundsen's party of five set out on October 19, 1911, and reached the South Pole on December 14. Scott's party set out on November 1, 1911, and reached the Pole on January 17, 1912, whereupon they learned that they had failed in their attempt to be first. On the return journey, Scott's team of five all perished on being trapped in a nine-day blizzard. Another milestone in the history of Antarctic exploration was accomplished by American RICHARD EVELYN BYRD, who, on November 29, 1929, during the First Byrd Antarctic Expedition, became the first man to fly over the South Pole.

The United States maintains a base at the South Pole, known as the Amundsen-Scott South Pole Research Station, for the purposes of scientific study, including earth sciences, meteorology, glaciology, geophysics, upper-atmosphere physics, astrophysics, and biomedicine. The first permanent station there was established in 1957 as part of the INTERNATIONAL GEOPHYSICAL YEAR, and it functioned until 1975, when the present station was occupied.

Soyuz program

The Soyuz program is a program of SPACE EXPLORATION of the former Union of Soviet Socialist Republics (USSR; Soviet Union) and now Russia, the name of the program referring to spaceflights using the Soyuz type of piloted spacecraft as well as the Soyuz type ROCKET. The program began in 1967, subsequent to the VOSTOK PROGRAM and the VOSKHOD PROGRAM, having been proposed five years earlier as part of the Soviet Union's push to put the first human on the Moon. When the United States succeeded in doing so in 1969 in its APOLLO PROGRAM, the Soyuz spacecrafts were redesigned to carry people and supplies to SPACE STATIONS, which included the Salyut stations, *Mir*, and currently the *International Space Station*.

The first piloted Soyuz missions, after several unmanned test flights of the new spacecraft, put the cosmonaut (*cosmonauts* is the Russian term for ASTRONAUTS) Vladimir M. Komarov into orbit on April 23, 1967. He became the first person to die in a spaceflight when the parachute on his descent module malfunctioned. During a dual flight, *Soyuz 2* and *Soyuz 3* failed in an attempt to rendezvous and dock in space in October 1968; *Soyuz 4* and *Soyuz 5* succeeded in doing so in January 1969. The suc-

cessful U.S. Moon landing the following July led to the redirection of the Soyuz program. The Soviet Union placed three spacecraft in simultaneous orbit in October 1969, with *Soyuz 6*, *Soyuz 7*, and *Soyuz 8*. Launched in June 1970, *Soyuz 9* set a record at the time for humans in space, 17 days. In April 1971, *Soyuz 10*, the first space station mission, failed to dock with *Salyut 1*. But *Soyuz 11* successfully accomplished the task the following June. In July 1975, *Soyuz 19*, with ALEXEI ARKHIPOVICH LEONOV as commander, in the first such joint mission, rendezvoused and docked in space with an American Apollo spacecraft. There have been some 80 Soyuz flights.

The Soyuz rocket uses liquid fuel, kerosene, and liquid oxygen to launch the Soyuz spacecraft. Soyuz spacecrafts have three modules: the front orbital module is oval in shape; the middle descent module, for entry, is bell-shaped; and the rear service module, containing rocket engines and solar panels to supply electricity, is cylindrical.

space exploration

Humans have always looked to the Sun, Moon, and stars and have devised systems of thoughts to explain them and have dreamed of ways to reach them. In recent time, space exploration has become a remarkable reality.

The Science of Astronomy

Space exploration can be said to begin with the early astronomers, who utilized the scientific method to explain celestial phenomena. HIPPARCHUS of Greece and PTOLEMY of Alexandria of the second century B.C. were among those laying the foundations of the science of astronomy, although they theorized an Earth-centered solar system, a concept that endured well into the RENAISSANCE. In 1543, astronomer Nicolaus Copernicus of Poland published *De revolutionibus orbium coelestium*, in which he described the Sun as the center of a solar system, with the planets in orbit around it. In 1609, Johannes Kepler, a German, established that the orbits of planets are elliptical, not circular. The next year, Italian scientist Galileo constructed the first complete astronomical telescope and began viewing features on the Moon and eventually the moons of Jupiter. His studies determined a more accurate scale of distance in space. English physicist Sir Isaac Newton, active in the late 17th and early 18th centuries, helped further the understanding of the solar system with his studies of the laws of motion and laws of gravitation.

Rocketry and Aviation

In the meantime, ROCKET technology was being developed. Probably the Chinese, in the 13th century, were the first to conceive the notion of placing gunpowder within a tube to propel a device as gases rushed out (see CHINESE

Sectundus.

EXPLORATION); such methods of propulsion were refined over the centuries, typically for purposes of warfare until the 20th century, when three scientists—Russian inventor Konstantin Eduardovich Tsiolkovsky, American physicist Robert Hutchings Goddard, and Romanian-born mathematics teacher Hermann Oberth—began theorizing rocket use in spaceflight.

While rocketry progressed, so did techniques of aviation (see AVIATION AND EXPLORATION). The first ascents in a hot-air BALLOON were conducted in the late 18th century, and the first ascents in an AIRSHIP, in the mid-19th century, all in France. And, in 1903, American brothers Orville and Wilbur Wright accomplished the first airplane flight.

Rocket technology progressed rapidly in the 1930s and 1940s, World War II providing impetus to develop it as weaponry. Advances were applied by the United States and the former Union of Soviet Socialist Republics (USSR; Soviet Union) to space exploration in the 1950s, during the cold war between the two nations.

Science Fiction as Inspiration

While science and technology were making spaceflight a possibility, writers were providing inspiration. In A.D. 160, Lucian of Samos, a Greek, wrote a story of flight to the Moon on artificial wings. Centuries later, a number of writers captured the public's imagination with their science fiction novels, in particular Frenchman Jules Verne's *De la Terre à la Lune (From the Earth to the Moon)*, published in 1865, and Englishman H. G. Wells's *The First Men on the Moon*, published in 1900. Science fiction, as a literary genre, and later a film and television genre, continued to presage developments in space exploration throughout the 20th century.

Satellites in Space

The first triumph of space exploration was the launching of the artificial SATELLITE *Sputnik 1* by the Soviet Union on October 4, 1957. On November 3, *Sputnik 2* carried the first living creature into space, a dog. The United States launched its own satellite on January 1, 1958, and reorganized its space program under the NATIONAL AERONAUTICS AND SPACE ADMINISTRATION, better known as NASA.

Humans in Space

The Soviet Union, with the VOSTOK PROGRAM, also achieved another first, placing the first human in space—cosmonaut YURI ALEKSEYEVICH GAGARIN—on April 12, 1961. He was also the first human to orbit space. Three weeks later, on May 5, the United States placed its first human in space—ALAN BARTLETT SHEPARD, JR.—on a sub-orbital flight. On July 21, 1961, American Virgil I. (Gus) Grissom completed a second suborbital flight. JOHN HER-

SHELL GLENN, JR., became the first American to orbit Earth on February 20, 1962. These early U.S. flights were part of the MERCURY PROGRAM. On June 16, 1963, the Soviets put the first woman in space—VALENTINA VLADIMIROVNA TERESHKOVA—aboard *Vostok 6*. An American woman, SALLY KRISTEN RIDE, first reached space 20 years later, on June 18, 1983. Still another Soviet first was part of the VOSKHOD PROGRAM: On March 1965, ALEKSEI ARKHIPOVICH LEONOV performed the first extravehicular activity (EVA), or “space walk.” The following June, EDWARD HIGGINS WHITE, II, carried out the first American EVA, as part of the GEMINI PROGRAM.

Space Probes

In addition to Earth-orbiting satellites and piloted spacecraft, various nations have made use of the SPACE PROBE for exploration, unmanned space vehicles carrying scientific equipment launched beyond Earth's gravitational field and directed to the Moon, another planet, or another planet's moon or moons. The United States launched the first probe, *Pioneer*, on October 11, 1958, but it failed to escape Earth's pull. *Luna 1*, a Soviet probe, launched in January 1959, became the first human-made object to escape Earth's orbit. In September of that year, *Luna 2* became the first artificial object to hit the Moon. And that October, *Luna 3* sent back the first photographs of the dark side of the Moon.

Humans on the Moon

The Soviet Luna and Zond probes and the U.S. Ranger, Surveyor, and Lunar Orbiter probes were launched with the goal in mind of sending humans to the Moon. The United States achieved this significant first in space exploration with its APOLLO PROGRAM; on July 20, 1969, with the *Apollo 11* mission, NEIL ALDEN ARMSTRONG and Edwin “Buzz” Aldrin, Jr., became the first humans to land on the lunar surface. Five subsequent Apollo missions carried humans to the Moon.

Space Stations

With the U.S. success on manned lunar missions, the Soviets shifted their SOYUZ PROGRAM to developing a SPACE STATION and studying the effects of long-term spaceflight on humans. Between 1971 and 1984, they launched seven Salyut space stations. The United States built its own space station, *Skylab*, which was occupied by three sets of crews in 1973. The first module of the *Mir* space station was launched in 1986, with other components added over the next 10 years (with Russia taking over control of it in 1991, after the breakup of the Soviet Union). Starting in 1995, Russia and the United States participated in joint *Mir* missions, with both cosmonauts and ASTRONAUTS spending extended periods of time in space. In 1995, Russian Valeriy

In this 1965 photograph, astronauts prepare for a simulated Gemini test at Cape Kennedy in Florida. (Library of Congress, Prints and Photographs Division [LC-USZ62-121458])

Polyakov completed a record 14 months aboard *Mir*; the next year, astronaut Shannon Lucid set an American space-flight endurance record of 188 days.

International cooperation in space programs has continued to the present. Many different nations are involved in the building of an *International Space Station* to be finished by 2006. The first module was launched in 1998. Eleven of the participating nations are members of the EUROPEAN SPACE AGENCY, an organization of presently 15 nations founded in 1975; Brazil, Canada, and Japan are also involved in the project.

Space Shuttle

In the 1980s, the United States began using the Space Transportation System (STS), popularly known as the SPACE SHUTTLE. It is a reusable spacecraft, launched by rockets but with gliding capabilities for landings. It has become the primary vehicle for building and taking supplies to the *International Space Station* and for the launching, servicing, and

repairing of artificial satellites. It has also the ability to conduct numerous scientific experiments. The *Columbia* disaster in 2003 (following the earlier *Challenger* disaster of 1986) has led to a reexamination of space shuttle safety issues, however.

Humans have thus traveled as explorers into Earth orbit time and again; they have even reached the Moon. Interplanetary travel might someday become a reality. Exploration to the Sun and other planets has been carried out by space probes, with humans participating from Earth, since the 1960s; the Sun, Mars, Venus, Mercury, Jupiter, Saturn, Uranus, Neptune, and some of their moons have been visited or approached. There have even been rendezvous with asteroids and Halley's Comet. Many more such missions are planned.

Space has been referred to as the final frontier. Its highly organized missions, depending to such a degree on technol-

ogy and such a large support team, seem to have little in common with the expeditions of ancient and even more recent explorers on land and sea. Yet the impulse to visit, examine, and understand unknown places is consistent with motivation for exploration through the ages.

space probe

Humans have traveled in orbit around the Earth time and again. They have also journeyed to the Moon. But for travel to other parts of the solar system, they have been dependent on space probes, which have instrumentation, including cameras, to collect scientific data and radio transmitters to send the data back to Earth. Unlike an artificial SATELLITE that is placed in orbit around Earth, a space probe is launched by a powerful enough ROCKET so that it escapes Earth's gravitational field and can navigate among other celestial bodies. Some probes are directed to orbit the Moon, another planet, or another planet's moons (becoming satellites, in effect), or to fly by one or more planets; others are directed to soft-land scientific equipment on lunar or planetary surfaces.

The first space probe, *Pioneer 1*, was launched by the United States, under the direction of the NATIONAL AERONAUTICS AND SPACE ADMINISTRATION (NASA), on October 11, 1958, one year after the first satellite, *Sputnik 1*, was launched by the Union of Soviet Socialist Republics (USSR; Soviet Union) and almost nine months after the first U.S. satellite, *Explorer 1*, was launched. *Pioneer* did not accomplish its attempted goal of orbiting the Moon, but it reached an altitude of some 72,800 miles in outer space, gathering data on meteors, temperature, radiation, and magnetic fields, before falling back toward Earth and disintegrating in the atmosphere.

The Soviet Union achieved the greatest early success in lunar exploration with the Luna series. *Luna 1*, launched in January 1959, became the first human-made object to escape Earth's orbit, but missed striking the Moon. The following September, *Luna 2* became the first artificial object to do so. That October, *Luna 3* sent back the first photographs of the far side of the Moon.

The United States, after a number of failures, achieved some success, and gained experience for its APOLLO PROGRAM and the goal of placing humans on the Moon, with its Ranger, Surveyor, and Lunar Orbiter probes of the 1960s, which sent back photographs, performed soft-landings, and mapped the Moon. In 1968, the Soviet Union sent the first Zond probes in preparation for their own piloted missions. On July 20, 1969, with the *Apollo 11* mission, NEIL ALDEN ARMSTRONG and Edwin "Buzz" Aldrin, Jr., became the first humans on the Moon's surface. In 1970, with *Luna 17*, the Soviet Union succeeded in placing the first wheeled vehicle on the Moon, *Lunakhod 1*, a re-

mote-controlled rover. The final Luna mission, *Luna 24*, took place in 1976. The United States put the probe Clementine in Moon orbit in 1994, using a laser to study topography, and the Lunar Prospector in orbit in 1999, to study surface composition as well as gravitational and magnetic fields.

There have been numerous space probes into interstellar space beyond the Moon. The United States has launched many probes, exploring to the end of the solar system and beyond from the 1960s to the present. The Mariner series explored Mars, Venus, and Mercury in the 1960s–70s. *Pioneer 10* passed through the asteroid belt and became the first artificial object to escape the solar system in 1973; *Pioneer 11* studied Jupiter and Saturn. Because of the great distances involved, some of these missions last decades; *Pioneer 11*, for example, launched in 1973, continued to send data back to Earth until 1994. The Viking series of the 1970s studied Mars, *Viking 2* of 1975–76 being one of the early success stories, with transmission of photographs and chemical analyses. Yet it found no trace of life on the Red Planet. The Voyager series launched in the 1970s passed by and made studies of Jupiter, Saturn, Uranus, Neptune, and their moons. In 1980, *Voyager 1* exited the solar system, followed by *Voyager 2* in 1989; in 1998, *Voyager 1* passed *Pioneer 10* to become the most distant human-made object in space. The *Magellan* probe, launched in 1989, orbited Venus. The *Ulysses* probe (shared by the EUROPEAN SPACE AGENCY) of the 1990s conducted studies of the Sun. The *Galileo* probe of the 1990s studied Venus, the Moon, the asteroids, Jupiter, and Jupiter's moons. The Mars *Pathfinder* and Mars *Global Surveyor* of the 1990s continued studies of Mars: *Pathfinder* returned many images from the surface and carried out 15 chemical analyses; *Global Surveyor*, in orbit, mapped the planet and took photographs of features to suggest the presence of water on or below the surface. The NEAR (Near Earth Asteroid Rendezvous)-Shoemaker studied the asteroid Mathilde and landed on the asteroid Eros. Launched in 2001, *Odyssey* is a successful orbiter around Mars, sending back numerous images into 2004.

Meanwhile, other nations have launched probes. The Soviet *Mars* probes of 1971–74 studied Mars. The Soviet Venera series of the 1960s–80s studied Venus. The Soviet Union's *Vega 1* and *2* probes, Japan's *Sakigake* and *Suisei* probes, and the European Space Agency's *Giotto* probe rendezvoused with Halley's Comet in 1986. The Japanese *Nozomi* probe of the late 1990s studied Mars.

Those mentioned are the success stories. Some probes, like the Soviet Union's *Phobos 1* and *2* to Mars in the late 1980s, and the U.S. *Mars Climate Orbiter*, *Mars Polar Lander*, and twin probes referred to as *Deep Space 2* in the late 1990s, failed in their missions. In fact, two-thirds of all probes to Mars have failed.

Many more space probes are planned, some of them already launched for later rendezvous with their targets. The joint U.S.-European *Cassini* probe, for example, launched in 1997, is intended to explore Saturn, its rings, and some of its moons on arrival in 2004. With the planet Mars closer to Earth in 2003–04 than it has been in 7,300 years, numerous nations have sent space probes to study it.

space shuttle

Space shuttle is the popular name of the Space Transportation System (STS), a reusable spacecraft of the United States. It was developed by the NATIONAL AERONAUTICS AND SPACE ADMINISTRATION (NASA) in the 1970s and first used in the 1980s as a reusable launch, orbital, and landing vehicle, which can transport humans and cargo to and from Earth. Despite setbacks over the years, it has proven a practical means of SPACE EXPLORATION. It has been used for the launching, servicing, and repairing of a variety of types of artificial SATELLITE; to retrieve previously deployed spacecraft; for the building and carrying of supplies to a SPACE STATION; and to conduct scientific experiments. For many of these tasks, extravehicular activities, popularly known as space walks, are required.

The space shuttle is launched vertically, two solid rocket boosters propelling the spacecraft for about two minutes to an altitude of about 28 miles before separating and falling into the ocean, where they are retrieved and later refurbished for reuse. The orbiter has three main liquid-propellant engines, the first reusable ROCKET engines, which fire for about eight minutes until reaching the desired altitude for orbit. An external fuel tank, the only part of the shuttle that is not recycled, is jettisoned, breaking up in the upper atmosphere and falling in pieces into the ocean. Other smaller engines are used for maneuvers when in orbit. The spacecraft's hull is protected from the friction and heat of reentry into the atmosphere by some 24,000 silicate fiber tiles. Directed by the crew, the winged orbiter glides to Earth and makes a horizontal landing on a runway.

The space shuttle crew consists of the commander and pilot, trained ASTRONAUTS, as well as up to five more people, some of them nonastronauts, including a mission specialist and payload specialists. The crew compartment is the front of the craft with a cargo bay (60 by 15 feet) behind it. The orbiter's crew compartment has three levels: the flight deck, from where the commander and pilot control the craft; the mid-deck, where the galley, toilet, sleep stations, along with storage and experiment lockers are located; and the utility area, with air and water tanks. In the mid-deck are also a hatch for entrance and egress before and after landing, and an airlock hatch into the cargo bay. The cargo bay doubles as a workstation; its doors give access to space.

The first space shuttle, *Columbia*, was launched on April 12, 1981. The space shuttle program completed numerous successful launches over the course of five years until January 28, 1986, with the *Challenger* disaster. A failure of a rubber sealant ring between two segments of one of the solid rocket boosters, made brittle by cold weather, led to the escape of burning fuel and an explosion 73 seconds after launch. The entire seven-member crew perished, among them Christa McAuliffe, a high school teacher from New Hampshire, who would have been the first teacher in space. The space shuttle program was suspended for design modifications until September 28, 1988, with the flight of the shuttle *Discovery*.

Three other space shuttles have been used in addition to the *Columbia* and *Challenger*: the *Discovery*, since 1983; the *Atlantis*, since 1985; and the *Endeavour*, since 1991. (The *Enterprise*, named after the vehicle in the fictional television series *Star Trek*, a prototype space shuttle, was launched from a 747 airplane in 1977 to test design features.) The vehicles' frames have remained the same, with the technology evolving and the craft being refitted over the years.

Successful missions since the *Challenger* disaster have included the launching of several exploratory spacecraft: *Magellan* in May 1989, a probe to the planet Venus; *Galileo* in October 1989, a probe to Jupiter; *Ulysses* in October 1990, a probe to the Sun; and the *Hubble Space Telescope* in April 1990, the placement in orbit of a telescope for astronomical studies, and a follow-up mission in December 1993, for repair of the telescope. In July 1995, the shuttle *Atlantis* rendezvoused and docked with the Russian space station *Mir*, the first in a series of nine linkups. The shuttle is also central to the building of the *International Space Station*, the first module of which was launched in 1998.

On February 1, 2003, the space shuttle program suffered another disaster when the *Columbia*, the first shuttle ever to fly a mission, broke up over Texas on reentry—because of damage to protective paneling on the left wing when a piece of foam insulation from the external fuel tank came loose and struck it during launch. This was the first accident during landing for NASA in 42 years of spaceflight. All seven crew members died, among them the first Israeli astronaut, Ilan Ramon.

The Union of Soviet Socialist Republics (USSR; Soviet Union) began its own space shuttle program in 1988, designing the Buran spacecraft; on the breakup of the Soviet Union in 1991, Russia inherited the program but halted it two years later. The United States plans to retire the space shuttle in 2012 and is designing a new generation of shuttle vehicles.

space station (space platforms)

The term *space station* refers to a facility in space, where humans live for extended periods of time. They are a type of ar-

tificial SATELLITE, in permanent orbit around Earth, unlike spacecraft, which stay in orbit relatively short periods of time. They relate to SPACE EXPLORATION as service centers for spacecraft and as laboratories for scientific experiments. In the future, they may serve as spaceports for travel to other parts of the solar system. They are self-contained systems, with their own oxygen, water, and food, yet need maintenance and restocking from Earth. They also have been referred to as space platforms.

A Russian inventor and ROCKET designer, Konstantin Eduardovich Tsiolkovsky, is credited with conceptualizing orbiting space stations for the purpose of interplanetary travel, in the early 20th century, long before the first spaceflight. The former Union of Soviet Socialist Republics (USSR; Soviet Union) launched the first space station, *Salyut 1*, in April 1971, 14 years after it launched the first artificial satellite, *Sputnik 1*. The *Soyuz 10* crew, part of the SOYUZ PROGRAM, docked with the space station four days later but could not enter it. The *Soyuz 11* crew, cosmonauts Georgi Dobrovolski, Viktor Patsayev, and Vladislav Volkov, made a successful docking on June 7, 1971, and lived on the station for three weeks. The Salyut series of space stations, a total of nine, were relatively small structures launched fully assembled and designed for up to three people. New docking and space assembling technologies were developed in the course of the program. The first Salyut stations had open-loop life support systems, designed to discard all waste matter into space. But closed-loop life-support systems were developed—the recovery of oxygen from carbon dioxide and the recycling of water—to decrease dependency on supplies carried from Earth.

The United States launched its first space station, *Skylab*, on May 14, 1973, its crew of three ASTRONAUTS—Pete Conrad, Joe Kerwin, and Paul Weitz—following on May 25 after a delayed launch. The NATIONAL AERONAUTICS AND SPACE ADMINISTRATION (NASA) provided rockets and spacecraft for *Skylab* missions from the APOLLO PROGRAM. Like the first Salyut stations, *Skylab* was fully assembled on Earth and had open-loop systems. With a telescope mount, it was the first manned solar observatory in space. Two other sets of crews lived on *Skylab* that year. It remained unoccupied until July 1979, when it reentered the atmosphere and disintegrated from the heat of friction, its pieces brought down in the Indian Ocean, with some mistakenly hitting isolated parts of Australia.

The Soviet Union followed its Salyut program with the *Mir* space station, the first permanently manned space station. The first core module was launched on February 19, 1986; six other modules were added through 1996. Soviet spacecraft of the Soyuz program originally ferried crews and supplies to *Mir*, but later the United States helped with the SPACE SHUTTLE. Crews of the *Mir* over the years consisted of people of many different nationalities, more passengers

than all previous space stations combined. After numerous repairs and growing technical problems, *Mir* was directed back to Earth, falling into the Pacific Ocean in March 2001.

The United States began a program to launch its own permanent space station, *Freedom*, in 1984. Ten years later, after the breakup of the Soviet Union, the program was combined with Russia's *Mir 2* project, with the goal of building an *International Space Station (ISS)*. Eleven nations in the EUROPEAN SPACE AGENCY, along with Brazil, Canada, and Japan, are involved in the project. The first component, a Russian-built core module, was launched in 1998. The first crew, two Russians and one American, arrived in 2000. Construction is planned through 2006; *ISS* will eventually support a crew of seven.

Spanish Main

The phrase *Spanish Main* was first generally applied to the “mainland” of Spanish America, especially the territory along the north coast, from the mouth of the ORINOCO RIVER westward to the isthmus of Panama, and comprising most of present-day coastal Venezuela, all of Colombia, and part of Panama. The phrase also came to be used in reference to waters off the mainland, that is, the southern portion of the Caribbean Sea, along with Spanish-held islands. Sometimes it was applied to the entire Caribbean basin.

The earliest use of the phrase is not known. Early mariners used the term *the main* to refer to any mainland. Non-Spanish people active in the Caribbean were most likely to cite the Spanish Main as distinct from territory controlled by other European nations. Starting in the late 16th century, along with the Spanish colonization of the region and its use as a transatlantic shipping center—especially to transport gold, silver, and gemstones plundered from indigenous peoples or forcibly mined by them—came PIRACY, some of it carried out by PRIVATEERS sanctioned by the English government, such as SIR FRANCIS DRAKE (see TREASURE AND EXPLORATION). Pirates were active in the Caribbean into the 19th century, and the phrase *Spanish Main* is most often associated with their activities.

speleology

Speleology is the scientific study of caves and cave systems. A cave is a natural underground cavity large enough for people to enter (sometimes the term *cavern* is used for a large cave). *Cave system* refers to a number of interconnected caves. Speleology includes classifying caves geologically, measuring and mapping them, analyzing their water systems, and reporting on flora and fauna found in them. In its infancy as a discipline in the late 19th century, speleology was regarded as a branch of geography since much of the activity associated with it was finding caves. Now it is perceived as a subdivision

of geology. It also draws on the disciplines of chemistry, hydrology, climatology, and biology. Speologists also employ surveying techniques (see SURVEYING AND EXPLORATION). And since caves have long served as shelters for humans, speleology and archaeology sometimes go hand-in-hand (see ARCHAEOLOGY AND EXPLORATION). One now-common application of speleology is the tracing of underground waters to monitor and prevent pollution.

The term *speleology* is derived from the Greek words for “cave” and the “study of.” In Middle English, *spelunk*, from the Latin *spelunca*, a derivation from Greek, was another name for a cave or grotto. *Speluncar* endured into modern English as an adjective form, meaning “pertaining to caves,” but fell out of usage by the mid-19th century. In 1895, Frenchman Edouard-Alfred Martel founded La Société de Spéléologie, the bulletin of which was called *Spelunca*. The term *spelunker* for someone who explores caves and *spelunking* for the act itself came into usage in the United States in the late 1930s and early 1940s. *Spelunking* remains a common term for the exploration of caves, along with *spelunker*, the term for those people who do the exploring. Yet most nonscientists skilled in spelunking techniques and equipment—such as special shoes, helmets, ladders, cables, and lamps—prefer the terms *caving* and *caver*. The term *cave diving* refers to exploring caves underwater.

Speologists and geologists have classified caves into primary caves and secondary caves. Primary caves were formed at the same time as the surrounding rocks, with the space of the cave remaining empty. Secondary caves were formed sometime after the formation of the surrounding rocks. Most caves are secondary caves, and the most common type of secondary cave is a karst cave, formed in limestone, gypsum, or other soluble rocks by dissolution.

The exploration of caves has grown in popularity in recent decades. The National Speleology Society, a U.S. organization, founded over 60 years ago and located in Huntsville, Alabama, now has more than 10,000 members. The National Caves Association, founded in 1965 and centered in Park City, Kentucky, is a nonprofit organization of publicly and privately owned caves and caverns developed for public visitation. There are many other such organizations in countries around the world. The Union Internationale de Spéléologie (UIS), founded in 1965 with its central office in the Czech Republic, is the international body for speleology and caving.

spelunking See SPELEOLOGY.

Spice Islands (Moluccas, Maluka)

Spice Islands is a former name for the Moluccas, a collection of islands between Celebes and New Guinea in the Malay

Archipelago, situated where the South Pacific Ocean and Indian Ocean meet. They encompass some 32,307 square miles, 90 percent of which is ocean. The Moluccas (or Maluka) are currently a province in the eastern portion of the Republic of Indonesia. The largest island is Halmahera, and the province’s capital is the city of Ambon on the island of Ambon. Other significant islands in the group are Ternate, Ceram, Buru, and Tidore. Because they were formed by volcanic activity, the Moluccas are mountainous. The climate is humid, and the soil fertile. The cloves, nutmeg, mace, and pepper produced by the islanders, and their central role in the SPICE TRADE, gave rise to the name Spice Islands.

For centuries before the arrival of Europeans, the Spice Islands were visited by Chinese from the east and Arab Muslims from the west; traveling by ship, both peoples were attracted by the islands’ agricultural goods (see CHINESE EXPLORATION; MUSLIM EXPLORATION). To protect their profits, the Arab traders who sold these commodities to Europe kept secret their location. The desire of European merchants to circumvent these Arab traders was a major motivating factor in what became the EUROPEAN AGE OF EXPLORATION, beginning in the 15th century.

The probable first European visitor to the Moluccas was Italian LUDOVICO DI VARTHEMA in 1505. The Portuguese, who had already begun trading in India with VASCO DA GAMA’s voyage of 1497–99, were anxious to get to the source of these precious spices. In 1511, Portuguese mariner and trader FRANCISCO SERRANO, after accompanying AFONSO DE ALBUQUERQUE in the conquest of the Malayan port of Malacca on the west coast of the Malay Peninsula, investigated the Spice Islands. After being appointed viceroy of Ternate, he established a Portuguese trading post there in 1513. A Spanish expedition originally headed by Portuguese mariner FERDINAND MAGELLAN reached the Spice Islands across the Pacific from the east in 1521 during the first CIRCUMNAVIGATION OF THE WORLD. Portuguese domination of the Spice Islands was henceforth challenged by the Spanish, who asserted that the islands were located in their half of the world according to Alexander VI’s papal bull of 1493. The dispute was resolved with the Treaty of Saragossa of 1529, in which the Spanish emperor, more interested in developing Spain’s possessions in the Americas, agreed to drop the claim in exchange for a cash payment from Portugal.

For most of the 16th century, Portugal held a tight monopoly on exports from the Spice Islands to Europe. In October 1579, SIR FRANCIS DRAKE made the first English voyage to the region and reached a trade agreement with the sultan of Ternate, beginning an intermittent English presence in the region. In 1595, CORNELIUS HOUTMAN was recruited by a group of Dutch merchants to open trade with the Spice Islands. Although not profitable, the expedition was successful in its defiance of the Portuguese. In April

1602, the newly chartered DUTCH EAST INDIA COMPANY sent its first fleet of ships to the islands. By the mid-1600s, through naval actions and privateering, the Dutch had gained control of the island group. Conflict with England was resolved by an agreement between the two countries to divide up their interests. England expanded its trading activities in India, and the Dutch maintained their presence in the Spice Islands.

The population of the Moluccas is ethnically diverse, including Malay, Papuan, and Javanese peoples. The native population has intermarried with Europeans over the centuries, especially the Portuguese and Dutch. About 60 percent of the people are Muslim; the rest, mostly Christian. Agriculture is still central to the economy; food crops include cassava, taro, yams, and sweet potatoes. The sago palm provides starch as a dietary staple as well as wood for building. Spices are no longer the main export products, but rather coconut, coffee, and wood products.

Spice Route

The SPICE TRADE, that is, the trade of spices and incense from the East to the West has followed many routes over its long history from Asia to the Near East, Africa, and Europe. The main overland route stretched over thousands of miles of forbidding landscape through central Asia and is commonly called the SILK ROAD, because it carried in addition to spices and incense, silks and other luxury items from China and India. The caravans traveling this route often consisted of thousands of camels. The goods might be sold to lands along the eastern and southern MEDITERRANEAN SEA, or distributed by sea by Phoenicians, Greeks, or other mariners to more distant lands (see GREEK EXPLORATION; PHOENICIAN EXPLORATION).

Yet overland travel was more expensive, dangerous, and slower than travel by sea, and so, even before the establishment of the Silk Road, in the second to first century B.C., spices and incense were brought by ship from India, across the Indian Ocean, through the Arabian Sea to the south coast of the Arabian Peninsula. Traders would hug close to the land, sailing through the Indian Ocean, to the coast of present-day Yemen. From there, where several wealthy kingdoms flourished in the centuries B.C., the goods would travel by boat through the RED SEA, which was dangerously infested with pirates, or by caravan to Mediterranean coastal regions, such as Alexandria in North Africa, another center of the spice trade.

The southern area of Arabia, occupied by modern-day Yemen, was called Arabia Felix (Happy Arabia) by the Romans for its great wealth as an important intermediary in the spice trade, as well as the source of frankincense and myrrh, gathered from trees growing just south of the Rub' al-Khali,

the desert region also known as the EMPTY QUARTER. The wealth supported the development of great kingdoms and many wealthy cities. The most noted kingdom was that of the Sabaeans, which flourished from the 10th century B.C. until about 115 B.C.; Marib was the capital city. This area was possibly that referred to as PUNT by the ancient Egyptians, who sent several seafaring expeditions through the Red Sea, including that of HANNU in about 2450 B.C., which returned to Egypt with spices and incense (see EGYPTIAN EXPLORATION). The Red Sea and the Arabian Sea were dangerous routes to take because of the pirates who habitually sallied out from the Arabian and African shores. The Sabaeans controlled the overland trade routes to Palestine and to Egypt, which cross deserts and mountains, passing through the part of Arabia called Arabia Petrea (Stone Arabia) by the Romans.

In about A.D. 45, a Greek merchant by the name of HIPPALUS endeavored to avoid the coasts altogether, sailing down the center of the Red Sea and through the Arabian Sea to India, and his route became commonplace, reducing the length and dangers of the journey East, as well as the dependence on the Arabs. Traders, at great risk to their ships and cargoes, began catching the yearly monsoon winds to sail across the Arabian Sea and back.

The Red Sea/Arabian Sea route remained a standard route for hundreds of years. Ships could travel between the Red Sea and the NILE RIVER by an ancient Egyptian canal, and from the Nile to the Mediterranean Sea. The growth of the Roman Empire resulted in the eradication of PIRACY in the Mediterranean Sea and Red Sea (see ROMAN EXPLORATION). Even after the breakup of the Roman Empire in the fifth century, Arab traders continued to do a brisk business, and the wealth fueled the expansion of the Islamic empire after the founding of Islam in the seventh century.

The main artery for the overland spice trade was Constantinople (present-day Istanbul, Turkey), the capital of the Eastern Roman Empire (or Byzantine Empire). After the CRUSADES of the late 11th to the late 13th centuries, the merchants in the Italian port city of Venice became responsible for most of the spices entering Europe, bringing them through the Mediterranean from ports on the coast of the Near East, a region known as the LEVANT.

With the Venetians holding a monopoly on Mediterranean trade with the Middle East, and with the rise to power of the Turks in Asia Minor, trade through Constantinople slowed to a trickle. European nations began sending out ambitious oceangoing expeditions to locate new trade routes with the East. The 1497–99 Portuguese voyage of VASCO DA GAMA southward in the Atlantic along the west coast of Africa, around the CAPE OF GOOD HOPE, then northward in the Indian Ocean along Africa's east coast, and across the Indian Ocean to India, created a viable route. A Spanish expedition headed by Portuguese mariner

FERDINAND MAGELLAN in 1619–22, which crossed the Atlantic, rounded South America, and crossed the Pacific, eventually completing the first CIRCUMNAVIGATION OF THE WORLD, proved that the EAST INDIES could be reached from the west. The English and the Dutch continued searching for water routes to the Orient, both a NORTHWEST PASSAGE through the Americas and a NORTHEAST PASSAGE to the north of Europe and Asia. These passages were not accomplished for centuries, however, because of ice conditions in the Arctic Ocean.

In the 19th century, even after the importance of the spice trade had dwindled, the establishment of European colonies in the East created a demand for other commodities. A quick route was therefore needed, which led to the digging of the Suez Canal, completed in 1869.

See also COMMERCE AND EXPLORATION.

spice trade

The common seasonings used to flavor foods today, including pepper, nutmeg, cinnamon, and cloves, were, for much of history, precious luxuries. As late as the 16th century in Europe, one small ship full of spices could make a fortune for the investors on an expedition of several ships and make its crew rich as well. Spices played an important role in flavoring foods and preserving their freshness, and incense was used in religious ceremonies by all the early peoples of the Near East and North Africa. Spices and herbs also served as the primary ingredients in many medicines. These spices, for the most part, along with fragrant resins and gums, such as frankincense, myrrh, and other incense, came from the East, over land and by sea. The importance of the spice trade endured from ancient times throughout the Middle Ages and RENAISSANCE and led to the establishment of various land and sea routes between Europe, Africa, and Asia and spurred on the search for oceanic routes as well (see SPICE ROUTE).

The Ancient Trade

The quest for spices and incense inspired what some consider the first voyage of exploration. An Egyptian, HANNU, set out to the RED SEA coast with 3,000 men at the orders of the Egyptian pharaoh Sahure in around 2450 B.C. and built ships which he sailed to the land the Egyptians called PUNT. It is not known what Hannu brought back, but later, in about 1492 B.C., Egyptian Queen HATSHEPSUT sent another expedition to Punt. It returned with incense, including frankincense, myrrh, and, of special importance, myrrh seedlings, which were planted in Egypt (see EGYPTIAN EXPLORATION). The conquests of ALEXANDER THE GREAT in the fourth century B.C. brought more contact between Mediterranean peoples and those in the East. At this time, Arab traders still had a monopoly on the spices traveling by

sea, and told fabulous stories of how they were obtained, in order to preserve the secret of their origin and to discourage any attempt to break their lucrative monopoly.

By about the time the Romans became interested in gaining hold of the spice trade, demand for spices was so great that Eastern traders were taking advantage of powerful monsoon winds to sail from India to Arabia, at great risk to life and cargo. The returns were great enough, though, to justify any risk. The spice trade passed through Alexandria, making it one of the most important centers for commerce in the ancient world. In about 25 B.C., after the Romans had annexed Egypt, under the reign of Augustus, officer GAIUS AELIUS GALLUS set out on an expedition to Arabia in order to conquer the Sabaeans, who occupied a kingdom on the southern end of the Arabian Peninsula, from where much of the trade passing through Alexandria originated. The Romans called this southern tip of the Arabian Peninsula, in modern-day Yemen, Arabia Felix, or Happy Arabia, because of the wealth it derived from trade in spices and resins. Gallus failed to subjugate the Sabaeans and to conquer their principal city of Marib, and returned to Egypt with only new geographic knowledge for the Romans (see ROMAN EXPLORATION).

The Spice Trade in the Middle Ages

The Arabs maintained control of much of the spice trade for centuries, and their control solidified with the rise of Islam. The Prophet Muhammad, who launched the religion, was married to a woman made wealthy by the spice trade. The Muslims carried Islam throughout Arabia, uniting the entire peninsula by the time of his death in A.D. 632 (see MUSLIM EXPLORATION).

By the eighth century, the Islamic empire had spread from North Africa in the West to Persia in the East. Trade continued between the East and West, if somewhat abrogated, until the conquest of the Arabs by Turks from the Anatolian Peninsula in the mid-11th century. The Turks, converting to Islam as they conquered, were more hardened against the Christians in the West than their Arab predecessors. The Turks threatened Constantinople (present-day Istanbul, Turkey), the seat of the Eastern Roman Empire (Byzantine Empire), and cut off Christian pilgrimages to the Holy Land. This sparked the CRUSADES, the military actions by European Christians against the Muslims of the Near East from the late 11th century to the late 13th century. Crusaders returning to Europe from the East had a greater desire for Eastern goods, among them spices.

Venice, a city in northern Italy, was the primary port for trade between East and West at this time. It was from Venice that Venetian merchant MARCO POLO set out for the East in 1271 with his father, NICCOLÒ POLO, and uncle MAFFEO POLO, and wound up traveling throughout China and the vast empire of the Mongols. Returning by sea, after 24

years, Marco Polo's account brought back detailed reports of the source of the spices craved by Europeans.

The Enduring Spice Trade

Just as early mariners attempted new routes to profit from the spice trade, so did mariners during the RENAISSANCE, helping prompt what has become known as the EUROPEAN AGE OF EXPLORATION. The Portuguese established a route around Africa. The Spanish ended up reaching the Americas and navigating the Pacific Ocean.

HENRY THE NAVIGATOR, prince of Portugal, developed a plan to reach India and the SPICE ISLANDS (the Moluccas) by rounding the tip of Africa. BARTOLOMEU DIAS rounded the CAPE OF GOOD HOPE in 1488, and VASCO DA GAMA, in 1497–99, crossed the Indian Ocean to India and returned to Portugal with a load of pepper. Meanwhile, Italian mariner CHRISTOPHER COLUMBUS was proposing a plan to sail westward across the uncharted waters of the Atlantic Ocean to reach the Spice Islands in the east. In 1492, sailing for Spain, he reached the WEST INDIES, so named because he thought them the outlying islands of the EAST INDIES, and began to search for gold and spices. In 1497, another Italian, JOHN CABOT, who had experience sailing for Venice in the spice trade, sailed under English sponsorship in 1497, reaching North America.

Portuguese mariner FERDINAND MAGELLAN, after a rift with the king of Portugal, moved to Spain and proposed a southwest passage through or around South America, in order to reach the Spice Islands. Five ships were provided. Magellan managed to sail from the Atlantic through South America's Strait of Magellan (see MAGELLAN, STRAIT OF) to the Pacific Ocean, then cross it to the Philippines, where he died in 1521, wounded by native arrows. Two of his ships reached the Spice Islands, and one ship, the *Victoria*, under JUAN SEBASTIÁN DEL CANO, managed to return to Spain in 1522, completing the first CIRCUMNAVIGATION OF THE WORLD. The load of cloves more than paid for the entire expedition and made the surviving sailors rich.

With ocean routes established, in the 17th century, European merchants founded companies, typically with royal charters and stockholders, to develop the Eastern trade, among them the BRITISH EAST INDIA COMPANY, the DUTCH EAST INDIA COMPANY, and the FRENCH EAST INDIA COMPANY. As the reach of European mariners expanded and as colonial empires grew, spices became a more affordable commodity. Spices were farmed on plantations and transplanted around the globe, and, in the 17th and 18th centuries, other commodities grew in importance, and other motives for exploration superseded the demand for spices. Yet many of the spices at the center of the centuries-long spice trade are still widely used throughout the world.

See also COMMERCE AND EXPLORATION.

sponsors of exploration

Not all individuals important to the history of exploration traveled to uncharted lands. Some among them changed the course of history by sponsoring expeditions. Some were sponsors and explorers both, who spent part of the time in the field. Sponsorship was provided for a variety of purposes; included among those backing expeditions were government leaders, merchants, scholars, mapmakers, publishers, and wives.

Henry the Navigator

Perhaps the most famous visionary and sponsor who made a huge impact on how the world was perceived was Portuguese nobleman Prince Henry. Although he never traveled beyond the region of the MEDITERRANEAN SEA, he became known to history—because of an 1868 biography by British writer Richard Henry Major—as HENRY THE NAVIGATOR. He also has been referred to as “the explorer who stayed home.” In 1416, Henry decided to live at Sagres near Cape St. Vincent, the southwesternmost point in Portugal, and there founded a naval depot and, soon afterward, an observatory and a school of navigation, where he brought together astronomers, mapmakers, and mariners. Over the next years, he sponsored numerous expeditions to the AZORES and along the coast of West Africa. Just after his death in 1460, his mariners reached as far as Cape Palmas, where the African coast turns eastward. Henry's contribution to exploration as a sponsor is often cited as the start of the EUROPEAN AGE OF EXPLORATION.

Kings, Queens, Presidents, and Other Officials

Many of those sponsors cited with regard to continuing the European Age of Exploration are kings and queens. In Portugal, after Prince Henry's death, various Portuguese kings sent out expeditions. King John II, who ruled from 1481–95, sponsored a new round of expeditions southward along the coast of Africa, including those of DIOGO CÃO in 1482–84, which reached the CONGO RIVER (Zaire River), and BARTOLOMEU DIAS in 1487–88, which sailed around the tip of the continent, locating the CAPE OF GOOD HOPE. Manuel I, who ruled Portugal from 1495 to 1521, dispatched VASCO DA GAMA on a voyage in 1497, in which he rounded Africa, reached India, then returned to Portugal in 1499.

The joint rulers of Aragon and Castile in Spain in 1479–1504—Ferdinand II and Isabella I—are famous for having sponsored CHRISTOPHER COLUMBUS's voyage across the Atlantic Ocean in 1492, as well as his subsequent expeditions in the Americas. Their grandson, Charles I, king of Spain from 1516 to 1556 (and as Charles V, Holy Roman Emperor from 1519 to 1556) sponsored the first CIRCUMNAVIGATION OF THE WORLD under FERDINAND MAGELLAN in 1519–22, as well as many expeditions in the

Americas for purposes of colonization, such as that of FRANCISCO PIZARRO in Peru in 1531–33.

Many of the Spanish CONQUISTADORES in turn became sponsors. For example, Pizarro sent out his half brother GONZALO PIZARRO and FRANCISCO DE ORELLANO to the AMAZON RIVER in 1541–42. Another Spaniard, DIEGO VELÁSQUEZ, who became governor of Cuba in 1514, sent out numerous expeditions in the Caribbean region, including that of HERNÁN CORTÉS, who explored Mexico in 1519–21 (although Cortés later tried to bypass Velásquez by seeking the endorsement of King Charles directly). Cortés later sent out FRANCISCO DE ULLOA, who explored northward to the Gulf of California and Baja California in 1539–40, as well as other expeditions. Another Spanish official known as a sponsor of explorations is ANTONIO DE MENDOZA, viceroy of New Spain in 1535–49, who sent out expeditions to the American Southwest, such as that of FRANCISCO VÁSQUEZ DE CORONADO in 1540–41.

An English courtier, soldier, and man of letters—SIR WALTER RALEIGH—although he headed two expeditions to the ORINOCO RIVER in northern South America, in 1595 and 1617, is best known regarding the history of exploration as a sponsor for failed colonies in 1584–87 along the coast of what is now northeastern North Carolina. The colonists of the second attempt vanished, leading to the mystery of the LOST COLONY.

Elizabeth I, who ruled England and Ireland from 1558 to 1603, was known as a sponsor of explorations in her own right. In 1577–80, for example, with her backing and that of English merchants, SIR FRANCIS DRAKE completed the first English circumnavigation of the world.

Nearly a century later, from Fort Henry, just to the north in what is now southeastern Virginia, colonial military leader ABRAHAM WOOD sent out exploratory expeditions westward. The men whom he sponsored—THOMAS BATTS, ROBERT FALLAM, GABRIEL ARTHUR, and JAMES NEEDHAM—were the first known Englishmen to explore the APPALACHIAN MOUNTAINS and beyond.

The third president of the United States, Thomas Jefferson, who served from 1801 to 1809, had long contemplated an overland expedition across the North American continent and recommended his private secretary MERIWETHER LEWIS to the Congress as leader of the Corps of Discovery. Lewis enlisted former soldier WILLIAM CLARK as his coleader. In 1804–06, the Lewis and Clark Expedition traveled from St. Louis in present-day Missouri to the Pacific Ocean at the mouth of the COLUMBIA RIVER and back.

Trading Companies and Geographical Societies

Many expeditions received backing in the name of commerce. Various trading companies—the HANSEATIC LEAGUE, LEVANT COMPANY, MUSCOVY COMPANY, CATHAY COMPANY,

COMPANY OF MERCHANTS OF LONDON DISCOVERERS OF THE NORTHWEST PASSAGE, VIRGINIA COMPANY, BRITISH EAST INDIA COMPANY, FRENCH EAST INDIA COMPANY, DUTCH EAST INDIA COMPANY, and DUTCH WEST INDIA COMPANY—all played a part in world exploration (see COMMERCE AND EXPLORATION).

Various fur-trading companies—the HUDSON'S BAY COMPANY, NORTH WEST COMPANY, AMERICAN FUR COMPANY, ST. LOUIS MISSOURI FUR COMPANY, ROCKY MOUNTAIN FUR COMPANY, and RUSSIAN-AMERICAN FUR COMPANY—had much to do with the opening of North America to non-Indian settlement. Some of the owners or directors of these firms, such as JOHN JACOB ASTOR of the American Fur Company, were businessmen who sent representatives into the wilderness. Others, such as ALEKSANDR ANDREEVICH BARANOV of the Russian-American Company and WILLIAM HENRY ASHLEY of the Rocky Mountain Fur Company, traveled to remote areas themselves. Ashley was also known as the trader who employed many of the MOUNTAIN MEN early in their careers (see FUR TRADE).

Other organizations sponsored expeditions for the purpose of knowledge. Among these were the ROYAL SOCIETY and ROYAL GEOGRAPHICAL SOCIETY of England and the AMERICAN GEOGRAPHICAL SOCIETY of the United States, all three still in existence today, although now acting as disseminators of information and not as sponsors of expeditions. Another company, the AFRICAN ASSOCIATION, important in sponsoring early British expeditions to Africa, merged with the Royal Geographical Society. SIR JOSEPH BANKS, founder of the African Association, was a naturalist. SIR JOHN BARROW, founder of the Royal Geographical Society, had studied mathematics and geography before becoming second secretary of the Admiralty.

A Wife and a Newspaper Publisher

One sponsor of a number of expeditions—Englishwoman JANE FRANKLIN—did so out of loss. Her husband, SIR JOHN FRANKLIN, had departed for the Canadian Arctic in 1845. By 1848, with no word of him, she began raising support for privately funded expeditions. American shipping magnate Henry Grinnell became involved as a sponsor as well, backing a number of expeditions: under EDWIN JESSE DE HAVEN in 1850–51; ELISHA KENT KANE in 1853–55; and CHARLES FRANCIS HALL in 1860–62 and in 1864–69. An expedition Lady Franklin financed herself under SIR FRANCIS LEOPOLD MCCLINTOCK in 1857–59 helped determine that her husband's ship had become icebound and that he and the entire crew had perished (see SEARCHES FOR MISSING EXPLORERS).

James Gordon Bennett, Jr., publisher of the American newspaper *New York Herald*, decided to back an expedition for the sake of a story when, in 1871, he sent out journalist

SIR HENRY MORTON STANLEY to search for missing Scottish missionary DAVID LIVINGSTONE. He sponsored subsequent explorations as well, such as that to the Arctic under GEORGE WASHINGTON DE LONG in 1879–81.

It should be kept in mind that, although some voyages of exploration were conceived of and paid for by the travelers themselves, most of those affecting world history had sponsors. Gaining the sponsorship and raising the funds to mount expeditions were sagas in themselves. Italian Christopher Columbus, for example, had conceived of his expedition westward across the Atlantic years before he made the journey and had presented his plan to King John II of Portugal—and had sent his brother Bartholomew to do so to King Charles VII of France and King Henry VII of England—and had invested a great deal of time and resources before gaining the eventual support of Ferdinand and Isabella of Spain.

submarine

A submarine is a water craft designed to spend substantial periods of time underwater. Unlike a SUBMERSIBLE, which is usually intended to make deep dives and collect a variety of scientific information, a submarine is more like a surface boat in its mobility. The development and use of the submarine has been closely tied to military objectives, although it did play a role in exploring the Arctic.

The earliest record of a submarine-type vessel comes from the writings of Olaf Magnus, a Swedish historian. He mentioned the capture of two underwater boats that the residents of GREENLAND had made in the early 16th century to attack European trading ships because of unfair practices. The underwater craft were enclosed with sealskin and had oars on either side for locomotion. Dutchman Cornelius van Drebbel built a similar vessel in 1620. He lived in England, where he built a submarine covered with leather, with six oars on each side, capable of diving to about 12 feet. His second submarine became well known as it traveled the Thames. King James I took a ride in it.

During the American Revolution of 1775–83, a submarine was invented by David Bushnell to sink British ships in New York Harbor. The *Turtle* was a single-person, egg-shaped craft moved by a propeller turned by the operator. On its first mission in 1776, Sergeant Ezra Lee could not affix an explosive device to the British flagship, the *Eagle*, because of a layer of copper used to protect the vessel from shipworms. Although it was spotted, the *Turtle* managed to escape British capture. It was then taken ashore and dismantled, remaining a secret until after the war. The first successful sinking of a ship by submarine occurred during the U.S. Civil War when the Confederate craft *Hunley*, using an explosive charge attached to a long pole, managed to sink the *Housatonic* on February 17, 1864. The explosion that sunk the *Housatonic* also took the *Hunley* and all her crew.

There were many attempts at building submarines in the 19th century. American Robert Fulton, inventor of the steamship, designed a vessel and won a contract with the French government to produce it. His 21-foot-long craft, the *Nautilus*, was built at Rouen, France. Fulton used water for ballast and compressed air for surfacing. The craft was operated successfully in 1800 and 1801, remaining submerged for six hours while fresh air was supplied by a tube from above, but it did not excite the French enough to continue the project. Englishman Reverend George William Garrett built the first steam-powered submarine in 1878. The ship given credit for being the first modern submarine was the *Gymnote*, built in France in 1886. It was cigar shaped, 60 feet long and 6 feet wide, and electrically powered. It could travel at five knots underwater to a distance of 100 miles. This vessel spurred England, Germany, and the United States to increase their efforts at submarine development.

The U.S. Navy contracted John Philip Holland in 1895 to build a state-of-the-art submarine. The first model he and his partner, Simon Lake, made did not fulfill the navy's expectations. Holland then produced a craft independently, which proved more useful. It was 54 feet long, had a crew of six, and used a dual-propulsion system—a gasoline engine for surface cruising and a battery-powered electric motor for underwater travel. In 1900, the U.S. Navy purchased it from Holland, naming it the *Holland*.

By World War I (1914–18), the United States, the United Kingdom, Germany, and Russia had all developed diesel-powered submarines, which operated on electrical batteries while underwater and could range across entire oceans. For a time, German U-boats (*Uterseeboot*) had the advantage until the Allied powers developed depth charges to counter them. Diesel-electric submarines, with improved torpedo designs, continued to play a significant role in naval battles of World War II (1939–45).

The idea of exploring the sea under the NORTH POLE by submarine is thought to have been first conceived by

French writer Jules Verne in his novel *20,000 Leagues Under the Sea*, published in 1870. This prospect fascinated SIR GEORGE HUBERT WILKINS, an Australian explorer who had been to the Arctic with VILHJALMUR STEFANSSON, and in the Antarctic with SIR ERNEST HENRY SHACKLETON. In 1930, Wilkins began modifications on the U.S. Navy submarine 0-12 with Simon Lake and Commander Danenhower. The retrofitting included vertical drills for making holes in the ice. The rechristened *Nautilus* (the name taken from Verne's novel) sailed in June 1931. After accidents and mechanical problems, she arrived at the PACK ICE near Spitsbergen (present-day Svalbard), where the decision was made to proceed despite the mysterious disappearance of part of the diving apparatus. Wilkins and the *Nautilus* did not succeed in reaching the North Pole, for his craft was not powerful enough to penetrate the ice along its journey, but he did set a new record for farthest north, at 82 degrees.

Reaching the North Pole by submarine and breaking through the ice was more difficult and dangerous than had been imagined. The underwater surface of the pack ice varied greatly in thickness and terrain. Several technological advances came together to make it possible. One was the

GYROCOMPASS, which minimized the effects of the submarine's steel hull on directional readings. Another was sonar (*sound navigation ranging*), which could detect obstacles without visual information. A third advance was the invention of the nuclear submarine, championed by Admiral Hyman G. Rickover. The nuclear submarine could remain submerged for much longer periods than conventional craft, since nuclear reactors could move the large vessels quietly and efficiently and maintain the crew in relative comfort. In August 1958, another submarine named the *Nautilus*, the first nuclear submarine (built by the Electric Boat Company, which had been founded by John Philip Holland), succeeded in making the first undersea transit of the North Pole, cruising under the polar ice from Point Barrow, Alaska, to a point between Spitsbergen, Norway, and Greenland. On March 17, 1959, at the North Pole, another U.S. craft, the *Skate*, succeeded in breaking through a fairly thin layer of ice to the surface. There, the crew scattered the ashes of Hubert Wilkins, who had died the previous December.

Nuclear submarines have been used for other scientific missions. In the 1990s, for example, the U.S. Navy and

The *Nautilus*, the U.S. Navy's first atomic-powered submarine, is shown here on its initial sea trials in 1955. (Library of Congress, Prints and Photographs Division [LC-USZ62-103120])

civilian scientists conducted SCICEX (Scientific Ice Expeditions) under the polar ice, during which the Arctic Ocean floor was mapped, ice was measured, and water samples were analyzed.

See also OCEANOGRAPHY AND EXPLORATION; SHIP-BUILDING AND EXPLORATION.

submersible

A submersible, or research submersible, is a specialized vehicle or station used to explore the ocean bottom. Many are designed for specific projects, and so they are often unique in their features and capabilities. Many are also designed to withstand extreme water pressure, which exists at great depths. A submersible differs from a SUBMARINE in having greater diving range but less mobility.

The development of submersibles relied on the construction of an apparatus that could resist water pressure while a person or persons made observations in an undersea environment. Americans CHARLES WILLIAM BEEBE, a biologist, and Otis Barton, an engineer, developed the BATHYSPHERE in 1926. They established various records for depth on several occasions, including a dive in 1934, when they came to the end of their cable at 3,028 feet. The BATHYSCAPH *Trieste II*, designed by Swiss physicist AUGUSTE PICCARD, was another important invention in the evolution of the submersible. In January 1960, it reached the greatest depth in the ocean at 35,800 feet in the MARIANAS TRENCH.

With the success of the *Trieste II*, the ultimate challenge of the ocean had been met, but it was not necessary for all craft to explore the greatest depths. Auguste Piccard and his son, JACQUES ERNEST-JEAN PICCARD, also designed a mesoscaphé for diving to 6,000 feet. The mesoscaphé used propellers like a helicopter to maintain its depth. In 1959, JACQUES-YVES COUSTEAU designed and built a two-man diving saucer. His vehicle was limited to a depth of 1,000 feet but was well suited to exploring the continental shelf due to its excellent maneuverability.

The *Aluminaut* was one of the largest mobile submersibles ever produced. Designed to operate to 15,000 feet, the 51-foot vehicle incorporated durable construction with a buoyancy system similar to that of a submarine. It was built by the General Dynamics Corporation for the Reynolds Aluminum Company and carried a crew of six. Perhaps the most well-known submersible is the R.V. *Alvin*. Based at the Woods Hole Oceanographic Institute, *Alvin* has proven to be a flexible and effective research tool with a long life. In 1966, both the *Aluminaut* and *Alvin* participated in the successful recovery of a hydrogen bomb, which the U.S. military had lost off the coast of Spain. In 1974, *Alvin*, along with two French submersibles, the *Archimède* and the *Cyana*, conducted Project FAMOUS (French-American

Mid-Ocean Undersea Study). This project explored the Mid-Atlantic Ridge, diving as deep as 9,000 feet. It was the most extensive study of a region of the ocean floor to date, finding evidence of recent volcanic activity and support for theories of seafloor spreading.

Along with moving underwater craft, submersibles may be stationary structures from which saturation diving may occur. These are also known as research habitats or habitat projects. Not all of them are designed for great depths either; in fact, most function at less than 60 feet. The pioneering work in this field has been carried out by the U.S. Department of the Interior with the Tektite project. Tektite I was conducted in 1969 off St. John in the Virgin Islands and experimented with an artificial atmosphere and its physiological effects on divers over the course of several weeks. Later, the Sealab missions were also in this category, with Sealab III operating at more than 500 feet.

The 1960s were the heyday for submersibles, with many projects developed. In the 1970s, many of the tools that had been developed for scientific purposes were bought by commercial interests and the military. Today, submersibles are mainly used for oil exploration, defense, and underwater archaeology, including the study and recovery of sunken ships. The cost of operating a submersible is high since most vehicles require that ballast be replaced after each dive and that a support ship and crew accompany them. The trend has been toward smaller, unmanned probes operated by remote control—remotely operated vehicles (ROVs).

surveying and exploration

Surveying is the accurate measurement of Earth's surface or just beneath it. A branch of applied mathematics, it determines position, dimension, and contour of land areas through linear or angular measurements based on principles of geometry and trigonometry. The results of a survey are typically represented on a chart, map, GLOBE, or plans (see MAPS AND CHARTS). Many explorers were trained in surveying methods, and many exploratory expeditions had the primary or secondary purpose of surveying.

Techniques of Surveying

There are two basic types of surveying: land and hydrographic. Land surveying is further subdivided into plane surveying and geodetic surveying. In plane surveying, a small portion of Earth's surface, in which Earth's curvature is negligible, is treated as a horizontal plane. Plane surveys are usually calculated on a rectangular grid, aligned north-south and east-west. Two methods of measurement are utilized, depending on the type of terrain to be surveyed: In a traverse survey, the directions (bearings) and distances of successive

lines are calculated; in triangulation, an area is divided into hypothetical triangles from a known baseline, that is, the position of a third point is determined by the angle it makes with each end of the baseline. Geodetic surveying, or geodesy, is used for larger areas where the curved shape of Earth, the geoid, must be taken into consideration. Two points, or stations, many miles apart are selected, and the LATITUDE AND LONGITUDE of each is determined astronomically, creating a baseline from where triangulation can be applied. Hydrographic surveying deals with bodies of water—seas, rivers, harbors, and lakes—and coastlines. Soundings from control points are carried out by hand, sonar soundings, or radar. The findings—bottom contours, channels, shoals, and buoys—are recorded on charts for purposes of navigation.

Other subgroups of surveying are classified according to purpose or methods. As for purpose, topographic surveying determines the contour of the land—or relief—through both horizontal and vertical measurements (three-dimensional traversing). Cartographic surveying is used for the specific purpose of making maps. Engineering surveying, construction surveying, route surveying, and mine surveying are other applied types of surveying. Terms such as *transit surveying*, *plane-table surveying*, and *photogrammetric surveying* (using photography) refer to methods of surveying.

Surveying equipment ranges from simple measuring tools to electronic devices. Instruments used for direct linear measurements include the COMPASS, Gunter's chain (or surveyor's chain), the tape, the rod, the plumb bob, the level, and the telescope. The compass enables a surveyor to determine directions. A chain is the standard unit of length or measuring band used in surveying, equivalent to 66 feet. Gunter's chain, named after its inventor, Edmund Gunter, a 16th–17th-century English mathematician, is divided into 100 links, as is the alternative engineer's chain. The calibrated tape has largely replaced the chain. The rod, with marked gradations, allows for a sighting from a specially designed telescope. The plumb bob—a weight on a line—enables the determination of a vertical line. The level enables the determination of a horizontal line; early levels used a bubble of water centered in a glass tube. The plane table is an early measuring device, consisting of a drawing board mounted on a tripod, with a ruler for pointing at objects, allowing for the plotting of lines directly from observations. The first telescope designed specifically for surveying was known as a theodolite and consisted of a telescope that could swing vertically. A variation, the transit theodolite—also known as the transit compass or simply the transit—can be transited (rotated) about both horizontal and vertical axes. Transits are tripod-mounted and have leveling devices, such as the spirit-level bubble, and magnetic compasses on them. Various electronic instruments are now also utilized to determine distances in surveying, such as the geodimeter,

which uses light waves, and the tellurometer, which uses microwaves. Photography is also used in surveying, especially AERIAL PHOTOGRAPHY.

History of Surveying

Surveying dates from ancient times and has played a part in marking boundaries in many societies. It was highly developed among the ancient Egyptians (see EGYPTIAN EXPLORATION). In the fourth century B.C., bematists, or surveyors, traveled with ALEXANDER THE GREAT's army into Asia, measuring their progress. During their occupation of Egypt starting in 30 B.C., the Romans acquired Egyptian surveying instruments, knowledge of which passed to other peoples (see ROMAN EXPLORATION). Many explorers were trained surveyors, and many surveyors went on to other professions as well. The first and the third presidents of the United States, George Washington and Thomas Jefferson, for example, both worked as surveyors as young men.

Many maritime expeditions included men trained as surveyors who charted coastlines. Some surveying expeditions were sent out as follow-ups to other expeditions: In his expedition of 1579–80, PEDRO SARMIENTO DE GAMBOA, a Spanish mariner also trained as a scientist, surveyed the Strait of Magellan (see MAGELLAN, STRAIT OF), which had been reached by a Spanish expedition earlier that century under FERDINAND MAGELLAN. Surveying is central to the story of other maritime expeditions. English mariner JOHN KNIGHT, during a 1601 expedition in search of the NORTHWEST PASSAGE for the BRITISH EAST INDIA COMPANY, disappeared after going ashore with a surveying party on the Atlantic coast of Labrador. The first official U.S. government CIRCUMNAVIGATION OF THE WORLD in 1838–42 under CHARLES WILKES and GEORGE FOSTER EMMONS was known as the United States South Sea Surveying and Exploring Expedition.

As for the exploration of land areas, many official surveys were carried out in the 19th century. Many of the most famous explorers of Australia's interior were surveyors. Both JOHN JOSEPH WILLIAM MOLESWORTH OXLEY and SIR THOMAS LIVINGSTONE MITCHELL served as surveyor general of New South Wales. Brothers SIR AUGUSTUS CHARLES GREGORY and FRANCIS THOMAS GREGORY were surveyors, as were JOHN MCDOUALL STUART and JOHN FORREST. In India, first the British East India Company, then the British government, sponsored the Great Trigonometrical Survey, headed for a time by SIR GEORGE EVEREST. After India had been surveyed and mapped, the PUNDITS, locally born emissaries, surveyed parts of Tibet and other lands to the north.

In the United States, a number of official expeditions were sent out starting in the 1830s. JOHN CHARLES FRÉMONT and JOSEPH NICOLAS NICOLLET headed such early expeditions. Subsequent surveys, from the late 1840s to the

This photograph by William Henry Jackson shows expedition members of the U.S. Geological and Geographical Survey of the Territories in the 1870s. Ferdinand V. Hayden sits at the far end of the table. (*National Archives, Photographs [NWDNS-57-HS-282]*)

late 1870s, especially to establish wagon routes and railroads, were carried out by the U.S. Army Corps of Topographical Engineers and other branches of the military under a number of officers, including RANDOLPH BARNES MARCY, JAMES HERVEY SIMPSON, HOWARD STANSBURY, LORENZO SITGREAVES, JOHN WILLIAM GUNNISON, AMIEL WEEKS WHIPPLE, EDWARD GRIFFIN BECKWITH, JOHN GRUBB PARKE, JOHN B. POPE, HENRY LARCOM ABBOTT, JOSEPH CHRISTMAS IVES, EDWARD FITZGERALD BEALE, JOHN N. MACOMB, WILLIAM FRANKLIN RAYNOLDS, GEORGE MONTAGUE WHEELER, and DAVID SLOAN STANLEY. (Mojave Indian chief IRATEBA served as a guide for Sitgreaves, Whipple, and Ives.) The U.S. government also sponsored geological surveying

under FERDINAND VANDEVEER HAYDEN, CLARENCE KING, and JOHN WESLEY POWELL.

Some of the later African explorations that gained new geographic knowledge were sent out as surveys, such as in the SAHARA DESERT by Frenchmen PAUL-XAVIER FLATTERS in 1880–81 and FERNAND FOUREAU in 1900–01.

Also in the 20th century, much of the Arctic and Antarctic came to be surveyed, especially through the use of aerial photography. RICHARD EVELYN BYRD, LINCOLN ELLSWORTH, and SIR GEORGE HUBERT WILKINS were aviators who conducted aerial surveys of these regions.

Tasmania

Tasmania lies 150 miles off the southeast coast of Australia. Bass Strait separates the two landmasses. To the west and south is the Indian Ocean; to the east is the Tasman Sea, an arm of the Pacific Ocean. An island of 26,383 square miles, Tasmania is associated with a number of smaller islands, most important is the Furneaux Group, situated to the northeast. The terrain of Tasmania is mountainous, its highlands a geological continuation of Australia's GREAT DIVIDING RANGE. Mount Ossa, rising 5,305 feet from a central plateau, is Tasmania's highest peak. Coastal plains are found in the northwest and northeast. Southern and western regions are especially exposed to ocean winds and heavy rain. The Tasmanian devil and the Tasmanian wolf (also called Tasmanian tiger), both marsupials (pouched mammals), are found on the island.

Dutchman ABEL TASMAN made the European discovery of Tasmania. While searching for the GREAT SOUTHERN CONTINENT (Terra Australis), under the sponsorship of the DUTCH EAST INDIA COMPANY, he sighted land on November 24, 1642. Difficult seas prevented him from landing, but he managed to send the ship's carpenter ashore to perform the rites of possession. Tasman named the territory Van Diemen's Land after the governor-general of the EAST INDIES. (It was renamed Tasmania in 1853.)

The island was not visited again by Europeans until 1773, when Englishman TOBIAS FURNEAUX explored part of its coastline as captain of the *Adventure* on JAMES COOK'S

second British expedition to the Pacific in 1772–74. Separated from Cook aboard the *Resolution*, Furneaux made the European discovery of Adventure Bay on the south coast, one of the finest anchorages in the world. Furneaux incorrectly concluded that Tasmania was part of mainland Australia. In 1798, MATTHEW FLINDERS and GEORGE BASS, also sailing for England, circumnavigated the island. Flinders named the waterway between the island and Australia Bass Strait. In 1791–94, a French expedition under ANTOINE-RAYMOND-JOSEPH DE BRUNI, chevalier d'Entrecasteaux surveyed the south coast. PHILIP PARKER KING conducted surveys of coastal Australia and Tasmania in his British expedition of 1817–22.

Great Britain, which had claimed the island in 1788, sent an 18-year-old lieutenant by the name of John Bowen there to establish a penal colony in 1803. Tasmania became known as the "jail of the Empire." The European population of the island grew, and, by 1825, the city of Hobart at the mouth of the Derwent River had become as large as Sydney, Australia. The island also became a way station for the colonization of New South Wales, the southeastern region of Australia. The Van Diemen's Land Company sponsored the exploration of the interior of Tasmania. Among those working for it was Danish mariner JORGEN JORGENSON in the 1820s–30s. In 1840–42, Polish geologist SIR PAUL EDMUND DE STRZELECKI engaged in explorations of the interior, some of them sponsored by SIR JOHN FRANKLIN, then governor of the colony. Another scientist who explored

Tasmania was British naturalist SIR JOSEPH DALTON HOOKER who, as part of SIR JAMES CLARK ROSS's expedition to southern waters in 1839–43, made an inventory of the island's plant life.

Tasmania's Aborigines are thought to have crossed to the island by way of a LAND BRIDGE more than 35,000 years ago. They numbered about 5,000 when Europeans arrived. A tribal people, probably of Melanesian stock, they had a remarkable relationship with their environment, which bordered on the magical when viewed through the eyes of the European observer. CHARLES ROBERT DARWIN commented on their powers of camouflage when he visited the island in 1836, during his travels on the *Beagle*. With increasing European settlement, they were driven from ancestral lands and systematically persecuted. The Aborigines retaliated against the settlers on a number of occasions, and, in 1830, the British began an offensive to isolate them once and for all. They were removed to Flinders Island, part of the Furneaux Group, where the population languished. Later, some were allowed to return, but, in 1876, the last of the Tasmanian Aborigines died.

In 1901, with Australian independence from Great Britain, Tasmania was federated as a state of the Australian Commonwealth. Its capital is Hobart.

Timbuktu (Timbuctoo, Tombouctou, Tombuto)

The city of Timbuktu is in the West African country of Mali. It sits on the southern edge of the SAHARA DESERT, just to the north of the great bend of the NIGER RIVER. In the latter half of the Middle Ages, Timbuktu was at its peak as a center of trade. Guarded to the north by Muslims and insulated to the west and south by thick jungle and African tribes, Timbuktu was inaccessible to Europeans. Still, information of the city made it to Europe, with exaggerated descriptions of wealth. Such stories made Timbuktu a destination for explorers, long after its glory had faded. The name of the city has been variously spelled as Tombouctou, Timbuctoo, and Tombuto.

Timbuktu was founded in the 11th century by the Tuareg, a nomadic Berber people of the Sahara who practiced Islam, yet retained vestiges of their earlier tribal religion. As a place to meet and trade on the Saharan camel caravan routes, the city grew and was eventually incorporated into the Mali Empire in the 14th century. During this period it prospered, as salt was brought from the north and ex-

changed for gold from the west. The earliest mention of the lands that would become Mali come from Greek historian HERODOTUS in the fifth century B.C. He mentions the "Silent Trade," a curious practice that endured through the 15th century, when it was described by Italian navigator ALVISE DA CADAMOSTO. He related how the Moors brought salt across the Sahara from the north to the middlemen of Mali. From Mali, the salt traveled to the fringes of the gold-mining regions, where the blocks of salt were left in a known location while the traders of Mali retreated and built a fire. The smoke from the fire alerted the Wangara, who mined the gold, and a quantity of the metal was placed on each salt block. After the Wangara had disappeared, the Malinese returned, and if the payment was deemed acceptable, the gold was taken and the salt left. If not, the gold and salt were left for the bargaining to continue.

Food, copper, textiles, and slaves were traded as well. Later, as part of the Songhai Empire in the 15th and 16th centuries, Timbuktu reached its height of prosperity with a population of as many as 1 million. It also became a center of Muslim education. The first of various raids and plunder by neighboring peoples occurred in 1591, beginning the city's economic and cultural decline.

Arab traveler ABU ABD ALLAH MUHAMMAD IBN BATUTAH's reports of Timbuktu from a visit in 1352 are among the earliest to have survived. Over a century later, in 1458, DIOGO GOMES was exploring the Gambia River for Portugal and brought back news of the city from his contact with native peoples. Based on his travels of 1512–14, Arab LEO AFRICANUS wrote a vivid description of the busy city. He told of large quantities of gold possessed by the king; a cavalry of 3,000; an educated class of doctors, priests, and judges; artisans who sold their handiwork; and slaves taken as tribute from surrounding lands.

The European expeditions in search of Timbuktu began with Englishman DANIEL HOUGHTON in 1790. Traveling for the AFRICAN ASSOCIATION, he began his journey from the Gambia River and made it inland 400 miles before being robbed and left to die by an Arab caravan. Scotsman MUNGO PARK came closer on a trip in 1795, most likely sighting the city as he sailed down the Niger in 1806. But he did not live to tell about it. In 1825, Scotsman ALEXANDER GORDON LAING led an expedition from the north across the Sahara, which reached Timbuktu in August 1826. He was the first European confirmed to have seen the city. He also died on the return journey, however.

RENÉ-AUGUSTE CAILLIÉ was the first person from Europe to reach Timbuktu and return to describe it. The son of a baker in France, Caillié became fascinated with Africa while young. In 1816, at age 17, he found work on a ship bound for Africa, and deserted his post once he got there to join an expedition in search of Mungo Park. In 1825, the Geographical Society of Paris offered a prize of 10,000

francs for the first person to visit Timbuktu and report on the city. Caillié, who was in Sierra Leone at the time, was determined to win the prize. In 1827, after preparing himself by learning Arabic, he departed Freetown on the west coast and proceeded eastward. On April 20, 1828, he reached Timbuktu. In Paris, where he claimed the prize, he described Timbuktu as mud houses surrounded by yellow sand and no longer a political or economic power.

Another explorer of note who sought Timbuktu was Scotsman HUGH CLAPPERTON, who, in 1825, investigated the Niger to the west with the hope of reaching the city. He died of dysentery in the city of Sokoto before he could fulfill his ambition. In 1853, German scholar HEINRICH BARTH reached Timbuktu while on an extensive tour of Africa and spent nine months studying the peoples. Another German, OSKAR LENZ, also was a visitor to Timbuktu, which he reached on his 1879–80 expedition. A colonial French army occupied Timbuktu in 1893–94.

Timbuktu, as it has been for centuries, is a regional trade center, with salt a principal commodity.

trade winds

The trade winds are the basic wind systems in the Atlantic, the Pacific, and the Indian Oceans in both the Northern Hemisphere and Southern Hemisphere. In the Northern Hemisphere, they circulate in a clockwise direction, while in the Southern Hemisphere they move counterclockwise. Trade winds form in the subtropical regions known as the horse latitudes (between 25 and 30 degrees) to the north and south of the EQUATOR, regions of high pressure. Their direction is determined by the Coriolis effect (or Coriolis force or Coriolis acceleration, an apparent force on winds, clouds, and aircraft because of the rotation of the Earth under them, such that their motion is deflected clockwise in the Northern Hemisphere and counterclockwise in the Southern Hemisphere, although speed is unaffected). This gives the winds an angular component of approximately 20 degrees.

Among the most positive aspects of the trade winds, as far as sailors were concerned, is their predictability. Their direction remains fairly constant throughout the seasons, with only a slight shift to the north during summer in the Northern Hemisphere. Their constancy gives them the primary influence they have on ocean currents.

Winds are named for the direction from which they originate, and so, off the coast of the Iberian Peninsula are the northeast trades. These were the winds Italian mariner CHRISTOPHER COLUMBUS, sailing for Spain in the 1490s, used to convey his ships to the Caribbean Sea.

A major exception to the trade winds system occurs seasonally in the Indian Ocean. There, with the Indian

subcontinent heated during the summer, the moist air from the Tropics is drawn to the land. The trade winds are supplanted by the monsoon winds, and the direction of the wind is reversed. This phenomenon was observed in ancient times, and used to advantage by Arab sailors, who would time their travels accordingly. When Portuguese VASCO DA GAMA made the first European journey to India in 1497–99, he hired a pilot in Africa who insisted on waiting for the monsoon winds before proceeding eastward.

traverse board

In the 15th to 17th centuries, the word *traverse* was a nautical term meaning to tack or to change the direction of a vessel when heading close into the wind (or beating to windward), thus making a zigzag course because sailing directly into the wind is impossible. The traverse board became an important device in early navigation because it enabled a navigator to keep track of the direction and speed a vessel sails. It consists of a small wooden board in the shape of a COMPASS with directions marked on it and eight holes for each half hour of the watch. At its rectangular base are other holes laid out in horizontal lines.

It was the responsibility of the officer of the watch to stick a peg into the compass holes every half hour (or sometimes every hour) to record each of the courses sailed, and stick a peg into the other holes to record the estimated speed during each course based on the process of DEAD RECKONING. The courses and calculated distances were then recorded on a chart.

An accomplished English navigator, JOHN DAVIS of the late 16th century, who also invented the Davis QUADRANT, designed a traverse book, or deck log, which served the same purpose as the traverse board. It is in the form of a ship's log or journal with a column for time spent on each course, a column for calculated distance of each watch, a column for observations of the Sun, and a column for additional comments. One also sees the term *traverse table* in texts describing early navigational tools, including Davis's traverse book. It is also used in a general sense to describe a table giving the difference of latitude and departure that corresponds to any given course and distance.

See also LATITUDE AND LONGITUDE; NAVIGATION AND EXPLORATION.

treasure and exploration

The quest for treasure is a recurring theme in the saga of world exploration. Discovering precious metals and stones in foreign lands, raiding shipping routes established by other nations, and reaching newly discovered goldfields have all been an incentive for numerous expeditions.

Ancient Treasure-Hunting

Gold, silver, and gemstones have been a standard of wealth from ancient times. The ancient Egyptians sought riches in distant lands, as indicated by Egyptian queen HATSHEPSUT's expedition down the RED SEA to the land of PUNT in the 15th century B.C. (see EGYPTIAN EXPLORATION). Her envoys returned with gold and silver among other desired items, such as spices, incenses, and exotic animals (another form of treasure in ancient times). The Egyptians developed mining as central to their economy to the point that they had a papyrus map—dated to about 1300 B.C.—showing the location of all the gold mines in their empire. The Bible's Old Testament tells of OPHIR, the location of "King Solomon's mines."

Conquest and plunder go hand in hand, and civilizations preyed on one another for treasure. ALEXANDER THE GREAT led his armies from Macedon and Greece to North Africa and Asia in the fourth century B.C. and plundered the riches of many different peoples. Numerous expeditions of the Romans, such as those against the Carthaginians in North Africa in the third and second centuries B.C., or those led by GAIVS JULIVS CAESAR into northern Europe in the first century B.C., brought booty from conquered peoples and helped pay for new expeditions (see ROMAN EXPLORATION). The first confirmed historical reference to diamonds occurs in first-century A.D. Roman literature, and it assumed they came from the mines of Golconda in India, the only source of the stones at the time.

Spain's Plunder of the Americas

Discovering treasure provided justification for military and exploratory expeditions. In the course of his late 15th-century voyage to the Americas, the acquisition of gold became an early focus for CHRISTOPHER COLUMBUS, an Italian mariner sailing for Spain, after he failed to reach the Orient. By trading gold to Columbus's men, the Arawak (Taino) tribe, led by GUANCANAGARI, raised the first expectations of finding gold in those lands newly visited by Europeans.

Columbus failed to make a fortune in his explorations, but the Spanish soon did so in other parts of the Americas. The Spanish conquest of the Aztec and Inca Indians under HERNÁN CORTÉS and FRANCISCO PIZARRO respectively in the first half of the 16th century led to a redistribution of great wealth between continents. By that time, the Aztec and Inca had accumulated vast amounts of gold and silver through mining or by exacting tribute from peoples they themselves had conquered and had shaped the precious metals into exquisite objects. BERNAZ DÍAZ DEL CASTILLO, a firsthand witness, described the Aztec wealth and the Spanish plunder of it in his history of the conquest of New Spain, published in 1632, long after his death. The Aztec and Inca also used gemstones in their ornamental objects

and jewelry, including jade, obsidian glass, crystal, turquoise, and emeralds.

The Spanish CONQUISTADORES appropriated the precious metals and gemstones. They melted down most of the gold and silver artwork into ingots for shipping back to Europe, where it was given to King Charles I of Spain (Holy Roman Emperor Charles V). The Spanish also took control of the mines in the lands they had conquered, using Native American labor. Other mines were sought and developed. For example, in 1545, silver was discovered in the ANDES MOUNTAINS of southern Bolivia. The next year, the town of Potosí in what is now Bolivia was founded and eventually became the world's leading silver center, with a population of some 150,000. The flow of precious metals from the Americas to Europe shaped world economy for years to come, with Spain becoming the richest and most powerful nation and building its overseas empire (see COMMERCE AND EXPLORATION). The wealth helped pay for continuing explorations and continuing exploitation of colonies (see COLONIZATION AND EXPLORATION).

Treasure Fleets

The transport of treasure also shaped maritime history. A complicated trading route was developed by Spain's Indies Bureau of Trade, a government office founded in 1503. The route was maintained for more than two centuries, from 1530 to 1792. A royal fleet of ships—of the GALLEON-type vessel, designed to carry heavy cargoes or armaments—sailed from Spain every year with European items. In the Americas, it separated into three smaller fleets and spread out, delivering its goods at various ports. One group eventually reached Portobello in present-day Panama and picked up silver from Peru (shipped there by way of the Pacific Ocean, then carried by mule to the Atlantic coast). Its next stop was Cartagena in present-day Colombia to collect emeralds from Colombia, gold from Ecuador, and pearls from Venezuela. A second group sailed to Veracruz, where it picked up gold and silver from Mexico, and spices, silks, and porcelain from China (shipped to Acapulco in Mexico via the Philippines on the Manila Galleon—an annual fleet established in the 1580s—then transported overland to the Atlantic coast). A third, smaller group traveled to Trujillo in present-day Dominican Republic to receive indigo dye. The fleet met up in Havana in present-day Cuba, the departure point back to Spain.

Sailing in numbers helped protect shipping against PIRACY. Some of the raids on treasure ships were carried out by PRIVATEERS, sanctioned by governments. English privateers, including SIR FRANCIS DRAKE in the 16th century and WILLIAM DAMPIER in the 17th century, raided Spanish ships in both the Atlantic and Pacific. Pirates based in the Caribbean as well as on the BARBARY COAST of North Africa were active well into the 19th century.

Legendary Lands

The Spanish sponsored many more expeditions throughout much of the Americas, hoping to locate treasure on a par with that of the Aztec and Inca. Various expeditions fanned out from Spanish holdings in Aztec and Inca territory, eventually to North America as well. In the early 1540s, HERNANDO DE SOTO led the first extensive expedition in the American Southeast, seeking treasure. At the same time, FRANCISCO VÁSQUEZ DE CORONADO explored much of the American Southwest and the southern plains. Legends of wealthy cities and lands—that of EL DORADO in South America and the Seven Cities of CIBOLA and QUIVIRA in North America—spurred on these explorers as well as those of other nations. Such legends typically involved treasure (see LEGENDS AND EXPLORATION). A pattern emerged in which Native American tribes described rich tribal lands elsewhere as a tactic to rid themselves of the outsiders.

A comparable legend surrounding the mythical PRESTER JOHN took shape in the 12th century as that of a Christian ruler of a kingdom in Asia who might offer help

to European nations against Muslims. But it expanded by the 14th century into that of a ruler of an extravagantly wealthy kingdom in Africa, where gold and gemstones were bounteous.

The French sought a land known as SAGUENAY in what is now Canada in the early 16th century. Their dreams of Native American treasure led to JACQUES CARTIER's mistakenly believing that iron pyrites were gold, leading to the alternate name for the mineral, FOOL'S GOLD. Later in the century, Englishman SIR MARTIN FROBISHER, exploring for England, brought a sample of fool's gold back from Baffin Island in northern Canada, believing it to be gold, leading to the organization of the CATHAY COMPANY and expeditions to mine the valueless ore.

Gold Rushes

Another phenomenon related to treasure and exploration is that of gold rushes, the travel to areas where gold has been discovered. New routes were explored and established to remote places. The California Gold Rush of 1849, the Colorado (Pikes Peak) Gold Rush of 1858–59, and the

This cartoon satirizes the frenzy in obtaining passage to California during the gold rush of 1849. (Library of Congress, Prints and Photographs Division [LC-USZ62-104557])

This photograph shows miners heading for the Klondike gold fields by way of Chilcoot Pass, Alaska, in 1898. (Library of Congress, Prints and Photographs Division [LC-USZ62-057312])

Klondike Gold Rush to the Yukon Territory and Alaska of 1896–98 helped lead to the opening of parts of North America. Similarly, the discovery of gold on other continents—in wilderness areas north of Rio de Janeiro in Brazil in the late 17th century, in New South Wales and Victoria in Australia in 1851, in Western Australia in the 1880s, and in Witwatersrand in South Africa in 1884—has also led to migrations of peoples and a redrawing of the world map. And the discovery of other precious minerals or stones—such as diamonds in Brazil in 1726 and South Africa in 1866—led to movements of peoples and the opening of new regions.

tropic of Cancer

The tropic of Cancer is a parallel of latitude, a cartographic feature based on natural phenomena, $23^{\circ}27'$ north of the EQUATOR. On a representation of the world, it delineates the farthest point north at which the Sun can be seen directly overhead at noon, the Sun's rays striking the Earth vertically. This event happens one day a year: the

summer solstice in the Northern Hemisphere, on or about June 22.

The tropic of Cancer marks the northern boundary of the tropical, or torrid, zone, as separate from the north temperate zone. The imaginary line crosses the SAHARA DESERT in Africa, central India, southern China, the Pacific Ocean north of Hawaii, Mexico, and the Caribbean Sea.

The name *Cancer*, from the Latin word for “crab,” was originally applied to one of 12 astrological constellations. In the second century B.C., Greek astronomer HIPPARCHUS observed that, on the summer solstice in the Northern Hemisphere, the Sun appeared to be within the boundaries of the Cancer sector of the zodiac. The first European expedition to reach the tropic of Cancer was under Portuguese AFONSO GONÇALVES BALDAYA in 1436.

See also GEOGRAPHY AND CARTOGRAPHY; LATITUDE AND LONGITUDE; MAPS AND CHARTS.

tropic of Capricorn

The tropic of Capricorn is a parallel of latitude, a cartographic feature based on natural phenomena, $23^{\circ}27'$ south of the EQUATOR. On a representation of the world, it delineates the farthest point south at which the Sun can be seen directly overhead at noon, the Sun's rays striking the Earth vertically. This event happens one day a year: the summer solstice in the Southern Hemisphere, on or about December 22.

The tropic of Capricorn marks the southern boundary of the tropical (or torrid) climatic zone, as separate from the south temperate zone. The imaginary line crosses southern Africa, the island of Madagascar, the Indian Ocean, central Australia, the Pacific Ocean south of Tonga, and south-central South America.

The name *Capricorn*, from the Latin words *caper*, for “goat,” and *cornu*, for “horn,” was originally applied to one of 12 astrological constellations. In the second century B.C., Greek astronomer HIPPARCHUS observed that, on the winter solstice in the Northern Hemisphere (that is, the summer solstice in the Southern Hemisphere), the Sun appeared to be within the boundaries of the Capricorn sector of the zodiac.

Ultima Thule

Ultima Thule is a phrase coined by Roman scholar PLINY THE ELDER in the first century A.D. to describe the northernmost land that could be reached by humankind. His information was based on the travels of Greek scholar PYTHEAS, who reportedly explored Arctic waters in the fourth century B.C.

Pytheas was a remarkable figure, not only for being perhaps the first Arctic explorer, but also for his scientific accomplishments. His first endeavors were in astronomy and geography, including the calculation of the latitude of his city to an accuracy of half a percent. Yet his geographic findings were met with skepticism for centuries after his death. His most vigorous detractor was Greek geographer STRABO of the first and second centuries A.D., who accused him of spreading untruths. History has been much kinder to Pytheas than Strabo was. Much of what Pytheas observed has been verified. Unfortunately, Pytheas's account of his journey, *On the Ocean*, has not survived. The sources that have come down are quotes and paraphrases from those ancients who had access to his work, many of them his critics.

The voyage that Pytheas made, in about 325 B.C., was probably financed by the merchants of Massilia (present-day Marseilles), a bustling trading town on what is now France's south coast. His mission was to find the source of tin and amber in the north, which had previously been carried overland, or on the ships of Carthaginians, who made handsome profits through their control of the sea-lanes (see CARTHA-

GINIAN EXPLORATION). Pytheas managed to navigate past the Strait of Gibraltar (see GIBRALTAR, STRAIT OF) into the Atlantic Ocean and head northward in his GALLEY or galleys, eventually reaching the British Isles. The people of England had experience in mining tin and gathering amber. They regularly traded with foreigners, and Pytheas was given a friendly reception.

In the course of his commercial transactions, Pytheas was told of the northern land of Thule. The etymology of the word remains the subject of great debate and numerous theories. Among them is the Old Saxon word *Thyle*, meaning "boundary" or "limit" as the root word. The Gothic word *Tiule* has a similar meaning. There are even words of Nordic origin, which mean "sun" or "darkness," which could have given rise to the name *Thule*.

The time for travel to Thule was said to be six days from the north of Britain. Considering such a journey feasible, Pytheas set off to find it. There are few details of the land itself, but the observations he made confirm that he approached or even crossed the ARCTIC CIRCLE. First, he mentions visiting a place where the Sun never sets, indicating northern latitudes. He also describes an ocean where the elements mix into a thick substance he calls "sea lung." This was the source of much ridicule by Strabo. Yet such a description is consistent with the PACK ICE, frothy water agitated by the wind and dense fog of northern waters. It was the ice that stopped Pytheas, forcing a return southward.

The actual location of Thule continues to be argued, and with little hope of resolution. There are three major theories. The 19th–20th-century Norwegian explorer FRIDTJOF NANSEN supported the idea that Thule was Norway. In his scholarly work *In Northern Mists*, he uses a process of elimination to persuade the reader of this point of view. A second theory, that Thule was ICELAND, has the largest number of supporters. Although this is the most southern location of the three, the distance of six days sail from England is consistent with its location, and the pack ice would certainly have presented problems for the ancient explorer. The third theory names Jan Mayen Island as Thule's location. The location of this island is certainly far

enough to the north, but the conditions of the ocean would most likely have been too severe for the ships of Pytheas's expedition. Others name the Shetland Islands off the coast of Scotland, but this is a less likely choice because of its more southerly location.

Today, there exists a town of Thule on the northwest coast of GREENLAND. The Danish-Inuit (Eskimo) explorer KNUD JOHAN VICTOR RASMUSSEN established a scientific observatory there that has evolved into the most important military base of the United States on Greenland. The mystery of Ultima Thule receded over the centuries as humankind pushed to the NORTH POLE.

Viking exploration

The people known as Vikings were actually a number of different Scandinavian peoples of northern Europe—ancient Danes, Norwegians, and Swedes related in their Germanic language and culture—who have come to be identified as one for a period of their history. During the Middle Ages, from about 800 to 1100, they traveled widely as traders, raiders, and settlers. They became known by other names in other parts of Europe, including Norsemen (from Northmen), and were feared as warriors. *Viking* in fact means “warrior.” Much of what is known about the Vikings comes from medieval literature of other European peoples, as well as from their own literature—the Norse sagas—accounts of historical events celebrating their heroic past, including exploratory sea voyages—which the Scandinavians began writing after adopting Christianity and writing in the Roman alphabet in addition to their traditional runic writing. These sagas, once thought to be legends, have proven to be accounts of real events, based on archaeological evidence.

Scandinavian peoples lived in small, scattered villages, and practiced farming, fishing, and hunting. With extensive coastlines in their homelands containing numerous fjords, they used the sea for fishing and trade and for raiding to capture slaves. They developed the LONGSHIP, a type of GALLEY, propelled primarily by oars but with a single sail

used in some winds. The *drakkar* (or *lanskip*, for “longship”) was the warship, and the *knörr* (or *hafskip* for “halfship”), shorter and much deeper in draught, the voyaging and cargo ship. The *knörr* especially was sturdy and enabled the Vikings to travel in open seas (see SHIPBUILDING AND EXPLORATION). During what is referred to as the Viking age, Scandinavian mariners were the most skilled navigators and traveled farther than any other people (see NAVIGATION AND EXPLORATION).

Living in the extreme north of Europe, Scandinavians had not been conquered by the Romans, nor, during the Viking age, had they yet come under Christian influence. Rather, they practiced their traditional pagan religion, similar to that of other Germanic peoples. Their gods included Odin, the god of war; Thor, the god of thunder; and Balder, the god of light. In their mythology, Loki and other evil giants did battle with the Norse gods.

The Scandinavians had a political organization in which warfare played a central role. A warrior elite gained status through success in raiding by which they obtained booty to distribute to their retainers. The spoils of war were desired as much or more as proofs of warrior prowess and bravery as for material gain. Moreover, Viking warriors believed that if they died heroically in battle, they would join Odin in Valhalla, a palace in the realm of the gods.

By the beginning of the ninth century, parts of Scandinavia had begun to consolidate into kingdoms. This growing centralization may have played a part in Viking

expansion in that some chieftains or warriors, used to an independent status, sought to earn prestige and carve out their own power base or even establish a new homeland. A growing population also strained local resources. Knowledge of the wealth of certain peoples to their south no doubt provided incentive.

The earliest Viking raids were quick forays against coastal settlements by small groups of warriors. In the late eighth and early ninth centuries, single or several ships typically carried out solo raiding ventures. The Vikings sometimes camped in foreign lands for the winter. By about 850, the expeditions grew in size, and participants chose to settle some of the conquered lands. The Danes and Norwegians tended to engage in raiding and colonization more than the Swedes, who focused on trading. The Swedes generally went east and south; the Danes and Norwegians generally west and south.

Swedes settled the east coast of the Baltic Sea and traded with and sometimes raided inland peoples. There is evidence that the Vikings traveled inland into present-day eastern Europe as early as the eighth century. Some groups followed the Neva River, which took them to Lake Ladoga. Viking travel into eastern Europe often involved dragging their ships against the current of the predominantly north-flowing streams and portaging them over stretches of land.

To Slavic peoples of eastern Europe, the Scandinavians were generally known as Varangians. Some of the Viking raiders united under the leader Rurik in 862 at Novgorod, a center of trade on the Volkhov River in present-day Russia, which feeds Lake Ladoga, and became known as Rus, or Ruser.

The Scandinavians eventually reached the south-flowing Dnieper River, establishing a base at Smolensk in present-day Russia. By way of the Dnieper, they had access to the Black Sea and the city of Constantinople (present-day Istanbul, Turkey), which they had first raided in 860 and where they came to trade regularly. From there, they also sailed by way of the Dardanelles (a strait), the Sea of Marmara, and the Bosphorus Strait into the MEDITERRANEAN SEA. The Vikings also traveled the south-flowing Volga River, which took them to the Caspian Sea. The Swedish Vikings are also thought to have reached even Baghdad and Jerusalem. Among the settlements they reestablished was Kiev on the Dnieper in present-day Ukraine, which under Prince Oleg, from about 882 to 912, was capital of a Rus principality.

In the course of their travels, the Vikings met with Finnic, Slavic, and Turkic peoples. At Bulgar, a trade center at the bend of the Volga River, they also probably encountered caravans of Chinese as well as Arab Muslims. A traveler AHMAD IBN FADLAN, a non-Arab Muslim who was at Bulgar in summer 922, later described Scandinavians in his work *Kitah* (Book).

The Viking presence in England began at least by about 790, when Lindisfarne (Holly Island) in the north was attacked. The Viking presence in Ireland, according to medieval records, began five years later with an attack on an unidentified island called Rechru. Scandinavian kingdoms eventually arose at Dublin, Limerick, and Waterford. The Viking king of Dublin was able to launch his own raids in England.

The Vikings in the British Isles came mostly from what is now Denmark and were generally referred to as Danes by the local peoples among whom they settled. In addition to coastal settlements, they also came to control surrounding islands, such as the Hebrides, Orkneys, and Shetlands. Norwegian Vikings settled the Faeroe Islands, far out to sea in the North Atlantic.

In the early ninth century, Vikings also gained control of parts of coastal France and traveled up rivers for other raids. In 845, the Vikings navigated the Seine River to attack Paris. Those Vikings who settled in Normandy (French for “land of the Northmen”), which was officially ceded to them by the king of France, Charles III, in 911, became known as Normans.

From their new staging areas or homes on the British Isles or on the coastal mainland—typically at the mouths of rivers—the Vikings launched expeditions farther to the south. In about 858, Bjorn Ironside, the son of a Danish king, and his lieutenant Hastein led a fleet of 62 longships in raids from the mouth of the Loire River in France along the Iberian Peninsula through the Strait of Gibraltar (see GIBRALTAR, STRAIT OF) and into the Mediterranean Sea, where they reached coastal North Africa, the Balearic Islands off Spain, and coastal southern France. A fleet of Moorish ships eventually drove them back to the Atlantic, and they returned to France four years after departure. Normans came to expand their holdings; in the second half of the 11th century, William the Conqueror invaded England, and Roger I, Sicily.

The Vikings reached ICELAND in the North Atlantic in the second half of the ninth century. The Irish had already settled the island by 800 and possibly a lot earlier (see SAINT BRENDAN’S ISLE). According to one saga, in about 860, NADDOD, a Norwegian Viking, was blown off course while traveling from Norway to the Faeroe Islands and reached the east coast of Iceland. Another Norse saga holds that, about the same time, GARDAR SVARSSON, a Swedish Viking, circumnavigated Iceland and built the first Viking house there on the north coast. Floki Vilgerdarsson, another Norwegian, is said to have built a house on the east coast. The first permanent settler is said to have been Ingólfur Arnarson, who established a farm at present-day Reykjavík on the southwest coast in about 874.

From Iceland, the Vikings ventured even farther to the west. Norwegian Viking ERIC THE RED is considered

the European discoverer of GREENLAND in about A.D. 982, although it may have been earlier sighted by Bjarni Gunnbjörn. Eric the Red established a settlement at present-day Julianehaab. From Greenland, the Vikings traveled farther westward. Norwegian BJARNI HERJULFSSON, in about 985 or 986, was blown off course and spotted land, three distinct coastlines, he later reported to those in Greenland. In about 1000, Eric the Red's son, LEIF ERICSSON, also reportedly blown off course, came to a land that came to be known as VINLAND, somewhere in northeastern North America, very likely Newfoundland, Labrador, or Quebec. (The VINLAND MAP, supposedly found in 1957, showing the location of Vinland, turned out to be a forgery.) Other Vikings would later attempt to colonize Vinland, among them Leif's brother THORVALD ERICSSON in about 1005, THORFINN KARLSEFNI in about 1010, and his half sister FREYDIS EIRÍKSDOTTER in about 1014. Those colonies failed. The Norse settlement in Greenland endured until the early 15th century, when the outbreak of the bubonic plague cut off communication with Scandinavia. Yet their settlements in Europe endured and the Vikings became part of the ethnic mix of many European nations.

What is defined as the Viking age ended by the 12th century. By that time, European kingdoms were able to defend themselves against their raids; three great Scandinavian kingdoms had emerged that became Denmark, Norway, and Sweden; and Christianity had been introduced into Scandinavia.

Vinland

Vinland is the name given to a place in North America visited by the Vikings in the beginning of the 11th century. It represents the location of the first known European visit to the Americas (see VIKING EXPLORATION).

The earliest surviving reference to Vinland is from *Adami Gesta Hammaburgensis ecclesiae pontificum* (translated as *History of the Archbishops of Hamburg-Bremen*) written by Adam of Bremen in about 1075. He was a German who had obtained his information from Danish king Sweyn Estrithson. In this work, Adam of Bremen mentions a land with grapes, which make superior wine, as well as self-sown wheat. He also mentions an ice buildup to the north, which makes sailing impossible. Scholarly research has shown that Adam's writings were not always accurate, and it is likely that his mention of grapes and wine came from the interpretation of the word *Vinland*. In German this would refer to a land of wine, but in the Old Norse the prefix *vin* means a grassy field. In any case, the work of Adam of Bremen led to the repetition of this characteristic of Vinland in the sagas written more than a century later.

The chief sources of information on Vinland come from two Norse sagas, *Groenlendinga* (or the *Saga of the*

Greenlanders) and *Eiríks saga* (or the *Saga of Eric the Red*). These stories had been passed down by word of mouth for centuries before being written. The first to be recorded, the *Saga of the Greenlanders*, written in ICELAND in about 1200, has proven to be the more reliable of the two.

The story of the temporary settlement of Vinland begins with Viking BJARNI HERJULFSSON in about 985 or 986. On a trip from Iceland to visit his father in GREENLAND in a LONGSHIP, he was blown off course, to the southwest. Although he spotted land—three distinct coastlines, he reported—he did not make a landing. Eventually, he made his way to Greenland, where he related his findings.

According to the sagas, on a voyage of exploration to find the land that Herjulfsson had seen, LEIF ERICSSON embarked with a crew of 35 from Greenland in about 1001. He came upon three different regions: The first he named Helluland, after its extreme flatness; the second he named Markland, referring to a land of woods; the third, and most southern, he called Vinland. At Vinland, he built houses and probably stayed for a year. He then returned to Greenland.

The next reported visit to Vinland involves Leif's brother THORVALD ERICSSON in about 1005. He took up residence in the houses Leif had built and was the first to see the native inhabitants of the land, whom he called Skraelingar or Skraelings, a derogatory term meaning a "wretched and ugly creature." It is significant because it is the first account of European and Native American contact. In a confrontation with the Skraelings, Thorvald was killed. After two years in Vinland, the remaining members of the party decided to return to Greenland.

Despite earlier troubles encountered, the following expedition was a journey of colonization. Gudrid, the widow of Thorstein—Leif and Thorvald's brother—convinced her new husband, THORFINN KARLSEFNI, to organize a group to settle Vinland in about 1010. With four ships, as many as 160 people, livestock, and supplies, they landed on its shores. Conditions in their settlement were poor, and, after trading and fighting with the native peoples, Karlsefni and his company returned to Greenland.

FREYDIS EIRÍKSDOTTER, the half sister of Leif, looms large in the sagas' account of a follow-up effort in about 1014. Freydis sailed to Vinland with her husband, Thorvald, in a small longship with two Norse brothers, Helgi and Finnbogi, who owned a larger boat. In Vinland, she reportedly took over the houses her brother had built. Later, desiring the boat owned by Helgi and Finnbogi, she fomented a murderous rampage in which the brothers and their allies were killed. On their return to Greenland, the story of the murders came out, but Freydis's punishment was mitigated because of her relationship to Leif.

Although different sagas give different details about these various voyages and colonies, the fact of Norse

settlements in Iceland and Greenland is not in dispute. It seems likely that from Greenland the enterprising Vikings would reach the North American continent a short distance away. The actual location of Vinland is another matter. Academic speculation has yielded more than 500 hypothetical sites, from Labrador to Florida. To support their theories, scholars have not only used the latitudes where grapes are found, but also astronomical observations in the sagas, which relate to the seasons and the length of days. The one thing lacking in the theories was physical evidence.

In 1960, Norwegian explorer and writer Helge Ingstad and his wife, archaeologist Anne Stine Ingstad, began an excavation at the town of L'Anse aux Meadows in the north of Newfoundland. They discovered the remnants of eight houses of Norse design, similar to those excavated in Iceland and Greenland, with walls and roofs, which had been sod, laid over a supporting frame. In the middle of the floor were long narrow firepits used for heating, lighting, and cooking. Recovered artifacts also resembled those from other Viking sites: a stone oil lamp; a soapstone spindle whorl, used as the flywheel of a handheld spindle; a whetstone for sharpening tools; a bronze, ring-headed pin, used to fasten cloaks; the fragment of a bone needle, probably used in knitting; a small decorated brass fragment that once had been gilded; and iron nails or rivets used in boat-making. A great deal of slag from smelting and working of iron was also present. Some of these implements confirm the presence of women in the settlement.

Their findings did not preclude all other locations for Vinland, but established archaeological proof that the Viking discovery of North America predated that of CHRISTOPHER COLUMBUS for Spain by nearly 500 years. The site of the excavation is now a National Historic Site of Canada as well a World Heritage Site.

A map known as the VINLAND MAP, reportedly found in 1957, showing the location of Vinland in North America, turned out to be a forgery.

Vinland Map

The Vinland Map is a world map that shows an island to the southwest of GREENLAND called Vinland. There are two inlets on the island, which could easily correspond to Hudson Strait, with HUDSON BAY at its end, and the Gulf of St. Lawrence leading to the St. Lawrence River. If authentic, the Vinland Map would be the earliest map to represent North America, confirming the Norse sagas and the discovery of the Americas by the Vikings.

In 1957, the Vinland Map was reportedly found in a manuscript relating the mid-13th-century travels of Friar GIOVANNI DA PIAN DEL CARPINI to the lands of the Mongols. The best estimate of the time of its creation was in

about 1440, since it contained close similarities to a map published in 1436 by Venetian B. Andrea Bianco.

Donated to Yale University in 1965, the Vinland Map was revealed to the public that same year by R. A. Seton, Thomas E. Marston, and George D. Painter in their book *The Vinland Map and the Tartar Relation*. Upon its publication, the Vinland Map generated much excitement, scrutiny, and skepticism. The skepticism proved well founded, for, in 1974, Yale announced that the map was a forgery. The ink used to make it contained a titanium oxide compound, which had not been invented until the 1920s. Although it was revealed as a fraud, experts on early Scandinavian exploration pointed out that the Vinland Map in no way detracted from what was known of Viking travels to North America.

See also VIKING EXPLORATION.

Virginia Company

Virginia Company refers to two English commercial joint-stock corporations, chartered by King James I at the same time in 1606, for the purpose of reasserting sovereignty over North America and colonizing it. One was the Virginia Company of London, which also came to be known as the London Virginia Company, or the London Company. The second was the Virginia Company of Plymouth, also known as the Plymouth Company and later the Council of New England. The name *Virginia*, honoring the Virgin Queen, Elizabeth I, James's predecessor, was used broadly to describe the Atlantic coast of North America. The new colonizing attempts were the first since the failed attempts of the 1580s on Roanoke Island in present-day North Carolina, sponsored by SIR WALTER RALEIGH for Queen Elizabeth.

The Virginia Company of London received a patent to develop a colony in a 100-square-mile region on the Atlantic Ocean between latitude 34 and 41 degrees north; the Virginia Company of Plymouth received a patent to do so between 38 and 45 degrees north. The overlapping territory could be settled by either company, although any settlement by one had to be at least 100 miles away from the other. Each company had the power to appoint a local council, which was under the authority of a council in England, acting on behalf of the king, as well as a governor and other officials. The companies also had the responsibility to provide settlers, ships, and supplies for the colonization attempts.

In December 1606, the Virginia Company of London dispatched a fleet of three ships under CHRISTOPHER NEWPORT, with military leader JOHN SMITH. The colonists landed in Chesapeake Bay near the mouth of the James River in May 1607, where they erected James Fort. The colony became known as Jamestown, the first permanent English settlement in America. Because of the mortality rate from disease and conflicts with the Powhatan Indians,

as well as the lack of profits, the charter for the Virginia Company of London was revoked in 1624, and Virginia became a Crown colony.

The ships of the Virginia Company of Plymouth's first colonizing expedition were captured by the Spanish. A second attempt led by GEORGE POPHAM departed from Plymouth in May 1607 and settled on the west bank of the Kennebec River, near present-day Popham Beach, Maine, the following August. After a severe winter, during which Popham died, the colonists finally abandoned the site, returning to England in October 1608. By 1609, the Virginia Company of Plymouth had become inactive, and the Virginia Company of London received an individual charter.

In 1620, the Virginia Company of Plymouth received a new charter from James I as the Council for New England, with rights to develop territory between 40 and 48 degrees north, from sea to sea. That same year, the PILGRIMS, among them EDWARD WINSLOW, had secured a patent to settle in territory of the Virginia Company of London to the south. They sailed from Plymouth, England, on the *Mayflower*, and landed at present-day Plymouth, Massachusetts, in December 1620, to the north of the agreed-on territory. At that time, they drew up the Mayflower Compact, pledging allegiance to the English king, later obtaining patents from the Council for New England, legalizing their settlement site. The Pilgrims, through the FUR TRADE with Native Americans, eventually liquidated their debts to the merchants of the Council for New England. The Virginia Company of Plymouth was disbanded in 1635.

Voskhod program

The Voskhod program of the former Union of Soviet Socialist Republics (USSR; Soviet Union) consisted of SPACE EXPLORATION using the Voskhod type of spacecraft, accommodating two or three people with more functions controlled by the crew than in the smaller but similar spacecraft of the earlier VOSTOK PROGRAM. The name *Voskhod* means "dawn" in Russian. The Voskhod program competed with the GEMINI PROGRAM of the United States.

The first mission of the Voskhod program, *Kosmos 47*, launched on October 6, 1964, was to test modifications of the Vostok capsule. Six days later, three cosmonauts (see ASTRONAUTS), Vladimir Komarov, Konstantin Feoktistov, and Boris Yegorov were launched on *Voskhod 1*. They completed 15 orbits of Earth, the first three-person spaceflight in history. Moreover, Feoktistov, who had helped design the spacecraft, became the first engineer in space, and Yegorov became the first physician in space. Another flight, *Kosmos 57*, was launched on February 22, 1965, to test the airlock design. Despite its malfunctioning, on March 18, 1965, Pavel Belyayev and ALEKSEI ARKHIPOVICH LEONOV were

launched on *Voskhod 2*. During the mission of 17 orbits, Leonov carried out the first extravehicular activity, or "space walk."

Vostok program

The Vostok program of the Union of Soviet Socialist Republics (USSR; Soviet Union) accomplished several firsts in SPACE EXPLORATION. On April 12, 1961, in *Vostok 1*, YURI ALEKSEYEVICH GAGARIN became the first human to be in space and to orbit Earth. On June 16, 1963, in *Vostok 6*, VALENTINA VLADIMIROVNA TERESHKOVA became the first woman in space.

The Vostok program (*vostok* means "east" in Russian) competed with the MERCURY PROGRAM of the United States, which put the first American in space, ALAN BARTLETT SHEPARD, JR., on May 5, 1961. The "space race" between the two nations had begun in 1957, with the launch of the first SATELLITE, *Sputnik 1*, by the Soviet Union. The design of the Vostok spacecraft evolved from that of Kosmos spy satellites; early models were tested under the name Kurabl-Sputnik, with dogs aboard. They consisted of two basic parts, the capsule and the equipment module. The next generation were designed to carry a single cosmonaut (see ASTRONAUTS).

A total of six Vostok spacecraft were launched carrying cosmonauts. After Gagarin's pioneering mission, Gherman Titov became the first human to eat and sleep while in space during the *Vostok 2* mission of August 1961. *Vostok 3* and *4*, in August 1962, were in orbit at the same time, another first. Over the course of five days in June 1963, cosmonaut Valeri Bykovskii orbited Earth 81 times on *Vostok 5*, establishing a record for the longest solo space mission. Tereshkova, the first woman in space, flew the last Vostok mission. A seventh launch was planned, but the Soviet Union decided to concentrate on the VOSKHOD PROGRAM, developing spacecraft able to carry two or three people.

The cosmonauts in Vostok flights controlled few of the spacecraft functions. In emergencies they could, however, override an automatic orientation system with a code provided in an envelope attached to the capsule wall. A retro-rocket directed the craft out of orbit and back to Earth. A heat shield protected the capsule from incineration during reentry into the atmosphere. The equipment module, which separated from the capsule, burned up as it plunged toward Earth. The capsule's descent was slowed by parachute and it was eventually retrieved. At about two miles above Earth, the cosmonaut ejected from the capsule in an ejection seat, then separated from the seat and also landed by parachute.

The Vostok program proved that humans could survive the rigors of spaceflight: launching under the force of ROCKET propulsion; weightlessness over an extended period of time; reentry into Earth's atmosphere; and landing.

voyageurs

The term *voyageur* is French for “traveler.” It came to be applied to a man who traveled into wilderness areas, typically by CANOE, to conduct the FUR TRADE. The profession began in New France (present-day eastern Canada) under SAMUEL DE CHAMPLAIN, who sent out expeditions by way of Native American waterways—first along the Ottawa and French Rivers, then in the Great Lakes. The first voyageurs were therefore French, and the term originally applied to them alone.

The term came to be used for any wilderness participants in the fur trade, such as trappers—something akin to the MOUNTAIN MEN of the American West. In later years, the term came to be applied to paddlers transporting goods and people for the licensed companies, such as the HUDSON’S BAY COMPANY and NORTH WEST COMPANY, as distinct from the COUREURS DE BOIS, the “runners of the woods,” unlicensed fur traders. Early official expeditions, such as that of LOUIS JOLLIET and JACQUES MARQUETTE in

1673, which traced the course of the MISSISSIPPI RIVER, made use of voyageurs. Many later explorers of Canada, such as PETER POND and SIR ALEXANDER MACKENZIE, active in the late 18th century, also traveled with voyageurs. Regular trades routes were eventually established into the Canadian West and Northwest, as well as northern parts of present-day United States, and men of other European ancestry, especially the Scottish, took up the profession as well, as did the Métis, people of mixed ancestry, many of them descended from French voyageurs and their Native American mates.

The voyageurs adapted many Native American customs. They copied canoe designs, using birch bark as a covering, which made the boats light enough to portage over land between rivers, streams, lakes, and ponds. They also traveled by dogsleds and snowshoes. Buckskin was the favored material for clothing. Pemmican—a food made from dried meat, melted fat, and berries—served as a practical trail food.

West Indies

The West Indies is an archipelago lying between southeastern North America and northern South America. The arc formed by the thousands of islands stretches about 2,500 miles from off the coast of Florida to the coast of Venezuela, and separates the Atlantic Ocean from the Gulf of Mexico and Caribbean Sea. The West Indies, also called the Antilles, include the Bahamas in the north; the Greater Antilles (Cuba, Jamaica, Puerto Rico, as well as a single island, formerly known as Hispaniola, with two nations, Haiti and the Dominican Republic) in the center; and the Lesser Antilles (Virgin Islands, Leeward Islands, Windward Islands, Barbados, Netherland Antilles, Trinidad, Tobago, Aruba, and other islands off Venezuela) in the south.

Italian mariner CHRISTOPHER COLUMBUS first applied the name “Indies” when he explored the region for Spain in 1492, believing he had reached islands off the coast of India, associating them with the EAST INDIES. The name *Antilles* also came to be used in Spain and in France; Antillia was the supposed name of a mythical land supposedly existing in the Atlantic (the antecedent of the legend of the Seven Cities of CIBOLA).

Many of the West Indies are mountainous, formed by a partly submerged mountain range, and some islands have active volcanoes; other islands are flat, formed from coral and limestone. All the islands, except the northern Bahamas, have a tropical climate, moderated by the cooling effect of the Atlantic Ocean and the TRADE WINDS, which blow from

the northeast (enabling passage in sailing ships from Europe). Hurricanes occur frequently in summer and fall. Some of the islands were originally heavily forested with altitude and latitude determining tree types, from pine to palm. Animal life includes the hutia and agouti—types of rodents—the iguana, and a wide variety of turtles, birds, and fish. Native peoples practiced some farming along with hunting, fishing, and gathering. The Ciboney Indians, their origin unknown, lived in small areas of western Hispaniola and western Cuba. They were eventually pushed westward by the Arawak Indians, or Taino, out of South America. Another people, the Carib Indians, displaced the Arawak from the Lesser Antilles before the islands were visited by Europeans.

Spanish Arrivals

A saga of exploration and colonialism is of course attached to each one of the many islands in the West Indies. Spanish arrival among them is also the beginning of the story of the European exploration of all the Americas (apart from the Vikings in northeastern North America centuries before), with explorers and colonizers venturing south, west, and north from the islands. The region was the first colonized by Europeans and the last to remain as colonies. The West Indies became a cultural crossroads, with many different European nations active among them. The transatlantic SLAVE TRADE led to an African presence there as well.

Christopher Columbus landed first on a small island of the Bahamas that he named San Salvador, probably Watling

Island (although some scholars have theorized that he first landed on Samana Cay, 65 miles to the southeast), on October 12, 1492, at two o'clock in the morning. His expedition later reached Cuba, which he believed the Asian mainland, and Hispaniola, which he believed to be Japan. On Hispaniola, he made contact with the Arawak Indian GUANCANAGARI. Columbus returned with gold, parrots, and native people to Spain in March 1493, but not the hoped-for riches. That same year, he headed a second, larger expedition of 17 ships back to the West Indies, still believing they were part of Asia. This time, he took with him soldiers, colonists, livestock, tools, and seeds. He navigated a more southerly route, and, before returning to Hispaniola again, he passed and named many of the Lesser Antilles and sighted the Virgin Islands and Puerto Rico. Later on, he further explored the coast of Cuba and reached Jamaica. Columbus had attempted to found settlements at two different sites on Hispaniola during his first expedition. On the second voyage, he gave orders to found Santo Domingo on the south shore of Hispaniola in the present-day Dominican Republic. The oldest permanent settlement in the Americas, it became the seat of Spanish rule in the West Indies and, as a base of expansion, the “mother of settlement” of Latin America. Columbus returned to Europe in 1496. He later led two more expeditions to the Americas—in 1498–1500 and 1502–04. On his third voyage, he reached the South American mainland—the so-called SPANISH MAIN—and the island of Trinidad. On his fourth voyage, he explored the coast of Central America.

The transatlantic crossing became commonplace for Spanish ships. Before long, they had conquered the tribes of Jamaica, Hispaniola, and Cuba. DIEGO VELÁSQUEZ, who had sailed with Columbus in 1493, along with his lieutenant PÁNFILO DE NÁRVAEZ, were central to these military operations. Velásquez, who declared himself governor-general of Cuba, founded Havana in 1519, which became another launching point for Spanish exploratory expeditions. San Juan, founded in 1511 on an island in a bay off Puerto Rico, became still another center of activity.

Staging Posts

Other Spaniards famous for explorations elsewhere—many of whom became known as CONQUISTADORES—spent part of their careers in the West Indies. JUAN PONCE DE LEÓN, who explored Florida in 1519, had previously served as governor of Puerto Rico. LUCAS VÁSQUEZ DE AYLÓN, who organized an expedition to the coast of present-day South Carolina in 1520, was a colonial official at Santo Domingo. HERNÁN CORTÉS, who conquered the Aztec of Mexico in 1521, had served under Velásquez in Cuba. FRANCISCO PIZARRO, who conquered the Inca of Peru in 1533, had served under Nicolás de Ovanda, governor of Hispaniola. In 1535, GONZALO FERNÁNDEZ DE

OVIEDO Y VALDEZ, who was a colonial official in the West Indies and the official historian of the Americas, published the first volumes of *Historia general y natural de las Indias Occidentales* (General and Natural History of the West Indies).

The ports of West Indies eventually served as staging posts for Spanish ships carrying cargo to other settlements and plundered riches from the Aztec and Inca back to Spain (see TREASURE AND EXPLORATION). In the second half of the 16th century, other nations began to show interest in the region. SIR JOHN HAWKINS completed the first successful English transatlantic slave-trading expedition in 1562–63, exchanging African slaves to Spanish colonists for sugar and hides, which he transported back to England. With ongoing conflict between England and Spain, English PRIVATEERS, such as SIR FRANCIS DRAKE, commissioned by Queen Elizabeth I, began raiding Spanish shipping in the 1560s.

Colonial West Indies

By the end of the 16th century, the native population of the West Indies had been decimated—from the spread of European diseases, warfare, and forced labor—with only a few pockets remaining. By the mid-17th century, England, France, and the Netherlands had established settlements in the West Indies. By that time also, sugar plantations had been introduced to the region. During the colonial period, most islands were deforested.

Colonial conflicts would continue over the next centuries, with colonial influence enduring to modern times. In the late 19th century, the United States also became active in the region politically and economically. With the Spanish-American War of 1898, Spain lost its last possessions in the West Indies. Great Britain granted independence to most of its colonies in the 1960s. Some of the West Indies islands are still British, French, Dutch, and American dependent territories, however. The island of Margarita is part of Venezuela.

See also CENTRAL AMERICA, EXPLORATION OF.

whaling and sealing

The hunting of sea mammals took mariners to waters of high latitudes and played a part in the history of exploration. Whaling and sealing as a means of subsistence have been a traditional activity of native peoples of Arctic regions for millennia. Yet, in more recent centuries, whaling to obtain oil, meat, bone, and other by-products, and sealing, especially for furs, became an organized business.

Whaling and Exploration

Whaling of many of at least 75 species of whales as a commercial enterprise dates back to the ninth century, early such activity carried out by the Basques of northern Spain and southwestern France in the Bay of Biscay of the Atlantic

Ocean. By the mid-16th century, when those waters became depleted, whalers ventured as far as Newfoundland off northeastern North America. After a Dutch expedition under WILLEM BARENTS in search of the NORTHEAST PASSAGE reached Spitsbergen (present-day Svalbard) in the Arctic Ocean north of Norway in 1596, and an English expedition under HENRY HUDSON for the MUSCOVY COMPANY in 1607 reported whales in the archipelago's vicinity, Spitsbergen became a center of whaling for the Dutch and the English. Basques were often hired for their crews. By the mid-17th century, when whale herds had been reduced in those waters, whalers hunted around GREENLAND. During whaling expeditions in 1806–17, especially in Arctic waters east of Greenland, an English whaler and his son, WILLIAM SCORESBY, SR., and WILLIAM SCORESBY, JR., made studies of natural science and navigation, reporting to England's ROYAL SOCIETY. The Davis Strait to the west of Greenland also was a rich hunting ground for a time.

America also became involved in the whaling business, starting in the mid-17th century, early hunters setting out from such places as Sag Harbor on Long Island in New York, and Provincetown on Cape Cod in Massachusetts, and the Island of Nantucket also in Massachusetts. In 1791, an American ship first rounded South America's CAPE HORN for hunting in the Pacific Ocean. By 1830, New Bedford on coastal Massachusetts had become the most important whaling center. New London, Connecticut, and San Francisco, California, also became important whaling ports. Norway, Japan, and Russia also became active in whaling.

Early hunters launched their rowboats from shore, in order to kill whales with handheld lances and hand-thrown harpoons. They later began launching their rowboats from ships. Whaling ships became larger over the centuries, from sloops of 30 to 40 tons, to schooners and brigs of 100 to 150 tons, and, by the 19th century, to ships and barks of twice that weight. By the late 19th century, large steamships were also used, some of them factory ships, on which whales could be processed after being killed. By the 19th century, voyages commonly lasted three or four years. The invention, in about 1856, of a harpoon containing an explosive head by the Norwegian Sven Foyn revolutionized whaling. The last rich hunting grounds were found in the waters off Antarctica. In 1904, a whaling station was founded on the island of South Georgia in the South Atlantic (where SIR ERNEST HENRY SHACKLETON sought help in his aborted Antarctic expedition of 1914–16). Modern whaling is heavily regulated, with many of the species endangered, such as the sperm whale, whose oil was once valued above that of all others.

Seal Hunting and Exploration

Seal hunting for food, oil, and hides, like whale hunting, has been a traditional part of subsistence for a number of north-

ern peoples, in particular the Inuit (Eskimo) of the North American Arctic. The term *seal* is applied broadly to a number of pinnipeds, or fin-footed mammals: the eared seals, which include the fur seal, the species most hunted for furs, and the sea lion; and the earless seals—the true seals—some of which are also valued for their furs, especially the harp seal, whose pups have fluffy white coats, and the ringed seal. The commercial hunting of seals dates back to 1515, when a cargo of fur seal skins arrived from Uruguay to the markets in Seville, Spain. During the next centuries, sealing was carried out on a small scale. In the 18th century, various nations became active in the seal fur business. In 1786, during the period that the Russians were expanding their fur-trading activities into Alaska, GAVRILO LOGINOVICH PRIBILOV (also known as Gerasim Pribilof) made the European discovery of the Pribilof Islands in the Bering Sea, which serve as an annual mating place for a large portion of the fur seal population. The Pribilof Islands are also known as the Fur Seal Islands.

At about the same time, sealers began hunting in southern waters and on southern islands, such as the Falklands. American EDMUND FANNING, who participated in and sponsored many expeditions to the South Pacific, participated in the sealskin trade. He was one of the sponsors of NATHANIEL BROWN PALMER's sealing expedition to waters south of CAPE HORN in 1829, which led to one of the earliest sightings of the Antarctic Peninsula. A Scottish sealer, JAMES WEDDELL, sailing for Great Britain in 1822–23, explored the South Orkney Islands and reached a southernmost point in the Atlantic's Weddell Sea not surpassed until the next century. Englishman JOHN BISCOE, also a sealer, circumnavigated Antarctica in 1831–32. Macquarie Island, south of TASMANIA in the South Pacific, as well as the Crozet Islands and Kerguelen Islands in the southern Indian Ocean, also became places for sealing.

It has been estimated that more than 25 million fur seals have been slaughtered for their skins from 775 to 1900. In the late 19th and early 20th centuries, nations came to agree on regulations to protect diminishing herds and endangered species. The controversy has continued to modern times because of the threat to the survival of certain species and the cruelty involved in clubbing seals to death, including pups, in order not to damage their coats.

women explorers

In historical studies of exploration, one encounters the names of many more men than women. Yet women played a significant role as wives of explorers, sponsors of expeditions, as well as explorers in their own right. Like men, they explored for a variety of reasons: to break free of society's constraints; to earn a living; out of religious conviction; as inspiration for their writing; to find subjects for painting; for

scientific studies; or, simply, in order to rise to the challenge of being a woman explorer.

Since the beginning of time, those with wanderlust have found a way and means to travel. While the opportunity to explore traditionally has come to men in many ways, it has not been readily granted to women. Women typically had to overcome societal obstacles before even facing the obstacles of the journeys themselves.

Some of those who managed to voyage beyond their homeland were women of privilege; others came from poverty and repression. Traveling as a companion to a husband or lover enabled travel for some women. Some women traveled as guides to expeditions, or as captives. Others dressed in the clothes of a man in order to travel.

Sponsors

In some instances, the role of sponsor—that is, the person having vision, incentive, wherewithal, and dedication to launch an expedition—was as critical as actions in the field (see SPONSORS OF EXPLORATION). In the case of HATSHEPSUT, the first woman pharaoh, who, in about 1492 B.C., sent a maritime trading expedition southward via the RED SEA to the land of PUNT in the region of the Gulf of Aden—one of the first known exploratory expeditions—her name has survived as the most significant with regard to the journey.

Ferdinand II and Isabella I, the joint rulers of Aragón and Castile in Spain in 1479–1504 sponsored Italian mariner CHRISTOPHER COLUMBUS's voyage across the Atlantic Ocean in 1492, leading to European awareness of the Americas. It is thought that it was indeed Isabella, called la Católica (the Catholic), an energetic and involved leader, who first believed such an undertaking was worth the investment, having been so advised by the finance minister Luis de Santangel. One of her motivations was the finding of new converts to Christianity.

Elizabeth I, who ruled England and Ireland from 1558 to 1603, also recognized the economic possibilities of exploration and colonization—in large part because of competition with Spain—and supported the ventures of such men as SIR FRANCIS DRAKE, SIR HUMPHREY GILBERT, and SIR WALTER RALEIGH.

In the mid-19th century, Lady JANE FRANKLIN, widow of SIR JOHN FRANKLIN, lost in the Canadian Arctic after departure from England, persistently raised funds for private expeditions to find him, when she was not satisfied with the results of government-backed endeavors.

For Better or for Worse

A number of wives played important roles in the lives of explorer husbands—and not only in offering moral support and maintaining their interests at home, but also as companions in foreign lands.

One wife, through happenstance, became known as an explorer in her own right. Ecuadorean woman ISABELA GODIN DES ODANAIS was wife of Frenchman Jean Godin des Odanais, part of a French scientific team. In 1769, after waiting for almost two decades, she set out on a journey down the AMAZON RIVER out of central Peru to be reunited with him. When everyone in her party perished, she had to wander in the rain forest alone for nine days before being rescued by Indians and rejoining her husband in Cayenne in French Guiana. She is the first known woman to descend the entire Amazon.

Protestant missionaries were very often a husband and wife team. Englishwoman MARY MOFFAT traveled to southern Africa to marry and be with missionary ROBERT MOFFET and helped him found a mission at Kuruman on the edge of the Kalahari Desert. She remained in Africa until 1870. Their eldest daughter Mary married Scottish missionary DAVID LIVINGSTONE in 1845 and traveled with him on a number of his subsequent African expeditions, dying on the ZAMBEZI RIVER in 1862.

In 1872, Englishwoman ELIZABETH SARAH MAZUCHELLI and her husband, Anglican clergyman Francis Mazuchelli, traversed the Singalila Mountains of eastern Nepal during a two-month, 600-mile trek from Darjeeling into the HIMALAYAS of northern Sikkim. She wrote about her Himalayan journey in the book *The Indian Alps and How We Crossed Them*, published in 1876.

The wives of two American missionaries to the American West—Narcissa Whitman, wife of MARCUS WHITMAN, and Eliza Spalding, wife of HENRY HARMON SPALDING—became the first known non-Indian women to cross the ROCKY MOUNTAINS while traveling with their husbands in 1836.

In the 20th century, two different wives, DELIA JULIA DENNING AKELEY and MARY LEONORE JOBE AKELEY, both American-born, worked and traveled with their husband, American naturalist CARL ETHAN AKELEY, in Africa. They were known as explorers in their own right, Delia in East Africa after her divorce, and Mary in the Canadian northwest before her marriage and in the Belgian Congo after her husband's death. Both wrote about their travel experiences.

Wives and Guides

Another woman who traveled with her husband—and actually proved much more critical to the success of the expedition than he—was Shoshone Indian SACAJAWEA. When her husband, French Canadian fur trapper TOUSSAINT CHARBONNEAU was hired by MERIWETHER LEWIS and WILLIAM CLARK at the Mandan Indian villages on the MISSOURI RIVER in early 1805, he had to convince them to allow his wife (whom he reportedly had won in a gambling game with Hidatsa Indians) to accompany them. Her giv-

ing birth to a baby (JEAN-BAPTISTE CHARBONNEAU) that February did not help his case. Yet, on the journey to the Pacific Ocean and back with the Corps of Discovery, she proved invaluable as a guide and interpreter. She even managed to procure horses from her brother Cameahwait, chief of a Shoshone band, in the course of the trip. Her participation through the return to the Mandan villages helped the expedition maintain mostly peaceful relations with the many other tribes encountered. In his writings about the journey, William Clark praised Sacajawea for her resourcefulness and criticized her husband for general incompetence.

Several years later, in 1811–12, another Native American woman, MARIE DORION of the Ioway tribe, played a similar role for the Astorians under WILSON PRICE HUNT for

fur trader JOHN JACOB ASTOR, serving as a guide beside her husband PIERRE DORION, JR.

Earlier in history, in 1519–21, Aztec woman MALINCHE served as HERNÁN CORTÉS's interpreter during the Spanish conquest of the Aztec Indians in present-day Mexico. Although they had a son together, Cortés eventually presented her as a gift to one of his military colleagues.

One Hand on the Pen

Many women are known as explorers through their writings. One of the earliest to record her experiences away from home was Chinese woman WEN-CHI, who, in about A.D. 190, at age 12, was abducted by the Hsiung-Wu, also known as the Huns. She later wrote about her experiences living as a nomad on the Mongolian steppes in a series of

In this early 20th-century photograph, Harriet Chalmers Adams is shown on an expedition to the Gobi Desert. (Library of Congress, Prints and Photographs Division [LC-USZ62-97426])

poems, known as *Eighteen Songs of a Nomad Flute*. A woman who helped begin the tradition of travel writing was Englishwoman CELIA FIENNES, who, in the late 17th and early 18th centuries, traveled throughout the British Isles on horseback. Her journals were published as *Through England on a Side-Saddle* in 1888.

IDA REYER PFEIFFER, an Austrian woman, circumnavigated the world twice, from west to east and east to west. She wrote about it in *A Woman's Journey Round the World*, published in 1852, and *A Woman's Second Journey Round the World*, published in 1856. ISABELLA BIRD BISHOP, the first woman member of the ROYAL GEOGRAPHICAL SOCIETY, earned this honor by also traveling much of the globe. She was initially instructed to travel by her doctor. She wrote about her travels in *The English Woman in America*, published in 1856, among many other works.

Many women continued this tradition of travel writing in the late 19th and early 20th centuries. ISABELLE EBERHARDT, a Russian-German woman born in Switzerland, converted to Islam, began dressing as a man, and traveled through North Africa in the late 19th century, chronicling her expeditions in many books and French newspapers. MAY FRENCH SHELDON, an American publisher and author in central Africa, was one of the first European women to visit many villages in present-day Kenya and Tanzania. She wrote an account of her experiences in East and central Africa, including her attempt to scale MOUNT KILIMANJARO, in *Sultan to Sultan*, published in 1892. British author MARY HENRIETTA KINGSLEY recorded her two-year journey through West and central Africa in three books, including *Travels in West Africa*, published in 1897.

American HARRIET CHALMERS ADAMS wrote about crossing the ANDES MOUNTAINS of South America and of other travels, including to the GOBI DESERT of central Asia, in the early 20th century, for *National Geographic* and other magazines. She was elected to the Royal Geographical Society and became the first president of the Society of Women Geographers. British archaeologist GERTRUDE MARGARET LOWTHIAN BELL traveled widely in the Middle East in the late 19th and early 20th centuries; she wrote extensively about her experiences, including *Amurath to Amurath*, published in 1911.

Frenchwoman ALEXANDRA DAVID-NÉEL became known as a journalist after she became the first European woman to obtain an audience with the Dalai Lama in exile in India, in 1911. She later became the first European woman to reach the Tibetan city of LHASA, which she described in *My Journey to Lhasa*, published in 1927. British travel writer and archaeologist FREYA MADELINE STARK had many maladies in her life, among them heart attacks, malaria, and dengue fever. None of them detoured her from her travels in the Hadramawt region of southern Arabia and central Asia, which she wrote about in a number

of works, including *The Valley of the Assassins*, published in 1934.

Natural Science

Some women traveled for the sake of science. In the 1860s–70s, German naturalist KONCORDIE AMALIE NELLE DIETRICH spent 10 years collecting the single largest assemblage of natural flora and fauna in Australia. British painter MARGARET URSULA MEE traveled throughout the Amazon Basin over a period of 32 years in the mid-20th century, making a visual record of plant life.

Disguised as Men

Ancient Egyptian queen Hatshepsut was known for wearing men's clothing to further her position of power. Writer Isabelle Eberhardt, mentioned above, also donned men's clothing to facilitate travels. Spanish woman CATALINA DE ERAUSO is also among those successful at traveling as a man. In the early 17th century, in disguise, she fought as a soldier and worked in mining camps in Argentina and Chile. In the 1760s, Frenchwoman JEANNE BARET, disguised as a male crewmember, participated in LOUIS-ANTOINE DE BOUGAINVILLE's official French expedition to the South Pacific, and she may have been the first woman to circumnavigate the world. In the early 19th century, Englishwoman HESTER LUCY STANHOPE adopted male dress in order to travel freely in Israel, Lebanon, and Syria. During her travels, she lived among the Bedouin in the Syrian Desert.

In the Name of Exploration

As has been the case with men, some women considered exploration a calling. Dutch woman ALEXANDRINE PETRONELLA FRANZINA TINNÉ and American LOUISE ARNER BOYD pursued careers as explorers. In the 1860s, Tinné explored portions of the NILE RIVER and SAHARA DESERT, eventually losing her life there to Tuareg tribesmen. Boyd, who came from a wealthy family, organized and led a number of expeditions to the Arctic in the mid-20th century. Both women supported the efforts of scientists, who were with them on some of their travels. In 1955, Boyd became the first woman to fly over the NORTH POLE.

Mountain Climbing

Two early woman mountaineers were ANNIE SMITH PECK and FANNY BULLOCK WORKMAN, both American and both active in the late 19th and early 20th centuries. After climbing in the Alps, Peck turned her attention to South and Central American peaks. Workman traveled throughout Europe, North Africa, the Far East, and central Asia. Among the mountains she climbed were the Himalayas.

The first woman to climb Mount Everest (see EVEREST, MOUNT) was Japanese Junko Taibei on May 16, 1975. Eleven days later, on May 27, Phantog, a Tibetan woman,

Fanny Workman sits next to climbing equipment on one of her expedition in the late 19th or early 20th century. (Library of Congress, Prints and Photographs Division [LC-USZ62-70538])

also made the ascent. The first American woman to reach the summit of the tallest mountain in the world was Stacey Allison in 1988.

Women in Space

With the arrival of the space race, certain women—in particular VALENTINA VLADIMIROVNA TERESHKOVA of the Union of Soviet Socialist Republics (USSR; Soviet Union) and SALLY KRISTEN RIDE of the United States—had a chance to make space history. In 1963, the VOSTOK PROGRAM mission made Valentina Tereshkova the first woman launched into space. She spent 70 hours in orbit. Twenty years later, Sally Ride became the first American woman in space. She orbited Earth for six days aboard the SPACE SHUTTLE.

The above are but a few of the women whose travels are relevant to the history of exploration. They journeyed for varied reasons, but all can be said to be adventurers and pioneers. They endured hardships and demonstrated resourcefulness that many considered beyond the capabilities of women, helping change stereotypical views even as they contributed to knowledge of the regions they visited. In modern times, it has become commonplace for women to travel widely and help explore the remote places of Earth and beyond.

writing and exploration

A rich literature is attached to world exploration. Writings by explorers or about them is filled with challenge, adventure, drama, and description. It is writing and documentation that defines history, and the history of exploration and the gaining of geographic knowledge provides a fascinating view of the saga of humankind. Yet writing is not just the means of telling and preserving the story; it is part of the story. Accounts about travels spurred on other travels. The success of books regarding one expedition helped justify and pay for others. Moreover, travel writing developed as a calling unto itself.

Writing and the Ancients

Tracing the careers of early explorers helps give a sense of the importance of writing in both preserving and shaping the chronicle of exploration. Four Greeks of the sixth and fifth centuries B.C., HECATAEUS OF MILETUS, HERODOTUS, CTESIAS OF CNIDUS, and XENOPHON, who traveled beyond their homeland—Hecataeus and Herodotus up the NILE RIVER, Ctesias to Persia (Iran) and India, and Xenophon from Persia to Greece—are sources for much of what we know about the period (see GREEK EXPLORATION). But they also sparked interest about foreign lands among their contemporaries and subsequent generations. While ostensibly a

historical account of the wars between the Greeks and Persians, Herodotus's *History* consists of a mixture of observation and myths, which sometimes veer wildly from the truth, similar to earlier Greek poetry, and with literary themes examining the consequences of the meetings of different peoples, and contrasting the values of democracy and tyranny. They helped inspire ALEXANDER THE GREAT in his campaign against Persia in the fourth century B.C., which resulted in the hellenization of much of the Middle East and a dissemination of Greek culture and literature. The Romans took up this tradition as they expanded their domination over the Mediterranean world in the early centuries B.C., spreading Roman culture and the Latin language (see ROMAN EXPLORATION).

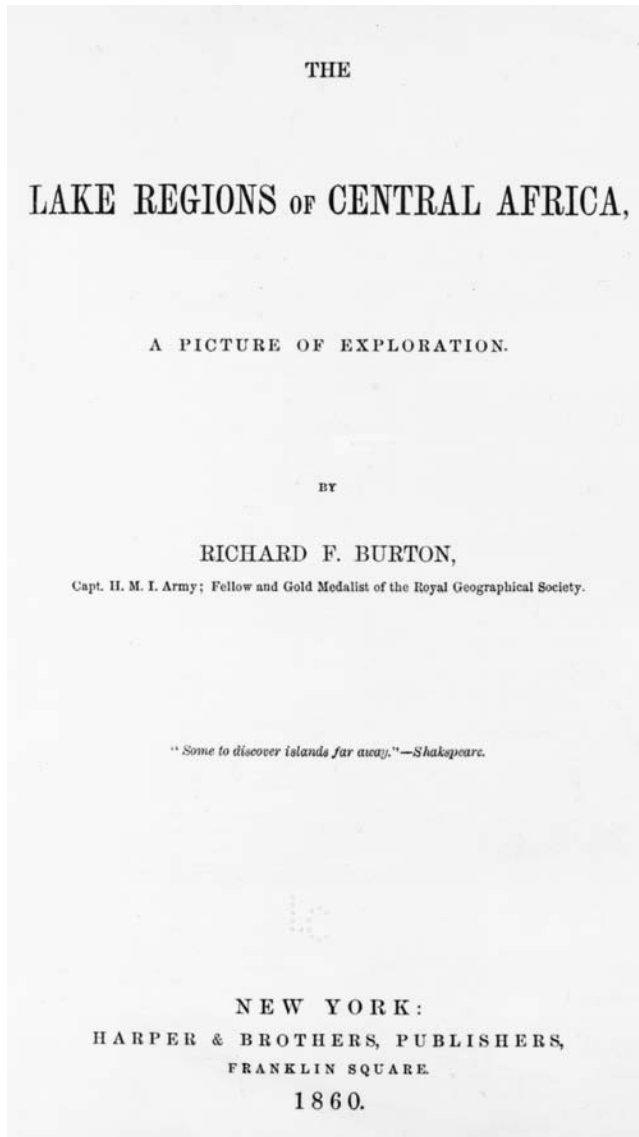

Cartographers, who are also part of the story of writing and publishing, drew on their accounts and those of other early travelers. Those who recorded and passed on the evolving view of the world from their own travels and/or the travels of others include Greeks ERATOSTHENES of the third and second centuries B.C. and STRABO of the first century A.D., Roman PLINY THE ELDER of the first century A.D., and hellenized Egyptian Ptolemy of the second century A.D. (see GEOGRAPHY AND CARTOGRAPHY).

Writings of the East

Writers and cartographers of the East, as in China, also disseminated knowledge gained through exploration (see CHINESE EXPLORATION). In about A.D. 220, the Han dynasty collapsed, which had united China in an empire for about 400 years. In subsequent years, Buddhism, a religion that had developed on the GANGES RIVER in India, was passed into China. But the Chinese Buddhists had learned from translated texts and word of mouth, leading to doctrinal disagreements. In A.D. 399, a Buddhist monk in China, FA-HSIEN, embarked on a voyage to India in order to make copies of original Buddhist texts in Sanskrit, translate them, and resolve these questions. Fa-hsien's journey lasted 15 years, and took him over the Takla Makan desert and through the HIMALAYAS to the INDUS RIVER and then across northern India, but he eventually returned to China with a wealth of Buddhist texts.

Fa-hsien was followed two centuries later, in A.D. 629, by another Chinese Buddhist monk, HSÜAN-TSANG, for the same purpose. After a long journey through central Asia and India, he too returned with Buddhist scriptures. Another scholar, I-CHING, set out for India in 671 in search of Sanskrit texts and traveled in Indonesia as well. Chinese cartographers, such as CHU SSU-PEN of the 14th century, defined the known world at the time based on others' accounts.

Many of the most famous Arab Muslims who played a part of the history of world exploration were geographers as well as writers (see MUSLIM EXPLORATION). ABU AL-HASAN

This title page is from an 1860 book on Africa by Sir Richard Burton. (*Library of Congress, Prints and Photographs Division [LC-USZ62-108547]*)

ALI AL-MASUDI traveled to Islamic lands in the 10th century; ABU ABD ALLAH MUHAMMAD ASH-SHARIF AL-IDRISI did so in the 12th century; and ABU ABD ALLAH MUHAMMAD IBN BATTUTAH did so in the 14th century. Ibn Battutah also voyaged southward into Africa beyond the world known to his peers.

Renaissance Writings

Among Europeans, early explorers such as German PETHAHIA OF REGENSBURG of the 12th century, Italian MARCO POLO of the 13th century, and Italian ODORIC OF PORDENONE of the 14th century shaped the European worldview during and after their lives with their tales of

foreign lands (all three men had the help of writers in recording their travel accounts). In 1375, ABRAHAM CRESQUES published a world atlas based largely on their accounts. This work was a milestone of the early RENAISSANCE, the name applied to a cultural phase in Europe from the 14th century into the 17th century, a time of new accomplishments in scholarship and the arts and a new awareness of the world (see EUROPEAN AGE OF EXPLORATION).

The development of the movable type printing press by German goldsmith and printer Johannes Gutenberg in the mid-15th century, part of the phenomenon of the Renaissance, made books accessible to a wider audience, and some of the most successful early books capturing the public's imagination involved accounts of distant lands. For example, Italian FRANCESCO ANTONIO PIGAFETTA, who served as Portuguese FERDINAND MAGELLAN's private secretary in the first CIRCUMNAVIGATION OF THE WORLD in 1519–20, kept a daily record of the voyage, which was published in Paris in 1540 and reached a large readership. BERNAL DÍAZ DEL CASTILLO's account of the Spanish conquest of the Aztec Indians of the 1520s in Mexico, in which he participated, was not published until the 17th century, but became the primary source for that event.

Various Approaches to Writing

Many different approaches to writing have furthered knowledge of exploration and geography. An 18th-century French historian PIERRE-FRANÇOIS-XAVIER DE CHARLEVOIX traveled in North America for the purpose of research, which was later incorporated in his six-volume *History of New France*. Other scholars who traveled for their work—such as German naturalist ALEXANDER VON HUMBOLDT in the late 18th century and 19th century, and British archaeologist JAMES THEODORE BENT in the late 19th century—recorded their findings in writing, which were passed on to the public through publishing (see NATURAL SCIENCE AND EXPLORATION and ARCHAEOLOGY AND EXPLORATION). The journals of MERIWETHER LEWIS and WILLIAM CLARK about their 1803–06 expedition have been published time and again. The role of the less renowned MOUNTAIN MEN in the FUR TRADE in the 1820s–30s, such as WARREN ANGUS FERRIS, might not be known if not for their own accounts of their careers, or as told to others who wrote about them. In some instances, professional writers became known in other capacities. For example, British-American journalist SIR HENRY MORTON STANLEY, who was in Africa in much of the 1870s–80s, became known as an explorer and colonizer first and as a writer second.

Travel Writing

In its modern incarnation of travel writing, the purpose of the trip is writing about the trip. Yet, with regard to earlier ages, the phrase is applied to any account involving travels.

WEN-CHI, a Chinese woman who was abducted by the Hsiung-nu (Huns) and who lived as a nomad on the Mongolian steppes in the second century A.D., wrote about her experiences in *Eighteen Songs of a Nomad Flute*. This might also be called a captivity narrative. In the 16th century, Portuguese FERNÃO MENDES PINTO wrote about his travels in the Far East on returning to Portugal and earned the sobriquet “Prince of Lies” because many of his adventures seemed too fantastic to be believed.

An early traveler whose writings became an intrinsic part of her wanderings was CELIA FIENNES. In the late 17th and early 18th century, she journeyed throughout England, keeping a journal of her experiences. Travel writing became a tradition for the British in the 19th century, especially for women. LUCY ATKINSON, ISABELLA LUCY BISHOP, ANNE ISABELLA BLUNT, MARY HENRIETTA KINGSLEY, and ELIZABETH SARAH MAZUCHELLI all can be said to have engaged in travel writing. This tradition carried over into the 20th century with ALEXANDRA DAVID-NÉEL and FREYA MADELINE STARK.

Austrian IDA REYER PFEIFFER, active in the 19th century, and Swiss ISABELLE EBERHARDT, active at the turn of the 20th century, might also be called travel writers. Americans who engaged in travel writing in the 19th century are HENRY MARIE BRACKENRIDGE, JOHN TREAT IRVING, and MAY FRENCH SHELDON; and, in the 20th century, HARRIET CHALMERS ADAMS and PAUL BELLONI DU CHAILLU.

Exploration and Literature

Once, when in old age, the British author and explorer CHARLES MONTAGU DOUGHTY had been asked why he had made his journey through the deserts of the Arabian Peninsula in the 1870s, he replied that he had made his voyage “to redeem the English language.” The only way for Doughty to capture his experience, far from the orderly landscape of England, was to abandon the built-up literary conventions, and to adopt a mode of expression from his environment, the Arabian desert. Doughty wrote his account of his explorations, *Travels in Arabia Deserta*, published in 1888, a work of more than 600,000 words, in a

style that hearkened back to an earlier period of English literature, to Edmund Spenser and the King James Bible, but he injected in it something new too, unique to the desert, for he took the inspiration for his style from the looser grammar and foreign rhythms of Arabic. His account was read by a generation of 20th-century writers including D. H. Lawrence, T. S. Eliot, and James Joyce, and inspired THOMAS EDWARD LAWRENCE (Lawrence of Arabia) in his Arabian travels and in writing his own account of his experiences in the Middle East, *Seven Pillars of Wisdom*, published in 1935. Whether or not Doughty had truly made his journey for the sake of language, his comment illustrates his understanding of the potential impact of exploration on the world's literature.

Beyond firsthand accounts of explorers, traders, and adventurers such as Doughty's account, are the works that take up exploration as a conceit around which main themes are built. These stories are older than written records, going back to the third millennium B.C., to the epic story of *Gilgamesh*, a legendary king of ancient Sumeria who embarks on a mythical journey in search of the secret of everlasting life. This could represent a journey through the Near East, up to the Black Sea. The myth wrestles with the questions of an individual's life and death and his place in the universe, while he makes a long voyage, much like the ones that were made by Sumerian and later Akkadian rulers (such as SARGON) in Mesopotamia to secure trading rights and maintain hold of the kingdom. Another early work of literature that uses a voyage through unknown lands as its central theme is the *Odyssey*—a Greek epic attributed to a circa ninth-century Greek poet Homer—recounting the 10-year voyage of Odysseus (the Roman Ulysses) home, from Troy. While grappling with fate and the gods, Odysseus encounters lands throughout the MEDITERRANEAN SEA, an area explored by early Greek traders. The work relates observations of the strange peoples and lands visited by Odysseus and his ship similar to those made by later Greek historians, such as Herodotus and Xenophon, whose writings reflect growing contacts among foreign cultures.

The effects of the travels of Chinese scholars had a profound influence on Chinese culture and literature. The influences can be seen in a 16th-century Chinese novel *Hsi Yu Chi* (known in the West as *Monkey* because one of the supernatural characters is a monkey spirit), by Wu Ch'eng-en, written during the Ming dynasty in China, when the Chinese were undergoing a reappraisal of their past after being freed from the rule of the Mongols. The work's Chinese title literally means a "Journey to the West," and, in it, Hsüantsang is fictionalized alongside a motley group of fantastic characters who embark on a journey to India. The book mixes both Confucian and Buddhist philosophy and religious images, reflecting the mixing of Chinese culture under influence from Indian thought in the West, and the many

fabulous happenings along the way represent the issues raised by the interaction of foreign cultures.

The European explorers of South America wrote accounts no less fabulous than those of Herodotus. Missionaries told stories of giants with oversized feet, of cities of gold and forests of cinnamon, and of women who fought like men. European seafarers spread throughout the seas, and Europeans established settlements. In 1609, nine ships under English sea captain CHRISTOPHER NEWPORT set out from England with 500 colonists on board, heading for John Smith's Virginia colony, and one ship, the *Sea Adventure*, (also listed as *Seaventure*) was wrecked in a storm off the coast of Bermuda. The island was a miraculous haven, and after nine months, the colonists were rescued. The accounts of survivors, by SILVESTER JOURDAIN and William Strachey, are generally regarded to have been the inspiration for Shakespeare's purportedly last and one of his most popular plays, *The Tempest*. Set on an island ruled by a European castaway, Prospero, and his daughter, Miranda, and populated by an indigenous native, Caliban, whom Prospero enslaves, a frightful storm strands a group of Europeans on the island. Among the themes dealt with are the implications of colonizing inhabited lands, and the dubious but compelling prospect of founding a utopian kingdom in new worlds.

A shipwreck inspired another work of literature, which is in great part a meditation on European exploration and colonization. ALEXANDER SELKIRK, a Scottish seaman on a privateering expedition along the Pacific coast of South America, was marooned on the island of Mas Tierra, one of the Juan Fernández Islands, in 1704. He survived four years on the island, building himself a shelter and hunting wild goats, before being rescued by other PRIVATEERS. This story came to the attention of Daniel Defoe, who then wrote his first novel based upon it, *Robinson Crusoe*, published in 1719. The novel was instantly popular, dealing with the novelties and excitement of exploration, as well as touching on the fundamental human problem of isolation. *Robinson Crusoe* has remained popular up until the present day, spawning many versions and imitations.

Irish satirist Jonathan Swift embarked on his own exploration of human nature, in a more pointed and fantastic way than Defoe had done. In a direct literary line from Homer's *Odyssey*, but, drawing on the abundant travel narratives of his day, he told the story, in *Gulliver's Travels*, published in 1726, of Lemuel Gulliver, a country doctor who enlists himself as a ship's doctor and embarks on a sea voyage during which he visits strange lands. In Swift's book, however, the discoveries of the inhabitants of these strange lands tell the reader more about the inhabitants of England than anything else.

The genre of science fiction—although wide-ranging in themes, some of them beyond the range of human

possibility—draws from the spirit of exploration. One of the earliest writers associated with the genre, Frenchman Jules Verne, wrote a number of books which presaged real events, *De la Terre à la Lune* (*From the Earth to the Moon*), published in 1865, and *Vingt Mille Lieues sous les mers* (*20,000 Leagues Under the Sea*), published in 1870. These works, along with other works such as *Voyage au centre de la Terre* (*Journey to the Center of the Earth*), published in 1864, create fictional characters very much in keeping with real-life explorers.

Exploration challenges humankind's view of the world and has led to the dissemination of knowledge as well as a body of literature. Moreover, the literature itself has inspired further voyages. The above-mentioned writers and their works help give a sense of the intrinsic relationship of writing and exploration, but it should be kept in mind they are just a sampling. Many explorers wrote accounts of their expeditions. And many writers and historians not known as explorers have added to the literature of exploration.

Yangtze River (Chang, Changjiang)

The Yangtze River, also known as the Chang, is the longest river in China and the third-longest in the world, after the NILE RIVER and the AMAZON RIVER. It extends for 3,900 miles, originating in the snows of the Kunlun mountain range at the eastern end of the Tibetan Plateau, and flows through central China into the East China Sea, a small arm of the Pacific Ocean. The Yangtze and its tributaries have a drainage area of some 650,000 square miles, taking the bulk of its waters from a number of tributaries: the Han, Yalong, Jialing, Min, and Tuo He, on the north and the Wu, on the south. As it discharges about 770,000 cubic feet of water into the sea, the Yangtze deposits 6 billion cubic feet of sediment annually, creating fertile soil, ideal for the growing of rice.

From its delta, the Yangtze rises gradually by only about 130 feet in its first 1,000 miles, making an excellent channel for ship traffic, except for the steep Yangtze gorges the river passes through at a distance of about 200 miles. Farther up-river, navigation becomes difficult due to shifting sandbars and becomes unnavigable at Pingshan at a height of about 1,000 feet above sea level. The river quickly rises in Upper Tibet to an altitude of 16,000 feet. While the river is commonly called the Yangtze, the name applies in China only to its last 300 to 400 miles of its extent, Changjiang (long river) being its official name. Local names apply to other parts of the river, such as Jinsha (golden sand) in its upper reaches.

Communication and Trade

The Yangtze has served as the principal route of communication and trade in China, from ancient times until the present (see CHINESE EXPLORATION). The first European on record to have seen the river is MARCO POLO, a Venetian merchant who traveled through China for almost 20 years in the 13th century. In his account, he recorded his impressions of the vast magnitude of ships on the Yangtze, saying that in one place they dwarfed all the traffic on every European waterway, put together. The first systematic exploration of the river from the West took place in the middle of the 19th century. The French, who had begun to colonize Indochina, sent expeditions to explore the Mekong River, which runs parallel to the Yangtze, though farther south and separated by a high ridge. Frenchman MARIE-JOSEPH-FRANÇOIS GARNIER accompanied an expedition, which followed the Mekong River before heading northward into China. When ERNEST-MARC-LOUIS DE GONZAGUE DOUDART DE LAGRÉE, the leader of the expedition, died, Garnier took control and under his command the expedition followed the upper Yangtze to the port city of Shanghai.

Once China was opened to Western travel, the port of Shanghai became an important entry point. Christian missionaries, such as Englishwoman ANNIE ROYLE TAYLOR, who, in 1892, attempted to enter LHASA, the Forbidden City of Tibet, traveled from there, as did other Westerners hoping to penetrate the interior of China. Another Frenchman, CHARLES BONIN, spent seven years exploring China

Shown here, in a photograph from about 1918, are Chinese junks on the Yangtze River. (*Library of Congress [LC-USZ62-102719]*)

at the end of the 19th century and made the first scientific survey of the river, charting its course. At the turn of the 20th century, the Yangtze and its tributaries carried nearly half of China's maritime commerce.

Canal and Dam

The river is still an immensely important waterway, and is joined by a canal called the "Great Canal," more than 1,100 miles long, to China's other important river, the YELLOW RIVER (or Huanghe). This canal has been of importance to transportation since it was first dug during the Wu Dynasty in about 486 B.C. It has been extended over time and redone for the last time over six years during the Sui dynasty from

A.D. 605 to 610. In addition, the Chinese government has been building a dam since 1994—the Three Gorges complex—near Yichang, in order to control the annual flooding of the river caused by snowmelt in the mountains. It will also generate electricity. The lake formed by the dam will displace some 1 million people and will flood many historical sites.

Yellow River (Huang, Huanghe, Hwang Ho)

At 3,395 miles, the Yellow River, or Huanghe (also spelled in English Hwang Ho), is China's second-longest river after the

YANGTZE RIVER (Chang), and the sixth-longest in the world. The Chinese call the river Yellow on account of the silt it carries in exceptionally high concentration. The river originates in the Kunlun Mountains of western China, fed by springs and high lakes, flowing turbulently eastward through deep gorges before turning northeast into the Ordos Desert, a part of the GOBI DESERT. This part of the river, called the “great northern bend,” ends after the river flows several hundred miles due east and turns to the south. Here, between the Shaanxi and Shanxi provinces, the river flows through a valley of especially fertile soil, known as loess. The river picks up the majority of its silt in this region where sudden heavy rains erode the soil, and where it is joined by its main tribu-

taries, the Wei and Fen Rivers. Thereafter, the river emerges onto the broad North China Plain where it meanders for a little more than 100 miles through one of China’s principal agricultural regions before emptying into the Gulf of Bo Hai, an arm of the Yellow Sea.

Civilization and Sorrow

The Yellow River is known as the “Cradle of Chinese Civilization” because the earliest evidence of Chinese civilization is found in its valley, and Chinese tradition traces its history, and indeed all Chinese ancestry, back to Huang Ti (Huangdi), the Yellow Emperor. Huang Ti, legend has it, was a marauder making his living plundering throughout the North China Plain but moved up into the plateaus of yellow loess soil. The settlement he founded supposedly prospered and gave birth to Chinese civilization. It is known that the Yellow River Valley was populated by scattered groups of neolithic peoples from about 9,000 to 6,000 years ago, and by 4,000 years ago, settled populations and technological and agricultural developments are found in the loess regions. Not yet highly eroded, the elevated fertile plains provided a perfect location for development.

The Yellow River is also called “China’s Sorrow” because of the catastrophic flooding to which it is prone. As farming spread through the North China Plain, farmers built dikes to protect their crops from periodic flooding. These dikes caused the river to deposit more silt as sediment on the riverbed, raising the river, and necessitating yet higher dikes. Now, in places, the river is as high as 30 feet above the surrounding ground level and far more susceptible to flooding. There is always danger of the many dikes or levees breaking. Historically, the river has flooded thousands of times, most devastatingly in 1931, when flooding covered 34,000 square miles of the densely populated North China Plain, leaving 80 million people homeless and 1 million people dead.

East and West

Chinese civilization developed in the Yellow River Valley and in the Yangtze River Valley in relative isolation, due to surrounding mountains and deserts and to the marauding tribes, which threatened trade caravans. Technological innovations such as the wheel made their way from the West, but it was not until the second century B.C. that communication with peoples living to the west became regular (see CHINESE EXPLORATION). The Han dynasty flourished in China but was threatened by the activities of the Hsiung-nu (Xiongnu, or Huns) in central Asia. CHANG-CH’IEN, a Chinese diplomat, was sent west in 138 B.C. to make a military alliance with the Yue-chi (known in the West as the Scythians). His expedition failed and he was held in captivity by the Huns for many years, but he eventually brought back reports of the West, including of the Roman Empire. A second

expedition revealed a trade route from the headwaters of the Yellow River, which skirted hostile tribes, and led to the establishment of the SILK ROAD, which developed into a main pathway for East-West trade.

The Yellow River, aside from its signal agricultural importance, was an important river for travel and trade. Its traffic—mostly of a type of boat known as the JUNK—amazed one of the first Western visitors to China, Italian merchant MARCO POLO. At that time, in the 13th century,

the Yellow River emptied directly into the Yellow Sea. It has changed its course in the eastern portion of the river several times in its history.

Starting in 1893, CHARLES BONIN spent seven years exploring China, during which he made the first modern scientific surveys of the Yangtze and Yellow Rivers, charting their courses.

Zambezi River (Zambesi River)

The Zambezi River (also spelled Zambesi), the fourth-largest river of Africa, follows a double S-shaped course as it flows 1,700 miles across much of southern Africa. It begins in northwestern Zambia, about 5,000 feet above sea level, and flows south through eastern Angola and western Zambia, to the border of northeastern Botswana, then flows east between Zambia and Zimbabwe, finally crossing central Mozambique and emptying into the Indian Ocean through many outlets. The Zambezi's many tributaries were once confused with the river systems of the CONGO RIVER (Zaire River) and the NILE RIVER to the north. Much early African exploration was carried out for the purpose of understanding the various sources and tributaries.

Portuguese Exploration

The Portuguese were the first to explore and make use of the Zambezi River. In 1505–14, a convict named Antonio Fernandes explored the region on a quest for gold. Although he found no gold, he determined that the Zambezi was navigable for 300 miles from its mouth upriver and concluded that it presented the best route for inland trade. In 1531, the Portuguese founded the outpost of Sena, and, in 1560, Tete farther upriver, both in present-day Mozambique. The Sena settlement became the first point of contact

between Europeans and the Bantu people. The Bantu claimed that the Zambezi was a river so great that no one knew its source. Portuguese traders eventually traveled some 800 miles inland.

In 1798, in the hope of joining Portuguese possessions on Africa's east and west coast, FRANCISCO DE LACERDA ascended the Zambezi from Tete and managed to make it past the Quebrabasa Rapids. He then entered the Luangwe River, one of the Zambezi's major tributaries. He died of fever near Lake Mweru, and his men returned to Tete via the Zambezi, failing to accomplish the east-to-west crossing of the continent.

The Livingstones

The Zambezi later captured the imagination of one of Africa's greatest explorers, Scottish missionary DAVID LIVINGSTONE. In 1851, after traveling northward through the Kalahari Desert with his wife, MARY MOFFAT LIVINGSTONE, and children, he stumbled upon a section of the upper Zambezi not yet seen by Europeans. Realizing the danger of the tropical climate, he sent his family back to England and resumed explorations in the region in 1853. Traveling from Capetown with ox carts and native porters, he came to Linyanti, the capital of the Makololo people. After a month-long fever, he hired more men and proceeded up the river by CANOE to the north. He succeeded in exploring a large portion of the upper Zambezi before heading west to the coast, reaching Luanda in present-day Angola. On his way back

This photograph shows a vista of the Zambezi River in the mid-20th century. (*Library of Congress, Prints and Photographs Division [LC-USZ62-98036]*)

from Luanda, he once again traveled the river. In 1855, he became the first European to witness the 420-foot Victoria Falls, which he named after Queen Victoria (local native peoples called it Mosiottatunya for the “smoke that thunders”). Continuing by river and overland, he reached the east coast at Quelimane in 1856. In so doing, he completed the first known voyage across the southern section of the continent.

Livingstone returned to England after his continental crossing and found himself a national hero. He had witnessed the misery of the SLAVE TRADE in Africa and had made it his goal to replace it with “Christianity and commerce,” believing that, if Africans could produce their own commodities for export, there would be less slaving. The Zambezi was a key part of his vision. For his next series of expeditions beginning in 1858, he obtained a paddle-wheel steamship to explore up the Zambezi from the east coast and establish trade contacts. His wife accompanied him. His expedition was soon frustrated by the rapids at Quebrabasa. When Livingstone had made his extensive studies of the Zambezi, he had heard of the Quebrabasa Gorge, but had not seen it. The description he was given, of “a few rocks in the river,” gave him hope that river would be navigable for

some distance. When this proved impossible, he steamed northward up the Shire River, and reached Lake Nyasa (Lake Malawi). While traveling on the Zambezi in 1862, his wife died of tropical fever. This sent Dr. Livingstone into a deep depression and may have been the reason that he quit his activities on the Zambezi. For the next two decades, he continued to explore Africa, but in other locations, pursuing other mysteries.

Livingstone had outlined the course of the Zambezi and described its independence from the Congo and Nile systems. More work would remain to be done concerning its minor tributaries. During his 1873–75 expedition, Englishman VERNEY LOVETT CAMERON studied various of the region’s smaller rivers, traveling the watershed between the Congo and Zambezi. In 1890, Scotsman JOSEPH THOMSON made additional explorations of the upper Zambezi.

Today, many of the lands that surround the Zambezi are fertile and populated, and long sections are used for local traffic. A number of hydroelectric plants along the river generate power for the peoples of Africa.

POLE, 1911–1912 | 469 |

Explorations of Antarctica, 1772–1916

1. **January 30, 1774:** James Cook's farthest south— $71^{\circ}10'S$, $106^{\circ}54'W$; dense ice prevents him from continuing.
2. **January 28, 1820:** Fabian Gottlieb von Bellingshausen makes the first sighting of the Antarctic continent.
3. **January 1841:** James Ross becomes the first to force a passage through the Antarctic pack ice; he discovers the Ross Sea, Victoria Land, and the Ross Ice Shelf.
4. **1899:** Carsten Egeberg Borchgrevink becomes the first to winter on Antarctica.
5. **December 30, 1902:** Robert Scott's farthest south— $82^{\circ}17'S$.
6. **December 1908:** Ernest Henry Shackleton discovers the huge Beardmore Glacier and climbs it to reach the 10,000-foot-high Antarctic Plateau.
7. **January 9, 1909:** Shackleton's farthest south— $88^{\circ}07'S$; 97 miles from the Pole.
8. **November 17, 1911:** Roald Amundsen discovers the Axel Heiberg Glacier.

9. **December 14, 1911:** Amundsen is the first to reach the South Pole.
10. **January 17, 1912:** Scott reaches the South Pole.
11. **February 17, 1912:** Death of Edgar Evans, the first of Scott's party to die.
12. **March 21, 1912:** Scott's last camp; Scott, Wilson, and Bowers die here; Oates dies nearby on March 17; the camp is just 11 miles from a large food depot, about $79^{\circ}39'S$.
13. **1913:** Douglas Mawson reaches George V Land
14. **January 18, 1915:** Shackleton's ship *Endurance* becomes icebound.
15. **November 21, 1915:** *Endurance* sinks.
16. **April 15, 1916:** Shackleton's party reaches Elephant Island; Shackleton leaves by boat for South Georgia Island on April 24.
17. **May 9, 1916:** Shackleton reaches South Georgia Island and returns to Elephant Island to rescue his men on August 30.

Chronology of Exploration

The following chronology of world exploration includes events relating directly to exploration, giving at least one date for the individuals listed in Volume I and other important dates from Volume II. Many general historical events, such as migrations of peoples and the establishment of nations, although important as a frame of reference to the subject matter, are not provided. To the left of certain entries is indicated the general geographic regions of exploration. The parenthetical place-names refer to modern-day nations, states, and provinces are further used to describe locations.

ca. 2450 B.C.

AFRICA/ASIA

- Egyptian HANNU sails into the RED SEA along the African coastline and Arabian Peninsula.

ca. 2340–2305

ASIA/EUROPE

- SARGON, the ruler of Akkad in Mesopotamia, establishes trade contacts with peoples of the Indus Valley, Arabian Peninsula, and eastern MEDITERRANEAN SEA. He launches naval campaigns in the Persian Gulf and possibly in the Mediterranean.

ca. 2270

AFRICA

- Egyptian provincial governor HERKHUF heads a trading expedition from the upper NILE RIVER southward to the interior of central East Africa.

ca. 1492

AFRICA

- Egyptian queen HATSHEPSUT sends a maritime trading expedition into the RED SEA to territory south of the Gulf of Aden in East Africa.

ca. 600

- Greek philosopher Thales of Miletus establishes natural science principles. On 585 B.C., he accurately predicts an eclipse of the Sun.

ca. 600–597

AFRICA

- Egyptian king NECHO II commissions a Phoenician maritime expedition into the RED SEA and Indian Ocean, which perhaps circumnavigates Africa.

ca. 575

- Greek philosopher Anaximander drafts the first known map to represent a concept of the world.

ca. 520–494

ASIA/AFRICA

- Greek historian HECATAEUS OF MILETUS travels in Asia Minor and Egypt and ascends the NILE RIVER.

510–507

ASIA

- Greek mariner SCYLAX descends the Indus River for Persian emperor Darius I and sails from the Arabian Sea to the RED SEA.

ca. 475

- Greek philosopher Parmenides hypothesizes that Earth is round.

ca. 470

AFRICA

- HANNO heads a Carthaginian maritime expedition from the MEDITERRANEAN SEA through the Strait of Gibraltar (see GIBRALTAR, STRAIT OF) along Africa's Atlantic coast.

ca. 457–443

ASIA/AFRICA/EUROPE

- Greek historian HERODOTUS travels in the Mediterranean region and ascends the NILE RIVER.

ca. 450

EUROPE

- HIMILCO heads a Carthaginian maritime expedition from the MEDITERRANEAN SEA through the Strait of Gibraltar (see GIBRALTAR, STRAIT OF) along Europe's Atlantic coast.

ca. 420–400

ASIA

- Greek physician CTESIAS OF CNIDUS travels in Persia (Iran) and India.

401**ASIA**

- Greek soldier XENOPHON leads mercenaries from Persia (Iran) through Iraq, Turkey, Armenia, and Georgia to Greece.

350

- Greek philosopher Plato writes of the lost continent of ATLANTIS in his dialogues *Timaeus* and *Critias*.

334–323**ASIA**

- Macedonian leader ALEXANDER THE GREAT conquers territory from the eastern Mediterranean to the Indus Valley of Pakistan and India.

ca. 325**EUROPE**

- Greek philosopher Aristotle determines scientific principles relating to navigation, among them that, in traveling from north to south, new constellations become visible while others disappear.
- Greek scholar PYTHEAS heads a maritime expedition along the coasts of Spain, France, and Britain, exploring the North Sea and Baltic Sea.

325–324**ASIA**

- Greek soldier NEARCHUS, under ALEXANDER THE GREAT, explores the coasts of Pakistan and Iran from the INDUS RIVER delta to the head of the Persian Gulf.

300–290**ASIA**

- Greek diplomat MEGASTHENES travels from Syria to northern India, reaching the GANGES RIVER.

240–195

- Greek scholar ERATOSTHENES heads a library at Alexandria and writes the first systematic treatise of geography.

ca. 170–120

- Greek scholar HIPPARCHUS makes astronomical and geographic observations.

ca. 150

- Greek geographer Crates of Mallus constructs the first known GLOBE.

ca. 138–109**ASIA**

- CH'ANG-CH'IEN heads two Chinese diplomatic missions to western lands, during which he ex-

plores the Altai Mountains of central Asia and Afghanistan and visits Sinkiang in western China. The route he travels develops into the SILK ROAD, a trade route between East and West.

120–115

- | | |
|---------------------|---|
| INDIA/AFRICA | <ul style="list-style-type: none"> ▪ Greek navigator EUDOXUS, in service to Egypt, makes two trips across the Arabian Sea to India. On the second, he lands on East Africa's coast and later unsuccessfully attempts to circumnavigate Africa. |

|---------------|---|
| AFRICA | <ul style="list-style-type: none"> ▪ Greek merchant DIOGENES explores inland in East Africa, possibly as far as Lake Victoria and Lake Albert. |
|---------------|---|

59–61**EUROPE**

- SUETONIUS PAULINUS heads a Roman military expedition in Britain.

77

- Roman PLINY THE ELDER publishes *Historia Naturalis* with geographic accounts of Europe, Asia, and Africa. He coins the name ULTIMA THULE for the northernmost land, based on the fourth-century B.C. travels of the Greek PYTHEAS.

77–84**EUROPE**

- GNAEUS JULIUS AGRICOLA commands a Roman naval exploration of the Orkney Islands and possibly circumnavigates Britain; he explores Scotland.

97**ASIA**

- Chinese diplomat KAN YING travels to central Asia and the Middle East.

100

- The *Periplus of the Erythraean Sea*, a surviving PERIPLUS, provides information about East Africa, including commercial activities in the region.

127–147

- Greek-Egyptian geographer PTOLEMY publishes *Geographia*.

ca. 190**ASIA**

- A Chinese woman, WEN-CHI, is abducted by the Hsiung-nu (Huns) and lives as a nomad on Mongolian steppes. She later writes *Eighteen Songs of a Nomad Flute* about her experiences.

399–414**ASIA**

- Chinese Buddhist monk FA-HSIEN travels west and south across China. He crosses the Takla Makan desert, Pamirs, and HIMALAYAS into Afghanistan and northern India, then sails to CEYLON (Sri Lanka).

ca. 548

- Egyptian merchant COSMAS INDICOPLEUSTES publishes *Topographia Christiana*, a Christian interpretation of geography.

ca. 566–573**ATLANTIC OCEAN**

- According to legend, Irish monk SAINT BRENDAN sails westward from Ireland into open wa-

ters of the Atlantic and reaches SAINT BRENDAN'S ISLE.

629–645

ASIA

- Chinese Buddhist monk HSÜAN-TSANG travels across the GOBI DESERT into western China and the Kirghiz region of central Asia, then crosses the Hindu Kush mountain range into Afghanistan. He explores Pakistan and India and returns to eastern China by way of the Takla Makan desert and the Tarim River.

671–695

ASIA

- Chinese Buddhist monk I-CHING travels to Indonesia and India.

ca. 680

ASIA

- Frankish pilgrim ARCULF travels to the Middle East.

ca. 700

- The Arabs reinvent the ASTROLABE (first used by ancient Greeks in the third or second century B.C.), a navigational tool.

776

- Spanish cartographer BEATUS OF VALCAVADO produces a map focusing on Jerusalem.

ca. 850–851

ASIA

- Arab merchant SOLEYMAN travels from the Persian Gulf by sea to India and China, visiting the Maldivic Islands, Laccadive Islands, CEYLON (Sri Lanka), and the Andaman Islands.

ca. 860

ICELAND

- Viking NADDOD, blown off course on the way from Norway to the Faeroe Islands, reaches ICELAND.

ca. 860–861

ICELAND

- Viking GARDAR SVARSSON circumnavigates ICELAND.

ca. 900–925

EUROPE/ASIA

- Muslim merchant ABU ALI AHMAD IBN RUSTA travels throughout the lower Volga region of eastern Europe and to Malay in Asia.

ca. 914–934

- ASIA/AFRICA/EUROPE** ▪ Arab historian ABU AL-HASAN ALI AL-MASUDI visits every country in the Islamic world.

921–922

- EUROPE** ▪ Muslim scholar AHMAD IBN FADLAN travels from Baghdad into the Volga region of European Russia.

943–973

- AFRICA/EUROPE/ASIA** ▪ Arab merchant and scholar ABU AL-QASIM IBN ALI AL-NASIBI IBN HAWQAL visits Islamic lands of the Middle East, Europe, and North Africa, then travels across the SAHARA DESERT.

ca. 950

- PACIFIC OCEAN** ▪ Polynesian chieftain KUPE reaches NEW ZEALAND.

ca. 982–986

- GREENLAND** ▪ Viking ERIC THE RED sails westward from ICELAND, reaching GREENLAND; he explores the west coast as far as Disko Island. In about 986, he founds a settlement on the southwest coast.

ca. 985–986

- NORTH AMERICA** ▪ Viking BJARNI HERJULFSSON possibly sights North America's northeast coast.

ca. 1001–02

- NORTH AMERICA** ▪ Viking LEIF ERICSSON heads a maritime expedition to VINLAND, probably at L'Anse aux Meadows in Newfoundland, or in Labrador or Quebec.

ca. 1005–07

- NORTH AMERICA** ▪ Viking THORVALD ERICSSON heads a colonizing expedition to North America's east coast.

ca. 1010–13

- NORTH AMERICA** ▪ Viking THORFINN KARLSEFNI heads a colonizing expedition to North America's east coast.

ca. 1014–15

- NORTH AMERICA** ▪ Viking woman FREYDIS EIRÍKSDOTTIR heads a colonizing expedition to North America's east coast.

ca. 1017

- ASIA** ▪ Arab scholar ABU AR-RAYHAN MUHAMMAD IBN AHMAD AL-BIRUNI travels to India from Afghan-

istan and writes a book, *India*, on Indian customs and geography.

1095

ASIA

- Pope Urban II calls for the liberation of the Holy Land (Palestine); in 1096–99, the First Crusade is undertaken, culminating in the capture of Jerusalem from the Seljuk Turks; other CRUSADES follow, the last in 1228–29.

1145–54

- Arab author and cartographer ABU ABD ALLAH MUHAMMAD ASH-SHARIF AL-IDRISI revolutionizes mapmaking in *The Book of Roger*, with accurate geographic information based on travels and use of the grid system.

ca. 1150–1200

- The HANSEATIC LEAGUE, a commercial union of German cities and towns and their merchants, becomes active.

1158

- Otto von Freisingen, bishop of Freising (Otto of Freising), publishes *Historia de Duabus Civitatibus*, in which is found the earliest known reference to the legendary Christian ruler PRESTER JOHN.

1159–73

ASIA

- Spanish rabbi BENJAMIN OF TUDELA travels from Spain to the Middle East and central Asia, possibly as far as China, and visits India and CEYLON (Sri Lanka).

ca. 1180–87

EUROPE/ASIA

- German PETHAHIA OF REGENSBURG travels in eastern Europe and the Middle East.

1182–85

ASIA/AFRICA/EUROPE

- Muslim official and scholar ABU AL-HASAN MUHAMMAD IBN JUBAYR journeys from Spain to Arabia, exploring the lands of the Mediterranean region.

1215–27

ASIA

- Mongol emperor GENGHIS KHAN leads armies westward from China to the Caspian Sea.

1221–22

ASIA

- Chinese sage CH'ANG-CH'UN travels from China through central Asia and reports to GENGHIS KHAN in Afghanistan.

1228–29

- Greek-born Muslim SHIHAB AL-DIN ABU ABD ALLAH YAQUT AL-RUMI publishes *Muʿjam al Buldan* (Dictionary of countries), a gazetteer-type geographic study.

1230

- English mathematician JOHN HOLYWOOD publishes *Treatise on the Sphere*, presenting the idea that Earth might be spherical.

1245–47

ASIA

- Italian GIOVANNI DA PIAN DEL CARPINI heads a papal mission to the court of the Great Khan of the Mongol Empire, traveling from Lyon in France, across eastern Europe and central Asia, to northern Mongolia and lands east of the Volga River.

1253–55

ASIA

- Flemish missionary WILLIAM OF RUBROUCK travels from Constantinople (Istanbul) across central Asia to Mongolia. He visits the Mongol capital at Karakorum.

1260–69

ASIA

- Italian merchants MAFFEO POLO and NICCOLÒ POLO travel the SILK ROAD across central Asia to the court of Kublai Khan in China.

1271–75

ASIA

- Italian merchants MAFFEO POLO, NICCOLÒ POLO, and MARCO POLO travel across central Asia to the court of Kublai Khan in China.

1275–92

ASIA

- Italian merchant MARCO POLO, in service to Kublai Khan, travels widely throughout the Mongol Empire, exploring China, Tibet, Southeast Asia, Indonesia, Mongolia, and possibly SIBERIA. The account of his experiences, *The Travels of Marco Polo*, inspires later explorers to locate CIPANGU, the Strait of Anian (ANIAN, STRAIT OF), and other places he references.

1280–1313

ASIA/EUROPE

- Turkish monk RABBAN BAR SAUMA travels from China to the Middle East and Europe.

ca. 1290

- The Hereford map, an early *MAPPA MUNDI*, is drafted in England.

1291

-
- ATLANTIC OCEAN** ■ Italian mariner UGOLINO VIVALDI attempts to reach India across the Atlantic but fails.

1291–94

-
- ASIA** ■ Italian missionary JOHN OF MONTECORVINO travels to India and China.

1292–95

-
- ASIA** ■ Italian merchants MAFFEO POLO, NICCOLÒ POLO, and MARCO POLO sail from China to Persia by way of the Strait of Malacca and the Indian Ocean and return to Italy by way of the Black Sea and Constantinople (Istanbul).

ca. 1300

-
- The mariner's COMPASS is developed in Amalfi, Italy.
 - The Italian cartographer Petrus Vesconte drafts the Pisan Chart, the oldest existing PORTOLAN CHART, representing coastlines and ports of the MEDITERRANEAN SEA.

1311–20

-
- Chinese cartographer CHU SSU-PEN produces a world map with accurate information about Africa.

ca. 1318–22

-
- ASIA** ■ Italian missionary ODORIC OF PORDENONE travels throughout much of Asia, including Persia (Iran), India, China, and Tibet.

1325–52

-
- ASIA/AFRICA/EUROPE** ■ Arab scholar ABU ABD ALLAH MUHAMMAD IBN BATTUTAH travels throughout Egypt, Arabia, central Asia, Spain, and Africa. He explores the SAHARA DESERT.

1339–53

-
- ASIA** ■ Italian missionary GIOVANNI DE MARIGNOLLI travels to China, India, and Indonesia.

ca. 1365

-
- An account of travel in Africa and Asia known as *Mandeville's Travels*, supposedly written by SIR JOHN MANDEVILLE, probably a pseudonymous name, is published in England.

ca. 1375

-
- Spanish cartographer ABRAHAM CRESQUES produces the *Catalan Atlas*, a world map based on

geographic information obtained from travelers such as MARCO POLO.

ca. 1400

- The CROSS-STAFF, a navigational tool, is developed in the Low Countries.

1403–06

ASIA

- RUY GONZÁLEZ DE CLAVIJO heads a Spanish diplomatic mission to Samarkand in central Asia.

1405–34

INDIAN OCEAN

- CHENG HO heads seven Chinese maritime expeditions, sailing from China to the Indian Ocean, reaching East Africa.

1416

- Portuguese prince HENRY THE NAVIGATOR establishes a base for explorations and eventually a naval depot, a school of navigation, and an observatory at Sagres in Spain, where his shipmakers develop the CARAVEL.

1418–60

AFRICA

- Portuguese prince HENRY THE NAVIGATOR sponsors voyages of exploration along Africa's west coast.

1419–44

ASIA

- Italian NICCOLÒ DI CONTI travels from Venice to Damascus in Syria, then across India to Burma (Myanmar) and Indonesia, returning to Europe by way of Southeast Asia, CEYLON (Sri Lanka), India's Malabar Coast, Arabia, and Egypt.

1432–34

ATLANTIC OCEAN

- GONÇALO VELHO CABRAL heads a Portuguese maritime expedition to the AZORES.

1433–35

AFRICA

- GIL EANNES heads three Portuguese maritime expeditions to Cape Bojador and beyond.

1436

AFRICA

- AFONSO GONÇALVES BALDAYA heads a Portuguese maritime expedition along Africa's west coast as far south as the TROPIC OF CANCER.

1441–43**AFRICA**

- NUNO TRISTÃO heads three Portuguese maritime expeditions along Africa's west coast, exploring Cape Blanco, Arguin Island, and the Senegal River delta. A fort he establishes on Arguin Island in 1482 becomes a center of the early African SLAVE TRADE.

1444–45**AFRICA**

- DINÍS DIAS heads a Portuguese maritime expedition along Africa's west coast, reaching Cape Verde, Africa's westernmost point.

1445–47**AFRICA**

- ÁLVARO FERNANDES heads two Portuguese maritime expeditions along Africa's west coast, south of Cape Verde. He explores the Gambia River and reaches just north of Sierra Leone.

ca. 1450

- German inventor Johannes Gutenberg develops printing with movable type, helping make texts available to a wider audience.

1455–56**AFRICA**

- ALVISE DA CADAMOSTO heads two Portuguese maritime expeditions along Africa's west coast, exploring the lower Senegal and Gambia Rivers and the Cape Verde Islands.

1458–62**AFRICA**

- DIOGO GOMES heads two Portuguese maritime expeditions along Africa's west coast, exploring Cape Palmas and the Gambia River and reaching the Cape Verde Islands.

1469–75**AFRICA**

- Portuguese merchant FERNÃO GOMES trades along Africa's west coast as far as the Gulf of Guinea and the island of Fernando Po.

1482–86**AFRICA**

- DIOGO CÃO heads two Portuguese maritime expeditions along Africa's west coast, exploring the lower CONGO RIVER (Zaire River). He travels as far south as Namibia, almost reaching the TROPIC OF CAPRICORN.

1487–88**AFRICA**

- Portuguese **BARTOLOMEU DIAS** heads a Portuguese maritime expedition around Africa's southern tip, reaching the **CAPE OF GOOD HOPE**.

1487–93**AFRICA/ASIA**

- Portuguese diplomat **PERO DA COVILHÃ** heads a mission to India and North Africa, reaching as far south as Sofala, opposite the island of Madagascar. He remains in Ethiopia.

1488**AFRICA**

- **DUARTE PACHECO** heads a Portuguese maritime expedition to Africa's southwest coast. He is shipwrecked on Principe Island in the Gulf of Guinea.

1492

- German cartographer **MARTIN BEHAIM** develops a **GLOBE** of the world depicting a large island west of the **AZORES**, perhaps indicating European knowledge of South America before subsequent voyages.

1492–93**CARIBBEAN**

- Italian **CHRISTOPHER COLUMBUS** heads a Spanish maritime expedition seeking a westward route across the Atlantic. He reaches the Bahamas, Cuba, and Hispaniola (Haiti and Dominican Republic) of the **WEST INDIES**; Arawak (Taino) Indian **GUANCANAGARI** provides help.

1493–96**CARIBBEAN**

- Italian **CHRISTOPHER COLUMBUS** heads a Spanish maritime expedition to the **WEST INDIES**. He explores coasts of the Lesser Antilles, Puerto Rico, Cuba, and Jamaica.

1497**NORTH AMERICA**

- Italian **AMERIGO VESPUCCI** heads a Spanish maritime expedition to the **WEST INDIES** and possibly North America's east coast as far north as Cape Hatteras, North Carolina.

1497–98**NORTH AMERICA**

- Italian **JOHN CABOT** heads two English maritime expeditions to North America. He reaches Newfoundland and the east coast of Labrador and travels southward along the Atlantic coast, possibly to Chesapeake Bay.

1497–99

- AFRICA/ASIA** ▪ VASCO DA GAMA heads a Portuguese maritime expedition from Europe around Africa to India.

1498–1500

- SOUTH AMERICA** ▪ Italian CHRISTOPHER COLUMBUS heads a maritime expedition from the Cape Verde Islands to the southern Caribbean Sea. He reaches Trinidad and the mainland of South America, then explores the Gulf of Pará, the coast of Venezuela, and the Orinoco Delta.

1499–1500

- SOUTH AMERICA** ▪ VICENTE YÁÑEZ PINZÓN, FRANCISCO MARTÍN PINZÓN, and ARIAS MARTÍN PINZÓN head a Spanish maritime expedition to South America's east coast. They reach the mouth of the AMAZON RIVER.

- SOUTH AMERICA** ▪ ALONSO DE OJEDA heads a Spanish maritime expedition along the coast of Venezuela.

ca. 1500

- Leonardo da Vinci researches human and avian flight.

1500

- ARCTIC/GREENLAND** ▪ GASPAR CÔRTE-REAL heads a Portuguese maritime expedition to North America, reaching GREENLAND's west coast and possibly the ARCTIC CIRCLE.

- GREENLAND** ▪ JOÃO FERNANDES heads a Portuguese maritime expedition to North America, reaching at least as far as GREENLAND.

1500–01

- SOUTH AMERICA/ASIA** ▪ PEDRO ÁLVARS CABRAL heads a Portuguese maritime expedition to India by way of the CAPE OF GOOD HOPE. Driven westward by unfavorable winds, he claims Brazil for Portugal.

1501

- NORTH AMERICA** ▪ GASPAR CÔRTE-REAL and MIGUEL CÔRTE-REAL head a Portuguese maritime expedition to Labrador and Newfoundland.

- SOUTH AMERICA/
MIDDLE AMERICA** ▪ RODRIGO DE BASTIDAS heads a Spanish maritime expedition to South America's northeast coast. He explores the Caribbean coast of Venezuela, Colombia, and Panama, exploring the Magdalena River, Cartagena Bay, and the Gulf of Darien.

1501–02**SOUTH AMERICA**

- Italian AMERIGO VESPUCCI heads a Portuguese maritime expedition to the coast of Brazil. He explores the harbor at Rio de Janeiro, then sails southward along South America's coast, possibly as far as South Georgia Island.

1502–04**MIDDLE AMERICA**

- Italian CHRISTOPHER COLUMBUS heads a Spanish maritime expedition to Central America, from Honduras southward to Panama.

1502–08**AFRICA/ASIA**

- Italian LUDOVICO DI VARTHEMA travels in Egypt, the Middle East, India, and Southeast Asia, returning to Europe by sailing around Africa. It is thought he was the first European to reach the SPICE ISLANDS (the Moluccas) in the EAST INDIES.

1503

- The Indies Bureau of Trade, a government office, is founded in Spain to regulate Spanish commerce in the Americas.

1503–05**AFRICA/ASIA**

- FRANCISCO DE ALMEIDA heads two Portuguese naval expeditions around Africa's CAPE OF GOOD HOPE to India. His son, LOURENÇO DE ALMEIDA, serves under him.

1504**SOUTH AMERICA**

- JUAN DE LA COSA heads a Spanish maritime expedition to the Gulf of Uraba in Colombia.
- French mariner Binot Palmière de Gonneville claims to have visited a paradise across the Atlantic Ocean; GONNEVILLE'S LAND becomes associated with the GREAT SOUTHERN CONTINENT.

1506–07**AFRICA/ASIA**

- Portuguese AFONSO DE ALBUQUERQUE commands a naval expedition to the Indian Ocean. He explores Africa's east coast and establishes a Portuguese outpost in Asia at Hormuz in the Persian Gulf.

CARIBBEAN

- VICENTE YÁÑEZ PINZÓN and JUAN DÍAZ DE SOLÍS head a Spanish maritime expedition to the Caribbean Sea. They circumnavigate Cuba and reach the Yucatán Peninsula and Bay of Campeche.

1507

- German cartographer MARTIN WALDSEEMÜLLER publishes the first world map depicting South America as a distinct continent, calling it “America,” taken from AMERIGO VESPUCCI’s name.

1507–18**AFRICA/ASIA**

- Moroccan diplomat LEO AFRICANUS travels in North Africa, the Middle East, and central Asia.

1508–09**SOUTH AMERICA**

- VICENTE YÁÑEZ PINZÓN and JUAN DÍAZ DE SOLÍS head a Spanish maritime expedition along the east coast of South America, reaching as far south as the mouth of Río Negro in Argentina.

CARIBBEAN

- JUAN PONCE DE LEÓN heads a Spanish maritime expedition to Puerto Rico.

ASIA

- DIEGO LÓPEZ DE SEQUIRA heads a Portuguese maritime expedition to Malacca on the Malay Peninsula and circumnavigates Sumatra.

1509**NORTH AMERICA/
ARCTIC**

- Italian SEBASTIAN CABOT heads an English maritime expedition to North America’s east coast, seeking the NORTHWEST PASSAGE. He sights Newfoundland, Nova Scotia, and Long Island.

1509–11**MIDDLE AMERICA**

- DIEGO DE NICUESA heads a Spanish colonizing expedition to Panama.

1511–13**ASIA**

- Portuguese FRANCISCO SERRANO heads a Portuguese maritime expedition to the SPICE ISLANDS (the Moluccas) in the EAST INDIES and explores northern Java.

1511–14**CARIBBEAN**

- DIEGO VELÁSQUEZ commands the Spanish conquest of Cuba.

1513**NORTH AMERICA**

- JUAN PONCE DE LEÓN heads a Spanish maritime expedition from Puerto Rico to Florida. He explores from St. Augustine on Florida’s Atlantic coast to Pensacola Bay on the Gulf of Mexico, in search of the FOUNTAIN OF YOUTH.

MIDDLE AMERICA

- VASCO NUÑEZ DE BALBOA heads a Spanish expedition across the Isthmus of Panama, reaching the Pacific Ocean.

1515–16

- SOUTH AMERICA**
- JUAN DÍAZ DE SOLÍS heads a Spanish maritime expedition along South America's east coast. He reaches Río de la Plata south of Uruguay.

1517

- MIDDLE AMERICA**
- FRANCISCO FERNÁNDEZ DE CÓRDOBA heads a Spanish maritime expedition to the Bahamas. When blown off course to Mexico's Yucatán Peninsula, he explores westward to the Bay of Campeche.
- ASIA**
- Portuguese envoy TOMÉ PIRES travels by ship from India to China.

1518

- MIDDLE AMERICA**
- JUAN DE GRIJALVA heads a Spanish maritime expedition from Cuba to the Yucatán Peninsula, from the Bay of Campeche and the Panuco River.

1518–19

- NORTH AMERICA**
- ALONSO ÁLVAREZ DE PINEDA heads a Spanish maritime expedition in the Gulf of Mexico, from Florida to Tampico.

1519

- MIDDLE AMERICA**
- PEDRO ARIAS DE ÁVILA founds Panama City for the Spanish.

1519–21

- MIDDLE AMERICA**
- HERNÁN CORTÉS commands a Spanish expedition from Cuba to Mexico and conquers the Aztec; BERNAL DÍAZ DEL CASTILLO serves under Cortés and later writes a history of the conquest. MALINCHE, an Aztec woman, serves as Cortés's interpreter.

1519–22

- WORLD**
- Portuguese FERDINAND MAGELLAN heads a Spanish maritime expedition seeking a westward route to the Far East; he reaches the Strait of Magellan (see MAGELLAN, STRAIT OF) at the tip of South America and crosses the Pacific to the Mariana Islands and the Philippines. On Magellan's death in the Philippines in 1521, JUAN SEBASTIÁN DEL CANO assumes command and completes the first CIRCUMNAVIGATION OF THE WORLD. FRANCESCO ANTONIO PIGAFETTA, as Magellan's private secretary, keeps a journal, which is later published as *Primo Viaggio Intorno al Mondo* (First journey around the terrestrial globe).

1520

- NORTH AMERICA** ▪ LUCAS VÁSQUEZ DE AYLLÓN heads a Spanish maritime expedition from Santo Domingo on the island of Hispaniola (Haiti and Dominican Republic) to the coast of South Carolina.

1520–27

- AFRICA** ▪ Portuguese FRANCISCO ÁLVARES travels in Ethiopia. In 1540, he publishes an account of his experiences, *The Prester John of the Indies*.

1522

- SOUTH AMERICA** ▪ PASCUAL DE ANDAGOYA heads a Spanish maritime expedition to South America's west coast below Panama as far south as Colombia.
- MIDDLE AMERICA** ▪ ANDRÉS NIÑO heads a Spanish maritime expedition along the Pacific coast of Panama, Costa Rica, Nicaragua, and Honduras as far north as Mexico. He explores the interior of Nicaragua and reaches Lake Nicaragua.

1522–24

- MIDDLE AMERICA** ▪ FRANCISCO FERNÁNDEZ DE CÓRDOBA heads a Spanish expedition from Panama into Nicaragua, exploring and colonizing the region around Lake Managua and Lake Nicaragua.

1522–26

- SOUTH AMERICA** ▪ Portuguese castaway ALEJO GARCÍA explores inland from the Brazilian coast to the ANDES MOUNTAINS in Bolivia seeking Indian riches. Reports of his travels contribute to the legend of the wealthy kingdom of LOS CÉSARES.

1523–26

- MIDDLE AMERICA** ▪ PEDRO DE ALVARADO heads a Spanish expedition from Mexico to Guatemala and El Salvador.

1524

- NORTH AMERICA** ▪ GIOVANNI DA VERRAZANO heads a French maritime expedition to North America's east coast from South Carolina to Newfoundland.

1524–25

- NORTH AMERICA** ▪ ESTEVÃO GOMES heads a Spanish maritime expedition along North America's east coast, seeking the NORTHWEST PASSAGE.

1524–28

- SOUTH AMERICA** ▪ FRANCISCO PIZARRO heads a Spanish maritime expedition southward from Panama along the Pa-

cific coast of Colombia, Ecuador, and northern Peru.

1525

- MIDDLE AMERICA** ■ HERNÁN CORTÉS heads a Spanish expedition of CONQUISTADORES from Mexico to Honduras.

1526

- MIDDLE AMERICA** ■ PEDRO ARIAS DE ÁVILA commands a Spanish military expedition in the conquest of Indian tribes of Nicaragua.

1526–27

- NORTH AMERICA** ■ LUCAS VÁSQUEZ DE AYLÓN heads a Spanish colonizing expedition from Santo Domingo on the island of Hispaniola (Haiti and Dominican Republic) to the Santee River in South Carolina. He explores southward to the Savannah River in Georgia.

1526–30

- SOUTH AMERICA** ■ Italian SEBASTIAN CABOT heads an English maritime expedition to the Río de la Plata and explores inland waterways of Brazil, Uruguay, Paraguay, and Argentina.

1527

- NORTH AMERICA** ■ JOHN RUT heads an English maritime expedition to Newfoundland.

1527–29

- PACIFIC OCEAN** ■ ÁLVARO DE SAAVEDRA CÉRON heads a Spanish maritime expedition from South America to Guam, the Philippines, and the SPICE ISLANDS (Moluccas). In an unsuccessful eastward return passage, he reaches Ponape Island in the Carolines and Eniwetok Island in the Marshalls.

1528–35

- MIDDLE AMERICA** ■ FRANCISCO DE MONTEJO commands a Spanish military expedition against the Maya of the Yucatán Peninsula. His son, FRANCISCO DE MONTEJO Y LEÓN, campaigns in 1537–46.

1528–36

- NORTH AMERICA** ■ PÁNFILO DE NÁRVAEZ heads a Spanish expedition to Florida; after the disappearance of Nárvaez at sea, four survivors, including ALVAR NÚÑEZ CABEZA DE VACA and former slave ESTEVANICO, wander from the coast of Texas into the American Southwest and northern Mexico as far west as the Gulf of California.

1529–33

- MIDDLE AMERICA** ▪ NUÑO BELTRÁN DE GUZMÁN commands the Spanish conquest of Indian tribes in western Mexico.

1530–31

- SOUTH AMERICA** ▪ Diego de Ordaz heads a Spanish maritime expedition to the mouth of the AMAZON RIVER, exploring the Orinoco and Meta Rivers.

1530–36

- SOUTH AMERICA** ▪ German NIKOLAUS FEDERMANN heads two expeditions to the interior of Venezuela, seeking the fabled land of EL DORADO. On the second, he explores the plains of eastern Colombia and makes the first east-to-west crossing of the ANDES MOUNTAINS.

1531

- Italian physicist Guglielmo de Lorena constructs a large barrel used to walk along the bottom of a body of water, a primitive DIVING BELL.

1531–33

- SOUTH AMERICA** ▪ FRANCISCO PIZARRO commands the Spanish conquest of the Inca in Ecuador and Peru. His half brothers, GONZALO PIZARRO and HERNANDO PIZARRO, serve under him.

- SOUTH AMERICA** ▪ German AMBROSIUS ALFINGER explores the interior of Venezuela, seeking the fabled land of EL DORADO, and reaches Rio Magdalena.

1534

- NORTH AMERICA** ▪ JACQUES CARTIER heads a French maritime expedition to northeastern Canada; he explores Newfoundland, the Gaspé Peninsula, Labrador's south coast, the Gulf of St. Lawrence and islands in the Bay of Fundy. Huron Indian DONNACONNA provides help. Cartier searches for the legendary land of SAGUENAY.

1534–35

- SOUTH AMERICA** ▪ SEBASTIÁN DE BENALCÁZAR commands the Spanish conquest of Ecuador.

1535

- NORTH AMERICA** ▪ HERNÁN CORTÉS heads a Spanish maritime expedition from Mexico to the Gulf of California.
- GONZALO FERNÁNDEZ DE OVIEDO Y VALDEZ publishes the first volume of *Historia general y*

natural de las Indias Occidentales (General and natural history of the West Indies), a history of Spanish activity in the WEST INDIES.

1535–36

- NORTH AMERICA**
- JACQUES CARTIER heads a French maritime expedition to northeastern Canada. He explores the St. Lawrence River as far as Montreal and determines that Newfoundland is an island.

1535–37

- SOUTH AMERICA**
- DIEGO DE ALMAGRO heads a Spanish expedition south from Cuzco, Peru, through the ANDES MOUNTAINS of Bolivia and Argentina, into Chile as far south as Concepción, and back across the Atacama Desert.
- SOUTH AMERICA**
- PEDRO DE MENDOZA heads a Spanish colonizing expedition to the lower Río de la Plata region of Argentina and founds a settlement on the site of Buenos Aires.
- SOUTH AMERICA**
- JUAN DE AYOLAS heads a Spanish expedition from Buenos Aires, Argentina, along the Río de la Plata, to the Paraná and Paraguay Rivers.

1535–38

- SOUTH AMERICA**
- German GEORG HOHERMUTH VON SPEYER explores Río Meta and its tributaries and Río Ariari in Colombia, seeking the fabled land of EL DORADO.

1536–39

- SOUTH AMERICA**
- GONZALO JIMÉNEZ DE QUESADA heads a Spanish expedition to the upper Magdalena River in Colombia, seeking the fabled land of EL DORADO.
- SOUTH AMERICA**
- SEBASTIÁN DE BENALCÁZAR heads a Spanish expedition to the interior of Colombia, seeking the fabled land of EL DORADO.

1539

- NORTH AMERICA**
- MARCOS DE NIZA and ESTEVANICO head a Spanish expedition from Mexico to the American Southeast, organized by ANTONIO DE MENDOZA. They explore Arizona and New Mexico as far north as the Zuni Indian pueblos.

1539–40

- NORTH AMERICA**
- FRANCISCO DE ULLOA heads a Spanish maritime expedition, which explores the Gulf of California, the mouth of the COLORADO RIVER, and the Pacific coast of Baja California.

1539–43

NORTH AMERICA

- HERNANDO DE SOTO heads a Spanish expedition through the American Southeast. After landing on Florida's west coast, he explores the northern panhandle. He heads northward into Georgia and the Carolinas, westward across the APPALACHIAN MOUNTAINS, southward into Alabama, then westward into Mississippi, locating the MISSISSIPPI RIVER. He crosses the Mississippi into Arkansas and eastern Oklahoma. De Soto dies in 1542 on the Mississippi River, and LUIS DE MOSCOSO takes command. Moscoso explores Texas as far as the Trinity River before descending the Mississippi to the Gulf of Mexico.

1540–41

SOUTH AMERICA

- PEDRO DE VALDIVIA heads a Spanish expedition from Peru into Chile, crossing the Atacama Desert, and founds Santiago.

1540–42

NORTH AMERICA

- FRANCISCO VÁSQUEZ DE CORONADO heads a Spanish expedition from Mexico into the American Southwest in search of the seven cities of CIBOLA, as organized by ANTONIO DE MENDOZA. He explores Arizona and New Mexico. He also explores the southern plains of the Texas Panhandle, Oklahoma, and Kansas in search of the legendary kingdom of QUIVIRA, as guided by the TURK, a Plains Indian. HERNANDO DE ALVARADO, under Coronado, explores the upper Rio Grande, the Canadian River, and the Pecos River. PEDRO DE TOVAR and JUAN DE PADILLA explore northeastern Arizona. GARCÍA LOPEZ DE CÁRDENAS explores northern Arizona as far as the Grand Canyon. MELCHOR DÍAZ explores southern Arizona and northern Baja California. In 1540–41, HERNANDO DE ALARCÓN heads a Spanish maritime expedition to the Gulf of California and the lower COLORADO RIVER, the seaward portion of Coronado's expedition, as organized by Mendoza.

1541–42

NORTH AMERICA

- JACQUES CARTIER heads a French maritime expedition to northeastern Canada. He explores the St. Lawrence River and the Saguenay River.

SOUTH AMERICA

- ÁLVAR NÚÑEZ CABEZA DE VACA explores the Río de la Plata as well as the Paraná, Iguazú, and Paraguay Rivers of Argentina and Paraguay for Spain.

- SOUTH AMERICA** ▪ FRANCISCO DE ORELLANA heads a Spanish expedition down the AMAZON RIVER, from the Napo River to the Atlantic coast.
- ASIA** ▪ Portuguese FERNÃO MENDES PINTO travels from China to the Mekong Delta in Vietnam and Japan.

1541–46

- SOUTH AMERICA** ▪ German PHILIP VON HUTTEN explores Río Meta and its tributaries plus Río Ariari in Colombia.

1541–51

- ASIA** ▪ Spanish missionary FRANCIS XAVIER travels to India, Indonesia, and Japan.

1542–43

- NORTH AMERICA** ▪ JEAN-FRANÇOIS DE LA ROQUE DE ROBERVAL heads a French colonizing expedition, which establishes a short-lived settlement on the St. Lawrence River near Quebec City.
- NORTH AMERICA** ▪ JUAN RODRÍGUEZ CABRILLO and BARTOLOMÉ FERRELO command a Spanish maritime expedition along North America's west coast, as organized by ANTONIO DE MENDOZA, from Mexico to the Oregon-California border.
- SOUTH AMERICA** ▪ ÁLVAR NÚÑEZ CABEZA DE VACA heads a Spanish expedition to the Paraguay River north of Asunción in Paraguay.

1542–46

- SOUTH AMERICA** ▪ DOMINGO MARTINEZ DE IRALA heads two Spanish expeditions to the upper Paraguay River. In the second, he reaches the eastern slopes of the ANDES MOUNTAINS.

1543

- Polish astronomer Nicolaus Copernicus publishes *De revolutionibus orbium coelestium*, describing the Sun as the center of a solar system, with the planets in orbit around it.

1551

- The MUSCOVY COMPANY, a joint-stock trading company, is founded in England to locate a NORTHEAST PASSAGE.

1553–54

- EUROPE/ARCTIC** ▪ HUGH WILLOUGHBY, RICHARD CHANCELLOR, and STEPHEN BOROUGH head an English maritime expedition to northern Russia, seeking the NORTH-

EAST PASSAGE. They sight Novaya Zemlya before Willoughby perishes; Chancellor and Borough travel overland to Moscow.

1554–62

- NORTH AMERICA**
- FRANCISCO DE IBARRA heads a Spanish expedition to north-central Mexico as far north as the Sonora Valley.

1556–57

- EUROPE/ARCTIC**
- Englishman STEPHEN BOROUGH heads an English maritime expedition seeking the NORTHEAST PASSAGE. He sails as far east as Novaya Zemlya, reaching the entrance to the Kara Sea. He explores the Arctic coast of European Russia.

1557–64

- EUROPE/ASIA**
- English trader ANTHONY JENKINSON undertakes two expeditions to Russia and central Asia. He becomes the first Englishman to visit Bukhara in Uzbekistan.

1559–61

- SOUTH AMERICA**
- PEDRO DE URSÚA heads a Spanish expedition from Lima, Peru, across the ANDES MOUNTAINS, and into the Amazon Basin. LOPE DE AGUIRRE mutinies and takes over the expedition, following the ORINOCO RIVER to its mouth in Venezuela.

1562

- NORTH AMERICA**
- JEAN RIBAUT heads a French colonizing expedition to Florida and South Carolina. He founds a short-lived Huguenot colony at Port Royal Sound in South Carolina.
 - Spanish cartographer DIEGO GUTIÉRREZ produces the first map of South America detailing the inland river systems.

1562–69

- AFRICA/
CARIBBEAN**
- Englishman JOHN HAWKINS establishes the transatlantic SLAVE TRADE between England, Africa, and the Americas.

1564–65

- NORTH AMERICA**
- Frenchman RENÉ GOULAIN DE LAUDONNIÈRE founds a short-lived Huguenot colony on the St. Johns River in Florida. Artist JACQUES LE MOYNE DE MORGUES is one of the colonists.
- PACIFIC OCEAN**
- MIGUEL LÓPEZ DE LEGAZPI heads a Spanish maritime expedition from Mexico to the western Pa-

cific. He explores the Mariana Islands and the Marshall Islands and founds the first permanent Spanish settlement in the Philippines.

1565

PACIFIC OCEAN

- ANDRÉS DE URDANETA heads a Spanish maritime expedition eastward across the Pacific from the Philippines to Mexico, via the Japan Current.

1565–67

NORTH AMERICA

- PEDRO MENÉNDEZ DE AVILÉS heads a Spanish colonizing expedition to coastal regions of the American Southeast. He founds St. Augustine, Florida, the first permanent European settlement on the North American mainland north of Mexico, and sends expeditions inland.

1567–69

PACIFIC OCEAN

- ÁLVARO DE MENDAÑA and PEDRO SARMIENTO DE GAMBOA head a Spanish maritime expedition from Peru westward, seeking the fabled GREAT SOUTHERN CONTINENT, and reach the Solomon Islands and Marshall Islands. Mendaña names the Solomon Islands after King Solomon from the Bible, believing he has reached the legendary land of OPHIR and King Solomon's mines.

1569

- Flemish cartographer GERARDUS MERCATOR produces a MERCATOR PROJECTION world map.

1569–72

SOUTH AMERICA

- GONZALO JIMÉNEZ DE QUESADA heads a Spanish expedition to eastern Colombia, from Bogotá to the confluence of the ORINOCO RIVER and the Guaviare River.

1570–98

- Flemish cartographer ABRAHAM ORTELIUS produces an annual world atlas.

1576

- English geographer HUMPHREY GILBERT publishes *A Discourse of a Discoverie for a Passage to Cataia*, furthering the idea of a NORTHWEST PASSAGE through North America to Cathay (China).

1576–78

ARCTIC

- MARTIN FROBISHER heads three English maritime expeditions to the Canadian Arctic, seeking the

NORTHWEST PASSAGE, the second two backed by the CATHAY COMPANY. He reaches Frobisher Bay on southeastern Baffin Island.

1577–80

WORLD

- FRANCIS DRAKE heads the first English CIRCUM-NAVIGATION OF THE WORLD. He navigates Drake Passage south of CAPE HORN in South America and explores North America's west coast as far north as Vancouver Island.

1579

ASIA

- English missionary THOMAS STEVENS travels to India on a Portuguese ship, becoming the first known Englishman in India.

1579–80

SOUTH AMERICA

- PEDRO SARMIENTO DE GAMBOA heads a Spanish expedition surveying the Strait of Magellan (see MAGELLAN, STRAIT OF).

1580

SOUTH AMERICA

- JUAN DE GARAY reestablishes the Spanish settlement of Buenos Aires, Argentina, formerly occupied in 1536–41.

1581

- The LEVANT COMPANY, a company to develop trade with the LEVANT, is founded in London.

1581–82

ASIA

- Russian Cossack YERMAK commands a military campaign across the Ural Mountains, initiating Russian expansion into SIBERIA.

1582–83

NORTH AMERICA

- ANTONIO ESTEVAN DE ESPEJO heads a Spanish expedition to western New Mexico and eastern Arizona, exploring the upper Rio Grande, the Sangre de Cristo Mountains, the Little Colorado River, and the upper Pecos River.

1582–89

- English geographer RICHARD HAKLUYT publishes three influential books on exploration and geography: *Diverse Voyages Touching the Discovery of America and the Islands Adjacent*; *A Discourse Concerning Western Planting*; and *The Principal Navigations, Voyages, and Discoveries of the English Nation*.

1583

-
- NORTH AMERICA** ■ English geographer HUMPHREY GILBERT heads a colonizing expedition to Newfoundland.

1583–84

-
- Pamphlets are published making the claim that England had a prior claim to the Americas based on the supposed travels of MADOC, a legendary 12th-century Welsh prince.

1583–85

-
- ASIA** ■ Merchant JOHN NEWBERRY escorts an English trade and diplomatic mission to India.

1583–91

-
- ASIA** ■ English merchant RALPH FITCH heads a trading expedition to India by way of Syria; he visits Burma (Myanmar) and Southeast Asia.

1584–85

-
- EUROPE/ARCTIC** ■ OLIVIER BRUNEL heads two Dutch expeditions seeking the NORTHEAST PASSAGE, reaching Novaya Zemlya.
- SOUTH AMERICA** ■ ANTONIO DE BERRÍO heads a Spanish expedition to the ORINOCO RIVER and the Guiana region, seeking the fabled land of EL DORADO.

1584–87

-
- NORTH AMERICA** ■ Englishman WALTER RALEIGH sponsors three Roanoke voyages to the Outer Banks region of North Carolina that explore the Carolina coast. RICHARD GRENVILLE commands the fleet transporting colonists in the second voyage and a failed attempt at a colony, with THOMAS HARRIOT serving as naturalist and JOHN WHITE as artist. A second colonizing attempt under John White also fails, becoming known as the LOST COLONY.

1585–87

-
- ARCTIC** ■ JOHN DAVIS heads three English maritime expeditions to the Canadian Arctic, seeking the NORTHWEST PASSAGE. He reaches as far north as 73 degrees north latitude in the Davis Strait and explores the eastern entrance of the Hudson Strait.

1585–94

-
- Flemish cartographer GERARDUS MERCATOR produces a comprehensive world atlas.

1590

- Spanish missionary JOSÉ DE ACOSTA, after serving in Peru and Mexico, publishes an account of the natural science of the Americas, *The Natural and Moral History of the Indies*.

1592

- NORTH AMERICA**
- Greek mariner JUAN DE FUCA reportedly explores the Pacific coast of California, Oregon, and Washington.

1594–95

- Geographer JAN HUYGHEN VAN LINSCHOTEN heads two Dutch expeditions in search of the NORTHEAST PASSAGE, reaching Novaya Zemlya.

ca. 1595

- The English mariner JOHN DAVIS invents the Davis QUADRANT, a navigational tool.

1595

- SOUTH AMERICA**
- WALTER RALEIGH heads an English expedition to the ORINOCO RIVER, seeking the fabled land of EL DORADO.
- PACIFIC OCEAN**
- ÁLVARO DE MENDAÑA heads a Spanish colonizing expedition to the South Pacific; he reaches the Marquesas Islands and Santa Cruz Islands.
- NORTH AMERICA**
- SEBASTIÁN MELÉNDEZ RODRÍGUEZ CERMENHO heads a Spanish maritime expedition to the California coast, reaching Monterey Bay.

1595–97

- ASIA**
- CORNELIUS HOUTMAN heads a Dutch maritime expedition to the EAST INDIES.

1596–97

- ARCTIC**
- WILLEM BARENTS heads a Dutch maritime expedition seeking the NORTHEAST PASSAGE, reaching Bear Island and Spitsbergen (Svalbard).

1598

- NORTH AMERICA**
- JUAN DE OÑATE heads the first Spanish colonizing expedition into New Mexico. In subsequent years, he explores much of the American Southwest.
 - MARTIN LLEWELLYN publishes the first English atlas showing the sea routes to the Far East.

1598–1600

- ASIA**
- Englishman ANTHONY SHERLEY travels to Persia. He heads diplomatic missions to Moscow,

Prague, and Rome on behalf of the Persian shah.

1598–1601

WORLD

- OLIVER VAN NOORT heads the first Dutch CIRCUMNAVIGATION OF THE WORLD. He explores coastal South America.

1599–1600

ASIA

- Englishman WILLIAM ADAMS serves as the pilot for a Dutch trade fleet, which reaches Japan by way of the Strait of Magellan (see MAGELLAN, STRAIT OF) and Chile.

1600

- The British East India Company, a joint-stock trading company, is founded in London.

1601–03

ASIA

- JAMES LANCASTER heads the first maritime trading voyage of the BRITISH EAST INDIA COMPANY to the EAST INDIES.

1601–07

ASIA

- Italian missionary MATTEO RICCI travels in China from a mission in Peking (Beijing).

1602

NORTH AMERICA

- BARTHOLOMEW GOSNOLD heads an English maritime expedition to New England. He explores Cape Cod, Martha's Vineyard, Buzzards Bay, and Naragansett Bay.
- The DUTCH EAST INDIA COMPANY, a joint-stock trading company, is founded in the Netherlands.

1602–03

NORTH AMERICA

- SEBASTIÁN VISCAÍNO heads a Spanish maritime expedition along the California coast. He explores Monterey Bay and surveys beyond Cape Mendocino as far north as southern Oregon.

1603

NORTH AMERICA

- SAMUEL DE CHAMPLAIN heads a French fur-trading expedition to eastern Canada. He explores the Gulf of St. Lawrence, the Saguenay River, and the St. Lawrence River as far as the Lachine Rapids.

NORTH AMERICA

- MARTIN PRING heads an English trading expedition along the New England coast, from Maine to the Long Island Sound.

1603–07

- ASIA**
- Portuguese missionary BENTO DE GÓES travels from India through Afghanistan and makes an eastward crossing of China as far as Suchow.

1603–20

- SOUTH AMERICA**
- Spanish woman CATALINA DE ERAUSO, disguised as a man, fights as a soldier and works in mining camps in Argentina and Chile.

1604–05

- NORTH AMERICA**
- SAMUEL DE CHAMPLAIN heads a French colonizing expedition to eastern Canada; he explores the Bay of Fundy and establishes Acadia on the St. Croix River, eventually moving the colony to Port Royal in southeastern Nova Scotia.

1604–08

- SOUTH AMERICA**
- HERNANDO ARIAS DE SAAVEDRA heads Spanish expeditions inland from Buenos Aires, Argentina.

1605

- NORTH AMERICA**
- GEORGE WEYMOUTH heads an English maritime expedition along the coast of Maine to establish trade contacts with Native Americans.
- AUSTRALIA**
- WILLEM JANSZ heads a Dutch maritime exploration of the south coast of New Guinea. He sights the Australian mainland.

1605–06

- PACIFIC OCEAN**
- Portuguese PEDRO FERNÁNDEZ DE QUIRÓS heads a Portuguese maritime expedition from Peru to the southwestern Pacific, seeking the fabled GREAT SOUTHERN CONTINENT. He explores island groups, including parts of Samoa, the Cook Islands, and New Hebrides. LUIS VÁEZ DE TORRES explores New Guinea's eastern end and reaches Louisiade Archipelago and the Torres Strait.
- ARCTIC/GREENLAND**
- Englishman JAMES HALL heads two Dutch maritime expeditions to GREENLAND's west coast.

1605–07

- NORTH AMERICA**
- SAMUEL DE CHAMPLAIN heads a French maritime expedition to coastal regions of northeastern North America, including Cape Breton Island, New Brunswick, Maine, and Massachusetts.

1606

- NORTH AMERICA**
- JOHN KNIGHT heads an English maritime expedition to the north coast of Labrador, seeking the

NORTHWEST PASSAGE. He disappears with a surveying party.

- The Virginia Company of London and the Virginia Company of Plymouth are founded to reassert English sovereignty over North America and colonize it; they both are referred to as the VIRGINIA COMPANY.

1607–08

- | | |
|-------------------------|--|
| ARCTIC/GREENLAND | ▪ HENRY HUDSON heads two English maritime expeditions seeking the NORTHEAST PASSAGE. He explores GREENLAND's east coast and the European Arctic coast. |
| NORTH AMERICA | ▪ GEORGE POPHAM founds Fort St. George, a short-lived English settlement on Monhegan Island off Maine. |

1607–09

- | | |
|----------------------|---|
| NORTH AMERICA | ▪ CHRISTOPHER NEWPORT and JOHN SMITH found the first permanent English settlement in the Americas at Jamestown, Virginia. Newport explores inland beyond the falls of James River in Virginia and possibly reaches the mouth of the Rappahannock River. Smith explores the Chesapeake Bay and the Potomac, Rappahannock, and Chickahominy Rivers. |
|----------------------|---|

1608

- | | |
|----------------------|--|
| NORTH AMERICA | ▪ SAMUEL DE CHAMPLAIN founds the first permanent French settlement in the Americas at Quebec City. |
|----------------------|--|

1608–17

- | | |
|-------------|--|
| ASIA | ▪ English trader JOHN JOURDAIN travels to India, Sumatra, Java, and the EAST INDIES. |
|-------------|--|

1609

- | | |
|-----------------------|---|
| NORTH AMERICA | ▪ SAMUEL DE CHAMPLAIN heads a French expedition southward from the St. Lawrence River along the Richelieu River, reaching Lake Champlain. |
| NORTH AMERICA | ▪ Englishman HENRY HUDSON heads a Dutch maritime exploration of New York Bay and the Hudson River, seeking the NORTHWEST PASSAGE. |
| ATLANTIC OCEAN | ▪ SILVESTER JOURDAIN's shipwreck leads to an English claim on Bermuda. |
| | ▪ German astronomer Johannes Kepler establishes that the orbits of planets are elliptical, not circular. |

1610

- Italian scientist Galileo constructs the first complete astronomical telescope and begins viewing

features on the Moon and eventually the moons of Jupiter.

1610–11

- | | |
|----------------------|--|
| NORTH AMERICA | ▪ HENRY HUDSON heads an English maritime expedition to the Hudson Strait, HUDSON BAY, and James Bay, seeking the NORTHWEST PASSAGE. |
| SOUTH AMERICA | ▪ THOMAS ROE heads an English maritime expedition to coastal South America; he explores from the mouth of the AMAZON RIVER to the ORINOCO RIVER delta. |

1611–12

- | | |
|----------------------|---|
| NORTH AMERICA | ▪ ÉTIENNE BRÛLÉ, under SAMUEL DE CHAMPLAIN, heads a French expedition to Lake Huron and Lake Ontario. |
|----------------------|---|

1612

- The COMPANY OF MERCHANTS OF LONDON DISCOVERERS OF THE NORTHWEST PASSAGE is chartered in England.

1612–13

- | | |
|---------------|---|
| ARCTIC | ▪ THOMAS BUTTON heads an English maritime expedition to HUDSON BAY, seeking the NORTHWEST PASSAGE. He explores the mouth of the Nelson River and the coast of the Southampton Island. |
|---------------|---|

1613

- | | |
|----------------------|--|
| NORTH AMERICA | ▪ SAMUEL DE CHAMPLAIN heads a French expedition to the Ottawa River as far as Allumette Island. |
| AFRICA | ▪ Spanish missionary PEDRO PÁEZ explores Lake Tana and the nearby Springs of Geesh, determining them as the principal source of the Blue Nile. |

1613–14

- | | |
|-------------|---|
| ASIA | ▪ JOHN SARIS heads an English maritime expedition to Japan. |
|-------------|---|

1614

- | | |
|----------------------|--|
| NORTH AMERICA | ▪ JOHN SMITH heads an English maritime expedition from Cape Cod to Penobscot Bay. He names the region New England. |
| NORTH AMERICA | ▪ ADRIAEN BLOCK heads a Dutch maritime expedition to the East River, in modern-day New York. He enters Long Island Sound from the west through the narrow channel known as Hell Gate. He explores the New England coastline, reaching the Housatonic and Connecticut Rivers as well as Block Island. |

1615

- ARCTIC**
- Englishmen WILLIAM BAFFIN and ROBERT BYLOT head an English maritime expedition to HUDSON BAY's northwest coast and the Foxe Basin, determining that Hudson Bay provides no navigable outlet westward to the Pacific.

1615–16

- NORTH AMERICA**
- SAMUEL DE CHAMPLAIN and ÉTIENNE BRÛLÉ head a French expedition from Montreal along the Ottawa River and Lake Nipissing to the French River and the Georgian Bay on the northeast shore of Lake Huron. They proceed southward along the eastern end of Lake Ontario to upstate New York. Étienne Brûlé explores the Susquehanna River from New York to Chesapeake Bay in Maryland.
- ATLANTIC OCEAN/
PACIFIC OCEAN**
- JAKOB LE MAIRE and WILLEM CORNELIS SCHOUTEN head a Dutch maritime expedition around South America's CAPE HORN; they locate the Juan Fernandez Islands and determine the eastern extent of New Guinea.

1615–19

- ASIA**
- THOMAS ROE heads an English diplomatic mission to the Mogul (Mughal) Empire in northern India.

1616

- ARCTIC/GREENLAND**
- WILLIAM BAFFIN and ROBERT BYLOT head an English maritime expedition to the west coast of GREENLAND, as well as Baffin Bay, Baffin Island, and Lancaster Sound.
- AUSTRALIA**
- DIRK HARTOG heads a Dutch maritime expedition to the EAST INDIES. He reaches Dirk Hartogs Island and explores Australia's west coast.

1619

- AUSTRALIA**
- FREDERIK HOUTMAN heads a Dutch maritime expedition to the EAST INDIES. He sights Australia's west coast.

1619–20

- NORTH AMERICA**
- JENS ERIKSEN MUNK heads a Danish maritime expedition to HUDSON BAY, seeking the NORTHWEST PASSAGE. He explores the Churchill River region.

1620

- NORTH AMERICA**
- Englishman EDWARD WINSLOW sails with the PILGRIMS to Massachusetts and helps found Plymouth colony.

1621

-
- NORTH AMERICA**
- ÉTIENNE BRÛLÉ heads a French expedition to the western Great Lakes, reaching Lake Superior.
 - The DUTCH WEST INDIA COMPANY, a joint-stock trading company, is founded in the Netherlands.

1621–22

-
- NORTH AMERICA**
- Wampanoag Indian SQUANTO aids the PILGRIMS in the exploration of coastal Massachusetts.

1622–30

-
- NORTH AMERICA**
- Spaniard ALONZO DE BENAVIDES serves as missionary to the American Indians of the Gila River Valley, Rio Grande, and the Pecos River Valley.

1624–25

-
- ASIA**
- Portuguese (or possibly Spanish) missionary ANTONIO DE ANDRADE travels from northern India across the HIMALAYAS, where he reaches a source of the GANGES RIVER, and continues into Tibet.

1626

-
- ASIA**
- Portuguese missionaries JOÃO CABRAL and ESTEVÃO CACELLA travel from India to Tibet.

1627

-
- AUSTRALIA**
- FRANÇOIS THYSSEN heads a Dutch maritime expedition eastward across the southern Indian Ocean to southwestern Australia and explores the Great Australian Bight.

1627–29

-
- ASIA**
- English writer THOMAS HERBERT explores Persia (Iran).

1628

-
- AFRICA**
- Portuguese missionary JERONIMO LOBO explores the Lake Tana region in Ethiopia. He reaches the source of the Blue Nile River and Tisisat Falls.

1631

-
- NORTH AMERICA/
ARCTIC**
- LUKE FOXE heads an English maritime expedition to western and northern HUDSON BAY, seeking the NORTHWEST PASSAGE.

1631–32

-
- NORTH AMERICA/
ARCTIC**
- THOMAS JAMES heads an English maritime expedition to HUDSON BAY and James Bay, seeking the NORTHWEST PASSAGE.

1631–33

- ASIA**
- Russian Cossack PYOTR BEKETOV expands the Russian dominion to the Yenisey, Lena, and Aldan Rivers of central SIBERIA.

1631–35

- ASIA**
- Portuguese (or Spanish) missionary FRANCISCO DE AZEVADO crosses the HIMALAYAS from India into Tibet.

1634

- NORTH AMERICA**
- French missionary JEAN NICOLET explores Lake Michigan and Green Bay.
 - Dutch cartographer WILLEM JANZON BLAEU publishes a comprehensive atlas detailing recent explorations.

1637–38

- SOUTH AMERICA**
- Portuguese PEDRO DE TEIXEIRA heads an expedition up the AMAZON RIVER. He reaches Río Negro and Quito by way of the Napo River and the ANDES MOUNTAINS. On the return journey in 1639, he is accompanied by Jesuit missionary CRISTÓBAL DE ACUÑA.

1640–49

- NORTH AMERICA**
- French missionary JEAN DE BRÉBEUF explores the eastern Great Lakes. He is joined by GABRIEL LALEMENT at Georgian Bay in 1648.

1640–80

- EUROPE/ASIA/AFRICA**
- Turkish writer ÇELEBI EVLIYA travels in eastern Europe, the Balkans, the Middle East, and North Africa.

1641

- NORTH AMERICA**
- French missionary ISAAC JOGUES explores Lake Superior and Lake Michigan.

1641–44

- ASIA**
- Russian Cossack MIKHAIL STADUKHIN explores the Arctic coast of SIBERIA, reaching the Kolyma River.

1642–43

- PACIFIC OCEAN**
- ABEL JANSZON TASMAN heads a Dutch maritime expedition from Indonesia, seeking the fabled GREAT SOUTHERN CONTINENT. He explores TASMANIA, NEW ZEALAND, and the Fiji Islands.

1643–46**ASIA**

- Russian Cossack VASILY DANILOVICH POYARKOV commands a Russian military expedition down the Amur River to the Sakhalin Gulf and the Sea of Okhotsk.

1644**AUSTRALIA**

- ABEL JANSZON TASMAN heads a Dutch maritime expedition from Indonesia to the South Pacific. He explores New Guinea's south coast and Australia's north and west coasts.

1644–48**NORTH AMERICA**

- Italian missionary FRANCESCO-GIOSEPPE BRESANI explores the eastern Lake Huron region of Ontario.

1646**NORTH AMERICA**

- French missionary ISAAC JOGUES explores Lake George in New York and Vermont.

1648**ASIA**

- Russian Cossack SEMYON IVANOVICH DEZHNEV heads an expedition from the mouth of Kolyma River eastward along the Arctic coast of SIBERIA. He rounds Cape Dezhnev and sights the BERING STRAIT.

1649–52**ASIA**

- YEROFEY PAVLOVICH KHABAROV heads two Russian expeditions to the Amur River region in southeastern SIBERIA.

1652–60**ASIA**

- Russian Cossack PYOTR BEKETOV expands Russian dominion to the Amur River of eastern SIBERIA.

1654**NORTH AMERICA**

- French missionary SIMON LE MOYNE explores Onondaga Lake in New York.

1654–56**NORTH AMERICA**

- French fur trader MÉDARD CHOUART DES GROSEILLIERS, one of the COUREURS DE BOIS, explores Illinois, Michigan, and Wisconsin, including the Fox and Wisconsin Rivers. He also explores the upper reaches of the MISSISSIPPI RIVER in Minnesota.

1659–60

-
- | | |
|----------------------|---|
| NORTH AMERICA | ▪ French COUREURS DE BOIS MÉDARD CHOUART DES GROSEILLIERS and PIERRE-ESPRIT RADISSON explore from Lake Superior to Chequamegon Bay. |
| NORTH AMERICA | ▪ French missionary RENÉ MÉNARD founds a mission at Keweenaw Bay on Lake Superior. |

1660

-
- The ROYAL SOCIETY (Royal Society of London for Improving Natural Knowledge) is founded in London.

1661–62

-
- | | |
|-------------|---|
| ASIA | ▪ Jesuit missionaries JOHANN GRUEBER and ALBERT D'ORVILLE travel from Peking (Beijing) across western China to Tibet, becoming the first Europeans to visit LHASA. They cross the HIMALAYAS into India. |
|-------------|---|

1664

-
- The FRENCH EAST INDIA COMPANY, a joint-stock trading company, is founded in France.

1665

-
- | | |
|----------------------|---|
| SOUTH AMERICA | ▪ CHARLES-EDOUARD DE LA NOUÉ heads a French expedition to Tierra del Fuego and Patagonia. |
|----------------------|---|

1665–69

-
- | | |
|----------------------|---|
| NORTH AMERICA | ▪ French missionary CLAUDE-JEAN ALLOUEZ explores the south shore of Lake Superior and the Fox and Wisconsin Rivers. |
|----------------------|---|

1666–67

-
- | | |
|----------------------|--|
| SOUTH AMERICA | ▪ AGOSTINHO VIALE heads a Portuguese expedition from São Paulo, Brazil, to the Mato Grosso region south of the AMAZON RIVER. |
|----------------------|--|

1667

-
- | | |
|----------------------|---|
| NORTH AMERICA | ▪ French missionary JACQUES BRUYAS travels from Quebec to upstate New York. |
|----------------------|---|

1667–71

-
- | | |
|----------------------|--|
| NORTH AMERICA | ▪ French fur trader NICOLAS PERROT explores the western Great Lakes. |
|----------------------|--|

1668–69

-
- | | |
|----------------------|---|
| NORTH AMERICA | ▪ Frenchman MÉDARD CHOUART DES GROSEILLIERS, backed by a British group of merchants, carries out a fur-trading expedition by sea from |
|----------------------|---|

England to HUDSON BAY. PIERRE-ESPRIT RADISSON, in a separate ship, is forced to turn back.

1669–70

- NORTH AMERICA ▪ German physician JOHN LEDERER explores the Piedmont and Blue Ridge of Virginia and North Carolina for the British colony of Virginia.
- NORTH AMERICA ▪ French missionaries RENÉ DE BRÉHANT DE GALINÉE and FRANÇOIS DOLLIER DE CASSON explore Niagara River, Lake Erie, and Lake Huron.

1670

- The HUDSON’S BAY COMPANY is founded in London to develop the FUR TRADE in North America. PIERRE-ESPRIT RADISSON reaches HUDSON BAY.

1671–72

- NORTH AMERICA ▪ French missionary CHARLES ALBANEL travels from the St. Lawrence River to HUDSON BAY.

1671–73

- NORTH AMERICA ▪ Englishman ABRAHAM WOOD sponsors Virginia colonial expeditions to the Appalachian frontier of Virginia and North Carolina. THOMAS BATTS and ROBERT FALLAM cross the Blue Ridge into West Virginia. GABRIEL ARTHUR and JAMES NEEDHAM reach Tennessee.

1673

- NORTH AMERICA ▪ French fur trader and missionary LOUIS JOLLIET and JACQUES MARQUETTE explore the Fox River, the Wisconsin River, and the MISSISSIPPI RIVER to the mouth of the Arkansas River. On the return journey, they explore the Illinois River.

1675–77

- SOUTH AMERICA ▪ German SIGISMUND NIEBUHR heads a Dutch maritime expedition to the southern tip of South America; he explores Le Maire Strait, CAPE HORN, and Tierra del Fuego.

1679

- The first EPHEMERIS, *Connaissance de Temps*, a table of astronomical data for purposes of navigation, is published in France.

1679–80

- NORTH AMERICA ▪ French fur trader DANIEL GREYSOLON DULUTH explores the headwaters of the MISSISSIPPI RIVER in Wisconsin and Minnesota.

- NORTH AMERICA**
- HENRI DE TONTI heads a French expedition to the north shore of Lake Erie and the south shore of Lake Michigan.

1680

- NORTH AMERICA**
- LOUIS HENNEPIN and MICHEL ACO head a French expedition to the Minnesota River and the Falls of St. Anthony.

1682

- NORTH AMERICA**
- RENÉ-ROBERT CAVELIER DE LA SALLE heads a French expedition along the MISSISSIPPI RIVER to the Gulf of Mexico.

1683–92

- ASIA**
- German ENGELBRECHT KAEMPFER travels on behalf of Sweden to Persia, Sri Lanka (CEYLON), Java, Thailand, and Japan.

1685

- NORTH AMERICA**
- Dutchman JOSEPH DE LA PENHA explores the interior of Labrador.
- NORTH AMERICA**
- English physician HENRY WOODWARD explores from Charleston, South Carolina, to beyond the Savannah River into Georgia.

1685–1717

- EUROPE**
- Englishwoman CELIA FIENNES begins traveling throughout England, writing a journal, later published as *Through England on a Side-Saddle*.

1686–1713

- SOUTH AMERICA**
- Bohemian missionary SAMUEL FRITZ explores the AMAZON RIVER and its tributaries in Ecuador, Peru, and Brazil.

1687–88

- NORTH AMERICA**
- Frenchman HENRI JOUTEL, an aide to RENÉ-ROBERT CAVELIER DE LA SALLE, explores eastern Texas and western Arkansas.

1688–89

- NORTH AMERICA**
- French soldier Baron LOUIS-ARMAND DE LOM D'ARCE DE LAHONTAN explores Lake Michigan and perhaps reaches the MISSISSIPPI RIVER.

1689

- NORTH AMERICA**
- ALONSO DE LEÓN heads a Spanish expedition from Coahuila in Mexico across the Rio Grande to the Gulf Coast of Texas.

- French physicist Denis Papin designs a DIVING BELL with fresh air from the surface pumped through a tube.

1690–92

- NORTH AMERICA**
- English fur trader HENRY KELSEY explores the Assiniboine and Saskatchewan Rivers for the HUDSON'S BAY COMPANY, reaching the Canadian prairies.

1696–1700

- ASIA**
- Russian Cossacks VLADIMIR VASILYEVICH ATLASOV and LUKA MOROZKO command the exploration and conquest of Kamchatka Peninsula.

1698–99

- NORTH AMERICA**
- JEAN-BAPTISTE LE MOYNE and PIERRE LE MOYNE head a French colonizing expedition to the mouth of the MISSISSIPPI RIVER and about 100 miles upriver.
- NORTH AMERICA**
- French missionary ALBERT DAVION explores the lower MISSISSIPPI RIVER and the Yazoo River in Mississippi.

1698–1706

- NORTH AMERICA**
- Italian missionary EUSEBIO FRANCISCO KINO explores the Gila River and the COLORADO RIVER in Arizona. He reaches the Gulf of California.

1699–1701

- PACIFIC OCEAN/
AUSTRALIA**
- WILLIAM DAMPIER heads an English scientific expedition to the Pacific and explores Australia's west coast, reaching the Dampier Archipelago. He explores New Guinea and New Britain Island.

1700–01

- NORTH AMERICA**
- French trader PIERRE-CHARLES LE SUEUR ascends the MISSISSIPPI RIVER, from the Gulf of Mexico to the Minnesota River.

1701

- NORTH AMERICA**
- ANTOINE LAUMET DE LA MOTHE founds the French post of Detroit on the Detroit River.

1701–08

- NORTH AMERICA**
- Englishman JOHN LAWSON explores the interior of the Carolinas northwestward from Charleston.

1704–09**PACIFIC OCEAN**

- Scottish mariner ALEXANDER SELKIRK is marooned in the Juan Fernández Islands. His story is adapted by Daniel Defoe in the 1719 novel *Robinson Crusoe*.

1706–08**MEDITERRANEAN**

- Italian count LUIGI FERDINANDO MARSILI engages in the first underwater exploration, investigating the MEDITERRANEAN SEA.

1712–17**NORTH AMERICA**

- Frenchman ÉTIENNE-VENIARD DE BOURGMONT explores the central MISSOURI RIVER region, possibly as far north as the mouth of the Platte River in eastern Nebraska.

1712–26**NORTH AMERICA**

- English naturalist MARK CATESBY studies wildlife in Virginia, the Carolinas, Bermuda, and the Bahamas.

1713–14**NORTH AMERICA**

- French-Canadian LOUIS JUCHEREAU DE ST. DENIS establishes a trading post at Natchitoches on the Red River. He crosses Texas to San Juan Bautista on the Rio Grande.

ASIA

- Russian Cossack fur trader SEMYON ANABARA explores eastern SIBERIA, from Yakutz on the Lena River to the southeast shore of the Sea of Okhotsk. He reaches the Shantar Islands.

1714–16**ASIA**

- Italian missionary IPPOLITO DESIDERI travels from Delhi in India northward through Kashmir and the HIMALAYAS to LHASA in Tibet.

1715–16**ASIA**

- Russian IVAN DMITRYEVICH BUKHGOLTS commands a military expedition southward from Tobolsk, descending the Irtysh River to the Om River.

1715–17**ASIA**

- Russian navigator and military leader ALEKSANDR BEKOVICH-CHERKASSKY explores the rivers feeding the Caspian Sea.

1716

- NORTH AMERICA** ■ British colonial governor ALEXANDER SPOTSWOOD heads an expedition into Virginia's Shenandoah Valley and Blue Ridge.

1719

- NORTH AMERICA** ■ Frenchman JEAN-BAPTISTE BÉNARD DE LA HARPE heads a trading expedition from Louisiana through Texas to Santa Fe, New Mexico.

1719–21

- NORTH AMERICA/
ARCTIC** ■ British fur trader JAMES KNIGHT explores northwestern HUDSON BAY for the HUDSON'S BAY COMPANY. After being shipwrecked on Marble Island, the entire crew perishes.
- NORTH AMERICA/
ARCTIC** ■ British fur trader HENRY KELSEY explores the Marble Island region of HUDSON BAY for the HUDSON'S BAY COMPANY.

1719–27

- ASIA** ■ DANIEL GOTTLIEB MESSERSCHMIDT heads a Russian scientific expedition to central SIBERIA, from the Lena and Yenisey Rivers in the north to Lake Baikal and the Amur River in the south.

1720

- NORTH AMERICA** ■ French historian PIERRE-FRANÇOIS-XAVIER DE CHARLEVOIX explores the Great Lakes, the Illinois River, and the MISSISSIPPI RIVER.

1721

- ARCTIC/GREENLAND** ■ Norwegian HANS EGEDE founds the first permanent settlement in GREENLAND.

1721–22

- PACIFIC OCEAN** ■ JAKOB ROGGEVEEN heads a Dutch maritime expedition seeking the fabled GREAT SOUTHERN CONTINENT; he explores South America's west coast and explores Easter Island and the Samoa Islands in the South Pacific.

1724

- NORTH AMERICA** ■ ÉTIENNE-VENIARD DE BOURGMONT heads a French expedition into western Kansas, the deepest French penetration to date into the territory west of the MISSISSIPPI RIVER.

1724–28

- NORTH AMERICA** ■ PEDRO DE RIVERA Y VILLALÓN heads a Spanish expedition inspecting and mapping northern New

Spain, including parts of Mexico, New Mexico, and Texas.

1725–30

ASIA

- VITUS JONASSEN BERING and ALEKSEY ILYICH CHIRIKOV command First Kamchatka Expedition for the Russian navy to SIBERIA's Pacific coast.

1726–33

ASIA

- Russian Cossack EMELYAN BASOV heads expeditions along SIBERIA's Lena River, seeking a seaward route to the Pacific.

1731–37

NORTH AMERICA

- CONRAD WEISER, a colonial American interpreter to the Indians, explores western Pennsylvania.

1731–43

NORTH AMERICA

- French fur trader PIERRE GAULTIER DE VARENNES DE LA VÉRENDRYE explores the northern plains as far west as the Bighorn Mountains in Wyoming. His sons, including LOUIS-JOSEPH GAULTIER DE LA VÉRENDRYE, work with him.

1733–40

ASIA/ARCTIC

- VITUS JONASSEN BERING and ALEKSEY ILYICH CHIRIKOV command the Great Northern Expedition (including the Second Kamchatka Expedition) for the Russian navy to the Arctic and Pacific coasts of SIBERIA, Kuril Islands, and inland areas of eastern Siberia. JOHANN GEORG GMELIN, STEPAN PETROVICH KRASHENINNIKOV, and GEORG WILHELM STELLER serve as naturalists.

1735

- French cartographer JEAN-BAPTISTE BOURGUIGNON D'ANVILLE produces the first accurate map of China.
- English carpenter John Harrison designs a practical CHRONOMETER to help measure longitude for purposes of navigation.

1738–39

ATLANTIC OCEAN

- Frenchman JEAN-BAPTISTE-CHARLES BOUVET DE LOZIER locates Bouvet Island in the South Atlantic near the ANTARCTIC CIRCLE.

1739–40

NORTH AMERICA

- French-Canadian fur traders PIERRE-ANTOINE MALLET and younger brother Paul Mallet explore

the central plains, including the Niobrara, Platte, Republican, Smoky Hill, Arkansas, and Canadian Rivers.

1740–41

- NORTH AMERICA** ■ VITUS JONASSEN BERING and ALEKSEY ILYICH CHIRIKOV head a Russian maritime expedition to BERING STRAIT, the Gulf of Alaska, Kodiak Island, the Aleutian Islands, and the Commander Islands.

1740–44

- WORLD** ■ GEORGE ANSON commands a British military fleet in warfare with Spain. In the course of a CIRCUM-NAVIGATION OF THE WORLD, he explores islands off Chile.

1740–75

- NORTH AMERICA** ■ British trader JAMES ADAIR explores the South Carolina frontier.

1741

- NORTH AMERICA/
ARCTIC** ■ CHRISTOPHER MIDDLETON heads a British maritime expedition to HUDSON BAY, seeking the NORTHWEST PASSAGE. He reaches Wager Bay and Repulse Bay.

1742–43

- ARCTIC** ■ SIMEON CHELYUSKIN heads a Russian maritime expedition to the Arctic coast of Russia from the White Sea to the Leptev Sea. He rounds Cape Chelyuskin.

1743

- SOUTH AMERICA** ■ Frenchman CHARLES-MARIE DE LA CONDAMINE heads a scientific expedition down the AMAZON RIVER, from northern Peru to the coast of Brazil.

1746–47

- NORTH AMERICA/
ARCTIC** ■ WILLIAM MOOR heads a British maritime expedition to HUDSON BAY, seeking the NORTHWEST PASSAGE. He explores Chesterfield Inlet and Wager Bay.

1748–50

- NORTH AMERICA** ■ JOSÉ DE ESCANDÓN heads a Spanish colonizing expedition from Mexico to the lower Rio Grande in southeastern Texas.

1750

-
- NORTH AMERICA** ■ Colonial American THOMAS WALKER crosses through the CUMBERLAND GAP of Virginia's Blue Ridge into eastern Kentucky.

1750–51

-
- NORTH AMERICA** ■ Colonial American traders CHRISTOPHER GIST and GEORGE CROGHAN explore trans-Appalachian regions of western Pennsylvania, southern Ohio, eastern Kentucky, and West Virginia.

1752

-
- NORTH AMERICA** ■ Irish-American trader JOHN FINLEY visits the blue-grass country of Kentucky.
- AFRICA** ■ Dutch pioneer AUGUST BEUTLER leads colonists eastward from Cape Town along Africa's south coast into the Transkei region.

ca. 1753

-
- NORTH AMERICA** ■ Colonial American trader THOMAS CRESAP and Lenni Lenape (Delaware) Indian Nemacolen explore the Redstone and Monongahela Rivers in western Pennsylvania.

1753

-
- Scottish naval doctor James Lind successfully publicizes a cure for SCURVY, citrus fruit, in *A Treatise On Scurvy*.

1753–58

-
- NORTH AMERICA** ■ Russian fur trader PYOTR BASHMAKOV explores the Aleutian Islands.

1754–55

-
- NORTH AMERICA** ■ British fur trader ANTHONY HENDAY explores the Canadian plains for HUDSON'S BAY COMPANY, within 40 miles of the ROCKY MOUNTAINS.

1756

-
- Frenchman CHARLES DE BROSSES publishes *Histoire de la navigation aux terres australes (History of Navigation to Southern Lands)* furthering the idea of a large landmass in southern latitudes, a GREAT SOUTHERN CONTINENT.

1760

-
- ASIA** ■ Russian NIKOLAY DAURKIN heads an expedition north and east of the Anadyr River into the Chukchi Peninsula.

1760–62

-
- ARCTIC/ASIA** ■ IVAN BAKHOV heads a Russian maritime expedition to the Arctic coast of northern SIBERIA, from the Lena River eastward to the mouth of the Kolyma River.

1761–63

-
- ASIA** ■ German CARSTEN NIEBUHR heads a Danish expedition to the southwestern Arabian Peninsula.

1763

-
- ARCTIC/ASIA** ■ STEPAN ANDREYEV heads a Russian military expedition from Fort Anadyr on the Bering Sea to the Arctic coast of SIBERIA. From the Bear Islands, he sights New Siberia Island.

1763–64

-
- NORTH AMERICA** ■ French fur traders PIERRE LIGESTE LACLEDE and RENÉ AUGUSTE CHOUTEAU found St. Louis on the MISSISSIPPI RIVER.

1764–66

-
- WORLD** ■ JOHN BYRON heads a British CIRCUMNAVIGATION OF THE WORLD. He claims Falkland Islands in the South Atlantic for Great Britain and explores South Pacific island groups.

1765

-
- ATLANTIC OCEAN/
PACIFIC OCEAN** ■ PIERRE-NICOLAS DUCLOS-GUYOT heads a French naval expedition from the Falkland Islands to South America's Pacific coast. He reaches South Georgia Island in the South Atlantic.

1765–66

-
- NORTH AMERICA** ■ Colonial American naturalists JOHN BARTRAM and WILLIAM BARTRAM explore eastern Florida and Georgia.

1766

-
- NORTH AMERICA** ■ Colonial American frontiersman JAMES SMITH explores west of the CUMBERLAND GAP into eastern Kentucky.

1766–68

-
- NORTH AMERICA** ■ ROBERT ROGERS and JONATHAN CARVER head a British expedition to Wisconsin and Minnesota, seeking the NORTHWEST PASSAGE.
- WORLD** ■ SAMUEL WALLIS and PHILIP CARTERET command a British naval expedition to the South Pacific.

Wallis reaches Tahiti and Wallis Archipelago. Carteret explores Pitcairn Island and the Admiralty, Santa Cruz, and Solomon Islands.

1766–69

WORLD

- LOUIS-ANTOINE DE BOUGAINVILLE heads the first French CIRCUMNAVIGATION OF THE WORLD; he explores the western Pacific and charts the Solomons and other island groups. On the trip JOSEPH-PHILIBERT COMMERSON serves as naturalist and JEANNE BARET becomes the first woman known to sail around the world.

1767

- The British Royal Observatory at Greenwich begins publishing the *Nautical Almanac and Astronomical Ephemeris* (or the *Nautical Almanac*), an early EPHEMERIS.

1768–70

NORTH AMERICA

- PYOTR KUZMICH KRENITSYN heads a Russian maritime expedition charting the Aleutian Islands and the western end of the Alaska Peninsula.

1768–71

PACIFIC OCEAN

- JAMES COOK heads a British naval expedition to the South Pacific. He explores Tahiti and the Society Islands and charts the coasts of NEW ZEALAND and eastern Australia. JOSEPH BANKS and DANIEL CARL SOLANDER serve as naturalists.

1768–74

AFRICA

- Scotsman JAMES BRUCE seeks the source of the NILE RIVER, traveling from Alexandria, Egypt, to Gondar, Ethiopia, by way of the RED SEA and Arabia. He visits Lake Tana and Tisisat Falls and mistakenly describes the Blue Nile as the main branch of the Nile rather than the White Nile.

1768–80

NORTH AMERICA

- French-Canadian missionary PIERRE GIBALT works among Native Americans in French settlements in Illinois and Indiana.

1769

- Scottish engineer James Watt patents the steam engine.

1769–70

- NORTH AMERICA** ▪ GASPAR DE PORTOLÁ and JUNÍPERO SERRA head a Spanish colonizing and missionary expedition to the coast of California, including San Diego Bay, Monterey Bay, and San Francisco Bay.
- SOUTH AMERICA** ▪ Ecuadoran ISABELA GODIN DES ODANAIS becomes the first known woman to descend the entire AMAZON RIVER, from central Peru to French Guiana.

1769–71

- NORTH AMERICA** ▪ Frontier hunter DANIEL BOONE explores the CUMBERLAND GAP of southwestern Virginia and Warriors' Trace into Kentucky, reaching the Falls of the Ohio.

1770–72

- NORTH AMERICA** ▪ SAMUEL HEARNE and Chipewyan Indian MATON-ABBEE head an expedition for the HUDSON'S BAY COMPANY from HUDSON BAY overland to the Arctic Ocean, seeking the NORTHWEST PASSAGE. They reach the Great Slave Lake.

1771–73

- NORTH AMERICA** ▪ Colonial American SIMON KENTON explores the upper Ohio River region in Kentucky.

1772

- PACIFIC OCEAN** ▪ YVES-JOSEPH DE KERGUÉLEN-TRÉMAREC heads two French maritime expeditions seeking the fabled GREAT SOUTHERN CONTINENT; he reaches the Kerguelen Islands.

1772–75

- PACIFIC OCEAN/
ATLANTIC OCEAN** ▪ JAMES COOK heads a British naval expedition to the South Pacific, during which he visits the Polynesian and Melanesian islands. He undertakes the first recorded crossing of the ANTARCTIC CIRCLE and circumnavigates the Antarctic continent, and he explores South Georgia Island and the South Sandwich Islands in the South Atlantic. During the expedition, TOBIAS FURNEAUX reaches Adventure Bay in TASMANIA. JAMES BURNEY serves as lieutenant and JOHANN GEORG ADAM FORSTER, JOHANN REINHOLD FORSTER, and ANDERS SPARSMAN serve as naturalists.
- NORTH AMERICA** ▪ British trader MATTHEW COCKING explores from southern HUDSON BAY to western Saskatchewan for the HUDSON'S BAY COMPANY.
- AFRICA** ▪ Swedish naturalist CARL PETER THUNBERG, in service to the Dutch, carries out three botanical expeditions north of Cape Town.

1773

-
- ARCTIC** ▪ CONSTANTINE JOHN PHIPPS heads a British naval expedition in an attempt to reach the NORTH POLE by water; passage is blocked by ice east of GREENLAND.

1774

-
- NORTH AMERICA** ▪ JUAN JOSEF PÉREZ HERNÁNDEZ heads a Spanish naval expedition to the Queen Charlotte Islands and Nootka Sound. He sites Mount Olympus.
- NORTH AMERICA** ▪ JUAN BAUTISTA DE ANZA heads a Spanish expedition from Tubac, Arizona, to San Gabriel Arcangel, California.
- ASIA** ▪ GEORGE BOGLE heads a British diplomatic expedition from Calcutta, India, across the HIMALAYAS into Tibet.

1775

-
- NORTH AMERICA** ▪ BRUNO HECETA heads a Spanish naval expedition along the northwest coast, seeking the outlet of the NORTHWEST PASSAGE; he reaches Grays Harbor in coastal Washington.

1775–76

-
- NORTH AMERICA** ▪ Spanish missionary FRANCISCO TOMÁS HERMENEGILDO GARCÉS explores the COLORADO RIVER and the Grand Canyon.
- NORTH AMERICA** ▪ Colonial American fur trader ALEXANDER HENRY (the elder) explores northwestern Saskatchewan.

1776–77

-
- NORTH AMERICA** ▪ Spanish missionaries FRANCISCO SILVESTRE VÉLEZ DE ESCALANTE and FRANCISCO ATANASIO DOMÍNGUEZ explore central Utah.

1776–80

-
- PACIFIC OCEAN** ▪ JAMES COOK heads a British naval expedition seeking the NORTHWEST PASSAGE, during which he visits the HAWAIIAN ISLANDS. He explores North America's west coast from Oregon to the Gulf of Alaska and Unalaska Island in the Aleutians, and he reaches northeastern SIBERIA's Chukchi Peninsula. After Cook's death in the HAWAIIAN ISLANDS in 1779, CHARLES CLERKE assumes command. On Clerke's death that same year, JOHN GORE assumes command. JAMES BURNEY and JAMES KING serve as lieutenants, JOHN LEDYARD serves as a marine, and JOHN WEBBER serves as artist.

1777–79

- AFRICA** ▪ Scotsman ROBERT GORDON explores South Africa's interior.

1778–82

- NORTH AMERICA** ▪ American trader PETER POND explores and charts northwestern Canada, from the Saskatchewan River to Lake Athabasca.

1779

- The NORTH WEST COMPANY is founded in Montreal to develop the FUR TRADE in North America.

1779–80

- NORTH AMERICA** ▪ American frontiersman JAMES ROBERTSON heads an expedition of settlers into Tennessee's Cumberland River region.

1781–1801

- SOUTH AMERICA** ▪ Spanish official FÉLIX DE AZARA explores and surveys the Río de la Plata and the Paraná and Paraguay Rivers of South America.
- ASIA** ▪ British diplomat SAMUEL TURNER heads a mission from India to Tibet.

1783

- French brothers Jacques Étienne Montgolfier and Joseph Michel Montgolfier launch the first BALLOON.

1783–86

- NORTH AMERICA** ▪ Russian trader GRIGORY IVANOVICH SHELIKOV directs the explorations of the Gulf of Alaska.

1783–92

- SOUTH AMERICA** ▪ Brazilian naturalist ALEXANDRE RODRIGUES FERREIRA conducts studies along the AMAZON RIVER and its tributaries.

1784

- NORTH AMERICA** ▪ Haitian French fur trader JEAN BAPTIST POINT SABLE settles on the site of present-day Chicago.

1785–88

- PACIFIC OCEAN** ▪ JEAN-FRANÇOIS DE GALAUP, comte de La Pérouse, heads a French maritime expedition to the Pacific; he explores the Gulf of Alaska and the coast of

Asia. PAUL-ANTOINE-MARIE FLEURIOT DE LANGLE commands the expedition's second ship. JEAN-BAPTISTE-BARTHÉLEMY DE LESSEPS serves as interpreter. Both ships disappear.

- NORTH AMERICA**
- French-Canadian trader JULIEN DUBUQUE explores the region west of Prairie du Chien on the upper MISSISSIPPI RIVER.

1785–93

- ARCTIC**
- JOSEPH BILLINGS, ANTON BATAKOV, and GAVRIIL ANDREYEVICH SARYCHEV command the Russian naval Northeastern Secret Geographical and Astronomical Expedition, seeking the NORTHEAST PASSAGE, from SIBERIA's northeast coast into BERING STRAIT. They explore the Aleutian Islands and the Gulf of Alaska.

1786

- ASIA**
- Russian fur trader GAVRILO LOGINOVICH PRIBILOV explores the Pribilof Islands in the Bering Sea.
- EUROPE**
- Frenchmen JACQUES BALMAT and Michel Paccard make the first ascent of MONT BLANC (see BLANC, MONT) in the Alps.

1786–87

- NORTH AMERICA**
- Frenchman PEDRO VIAL pioneers a route for the Spanish from San Antonio, Texas, to Santa Fe, New Mexico.

1787–89

- PACIFIC OCEAN**
- WILLIAM BLIGH heads a British naval expedition to Tahiti, which ends in mutiny. With 18 others, he sails in a small, open boat 4,000 miles across the western Pacific to Timor in Indonesia.

1787–90

- WORLD**
- American captain and trader ROBERT GRAY sails from Boston to British Columbia, then to China and back to Boston, in the first CIRCUMNAVIGATION OF THE WORLD by a U.S. flagship.

1788

- AFRICA**
- JOSEPH BANKS founds the AFRICAN ASSOCIATION, a society to encourage the exploration of Africa, in England.
- AUSTRALIA**
- ARTHUR PHILLIP founds a British penal colony at present-day Sydney, the first permanent European settlement in Australia.

1789

-
- NORTH AMERICA** ■ Scottish fur trader ALEXANDER MACKENZIE explores from the Great Slave Lake along the Mackenzie River to the Arctic Ocean for the NORTH WEST COMPANY.

1789–94

-
- WORLD** ■ ALESSANDRO MALASPINA heads a Spanish naval scientific CIRCUMNAVIGATION OF THE WORLD, during which he explores the east and west coasts of South America. He charts North America's west coast and searches for an outlet of the NORTH-WEST PASSAGE in southeastern Alaska; and he visits Australia and NEW ZEALAND.

1789–97

-
- NORTH AMERICA** ■ Russian navigator GERASIM ALEKSEYEVICH IZ-MAILOV explores the coastal regions of southern Alaska.

1790–91

-
- AFRICA** ■ Englishman DANIEL HOUGHTON explores up the Gambia River in West Africa, seeking the NIGER RIVER.

1791

-
- NORTH AMERICA** ■ Russian fur trader DMITRY IVANOVICH BOCHAROV locates a passage through the eastern end of the Alaska Peninsula, connecting Bristol Bay and the Gulf of Alaska.

1791–93

-
- NORTH AMERICA** ■ Russian fur trader ALEKSANDR ANDREYEVICH BARANOV explores Alaska's Kodiak Island, Cook Inlet, and Prince William Sound.

1791–94

-
- PACIFIC OCEAN** ■ ANTOINE-RAYMOND-JOSEPH DE BRUNI, chevalier d'Entrecasteaux, heads a French naval expedition in search of JEAN-FRANÇOIS DE GALAUP, comte de La Pérouse. He explores the south coast of TASMANIA and the Great Australian Bight and reaches the Solomon Islands. JEAN-MICHEL HUON DE KERMADEC reaches Esperance Bay in western Australia. On the death of d'Entrecasteaux in 1793, ALEXANDRE HESMIVY D'AURIBEAU assumes command. ELISABETH-PAUL-EDOUARD DE ROSSEL is one of the naval officers. CHARLES-FRANÇOIS BEAUTEMPS-BEAUPRÉ serves as cartographer, and

JACQUES-JULIEN HOUTOU DE LA BILLARDIÈRE and CLAUDE-ANTOINE-GASPARD RICHE serve as naturalists.

1791–95

WORLD

- GEORGE VANCOUVER and WILLIAM ROBERT BROUGHTON head a British naval CIRCUMNAVIGATION OF THE WORLD. They sail around the CAPE OF GOOD HOPE to Australia, NEW ZEALAND, and the HAWAIIAN ISLANDS, and survey North America's Pacific coast, from the Gulf of Alaska to southern California. Vancouver and Broughton explore the Strait of Juan de Fuca and Puget Sound. In 1792, Broughton explores the mouth of the COLUMBIA RIVER.

1791–1814

NORTH AMERICA

- American fur trader ALEXANDER HENRY (the younger) establishes and manages NORTH WEST COMPANY posts from Lake Superior to the Oregon coast.

1792

NORTH AMERICA

- American captain and trader ROBERT GRAY explores the Northwest Coast, including the mouth of the COLUMBIA RIVER and Grays Harbor.

1792–93

NORTH AMERICA

- Scottish-Canadian fur trader ALEXANDER MACKENZIE, exploring for the NORTH WEST COMPANY, travels the Peace and Smoky Rivers. He follows the Parsnip River into the ROCKY MOUNTAINS. After reaching the Fraser River, he descends the Bella Coola River to the Pacific, completing the first overland journey across North America north of Rio Grande.

NORTH AMERICA

- JUAN FRANCISCO DE LA BODEGA Y QUADRA heads a Spanish naval expedition to the coasts of British Columbia and southeastern Alaska, seeking an outlet of the NORTHWEST PASSAGE.

1793–1811

NORTH AMERICA

- British fur trader DAVID THOMPSON maps the Canadian West and northern parts of the American West for the HUDSON'S BAY COMPANY, then for the NORTH WEST COMPANY.

1794–95

NORTH AMERICA

- French-Canadian fur trader JEAN-BAPTISTE TRUTEAU travels up the MISSOURI RIVER, from St. Louis to the Dakotas and Black Hills.

1795

-
- NORTH AMERICA** ▪ Russian fur trader ALEKSANDR ANDREYEVICH BARANOV explores the Gulf of Alaska around Sitka and Yakutat Bay.

1795–96

-
- AUSTRALIA** ▪ Englishmen GEORGE BASS and MATTHEW FLINDERS explore Australia's Botany Bay, Georges River, and the east coast south of Sidney.

1795–97

-
- AFRICA** ▪ Scottish surgeon MUNGO PARK reaches the NIGER RIVER in West Africa.

1798

-
- PACIFIC OCEAN** ▪ American sea captain EDMUND FANNING explores Fanning's Islands in the South Pacific.
- AFRICA** ▪ Portuguese colonial official FRANCISCO DE LACERDA attempts to cross Central Africa, exploring the ZAMBEZI RIVER and Luangwe River.

1798–99

-
- AUSTRALIA** ▪ Englishmen GEORGE BASS and MATTHEW FLINDERS circumnavigate TASMANIA.

1798–1801

-
- AFRICA** ▪ German FRIEDRICH CONRAD HORNEMANN heads a British scientific expedition across the SAHARA DESERT, seeking the source of the NIGER RIVER.

1799

-
- The RUSSIAN-AMERICAN COMPANY is founded to promote the Russian FUR TRADE in North America.

1799–1800

-
- SOUTH AMERICA** ▪ German naturalist and geographer ALEXANDER VON HUMBOLDT explores the upper ORINOCO RIVER in Venezuela and determines it is connected to the AMAZON RIVER by the Casiquiare River.

1800–04

-
- AUSTRALIA** ▪ THOMAS-NICOLAS BAUDIN heads a French scientific expedition to the coast of TASMANIA and Australia; FRANÇOIS PÉRON and CHARLES-ALEXANDRE LESUEUR serve as naturalists.

1801

-
- SOUTH AMERICA** ▪ German naturalist and geographer ALEXANDER VON HUMBOLDT explores the ANDES MOUNTAINS in Ecuador and Peru.

1801–03

AUSTRALIA

- MATTHEW FLINDERS heads a British maritime expedition to Australia's south, east, and west coasts. He reaches the Spencer Gulf, Kangaroo Island, and Gulf St. Vincent and circumnavigates Australia. FERDINAND LUCAS BAUER, ROBERT BROWN, and WILLIAM WESTALL serve as artists and naturalists.

1802

NORTH AMERICA

- FRANÇOIS-MARIE PERRIN DU LAC heads a French expedition up the MISSOURI RIVER, from St. Louis to the White River in South Dakota.

1802–11

AFRICA

- Portuguese PEDRO JOÃO BAPTISTA heads an expedition from Angola to Mozambique and back, the first known crossing of the African continent.

1803–06

WORLD

- ADAM IVAN RITTER VON KRUSENSTERN and YURY FYODOROVICH LISIANSKY head the first Russian CIRCUMNAVIGATION OF THE WORLD. They explore uncharted islands and reefs of the HAWAIIAN ISLANDS.

1804

NORTH AMERICA

- The BRITISH EAST INDIA COMPANY organizes the Great Trigonometrical Survey of the Indian subcontinent. The British government later directs it and, starting in the 1860s, hires native surveyors, known as PUNDITS.
- Scottish surveyor WILLIAM DUNBAR heads a U.S. government exploration to southern Louisiana Territory.

1804–05

NORTH AMERICA

- Russian fur trader ALEKSANDR ANDREYEVICH BARANOV explores North America's west coast, from the Gulf of Alaska to San Francisco Bay.

1804–06

NORTH AMERICA

- MERIWETHER LEWIS and WILLIAM CLARK head a U.S. expedition from St. Louis up the MISSOURI RIVER, across the ROCKY MOUNTAINS, to the mouth of the COLUMBIA RIVER on the Pacific and back. Shoshone Indian woman SACAJAWEA and her husband TOUSSAINT CHARBONNEAU and infant son JEAN-BAPTISTE CHARBONNEAU partici-

pate, as do JOHN COLTER, GEORGE DROUILLARD, PIERRE DORION, SR., PIERRE DORION, JR., and RENÉ JUSSEAUME.

1805–06

- AFRICA**

- Scotsman MUNGO PARK heads a British expedition from the Gambia River to the NIGER RIVER, possibly reaching Bussa in northern Nigeria. He identifies the southern limit of the SAHARA DESERT.
- NORTH AMERICA**

- GAVRIIL IVANOVICH DAVYDOV heads a Russian naval expedition to Alaska and Sitka.

1805–07

- NORTH AMERICA**

- ZEBULON MONTGOMERY PIKE heads two U.S. military expeditions to the upper MISSISSIPPI RIVER and the eastern ROCKY MOUNTAINS.

1805–08

- NORTH AMERICA**

- American fur trader SIMON FRASER explores west of the Canadian ROCKY MOUNTAINS for the NORTH WEST COMPANY; he follows the Fraser River to its Pacific outlet in British Columbia.

1806

- NORTH AMERICA**

- THOMAS FREEMAN heads a U.S. expedition along the Red River, from southwestern Mississippi to Texas.

1806–22

- ARCTIC/GREENLAND**

- British whaler WILLIAM SCORESBY, SR., and his scientist son WILLIAM SCORESBY, JR., explore the Arctic regions of GREENLAND, pioneering Arctic navigation and scientific studies.

1807

- NORTH AMERICA**

- American fur trader JOHN COLTER explores the Wind River and Teton Mountains in Wyoming.

1807–11

- WORLD**

- VASILY MIKHAILOVICH GOLOVNIN heads a Russian naval expedition from Europe, rounding Africa rather than the intended South America. He explores coastal Alaska, then reaches the Kamchatka Peninsula of Asia. He also explores the Kuril Islands of Japan.
- ASIA**

- British diplomat HARFORD JONES BRYDGES heads an expedition from Bombay in India to Persia (Iran). He visits Baluchistan on the Arabia Sea, Afghanistan, and the Caucasus Mountains.

1808

- NORTH AMERICA**
- American JOHN JACOB ASTOR founds the AMERICAN FUR COMPANY to develop the western FUR TRADE.
 - The AMERICAN GEOGRAPHICAL SOCIETY is founded in New York City.

1809

- NORTH AMERICA**
- American fur traders MANUEL LISA, ANDREW HENRY, ANTOINE PIERRE MENARD, WILLIAM CLARK, and brothers AUGUSTE PIERRE CHOUTEAU, JEAN PIERRE CHOUTEAU, PIERRE CHOUTEAU, and RENÉ AUGUSTE CHOUTEAU found the ST. LOUIS MISSOURI FUR COMPANY to develop the western fur trade.

1810–11

- NORTH AMERICA**
- American JOHN JACOB ASTOR sponsors a maritime trading expedition from New York to the Oregon coast under ROBERT STUART and GABRIEL FRANCHÈRE. They found the post of Astoria on the COLUMBIA RIVER.

1810–12

- ASIA**
- Englishmen CHARLES CHRISTIE and HENRY POTTINGER command an expedition to the interior of Pakistan into Afghanistan, and to the Persian Gulf.

1810–13

- ASIA**
- Englishwoman Lady HESTER LUCY STANHOPE travels in Israel, Lebanon, and Syria. She lives among the Bedouin in the Syrian Desert.

1810–15

- AFRICA**
- British naturalist WILLIAM JOHN BURCHELL explores the interior of South Africa west and north of Cape Town.

1811

- NORTH AMERICA**
- American writer HENRY MARIE BRACKENRIDGE and Scottish naturalist JOHN BRADBURY travel up the MISSOURI RIVER with fur traders.

1811–12

- NORTH AMERICA**
- American fur trader JOHN JACOB ASTOR sponsors the Astorians under WILSON PRICE HUNT in an overland journey from St. Louis to Astoria on the Oregon coast. Ioway Indian woman MARIE DORION and her husband PIERRE DORION, JR., serve as guides.

ASIA

- Englishman THOMAS MANNING travels from Calcutta, India, through Bhutan to LHASA in Tibet.

1812**ASIA**

- HYDER JUNG HEARSEY and WILLIAM MOORCROFT head a British expedition from India across the HIMALAYAS to Tibet.

1812–13**NORTH AMERICA**

- Scottish fur trader ROBERT STUART, working for JOHN JACOB ASTOR, travels from Astoria in Oregon eastward through the SOUTH PASS of the ROCKY MOUNTAINS. He descends the Platte River and MISSOURI RIVER to St. Louis.

1812–14**AFRICA**

- Englishman JOHN CAMPBELL explores the interior of South Africa, from Algoa Bay northward to the southern edge of Kalahari Desert, reaching the Vaal River. He returns to the Atlantic coast by way of the Orange River.

1812–15**AFRICA**

- JOHANN LUDWIG BURCKHARDT heads a British expedition to the NIGER RIVER from North Africa. Although failing to reach the Niger, Burckhardt explores parts of Egypt, Sudan, and Arabia.

1813**AUSTRALIA**

- Australian colonists GREGORY BLAXLAND and WILLIAM CHARLES WENTWORTH cross the BLUE MOUNTAINS west of Sydney and view the Bathurst Plains.

1814**NEW ZEALAND**

- Englishman SAMUEL MARSDEN establishes an Anglican mission at the Bay of Islands on North Island, New Zealand.

1815–18**WORLD**

- Otto von Kotzebue heads a Russian naval expedition searching for outlets of the NORTHEAST PASSAGE or the NORTHWEST PASSAGE in the North Pacific. He names Kotzebue Sound and explores island groups in the South Pacific, including the Marshalls and Gilberts. LOUIS-CHARLES-ADÉLAÏDE CHAMISSO DE BONCOURT and JOHANN FRIEDRICH ESCHSCHOLTZ serve as naturalists. LOUIS CHORIS serves as draftsman.

1816–19

- NORTH AMERICA**
- Scottish-Canadian fur trader DONALD MACKENZIE sends out fur-trapping brigades throughout the Pacific Northwest and the northern ROCKY MOUNTAINS for the NORTH WEST COMPANY.

1817–18

- AUSTRALIA**
- British-born surveyor general JOHN JOSEPH WILLIAM MOLESWORTH OXLEY heads two Australian expeditions to the Lachlan River and the Macquarie River. He reaches the Arbuthnot Range and Liverpool Plains.

1817–20

- WORLD**
- LOUIS-CLAUDE DE SAULCES DE FREYCINET heads a French naval CIRCUMNAVIGATION OF THE WORLD. He explores western Australia, Timor, the Moluccas (SPICE ISLANDS), Samoa, and the HAWAIIAN ISLANDS. CHARLES GAUDICHARD-BEAUPRÉ, JEAN-RENÉ-CONSTANT QUOY, and JOSEPH-PAUL GAIMARD serve as naturalists. JACQUES ARAGO serves as artist and writer.
- SOUTH AMERICA**
- German botanist CARL FRIEDRICH PHILLIPP VON MARTIUS explores eastern Brazil and the upper Amazon Basin.

1817–22

- AUSTRALIA**
- PHILIP PARKER KING heads a British coastal survey of northern Australia and TASMANIA.

1818

- ARCTIC**
- DAVID BUCHAN heads a British naval expedition attempting a seaward passage across the Arctic Ocean to the Pacific, passing as close as possible to the NORTH POLE.
- ARCTIC**
- JOHN ROSS heads a British naval expedition to Baffin Bay in the Canadian Arctic, seeking the NORTHWEST PASSAGE. He explores Lancaster Sound.

1818–19

- MIDDLE EAST**
- JOSEPH RITCHIE and GEORGE FRANCIS LYON command a British expedition southward across the SAHARA DESERT, from Tripoli to the NIGER RIVER region of West Africa.

1818–20

- NORTH AMERICA**
- British naturalist THOMAS NUTTALL explores the Arkansas River and Red River in Louisiana, Arkansas, and Oklahoma.

1819

-
- NORTH AMERICA** ▪ HENRY ATKINSON heads the U.S. military's first Yellowstone Expedition up the MISSOURI RIVER into Nebraska.
 - ASIA** ▪ British diplomat GEORGE FOSTER SADLIER becomes the first European to cross the Arabian Peninsula, from Quatif on the Persian Gulf to Yenbo on the RED SEA.
 - AUSTRALIA** ▪ JOHN JOSEPH WILLIAM MOLESWORTH OXLEY and HAMILTON HUME head an Australian maritime expedition to Jervis Bay.
 - German inventor Augustus Siebe develops the first efficient DIVING SUIT, consisting of a copper helmet attached to a watertight canvas and leather jacket with weights attached around the chest.

1819–21

-
- ANTARCTIC** ▪ Baron FABIAN GOTTLIEB BENJAMIN VON BELLINGSHAUSEN heads a Russian naval expedition, which makes an early sighting of Antarctica. He explores the Fiji Islands and Tuamotu Archipelago in the South Pacific. On returning to Antarctica, he sights Peter I and Alexander I Islands.
 - AFRICA** ▪ Englishman JOHN CAMPBELL reaches the source of the Limpopo River in South Africa.

1819–22

-
- NORTH AMERICA/
ARCTIC** ▪ JOHN FRANKLIN heads a British naval overland expedition eastward along the Arctic coast of Canada, from the mouth of the Coppermine River, along the Coronation Gulf, to the Kent Peninsula. ROBERT HOOD and GEORGE BACK serve as midshipmen. JOHN RICHARDSON serves as naturalist.

1819–25

-
- ARCTIC** ▪ WILLIAM EDWARD PARRY heads three British naval expeditions to the Canadian Arctic, seeking the NORTHWEST PASSAGE. He reaches Barrow Strait and as far west as Melville Island. He explores HUDSON BAY, Foxe Basin, and Fury and Hecla Straits as well as Prince Regent Inlet and the Gulf of Boothia.

1819–26

-
- ASIA** ▪ GRIGORY GAVRILOVICH BASARGIN heads a Russian naval expedition to the Caspian Sea.

1820

-
- NORTH AMERICA** ▪ STEPHEN HARRIMAN LONG heads a U.S. military expedition to the central plains and eastern ROCKY MOUNTAINS.

- ANTARCTIC**
- British naval officer EDWARD BRANSFIELD charts the South Shetland Islands and sights the Antarctic Peninsula.

1820–21

- ANTARCTIC**
- American sealer NATHANIEL BROWN PALMER reaches the Palmer Archipelago and South Orkney Islands and sights the Antarctic Peninsula.

1821

- NORTH AMERICA**
- The HUDSON'S BAY COMPANY and the NORTH WEST COMPANY merge under the name of the former.
 - Swedish-Finnish naval officer ARVID ADOLF ETHOLÉN conducts a Russian maritime exploration of the coast of Alaska north of the Alaskan Peninsula as far as the Kuskokwim River.

1821–22

- NORTH AMERICA**
- American traders JACOB FOWLER and Hugh Glenn pioneer a route known as the Old Taos Trail through the Sangre de Cristo Mountains of southern Colorado into New Mexico.

1821–23

- ATLANTIC OCEAN**
- Scottish sealer JAMES WEDDELL explores the South Orkney Islands in the South Atlantic. He reaches the Weddell Sea east of the Antarctic Peninsula.

1821–25

- AFRICA**
- WALTER OUDNEY, HUGH CLAPPERTON, and DIXON DENHAM lead the British-backed Bornu Mission from Libya across the SAHARA DESERT into West Africa. They reach Lake Chad and the Chari River and seek the NIGER RIVER.
- AFRICA**
- British missionaries ROBERT MOFFAT and MARY MOFFAT found missions near the Kalahari Desert in South Africa; they explore the region in years to come.

1822

- NORTH AMERICA**
- American trader WILLIAM BECKNELL pioneers a wagon route from Missouri via the Cimarron Cut-off of the Santa Fe Trail.

1822–25

- WORLD**
- LOUIS-ISADORE DUPERREY heads a French naval CIRCUMNAVIGATION OF THE WORLD. He explores coastal South America and visits island

- groups in the Pacific. RENÉ-PRIMEVÈRE LESSON serves as zoologist.
- WORLD**
- MIKHAIL PETROVICH LAZAREV heads a Russian naval CIRCUMNAVIGATION OF THE WORLD.

1822–26

- NORTH AMERICA**
- Americans WILLIAM HENRY ASHLEY and ANDREW HENRY found the ROCKY MOUNTAIN FUR COMPANY in 1822. Over the next years, Ashley sponsors trading expeditions to the northern ROCKY MOUNTAINS and the Great Basin. MOUNTAIN MEN working for Ashley include JAMES PIERSON BECKWOURTH, JAMES BRIDGER, ROBERT CAMPBELL, JAMES CLYMAN, THOMAS FITZPATRICK, HENRY FRAEB, HUGH GLASS, CALEB GREENWOOD, DAVID E. JACKSON, ÉTIENNE PROVOST EDWARD ROSE, JEDEDIAH STRONG SMITH, WILLIAM LEWIS SUBLETTE, WILLIAM HENRY VANDERBURGH, LOUIS VASQUEZ, and JOHN H. WEBER, many of whom continue trapping, trading, and guiding in the subsequent years. Ashley and others undertake the first known successful navigation of the Uinta River and explore the Green River and the Great Salt Lake region of Utah.

1823

- AUSTRALIA**
- British-born surveyor general JOHN JOSEPH WILLIAM MOLESWORTH OXLEY heads an Australian expedition to Moreton Bay. He reaches the Brisbane River.
- AUSTRALIA**
- British naturalist ALLAN CUNNINGHAM explores a route from Bathurst through Pandora's Pass to the Liverpool Plains north of Sydney.
- NORTH AMERICA**
- Italian GIACOMO COSTANTINO BELTRAMI explores the MISSISSIPPI RIVER and Minnesota River.

1823–26

- PACIFIC OCEAN**
- OTTO VON KOTZEBUE heads a Russian naval expedition to the South Pacific, exploring the Tuamotu, Society, and Marshall island groups.

1823–43

- ASIA**
- GEORGE EVEREST heads Britain's Great Trigonometrical Survey of India.

1824

- NORTH AMERICA**
- Scottish-Canadian fur trader ALEXANDER ROSS explores the Snake River, from Montana to the mouth of the Boise River in Idaho, for the HUDSON'S BAY COMPANY.

- AUSTRALIA**
- Englishmen WILLIAM HILTON HOVELL and HAMILTON HUME explore southeastern Australia, from Lake George to Geelong, reaching the Australian Alps.

1824–26

- WORLD**
- HYACINTHE-YVES-PHILLIPE POTENTIEU DE BOUGAINVILLE heads a French CIRCUMNAVIGATION OF THE WORLD.

1824–30

- NORTH AMERICA**
- Canadian fur trader PETER SKENE OGDEN explores the Pacific Northwest and the Great Basin for JOHN MCLOUGHLIN and the HUDSON'S BAY COMPANY.

1825

- NORTH AMERICA**
- HENRY ATKINSON heads the U.S. military's second Yellowstone Expedition to eastern Montana.

1825–26

- AFRICA**
- ALEXANDER GORDON LAING heads a British expedition seeking the source of the NIGER RIVER. He reaches the city of TIMBUKTU in Mali.

1825–27

- NORTH AMERICA**
- JOHN FRANKLIN heads a British expedition westward from the mouth of the Mackenzie River to Prudhoe Bay on Alaska's North Slope.

1825–28

- AFRICA**
- HUGH CLAPPERTON and RICHARD LEMON LANDER head a British expedition into the interior of Nigeria. They reach the NIGER RIVER, where Clapperton dies. WILLIAM PASCOE of the Hausa tribe serves as guide.
- PACIFIC OCEAN**
- FREDERICK WILLIAM BEECHEY heads a British naval expedition to the Pacific, exploring South America's west coast, the Gambier Islands in central Polynesia, the BERING STRAIT and Alaska's west coast, and the islands off southern Japan.

1825–29

- SOUTH AMERICA**
- GEORG HEINRICH RITTER VON LANGSDORFF heads a Russian scientific expedition to the Amazon Basin.

1825–32

- AUSTRALIA**
- Danish mariner JÖRGEN JÖRGENSEN explores TASMANIA.

1826–27

-
- NORTH AMERICA** ▪ American fur trader EWING YOUNG heads a trapping expedition from Taos in New Mexico into southern Arizona.
 - NORTH AMERICA** ▪ American fur trader JAMES OHIO PATTIE establishes an overland route from New Mexico to California.

1826–29

-
- PACIFIC OCEAN** ▪ JULES-SÉBASTIEN-CÉSAR DUMONT D'URVILLE heads a French maritime expedition to coastal Australia and NEW ZEALAND and the islands of the western Pacific. He finds relics of the JEAN-FRANÇOIS DE GALAUB, comte de La Pérouse, expedition.
 - WORLD** ▪ FYODOR PETROVICH LITKE heads a Russian naval CIRCUMNAVIGATION OF THE WORLD. He explores the Carolines in the South Pacific. He charts islands in the Bering Sea and explores SIBERIA's Kamchatka and Chukchi Peninsulas. KARL HEINRICH MERTENS serves as naturalist.
 - NORTH AMERICA** ▪ American fur trader JEDEDIAH STRONG SMITH leads expeditions from the Great Salt Lake to California. He makes the first eastward crossing of the Sierra Nevada and Great Salt Lake and explores northern California and Oregon.

1826–34

-
- SOUTH AMERICA** ▪ French naturalist ALCIDE-CHARLES-VICTOR DES-SALINES D'ORBIGNY conducts studies throughout South America.

1827

-
- ARCTIC** ▪ WILLIAM EDWARD PARRY heads a British naval attempt on the NORTH POLE from Spitsbergen (Svalbard), setting the northernmost record at the time.
 - French physicist Joseph Nicéphore Niépce creates the first known photograph.

1827–28

-
- AFRICA** ▪ Frenchman RENÉ-AUGUSTE CAILLIÉ crosses Guinea to the upper NIGER RIVER and descends it to TIMBUKTU, then crosses the SAHARA DESERT from south to north.
 - AUSTRALIA** ▪ British naturalist ALLAN CUNNINGHAM develops a route from Darling Downs through the GREAT DIVIDING RANGE to the Pacific coast.
 - NORTH AMERICA** ▪ French naturalist JEAN-LOUIS BERLANDIER explores the interior of Texas.

1827–30

-
- NORTH AMERICA** ■ American fur trader JOSHUA PILCHER heads an expedition from St. Louis, along the Platte River and through the ROCKY MOUNTAINS, to the COLUMBIA RIVER.

1828

-
- NORTH AMERICA** ■ Scottish official GEORGE SIMPSON of the HUDSON'S BAY COMPANY travels across Canada to British Columbia via the Thompson and Fraser Rivers.
- NORTH AMERICA** ■ French-Canadian ANTOINE ROBIDOUX extends the fur trade to Taos in New Mexico and northward into Colorado.

1828–29

-
- AUSTRALIA** ■ Englishman CHARLES STURT explores the Macquarie and Darling Rivers in southeastern Australia.

1829–33

-
- ARCTIC** ■ Englishmen JOHN ROSS and his nephew JAMES CLARK ROSS explore the Canadian Arctic, including the Boothia Peninsula. They travel from Prince Regent Inlet to Lancaster Sound. In 1831, James Clark Ross reaches the NORTH MAGNETIC POLE.
- NORTH AMERICA** ■ Scottish-Canadian fur trader KENNETH MCKENZIE sends out expeditions to the northern ROCKY MOUNTAINS and northern plains for the AMERICAN FUR COMPANY.

1829–35

-
- NORTH AMERICA** ■ American fur trader WARREN ANGUS FERRIS explores the upper MISSOURI RIVER and the northern ROCKY MOUNTAINS.

ca. 1830

-
- The SEXTANT is invented independently in England and America in response to a challenge by the ROYAL SOCIETY and the British parliament to solve the problem of how to measure longitude accurately.

1830

-
- NORTH AMERICA** ■ JOHN BARROW founds Great Britain's ROYAL GEOGRAPHICAL SOCIETY.
- NORTH AMERICA** ■ Irish fur trader JOHN WORK explores in the Snake River region of eastern Washington, western Idaho, northern Nevada, and central Oregon for the HUDSON'S BAY COMPANY.

1830–31

- AFRICA**

- RICHARD LEMON LANDER heads a British expedition, which traces the course of the NIGER RIVER to the Gulf of Guinea.
- NORTH AMERICA**

- American fur traders WILLIAM WOLFSKILL and GEORGE CONCEPCION YOUNT pioneer the Old Spanish Trail from Taos, New Mexico, through Utah and Arizona, to Los Angeles, California, as a trade route.

1830–36

- NORTH AMERICA**

- American GEORGE CATLIN paints Native Americans in the American West and Southeast.

1830–39

- NORTH AMERICA**

- American LUCIEN FONTENELLE develops the fur trade in Nebraska.

1831

- The ROYAL GEOGRAPHICAL SOCIETY and AFRICAN ASSOCIATION merge under the name of the former.

1831–32

- ANTARCTIC**

- JOHN BISCOE heads a British seal-hunting expedition, which circumnavigates Antarctica. He reaches Enderby Land and Biscoe Island.

1831–36

- SOUTH AMERICA/
PACIFIC OCEAN**

- ROBERT FITZROY and CHARLES ROBERT DARWIN conduct a British naval scientific expedition to coastal South America and the Galapagos Islands aboard the *Beagle*.
- AUSTRALIA**

- Scottish surveyor THOMAS LIVINGSTONE MITCHELL heads three expeditions west of Sydney to chart the continent's river system. He explores the Darling and Murray Rivers and their tributaries.

1831–39

- NORTH AMERICA**

- American artist and naturalist JOHN JAMES AUDUBON paints North American wildlife.

1831–44

- SOUTH AMERICA**

- German naturalist ROBERT HERMANN SCHOMBURGK heads a British expedition to the rivers of Guyana.

1832

- NORTH AMERICA**

- American geologist and ethnologist HENRY ROWE SCHOOLCRAFT determines that Lake

Itasca in Minnesota is the source of the MISSISSIPPI RIVER.

1832–33

- NORTH AMERICA**
- Spanish-born fur trader MANUEL ÁLVAREZ explores the region of Yellowstone National Park in northeastern Wyoming.

1832–35

- NORTH AMERICA**
- Former U.S. army officer BENJAMIN LOUIS EULALIE DE BONNEVILLE heads a fur-trading expedition across the ROCKY MOUNTAINS, including SOUTH PASS, to Utah and later explores Oregon. In 1833, he dispatches MOUNTAIN MEN JOSEPH REDDEFORD WALKER, ZENAS LEONARD, and JOSEPH L. MEEK across the Great Basin and Sierra Nevada to California, where they explore Yosemite Valley. Their route becomes the California Trail.
- ASIA**
- ALEXANDER BURNES heads a British military expedition across central Asia from Peshawar, Pakistan, through Afghanistan, to the Caspian Sea, Tehran, and the Persian Gulf.

1832–36

- NORTH AMERICA**
- American fur trader NATHANIEL JARVIS WYETH heads two expeditions to the Pacific Northwest. Fellow fur trader OSBORNE RUSSELL accompanies him in 1834.

1832–42

- NORTH AMERICA**
- American trapper and guide CHRISTOPHER HOUTON CARSON (Kit Carson) explores the ROCKY MOUNTAINS.
- NORTH AMERICA**
- Russian-Aleut ALEKSANDR FILIPPOVICH KASHEVAROV heads a Russian expedition to Alaska's west coast, from Norton Sound to Point Barrow.

1833

- NORTH AMERICA**
- American fur traders CHARLES BENT, WILLIAM BENT, and CÉRAN DE HAULT DE LASSUS DE ST. VRAIN found Bent's Fort, a trading post on the Arkansas River in southeastern Colorado.
- NORTH AMERICA**
- American writer JOHN TREAT IRVING explores the plains of Kansas and Nebraska.

1833–34

- NORTH AMERICA**
- German naturalist Prince ALEXANDER PHILIPP MAXIMILIAN and Swiss artist KARL BODMER travel up the MISSOURI RIVER, from St. Louis to central

Montana. Bodmer paints the Mandan and other Native Americans.

1833–35

- NORTH AMERICA** ▪ GEORGE BACK heads a British naval overland expedition north and east of the Great Slave Lake, reaching the Great Fish (Back) River.

1834

- NORTH AMERICA** ▪ HENRY LEAVENWORTH and HENRY DODGE command a U.S. military expedition to the southern plains. They explore the Arkansas and Red Rivers. BLACK BEAVER and JESSE CHISHOLM serve as guides.

1834–35

- NORTH AMERICA** ▪ Russian fur trader ANDREY GLAZUNOV explores the Yukon and Kuskokwim Rivers of western Alaska.

1834–36

- ASIA** ▪ JAMES WELLSTED heads a British expedition surveying the south coast of the Arabian Peninsula. He explores Oman and sights the Rub' al-Khali desert (EMPTY QUARTER).

1835

- NORTH AMERICA** ▪ HENRY DODGE heads a U.S. military expedition from Oklahoma to the ROCKY MOUNTAINS and the Oregon Trail, returning along the Santa Fe Trail.

1836

- NORTH AMERICA** ▪ American missionaries MARCUS WHITMAN and HENRY HARMON SPALDING pioneer the Oregon Trail west of Fort Hall, Idaho, as a wagon route.

1836–37

- ASIA** ▪ WILLIAM C. MCLEOD heads a British military expedition to northern Burma (Myanmar).

1836–39

- WORLD** ▪ ABEL-AUBERT DUPETIT-THOUARS heads a French naval CIRCUMNAVIGATION OF THE WORLD. He explores South America's west coast and the South Pacific.

1837

- NORTH AMERICA** ▪ American ALFRED JACOB MILLER paints landscapes and Native Americans along the Oregon Trail.

1837–39

-
- | | |
|----------------------------------|---|
| ARCTIC/
NORTH AMERICA | ▪ Scotsman THOMAS SIMPSON and Canadian PETER WARREN DEASE explore the Arctic coastline of Alaska and Canada for the HUDSON'S BAY COMPANY. |
| AUSTRALIA | ▪ GEORGE GREY heads a British expedition to western Australia. He reaches the Gascoyne River and the upper Swan River. |

1837–40

-
- | | |
|------------------|--|
| ANTARCTIC | ▪ JULES-SÉBASTIEN-CÉSAR DUMONT D'URVILLE heads a French naval expedition south of the ANTARCTIC CIRCLE. He reaches Adélie Land and the approximate position of the SOUTH MAGNETIC POLE. CHARLES-HECTOR JACQUINOT commands the second ship. |
|------------------|--|

1837–42

-
- | | |
|----------------------|---|
| NORTH AMERICA | ▪ EDWARD BELCHER heads a British naval expedition to the Pacific coast of the Americas. |
|----------------------|---|

1838–39

-
- | | |
|----------------------|---|
| NORTH AMERICA | ▪ JOSEPH NICOLAS NICOLLET heads two U.S. surveying expeditions to the lands between the upper MISSISSIPPI RIVER and the MISSOURI RIVER. |
|----------------------|---|

1838–40

-
- | | |
|----------------------|---|
| NORTH AMERICA | ▪ American fur trader RICHENS LACY WOOTTON travels throughout the American West out of Bent's Fort, Colorado. |
|----------------------|---|

1838–42

-
- | | |
|---|---|
| PACIFIC OCEAN/
NORTH AMERICA | ▪ CHARLES WILKES and GEORGE FOSTER EMMONS head the U.S. South Sea Surveying and Exploring Expedition, which completes the first U.S. government CIRCUMNAVIGATION OF THE WORLD. They explore South America, Antarctica, and Pacific island groups. They direct extensive inland penetration of Oregon and northern California. JAMES DWIGHT DANA serves as naturalist. |
|---|---|

1838–52

-
- | | |
|----------------------|--|
| SOUTH AMERICA | ▪ Swiss naturalist JOHANN JAKOB VON TSCHUDI travels throughout the Peruvian Andes. |
|----------------------|--|

1839

-
- | | |
|--------------------|---|
| NEW ZEALAND | ▪ Englishman WILLIAM WILLIAMS makes a south-to-north crossing of North Island, NEW ZEALAND. |
|--------------------|---|

1839–41

- AUSTRALIA** ▪ British sheep farmer EDWARD JOHN EYRE explores the Flinders Range north of Adelaide and Lake Torrens. He travels across Eyre Peninsula to Streaky Bay. He explores north and west of Adelaide and sights Lake Eyre. He heads westward from Fowlers Bay along the coast of the Great Australian Bight to Albany and back to Fremantle, completing the first east-to-west crossing of Australia.
- NORTH AMERICA** ▪ American fur trader ROBERT NEWELL drives the first wagons along the entire length of the Oregon Trail.

1839–43

- ANTARCTIC** ▪ JAMES CLARK ROSS heads a British naval expedition to Antarctica. He reaches the Ross Sea, Victoria Land, Prince Albert Range, McMurdo Sound, and the Ross Ice Shelf. He explores Graham Land on the Antarctic Peninsula. JOSEPH DALTON HOOKER serves as botanist.
- AUSTRALIA** ▪ Polish geologist PAUL EDMUND DE STRZELECKI explores southeastern Australia and TASMANIA.

1840

- NORTH AMERICA** ▪ Scottish trader ROBERT CAMPBELL reaches the source of the Pelly River in the Yukon Territory for the HUDSON'S BAY COMPANY.

1841

- NORTH AMERICA** ▪ Belgian missionary PIERRE-JEAN DE SMET heads the first large-scale wagon train migration on the Oregon Trail. THOMAS FITZPATRICK serves as guide.
- NORTH AMERICA** ▪ JAMES SINCLAIR, a Métis, pioneers a wagon route through the Canadian ROCKY MOUNTAINS for the HUDSON'S BAY COMPANY.

1841–42

- MEDITERRANEAN** ▪ Scottish naturalist EDWARD FORBES studies a deep seabed in the MEDITERRANEAN SEA.

1841–47

- NEW ZEALAND** ▪ Englishman WILLIAM COLENSO carries out three expeditions to NEW ZEALAND'S North Island.

1841–59

- NORTH AMERICA** ▪ American fur trader JAMES BAKER traps in northern Utah and southern Wyoming.

1842

-
- NORTH AMERICA** ■ JOHN CHARLES FRÉMONT heads a U.S. military expedition to the Great Plains, exploring the Platte River and SOUTH PASS through the ROCKY MOUNTAINS.

1842–44

-
- NORTH AMERICA** ■ Russian naval officer LAVRENTY ALEKSEYEVICH ZAGOSKIN explores the Yukon and Kuskokwim plus other rivers of Alaska's interior.

1842–45

-
- NORTH AMERICA** ■ American fur traders WILLIAM SHERLEY WILLIAMS and WILLIAM THOMAS HAMILTON explore the Green River and the North Platte River in southern Wyoming and northern Utah.

1843

-
- NORTH AMERICA** ■ Canadian-born fur trader NORMAN WOLFRED KITTSON promotes JOHN JACOB ASTOR's AMERICAN FUR COMPANY in the Red River of the North region of Minnesota and North Dakota.

1843–44

-
- NORTH AMERICA** ■ JOHN CHARLES FRÉMONT heads a U.S. military expedition to the ROCKY MOUNTAINS, the Great Basin, Great Salt Lake, the eastern Cascade Mountains, and California.

1843–47

-
- SOUTH AMERICA** ■ FRANÇOIS DE LA PORTE, comte de Castelnau, heads two French expeditions to the AMAZON RIVER. He explores the watershed between the Río de la Plata and the Amazon River and reaches the source of the Paraguay River. He completes the west-to-east crossing of the continent by way of Peru and Brazil.

1843–48

-
- NEW ZEALAND** ■ Englishman THOMAS BRUNNER explores the interior of NEW ZEALAND's South Island, from Tasman Bay to Mount Cook. He travels around Lake Rotorua and descends the Buller River to the Tasman Sea. He explores the Grey River and the Southern Alps, reaching Lake Brunner.

1844–45

-
- AUSTRALIA** ■ German FRIEDRICH WILHELM LUDWIG LEICHHARDT makes the first successful crossing of northeastern Australia, from Moreton Bay to the

Gulf of Carpentaria, then through Arnhem Land to Port Essington.

1845

- NORTH AMERICA**
- STEPHEN WATTS KEARNY heads a U.S. military expedition to the Platte and Arkansas Rivers and the eastern ROCKY MOUNTAINS, including the SOUTH PASS. JAMES WILLIAM ABERT leads a party to western Oklahoma and western Texas.
 - French chemist and physicist, Henri-Victor Regnault, develops a practical HYPSONETER.

1845–46

- AUSTRALIA**
- Scottish-born surveyor general THOMAS LIVINGSTONE MITCHELL attempts a northwestward crossing of the continent from Darling Downs to the north coast. He explores the central region of Queensland.
- NORTH AMERICA**
- MERVIN VAVASOUR and HENRY JAMES WARRE carry out British military reconnaissance in Oregon.
- ASIA**
- French missionary ÉVARISTE-RÉGIS HUC travels from Mongolia across the Ordos Desert to LHASA in Tibet.

1845–47

- NORTH AMERICA**
- JOHN CHARLES FRÉMONT heads a U.S. military expedition to the Great Basin, the Sierra Nevada, northern California, and southern Oregon.

1845–48

- NORTH AMERICA**
- JOHN FRANKLIN commands a British naval expedition to the Canadian Arctic in an attempt to navigate the NORTHWEST PASSAGE. The ship is icebound in the Victoria Strait. On Franklin's death in 1847, FRANCIS RAWDON MOIRA CROZIER assumes command. All expedition members eventually perish.

1846

- NORTH AMERICA**
- WILLIAM HEMSLEY EMORY heads a U.S. military topographic expedition to the American Southwest and creates the first scientific map of the region.
- NORTH AMERICA**
- American HENRI CHATILLON leads historian Francis Parkman's expedition onto the Great Plains.
 - The HAKLUYT SOCIETY, a charity furthering knowledge of exploration, is founded in London.

1846–47

- ARCTIC**
- Scottish physician JOHN RAE explores the northern extent of the Boothia Peninsula in the

- Canadian Arctic for the HUDSON'S BAY COMPANY.
- NORTH AMERICA**
- American pioneer JESSE APPLGATE explores the Humboldt River and the Black Rock Desert of northern Nevada. He establishes the Applegate Trail as a new and shorter southern route from Fort Hall, Idaho, to the Willamette Valley in Oregon. He explores the Umpqua Valley of west-central Oregon.

1846–48

- NORTH AMERICA**
- Canadian painter PAUL KANE explores western Canada, from Toronto to Vancouver.

1847

- NORTH AMERICA**
- American BRIGHAM YOUNG leads the Mormons from Winter Quarters on the MISSOURI RIVER to the Great Salt Lake Valley, establishing the Mormon Trail.
- AUSTRALIA**
- Australian EDMUND KENNEDY explores the interior of Queensland and the Barcoo River.

1847–49

- ARCTIC**
- JOHN RICHARDSON and JOHN RAE head a British expedition in search of JOHN FRANKLIN; they explore Canada's Arctic coastline eastward from the Mackenzie River to Dolphin and Union Strait. In 1849–50, Rae continues the search on his own, reaching Victoria Island.

1847–52

- NORTH AMERICA**
- Swiss painter RUDOLPH FRIEDERICH KURZ explores the MISSOURI RIVER and western plains.

1847–55

- WORLD**
- Austrian woman IDA REYER PFEIFFER travels twice around the world, west to east and east to west, and writes books, *A Woman's Journey Round the World* and *A Woman's Second Journey Round the World*.

1848

- AFRICA**
- German missionary JOHANN REBMANN explores the interior of East Africa from Mombasa and reaches MOUNT KILIMANJARO.

1848–49

- NORTH AMERICA**
- American JOHN CHARLES FRÉMONT seeks a route from the Great Plains to upper Rio Grande through Sangre de Cristo and the San Juan Mountains of northern New Mexico. Brothers BEN-

- JAMIN JORDAN KERN, EDWARD MEYER KERN, and RICHARD HOVENDON KERN serve as naturalists, topographers, and artists.
- ARCTIC**
- JAMES CLARK ROSS heads a British naval expedition to the Canadian Arctic in search of JOHN FRANKLIN. He travels through Lancaster Sound as far as Barrow Strait and southward from Somerset Island into Peel Strait.

1848–52

- SOUTH AMERICA**
- British naturalists HENRY WALTER BATES and ALFRED RUSSEL WALLACE explore the Amazon Basin. Bates continues his explorations until 1859.

1848–53

- ASIA**
- British couple THOMAS WITTLAM ATKINSON and LUCY ATKINSON travel in SIBERIA, Mongolia, and central Asia.

1849

- NORTH AMERICA**
- RANDOLPH BARNES MARCY and JAMES HERVEY SIMPSON head a U.S. military topographic survey of a wagon route between Fort Smith, Arkansas, and Santa Fe, New Mexico. Simpson locates Native American ruins at Chaco Canyon in New Mexico and Canyon de Chelly in Arizona.
- AFRICA**
- German missionary JOHANN LUDWIG KRAPF explores the interior of East Africa westward from Mombasa and sights Mount Kenya.

1849–50

- NORTH AMERICA**
- HOWARD STANSBURY heads a U.S. military topographic expedition to Utah. He surveys Great Salt Lake's west shore, Utah Lake, and River Jordan.

1849–55

- ASIA**
- GENNADY IVANOVICH NEVELSKOY heads two Russian naval expeditions to the Amur River and Tatar Strait. He determines that Sakhalin is an island, not a peninsula.

1849–63

- AFRICA**
- Scottish missionary DAVID LIVINGSTONE carries out three expeditions in central Africa, two of them accompanied by his wife MARY MOFFAT LIVINGSTONE. He crosses the Kalahari Desert and reaches Lake Ngami. He explores the ZAMBEZI RIVER and the Ruvuma River. He also reaches Victoria Falls on the Zambezi and Lake Nyasa (Lake Malawi). Artist THOMAS BAINES accompanies him on the Zambezi expedition.

1849–64

SOUTH AMERICA

- British botanist RICHARD SPRUCE conducts research along the AMAZON RIVER and Río Negro and other rivers in northern South America.

1850–51

ARCTIC

- EDWIN JESSE DE HAVEN heads a maritime expedition to the Canadian Arctic backed by shipping magnate Henry Grinnell in search of JOHN FRANKLIN. He is trapped in ice north of the Baffin Island and the Lancaster Sound; he reaches Grinnell Land on Devon Island.

ARCTIC

- JOHN ROSS heads a British maritime expedition in search of JOHN FRANKLIN; he winters in Barrow Strait.

1850–52

AFRICA

- British scientist FRANCIS GALTON conducts research in Damaraland and Ovamboland in southwestern Africa.

1850–54

ARCTIC

- ROBERT JOHN LE MESURIER McCLURE heads a British naval expedition to the Canadian Arctic in search of JOHN FRANKLIN. He reaches Prince of Wales Strait between Banks Island and Victoria Island. He completes the first transcontinental crossing of North America above the ARCTIC CIRCLE.

1850–55

AFRICA

- HEINRICH BARTH, ADOLF OVERWEG, and JAMES RICHARDSON head a British expedition into West Africa; they cross the SAHARA DESERT from north to south and explore the Lake Chad region. Barth explores the Benue River, the upper NIGER RIVER, and TIMBUKTU.

ARCTIC

- RICHARD COLLINSON heads a British naval expedition in search of JOHN FRANKLIN; he explores the Arctic coasts of Alaska and Canada as far east as Victoria Island.

1851

NORTH AMERICA

- LORENZO SITGREAVES heads a U.S. military topographic expedition from Santa Fe, New Mexico, to the Zuni and Little Colorado Rivers in Arizona. Mojave Indian IRATEBA serves as guide.
- The AMERICAN GEOGRAPHICAL SOCIETY is founded in New York City.

1852

- NORTH AMERICA**
- RANDOLPH BARNES MARCY heads a U.S. military topographic expedition, which reaches the source of the Red River near present-day Amarillo, Texas.
 - French engineer Henri Gifford makes the first successful AIRSHIP flight.
 - French physicist Jean-Bernard-Léon Foucault develops the modern version of the GYROSCOPE.
 - The U.S. Naval Observatory begins publishing the *American Ephemeris and Nautical Almanac*, an early EPHEMERIS.

1852–54

- ARCTIC**
- EDWARD BELCHER heads a British naval expedition in search of JOHN FRANKLIN; he explores the Canadian Arctic west of Lancaster Sound. FRANCIS LEOPOLD McCLINTOCK, part of the expedition, reaches Eglington Island and Prince Patrick Island on the edge of the Beaufort Sea.

1853

- NORTH AMERICA**
- American JOHN CHARLES FRÉMONT explores the Wasatch Mountains and Sierra Nevada for a proposed railroad through Utah.
- NORTH AMERICA**
- JOHN WILLIAMS GUNNISON heads a U.S. military topographic expedition from Kansas across the plains and the Wasatch Mountains to northwestern Utah.

1853–54

- ARCTIC**
- JOHN RAE heads a British expedition in search of JOHN FRANKLIN. On the Boothia Peninsula, he recovers relics of the Franklin expedition. He reaches Rae Strait, establishing that King William Island is not connected to the mainland.
- AFRICA**
- Portuguese trader ANTONIO FRANCISCO DA SILVA PORTO explores the upper ZAMBEZI RIVER; he makes a west-to-east crossing of central Africa.

1853–55

- ARCTIC/GREENLAND**
- American ELISHA KENT KANE heads a second expedition backed by shipping magnate Henry Grinnell in search of JOHN FRANKLIN. Some expedition members explore GREENLAND's Humboldt Glacier; others explore Ellesmere Island.

1853–56

- NORTH AMERICA**
- AMIEL WEEKS WHIPPLE heads a U.S. military topographic expedition from Albuquerque, New Mexico, to San Bernardino, California. Mojave Indian IRATEBA serves as guide.

- AFRICA**
 - RICHARD FRANCIS BURTON and JOHN HANNING SPEKE command a British expedition seeking the source of the NILE RIVER. They explore the interior of East Africa and reach Lake Tanganyika. Speke reaches Lake Victoria. SIDI BOMBAY of the Yao tribe serves as guide.
- ASIA**
 - Russian scientist PYOTR PETROVICH SEMYONOV makes the first European crossing of the Tien Shan mountains between Russia and China. He explores the Dzungaria region and the Altai Mountains of China.
- NORTH AMERICA**
 - JOSEPH CHRISTMAS IVES heads a U.S. military topographic expedition along the COLORADO RIVER. Mojave Indian IRATEBA serves as guide, and JOHN STRONG NEWBERRY serves as geologist.
- NORTH AMERICA**
 - EDWARD FITZGERALD BEALE heads a U.S. wagon road-building project from Camp Verde in western Texas to Fort Tejon, California, using camels as draft animals.

1857–59

- AFRICA**
 - WILLIAM BALFOUR BAIKIE heads a British expedition up West Africa's NIGER RIVER by steamboat, establishing a trading settlement at Lokoja at the confluence of the Niger and Benue Rivers.
- ARCTIC**
 - British naval officer FRANCIS LEOPOLD McCLINTOCK heads an expedition in search of JOHN FRANKLIN in the Canadian Arctic, commissioned by JANE FRANKLIN. He explores southward from the Lancaster Sound. He circumnavigates King William Island. He recovers relics of the Franklin expedition.
- NORTH AMERICA**
 - JOHN PALLISER heads a British scientific expedition to western Canada. He surveys the 49th Parallel from Lake Superior to the Pacific. He explores passes in the Canadian ROCKY MOUNTAINS. Meanwhile, in 1857–58, Englishman HENRY YOULE HIND explores the river systems of Manitoba and Saskatchewan.

1857–61

- AFRICA**
 - Frenchman HENRI DUVEYRIER explores the SAHARA DESERT.
- AUSTRALIA**
 - British surveyor FRANCIS THOMAS GREGORY charts the river systems of western Australia.

1858

- The Alpine Club, a society to promote MOUNTAIN-CLIMBING, is founded in London.

1858–61

- ASIA** ▪ French naturalist HENRI MOUHOT explores Southeast Asia; he reaches the ruins at Angkor in Cambodia.

1859

- NORTH AMERICA** ▪ JOHN N. MACOMB commands a U.S. military topographic expedition from Santa Fe, New Mexico, to southern Utah and southern Colorado. He locates Anasazi ruins at Mesa Verde and explores the upper COLORADO RIVER. JOHN STRONG NEWBERRY serves as geologist.

1859–60

- NORTH AMERICA** ▪ WILLIAM FRANKLIN RAYNOLDS heads a U.S. topographic expedition from Fort Pierre, South Dakota, to Wyoming and Montana.

1860–61

- AUSTRALIA** ▪ Irishman ROBERT O'HARA BURKE and Englishman WILLIAM JOHN WILLS attempt to cross Australia south to north, from Melbourne nearly to the Gulf of Carpentaria. Both die of starvation.
- ARCTIC/GREENLAND** ▪ American physician ISAAC ISRAEL HAYES explores the GREENLAND ice cap and Ellesmere Island. He fails to reach the NORTH POLE.
- NORTH AMERICA** ▪ American fur traders HENRY A. BOLLER and CHARLES LARPENTEUR work the Yellowstone River region.

1860–62

- ARCTIC** ▪ American journalist CHARLES FRANCIS HALL explores Frobisher Bay in the Canadian Arctic.

1860–63

- AFRICA** ▪ JOHN HANNING SPEKE and JAMES AUGUSTUS GRANT command a British expedition to Lake Victoria. He reaches Ripon Falls and follows the NILE RIVER from Uganda into Sudan.

1861–62

- AUSTRALIA** ▪ Scottish surveyor JOHN MCDOUALL STUART completes the first south-to-north crossing of Australia, from Adelaide to Van Diemen Gulf.
- AUSTRALIA** ▪ Scotsman WILLIAM LANDBOROUGH completes a north-to-south crossing of Australia, from the Gulf of Carpentaria to Melbourne.

1861–64**ASIA**

- Hungarian linguist ARMIN VAMBÉRY travels in Armenia, Persia (Iran), and Turkestan. He visits the cities of Bukhara and Samarkand.

1861–65**AFRICA**

- Englishman SAMUEL WHITE BAKER and his Hungarian-born wife, FLORENCE BAKER, seek the source of the NILE RIVER in southern Sudan and Uganda, reaching Lake Albert and Murchison Falls.

1862**AFRICA**

- Dutch woman ALEXANDRINE PETRONELLA FRANCINA TINNÉ sails up the NILE RIVER as far as Gondokoro in southern Sudan. She travels into the Mongalla Mountains and the upper White Nile River region of northeastern Zaire.

1862–63**ASIA**

- British missionary WILLIAM GIFFORD PALGRAVE makes the first known west-to-east crossing of the Arabian Peninsula, from Ma'an in southern Jordan to Quatif on the Persian Gulf.

NORTH AMERICA

- Englishmen WALTER BUTLER CHEADLE and WILLIAM-WENTWORTH FITZWILLIAM MILTON cross the Canadian ROCKY MOUNTAINS through Yellowhead Pass and reach the Pacific by way of the North Thompson and Fraser Rivers.

1863**NORTH AMERICA**

- American pioneer JOHN MERIN BOZEMAN establishes the Bozeman Trail, a wagon route from Colorado to Montana, along the east side of the Bighorn Mountains and through the Bozeman Pass of the Belt Mountains.

1863–73**AUSTRALIA**

- German woman naturalist KONCORDIE AMALIE NELLE DIETRICH collects specimens in Queensland.

1864–66**ASIA**

- Indian NAIN SINGH crosses the eastern HIMALAYAS to Tibet. He explores the upper Brahmaputra River for Great Britain's Great Trigonometrical Survey.

1864–69

- ARCTIC**
- American journalist CHARLES FRANCIS HALL explores King William Island and Boothia Peninsula. He finds evidence of the JOHN FRANKLIN expedition.

1865

- AFRICA**
- German FRIEDRICH GERHARD ROHLFS, a soldier in the French Foreign Legion, crosses West Africa from Tripoli through the SAHARA DESERT by way of Lake Chad and the Benue River and NIGER RIVER to the Gulf of Guinea.
- NORTH AMERICA**
- Cherokee Indian trader JESSE CHISHOLM blazes the Chisholm Trail from Texas to Wichita.
- EUROPE**
- Englishman EDWARD WHYMPER climbs the Matterhorn in the Alps.

1866–68

- ASIA**
- ERNEST-MARC-LOUIS DE GONZAGUE DOUDART DE LAGRÉE and MARIE-JOSEPH-FRANÇOIS GARNIER head the French naval Mekong Expedition along the Mekong River, from the coast of Vietnam to southeastern China.

1866–69

- AFRICA**
- Scottish missionary DAVID LIVINGSTONE carries out three expeditions in central Africa. He searches for the source of the NILE RIVER. He reaches Lake Mweru and the Lualaba River.
- SOUTH AMERICA**
- Englishman HENRY ALEXANDER WICKHAM explores the ORINOCO RIVER and its tributaries, the Atabapo River and Río Negro. He establishes a rubber plantation on the AMAZON RIVER near Santarem, Brazil.

1868

- ARCTIC**
- NILS ADOLF ERIK NORDENSKJÖLD heads the First Swedish North Polar Expedition, failing to reach the NORTH POLE.
- ASIA**
- Englishman THOMAS THORNVILLE COOPER travels westward from Shanghai across China.

1868–70

- ARCTIC/GREENLAND**
- KARL CHRISTIAN KOLDEWEY heads two German maritime expeditions to Spitsbergen (Svalbard) and GREENLAND's east coast.

1868–71

- AFRICA**
- German naturalist GEORG AUGUST SCHWEINFURTH explores the watershed between the White

- Nile River and the upper CONGO RIVER (Zaire River). He reaches the Uele River.
- ASIA**
- Russians ALEKSEY PAVLOVICH FEDCHENKO and OLGA FEDCHENKO command a scientific expedition into the Pamir region of south-central Asia. They reach the Trans-Alai Mountains.

1868–72

- ASIA**
- German geologist FERDINAND PAUL WILHELM VON RICHTHOFEN explores China.

1868–74

- AFRICA**
- German physician GUSTAV NACHTIGAL travels southward across the SAHARA DESERT from Tripoli to Bornu in Nigeria. He explores Lake Chad and the Chari River. He makes a southeastward crossing of the Sahara to the White Nile River.
- NORTH AMERICA**
- American naturalist JOHN MUIR explores Yosemite Valley and the Sierra Nevada in California.

1869

- NORTH AMERICA**
- American geologist and ethnologist JOHN WESLEY POWELL explores the COLORADO RIVER and the Grand Canyon.

1869–70

- SOUTH AMERICA**
- Englishman GEORGE CHAWORTH MUSTERS makes a south-to-north crossing of Patagonia, from the Strait of Magellan (see MAGELLAN, STRAIT OF) to Río Negro in central Argentina.

1869–76

- NORTH AMERICA**
- FERDINAND VANDEVEER HAYDEN heads a U.S. geological and geographic study of the Great Plains and the ROCKY MOUNTAINS.

1870

- NORTH AMERICA**
- NATHANIEL PITT LANGFORD heads a U.S. expedition to the Yellowstone Park region of Idaho, Montana, and Wyoming.

1870–85

- ASIA**
- Russian NIKOLAY MIKHAILOVICH PRZHEVALSKY makes four scientific expeditions to central Asia, reporting on geography and wildlife.

1871

- AFRICA**
- British-American journalist HENRY MORTON STANLEY journeys from Zanzibar to Ujiji on Lake

Tanganyika and locates Scottish missionary DAVID LIVINGSTONE. Stanley also explores the lake's northern end.

1871–73

- | | |
|-------------|--|
| ASIA | ▪ French trader JEAN DUPUIS explores the Red River, seeking a navigable water route between China's Yunnan Province and the coast of Southeast Asia. |
| ARCTIC | ▪ CHARLES FRANCIS HALL heads a U.S. expedition, which attempts to reach the NORTH POLE from northeastern Ellesmere Island. He reaches the Lincoln Sea. |
| EUROPE/ASIA | ▪ Russian geographer PETER KROPOTKIN undertakes scientific expeditions to northern Finland, SIBERIA, and Manchuria. |

1871–74

- | | |
|--------|---|
| ARCTIC | ▪ JULIUS VON PAYER and KARL WEYPRECHT head the Austro-Hungarian Arctic expedition, reaching Franz Josef Land. |
|--------|---|

1871–79

- | | |
|---------------|---|
| NORTH AMERICA | ▪ GEORGE MONTAGUE WHEELER heads U.S. military surveys of the American West. |
|---------------|---|

1872

- | | |

|----------------------------------|---|
| ATLANTIC OCEAN/
PACIFIC OCEAN | ▪ GEORGE STRONG NARES and CHARLES WYVILLE THOMSON head a British oceanographic research expedition aboard the <i>Challenger</i> . |
|----------------------------------|---|

1873

- | | |
|---------------|---|
| NORTH AMERICA | ▪ DAVID SLOAN STANLEY heads a U.S. military Yellowstone Expedition from the Dakotas into Montana and Wyoming. |
| AUSTRALIA | ▪ Englishman PETER EGERTON WARBURTON completes the first east-to-west crossing of western Australia, from Alice Springs to Roebourne on the Indian Ocean. |

- AUSTRALIA** ▪ Australian WILLIAM CHRISTIE GOSSE heads an unsuccessful attempt at an east-to-west crossing of the continent. He reaches Ayers Rock.
- ANTARCTIC** ▪ EDUARD DALLMAN heads a German whaling expedition to the Antarctic Peninsula.

1873–75

- AFRICA** ▪ VERNEY LOVETT CAMERON heads a British expedition to relieve DAVID LIVINGSTONE. He explores Lake Tanganyika and the Lukuga River. He travels from the Lualaba River to Angola's Atlantic coast.

1874

- AUSTRALIA** ▪ The brothers JOHN FORREST and ALEXANDER FORREST head an Australian surveying expedition and complete the first west-to-east crossing of western Australia.

1874–75

- AFRICA** ▪ American CHARLES CHAILLÉ-LONG, in service to Egypt, explores the upper White Nile in Uganda. He reaches the Kioga River in East Africa. He heads a military expedition from southern Sudan west into the great divide between the NILE RIVER and CONGO RIVER (Zaire River); he explores the Giuba River in Somalia.

1874–77

- AFRICA** ▪ British-American journalist HENRY MORTON STANLEY circumnavigates Lake Victoria and Lake Tanganyika. He reaches Lake Edward. He descends the Lualaba River and the CONGO RIVER (Zaire River) to the Atlantic, completing an east-to-west crossing of central Africa.

1875–76

- AUSTRALIA** ▪ Englishman ERNEST GILES heads a commercial expedition through the GREAT VICTORIA DESERT; he completes the first successful inland crossing of Australia, then returns through the Gibson Desert.
- ARCTIC** ▪ GEORGE STRONG NARES heads the British Arctic Expedition, which explores northern Ellesmere Island and makes an unsuccessful attempt on the NORTH POLE.

1876–77

- SOUTH AMERICA** ▪ Argentine naturalist FRANCISCO MORENO explores the southern region of the ANDES MOUNTAINS; he reaches Lake San Martin.

1876–78

- ASIA**
- Englishman CHARLES MONTAGU DOUGHTY travels southward from Syria across Arabia; he visits the Najd Desert.

1876–79

- SOUTH AMERICA**
- Frenchman JULES-NICOLAS CREVAUX explores the northern tributaries of the AMAZON RIVER and crosses the Tumuc-Humuc Mountains in French Guiana.

1876–83

- AFRICA**
- German WILHELM JOHANN JUNKER explores the upper tributaries of the CONGO RIVER (Zaire River) and the NILE RIVER in North and East Africa.

1878–79

- ARCTIC**
- Swedish geologist NILS ADOLF ERIK NORDENSKJÖLD heads the Vega Expedition, making the first successful navigation of the NORTHEAST PASSAGE from Norway along Asia's Arctic coast to the BERING STRAIT. In 1880, he returns to Europe by way of the Suez Canal, completing the first circumnavigation of Europe and Asia.
- ASIA**
- British couple WILFRED SCAWEN BLUNT and Lady ANNE ISABELLA BLUNT explore the Arabian Peninsula and Iraq.

1878–80

- ARCTIC**
- American FREDERICK SCHWATKA heads a private expedition in search of JOHN FRANKLIN. He explores from northwestern HUDSON BAY to King William Island, exploring the Hayes River.

1878–82

- ASIA**
- KISHEN SINGH of India travels from northeastern India into western China as far as the GOBI DESERT for Great Britain's Great Trigonometrical Survey.

1878–83

- AFRICA**
- German physician MEHMED EMIN PASHA, as an Anglo-Egyptian governor, explores the watershed between the NILE RIVER and CONGO RIVER (Zaire River) in Sudan and in East Africa.

1879

- AUSTRALIA**
- Australian ALEXANDER FORREST explores northwestern Australia, including Dampier Land, Fitzroy River, and Daly River.

- AFRICA**
- JOSEPH THOMSON heads a British expedition from East Africa's coast to northern Lake Nyasa (Lake Malawi). He explores Lake Rukwa, southern Lake Tanganyika, and the Lukuga River.

1879–81

- ARCTIC**
- GEORGE WASHINGTON DE LONG heads a U.S. expedition into the Arctic Ocean by way of the BERING STRAIT. He fails to reach the NORTH POLE when the ship is trapped in the ice north of Wrangel Island, then drifts westward. Expedition members set out for the Siberian mainland over the frozen sea, visiting some of the New Siberian Islands. Some of them perish in the Lena River delta.
- NORTH AMERICA**
- American geologist CLARENCE KING organizes the U.S. Geological Survey.

1879–82

- AFRICA**
- Italian PIERRE-PAUL-FRANÇOIS-CAMILLE SAVORNAN DE BRAZZA explores and develops the CONGO RIVER (Zaire River) region for France in West Africa.

1879–84

- AFRICA**
- British-American journalist HENRY MORTON STANLEY ascends the CONGO RIVER (Zaire River) on behalf of Belgium. He explores the interior of Zaire and reaches Lake Tumba and Lake Leopold II.
- ASIA**
- KINTUP of India explores Tibet for Great Britain's Great Trigonometrical Survey. He determines that Tibet's Tsangpo River is the same as India's Brahmaputra River.

1880

- SOUTH AMERICA**
- Englishman EDWARD WHYMPER climbs Chimborazo in the ANDES MOUNTAINS.

1880–81

- AFRICA**
- PAUL-XAVIER FLATTERS heads two French surveying expeditions from the Mediterranean coast of Algeria into the SAHARA DESERT, reaching the Ahaggar region.

1881–84

- ARCTIC/GREENLAND**
- ADOLPHUS WASHINGTON GREELY heads a U.S. military expedition to Ellesmere Island. Expedition member OCTAVE PAVY explores northern Ellesmere Island. Other expedition members explore GREENLAND's northwest coast.

1883–84

- AFRICA**
- JOSEPH THOMSON heads a British expedition from Mombasa on the Indian Ocean across central Kenya's Masailand and along the Great Rift Valley to Lake Victoria. He reaches Lake Baringo and the Abedare Range.

1883–85

- AFRICA**
- German HERMANN VON WISSMANN, in service to Belgium, explores the Kasai River system in Zaire, reaching the Sankuru tributary.

1884

- AFRICA**
- HARRY HAMILTON JOHNSTON heads the British Kilimanjaro Expedition, exploring the region around Mount Kilimanjaro (see KILIMANJARO, MOUNT), Africa's highest peak.
 - The Washington Meridian Conference establishes Greenwich, England, as the location of the PRIME MERIDIAN.

1884–87

- AFRICA**
- British missionary GEORGE GRENFELL surveys the CONGO RIVER (Zaire River).

1885

- NORTH AMERICA**
- HENRY TUREMAN ALLEN heads a U.S. military expedition to the Yukon, Koyukuk, and Copper Rivers in eastern Alaska.

1885–87

- AFRICA**
- German geologist OSKAR LENZ ascends the CONGO RIVER (Zaire River). He crosses Africa by way of the Lualaba River, Lake Tanganyika, and Lake Nyasa (Lake Malawi).

1886

- The *Gymnote*, this first modern SUBMARINE, is built in France.

1886–87

- ASIA**
- British army officer FRANCIS EDWARD YOUNG-HUSBAND travels east to west across China from Manchuria, through the GOBI DESERT, to Kashgar and Yarkand. He reaches the Mustagh Pass in the Karakoram Mountains.

1886–89

- AFRICA**
- Hungarians LUDWIG VON HOEHNEL and SAMUEL TELEKI explore Lake Rudolf, the Omo River, and

Lake Stefanie in northern Kenya and southern Ethiopia.

1886–1900

- ARCTIC/GREENLAND** ▪ American ROBERT EDWIN PEARY carries out five expeditions to the Arctic regions of GREENLAND and Ellesmere Island.

1887–89

- AFRICA** ▪ British-American journalist HENRY MORTON STANLEY travels up the CONGO RIVER (Zaire River) and across central Africa to relieve MEHMED EMIN PASHA. He reaches the Semliki River and Ruwenzori Mountains. He completes a west-to-east crossing of central Africa.
- AFRICA** ▪ LOUIS-GUSTAVE BINGER heads a French expedition into West Africa from Senegal. He explores the NIGER RIVER, the Volta River, and the Comoe River.

1888

- ARCTIC/GREENLAND** ▪ Norwegian FRIDTJOF NANSEN explores GREENLAND's interior.

1888–1911

- EUROPE/
SOUTH AMERICA** ▪ American woman ANNIE SMITH PECK climbs in the Alps and the ANDES MOUNTAINS.

1888–1912

- ASIA/AFRICA** ▪ American woman FANNY BULLOCK WORKMAN travels throughout Europe, North Africa, and the Far East. She climbs in the HIMALAYAS and other mountain ranges in central Asia.

1889

- AFRICA** ▪ HANS MEYER climbs Mount Kilimanjaro (see KILIMANJARO, MOUNT) in East Africa.

1891

- AFRICA** ▪ American woman publisher MAY FRENCH SHELDON travels from Mombasa on Africa's east coast to Mount Kilimanjaro (see KILIMANJARO, MOUNT). She explores Lake Chala.
- German engineer Otto Lilienthal makes the first successful glider flight.

1891–95

- ASIA** ▪ AUGUSTE-JEAN-MARIE PAVIE conducts the Pavie Mission surveys of Southeast Asia.

1892–93

- AFRICA** ■ OSKAR BAUMANN heads a German expedition to Lake Victoria and the Kagera River, its principal source.
- ASIA** ■ British missionary ANNIE ROYLE TAYLOR visits China.

1892–94

- ARCTIC** ■ EDUARD VON TOLL heads a Russian expedition to the Siberian Arctic by way of Cape Chelyuskin; he explores the deltas of the Yana, Indigirka, and Kolyma Rivers.

1893–95

- AFRICA** ■ British woman author MARY HENRIETTA KINGSLY travels in West and central Africa.

1893–96

- ARCTIC** ■ Norwegian FRIDTJOF NANSEN attempts to approach the NORTH POLE by having an ice-bound ship drift northward from the New Siberian Islands. The crew leaves the ship, continuing on kayaks and sledges, reaching Franz Josef Land.

1893–97

- ASIA** ■ Swede SVEN ANDERS HEDIN heads two scientific expeditions to the Tarim Basin, the Takla Makan desert, and Lop Nor Lake in western China. He explores the Tibetan Plateau and maps the HIMALAYAS.
- ASIA** ■ British archaeologist JAMES THEODORE BENT explores the Arabian Peninsula.

1893–98

- ASIA** ■ British surveyor and diplomat PERCY MOLESWORTH SYKES explores Persia (Iran).

1893–1900

- ASIA** ■ Frenchman CHARLES BONIN travels in Southeast and central Asia and charts the YANGTZE RIVER (Chang) and the YELLOW RIVER (Huanghe).

1894–95

- ANTARCTIC** ■ CARSTEN EGEBERG BORCHGREVINK heads a Norwegian whaling expedition and makes the first known landing on the Antarctic continent.

1894–97

- ARCTIC**
- FREDERICK GEORGE JACKSON heads the British Jackson-Harmsworth Arctic Expedition to Franz Josef Land.

1897

- ARCTIC**
- Swedish SALOMON AUGUST ANDRÉE attempts to reach the NORTH POLE by BALLOON. He is forced down and eventually perishes on White Island.
- NORTH AMERICA**
- Italian LUIGI AMEDEO DI SAVOIA D'ABRUZZI makes the first successful ascent of Alaska's Mount Saint Elias.
- SOUTH AMERICA**
- Italian MATTHIAS ZURBRIGGEN makes the first successful ascent of Anaconda in the ANDES MOUNTAINS.

1897–99

- ANTARCTIC**
- ADRIEN-VICTOR-JOSEPH DE GERLACHE DE GOMERY heads a Belgian expedition to Antarctica; icebound, he winters off the Antarctic Peninsula.

1897–1904

- AFRICA**
- Swiss-born Russian-German woman writer ISABELLE EBERHARDT travels throughout North Africa.

1898–99

- AFRICA**
- JEAN-BAPTISTE MARCHAND heads a French military expedition from the mouth of the CONGO RIVER (Zaire River) to the upper White Nile region of southern Sudan.

1898–1902

- ARCTIC**
- OTTO NEUMANN SVERDRUP heads a Norwegian expedition to the Canadian Arctic. He explores the west coast of Ellesmere Island and the Sverdrup Islands.

1899–1900

- ARCTIC**
- LUIGI AMEDEO DI SAVOIA D'ABRUZZI heads an Italian expedition in an attempt to reach the NORTH POLE from Franz Josef Land, setting the northernmost record at the time.
- ANTARCTIC**
- CARSTEN EGEBERG BORCHGREVINK heads a Norwegian expedition and winters in Antarctica, exploring parts of the interior.

1900–02

- ASIA**
- Russian scholar GOMBOZHAB TSYBIKOV heads a political mission to Tibet for Russia.

1900–10

- ASIA**
- British archaeologist GERTRUDE MARGARET LOW-THIAN BELL travels throughout the Middle East.

1901–03

- ANTARCTIC**
- ERICH DAGOBERT VON DRYGALSKI heads a German Antarctic Expedition to the Antarctic coast in the Indian Ocean. He reaches and names Kaiser Wilhelm II Land and Mount Gauss.
- ANTARCTIC**
- NILS OTTO GUSTAF NORDENSKJÖLD heads a Swedish expedition to Antarctica. He explores the South Shetland Islands, Graham Land, and Mount Haddington on the Weddell Sea.

1901–04

- ANTARCTIC**
- ROBERT FALCON SCOTT heads the British National Antarctic Expedition. He explores Victoria Land and the Ross Ice Shelf and reaches Edward VII Land, setting the southernmost record at the time. ERNEST HENRY SHACKLETON and EDWARD ADRIAN WILSON are part of his team.

1902

- ARCTIC**
- American ROBERT EDWIN PEARY attempts unsuccessfully to reach the NORTH POLE from Cape Hecla on the northern Ellesmere Island, but he sets the northernmost record at the time.

1902–04

- ANTARCTIC**
- WILLIAM SPIERS BRUCE heads the Scottish National Antarctic Expedition. He explores the Weddell Sea and charts Coats Land.
- ARCTIC/GREENLAND**
- LUDWIG MYLIUS-ERICHSEN heads the Danish Greenland Expedition to Melville Bay. He reaches as far north as Cape York.

1903

- American brothers Orville Wright and Wilbur Wright make the first successful airplane flights.

1903–05

- ANTARCTIC**
- JEAN-BAPTISTE-ÉTIENNE-AUGUSTE CHARCOT heads a French expedition, which maps the Antarctic Peninsula, the Loubet Coast, and Adelaide Land.

1903–06

- ARCTIC**
- ROALD ENGELBREGT GRAVNING AMUNDSEN heads a Norwegian expedition, which locates the NORTH MAGNETIC POLE and makes the

- first successful navigation of the NORTHWEST PASSAGE.
- SOUTH AMERICA**
- American woman HARRIET CHALMERS ADAMS tours South America, crossing the ANDES MOUNTAINS four times.

1904–11

- ARCTIC**
- JOSEPH ELZÉAR BERNIER heads a series of Canadian expeditions, claiming and charting islands in the Arctic Ocean north of the Canadian mainland.

1905–06

- ARCTIC**
- American ROBERT EDWIN PEARY attempts unsuccessfully to reach the NORTH POLE by way of the Robeson Channel, but he sets the northernmost record at the time.

1905–08

- ASIA**
- Swede SVEN ANDERS HEDIN reaches the sources of the INDUS RIVER, Brahmaputra River, and Sutlej River in the Transhimalaya Mountains of Tibet.

1905–11

- AFRICA**
- Americans CARL ETHAN AKELEY and DELIA JULIA DENNING AKELEY head two expeditions to East and central Africa for the Field Museum in Chicago and the Museum of Natural History in New York.

1906

- AFRICA**
- Italian LUIGI AMEDEO DI SAVOIA D'ABRUZZI makes the first ascent of peaks in East Africa's Ruwenzori Mountains.

1906–07

- ARCTIC/GREENLAND**
- LUDWIG MYLIUS-ERICHSEN heads a Danish expedition to northeastern GREENLAND, reaching the Northeast Foreland.

1906–08

- ASIA**
- Hungarian archaeologist MARC AUREL STEIN follows the ancient SILK ROAD into western China. He locates the Caves of the Thousand Buddhas at Tunhuang.

1906–12

- ARCTIC/GREENLAND**
- Danish-Inuit ethnologist KNUD JOHAN VICTOR RASMUSSEN explores northern GREENLAND. He determines that Peary Land is part of Greenland.

1906–14

- SOUTH AMERICA**
- British surveyor PERCY HARRISON FAWCETT explores the Amazon Basin and the central ANDES MOUNTAINS.

1907–09

- ANTARCTIC**
- ERNEST HENRY SHACKLETON heads a British Antarctic expedition, which reaches the Beardmore Glacier and the Polar Plateau within 97 miles of the SOUTH POLE. In 1909, expedition members including DOUGLAS MAWSON ascend Mount Erebus and reach the SOUTH MAGNETIC POLE.

1907–25

- SOUTH AMERICA**
- American ALEXANDER HAMILTON RICE surveys the rivers draining into the northwestern Amazon Basin. In 1924–25, he makes the first use of an aircraft to explore South America.

1908

- ARCTIC**
- American FREDERICK ALBERT COOK possibly reaches the NORTH POLE from northern GREENLAND and the Ellesmere Island, but his claim is disputed.
- ARCTIC**
- Russian mariner and fur trader NIKIFOR ALEKSEYEVICH BEGICHEV determines that Bolshoy Begichev is an island and not part of a peninsula on the Arctic coast of central SIBERIA.

1908–10

- ANTARCTIC**
- JEAN-BAPTISTE-ÉTIENNE-AUGUSTE CHARCOT heads a French expedition and surveys Palmer Archipelago. He reaches the Fallières Coast.

1909

- ARCTIC**
- Americans ROBERT EDWIN PEARY and MATTHEW ALEXANDER HENSON successfully reach the NORTH POLE by sledge from Cape Columbia on the north coast of Ellesmere Island.
- ASIA**
- Italian LUIGI AMEDEO DI SAVOIA D'ABRUZZI attempts the ascent of K2 in the HIMALAYAS, setting the altitude record at the time.

1910–12

- ANTARCTIC**
- ROALD ENGELBREGT GRAVNING AMUNDSEN heads a Norwegian expedition, which completes the first successful expedition to the SOUTH POLE, from the Bay of Whales by way of the Axel Heiberg Glacier (Antarctic).

- ANTARCTIC**
- ROBERT FALCON SCOTT heads a British expedition, which reaches the SOUTH POLE from McMurdo Sound by way of the Beardmore Glacier. All the expedition members, including the physician and zoologist EDWARD ADRIAN WILSON, perish on the return trip.

- ANTARCTIC**
- WILHELM FILCHNER heads the Second German Antarctic Expedition. He reaches the Filchner Ice Shelf on the Weddell Sea and Luitpold Land.

1911

- SOUTH AMERICA**
- American historian HIRAM BINGHAM reaches the Inca ruins at Machu Picchu.

1911–14

- ANTARCTIC**
- DOUGLAS MAWSON heads an Australian expedition to Antarctica, exploring George V Land.

1912

- ANTARCTIC**
- NOBU SHIRASE heads a Japanese expedition to Antarctica. He explores the Ross Ice Shelf and King Edward VII Land.

1912–15

- AFRICA**
- American military attaché CHARLES DENTON YOUNG charts the interior of Liberia.

1913

- NORTH AMERICA**
- Anglo-American HUDSON STUCK makes the first ascent of Mount McKinley (see MCKINLEY, MOUNT) in Alaska.

1913–18

- ARCTIC**
- VILHJALMUR STEFANSSON heads a Canadian Arctic expedition to the Beaufort Sea; he reaches uncharted islands in the Canadian Arctic Archipelago north of Prince Patrick Island.

1914–16

- ANTARCTIC**
- ERNEST HENRY SHACKLETON heads a British Imperial Trans-Antarctic expedition and attempts to cross the Antarctic continent from the Weddell Sea to the Ross Sea. After his ship sinks in the Weddell Sea, the crew takes refuge on Elephant Island. Shackleton and five others make the open boat voyage to South Georgia Island and cross the island overland to the inhabited side. Shackleton mounts a successful rescue of the crew still on Elephant Island.

1916–18

- ASIA**
- Englishman THOMAS EDWARD LAWRENCE (Lawrence of Arabia) explores the Hejaz region of the Arabian Peninsula while leading an Arab revolt against Turkey.

1917

- ASIA**
- Englishman HARRY ST. JOHN BRIDGER PHILBY makes an east-to-west crossing of the Arabian Peninsula from Qatar to Jidda.

1921–24

- ARCTIC**
- Danish-Inuit KNUD JOHAN VICTOR RASMUSSEN travels from western GREENLAND across the Canadian Arctic to the BERING STRAIT.

1923–24

- ASIA**
- Frenchwoman ALEXANDRA DAVID-NÉEL travels from China through the Dokar Pass of the Kharpo Mountains to LHASA in Tibet.

1924

- ASIA**
- Englishman GEORGE HERBERT LEIGH MALLORY and Andrew “Sandy” Irvine die while climbing Mount Everest (see EVEREST, MOUNT) in the HIMALAYAS.

1924–25

- ARCTIC/GREENLAND**
- American RICHARD EVELYN BYRD makes the first flights over the GREENLAND ice cap by airplane.

1924–28

- ASIA**
- Russian painter NIKOLAY KONSTANTINOVICH ROERICH explores in the HIMALAYAS and central Asia.

1926

- ARCTIC**
- American RICHARD EVELYN BYRD makes the first flight over the NORTH POLE by airplane.

- ARCTIC**
- ROALD ENGELBREGT GRAVNING AMUNDSEN, LINCOLN ELLSWORTH, and UMBERTO NOBILE fly over the NORTH POLE by AIRSHIP, completing the first flight from Europe to North America.

- AFRICA**
- Americans CARL ETHAN AKELEY and MARY LEONORE JOBE AKELEY collect specimens in the Belgian Congo for the American Museum of Natural History.

1927

- American aviator Charles Lindberg makes the first successful nonstop solo flight across the Atlantic Ocean.

1928

ARCTIC

- UMBERTO NOBILE heads an Italian expedition over the NORTH POLE by AIRSHIP.

ARCTIC

- Australian GEORGE HUBERT WILKINS makes an airplane flight over the Arctic from North America to Europe.
- American aviator Amelia Earhart becomes the first woman to fly solo across the Atlantic Ocean.

1928–33

ARCTIC/GREENLAND

- American woman LOUISE ARNER BOYD heads three scientific expeditions to the Arctic region of eastern GREENLAND.

1929–30

ANTARCTIC

- RICHARD EVELYN BYRD heads the First Byrd Antarctic Expedition; he makes the first flight over the SOUTH POLE.

ARCTIC/GREENLAND

- German ALFRED LOTHAR WEGENER heads the Greenland Expedition, which establishes the first permanent weather stations on the GREENLAND ice cap.

1929–31

ANTARCTIC

- DOUGLAS MAWSON heads Australian, NEW ZEALAND, and British aerial surveys of Antarctica. He explores the MacRobertson Coast and Enderby Land.

1930–31

ASIA

- Englishman BERTRAM SYDNEY THOMAS crosses the southeastern Arabian Peninsula's Rub' al-Khali desert (EMPTY QUARTER).

1930–32

ARCTIC/GREENLAND

- HENRY GEORGE WATKINS heads the British Arctic Air Route Expedition to GREENLAND. He explores the Greenland ice cap and surveys the southeast and southwest coasts. Expedition member AUGUSTINE COURTAULD spends the 1930–31 winter alone on the ice cap.

1931

- Belgian/Swiss physicist AUGUSTE PICCARD penetrates the stratosphere in a high-altitude BALLOON.

- ARCTIC**
- Australian GEORGE HUBERT WILKINS attempts to reach the NORTH POLE from Spitsbergen (Svalbard) by SUBMARINE.

1932

- ARCTIC**
- OTTO Y. SCHMIDT commands a USSR icebreaker completing the first crossing of the NORTHEAST PASSAGE in a single season.

1933–35

- ANTARCTIC**
- RICHARD EVELYN BYRD heads the Second Byrd Antarctic Expedition. He winters alone about 1,000 miles inland. He charts Marie Byrd Land and the Edsel Ford Mountains.

1934

- American CHARLES WILLIAM BEEBE sets the record for an ocean dive in the BATHYSPHERE with Otis Barton.

1935

- ANTARCTIC**
- American LINCOLN ELLSWORTH completes the first flight across the Antarctic continent.
- ASIA**
- Englishwoman FREYA MADELINE STARK visits the Hadramawt region of the southern Arabian Peninsula.

1937

- ARCTIC**
- OTTO Y. SCHMIDT establishes a manned scientific post on the frozen Arctic Ocean near the NORTH POLE for the USSR.
 - The *Hindenburg*, a German-built AIRSHIP, crashes in New Jersey, killing 36 people.
 - American aviator Amelia Earhart disappears as she attempts to become the first woman to fly an airplane around the world.

1937–38

- ARCTIC**
- American woman LOUISE ARNER BOYD heads two scientific expeditions to the Arctic Ocean northeast of Norway, between Bear Island and Jan Mayen Island.

1939–41

- ANTARCTIC**
- RICHARD EVELYN BYRD heads the U.S. Antarctic Service Expedition, establishing new bases.

1941

- ARCTIC**
- American woman LOUISE ARNER BOYD heads a U.S. scientific expedition studying the Arctic magnetic phenomenon.

1942**SPACE**

- During World War II, German engineer Wernher von Braun conducts the first successful launch of the A-4 (later called the V-2) ROCKET, a long-range guided missile propelled by liquid fuel. In 1945, he moves to the United States and participates in American SPACE EXPLORATION.

1943

- Frenchman JACQUES-YVES COUSTEAU helps develop the Aqua Lung.

1946–48**ASIA**

- Englishman WILFRED PATRICK THESIGER undertakes two journeys into the southeastern Arabian Peninsula's Rub' al-Khali (the EMPTY QUARTER).

1947**PACIFIC OCEAN**

- Norwegian THOR HEYERDAHL travels from South America to Polynesia in the balsa RAFT *Kon-Tiki* to prove the theory of eastward transoceanic migrations of native peoples.

1947–48**ANTARCTIC**

- RICHARD EVELYN BYRD heads U.S. Operation High Jump, an aerial reconnaissance of Antarctica.

1953**ASIA**

- EDMUND PERCIVAL HILLARY and TENZING NORGAY head the British Mount Everest Expedition, reaching the top of Mount Everest (see EVEREST, MOUNT) in the HIMALAYAS.

1955**ARCTIC**

- American LOUISE ARNER BOYD makes the first flight over the NORTH POLE by a woman.

1956–88**SOUTH AMERICA**

- British botanical painter MARGARET URSULA MEE travels in the Brazilian rain forest.

1957**SPACE**

- The USSR launches the first artificial SATELLITE, *Sputnik 1*.

SPACE

- The USSR launches the first animal into space, the dog Laika, aboard the SATELLITE *Sputnik 2*.

1957–58

- ANTARCTIC**
- Englishman VIVIAN ERNEST FUCHS and New Zealander EDMUND PERCIVAL HILLARY head the Commonwealth Trans-Antarctic Expedition, which completes the first crossing of the Antarctic continent.
 - Thirty-seven nations participate in the INTERNATIONAL GEOPHYSICAL YEAR, a period of cooperative study of Earth's geophysics.

1958

- SPACE**
- The United States launches its first artificial SATELLITE, *Explorer 1*, and its first SPACE PROBE, *Pioneer*.
- SPACE**
- The U.S. government establishes the NATIONAL AERONAUTICS AND SPACE ADMINISTRATION (NASA). In 1959, it selects its first ASTRONAUTS.
- ARCTIC**
- The *Nautilus*, the first nuclear SUBMARINE, makes an undersea transit of the NORTH POLE.

1959

- SPACE**
- The USSR launches *Luna 1*, a SPACE PROBE; it becomes the first human-made object to escape Earth's orbit. *Luna 2* becomes the first artificial object to hit the Moon. *Luna 3* sends back the first photographs of the dark side of the Moon.

1960

- PACIFIC OCEAN**
- JACQUES ERNEST-JEAN PICCARD heads a U.S. Navy BATHYSCAPH dive to the bottom of the Challenger Deep in the Pacific's MARIANAS TRENCH, the deepest point on Earth.

1961

- SPACE**
- YURI ALEKSEYEVICH GAGARIN, in a USSR Vostok mission, becomes the first human in space and to orbit Earth.
- SPACE**
- ALAN BARTLETT SHEPARD, JR., in a U.S. Mercury mission, becomes the first American in space.
- SPACE**
- The Apollo program is organized by the United States to launch a person to the Moon.

1962

- SPACE**
- JOHN HERSCHELL GLENN, JR., in a U.S. Mercury mission, becomes the first American to orbit Earth.

1963

- SPACE**
 - VALENTINA VLADIMIROVNA TERESHKOVA becomes the first woman in space in a USSR Vostok mission.
- SPACE**
 - ALEXEI ARKHIPOVICH LEONOV, in a USSR Voskhod mission, becomes the first human to walk in space.
- SPACE**
 - EDWARD HIGGINS WHITE II, in a U.S. Gemini mission, becomes the first American to walk in space.

1964

- WORLD**
 - American aviator Geraldine Mock becomes the first woman to fly solo around the world.

1965

- The Union Internationale de Spéléologie, the international body for SPELEOLOGY and caving, is founded with a central office in the Czech Republic.

1967

- WORLD**
 - British yachtsman Sir Francis Charles Chichester completes the first solo maritime journey around the world.

1969

- SPACE**
 - NEIL ALDEN ARMSTRONG, in an Apollo mission, becomes the first human to walk on the Moon. Edwin “Buzz” Aldrin also explores the lunar surface. Michael Collins, the third member of the expedition, orbits the Moon.

1970

- ATLANTIC OCEAN**
 - Norwegian THOR HEYERDAHL travels from North Africa to South America in the papyrus boat *Ra* to prove that ancients could have made the journey.

1971

- SPACE**
 - The USSR launches the first SPACE STATION, *Salyut 1*.

1973

- SPACE**
 - The United States launches its first SPACE STATION, *Skylab*.
- SPACE**
 - GPS, formally known as the Navstar Global Positioning System, a SATELLITE system, is initiated to aid in navigation.
- SPACE**
 - The U.S. *Pioneer 10* SPACE PROBE passes through the asteroid belt and becomes the first artificial object to escape the solar system.

1975

ASIA

- The European Space Agency is founded, with headquarters in Paris.
- Junko Tabei of Japan becomes the first woman to summit MOUNT EVEREST.

1975–76

SPACE

- U.S. *Viking 2* SPACE PROBE lands on Mars and successfully transmits data.

1977

ARCTIC

- The USSR icebreaker *Arktika* reaches the NORTH POLE.

1981

SPACE

- The United States launches the first SPACE SHUTTLE, the *Columbia*.

ARCTIC/ANTARCTIC

- British explorers Sir Ranulph Fiennes and Charles Burton reach the NORTH POLE, having traveled there from the SOUTH POLE, becoming the first men to circle Earth Pole to Pole.

1983

SPACE

- SALLY KRISTEN RIDE, in a U.S. SPACE SHUTTLE mission, becomes the first American woman in space.

1986

SPACE

- The *Challenger* SPACE SHUTTLE breaks up during liftoff, killing all seven crew members.

SPACE

- The USSR launches the first permanently manned space station, *Mir*; six other modules are added through 1996.

1990

SPACE

- The United States launches the Hubble Space Telescope, a research SATELLITE.

1997

SPACE

- The U.S. SPACE PROBE *Pathfinder* returns images from the surface of Mars and carries out 15 chemical analyses.

SPACE

- The *Global Surveyor*, a U.S. SPACE PROBE in orbit around Mars, photographs and maps the planet.

1998

SPACE

- The first module of the International Space Station is launched.

- SPACE**
- The U.S. SPACE PROBE *Voyager 1* passes *Pioneer 10* to become the most distant human-made object in space.
-
- 1999**
- WORLD**
- Bertrand Piccard, AUGUSTE PICCARD's grandson, and Brian Jones, a British pilot, complete the first nonstop circumnavigation of Earth by BALLOON.
-
- 2000**
- SPACE**
- The first crew, two Russians and one American, arrive on the International Space Station.
-
- 2003**
- SPACE**
- The *Columbia* SPACE SHUTTLE breaks up on reentry, killing all seven crew members.
- SPACE**
- With the planet Mars closer to Earth than it has been in 7,300 years, numerous nations send SPACE PROBE missions to study it.
-
- 2004**
- SPACE**
- The United States, in two SPACE PROBE missions, retrieves data from two Mars exploration rovers: Mars Rover-A, or *Spirit*, and Mars Rover-B, or *Opportunity*. *Opportunity* finds evidence of water having formerly existed on Mars.

Further Reading for the Set

Many explorers wrote firsthand accounts of their expeditions, some of which are mentioned in the entries. The following are mainly secondary sources.

Contributors

The authors would like to thank all the writers, researchers, and editors who helped with Volume II of the *Encyclopedia of Exploration*. The areas of their invaluable contributions are listed parenthetically below.

Mary Ashwood, a teacher and freelance writer, has written for children's publications. She also writes a regular column for *The Freeman's Journal* in Cooperstown, New York. She holds a B.S. from the State University of New York at Oneonta and an M.A.T. from SUNY-Albany. (North American geography.)

Breath-Alicen Valentine Hand, née Cox, is a freelance writer, editor, researcher, and grant writer as well as Vice President of Hand & Hand Multimedia. (Photo research, women explorers, general research and editing.)

Benjamin Harnett, since graduating from Hamilton College, has studied the classics at the University of Pennsylvania and Columbia University. (Near East and the Mediterranean, central Asia, Far East, South America, commerce, literature of exploration.)

Catherine Mason, a freelance writer, has written about a wide range of subjects, including the history and natural science of upstate New York. A graduate of Lebanon Valley College, she currently works in development at the New York State Historical Association. (Religion, natural science and disease, navigation, European history.)

Elizabeth Smith is a writer and freelance editor who holds a B.A. in English and American literature from Harvard and an M.A. in literature from the University of Sydney, Australia. (General research and editing.)

Kathleen Taylor is host and producer of the nationally syndicated public radio program *Word for the Wise*. She holds an M.A. in communication and a B.A. in English and political science from the State University of New York at Albany. Her writings on language have appeared in a number of publications. (Africa, Australia, navigation, general research and editing.)

Chloe Shannon Waldman, a graduate of the State University of New York at Buffalo, is a freelance writer/researcher. (General research and editing.)

Cumulative Index for the Set

Roman numerals in **boldface** indicate the volume. Page numbers in **boldface** indicate main entries. Page numbers in *italics* indicate photographs. Page numbers followed by *c* indicate chronology entries. Page numbers followed by *m* indicate maps.
