Montejo established a stronghold at the former Maya settlement of Champotan on the west coast of the Yucatán Peninsula. He then advanced northeastward, and by 1540, he had captured the ancient Maya stronghold of Kimpech, where he then founded a city known today as Campeche. From there, he penetrated into the interior of the peninsula and, in 1542, after taking control of most of western Yucatán, founded the city of Mérida on the ruins of another Maya city. By 1546, after suppressing a final uprising by a coalition of Maya tribes, he had the rest of the Yucatán Peninsula's eastern region firmly under Spanish control.

Montejo was appointed assistant governor of Yucatán and nearby Cozumel Island by his father in 1545. He settled in Mérida, which later became the principal city of the region and, after 1821, was capital of Mexico's Yucatán State.

Francisco de Montejo, part of the first wave of CONQUISTADORES in Mexico, participated in the subjugation of Indian peoples of the Yucatán, which opened the region to Spanish settlement.

Montejo y León, Francisco de

(ca. 1479–ca. 1549) *Spanish conquistador in Mexico and Central America, father of Francisco de Montejo*

Born in Salamanca, Spain, Francisco de Montejo was a member of a noble family. There are few details of his early years until 1514, when he sailed to the coast of Panama as a member of PEDRO ARIAS DE ÁVILA's expedition.

After a brief stay at Ávila's settlement at Nombre de Dios in Panama, Montejo went on to Cuba, where he entered the service of the island's colonial governor, DIEGO DE VELÁSQUEZ. In May 1518, he was given command of the soldiers who were sent under JUAN DE GRIJALVA to explore reports of a rich Indian civilization to the west. With Grijalva, Montejo explored the coast of Yucatán; he was among the first Europeans to learn of the Aztec Indian civilization of Mexico.

In 1519, Montejo served as an officer under HERNÁN CORTÉS in his expedition to the mainland of Mexico. Among the original landing party on the Yucatán Peninsula, he was later sent northward along the coast to discover a suitable landing site. He soon located a natural harbor where Cortés's ships were able to anchor. Cortés organized a permanent settlement, which he named Veracruz (true cross), and appointed Montejo as one of its administrators.

In July 1519, Montejo was sent back to Spain by Cortés to report personally to the Spanish monarch, Charles I (Holy Roman Emperor Charles V) on his contacts with the Aztec and to present him with gifts of gold, silver, and jewels acquired from the Indians. Charles appointed Montejo as governor of Veracruz.

Returning to Mexico in 1522, Montejo went on to assist Cortés in his conquest of the Aztec, leading the Spanish advance into Coatzacoalcos province, as far as the Gulf of Honduras and present-day Belize.

Montejo again returned to Spain in 1526, where he was commissioned to undertake the conquest of the Yucatán, which was then thought to be an island. In May 1528, he sailed from the port of Sanlúcar de Barrameda, near Seville, in command of a fleet of three ships and a force of 500 soldiers. His first attempt to subdue the Maya Indians from the east failed, and, in 1530, the CONQUISTADORES were forced to withdraw to Mexico.

In the meantime, Montejo succeeded in conquering the Tabasco region of southern Mexico, and, in 1531, he launched a second offensive against the Maya. This too met with little success in the face of stiff resistance. His men, disappointed at not finding wealth among the Maya comparable to the riches of the Aztec, deserted him in 1535, and he again returned to Mexico.

In 1540, Montejo's son, also named FRANCISCO DE MONTEJO, mounted a successful campaign that resulted in the total subjugation of the Maya and other native peoples of Yucatán.

The elder Montejo received the surrender of the Yucatán's most powerful native chief, Tutulxin, on January 23, 1541. The following year, he was appointed governor of Honduras, where he established the cities of Caballos and Comayagua. In 1547, he took charge of the Chiapas region of southern Mexico and became governor of Guatemala, where he founded the cities of New Sevilla and Olancho.

Montejo's colonial administration was investigated by a royal commission in 1546. To clear his name, he sailed to Spain in 1548, where he died the following year.

Francisco de Montejo served as one of Cortés's leading officers in the conquest of Mexico. He is credited with helping found Veracruz, one of the earliest permanent Spanish settlements on the North American mainland, and with initiating the conquest of the Yucatán, the last part of Mexico to fall under Spanish domination.

Moor, William (unknown–1765) *British mariner in Hudson Bay*

William Moor, who had served as a mate on HUDSON'S BAY COMPANY supply ships, was selected in 1746 to lead an expedition in search of an entrance to the NORTHWEST PASSAGE on the west coast of HUDSON BAY.

Moor was given command of the *Dobbs*, named after the enterprise's chief promoter, Arthur Dobbs, a politically well connected former Irish parliamentarian and surveyor general, who had won the support of the British Admiralty for this and a previous venture commanded by CHRISTOPHER MIDDLETON in 1741–42. A year before Moor sailed in 1746, the British Parliament had offered a prize of £20,000 to anyone who found the Northwest Passage. The expedition included another vessel, the *California*, commanded by Francis Smith, also a seafarer from the Hudson's Bay Company's supply fleet.

After wintering on the southwest shore of Hudson Bay at York Factory, Moor cruised northward along the bay's west coast and explored what first seemed to be a passage westward. Upon further exploration, the passage proved to be a closed-end bay, later known as Chesterfield Inlet. To the north, he made a thorough investigation of Wager Bay, located by Middleton in 1742. Using longboats, Moor and his men went more than 150 miles up Wager Bay, reaching Brown Lake at its western end, where they found the mouth of an unnavigable stream. Finding no other major openings to the west, Moor and his ships returned to England.

William Moor's expedition of 1746–47 served to convince many English navigators and geographers that Hudson Bay was not the gateway to the Northwest Passage. In the decades that followed, maritime explorers seeking the elusive waterway through North America concentrated their efforts on the coast of the Pacific Northwest.

Moorcroft, William (1765–1825) *British veterinarian in central Asia*

William Moorcroft, of Lancashire, England, studied medicine at the Liverpool Infirmary and, while still a student, was called upon to help determine the cause of a livestock epidemic known as the Derbyshire Cattle Plague of 1783. The experience led him to pursue a career in veterinary medicine, for which he went to France for additional training.

Moorcroft settled in London and developed a highly successful practice as an animal doctor. Then, in the late 1790s, he began to suffer financial losses as a result of problems arising from a patent he had obtained for a mechanical horse-shoeing process. In 1808, he accepted a position as a veterinary surgeon with the British-controlled Bengal government in northeastern India, caring for Bengal army horses; he also was engaged as the superintendent of the BRITISH EAST INDIA COMPANY's horse-breeding operations near the city of Kanpur.

It was in connection with his duties as an army veterinarian and horse breeder for the British East India Company that Moorcroft first became involved in the exploration of central Asia. In an effort to improve the quality of the na-

tive cavalry horses, he sought to travel overland into Turkistan to acquire breeding stock from the central Asian steppes. In 1812, he accompanied British army officer HYDER JUNG HEARSEY on an expedition, undertaken as part of the British government's Great Trigonometrical Survey of India, in which they searched for the source of the GANGES RIVER and crossed the HIMALAYAS into Tibet.

In 1819, Moorcroft embarked on a trade mission northwestward from Calcutta, seeking to open the independent states of northern India to trade with the British East India Company. Accompanied by a young English geologist, George Trebeck, he traveled to the city of Leh in the Ladakh region (now part of Kashmir), where he remained for more than two years, establishing diplomatic and commercial ties. In 1822, the company showed its displeasure at his overly long stay in Leh by suspending him from its payroll.

Undaunted, Moorcroft set out to implement his plan to obtain larger and stronger horses in Turkistan for the Bengal Army. He had first intended to travel by way of western China but he was denied permission to cross the border. Instead, he set out from Leh for Kashmir, where he arrived in early November 1822. While there, he arranged to send back several live "shawlwool goats," whose offspring eventually reached England.

From Kashmir, Moorcroft and Trebeck traversed the Punjab region of what is now northern Pakistan on a route not traveled by Europeans in modern times, and reached Peshawar. After crossing the Hindu Kush range and the KHYBER PASS, then following the Kabul River, they reached Kabul, Afghanistan. Moorcroft then traveled to the Turkistani kingdom of Bukhara, again through country not visited by Europeans since the days of ALEXANDER THE GREAT. In Bukhara, he met with the region's king and sold a shipment of trade goods.

In August 1825, Moorcroft set out from Bukhara for the city of Meymaneh on the northern Afghani border, hoping to find the finest horses in the world. While en route, he was captured by bandits. He died soon afterward, either from the effects of poison or from fever. His body was transported to the city of Balkh, where he was buried. Trebeck died of fever not long afterward at the Afghani city of Mazar.

In his 1812 expedition with Hearsey, William Moorcroft became one of the first Englishmen to cross the Himalayas. His account of this journey was published in England in the journal *Asiatic Researches* in 1816. At the time of his death in Afghanistan in 1825, he was still under suspension by the British East India Company, a fact that later led to a dispute over who actually had a claim to the journals of his last expedition. They remained unpublished for more than 20 years, and later British travelers from India, covering much of the same territory through which

Moorcroft had already explored, mistakenly believed they were the first Europeans to visit northern Afghanistan and the Turkistan region. Finally, in 1841, the ROYAL GEOGRAPHICAL SOCIETY published Moorcroft's account of the six years he spent in northern Pakistan and Turkistan, entitled *Travels in the Himalayan Provinces of Hindustan and the Punjab, from 1819 to 1825*. Even though he did not obtain the Asian horses for the Bengal army as planned, the "shawlwool" goats he sent back had a great impact on the British woolen industry and led to the introduction into western markets of what is known today as cashmere (Kashmir) wool.

Moreno, Francisco (1827–ca. 1905)

Argentine naturalist in the Andes Mountains and Patagonia

Born in Buenos Aires, Francisco Moreno attended Argentina's University of Córdoba, then went on to the University of Buenos Aires, graduating in 1854 as a doctor of natural science.

Moreno became a professor in the department of natural history at the University of Buenos Aires, where he concentrated in anthropology. In 1872, he undertook the first of a series of explorations, which would take him through much of the little-known regions south and west of Buenos Aires.

In 1876–77, Moreno traveled into the southern Andes Mountains and Patagonia to study the life and culture of the region's native peoples. After exploring Lake Nahuel Huapi, he continued southward, and on February 14, 1877, he became the first non-Indian to see Lake San Martín; two weeks later, he explored Cerro Chaltel (Mount Fitzroy).

On his second Patagonian expedition in 1880, Moreno was taken captive by the Tehuelche Indians (the "fabled Patagonian giants" reported by FERDINAND MAGELLAN and other earlier explorers of South America). He managed to escape just before his captors planned to kill him.

In 1882–83, Moreno undertook his most extensive exploration of the ANDES MOUNTAINS, traveling southward along the length of the mountain range, from Bolivia into the frontier region between Chile and Argentina. In 1884–85, he explored southwestward into the region south of Argentina's Río Negro, and into the Andean country around Lake Buenos Aires.

Francisco Moreno wrote many books based on his explorations into southern Argentina and the Andes Mountains. He was named chief of the Argentine government commission on the exploration of the country's southern territories and became director of Buenos Aires's anthropological museum. His work carried on the tradition of scientific study of the natural history of Patagonia begun by CHARLES ROBERT DARWIN and GEORGE CHAWORTH MUSTERS.

Morgues, Jacques Le Moyne de See LE MOYNE DE MORGUES, JACQUES.

Morozko, Luka (Luka Moroskoi)

(unknown–ca. 1699) *Russian Cossack in eastern Siberia*

In the late 1690s, the Russian Cossack Luka Morozko participated in the exploration and conquest of northeastern SIBERIA. Morozko served under VLADIMIR VASILYEVICH ATLASOV at Anadyr, which at that time was Russia's main settlement on the Pacific coast of Siberia, located at the mouth of the Chukchi Peninsula's Anadyr River. In 1696, under the direction of Atlasov, Morozko led a detachment of 16 Cossacks to investigate reports of a land to the south rich in fur and minerals. Morozko and his men penetrated the Kamchatka Peninsula, the only part of Siberia still unknown to Europeans, exploring along its west coast as far as the Tigil River.

Back at Anadyr later that year, Morozko reported to Atlasov on his findings, including accounts he had heard of the Kuril Islands, a chain of islands that stretch off the southern tip of Kamchatka, all the way to northern Japan. Starting in 1697, Morozko took part in Atlasov's campaign to bring the newly explored Kamchata Peninsula under Russian control. He was killed in about 1699 in a battle with the Kamchadal natives of eastern Kamchatka.

With Luka Morozko's penetration of the Kamchatka Peninsula in 1696, the full extent of Russia's vast Siberian domain was revealed.

Moscoso, Luis de (Luis de Moscoso de Álvara, Luis de Moscoso de Alvarado, Luys Moscoso)

(fl. 1530s–1540s) *Spanish conquistador in the American Southeast and Southwest*

Luis de Moscoso was born at Zafra in southwestern Spain, the son of a local government official. From 1530 to 1535, Moscoso, having become a professional soldier, served as an officer under PEDRO DE ALVARADO in campaigns of conquest in present-day Guatemala and in the northern Inca province of Quito, part of present-day Ecuador.

In April 1538, Moscoso left Spain with HERNANDO DE SOTO's expedition to explore Florida and adjacent lands for new sources of wealth. He sailed with de Soto's fleet, in command of the GALLEON *Concepción*, and after a long stopover in Cuba, landed with the expedition in the Tampa Bay area in May 1539. As de Soto's *maestro de campo*, or second in command, Moscoso undertook reconnaissance missions ahead of the main body of Spanish forces as they traveled through what is now northwestern Florida and into the southern APPALACHIAN MOUNTAINS of present-day Georgia, the Carolinas, and Tennessee. He was frequently sent

ahead to confer with local native leaders and to announce de Soto's arrival.

In fall 1540, Moscoso warned de Soto that the Creek Indians were planning to attack the Spaniards while they were encamped near present-day Mobile, Alabama. His warning went unheeded, and although de Soto and his forces were able to repel the Indians, they suffered losses in both men and equipment. De Soto replaced Moscoso as chief lieutenant with Baltasar Gallegos following a defeat at the hands of the Chickasaw Indians near present-day Pontotoc, Mississippi, in March 1541. Nevertheless, as de Soto was dying of fever in May 1542, he appointed Moscoso as his successor.

Moscoso tried, without much success, to convince local Indian leaders that de Soto had not really died but had ascended into heaven and would soon return. For this reason, he had his men weight de Soto's body with rocks and dispose of it secretly in the MISSISSIPPI RIVER.

After conferring with his officers, Moscoso determined that the expedition, with severe losses in men, livestock, food, and equipment, was in no condition to continue the quest for riches among the Indians, and he decided to lead survivors to safety in New Spain (Mexico). In late spring 1542, from a site near what is now Texarkana, Arkansas, he led them westward into eastern Texas. From Indians in Texas, Moscoso heard legend-like accounts of ÁLVAR NÚÑEZ CABEZA DE VACA and his companions, who had wandered through much of Texas and the American Southwest in the early 1530s.

By fall 1542, after reaching as far westward as the Trinity and Brazos Rivers, near the present-day Dallas–Fort Worth area, Moscoso abandoned his attempt to reach Mexico overland across the seemingly endless southern plains. He led his men back eastward along the Arkansas River and returned to the Mississippi River, where the expedition wintered in 1542–43, near present-day Natchez, Mississippi. While there, seven crude barges were built under the direction of a Genoese shipwright and, on July 2, 1543, Moscoso and his men sailed down the Mississippi River into the Gulf of Mexico, then followed the Gulf Coast southward. After a voyage of 52 days, they reached the mouth of the Pánuco River, near the newly established Spanish settlement of Tampico, Mexico, on September 10, 1543. Reequipped with food and clothing, they walked from there to Mexico City, where Moscoso was received by the Spanish viceroy, ANTONIO DE MENDOZA, to whom he presented an official narrative of the expedition, written by Luis Hernández de Biedma and sent back to King Charles I in Spain. Of the more than 600 men who had started out with de Soto, only 311 returned to Mexico with Moscoso.

As de Soto's second in command and as his successor, Moscoso had covered more than 4,000 miles of territory

through what is now the southeastern United States and eastern Texas and had commanded the first vessels to be sailed by Europeans down the Mississippi River into the Gulf of Mexico.

Luis de Moscoso's explorations, taken together with those of de Soto and Coronado, provided Spain with much information on the interior of the vast country north and east of Mexico. Yet Moscoso's return to Mexico marked the end of European exploration into the lower Mississippi River Valley and the southeastern United States for 140 years. The next major European penetration into the region did not occur until the 1682 expedition of RENÉ-ROBERT CAVELIER DE LA SALLE.

Mothe, Antoine Laumet de la See LA MOTHE, ANTOINE LUMET DE.

Mouhot, Henri (Alexandre-Henri Mouhot)

(1826–1861) *French naturalist in Southeast Asia*

Henri Mouhot was born at Montbeliard in eastern France, the son of an official in the French government. With his father's support, Mouhot embarked on a career of full-time scholarship. In the early 1850s, after studies in natural history at various European universities, as well as philology studies in Russia, he became involved in an early form of photography. He traveled throughout Europe with his brother, producing daguerreotype pictures of well-known natural scenes and works of art.

In 1856, Mouhot settled on Jersey in the Channel Isles, with his English wife, a descendant of the Scottish explorer of Africa, MUNGO PARK. Mouhot continued his work as a naturalist, concentrating on ornithology and on conchology, the study of shells. Not long afterward, inspired by reading about the kingdom of Siam (present-day Thailand), Mouhot resolved to attempt a scientific expedition into the upper Mekong River region of Southeast Asia, an area little known to Europeans.

With the support of Great Britain's ROYAL GEOGRAPHICAL SOCIETY and Royal Zoological Society, Mouhot sailed to Singapore in April 1858, from where he traveled to Bangkok and met with the king of Siam. Mouhot was one of the first Europeans to report that the native people of Siam called themselves and their land "Thai," meaning "free" in the Thai language.

Mouhot made his first scientific foray into the jungles of Southeast Asia in October 1858 on a voyage up the Mae Nam River, during which he collected specimens of fish, reptiles, and mammals. After several weeks, he returned to Bangkok. That December, he set out for Phnom Penh, capital of the neighboring kingdom of Cambodia. He was also received by this country's ruler.

Soon afterward, Mouhot embarked on his first expedition up the Mekong River. West of the river, in early 1860, he came upon the ruins of the ancient temples at Angkor. Extending over 100 square miles, they comprise the largest complex of religious buildings ever constructed. Erected from about A.D. 880 to 1434 by the Khmers, they had since been abandoned and overgrown with dense jungle. Mouhot sent back to England and France a written description and sketches of the site.

In October 1861, Mouhot traveled into northern Laos and made a study of the region's animal life. He visited additional sites of ancient ruins, accompanied at times by French missionary priests. He also explored the upper Mekong River and some of its tributaries. While traveling through the Plain of Jars region of northern Laos, he was stricken with tropical fever, dying near Louangphrabang on November 10, 1861.

Henri Mouhot's account of his explorations in Southeast Asia, *Journey to the Kingdoms of Siam, Cambodia, Laos and Parts of Indochina*, was first published in France in 1863. The Angkor ruins were hailed in Europe as one of the greatest archaeological finds of all time. Moreover, Mouhot's explorations in Laos immediately prompted the French government to sponsor efforts to find the source of the Mekong River. The most important of these efforts was the Mekong River Expedition of 1866, undertaken by ERNEST-MARC-LOUIS DE GONZAGUE DOUDART DE LAGRÉE and FRANÇOIS GARNIER.

Muir, John (1838–1914) *American naturalist, preservationist, writer*

John Muir was born in Dunbar, Scotland. When he was 11 years old, his family immigrated to the United States and settled on a farm in Portage, Wisconsin. He attended the University of Wisconsin in 1860–63, leaving before obtaining a degree. He pursued an interest in natural science on walking trips through the countryside, studying geography, geology, and wildlife. In 1867, he hiked from Indianapolis, Indiana, to the Gulf of Mexico.

In 1868–74, Muir spent time in the West, exploring and studying Yosemite Valley and the peaks of the Sierra Nevada in California and Glacier Bay in Alaska. In 1880, he settled on a fruit ranch in Martinez, California, and became successful in horticulture. In the 1890s, he traveled to and studied the forests of Australia, Africa, Europe, and South America.

Muir became active politically as a preservationist of wilderness areas and wildlife. His efforts led to the founding of Yosemite and Sequoia National Parks in 1890. He also was one of the founders of the Sierra Club in 1892, an environmental organization still active at present. His books include *The Mountains of California* (1894), *Our National*

John Muir (Library of Congress)

Parks (1901), *My First Summer in the Sierra* (1911), and *The Yosemite* (1912). His journals, *Travels in Alaska* (1915) and *A Thousand Mile Walk to the Gulf* (1916), were published posthumously.

John Muir's work was central to the shaping of the environmental movement in the United States and around the world and influenced President Theodore Roosevelt to set aside national forest reserves, national parks, and national monuments. Muir Glacier, which Muir located in Glacier Bay, Alaska, was named after him. In 1964, Muir's California home, some of his fruit orchards, and his gravesite were designated the John Muir National Historic Site.

Munk, Jens Eriksen (Eriksen Munk, Eriksen Munke, Jens Muncke) (1579–1628) *Danish mariner in Hudson Bay*

Jens Munk was born in Barbo on the south coast of Norway, at that time under the sovereignty of Denmark. He went to sea when very young, serving as a merchant sailor in Portugal and Brazil, as well as with the Dutch merchant fleet. By

the age of 25, he had become an experienced mariner and shipowner.

In 1609, Munk attempted a voyage to Novaya Zemlya, but, in the Barents Sea, he lost his ship to the ice. On Kolguyev Island, he and his men constructed a boat from the wreckage and used it to reach Archangel 580 miles away. From there, they returned to Copenhagen.

Munk was commissioned as a captain in the Danish navy in the Kalmar War of 1611–13 with Sweden. Afterward, he remained in service to Danish king Christian IV, carrying out a campaign against PIRATES along the North Sea coast of Norway. Munk was one of the first Danes to recognize the profits to be gained from Arctic whaling, and, in about 1618, he established the first Danish whaling facility on Spitsbergen (present-day Svalbard).

In 1619, Munk was directed by Christian IV to explore HUDSON BAY's west shore for a NORTHWEST PASSAGE to India. King Christian, known as the Danish Sailor King for his efforts to make Denmark a maritime power, decided upon this expedition after learning of the explorations of the Greek seafarer known as JUAN DE FUCA, who reportedly had

located the STRAIT OF ANIAN, a fabled opening on the west coast of North America providing a passage between the Pacific and Atlantic Oceans.

Outfitted with two naval vessels, the frigate *Unicorn* and a sloop the *Lamprey*, Munk and a combined crew of 63 men sailed from Denmark in May 1619. Following a course north of the Shetlands, they passed the Faeroe Islands and sighted Cape Farewell, GREENLAND's southern tip, in late June 1619. Sailing northwestward across Davis Strait, Munk and his ships entered closed-end Frobisher Bay, which they mistook for Hudson Strait.

Although Munk soon realized his error and managed to locate the entrance to Hudson Strait, he then sailed too far to the south, into Ungava Bay on the north coast of present-day Quebec, mistaking it for HUDSON BAY. He went ashore on land he called "Rinsund," where he met with a band of Inuit (Eskimo) and hunted reindeer. He took possession of the region in the name of King Christian.

By August 1619, Munk had managed to correct his navigational errors and negotiate the length of Hudson Strait, rounding Cape Wolstenholme and Digges Island. He then made a southwestward crossing of the bay, reaching the estuary of the Churchill River, near present-day Churchill, Manitoba, in early September 1619. The ships were beached to protect them from storms, and Munk and his men settled in for the winter.

During his stay, Munk undertook the first scientific studies to be made in Hudson Bay, noting bird migrations, making astronomical observations, and recording his own speculations on the origins of the icebergs he had encountered while negotiating Davis and Hudson Straits. By noting the exact time of an eclipse on December 20, 1619, and later correlating it with the time the same eclipse was observed in Paris, he was able to determine accurately the exact meridian of longitude of his winter base at Churchill.

By mid-January 1620, SCURVY had begun to take its toll among the crew; by the end of June 1620, only Munk and two others remained alive. Some sources suggest that the crew may have actually succumbed to an outbreak of trichinosis resulting from eating undercooked polar bear meat. Munk had commented in his journal that he preferred his meat cooked well-done, a factor that may have saved his life.

Munk and the other two survivors recovered by eating grass and other plants on shore. They refloated the *Lamprey* and sailed back to Norway, which they reached in September 1620. From there, Munk returned to Denmark.

Despite the disastrous outcome of his Hudson Bay voyage, Munk planned a second expedition to the Churchill River region, where he intended to establish a fur-trading colony. Called back to naval service in 1623, he never did return to Hudson Bay. He served on the Weser River in the Thirty Years' War of 1618–48, reaching the rank of admiral in 1625. He died three years later at the age of 49.

Jens Munk's 1619–20 expedition to Hudson Bay was the only known Danish attempt to find the Northwest Passage. He and his men were the first to winter in the Churchill River estuary in 1625, a region that had been visited but not thoroughly explored by SIR THOMAS BUTTON in 1612–13. Munk's account of his voyage and the harrowing winter he spent on Hudson Bay was published in 1624. His map was the first to depict Hudson Bay in its entirety and identify it as a single inland sea, which he had named the Novum Mare Christian (new Christian sea). European exploration of Hudson Bay resumed 10 years after Munk's expedition, with the 1631 voyages of THOMAS JAMES and LUKE FOXE.

Musters, George Chaworth (1841–1879)

British naval officer in South America

Born in Naples, Italy, George Musters was the son of a former British army officer, whose family was among the landed gentry of Nottinghamshire, England. Orphaned by the time he was four, he was raised by his uncles, one of whom, Robert Hammond, had sailed the Pacific Ocean and the coasts of South America on the *Beagle* with Admiral ROBERT FITZROY.

Musters underwent schooling on the Isle of Wight, then at a naval academy near Portsmouth; he entered the British navy as a cadet in 1854. His first assignment took him to the Black Sea, where he participated in naval actions in the Crimean War of 1853–56. By the war's end, at the age of 15, he had been awarded medals for valor by both the British and Turkish governments.

In 1861, Musters was promoted to lieutenant while serving on Queen Victoria's yacht; soon afterward, he was assigned to the *Stromboli*, on which he took part in a five-year cruise in South American waters. While ashore at Rio de Janeiro in 1862, he and a midshipman from the *Stromboli* scaled Sugarloaf Mountain and, as a prank, planted a British flag at the mountain's peak. The flag remained there for several years, despite efforts by Brazilian authorities to remove it.

Musters purchased lands around Montevideo, Uruguay, where he established a sheep ranch while still with the British navy. Leaving active naval service at the rank of commander by 1869, he settled briefly in the Falkland Islands in the Atlantic Ocean. He became interested in the natives of Patagonia, the Tehuelche, whom FERDINAND MAGELLAN and other explorers had described as giants.

In 1869, Musters embarked on an expedition to explore the little-known interior regions of Patagonia and to study the life and culture of the Patagonian natives. From the Falklands, he first sailed to Punta Arenas on the STRAIT OF MAGELLAN. He then traveled northward to Santa Cruz on the southeast coast of Argentina. Accompanied by a band of

Tehuelche (who came to regard him as their king), he traced the course of the Río Chico westward almost to its source, then followed the eastern slopes of the southern ANDES MOUNTAINS northward. After crossing Argentina's Pampas, he followed the Río Negro to its mouth on the South Atlantic, which he reached in 1870, having covered more than 1,400 miles through the interior of southernmost South America.

Musters returned to England, where he wrote an account of his journey, entitled *At Home With the Patagonians, a Year's Wanderings on Untrodden Ground from the Straits of Magellan to the Río Negro*. It was published in London in 1871. The work provided his contemporaries with a full description of the customs of the Tehuelche, distinguishing them from the Araucanian tribes to the north and the Tierra del Fuego people to the south. In addition, it added much to the geographic knowledge of the interior of southern Argentina, which until that time had remained largely unknown to Europeans. Musters's achievements in exploring South America were officially recognized by the ROYAL GEOGRAPHICAL SOCIETY, which awarded him a gold watch in 1872.

Musters made a visit to Vancouver Island, British Columbia, where he lived among the Indians and studied their life and culture. Afterward, he returned to South America, planning to make a west-to-east crossing of the continent from Chile to Patagonia. Circumstances led him to abandon this venture, however. He soon married the daughter of a British family living in Bolivia and settled there, traveling throughout that country and adjoining regions.

In 1876, Musters returned to his family's home, Wiverton Hall, in Nottinghamshire. Two years later, he was appointed Great Britain's diplomatic representative in Mozambique, but he died in early 1879 before he could travel there.

Nicknamed the "King of Patagonia" for his exploits among the Tehuelche, George Musters provided one of the first modern descriptions of the aboriginal people of southern Argentina. Lake Musters, near the headwaters of the Chico River, was named in honor of his explorations along the southeastern slopes of the Andes and the upper Chico River region.

Mylius-Erichsen, Ludwig (Ludvig Erichsen)

(1872–1907) *Danish explorer in Greenland*

Born in Denmark, Ludwig Mylius-Erichsen commanded the Danish Greenland Expedition of 1902–04. His team of anthropologists, scholars, and scientists traveled to GREENLAND's northwest coast, at the upper end of Melville Bay, where they made a study of the language and customs of the Inuit. They also explored the uncharted shores of the Hayes Peninsula, near what is now Thule Air Force Base, Greenland, reaching as far north as Cape York.

In an expedition aboard the Arctic exploring vessel *Danmark*, Mylius-Erichsen led another Danish scientific expedition to Greenland's northeast coast in 1906. He reached a point farther north than the one achieved by KARL CHRISTIAN KOLDEWEY in a 1869–70 expedition to eastern Greenland. In 1907, Mylius-Erichsen reached the Northeast Foreland, a peninsula jutting out of Greenland's northeastern corner. While exploring Northeast Foreland, he and two members of his expedition perished of cold, hunger, and exhaustion.

The peninsula Ludwig Mylius-Erichsen located at 82° north latitude, Greenland's northeasternmost point, was renamed Mylius-Erichsen Land in his honor. One of the survivors of the expedition was the German meteorologist and geophysicist ALFRED LOTHAR WEGENER, who undertook subsequent explorations in Greenland.

Nachtigal, Gustav (1834–1885) *German physician, diplomat in North and West Africa*

Gustav Nachtigal was born in the Bavarian town of Eichstatt, the son of a Lutheran pastor. He studied medicine at several German universities and eventually became an army surgeon.

With the onset of tuberculosis, Nachtigal traveled to Algeria in 1862 to recover his health in the dry desert climate. While there, he made his first explorations into the SAHARA DESERT. Two years later, he was appointed court physician to the bey of Tunis. Learning enough Arabic to travel among the Arabs as one of them, he took part in a year-long military expedition with the Tunisian army against marauding desert nomads.

In 1868, the German explorer GERHARD ROHLFS of North Africa contacted Nachtigal in Tunis, arranging a commission from Wilhelm I of Prussia for a diplomatic mission to the Sultanate of Bornu in what is now northeastern Nigeria. Nachtigal set out from Tripoli and, traveling southward into the Fezzan, reached the desert city of Murzuk in southwestern Libya, where he was joined for a short time by the Dutch woman explorer of North Africa, ALEXANDRINE PETRONELLA FRANCINA TINNÉ. From Murzuk, Nachtigal headed southeastward across nearly 500 miles of desert into the 11,000-foot-high Tibesti range of what is now northwestern Chad, becoming the first European to visit the region.

Nachtigal eventually reached Kukawa, the capital of Bornu, where he presented the sultan with gifts from the

Prussian monarch, among which was a type of portable organ known as a harmonium. He then proceeded to Lake Chad, disguised as a Muslim pilgrim, and after exploring the Chari River, he journeyed to TIMBUKTU and into central Africa before traveling into the eastern Saharan states of Wadai, Darfur, and Kordofan. He then made a southeastward crossing of the Sahara Desert. By summer 1874, he had reached Khartoum on the White Nile River, from where he traveled to Cairo, then back to Europe. In Germany, Nachtigal wrote a three-volume account of his explorations in North Africa, *Sahara and Sudan*, published from 1879 to 1889.

Nachtigal became German general consul of Tunisia in 1884, soon after it had become a French protectorate. After a subsequent appointment as German imperial commissioner to West Africa, he headed a diplomatic expedition to Togoland and Cameroon, which by then were among the last regions of West Africa not yet under European colonial rule. In July 1884, Nachtigal successfully negotiated a treaty with the native ruler of Togoland, making the region a German colony. In the same month, he entered into an agreement with the tribal leaders of Cameroon under which that land became a German protectorate. While returning to Germany, he died at sea off the Ivory Coast and was buried ashore at Grand-Bassam.

Gustav Nachtigal was the first European to make a southeastward crossing of the Sahara and travel through the region between Lake Chad and the White Nile. He revealed much about the relationship between the dominant

geographic features of the eastern and western regions of North Africa.

Naddod (Naddod the Viking, Naddoc)

(fl. 860s–870s) *Norse mariner in Iceland*

Naddod the Viking appears in several traditional Norse historical accounts as a seafarer. In about A.D. 860 (according to events reconstructed from one version of the Norse *Book of the Settlements*), Naddod sailed from Norway on a voyage to the Faeroe Islands. After being driven by a storm about 250 miles northwest of the northernmost of the Faeroes, he came upon the east coast of ICELAND.

Naddod and his crew landed at a point that may have been near Reyðharfjordhur and briefly explored the surrounding countryside. They scaled a mountain, hoping to find some sign of human habitation. Failing to do so, they set sail for the Faeroes. As they left, snow began to fall, whereupon Naddod and his men named the land Snaeland, meaning “snow land” in Old Norse.

In another version of the *Book of the Settlements*, the Swedish Viking GARDAR SVARSSON is credited with landing in Iceland at about the same time as Naddod. Although one of them may have been the first Norseman to reach Iceland, traditional Irish sources suggest that Irish monks may have made voyages there earlier.

Nain Singh See SINGH, NAIN.

Nansen, Fridtjof (1861–1930) *Norwegian zoologist, oceanographer, statesman in Greenland and the Arctic Ocean*

Fridtjof Nansen was born in Store Froen, Norway, near Christiania (present-day Oslo). In 1880, he entered the University of Oslo, where he concentrated in zoological studies.

In 1882, while still a student, Nansen undertook his first venture to the Arctic, sailing on the Norwegian sealing vessel the *Viking* to Spitsbergen (present-day Svalbard), where he collected zoological specimens. On the return voyage, he sailed by way of the east coast of GREENLAND, where the vessel was trapped in the PACK ICE for three weeks. Soon after his return to Norway, Nansen was appointed as curator of the Museum of Natural History in Bergen.

In 1888, a year after he had received his doctorate in zoology, Nansen, inspired by the accounts of NILS ADOLF ERIK NORDENSKJÖLD, organized an expedition to explore the southern part of Greenland. He designed special equipment for the venture, including an ultralight sledge and a portable stove that used a minimum of fuel, which came to be known as the “Nansen Cooker.”

Among the five men Nansen had recruited to accompany him were two Laplanders (Sami) and three Norwe-

gians, including OTTO NEUMANN SVERDRUP. Aboard the sealing ship the *Jason*, they sailed from Oslo in May 1888. Upon reaching the uninhabited southeast coast of Greenland, they approached the shore in two small boats, making a landing at Kjøge. Using snowshoes and what are known today as cross-country skis, Nansen and his companions then traveled westward, and, by mid-August 1888, they had ascended Greenland’s ice cap to an altitude of 9,000 feet. On September 27, they reached Greenland’s west coast at Ameralikfjord, then made their way to the Danish settlement at Godthaab (present-day Nuuk). While wintering there in 1888–89, Nansen made a study of the Inuit (Eskimo) and their Arctic survival techniques.

Nansen returned to Norway in 1889, having proven that Greenland’s ice cap extended all the way into the interior. Soon afterward, he married Eva Sars, the daughter of a university professor. His account of the expedition, *The First Crossing of Greenland*, was published in 1890.

In 1884, Nansen had learned that wreckage from the *Jeannette*, American Arctic explorer GEORGE WASHINGTON DE LONG’s ship, which had been crushed and sunk by the ice in the polar seas off the New Siberian Islands in 1881, had been found on the southwest coast of Greenland. Based on this information, he speculated that a specially designed vessel could be deliberately set in the ice near where the *Jeannette* had been stranded and drift enough northward through the frozen Arctic Ocean to serve as a base for a successful expedition by sledge across the ice to the NORTH POLE.

Although Nansen’s plan was at first met with some skepticism, by 1893 he had gained enough financial support from the Norwegian government, King Oscar of Norway, and Great Britain’s ROYAL GEOGRAPHICAL SOCIETY to mount an attempt. A ship, the *Fram*, built under the direction of Scottish naval architect Colin Archer, was equipped with a saucer-shaped hull designed to withstand the pressure of advancing ice and force the vessel on top of the surface of the frozen Arctic Ocean.

In June 1893, Nansen and the *Fram* sailed from Oslo with a crew of 12, including a member of the earlier Greenland expedition, Otto Sverdrup, as second in command. On rounding North Cape, they made their way into the NORTHEAST PASSAGE along the Arctic coast of Russia and SIBERIA. Before entering the Kara Sea, they stopped at Khabarova, near Vaigach Island, where Russian Arctic explorer EDUARD VON TOLL provided them with dogs for the planned sledge journey to the North Pole.

Sailing eastward beyond Cape Chelyuskin, Asia’s northernmost point, they entered the Sea of Laptev, and, on September 26, 1893, they achieved their goal of being ice-bound near the New Siberian Islands, at 77° north latitude. After a year, the ship had drifted only 5° northward and had begun to trend more to the west. In March 1895, with the *Fram* still heading too much to the west, Nansen de-

Fridtjof Nansen (Library of Congress)

cided to leave the ship and make an attempt on the North Pole, then 400 miles to the north. Leaving Sverdrup in charge, on March 14, 1895, he and Frederik Hjalmar Johansen embarked across the ice equipped with two kayaks, three sledges, and 24 dogs.

On April 8, 1895, at a point 240 miles from the North Pole, Nansen decided to turn back when ice conditions made progress northward by either sledge or kayak impossible. He had reached 86°14' north latitude, a record at that time.

Realizing that they would be unable to locate the still drifting *Fram*, Nansen and Johansen traveled southward toward the Siberian mainland. On July 24, 1895, they reached the northernmost islands of Franz Josef Land, where they built a hut of stone and moss, with a roof of walrus skins. They wintered there, hunting polar bear and walruses. On June 17, 1896, Nansen met up with British Arctic explorer FREDERICK GEORGE JACKSON, then in Franz Josef Land with the Jackson-Harmsworth Expedition. Anticipating such a meeting, Jackson had brought along letters from both the Norwegian government and Nansen's wife, Eva, which he presented to Nansen at his base at Cape Flora. Soon afterward, Nansen and Johansen were picked up by Jackson's relief ship, the *Windward*, on which they sailed to the northern Norwegian port of

Vardo. There, they learned of the arrival of the *Fram* at Tromsø a few days later. The *Fram* had drifted to Spitsbergen, where Sverdrup had managed to free it from the ice.

Hailed as a national hero in Norway, Nansen returned to academic life as a professor of zoology. He was honored with degrees from both Oxford and Cambridge Universities in England, where an English edition of his account of his attempt on the North Pole, *Farthest North*, was published in 1897. Having achieved national prominence, he went on to play an important political role in the dissolution of Norway's union with Sweden in 1905, and, that year, he was appointed modern Norway's first ambassador to Great Britain.

In 1908, Nansen became professor of oceanography at the University of Oslo. Ten years later, he became involved in relief efforts to aid displaced persons and war prisoners in the aftermath of World War I, for which he was awarded the Nobel Peace Prize in 1922. He had planned another Arctic exploit, a flight over the North Pole in an AIRSHIP, the *Graf Zeppelin*, before he died in May 1930, at his home outside of Oslo.

Fridtjof Nansen made the first known crossing of Greenland in 1888. Although he did not reach the North Pole in his Arctic expedition of 1893–96, the oceanographic studies he conducted revealed the Arctic Ocean to be much deeper than was thought, containing neither large landmasses nor a large number of islands, as some geographers and scientists had speculated. Among his numerous published works on oceanography and Arctic exploration, he wrote *Northern Mists* (1911), which recounts the history of Arctic exploration, dating from the ancient voyages of PUTHIAS and the medieval voyages of the VIKINGS. Nansen's ship, the *Fram*, was used by ROALD ENGELBREGT GRAVNING AMUNDSEN on his successful 1910–12 expedition to Antarctica and the SOUTH POLE.

Nares, Sir George Strong (1831–1915)

British naval officer in the Canadian Arctic

George Nares was born in Aberdeen, Scotland, the son of a British naval officer. At the age of 15, he entered the British navy as a midshipman.

In 1852, Nares was appointed as second in command aboard the *Resolute*, one of the fleet of ships under SIR EDWARD BELCHER searching for SIR JOHN FRANKLIN, who had been missing in the Canadian Arctic since 1845. He undertook several long sledge journeys over the next two years, surveying more than 1,100 miles to the north and west of Devon Island.

Nares next took part in naval actions in the Black Sea in the Crimean War of 1853–56. During the late 1860s, he undertook coastal surveys for the British Admiralty in Australia as well as in the Gulf of Suez.

In 1872, at the rank of captain, Nares was given command of the steamer *Challenger* and sailed around the world on one of the first oceanographic research voyages in history. In charge of the expedition's scientific team was SIR CHARLES WYVILLE THOMSON. After three crossings of the Atlantic Ocean, Nares directed the expedition to the Pacific Ocean by way of the CAPE OF GOOD HOPE. The team made oceanographic observations in the waters off Australia, NEW ZEALAND, and Japan, as well as in Polynesia. The expedition then headed southward, and, in February 1874, the *Challenger* became the first steamship to cross the ANTARCTIC CIRCLE. From the findings of his subsequent coastal survey, geographers were able to determine that Antarctica was a continent.

Later in 1874, Nares was called back to England and placed in command of the British Arctic Expedition, the major aim of which was to plant the British flag at the NORTH POLE. With two ships, the *Alert* and the *Discovery*, he was to explore the region north of Smith Sound and the channel between northern Ellesmere Island and northwestern GREENLAND, from where he could make an attempt on the North Pole. On May 29, 1875, he sailed with his ships from Portsmouth, England. After a stopover for sledge dogs at Proven, Greenland, he headed into Baffin Bay and then to Smith Sound, which he reached in July 1875. He then crossed westward to Ellesmere Island and northward to Cape Frazier.

Leaving the *Discovery* at the southern end of Kennedy Channel to serve as a relief ship, Nares, on the *Alert*, continued northward into Robeson Channel. He reached a point on the north coast of Ellesmere Island, adjacent to the edge of the frozen Arctic Ocean, where he and his men wintered.

Under Nares's command, sledging parties explored westward along the north coast of Ellesmere Island. The sledging expedition on the polar attempt was led by Commander Albert Markham, who managed to reach 83°20'26" north latitude, the northernmost record until that time. At that point, on encountering impassable stretches of ice, the team was forced to return.

Nares and his ships returned to England on October 27, 1876. He again commanded the *Alert* in an 1878 survey of the STRAIT OF MAGELLAN. Knighted for his achievements in Arctic exploration, he was made a vice admiral in 1892.

Based on his 1875–76 expedition, Sir George Nares reported that he had proved the nonexistence of an ice-free polar sea, and he concluded erroneously that the impassable permanent ice fields north of Ellesmere Island and Greenland made any attempt on the North Pole futile. He confirmed and corrected the locations of earlier geographic discoveries made by the Americans ISAAC ISRAEL HAYES and CHARLES FRANCIS HALL, and established that Greenland was an island. In addition, his study of the ice north of

Ellesmere Island revealed it to be nearly identical to the type of ice encountered around Banks Island, farther to the west, demonstrating that the Arctic Ocean was a single, unified, frozen expanse. On the site of the north coast of Ellesmere Island where Nares and his expedition spent the winter of 1875–76, a radio and meteorological base was later established by the U.S. and Canadian governments. Named Alert in honor of Nares's ship, the base is the most northerly permanent settlement in the world. The body of water that separates northwestern Greenland from Ellesmere Island is named Nares Strait.

Narváez, Pánfilo de (ca. 1478–ca. 1528)

Spanish soldier, colonial official in the Caribbean, Mexico, and Florida

Pánfilo de Narváez was born in Valladolid, Spain. A soldier by profession, he traveled to the Americas in about 1500, where he took part in the Spanish conquests of Jamaica and Hispaniola (present-day Haiti and the Dominican Republic). In 1511–14, he was DIEGO VELÁSQUEZ's chief lieutenant in the conquest of Cuba.

In 1520, Narváez was sent from Cuba by Velásquez to arrest conquistador HERNÁN CORTÉS, who had disobeyed official orders in his advance on the Aztec. That May, Narváez landed near Veracruz, Mexico, with a 900-man military force. Cortés launched a surprise counterattack against Narváez at Veracruz. Narváez lost an eye in battle and was taken prisoner, whereupon most of his men deserted to join Cortés in the conquest of Mexico. In 1521, after his release, Narváez returned to Spain.

In 1526, Narváez was appointed *adelantado* (governor) of Florida by Spanish king Charles I (Holy Roman Emperor Charles V) and was empowered to explore and conquer the lands between the Río de las Palmas in northeastern Mexico and the Cape of Florida. With a fleet of five ships, carrying 600 soldiers and colonists, Narváez left the Spanish port of Sanlúcar de Barrameda in June 1527. He stopped first at the Spanish settlements in Cuba and Santo Domingo, where one-third of the colonists deserted. In April 1528, his expedition, now reduced to 400 men, attempted to reach the Mexican coast at Tampico, but the ships were blown off course by storms. He instead made a landing at Tampa Bay on Florida's Gulf Coast.

Narváez stayed ashore with 300 men, sending his ships with the rest of his forces northward. He planned to rejoin the ships after a short exploratory march and sail to a Spanish settlement at the mouth of the Pánuco River on the east coast of Mexico.

Narváez led his reduced expedition inland into the Florida Panhandle. From the Indians, he heard tales of gold and other riches at the town of Apalachen to the north. This site, near present-day Tallahassee, Florida,

proved to have only an abundance of food. The Spanish pillaged Apalachen, thus earning the hostility of the Indians. After engaging the Indians in several battles and losing some of his men to Indian arrows as well as to tropical fever, Narváez headed for the Gulf Coast, where he believed his ships were waiting.

Narváez reached Apalachicola Bay, but the ships had since departed for Mexico. When food ran out, his men were forced to eat the last remaining horses at Apalachicola Bay, referred to as the “Bay of Horses.” With no gold to be found and supplies critically low, Narváez decided to abandon the enterprise and try to reach Mexico by sea, still believing it to be only a few days’ journey away. His men undertook the construction of five crude barges.

On September 22, 1528, Narváez and his 242 remaining men set sail into the Gulf of Mexico, intending to follow the shoreline to the Pánuco River. At a point below the outlet of the MISSISSIPPI RIVER, the barges were driven farther offshore by the river’s currents. Narváez, in command of one barge, was caught in a storm and never seen again. Only a handful of the expedition later reached the Texas mainland and Mexico, including the expedition’s treasurer, ÁLVAR NÚÑEZ CABEZA DE VACA, and a former slave, ESTEVANICO.

Pánfilo de Narváez’ 1528 attempt to conquer and colonize Florida ended in disaster. Nevertheless, his explorations resulted in the first significant land penetration by Europeans into the present-day United States. The expedition’s few survivors brought back the first reports by Europeans of a great river—the Mississippi—flowing into the Gulf of Mexico.

Nearchus (Nearchos) (ca. 360–312 B.C.)

Greek mariner under Alexander the Great in the Arabian Sea, Gulf of Oman, and Persian Gulf

Nearchus was a native of the island of Crete in the Mediterranean Sea. He settled at Amphipolis in the northern Greek kingdom of Macedon, where he was befriended by ALEXANDER THE GREAT. Starting in 334 B.C., he joined Alexander in his campaign against the Persian Empire, and, following the victory over Darius III at Granicus that same year, he was appointed governor of Lycia, a town on the Mediterranean coast of present-day Turkey.

In 329, Nearchus traveled east into Bactria (present-day Afghanistan), bringing reinforcements for Alexander’s campaign to India. By 325, Alexander had reached western India’s Hydaspes (the Jhelum River), where his army refused to continue. A fleet of 150 ships was constructed for a voyage of exploration, and a force of 5,000 men, including Macedonian officers, plus Greek, Cypriot, and Egyptian soldiers, was placed under Nearchus’s command.

By September 325, Nearchus had reached the mouth of the INDUS RIVER near modern-day Karachi, Pakistan. The

expedition was delayed in the Indus Delta by unfavorable monsoon winds for about three weeks. Nearchus then headed westward along the coast of what is now Pakistan. The fleet made daily stops for food and water, putting in at Gwadar Bay near the present-day Pakistan-Iran border.

Nearchus sailed into the Gulf of Oman, then passed through the Strait of Hormuz and entered the Persian Gulf. During one of his frequent stops along the west shore of the Persian Gulf, he met up with Alexander’s lieutenant Leonnatus, with whom he made a five-day march inland to present-day Kerman, Iran. With fresh supplies from Alexander’s army, Nearchus returned to his fleet on the Persian Gulf.

Sailing along the Makran Coast—the Persian Gulf coast of what is now Iran—Nearchus came into contact with several different primitive peoples, whom he described in his subsequent report to Alexander. He reported seeing “hairy men,” who used their long fingernails as tools, as well as a people he called the Ichthyophagi (literally, “fish eaters”), who subsisted entirely on fish and built houses from whale bones. At one point, the fleet had an encounter with a group of large whales, creatures unknown to his Mediterranean sailors. Nearchus made a visit to the island of Astola, which, according to legend, was inhabited by mermaids.

Nearchus journeyed inland to meet with Alexander at Gulashkird, then returned to the Persian Gulf and his ships. He sailed to the head of the Persian Gulf and the mouth of the Euphrates River, which he ascended to the Tigris, rejoining Alexander at Susa.

Nearchus had intended to undertake additional voyages of exploration, including a proposed voyage around the Arabian Peninsula and a circumnavigation of Africa, but Alexander’s death in 323 put an end to these plans. Nearchus resumed his governorship of Lycia.

Alexander had hoped Nearchus’s coastal voyage from western India to the head of the Persian Gulf would establish a sea route connecting the Asian and Mediterranean portions of his empire. Following the breakup of Alexander’s empire after 323, a better route to India was established that made use of the monsoon winds of the Indian Ocean. Nonetheless, an account of Nearchus’s expedition, written in the second century A.D. by the Greek historian Arrian in his work *Indica*, survives as one of the earliest records of nonmilitary exploration.

Necho II (Neco, Nechoh) (unknown–593 B.C.)

king of ancient Egypt, organizer of expedition along coastal Africa

Pharaoh Necho II, who ruled Egypt from 609 to 593 B.C., was the son of Psamtik, founder of the XXVI dynasty.

Soon after his ascent to the throne, Necho launched a campaign of expansion eastward into what is now Israel and

Syria, decisively defeating King Josiah of Judah and his army at Megiddo in 608. Three years later, Necho himself was defeated at Carchemish on the Euphrates River by the Babylonians under Nebuchadnezzar, and withdrew to Egypt.

From his capital in the ancient Nile Delta city of Saïs, Necho turned his attention to establishing a trade link between the MEDITERRANEAN SEA and the RED SEA. He first attempted to re-excavate an old canal that had run from the city of Bubastis, on the NILE RIVER north of Cairo, eastward to the Red Sea. He abandoned the project after an oracle warned him of its dire consequences.

In about 600, Necho commissioned a group of Phoenician seafarers to undertake a voyage from the Gulf of Aqaba southward into the Red Sea and Indian Ocean, in an attempt to find an alternate sea route from Egypt to the Mediterranean. The Phoenicians reportedly followed the coastline of Africa, and, on rounding the continent's southern end from east-to-west, sailed northward to the STRAIT OF GIBRALTAR, from where they crossed the Mediterranean eastward to Egypt's Nile Delta.

According to an account of the expedition by HERODOTUS, written more than 100 years later, the voyage Necho had commissioned took almost three years to complete, during which the Phoenicians stopped each fall to plant a crop of grain, remaining until the following spring to harvest it. The sailors' descriptions of the relative position of the sun as they rounded southern Africa from east to west strongly suggests that they were the first people from the Mediterranean world to travel south of the EQUATOR and circumnavigate Africa.

Although the expedition Necho II had sent out located no practical alternate sea route between Egypt and the Mediterranean, the geographic information it brought back led Herodotus to conclude correctly that Africa, except where it is connected to Asia, is surrounded by a continuous sea. Almost 2,000 years afterward, surviving fragments of Herodotus's account inspired Portugal's HENRY THE NAVIGATOR, prince of Portugal, to launch a program of exploration, which culminated in the voyage around Africa under VASCO DA GAMA in 1497–99.

Needham, James (unknown–1673) *English colonist in North Carolina and Tennessee*

In April 1673, Carolina colonist James Needham accompanied GABRIEL ARTHUR on a voyage of exploration of the Occaneechi Path, an Indian trail that followed the Blue Ridge southwest from Fort Henry, present-day Petersburg, Virginia. Their expedition was organized by prominent Virginia colonist Major General ABRAHAM WOOD.

At the headwaters of the Roanoke River, Needham and Arthur were turned back by Occaneechi Indians, who resented the intrusion of Englishmen into their lucrative trade with the inland Cherokee. Needham and Arthur again set

out from Fort Henry in May 1673 and traveled southwestward across present-day North Carolina into Cherokee territory at the headwaters of the Tennessee River. Needham left Arthur with the "Tomahitan" Indians (probably Cherokee) to learn their language, and headed back to Fort Henry.

In September 1673, Needham departed Fort Henry to rejoin Arthur. His Occaneechi guide, John Hasecoll, fearing that his tribe's trade with the Cherokee would be jeopardized by English interlopers, murdered Needham at a point southwest of present-day Winston-Salem, North Carolina. Arthur, after being held captive, wandered for several months through a wide area of the western APPALACHIAN MOUNTAINS.

James Needham participated in one of the earliest explorations of the Blue Ridge southwest of the early English Virginia settlements. He was among the first Englishmen to enter what is now Tennessee and make contact with trans-Appalachian tribes.

Nevelskoy, Gennady Ivanovich (Genadii Nevelskoi) (1814–1876) *Russian naval officer in southeastern Siberia and the Russian Far East*

Gennady Nevelskoy was a captain-lieutenant in the Russian navy in 1848, when he commanded the *Baykal* on a voyage from the Baltic port of Kronstadt, by way of CAPE HORN, to Kamchatka on the Pacific coast of SIBERIA.

In 1849, Nevelskoy undertook explorations southward from Kamchatka to the region around the mouth of the Amur River and the northern end of Tatar Strait. He then cruised around the northern end of Sakhalin, proving it to be an island.

Nevelskoy traveled westward across Siberia and European Russia and returned to St. Petersburg in 1850, thus completing a journey around the world. He reported that the lower Amur River was navigable, and that a strait separated Sakhalin from the mainland, indicating the existence of a short sea route from the mouth of the Amur River into the Sea of Okhotsk and the North Pacific Ocean.

In 1851, Nevelskoy, as commander of the Amur Expedition, again traveled to the region southwest of the Sea of Okhotsk and claimed for Russia the territory around the lower Amur River, as well as all of Sakhalin. He established Nikolayevsk, an outpost near the mouth of the Amur, and, during the next four years, directed further explorations of Sakhalin and the regions inland from Tatar Strait. These expeditions located new harbors, including one that came to be known as Nevelskoy Bay. The results of the land explorations were later used to establish a portion of the Russian-Chinese border in the early 1860s.

Nevelskoy returned to European Russia in 1856. Soon afterward, he left active naval service, taking up residence in Paris.

Gennady Nevelskoy's explorations revealed Sakhalin to be an island, not a peninsula, as had been previously reported by JEAN-FRANÇOIS DE GALAUP, comte de La Pérouse, and ADAM IVAN RITTER VON KRUSENSTERN. His finding that the lower Amur River was navigable soon led to the development of Nikolayevsk as an important Pacific port for Russia.

Newberry, John (unknown–ca. 1585)

English merchant, traveler in Persia and India

In 1580, John Newberry, an English merchant, was sent by the London-based LEVANT COMPANY to revive direct overland trade links between India, the Persian Gulf ports, and the MEDITERRANEAN SEA. His sponsors hoped to establish an alternative to the sea route around Africa, which was then dominated by Portugal and Spain.

Newberry descended the Euphrates River to Baghdad, and then Basra, reaching the Persian Gulf. He sailed down the gulf to Portuguese-controlled Hormuz, from where he traveled northward into western Persia (present-day Iran), visiting the cities of Shiraz, Esfahan, Qazvin, and Tabriz. On his return trip to England, he made a westward crossing of what is now Turkey to Constantinople (present-day Istanbul), and sailed for England, reaching it in 1581.

In 1583, Newberry acted as guide for an English diplomatic and trade expedition to the court of Akbar, the Mogul emperor of India. The group, which included merchant and diplomat RALPH FITCH, sailed to Syria, then reached the Persian Gulf by way of the Euphrates River.

At Hormuz, Newberry and his party were arrested by the Portuguese and taken across the Arabian Sea to Goa, the Portuguese colony on India's southwest coast. Yet they soon managed to gain their release.

Newberry then accompanied Fitch and another Englishman to the court of Akbar at Fatehpur Sikri, near Agra, India, and presented the Mogul ruler with letters from Queen Elizabeth I.

In 1585, Newberry began the return trip to England on his own, having left his companions at the Mogul capital. Soon after his departure for Lahore to the northwest, he disappeared without a trace.

John Newberry was the first Englishman to descend the Euphrates and to travel across Persia. Along with Ralph Fitch, he initiated trade contacts leading to the organization of the BRITISH EAST INDIA COMPANY in 1600.

Newberry, John Strong (1822–1892)

American physician, geologist in the American West

John Strong Newberry was born in Windsor, Connecticut. He attended Western Reserve College (now Case Western Reserve University) in Cleveland, graduating in 1846. He continued his studies at Cleveland Medical College, receiving a degree as a doctor in 1848. After two years of travel

and additional studies in Europe, he returned to Cleveland, where he set up a medical practice.

In May 1855, Newberry served as assistant surgeon and geologist for an official U.S. government expedition exploring the country between San Francisco and the mouth of the COLUMBIA RIVER, as part of a survey for a proposed transcontinental railroad route. Under the command of Lieutenant Robert S. Williamson of the U.S. Army Corps of Topographical Engineers, he made a detailed study of the geology, plant life, and animal life of northern California and the Pacific Northwest, which was incorporated into the official account of the expedition, published in 1857, *Reports of Explorations and Surveys to ascertain the most Practical and Economical Route for a Railroad from the Mississippi River to the Pacific ocean, made in 1853–6*.

Newberry took part in a subsequent topographical expedition in 1857–58, accompanying Lieutenant JOSEPH CHRISTMAS IVES in a journey by steamboat 500 miles up the COLORADO RIVER. He then spent nearly a year studying the natural history of the Grand Canyon and the surrounding territory; he contributed much to the expedition's official report, *Report Upon the Colorado River of the West, explored in 1857–58*, which was published in 1861.

In summer 1859, Newberry served under Captain JOHN N. MACOMB in a Topographical Corps expedition to the San Juan and upper Colorado River regions of what is now southwestern Colorado, southern Utah, and northern New Mexico and Arizona. While traveling across hundreds of square miles of unknown territory, he collected thousands of fossil specimens and made several discoveries of mineral deposits. His findings were included in *Report of the Exploring Expedition from Santa Fe to the junction of the Grand and Green Rivers*, published in 1876.

During the Civil War, Newberry directed the supply and administration of the Union army's hospitals. At the war's end, he became a professor of geology and paleontology at New York's Columbia College (now Columbia University). In 1869, he was appointed state geologist of Ohio, and he later worked as a consultant to mining operations throughout the United States. In 1884, he joined the U.S. Geological Survey as a paleontologist.

In the course of his scientific work in the American West, John Strong Newberry amassed more than 100,000 fossil and geological specimens, which later became part of the natural history collection at Columbia University.

Newell, Robert (1807–1869) *American fur trader, trapper, pioneer in Oregon*

Robert Newell was originally from Ohio. While in his early 20s, he became a trapper, and, in 1829, he traveled from St. Louis up the MISSOURI RIVER with one of JEDEDIAH STRONG SMITH's fur-trading expeditions to the northern ROCKY MOUNTAINS.

After about 10 years in the fur trade, Newell decided to head into the Oregon Country. In 1839, he set out with his family from Fort Boise and took his wagons along the difficult last leg of the Oregon Trail northwestward to Walla Walla. The following year, he continued his trek westward, arriving in the Willamette Valley, south of present-day Portland, Oregon, in early 1841.

Newell was one of the founders of Oregon's first provisional government in 1843, several years before the region was organized as a U.S. territory. His memoirs of his career as a mountain man in the Rockies, and of his later life as a pioneer in Oregon, were edited by D. O. Johansen and published in 1959 as *Memoranda*.

In his journey from Fort Boise into what is now southeastern Washington in 1839–41, Robert Newell became the first settler to lead wagons along the entire length of the Oregon Trail, having blazed a wagon road through northeastern Oregon's Blue Mountains, a barrier over which previous Oregon Trail travelers had passed only on horses and mules, or by foot.

Newport, Christopher (ca. 1565–1617)

English mariner in Virginia and the East Indies

Christopher Newport, an English sea captain and privateer, took part in SIR FRANCIS DRAKE's raid of PRIVATEERS on the Spanish port of Cádiz in 1587.

In 1590–91, Newport commanded one of the ships in the fleet sent by JOHN WHITE to bring relief to the Roanoke Colony off the coast of what is now North Carolina. The ships sailed first to the WEST INDIES, where Newport and his ship, the *Little John*, remained behind to attack Spanish settlements on Hispaniola (present-day Haiti and the Dominican Republic) and along the coast of Honduras. The next year, while in the AZORES, Newport aided in the capture of the Spanish galleon the *Madre de Dios*, which proved to be the richest prize ever taken by Queen Elizabeth I's privateers.

During the next 10 years, Newport commanded several more voyages to the Caribbean in which he continued to prey on Spanish shipping. In September 1605, he was back in England, where he presented King James I with two live young crocodiles and a wild boar captured in the West Indies.

A year later, Newport was engaged by the London Company as commander of its colonizing expedition to Virginia. BARTHOLOMEW GOSNOLD was his vice admiral. In December 1606, he sailed from England with a fleet of three vessels, the *Discovery*, the *Godspeed*, and the *Susan Constant*, carrying 120 colonists. After the Atlantic crossing to the West Indies, Newport sailed north to Chesapeake Bay, which he entered in April 1607. The colonists disembarked near the mouth of the James River, where,

on May 14, 1607, they founded the settlement of Jamestown.

Newport had been instructed by the VIRGINIA COMPANY to explore inland from the settlement for a waterway to the Far East, the much-sought-after NORTHWEST PASSAGE. In May 1607, he sailed about 100 miles up the James River to its head of navigation, near what later became Richmond, Virginia. At the same time, the settlement's military leader, Captain JOHN SMITH, explored along the shores of Chesapeake Bay.

In late July 1607, Newport returned to England with mineral samples from Virginia that he believed to be gold. Upon analysis, they proved to be worthless.

In January 1608, Newport arrived back in Jamestown in command of the "First Supply," the Virginia Company's first follow-up expedition, carrying an additional 100 colonists. More than half of the original Jamestown settlers had since died; the colony's director, E. M. Wingfield, had been jailed, and John Smith was about to be hanged. Newport soon freed Wingfield and Smith and restored order to the colony. Less than a week later, another crisis developed when a fire swept through the settlement. With their food supplies destroyed, Newport and Smith were compelled to seek aid from the Indian leader Powhatan. They journeyed to his village, Werowocomoco, on the York River in late February 1608, where they were able to obtain a supply of corn. Having seen the Jamestown colony survive through its first difficult year, Newport sailed back to England.

On his third trip to Virginia, in 1608–09, Newport presented Powhatan with gifts, including a crown, which he used in a coronation ceremony for the Indian leader. Newport later undertook an overland exploration along the upper James River, probing beyond the point he had sailed to in 1607, possibly reaching as far inland as the mouth of the Rivanna River near present-day Columbia, Virginia.

In 1609, at the rank of vice admiral, Newport sailed from England for Virginia in command of a nine-ship fleet. Along with him were Sir Thomas Gates, the deputy governor of the Virginia colony; Sir George Somers, a founder of the Virginia Company; and SILVESTER JOURDAIN, British mariner. On September 28, 1609, Newport's ship was wrecked off Bermuda, and he, Gates, Somers, and some of the colonists were stranded on the island for 10 months. Somers took the opportunity to claim Bermuda and the neighboring islands for Great Britain. By the following spring, they had constructed several small sailboats, with which they managed to reach Virginia in May 1610.

Newport commanded a fourth colonizing expedition to Virginia in 1611, then left the Virginia Company for the BRITISH EAST INDIA COMPANY. He made his first voyage to the EAST INDIES in 1613–14, in which he took the shah's ambassador, the Englishman Sir Robert Sherley, brother of SIR ANTHONY SHERLEY, back to Persia (present-day Iran)

from a diplomatic mission in Europe. Traveling with Newport on his second voyage for the British East India Company in 1615–16 was SIR THOMAS ROE, on his way to India as England's ambassador to the court of the Mogul emperor. In August 1617, while on his third voyage to the Far East, Newport died at Bantam, in the East Indies.

Christopher Newport played a part in establishing what was to become the first permanent English settlement in North America. He also carried out the earliest European explorations deep into the interior of Virginia, and he was among the first to realize that the rivers that emptied into Chesapeake Bay led inland only as far as the barrier of the Blue Ridge. Accounts of the shipwreck and time in Bermuda in 1609–10 by Silvester Jourdain and fellow crew member William Strachey reportedly served as inspiration for William Shakespeare's 1611 play *The Tempest*.

Nicolet, Jean (Jean Nicollet de Bellesborne)

(ca. 1598–1642) *French fur trader, interpreter in Lake Michigan and Green Bay areas*

Jean Nicolet was born in Cherbourg, France. In 1618, he arrived in French Canada, as a protégé of SAMUEL DE CHAMPLAIN and as an agent in the FUR TRADE for merchants in Rouen and St.-Malo, France.

From 1618 to 1620, Nicolet lived among the Algonquin Indians on Allumette Island in the Ottawa River. He then spent nine years with the Nipissing Indians, a subgroup of the Chippewa (Ojibway), in the Georgian Bay region of Lake Huron.

By 1634, Nicolet had learned a variety of Indian languages and had become an important intermediary between French traders and the region's tribes. That year, Champlain sent him to investigate reports of a great "bad-smelling" sea that lay to the west of Lake Huron. After escorting a group of Jesuit missionaries to the Huron (Wyandot) Indian settlements on Georgian Bay, Nicolet set out by CANOE with seven Huron and retraced ÉTIENNE BRULÉ's route to Sault Sainte Marie. He explored the entrance to Lake Superior, located the Straits of Mackinac, and entered Lake Michigan.

Nicolet had been instructed to make contact with the Winnebago (Ho-Chunk) Indians. He followed the north shore of Lake Michigan, entered Green Bay, and came upon a Winnebago band living at the mouth of the Fox River. Under the impression that he was not far from the East China Sea and China, Nicolet believed the Indians were subjects of the Great Khan. He reportedly dressed in a Chinese damask robe in preparation for a meeting with Chinese officials.

From Green Bay, Nicolet explored the Fox River and the watershed above the Wisconsin River. From the Indians, he heard of a great river to the south, which he speculated flowed into the Pacific Ocean.

Nicolet returned to Trois Rivières on the St. Lawrence River, where he became prominent in the fur trade. In 1642, while he was traveling on the St. Lawrence, his small boat capsized and he was drowned.

Jean Nicolet was the first non-Indian to report the existence of Lake Michigan. He also brought back Indian accounts of what turned out to be the MISSISSIPPI RIVER. Twenty years after Nicolet's visit to Green Bay, French fur traders MÉDARD CHOUART DES GROSEILLIERS and PIERRE ESPRIT RADISSON followed his route and developed a lucrative fur-trading business with the Indians. Green Bay, in the 1670s, would become a key staging area for French explorations of the Mississippi Valley undertaken by LOUIS JOLLIET, JACQUES MARQUETTE, and RENÉ-ROBERT CAVELIER, DE LA SALLE.

Nicollet, Joseph Nicolas (Jean N. Nicollet)

(1786–1843) *French mathematician, astronomer in North America*

Joseph Nicollet was born at Cluses in southeastern France. As a child, he exhibited talent for mathematics and astronomy, and he went on to become a professor at the Collège Louis-le-Grand. His academic career in France came to an end in 1832 with his immigration to the United States, resulting from a series of financial setbacks. He settled in New Orleans, where he was received by the French community as an internationally known scientist.

Seeking to carry on the tradition of French exploration in North America, Nicollet, in 1836–37, organized and led an expedition in search of the source of the MISSISSIPPI RIVER (although HENRY ROWE SCHOOLCRAFT had correctly determined the river's source four years earlier).

In 1838, Nicollet traveled to Washington, D.C., where he accepted an appointment with the U.S. Army Corps of Topographical Engineers, and, in 1838–39, he headed two government surveying expeditions into the prairies between the upper Mississippi River and MISSOURI RIVER, assisted by the young lieutenant JOHN CHARLES FRÉMONT. Nicollet and Frémont explored up the Minnesota River from Fort Snelling to the Red Pipestone Quarry in what is now southwestern Minnesota, a site sacred to a number of tribes.

Nicollet's later work was devoted to astronomy and mathematics, including the calculation of actuarial charts for life insurance companies. During a visit to St. Louis, Nicollet became interested in exploration of the American West, and in 1842, he was chosen to command a Topographical Corps expedition into the ROCKY MOUNTAINS. Because of serious illness, however, he was replaced by Frémont. Nicollet died the following year.

Joseph Nicollet's report of his explorations in the upper Mississippi River region was published in 1843. The maps

he produced of the territory between the upper Mississippi and the Missouri Rivers were the first to be based on mathematical calculations and astronomical observations. While serving with Nicolle in 1838–39, John C. Frémont learned the skills necessary for his subsequent explorations into the Rocky Mountains and California.

Nicuesa, Diego de (unknown–1511)

Spanish conquistador in Central America

Diego de Nicuesa was born at Baeza in the Andalusia region of southern Spain into a noble family. He was well connected to the Spanish ruling family, serving in the household of an uncle of King Ferdinand II, and was known in Spain as an accomplished lute player. His involvement in the early Spanish settlement of Hispaniola (present-day Haiti and the Dominican Republic) brought him considerable wealth.

In 1508, King Ferdinand granted Nicuesa a license to establish a colony on the mainland of CENTRAL AMERICA in what is now Panama, west of the Gulf of Urabá. At the same time, the coastal region to the east in the vicinity of present-day Cartagena, on the Caribbean coast of present-day Colombia, had been granted to ALONSO DE OJEDA.

Both Nicuesa and Ojeda launched their colonizing expeditions from Hispaniola in 1509. The first to sail was Ojeda, whose men were attacked by Indians soon after landing at Cartagena. Nicuesa arrived there not long afterward and aided Ojeda in a counterstrike against the native peoples. He then sailed westward across the Gulf of Darien for the coast of Panama.

Nicuesa's fleet of four ships, carrying more than 700 men, became separated in a storm, leaving him with only one ship and fewer than 100 men. He tried to reach the site of his proposed colony at the mouth of the Darién River, but his ship ran aground and was wrecked. Nicuesa and his men then set out westward along the coast, although the site of the proposed colony lay in the opposite direction. With supplies of food running short, and having suffered repeated attacks by Indians, the Spaniards were relieved to come upon a natural harbor. Nicuesa decided to found his settlement on the site and reportedly exclaimed, "Here let us stop, in the name of God." His men called the site Nombre de Dios (name of God) after Nicuesa's remark. Soon afterward, contact was made with the other members of the expedition, who had reached the mouth of the Darién River to the west.

Nicuesa promptly sailed there to claim governorship over the newly established colony, Santa María la Antigua del Darién, but he found members of Ojeda's expedition in control. The colonists, under the leadership of VASCO NÚÑEZ DE BALBOA, refused to accept Nicuesa as their ruler. They sent him and 17 of his followers out to sea in an unseaworthy vessel. They were never seen or heard from again.

Diego de Nicuesa's settlement at Nombre de Dios later became the eastern terminus of the main route across the Isthmus of Panama from the Pacific coast, serving as the transshipment point for Spanish gold and other treasure from Peru and the Philippines.

Niebuhr, Carsten (Karsten Niebuhr)

(1733–1815) *German traveler in Arabia, Yemen, and the Persian Gulf, in service to Denmark*

Carsten Niebuhr was born into a German family at Holstein, which then was under the dominion of Denmark, and later became part of northern Germany. Following his early education, he went on to advanced studies in astronomy and mathematics, and, by the age of 27, he had applied his skills to become an accomplished surveyor, topographer, and cartographer.

At the invitation of Frederick V, King of Denmark, Niebuhr joined a Danish government-sponsored scientific expedition to explore the once-fertile southwestern corner of the Arabian Peninsula, a region known to Europeans since classical times as Arabia Felix, and comprising the Arab kingdom of Yemen. Although the expedition was loosely organized, without an appointed leader, Niebuhr held the position of "Engineer-Lieutenant." Along with the scientific aim of the project, a thorough study of the topography and animal and plant life of the region, the expedition was also charged with determining if Denmark could enter into trade contacts with Yemen, a region where foreign commerce was then dominated by the English and the Dutch.

In fall 1761, Niebuhr left Copenhagen with the five other members of the expedition: Peter Forsskal, a Swedish naturalist; Christian Kramer, a Danish physician and zoologist; George Baurenfeind, a German artist; Friedrich von Haven, a Danish linguist; and a former Swedish military man named Berggren. They first traveled to Egypt, where they remained until October 1762. Then, disguised as Muslims, they sailed on a ship carrying pilgrims to the Arabian port of Jidda on the RED SEA.

From Jidda, Niebuhr and his companions continued their journey to southern Arabia in a type of open boat known as a *tarrad*. During nightly stops, Niebuhr went ashore and made astronomical observations and calculations, upon which he based his later map of Yemen. The naturalists Forsskal and Kramer collected specimens of the region's fauna and flora, sending them back to Europe.

On December 29, 1762, Niebuhr and the Danish expedition arrived at Luhaiya, a port on the Red Sea coast of northern Yemen in what is now the Yemen Arab Republic. They proceeded inland, heading southward on donkeys along the coastal plain of the Tihama region. Niebuhr continued to make stellar and solar observations

en route. In February 1763, the expedition reached the coastal city of Bait al-Faqih, where Niebuhr and von Haven both contracted malaria. At the port city of Mocha on the southwestern corner of the Arabian Peninsula, von Haven died.

In late June 1763, Niebuhr and the four remaining expedition members headed inland from Mocha across the desert toward the Yemeni capital Sanaa, where they hoped to meet with the ruler of Yemen, known as the imam. During this leg of the journey, the naturalist Forrskal died of malaria, and Niebuhr, himself weakened by the disease, was unable to record their route on his map. Despite his illness, he managed to reach Sanaa and also explored the region to the east, on the edge of the Rub' al-Khali Desert, the great waterless region of southern Arabia known as the EMPTY QUARTER.

After meeting with the imam in late July 1763, Niebuhr, Baurenfeind, Kramer, and Berggren made their way back to Mocha on camels just in time to catch the yearly ship to Bombay, India, as planned. Both Baurenfeind and Berggren died on the voyage to India. In Bombay, in February 1764, Kramer also died, leaving Niebuhr as the expedition's sole survivor.

Niebuhr remained in India until late 1764, sailing to the Persian Gulf aboard a British naval vessel in December of that year. He made his way overland through southwestern Persia (present-day Iran), then traveled up the Tigris River through present-day Iraq into Syria and what is now Israel, returning to Copenhagen by way of Constantinople (present-day Istanbul, Turkey) in 1767.

Carsten Niebuhr's account of his journey in Arabia and the Persian Gulf was first published in German in 1772–74, with an English edition, *Travels through Arabia*, published in Edinburgh in 1792. His work provided Europeans with the first comprehensive descriptions of the region from an 18th-century rationalist viewpoint. Niebuhr was also the first European to report on the spread of the Wahhabi revolution, an Islamic fundamentalist movement that had begun to sweep through Yemen and subsequently had a tremendous impact on the history of Arabia and adjoining lands. His map of Yemen was the first to detail scientifically that portion of the Arabian Peninsula.

Niebuhr, Sigismund (1631–1699)

German navigator along the south coast of South America, in service to Holland

Sigismund Niebuhr was born near the southwestern German town of Breisach on the Rhine. He became a skilled mariner and navigator, and, in about 1670, he entered the service of the Dutch government, the States-General.

In 1675, commissioned by the States-General, Niebuhr left Holland to explore the southernmost coast of South

America. He first sailed to Rio de Janeiro, then made his way southward to Le Maire Strait off the south coast of Tierra del Fuego (explored in 1616 by JAKOB LE MAIRE and WILLEM CORNELIS SCHOUTEN). He undertook depth soundings and plotted the exact locations of dangerous rocks and other hazards to navigation. Niebuhr made a landing on Tierra del Fuego, where he befriended the natives and convinced two of them to accompany him back to Holland. Although Niebuhr's ship was wrecked in a storm off Los Reyes Island, he and his crew managed to construct another vessel, on which they returned to Holland in October 1677.

The next year, Sigismund Niebuhr published an account of his explorations around CAPE HORN and Tierra del Fuego. He also produced a navigational chart of Le Maire Strait, which greatly aided subsequent mariners in using that passage as a more practical alternate route around the tip of South America than the maze of channels that make up the STRAIT OF MAGELLAN.

Niño, Andrés (1475–ca. 1530) *Spanish mariner in Central America*

Born at Moguer in southwestern Spain, Andrés Niño went to sea when young. His first maritime exploits were on Portuguese ships along the coast of Africa and in the EAST INDIES. In 1515, he went to the newly established Spanish colony in Panama, where he became known as a skilled pilot.

When Spanish conquistador Gil González de Ávila set out to explore and conquer the Pacific coast of CENTRAL AMERICA in 1521–22, Niño was named as chief pilot for the seaward part of the expedition. In January 1522, at Tararegui, the expedition embarked on four ships that had been constructed on the Bay of San Miguel along the eastern end of Panama's Pacific coast.

After González de Ávila and his forces had gone ashore at the Bay of San Vicente to explore the interior, Niño and the small fleet continued northward along the coast, hoping to locate a strait that, according to reports by Indians, linked the Pacific Ocean and the Atlantic Ocean. He reached as far as 17°50' north latitude, off the Pacific coast of southern Mexico, and, finding no inland passage to the Atlantic, returned southward.

Niño found González de Ávila and his men under attack by a large force of Indians, reportedly numbering 4,000. He helped fight them off, then joined González de Ávila in exploring the coastal region around Cape Blanco and the Gulf of Papagayo, on the Pacific coast of what is now northwestern Costa Rica. They became the first known Europeans to reach the Possession River, and on the coast of what is now Honduras, they came upon a large bay, which they named the Gulf of Fonseca in honor of Bishop Juan Rodríguez de Fonseca, the head of the Council of the

Indies (which then supervised all Spanish explorations in the Americas).

Niño and González de Ávila's expedition next explored southward into the lands of an Indian chieftain known as Nicarao. They came upon a large body of freshwater, which they named Mar Dulce (sweet sea), later known as Lake Nicaragua after Nicarao. North of the lake, the Spaniards sighted the volcano called Masaya, near the present-day Nicaraguan city of the same name.

After exploring the interior of what is now western Nicaragua, Niño and González de Ávila returned to the Panama colony by sea, arriving on December 29, 1522. The gold, precious stones, and other valuables they obtained from the natives led them to compare the lands they had explored to the "paradise of Mohammed."

In 1523, Andrés Niño and González de Ávila returned to Spain with their treasure. Soon afterward, the region of Central America that they had explored was colonized by FRANCISCO FERNÁNDEZ DE CÓRDOBA. Lake Nicaragua, which Niño reached with González de Ávila in 1522, is the largest lake in Central America.

Niza, Marcos de (Fray Marcos, Fray Marcos of Nizza, Marco de Nica, Sayota) (ca. 1495–1558)

Italian missionary in Peru and the American Southwest

Marcos de Niza, born in Nice, then part of the Italian principality of Savoy, grew up to become a Franciscan missionary priest. In 1531–35, he served with FRANCISCO PIZARRO in the conquest of the Inca Indians of Peru in South America.

After time in Guatemala, Niza was assigned to Culiacán, Mexico, in 1537. Two years later, he was commissioned by ANTONIO DE MENDOZA, viceroy of New Spain, to undertake a reconnaissance of Sonora and investigate the reports, brought back by ÁLVAR NÚÑEZ CABEZA DE VACA and ESTEVANICO, of fabulously rich Indian cities to the north.

Niza was chosen by Mendoza because of the priest's earlier experience among the Inca of Peru. It was thought that a priest would be better received by the Indians. Additionally, sending Niza was much less expensive than mounting a military expedition led by a knight.

In March 1539, Niza, accompanied by Estevanico and another priest named Honorato, journeyed north from Culiacán on the west coast of Mexico, along the Sonora and San Pedro Rivers, into present-day Arizona. Among Indians he encountered, Niza became known as Sayota, or "Man from Heaven."

Niza sent Estevanico ahead, with instructions to send back crosses of varying sizes indicating the relative importance and wealth of any cities he came upon. Estevanico, at times two weeks ahead of Niza, sent back a cross the size

of a man, signifying that he had found cities that contained greater riches than those of the Aztec Indians. Soon afterward, Niza received news of Estevanico's death at the hands of Zuni Indians at Hawikuh Pueblo near present-day Zuni, New Mexico. The priest proceeded northward and espied from a distance what he thought must be cities of gold—the legendary Seven Cities of CIBOLA. They were actually adobe pueblos whose turquoise decorations glistened in the sun. Niza then went to Mexico City, where he presented his exaggerated report to Mendoza.

In spring 1540, Niza guided FRANCISCO VÁSQUEZ DE CORONADO and an advance party of about 100 soldiers and Indians from Culiacán, back across the Colorado Plateau, into present-day western New Mexico. After a battle, the Spaniards subjugated Hawikuh and learned it was not the hoped-for Cibola. Coronado, concerned that his disappointed soldiers would vent their anger against Niza, whose misinformation had led them there, sent the priest back to Sonora, Mexico, with one of his lieutenants.

Niza remained in Mexico for the rest of his life, serving as father provincial of Franciscan missionaries in New Spain. He later wrote of his explorations in what is now northern Mexico, the Gila River region of Arizona, and western New Mexico, in his published account, *Descubrimiento* (Discovery). In addition to erroneous descriptions of the Indians, he also reported seeing elephants, camels, unicorns, and other fabulous creatures.

Marcos de Niza was one of the earliest Europeans to explore north of Mexico. His report that the region's Indian pueblos were the fabled Seven Cities of Cibola, inspired Coronado's subsequent extensive explorations of the American Southwest and Great Plains.

Nobile, Umberto (1885–1980) *Italian air force officer, aviator, aeronautical engineer in the Arctic*

Umberto Nobile was born in the southern Italian city of Avellino near Naples. Trained as an aeronautical engineer, he became a high-ranking officer in the Italian Military Aeronautic Corps during World War I, supervising Italian aircraft production.

After the war, Nobile became an accomplished pilot and designer of AIRSHIPS, in particular the semi-rigid variety with a longitudinal keel providing support for the bags holding hydrogen gas. In 1925, Norwegian polar explorer ROALD ENGELBREGT GRAVNING AMUNDSEN and his partner, American millionaire LINCOLN ELLSWORTH, purchased from the Italian government the airship *N-1*, which Nobile had designed. Planning to use the airship for a flight over the NORTH POLE, they engaged Nobile as pilot for the expedition.

Nobile flew the airship, which had been rechristened the *Norge* by Amundsen, from Italy northward across

Europe. At the port of Vadso, on Norway's Arctic coast, he left the mainland and crossed over the Arctic Ocean to King's Bay, Spitsbergen (in Svalbard), arriving in early May 1926. He was met by Amundsen and Ellsworth, who had been on the Arctic island since the previous October, supervising the construction of a huge hangar for the airship.

While Nobile, Amundsen, and Ellsworth were making final preparations before take-off, RICHARD EVELYN BYRD and Floyd Bennett arrived at King's Bay, and they soon reportedly made a successful flight to the North Pole and back in an airplane on May 9, 1926. On May 11, 1926, the *Norge* lifted off from King's Bay, and, the next day, flew over the North Pole and continued over the ice cap to Teller, Alaska, completing the first Europe-to-America flight by way of the North Pole (and perhaps the first flight over the Pole since there is some question as to whether Byrd and Bennett passed directly over it). While over the Pole, the explorers dropped the flags of the United States, Norway, and Italy onto the ice. The flight had taken them across more than 3,400 miles in two and a half days. Inuit who had viewed the *Norge* from the ground later described it as a great "flying whale."

In the following weeks, Nobile grew to resent that the international press had overlooked his important contributions to the mission as both the pilot and designer of

the *Norge*. Instead, public attention concentrated on Amundsen, now acclaimed as the first man to have reached both South and North Poles. Nobile's cause was taken up by the Italian press, who supported his contention that he had not been sufficiently credited for his role. A falling-out developed between Nobile and Amundsen after the latter openly criticized Nobile's ability as an aviator, claiming he had made several serious navigational errors during the flight. He characterized Nobile as a "boasting dreamer" and an "epauletted Italian." Nobile was affronted even more when Amundsen expressed the view that dirigibles were unreliable and impractical, and that future polar exploration from the air should be with airplanes with at least four engines.

Nobile reacted by organizing an Italian-sponsored dirigible flight over the North Pole under his command. Money for the venture was raised by public subscription in Milan; additional support came from Great Britain's ROYAL GEOGRAPHICAL SOCIETY. Nobile designed the airship *Italia*, specially equipped for the polar regions. He also received the backing of the Italian government under Mussolini, who provided the expedition with the naval vessel *Citta' di Milano* as an escort ship. Nobile recruited a mostly Italian crew of expert mountaineers from the Alps, and, intending to make scientific studies while at the North Pole, took along three internationally known scientists: Czechoslovakian radium specialist Franz Behounek, Italian physicist Aldo Pontremoli, and Swedish meteorologist Finn Malmgren. Spiritual support for the enterprise came from Pope Pius XI, who blessed the *Italia* and gave Nobile a large cross to drop at the North Pole.

In May 1928, almost exactly two years after his flight with Amundsen, Nobile arrived in Spitsbergen with the *Italia*. A planned preliminary flight over the Siberian archipelago of Nicholas II Land was called off because of bad weather. On May 23, Nobile and the *Italia* took off from Spitsbergen and headed for the North Pole, which he reached at one o'clock the next morning. As he flew over the Pole, the flag of Italy and the pope's cross were thrown out of the airship, and a message was radioed to Mussolini announcing that "the standard of Fascist Italy is floating in the breeze over the ice of the Pole." The *Italia* circled the North Pole for two hours, but it did not land to make oceanographic observations as planned. Because the airship's aerial had become ice-encrusted, and radio contact had been lost, Nobile decided instead to return to Spitsbergen.

With intense cold and winds, the airship was iced over on the return flight. The added weight of the ice and conditions of dense fog forced a crash landing onto the frozen sea, 180 miles northwest of Spitsbergen. On hitting the ice, the *Italia's* control gondola, carrying Nobile and eight others, broke free, while the lighter-than-air portion of the airship, carrying seven other crewmen, became airborne once again

Umberto Nobile (Library of Congress)

and drifted out of control. No trace of it or the men aboard was ever found.

Nobile suffered a broken leg and broken arm in the crash, and one of the crewmen in the gondola was killed on impact. The others suffered a variety of injuries. Although the *Italia* had landed only 180 miles northwest of Spitsbergen, the PACK ICE was too rugged for most of the survivors to cross on foot, and Nobile decided to remain in that location and radio for help. After two weeks, three of the survivors, two Italians, Zappi and Mariano, and the Swedish meteorologist Malmgren, set out over the ice to obtain help, while Nobile and the others continued to transmit a distress call on the gondola's emergency radio set.

On June 6, 1928, an amateur radio operator near Arkhangelsk, Russia, picked up the signal from Nobile's party. The Soviet icebreaker *Krassin* was dispatched, and its reconnaissance plane sighted Zappi, Mariano, and, reportedly, Malmgren. Yet, when the ship reached them several weeks later, only Zappi and Mariano were found. Zappi reported that there were only two of them left, contrary to what the Soviet pilot had seen, and claimed that Malmgren had died a month earlier. The contradictory accounts led to charges that Malmgren may have met with foul play, and that Zappi may have committed cannibalism.

Sixteen ships, 21 airplanes, and more than 1,500 men from Italy, Norway, Sweden, and the Union of Soviet Socialist Republics (USSR or Soviet Union) took part in the search and rescue efforts for Nobile and his crew. Amundsen, despite his previous differences with Nobile, agreed to the Norwegian government's request that he join the search; he perished when his plane disappeared en route to Spitsbergen.

On June 24, 1928, Nobile's red tent was sighted from the air by Swedish aviator Einar Lundborg, who then made a landing on the ice. With room in his plane for only one passenger, Lundborg took Nobile back first, reportedly so that the commander of the expedition could more effectively supervise the rest of the rescue effort. The others were later rescued by ship. Nonetheless, with charges of cannibalism already leveled against one member of the expedition, Mussolini took a dim view of the fact that Nobile had been the first to be saved, and he ordered the aviator to be put under arrest for allegedly deserting his men.

Back in Italy in 1929, Nobile faced a board of inquiry that ultimately found him at fault for the disastrous outcome of the expedition. His reputation became further clouded amid reports that the real reason why he was the first to be rescued was because his life had been heavily insured and that underwriters at Lloyds of London had offered Lundborg a substantial cash reward for his rescue.

With his conduct officially condemned, Nobile was compelled to resign his commission as general in the Italian air force. He also lost his post as professor at Italy's Aero-

autical Institute, and, in 1931, he went into voluntary exile in the Soviet Union. He lived there for the next five years, teaching aeronautics and advising the Soviet government on airship construction. In 1936, Nobile moved to the United States, where he became head of the aeronautical engineering department at Lewis College of Science and Technology (now Lewis University) near Chicago, Illinois.

At the end of World War II, Nobile returned to Italy, where the newly installed democratic government, having reconsidered his role in the 1928 Arctic disaster, cleared him of any wrongdoing and reinstated him in the air force. In 1946, he was elected as a deputy in the Italian parliament.

Several firsthand accounts were written about the *Italia* expedition, including Nobile's own *With the Italia to the North Pole* (1930), Einar Lundborg's *The Arctic Rescue* (1929), and *The Truth About the Red Tent* (1929), written by one of the survivors, Czech scientist Franz Behounek.

Umberto Nobile's Arctic exploit marked the last time aircraft were used to explore large stretches of uncharted territory in the Arctic. In the years that followed, such flights were made mainly to establish new air travel routes between specific points.

Noort, Oliver van (Olivier van Noort)

(1568–ca. 1622) *Dutch mariner on the coasts of South America and in the South Pacific*

A native of Utrecht in the Netherlands, Oliver van Noort became well known in Holland as an accomplished seafarer and navigator. In 1598, a group of Dutch merchants commissioned van Noort to command two commercial fleets on a voyage to the Far East by way of the STRAIT OF MAGELLAN. He sailed from Rotterdam on September 13, 1598, and reached the South American coast at Rio de Janeiro. When his ships were driven back by storms, he sought shelter along the coast of Brazil, where he lost some of his men in Indian attacks.

Van Noort came upon uninhabited Santa Clara Island, on which he and his men spent the winter of 1598–99. Resuming the voyage on June 2, 1599, he continued southward to the coast of Patagonia, and, three weeks later, he came upon an uncharted island, where his ships put in for repairs.

Van Noort's expedition entered the eastern approach to the Strait of Magellan on November 23, 1599. During the next two months, he made landings along the strait's north shores, during which he suffered additional losses in repeated Indian attacks. In the Penguin Islands, he located three uncharted bays, which he named Mauritius, Henry, and Oliver.

Van Noort and his ships left the Strait of Magellan and entered the Pacific Ocean on February 6, 1600. He then followed the coast of Chile northward, attacking Spanish

ports and ships as far as the coast of Peru. Although the Spanish viceroy of Peru, Luis de Velasco, sent a naval force after the Dutch, they eluded capture and made their way westward across the Pacific to Guam in the Mariana Islands. From there, they resumed their attacks on the Spanish in the Philippines, then visited the Indonesian islands of Java and Borneo. The expeditor continued westward across the Indian Ocean, and, after rounding the CAPE OF GOOD HOPE, arrived back in Rotterdam on August 26, 1601.

Oliver van Noort commanded the first Dutch ships in a CIRCUMNAVIGATION OF THE WORLD and was among the first northern European navigators to probe the Pacific Ocean, a part of the world that had been explored mainly by the Spanish and Portuguese. A Dutch narrative of his voyage was published in Amsterdam in 1612, with translations in French and German appearing in 1613.

Nordenskjöld, Nils Adolf Erik (Baron Nordenskjöld, Adolf Nordenskiöld)

(1832–1901) *Swedish-Finnish geologist in the Arctic regions of Spitsbergen, Greenland, and Siberia, explorer of Northeast Passage, uncle of Nils Otto Gustaf Nordenskjöld*

Adolf Nordenskjöld was born in Helsinki, Finland, the son of prominent Swedish parents. He attended Helsinki University, specializing in chemistry, mineralogy, and geology.

In 1858, Nordenskjöld left Finland, which was then under Russian rule, and moved to Stockholm, Sweden, where he accepted both an appointment as head of the mineralogy department of the National Museum of Natural History and a professorship at the University of Stockholm. That year, he began his career in Arctic exploration with a Swedish scientific expedition, led by Otto Martin Torell, to Spitsbergen (in Svalbard), midway between the north coast of Norway and the NORTH POLE. In 1861, he accompanied Torell on a second expedition to Spitsbergen, exploring the northern islands of the group by dogsled and producing one of the first scientifically based maps of the region.

Nordenskjöld led his own expedition to Spitsbergen in 1864, then again in 1868, in command of the First Swedish North Polar Expedition. On the steamer *Sofia*, accompanied by naval officer F. W. von Otter (who went on to become a prime minister of Sweden), Nordenskjöld reached 81°42' north latitude, the northernmost point a ship had reached in the Eastern Hemisphere until that time. For his achievement, Great Britain's ROYAL GEOGRAPHICAL SOCIETY awarded him a gold medal the following year.

In 1870, Nordenskjöld turned his attention to western GREENLAND, where he made an attempt at an inland penetration by dogsled. Although he traveled only 30 miles inland from Disko Island, he reached an elevation of 2,200

feet and undertook the first scientific investigation of the Greenland ice cap.

Nordenskjöld returned to Spitsbergen in command of the Second Swedish North Polar Expedition in 1872. He had planned to use reindeer to pull his sledges over the frozen expanse of the Arctic Ocean to the North Pole, but the PACK ICE proved to be too rugged, and his ship was later frozen in for the winter. Unable to make an attempt on the Pole, he instead explored Nordaustlandet, the northernmost of Spitsbergen's islands.

Back in Sweden in 1873, Nordenskjöld became interested in finding a navigable sea route from Europe, along the Arctic coast of Russia and SIBERIA, to the Bering Sea and the Pacific Ocean—the long-sought NORTHEAST PASSAGE. After familiarizing himself with the history of earlier unsuccessful attempts, he sailed on the walrus-hunting ship *Proeven* in 1875, across the Barents Sea to the islands of Novaya Zemlya. The next year, with the financial support of Swedish merchant Baron Oscar Dickson, he sailed on the steamer *Ymer*, halfway across the Kara Sea, to the mouth of the Yenisey River. Nordenskjöld came upon a natural harbor, which he named Port Dickson after his sponsor, reporting that it could become an important seaport if an ice-free Northeast Passage route were established.

With his reports that the Kara Sea's coastal waters were generally ice-free, Nordenskjöld gained additional support for a Northeast Passage expedition from King Oscar II of Norway and Sweden, as well as from Aleksandr Sibiryakov, a Russian mining and shipping tycoon. The expedition was outfitted with a 300-ton converted whaler, the *Vega*, which was driven by sails as well as a steam engine. Nordenskjöld sailed aboard the *Vega*, equipped with coal and provisions for two years, from Tromsø on Norway's Arctic coast on July 21, 1878, accompanied by three Russian merchant vessels. The expedition headed eastward around North Cape, then proceeded across the Barents Sea to the Kara Sea. At Port Dickson, two of the Russian ships left the group to ascend the Yenisey River, planning to return to Sweden with a cargo of Siberian wheat. Nordenskjöld and the *Vega*, along with the remaining merchant vessel, the *Lena*, continued to follow the coast eastward, and, on August 19, 1878, they rounded Cape Chelyuskin, making Nordenskjöld and his expedition the first men known to have sailed past the Asian mainland's northernmost point.

By August 28, 1878, Nordenskjöld had reached the Arctic delta of eastern Siberia's Lena River, where the *Vega* and the remaining merchant ship parted. While the *Lena* proceeded to ports on the upper Lena River, Nordenskjöld, aboard the *Vega*, made an attempt to reconnoiter the New Siberian Islands to the north. Pushed back to the Siberian mainland by the advancing pack ice, he resumed the voyage eastward.

On September 27, 1878, Nordenskjöld was off North Cape (now Cape Shmidta), the westernmost point JAMES COOK had reached from the Pacific Ocean in his search for the Northeast Passage in 1778. The next day, the last remaining ice-free channel also became choked, and, at a point only 120 miles from BERING STRAIT, the *Vega* became icebound. During the next 10 months, friendly contacts were made with the region's natives, the Chukchi people of northeastern Siberia, whose customs were studied by the expedition's scientific team. Extensive scientific work was also undertaken in the areas of zoology, botany, oceanography, and geophysics.

The *Vega* was able to break free of the ice on July 18, 1879, and, on July 20, Nordenskjöld sailed southward into Bering Strait, thus completing the first voyage from the Atlantic Ocean to the Pacific by way of the Northeast Passage. After stops in Japan and CEYLON (present-day Sri Lanka), the *Vega* returned to Europe by way of the recently opened Suez Canal, arriving in Stockholm on August 24, 1880.

Nordenskjöld was made a baron for his achievement and soon published an account of the voyage, *The Voyage of the Vega Round Asia and Europe, With a Historical Review of Previous Journeys Along the North Coast of the Old World* (1881). The book became a best-seller and was followed by a five-volume report on the expedition's scientific work, *Scientific Observations of the Vega Expedition*. Published from 1882 to 1887, it served as a model for subsequent polar studies.

Nordenskjöld resumed his explorations of the Greenland ice cap in 1882–83, hoping to locate an ice-free region, which he theorized lay within the interior. He again scaled the glacier on the mainland at Disko Bay, reaching about 75 miles inland.

In addition to his Arctic exploits, Nordenskjöld also undertook studies on the history of geographic exploration. His *Facsimile-Atlas to the Early History of Cartography* (1889) and his *Periplus: An Essay on the Early History of Charts and Sailing Directions* (1897), published simultaneously in English and Swedish editions, were important early works on the history of mapmaking and exploration.

Baron Adolf Nordenskjöld led the first successful navigation through the Northeast Passage, a feat that had challenged mariners since the voyages of SIR HUGH WILLOUGHBY, WILLIAM BOROUGH, and STEPHEN BOROUGH in the 1550s, and WILLEM BARENTS in the 1590s. On his return voyage to Sweden, Nordenskjöld completed the first circumnavigation of Europe and Asia. In the years following the Russian Revolution of 1917, the Soviet government developed the Northeast Passage into a viable commercial waterway, which became known as the Northern Sea Route. As Nordenskjöld had predicted, the once uninhabited Port Dickson (known today as Dikson), strategically located

midway between the Atlantic and Pacific entrances of the Northeast Passage, became a vital stopover point and Arctic gateway to central Siberia. The Laptev Sea, the arm of the Arctic Ocean east of the Kara Sea, was known for a time as the Nordenskjöld Sea in his honor, and April 24 is still celebrated in Sweden as Vega Day, in recognition of his triumphant return from his 1878–79 Northeast Passage voyage. His nephew NILS OTTO GUSTAF NORDENSKJÖLD became a renowned geologist.

Nordenskjöld, Nils Otto Gustaf (Otto Nordenskiöld) (1869–1928) *Swedish geologist in Antarctica, South America, Greenland, and Alaska, nephew of Nils Adolf Erik Nordenskjöld*

Otto Nordenskjöld, born in Sweden, like his famous uncle, the NORTHEAST PASSAGE pioneer NILS ADOLF ERIK NORDENSKJÖLD, was a distinguished geologist who embarked on a career of scientific exploration.

In 1895–97, Nordenskjöld led a scientific team to southernmost South America, where he undertook geological studies in Patagonia and Tierra del Fuego.

In 1898, Nordenskjöld conducted geological research in Alaska and the adjoining Klondike region of the Yukon Territory, and, in 1900, he visited GREENLAND. That same year, the International Geographical Congress was held in Berlin, where the world's leading scientists declared 1901–03 to be the Antarctic Year, with scientific expeditions to Antarctica planned by Germany, France, Scotland, and Sweden.

Appointed to lead the Swedish expedition, Nordenskjöld sailed from Gothenburg, Sweden, in October 1901 on the *Antarctic*, captained by C. A. Larsen. After stopovers in the New Hebrides and in Argentina, the *Antarctic* went to the South Shetland Islands off the Antarctic Peninsula. In exploring the southwestern South Shetlands, the expedition corrected some errors made by SIR JAMES CLARK ROSS and JULES-SÉBASTIEN-CÉSAR DUMONT D'URVILLE when they charted the Antarctic archipelago more than 60 years earlier.

After surveying the Antarctic coast of Louis Philippe Land, Nordenskjöld and his expedition landed on the Weddell Sea coast of Grahamsland, where he planned to undertake geological studies to determine if northeastern Antarctica had ever been joined to the southern end of South America. While a base was established at Snow Hill Island, Larsen sailed the *Antarctic* back toward South America, planning to return the following Antarctic summer. Although the ship failed to arrive after a year, Nordenskjöld and his men, equipped for only one winter in the Antarctic, nevertheless managed to comfortably survive through a second winter, living on birds and animals they hunted and whatever edible vegetation they could forage.

In October 1903, Nordenskjöld explored nearby Mount Haddington, which he found to be an island surrounded by ice. He encountered three members of the expedition who had sailed with the *Antarctic* and learned from them that the ship had been unable to breach the PACK ICE the previous year. A month later, Captain Irizar of the Argentine navy arrived on the ship *Uruguay*, having been dispatched to rescue the Swedish expedition when the *Antarctic* failed to arrive in Argentina. As it turned out, the *Antarctic* had sunk in February 1903, crushed in the ice on its second attempt to reach Snow Hill Island. Larsen and the rest of the *Antarctic* crew arrived at Nordenskjöld's encampment soon afterward, and all expedition members were safely taken back to South America by the *Uruguay*.

Nordenskjöld continued his geological studies of South America with scientific expeditions to the Andes in 1904–05 and again in 1920–21. He made another visit to Greenland in 1909.

In 1905, Otto Nordenskjöld was appointed as professor of geography at the University of Gothenburg. His geological investigation in Antarctica in 1901–03 revealed an abundance of fossil evidence suggesting that Graham Land had been covered with lush forests during the Jurassic period and was probably once connected to Tierra del Fuego or TASMANIA.

Norgay, Tenzing See TENZING NORGAY.

Noué, Charles-Edouard de la (1624–1691)

French priest in South America

Charles-Edouard de la Noué was born in the Anjou region of western France. Although he had entered the priesthood, he involved himself more in the study of scientific matters than in the practice of religion.

In 1665, the French government sent Noué to explore Tierra del Fuego and the Pacific coast of southern Patagonia in what is now southern Chile. The region, nominally part of Spanish territory, had not yet been settled by Europeans, and France hoped to claim it.

Noué traveled in Patagonia and Tierra del Fuego for a number of years. Taken captive by the Indians, he learned their language and customs and adopted their mode of dress. The natives came to accept him as an equal and eventually allowed him to depart on a passing European ship.

Back in France, Charles-Edouard de la Noué recorded his experiences in South America in his two-volume *Mémoire*, published in 1675. Its stark portrayal of the region's rugged terrain, inhospitable climate, and primitive native population served to discourage any further attempts by the French to settle that part of South America.

Núñez de Balboa, Vasco (1475–1519)

Spanish conquistador, colonizer in Panama, brother-in-law of Hernando de Soto

Vasco Núñez de Balboa was born in the Estremadura region of west-central Spain. Although of a humble family, he became well-connected among the Spanish nobility, serving in his early years as a page in the court of Don Puertocarrero, the lord of Moguer.

In 1501, Núñez de Balboa embarked on a career as a conquistador in the Americas. He left Spain as part of RODRIGO DE BASTIDAS's expedition to the north coast of South America in search of pearls. With Bastidas, he explored the harbor around what is now Cartagena, Colombia, and also visited the Gulf of Urabá, at the lower end of the Isthmus of Panama. Problems with the ships forced the expedition to head for the Spanish settlements on the island of Hispaniola (present-day Haiti and the Dominican Republic). Núñez de Balboa settled there and attempted to establish a plantation.

By 1510, Núñez de Balboa found himself seriously in debt. To escape his creditors, he stowed away on a ship headed for San Sebastián, on the eastern end of the Gulf of

Vasco Núñez de Balboa (Library of Congress)

Vasco Núñez de Balboa at the Pacific Ocean (*Library of Congress*)

Urabá, to commence an expedition. With him, he had few possessions other than his sword and his dog, Leoncico. The leader of the expedition, Martín Fernández de Encisco, agreed reluctantly to allow Núñez de Balboa to remain with it. Upon reaching San Sebastián, they discovered the colony had been abandoned. Drawing upon his earlier experience on the Panama coast with Bastidas, Núñez de Balboa directed the expedition and the remaining colonists to the western side of the Gulf of Urabá and established the settlement of Santa María de la Antigua del Darién.

By 1511, Núñez de Balboa had consolidated his control over the new colony, deposing the former Spanish rulers, DIEGO DE NICUESA and ALONSO DE OJEDA. The Spanish king commissioned him as interim governor and captain general of Darién, as Panama was then known. Núñez de

Balboa penetrated the interior of the isthmus, battling Indians and expanding the colony. His chief lieutenant at this time was FRANCISCO PIZARRO.

Núñez de Balboa was skillful in his diplomatic relations with native peoples. He made alliances with Indian leaders Careta and Comogre, from whom he first heard reports of tribes to the south and west who possessed gold and pearls. He was told that if he could defeat the powerful chief Tubanamá, these riches could be his. He also learned from the Indians of a great sea on the other side of the Sierra de Quareca Mountains.

In early September 1513, Núñez de Balboa set out from Darién with a force of almost 200 Spaniards and 1,000 Indians and slaves. Crossing the lower part of the isthmus, his men struggled through some of the densest jungles and most rugged mountains in CENTRAL AMERICA. On September

25, 1513, they came to a hill that appeared to afford an unobstructed view to the south and west. Núñez de Balboa ascended it, accompanied only by his dog, and viewed the PACIFIC OCEAN.

Núñez de Balboa and his men pushed onward through the jungle and reached the shores of the Pacific on September 29. He called it the Great South Sea and, in a solemn ceremony, claimed it and all the lands it touched for the king of Spain. He named the bay there the Gulf of San Miguel. On this expedition, he and Pizarro heard the earliest reports of the Inca civilization to the south in present-day Peru. Núñez de Balboa obtained gold and pearls on the Pacific coast of Panama, then returned to the Atlantic side of the isthmus and, following a different route, conquered more Indian towns and obtained more riches.

Núñez de Balboa arrived back at the Darién settlement in January 1514. Meanwhile, court intrigues in Spain led to his being superceded in command in Panama by PEDRO ARIAS DE ÁVILA, who arrived at the colony later that year.

In 1516, Núñez de Balboa directed another expedition across Panama to the Pacific. On this occasion, the parts of disassembled ships were carried across the isthmus from Acla, a town Núñez de Balboa had established as his base on the Atlantic coast of Panama, near Puerto Careta. Transporting the ships through the mountains and jungles was accomplished with great difficulty and succeeded only because of Núñez de Balboa's great organizational skills. Núñez de Balboa himself had to make 20 crossings of the isthmus in the course of this project. Nearly 500 Indian laborers lost their lives. Two brigantines were eventually launched into the Gulf of San Miguel, and Núñez de Balboa sailed to the Perlas Islands, where he obtained pearls and undertook a few short explorations southward along Panama's Pacific coast.

Meanwhile, back on the Atlantic coast, intrigues against Núñez de Balboa continued. He was lured to Acla by Arias de Ávila and was arrested by his former lieutenant, Pizarro. In late January 1519, Núñez de Balboa was tried and found guilty of treason, stemming from trumped-up charges that he planned to establish his own colony on the Pacific side of the isthmus. Along with four of his chief supporters, he was publicly beheaded.

Vasco Núñez de Balboa was the first European to see the Pacific Ocean from the west coast of the Americas. His exploit had a profound influence on subsequent explorers, encouraging hopes that the newfound continent was narrow enough to provide an all-water route to the Pacific. His explorations also revealed that the riches of the Far East lay much farther west of the American landmass than previously believed. Núñez de Balboa established the first overland trail across the Americas, which subsequently provided the Spanish with a direct route to the west coast of South America and the gold and silver of Peru.

Nuttall, Thomas (1786–1859) *British naturalist in North America*

Born in the town of Settle in Yorkshire, England, Thomas Nuttall grew up in a family of modest means. After serving as an apprentice in the printing trade, he went to work at his uncle's printing shop in Liverpool.

In 1808, at the age of 22, Nuttall traveled to the United States, settling in Philadelphia. He became acquainted with the physician and naturalist Benjamin S. Barton, who encouraged him to pursue his interest in natural history. Nuttall soon began making field trips southward into the Delaware River Valley, as well as northward to the New Jersey Pine Barrens. His specimen-collecting expeditions eventually took him into the Delaware-Maryland Peninsula, coastal Virginia, the lowlands of North Carolina, and as far south as Mississippi and Florida.

In 1811, Nuttall, along with Scottish naturalist JOHN BRADBURY, accompanied WILSON PRICE HUNT and his fur-trading expedition from St. Louis up the MISSOURI RIVER by keelboat, reaching a point on the river above the Mandan Indian villages in what is now North Dakota.

Nuttall was back in Philadelphia in 1811, where he prepared a detailed study of his botanical specimens from the West. In 1813, he was elected a fellow of London's prestigious Linnaean Society, and, in 1817, he was made a member of the Philadelphia-based American Philosophical Society and correspondent of Philadelphia's Academy of Natural Sciences.

In 1818–20, Nuttall returned to scientific exploration in the American West, traveling along the Arkansas and Red Rivers into the remote parts of what is now Arkansas, Louisiana, and eastern Oklahoma. His *Journal of Travels into the Arkansas Territory, during the Year 1819*, published in 1821, includes information on the history of the region's Indian tribes as well as meteorological observations.

Nuttall's major botanical work, *The Genera of North American Plants, and a Catalogue of the Species, in the Year 1817*, first published in 1818, brought him fame in American scientific circles. In 1822, he was appointed a professor of natural history at Harvard, where he also served as curator of the botanical gardens.

Nuttall left his post at Harvard in 1834 to travel with NATHANIEL JARVIS WYETH's fur-trading expedition to the mouth of the COLUMBIA RIVER. He was accompanied by another naturalist, ornithologist John Townsend, as well as by Jason Lee and his small band of missionaries on their way to the Oregon Country. After the overland crossing to the Pacific coast, Nuttall returned to the East the following year by ship, sailing via the HAWAIIAN ISLANDS and CAPE HORN.

Nuttall returned to England in 1842 to live on an estate near Liverpool called Nutgrove, left to him by his uncle, where he cultivated exotic plants. He returned to Philadelphia

for a visit in 1847–48, during which he studied a natural history collection that had recently arrived at the Academy of Sciences from the Far West. He spent his remaining years in England.

With the publication in 1832 of his *Manual of the Ornithology of the United States and Canada*, Thomas Nuttall, like his contemporary JOHN JAMES AUDUBON, was acclaimed as one of the foremost authorities on the birds of North America. The first ornithological association in the United States was subsequently named in Nuttall's honor. In

addition to his work in botany and bird studies, Nuttall was a pioneer paleontologist, and he was among the first to cite the similarities in the geological makeup of such widely separated regions as Iowa and Derbyshire, England. He was one of the best-traveled naturalists to study the flora and fauna of North America in the first half of the 19th century. His explorations in search of plant and bird specimens took him into almost every state in the Union as well as into uncharted territory of the American West.

Odanais, Isabela Godin des See GODIN DES ODANAIS, ISABELA.

Odoric of Pordenone (Friar Odoric, Friar Oderic) (ca. 1265–1331) *Italian missionary in India, China, and Tibet*

Odoric of Pordenone was probably born in the northeastern Italian city of that name, north of Padua. He took holy orders as a Franciscan friar, becoming a missionary priest committed to winning converts to Christianity in Asia.

In about 1318, Odoric left Italy on a missionary expedition to the Far East. From Constantinople (present-day Istanbul, Turkey), he traveled overland across Asia Minor and Persia (present-day Iran) to the mouth of the Persian Gulf and the port of Hormuz, from where he continued his eastward journey by ship. He sailed first to Thana on India's northwest coast, north of Bombay, where he collected the bones of some recently martyred Christian missionaries. On southwestern India's Malabar Coast, he visited the port of Quilon and witnessed the trade carried on in the city's pepper and ginger markets.

Odoric then sailed to the island of CEYLON (present-day Sri Lanka); he later reported seeing a two-headed bird, probably a variety of hornbill whose long, curved bill confused him. After stopping at the Nicobar Islands of the eastern Indian Ocean, he reached Sumatra and the Strait of Malacca, from where he sailed to Borneo and Java, then

landed on the East Asian mainland of Cochin China (present-day Vietnam).

In about 1322, Odoric arrived at the Chinese port of Hangchow, then proceeded inland along the Grand Canal to Peking (Beijing). He stayed with JOHN OF MONTECORVINO, who had founded a Franciscan mission and church in the Chinese capital.

The bones of the martyred missionaries Odoric had carried from India were interred in Peking. Odoric remained in northern China until about 1328, then set out overland for his return journey to Europe. From Peking, he traveled northward, beyond the Great Wall of China into Inner Mongolia, then made his way southwestward across central China and entered Tibet. He reportedly reached the Tibetan capital of LHASA, the first Christian to do so. He later described the Tibetan people in critical terms, stating that they practiced cannibalism and that they drank out of the skulls of their ancestors.

Odoric's homeward journey took him along the northern slopes of the HIMALAYAS and through the Hindu Kush. He passed through Persia again, traveling along the south shore of the Caspian Sea, and, in about 1330, he arrived back in Padua. His route to the Far East and back followed in reverse that taken by MARCO POLO some 40 years earlier.

Soon after returning to Italy, Odoric wrote, with the help of another Franciscan friar, an account of his 12-year odyssey to the Far East. In the course of his travels, he reportedly had made as many as 10,000 converts to Christianity.

Odoric of Pordenone died in 1331, one year after his return from China. At the time of his death, he was planning a second proselytizing mission to Asia. The narrative of his travels, along with that of Marco Polo, fueled European interest in Asia, with its descriptions of the great size and marvels of such Chinese cities as Hangchow (Hangzhou) and Zaiton (Quanzhou), and the SPICE TRADE in India and Sumatra. It also provided Europeans with new geographic information about the Orient, much of which was incorporated by cartographer ABRAHAM CRESQUES in his *Catalan Atlas* of 1375. Odoric's account seems to have been a source for the 14th-century travel book *The Travels of Sir John Mandeville* by Sir John Mandeville, thought to be a pseudonym. After Odoric, 300 years elapsed before the next European visited Tibet; Jesuit missionary ANTONIO DE ANDRADE entered the region from India in 1624.

Ogden, Peter Skene (M'sieu Pete) (1794–1854)
Canadian fur trader in the American West

Peter Skene Ogden was born in Quebec City, Canada, to a Loyalist family who had settled there during the American Revolution. He was raised and educated in Montreal, where his father was a magistrate.

Although trained as a lawyer, Ogden decided against a legal career in favor of a life of travel and adventure in the FUR TRADE. In 1811, he joined the Canadian-owned NORTH WEST COMPANY and took part in fur-trading and trapping operations in the Great Lakes region.

Ogden journeyed to the Pacific Northwest in 1818. In 1824, three years after the North West Company's merger with the HUDSON'S BAY COMPANY, he became chief lieutenant to the Hudson's Bay Company's factor, JOHN MCLOUGHLIN, in the COLUMBIA RIVER region.

In late 1824, Ogden, with a party of 75 trappers and about 400 pack animals, embarked on an expedition to the south and east of the Hudson's Bay Company's Flathead Post in present-day northern Idaho. He was directed to deplete the area's beaver resources in an effort to discourage American trappers who were then penetrating the region from the upper MISSOURI RIVER. Driven out of the Three Forks of the Missouri area by Indian attacks, Ogden and his men explored the upper Jefferson River, then headed southward to the Salmon River, crossing the Continental Divide en route.

By May 1825, Ogden reached the northern Wasatch Mountains, near the site of present-day Ogden, Utah. From there, he explored the Weber River and the Bear River to its outlet into the Great Salt Lake. He returned to the Three Forks of the Missouri, and, after exploring and trapping along the Marias River, he reached Fort Vancouver, the Hudson's Bay Company's main post on the Columbia, in late 1825.

Ogden soon embarked on a second wide-ranging fur expedition. Starting from Fort Vancouver in winter 1825–26, he led a group of traders and trappers southward from the Columbia along Oregon's Deschutes River, then explored the region of the Blue Mountains to the east, as far as the Snake River.

In 1826–27, Ogden again headed southward from Fort Vancouver to Klamath Lake and northern California. While trapping and exploring there in 1827, Ogden and his party became the first non-Indians to sight Mount Shasta, which he named.

Ogden undertook an expedition into Utah's Great Basin in 1828–29. He and his men explored the north and west shores of the Great Salt Lake, then traced a previously unknown stream to its sink in what is now western Nevada, which Ogden named the Marys River. Fifteen years later, it was located by JOHN CHARLES FRÉMONT, who renamed its lower course the Humboldt River.

The next season, 1829–30, Ogden led his men from the Columbia southward across the Great Basin to the COLORADO RIVER, which he followed to its outlet into the Gulf of California. He and his party crossed the Sierra Nevada into California via Walker Pass, then returned northward to the Columbia through the San Joaquin and Sacramento Valleys. Along the way, Ogden was joined at times by EWING YOUNG and his men.

Throughout the 1830s, Ogden continued to expand the Hudson's Bay Company's operations in the Pacific Northwest. For a time, he supervised the fur trade in the Stikene River region of southeastern Alaska, and he was subsequently appointed as chief factor at Fort Vancouver. In 1847, he helped negotiate the release of non-Indian captives held by Cayuse Indians following the attack on missionary MARCUS WHITMAN and his followers.

After retiring from the fur trade, Ogden settled in Oregon City, Oregon, with his Indian wife. His explorations of the American West had brought him into contact with a wide variety of Native Americans, and he wrote about these experiences in his book *Traits of American Indian Life and Character. By a Fur Trader*, published posthumously in 1855.

Peter Skene Ogden's trading expeditions took him over a vast area of the American West. He was among the first non-Indians to report the existence of the Great Salt Lake. His 1828–29 exploration along the Humboldt River to the Humboldt sink in Nevada confirmed that it was not the fabled Bonaventura River and ended speculation that the Great Salt Lake was an arm of the Pacific Ocean. His 1829–30 expedition took him from the Columbia River as far south as the Gulf of California and constituted the first north-south crossing by non-Indians of the North American continent west of the Continental Divide. Utah's Ogden City, Ogden River, Ogden Valley, and Ogden Canyon were named in honor of his extensive explorations of the Great Basin.

Ojeda, Alonso de (Alonso de Hojeda)

(ca. 1465–ca. 1515) *Spanish conquistador in the West Indies, South America, and Panama*

Alonso de Ojeda was born in Cuenca, Spain, the son of aristocratic parents. In his early years, he was a member of the household of the Duke of Medina Celi and took part in Spain's final campaigns of reconquest against the Moors.

In 1493, Ojeda commanded one of the ships in CHRISTOPHER COLUMBUS's second voyage of exploration, sailing to the island of Hispaniola (present-day Haiti and the Dominican Republic), where he helped establish the settlement of Isabela. He then explored the interior of the island, discovering gold mines near Cibao. In April 1494, Ojeda led a military expedition against Indians in the La Vega Real region of Hispaniola, defeating the leader Caonabo at the Battle of La Vega the following March.

In 1497, Ojeda returned to Spain and sought royal authority for an expedition of his own to the Americas. In 1499, he received permission to explore along the coast of South America, reached by Columbus on his third voyage in 1498. On May 16, 1499, Ojeda sailed with several ships from the Spanish port of Santa María, near Cádiz. Accompanying him were Columbus's former pilot, JUAN DE LA COSA, and AMERIGO VESPUCCI, a representative of the Italian banking interests that had partly financed the voyage.

Ojeda's small fleet reached South America at about 5° north latitude, off the coast of what later became French Guiana. While Vespucci explored to the south and east, Ojeda coasted to the north and west, making stops at Margarita Island and Trinidad. On the mainland, along a coastal inlet, he came upon an Indian settlement of houses supported by piers in the water. The scene reminded Ojeda of Venice with its canals and he named the place Venezuela, "Little Venice" in Spanish. He also came upon a similar village at what is now Maracaibo, which he called San Bartolomé.

After exploring the northeast coast of South America as far as Cape Vela, Ojeda sailed to Hispaniola for ship repairs. He soon ran afoul of Columbus's lieutenants, who ordered him to leave Hispaniola, accusing him of trespassing on territory already claimed by Columbus. In response, Ojeda attempted, without success, to mount an uprising against Columbus's rule on Hispaniola. He then sailed to Jamaica, and, on a stopover in the Bahamas, he captured a number of Indians whom he sold as slaves upon his return to Cádiz in June 1500. He also took back a cargo of brazilwood, used for dyeing cloth, as well as a quantity of pearls from the Gulf of Paria.

In January 1502, Ojeda led another expedition to the northeast coast of South America, intending to establish a colony on the coast of Venezuela. The settlement, which he called Santa Cruz, was constantly besieged by the Indians. After about nine months, when supplies became low, his

men mutinied. They arrested Ojeda and sent him in chains to Spanish authorities in Hispaniola, charging him with being despotic and brutal in his treatment of both his own men and the region's Indians. Bishop Fonseca, president of the Council of the Indies, which directed all Spanish exploration and settlement in the Americas, interceded on Ojeda's behalf and won his release. In 1505, Ojeda again unsuccessfully attempted to establish a colony on the Venezuelan mainland.

In 1508, Ojeda sent Cosa to Spain to seek another royal commission for a colony in South America. As a result, Ojeda was named governor of New Andalusia, a colonial province extending from Cape Vela to the Gulf of Darien, comprising most of the Atlantic coast of what is now Colombia and eastern Panama.

Among the men Ojeda recruited on Hispaniola for this enterprise was FRANCISCO PIZARRO, the future conqueror of Peru. HERNÁN CORTÉS, who later commanded the conquest of Mexico, also planned to accompany Ojeda, but he was forced to stay behind due to an injury. In November 1509, Ojeda sailed from Hispaniola's port of Santo Domingo with four ships, carrying 300 men and supplies. He landed at what is now Cartagena, Colombia, where his men suffered a devastating defeat in an Indian attack; Cosa, who had partly financed the expedition, was killed. Soon afterward, DIEGO DE NICUESA, in command of a rival expedition, arrived at Cartagena, rescued Ojeda, then helped him launch a counterattack against the Indians.

Unable to subdue the native peoples around Cartagena, Ojeda moved his colony westward along the coast, establishing San Sebastian on the east shore of Colombia's Gulf of Urabá. The relief ship supposedly sent by the principal backer, Spanish lawyer Martín Enciso, failed to arrive, and Ojeda decided to return to Hispaniola. Leaving Pizarro in command, he sailed with Bernardino de Talavera (or Calavera), one of the Spanish PRIVATEERS active in the region. The ship was wrecked off the coast of Cuba. A message sent by CANOE to Jamaica was received there by PÁNFILO DE NARVÁEZ, who sent a ship to pick up Ojeda and take him back to Hispaniola. Meanwhile, Enciso had already sailed for the mainland, and VASCO NÚÑEZ DE BALBOA, in Ojeda's absence, usurped his authority and reorganized the Panama colony under his own leadership.

Left without financial backing to reestablish his claim on New Andalusia, Ojeda spent his last years on Hispaniola in poverty. His death was reportedly due to the effects of a poison-tipped arrow with which he had been wounded on his final expedition to the mainland of South America and the Isthmus of Panama.

Alonso de Ojeda was among the first generation of Spanish adventurers to colonize the lands explored by Columbus between the mouths of the ORINOCO RIVER and Panama's Gulf of Urabá. Based on his 1499 voyage with

Ojeda, Cosa produced the first map to depict the mainland of northern South America. Although Ojeda's own colonizing efforts were unsuccessful, they soon led to permanent European settlements on the coast of what is now Venezuela, Colombia, and Panama. His son, also named Alonso, played a leading role in the Spanish conquest of Mexico under Cortés in 1519–21.

Oñate, Juan de (ca. 1550–ca. 1630)

Spanish colonizer of New Mexico

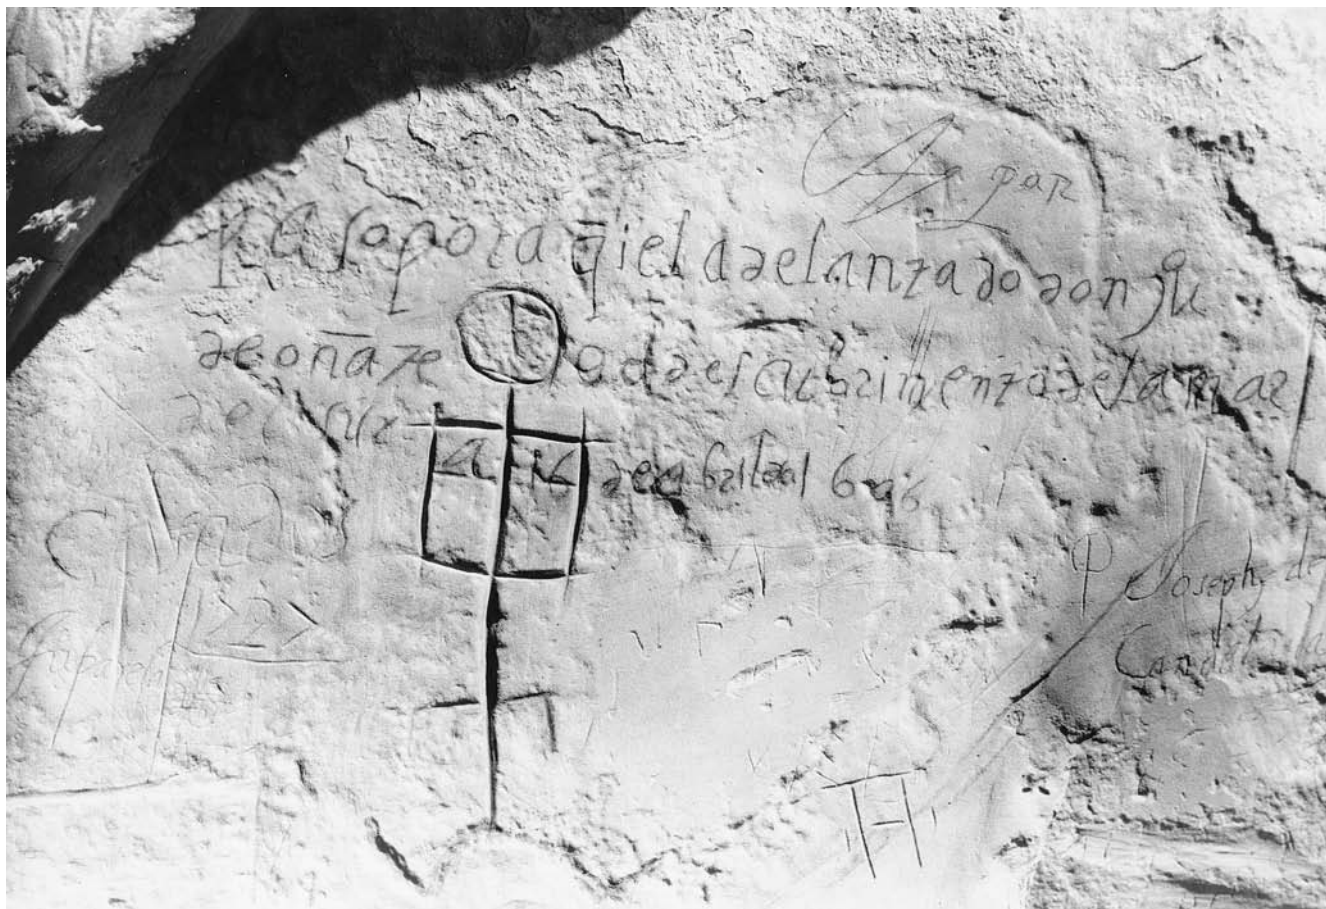

Juan de Oñate was probably born in western Mexico, in the old colonial province of Nueva Galicia. His father, Cristóbal de Oñate, was one of the original European discoverers of the silver mines of Zacatecas. The younger Oñate married a direct descendant of HERNÁN CORTÉS, the leader of the Spanish conquest of Mexico.

In 1595, Juan de Oñate was commissioned by the Spanish government to undertake a colonizing expedition north of the Rio Grande into what is now New Mexico. Three years later, in late 1598, he led several soldiers, settlers, and Franciscan missionaries north from Nueva Gal-

icia into what is now western Texas. Oñate and his expedition reached the Rio Grande near present-day El Paso, Texas, and followed it to its confluence with the Chama, where they established the settlement of San Juan de los Caballeros, near present-day Santa Fe. He claimed New Mexico for Spain and became the province's first Spanish governor. Soon afterward, he established a permanent settlement nearby at San Gabriel de Yungue-Ouinge, at what became known as the San Gabriel Pueblo, the first colonial capital of the province of New Mexico.

Beginning in 1601, Oñate undertook a series of explorations in the lands surrounding his New Mexico settlements, in search of mineral wealth and the fabled Seven Cities of CIBOLA and QUIVIRA. He explored the Texas Panhandle and the Canadian and Arkansas Rivers, crossing what is now Oklahoma, and penetrated the southern plains as far as present-day Wichita, Kansas.

In 1604–05, Oñate explored westward from the San Gabriel settlement into the Gila River region of present-day Arizona, in search of a direct route to the "South Sea." He reached the COLORADO RIVER and followed it to the northern end of the Gulf of California.

Juan de Oñate's inscription at El Morro in New Mexico (Library of Congress)

Oñate served as Spain's first colonial governor of New Mexico until 1609. After he resigned, he was charged with mismanagement and excessive cruelty in suppressing Indian uprisings, especially at Acoma Pueblo in 1598–99. In 1609, he founded a settlement at Santa Fe. In 1614, he was exiled from New Mexico. He later traveled to Spain, where he won a reversal of his sentence.

Juan de Oñate explored much of the same territory covered by FRANCISCO VÁSQUEZ DE CORONADO in 1541. He founded the first permanent European settlements west of the MISSISSIPPI RIVER in what is now the United States. Oñate's 1604–05 expedition across what is now western New Mexico took him to the famous inscription rock, El Morro, where he was the first European to record his name at the base of the 200-foot-high natural sandstone monument.

Orbigny, Alcide-Charles-Victor Dessalines d'

(1802–1857) *French naturalist in South America*

Alcide d'Orbigny was born in Coueron, France. In 1825, when he was just 23 years old, his studies of foraminifera (a class of shelled, near-microscopic, protozoa-type creatures) so impressed the directors of the Paris Museum of Natural History that they commissioned him to lead a scientific expedition to South America.

In 1826–27, Orbigny traveled across Brazil and Uruguay, collecting zoological and botanical specimens. In 1827–28, he undertook an exploration of the Paraná River and its tributaries in southeastern Brazil, Paraguay, and Argentina.

In 1828, Orbigny was commissioned by the government of Argentina to explore the Pampas and prepare a report on its potential for agricultural development. That year, he went south to Patagonia to conduct natural history studies. While there, he was adopted by a native band and fought on their side in an intertribal war. He then spent several years exploring Bolivia and traveling in Peru, during which he carried out additional scientific studies and collected plant and animal specimens.

Orbigny returned to France in 1834. The extensive natural history collection he had amassed in his travels in South America brought him the Grand Prize from the Geographical Society of Paris, and the French government published his nine-volume report of the expedition, *Voyage dans l'Amérique Méridionale* (1834–47). In the course of his explorations in South America, Orbigny had also collected and studied microscopic fossils, work that became the foundation for the science of stratigraphical paleontology.

Alcide d'Orbigny's explorations through nearly every part of South America yielded much new geographic information, and, in 1842, he produced the first comprehensive map of the continent.

Ordaz, Diego de (Diego de Ordás) (1480–1535)

Spanish conquistador in the Americas

Diego de Ordaz was born at Zamora in northwestern Spain. While in his early 20s, he sailed to the WEST INDIES. In 1509, he embarked from Hispaniola (present-day Haiti and the Dominican Republic) with ALONSO DE OJEDA's abortive colonizing expedition to the coast of what is now Colombia and Panama.

Ordaz took part in the conquest of Cuba under DIEGO DE VELÁSQUEZ in 1511 and he later served in Velásquez's household after the latter was appointed as the island's first colonial governor.

Ordaz served as an officer under HERNÁN CORTÉS in his conquest of Mexico in 1519–21. In the early stages of that campaign, he commanded a reconnaissance of the Yucatán coast. Later, as Cortés and his army approached the Aztec capital, Ordaz led a number of men part way up 17,930-foot Popocatepetl, an active volcano on the outskirts of what is now Mexico City. He thus became one of the first Europeans to catch a glimpse of Tenochtitlán, the Aztec capital. Soon afterward, Ordaz accompanied Cortés in his first meeting with the Aztec emperor Montezuma (Moctezuma).

In 1521, Ordaz returned to Spain and reported on the conquest of Mexico to King Charles I (Holy Roman Emperor Charles V). In honor of Ordaz's having made the climb of Popocatepetl, the Spanish monarch permitted his family to display a burning mountain in its coat of arms.

Ordaz became the commander of his own expedition in 1530. He was commissioned by the king to explore, conquer, and colonize a large portion of the northeast coast of South America, stretching from the mouth of the AMAZON RIVER to Cape de la Vela, a region comprising part of what is now eastern Colombia, Venezuela, the Guianas, and northeastern Brazil.

Ordaz sailed from Spain with three ships carrying 500 men. Although he located the mouth of the Amazon, he was unable to make a landing, and instead he sailed westward along South America's northeast coast to the Gulf of Paria. He learned from the natives of another great river, which the natives called the Huyapari. By June 1531, Ordaz had succeeded in finding the delta of this river, now known as the ORINOCO RIVER. He explored upriver for about 800 miles, reaching its junction with the Meta River, which he briefly investigated.

From the region's Indians, Ordaz learned of a mysterious people called the "Guiana," who supposedly possessed vast amounts of gold and other riches and were said to be white, like Europeans. Ordaz searched in vain for this fabled land of wealth before returning to the coast. On nearby Cubagua Island he ran afoul of Spanish settlers, who charged him with trespassing in lands that had already been claimed in that part of what is Venezuela.

Placed under arrest, Ordaz was transported to Santo Domingo on Hispaniola, where he was soon released. In 1532, he sailed for Spain to assert his claim on the lands he had explored, but he died on the homeward voyage.

Diego de Ordaz, who played a significant role in the early stages of the Spanish conquest of Mexico, became the first European to explore the Orinoco River, one of the longest in South America, ascending it to a point about 600 miles inland from the Caribbean coast of present-day Venezuela. The reports he related of a rich Native American civilization rumored to exist in the region encouraged subsequent explorations of the Orinoco, in search of the fabled land of EL DORADO.

Orellana, Francisco de (ca. 1490–ca. 1546)

Spanish conquistador in Peru, Ecuador, and the Amazon Basin

Born at Trujillo in the Extremadura region of western Spain, Francisco de Orellana was a relative and boyhood friend of FRANCISCO PIZARRO. In 1527, he left Spain to seek his fortune in the WEST INDIES. In the years that followed, he took part in campaigns of conquest on the mainland.

Orellana joined his kinsman Pizarro in the conquest of Peru in 1533–35, during which he fought in battles against the Inca at Lima, Trujillo, and Cuzco, suffering the loss of an eye in one engagement. In 1538, he led Spanish forces in the conquest of the Inca province of La Culata, and soon afterward he helped reestablish the city of Guayaquil near the Pacific coast of what is now Ecuador. Orellana also aided Pizarro and his forces in defeating DIEGO DE ALMAGRO in the civil war that same year.

Orellana settled for a time at Puerto Viejo (present-day Portoviejo, Ecuador) near Guayaquil, where he had been appointed governor by Pizarro. In early 1541, he organized at his own expense a small force of about 20 Spaniards and a number of Indians and set out eastward from Quito, across the northern ANDES MOUNTAINS, hoping to join up with a larger expedition under the command of GONZALO PIZARRO, Francisco Pizarro's younger brother. The younger Pizarro was at that time in search of La Canela (the land of cinnamon), reportedly an abundant source of that highly prized spice, and of the fabled kingdom of EL DORADO, a land that, according to Indian stories, was rich with gold.

In March 1541, Orellana met up with Gonzalo Pizarro and his men on the upper Coca River in what is now northern Ecuador; he was immediately named second in command. Pizarro had located some cinnamon trees in the region, but not enough to be of any commercial value. The search for El Dorado persisted, and, by late 1541, the combined expedition was facing a critical shortage of food and supplies. A brigantine-type boat, the *San Pedro*, was constructed with improvised materials, and on Christmas Day

1541, Orellana, accompanied by 56 men and a number of natives traveling by CANOE, headed down the Coca, hoping to find an Indian village with food.

Although he had been instructed by Pizarro to return within 12 days, Orellana and his men were soon swept into the upper Napo River. At the confluence of the Napo and the Aguarico Rivers, they came upon an Indian village called Aparia, where they found ample food, and it was there that Orellana decided not to attempt a return journey upstream to rejoin Gonzalo Pizarro. Instead, he resolved to construct a larger vessel and continue downstream into the AMAZON RIVER, then known as the Marañon (maze), intending to explore it to its mouth on the Atlantic Ocean. After two months, the second boat, the *Victoria*, was completed, and, on April 24, 1542, Orellana resumed his downriver journey.

In mid-May 1542, Orellana and his men successfully fought off a series of Indian attacks as they made their way downstream. In early June, after locating the mouth of the Río Negro (so named after the darker appearance of its water as it combined with the main stream of the Amazon), the Spaniards were reportedly besieged by a group of women warriors, likened by the expedition's chronicler, Dominican friar Gaspar de Carvajal, to the Amazon women of Greek legend.

On July 28, 1542, Orellana and his men reached the tidal basin of the Amazon. After rigging sails made from blankets, they continued into the mouth of the Amazon, entering the Atlantic on August 26, 1542. While following the northeast coast of South America, along the shores of what is now the Guianas and Venezuela, the ships were separated. They were not reunited until September 11, when they met up at Nueva Cádiz on Cubagua Island off the central Caribbean coast of what is now Venezuela.

Meanwhile, Gonzalo Pizarro, having managed to return to Quito with the remnants of his expedition, charged Orellana with deserting him. Amidst the political turmoil that soon erupted in Peru, and which resulted in the end of the Pizarro family's domination of the region, the accusations were overlooked.

In 1543, Orellana returned to Spain to seek royal sponsorship for another voyage of exploration. King Charles I (Holy Roman Emperor Charles V) appointed him governor of the region around the river he had descended and commissioned him to lead a colonizing expedition to New Andalusia, as it was named. In May 1545, Orellana sailed from the Spanish port of Sanlúcar de Barrameda with four ships and about 350 men. By the time he had returned to the mouth of the Amazon in December 1545, he had only two ships remaining. He explored the great river's estuary, searching for the river's main channel, until December 1546, when he reportedly died of tropical disease.

Although it was not his intention, Francisco de Orellana led the first known journey down the Amazon River, traveling along it for 2,000 miles, from a point near its source in the Andes to its outlet on the Atlantic. Taken together with his preliminary trek over the Andes from Guayaquil in 1541–42, he and his men had also made the first complete crossing of the South American continent. Friar Carvajal's eyewitness account of the expedition, entitled *Account by Friar Gaspar de Carvajal of the Voyage down the River that Captain Francisco de Orellana Discovered*, appeared in Spain soon afterward. Carvajal referred to the river as the "Orellana," although VICENTE YAÑEZ PINZÓN had actually reached the mouth of the river in 1500 and had named it La Mar Dulce (the freshwater sea). By the early 1600s, because of Carvajal's report on the women warriors, whom he had likened to the Amazons of Greek legend, the river had come to be known as the Amazon. Carvajal also described the so-called Amazons as being fair-skinned and reported other white inhabitants in the rain forest. Similar sightings of white-skinned native people in the Amazon Basin persisted well into the 20th century. Orellana's voyage of 1542 initiated exploration of the Amazon and revealed for the first time the full extent of the river. The geographic knowledge resulting from his expedition was incorporated into the first comprehensive map of the South American continent, produced by DIEGO GUTIÉRREZ in 1562.

Ortelius, Abraham (Abraham Oertel, Abraham Ortell, Abraham Ortel) (1527–1598)

Flemish cartographer, geographer

Abraham Ortelius was born at Antwerp in present-day Belgium, which was then under Spanish rule. His original family name, Oertel or Oertell, was later Latinized in the humanist tradition. He became involved with cartography early in his life, becoming a skilled illuminator of maps by the time he was 20 years old.

The death of Ortelius's father left him as the sole support for his widowed mother and two sisters, and, to augment their income, he became an itinerant dealer in maps. The maps he acquired were mounted on linen by his mother and sisters and sold on his commercial trips to Germany, France, Italy, and England. Ortelius also collected locally produced maps in the course of his travels, which he brought back to Antwerp, illuminated, and resold.

In about 1549, Ortelius was commissioned by Dutch merchant Aegidius Hoofman to put together a comprehensive collection of European maps in book form. Hoofman and other businessmen of that time needed such a portable reference work to aid in determining the best routes with which to carry on trade during the nearly constant political and religious warfare then raging between the nations of Europe. Demand for more such works soon followed, and over

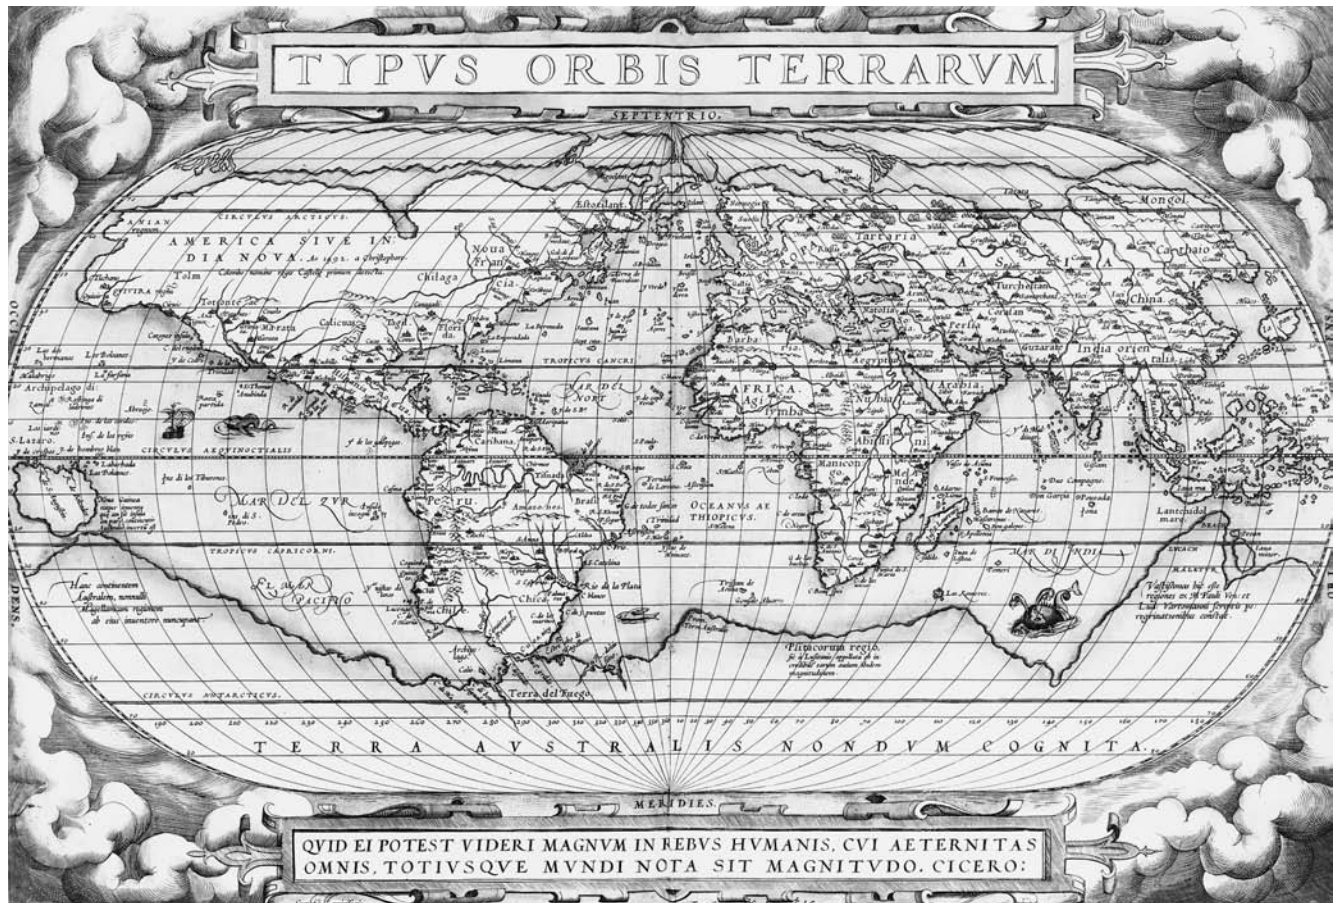

the next 10 years, Ortelius published maps he had collected in bound, uniform-sized sheets. He became a friend and associate of Flemish cartographer GERARDUS MERCATOR, who assisted him in acquiring maps and with whom he corresponded about the latest geographic information.

On May 20, 1570, Ortelius published what amounted to the first modern geographic world atlas. Entitled *Theatrum Orbis Terrarum* (Picture of the world), it contained 53 maps printed from newly etched copperplates. It was an immediate commercial success. During the next 28 years, Ortelius regularly produced annual editions; by 1598, the year of his death, the work included more than 100 maps with an accompanying text.

Ortelius's reputation as one of the leading cartographers of his day spread across Europe. Editions of his books of maps were soon published in Dutch, German, French, Italian, and English translations from the original Latin, and in 1575, he was appointed as royal geographer to King Philip II of Spain. In addition to his cartographic work, Ortelius produced a geography, *Thesaurus Geographicus*, first published in 1587.

Abraham Ortelius (Library of Congress)

Map of the world by Abraham Ortelius (1570) (Library of Congress)

The maps included in Abraham Ortelius's published works were based more on actual explorations and reports of mariners and less on the traditional geographic dogma handed down since the days of PTOLEMY. Although his charts did continue to depict such traditional inaccuracies as Terra del Fuego being an extension of Terra Australis (the hypothetical GREAT SOUTHERN CONTINENT), some features were inexplicably accurate. His map of North America, published in 1570, details what appears to be HUDSON BAY, yet that feature was not reported until after HENRY HUDSON's last voyage 41 years later in 1611. In addition, Ortelius's atlases were among the first to list the Americas among the continents of the world and to reflect the rapid gains in geographic knowledge that were made in his lifetime. With his annually updated atlases, Ortelius made the latest findings of such explorers as CHRISTOPHER COLUMBUS, VASCO NÚÑEZ DE BALBOA, FERDINAND MAGELLAN, and SIR FRANCIS DRAKE available to the European public. Prior to his work, such information had been included only on charts used by mariners or in lavishly produced works privately commissioned by wealthy, usually royal, patrons.

Orville, Albert d' (1621–1662) *Flemish missionary in China, Tibet, and India*

Albert d'Orville was a native of Flanders, territory now part of Belgium. After entering the Jesuit order, he dedicated himself to a career as a missionary priest in the Far East.

Orville was in Peking (Beijing) in 1658, when fellow Jesuit missionary JOHANN GRUEBER arrived there from Europe. In 1661, the two set out on a journey westward across China, which took them across the Ordos desert country to Lake Koko Nor, then southward into Tibet.

After a brief visit to LHASA, the Tibetan capital, Orville and Grueber crossed the HIMALAYAS into Nepal and India. While on a stopover at Agra in north-central India, Orville died, and soon afterward, Grueber resumed his journey, traveling back to Europe by way of the Middle East and the MEDITERRANEAN SEA.

Albert d'Orville, together with Johann Grueber, made one of the first extensive journeys across China and into Tibet since the travels of MARCO POLO in the late 1200s and ODORIC OF PORDENONE in the early 1300s. Grueber survived to take back to Europe much updated information about the geography and people of central Asia.

Oudney, Walter (1790–1824) *Scottish physician, naturalist in North and West Africa*

Walter Oudney was born into a family of modest means in Edinburgh, Scotland. As a youth, he acquired some knowledge of medicine, and in 1810, he entered the British navy as a surgeon's mate. In 1814, after serving in the EAST INDIES, he was made a naval surgeon. Soon after the conclusion of the Napoleonic Wars in 1815, Oudney left the navy and began a course of medical studies at Edinburgh University. He also undertook studies in chemistry and natural history and pursued an interest in botany. Soon after receiving his medical degree in 1817, he opened a private practice in Edinburgh and also carried on independent studies in chemistry and natural history, hoping to someday secure a university professorship in botany.

In 1820, Oudney accepted the British government's proposal to determine the course of West Africa's NIGER RIVER. Accompanying him on this venture was British naval officer HUGH CLAPPERTON, with whom he sailed to Tripoli in present-day Libya, arriving there in October 1821. They were soon joined by British army officer DIXON DENHAM, as well as by an English shipbuilder named William Hillman.

Oudney, having been instructed to trace the course of the Niger River through the kingdom of Bornu in what is now northern Nigeria, almost at the opposite end of Africa's great western bulge from Tripoli, led his expedition southward across the SAHARA DESERT. By April 1822, they had reached Murzuk in the Fezzan region of present-day southwestern Libya. They remained there for the next seven months, exploring the surrounding territory while waiting to arrange for an armed escort from the bey, the region's local ruler. In December 1822, Oudney and his companions managed to get the support they needed from a wealthy native merchant, Abu Bakr bu Khullum, and they soon crossed the border into the kingdom of Bornu.

On February 4, 1823, Oudney, Clapperton, Denham, and Hillman became the first confirmed Europeans to see Lake Chad. On a reconnaissance around the lake with Clapperton, Oudney went on to locate the Chari River, Lake Chad's principal tributary.

Oudney and the expedition next visited the Bornu capital at Kuka (now the Nigerian city of Kukawa), where they remained until the following fall. He began his quest for the Niger on December 14, 1823, when he left Kuka and headed into western Bornu, believing that the river flowed from somewhere in a region called Nupe to the southwest. Clapperton alone accompanied him, while Denham and Hillman remained at the Bornu capital.

Exposed to extreme cold, Oudney contracted pneumonia and died at Katagum on January 12, 1824, barely a month after setting out from Kuka. Clapperton continued on alone but returned to Kuka after native rulers warned

him that to proceed to Nupe would be too hazardous. With Denham and Hillman, he then returned to Tripoli, from where they sailed to England, arriving in June 1825.

Some of the mineralogical studies made by Walter Oudney on his crossing of the Sahara in 1821–22 were later incorporated into Dixon Denham's published account of the expedition, as was Oudney's account of the journey from Murzuk to Bornu. Further exploration to determine the true course of the Niger River resumed with Clapperton's expedition of 1825 and ended in 1830 when RICHARD LEMON LANDER and his brother John followed the river to its outlet into the Gulf of Guinea.

Overweg, Adolf (1822–1852) *German geologist, astronomer in North and central Africa*

A native of Germany, Adolf Overweg had, by his late 20s, achieved a reputation as an accomplished geologist and astronomer. In 1849, he joined German geographer HEINRICH BARTH in an expedition into central and West Africa, sponsored by the British government and led by antislavery activist and explorer JAMES RICHARDSON.

Overweg and Barth arrived in Tripoli along the North African coast on January 18, 1850. They were soon joined by Richardson, and the three set out southward across the SAHARA DESERT to the oasis city of Murzuq in the Fezzan region of what is now southwestern Libya. In October 1850, they arrived at Agades in what is now central Niger, from where they continued into the sub-Saharan region, traveling with a salt caravan. They then separated, each taking a different route southward to Lake Chad, with Overweg approaching the lake from the northwest.

In April 1851, Overweg rejoined Barth in Kuka, the capital of the black Muslim kingdom of Bornu in what is now northern Nigeria. They learned there that Richardson, who had been sent to Bornu on a semidiplomatic mission, had died en route to Lake Chad.

Overweg returned to his explorations around Lake Chad, while Barth independently explored the Chari River, as well as the Benue River. In summer 1851, Overweg completed his survey of the west and north shores of Lake Chad. From his continuous exposure to the swampy regions around the lake, he developed a fever, dying on September 27, 1852. The inhabitants of the lakeside village, with whom he had become friends, buried him on the shore of the lake he had explored, according to his final wishes.

In the course of his explorations, Adolf Overweg mapped the entire perimeter of Lake Chad from a small boat and was the first known European to sail completely around the lake. Barth, who continued to explore in West and North Africa until 1855, sent Overweg's maps back to Europe.

Oxley, John Joseph William Molesworth

(ca. 1783–1828) *British explorer, government official in Australia*

Born at Westow in Yorkshire, England, John Oxley entered the British navy as a teenager. After 12 years of service, he left the navy at the rank of lieutenant. He sailed to Australia in 1812, where he had been appointed surveyor general of New South Wales.

Oxley undertook his first major exploration into the interior of southeastern Australia in 1817, when he was sent by New South Wales governor Lachlan Macquarie to explore the Lachlan River, southwest of Bathurst. Macquarie hoped to determine if the Lachlan led to an internal network of rivers, similar to the MISSISSIPPI RIVER and its tributaries in North America. If so, he speculated that such a river system could provide a water route through the continent from Sydney to either the Indian Ocean to the west or to Spencer Gulf on the south coast.

Oxley and his expedition left Bathurst on April 28, 1817. Second in command was George W. Evans, who had made the European discovery of the Lachlan River five years earlier. Along with Oxley and Evans were 11 other men, including botanist ALLAN CUNNINGHAM. Equipped with packhorses and boats, it was the largest expedition to penetrate the Australian interior until that time. Evans led Oxley to the point he had reached on the Lachlan in his earlier exploration. From there, the expedition attempted to trace the river's westward-flowing course. After several hundred miles, the river opened up into a vast and impassable morass of reedy marshlands they called Field's Plains. Oxley led the expedition overland to the southwest, hoping to find a navigable stretch of the Lachlan downstream, but he once again found it blocked by swamps. Without realizing it, Oxley had reached a point only 25 miles from the mouth of the Murrumbidgee River, a major tributary of the Murray and one of southeastern Australia's longest rivers.

Deciding that further exploration through the Lachlan's swampy lower reaches would be impossible, Oxley proceeded overland to the Macquarie River, which he followed back to Bathurst, arriving on August 29, 1817.

In April 1818, Oxley, again accompanied by Evans, led a larger expedition in an exploration of the upper Macquarie River, northwest of Bathurst. In June, 220 miles downriver,

they were again halted by a great expanse of marshes. In an attempt to skirt southward around the region, Oxley came upon a chain of mountains he called the Arbuthnot Range, as well as an expanse of fertile grazing land he called the Liverpool Plains. After crossing the GREAT DIVIDING RANGE, the expedition headed southward down the Hastings River and reached the Pacific coast, then returned to Sydney.

In 1819, Oxley, with HAMILTON HUME, undertook an exploration by boat along the shores of Jervis Bay and the Illawarra District, south of Sydney. Four years later, in 1823, New South Wales governor Thomas Brisbane sent Oxley northward from Sydney to explore Moreton Bay, hoping to find a suitable site for a new penal colony. Although Moreton Bay had been charted 50 years earlier by JAMES COOK, Oxley conducted the first thorough reconnaissance of the bay, locating the mouth of the Brisbane River. He came upon two shipwrecked sailors who, having been adopted by Aborigines, had survived on the abundant supply of fish and birds in the region. On his return to Sydney, Oxley reported that the region contained rich soil and adequate freshwater. Although he recommended that the Moreton Bay area be colonized by free settlers, a penal colony was nonetheless established the following year.

John Oxley was active in the early political life of the New South Wales colony, and was one of the pioneer settlers of the coastal Bowral District, south of Sydney. From his explorations of both the Lachlan and Macquarie Rivers in 1817–18, he speculated that the interior of the Australian continent was not crisscrossed by a network of interconnecting rivers but contained a large, landlocked inland sea. This view, which had been expressed previously by MATTHEW FLINDERS and others, was based on Oxley's having found great marshes in his explorations of both the Lachlan and Macquarie, which he concluded defined the inland sea's shoreline. His theories inspired the subsequent expeditions of CHARLES STURT and THOMAS LIVINGSTONE MITCHELL, who also searched for the hypothetical sea. The Oxley Highway, which crosses New South Wales along the route of his 1818 expedition, was named in honor of Oxley's contributions to the exploration of southeastern Australia, as was the town of Oxley on the Lachlan River, near its junction with the Murrumbidgee.

P

Pacheco, Duarte (Duarte Pacheco Pereira)

(unknown–ca. 1530) *Portuguese mariner, soldier in Africa and India*

Duarte Pacheco was born at Santarem, near Lisbon, into a family of nobles with close ties to the Portuguese ruling family. He was well educated and, in his early career, served as a personal assistant to King John II of Portugal.

Pacheco took part in Portuguese voyages of exploration along the southwest coast of Africa during the 1480s. In 1488, he was shipwrecked with his crew on the island of Principe in the gulf of Guinea. He and his men were rescued later that year by BARTOLOMEU DIAS, who was returning to Portugal from the CAPE OF GOOD HOPE.

According to some sources, Pacheco first sailed to India with PEDRO ÁLVAREZ CABRAL's fleet in 1500, which also landed along the coast of Brazil. In 1503, he accompanied AFONSO DE ALBUQUERQUE on his expedition to the ports of southwestern India's Malabar Coast, where he played a major role in naval victories against Calicut. In 1504–05, he successfully defended the port of Cochin against a year-long siege.

Proclaimed a hero, Pacheco returned to Lisbon in 1505, where he was personally greeted by King Manuel I. Four years later, he added to his naval triumphs with a decisive victory over the pirate Mondragon, who had long been preying on Portuguese treasure ships along the African coast.

In 1520, Pacheco was appointed military governor at the fortress of São Jorge da Mina, the Portuguese trading settlement on the Gulf of Guinea coast (present-day Elmina,

Ghana). After two years, he was sent back to Lisbon in chains, accused of embezzlement. Although he managed to prove his innocence and regain his freedom, the scandal ruined his reputation. Poverty-stricken, he lived out the rest of his days in obscurity.

Pacheco wrote an account of Portuguese explorations, entitled *Principio do Esmeraldo de Situ Orbis*. The work, which contained valuable geographic information, as well as sailing and navigational directions for voyages to India, was long suppressed by the Portuguese government under its policy of keeping all such information secret.

In the 1570s, nearly 50 years after his death, Duarte Pacheco's fame as a hero was revived in the works of the Portuguese epic poet Luíz Vaz de Camões, who bestowed on Pacheco the sobriquet Aquiles Lusitano—the “Portuguese Achilles.”

Padilla, Juan de (ca. 1500–1542) *Spanish missionary in Mexico and the American Southwest and Midwest*

Spanish Franciscan missionary Friar Juan de Padilla arrived in Mexico in 1528. He accompanied HERNÁN CORTÉS on an expedition into southern Mexico in 1533, and, in 1540, he was attached to FRANCISCO VÁSQUEZ DE CORONADO's expedition northward from western Mexico into what is now Arizona and New Mexico. He hoped to prove the truth of the legendary, fabulously rich Seven Cities of Antillia, which now were thought to be the Seven Cities of CIBOLA.

In July 1540, after finding no great wealth among the Zuni Indians, Padilla, along with one of Coronado's officers, PEDRO DE TOVAR, explored into what is now eastern Arizona. They came upon seven Hopi Indian villages and returned to Coronado with reports of a great river to the west. A follow-up expedition, led by GARCÍA LÓPEZ DE CÁRDENAS, further investigated the region and made the European discovery of the COLORADO RIVER, as well as the Grand Canyon.

Padilla was among the friars who traveled with Coronado and his army of CONQUISTADORES in search of QUIVIRA, an Indian land that, according to the account of the captured Indian TURK, contained an abundance of gold and silver and that Padilla believed might be Antillia. In April 1541, the expedition departed Tiguex in the upper Rio Grande Valley of what is now north-central New Mexico and marched across the Texas Panhandle into present-day western Oklahoma.

Padilla may have remained with Coronado until his expedition reached what was thought to be Quivira, near present-day Lindsborg in central Kansas. Finding no riches, Coronado led his men back to Tiguex on the Rio Grande, from where he planned to return to Mexico. With the prospect of winning new Christian converts, Padilla decided not to return to Mexico with Coronado but instead to proselytize among the Plains Indians. He may have been joined by two other missionaries, Juan de la Cruz and Luis de Escalona. Soon after traveling back onto the plains, he was murdered by the native people.

Friar Juan de Padilla's explorations with Pedro de Tovar led to the Spanish discovery of the upper Colorado River. Padilla was the last known European to visit the plains of central Kansas until JUAN DE OÑATE sent his reconnaissance expeditions into the region more than a half century later.

Páez, Pedro (Pedro Páez Xaramillo) (1564–1622)

Spanish missionary in Ethiopia, in service to Portugal

Pedro Páez was a native of Spain. In about 1586, after entering the Jesuit order, he sailed to Goa, the Portuguese colony on the west coast of India, where he worked as a missionary.

In 1589, Páez set out from Goa for Ethiopia, drawn there by reports of a Christian kingdom, possibly that of the fabled PRESTER JOHN. While sailing across the Arabian Sea, Páez's ship was attacked by Turkish pirates, and he was taken captive and sold into slavery. He then spent seven years as a slave in Yemen before his release, returning to Goa in 1596.

In 1603, Páez again left Goa for Ethiopia, and he soon reached the northern Ethiopian port of Massawa on the RED SEA. During the next 10 years, he made numerous journeys inland, including one in 1613 in which he traveled from

Gondar to Lake Tana and the nearby Springs of Geesh, which he determined were the principal source of the Blue Nile, which feeds the NILE RIVER. By the time of his death in 1622, Páez had succeeded in converting the emperor of Ethiopia, Negus Susenyos, and his family to Catholicism.

Although Pedro Páez was the first European known to have reached Lake Tana and to have determined that the Blue Nile flowed from it, his finding was long suppressed by the Portuguese, who, with their traditional policy of keeping new geographic information secret, then dominated European contacts with East Africa. A century and a half later, Scottish explorer JAMES BRUCE, in his travels in Ethiopia during the early 1770s, finally confirmed Páez's earlier finding that Lake Tana was the true source of the Blue Nile.

Palgrave, William Gifford (1826–1888)

British missionary, diplomat, writer in Arabia, in service to France

William Palgrave was born in London, England, the son of prominent upper-class parents. His father was the historian Sir Francis Palgrave, and his grandfather, Meyer Cohen, was a member of the London Stock Exchange. Palgrave's early education at Charterhouse School was followed by several years at Oxford University, where he studied modern and classical languages, graduating in 1846. Having developed an interest in Eastern studies, he traveled to India and entered the Eighth Bombay Infantry Regiment as a lieutenant. After only a few years, he left the military and converted to Catholicism. In 1848, he began studies at a Jesuit college near Madras. He eventually undertook missionary work in southern India.

In 1853, Palgrave sailed back to Europe, where he continued his religious studies in Italy at the Colegio Romano in Rome. He was assigned to Beirut, Lebanon, where he served as a priest and teacher in the Maronite Christian community. He became proficient in Arabic, and, in 1857, he was ordained a priest.

Palgrave remained in Lebanon until 1860, when he was forced to flee to France amid a widespread outbreak of persecution and violence against the Christian minority. In 1861, he conceived a plan to undertake a missionary expedition into the heart of the Arabian Peninsula. His idea came to the notice of French emperor Napoléon III, who, anticipating the construction of the Suez Canal, sought to extend French hegemony over the region and was willing to provide financial backing. French businessmen were also interested in exploring the possibility of trade in Arabia, as well as in the prospect of increased imports of the region's cotton, for cotton was in short supply in Europe because shipments from the United States had been interrupted with the outbreak of the Civil War. European horse breeders also

gave their support to Palgrave, hoping his expedition would facilitate the importation of pure-blood Arabian breeding stock.

Palgrave left Europe for the Middle East on June 24, 1861. After a stopover in Egypt, he continued to the city of Ma'an in what is now southern Jordan; in July 1862, he left there and headed into the Arabian Peninsula. Disguised as a Syrian doctor and accompanied by a Syrian-Greek Christian priest and teacher named Barakat Jurayjuray, Palgrave traveled southeastward across the Nafud Desert into the land of the Shammar people. After a visit to the Shammar capital at Hai'l, where he was welcomed by the emir, he continued to Riyadh, finally reaching the Persian Gulf coast at Qatif, north of Qatar.

Back in England, Palgrave lectured on his Arab exploits before the ROYAL GEOGRAPHICAL SOCIETY, and, in recognition of his accomplishment, Napoléon III and the French government awarded him a grant of 10,000 francs. In 1865, he published an account of his 13-month, 1,500-mile trek from Jordan to the Persian Gulf, entitled *Narratives of a Year's Journey Through Central and Eastern Arabia*. The book was immediately translated into French and became a best-seller throughout Europe.

In 1865, Palgrave left the priesthood and began a diplomatic career with the British Foreign Office. That year, he was dispatched to Ethiopia, where he obtained the release of the British consul and his staff, who had been taken hostage by the Abyssinian ruler, King Theodore. Soon afterward, he assumed consular duties at Trabzon, on the Black Sea coast of the Ottoman Empire, and while stationed there, he undertook explorations into various regions of Asia Minor. During the next 20 years, he served in diplomatic posts in the Philippines, Japan, Bulgaria, Thailand, and the WEST INDIES. His last assignment was in Montevideo, Uruguay, where he died of bronchitis in September 1888.

William Palgrave was the second European known to have crossed the Arabian Peninsula, the first being British officer GEORGE FOSTER SADLIER in 1819. While Sadlier had made the first east-to-west crossing of Arabia, Palgrave was the first to traverse the region from west to east.

Palliser, John (1807–1887) *Irish sportsman, traveler in the Canadian West*

Born into a family of wealthy landowners in Waterford County, Ireland, John Palliser attended schools in Europe before going on to Trinity College in Dublin. While serving as a captain with the Waterford Artillery Militia in the mid-1840s, he was probably exposed to modern topographic mapping techniques, knowledge of which was vital in his subsequent explorations into the Canadian West.

Palliser was a sportsman as well as a hunter, and in 1847–48, he undertook a hunting expedition up the MIS-

SOURI RIVER into the Great Plains, where he hunted buffalo while living with Indians. Upon his return to Great Britain, he wrote an account of the experience, published in 1853 as *Adventures of a Hunter in the Prairies*. The book became a bestseller, and, in 1856, Palliser was elected as a fellow of the ROYAL GEOGRAPHICAL SOCIETY.

Later in 1856, Palliser received the support of the Royal Geographical Society for a planned expedition into the Canadian West. At that time, much of the vast prairie country extending across what was to become southern Saskatchewan and Alberta was largely unknown to non-Indians, and there was great interest in learning whether the region had potential for agricultural development.

The British government provided financial backing for the proposed expedition through the influence of Palliser's friend John Ball, then undersecretary of state for the colonies. The government wanted Palliser to undertake a topographic survey along the 49th parallel, westward from Lake Superior to the Pacific Ocean, and thereby determine the international border between western Canada and the United States. He was also instructed to explore and evaluate the lands of the Canadian West and investigate the old CANOE route of the NORTH WEST COMPANY between Lake Superior and the Red River Settlement (present-day Winnipeg, Manitoba), in order to determine whether it could be revived as a transportation and communications link. The British government also provided Palliser with a scientific team: John William Sullivan, an astronomer; James Hector, a geologist; Eugène Bourgeau, botanist; and Thomas Wright Blakiston, an ornithologist. A simultaneous expedition under HENRY YOULE HIND also was to explore the region.

In May 1857, the expedition arrived in New York and from there headed westward to Sault Sainte Marie and the Lake Superior shore of Michigan's Upper Peninsula. At Isle Royale, they met up with VOYAGEURS with canoes provided with the help of HUDSON'S BAY COMPANY governor SIR GEORGE SIMPSON. After examining eastern Lake Superior's White Fish Bay and the White Fish River, the party headed north and west along the Rainy River and Lake of the Woods canoe and portage route to what is now Winnipeg, Manitoba. From there, the expedition traveled southward to the 49th parallel at present-day Pembina, North Dakota, which they surveyed westward as far as the Turtle Mountains along the present-day border between western Manitoba and north-central North Dakota.

While the rest of the expedition spent the winter of 1857–58 at Fort Carlton in what is now north-central Saskatchewan, Palliser traveled to New York, where he conferred with British government officials in an attempt to get more funding for the project. In spring 1858, he rejoined the expedition, which proceeded westward into the ROCKY MOUNTAINS.

Accompanied by the expedition's astronomer, John W. Sullivan, Palliser crossed the Buffalo Prairie of southern Alberta and made his way through the Rockies by way of the North Kananaskis and North Kootenay Passes. He then returned to Edmonton, Alberta, where he was reunited with the other members of the expedition, who had explored South Kootenay and Kicking Horse Passes. After wintering at Edmonton, Palliser and his companions headed eastward to explore the region around the confluence of the Red Deer and South Saskatchewan Rivers on the present-day border of Saskatchewan and Alberta. He thus completed a wide circuit around an expanse of the Canadian prairies, which, except for fur traders, was largely unknown to non-Indians.

From the Red Deer River, Palliser and his expedition returned westward, crossed western Canada's Blackfoot country, and traversed the Rockies by way of North Kootenay Pass. West of the COLUMBIA RIVER, they traveled overland to New Westminster, where the 49th parallel meets the Pacific coast. Palliser had surveyed nearly 2,000 miles of the border, as well as having undertaken an exploration of the prairies and the key passes through the Rockies.

In 1859, Palliser was awarded a gold medal by the Royal Geographical Society for his wide-ranging explorations. He returned to England in 1860, then traveled to North America again in 1862–63, visiting the American South, which at the time was embroiled in the Civil War. In 1869, he sailed to the Russian and Siberian Arctic, where he hunted and explored along the Kara Sea and the islands of Novaya Zemlya.

John Palliser completed the first scientific survey of western Canada, topographically determining the present-day U.S.-Canada boundary from the western end of Lake Superior to the Pacific coast. Based on his recommendations, Canada's first transcontinental railroad used Kicking Horse Pass as its principal route through the Rocky Mountains. The semiarid prairies of southern Saskatchewan and Alberta that he surveyed came to be known as Palliser's Triangle. The maps resulting from Palliser's topographic survey were of great help to subsequent geological expeditions, as well as to the region's first civil authority, the North West Mounted Police.

Palmer, Nathaniel Brown (Captain Nat)

(1799–1877) *American mariner, sealer in Antarctica*

Nathaniel Palmer was born in Stonington, Connecticut, a small seaport at the eastern end of Long Island Sound. He was a descendant of one of the town's original 17th-century settlers and the son of a shipbuilder and lawyer.

At the age of 14, Palmer went to sea, and, during the next four years, he served on vessels plying the coastal waters between Maine and New York. In 1819, he sailed with Stonington's sealing fleet to the South Shetland Islands south of

CAPE HORN in the South Atlantic Ocean, serving as second mate aboard the *Hersilia* under Captain James P. Sheffield. The voyage proved highly profitable, and, the next year, Palmer again sailed to the South Shetlands with the Stonington fleet, this time as captain of the sloop *Hero*.

In November 1820, after a sighting of what appeared to be mountains, the fleet's commodore, Captain Benjamin Pendleton, sent Palmer and the *Hero* to explore southward from Deception Island in the South Shetlands. Palmer soon sighted an archipelago of barren, snow-covered islands, about 700 miles southwest of CAPE HORN, just north of the ANTARCTIC CIRCLE. Since there were no seals to be found there, he continued south and west. After a month, he encountered what appeared to be a contiguous mainland, which later proved to be a peninsula extending from the Antarctic continent.

In February 1821, on his way back to the fleet in the South Shetlands, Palmer met up with the Russian navigator FABIAN GOTTLIEB BENJAMIN VON BELLINGSHAUSEN and his vessels, which were then engaged in exploring the waters around Antarctica. When Palmer informed the baron of his recent findings, Bellingshausen insisted on naming the new islands the Palmer Archipelago and the new coastline Palmer Land in honor of the young American seafarer, and he indicated them as such on the charts he published in Europe. Before rejoining the Stonington vessels, Palmer came upon another group of uncharted islands near the Falklands, now known as the South Orkneys.

Palmer commanded the *James Monroe* on another sealing voyage to the Antarctic in 1821. After again reaching the coast of Palmer Land, he proceeded eastward and located a strait that he named Washington Strait. Upon further examination, he found that the strait led into a bay, which he named Monroe Bay. A good natural anchorage he found there became known as Palmer's Harbor. He made a landing on an offshore island teeming with leopard seals and king penguins. Although he found no vegetation, Palmer was certain he had come upon a continuation of the large landmass he had located the previous year, having sighted rocky peaks projecting from the ice and snow along the coast.

Palmer then undertook voyages to the Caribbean Sea and the northeast coast of South America, during which he reportedly carried troops and supplies for Simón Bolívar in his struggle for independence. Palmer returned to the Antarctic in 1829, on a voyage that included a scientific team, and attempted, without success, to locate uncharted lands west of Palmer Land.

In 1833, Palmer received his first appointment as captain of a packet, plying the sea route between New York and New Orleans. Over the next several years, he became one of the most accomplished sea captains in New England, commanding clipper ships between New York and Liverpool, England, and eventually to China. In 1845, Palmer became

one of the founding members of the New York Yacht Club. After commanding the steamship *United States* on a voyage to Bremen, Palmer retired from the sea in 1850. Thereafter, he became director of a major New England-based steamship line. He remained active in yacht racing, becoming well known as a ship designer. "Captain Nat," as he was known through much of his career, died in San Francisco while returning from a voyage to China in 1877.

Nathaniel Palmer was only 21 years old when he was credited with sighting the Antarctic mainland. Although the land he reached in 1820 was called Palmer Land on American, Russian, and other charts in the years that followed, Great Britain claimed that the peninsula had actually been first sighted by British naval officer EDWARD BRANSFIELD in January 1820. Accordingly, Palmer Land was for years depicted on British charts as Graham Land, in honor of then lord of the Admiralty, James R. G. Graham. The dispute over just which seafarer the land should be named after was finally resolved in 1964 when Great Britain and the United States agreed to call that part of the continent the Antarctic Peninsula.

Park, Mungo (1771–1806) *Scottish physician, explorer in West Africa*

Mungo Park was born at Foulshiels, near Selkirk, in southern Scotland, the son of a tenant farmer and the seventh in a family of 13 children. He attended Edinburgh University, studying medicine and botany.

In 1792, Park's brother-in-law, botanist James Dickson, arranged for him to sail to the EAST INDIES as assistant ship's surgeon aboard the BRITISH EAST INDIA COMPANY vessel the *Worcester*. Park's study of Sumatra's plant and animal life, published upon his return to England the following year, came to the attention of the naturalist SIR JOSEPH BANKS, president of the ROYAL SOCIETY and principal founder of the AFRICAN ASSOCIATION.

Prompted by Banks's recommendations, the African Association commissioned Park to undertake an exploration into the interior of West Africa. His main objectives were to find the NIGER RIVER and determine its course, then follow it to the legendary city of TIMBUKTU and return to the African coast by way of the Gambia River or by some other route that he might locate. At that time, Europeans knew of the Niger only from the reports of the medieval Arab travelers ABU ABD ALLAH MUHAMMAD IBN BATTUTAH and LEO AFRICANUS and from descriptions attributed to ancient Greek historian and geographer HERODOTUS. As late as the last decade of the 18th century, European geographers were not certain if the Niger flowed east or west, or whether it was a western tributary of the NILE RIVER.

Park sailed from England aboard the MERCHANT SHIP *Endeavor*, arriving at the mouth of the Gambia River along

the coast of West Africa in June 1795. He made contact with an English trader, Dr. John Laidley, at his Gambia River trading post at Pisania (present-day Karantaba, Gambia), and there was soon stricken with tropical fever. While recovering, Park studied the native Mandingo language and engaged an interpreter, a former slave named Johnson, who had lived for a time in Jamaica.

On December 2, 1795, Park set out from Pisania, accompanied by the interpreter Johnson, a slave boy named Demba, and several servants. His party first headed up the Gambia with a group of native slave traders. Park then crossed from the swampy Gambia River Valley into the semiarid Kaarta region of what is now eastern Senegal. At Nioro, he was shown the place where another explorer sent by the African Association, Major DANIEL HOUGHTON, had died four years previously. Park then entered the kingdom of Bondou, where he was treated well by the native ruler. Nevertheless, as he continued north and east toward the Niger and Timbuktu, the natives proved to be far less hospitable and increasingly larcenous, and, by the time he had entered the lands of hostile Muslim tribesmen, he had been robbed of most of his possessions. Deserted by most of his servants, including his interpreter Johnson, Park was left with only the slave boy Demba. In spring 1796, the two were taken captive at Benowm by the Moorish chief Ali, king of Ludamar.

Mungo Park (Library of Congress)

Park was held prisoner by Ali and his people for three months, traveling with the nomadic tribe through the arid regions of western Mali. On July 1, 1796, at Quiera, after suffering much ill treatment at the hands of his Moorish captors and learning that he was about to be put to death as a Christian spy, he managed to escape. Instead of fleeing for the safety of European settlements on the coast, he continued inland, traveling alone and totally impoverished, in search of the Niger River and Timbuktu. At a native village, Park received help in the way of food and cowrie shells with which to trade. Traveling by horseback, he finally sighted the Niger River at Segou on July 21, 1796.

Park determined that the Niger indeed flowed eastward, as had been reported by Ibn Battutah in the 14th century. He then headed downstream toward Timbuktu, hoping to determine if the river led to the Nile River, the Atlantic Ocean, or, as he himself had theorized, to the CONGO RIVER (Zaire River). After about 300 miles, at a village called Silla, he was informed by friendly natives that Muslims controlled the region downriver, including Timbuktu. Rather than face more hostile tribesmen, and with his resources running low, Park headed back upriver to Bamako, and from there crossed overland to the Gambia River. His westward journey was halted for seven months at Kamalia, where he was again stricken with fever. By the time he had reached Pisanía, near the Gambia River's mouth, in spring 1797, no one had heard from him for 18 months and he had been given up for dead.

In June 1797, Park left the coast of West Africa aboard an American slave ship, the *Charleston*, and, by way of the WEST INDIES and the South Carolina coast, he arrived back in England in December. In 1799, his account of his African explorations, *Travels in the Interior Districts of Africa*, was published and became an immediate bestseller.

Park returned to Scotland, married, and settled down to a medical practice in the town of Peebles, near Selkirk. Although he wanted to return to Africa and further explore the Niger, the African Association was not forthcoming with additional support. In 1801, Park was offered a post with the British navy on a scientific voyage to Australia, under the command of MATTHEW FLINDERS, a position he declined and which was later filled by naturalist ROBERT BROWN.

In 1803, the British Colonial Office proposed to Park that he lead a second exploration of the Niger. By then, the British government, concerned about French expansion into Africa south of the Sudan, wanted to establish a colonial presence of its own in West Africa. After a series of delays, Park sailed from England in January 1805. As commander of the expedition, he had been commissioned a captain, and, at the British garrison on Goree Island, off the coast of Dakar and Cape Verde, he recruited 35 soldiers to accompany him into the African interior. Joining him as well were

two ship's carpenters, who were to supervise the construction of a boat for the voyage down the Niger. Second in command was fellow surgeon Alexander Anderson, who was also Park's brother-in-law.

In April 1805, Park led his expedition eastward up the Gambia from the river port of Kaiaf, then crossed the mountains to the Senegal River. Continuing eastward across southwestern Mali, Park and his expedition reached the Niger at Bamako. By that time, tropical fever and dysentery had taken their toll on Park's men. More than 30 had died, including Anderson. The survivors continued downriver to Sansanding, at which point their interpreter, a Mandingo priest named Isaaco, was sent back to the coast with journals of the expedition's progress to date. A boat was constructed from two native canoes fitted together, which Park named the *Joliba* after the Mandingo name for the Niger River. On November 19, 1805, Park, three surviving soldiers, several slaves, and a native guide and interpreter named Amadi Fatouma set out on the Niger, planning to discover where it ultimately led.

No word was heard of Park or any of his expedition until nearly three years later, when, in 1808, British colonial authorities sent Park's former interpreter Isaaco to investigate what had happened. Isaaco located Fatouma, Park's last interpreter. According to his account, in April 1806, the boat had been attacked as it descended the rapids at Bussa in what is now northern Nigeria. When the *Joliba* ran aground on a rock, Park and the three remaining Europeans attempted to escape from the native people by jumping into the raging waters but were drowned. Since this was at a point about 500 miles upstream from the Niger's outlet into the Gulf of Guinea, if he indeed had reached this far, he had gone by Timbuktu, although there is no record of his having stopped there.

One of the objects of the Bornu Mission, the British expedition into West Africa undertaken in 1821 by HUGH CLAPPERTON, WALTER OUDNEY, and DIXON DENHAM, was to find out what had happened to Park. In 1827, Park's son Thomas, who had become a naval officer, attempted to find some trace of his father, but he died of fever en route to Bussa.

Mungo Park was the first European known to have reached the Niger River in modern times. On his return from his first expedition in 1797, he was acclaimed "the Great African Traveler." Park's explorations led to a series of journeys into West and central Africa sponsored by European governments. His published account of his travels into the interior of West Africa revealed to Europeans for the first time the varied cultures of the region. Park added to the geographic knowledge of Africa by identifying the southern limit of the SAHARA DESERT and demonstrated that there was a feasible route into the southern Sudan from the coast of West Africa, a finding that had great impact on the fu-

ture of European trade and colonial expansion south of the Sahara.

Parke, John Grubb (1827–1900) *U.S. Army officer, American topographer in the American Southwest*

John G. Parke was born in Coatesville, Pennsylvania, and raised in Philadelphia. He attended the University of Pennsylvania, then went on to West Point, graduating in 1849 as a second lieutenant in the U.S. Army Corps of Topographical Engineers.

In 1851, after taking part in a survey of the Minnesota-Iowa boundary, Parke went to the Southwest, where he assisted Captain LORENZO SITGREAVES in an expedition that explored westward from Santa Fe to Fort Yuma on the COLORADO RIVER, and across the Mojave Desert and Sierra Nevada to San Diego. Just prior to this expedition, Parke, with RICHARD HOVENDON KERN, prepared an updated map of the Southwest based on the explorations by JOHN CHARLES FRÉMONT, as well as information provided by mountain men WILLIAM SHERLEY WILLIAMS and Antoine Leroux.

Parke undertook several important explorations for the Pacific Railroad Surveys of 1852–55. He explored along the coastal ranges of California and Oregon with Lieutenant HENRY LARCOM ABBOTT, seeking connections between Pacific ports north and south of any proposed western terminus for the planned transcontinental railroad.

In January 1854, Parke commanded an expedition that examined the possibility of a railroad route along the 32nd parallel, from San Diego, California, to El Paso, Texas. Parke and his party traveled along the Gila River from the Pima (Akimel O'odham) Indian villages of south-central Arizona, through Tucson, and into the Chiricahua Mountains. Along the way, he ascertained the correct location of an emigrant trail known as Nugents Wagon Road. He then followed part of Cooke's Wagon Road to the Rio Grande, undertaking a side expedition that revealed a more direct route to El Paso. In spring 1855, on a second exploration of the Gila River country, Parke found a pass through the Chiricahua Mountains near Mount Graham, which shortened the 32nd parallel route.

From 1857 to 1861, Parke was chief astronomer and surveyor in the Canada-U.S. boundary survey. He worked directly with the British Royal Engineers and helped establish the last segment of the international border, from the ROCKY MOUNTAINS to the Pacific coast of Washington.

In the Civil War, Parke commanded Union troops in campaigns throughout the South and was breveted a major general. He returned to the Topographical Corps after the war and went on to become superintendent of West Point. After his retirement from the army in 1889, he was involved in railroad development and banking.

Parke's official account of his explorations along the 32nd parallel in 1854–55 were included in the U.S. government's *Pacific Railroad Reports* (1855–59). He described the territory from southern Arizona to the Rio Grande as generally level and practical for a railroad, the only drawbacks being lack of a water supply and a scarcity of timber.

Parry, Sir William Edward (1790–1855)

British naval officer in the Canadian Arctic

Born in Bath, England, Edward Parry entered the British navy in 1803, at the age of 13. After serving for five years on the English Channel, he took part in naval operations in the Baltic Sea. In 1810, as a lieutenant, he made his first voyage to the Arctic aboard a naval escort for British whalers in the Spitsbergen (present-day Svalbard) region, north of Norway.

In 1818, Parry was named second in command to SIR JOHN ROSS in a British naval expedition in search of the NORTHWEST PASSAGE. In command of the *Alexander*, he accompanied Ross on the *Isabella* to GREENLAND's west coast, then headed northward into Baffin Bay, in an attempt to verify the early-17th-century findings of ROBERT BYLOT and WILLIAM BAFFIN. Sailing westward to the northern end of Baffin Island, the expedition examined the entrance to Lancaster Sound; soon afterward, Ross ordered the ships to turn back, having sighted what he believed was a mountain range blocking further progress westward. Parry and some other officers later reported to the British Admiralty that they had seen a clear channel ahead, which they would have explored had they not been ordered back by Ross.

By 1819, Parry had been elected to the ROYAL SOCIETY for his studies on nautical astronomy. That year, SIR JOHN BARROW, second secretary of the Admiralty, and Lord Melville, the first lord of the Admiralty, put Parry in command of a Northwest Passage expedition of his own, instructing him to navigate through Lancaster Sound, and thereby resolve the controversy that had arisen from Ross's voyage of the previous year.

In command of two ships, the *Hecla* and the *Griper*, he sailed from Yarmouth on May 11, 1819, heading westward back to Baffin Bay and Lancaster Sound.

By August 1, 1819, Parry had managed to sail through Lancaster Sound, establishing that it was actually a strait. He then made the European discovery of Barrow Strait, which he named after Sir John Barrow. Continuing westward, he reached the south coast of a large island he named Melville Island after Lord Melville. Parry and his men had sailed west of the 110th meridian of longitude, half the distance of the Northwest Passage, and thereby won a prize of £5,000, which Parliament had offered as an incentive for its discovery.

Frozen in at Melville Island, Parry and his expedition were well equipped for the first deliberate wintering by a naval expedition above the ARCTIC CIRCLE. At an anchorage they called Winter Harbor, the decks of the ship were covered with an insulated roof. Heat was supplied by coal-fueled stoves, and dietary precautions were taken against SCURVY. Recreation among the men was encouraged, and the officers published a newspaper. A theatrical troupe was organized, with Parry himself writing a musical play entitled *The Northwest Passage*, a light-operatic satire of the expedition that was staged by the crew and directed by one of Parry's officers, FREDERICK WILLIAM BEECHEY.

In spring 1820, Parry undertook a two-week land exploration of Melville Island. He observed such Arctic animals as musk oxen, reindeer, wolves, and foxes, and found patches of grass and moss, as well as traces of abandoned Inuit (Eskimo) encampments. Having trekked as far westward as Cape Dundas, at 113°48' west longitude, he was just 250 miles from the Beaufort Sea, which subsequently proved to be the western outlet of the Northwest Passage. With the southeastward drift of the PACK ICE making further progress westward impossible, Parry sailed back to England, arriving in fall 1820.

Sir William Edward Parry (Library of Congress)

Parry's encouraging reports of ice-free channels leading far to the west of Lancaster Sound soon led to his appointment as commander of yet another Northwest Passage expedition. On this voyage, which sailed from England in May 1821, he had under his command the *Hecla*, as well as an identical vessel, the *Fury*. Instead of returning to Lancaster Sound, he directed the expedition into HUDSON BAY by way of Hudson Strait and toward its north shore at Foxe Channel and Foxe Basin, hoping to find an ice-free passage into Prince Regent Inlet from the south.

The expedition explored around Southampton Island in the northwestern corner of Hudson Bay, then wintered at Winter Island off the south coast of the Melville Peninsula. Overland exploring parties probed inland along the coast, with one group discovering the complete skeleton of a whale, inexplicably perched atop a rocky cliff, 100 feet above sea level. In July 1822, Parry resumed his explorations for a western outlet from Hudson Bay, reaching a strait that he named Fury and Hecla Strait after his ships. Although unobstructed by land, it proved to be ice-choked the year round and unnavigable for sailing ships even in summer. After only a month of open-sailing conditions, the ships were again iced in for the winter in August 1822. They anchored near the Inuit settlement Igloodik at the northern end of the Melville Peninsula along the eastern end of Fury and Hecla Strait.

Over the winter, Parry and his men established good relations with the Inuit, who constructed an igloo village on the ice alongside the ship. Parry made a study of Inuit customs, observing how efficiently their survival skills enabled them to thrive even in wintertime. He also entertained the Inuit, delighting them with an organ recital aboard one of his ships. Over the winter of 1822–23, Parry purchased a dog team from the Inuit, which he used in the first British naval explorations of the Arctic by dogsled.

In July 1823, Parry sailed back to England. Although he had established Fury and Hecla Strait as the long-sought western outlet from Hudson Bay, its icebound condition made it unusable for the Northwest Passage.

Parry led another expedition with the *Fury* and *Hecla* to the Canadian Arctic in 1824, in search of an ice-free route west of Lancaster Sound that would ultimately lead to the Bering Sea and the Pacific Ocean. After sailing through Lancaster Sound in 1824, he headed southward into Prince Regent Inlet, hoping again to locate the Northwest Passage by skirting Canada's Arctic mainland. After exploring the Gulf of Boothia, south of Lancaster Sound and Somerset Island, the *Fury* became entrapped in the ice and was wrecked. Left with only one vessel for his combined crews, and short on supplies, Parry was compelled to cut short his search for the Northwest Passage in spring 1825 and return to England.

After 1825, Parry's exploits won him national renown as the British navy's foremost Arctic explorer and navigator. In

1827, he won the support of both the Admiralty and the Royal Society for an attempt on the NORTH POLE. In April 1827, he sailed from England with the *Hecla*, and at Spitsbergen he set out across the frozen Arctic Ocean with flat-bottomed, amphibious sledges and boats hauled by a party of 24 sailors and marines. Among the officers accompanying him were SIR JAMES CLARK ROSS, who had been with Parry on all of his previous Arctic expeditions, and FRANCIS RAWDON MOIRA CROZIER, a veteran of Parry's second and third voyages.

Although Parry and his men traversed more than 700 miles, the actual distance they advanced from Spitsbergen northward to the pole was less than 200 miles, due to the southward drift of the pack ice. At 82°45' north latitude, the latitude of Greenland's northernmost point, and less than eight degrees from the North Pole, Parry turned back, having concluded he was being pushed southward faster than he was progressing northward. Nonetheless, he had set a farthest-north record that stood for years, until CHARLES FRANCIS HALL's expedition of 1871.

Parry, who had married a daughter of Lord Stanley, was knighted in April 1829. Soon afterward, he left the navy to supervise a private agricultural enterprise in New South Wales, Australia. He returned to England in 1837, where he was appointed to a government post in Norfolk, and he subsequently returned to the navy and directed the development of steam machinery for ships. He went on to serve as governor of Greenwich Hospital. In 1852, he was made a rear admiral.

Parry's *Journal of a Voyage for the Discovery of a North-West Passage from the Atlantic to the Pacific; performed in the years 1819–20 in his Majesty's Ships Hecla and Griper, under the orders of William Edward Parry, R.N., F.R.S., and commander of the Expedition* was published in London in 1821. His *Narrative of an Attempt to Reach the North Pole in Boats Fitted for the Purpose, and Attached to his Majesty's Ship Hecla, in the year MCCCXXVII* was first published in 1828.

Sir William Edward Parry's feat of reaching as far west as Melville Island in one season was not equaled until 1969 by the steel-hulled tanker *Manhattan*. As a result of Parry's 1819–20 voyage, the islands and channels of the Canadian Arctic archipelago north of the North American mainland were revealed to Europeans for the first time. The westernmost islands of this group are known today as the Parry Islands in his honor. The techniques Parry developed for wintering in the Arctic were adopted by later British naval expeditions, including Franklin's in 1845, as well as those sent to search for Franklin in the 1850s. Parry's explorations in the Canadian Arctic firmly established that Lancaster Sound was the only practical eastern entrance to the Northwest Passage. As the leading Arctic explorer of his time, Parry had traveled farther westward through the

Northwest Passage and reached a point closer to the North Pole than anyone before him. His 1827 North Pole attempt was the first Arctic expedition the main objective of which was not the discovery of a Polar Sea route between the Atlantic and Pacific Oceans, but the attainment of the pole itself.

Pascoe, William (Pasko, abu-Bakr)

(unknown–1833) *African guide and interpreter in West Africa*

William Pascoe was born in the Gobir region of what is now northern Nigeria. The Hausa, his tribe, are a Muslim people, and his name among them was abu-Bakr. As a young man, he was kidnapped and sold into slavery to the Portuguese but was liberated in a British naval attack on the slaver ship. He served with the Royal Navy for a time, but, in 1823, at Cape Coast, in present-day Ghana, he left to work as a guide and interpreter for an Italian by the name of Giovanni Belzoni on an expedition to locate the NIGER RIVER. Belzoni died soon afterward, however.

Pascoe was eventually hired by the Englishman HUGH CLAPPERTON for an expedition undertaken with RICHARD LEMON LANDER to locate the true source of the Niger. In 1825, with Pascoe serving as a cook as well as a guide and interpreter, they set out from the Gulf of Guinea, which Clapperton believed to be the outlet of the Niger—not the NILE RIVER, a prevalent theory. They reached the Niger in early 1826. Pascoe deserted more than once because of disputes with Clapperton and was dismissed by the Englishman once. But when Clapperton succumbed to dysentery in Sokoto in spring 1827 before an attempt to reach TIMBUKTU, Lander—the only surviving European member of the expedition—hired Pascoe to help him return to the coast, which they accomplished despite great hardship. Lander hired Pascoe for a subsequent expedition in 1830, during which it was determined that the Niger did indeed flow into the Gulf of Guinea, as Clapperton had theorized. Lander and Pascoe also located the Niger's main tributary, the Benue.

In 1832, on a third expedition, this one organized by a group of Liverpool merchants to develop commercial interests along the Niger, Pascoe again accompanied Lander into the interior. The next year, because of disputes over trading, he was reportedly poisoned by a local ruler because he recommended trading with another people farther upriver.

William Pascoe, like fellow African guide SIDI BOMBAY, proved indispensable to the efforts of the Europeans for whom he worked and helped solved the mystery of the source of the Niger River.

Pasha, Mehmed Emin See EMIN PASHA, MEHMED.

Pattie, James Ohio (ca. 1804–ca. 1851)*American fur trapper, trader in the American West*

James Ohio Pattie, son of frontiersman Sylvester Pattie, was born in Bracken County, Kentucky. He moved to the Missouri frontier with his father in 1812. In 1824, the Patties became traders on the MISSOURI RIVER. In July of that year, the two joined up with Silvestre Pratte's trade caravan near what is now Omaha, Nebraska, and traveled across the southern plains to Santa Fe, arriving there in November 1824.

While his father operated a copper mine at Santa Rita in southwestern New Mexico, James Ohio Pattie embarked on a career in the FUR TRADE in the southern ROCKY MOUNTAINS. In 1826, Pattie trapped the Gila River region with EWING YOUNG and his party. He explored the COLORADO RIVER into the Grand Canyon and established an overland route from New Mexico to the eastern edge of California, south of the Old Spanish Trail. Pattie also reportedly traveled northward along the Rockies as far as the Bighorn and Yellowstone Rivers of present-day Montana and Wyoming. He returned to Santa Fe via the Arkansas River and the Rio Grande in September 1827.

In winter 1827–28, Pattie, accompanied by his father, again trapped the Gila River into northern Mexico, then followed the Colorado River to its outlet on the Gulf of California. They crossed the northern end of the Baja California peninsula to the Pacific coast at Santa Catalina mission, arriving in March 1828. They were taken into custody by Mexican officials for unauthorized trapping in California. The elder Pattie died after a month of imprisonment in San Diego. The younger Pattie won his release from the Mexicans in 1829, after helping stem an epidemic of smallpox with vaccine he and his father had brought from New Mexico.

Pattie returned to U.S. territory in 1830, settling for a time near his Kentucky birthplace. He collaborated with Cincinnati journalist Timothy Flint in writing an account of his adventures and explorations in the American West, entitled *The personal narrative of James O. Pattie of Kentucky, During an Expedition from St. Louis, through the Vast Regions Between That Place and the Pacific Ocean*. First published in 1831, it was an immediate success.

Pattie returned to California during the gold rush of 1849. In winter 1850–51, he left a mining camp in the Sierra Nevada, and he was never seen or heard from again.

James Ohio Pattie was one of the first Americans to travel widely through the entire Rocky Mountain frontier. The route he blazed from New Mexico to California became a well-traveled path for traders and trappers in the 1830s, and for California-bound emigrants following the U.S.-Mexican War of 1846–48.

Paulinus, Suetonius (Caius Suetonius Paulinus)*(unknown–ca. A.D. 70) Roman general in North Africa*

Suetonius Paulinus, a Roman general under Emperor Claudius I, served in Rome's Mauretanian provinces in North Africa, now comprising the coastal regions of north-eastern Morocco and western Algeria. In A.D. 42, soon after the Romans had subdued a native rebellion and organized the region into provinces, Paulinus led a company of soldiers inland from the MEDITERRANEAN SEA to investigate the country to the south. He crossed the Atlas Mountains somewhere between Tangier and Algiers and came upon the northern edge of the SAHARA DESERT. Determining that the Roman provinces of North Africa were bounded by a vast arid expanse, he returned to the Mediterranean Sea and Rome, where he was hailed for having explored beyond the southern frontiers of the empire.

Paulinus's later career took him to Britain, where from 59 to 61, as military governor, he commanded Roman forces in suppressing a revolt by the Druids, as well as by Queen Boudicca of the Iceni. GNAEUS JULIUS AGRICOLA served under him. He later played a leading role in the military revolt against Emperor Nero in A.D. 69.

Suetonius Paulinus was one of the first Europeans known to have traveled beyond the barrier of the Atlas Mountains; his reports indicated the vast extent of the African continent, stretching southward from the Mediterranean. His expedition marked one of the few recorded instances of official Roman exploration.

Pavie, Auguste-Jean-Marie (1847–1925)*French diplomat in Southeast Asia*

Originally from France, Auguste Pavie arrived in Southeast Asia as a member of a French marine regiment in the early 1860s, when the French government first began to bring the region around the lower Mekong River within its colonial sphere.

In 1868, Pavie went to work for the French colonial government of Cochin China (present-day Vietnam), serving at Kampot on the Cambodian coast of the Gulf of Thailand. While there, he made sojourns into the countryside, traveling through territory little known to Westerners, and undertook a study of the Cambodian language and culture.

Pavie's interest in further exploring the interior of Indochina (present-day Cambodia, Thailand, Laos, and Vietnam) came to the attention of the French colonial authorities in Cochin China. In 1880, they commissioned him to direct the construction of the first telegraph line between Phnom Penh and Bangkok.

Starting in 1881, Pavie directed a series of surveys into the interior of what is now Cambodia and Laos, as well as the upper Mekong River. Over the next 14 years, he and his associates traversed 18,000 miles of Southeast Asian territory, much of which was unknown to Europeans.

In 1886, Pavie was appointed as French vice consul at Louangphrabang, capital of the northern Laotian principality. During the next five years, he oversaw the demarcation of the Laotian kingdom's border with Siam (present-day Thailand) in the upper Mekong Valley, and was instrumental in the establishment of a French protectorate over the region in 1893, as part of French Indochina. He also served as French consul general at Bangkok from 1891 to 1893.

Auguste Pavie's extensive program of exploration from 1881 to 1895 became known as the Pavie Mission. As a result of his efforts, few areas of Southeast Asia, outside of some remote mountain and highland regions, remained unknown to Europeans by the beginning of the 20th century. Pavie was the editor of the expedition's official record, *Mission Pavie* (1898–1919), an 11-volume study of Southeast Asia that included scientific information as well as linguistic and cultural profiles of the region's native peoples.

Pavy, Octave (1844–1884) *American physician and naturalist in the Arctic*

Born in New Orleans, Octave Pavy was the son of Creole parents and a descendant of Louisiana's original French settlers. He was educated in France, attending the University of Paris, where he studied science, art, and medicine; he regularly took time out from his studies for travel in Europe.

In 1869, Pavy was named second in command of a French government-sponsored Arctic expedition that was to have been led by Gustave Lambert. The following year, before the expedition could leave France, it was called off due to the outbreak of the Franco-Prussian War. In that conflict, Pavy, along with a nephew of Confederate general Pierre G. T. Beauregard and a number of other Americans of French descent, served in the French army with the Zouave Corps, a volunteer unit that he had helped to organize.

At the war's end in 1871, Pavy returned to the United States, where he was soon named a member of a privately backed Arctic expedition that planned to reach the NORTH POLE by way of the BERING STRAIT. This endeavor was also abandoned before it could get under way when its chief financial sponsor suddenly died.

Nearly 10 years elapsed before Pavy was to reach the Arctic. In the meantime, he completed his medical studies at the Missouri Medical College, and, in 1878, he married Lilla May Stone, a woman from Lebanon, Illinois. They resided in St. Louis, where he served as a physician at an iron works and lectured about the Arctic.

Finally, in June 1880, Pavy sailed for GREENLAND on the *Gulnare*, as surgeon and naturalist in H. W. Howgate's Arctic expedition. It seemed like another false start for Pavy when, soon after the *Gulnare* had arrived off the west coast

of Greenland, the vessel was found to be unsuitable for navigation northward into the ice-choked channels above Baffin Bay and was forced to return to the United States. Pavy, however, opted to stay behind in Greenland. Over the next year, he explored the west-central coast, learned Inuit survival and travel techniques and undertook a study of the region's animal and plant life. In July 1881, at Godhavn, Pavy joined ADOLPHUS WASHINGTON GREELY and his U.S. government expedition to northwestern Ellesmere Island's Lady Franklin Bay. In April 1882, after a winter at the expedition's base at Lady Franklin Bay, Pavy undertook a sledge exploration northward in which he reached the north coast of Ellesmere Island and rounded Cape Joseph Henry. Although he had neared the northernmost point reached by members of SIR GEORGE STRONG NARES's 1876 expedition, he was unable to proceed farther northward or westward when the PACK ICE on which he had been traveling began to break up and drift away from the coast.

When a relief ship failed for a second time to reach the expedition in 1883, Pavy and the rest of the expedition withdrew southward to Smith Sound. At Cape Sabine, they awaited a third rescue attempt. With their food supply all but exhausted, the men began to succumb to starvation and exposure. Pavy died on June 6, 1884, just 16 days before a relief ship finally reached Cape Sabine to pick up Greely and the other survivors.

In his sledge journey in spring 1882, Dr. Octave Pavy reached the north coast of the Ellesmere Island, one of the northernmost points of land on Earth. He later reported that the frozen sea ice stretching northward to the pole was subject to drift and broke up regularly, demonstrating that it was not a solid and immovable mass as had been previously thought. In Greely's official account of the expedition, he reported that Pavy had been insubordinate in questioning some of his commander's decisions, and, at one point, Greely had placed the doctor under arrest. Yet Pavy's medical skill helped maintain the health of the expedition's surviving members during their last two difficult years.

Payer, Julius von (1842–1915) *Austrian army officer in the Arctic*

Julius von Payer was born in Schoenau, Bohemia, in what is now the Czech Republic. After his education at the military academy in Vienna, he entered the Austrian army as a lieutenant in 1859. In 1866, after serving briefly as a history professor at the military academy, he conducted a survey for the army's general staff in which he determined the altitude of most of the peaks in the Austrian Alps.

Payer first visited the Arctic in 1869–70, when he took part in a German expedition to GREENLAND, led by KARL CHRISTIAN KOLDEWEY, during which he discovered a

mountain range in the interior with summits as high as 11,000 feet above sea level.

Soon after his return from Greenland, Payer was commissioned by the Austrian government to explore the Arctic coast of Russia on the Austro-Hungarian Arctic Expedition. The goal was to locate an open “polar sea,” extending eastward from Spitsbergen to North America—the long-sought NORTHEAST PASSAGE. In spring 1871, Payer, along with German Arctic explorer KARL WEYPRECHT, undertook a preliminary voyage on the ship *Isbjorn* to Novaya Zemlya, the islands extending northward from the Arctic coast of eastern Russia. They speculated that if the ice-free polar sea opened to the north of these islands, it might provide access not only to the Northeast Passage, but also to the NORTH POLE itself.

Payer and Weyprecht left for Novaya Zemlya once again in June 1872, sailing from Bremen aboard the *Tegethoff*, a ship equipped with both sails and steam power. There were 23 others in the expedition, which had been outfitted with provisions for three years. Off the northwest coast of Novaya Zemlya, the *Tegethoff* became entrapped in the ice of the eastern Barents Sea. Payer and the Austrian expedition drifted northward with the ice until August 1873, when they came upon an uncharted chain of islands, which they christened Franz Josef Land in honor of the Austrian emperor.

In spring 1874, after wintering off Franz Josef Land, Payer explored the archipelago, reaching as far north as 82°5' north latitude. Soon afterward, convinced that the *Tegethoff* was likely to remain trapped in the ice for another winter, Payer and Weyprecht decided to abandon the vessel and return across the frozen sea to the continental mainland. After leading the expedition on a 300-mile sledge journey southward, they reached the southern limit of the PACK ICE, then continued across the open water in small boats they had hauled over the ice. The Austrian explorers soon encountered the Russian whaling ship *Nicholas*, which took them safely to the coast of northern Lapland.

Payer was back in Vienna by July 1874. He retired from the military the following year. In 1876, he published an account of his attempt on the Northeast Passage and the North Pole from Novaya Zemlya. He later settled near Frankfurt, Germany, where he undertook scientific research and painted pictures depicting his experiences in the Arctic.

In their 1872–74 voyage, Julius von Payer and Karl Weyprecht demonstrated that the seas north of Novaya Zemlya were frozen year round, a finding that helped disprove the idea that an open polar sea surrounded the North Pole. Along with Weyprecht, Payer was one of the European discoverers of Franz Josef Land, the northern islands of which constitute the northernmost points of land in the Eastern Hemisphere.

Peary, Robert Edwin (1856–1920) *U.S. naval officer in the Arctic*

Born in Cresson, Pennsylvania, Robert E. Peary grew up in Maine, where he attended Bowdoin College, graduating in 1877 with a background in engineering. After working as a draftsman for the United States Coast and Geodetic Survey in Washington, D.C., he entered the U.S. Navy as a commissioned officer and civil engineer in 1881.

In 1884–85, Peary was in Nicaragua, where he took part in a survey for a proposed canal route across Central America. In 1886, inspired by the accounts of Norwegian polar explorer NILS ADOLF ERIK NORDENSKJÖLD, Peary made his first trip to the Arctic, in which he attempted a west-to-east crossing of GREENLAND from Disko Bay. Although he managed to ascend the ice cap to a height of 7,500 feet, he was able to reach only 125 miles inland before bad weather forced him back. Nevertheless, he had penetrated the interior of Greenland farther than any expedition before him.

Back in Washington, D.C., in 1887, Peary hired as his butler MATTHEW ALEXANDER HENSON, who, for the next 22 years, accompanied and assisted Peary in all his Arctic expeditions. After a surveying assignment in Nicaragua later in 1887, Peary returned to the United States and sought support for other Arctic explorations. He married Josephine Diebitsch in 1888. In 1891, the Philadelphia Academy of Natural Sciences appointed him to lead an expedition to the northwest coast of Greenland. That year, with his wife and Henson, Peary sailed aboard the *Kite* to Inglefield Gulf on Greenland’s west coast north of Baffin Bay. En route, he suffered a broken leg in an accident aboard the ship and was treated by the expedition’s medical officer, FREDERICK ALBERT COOK. At Inglefield Gulf, a portable house was set up, and, during the next 13 months, Peary and his expedition lived among the region’s Inuit (Eskimo) and made a study of their Arctic survival techniques.

In spring 1892, Peary set out to explore eastward by sledge. After traveling 500 miles across the north of Greenland, he came upon an inlet along the east coast on July 4, 1892, which he named Independence Bay. Peary made another trek across Greenland to the same region in 1893. In the fall of that year, his wife gave birth to a daughter, Marie Ahnighito Peary, while at the Inglefield Gulf base.

By 1895, Peary had reached Greenland’s northernmost extension, a peninsula that came to be known as Peary Land in his honor. On expeditions to Independence Bay and northern Greenland from 1895 to 1897, he found several large meteorites, which had previously been reported as an “iron mountain.” Peary shipped them to the United States.

The Peary Arctic Club, organized in 1898 by a group of wealthy New Yorkers, provided funding for Peary’s later Arc-

tic expeditions. The AMERICAN GEOGRAPHICAL SOCIETY also offered support. In 1898–99, Peary explored Grant Land on Ellesmere Island. At Fort Conger (ADOLPHUS WASHINGTON GREELY's former base near Lady Franklin Bay), he lost eight of his toes to frostbite.

In 1900, Peary demonstrated conclusively that Greenland was an island on reaching its northernmost point, which he named Cape Morris Jesup in honor of the president of the American Museum of Natural History and one of his chief patrons. By that time, he had resolved to make an attempt on the NORTH POLE and had determined that the only feasible starting point was the north coast of Ellesmere Island.

Peary set out for the Pole from Cape Hecla on northern Ellesmere Island in 1902, and, although he was forced back by DRIFT ICE 340 miles short of his goal, he nonetheless set a farthest-north record for the Western Hemisphere by reaching 84°17'27" north latitude.

In 1905, Peary sailed from New York on the *Theodore Roosevelt*, a steam-powered vessel specially designed for Arctic navigation. Planning to penetrate Robeson Channel, the northern part of the passage between Ellesmere Island and Greenland, he hoped to reach the Lincoln Sea and the North Pole beyond. Peary set yet another farthest-north record on this voyage, reaching 87°6' north latitude, within 200 miles of the North Pole. Nevertheless, the ship had become badly damaged in its forced passage through the ice, and, with the onset of rough weather, the expedition was forced to turn back.

Two years passed while the *Theodore Roosevelt* underwent repairs, and Peary raised the additional support he needed for another polar attempt. He sailed on the *Theodore Roosevelt* from New York on July 6, 1908, and, by early September of that year, he had set up his base camp at Cape Sheridan on Ellesmere Island. En route, he had stopped at Etah, Greenland, where he had taken on a number of Inuit families and several hundred sled dogs. Over the next several months, supply depots were set up along a trail to the north coast of Ellesmere Island, terminating at Cape Columbia. From there, on March 1, 1909, Peary, Henson, and four Inuit set out northward with sledges and dogs. After a month-long trek across the frozen sea, they reached the North Pole on April 6, 1909.

Peary and his companions unfurled five flags at the Pole: the U.S. flag, the U.S. Navy flag, the official banner of his Delta Kappa Epsilon fraternity chapter at Bowdoin College, a Red Cross flag, and the "World Ensign of Liberty and Peace." Soundings were made of the ocean depths beneath the ice, revealing that they were atop 10,000 feet of water, thus proving that no continental shelf lay beneath the North Pole. Peary, Henson, and their Inuit companions then made a safe dash back to Cape Columbia, from where they returned with the rest of the expedition to the *Theodore Roosevelt* at Cape Sheridan.

The news that Peary had reached the North Pole could not be communicated to the outside world until July 17, 1909, when the *Theodore Roosevelt* put in at Indian Harbor, Labrador. There, Peary learned that Dr. Frederick Cook, the medical officer on his 1891–92 expedition, had announced five days earlier that he had reached the North Pole in April 1908, a full year ahead of Peary. Upon Peary's return to New York, a bitter controversy ensued over who had actually reached the Pole first, with many doubting that Cook had reached it at all. Scientists and Arctic explorers continued to take sides in the dispute, although, in 1911, Peary received official recognition from the U.S. Congress for his achievement (although Peary may have missed the Pole by a couple of miles). He retired from the navy that year with the rank of rear admiral and spent his latter years promoting the advancement of U.S. air power.

Peary published accounts of his Arctic explorations, including *Northward over the "Great Ice"* (1898), about his experiences in Greenland; *Nearest the Pole* (1907), an account of his 1905–06 North Pole attempt; *The North Pole* (1910), about his final success in 1909; and *Secrets of Polar Travel* (1917). Josephine Peary recounted her own experience in northern Greenland in *My Arctic Journal* (1894) and *The Snow Baby* (1901).

Admiral Robert E. Peary, along with Henson and their four Inuit companions, were the first men known to have stood at the North Pole. Peary is also credited with having clearly established that Greenland is an island and not part of a continental landmass extending northward to the Pole. Peary's consistent success in his Arctic expeditions was due largely to what he called the "Peary System," which freely adapted the Arctic survival techniques of the Inuit to his own method of establishing food depots and shelters in advance of the main exploring party.

Peck, Annie Smith (1850–1935) *American mountain climber in the Alps and Andes Mountains*

Annie Peck was born in Providence, Rhode Island. In 1870–72, she attended the Rhode Island State Normal School (now Rhode Island College) and, in 1874–78, the University of Michigan, graduating with honors. She earned a master's degree from Michigan in 1881. She went on to teach Latin at Purdue University, then continued her studies in Germany. In 1885, she became the first woman to attend the American School of Classical Studies in Athens, Greece. In 1886–87, she taught at Smith College in Massachusetts as a professor of classics.

During a visit to the Alps, Peck, who had participated in sports with her older brothers, decided to pursue MOUNTAIN CLIMBING as a hobby. Her first climb, in 1888, at the age of 38, was Mount Shasta in the Cascade Range in northern California. In 1895, she climbed the Matterhorn in the Swiss Alps, first summited by EDWARD WHYMPER 30 years

Annie Peck (Library of Congress)

before, and by only two women before Peck. With her reputation as a woman mountaineer growing, she ascended two volcanoes in Mexico in 1897, Popocatepetl and Citlaltépetl (Pico de Orizaba), the latter the highest peak (18,700 feet) in the Western Hemisphere ascended by a woman to that time.

Peck lectured and wrote magazine articles to raise money for her climbs. She completed other climbs in Europe and founded the American Alpine Club in 1902. In the years to follow, she turned her attention to South American peaks. In 1904, she ascended Illampu, a peak on Mount Sorata in Bolivia's Cordillera Real. In 1906, after failing to reach the top of Huascarán in Peru's ANDES MOUNTAINS, she pursued the source of the AMAZON RIVER, traveling up the Marañón and Ucayali tributaries. In 1908, on her sixth attempt, she finally reached the summit of Huascarán. In 1911, she climbed the north peak of the Coropuna volcano, also in the Peruvian Andes. At the age of 82, Peck made her last climb, ascending Mount Madison in New Hampshire's White Mountains.

Peck also had an interest in the development of South America and researched the possibilities of commercial aviation there, flying 20,000 miles at the age of 80. Peck's books include *A Search for the Apex of South America* (1911), *The South American Tour* (1913), *Industrial and Commercial South America* (1922), and *Flying over South America—20,000 Miles by Air* (1932).

Annie Peck's fame as a mountain climber in Victorian times helped further the cause of women's rights. Already controversial for wearing pants when mountain climbing, Peck raised a "Votes for Women" banner at the summit of Mount Coropuna. In 1927, the Lima Geographical Society named the north peak of Huascarán in her honor—Cumbre Ana Peck.

Pedrarias Dávila See ÁVILA, PEDRO ARIAS DE.

Penha, Joseph de la (fl. 1680s–1690s)

Dutch explorer in eastern Canada

In about 1685, Joseph de la Penha, a Dutch Jew from Rotterdam, reportedly explored and settled parts of northeastern Canada, including Labrador, as well as regions he identified as Corte Real Land and Estotis Land.

In 1697, King William III of England, who also ruled the Netherlands, granted Penha and his descendants ownership of Labrador, in recognition for his having claimed the region in the name of the House of Orange.

Joseph de la Penha's heirs never attempted to gain title to the region, although their claim to it was officially recognized by Prince William of Orange, the Dutch monarch, in 1768.

Pérez Hernández, Juan Josef (Juan Pérez)

(ca. 1725–1775) *Spanish naval officer in California and the Pacific Northwest*

Juan Pérez was born in Majorca, Spain. A trained pilot, he served aboard Spanish naval vessels in the Pacific Ocean, along the Manila Galleon route between the Philippines and the west coast of Mexico and South America.

In 1767, Pérez was assigned to San Blas, then the main Spanish naval base on Mexico's Pacific coast and the administrative center for all settlements to the north. At about that same time, Spanish colonial authorities in Mexico, alarmed by reports of Russian encroachment southward from the Aleutian Islands and Alaska into Spanish territory, initiated a full-scale program to colonize California. In 1769, Pérez took part in the earliest of these efforts, commanding the packet boat *Príncipe*, which carried some of the first colonists to the newly established settlements at San Diego and Monterey.

Although not a high-ranking naval officer in 1774, Pérez was nonetheless the most senior officer at San Blas and, as such, was commissioned to lead a voyage of exploration north of the known sections of the California coast. Spanish viceroy Antonio María Bucareli y Ursúa instructed him to sail as far northward as the 60th parallel and thereby determine the geography of the coastline north of California, as well as evaluate the extent of Russian settlement southward from the Gulf of Alaska. On his return southward, he was to land at various points along the coast and make formal acts of possession of the mainland in the name of Spain. In addition, he was to study the coastal Indians and try to establish friendly relations with them.

Pérez departed San Blas on January 25, 1774, in command of the frigate *Santiago*. After stops at San Diego and Monterey, he headed northwestward in June 1774. He sailed out of sight of land for several weeks, then changed his course to due north. On July 15, 1774, the North American mainland came in sight again at 55°30' north latitude, near Dixon Entrance and the southernmost point of the Alaskan Panhandle. Pérez and a landing party went ashore on one of the northernmost of the Queen Charlotte Islands, where he and his men encountered the Haida Indians. The Spaniards, the first Europeans to come in contact with the Haida, established friendly contacts with these coastal Indians and traded copper, cloth, and beads for furs.

Faced with unfavorable winds, Pérez decided not to sail any farther to the north. On his return along the coast, the mainland was shrouded in fog, and a thorough reconnaissance near the coastline was not possible due to currents and hazardous rocks. Pérez did manage to examine the west coast of Vancouver Island, although he was unaware that it was separated from the mainland. There, on August 8, 1774, he made the European discovery of an inlet he named Surgidero de San Lorenzo, later known as Nootka Sound. A landing was made; Pérez and his crew became the first Europeans to

meet the Nootka Indians, with whom they also traded for furs. At that point in the voyage, the crew was weakened by SCURVY, so Pérez decided against additional landings and set sail for Mexico. Soon after leaving Nootka Sound, his second in command, Esteban José Martínez, reportedly sighted what he believed was the much-sought-after entrance to the Strait of Juan de Fuca, but Pérez declined to investigate, having determined that the offshore breakers and coastal fog posed too great a risk. Within a short time, they sighted a snow-capped peak rising eastward beyond the coastline of what is now Washington State. Named Sierra Nevada de Santa Rosalía by Pérez, it is known today as Mount Olympus. The expedition then continued back to San Blas.

In spring and summer 1775, Pérez took part in a second voyage of exploration north of California, serving with JUAN FRANCISCO DE LA BODEGA Y QUADRA under BRUNO DE HECETA. On the return trip to San Blas, in November 1775, Pérez died of scurvy off the California coast and was buried at sea with full naval honors.

Juan Pérez commanded the first known European expedition along the Pacific coast of what is now British Columbia. His exploration of Nootka Sound in 1774 provided the basis for Spain's claim in the Nootka Sound Crisis of 1789. In 1778, a landing party from JAMES COOK's expedition visited Nootka Sound, where they found the natives to be in possession of several silver spoons that had been stolen from one of Pérez's officers four years earlier. This was cited by Cook's own officers as proof that the Spanish had been there earlier, even though later accounts incorrectly credited Cook with having made the European discovery of Nootka Sound. In addition to geographic data, Pérez's written accounts of the Haida and Nootka tribes provide an image of the pre-contact life and culture of these coastal Indians.

Péron, François (1775–1810) *French naturalist in Australia and Tasmania*

François Péron was born and raised at Cerilly in central France near Vichy. With the onset of the French Revolutionary Wars in 1792, the 17-year-old Péron abruptly ended his theological studies to enlist in a local militia unit. In the ensuing conflict, he lost his right eye and was discharged from the army. Soon afterward, a woman he had planned to marry broke off their engagement. He then undertook medical studies in Paris, pursuing also an interest in natural history.

Péron's abilities as a naturalist came to the attention of French botanist Antoine-Laurent de Jussieu, who recommended him for the scientific team on a proposed French government-sponsored voyage of exploration to Australia and the South Pacific Ocean. Appointed as one of the expedition's zoologists, Péron sailed on the *Géographe* from Le

Havre in October 1800, under the command of THOMAS-NICOLAS BAUDIN. The *Géographe*, accompanied by the *Naturaliste*, reached the west coast of Australia in July 1801, after a voyage around the CAPE OF GOOD HOPE and across the Indian Ocean.

Péron went ashore on Bernier Island at the mouth of Western Australia's Shark Bay, where he made a study of a species of red-headed marine snakes that lived on the rocky shoreline. At a stopover at Kupang on the island of Timor, Péron became friends with the headman of local natives.

In January 1802, Péron went ashore on Van Diemen's Land (TASMANIA), becoming one of the first Europeans to encounter the island's natives. Soon afterward, he took part in a specimen-gathering expedition on King Island, off southeastern Australia, in which he collected 180 different types of mollusks and zoophytes and undertook a study of elephant seals. He also made contact with King Island's natives.

Baudin's expedition next visited the British colony at Sydney, which Péron, in his later published account of the voyage, described in glowing terms, citing the penal settlement's great success in transforming its population of transported convicts and prostitutes into productive citizens. On a second visit to Timor in 1803, Péron joined the expedition's naturalist artist, CHARLES-ALEXANDRE LESUEUR, in a crocodile hunt.

By the time the *Géographe* arrived back in France in March 1804, Péron was the last remaining zoologist among the scientists, the others having died or left the expedition due to illness. Péron took on the task of classifying and cataloging the more than 100,000 zoological specimens, which had been collected in the four years of the Baudin voyage. His finished work, presented to the French Academy of Sciences in June 1806, included as many as 2,500 species new to science.

Acclaimed for his efforts, Péron was elected in 1806 to the Institute of France, the prestigious governmental body that, under the direction of Napoléon, had organized the Baudin expedition. He was then commissioned to write an official account of the expedition, the first volume of which appeared in 1807 as *Voyage aux terres australes sur le "Géographe" et le "Naturaliste"* (Voyage to southern lands on the *Géographe* and *Naturaliste*).

François Péron was unable to finish his account. He developed tuberculosis and died at his home at Cerilly in 1810. His work was later completed by his friend LOUIS-CLAUDE DE SAULCES DE FREYCINET, who had served as a naval officer on the Baudin expedition, and was published from 1811 to 1816. Although it was soon revealed that many of the geographic discoveries attributed to Baudin had actually been made a year earlier by British naval officer MATTHEW FLINDERS, Péron's zoological studies based on the 1800–1804 voyage remained a standard source on Australia's animal life for years afterward.

Perrin du Lac, François-Marie (1766–1824)*French government official, traveler on the Missouri River*

François Perrin du Lac was born at La Chaux de Fonds, Neuchâtel (now part of Switzerland), into a noble French family. In 1789, he was appointed to an administrative post with the French colonial administration in Haiti, attached to the colony's treasury department. Soon after his arrival, civil strife erupted between the slaves, the mixed-bloods, and the French colonists.

In 1791, Perrin du Lac was part of an official French delegation to Washington, D.C., requesting military help from the U.S. Congress in suppressing the slave rebellion. With the situation still unsettled in Haiti, and the outbreak of war between France and England in 1792 preventing his return to Europe, Perrin du Lac decided to remain in the United States. During the next years, he traveled widely throughout the valleys of the lower MISSISSIPPI RIVER and Ohio River, exploring Pennsylvania and Spanish-held Louisiana.

On May 18, 1802, Perrin du Lac, accompanied by a former fur trader, set out from St. Louis up the MISSOURI RIVER. He reached as far as the river's junction with the White River in what is now south-central South Dakota before returning to St. Louis.

Perrin du Lac returned to France in 1803, where he accepted a position with Napoléon's government in Hamburg, a post he held only briefly. He retired from government service until the restoration of the monarchy in 1814, when he was granted an appointment with the navy; in 1819, he accepted a government administrative post near Paris.

François Perrin du Lac included an account of his 1802 Missouri River trip in his book on his travels in North America: *Voyage dans les deux Louisianes, et chez les nations sauvages du Missouri . . .* (Journey in the two Louisianas and among the Indian nations of the Missouri River . . .). Published in Paris in 1805, it was the first written report describing the upper Missouri River. It was in print a full year before the first official American expedition into the region, under MERIWETHER LEWIS and WILLIAM CLARK, returned to St. Louis.

Perrot, Nicolas (ca. 1644–1717) *French fur trader, interpreter in the western Great Lakes and upper Mississippi Valley regions*

Nicolas Perrot was born in the Burgundy region of France, the son of a government law enforcement officer. Arriving in French Canada in 1660, he served for a few years as an assistant to the Jesuit missions, during which he learned several Indian languages.

In about 1667, Perrot embarked on a career in the FUR TRADE. He undertook an expedition west from Quebec to the Great Lakes, where he visited the Potawatomi and Fox

(Mesquaki) Indians around Green Bay in present-day Wisconsin. He introduced the first European trade goods to the Indians of the western Great Lakes and may have been the first Frenchman to trade directly with the Sioux (Dakota, Lakota, Nakota). Perrot not only succeeded in convincing the Green Bay tribes to trade directly with the French, but also won their allegiance in the French wars against the Iroquois (Haudenosaunee) Indians.

From Green Bay, Perrot explored the Fox and Wisconsin Rivers, then became one of the earliest Europeans to see the upper MISSISSIPPI RIVER. In 1669–70, he served as an interpreter for the French colonial government in an expedition to the Indians of the Great Lakes. He traveled to northern Lake Huron by way of the Ottawa River and Lake Nipissing, and, after wintering on Manitoulin Island, went to Green Bay.

At Green Bay, Perrot induced the Potawatomi and other Wisconsin tribes to attend a ceremony at Sault Sainte Marie in which French colonial official Simon Francis Daumont, sieur de St. Lusson, formally took possession of the Great Lakes and upper Mississippi Valley in the name of King Louis XIV. This event, which occurred in June 1671, was attended by major tribal leaders of the Old Northwest, as well as Perrot, LOUIS JOLLIET, and missionary CLAUDE-JEAN ALLOUEZ.

Later in 1671, Perrot returned to Quebec, where he married and continued to develop his fur trading. In the 1680s, he used his influence among the western Great Lakes tribes to win their military support in the French conflicts with the Iroquois and English. In 1685, he was named commander of the French fur-trading and military settlement at Green Bay. He then made peace between warring Chippewa (Ojibway) and Fox bands by winning the release by the Fox of a Chippewa Indian girl, who otherwise would have been burned at the stake.

While in Green Bay in 1685, Perrot explored the Fox River to the lands of the Miami and Illinois Indians, then descended the Wisconsin River to the Mississippi.

In 1687, Perrot led a large force of Great Lakes Indians eastward in a raid against the Seneca Indians. While he was away, his stock of furs, stored at a Jesuit mission, was destroyed in a fire. Financially ruined, he returned to Montreal, where he served as an interpreter to delegations of Sac, Miami, and Potawatomi Indian leaders.

Two years later, in 1689, Perrot again ventured west of Lake Michigan. He explored the Fox, Wisconsin, and Mascouten Rivers and established trading forts at Lake Pepin and at the mouth of the Wisconsin River, near present-day Prairie du Chien, Wisconsin. The next year, he explored parts of present-day northern Iowa and discovered lead deposits.

With the revocation of independent trading licenses in 1696, Perrot was forced to leave the fur trade. He settled in

Montreal and continued to serve as an important intermediary with the Indians.

Nicolas Perrot's efforts helped open up the western Great Lakes and the upper Mississippi Valley to French trade interests. He made a significant impact on the life and culture of the Indians of the region by introducing tools and implements made of iron.

Petermann, August Heinrich (1822–1878)

German geographer

August Petermann was born in the central German town of Bleicherode near Weimar. After studying geography in Potsdam, he continued his studies in Edinburgh, Scotland, where he also was trained as a cartographer.

Petermann opened a small London map-publishing business in 1847. After seven years he returned to Germany, where he had been appointed director of the Perthes Geographical Institution in Gotha. The following year, 1855, he launched his journal, *Petermann's Geographische Mitteilungen*, which, in the latter part of the 19th century, became an important record for new geographic knowledge.

Petermann became an internationally recognized authority on the geography of central Africa and the Arctic. In 1852, he speculated that SIR JOHN FRANKLIN and his expedition, missing in the Canadian Arctic Archipelago since 1845, may have actually navigated the ice-choked channels northward into what he theorized was an "open polar sea." If this were the case, he theorized, Franklin and his men could be found somewhere between the NORTH POLE and the Bering Sea.

Petermann persisted in advancing his idea of an open polar sea for the next 20 years. In the late 1860s, he cited the unexplored Arctic region north of European Russia, between Spitsbergen (in Svalbard) and Novaya Zemlya, as a likely place where an ice-free entrance to such a body of water could be found. Prompted by Petermann's ideas, KARL CHRISTIAN KOLDEWEY led explorations into the region between Spitsbergen and GREENLAND from 1868 to 1870. Also influenced by Petermann were Austrian Arctic explorers JULIUS VON PAYER and KARL WEYPRECHT, who probed the frozen Arctic seas north of Novaya Zemlya. Although they found no ice-free passage to the Arctic Basin, they nonetheless made the European discovery of Franz Josef Land.

By the mid-1870s, Petermann had formulated a new concept of the geography of the Arctic, suggesting that Greenland, the northern limits of which were yet to be determined, extended northward across the North Pole, to the East Siberian Sea, where it was known as Wrangel Island.

August Petermann died in 1878, a suicide. A year later, American naval officer GEORGE WASHINGTON DE LONG, prompted by Petermann's last Arctic theory, undertook an

attempt on the North Pole by way of BERING STRAIT and Wrangel Island. This expedition, which ended disastrously in 1881, nevertheless showed that Petermann's theory of a polar landmass extending from Arctic SIBERIA to Greenland was as erroneous as his earlier ideas about the open polar sea. Although he was ultimately wrong in his views on Arctic geography, Petermann nonetheless gave impetus to American and European expeditions to the Arctic and helped promote modern geographic investigations in central Africa. Significant among his works were his atlas of physical geography and his maps of Africa, which provided details on the continent's interior based on the most recent European explorations.

Pethahia of Regensburg (Petahiah of Regensburg) (fl. 1180s–1190s) *German traveler, writer in eastern Europe and Middle East*

Pethahia was a German Jew from the Bavarian city of Regensburg. In about 1180, he left Prague and journeyed eastward through Europe, the Crimea, and Armenia, into the Middle East, visiting Jewish communities in the lands of present-day Syria, Iraq, Jordan, Israel, Turkey, and Iran.

Soon after Jerusalem fell to MUSLIMS in 1187, Pethahia returned through Greece to Prague, where an account of his travels was recorded in Hebrew in a work entitled *Sibbuw* (Circuit).

Although mainly concerned with the Jewish legends and traditions that Pethahia had collected in the course of his journey, his report also included geographic and cultural information on the Middle Eastern lands he had visited, including contemporary descriptions of the Holy Land's sacred sites. His work became an important source of information for Western Europeans when contacts with the region accelerated with the initiation of the third of the CRUSADES in 1189.

Pfeiffer, Ida Reyer (1797–1858) *Austrian world traveler, writer*

Ida Pfeiffer, née Reyer, was born in Vienna, the daughter of a wealthy merchant. She had a liberal upbringing and was educated at home by tutors. At the age of 22, she married a Swiss-born lawyer named Pfeiffer who was many years her senior; they had two sons together.

Starting in 1842, at the age of 45, after her children had grown and her husband had gone to live with a son from a former marriage, Pfeiffer embarked on a career of world travel. She first went to the Middle East, where she visited Jerusalem and Egypt, crossing the desert region between Cairo and Suez. After nine months in the region, she returned to Vienna where her journal of the trip was published in 1843. (The first English edition of this work was pub-

lished in London in 1852 as *Visit to the Holy Land, Egypt and Italy*.)

With the money from this work, Pfeiffer was able to finance a trip to ICELAND in 1844. During a stay of six months, she collected geological and plant specimens that she later sold to museums. With this money, along with what she earned from the publication of her account of the trip (published in an English edition in 1852 as *Visit to Iceland*), she was able to undertake a trip around the world.

Leaving in spring 1847, Pfeiffer sailed to Brazil; from Rio de Janeiro, she traveled inland to the town of Petropolis. In the surrounding forest area she visited with the Puri Indians, with whom she took part in a monkey hunt. She next sailed to Tahiti, where she remained for several weeks before continuing across the Pacific Ocean to Hong Kong, then sailed by a Chinese JUNK to Canton (Guangzhou), China, where she toured the city and the surrounding countryside.

Pfeiffer's next destination was India, where she visited nutmeg groves and a sugar cane processing plant. She also took part in a tiger hunt. In her travels in India, she collected plants and insect specimens for sale to European museums. She then went on to the Persian Gulf region, where she ascended the Tigris River to Baghdad. After traveling by camel caravan 300 miles to Mosul in what is now northern Iraq, she continued to the Persian city of Tabriz in present-day northern Iran. Pfeiffer proceeded northward into the Kurdistan region of eastern Turkey and crossed into Russia, where Cossack authorities detained her briefly due to some misunderstanding concerning her passport. She then returned home by way of Greece and Italy, reaching Vienna in November 1848. In all, she had traversed some 2,800 miles by land, and 35,000 miles by sea.

Pfeiffer's account of her trip was published soon afterward, the first English edition of which appeared in 1852 as *A Woman's Journey Round the World*. The book earned her wide acclaim, and shipping companies offered her free passage on trans-oceanic vessels in recognition of her accomplishments as a world traveler.

Pfeiffer began her second round-the-world journey in May 1851. From London, she sailed to Cape Town, and, following a month-long stay, she continued across the Indian Ocean to the Dutch East Indies (present-day Indonesia). At Sarawak on the island of Borneo, she was hosted by the territory's British-born rajah, Sir James Brooke.

During her six months on Borneo, Pfeiffer undertook several forays into the interior, making contact with the Dyak, a tribe of headhunters. She also went to Sumatra where she visited with another tribe, the Batak. On Ceram, she spent time among the Alfora.

Pfeiffer next sailed across the Pacific Ocean to San Francisco, California, from where she left for additional travels in South America. Before returning home, she undertook a tour of the United States. In June 1855, she arrived back in

London, having circled the world for the second time. She chronicled her four-year odyssey in another travel book, published in an English edition in 1856 as *A Woman's Second Journey Round the World, from London to the Cape of Good Hope, Borneo, Java, Sumatra, Celebes, Ceram, the Moluccas etc., California, Panama, Peru, Ecuador, and the United States*.

Pfeiffer's last journey was to Madagascar, where she joined several other Europeans in an abortive plot to overthrow the island's tyrannical ruler, Queen Ranavalona. After the plot failed, she and the other Europeans were expelled. She had become ill with fever and was still ailing when she reached Vienna, where she died in October 1858.

Although without great financial resources, Ida Reyer Pfeiffer managed to travel on her own around the world two times, both west to east as well as east to west. The exotic places she visited and described in her highly popular travel accounts had rarely been seen by European women.

Philby, Harry St. John Bridger (1885–1960)

British diplomat, traveler in Arabia

Harry St. John Philby was born on the island of CEYLON (present-day Sri Lanka) into a British colonial family who operated a tea plantation. After attending Westminster School in London, he went on to Cambridge University's Trinity College, where he studied classical and modern languages, including Persian and Arabic, as well as Urdu and Hindi, two of the major languages of India.

In 1908, Philby entered the British diplomatic service in India. Soon after the outbreak of World War I in 1914, he was sent to the Middle East, attached to the British army as a political officer in Baghdad.

Philby made his first long journey into the Arabian Peninsula in 1917, when he was sent to Riyadh to meet with Ibn Saud, a local Arab leader, in an attempt to gain his support for the Arab rebellion against Turkish rule that had erupted the year before. From Baghdad, Philby traveled to the Persian Gulf coast of Arabia, then headed inland at Qatar, and, from Hofuf, proceeded to Riyadh. After conferring with Ibn Saud, Philby made his way westward across the interior of Arabia, visiting ancient ruins at Dariyan. He then went through the Sagta Pass and followed the Muslim pilgrim route toward Mecca, arriving on the coast of the RED SEA at Jidda. He thus completed an east-to-west crossing of the Arabian Peninsula, the first European to do so since GEORGE FOSTER SADLIER, who had made a similar journey a century earlier in 1819.

From Jidda, Philby sailed to Bombay, India, then returned to Basra (present-day Iraq), at the head of the Persian Gulf. In 1918, he again traveled southward into Arabia and explored the southern provinces of the Nejd region, as far as the northern edge of southeastern Arabia's vast Rub' al-Khali

—known as the EMPTY QUARTER—one of the largest sand deserts in the world.

In 1920, the ROYAL GEOGRAPHICAL SOCIETY awarded Philby a gold medal for his explorations into the little-known regions of Arabia. He remained in the diplomatic service in the Middle East for the next few years. In 1920–22, he explored the Syrian Desert, covering the territory between Amman, Jordan, and the upper Euphrates River.

In 1924, Philby left the British diplomatic corps to pursue private business ventures in Arabia. He returned to the Riyadh region, and, over the next five years, as an agent for Western oil and mining interests, he sought the cooperation and support of Ibn Saud, who was then emerging as the dominant leader on the Arabian Peninsula.

By 1930, Philby had become disenchanted with British foreign policy in regard to Arabia; after converting to Islam, he became a trusted political adviser to Ibn Saud. Soon afterward, Ibn Saud succeeded in consolidating his rule into the present-day Kingdom of Saudi Arabia.

In 1931, Philby received permission from the Saudi king to undertake an exploration into the Rub' al-Khali in search of the ruins of the legendary city of Wabar, which, according to Muslim tradition reminiscent of the biblical account of Sodom and Gomorrah, had been destroyed by God for its wickedness. On January 7, 1932, Philby set out from the wells at Dulaiqiya, west of Qatar near Hofuf, and traveled southward into the Empty Quarter. In the middle of this great desert, he located several large craters near a site known as Al Hadida. There, he discovered quantities of iron, which he later determined were fragments of a giant meteor, and which some Muslim authorities judged to be remnants of the fabled Wabar. From this site, Philby headed westward across the desert wastes, and, on March 11, 1932, he arrived at the mouth of the Wadi Dawasir, near the Arabian oasis settlement at Sulaiyil.

In 1936, Philby undertook additional explorations in southwestern Arabia, traveling from Mecca southward into the Hadhramaut region of what is now the People's Democratic Republic of Yemen.

Philby remained as an adviser to the Saudi royal family in the years after the discovery of great oil reserves in Arabia in 1936, guiding the kingdom through the massive changes that resulted from the sudden influx of western capital and technology.

Harry St. John Philby, whose epitaph hails him as the "Greatest of Arabian Explorers," was one of the last Europeans to explore vast areas of Arabia before oil companies began to probe the remote regions of the interior with motorized vehicles and aircraft. Although Englishman BERTRAM THOMAS had been the first European to cross the Empty Quarter in 1931, Philby's journey a year later, in which he traversed far more difficult terrain, is considered

to have been a more thorough exploration. In his travels in Arabia, Philby amassed hundreds of plant, animal, and fossil specimens that later became part of the natural history collections of major museums in Great Britain and the United States. Among Philby's works on the region are *Heart of Arabia* (1923), *The Empty Quarter* (1933), *Sa'ud Arabia* (1955), and *Forty Years in the Wilderness* (1957). His son, Kim Philby, was exposed in 1963 as having been a long-time Soviet spy within the British intelligence establishment.

Phillip, Arthur (1738–1814) *British naval officer in Australia*

Arthur Phillip, a British naval officer, received command of the *Sirius*, the flagship of First Fleet, consisting of 11 ships on what was to be first colonizing expedition to Australia. The excursion was planned as a follow-up to JAMES COOK's landing in Botany Bay in 1770.

Commissioned by Thomas Townsend, Viscount Sydney, the First Fleet departed Portsmouth, England, on May 13, 1787, with 450 crew members; 564 male and 192 female convicts, plus 58 wives and children; and two years' worth of supplies. Sailing via Rio de Janeiro in Brazil around Africa's CAPE OF GOOD HOPE and past Van Diemen's Land (TASMANIA), the First Fleet arrived in Botany Bay on the east coast of Australia and then continued northward to Port Jackson (present-day Sydney) and founded a colony on January 26, 1788. Despite great hardship, the colony survived with Phillip serving as governor until 1792, when he returned to England because of failing health.

Arthur Phillip's expedition led to the first permanent European settlement in Australia and the New South Wales colony. January 26 is celebrated as Australia Day.

Phipps, Constantine John (1744–1792)
British naval officer in the Arctic

Constantine Phipps, an experienced British naval officer, received command of an early expedition to the NORTH POLE, proposed by John Montagu, earl of Sandwich, and sponsored by the ROYAL SOCIETY, with the support of the Lords of the Admiralty and King George III. The hulls of two warships, the *Racehorse* and the *Carcass*, were reinforced for DRIFT ICE. It was believed at the time that the North Pole could be reached by a water route.

Captain Phipps and his expedition departed England in June 1773, sailing due north. Between GREENLAND and the Spitsbergen island group (part of present-day Svalbard), Phipps found passage blocked by ice. While skirting the ice barrier, Phipps attempted to carry out planned experiments, using a thermometer for measuring

water temperature and an apparatus for distilling fresh-water from the sea. The expedition reached 80°48' North latitude.

Phipps wrote about the expedition in *A Voyage Towards the North Pole Undertaken by His Majesty's Command 1773*, published in 1774. His observations on Arctic navigation as well as on natural science, including a discussion of polar bears, proved helpful to subsequent Arctic explorers sent out by the British Admiralty, including DAVID BUCHAN and SIR JOHN ROSS in 1818.

Piccard, Auguste (1884–1962) *Swiss physicist, aviator, oceanographer, father of Jacques Ernest-Jean Piccard*
Auguste Piccard was born in Basel, Switzerland. In 1922, he became a professor of physics at the Polytechnic Institute of the University of Brussels in Belgium.

Piccard, interested in lighter-than-air flight, pioneered the use of the pressurized cabin to enable a high-altitude ascent in a BALLOON. In 1931, he and Paul Kipler, in a sealed spherical gondola lifted by a hydrogen-filled balloon, set a new world altitude record of 51,793 feet, becoming the first humans to penetrate the stratosphere. In 1932, Piccard reached 55,577 feet. In these ascensions, he studied temperature and cosmic rays in the stratosphere. His twin brother, Jean-Félix Piccard, ascended with his wife to an altitude of 57,564 feet in 1934.

Auguste Piccard next turned his attention to undersea exploration and the SUBMERSIBLE. In 1947, applying the principles of an AIRSHIP, he built his first BATHYSCAPH (an improvement on the BATHYSPHERE), an envelope filled with heptane (an aviation petrol), bearing a steel watertight cabin. In 1954, after a series of dives, he accomplished a descent to a depth of 13,125 feet.

In 1957, the U.S. Navy financed a series of dives in Piccard's bathyscaph, refurbished and renamed the *Trieste II*, off the island of Capri, Italy. Piccard's son JACQUES ERNEST-JEAN PICCARD was hired to join the team. In 1959, the bathyscaph was brought to the island of Guam in the Pacific Ocean. After a series of engineering trials, on January 23, 1960, Jacques, as pilot, along with Donald Walsh, a navy lieutenant, dove in the *Trieste II* about 35,810 feet to the bottom of the Challenger Deep of the MARIANAS TRENCH, the deepest point on Earth, and set the world record in depth.

Auguste and Jacques Piccard also designed a mesoscaph for diving to 6,000 feet. The mesoscaph used helicopter-like propellers to maintain its depth.

Auguste Piccard was a pioneer in both aviation and oceanography. He also collaborated with Albert Einstein on the development of instruments for measuring radioactivity. His grandson Bertrand Piccard participated in the first non-stop balloon flight around the world in 1999.

Piccard, Jacques Ernest-Jean (1922–)

Swiss oceanographer, engineer, son of Auguste Piccard

Born in Brussels, Belgium, the son of the Swiss physicist AUGUSTE PICCARD, Jacques Piccard originally pursued a career in economics, graduating from the University of Geneva in Switzerland in 1946 and then becoming an assistant professor there.

Moving to Italy and working as an economist in Trieste, Piccard was invited to join the team building the BATHYSCAPH, a type of BATHYSPHERE, designed by his father. In 1957, the U.S. Navy purchased Auguste Piccard's second bathyscaph, the *Trieste*, completed five years earlier, and hired Jacques as a scientific consultant. Starting in 1959, off Guam in the Pacific Ocean, more engineering trials were carried out. On January 23, 1960, Jacques, as pilot, and Donald Walsh, a navy lieutenant, dove in the renamed *Trieste II* some 35,810 feet (seven miles), nearly to the bottom of the Challenger Deep of the MARIANAS TRENCH, the deepest point on Earth, setting the world record in depth.

Piccard, working in Lausanne, Switzerland, designed an exploratory SUBMARINE, the *Auguste Piccard*. In 1964, some 33,000 visitors of the Swiss National Exhibition, were taken on sight-seeing dives in Lake Geneva to a depth of 330 feet. Piccard designed another submarine, the *Ben Franklin* (PX-15), for the purpose of studying OCEAN CURRENTS. In 1969, he and a team of five observers drifted in the GULF STREAM along North America's Atlantic coast from Palm Beach, Florida, to Cape Hatteras, North Carolina.

For their record-setting dive in the *Trieste*, Piccard and Walsh were awarded the Distinguished Public Service award by the U.S. government. Piccard's writings include *Seven Miles Down* (1961, with American oceanographer Robert Dietz) and *The Sun Beneath the Sea* (1971).

Jacques Piccard's dive in the Pacific Ocean's Marianas Trench—more than 6,000 feet deeper than the highest point on Earth from sea level, MOUNT EVEREST—still stands as a world record. His son, Bertrand Piccard, participated in the first nonstop BALLOON flight around the world in 1999.

Pigafetta, Francesco Antonio

(ca. 1491–ca. 1535) *Italian author, traveler in South America and the South Pacific, in service to Spain*

Antonio Pigafetta was born at Vicenza in northern Italy's Lombardy region, the son of noble parents. He received a good education, and, with his talent for languages, planned a career as a diplomat.

In 1518, Pigafetta toured the major European capitals with a Vatican diplomatic mission. He had become interested in the explorations then being undertaken by Portuguese and Spanish navigators, and, while in Spain with the papal delegation, he learned of FERDINAND MAGELLAN'S

planned expedition to the EAST INDIES. He offered his services to Spain's king Charles I (Holy Roman Emperor Charles V), the expedition's chief sponsor, and received a royal commission as a "gentleman volunteer" to be Magellan's private secretary.

Pigafetta arrived in May 1519 in Seville, where he spent the next few months studying navigational techniques in preparation for the voyage. On September 20, 1519, he sailed from the nearby port of Sanlúcar de Barrameda on Magellan's flagship, the *Trinidad*, one of a fleet of five vessels.

During the next three years, Pigafetta kept a daily record of this historic voyage in which the STRAIT OF MAGELLAN was located and the world was first circumnavigated. He was one of the 18 survivors of the expedition to return to Spain on the *Victoria* in September 1522. As it turned out, Pigafetta's journal was the only surviving eyewitness written record of the historic voyage, the Portuguese having confiscated Magellan's own log when they seized the *Trinidad* in the East Indies in 1521.

Soon after his return to Spain, Pigafetta presented his journal to King Charles I. He then went to Rome, where he was received by Pope Clement VII. Through the pope's influence, in 1524, Pigafetta became a member of the Knights of Rhodes (later the Knights of Malta), a military-religious order. At the request of Pope Clement and King Charles, Antonio Pigafetta wrote an account of the Magellan voyage, *Primo viaggio intorno al mondo* (First journey around the terrestrial globe), which was first published in an abridged form in Paris in 1540.

The work describes the mutiny on the South American coast and Magellan's death in the Philippines. Although JUAN SEBASTIÁN DEL CANO was initially hailed as having completed the first CIRCUMNAVIGATION OF THE WORLD, since he commanded the *Victoria* on its return voyage to Spain after Magellan's death in 1521, the accomplishment, according to Pigafetta, was largely due to Magellan's skill as a navigator and leader. With his background in navigation, Antonio Pigafetta was able to provide details on the locations of the various islands he visited. The work relates that Magellan first learned of the passage at the southern end of South America (afterward known as the Strait of Magellan) from a secret GLOBE or chart he had seen in Lisbon, produced by MARTIN BEHAIM in 1492.

In addition to revealing to European geographers the vast extent of the Pacific Ocean, Antonio Pigafetta was among the first to comment on the phenomenon of having lost a day in the westward journey around the world. Although he had kept an accurate record of all the days that had transpired on the three-year voyage, Pigafetta nonetheless failed to take into account that the expedition had sailed westward across the 180th meridian of longitude in its passage across the Pacific Ocean and, in so doing, had traversed what has since been designated as the INTERNATIONAL

DATE LINE. Pigafetta also provided European leaders with valuable information on trading practices in the East Indies and described the native peoples he had encountered.

Pike, Zebulon Montgomery (1779–1813)

U.S. Army officer, American explorer of the upper Mississippi, eastern Colorado Rockies, and Arkansas River

Zebulon Pike was born in Lambertton, near Trenton, New Jersey. His father, who had the same name, was an American army officer in the Revolutionary War. The younger Pike joined the army in about 1793, serving alongside his father under General "Mad" Anthony Wayne in campaigns against the Ohio Valley tribes in the Miami War, or Little Turtle War, of 1790–94. Pike remained in the army and was subsequently stationed at garrisons throughout the Old Northwest. By 1799, he had been commissioned a second lieutenant.

In 1805, General James Wilkinson sent Pike on an expedition to explore the headwaters of the MISSISSIPPI RIVER. In addition to locating the Mississippi's source, Pike was ordered to assert U.S. sovereignty over the upper Mississippi and Great Lakes region and to enforce the terms of Jay's Treaty of 1794, under which British traders and military personnel were to leave U.S. territory. Pike was also instructed to establish peaceful contacts with Indians in the region and survey fur and mineral resources.

Pike's expedition of 20 soldiers departed St. Louis on August 9, 1805, and traveled up the Mississippi aboard a 70-foot KEELBOAT. After meeting with leaders of the Sac tribe at

Zebulon Pike (Library of Congress)

Map of the Louisiana Territory by Zebulon Pike (1807) (Library of Congress)

present-day Keokuk, Iowa, and surveying the lead deposits at Dubuque, Pike continued upriver to Prairie du Chien. At this point, he left his keelboat, proceeding with his expedition on two smaller and faster boats. He negotiated a purchase of 100,000 acres of land in Minnesota from the Sioux (Dakota, Lakota, Nakota) Indians, which later became the site of Minneapolis.

About 230 miles above the Falls of St. Anthony, Pike established winter quarters for most of his party. In December 1805, accompanied by some of his men, he pushed onward into northern Minnesota, seeking the source of the

Mississippi. The river was frozen in some places, and his expedition traveled alternately by CANOE and sled. In February 1806, Pike and his men reached Red Cedar Lake (Cass Lake) and Leech Lake, which he wrongly concluded were the sources of the Mississippi River. The actual source of the Mississippi, Lake Itasca, was determined by HENRY ROWE SCHOOLCRAFT in 1832.

Pike returned to his expedition's winter encampment at present-day Little Falls, Minnesota, and from there descended the Mississippi, arriving back in St. Louis on April 30, 1806.

Two months later, Wilkinson again dispatched Pike. This time, he was to search for the sources of the Arkansas and Red Rivers and survey the southern boundary of the newly acquired Louisiana Territory. On July 15, 1806, with 23 soldiers and 51 recently freed Osage Indians, whom he was to escort back to their homeland, plus Wilkinson's son James Biddle, also a U.S. army lieutenant, and a naturalist, Dr. John Robinson, Pike left Fort Belle Fontaine, near St. Louis, and headed up the MISSOURI RIVER on two riverboats. By way of the Osage River, Pike and his men reached the Osage lands, then traveled on horseback overland to the Republican River in what is now western Nebraska. On learning that a Spanish military force had been sent to intercept him, Pike led his men southward to the Great Bend of the Arkansas River. While the younger Wilkinson and a small party explored the Arkansas to its junction with the Mississippi, Pike and the rest of his command ascended the Arkansas into Colorado.

In November 1806, Pike and his men first sighted the Front Range of the ROCKY MOUNTAINS, near what is now Pueblo, Colorado. From a distance, they espied the 14,110-foot mountain that would later be known as Pikes Peak. Pike and a small party attempted to climb the mountain, but early winter snows prevented an ascent. The expedition headed southward and returned to the Arkansas, tracing it to its source in the Royal Gorge.

Pike then attempted to reach the Red River. He crossed the Sangre de Cristo Mountains into the San Luis Valley. On the Conejos River, a tributary of the Rio Grande, he established a stockade, where he and his men spent the winter.

In spring 1807, Spanish military authorities arrested Pike's party for illegally crossing into Spanish territory. They suspected that the expedition had been sent to spy on Spanish defenses in the Southwest. The prisoners were taken to Santa Fe, then to Chihuahua, Mexico. Pike maintained that he had mistaken the Rio Grande for the Red River and had entered Spanish territory accidentally. Historians have speculated that Pike knew his true location and was indeed engaged in a spying operation against the Spanish. After being held in custody for several months, Pike and his men were taken across Texas and returned to the United States at Natchitoches, Louisiana, on June 30, 1807.

Pike was subsequently implicated along with Wilkinson in Aaron Burr's plot to establish a separate empire in the American Southwest, but he was soon acquitted of any wrongdoing. He went on to serve as a brigadier general in the War of 1812. In April 1813, while leading an attack against Toronto, he was killed in an explosion of a British powder magazine.

The charts and journals that Pike made on his Colorado expedition were confiscated by the Spanish. Nevertheless, he was able to reproduce most of his observations from memory and from private papers he had smuggled back to St. Louis.

Zebulon Pike's report of his expeditions up the Mississippi and into the Rockies was published in 1810 as *An Ac-*

count of the Expeditions to the Sources of the Mississippi and through the Western Parts of Louisiana. It was translated into French, German, and Dutch. In it, Pike described the southern plains as too arid for agricultural settlement. His findings were confirmed by STEPHEN HARRIMAN LONG in his 1819 expedition and helped lay the foundation for the myth of the "Great American Desert." Yet Pike's descriptions of the Spanish settlements in New Mexico encouraged St. Louis traders to develop commerce by way of the Santa Fe Trail. Pike's explorations of the southern plains began at the same time that the expedition of MERIWETHER LEWIS and WILLIAM CLARK was returning from the Pacific Northwest. His account, along with that of Lewis and Clark, provided the first complete picture of the American trans-Mississippi West.

Pilcher, Joshua (1790–1843) *American fur trader on the upper Missouri and in the Rocky Mountains*

Born in Culpeper County, Virginia, Joshua Pilcher moved with his family to western Tennessee while young. He studied medicine for a short time, but gave it up to become a frontier merchant.

In 1815, Pilcher arrived in St. Louis, Missouri, where he soon became prominent in business as a director of the Bank of St. Louis. He entered the FUR TRADE, and, by 1819, he had become a partner with MANUEL LISA in the ST. LOUIS MISSOURI FUR COMPANY.

Following Lisa's death in 1820, Pilcher became president of the company and directed its trading operation on the upper MISSOURI RIVER. In spring 1823, one of his fur brigades was attacked and annihilated by Arikara Indians in the Dakota country. That summer, Pilcher led a battalion of fur traders and allied Sioux (Dakota, Lakota, Nakota) Indians as part of Colonel HENRY LEAVENWORTH's punitive military expedition against the Arikara at their villages on the Missouri near the present border between North and South Dakota. During this operation, Pilcher's men, without authorization from Leavenworth, destroyed the Arikara villages. That same year, another of his trading parties was wiped out by marauding Blackfoot Indians in western Montana.

With the upper Missouri effectively closed by Indian resistance, the St. Louis Missouri Fur Company continued to suffer losses and went out of business by 1825. He subsequently organized a new trading outfit in 1827. That year, he led 45 traders and trappers into the ROCKY MOUNTAINS by way of the Platte River. Pilcher's explorations across the northern plains and into the northern Rockies continued for the next three years. He and his men eventually reached the Columbia River Basin and the HUDSON'S BAY COMPANY post, Fort Vancouver.

Pilcher returned to St. Louis in 1830, and, the following year, he took charge of the AMERICAN FUR COMPANY's trading fort on the Missouri at Council Bluffs.

In 1833, he accompanied ALEXANDER PHILIPP MAXIMILIAN and artist KARL BODMER on their tour of the upper Missouri.

Through his fur-trading operations, Pilcher developed extensive contacts with the upper Missouri Indian tribes, and in 1837, he was appointed Indian subagent to the Sioux, Ponca, and Cheyenne. In 1839, he succeeded WILLIAM CLARK as superintendent of Indian affairs at St. Louis, serving until 1841. He remained prominent in St. Louis political and business affairs and was a friend and associate of Missouri senator Thomas Hart Benton.

Joshua Pilcher's report on his explorations was later published by the U.S. Congress. In it, he commented on the Oregon Country's potential for agricultural settlement, pointing out that emigrants could easily reach it by way of the Platte River route and the SOUTH PASS. His account gave impetus to the development of the Oregon Trail as a major migration route across the Great Plains and northern Rockies to the Pacific Northwest.

Pinto, Fernão Mendes (Fernando Pinto)

(1509–1583) *Portuguese traveler in India and the Far East*
Born at Montemor-o-Velho in southern Portugal, Fernão Pinto came from a family of modest means. As a teenager, he served as a page in the households of nobles.

In about 1537, Pinto traveled to India with Cristoval da Gama, a son of VASCO DA GAMA, and was taken captive by Turks, who sold him into slavery. He eventually regained his freedom in Malaya, from where he went to China with a European trading expedition.

In about 1541, Pinto arrived in Peking (Beijing), where he entered the diplomatic service of the Chinese government. He accompanied an official Chinese delegation to Cochin China (present-day Vietnam), visiting the lower Mekong River region and Hainan Island in the South China Sea. From there, he sailed to Japan, arriving in 1542. While in Japan, he became associated with FRANCIS XAVIER, with whom he traveled for a time.

After 20 years as a trader and adventurer in Southeast Asia, China, Indonesia, and India, Pinto returned to Europe, arriving in Portugal in 1558. He settled near Lisbon and wrote an account of his travels, entitled *Peregrinação* (Peregrinations, or Wanderings). It was published in 1614, 30 years after his death.

Although many of his described adventures were too fantastic to be believed and earned him the sobriquet "Prince of Lies," Fernão Pinto is nonetheless credited as being the first known European to visit Japan.

Pinzón, Arias Martín (1465–1510) *Spanish mariner in the West Indies and South America, nephew of Francisco*

Martín Pinzón, Martín Alonso Pinzón, and Vicente Yáñez Pinzón

Arias Pinzón was born at Palos de Moguer in the Andalusia region of southwestern Spain. A member of a family of well-established seafarers and shipowners, he was the son of an older brother of FRANCISCO MARTÍN PINZÓN, MARTÍN ALONSO PINZÓN, and VICENTE YÁÑEZ PINZÓN.

By 1492, Pinzón had become an accomplished mariner and pilot. He sailed on CHRISTOPHER COLUMBUS's first voyage to the WEST INDIES as a crewman on the *Niña*, commanded by his uncle Vicente. Also along on this expedition were his uncle Martín, who commanded the *Pinta*, as well as his uncle Francisco, who was the first mate on the *Pinta*.

The next year, 1493, Pinzón joined Columbus on a second exploration of the West Indies, taking him to Hispaniola (present-day Haiti and the Dominican Republic), Puerto Rico, the south coast of Cuba, and the north coast of Jamaica. Five years later, in 1498, he sailed again with Columbus to the northeast coast of South America and the island of Trinidad.

In 1499, together with his uncles Vicente and Francisco, Pinzón commanded several ships exploring the South American coast north and south of the mouth of the AMAZON RIVER. On the westward voyage across the Atlantic Ocean from the Cape Verde Islands, Pinzón's ships and those of Vicente became separated in rough weather. They met up again in late January 1500, off Cape São Augustinho, just south of South America's great eastern bulge, near what is now Recife, Brazil. They then headed northward along the coast to the mouth of the Amazon. While Vicente continued to probe northward along the coast of the Guianas, Pinzón returned southward and may have cruised along the Brazilian shore as far as what is now Rio de Janeiro. He later rejoined his uncle in the Gulf of Paria, on the coast of present-day Venezuela, from where they returned to Spain by way of Hispaniola.

Over the next several years, Pinzón became wealthy as one of the first traders to develop commercial ties between his home at Palos de Moguer in Spain, and Spanish colonies in the West Indies. In 1506–07, together with his uncle Vicente and JUAN DÍAZ DE SOLÍS, he explored along the coast of the Yucatán Peninsula, and, in 1509–10, he returned to the South American coast in search of an interoceanic strait through the continent.

Arias Pinzón, while not the best known of the Pinzóns, was nevertheless instrumental in the early exploration of the West Indies and the mainland of South America.

Pinzón, Francisco Martín (1462–1500)

Spanish mariner in the West Indies and South America, brother of Martín Alonso Pinzón and Vicente Yáñez Pinzón, uncle of Arias Martín Pinzón

Born at Palos de Moguer in southwestern Spain, Francisco Pinzón was the youngest of the three Pinzón brothers whose

shipbuilding firm provided the *Niña* and the *Pinta* for CHRISTOPHER COLUMBUS's first voyage to the Americas.

On that 1492 voyage, in which Columbus reached the Bahamas, Hispaniola (present-day Haiti and the Dominican Republic), and other islands in the WEST INDIES, Pinzón sailed as first mate and pilot on the *Pinta*, under the command of his brother MARTÍN ALONSO PINZÓN. He supported his brother's attempt to desert the expedition with the *Pinta* off the coast of Cuba, despite the fact that another brother, VICENTE YÁÑEZ PINZÓN, commander of the *Niña*, remained loyal to Columbus.

With Martín's death in 1493, Pinzón became managing partner of the family shipbuilding business. In 1499–1500, he joined his brother Vicente and their nephew ARIAS MARTÍN PINZÓN in an exploration of the northeast coast of South America, during which they made the European discovery of the AMAZON RIVER. On the homeward voyage, he was lost with all his crew when the ship he commanded went down in a hurricane off Hispaniola.

Francisco Pinzón, together with his brothers and nephew, provided the ships and navigational expertise essential for the success of Columbus's 1492 voyage. In his final voyage with Vicente and Arias, he took part in the first European exploration of the South American mainland south and east of Trinidad.

Pinzón, Martín Alonso (Martín Alonzo Pinzón)

(ca. 1441–1493) *Spanish mariner in the West Indies, brother of Francisco Martín Pinzón and Vicente Yáñez Pinzón, uncle of Arias Martín Pinzón*

Martín Pinzón was a native of Palos de Moguer, near the former seaport of Palos de Frontera, on the Andalusian coast of southwestern Spain. A descendant of a long line of seafarers, he became an accomplished mariner and ship's pilot, taking part in trading voyages throughout the MEDITERRANEAN SEA and along the coast of West Africa.

According to some accounts, Pinzón sailed with a French navigator named Cousin in a 1488 voyage to the coast of West Africa; after a storm had driven their vessel far to the southwest, they reportedly came within sight of uncharted land and reached the mouth of large river.

Another source relates that, by the late 1480s, Pinzón had retired from the sea and joined his brothers FRANCISCO MARTÍN PINZÓN and VICENTE YÁÑEZ PINZÓN in the family's shipbuilding business in Palos de Frontera, as the senior partner. The Pinzón brothers befriended CHRISTOPHER COLUMBUS and supported his idea that Japan and China could be reached by sailing westward across the Atlantic Ocean. On a visit to Rome about 1490, Pinzón reportedly came across records that papal taxes, or tithes, had been collected from a land called VINLAND until about 1400, and found references to this place on old Norman charts, indicating that it was located westward across the Atlantic.

Pinzón was well respected in the Spanish royal court as an authority on maritime matters, and on his return to Spain, he presented these findings to the advisers of King Ferdinand II and Queen Isabella I. His report may have influenced the Spanish monarchs' ultimate decision to sponsor Columbus in 1492.

Pinzón provided one-eighth the cost of mounting the expedition, helped recruit the crews from his native Palos de Moguer and Palos de Frontera, and was instrumental in obtaining two of the ships for the voyage, the *Niña* and the *Pinta*. He sailed with Columbus in early August 1492, as captain of the *Pinta*, assisted by his brother Francisco. His brother Vicente commanded the *Niña*, while Columbus commanded the expedition's flagship, the *Santa María*.

In early October 1492, Pinzón convinced Columbus to follow flocks of birds migrating southward, a sign that land was probably in that direction. He had determined that they had traveled westward beyond the point where Japan was thought to be; the decision to head toward a possible landfall calmed the fears of the men on all the ships, who had become alarmed at not having come upon land since leaving the CANARY ISLANDS three weeks earlier.

On the morning of October 12, 1492, one of Pinzón's crewmen on the *Pinta*, Roderigo de Triano, sighted land, one of the Bahama Islands. Columbus named it San Salvador (also known as Watling Island).

Pinzón and the *Pinta* abruptly left Columbus and the other two ships off the east coast of Cuba on November 21, 1492. The natives on Cuba had reported that gold could be found in abundance on a nearby island, and it was there that Pinzón had gone. He later reported that he had landed on Great Inagua Island, off Cuba's eastern tip, but found no gold there. He then explored the Cibao region along the north coast of the island of Hispaniola (present-day Haiti and the Dominican Republic), where he found some gold and learned from the natives that the *Santa María* had been wrecked. On January 6, 1492, off northern Hispaniola's Monte Cristi Peninsula, Pinzón rejoined Columbus and his one remaining ship, the *Niña*.

Pinzón sailed back toward Europe with Columbus as far as the AZORES, where their ships were again separated, this time by a storm. The *Pinta*, driven northward, reached the northwest coast of Spain near Vigo. King Ferdinand and Queen Isabella refused Pinzón's request for an audience to report on his findings. Instead, they ordered Pinzón not to leave his ship until he had returned to Palos de Frontera, where he was to wait for Columbus, who had stopped in Portugal. Pinzón and the *Pinta* reached Palos de Frontera on March 15, 1493, just hours after Columbus had arrived. Reportedly, the snub by the Spanish court, coupled with Columbus's accusations of disloyalty, further undermined his health, already weakened by the voyage, and Pinzón died in Palos de Moguer several weeks later. Some sources suggest that Pinzón may actually have succumbed to a particularly

virulent strain of syphilis, contracted in his contacts with the natives in the WEST INDIES, which would make him one of the first Europeans to die of that disease.

The fact that Martín Pinzón apparently deserted Columbus on the Cuban coast has cast a shadow on his reputation as one of the European discoverers of the Americas. Nonetheless, Pinzón's support was essential for the success of Columbus's first voyage. He had helped Columbus gain the backing of the Spanish court and had contributed his own money to the venture. As second in command, he served as an intermediary between Columbus and his men, most of whom, like Pinzón, were from the Palos area and regarded the Italian-born Columbus as a foreigner. In his independent explorations in the West Indies, Pinzón may have actually preceded Columbus in reaching the island of Hispaniola.

Pinzón, Vicente Yáñez (Vicente Anes Pinzón)

(1463–ca. 1523) *Spanish mariner in the West Indies, South America, and Central America, brother of Francisco Martín Pinzón and Martín Alonso Pinzón, uncle of Arias Martín Pinzón*

Vicente Pinzón was born at Palos de Moguer on the Andalusian coast of southwestern Spain, a member of a prominent family of seafarers and shipbuilders that included his brothers FRANCISCO MARTÍN PINZÓN and MARTÍN ALONSO PINZÓN.

Along with his brothers, Pinzón was a friend of CHRISTOPHER COLUMBUS and a backer of his plan to reach Japan and China by sailing westward across the Atlantic Ocean. All three brothers took part in Columbus's first voyage, which sailed, in August 1492, from the seaport of Palos de Frontera, near their home. On the historic voyage, Pinzón commanded the *Niña*, on which he was assisted by his nephew ARIAS MARTÍN PINZÓN.

Pinzón remained loyal to Columbus after his brother Martín, captain of the *Pinta*, deserted the expedition off the coast of Cuba in November 1492. A month later, when the *Santa María* was wrecked off the north coast of Hispaniola (present-day Haiti and the Dominican Republic), Pinzón rescued Columbus and his crew, and it was his ship, the *Niña*, on which Columbus triumphantly returned to Spain in March 1493. Pinzón may have sailed again with Columbus on his second voyage of 1493 and on his third voyage of 1498, but there is no accurate record of his having done so.

Although the Spanish government had granted him permission to undertake an additional voyage of exploration on his own in 1495, Pinzón apparently did not sail until November 13, 1499. His fleet of four ships embarked from Palos de Frontera, on a voyage in which he was joined by his brother Francisco and his nephew Arias. After first sailing to the Cape Verde Islands, where the ships were resupplied, Pinzón headed southwestward. According to his astronomical observations, he lost sight of the NORTH STAR,

indicating that he had gone south of the EQUATOR. On January 20, 1500, he sighted a cape on the mainland of South America, which he named Santa María de la Consolación, later known by the Portuguese as São Augustinho, near present-day Recife, Brazil.

Proceeding northwestward, Pinzón made the European discovery of the mouth of the AMAZON RIVER, which he named La Mar Dulce (the freshwater sea), having noted that the river's water flowed well out to sea, where it was still fit to drink. He explored up the Amazon for about 50 miles, then continued along the Caribbean coast of the Guianas and what is now Venezuela. He explored the Gulf of Paria, where he made the European discovery of the island of Tobago, which he called Isla de Mayo.

Pinzón then examined the coast of CENTRAL AMERICA, sailing as far northward as what is now Honduras and Costa Rica. Some accounts suggest that on this voyage, Pinzón made one of the first known circumnavigations of Cuba, thus establishing that it was an island, contrary to Columbus's previous assertion that it was part of the mainland of Asia.

Pinzón's ships were struck by a hurricane off Hispaniola in July 1500. Two of his four vessels were lost with all hands, including the one commanded by his brother Francisco. He returned to Spain on September 30, 1500, with a cargo of tropical wood and 20 Indian slaves. He also brought back an opossum from South America, the first marsupial ever to be seen by Europeans.

Pinzón returned to the northeast coast of South America in 1502. Over the next two years, he traded with the Indians along the Gulf of Paria, from whom he obtained gold, woven cotton fabrics, and parrots, which had become popular pets in Europe soon after the European discovery of the Americas.

In 1504, Pinzón visited the Spanish settlement on Hispaniola, where he met with Columbus. The next year, he was named governor of Puerto Rico, an appointment that lapsed when he made no attempt to colonize that island.

In 1506, Pinzón joined JUAN DÍAZ DE SOLÍS in an exploration of the coast of Central America. Together they retraced the route of Columbus's last voyage of 1502, landing on Guanaja Island, off the coast of what is now Honduras. From there, they sailed into the Gulf of Mexico and were among the first Europeans to explore the coast of the Yucatán Peninsula and Bay of Campeche.

Pinzón returned to Spain in 1507, where he conferred with AMERIGO VESPUCCI on the findings of his recent voyage. In 1508, he sailed again with Díaz de Solís, leaving Spain with two ships, the *Isabeleta* and the *Magdalena*. Pinzón and Díaz de Solís had been commissioned by the Spanish government to follow the coast of South America southward in hopes of locating a strait leading to the Indian Ocean and the SPICE ISLANDS, the present-day Moluccas of Indonesia. (The fact that the Pacific Ocean lay on the other side of South

America was then unknown to Europeans.) From Cape São Augustinho on the Brazilian coast, Pinzón and Díaz de Solís explored southward as far as 40° south latitude, where they reached the mouth of the Río Negro, on the central coast of what is now Argentina.

Pinzón returned to Spain in 1509, having had a falling-out with Díaz de Solís during the voyage, and he undertook no further voyages of exploration. In 1518, King Charles I of Spain (Holy Roman Emperor Charles V) granted Pinzón and his heirs a hereditary title of nobility.

In addition to his vital role in the Columbus voyage of 1492, Vicente Pinzón became well known as an explorer in his own right. Although generally credited with the European discovery of the Amazon River, his reported sighting of the Brazil coast to the south in 1500 has been disputed by Portuguese and Brazilian historians. They maintain that Pinzón never went south of the equator, and that the European discoverer of Brazil was Portuguese navigator PEDRO ÁLVARS CABRAL, who reached the southern Brazilian coast in April 1500, several months after Pinzón's reported landing.

Pires, Tomé (ca. 1468–ca. 1540) *Portuguese apothecary, diplomat in the East Indies and China*

Portuguese-born Tomé Pires was the son of the apothecary to King João II. In 1490, he himself became an apothecary in the Portuguese royal household.

Pires traveled to India in 1511, with what is assumed to be a royal commission to study medicinal spices of the Orient. After a year amassing a fortune in the SPICE TRADE, he participated in expeditions under the Portuguese viceroy of the region, AFONSO DE ALBUQUERQUE, visiting Java in 1513, and Sumatra and Malacca on the Malay Peninsula in the South China Sea two years later.

In 1516, the new viceroy, Lopo Soares de Albergaria, chose Pires as an envoy to the Chinese. The fleet failed to reach China, after being driven off course south of present-day Vietnam in September of that year. A second attempt succeeded in August 1517, and it is thought that Pires stayed at the Chinese court in Peking (Beijing) for some 20 years.

In the *Suma Oriental*, written in India and Malacca in 1512–15, Tomé Pires gives an account of the Far East from his travels and those of others. Although his writings on China have not survived, his visit there is important in that it represents the first opening of diplomatic relations between Portugal and China.

Pizarro, Francisco (ca. 1475–1541)
Spanish conquistador in South America, half brother of Gonzalo Pizarro and Hernando Pizarro

Francisco Pizarro was born at Trujillo in the Estremadura region of west-central Spain. He was born out of wedlock; his father was a nobleman and officer in the Spanish army,

and his mother was a local peasant girl. Raised outside his father's aristocratic household, he remained uneducated in his early years, during which he worked as a swineherd tending his father's pigs. Some sources suggest he gained his earliest military experience while serving with his father in campaigns in Italy.

In about 1500, Pizarro ran away to Seville, then a major staging area for colonizing expeditions to the newly explored WEST INDIES. He soon entered the service of Nicolas de Ovando, who had just been appointed governor of Hispaniola (present-day Haiti and the Dominican Republic), succeeding CHRISTOPHER COLUMBUS, and sailed with Ovando's fleet to the West Indies in 1502. In 1509, he made his first landing on the South American mainland as part of ALONSO DE OJEDA's expedition to the Caribbean coast of what is now Colombia. Left in charge at San Sebastián, he later moved the colony to Panama's Gulf of Urabá, where he helped to found the settlement of Santa María de la Antigua.

Pizarro accompanied VASCO NÚÑEZ DE BALBOA in his explorations of the Isthmus of Panama, including the 1513 expedition in which Europeans first sighted the Pacific Ocean. From Native Americans encountered on these expeditions, Pizarro heard of a fabulously rich native kingdom to the south, called by the natives Biru and known afterward as Peru.

It was Pizarro who later arrested Núñez de Balboa on behalf of Panama's colonial governor PEDRO ARIAS DE ÁVILA. In the years following Núñez de Balboa's execution in 1519, Pizarro rose to prominence in Panama, becoming mayor of Panama City and receiving grants of land. He also explored the Pearl Islands off Panama's Pacific Coast. In 1522, he learned more about an advanced Indian civilization south of Panama from the accounts of Spanish navigator PASCUAL DE ANDAGOYA. The next year, he entered into a partnership with DIEGO DE ALMAGRO to undertake the exploration and conquest of the fabled land of Biru. Another partner was a priest named Hernando de Luque, who provided financing for the venture.

In 1524, Pizarro sailed from Panama southward along the Pacific coast of what is now Colombia to Cabo Corrientes and the San Juan River. His explorations along Colombia's Buenaventura Bay were soon curtailed when he lost two-thirds of his 80-man expedition to disease and Indian attacks.

Pizarro's losses were so great that Spanish authorities forbade his undertaking any additional explorations. Undaunted, he and Almagro continued their probings southward, and in 1526, they reached as far as the Gulf of Guayaquil on the coast of what is now southern Ecuador. A landing was soon made at the Inca town of Tumbes, where Pizarro's men saw evidence of an advanced civilization rich with gold and jewels. A further seaward reconnaissance along the coast by Pizarro's chief mariner, Bartolomeo Ruiz,

confirmed that there were greater Inca Indian cities south-east of Tumbes.

In 1528, Pizarro returned to Spain to seek royal backing for a large-scale expedition of exploration and conquest. In Toledo, he met with King Charles I (Holy Roman Emperor Charles V), to whom he presented gold and jewels from Peru; several captured Indians; several llamas, an animal that had been unknown in Europe; and samples of a silk-like cloth produced from the wool of the vicuña, a species of wild camel found in the ANDES MOUNTAINS. Coincidentally, HERNÁN CORTÉS, a distant relative of Pizarro, was visiting the Spanish royal court, reporting on his recent conquest of the Aztec Indians of Mexico. Encouraged by Cortés's success, the king agreed to sponsor Pizarro's planned expedition, naming him captain general and governor of New Castile, as the yet-to-be explored region of what is now Peru had been designated. Pizarro's partner, Almagro, who had remained behind in Panama, was given a subordinate position as commandant of Tumbes.

Along with his half brothers GONZALO PIZARRO, HERNANDO PIZARRO, Juan Pizarro, and Martín Pizarro, Pizarro returned to Panama in 1530. In January 1531, he set out by boat with a force of 180 men and 27 horses. They landed at San Mateo Bay on the coast of present-day Ecuador, and, soon afterward, they occupied the Inca Indian town of Tumbes without resistance. The Inca emperor, Atahualpa, had recently consolidated his rule by defeating his half brother Huascar in a civil war. On learning of the arrival of Pizarro and his forces, Atahualpa decided to allow the Spaniards to penetrate the interior of his realm, where they could then be easily contained. The Inca may also have mistaken the Spaniards for legendary white gods, who, according to traditional beliefs, were expected to arrive soon after the death of Atahualpa's father, which had occurred at about that time.

Pizarro was joined by additional forces at Tumbes, led by HERNANDO DE SOTO and SEBASTIÁN DE BENALCÁZAR. After establishing a base he called San Miguel, south of Tumbes, near the mouth of Peru's Piura River, he led his men along the Royal Inca Road, eastward into the Andes and the Piura Valley. Unopposed by the Inca, he crossed the Sechura Desert and proceeded through the high passes of the Western Cordillera to the central plateau region of the Andes.

On November 15, 1532, Pizarro entered the city of Cajamarca, which he found to be deserted. Nearby, the Inca ruler, Atahualpa, had encamped with 50,000 of his men. Pizarro's half brother Hernando, the only one of them of legitimate and noble birth, was sent as an emissary to Atahualpa. He presented the Inca leader with a Bible and asked him to embrace Christianity and pledge his allegiance to Charles V. On hearing that the Bible would teach him about Christ, the Inca leader reportedly held it to his ear, expecting it to speak to him; when it did not, he cast it to the

ground. This gesture was taken by the Spaniards as an insult to their faith and provided them with an excuse to launch a surprise assault on the Inca, charging them with horses and firing upon them with cannon. Thousands of the Inca were killed in the attack, and Atahualpa was taken captive. The Spaniards, numbering fewer than 200 men, suffered minimal casualties.

Atahualpa, knowing how interested Pizarro and his men were in acquiring gold, offered to ransom himself for an amount of the metal that would fill the room of the building in which he was being held (a space measuring 22 by 17 feet) to a height equal to his own. Pizarro ostensibly agreed to these terms, and during the next several months, gold was brought from all parts of the Inca Empire. Many of the objects were artistic and religious works, which were nevertheless melted down into gold bars by the Spaniards. The total amount of gold brought to rescue Atahualpa in Cajamarca amounted to 1,325 pounds.

Pizarro betrayed his word and kept Atahualpa prisoner. Atahualpa had meanwhile ordered the murder of his half brother Huascar to prevent him from forming an alliance with the Spaniards. Pizarro used this act as a pretext to try Atahualpa and condemn him to death for conspiring against the Spanish. Both de Soto and Pizarro's half brother Hernando protested against the killing of the Inca ruler, but to no avail. Although Atahualpa had been sentenced to be burned, Pizarro had him garroted after the Inca ruler agreed to embrace some measure of the Christian faith. Just prior to his death in July 1533, he reportedly uttered a curse on Pizarro and all his descendants.

On November 15, 1533, Pizarro's forces captured the Inca capital at Cuzco, seizing all its gold and enslaving many of its inhabitants. Pizarro then founded a new capital for his domain nearer to the coast, which he called Ciudad de Los Reyes (city of kings), at the mouth of the Rimac River. Established on January 18, 1535, it later came to be known as Lima (after a corruption of the name of the nearby Rimac River) and is one of the oldest capital cities in South America.

Pizarro's partner, Almagro, suppressed an Inca revolt at Cuzco in 1538, and, soon afterward, he attempted to seize control of Peru for himself. He was captured and executed by forces loyal to Pizarro.

Pizarro was made a marquis in his last years. He sent his brother Gonzalo on an expedition across the Andes to the headwaters of the AMAZON RIVER, in an expedition under FRANCISCO DE ORELLANA. In June 1541, followers of the late Almagro's half-Indian son and heir, Don Diego Almagro, assassinated Pizarro at his residence at Lima.

The high level of culture that the Inca had reached at the time of European contact facilitated Pizarro in his conquest. Specifically, their highly centralized system of roads, spanning more than 2,000 miles and connecting every part of their empire, enabled the Spaniards to subjugate rapidly

a large portion of western South America, equal in size to the eastern seaboard of the United States (with the spread of European diseases among the native population being a major factor in the conquest). The Spanish had by then realized that the Indians of the Americas were not subjects of the great powers of the Orient, as had previously been thought, and therefore could be conquered without instigating the wrath of the rulers of China and central Asia. In the subsequent years of colonial rule, the Spanish suppressed all active traces of the Inca civilization. Nevertheless, contact with the Inca had a long-ranging impact on Europe, where the sudden influx of vast quantities of gold led to severe inflation, with dire economic consequences, especially in Spain.

The tremendous wealth that Francisco Pizarro and his followers reaped in their conquest of Peru inspired the subsequent explorations of de Soto into the American Southeast and those of FRANCISCO VÁSQUEZ DE CORONADO into the American Southwest. Another of his officers, Benalcázar, went on to undertake an exploration into what is now central Colombia.

Pizarro, Gonzalo (ca. 1506–1548)

Spanish conquistador in South America, half brother of Francisco Pizarro and Hernando Pizarro

Born at Trujillo in Extremadura, Spain, Gonzalo Pizarro was the youngest of FRANCISCO PIZARRO's four half brothers. As a youth, he served with his father, a nobleman and army officer, in military campaigns in Italy during the 1520s. In 1530, he arrived in Panama with Francisco, along with HERNANDO PIZARRO, Juan Pizarro, and Martín Pizarro. Over the next four years, he served with them in the Spanish conquest of Peru.

After taking part in the suppression of the Inca uprising in 1536–37 and in the defeat of DIEGO DE ALMAGRO in 1538, Gonzalo was appointed by Francisco as governor of the northern Inca province of Quito, comprising most of present-day Ecuador.

From the Indians in the Quito region, Pizarro learned of La Canela (the land of cinnamon), located east of the ANDES MOUNTAINS, which was said to contain extensive forests of cinnamon, a spice highly prized in Europe. The Indians also reported the existence of the kingdom of EL DORADO, the fabled land of the Gilded One, where there was supposedly a lake with a bottom lined in gold and jewels. In 1540, Pizarro was authorized by Francisco to undertake an expedition eastward into the Andes to locate and conquer both these places.

Pizarro recruited about 300 Spanish adventurers, and, along with nearly 4,000 enslaved Indians, left Quito in February 1541, heading eastward into the Andes. The Spaniards took along a large herd of pigs as a mobile source of fresh food, plus a number of llamas as pack animals. They also had a pack of hunting dogs, used to terrorize the natives.

Many of the Indians died of the cold in the high altitudes of the Andes, and Pizarro's men soon ran short of supplies when most of the pigs and llamas died or ran away into the jungles beyond the eastern slopes of the mountains. At the Valley of Zumaco, Pizarro was joined by the lieutenant governor of Guayaquil, FRANCISCO DE ORELLANA, and a small contingent of Spaniards. After seven months, they reached the upper Coca River, where Pizarro located some cinnamon trees, but not in sufficient quantity to be of any commercial value. With his men facing starvation, he decided to send Orellana, whom he had named as his second in command, downriver to search for an Indian village where food could be obtained. The Spaniards constructed a brigantine-type riverboat with which to proceed farther downstream, the jungle having by that time become flooded and made impassable by the seasonal rains. On December 26, 1541, Orellana and his men left Pizarro and continued down the Coca, eventually reaching the Napo River and the AMAZON RIVER, which they followed all the way to its outlet on the Atlantic Ocean.

Meanwhile, Pizarro and his men suffered great privations in the jungle. Believing he had been deserted by Orellana, Pizarro decided to head back westward across the Andes to Quito, which they reached in June 1542. Only 80 of his 300 men had survived, and nearly all of the Indians with the expedition had perished.

On his arrival in Quito, Pizarro learned of his half brother Francisco's murder in Lima the year before. Although he had been designated by the elder Pizarro as his successor, the administration of Peru had been given to a royal viceroy, Blasco Núñez Vela, appointed by the king of Spain. During the next six years, Pizarro and his followers attempted to seize control of Peru, but they were ultimately defeated in 1548. Soon afterward, Pizarro was taken prisoner by the royal viceroy's forces and executed in Cuzco.

Gonzalo Pizarro was the first of many European explorers to seek the fabled land of El Dorado. His expedition took him across the Andes from Quito, to the western edge of the Amazon Basin, and ultimately led to the first known descent of the Amazon River and the first known crossing of the South American continent, accomplished by Orellana in 1542.

Pizarro, Hernando (ca. 1478–1578)

Spanish conquistador in South America, half brother of Francisco Pizarro and Gonzalo Pizarro

Hernando Pizarro was born at Trujillo in the Extremadura region of Spain. A half brother of FRANCISCO PIZARRO, GONZALO PIZARRO, Juan Pizarro, and Martín Pizarro, he was the only one of the five to be of legitimate birth and the only one to receive any sort of formal education. With his father, a nobleman and colonel in the Spanish army, he was part of military campaigns in Italy in 1502–03 and in the Navarre region of Spain in 1512.

In 1530, Pizarro accompanied Francisco and his other three half brothers to Panama, and soon afterward, he took part in the conquest of the Inca Empire in Peru. He returned to Spain in 1533 to present the king of Spain, Charles I (Holy Roman Emperor Charles V), with his share of the treasure obtained as ransom for the Inca ruler Atahualpa. After being received at court and knighted, Pizarro organized an expedition of his own and returned to Peru in 1535. Named governor of Cuzco, he defended that city when it was besieged by its former Inca inhabitants the following year.

In the civil war that erupted between the Pizarros and DIEGO DE ALMAGRO in 1537, Pizarro was taken prisoner. Released soon afterward, he promptly breached the terms of his parole and led his troops against Almagro, whom he captured and executed in 1538.

In 1539, Pizarro returned to Spain to answer charges against himself and his half brothers in connection with the execution of Almagro and their administration of Peru. He appeared before Charles I, to whom he presented an additional large quantity of Inca gold as a gift. Although not actually sentenced for any wrongdoing, Pizarro was nonetheless held as a prisoner until 1568. During his incarceration at the fortress of Medina del Campo in León, he was allowed a fair amount of liberty and was able to marry a niece in 1551. Upon his release, he returned to his native Trujillo, where he reportedly lived until the age of 100.

Hernando Pizarro, as the sole legitimate half brother among the Pizarros, was the only one deemed suitable to act as the official emissary to the Inca emperor Atahualpa at Cajamarca in 1532. The next year, he was one of the few Spanish officers to protest the execution of the Inca ruler when Francisco betrayed his promise to release Atahualpa and had him put to death, despite the payment of an enormous ransom in gold.

Pliny the Elder (Pliny, Gaius Plinius Secundus)

(ca. A.D. 23–79) *official, geographer in ancient Rome*

Born near Lake Como in what is now northern Italy, Pliny went to Rome as a young man and embarked on a military career in which he served as a cavalry officer in Africa and Germany. He was a friend of the Roman emperor Vespasian and of Titus, who also went on to become emperor.

Known as Pliny the Elder to distinguish him from his adopted nephew, the Roman orator and statesman Pliny the Younger, he served as a Roman government official in what is now Spain, France, and northern Italy. He was an industrious scholar as well, producing many literary works detailing information about the known world. Pliny the Elder died of asphyxiation near Mount Vesuvius during a visit to observe the volcano's eruption in A.D. 79.

The only one of Pliny's works to survive was his *Historia Naturalis*, a comprehensive study of the physical world as

Pliny the Elder (Library of Congress)

it was known in his day. Completed in 77, it includes much geographic information about the Mediterranean world, western and northern Europe, Asia, and Africa. He is known as the first writer to have referred to what is now Norway and Sweden as Scandinavia, although he depicted that region as an island, not a peninsula. Relying on secondhand sources for his accounts of Asia, he makes references to the Tigris and Euphrates Rivers, northern India, and the island of CEYLON (present-day Sri Lanka), as well as the SILK ROAD between the Black Sea and central Asia. In his descriptions of West Africa, Pliny the Elder made the earliest known reference to a great river south of the SAHARA DESERT, which he called the "Nigris," which came to be referred to as the NIGER RIVER. Pliny the Elder's geographic works, along with MARCO POLO's account of his travels to the Far East, influenced CHRISTOPHER COLUMBUS. In addition, his accounts of the interior of North and West Africa, largely unknown to Europeans until the early 19th century, inspired German explorer HEINRICH BARTH in his archaeological investigations in the Sahara during the 1850s.

Polo, Maffeo (Matteo Polo) (fl. 1260s–1290s)

Italian merchant, traveler in central Asia and the Far East, brother of Niccolò Polo, uncle of Marco Polo

Maffeo Polo was a minor Venetian nobleman and merchant. With his brothers Marco and NICCOLÒ POLO, he operated

a lucrative trade in jewels and precious stones in Constantinople (present-day Istanbul, Turkey).

In 1260, Maffeo and Niccolò sailed across the Black Sea to Soldaia in the Crimea, where the family operated a trading establishment. Unable to obtain an adequate price for the jewels they had brought from Constantinople, they headed eastward across the Crimea to the north shore of the Caspian Sea and the court of Barka Khan at Serai, near the mouth of the Volga River.

Barka Khan welcomed the Polo brothers and bought their entire stock of jewels for a price that netted them a 100 percent profit. While they were at Serai, a war broke out between Barka Khan and the khan of Persia, to the south. The conflict made a trip back across the Crimea to the Black Sea too hazardous to consider. Cut off from any homeward route, the Polo brothers headed eastward again in 1263. After a 17-day trek across the Kara-Kum desert, they arrived at the city of Bukhara in what is now Uzbekistan.

The Polo brothers remained in Bukhara, at that time a major center of the caravan trade, from 1263 to 1266. Their planned return to Italy by way of Persia (present-day Iran) and the MEDITERRANEAN SEA was still impossible because of warfare and uncertainty to the west. They then met up with a group of Tartar envoys who were on their way to visit the court of Kublai Khan—the Great Khan, ruler of the vast Mongol Empire—at his capital at Cambaluc (present-day Beijing, China). The envoys invited the Polos to travel with them eastward across China to Cambaluc, and, encouraged by the prospect of great profits to be made there, Maffeo and Niccolò agreed.

In their eastward journey across central Asia and China, the Polo brothers followed the well-established SILK ROAD. They stopped at Samarkand, crossed Turkistan, and, after skirting the northern rim of the Tarim Basin and the desert regions north of Tibet, traversed the Mongolian steppes, arriving at Cambaluc in 1266.

In Cambaluc, the Polos met with Kublai Khan, who had never seen Europeans before and was very interested in the culture of the West, especially Christianity. Since the Mongols had no strong religious institution of their own, and were continually threatened by the Islamic armies to the South, he wanted to bring Christianity to his empire, hoping it would have a unifying and civilizing effect on the Mongols, as well as the other diverse peoples he now ruled. After a year in the Chinese capital, the Polo brothers were given leave by Kublai Khan to return home. He gave them a passport, made of a large slab of gold, which ensured safe passage and hospitality as they traveled westward through his vast empire stretching from the Pacific coast of China to the Black Sea. Moreover, he made them his envoys to Pope Clement IV. He entrusted them with a letter to the pontiff requesting that 100 missionary priests be sent to China to teach his people the ways of Christianity. He also wanted some holy oil from the Church of the Holy Sepulcher in Jerusalem.

It took the Polo brothers three years to reach Europe, traveling westward to Bukhara, then southwestward across Persia and Syria to the northeastern corner of the Mediterranean. From there, they headed southward to Palestine, reaching Acre, north of Jerusalem, in April 1269. From the papal legate Teobaldo Visconti, they learned that Pope Clement IV had died the year before, and that conflicts between factions in the Church would delay the election of his successor for some time. They returned to Venice, where they remained for the next two years.

In 1271, the Polo brothers left Venice for China, accompanied by Niccolò's 17-year-old son, MARCO POLO. Even though a new pope had not yet been elected, they were eager to reestablish their contacts with the Mongol emperor. This time, the Polos remained in China until 1292, acquiring great wealth, which they carried with them in the form of jewels and precious stones sewn into their Mongol-style garments.

In his famous account of his travels, Marco Polo relates little about his father and uncle's experiences in China, because he traveled apart from them much of the time. He did mention, however, that at one point they helped design siege engines for an assault on the city of Siang Yang Fou near present-day Yangzhou. He does not describe how the Polo brothers acquired the great riches they carried back to Europe by 1295.

Maffeo and Niccolò Polo were the first Europeans to visit what is now Beijing, China. Their 1260–69 journey to the Far East marked the beginning of a century of open contacts between East and West resulting from the stabilization of the Mongol Empire.

Polo, Marco (1254–1324) *Italian traveler in central Asia and the Far East, son of Niccolò Polo, nephew of Maffeo Polo*

A native of Venice, Marco Polo was the son of NICCOLÒ POLO, a minor nobleman and merchant in jewels. Just prior to Marco's birth, his father and his uncle MAFFEO POLO had left for Constantinople (present-day Istanbul, Turkey), from where they subsequently embarked on a journey across Asia to Cathay and the court of Kublai Khan, the Great Khan, ruler of the Mongols, at Cambaluc (present-day Beijing, China). Marco's mother had died in childbirth, and he was 15 before his father returned to Venice in 1269.

In 1271, 17-year-old Polo accompanied his father and uncle on their second journey to the East. From Venice, they sailed to the east shore of the MEDITERRANEAN SEA, and at Acre, north of Jerusalem, they met with papal legate Teobaldo Visconti. He gave them a letter for Kublai Khan explaining that the delay in the election of a new pope had precluded the sending of 100 missionary priests, which the Mongol emperor had requested on the elder Polos' earlier trip to China. Soon afterward, Visconti himself was elected

Marco Polo (*Library of Congress*)

to the papacy as Pope Gregory X, and the Polos, recalled to Acre upon hearing the news, were joined there by just two Dominican friars, William of Tripoli and Nicolas of Vicenza, who planned to carry Christian learning to Kublai

Khan's domain. Not long after they had left Acre, the two priests decided not to risk the hazards of a long journey to the East, and they turned back to the Mediterranean coast. The Polos nevertheless continued eastward across

Mesopotamia to Baghdad and into Persia (present-day Iran), then went southward to Hormuz, at the mouth of the Persian Gulf, carrying with them a flask of holy oil from the Holy Sepulcher in Jerusalem for Kublai Khan.

Although the Polos had planned to continue their journey by sea, they were unable to find a boat at Hormuz on which they were willing to embark. Instead, they decided to undertake an overland journey, and, in 1272, they traversed the desert of Persia's southern Kerman region, traveling north-eastward into the mountains of Khorasan. From there, they entered northern Afghanistan, visiting the cities of Herat and Balkh, the easternmost point reached by ALEXANDER THE GREAT in his conquests 1,500 years earlier. En route to the caravan trade center at Kashgar on the Chinese frontier, the young Polo fell ill, and his father and uncle took him to the mountains of Badakhsan in northeastern Afghanistan, where they remained a year while he recovered his health.

From the mountains of northern Afghanistan, the Polos continued their journey to Cathay by following the Oxus River (the Amu Darya) northward toward Samarkand and around the northern Hindu Kush mountain range to the 15,600-foot-high Pamir Plateau, where Marco noted the effects of the high altitude and also observed a peculiar type of large wild sheep. They then traveled along the edge of the Taklimakan desert to the remote western Chinese city of Lop Nor on the edge of the GOBI DESERT.

Polo and his father and uncle crossed the desert region of northwestern China with a camel caravan. In the middle of inner Mongolia, a 40-day journey from the court of Kublai Khan, they were met by representatives of the Mongol emperor, who escorted them to the royal palace, Shangdu, northwest of Cambaluc, which they reached in 1275, after a three-and-a-half-year journey from Europe.

The Mongol emperor, much impressed by Polo, who by then was a young man of 21, appointed him to a diplomatic post. Over the next 17 years, the emperor sent Polo on missions throughout his vast empire. Adept at languages, Polo quickly mastered several Mongol dialects. His official travels took him all over China and Southeast Asia. He visited Tibet and the provinces along the YANGTZE RIVER (Chang), YELLOW RIVER (Huang He), and upper Mekong River, and he was the first known European to visit the interior of Burma and what is now Thailand and Vietnam. At one point, he undertook a seaward expedition on behalf of Kublai Khan in which he sailed to the islands of Indonesia. In the north, he visited the former Mongol capital at Karakorum in what is now modern Mongolia, and he may have journeyed into eastern SIBERIA. For three years of his stay in China, 1282 to 1285, Polo served as governor of the city of Yangchow (Yangzhou).

While Marco had been in service to the emperor, his father and uncle had become wealthy from their trading activities. By 1292, however, all three were concerned about their future in China after the death of the emperor, who

by that time was well advanced in years, and they were anxious to return to Italy. That year, they accepted an opportunity to return to the West as escorts for the Mongolian princess Cocachin, who had been betrothed to the khan of Persia, Arghun. Since warfare still raged along the overland route to Persia, it was decided to travel by sea. The Polos, provided with a 14-ship fleet, carrying combined crews of 600, sailed from the Chinese port of Zaiton (Quanzhou) and, after a long passage around Sumatra, entered the Indian Ocean by way of the Strait of Malacca. The voyage across the Indian Ocean included stops at the Nicobar and Andaman Islands, as well as a visit to CEYLON (present-day Sri Lanka).

In 1294, Polo, his father, his uncle, and the princess arrived safely in Hormuz after a two-year voyage. All but 18 of the 600 members of the expedition had perished, either in shipwrecks or from SCURVY. Since Arghun, the khan of Persia to whom Cocachin had been promised, had died a year before they arrived, she became the bride of his son and successor, Ghazan.

The Polos remained at the Persian court at Tabriz for some months, then continued their homeward trek to Trabzon on the Black Sea, from where they sailed to Constantinople (present-day Istanbul, Turkey). They then headed for Venice, arriving in late 1295, after an absence of 24 years.

In 1298, Marco took part in a naval war between Genoa and his native Venice, serving as a commander of a Venetian galley. On September 6, 1298, he was captured along with 7,000 other Venetians following a naval engagement at Curzola on the Dalmatian coast of what is now Croatia. In the Genoese prison where he was confined, Polo met a writer of romances, Rustichello (or Rusticano) of Pisa, also a prisoner of war. Polo related his experiences in the Far East to him, and Rustichello recorded them in a work that came to be known as *The Book of Ser Marco Polo, the Venetian, Concerning the Kingdoms and Marvels of the East* (also known in various editions and languages as *The Travels of Marco Polo*, *The Book of Marco Polo*, *The Book of Marvels*, *The Description of the World*, and *Il Milione*, the last referring to Marco Polo himself, "the man with a million stories").

Released after a year, Polo returned to Venice, where he married and lived the life of a wealthy merchant, dying in 1324 at the age of 70.

During the next two centuries, Marco Polo's book became the principal source of information about the Far East for medieval Europeans. Many of the places and customs he described were unknown in Europe, where contact with the Orient had been severed by the Muslim conquests five centuries earlier. His depictions of the great cities of China, with populations far exceeding any in Europe, as well as his account of the huge palaces of the Mongols and other wonders of the East, were met with skepticism. For his repeated use of the term *millions* in his expansive descriptions of the Orient, he later became known as "Marco Millions." He was

the first European to mention the use of paper, the Chinese method of printing from blocks of carved type, how coal was used as a fuel, and the Chinese practice of using paper money, all of which were unknown in Europe until that time. Many of his observations were rejected by his contemporaries as outlandish exaggerations, although his geographic descriptions of Asia were more readily accepted and were incorporated by ABRAHAM CRESQUES in his *Catalan Atlas* of 1375. In the late 1400s, CHRISTOPHER COLUMBUS, influenced by Polo's writings, grossly underestimated the distance between the west coast of Europe and the easternmost point of Asia, and, based on this determination, undertook his historic voyage in 1492. When he arrived in the WEST INDIES that year, he believed he had reached CIPANGU, as described by Marco Polo (probably referring to Japan or some other outlying islands of Asia). Parts of Burma, Southeast Asia, and western China that Marco Polo visited during his long sojourn in the Far East were not seen again by Europeans until the 19th century. The type of long-horned sheep he described in the Pamir region was later named *Ovis polii*, in his honor, by British zoologist Edward Blyth in 1840.

Polo, Niccolò (Nicolò Polo) (fl. 1260s–1290s)

Italian merchant, traveler in central Asia and the Far East, brother of Maffeo Polo, father of Marco Polo

Niccolò Polo, a Venetian merchant and minor nobleman, made two journeys to China. In his first, he and his brother MAFFEO POLO were the first Europeans to reach what is now Beijing, China (then known as Cambaluc), in 1266, after an overland journey eastward across Asia from Constantinople (present-day Istanbul, Turkey).

On a second visit to China in 1275, in which he was again joined by his brother Maffeo, as well as by his son, MARCO POLO, he remained for 17 years, and returned to Venice in 1295, after a two-year sea voyage through the islands of Indonesia and across the Indian Ocean to Persia (present-day Iran).

Although his son became known as the greatest medieval traveler to the Orient, Niccolò Polo, along with his brother, may have actually traveled over a much wider territory of central Asia. They followed a northern route around the Caspian Sea on their first voyage in 1260–66 and took a more southern route through the Hindu Kush mountain range on their second journey to the East with Marco in 1271–75. In any event, with Maffeo, Niccolò Polo was the first European known to have made a complete west-to-east crossing of Asia and an east-to-west trek back to Europe.

Ponce de León, Juan (ca. 1460–1521) *Spanish colonial official in Puerto Rico, conquistador in Florida*

Juan Ponce de León was born in Tierra de Campos in the León province of Spain (although some sources say he was born at Santervas del Campo in the province of Valladolid). As the son of a noble family, he served as a page at the Spanish royal court at Aragon. He went on to a military career, taking part in the reconquest of Spain from the Moors. In 1490, he participated in the recapture of the city of Granada.

In 1493, Ponce de León sailed with CHRISTOPHER COLUMBUS on his second voyage to the WEST INDIES. He eventually settled in the Spanish colony on Hispaniola (present-day Haiti and the Dominican Republic). In 1502, he served as a deputy to Spanish colonial governor Nicolás de Ovando, and, during the next two years, he fought the Arawak (Taino) Indians in the conquest of the eastern part of the island.

In 1508, on orders from Ovando, Ponce de León undertook an expedition to Puerto Rico, which he had visited with Columbus in 1493. Columbus had named the island San Juan de Boriquen, but, after Ponce de León reportedly discovered gold there, it became known as Puerto Rico, Spanish for “rich port.”

By 1509, the island of Puerto Rico had been subjugated by Ponce de León. That year, King Ferdinand of Spain appointed him governor of Puerto Rico, and Ponce de León established Caparra, the first Spanish settlement on Puerto Rico, near the site of what later became the city of San Juan on an offshore island.

Over the next several years, Ponce de León prospered on Puerto Rico, making his fortune in gold, slaves, and land. He heard tales from the Indians about an island to the north, called Bimini, which he was told possessed great riches. He supposedly also heard that on Bimini was a fabled FOUNTAIN OF YOUTH, the waters of which had great restorative powers, providing anyone who drank from it with the gift of perpetual youth.

In 1512, Ponce de León lost his position as governor of Puerto Rico when Diego Columbus, son of Christopher, asserted his exclusive right to make official appointments in the newly explored West Indies. To compensate for his loss, King Ferdinand commissioned Ponce de León to search for Bimini and conquer and colonize it.

Ponce de León's expedition left the port of San Germán, Puerto Rico, on March 3, 1513. His three ships, the *Santa María de la Consolación*, the *Santiago*, and the *San Cristóbal*, sailed northwestward through the Turks and Caicos Islands and into the Bahamas. On March 13, 1513, the expedition made a brief stop at the island then known as San Salvador, where Columbus possibly had made his first landing in the Americas in 1492. From there, they approached the coast of what is now Florida.

Ponce de León and some of his men landed on the Florida mainland on April 2, 1513, below the mouth of the St. Johns River, where the city of St. Augustine would be

Juan Ponce de León (Library of Congress)

founded 52 years later. (Some sources indicate Ponce de León's landing place was at what is now known as Ponce Inlet near Daytona Beach, Florida.) The next day, Easter Sunday, he officially claimed it for Spain, naming it Florida after the Spanish name for Easter—Pascua Florida.

According to some sources, Ponce de León and his ships explored the Atlantic coast as far north as the Okefenokee Swamp. In any event, soon after his initial landing on the Florida mainland, he sailed southward and made additional stops at Jupiter Inlet, where his men obtained fresh water from the Santa Cruz River. He also made a landing at what is now Cape Canaveral. After exploring Biscayne Bay, he headed into the Florida keys, then reached a group of islands he called the Dry Tortugas because of the quantity of sea turtles his men captured there. On this part of the expedition, Ponce de León made an early observation of the GULF STREAM, a current that seemed to drive his ships more forcefully than the wind.

At the time of his voyage, Ponce de León believed Florida to be an island. To confirm this, he sailed up the Gulf Coast of the Florida peninsula and made a landing at Pine Island, off the shores of Charlotte Harbor, between what is now Sarasota and Fort Myers, Florida. A Calusa Indian attack soon cut short his inland explorations.

Ponce de León continued along the west coast of Florida, possibly sailing as far north as Pensacola Bay. He

turned to the southwest and reached what he thought was the unexplored coast of Cuba (although some historians believe it was the Yucatán). From there, he returned to the southern end of Florida, explored Miami Bay and, after stopping at Cuba, returned to Puerto Rico on September 21, 1513.

The next year, Ponce de León was involved in the suppression of a revolt on Puerto Rico. In September 1514, he was named captain general of Puerto Rico. Soon afterward, he returned to Spain, where he presented an account of his explorations in Florida to King Ferdinand. The king then appointed Ponce de León *adelantado* (governor) of Florida, commissioning him to return there and establish a colony.

Ponce de León returned to the West Indies in 1517. Before undertaking a second expedition to Florida, he was involved in a military expedition against the Carib Indians of Guadeloupe and also participated in the conquest of Trinidad. In the meantime, expeditions by Spanish explorers LUCAS VÁSQUEZ DE AYLÓN and ALONSO ÁLVAREZ DE PINEDA had explored the Florida coast in 1519 and 1520, determining it was an extension of a much larger mainland.

Ponce de León's royal appointment as *adelantado* had granted him control over Florida and all lands contiguous to it. Fearing encroachment by other CONQUISTADORES, he set about organizing a new colonizing expedition. In spring 1521, with two ships carrying 200 soldiers and settlers, as well as a number of farm animals and agricultural tools and supplies, he sailed from Puerto Rico to the west coast of Florida. Ponce de León and his expedition landed on Sanibel Island in the mouth of the Caloosahatchee River, where they were soon attacked by Indians, possibly Calusa.

After Ponce de León was wounded by an Indian arrow, the attempt to colonize Florida was abandoned, and the expedition withdrew to Cuba. There, in July 1521, he died of his wounds. His remains were subsequently moved to San Juan, Puerto Rico. The city of Ponce, the second largest in Puerto Rico, was named in his honor.

Juan Ponce de León was one of the first generation of Spanish conquistadores to travel to the New World after Columbus's earlier voyages. In the course of his expedition to Florida, he unwittingly made the first recorded European exploration of what is now the mainland United States. Moreover, he founded the first settlement on Puerto Rico. His attempt to colonize Florida in 1521 was soon followed by the expeditions of PÁNFILO DE NARVÁEZ and HERNANDO DE SOTO. Almost as significant as his expedition to Florida was Ponce de León's report of the Gulf Stream, which soon was used by treasure-laden Spanish ships in their northeastward journey across the Atlantic to Europe. Two small islands of the Bahamas east of Florida were named the Bimini Islands after the mythical land.

Pond, Peter (1740–1807) *American fur trader in the Canadian Northwest*

Peter Pond was born in Milford, Connecticut, the son of a shoemaker. In 1756, he enlisted in the colonial militia and took part in the final years of the French and Indian War. In the campaign against Montreal of 1760, he was commissioned an officer.

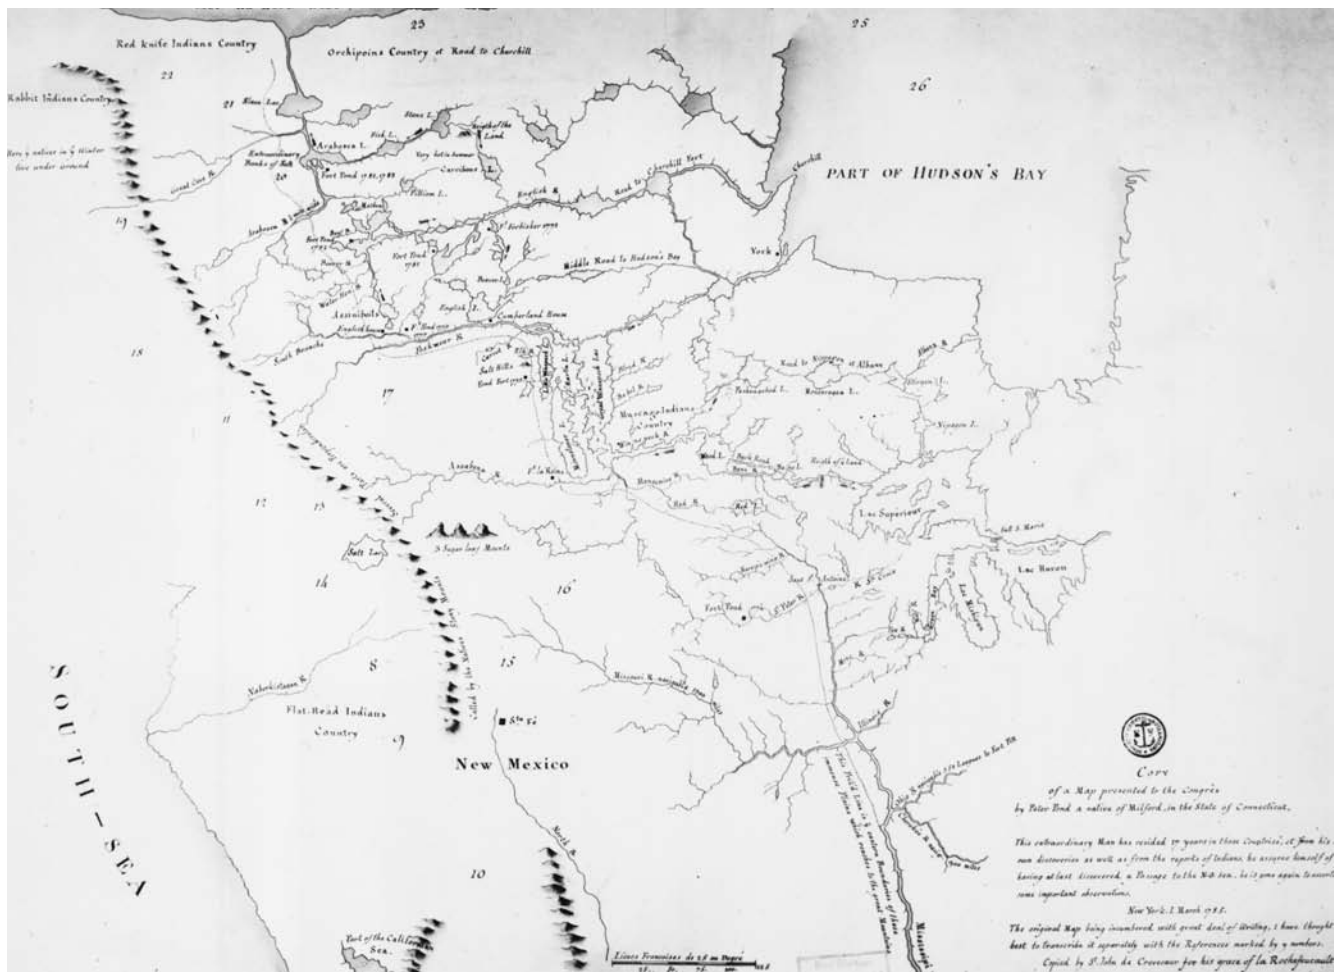

Pond left the military after the war and entered the fur trade in the Great Lakes region. From 1765 to 1771, he operated out of Detroit in present-day Michigan. During this period, he killed a man in a duel, the first in a series of violent episodes that would mark his career.

In 1772, Pond went to Mackinac, from where he undertook fur-trading expeditions into the upper MISSISSIPPI RIVER region of what is now Wisconsin and Minnesota.

Pond first traveled to western Canada in 1775. Accompanied by fellow trader ALEXANDER HENRY (the elder), he traveled to the Saskatchewan River region by way of Lake Superior, Grand Portage, and Lake Winnipeg. From there, he went on by himself to Dauphin Lake, south of Lake Winnipegosis.

In 1777, Pond entered into a partnership with Simon McTavish, the Frobisher brothers, and the McGill brothers, which eventually developed into the NORTH WEST COMPANY. That year, Pond established a trading fort on the Saskatchewan River that brought the FUR TRADE to the Indians of western Canada and cut into the monopoly of the HUDSON'S BAY COMPANY outposts to the east.

In spring 1778, Pond led a trading expedition northwest of Cumberland House on the lower Saskatchewan River. His party of 16 VOYAGEURS, traveling by CANOE, carried several tons of supplies and trade goods. In summer 1778, they reached the Methye Portage, which they crossed, becoming the first non-Indians to traverse the watershed between the rivers draining into HUDSON BAY and those emptying into the Mackenzie River Basin and the Arctic Ocean. The Methye Portage took them to the Clearwater River, which they followed into the Athabasca River. Thirty miles below the entrance to Lake Athabasca, Pond and his men established winter quarters. He traded with the Chipewyan Indians and was able to obtain twice as many fur pelts as

Map of western North America by Peter Pond (1775) (Library of Congress)

expected. He returned to the lower Saskatchewan post at Cumberland House in summer 1779.

Pond made his next trip to the Lake Athabasca region in 1780. The next year, he was caught in early winter weather and remained at Lac La Ronge. While there, he was involved in another killing, this time of a competing trader. He returned to Montreal in 1782, where he was tried and acquitted of murder. Soon afterward, he left Canada and returned to the United States.

While in the Lake Athabasca region, Pond had heard from the Indians of a river flowing eastward from the ROCKY MOUNTAINS, now known as the Peace River. He incorrectly surmised that from Lake Athabasca the distance to the Pacific Ocean was less than 400 miles. His error was based on his incorrect determination of the longitude of Lake Athabasca, which Pond placed 700 miles farther west than it really was. In 1784, the first published reports of JAMES COOK's 1778 exploration of the coast of the Pacific Northwest appeared. Based on the maps included in Cook's account, coupled with tales from the Chipewyan Indians, Pond speculated that there was a water route that linked the rivers north of Lake Athabasca with the Pacific coast of Alaska, near present-day Anchorage.

In 1785, Pond went to New York City, then the U.S. capital, where he tried to present a map of the Canadian Northwest to the U.S. Congress, in the hope of winning support for an expedition to the lucrative sea otter resources on the Alaskan coast. Failing to gain governmental support, he returned to Lake Athabasca.

From 1785 to 1788, Pond explored the Lake Athabasca region, reaching Great Slave Lake. He observed there the Mackenzie River, which seemed to flow southwestward toward the Pacific Ocean. He mistakenly concluded that this stream would link up with the Cook River, thus providing a canoe route to the sea otter trade in the Gulf of Alaska and beyond to the Kamchatka Peninsula of eastern SIBERIA.

Pond left northwestern Canada in about 1788, after another violent confrontation in which a rival trader was shot and killed. He reportedly returned to Milford, Connecticut, where he remained for the rest of his life, although other sources indicate that he returned to the upper Mississippi.

Peter Pond's 1785 map provided the first comprehensive picture of the Canadian Northwest. During his last year at Lake Athabasca, he conferred with North West Company trader and explorer ALEXANDER MACKENZIE, who, in 1789, explored Great Slave Lake and followed the river previously reached by Pond. This was the Mackenzie River, which led to the Arctic Ocean, not the Pacific. Nevertheless, several years later, Mackenzie, based on Pond's reports of the Peace River, was able to trace a canoe-and-portage route from Lake Athabasca to the Pacific coast.

Pope, John B. (1822–1892) *U.S. Army officer, American topographer in the American Southwest*

Born in Louisville, Kentucky, John B. Pope graduated from West Point in 1842. During the next four years, as a second lieutenant in the U.S. Army Corps of Topographical Engineers, he conducted government surveys of Florida as well as the northeastern part of the U.S.-Canada boundary.

During the U.S.-Mexican War of 1846–48, Pope served under General Zachary Taylor in the Texas and Mexico campaigns. After the war, Pope returned to the Topographical Corps. In 1849, he undertook a survey of the Red River of the North in the Minnesota Territory.

In 1851, Pope became chief topographical engineer for the Department of New Mexico. That year, he surveyed a route between Santa Fe, New Mexico, and Fort Leavenworth, Kansas, that was to serve as an alternative to the established Santa Fe Trail.

In February 1854, as part of the Pacific Railroad surveys, Pope led an expedition eastward from Dona Ana on the Rio Grande, across central Texas, to Fort Washita on the Red River. The expedition explored the eastern segment of the proposed 32nd parallel transcontinental railroad route, while another expedition, under the command of Lieutenant JOHN GRUBB PARKE, explored the western segment from the Rio Grande to the Pacific Ocean.

Heading eastward from the Rio Grande, Pope located a pass over western Texas's Guadalupe Mountain. He sent two small parties northward to explore the arid Llano Estacado (Staked Plain) region. The expedition reached Fort Washita by following a route that closely paralleled a well-established emigrant wagon road.

In 1855, Pope returned to western Texas, where he supervised the drilling of experimental artesian wells in the Staked Plain region to determine if the 32nd parallel route was viable for a railroad.

Pope rose to prominence as a Union commander in the early battles of the Civil War. Yet, after suffering a severe reversal at the second battle of Bull Run in 1862, he was sent to western Minnesota to help suppress the Santee Sioux (Dakota) Indian uprising. After the war, during the late 1860s, he commanded the army's vast Department of the Missouri. He retired from the army in 1886 as a major general.

John B. Pope's contribution to North American exploration is somewhat tainted by the fact that his 1849 map of Minnesota was revealed by Lieutenant HENRY LARCOM ABBOTT to be a plagiarism of JOSEPH NICOLAS NICOLLET's map of the same region, published in 1843. Nonetheless, his subsequent official account of his explorations from the Rio Grande to the Red River, included as part of the results of the Pacific Railroad surveys, widened geographic knowledge of the southern plains.

Popham, George (ca. 1550–1608) *English mariner, colonizer in the Americas*

Born at Huntsworth in Somerset, England, near Bristol, George Popham was a nephew of Sir John Popham, England's lord chief justice. In 1594–95, Popham commanded a ship of British PRIVATEERS to the WEST INDIES and the mainland of northeastern South America, where he took part in raids on Spanish ships and ports. From a captured Spanish vessel, he recovered documents detailing the interior of the region known as Guiana, which he later gave to SIR WALTER RALEIGH.

In 1606, Popham was one of the original organizers of the VIRGINIA COMPANY of Plymouth, which, with the VIRGINIA COMPANY of London, had received from King James I grants of land in what is now New England and Virginia. That year, with the help of his uncle Sir John Popham and Sir Ferdinando Gorges, he organized a colonizing expedition to North America.

On May 31, 1607, Popham sailed from Plymouth in command of the *Gift of God*, accompanied by the *Mary and John* captained by Raleigh Gilbert, a son of SIR HUMPHREY GILBERT and a nephew of Sir Walter Raleigh. The ships, carrying about 100 colonists, reached Maine in late July. After exploring along the coast, they made an initial landing on Monhegan Island on August 9, 1607. One week later, they established a colony at the mouth of the Kennebec River (then known as the Sagadahoc), near what is now Phippsburg, Maine. The settlement consisted of 15 huts and a church. Popham was elected governor of the colony, which was called Fort St. George.

Popham, Gilbert, and about 45 colonists remained in the Maine colony when the ships sailed back to England on December 5, 1607. Before long, however, a fire destroyed most of their provisions, and, on February 8, 1608, Popham died. Gilbert soon sailed for England, and, the following summer, the remaining colonists abandoned the settlement and also returned to England.

Short-lived as it was, George Popham's settlement on the Maine coast was the first English colony in New England. At the same time, a more successful settlement had been established by the London Company at Jamestown on the Virginia coast. Popham Beach, Maine, near the site of the abandoned colony, was named in his honor.

Popov, Fyodot Alekseyev (Feodot Alekseyev Popov) (fl. 1640s) *Russian trader in Siberia*

Fyodot Alekseyev Popov was a merchant from the Northern Dvina River port of Veliki Ustyug, north of Moscow and then an important trade and transportation center on the road from European Russia to SIBERIA. Popov became a pioneer Russian trader along the Arctic coast of eastern Siberia. In 1647, he organized an expedition planning to travel by sea from Nizhnekolymsk, a settlement near the

mouth of the Kolyma River, around the Chukchi Peninsula, to Anadyr Island off the Siberian coast of the Bering Sea, which had been reported as a rich source of walrus ivory.

Turned back by ice at the mouth of the Kolyma River in his first attempt, Popov set out again in 1648, accompanied by SEMYON IVANOVICH DEZHNEV, a Cossack in service to the czar. With six small boats, carrying about 90 men, he left Nizhnekolymsk and managed to travel eastward around what later came to be known as Cape Dezhnev, to the mouth of the Anadyr River and Anadyr Island. Afterward, he reportedly went south into the northern Kamchatka Peninsula.

In their 1648 voyage, Fyodot Alekseyev Popov and Dezhnev unwittingly located the northeasternmost extent of the Asian continent, a finding that eventually led Russian geographers to conclude that Asia and North America were separated by open sea.

Pordenone, Odoric of See ODORIC OF PORDENONE.

Porte, François de la (comte de Castelnau, Francis de la Porte, count of Castelnau)

(1812–1880) *French naturalist in the Americas*

François de la Porte, comte de Castelnau, was born in London, England, to French nobility. His interest in geography and the natural sciences led him to an appointment as head of an 1837 French scientific expedition to North America. During the next four years, Castelnau and his team of scientists undertook a study of the lakes of Mexico, the United States, and Canada.

In 1843, Castelnau led a French scientific team in an expedition to South America. From Rio de Janeiro, he traveled to the Río de la Plata, which he ascended in his exploration of the interior of Brazil. He then surveyed the watershed between the AMAZON RIVER and the Río de la Plata, and explored the Paraguay River, locating its source in the Mato Grosso region of western Brazil. Proceeding westward from Brazil, he became one of the few 19th-century European explorers to traverse the difficult and uninhabited Gran Chaco region. While in Brazil, he also explored the Araguaia and Tocantins Rivers. Entering Bolivia from the east, Castelnau continued on to Potosí, eventually reaching Lake Titicaca, near the Pacific coast.

Starting in 1846, Castelnau began his second great exploration of South America. From Urubamba, north of Cuzco, Peru, he traveled along the eastern slopes of the ANDES MOUNTAINS to the Urubamba and Ucayali Rivers into the Amazon. Eventually reaching the Pará River, he followed it to the Atlantic Ocean, arriving in 1847.

Comte de Castelnau's two explorations of the South American continent revealed much about the geography of the little-known area lying between the Amazon and Río de la Plata. In his second expedition of 1846–47, he made the first west-to-east crossing of South America by way of Peru and Brazil.

Porto, Antonio Silva See SILVA PORTO, ANTONIO.

Portolá, Gaspar de (ca. 1722–ca. 1784)

Spanish army officer, colonial governor in California

Gaspar de Portolá was born at Balaguer in the Catalonia region of Spain, into a noble family. While in his early teens, he entered the Spanish army as a commissioned officer, and during the next 30 years, he served in assignments in Portugal and Italy, attaining the rank of captain in 1764.

In 1767, Portolá was named governor of the Spanish-held province of California, which then comprised Mexico's Baja California as well as what is now the state of California. Two years later, on May 15, 1769, he left Velicate, the Spanish settlement in Baja California, in command of a colonizing expedition northward into present-day southern California. Accompanied by Franciscan missionary Father JUNÍPERO SERRA, Portolá led a group of 126 soldiers, colonists, and Franciscan friars, along with pack animals and a large herd of cattle, northward across several hundred miles of unexplored desert.

On July 1, 1769, after an overland trek of six weeks, Portolá and his party arrived at San Diego. They met up with another contingent of colonists there, who had arrived by ship several weeks earlier. Two weeks later, Portolá set out with a party of 40 soldiers, heading northward along California's coastal valleys and mountains, seeking the great bay that SEBASTIÁN VISCAÍNO had reported finding in 1602. Serra stayed in San Diego for the time being.

On October 1, 1769, Portolá and his party arrived at the mouth of the Salinas River on the shores of Monterey Bay, although at the time the Spaniards did not recognize it as the one Viscaíno had described. Instead, they continued to search northward. After several more weeks, a reconnaissance team reached Drakes Bay, a site already known to Spanish navigators. Soon afterward, on November 1, 1769, Portolá's scouts came upon a huge natural harbor, which one member of the expedition later described as big enough to hold the ships of all the navies of Europe. Portolá took possession of the harbor and the surrounding territory for the Spanish Crown, naming it San Francisco Bay. He then led his men southward, back to San Diego, which they reached on January 24, 1770.

After a rest at San Diego, and the arrival of a ship carrying much-needed supplies, Portolá set out again in search of

Monterey Bay. On May 24, 1770, he reached Monterey Bay a second time, and, from the height of a mountain overlooking the coast, he was able to discern that it was indeed the shape of the bay that Viscaíno had described. One week later, Portolá established the mission and presidio of San Carlos Borromeo on the shores of the bay. The next year, it was moved to the north near present-day Carmel, California.

With a permanent Spanish presence firmly established in California, Portolá returned to Mexico. In 1776, he was appointed governor of the city of Puebla, a post he held until 1784. He may have then returned to Spain, although some sources suggest he spent his last years in Mexico.

Gaspar de Portolá, along with Serra, played an important role in establishing the first European settlements in California. His overland explorations in 1769–70 resulted in the first European penetration into California's interior, and his northward route from San Diego to San Francisco later developed into the California Mission Trail. It was Portolá's landbased expedition that made the European discovery of San Francisco Bay in 1769, a find that had eluded European navigators through more than 200 years of exploration along that part of the California coast by sea, beginning with JUAN RODRÍGUEZ CABRILLO's voyage of 1542.

Pottinger, Sir Henry (1789–1856) *Irish-born*

British army officer in southwestern Asia

A native of Ireland, Henry Pottinger's military and diplomatic career began in the early 1800s with the British army in India. In 1810, Pottinger and a military surveyor, Captain CHARLES CHRISTIE, were sent from Bombay to the Baluchistan coast of what is now southern Pakistan to explore northward as far as the Afghan frontier, territory then little known to Europeans. The expedition had been spurred on by British concern that the French, under Napoléon, might get military support from Russia and Persia (present-day Iran) for an assault on India. Essential to meeting this possible challenge to British influence in southwestern Asia was updated and accurate geographic information about the territory between the Persian Gulf and western India.

Pottinger and Christie sailed from Bombay, and after landing at Karachi, they explored inland disguised as horse traders. They traversed the interior of Pakistan northward to Nushki on the Afghan border, where they separated. While Christie crossed Afghanistan to Herat, Pottinger made his way westward through the Kerman region of Persia, present-day southeastern Iran. He reached Bushehr, midway up the Persian Gulf, from where he went northward to Esfahan and rejoined Christie.

From there, Pottinger and Christie traveled northward to the city of Qazvin, where they again parted. Christie surveyed the region around Baku, west of the Caspian Sea, and

Pottinger went southward to Baghdad, then proceeded down the Euphrates River to Basra and the Persian Gulf.

In his later career, Pottinger took part in military campaigns in west-central India, and, following the consolidation of British rule there, held diplomatic positions in southern Pakistan's Sindh region. He went on to command British forces in the Far East in the Opium War of 1839–42, and, in 1843, he became the first British governor of Hong Kong. In 1846, he served as British colonial governor at the CAPE OF GOOD HOPE, returning to India the following year to become governor of Madras. Pottinger described his early travels in Persia and Pakistan in his book *Travels in Beloochistan and Sinde*, first published in 1816.

Sir Henry Pottinger and Charles Christie were among the first modern European explorers of southwestern Asia, a part of the world that had remained largely unknown to Europeans since medieval times.

Powell, John Wesley (1834–1902)

American geologist, ethnologist, explorer of the Grand Canyon
John Wesley Powell was born at Mount Morris in western New York State's Genesee Valley region. His father, who had come from England in 1830, was an exhorter for the Methodist Episcopal Church. While still young, Powell moved with his family to Jackson, Ohio, where he first studied the natural sciences as a student of naturalist George Crookham. The family subsequently moved west to Wisconsin, finally settling in Wheaton, Illinois.

Starting in 1852, Powell attended what later became Wheaton College, while supporting himself as a schoolteacher. He went on to Illinois College at Jacksonville and also studied at Oberlin College in Ohio. Powell planned to follow his father in a career as a Methodist minister, but instead embarked on a study of natural science, concentrating on geology.

From 1855 to 1858, while studying at Oberlin and Wheaton, Powell undertook solo expeditions in a small boat along the MISSISSIPPI RIVER and Ohio River.

With the onset of the Civil War in 1861, Powell enlisted in the army and received a commission as a lieutenant. He organized an artillery unit in 1862, and that year, at the battle of Shiloh, suffered a wound in which he lost the lower part of his right arm. In 1865, Powell left the army at the rank of major and became a professor of geology at Illinois Wesleyan College in Bloomington, Illinois.

In summer 1867, Powell took a group of his geology students and a party of scientists on a field trip to the Colorado ROCKY MOUNTAINS. On a second field trip the following summer, he visited the gorge of the Green River in present-day Wyoming and the Grand Canyon in present-day Arizona, which inspired him to obtain federal funding for an exploration of the COLORADO RIVER.

John Wesley Powell (Library of Congress)

On May 24, 1869, Powell's expedition of 11 men entered the Flaming Gorge of the Green River at the Union Pacific Railroad's crossing near the town of Green River, Wyoming. In four specially constructed boats, Powell and his men traveled southward through what is now eastern Utah to the Green River's confluence with the Colorado, which they descended into what is now northern Arizona. At the entrance to the Grand Canyon, three of his party decided not to continue. Powell and the remaining eight men then proceeded in boats down the rapids and through the mile-high walls.

In 1871, Powell led a government scientific expedition that explored and charted the Colorado Plateau in Utah and Arizona. Over the next four years, he undertook topographic and geological surveys of the Uinta Mountains. In 1875, he became a director of the U.S. Geological and Geographical Survey of the Territories, then went on to succeed CLARENCE KING as director of the U.S. Geological Survey in 1881.

Powell's interest in the American West also included the study of the culture of Pueblo Indians. In 1894, he became the director of the Smithsonian Institution's Bureau of American Ethnology and supervised anthropologists in studies of Indian tribes. Powell's account of his 1869 exploration of the Grand Canyon is included in his *Explorations*

of the *Colorado River of the West and Its Tributaries*, first published in 1875.

John Wesley Powell led the first successful navigation down the Colorado River through the Grand Canyon. His subsequent efforts helped promote and consolidate U.S. government-sponsored scientific explorations in the American West. His studies of topography and geology in Arizona and Utah led to his theories on the origins of the Uinta Mountains and other ranges in the West, and laid the foundation for the science of geomorphology, the branch of geology that studies the origins of the Earth's land forms.

Poyarkov, Vasily Danilovich (Vasili Poyarkov)

(fl. 1640s) *Russian Cossack in eastern Siberia*

Vasily Poyarkov was a Russian Cossack leader in service to the czarist government in eastern SIBERIA. In 1643, he was commissioned to lead a military expedition from Yakutsk in search of the Shilka (black dragon), a river thought to lead southward into China. He was also to investigate the region's mineral resources and collect taxes from the area's fur traders.

From Yakutsk, Poyarkov and his command traveled along the Lena River to its junction with the Aldan, which they followed eastward and southward to the edge of the Aldan Plateau. At the Gonam River, he established a small garrison, leaving a contingent of men, then continued southward across the mountains. He came upon the Zeya River, an uncharted tributary of the Amur.

Poyarkov and his men wintered on the Zeya, and, in spring 1644, the rest of his command arrived from the Gonam River post with fresh supplies. Soon afterward, Poyarkov led his expedition down the Zeya and reached the Amur River, near what is now the Russian city of Blagoveshchensk on the Chinese border. The Cossack leader's brutal treatment of the region's native Daurian people aroused hostility, instigating attacks in which Poyarkov lost half his force.

Poyarkov and the survivors descended the Amur in small boats; after three months, they reached its mouth on the Sea of Okhotsk. In summer 1645, following delays because of ice at the mouth of the Amur, they sailed into Sakhalin Gulf and sighted the north coast of Sakhalin Island. They followed the shore of the Sea of Okhotsk northward, eventually reaching the mouth of the Ulya River, where they encamped for the winter.

Poyarkov and his men began the last leg of their journey homeward in spring 1646, with a trip up the frozen Ulya River on skis. They eventually reached the Aldan River, which led them back to the Lena and Yakutsk by June 1646.

Vasily Poyarkov is the first European known to have descended the length of the Amur River to the Sea of Okhotsk and the Pacific. The information he brought back about the Amur River and the surrounding territory was

used by the Russian government in planning its conquest of the region in the 18th and early 19th centuries. His combined river and overland explorations took him across a vast area of southeastern Siberia.

Pribylov, Gavriilo Loginovich (Gavril Pribylov, Gerasim Pribilof) (fl. 1780s) *Russian mariner in the Bering Sea*

During the 1780s, sea captain Gavriilo Pribylov sailed the Bering Sea for a Russian fur-trading company in search of new sources of seal and sea otter fur. In 1786, two years after the establishment of the first Russian fur-trading colony in Alaska on Kodiak Island, Pribylov reached a group of four volcanic islands, approximately 230 miles north of Unalaska. Although previously sighted by earlier mariners, they had not been visited by Europeans. These islands proved to be the main breeding grounds of the Alaska fur seal, a type of eared seal, related to the California sea lion and highly prized as a source of fur.

Gavriilo Pribylov named the uninhabited islands after himself (later spelled Pribilof). Russian fur traders soon took some Aleut there to hunt the fur seals for their valuable pelts as well as for their sex glands, which were then in great demand in China, where they were believed to have rejuvenative powers. Seal hunting in the Pribilofs became so extensive in the next two decades that by 1810 the seal population there had been reduced by 90 percent. In 1868, the year after the United States took possession of the islands as part of its purchase of Alaska, the Pribilofs became a seal preserve. Nevertheless, open-sea hunting of seals migrating to the Pribilof Islands in the spring continued on a wide scale so that, by 1911, the herd was threatened with extinction. The situation changed that year, when the United States, Japan, and Russia entered into the North Pacific Sealing Convention under which the three nations agreed to prohibit open-sea seal hunting; as a result, the seal herd was gradually built up again.

Pring, Martin (fl. 1603–1606) *English mariner on the New England coast*

Martin Pring was originally from Devonshire, England. By the early 1600s, he had developed a reputation as an able navigator and sea captain. In 1603, a group of Bristol merchants commissioned a followup of BARTHOLOMEW GOSNOLD's 1602 voyage to the New England coast. The expedition was organized by English geographer RICHARD HAKLUYT and was to be headed by Pring.

In April 1603, Pring departed England in command of the ship the *Speedwell*. A smaller ship, the *Discoverer*, commanded by William Brown, was also part of the expedition. Pring followed Gosnold's route to North America, reaching the coast of Maine in June 1603. From there, he

sailed southward around Cape Cod and made a landing at what is now Edgartown on Martha's Vineyard. He proceeded along the Massachusetts coast to New Bedford, then explored the New England coast of Long Island Sound.

Pring traded with the Indians, obtaining furs and sassafras, which he sent back to England aboard the *Discoverer*. On locating a good harbor, he sent a party ashore to investigate the fertility of the soil. His men planted wheat, barley, oats, peas, and other garden vegetables. After seven weeks, the crops started to sprout, confirming earlier reports that the New England coastal region was highly suitable for an agricultural colony.

In August 1603, Martin Pring and the rest of his party sailed for England, reaching Bristol about nine weeks later. He made another voyage to the Maine coast in 1606. The success of Pring's agricultural experiment, the first such undertaking in New England, inspired the establishment of an English colony under GEORGE POPHAM on Maine's Kennebec River in 1607.

Provost, Étienne (1782–1850) *French-Canadian fur trader in the American West*

Born in Montreal, Canada, Étienne Provost arrived in St. Louis in 1815, where he entered the FUR TRADE as a trapper with AUGUSTE PIERRE CHOUTEAU. He took part in Chouteau's 1815–17 expedition up the Arkansas River into present-day Colorado. When his party wandered into Spanish-held New Mexico, he was arrested along with them and briefly jailed in Santa Fe.

Provost remained in New Mexico after Mexican independence had been won in 1821, and he undertook fur-trapping expeditions into the ROCKY MOUNTAINS north of Taos, New Mexico. He may have been with an 1823 fur-trapping expedition under JEDEDIAH STRONG SMITH that rediscovered the SOUTH PASS in what is now southern Wyoming. In 1824, Provost and a party of trappers explored the Wasatch Mountains, into the area around present-day Provo, Utah, and may have continued northward as far as the Great Salt Lake.

Indians later attacked the trappers in the Wasatch Mountains, killing several. Provost and the other survivors fled to their encampment on the Green River in northeastern Utah. In 1825, Provost joined with WILLIAM HENRY ASHLEY on the way to the first trappers' rendezvous on the Green River at Henrys Fork.

In 1837, Provost traveled with THOMAS FITZPATRICK and frontier artist ALFRED JACOB MILLER along the Oregon Trail to Fort Laramie on the Laramie River in present-day Wyoming. Two years later, in 1839, he guided JOHN CHARLES FRÉMONT and JOSEPH NICOLAS NICOLLET in their exploration of the territory between the upper MISSISSIPPI RIVER and upper MISSOURI RIVER. Then, in 1843, he

served as a guide for JOHN JAMES AUDUBON's expedition to the upper Missouri.

The city of Provo, Utah, although spelled differently, was named in honor of Étienne Provost, as were a Utah river and mountain peak. His career as a mountain man and fur trader took him across a wide area of the Rocky Mountains and brought him in contact with some of the best-known explorers of the American West.

Przhevalsky, Nikolay Mikhailovich (Nikolai Mikailovich Prejevalski, Nicholas Michailovitch Prjevalsky, Nicholas Przevalskii, Nikolai Przewalski) (1839–1888) *Russian army officer, naturalist in central Asia*

Born in the Russian town of Otradnoe, near Smolensk, west of Moscow, Nikolay Przhevalsky was of Cossack descent, born into a family of landed gentry. He attended secondary school in Smolensk; in 1855, at the age of 16, he entered the Russian army as a career military officer. He served with a Moscow-based regiment, then became a teacher of geography at the army's military academy in Warsaw.

In 1867, on volunteering for an assignment in eastern SIBERIA, Przhevalsky was sent to the frontier region along the Ussuri River on the Russia-China border, 200 miles inland from the Pacific coast. He conducted a census of the native inhabitants and took part in military actions against the gangs of marauding Chinese bandits infiltrating Russian territory from Manchuria. Przhevalsky also studied the region's natural history, and, in his subsequent report, he detailed the plant and animal life around the Ussuri River region, as well as the life and culture of its native people.

Highly impressed with Przhevalsky's account, the Russian Imperial Geographical Society agreed to sponsor his plan to conduct a series of extensive explorations into the interior of Mongolia and China. A leave of absence from the army was arranged, and in 1870 he set out on his first expedition from the southeastern Siberian city of Irkutsk, accompanied by two Russian companions. The group traveled southward around Lake Baikal to Kyakhta along Mongolia's north-central frontier, continuing on to Ulan Bator, where they obtained camels for the journey across the GOBI DESERT to Peking (Beijing) in China. Przhevalsky and his party followed the traditional caravan route across northeastern China, crossing the Great Wall at Kalgan. They completed the last leg of the trip to Peking on horseback, arriving in early 1872. From there, he assembled another camel caravan for an expedition into northern and western China.

Following the east-west caravan route, Przhevalsky reached Koko Nor, a large salt lake, and the Tsaidam Swamp (depression) in western China. By that time, he had run out of funds to continue his explorations southwestward into the Tibetan Plateau and to LHASA. He made an arduous

return journey across the Ordos desert to the Russia-Mongolia frontier at Kyakhta. On this expedition, he had traversed Mongolia from north to south, and had traveled along a wide arc through eastern, western, and southern China.

Przhevalsky's next expedition penetrated China from the west. In 1876, he set out from Kuldja (present-day Yinling, China), then a Russian-held city on China's northwestern frontier with Russia. He crossed the Tian Shan range and the Taklimakan Desert; after exploring the Tarim River Basin, he came upon Lop Nor, the dried-up bed of an immense salt lake whose location had mysteriously shifted over the last six centuries. Afterward, in an attempt to reach Tibet, he entered the previously uncharted Astin Tagh mountains. With the onset of winter in the difficult mountain terrain, he was again forced to abandon his planned trip to Lhasa, and he returned to Kuldja.

In 1879, Przhevalsky undertook another exploration of the Chinese interior from the west, starting out from Zaysan in what is now Kazakhstan. On this exploration, he explored the upper Yellow River (Huang He) region and approached the Tsaidam Swamp and Koko Nor from the west. He then traveled southward across southwestern China's Dzungaria region into Tibet. He reached within 150 miles of Lhasa, when Tibetan authorities, suspicious of all Westerners, ordered him out of the country. The next year, he returned to Russian territory.

In 1883–85, in his fourth and final expedition, Przhevalsky again crossed the Gobi Desert from northern Mongolia and traversed China westward to Koko Nor. He proceeded westward through the Kunlun and Tian Shan Mountains to Karakul, on Issyk Kul, a lake in what is now Kyrgyzstan. He had planned a fifth expedition to Tibet in 1888, but he died that year, shortly after setting out from Karakul.

Nikolay Przhevalsky is credited with making the first scientific exploration of central Asia. His expeditions were undertaken amid Russian apprehensions over possible British encroachment into central Asia from India and Afghanistan, making his reports on the region's geography politically significant as well. In his nine years of explorations, he traveled more than 20,500 miles in Mongolia, China, and Tibet, covering a vast area ranging from the edge of the Pamirs in the west, eastward to Peking, and from Mongolia southward to Tibet. Among the species new to science that he encountered were a type of wild camel, a type of wild sheep, a long-eared pheasant, and a type of wild horse, known today as Przhevalsky's horse, which in its pure-bred state is believed to be a "living ancestor" of the domestic horse. A city in the Kirghiz region where Przhevalsky died has since been named Przhevalsk in his honor. Przhevalsky's visit to Lop Nor in 1876 marked the first time a European ventured to that region since the travels of

MARCO POLO, 600 years earlier. Although he did not achieve his goal of reaching the city of Lhasa, which was then forbidden to most foreigners, he is nonetheless considered the greatest Russian explorer of central Asia. His published accounts of his travels include *From Kulja, Across the Tian Shan to Lop-Nor* (1879) and the two-volume *Mongolia, the Tangut Country and the Solitudes of Northern Tibet* (1876).

Ptolemy (Ptolemy of Alexandria; Claudius Ptolemaeus) (ca. A.D. 90–ca. A.D. 150)

Hellenized Egyptian geographer, astronomer, mathematician in ancient Alexandria, Egypt

A Hellenized Egyptian, Ptolemy was a native of Alexandria, Egypt, and a leading scholar and scientist among that city's Greek intellectual community in the second century A.D. His exact heritage is not known. He may have had Egyptian, Greek, or Roman ancestry, or a combination. He conducted studies in and wrote works on mathematics, astronomy, and geography.

From A.D. 127 to 147, Ptolemy produced an eight-volume work summarizing the geography of the known world. Known as *Geographia*, or *Introduction to the Description of the Earth*, it includes a compilation of 8,000 places, along with their coordinates of LATITUDE and LONGITUDE, with relative distances obtained from travel reports and some astronomical observations.

Like other learned Greeks of his day, Ptolemy conceived the world as spherical, although he rejected the notion that all the lands on Earth were surrounded by a great "Ocean Stream," and instead suggested that uncharted lands could be located across the unexplored seas.

Ptolemy's *Geographia* was fairly accurate about the Mediterranean region and correctly located Ireland as lying west of Britain. His northernmost point, known as ULTIMA THULE, has since been hypothesized as one of Scotland's Shetland Islands. He also mentions eastern Europe's Volga River and makes the first known reference to the Carpathian Mountains. He was also aware of the lands of western China, citing that region as the ultimate source of silk that was transported along the SILK ROAD. Much of his work was drawn from earlier Greek geographers, including Marinus of Tyre and STRABO.

Ptolemy's larger view of world geography, based more on traditional beliefs than on actual travel accounts, was far less precise. In later world maps based directly on his work, Africa is shown to be joined to eastern Asia, thus depicting the Indian Ocean as an entirely enclosed inland sea. He also believed that a great unknown landmass had to exist in the Southern Hemisphere to counterbalance the known continents of the Northern Hemisphere, an idea that later prompted European exploration of the Pacific Ocean in

Map by Ptolemy (Library of Congress)

search of the GREAT SOUTHERN CONTINENT, or Terra Australis, including the first two voyages of JAMES COOK in the early 1770s. Yet Ptolemy accurately portrayed the NILE RIVER as flowing from two large lakes in the interior, fed by snow melting off the fabled MOUNTAINS OF THE MOON. This idea, rejected by later geographers, was later proven to be true with the African expeditions of SIR HENRY MORTON STANLEY and his exploration of the Ruwenzori Mountains in the 1870s. (It is not certain, however, if Ptolemy was actually describing the Ruwenzori Range, or other peaks, such as MOUNT KILIMANJARO and Mount Kenya.) Ptolemy's work included an account of the journey across the Atlas Mountains into the northern SAHARA DESERT undertaken by the Roman officer JULIUS MATERNUS in the first century A.D.

After the decline of Roman rule in Egypt, Ptolemy's *Geographia* was preserved by Arab scholars. Translated into Arabic, it greatly influenced geographic thought in the

Muslim world throughout the medieval period. In about 1400, a copy in Greek translation was taken from Constantinople (present-day Istanbul, Turkey) to Florence, along with 27 maps, reported to be copies of originals produced under Ptolemy's direction. The *Geographia*, translated into Latin by 1410, widely circulated in Europe and greatly influenced mapmakers GERARDUS MERCATOR and ABRAHAM ORTELIUS and Italian navigator CHRISTOPHER COLUMBUS. The work detailed the principles of mapmaking, with directions for projecting a spherical image of the world onto a plane, and such now commonly followed practices as orienting a map with north at the top and east to the right, with parallels of latitude and meridians of longitude. In 1477, the first printed atlas of the world, based on Ptolemy's work, was published in Bologna. His writings, and the maps that resulted from them, helped popularize the idea among educated Europeans that the world was round. About the same time that Ptolemy's

geographic ideas were being revived in Europe, direct overland contact with Asia was severed by the conquests of the Turks; influenced by his work, geographers and navigators began to turn their attention westward in their search for a new route to the Orient. In addition to his work in geography, Ptolemy's studies in astronomy and his concept of an Earth-centered solar system dominated European thought until the findings of Copernicus in the 16th century.

Pytheas (Pytheas of Marseilles, Pytheas of Massilia, Pytheas of Masilia) (fl. 320s B.C.)

Greek scholar, mariner in the British Isles and the North Sea

Pytheas was born in the Greek colony of Massilia (present-day Marseilles, France) in the early fourth century B.C. Trained in mathematics and astronomy by Plato's student Eudoxus of Cnidus, he went on to become an accomplished navigator, and he is known to have used astronomical observations to determine the latitude of Massilia.

In about 325 B.C., Pytheas set out from Massilia on a voyage to explore westward beyond the STRAIT OF GIBRALTAR and along the west coast of Europe. At that time, Greek mariners had been prevented from venturing from the MEDITERRANEAN SEA into the Atlantic Ocean by the Carthaginians, who dominated the western Mediterranean and maintained a naval blockade of the Strait of Gibraltar. The Greeks had been further discouraged by a belief in sea monsters and other terrible hazards as reported by the Carthaginians HANNO and HIMILCO in their separate Atlantic voyages a century earlier.

Pytheas may have received backing for his expedition from the merchants of Massilia, who were keenly interested in establishing a direct sea route to tin and amber sources in northern Europe. Carthage, then engaged in a war with Rome, had temporarily left the Strait of Gibraltar unguarded, allowing Pytheas to sail along the south coast of Spain to Gades (present-day Cádiz) and into the Atlantic.

Pytheas sailed northward along the coast of Spain to Cape Ortegal, then turned northeast into the Bay of Biscay and reached the coast of Brittany, which he later accurately described as a peninsula, extending westward. From there, he crossed the English Channel and landed on the coast of Cornwall, near Land's End. He established friendly contacts with the natives, who, as tin miners, had frequent contacts with foreign traders, which, Pytheas later noted, had made them civilized and less warlike. In several inland excursions, he noted other aspects of life in southern Britain, including how alcoholic beverages were made: beer from fermented grain and mead from honey.

Pytheas next sailed northward along Britain's west coast, sighted Ireland, and rounded the north coast of Scotland. He heard reports there of an island called Thule, a six-day

sail to the north, which he believed to be the northernmost point on Earth. He made an attempt to reach Thule but was forced back by icebergs or dense, chilled fog. Pytheas later reported on the great difference between the length of day and night, indicating he may have approached the high latitudes near the ARCTIC CIRCLE, or, at the very least, reached as far north as the Shetland Islands, or the south coast of Norway near Bergen.

Pytheas completed his exploration of Britain by sailing down its east shore, reportedly completing one of the first circumnavigations of the island. He then sailed across the North Sea in search of principal sources of amber, a commodity highly prized by the Greeks for making jewelry. He entered the Baltic and sailed along its south coast as far as the mouth of the Vistula. After exploring islands in the Baltic as well as Heligoland Island at the mouth of the Elbe River, he followed the Atlantic coast of Europe back to the Mediterranean and Massilia.

Pytheas wrote an account of his voyages called *On the Ocean* (ca. 310 B.C.). Although the work did not survive long after his death, his observations were cited in the works of subsequent ancient geographers, including Polybius, STRABO, and Pliny the Elder. Strabo rejected as outright fabrications much of what Pytheas described on his northern voyage. After Pytheas's expedition, the Carthaginians again closed off the sea route to the Atlantic, and additional seaward exploration of northwestern Europe was not resumed until the Roman expedition to Britain under GAIUS JULIUS CAESAR 200 years later. In terms of trade, Pytheas revealed to the Massilian merchants that the sea route to the tin mines of Cornwall and the amber sources along the Baltic was impractical compared to the much shorter overland route across present-day France and Germany. Yet he demonstrated that the supposed terrors of the Atlantic were imaginary, probably having been invented by the Carthaginians to discourage Greek maritime expansion westward from the Mediterranean.

In addition to being known as the first Arctic explorer, Pytheas is sometimes thought of as the discoverer of Britain, making the first known reference to that island and correctly determining its shape to be triangular. His 8,000-mile voyage, considered to be the longest sea journey undertaken in ancient times, took several years. One result of his expedition was his finding that the NORTH STAR did not lie above true north. Another was his observations on the great effect the moon had on the tides along the North Atlantic coast of Europe, a phenomenon that was much less evident in the Mediterranean basin. Pytheas's report of Thule led to the image of ULTIMA THULE, a literary allusion to the most remote place on Earth. The name was given to the northwestern GREENLAND settlement founded by KNUD JOHAN VICTOR RASMUSSEN in 1910, which after World War II became the site of a major U.S. Air Force base.

Quirós, Pedro Fernández de (Pedro Fernandes de Quirós, Pedro Queiróz, Pero Fernandes de Queiros) (ca. 1565–1615) *Portuguese mariner in South Pacific, in service to Spain*

Born in the Alentejo region of southeastern Portugal (where he was known as Pero Fernandes de Queiros), Pedro Fernández de Quirós settled in Spain as a teenager, becoming a naturalized Spanish citizen and entering the maritime service of the Spanish government as a pilot and navigator.

In 1595, Quirós sailed from Peru with ÁLVARO DE MENDANA as second in command and chief pilot on an expedition in search of the Solomon Islands in the South Pacific Ocean, which Mendaña had found on a voyage in 1568. After Mendaña's death, it was Quirós, left in command, who conducted the survivors of the abandoned colony to Manila on the *San Jerónimo* in February 1596. On this voyage, many of the crew died from shortages of food and water, and conditions were compounded by the difficult Doña Isabela, Mendaña's widow, who hoarded supplies for herself and her three brothers. Quirós left the Philippines in

August 1597, sailing eastward across the Pacific to Acapulco, Mexico, where he arrived in late 1597. He returned to Spain soon afterward.

In about 1600, Quirós secured a position as tutor of geography to the son of the duke of Sessa, then Spain's ambassador to the Vatican. By that time, Quirós had become convinced that Terra Australis, or the GREAT SOUTHERN CONTINENT—the hypothetical landmass thought to occupy most of the Southern Hemisphere, as depicted on most world maps of the period—lay just south of the islands he had explored with the 1595–96 Mendaña expedition. While serving with Sessa's household in Rome, he was granted an audience with Pope Clement VIII, from whom he sought support for an expedition in search of the continent, where he intended to make Christian converts among its supposedly large population. With a letter of recommendation from the pope, he then approached King Philip III of Spain, who, in 1602, agreed to sponsor a voyage of exploration.

After numerous delays, including a shipwreck in the West Indies in 1604, Quirós arrived in Callao, Peru, from where he planned to set out on his exploration of the South Pacific Ocean. The Spanish government had provided him with provisions and three ships: the *Capitana*, which he commanded; the *Almirante*; and an unnamed launch.

Quirós and his fleet left the Peruvian port on December 21, 1605, carrying 300 men, including Spanish, Portuguese, and Flemish sailors and soldiers, as well as a number of Franciscan missionaries. He followed a more southerly course

than had Mendaña, expecting it would lead him to the mainland of Terra Australis. After a month at sea, Quirós had reached as far as 26° south latitude, where rough weather and unfavorable winds forced him to turn to the northwest. He soon came upon the Tuamotu Archipelago, and, on February 10, 1606, he landed on Anaa Island, 200 miles east of Tahiti. From there, he continued westward, and, after landing on numerous small islands in the southwestern Pacific, sighted what appeared to be the mainland of a large continent on May 1, 1606.

A landing was made two days later, in which Quirós proclaimed possession in the name of the king of Spain of all land extending southward from that point to the SOUTH POLE. Believing he had finally located the Great Southern Continent, he named it Australia del Espíritu Santo. Actually he had reached Manicolo, the largest island of the New Hebrides group. Quirós and his expedition held a religious festival on the island but made no attempt to convert the natives. A church was erected, but, after less than six weeks, he was compelled to take leave for reasons that are still not clear. Rough weather may have threatened his ships lying at anchor offshore, or his crew may have threatened mutiny. In any event, he sailed on June 8, 1606, and, although he may have planned to return to Espíritu Santo, contrary winds soon made that impossible.

Meanwhile, the other main ship in Quirós's fleet, the *Almirante*, captained by LUIS VÁEZ DE TORRES, had waited for Quirós off Espíritu Santo. When the *Capitana* failed to return after two weeks, Torres set out on his own to the west and explored the coast of New Guinea.

Quirós and the rest of the expedition headed back eastward across the Pacific along the latitude of Guam, reaching the coast of North America at Acapulco in Mexico in late November 1606. He sailed from Mexico to Madrid the following year, where he published, at his own expense, an account of his voyage. After submitting numerous proposals to the king, he was finally granted support for a new expedition to the South Pacific, but, en route to Peru, he died in Panama in 1614.

Unlike his predecessors, Mendaña and FERDINAND MAGELLAN, Pedro Fernández de Quirós encountered numerous clusters of islands in his explorations of the Pacific, including the islands in what are now known as the Cook Islands and the New Hebrides. These landfalls encouraged subsequent geographers and navigators in their belief that Terra Australis, the Great Southern Continent, still remained to be located, and influenced explorations into the Pacific well into the 18th century, including the voyages of

the Frenchman LOUIS-ANTOINE DE BOUGAINVILLE and the Englishman JAMES COOK.

Quoy, Jean-René-Constant (1790–1869)

French naturalist in Australia and the South Pacific

Jean-René-Constant Quoy was born in St. Jean de Liverasy, France, near the port city of Rochefort on the Bay of Biscay. Trained as a surgeon at Rochefort, he also studied natural history with Gaspard Vives, a veteran scientist who had sailed the South Pacific Ocean with LOUIS-ANTOINE DE BOUGAINVILLE in 1766–69.

In 1808, Quoy entered the medical service of the French navy, taking part that year in a government expedition to the WEST INDIES, as well as to the island of Reunion in the Indian Ocean. In early 1817, he was selected to serve on the *Uranie* as surgeon and zoologist in LOUIS-CLAUDE DE SAULCES DE FREYCINET's scientific voyage to Australia and the southwestern Pacific.

Quoy was assisted on this voyage by JOSEPH-PAUL GAIMARD. The *Uranie*'s scientific team also included botanist CHARLES GAUDICHAUD-BEAUPRÉ and artist JACQUES ARAGO. In the 1817–20 voyage, in which he circumnavigated the world, Quoy collected zoological specimens, which he sent back to the Paris Museum of Natural History, including a type of striped kangaroo from the islands off of Western Australia's Shark Bay and some species of sand lizards that he found near Sydney.

In 1826–29, Quoy served on another French scientific voyage to the South Pacific, sailing as a naturalist aboard the *Astrolabe*, under the command of JULES-SÉBASTIEN-CÉSAR DUMONT D'URVILLE, along with Gaimard. On this expedition, he undertook extensive zoological field research in NEW ZEALAND, where he found species of quail, plover, and dolphin unique to those islands. He also visited New Guinea, where he captured a scrub wallaby, a small kangaroo about the size of a rabbit. In the Fiji Islands, he undertook ethnological studies detailing the life and culture of the native inhabitants.

Jean-René Quoy's reports on the zoology of the South Pacific regions he had visited were first published in 1830–33. He later served as a professor of medicine at the naval school at Rochefort. Upon his return to France from his 1826–29 voyage on the *Astrolabe*, the French Academy of Sciences and the Paris Museum of Natural History credited him with bringing back a larger collection of zoological specimens than had any previous French scientific expedition.

R

Radisson, Pierre-Esprit (ca. 1630—1710)

French fur trader in the Great Lakes, upper Mississippi River region, and Hudson Bay, brother-in-law of Médard Chouart des Groseilliers

A native of France, Pierre-Esprit Radisson arrived in 1651 in French Canada, where he joined his half-sister at Trois-Rivières, Quebec, on the St. Lawrence River. A year later, he was captured and adopted by Mohawk Indians. He learned various Indian dialects while living among them for the next year and a half.

In 1653, Radisson escaped from his captors and made his way to the Dutch settlement of Fort Orange (present-day Albany, New York), where he worked as an interpreter for Dutch fur traders. In 1657, he joined a Jesuit missionary expedition to Onondaga Indian territory near present-day Syracuse, New York.

Radisson's half sister, Marguerite Hayet, was married to fur trader MÉDARD CHOUART DES GROSEILLIERS, who had explored the western Great Lakes in 1654–56. In 1659, Radisson accompanied his brother-in-law on a fur-trading expedition out of Montreal. Traveling by way of a canoe-and-portage route along the Ottawa River and Lake Nipissing to Georgian Bay on Lake Huron, they crossed to Lake Superior and followed the south shore to its western end at Chequamegon Bay, where they established Fort Radisson.

The next year, Radisson took part in further explorations of Lake Superior, reaching as far north as Lake Nipigon. He traveled the entire length of Lake Michigan and

explored what is now southern Michigan and northern Illinois. With Groseilliers, he made forays into what is now Wisconsin, as far as Sawyer County, and explored the Fox and Wisconsin Rivers. From the Native Americans, Radisson learned of a possible water route northeast of Lake Superior leading into HUDSON BAY. (He later claimed he had also made an overland journey from Lake Superior to James Bay, but it is thought he made the claim to win over British support for a fur enterprise.)

Radisson and Groseilliers eventually headed back eastward with a valuable cargo of furs. When they reached Montreal, French colonial officials confiscated their goods for unauthorized trading as COUREURS DE BOIS. Radisson and his brother-in-law headed for Boston, where they found employment with New England merchants from 1663 to 1665.

In 1665, Radisson and Groseilliers traveled to England, where, after four years, they succeeded in organizing a syndicate of merchants into the HUDSON'S BAY COMPANY. In 1668–69, Groseilliers made a trip by sea from England to Hudson Bay. Radisson, meanwhile, ran into trouble in Ireland and was forced to turn back. In 1670, Radisson again sailed to Hudson Bay from England and established a post at the mouth of the Nelson River, the first permanent settlement on the west shore of Hudson Bay in what is now northeastern Manitoba, Canada.

During the early 1670s, Radisson served as an interpreter and adviser on Indian affairs for Hudson's Bay

Pierre-Esprit Radisson and the sieur des Groseilliers with some American Indians in the North American wilderness, painting by Frederic Remington (*Library of Congress*)

Company forts. He again worked for French interests for a time, even participating in French naval attacks against the settlement at Fort Nelson as well as English posts on James Bay. By 1684, however, Radisson had returned to the Hudson's Bay Company, and he subsequently retired to England on a company pension.

Radisson's account of his explorations and exploits in North America, *Voyages of Pierre-Esprit Radisson*, was published in 1885. In it he states that he accompanied Groseilliers on a 1654 expedition to the Great Lakes, but this claim has since been discredited.

Pierre-Esprit Radisson took part in the first recorded explorations of Minnesota and Wisconsin and brought back the earliest reports from Indians of the extent of the MISSISSIPPI RIVER and MISSOURI RIVER. His descriptions of the upper Mississippi Valley were the first to cite its great potential as a region for European settlement. His efforts to bring the FUR TRADE to both the western Great Lakes tribes

and those west of Hudson Bay led to increased profits for French and English traders by enabling them to circumvent the Ottawa and Huron Indians who, as middlemen, had dominated the trade on the western St. Lawrence. He was a major force behind the creation of the Hudson's Bay Company, which would play a key role in the exploration of western Canada.

Rae, John (1813–1893) *Scottish physician and explorer in the Canadian Arctic*

John Rae was born near Stromness in northern Scotland's Orkney Islands, the son of an estate manager. At the age of 16, he entered medical school in Edinburgh, graduating four years later. Soon afterward, he obtained an appointment as ship's surgeon aboard the *Prince of Wales*, a HUDSON'S BAY COMPANY supply vessel, and he sailed to Moose Factory on lower James Bay in 1834–35.

Rae stayed on at Moose Factory as a doctor for the Hudson's Bay Company for the next eight years. He accompanied local Cree Indians into the interior on hunting expeditions, during which he became adept at wilderness travel and survival skills. His ability in this regard came to the attention of SIR GEORGE SIMPSON, the Hudson's Bay Company governor, who, in 1843, appointed Rae to survey and chart the region north of Fury and Hecla Strait, above the northernmost end of HUDSON BAY, a part of the eastern Canadian Arctic mainland not yet explored by fur traders.

In July 1846, after studying surveying and map-making in Toronto, Rae led 12 others from Churchill on the southwest shore of Hudson Bay northward aboard two small boats, the *Magnet* and the *North Pole*. At Repulse Bay, just north of Southampton Island, the expedition set up a winter base called Fort Hope, where they survived the winter by hunting and by living in Inuit-style shelters built from snow, thus becoming the first Europeans known to have used igloos.

In spring 1847, Rae undertook a series of explorations northward from Repulse Bay to the Arctic coast, during which he mapped over 600 miles of uncharted shoreline and determined the northern extent of the Boothia Peninsula. He firmly established that it was a peninsula, extending beyond 68° north latitude.

Later in 1847, Rae took part in a British government effort to locate SIR JOHN FRANKLIN and his expedition, which had been missing in the Canadian Arctic since 1845. Along with SIR JOHN RICHARDSON, Rae set out from Great Bear Lake to the Mackenzie River's delta, then followed Canada's Arctic coastline eastward. At Dolphin and Union Strait, ice conditions made it impossible to continue into Coronation Gulf, and Rae and Richardson turned back to Great Bear Lake for the winter. In spring 1849, Rae set out to search again on his own, reaching as far as Cape Krusenstern at the western end of Coronation Gulf. The next year, he crossed over to the Wollaston Peninsula and Prince Albert Sound on Victoria Island, mapping and surveying while continuing his search for Franklin. Rae surveyed Victoria Strait, separating southeastern Victoria Island from King William Island, not realizing at the time that he was less than 100 miles from Franklin's ice-bound expedition.

In 1852, the ROYAL GEOGRAPHICAL SOCIETY awarded Rae its Founder's Medal for having undertaken extensive explorations on Victoria Island. In 1853, he returned to Repulse Bay in northeastern Hudson Bay, from where he resumed his exploration of the Arctic coastline. On this 1853–54 expedition, he located the strait off the southwest coast of the Boothia Peninsula that now bears his name, and, in so doing, he established that King William Island was not connected to the mainland.

In April 1854, at Pelly Bay on Boothia's east shore, Rae learned from an Inuit man named In-Nook-Poo-Zhee-Jook that whites had been seen several years earlier, marching southward from King William Island toward the estuary of the Back River, and that all of them had eventually died of starvation and exposure. From other Inuit in the region, Rae recovered such relics as silverware inscribed with Franklin's personal crest, as well as Franklin's Order of Merit medal. Rae immediately returned to York Factory, then went on to England with his findings.

In England, Rae was awarded the £10,000 prize that had been offered for conclusive proof of the fate of Franklin and his expedition. Based on Rae's findings, the British Admiralty officially declared that Franklin and his men had perished and ended its search efforts. Yet when Rae's report on the fate of the Franklin expedition revealed that the men had resorted to cannibalism in their final days, the startling news resulted in a storm of controversy directed against Rae, who was publicly criticized for having rushed back to England to claim his monetary reward rather than carry on additional search efforts in the Back River region. Not satisfied with the results, Franklin's widow, Lady JANE FRANKLIN, decided to continue the search at her own expense, culminating in an expedition under SIR FRANCIS LEOPOLD MCCLINTOCK in 1857–59.

Rae retired from the Hudson's Bay Company in 1856; soon afterward, he went on a hunting trip to GREENLAND. He married the daughter of a British army officer in 1860. After taking part in a telegraph line survey between Winnipeg and the Pacific coast in 1864, he lived out his life in London and in his hometown on the Orkney Islands.

Underlying Dr. John Rae's great achievements in Arctic exploration was his use of the wilderness skills he had adopted from the native peoples. In his career with the Hudson's Bay Company, he is credited with having walked across 23,000 miles of Canadian wilderness territory and charting 1,500 miles of Arctic coastline. His explorations demonstrated that any NORTHWEST PASSAGE across the top of North America had to pass north of the Boothia Peninsula. From his explorations north of Repulse Bay, he proved the insularity of King William Island, and the strait separating it from the Boothia Peninsula was named Rae Strait in his honor. This channel later proved vital in the first seaward voyage through the Northwest Passage, successfully completed in 1903–06 by Norwegian explorer ROALD ENGELBREGT GRAVNING AMUNDSEN. The Rae River, which empties into western Coronation Gulf, and the Rae Isthmus, north of Repulse Bay, also bear his name. Rae's only book on his Arctic exploits, an account of his first expedition to Repulse Bay, *Narrative of an Expedition to the Shores of the Arctic Sea in 1846 and 1847*, was published in London in 1850.

Raleigh, Sir Walter (Walter Raleigh)

(ca. 1554–1618) *English colonizer in North America, explorer on the Orinoco River in South America, half brother of Sir Humphrey Gilbert*

Walter Raleigh was born at Hayes Barton in Devon, England, into an affluent and landed family. In 1569, he took part in military campaigns in France on behalf of the Huguenots. During the early 1570s, he attended Oxford University, but he did not receive a degree.

In 1578, Raleigh joined his half brother SIR HUMPHREY GILBERT in a voyage to the Americas, during which he took part in raids on Spanish shipping. Two years later, Raleigh won the favor of Queen Elizabeth I after leading English forces in suppressing a rebellion in Ireland. He was rewarded with commercial licenses and trade monopolies, and, in 1584, he was knighted. That same year, he received a royal patent to explore and colonize the region of the eastern seaboard of North America, north of the Spanish settlements in Florida.

In April 1584, Raleigh sent out two ships from Plymouth, England, commanded by Philip Amadas and Arthur Barlowe. They reached the coast of present-day North Carolina and explored the region around Pamlico Sound, naming it “Virginia” in honor of the Virgin Queen, Elizabeth I.

In 1585, Raleigh commissioned SIR RICHARD GRENVILLE to found a colony on the North Carolina coast. A fleet of seven ships carried 600 men, among them the scientist THOMAS HARRIOT and cartographer and painter JOHN WHITE. Yet, the next year, because of trouble with Roanoke Indians, the colonists returned to England with SIR FRANCIS DRAKE after a stopover by him.

In May 1587, Raleigh sent JOHN WHITE to reestablish the Roanoke Colony, this time with 150 men, women, and children. White returned to England for supplies that August, but he was delayed in his return to the settlement by the outbreak of hostilities with Spain in 1588. White finally arrived in 1590 but found no trace of the colony or the settlers. Raleigh’s men found the inscription “CROATOAN” on a tree, indicating that the colonists may have moved to a nearby island of that name, but a search turned up no trace.

In 1595, Raleigh won royal authorization for an expedition to search for the fabled kingdom of EL DORADO and its golden city of Manoa, then believed to be somewhere in northern South America. Reports by Spanish explorers DIEGO DE ORDAZ and others led Raleigh to believe that El Dorado would rival the Inca and Aztec civilizations in riches. Raleigh’s five ships sailed from Plymouth, England, for South America in February 1595. A stormy Atlantic Ocean crossing scattered the fleet, however. Raleigh arrived in Trinidad, where he soon led an attack on Spanish settlements. From the captured Spanish official ANTONIO DE BERRÍO, he obtained additional reports of El Dorado. While

in Trinidad, he visited Pitch Lake, a natural asphalt seepage, which he described in his later published account.

Raleigh’s ships regrouped at Port of Spain, Trinidad, from where they embarked on an exploration of the ORINOCO RIVER in the Guiana region. Using small boats, Raleigh led a party of 100 men up the branches of the Orinoco to its confluence with the Caroni. Along the way, they explored Lake Parime and other affluents of the Orinoco in what is now Venezuela. Tropical fever and shortages of supplies soon led Raleigh to abandon the search for El Dorado, and he headed back to the Caribbean coast by way of the Cano Macareo River. His ships then embarked for England, making stops on the Venezuelan coast and in Cuba.

In 1596, Raleigh published an account of his first South American expedition, *The Discoverie of the Beautiful Empire of Guiana, with a Relation of the Great and Golden City of Manoa . . . in the year 1595*.

By the late 1590s, Raleigh had fallen out of favor with Queen Elizabeth. Shortly after King James I came to the English throne in 1603, Raleigh was implicated in a plot against the new monarch and was imprisoned in the Tower of London under sentence of death.

Raleigh remained a prisoner until 1616, when he succeeded in convincing King James to allow him to undertake another expedition to South America in search of El Dorado. In 1617, his ships sailed to Trinidad, where Raleigh

Sir Walter Raleigh (New York State Library, Albany)

was stricken with fever. His son Walter and English courtier Lawrence Kemys went ahead to the Orinoco, in search of a gold mine. They entered Spanish-held territory and attempted to take the settlement of São Tomé, but were defeated. Raleigh's son was killed in the conflict, and Kemys committed suicide soon afterward.

Raleigh then returned to England. He had defied the king's orders not to undertake any attacks against the Spanish and had failed to find the fabled El Dorado. For these reasons, the death sentence was reinstated, and, in 1618, Raleigh was beheaded.

Sir Walter Raleigh never visited his short-lived settlement on the coast of what is now North Carolina. The fate of Roanoke, later known as the LOST COLONY, became one of the great mysteries of early colonial American history. Although he failed in his own efforts to found an English colony in North America, Raleigh did indirectly influence the success of the subsequent colony at Jamestown in Virginia, established in 1607. In the 1580s and 1590s, Raleigh was a prominent figure at the court of Queen Elizabeth I, and, as a trend-setter of his day, he popularized tobacco smoking in England. As a result, demand for tobacco soared in England, and after 1612, tobacco became Jamestown's principal export product and the basis for the colony's prosperity and survival as the first permanent English colony in what is now the United States. Raleigh's 1617 Orinoco expedition was the last organized attempt by a European power to find the legendary El Dorado.

Rasmussen, Knud Johan Victor (1879–1933)

Danish-Inuit anthropologist in Greenland and the Canadian Arctic

Knud Rasmussen was born in Jakobshavn, a Danish settlement on the west coast of GREENLAND. The son of a Danish father and an Inuit mother, he was educated in the European tradition, as well as in the ways of the Greenland Inuit.

Rasmussen's interest in the Arctic was focused on the study of the life and culture of the Inuit (Eskimo). In 1902–04, he took part in the Danish Literary Expedition under the leadership of Arctic explorer LUDWIG MYLIUS-ERICHSEN, exploring northwestern Greenland and conducting an ethnological study of the region's Inuit. It was on this expedition that Rasmussen made the first known sledge crossing of Melville Bay on Greenland's northwest coast.

From 1906 to 1908, Rasmussen continued his ethnological studies among the Inuit of northwestern Greenland, reaching native settlements as far north as Smith Sound. In 1910, he founded a permanent settlement on Greenland's northwest coast at North Star Bay, naming it Thule, after the legendary northernmost point on Earth reported by the ancient Greek navigator PYTHEAS (see ULTIMA THULE). In ad-

dition to serving as a base for future expeditions, the settlement asserted Danish sovereignty over the region, thereby ending the exploitation of the Inuit by visiting whalers.

In 1912, Rasmussen began the first of a series of explorations across the northern part of Greenland. He set out from Thule to a point north of 82° north latitude in a west-to-east crossing of Greenland. As a result of this exploration, he determined that Peary Land, the barren stretch of territory north of the Greenland ice cap, was a northern extension of the mainland, and not an island off the north coast as some geographers believed, thus disproving the existence of what was thought to be "Peary Channel."

Rasmussen's greatest Arctic expedition began in 1921. His main goal was to make a comprehensive study of the various Inuit bands living in the Arctic region between Baffin Bay and the BERING STRAIT, and to prove his hypothesis that the Inuit of Greenland and the Canadian Arctic were descended from Asian stock.

Accompanied by an Inuit couple, Knud Rasmussen embarked from Upernavik on September 7, 1921, aboard the ship *King of the Sea*. He first sailed to Denmark Island on the northwest coast of HUDSON BAY, where he established a winter base. During the next two years, he conducted ethnological studies on the life and culture of the nomadic Caribou Inuit.

In spring 1923, Rasmussen and his companions set out on their journey across the entire width of the Canadian Arctic to the Bering Sea, 1,800 miles to the west. After being held captive briefly by the Seal Inuit of the Boothia Peninsula, Rasmussen and his party continued westward to King William Island, where they came upon some skeletal remains of the ill-fated SIR JOHN FRANKLIN expedition of 1845–47. After another Arctic winter, they crossed frozen Viscount Melville Sound to Victoria Island, making the first traverse of the NORTHWEST PASSAGE's 110th meridian by dogsled. In spring 1924, they reached Point Barrow, Alaska, and soon afterward, they passed southward through the Bering Strait, arriving in Nome.

Rasmussen undertook his last Arctic expedition in 1932, traveling from Thule to southeastern Greenland and continuing his study of native peoples.

In addition to exploring much of northernmost North America and Greenland, Knud Rasmussen gathered a great wealth of ethnological data on the Inuit. His books include *The People of the Polar North* (1908), *Myths and Legends from Greenland* (1921–25), *In the Home of the Polar Eskimo* (1923), and *Greenland by the Polar Sea* (1921).

Raynolds, William Franklin (1820–1894)

U.S. Army officer on the northern plains

William F. Raynolds was a native of Canton, Ohio. He graduated from West Point in 1843 as a second lieutenant in

the Fifth Infantry. After serving in the U.S.-Mexican War of 1846–48, he was attached to the U.S. Army Corps of Topographical Engineers.

In 1859, Reynolds, now a captain, was given command of a scientific and military expedition to the upper MISSOURI RIVER and Yellowstone River. In addition to 30 soldiers, his command included geologist FERDINAND VANDEVEER HAYDEN, artist Antoine Schoenborn, and an astronomer and meteorologist. Mountain man JAMES BRIDGER was Reynolds's chief guide.

Reynolds was ordered to locate routes for wagon roads between Fort Laramie and Fort Union. He was also to seek a suitable route from Fort Laramie northwestward along the Bighorn Mountains to Fort Benton, in order to provide connections between army posts in the Dakotas and the Platte River. From Fort Benton, he was to find a link by way of the Mullan road and Fort Walla Walla and the Columbia River Basin beyond. In addition, Reynolds was instructed to explore the region between the Yellowstone country and the South Pass.

On June 28, 1859, Reynolds led his expedition westward from Fort Pierre in present-day South Dakota, along the Cheyenne River, and around the northern edge of the Black Hills. He reached the Powder River in what is now north-central Wyoming, then followed its northeastward course into present-day southern Montana. At the Yellowstone River near the mouth of the Bighorn, he divided his group. Part of the expedition explored O'Fallon Fork; Reynolds led the rest of his men southward along the Bighorn River to a trading fort on the Platte, where they rejoined the others and spent the winter.

In May 1860, Reynolds resumed his exploration, heading westward to the Wind River. He attempted to cross into the Yellowstone Park region but was forced back by spring snows and rugged terrain. After exploring the Grand Tetons near Pierre's Hole, he reached the Three Forks of the Missouri and crossed the Continental Divide. On this segment of the trek, Reynolds located and named Union Pass, the same route through the Wind River Mountains used by WILSON PRICE HUNT and the Astorians in 1811.

From the Three Forks of the Missouri, Reynolds and his party headed northward to Fort Benton in what is now north-central Montana. The expedition then traveled by riverboat to Fort Union near the mouth of the Yellowstone, from where they continued overland back to Fort Pierre, arriving on September 7, 1860.

Reynolds went on to serve in the Civil War as chief topographical engineer in the Virginia campaign. After the war, he supervised lighthouse construction and harbor improvements on the Great Lakes.

William F. Reynolds's 14-month expedition through the northern plains and upper Missouri was the final U.S. Army Topographical Survey in the West. Although he

failed to find wagon routes connecting the lower Missouri River and the Columbia River Basin, his expedition collected extensive scientific data on the last region of the American West to be explored. Most significantly, Hayden's findings in the Dakotas and Montana completed a total geological profile of the West. Reynolds's official account, *Report on the Exploration of the Yellowstone and the Country Drained by That River*, published in 1868, included extensive information on the disposition of the region's Indian tribes, and the accompanying map was used throughout the Indian wars.

Real, Gaspar Côrte See CÔRTE-REAL, GASPAR.

Real, Miguel Côrte See CÔRTE-REAL, MIGUEL.

Rebmann, Johann (Johannes Rebmann)

(1820–1876) *German missionary in East Africa*

Johann Rebmann was born in Württemberg, Germany, into a peasant family. Educated in Switzerland at the Basel Missionary Institute, he became a missionary in East Africa with the Church Missionary Society, an Anglican organization.

In 1848, Rebmann served as an assistant to JOHANN LUDWIG KRAPF at his Neu-Rabai mission near Mombasa on the Indian Ocean coast of present-day Kenya. Based on reports from native travelers, the German missionaries learned of huge mountains topped with an unknown white substance, as well as a large inland sea, in the interior of East Africa. Krapf, who was then too ill with malaria to venture inland and investigate these accounts himself, sent Rebmann to explore in his place.

Rebmann left Mombasa in April 1848, and, traveling westward in the company of Swahili and Nyika tribesmen, eventually sighted the snow-covered twin peaks of MOUNT KILIMANJARO, which at 19,340 feet is the highest mountain in Africa. Several months later, Krapf himself sighted the snow-covered mountain and also sighted Mount Kenya.

Johann Rebmann and Johann Ludwig Krapf pioneered exploration into the interior of East Africa from the Indian Ocean coast. In 1855, the London Missionary Society published a map of East Africa produced by the missionaries, based on their own explorations and the accounts they had gathered from native travelers. Their depiction of snow-topped mountains lying along the EQUATOR, plus an inland sea as large as the Caspian Sea in the interior of East Africa, was met with skepticism by British geographers and scientists. To SIR RICHARD FRANCIS BURTON and JOHN HANNING SPEKE, however, Rebmann and Krapf's description of East Africa's interior strongly suggested the existence of the fabled MOUNTAINS OF THE MOON, the ultimate

source of the NILE RIVER as recounted by ancient Greek geographer PTOLEMY. Encouraged by the missionaries' reports, Burton and Speke embarked on their 1856–59 expedition, which resulted in the European discovery of Lake Tanganyika and Lake Victoria.

Regensburg, Pethahia of See PETHAHIA OF REGENSBURG.

Ribault, Jean (Jean Ribaut) (ca. 1520–1565)

French naval officer, colonizer in Florida and South Carolina
Jean Ribault, a native of Dieppe, France, was an early Huguenot convert. He went to sea and became a prominent captain in the French navy under Admiral Gaspar de Coligny, a fellow Huguenot.

In 1562, with Coligny's support, Ribault led a colonizing expedition to the southeast coast of North America, which had previously been claimed for France by GIOVANNI DA VERRAZANO. On May 1, 1562, Ribault and his fleet of three ships, carrying 150 colonists, including the Huguenot RENÉ GOULAIN DE LAUDONNIÈRE and artist JACQUES LE MOYNE DE MORGUES, arrived off the coast of northern Florida, near the mouth of the St. Johns River. On landing, Ribault erected a stone monument and claimed the region for France.

From the St. Johns River, Ribault sailed northward into the Sea Islands off the coast of what is now Georgia and South Carolina. He explored and named Port Royal Sound, and, at a point 18 miles up the sound near present-day Paris Island, he established his Huguenot colony, naming it Charlesfort in honor of French king Charles IX. Soon afterward, Ribault returned to France for supplies.

The outbreak of religious war in France prevented Ribault's immediate return. He was forced to flee France to England in October 1562. Queen Elizabeth I proposed that he join Thomas Stukely in an English colonizing venture to Florida. When Ribault declined the offer, he was imprisoned. In the meantime, because Ribault's relief expedition had failed to arrive, the colonists had abandoned Charlesfort. In 1564, Huguenots under Laudonnière made a second attempt to establish a North American colony, founding Fort Caroline on the St. Johns River in Florida, previously explored by Ribault.

In spring 1565, Ribault and a French fleet arrived offshore from the new site. The following August a Spanish naval force under PEDRO MENÉNDEZ DE AVILÉS landed at what is now St. Augustine, Florida, 40 miles to the south. The Spanish attempted a surprise attack on the French, but Ribault and his ships were able to escape. Menéndez then led an attack on the defenseless Fort Caroline, in which he massacred most of the inhabitants. A subsequent French

counterattack was foiled by a storm at sea, which all but destroyed Ribault's fleet.

Ribault and his men came ashore near what is now Cape Canaveral, Florida. He attempted to lead his forces northward back to Fort Caroline but was intercepted by the Spanish. Menéndez then tricked Ribault and many of his men into surrendering. Taken captive, most of the French non-Catholics, including Ribault, were put to death on Menéndez's orders.

Jean Ribault's colonizing efforts in 1562 were the first attempt to establish a French settlement on the North American mainland since the expeditions of JACQUES CARTIER. In 1563, while in England, Ribault published an account of his explorations in Florida and South Carolina, entitled *The Whole and True Discovery of Terra Florida*, providing some of the earliest descriptions of the Indian tribes of the region.

Ricci, Matteo (Li Ma-tou, Li Madou) (1552–1610)
Italian missionary in India and China

A native of Italy, Matteo Ricci went to Rome at the age of 17 with plans to study law. Despite his family's protests, he decided instead on a religious career. He attended the Jesuit college, studying astronomy and mathematics under German scholar Christoph Clavius. In 1577, a chance meeting with a Jesuit priest returning from India inspired Ricci to become a missionary in the Far East.

Later that year, Ricci sailed from Genoa to Portugal, then traveled with the annual trading fleet around the CAPE OF GOOD HOPE to India and the Portuguese colony at Goa, arriving in September 1578. For the next four years, he engaged in theological studies in Goa. During that period, he visited Cochin on southwestern India's Malabar Coast.

In 1582, Ricci sailed to the Portuguese island of Macao near Canton (Guangzhou), China. After a short course of study in Chinese, he crossed over to Canton, where he was soon granted permission to establish a Christian mission in Chao-ch'ing (Zhao-Qing).

Along with a fellow Jesuit, Father Michele Ruggieri, Ricci stayed at his Chao-ch'ing mission for the next seven years, continuing his study of the Chinese language and culture and introducing the Chinese to European scientific and geographic knowledge. In 1584, he produced a translation of ABRAHAM ORTELIUS's 1570 map of the world, which demonstrated to the Chinese the position of their country in relation to continents and oceans of the West. Ricci also introduced the concept of a spherical Earth to Chinese thought.

Driven from Chao-ch'ing by townspeople suspicious of the missionaries' motives, Ricci and Ruggieri headed northward in 1591 toward the capital at Peking (Beijing), hoping to meet with the Chinese emperor Wan-Li (Wanli). Refused

time and again, they took up residence in Nanking. In 1601, they were finally invited to meet with the Chinese monarch. Ricci eventually became the official mathematician and astronomer to the court and was allowed to open a mission in Peking. He was also allowed to travel freely and was able to conduct explorations of China's interior. In 1602, Ricci produced a world map, drawing on the work of Chinese scholars, such as CHU SSU-PEN.

In 1607, Ricci sent word to Portuguese missionary BENTO DE GÔES, who was then in western China. Gôes had been sent overland from northern India to determine if the Cathay reported by MARCO POLO was the China that the Portuguese were then regularly visiting by sea. Ricci confirmed this fact, which the Portuguese traveler received just days before he died. Ricci lived in China for a total of 28 years, dying in 1610.

Known in China as Li Ma-tou, Father Matteo Ricci traveled widely in the country, sending back to Europe his reports on China. He also wrote several classic religious works in Chinese, which helped introduce Christian theological thought to China. Ricci gave the Chinese a modern geographic perspective, introducing them to the world beyond their borders. In revealing the enormous distance separating China from Europe, he helped allay the concerns the Chinese had about possible encroachment, making the country more open to foreign contacts.

Rice, Alexander Hamilton (Ham Rice)

(1875–1956) *American physician, surveyor in South America*

Born in Boston, Hamilton “Ham” Rice was a Harvard graduate and medical doctor. His interest in tropical diseases led him to embark on a career of exploration in northern South America.

In 1907, Rice traveled over the ANDES MOUNTAINS from Quito, Ecuador, to the Napo River, which he descended to its junction with the AMAZON RIVER in northeastern Peru. From there, he traveled northward across the Amazon Basin to the Uaupes River, which he explored to its confluence with the Rio Negro in northwestern Brazil.

In 1912–13, Rice undertook a survey of the northwestern Amazon Basin. From Cartagena on the Caribbean, he crossed Colombia southward to Bogota, then traversed the Andes to Villavicencio and the Ariari River region. After exploring the Içana and Inírida Rivers, he set out northward in search of the source of the ORINOCO RIVER, but he was forced to withdraw from the area because of hostile Indians.

Rice completed a topographical study of the Rio Negro to its junction with the Amazon at Manaus in 1917. Two years later, he began to explore the Casiquiare River, the natural canal that joins the eastern Rio Negro to the Orinoco and the Amazon. By 1920, he had surveyed the upper

reaches of the Rio Negro, from the Uaupes River of southwestern Colombia to the Casiquiare and the Orinoco of southern Venezuela.

Rice's most extensive survey of the northern Amazon Basin was carried out over nine months in 1924–25. He explored the Branco and Uraricoera Rivers, both northern tributaries of the Rio Negro and Amazon system in north-central Brazil. He traced the Uraricoera into the Sierra Parimá, the mountains that skirt the border between southeastern Venezuela and northwestern Brazil, then made his way overland to the upper Orinoco.

Dr. Hamilton Rice initiated 20th-century exploration in South America with his systematic survey of all the rivers draining into the northwestern Amazon Basin. In his 1924–25 expedition, he was the first to employ aircraft and wireless communication to explore large areas of South America. Using a seaplane, members of his expedition flew over 12,000 miles of unexplored territory, taking photographs from the air and communicating by radio their findings to Rice.

Richardson, James (1806–1851) *British minister, antislavery activist in North and West Africa*

James Richardson was born at Lincolnshire in eastern England. Trained as a minister, he became an evangelical preacher and was committed to the spread of Christianity to the peoples of Africa, as well as to the abolition of the African SLAVE TRADE.

Richardson became a leading member of the English Anti-Slavery Society, which sent him to Malta to prepare for his planned journey into Africa. While there, he learned Arabic and studied the geography of the interior of North and West Africa, which at that time was known by Europeans only as far as Lake Chad.

After visiting the Moroccan coast for several months, Richardson undertook his first journey into the interior of North Africa in spring 1845. He landed in Algiers, then traveled to Tripoli, from where he set out into the SAHARA DESERT. Heading southward, he made a stopover at Ghadames, and, in late October 1845, he arrived at the oasis town and former caravan center of Ghat, in present-day southwestern Libya, 600 miles south of the MEDITERRANEAN SEA. During the next several weeks, Richardson recorded his observations of the native people at Ghat and established contacts with Arab sheiks who controlled the desert lands between there and Lake Chad. Soon afterward, he traveled northward through the Fezzan region, arriving in Tripoli on April 8, 1847.

Back in England, Richardson received British foreign minister Lord Palmerston's support for another, more extensive exploration into North and West Africa. Appointed to lead a government-sponsored expedition to investigate the

little-known region around Lake Chad, Richardson also planned to establish diplomatic contacts with the Bornu kingdom in what is now northern Nigeria, as a preliminary step in stemming the slave trade in West Africa. The expedition, organized as an international effort, included German scholar and archaeologist HEINRICH BARTH and German geologist ADOLF OVERWEG, both of whom had been recruited through Prussia's ambassador to Great Britain.

Richardson was married just prior to embarking on his second Sahara expedition, and in 1850, he took his new wife to Tripoli, where she would await his return. On March 23, 1850, Richardson, accompanied by Barth and Overweg, set out from Tripoli and undertook a 14-day trek across the waterless Hamada el Homra desert to Murzuk, 500 miles to the south. Along the way, they came upon the ruins of an ancient Roman settlement.

Richardson and his companions made their way southwestward through what is now northern Niger and across the Air Mountains, reaching the southern edge of the Sahara in January 1851. Near Agades, the party decided to separate, with Richardson continuing on his own directly toward Lake Chad, while Overweg went to Maradi and Barth headed for the city of Kano. They planned to join up again at Kuka, the capital of Bornu.

Two months later, Richardson, whose health had begun to suffer as a result of the climate, was stricken with fever at Ungouratona in what is now northern Nigeria, less than two weeks' travel from Lake Chad. He died on March 4, 1851. The native villagers buried him with honors; his journals were later recovered by Barth, who sent them, along with news of his death, back to Tripoli. The year after Richardson's death, Overweg also died, and, over the next three years, Barth carried out extensive explorations of West Africa on his own.

James Richardson's *Travels in Morocco* was edited by his widow Mrs. J. E. Richardson and first published in 1860. His journey to Ghat and Ghadames was recounted in his *Travels in the Desert of Sahara, 1845–6* (1848); and his report on his last expedition, *Mission to Central Africa, 1850–1*, was published posthumously in 1853. He also wrote extensively on the language and culture of the Sahara's Tuareg people. Richardson's explorations encompassed a wide area of the western Sahara and Sudan, and his published accounts described for the first time large areas unknown to Europeans.

Richardson, Sir John (1787–1865) *Scottish physician, naturalist in the Canadian Arctic*

John Richardson was born at Dumfries in southern Scotland, the son of a local magistrate. Scottish poet Robert Burns was a friend of his family, and Richardson attended the local grammar school with Burns's eldest son.

While still in his early teens, Richardson began his medical training with an apprenticeship to his uncle, a surgeon in Dumfries. He continued his education at Edinburgh University in 1801. In 1807, after working several years at a local hospital in Dumfries, Richardson entered the British navy as an assistant surgeon. In the Napoleonic Wars of 1803–15, he saw action in the attack on Copenhagen in 1807, in the Baltic Sea in 1813, and off the southeast coast of the United States in 1815.

Richardson resumed his medical studies at Edinburgh in 1815, where he also undertook the study of botany and mineralogy, receiving his M.D. the following year. After pursuing a private practice, he returned to active naval service in 1819, appointed as surgeon and naturalist for an overland exploration of the Canadian Arctic, under the command of SIR JOHN FRANKLIN, then a naval lieutenant. As part of the British navy's newly revived efforts to find the NORTHWEST PASSAGE, the expedition planned to conduct a survey of the largely unknown Arctic coastline of North America, between HUDSON BAY and the Bering Sea.

Richardson and Franklin, along with midshipmen GEORGE BACK and ROBERT HOOD, sailed from England to York Factory on the southwest shore of Hudson Bay. From there, they traveled northwestward by way of the Nelson and Saskatchewan Rivers, and, after wintering at the fur-trading post Cumberland House in present-day northern Saskatchewan, they reached the north shore of Great Slave Lake and established a base camp. On July 14, 1821, accompanied by VOYAGEURS working for the HUDSON'S BAY COMPANY, Franklin, Richardson, Hood, and Back set out for the Coppermine River, which they descended to the Arctic coast. They then explored eastward along Coronation Gulf as far as Turnagain Point on the Kent Peninsula. On the return trip across the Barren Grounds toward Great Slave Lake, the expedition suffered from a critical shortage of food, and Richardson shot to death a voyageur named Michel who had murdered Hood and resorted to cannibalism.

After a second winter on Great Slave Lake, Richardson returned to England with Franklin and Back in October 1822. They had covered more than 5,500 miles of Canadian territory. Richardson's natural history observations were subsequently incorporated into Franklin's official narrative of the 1819–22 expedition, including studies on the aurora borealis and the fish of the Canadian Arctic.

Richardson was appointed surgeon to a British marine unit in 1824, and the following year, he was named second in command in Franklin's second expedition to the Canadian Arctic. He traveled to Great Bear Lake with Franklin, again accompanied by George Back. After wintering there in 1825–26, they set out in small boats down the Mackenzie River on June 22, 1826, reaching its delta on July 4. They separated there, with Franklin exploring the Arctic coastline

westward toward Point Barrow, Alaska, while Richardson and his party made their way eastward in two small boats. Richardson covered 2,000 miles in 10 weeks, reaching as far as the channel between Victoria Island and the mainland, west of Coronation Gulf, which he named Dolphin and Union Strait, after his contingent's two small boats.

Richardson returned to Franklin's base camp at Great Bear Lake on September 1, 1826. He then undertook a geological survey of the lake by CANOE. After another winter in the Canadian Arctic, he returned to England, by way of Cumberland House and New York, in September 1827.

Back in Edinburgh, Richardson wrote an account of his studies of the animal life he had observed in the Canadian Arctic, *Fauna Boreali-Americana*, published from 1829 to 1837. In 1847, after serving as an inspector of hospitals for the British navy, Richardson was appointed to lead the first search efforts for Franklin and his Northwest Passage expedition, which then had been missing in the Canadian Arctic for 18 months. Accompanied by JOHN RAE of the Hudson's Bay Company, he made another descent of the Mackenzie River, then searched for Franklin and his ships along Canada's Arctic coastline eastward, almost as far as the mouth of the Coppermine River. Their efforts were finally halted by impassable ice conditions in Dolphin and Union Strait. After wintering at Great Bear Lake, Richardson returned to England in 1849, while Rae continued the search.

Richardson retired from the British navy in 1855, after 48 years of service. He wrote an account of his 1847–48 expedition, *Arctic Searching Expedition, A Journal of a Boat Voyage Through Rupert's Land* (1851), which included his observations on the region's geology and native inhabitants. He also published *The Polar Regions* (1861). He was elected a member of the ROYAL SOCIETY in 1825 and knighted in 1846.

During his explorations, from the Mackenzie River's delta to the eastern end of Coronation Gulf, Sir John Richardson surveyed a wider area of North America's Arctic coastline than any explorer before him.

Riche, Claude-Antoine-Gaspard (1762–1797)

French physician, naturalist in Australia and the South Pacific

Claude Riche was born in the Beaujolais region of eastern France. While studying medicine, he also pursued an interest in botany and zoology.

In 1791, stricken with tuberculosis, Riche left his medical practice in Montpellier to join a French naval and scientific expedition to the South Pacific Ocean, hoping the long sea voyage might restore his health. He sailed from Brest on September 29, 1791, as a member of the scientific team aboard the *Espérance*, one of the two vessels in

ANTOINE-RAYMOND-JOSEPH DE BRUNI, chevalier d'Entrecasteaux's expedition in search of JEAN-FRANÇOIS DE GALAUP, comte de La Pérouse.

In April 1792, Riche, along with the other scientists on the expedition, including JACQUES-JULIEN HOUTOU DE LA BILLARDIÈRE, collected specimens of plant and animal life in the islands that d'Entrecasteaux explored off the southeast coast of TASMANIA. In December 1792, Riche and La Billardière undertook an investigation inland from what came to be known as Esperance Bay on the south coast of present-day Western Australia. It was there that Riche became separated from his companions and was lost for two days before making his way back to La Billardière and the rest of the landing party. He reported that while lost, he had encountered three giant kangaroos. Riche also participated in explorations of the New Hebrides, Friendly, Admiralty, and Santa Cruz island groups.

In February 1794, Riche and the rest of the d'Entrecasteaux expedition were detained as enemies by Dutch authorities in Batavia (present-day Jakarta). The French Revolutionary Wars had erupted the previous year, and the Netherlands had sided with the royalist cause against France. Soon afterward, Riche was permitted to embark for Île de France, where he remained for some time before returning to France, which he finally reached in 1797. His health had deteriorated and, upon his return, he went to the Monts Doré region of central France seeking a cure. He died there in September 1797.

Claude Riche's poor health and early death precluded his preparing a report of his work in the South Pacific. Nonetheless, as a member of the scientific team with the d'Entrecasteaux expedition, he took part in one of the earliest zoological and botanical investigations inland into southwestern Australia and explored a portion of Tasmania that until then had not been visited by Europeans.

Richtofen, Ferdinand Paul Wilhelm von **(baron von Richtofen)** (1833–1905)

German geologist in China

Born in the southwestern German city of Karlsruhe, Ferdinand von Richtofen became a geologist. His early scientific investigations took him into the Dolomite Alps of northern Italy and the Transylvanian Alps of central Romania.

Richtofen first traveled in the Far East as a member of a Prussian diplomatic and trade mission in 1860–62. He later lived in California for a number of years, working as a geologist.

In 1868, Richtofen arrived in Shanghai, which became his base for a series of expeditions into a wide area of eastern, central, and southern China. That year, he traveled up the YANGTZE RIVER (Chang) to Hankow (part of present-day Wuhan), about 500 miles upstream from Shanghai, then

returned downriver as far as Chengchou (Zhengzhou). From there, he headed northward into the Shan-tung (Shandong) Peninsula and continued on into Manchuria. After a visit to Peking (Beijing), he sailed down the Chinese coast back to Shanghai.

In 1869, Richthofen sailed from Shanghai to Canton (Guangzhou) on China's south coast, then set out on a south-to-north crossing of eastern China, as far north as Peking, a distance of more than 1,200 miles.

Back in Shanghai in 1870, Richthofen explored the region south of the Yangtze's mouth, then sailed northward into the Yellow Sea to Tientsin (Tianjin), from where he traveled overland to Peking. He also traveled through southern China's Szechwan (Sichuan) region and visited Shensi (Shaanxi) and Shansi (Shanxi) provinces in east-central China, while tracing the course of the Yangtze River.

Richthofen returned to Germany in 1872, where he wrote his great multivolume work on China. Known by the abbreviated title *China* and published, along with an accompanying *Atlas*, from 1875 to 1883, it included the first comprehensive, modern geographic, geological, and cultural profile of China, including a description of the region's mineral resources.

Baron Ferdinand von Richthofen went on to an academic career, which included professorships at universities in Bonn, Leipzig, and Berlin. In 1911, three more volumes of his work on China were published posthumously. Richthofen's explorations of eastern and southern China, taken together with MARIE-JOSEPH-FRANÇOIS GARNIER's earlier Mekong River explorations, helped give Europeans detailed knowledge of eastern Asia, from the Southeast Asian regions of Thailand and Vietnam as far northward as Manchuria. Richthofen's grandson was the famous World War I air ace, Baron Manfred von Richthofen, the "Red Baron."

Ride, Sally Kristen (1951–) *American astronaut, first American woman in space*

Sally Ride was born in Encino, California. She attended Westlake School for Girls in Los Angeles on a tennis scholarship. She enrolled in Swarthmore College in 1968 but dropped out to play professional tennis. She later attended Stanford University, earning a B.S. in physics and a B.A. in English in 1973 and a Ph.D. in physics in 1978. At the age of 27, she was accepted by the NATIONAL AERONAUTICS AND SPACE ADMINISTRATION (NASA) into the training program for ASTRONAUTS aboard the SPACE SHUTTLE. Her training included radio communications, navigation, working in zero gravity, parachute jumping, and water survival.

Ride served as mission control communications officer for the second and third flights of the space shuttle *Columbia* in November 1981 and in March 1982. On June

18, 1983, she became the first American woman in space on the shuttle *Challenger*, orbiting the Earth for six days. (The cosmonaut VALENTINA VLADIMIROVNA TERESHKOVA had become the first woman in space 20 years before in the VOSTOK PROGRAM of the Union of Soviet Socialist Republics.) Ride next served as a mission specialist, participating in SATELLITE launching and retrieval. She again traveled on *Challenger* on an eight-day mission in October 1984.

Ride later formed part of the presidential commission investigating the *Challenger* disaster of 1986 and also became involved in long-range planning of SPACE EXPLORATION. She left NASA in 1987 and has since been affiliated with Stanford University and the University of California at San Diego. She has dedicated herself to promoting science education, especially for girls because of a lack of women scientists and engineers. Some of her activities have been Internet-based. She has written a number of children's books about space.

As the first American woman to walk in space, Sally Ride has a special place in the history of space exploration.

Ritchie, Joseph (ca. 1788–1819) *British physician, writer in North Africa*

Joseph Ritchie was born at Otley in Yorkshire, England. The son of a local doctor, he entered the medical field himself, and, when in his early 20s, he began practicing as a hospital surgeon in York. Then, starting in 1813, he practiced at London's Lock Hospital.

While in London, Ritchie developed contacts among the literary and scientific community, which led to his meeting with the German naturalist and explorer ALEXANDER VON HUMBOLDT in Paris in 1817. Impressed by Ritchie's ability as an observer of natural phenomenon and his talent as a writer, Humboldt recommended him to the British government for its planned expedition to explore the upper NIGER RIVER region of West Africa.

Ritchie was instructed to penetrate the interior of West Africa from the north, with a crossing of the SAHARA DESERT from the Mediterranean coast at Tripoli, Libya. In September 1818, he arrived in Malta, where he was joined by British naval officer GEORGE FRANCIS LYON. They then traveled to Tripoli, where they remained for several months, during which they explored the mountains around nearby Gharyan.

On March 22, 1819, Ritchie and Lyon, disguised as Muslims, began their intended trans-Sahara trek, setting out from Tripoli for Murzuk south of the Fezzan region of southwestern Libya. Short on supplies and funds, their trip from Tripoli was fraught with difficulties, and, by the time they had reached Murzuk, Ritchie had become seriously ill. He died there on November 20, 1819, and, soon afterward,

Lyon was compelled to abandon the expedition and return to Tripoli.

While preparing for the expedition in London in 1817–18, Joseph Ritchie encountered the English Romantic poet John Keats, then 23 years old. Greatly impressed by Keats's recently published poem "Endymion," with its images alluding to the fabled MOUNTAINS OF THE MOON, Ritchie resolved to carry a copy of the work on the expedition and cast it symbolically into the sands of the Sahara. Ritchie was a poet in his own right, and just before he departed for Africa, he wrote a poem in Spenserian stanzas entitled "A Farewell to England." It was published posthumously in 1829. Ironically, Joseph Ritchie had been chosen to lead the expedition partly because of his abilities as a writer, yet he recorded no observations while en route, planning to rely on his memory afterward. Consequently, the history of the journey to Murzuk was written by Lyon, and when published in 1821, it proved to be one of the most popular narratives of African travel of that period.

Rivera y Villalón, Pedro de (ca. 1664–1744)

Spanish soldier, official in Mexico, New Mexico, and Texas

Pedro de Rivera was born in Antequera, Spain. Pursuing a career in the military, he served in the Netherlands in the late 1670s.

It is thought that Rivera had traveled to New Spain (Mexico) in the Americas by the 1690s, where he served as an engineer. He eventually reached the rank of colonel. In 1710, he was appointed governor of Tlaxcala but returned to Spain in 1714–15 to battle the French at Barcelona. Back in New Spain, he campaigned against pirates along the Yucatán Peninsula coast.

In 1724, Rivera was sent to inspect the northern defenses of New Spain. He traveled from the Gulf of California, then northward to Santa Fe in New Mexico and back southward, then east to the Gulf of Mexico in Texas, covering more than 8,000 miles until 1728. Rivera produced a written report of his inspection, and his assistant, Francisco Álvarez Barreiro (or Barreyto), drafted maps.

Rivera became governor of Veracruz in 1731 and then of Guatemala the next year. He retired in 1742 and moved to Mexico City.

Pedro de Rivera's expedition led to the most accurate maps of northern New Spain at that time. His report led to consolidation of the economy and increased defenses against Apache Indians.

Robertson, James (1742–1814) *American*

frontiersman, colonizer in North Carolina and Tennessee

Born in Brunswick County, Virginia, James Robertson had, by 1768, moved with his family into North Carolina's Yad-

kin Valley. Two years later, in fall 1770, he traveled with a hunting expedition to the Holston and Watauga Rivers in northwestern North Carolina and present-day eastern Tennessee.

Robertson took his family from Wake County, North Carolina, to the Watauga region in spring 1771. Other settlers soon followed.

Robertson played a key role in securing the lease on the Watauga region from the Cherokee Indians. Moreover, at the outbreak of Lord Dunmore's War in 1774, his diplomatic efforts ensured Cherokee neutrality.

In February 1779, Robertson left Virginia in command of a small advance party sent by the Transylvania Company to explore and settle the Cumberland River Valley of what is now Tennessee. Soon after this group had planted a crop and laid out a town, the main party of 300 settlers began to arrive, traveling through the APPALACHIAN MOUNTAINS overland through the CUMBERLAND GAP, or by riverboat along the Tennessee River and Cumberland River route. In 1780, Robertson officially organized the settlement as Nashborough, which later became Nashville, the capital of Tennessee. In March of that year, with the colony facing starvation, Robertson undertook an overland trek through the wilderness to obtain supplies at DANIEL BOONE's settlement of Boonesborough, Kentucky.

In 1784, Robertson, with the North Carolinian William Blount, organized a settlement in western Tennessee on the Chickasaw Bluffs of the MISSISSIPPI RIVER, near what is now Memphis.

Throughout the 1780s and 1790s, Robertson was active in the North Carolina legislature. He was one of the organizers of the short-lived state of Franklin, after which he helped establish the state of Tennessee. He was briefly connected with a Spanish plan to annex Tennessee, but he ultimately remained loyal to the United States.

James Robertson's explorations west of the Appalachian Mountains accelerated the rate of non-Indian settlement beyond the mid-Atlantic seaboard in the years immediately before and after the American Revolution. He is known as the "Father of Tennessee."

Roberval, Jean-François de La Roque de (sieur de Roberval) (ca. 1500–1561)

French nobleman, colonizer in North America

Jean-François de La Roque de Roberval was a member of an aristocratic family of northern France's Picardy region, the son of a diplomat and a noblewoman. During the 1520s, he served as an officer with French forces in Italy, and later he was an official in the court of King Francis I of France.

In January 1541, Roberval received a commission from the king to command a colonizing expedition to Canada's St. Lawrence River region. His appointment superseded that

of JACQUES CARTIER, who had explored the Gulf of St. Lawrence and the St. Lawrence River in his voyages of 1534 and 1535–36. Cartier remained as Roberval's second in command.

Roberval provided the financing for what was to be Cartier's third voyage to Canada, which sailed from France in spring 1541. Meanwhile, he remained in France for the next 11 months, raising additional funds through privateering raids on Portuguese and English ships in the English Channel. On April 16, 1542, Roberval sailed from La Rochelle to join Cartier, who had by then established a small settlement near what is now the city of Quebec.

On June 7, 1542, Roberval's three ships, the *Marye*, the *Sainte-Anne*, and the *Valletyne*, carrying more than 150 men and women colonists as well as a number of soldiers, arrived at St. John's Harbor on the southeast coast of Newfoundland, a place already known to European fishermen. Less than a week later, Roberval was joined by Cartier and his contingent of colonists, who, after suffering through a severe winter at the St. Lawrence River settlement, had decided to return to France. Cartier was also eager to reach France to learn if the mineral deposits he had discovered in Canada were diamonds and gold.

Despite Roberval's insistence that Cartier accompany him back to the St. Lawrence, Cartier, under cover of darkness, departed the Newfoundland anchorage and sailed for France. Roberval remained at St. John's Harbor for several more weeks, and then, resolving to carry on the colonizing effort on his own, sailed his fleet into the Gulf of St. Lawrence by way of the Strait of Belle Isle. He then ascended the St. Lawrence River to the site of Cartier's colony of Charlesbourg-Royal at the mouth of what is now the Jacques Cartier River. A better-fortified settlement was constructed on the site, which Roberval renamed France-Roy.

In September 1542, two of Roberval's ships returned to France to obtain additional provisions, as well as to find out if Cartier had indeed discovered mineral wealth, which he had not, the minerals brought back to Europe proving to be worthless mica and iron pyrites, the latter known as FOOL'S GOLD. During the next winter, 50 of the colonists died from SCURVY at France-Roy. In spring 1543, Roberval explored southwestward up the St. Lawrence in small boats, in search of a possible westward passage to the Pacific Ocean, as well as the fabled native kingdom SAGUENAY, which, according to what Cartier had learned from the Indians, was rich in gold and precious stones.

Roberval reached the Lachine Rapids near present-day Montreal, where he decided to turn back after losing a boat and eight crewmen. His chief pilot, Jean Alfonse, undertook a similar reconnaissance of the Saguenay River to the northeast, reaching almost as far as its junction with the Chicoutimi River.

By mid-summer 1543, Roberval decided to abandon his settlement, faced with the prospect of another harsh winter on the St. Lawrence and unable to locate either Saguenay or a passage to the Far East. He sailed with the surviving colonists on the one remaining vessel, arriving in France on September 11, 1543. (According to some accounts, Cartier returned to North America that year and picked up the colonists.)

Roberval continued his career as a courtier under Francis's successor, King Henry II, and engaged in several unsuccessful mining ventures. In 1561, he was killed in an outbreak of religious violence in Paris.

After Sieur de Roberval's 1542–43 expedition, France's efforts to explore and settle Canada were suspended for the next 60 years by the outbreak of religious and civil wars. The efforts were not resumed until the voyages of SAMUEL DE CHAMPLAIN in the early 1600s.

Robidoux, Antoine (Antoine Robidou)

(1794–1860) *American fur trader, interpreter in the southern Rocky Mountains*

Antoine Robidoux was born in St. Louis, Missouri, to a family of French-Canadian descent. In 1822, he was one of the first St. Louis traders to embark on the newly opened Santa Fe Trail. In 1824–25, he took part in a fur-trading expedition from Fort Atkinson, near present-day Omaha, to the Green River in what is now northern Utah.

Robidoux then took the FUR TRADE to New Mexico. In 1828, he married into a prominent New Mexico family and settled in Taos, where he became known as the "first fur trader out of Taos." Also in 1828, he established Fort Uncompahgre on the Gunnison River in what is now southwestern Colorado. In 1837, he opened Fort Uinta in northeastern Utah, a post that came to be known as the Robidoux Rendezvous.

Competition from Bent's Fort on the Arkansas River and Fort Laramie to the north, plus Ute Indian uprisings, drove Robidoux out of business by 1844. That year, JOHN CHARLES FRÉMONT and his expedition stopped at Fort Uinta.

After a short stay at St. Joseph, Missouri, which his brother Joseph Robidoux had founded in 1831, Antoine again ventured west in 1846, as an interpreter for General STEPHEN WATTS KEARNY's expedition across the Great Plains and ROCKY MOUNTAINS to New Mexico for engagement in the U.S.-Mexican War. After Kearny's conquest of Santa Fe, Robidoux continued westward into California with the American forces. He was severely wounded at the Battle of San Pascual in December 1846, and he soon retired to St. Joseph, Missouri. Eight years before his death in 1860, he was stricken with blindness.

Antoine Robidoux's five brothers (Joseph, François, Louis, Michel, and Isidore) joined him in trading ventures in the southern Rockies and southern plains. From 1832 to 1844, the Robidoux brothers dominated the trade between northern Utah and what is now southern Arizona, providing north-south supply routes for traders along both the eastern and western slopes of the Rocky Mountains.

Rodríguez, Cermeño See CERMENHO, SEBASTIÁN MELÉNDEZ RODRÍGUEZ.

Roe, Sir Thomas (Sir Thomas Rowe)

(ca. 1581–1644) *English mariner in South America, traveler, diplomat in India*

Thomas Roe was born at Low Leyton in Essex, England, into a prominent London family, his grandfather having served as that city's lord mayor. After attending Oxford's Magdalen College, Roe studied law in London, and, in about 1601, he became an official in the court of Queen Elizabeth I. After her death in 1603, he gained prominence in service to her successor, King James I, from whom he received a knighthood in 1605.

Roe's closest friend at court was the king's son, Henry, Prince of Wales, through whose influence he gained support for a voyage of exploration to the northeast coast of South America in search of gold. With financial backing from SIR WALTER RALEIGH and the earl of Southampton, Roe sailed from Plymouth in command of two vessels on February 24, 1610.

After reaching the coast of the Guianas, Roe located the mouth of the AMAZON RIVER and sailed his ships 200 miles upriver. He then explored 100 miles farther upstream in small boats, investigating the surrounding Brazilian jungle for signs of gold before returning to the river's mouth. The next year, Roe examined the coastline northward as far as the ORINOCO RIVER delta. Traveling by CANOE, he explored inland along the region's numerous rivers that emptied into the sea, including the Oyapock on the present border between French Guiana and northeastern Brazil.

In July 1611, Roe returned to England without the hoped-for riches. He reportedly made two more voyages to the lower Amazon region the following year, and he may have established a small settlement there.

Soon after Prince Henry's death in 1612, Roe left the royal court to serve as a member of the House of Commons. In 1614, he returned to the king's service, as the royal ambassador to the court of the Mogul Empire in northern India.

Roe's appointment had been instigated by the BRITISH EAST INDIA COMPANY's desire to win from Mogul emperor Jahangir the trade concessions that were vital in an effort to compete effectively with the Portuguese, the chief commer-

cial rivals of the English in India. Roe departed England with the British East India Company's fleet in February 1615, sailing aboard the *Lion*. After a voyage around the CAPE OF GOOD HOPE, with stops at the Comoro Islands in the INDIAN OCEAN and Socotra Island, south of the Arabian Peninsula, he arrived at Surat on India's western coast in September 1615. From there, he journeyed inland with a small diplomatic delegation, through Burghampur and Mandu, and, on Christmas Eve 1615, he reached the Mogul capital, Ajmer.

Roe remained at Jahangir's court for a year. He presented the emperor with such gifts as an English-style coach and two virginals (early-17th-century piano-type instruments), and he traveled with the Mogul ruler on a tour of his domain in northeastern India. Prior British attempts to enter into a commercial treaty with Jahangir had been frustrated by the emperor's general disdain for businessmen and traders, but by demonstrating that the English king was of equal stature to the Mogul emperor, Roe eventually succeeded in obtaining for British merchants the same privileges enjoyed in India by other foreign merchants.

Roe's return route was by way of Persia (present-day Iran), where he discussed matters relating to the silk trade with government officials. He arrived back in England in September 1619. After another year in Parliament, he became British ambassador to the Ottoman Empire, a post he held until 1628. He was made a member of the Order of the Garter in 1636. In the course of his later diplomatic career, he represented England at peace conferences in Europe in connection with the Thirty Years' War.

Sir Thomas Roe was the first Englishman known to have explored the Amazon. In his better-known diplomatic mission to the Mogul emperor, he laid the foundation for Great Britain's subsequent commercial foothold in the Bombay region, which eventually led to British domination of all of India. His journal of his experiences in India was published in 1625 by Samuel Purchas as part of *Hakluytus Posthumus, or Purchas His Pilgrims*. The work introduced Englishmen to the great wealth of India's Moguls, relating how he had witnessed Jahangir receive his weight in gold and jewels as tribute from his subjects. Roe remained an ardent supporter of British voyages of exploration and used his influence to help LUKE FOXE mount his 1631 expedition in search of the NORTHWEST PASSAGE. When Foxe located the stretch of water separating Southampton Island from the northwest shore of HUDSON BAY, he named it Roe's Welcome Sound.

Roerich, Nikolay Konstantinovich (Nicholas Konstantin Roerich) (1874–1947)

Russian painter, writer in central Asia

Nikolay Roerich was born in St. Petersburg; his father, Konstantin Roerich, was a prominent attorney. Showing an early

interest in art yet wanting to please his father with a career in law, he simultaneously attended the Academy of Art and St. Petersburg University. After finishing his university thesis, he traveled in Europe for a year, during which he visited museums in Berlin and Paris and began his career as a painter. On his return, he married Helena Blavatsky, a writer interested especially in spiritual themes.

Roerich and Blavatsky lived for a time in New York where they pursued their mutual interests and promoted a cross-fertilization of the arts and world religions. Roerich became secretary of a school associated with the Society for the Encouragement of Art and would later become its director, one of many such positions in the course of his life as a teacher and sponsor of the arts. In addition to working in painting and writing, he designed sets and costumes for theatrical productions. In 1923, the Nicholas Roerich Museum was founded in New York City in his honor.

Also in the 1920s, after the period of unrest during World War I and the Russian Revolution, Roerich and Blavatsky undertook a journey to India and central Asia, along with their son George Roerich, who spoke Chinese, Mongolian, Tibetan, and several Indian languages. They landed in Bombay at the end of 1923 and after meeting prominent scholars and artists, continued to the HIMALAYAS. They traveled in central Asia until 1928, visiting Chinese Turkestan, Altai, Mongolia, and Tibet. Afterward, the family made a home in the Kulu Valley of India's Himalayan foothills and founded the Urusvati Himalayan Research Institute for studies of natural science, archaeology, linguistics, and religion. Roerich wrote about the central Asian expedition in his book *Heart of Asia* and recorded scenes from it in about 500 paintings. Roerich lived in the Himalayas until his death.

Nikolay Roerich, among his many other accomplishments, furthered knowledge among Europeans of Asian culture and history. A central thesis of his work was the common cultural bond of the peoples with whom he came into contact, such as the Tibetans and nomadic people of the Russian steppes. Among Helena Roerich's works is *The Foundations of Buddhism*.

Rogers, Robert (1731–1795) *Colonial American army officer in New York and Great Lakes, seeker of the Northwest Passage*

Robert Rogers was born in Methuen, Massachusetts. As a young child, he moved with his family to the frontier region of New Hampshire, where he learned wilderness skills. While still in his teens, he served as a scout for British troops in King George's War of 1744–48.

Rogers went on to serve in the French and Indian War of 1754–63, reportedly as an alternative to imprisonment on counterfeiting charges. He led a unit of frontiersmen,

known as Rogers' Rangers, in raids against the French-allied Indians of Lake Champlain and the eastern St. Lawrence valley.

In November 1760, following the fall of Quebec and Montreal, Rogers, who had been promoted to major, was sent west to receive the surrender of the French trading posts at Detroit and Mackinac. In 1763, he took part in campaigns against the tribes of the Old Northwest in Pontiac's Rebellion, an uprising led by the Ottawa Indian of that name.

Rogers left Mackinac in 1765, amid charges of illegal trading activities. He went to London to clear his name, and while there wrote and published the book *A Concise Account of North America*. He also had a play produced, *Ponteach*, a sympathetic dramatic portrait of Pontiac.

By 1766, Rogers was back in Mackinac, after winning reappointment as a British administrator of the region's Indian trade. Based on reports by Indians and on old maps, he had long believed a water route, the much sought-after NORTHWEST PASSAGE, led to the Pacific coast from the western Great Lakes. That year, he dispatched JONATHAN CARVER and James Tute from Mackinac on explorations to Lake Superior and northern Minnesota, with instructions to expand the Mackinac trade to outlying Indian tribes and to investigate streams west and north of Lake Superior in hopes of locating the Northwest Passage. Yet, in 1768, Carver and Tute abandoned their search at Grand Portage on the north shore of Lake Superior, because Rogers failed to send the promised supplies.

Rogers was implicated in a Spanish plot to take over the British Great Lakes posts but was acquitted of any wrongdoing. He returned to England in 1769, where he was imprisoned for debt. At the outbreak of the American Revolution in 1775, he returned to America. He served briefly under George Washington but was soon arrested as a Loyalist spy. After escaping to the British, Rogers organized a unit known as the "Loyalist Rangers," but they played no significant role in the war.

Rogers left the United States for England in 1780, where he lived out his remaining years in obscurity.

The heroic exploits of Major Robert Rogers in the French and Indian War are legendary. Nevertheless, his nonmilitary career was checkered with accusations of dishonesty and malfeasance. In terms of exploration, Rogers kept alive the idea of the Northwest Passage in the years between the French and Indian War and the American Revolution. Ironically, the expedition he sponsored, undertaken by Carver and Tute in 1767–68, did reach Grand Portage, where 20 years later NORTH WEST COMPANY fur traders PETER POND and SIR ALEXANDER MACKENZIE would launch their explorations into the Canadian West and ultimately locate a river system that drained into the Pacific Ocean.

Roggeveen, Jakob (Jacob Roggeveen)*(1659–1729) Dutch mariner in the South Pacific*

Born at Middelburg in the southwestern Netherlands, Jakob Roggeveen was the son of a wine merchant. Trained in theology and law, he also acquired a fair knowledge of navigation, cartography, and the natural sciences.

In 1706, after working as a lawyer in Middelburg for a number of years, Roggeveen sailed to the EAST INDIES (present-day Indonesia), where he had been appointed to a post with the Dutch colonial administration. After nine years, he returned to the Netherlands.

In 1721, the DUTCH WEST INDIA COMPANY appointed Roggeveen commander of an expedition to the South Pacific Ocean in search of Terra Australis, the theoretical GREAT SOUTHERN CONTINENT, which European geographers believed spanned a wide area of the Southern Hemisphere.

From Amsterdam, Roggeveen, in command of a fleet of three ships, sailed to the southern tip of South America and, after passing through Le Maire Strait, continued southward beyond CAPE HORN as far as 60° south latitude. He correctly surmised that the icebergs encountered in those waters indicated a large landmass to the south.

The onset of cold weather conditions compelled Roggeveen to turn back northward before he could investigate further. Sailing west of Cape Horn, he entered the Pacific Ocean along the coast of present-day Chile. After a brief exploration of the Juan Fernandez Islands, Roggeveen and his crew made the first European visit to an island on April 5, 1722, Easter Sunday. In honor of the occasion, he named it Easter Island.

In need of fresh provisions, Roggeveen then headed westward across the Pacific toward the Dutch colonies in the EAST INDIES. Along the way, he made the European discovery of the islands of Samoa and stopped at New Britain.

After sailing along the north coast of New Guinea, Roggeveen arrived at the Dutch port of Batavia (present-day Jakarta, Indonesia). There, his ships were confiscated by officials of the DUTCH EAST INDIA COMPANY, because as an employee of the Dutch West India Company, he was considered to be trespassing in the other company's commercial domain. He was arrested but soon released and sent back to the Netherlands by way of the Cape of Good Hope, thus completing a CIRCUMNAVIGATION OF THE WORLD. He spent his remaining years in his hometown of Middelburg.

Jakob Roggeveen was the first European to report on the giant stone monuments and inscriptions on Easter Island, the origins of which still pose one of the best-known archaeological riddles. His voyage in search of Terra Australis, one of the last major explorations of the South Pacific undertaken by the Dutch, revealed that the missing Southern Continent, if it existed, had to lie even farther south than the cartographers and geographers of his day supposed.

Roggeveen is also credited with the European discovery of Samoa.

Rohlfs, Friedrich Gerhard (1831–1896)*German-born French Foreign Legionnaire in North Africa*

Gerhard Rohlfs was born in the German town of Vegesack, near Bremen. He studied medicine at Heidelberg, Würzburg, and Göttingen universities, then briefly served with the Austrian army.

Rohlfs's career as an explorer of West and North Africa began in 1855, when he enlisted in the French Foreign Legion as an assistant pharmacist and took part in French efforts to subdue the Berber tribes of the Great Kabylia region in what is now central Algeria. Over the next several years, while with the Legion in Algeria and Morocco, he became fluent in Arabic and familiar with the teachings of Islam and the culture of the native peoples of the northern SAHARA DESERT.

Rohlfs remained in North Africa after his discharge from the Foreign Legion in 1861. He was appointed physician general for the army of the sultan of Morocco and chief of sanitation for the sultan's harem.

In July 1862, Rohlfs, disguised as a Muslim doctor, set out from Tangier in an attempt to travel southward across the Sahara to TIMBUKTU. From Meknes, he made his way through central Morocco's Atlas Mountains to the Tafilet Oasis, the first European to reach it since RENÉ-AUGUSTE CAILLIÉ, nearly 40 years earlier. Wounded in an attack by bedouin tribesmen, Rohlfs was compelled to turn back, eventually reaching Rabat on the Moroccan coast.

About a year later, Rohlfs undertook a second journey into the Sahara, starting out from Agadir, Morocco. He made his way across the mountains and desert to central Algeria's Touat Oasis, becoming the first European to reach it. From there, he continued eastward to the caravan trade center in In-Salah, then turned northeastward into present-day Libya, stopping at Ghadames before arriving at Tripoli.

In his next expedition, Rohlfs departed Tripoli in 1865, and, after traveling to Murzuk in southern Libya, he crossed the Sahara Desert to Lake Chad and the Bornu Kingdom of what is now northern Nigeria. He examined Lake Chad for a possible connection with the NIGER RIVER, then traveled down the Benue River to its junction with the Niger, which he descended to its outlet in the Gulf of Guinea.

In 1867–68, Rohlfs explored the Abyssinian Highlands of Ethiopia. In 1874, he returned to Tripoli to begin a series of expeditions, at times accompanied by GEORG AUGUST SCHWEINFURTH. He explored eastward toward Alexandria, Egypt, visiting the Siwa Oasis in northwestern Egypt as well as the little-known Kufra Oasis in southeastern Libya, which he reached in 1878. Later that year, Rohlfs led a German

government-sponsored expedition into the Wadai region of what is now southeastern Chad.

Rohlfs was back in Ethiopia in 1880–81, where he explored from Massawa on the RED SEA coast inland to the upper reaches of the Blue Nile River. In 1885, he began a brief term as German consul at Zanzibar on the Indian Ocean coast of central Africa. He later retired to Godesberg, Germany.

Gerhard Rohlfs was the first European to complete a north-to-south crossing of the entire bulge of West Africa, from the Mediterranean coast to the Gulf of Guinea. Great Britain's ROYAL GEOGRAPHICAL SOCIETY, in recognition of this accomplishment, awarded him its Patron's Medal in 1868. In the course of his 30 years in Africa, Rohlfs spent more than 16 years engaged in exploration. He covered a vast area of the continent, ranging from Tangier and Tripoli southward to Lagos on the Gulf of Guinea, and from the Niger River eastward to the upper reaches of the Blue Nile in Ethiopia.

Rose, Edward (Nez Coupé, Cut Nose, Five Scalps) (ca. 1775–ca. 1832) *American interpreter, guide in the northern Rocky Mountains*

Details of Edward Rose's life before 1807 are sketchy. He was the son of a non-Indian trader to the Cherokee Indians, and his mother was part African American and part Cherokee. He may have spent some years as a river pirate with Jean Lafitte on the MISSISSIPPI RIVER between southern Illinois and New Orleans.

In 1807, Rose was an interpreter for MANUEL LISA's fur-trading expedition to the Bighorn River region of present-day Montana. While there, he settled among the Crow Indians and became a chief. By that time, Rose was known by the Indians as Nez Coupé or Cut Nose, because a piece of his nose had been bitten off in a brawl. Later in his career, he would be known as Five Scalps, after a reported fight in which he killed five Blackfoot warriors. Two years later, in 1809, Rose was an interpreter for Lisa and his partner ANDREW HENRY in their dealings with the Arikara Indians at their Knife River post in what is now North Dakota.

In 1810, Rose traveled to the Three Forks of the Missouri with Andrew Henry, ANTOINE PIERRE MENARD, JOHN COLTER, and GEORGE DROUILLARD, then explored the Madison River in southeastern Montana and Henrys Fork of the Snake River in eastern Idaho. In 1811, Rose served as an interpreter and guide for WILSON PRICE HUNT and his party of Astorians, heading for Oregon. He was discharged in Crow territory on suspicion of leading the group into an ambush. During the War of 1812, Rose is believed to have assisted Manuel Lisa in keeping the upper Missouri tribes from siding with the British.

In 1823, Rose was an interpreter and negotiator for WILLIAM HENRY ASHLEY's fur-trading expedition to the Arikara and worked with other MOUNTAIN MEN. After warfare erupted between non-Indians and the Arikara, Rose acted as a negotiator on behalf of Colonel HENRY LEAVENWORTH in his punitive military expedition. Rose then joined JEDEDIAH STRONG SMITH in an expedition from Fort Kiowa in present-day South Dakota, overland through the Badlands and Black Hills to the northern ROCKY MOUNTAINS.

In 1825, Rose joined General HENRY ATKINSON's Yellowstone Expedition at Council Bluffs on the Missouri and served as a guide and Indian diplomat to the Crow. Rose is believed to have been killed in an attack by Arikara while hunting with HUGH GLASS on the Yellowstone River, below the mouth of the Bighorn River, during the winter of 1832–33.

Edward Rose's career in the northern plains and Rockies spans the entire period of the early upper Missouri FUR TRADE. His exploits have been confused with those of another part-African mountain man, JAMES PIERSON BECKWORTH. It is probable that Beckwirth claimed Rose's adventures as his own in a written account of his life.

Ross, Alexander (1783–1856) *Scottish-Canadian fur trader in Pacific Northwest and Montana*

Alexander Ross was a native of Nairnshire, Scotland. When he was about 20 years old, he immigrated to present-day Ontario, Canada, where he worked as a schoolteacher until 1810. That year, he met with WILSON PRICE HUNT in Montreal and soon joined JOHN JACOB ASTOR's fur-trading venture to the Pacific Northwest.

In September 1810, Ross embarked on the *Tonquin* from New York, and sailed around CAPE HORN, to the Oregon Coast. He was one of the founders of the Astoria outpost for Astor's Pacific Fur Company, a subsidiary of the AMERICAN FUR COMPANY, and the first permanent non-Indian settlement in Oregon.

Ross remained at the Astoria post after 1813, when it was purchased by the NORTH WEST COMPANY and renamed Fort George. In 1818, he undertook a trade expedition from the mouth of the COLUMBIA RIVER as far as its confluence with the Snake River. Nearby, he founded Fort Nez Percés, later known as Fort Walla Walla.

In 1823, following the takeover of the North West Company by the HUDSON'S BAY COMPANY, Ross assumed command of the latter company's post at Flathead Lake in what is now western Montana. In February 1824, he led an expedition from the Flathead Lake post into the Snake River country of western Idaho, exploring southward as far as the mouth of the Boise River. Along the way, a group of his Iroquois (Haudenosaunee) trappers were rescued from

local Indians by American mountain man and fur trader JEDEDIAH STRONG SMITH. Ross then allowed Smith and his companions to explore the exclusive Hudson's Bay Company trapping grounds in the Oregon Country, a decision that alarmed the company's directors and led to Ross being replaced at Flathead Lake by PETER SKENE OGDEN.

From Flathead Lake, Montana, Ross headed eastward with his Okanagan Indian wife in 1825. He settled at the Red River Colony, near present-day Winnipeg, Manitoba, where, during the next three decades, he played a significant role in the settlement's administration.

Alexander Ross, in the course of his career in the FUR TRADE, explored uncharted territory eastward from the Pacific coast into what is now Idaho, Washington, and Montana. His books, *Adventures of the First Settlers on the Oregon or Columbia River* (1849) and *The Fur Hunters of the Far West* (1853), provide some of the earliest accounts of the first decade and a half of non-Indian settlement in the Pacific Northwest.

Ross, Sir James Clark (1800–1862) *British naval officer in the Canadian Arctic and Antarctic, nephew of Sir John Ross*

Born in London, James Clark Ross was of Scottish descent. At the age of 12, he entered the navy, serving on ships commanded by his uncle SIR JOHN ROSS for the next six years.

In 1818, Ross sailed as a midshipman on the *Isabella* in the elder Ross's expedition to Baffin Bay and Lancaster Sound, undertaken as part of the British navy's newly revived effort to find the NORTHWEST PASSAGE. The next year, he took part in SIR WILLIAM EDWARD PARRY's voyage through Lancaster Sound to Melville Island, and, while wintering there with the expedition, learned survival skills essential to polar exploration.

Ross again accompanied Parry on an 1821–23 exploration of northwestern HUDSON BAY, and, in 1824–25, he took part in Parry's voyage to Lancaster Sound and Prince Regent Inlet, during which he was promoted to lieutenant. In 1827, Ross joined Parry in his unsuccessful attempt to reach the NORTH POLE from Spitsbergen (present-day Svalbard).

Promoted to commander on his return, Ross took a leave from the navy in 1829 to serve as second in command in his uncle John's privately funded Northwest Passage expedition to the Canadian Arctic. While their vessel, the *Victory*, was icebound on the east shore of the Boothia Peninsula, he undertook a series of overland explorations. In spring 1830, he crossed to the west coast of the Boothia Peninsula and reached what he thought was a northward extension of the mainland. He named it King William Land, not realizing that it was actually an island separated from the Boothia Peninsula by a frozen strait. On May 31, 1831, in

Sir James Clark Ross (Library of Congress)

the course of another overland expedition, Ross located the NORTH MAGNETIC POLE, then situated at 70°5'17" north latitude and 96°46' west longitude on the west coast of the Boothia Peninsula.

Soon after his return to England in 1833, Ross was promoted to the rank of captain, and, in 1835–38, he conducted an extensive study of terrestrial magnetism throughout the British Isles.

Ross was next given command of a British navy expedition to seek the SOUTH MAGNETIC POLE and explore the seas around Antarctica. In command of the *Erebus*, and accompanied by the *Terror* under FRANCIS RAWDON MOIRA CROZIER, Ross sailed from England in September 1839. The next year, he established a series of magnetic observatories in the Southern Hemisphere on St. Helena Island in the South Atlantic Ocean; at Cape Town, South Africa; in the Kerguelen Islands of the southern Indian Ocean; and in Hobart, Tasmania.

After several months in Hobart, where he was hosted by SIR JOHN FRANKLIN, then Tasmania's governor, and his wife Lady JANE FRANKLIN, Ross and his expedition set out for Antarctica. He sailed due south along the INTERNATIONAL DATE LINE, planning to explore east of those portions of the Antarctic coast already sighted the previous year in the American expedition of CHARLES WILKES and the

French expedition of JULES-SÉBASTIEN-CÉSAR DUMONT D'URVILLE.

On January 1, 1841, Ross and his ships crossed the ANTARCTIC CIRCLE. After forcing a passage through the PACK ICE, they sailed another 500 miles across ice-free seas to the Antarctic mainland at Cape Adare. He then entered what later became known as the Ross Sea, and, on January 11, 1841, he sighted a mountain range on a section of uncharted coastline. He called this Victoria Land in honor of Queen Victoria, and named the mountains the Prince Albert Range after her consort. A landing party sent ashore took possession of the region for Great Britain. An active volcano was soon sighted on the coast, which Ross named Mount Erebus after his ship. He named a nearby, dormant volcanic peak Mount Terror after the expedition's other vessel. A large bay explored in the vicinity was named after Archibald McMurdo, an officer on the *Terror*, and was known afterward as McMurdo Sound.

Ross soon found his efforts to continue southward toward the SOUTH POLE blocked by an immense floating mass of ice, several hundred feet high, extending along the shoreline for more than a thousand miles. Known afterward as the Ross Ice Shelf, it was later determined to cover an area roughly the size of France. Although his southward progress was blocked, Ross nonetheless reached 78°4' south latitude, breaking the record set by navigator JAMES WEDDELL in 1822–23.

After making oceanographic studies in the Ross Sea for the ROYAL SOCIETY, as well as a study of offshore plant, animal, and marine life, Ross and his expedition sailed for Tasmania and Port Jackson (Sydney), Australia, to spend the Antarctic winter.

Ross made his second probe into the Antarctic seas in December 1841. On returning to the Ross Sea, he succeeded in bettering his previous farthest-south record by an additional 11 seconds of latitude. Soon afterward, in early February 1842, his ships were damaged in a collision in the Ross Sea while trying to avoid icebergs. Ross then made for the Falkland Islands for repairs.

In December 1842, after brief explorations of Tierra del Fuego and Hermite Island just west of CAPE HORN, Ross again sailed southward to the Antarctic mainland. This time, he explored along the Antarctic Peninsula (Graham Land), surveying its uncharted Weddell Sea coast, along which he located the island group that now bears his name.

Ross arrived back in England in September 1843 and was knighted soon afterward. Although offered the command of yet another attempt on the Northwest Passage, he resolved to undertake no more long voyages. Sir John Franklin, who had been given command of the expedition in his place, subsequently disappeared in the Canadian Arctic in 1845 with the *Erebus* and the *Terror*; the latter still

commanded by Crozier, along with the expedition's entire complement of 127 officers and men.

In 1848–49, Ross commanded the *Enterprise* and the *Investigator* in the British navy's first seaward search effort for Franklin. Ross managed to navigate through Lancaster Sound as far as Barrow Strait to Somerset Island, wintering on its north shore. Overland expeditions were undertaken to find some trace of Franklin, including one in which Ross, accompanied by SIR FRANCIS LEOPOLD McCLINTOCK, traveled down Peel Sound and reached within 70 miles of where Franklin's ships had become icebound on King William Island. Short of supplies, Ross and McClintock were compelled to return to the ships at the Somerset Island anchorage, without realizing how close they had come to solving the mystery of Franklin's disappearance. Ironically, it may have been Ross's error 18 years earlier, when he had incorrectly charted King William Island as joined to the mainland, that led Franklin to head away from the only navigable strait along that segment of the Northwest Passage, thus dooming his expedition.

After his return to England in 1849, Ross ended his career at sea. Made a rear admiral in 1856, he retired to his home at Aylesbury, near London.

Sir James Clark Ross commanded the first British scientific expedition to Antarctica since the voyages of JAMES COOK in the late 1770s. His two-volume account of the expedition, *A Voyage of Discovery and Research in the Southern and Antarctic Regions During the Years 1839 to 1843*, was published in 1847. In addition to charting the Ross Sea and the Ross Ice Shelf, he also determined that the South Magnetic Pole lay inland from the Antarctic coast. His explorations along the Antarctic mainland ultimately revealed that the geographic South Pole was surrounded by a large landmass. During the first decades of the 20th century, the Ross Sea and the adjoining Ross Ice Shelf, which extend deeper into the continent than any other part of the Antarctic coast, provided an entry way into the continent for the South Polar attempts of ROBERT FALCON SCOTT, ERNEST HENRY SHACKLETON, and ROALD ENGELBREGT GRAVNING AMUNDSEN.

Ross, Sir John (1777–1856) *Scottish-born British naval officer in the Canadian Arctic, uncle of Sir James Clark Ross*

Born near Wigtown, on the southwest coast of Scotland, John Ross entered the British navy when he was only nine years old. He served on British warships in the MEDITERRANEAN SEA and on merchant vessels in the WEST INDIES and the Baltic Sea. In 1799, after several years with the BRITISH EAST INDIA COMPANY, he returned to the navy to serve in the Napoleonic Wars of 1803–15, reaching the rank of commander by 1812.

In 1818, Ross was given command of the navy's effort to explore west of GREENLAND in search of the NORTHWEST PASSAGE. He sailed on the *Isabella*, along with his nephew SIR JAMES CLARK ROSS, then a midshipman. Second in command of the expedition was SIR WILLIAM EDWARD PARRY aboard the *Alexander*.

Ross and his ships rounded the southern tip of Greenland and sailed up Davis Strait into Baffin Bay. In his initial explorations along the west coast of Greenland, he made the European discovery of Melville Bay, where he encountered a theretofore unknown band of Inuit, whom he dubbed the "Arctic Highlanders." He also reported finding meteorites at Cape York. From there, he surveyed the entrances to Smith Sound and Jones Sound, determining that neither one provided a western entrance to a Northwest Passage.

Ross next explored Lancaster Sound, and, after navigating through it for about 50 miles, sighted what he took to be a chain of mountains blocking progress westward, which he named the Croker Mountains. Although a number of his officers, most notably Parry, reported seeing nothing ahead but open water, Ross nonetheless turned back to England, where he informed British naval authorities that all three of the channels he had explored, including Lancaster Sound, were closed-end bays, affording no western outlet from Baffin Bay. A year later, Parry sailed back to Lancaster Sound and navigated westward as far as Melville Island, exploring the islands and channels of the Canadian Arctic and reaching a point that was at least half-way through the Northwest Passage.

Ross's professional reputation suffered after news of Parry's success reached England. As a result, despite his proposal to lead another Arctic expedition, he was offered no new commands. In 1828, however, Felix Booth, a gin distiller who also held the position of sheriff of the City of London, provided Ross with the financial backing to undertake a second Arctic expedition.

In spring 1829, Ross left England for the Canadian Arctic aboard the *Victory*, a paddle-wheel steamer that had formerly served as an English Channel ferry, now rigged with sails and equipped for Arctic navigation. Second in command was his nephew James Clark Ross, who had been promoted to commander after taking part in a series of Arctic explorations with Parry during the 1820s. The elder Ross planned to investigate Prince Regent Inlet, the channel leading southward from Lancaster Sound, which Parry had explored in 1824–25.

After passing through Lancaster Sound, Ross entered Prince Regent Inlet and managed to reach a point 200 miles beyond where Parry's ship, the *Fury*, had been wrecked five years earlier. By October 1829, the *Victory* had become ice-bound, and the expedition spent the winter aboard the ship at an anchorage Ross called Felix Harbor in honor of his backer. Overland expeditions were undertaken under the command of the younger Ross.

From the reports of the exploring parties and from local Inuit, John Ross determined that they were on the mainland of North America, a region he named the Boothia Peninsula, also in honor of the London gin maker. On an overland expedition in spring 1831, James Clark Ross located the NORTH MAGNETIC POLE.

In 1832, John Ross, concluding that the *Victory* was inextricably entrapped in the ice at Felix Harbor, resolved to abandon the ship and travel northward with his men in sledges and boats to Lancaster Sound, in the hope that they would be picked up there by a passing whaling ship. Unable to progress beyond what remained of the *Fury*, Ross and his men spent the winter of 1832–33 in a shelter made from the wreckage, which Ross called Somerset House. They survived fairly well through the winter, eating the canned and preserved food that had been left on Parry's ship.

In the spring, Ross and his men reached Lancaster Sound, where, on August 26, 1833, they were rescued. The ship that picked them up turned out to be the *Isabella*, the same vessel on which Ross had made his first voyage to Lancaster Sound 15 years before.

Back in England, Ross, who was thought to have perished with his expedition, quickly redeemed himself as one of Great Britain's leading Arctic explorers. He was honored with a knighthood in 1834 for having survived four consecutive Arctic winters and for having brought his men through the ordeal with few losses. In addition, he had made the first European sighting of the Boothia Peninsula, which he determined to be the northernmost point of the North American mainland. The British Parliament awarded Ross and his men £5,000 for having made significant gains in revealing the geography of the Canadian Arctic and the eastern segment of the Northwest Passage. Moreover, the government reimbursed Felix Booth for the costs of mounting his private Arctic expedition.

Ross became a diplomat afterward, serving from 1839 to 1846 as British consul at Stockholm. In 1847, although then entering his seventies, Ross sought to lead a British navy search effort for SIR JOHN FRANKLIN and his expedition, which had been missing in the Canadian Arctic for two years. Although he was turned down by the navy, Ross again won the support of Sir Felix Booth (who had also been knighted for his contribution to British Arctic exploration). Booth provided Ross with the schooner *Felix*, on which Ross wintered at Barrow Strait in 1850–51. Finding no trace of Franklin's expedition, Ross returned to England. He retired to his home, North West Castle, on southern Scotland's Loch Ryan.

Sir John Ross, with his controversial 1818 voyage to Baffin Bay and Lancaster Sound, initiated modern exploration of the Canadian Arctic. In addition, he reaffirmed the findings made by WILLIAM BAFFIN and ROBERT BYLOT in their 1616 voyage, which, after two centuries, had remained largely forgotten. Ross's 1829–33 expedition was the first to

employ steam power in polar exploration, even though the *Victory's* engine proved unreliable and was abandoned in Prince Regent Inlet before the end of the first winter. His landing on the Boothia Peninsula in 1829 marked the first time the North American mainland had been approached from the north. Ross's 1829–33 expedition also indirectly led to the European discovery of one of northern Canada's longest rivers—the Back River—by British naval officer SIR GEORGE BACK, after he had participated in an overland search for Ross in 1833–34.

Rossel, Elisabeth-Paul-Edouard de (chevalier de Rossel) (1765–1829) *French naval officer in the South Pacific*

Elisabeth-Paul-Edouard de Rossel was born in the north-central French town of Sens. He joined the French navy's Marine Guard in 1780 and, after serving in the Caribbean Sea, took part in French efforts in the American Revolution, including the Battle of Yorktown in October 1781.

In 1785, Rossel served with ANTOINE-RAYMOND-JOSEPH DE BRUNI, chevalier d'Entrecasteaux, in the Indian Ocean, becoming his protégé. Promoted to lieutenant in 1789, he went on to sail aboard the *Récherche* as third in command under d'Entrecasteaux in the 1791–94 search for JEAN-FRANÇOIS DE GALAUP, comte de La Pérouse, whose expedition had vanished in the southwestern Pacific Ocean several years earlier.

On the 1791–94 voyage, Rossel made astronomical observations and conducted studies of terrestrial magnetism. In August 1793, while the expedition was off the eastern end of New Guinea, he briefly assumed leadership of the expedition when ALEXANDRE HESMIVY D'AURIBEAU, d'Entrecasteaux's successor, became too ill with SCURVY to carry on his command.

In 1795, Rossel sailed from Surabaya, Java, for France aboard a Dutch vessel. By that time, the expedition had been abandoned, and as a result of the outbreak of the French Revolutionary Wars two years earlier, the ships had been confiscated by pro-royalist Dutch authorities in the EAST INDIES. On the homeward voyage, Rossel's ship was captured by British naval forces, and he was held prisoner in England until 1802, when the Peace of Amiens temporarily ended hostilities. Rossel's account of d'Entrecasteaux's explorations in search of La Pérouse, *Voyage d'Entrecasteaux envoyé à la recherche de La Pérouse* (Journey of d'Entrecasteaux, sent to search for La Pérouse), was published in 1808.

Rossel went on to a distinguished scientific and naval career. After serving as director general of the French navy's department of maps and charts, he reached the rank of rear admiral in 1828. He took part in the planning of JULES-SÉBASTIEN-CÉSAR DUMONT D'URVILLE's expedition of 1826–29, in the course of which the wreck of one of La Pérouse's ships was finally located. Rossel had been named

to the French Academy of Sciences in 1812, and in 1821, he was founding member of the Geographical Society of Paris.

Rossel Island, one of the islands of the Louisiade Archipelago, which d'Entrecasteaux discovered off the eastern end of New Guinea, was named in honor of the chevalier de Rossel. Captured along with Rossel in 1795 were maps he was carrying of the Australian coastline, which had been prepared by d'Entrecasteaux's hydrographer, CHARLES-FRANÇOIS BEAUTEMPS-BEAUPRÉ. Copies of these French charts were later provided to Captain MATTHEW FLINDERS for his explorations around Australia on the *Investigator* in 1801–03.

Rumi, Shihab al-Din Abu Abd Allah Yaqut al- See YAQUT AL-RUMI, SHIHAB AL-DIN ABU ABD ALLAH.

Russell, Osborne (ca. 1814–1892) *American fur trapper in the northern Rocky Mountains and Oregon*

Osborne Russell was born in southern Maine. Little is known of his family background or early life. At the age of 16, he briefly went to sea, then embarked on a career in the FUR TRADE in the frontier regions of present-day Wisconsin and Minnesota.

In 1834, Russell accompanied NATHANIEL JARVIS WYETH and his fur-trading expedition to the Snake River region of what is now southern Idaho, where he took part in the establishment of Fort Hall. Over the next year, he trapped and hunted in the Cache Valley, the Teton Mountains, and the Jackson Hole region of present-day western Wyoming. Soon afterward, Russell joined up with CHRISTOPHER HOUSTON CARSON (Kit Carson), JAMES BRIDGER, and JOSEPH MEEK in trapping forays into the northern ROCKY MOUNTAINS, during which he survived attacks by Blackfeet and Crow Indian war parties.

In 1842, Russell traveled to the Oregon Country with an emigrant wagon train, settling in the upper Willamette Valley. He taught himself law while recovering from an eye injury, and, in 1843, he was appointed to a judgeship by Oregon's provisional government. In 1848, soon after his election to the territorial legislature, he left Oregon for the California goldfields.

After trying his hand at prospecting, Russell operated a general store in Placerville, California, where he also served as a frontier judge. His later business enterprises included a shipping line between Sacramento, California, and Portland, Oregon.

Russell's fortunes sharply declined after a business partner suddenly took off with most of his firm's assets, leaving him seriously in debt for his remaining years in Placerville.

Osborne Russell was one of the few MOUNTAIN MEN known to have kept a written account of his experiences in the Rocky Mountain fur trade. Although he had submitted his journal to a New York City publisher in 1846, it was not printed until 68 years later. His *Journal of a Trapper: or, Nine Years in the Rocky Mountains, 1834–1843*, published in 1914, provides an eyewitness account of the northern Rockies frontier in the decade between the initial exploration of the region and the advent of non-Indian settlement.

Rusta, Abu Ali Ahmad ibn See IBN RUSTA, ABU ALI AHMAD.

Rut, John (fl. 1520s) *English mariner in Newfoundland*
John Rut, an English mariner, was given command of an expedition to the Americas in search of a NORTHWEST PASSAGE to the Orient, sailing for King Henry VIII.

In 1527, Rut departed England with two ships, the *Mary Guildford* and the *Samson*, and crossed the Atlantic Ocean to a point off the Labrador coast near the Strait of Belle Isle, which separates Newfoundland from the mainland. He proceeded to the Avalon Peninsula on Newfoundland's east coast and anchored in the harbor opposite present-day St. John's. From there, he sailed southward to Santo Domingo on Hispaniola (the island made up of present-day Haiti and the Dominican Republic) in the WEST INDIES.

John Rut's visit, 30 years after that of JOHN CABOT to the Newfoundland region, held historical importance in that he wrote a letter to King Henry, describing the fishing activity around the island. He reported seeing 14 fishing ships—11 Norman, one Breton, and two Portuguese—in the "Haven of St. John" in the month of August. St. John's, frequented by fishermen from many nations in the 16th century, became a thriving settlement and is represented as "St. Jehan" and "San Joham" on maps of the 1540s.

S

Saavedra Cerón, Álvaro de (unknown–1529)

Spanish mariner in the South Pacific

Born in Spain, Álvaro de Saavedra was a cousin of HERNÁN CORTÉS, serving under him in the conquest of Mexico in 1519–21 and afterward as lieutenant governor of Veracruz.

In 1526, Cortés commissioned Saavedra to undertake a voyage from Mexico, westward across the Pacific Ocean, to rescue the survivors of a previous Spanish expedition stranded in the SPICE ISLANDS (the Moluccas of present-day Indonesia). Three ships were constructed for the expedition—*Santiago*, *Espíritu Santo*, and *Florida*—and, on October 31, 1527, Saavedra and his fleet sailed from Zihuatanejo on Mexico's Pacific coast, just north of Acapulco.

After a month at sea, two of the vessels were lost in a storm, leaving Saavedra with only his flagship, the *Florida*. On December 29, Guam was sighted. By the end of January, after a stopover on the north coast of New Guinea, he reached the Philippines. He landed on Mindanao on February 2, 1528, where he ransomed some of the crew of the previous Spanish expedition held by natives. He then headed southward for Halmahera and Tidore in the Moluccas.

After picking up more survivors on Tidore and obtaining a valuable cargo of cloves, Saavedra set sail back to Mexico. Although he went northward as far as 14° north latitude, he was forced to return to Tidore on failing to find the westerly winds necessary for an eastward passage across the Pacific. In a second attempt, he sailed even farther to the north, reaching as far as 31° north latitude, making the European

discovery of Ponape Island in the Carolines as well as Eniwetok in the Marshalls.

Soon afterward, Saavedra died at sea. The *Florida* returned to the Moluccas in early December 1529, once again unable to locate winds favorable for the homeward voyage. The surviving crew members were taken into custody by Portuguese authorities on Halmahera and held until 1533.

Álvaro de Saavedra was among the first Europeans to sail westward across the Pacific Ocean since the 1519–21 voyage of FERDINAND MAGELLAN. It was not until 1565 that Spanish navigator ANDRÉS DE URDANETA finally succeed in making the first known eastward voyage across the Pacific, sailing from the Philippines to the west coast of Mexico.

Saavedra, Hernandarias See ARIAS DE SAAVEDRA, HERNANDO.

Sable, Jean Baptist Point (Jean-Baptiste Point du Sable, Jean-Baptiste Pointe du Sable)

(ca. 1745–1818) *Haitian-French fur trader, trapper in the American Midwest, founder of Chicago*

Jean Baptist Point Sable is thought to have been born in Saint Marc in the French colony of Saint Domingue (present-day Haiti), his father a French sailor and his mother a slave of African ancestry. He was raised Catholic.

Many stories of Sable's early life are not confirmed. He may have studied in Paris. He was reportedly shipwrecked off the coast of Louisiana with a friend, Jacques Clemorgan, and after the two were rescued by a passing ship, they were taken to New Orleans, where Sable stayed and worked for French priests. After saving enough money to buy a CANOE and supplies, he possibly traveled up the MISSISSIPPI RIVER to the western Great Lakes. Other accounts indicate Sable reached the Great Lakes by way of French Canada.

Sable came into contact with the Potawatomi Indians, at that time living along the west coast of Lake Michigan. He gained the tribe's permission to hunt and trap on the Eschikagou Plain surrounding present-day Chicago and built his first home in the region, south of Chicago on the Illinois River.

In 1779, during the American Revolution, Sable appears in an official record, a British officer in the Great Lakes region reporting that he was active in the FUR TRADE with sympathies for the French. He was arrested in present-day Indiana and his goods confiscated. He was taken to Fort Michilimackinac in present-day Michigan. The British eventually released him, and he became their liaison to Indians along the Saint Clair River north of present-day Detroit.

In 1784, Sable returned to the Eschikagou Plain, where he built a homestead and trading post at the mouth of the Eschikagou River (now known as the Chicago River) on the site of present-day Chicago. He also built docks on Lake Michigan. At some point, he married a Potawatomi woman, Kittihawa, known to non-Indians as Catherine. On failing to win the tribe's chieftaincy in 1800, he and Kittihawa left the region and lived for a time in Peoria in present-day Illinois and eventually settled at Saint Charles in present-day Missouri.

As the first non-Indian to settle on the site of Chicago, Jean Baptist Point Sable is credited with founding the city; his successor at the trading post, John Kinzie, is also considered a father of Chicago. Sable's house and his role in the city's history are commemorated by a plaque at the corner of Pine and Kinzie Streets.

Sacajawea (Sacagawea, "Bird Woman," Boinaiv, "Grass Maiden," Janey) (ca. 1784–1812 or 1884)

Shoshone Indian interpreter, guide for Lewis and Clark Expedition in the American West, wife of Toussaint Charbonneau, mother of Jean-Baptiste Charbonneau
Sacajawea was born in the Lemhi Mountains region of what is now western Montana, the daughter of a Shoshone Indian chief. When she was about 10 years old, she was taken captive by a band of Hidatsa Indians.

By 1804, Sacajawea had become the wife of French-Canadian fur trapper TOUSSAINT CHARBONNEAU, who re-

Statue of Sacajawea in Portland, Oregon (*Library of Congress*)

portedly had won her and another Indian young woman in a gambling game with the Hidatsa. In the winter of 1804–05, the Corps of Discovery under the command of MERIWETHER LEWIS and WILLIAM CLARK encamped at the Mandan Indian villages at the confluence of the Knife River and MISSOURI RIVER, near present-day Bismarck, North Dakota. There, Toussaint Charbonneau was hired on as the expedition's interpreter, with the understanding that Sacajawea would accompany him on the trek to the Oregon coast.

In February 1805, Sacajawea gave birth to a son, JEAN-BAPTISTE CHARBONNEAU. Two months later, with her newborn infant strapped to her back, she and her husband departed the Mandan Indian villages with Lewis and Clark. Sacajawea served as a guide, as well as interpreter to Indian

tribes. The Corps of Discovery reached the Three Forks of the Missouri in August 1805; she guided them along the southwesternmost branch, the Jefferson, then through the Lemhi Pass to her Shoshone homeland. There, she was reunited with her brother Cameahwait, who had by that time become a chief.

Sacajawea convinced her brother to provide the expedition with horses, vital for their continued progress overland to the Clearwater, Snake, and Columbia watershed. She continued westward with Lewis and Clark and their men to the Oregon coast, arriving there in November 1805. On the return journey east in March 1806, she accompanied William Clark and his contingent as they explored the Yellowstone River to its junction with the Missouri. She and her husband left the expedition when it returned to the Mandan villages at the mouth of North Dakota's Knife River in summer 1806.

Details of Sacajawea's life after 1806 are contradictory. According to one account, she accompanied Toussaint Charbonneau to St. Louis in 1809, when he took their young son to William Clark, who had arranged to adopt the boy. She then reportedly returned to the upper Missouri with one of MANUEL LISA's fur-trading expeditions, where she died of fever in 1812.

An alternate, less likely version relates that Sacajawea went on to live with the Comanche Indians, then returned to her homeland and finally settled on the Wind River Indian Reservation in Wyoming, living there until her death at about age 100 in 1884.

Sacajawea was one of the few women to play an active role in the early exploration of North America. Through her skill as an interpreter and diplomat, the Lewis and Clark Expedition had mostly peaceful encounters with the more than 50 Indian tribes they met en route.

Sadlier, George Foster (fl. 1819) *British army officer in Arabia*

In 1819, George Sadlier, a captain with the British army in India, was sent to Arabia on a diplomatic mission to Ibrahim Pasha, the Egyptian military leader who had just defeated the Wahhabis, an Islamic reform movement.

Sadlier landed at Qatif, north of Bahrain on the Persian Gulf coast of Arabia, in June 1819. Accompanied by a small detachment of Egyptian soldiers, he set out westward across the desert of central Arabia, hoping to catch up with Ibrahim Pasha, who was then withdrawing with his army back to Egypt. En route, Sadlier visited Dar'iyah, a city that had never before been seen by Europeans, although by the time of his arrival, it was deserted and mostly destroyed by Ibrahim Pasha's forces.

Halfway across the Arabian Peninsula, near Anaiza, Sadlier learned that Ibrahim Pasha had continued westward

to the holy city of Medina. Sadlier continued across the desert and, on reaching the outskirts of Medina, presented Ibrahim Pasha with a ceremonial sword from the British government, as well as an offer of British military aid in support of the continuing campaign against the Wahhabis. Sadlier then headed for the RED SEA port of Yenbo, north of Jidda, arriving on September 20, 1819.

With his trek from the Persian Gulf to the Red Sea, which had taken a little longer than three months, Captain George Sadlier became the first European to cross the Arabian Peninsula, an accomplishment not duplicated until the 1917 journey of HARRY ST. JOHN BRIDGER PHILBY.

St. Denis, Louis Juchereau de (Louis Juchereau de St. Denys) (1676–1744) *French colonizer, trader in Louisiana and Texas*

A native of French Canada, Louis de St. Denis was born in Beauport, near Quebec City, the son of a local seigneur, or titled landowner. In 1698–99, he sailed to Mobile Bay with the brothers PIERRE LE MOYNE, sieur d'Iberville and JEAN-BAPTISTE LE MOYNE, sieur de Bienville, taking part in their colonizing expedition to the lower MISSISSIPPI RIVER.

In 1700, soon after the establishment of the French settlement on Biloxi Bay, St. Denis accompanied Bienville in an exploration up the Red River, ascending it into northwestern Louisiana and eastern Texas, which then was the northeastern frontier of New Spain. Two years later, he took command of a French outpost on the Mississippi Delta, Fort de la Boulaye. During the next three years, he undertook additional explorations westward into the interior.

St. Denis returned to the Red River in 1710, traveling upstream to the land of the Natchitoches Indians, a subgroup of the Caddo, among whom he established trade contacts; he did the same in nearby eastern Texas. In 1713, the French governor of Louisiana, ANTOINE LAUMET DE LA MOTHE, sieur de Cadillac, received word from a Spanish missionary in Mexico, Francisco Hidalgo, informing him that the Spanish had failed to provide enough missionaries to area tribes, and that the presence of French priests might be welcomed. Interpreting this news more as an open invitation for the French to extend their Indian trade into Texas, Cadillac sent St. Denis back up the Red River in 1713, with instructions to cross Texas to the Rio Grande and open up trade contacts with Indians.

St. Denis first traveled back to the Natchitoches village on the Red River, where he established a trading post, then set out across Texas. On July 14, 1714, he arrived at San Juan Bautista, the northernmost Spanish settlement on the Rio Grande, opposite present-day Eagle Pass, Texas, where he was promptly arrested for illegally entering Spanish territory.

St. Denis won the favor of the post commander's granddaughter, Manuela Sánchez Ramón, but he was later sent to Mexico City and imprisoned. On convincing the viceroy of Mexico that he was sincerely interested in extending Spanish settlement into Texas, he was released. He was so persuasive that the viceroy sent him back to San Juan Bautista, where he married Sánchez Ramón. Several months later, he set out on an expedition with her grandfather, Captain Domingo Ramón, planning to establish additional Spanish settlements to counter the threat of French expansion westward from Louisiana.

Proceeding northeastward from San Juan Bautista, St. Denis and Ramón, jointly in command of a party of 25 soldiers and nine missionaries, crossed from the Rio Grande to the Neches River of eastern Texas, which they reached in July 1716. There, they established the mission of Nuestro Padre San Francisco de los Tejas, as well as Mission San Miguel, not far from the Red River, and Mission Ais, west of the Neches.

St. Denis returned to Mobile soon afterward, where he again entered the service of Cadillac. In 1717, he returned to the Natchitoches trading post on the Red River, from where he recrossed Texas to the Rio Grande. Back at San Juan Bautista, the Spanish confiscated his trading goods. St. Denis traveled to Mexico City to protest this action, but he was again imprisoned. He managed to escape in September 1718, then made his way back to Mobile and on to Natchitoches, where he was soon joined by his wife, Manuela.

St. Denis remained in command of the French Red River post at Fort St. Jean Baptiste de Natchitoches for the next 24 years. In 1731, he succeeded in repelling a siege by Natchez Indians, and the next year, he led a party of soldiers and allied Indians in a counterattack at nearby Sang Pour Sang Hill.

Louis de St. Denis's settlement at Natchitoches became a starting point for a number of French explorations into the Canadian River and Arkansas River regions of Oklahoma and northern Texas; after 1719, it was the first center for the western FUR TRADE. Most significantly, St. Denis's activity on New Spain's northern border with French Louisiana caused the Spanish great concern over the threat of further French incursions and instigated stepped-up Spanish efforts to settle Texas.

St. Vrain, Céran de Hault de Lassus de

(1802–1870) *American fur trader, businessman in the American Southwest*

Céran de St. Vrain was born in Spanish Lake, near St. Louis, Missouri, the son of a former French naval officer. As a youth in the early 1820s, St. Vrain worked as a clerk for one of the fur-trading firms operating out of St. Louis. In fall 1824, he mounted his own fur-trading expedition across the

southern plains and into the southern ROCKY MOUNTAINS, arriving in Taos, New Mexico, on March 21, 1825. The next year, St. Vrain, together with mountain man and itinerant preacher WILLIAM SHERLEY WILLIAMS, received permission to trade and trap in the Gila River region of what is now southern Arizona.

St. Vrain entered into partnership with the brothers CHARLES BENT and WILLIAM BENT in 1830, establishing the firm of Bent, St. Vrain & Company, which outfitted fur-trapping and trading expeditions from Taos and Santa Fe. Three years later, the company founded its post on the Arkansas River, near the mouth of the Purgatoire, not far from present-day La Junta in southeastern Colorado. At the same time, St. Vrain and the Bents developed the trail southward from their Arkansas River post to Raton Pass and Taos, widening it to accommodate wagon caravans. Known as the Raton Pass Route, it provided traders from Missouri headed for New Mexico with a safer alternative than the hazardous Cimarron Cutoff, part of the Santa Fe Trail.

In 1847, St. Vrain, who had settled in Taos, led a volunteer force of mountain men in support of U.S. forces in the U.S.-Mexican War of 1846–48. After 1849, he left the FUR TRADE to engage in banking, real estate, and railroad ventures in the newly organized New Mexico Territory, where he also became a leading figure in territorial politics, although he was never elected to public office.

The site of the trading post that Céran de St. Vrain and the Bent brothers established on the Arkansas River was designated as a National Historic Site by the U.S. government in 1960. Known as Bent's Old Fort, it was the focal point of the fur trade in the southern and central Rockies, and, during the 1840s, was the staging area for the exploratory expeditions of CHRISTOPHER HOUSTON CARSON (Kit Carson) and JOHN CHARLES FRÉMONT.

Salle, René-Robert Cavalier de la See LA SALLE, RENÉ-ROBERT CAVELIER, SIEUR DE.

Sargon (Sargon of Akkad, Sargon the Great, Sargon I, Sharrukin, "the Righteous King")

(fl. 2340s–2300s B.C.) *Mesopotamian ruler in the Persian Gulf and eastern Mediterranean*

Sargon was a ruler of the ancient Mesopotamian kingdom of Akkad, situated at the northern end of the Persian Gulf, comprising much of what is now Iraq. Sargon's reign (from about 2340 to 2305 B.C.) was highlighted by a great campaign of conquest in which he expanded his domain northward, beyond the central Euphrates River Valley, into what is now Syria and southern Turkey, founding the first empire in Mesopotamia. Moreover, he established trade contacts to the east with the peoples of the Indus Valley, to the south

with the peoples of the southeast coast of the Arabian Peninsula, and to the west with the peoples of the eastern MEDITERRANEAN SEA.

According to an ancient account, Sargon mounted several naval campaigns in which he sailed across a great sea west of his kingdom, possibly the Mediterranean, to locate and conquer lands some historians have identified as Crete and Spain. Other scholars have speculated that his maritime exploits were probably limited to the islands and coasts of the Persian Gulf.

Sargon, along with the Egyptian HANNU, is one of the earliest known explorers. The dynasty he founded lasted until about 2180 B.C.

Saris, John (unknown–1646) *English trader, mariner in Japan*

An English seafarer and merchant, John Saris first visited the Far East in 1604, when he accompanied Sir Henry Middleton of the BRITISH EAST INDIA COMPANY on a voyage to Bantam in the Dutch East Indies.

Saris remained in Bantam as an agent of the British East India Company for the next four years, returning to England in 1609. On April 18, 1612, he sailed from England on the *Clove*, in command of a company fleet bound for Japan. The voyage took him around the CAPE OF GOOD HOPE and along the coast of East Africa to the Ethiopian port of Assab near the mouth of the RED SEA.

After a stopover at Bantam and the SPICE ISLANDS (the Moluccas of present-day Indonesia), Saris landed on Japan's southernmost island of Kyushu in June 1613. There, he was met by his countryman, WILLIAM ADAMS, who had been living in Japan since 1600 as a naval adviser to the emperor. With Adams as his guide and interpreter, Saris made his way northward to the main Japanese island of Honshu. After visiting Osaka, he was received by the emperor at his court in nearby Suruga in early September 1613. Saris presented the emperor with a letter and gifts from King James I of England and, with Adams's help, obtained liberal trading privileges in Japan for the British East India Company.

After founding an English trading establishment on Kyushu and leaving Adams in charge of the company's interests in Japan, Saris sailed for England in November 1613, a journey that took almost a year. It was soon revealed that Saris had carried back a shipment of erotic books and pictures from the Far East, precipitating a minor scandal for the British East India Company that was resolved only when the offending material was destroyed.

John Saris settled near London, remaining as a consultant to the court of King James on matters relating to Far Eastern trade. His published narrative of his experiences was the earliest English account of Japanese life and culture. Although he had commanded the first English ships to land

in Japan, his success in opening the country to British trade was short-lived. By the mid-1600s, Japan's rulers had closed the country to all European trade, except for the Dutch, and contact between Japan and the West was not reestablished until 1853, with the arrival of American admiral Matthew Perry and his fleet.

Sarmiento de Gamboa, Pedro

(ca. 1530–ca. 1592) *Spanish mariner, scientist, historian in South America and the Pacific Ocean*

Pedro Sarmiento de Gamboa was born in Galicia, Spain. By 1555, he had reached the Americas, first Mexico, then Peru. An accomplished scientist as well as mariner, in 1564, during the Spanish Inquisition, he had to defend himself against charges of conjuration by the Catholic Church in Lima, but was cleared of wrongdoing, although he would continue to be harassed by religious authorities over the years.

In 1567–69, Sarmiento de Gamboa planned and accompanied an expedition under ÁLVARO DE MENDAÑA that headed westward from Peru in search of the fabled GREAT SOUTHERN CONTINENT, also known as Terra Australis. The excursion made instead the European discovery of the Solomon Islands and the Marshall Islands. Sarmiento de Gamboa also helped suppress Inca Indian resistance to Spanish rule. He wrote a history of the Inca people that was widely read in Europe.

In 1579, following English attacks under SIR FRANCIS DRAKE against Spanish settlements and ships along the coasts of Peru and Mexico, Sarmiento de Gamboa received the naval assignment of intercepting Drake in the STRAIT OF MAGELLAN at the southern tip of South America. Drake, however, returned to the Atlantic Ocean westward by way of the Indian Ocean and the CAPE OF GOOD HOPE. Over the next 16 months, Sarmiento de Gamboa conducted a survey of the strait, returning to Spain in 1580 and reporting his findings to King Philip II. A colonizing expedition of 350 was planned under Sarmiento de Gamboa and Diego Flores de Valdés. Many of the 24 vessels were lost in a storm, and Flores de Valdés led a number of ships back to Spain. Sarmiento de Gamboa continued on to the strait with four ships and 64 colonists, and, in 1584, founded the settlements of Rey Don Felipe and Nombre de Jesús.

On his return voyage to Spain for supplies, Sarmiento de Gamboa was captured by the English. In London, he was interviewed by Queen Elizabeth I in 1588. He borrowed funds to be ransomed but was captured in France and held there until 1590 when he was ransomed by the Spanish Crown. By that time, the colony he had founded had been abandoned, many of the colonists dying of starvation. In 1591, he was assigned the task of organizing another colonizing expedition but died before departure.

Pedro Sarmiento de Gamboa played a part in the Spanish discovery of the Solomon and Marshall Islands and contributed to knowledge of South America through his historical and scientific writings. In addition to his survey of the Strait of Magellan, he is also known for the most accurate calculation of the longitude of Peru up to that time.

Sarychev, Gavriil Andreyevich (1763–1831)

Russian naval officer in Alaska and eastern Siberia

Gavriil Sarychev was a Russian naval officer trained in the art of producing coastal maps from navigational surveys. Starting in 1785, he took part in the Russian government's Northeastern Secret Geographical and Astronomical Expedition, an official exploration of northeasternmost SIBERIA and the Gulf of Alaska, under the leadership of British seafarer JOSEPH BILLINGS.

In 1790–91, as second in command on the ship *Slava Rossy*, Sarychev accompanied Billings in an exploration of the Aleutian Islands and the Gulf of Alaska, during which he charted Alaska's southern coastline eastward as far as Prince William Sound and Cape St. Elias. The next year, he and Billings undertook an examination inland into northeastern Siberia's Chukchi Peninsula.

In 1802, Sarychev continued his hydrographic work with a survey of the west coast of Russia, along the shores of the Gulf of Finland and the Baltic Sea.

In 1806, Gavriil Sarychev's report on his explorations with Billings was published in an English edition as *Account of a Voyage of Discovery to the North-East of Siberia, the Frozen Ocean, and the North-East Sea*. Named as the Russian navy's chief hydrographer in 1808, and made an admiral in 1830, Sarychev was responsible for producing the first accurate charts of the Aleutian Islands, the Gulf of Alaska, and the coast of eastern Siberia's Chukchi Peninsula.

Sauma, Rabban bar See BAR SAUMA, RABBAN.

Schlagintweit, Adolf von (1829–1857)

German traveler in India and central Asia, brother of Hermann von Schlagintweit and Robert von Schlagintweit

Born in Munich, Adolf von Schlagintweit was the brother of HERMANN VON SCHLAGINTWEIT and ROBERT VON SCHLAGINTWEIT. Starting in 1854, Schlagintweit accompanied his two brothers in their scientific exploration of India, Tibet, and western China. In 1857, he stayed behind in western China after Hermann and Robert had returned to Europe; he was intent on continuing northward into the Pamir region of southern central Asia. Later that year, Schlagintweit followed the Northern Way segment of the ancient SILK ROAD as far as the caravan center of Kashgar, where he was killed by bandits.

Adolf von Schlagintweit's brief career as an explorer in central Asia ended before he was 28 years old. Along with his brothers, he was among the first Europeans to travel from Tibet, northward across the Kun Lun mountain range, into the desert regions of western China's Sinkiang (Xinjiang) province.

Schlagintweit, Hermann von (1822–1882)

German mountain climber in India and central Asia, brother of Adolf von Schlagintweit and Robert von Schlagintweit

Hermann von Schlagintweit was born in Munich, the older brother of ADOLF and ROBERT VON SCHLAGINTWEIT. Schlagintweit, who had become an accomplished mountaineer in his early climbing expedition in the Alps, joined his brothers on an 1854–57 scientific expedition to India, Tibet, and western China.

By the time he had returned to Europe in 1857, Hermann von Schlagintweit had explored the Karakoram mountain range of north-central India, as well as the Kunlun mountain range between northern Tibet and the western Chinese province of Sinkiang (Xinjiang).

Schlagintweit, Robert von (1833–1885)

German mountain climber, geologist in India and central Asia, brother of Adolf von Schlagintweit and Hermann von Schlagintweit

Robert von Schlagintweit was born in Munich, the son of an ophthalmologist. Educated as a geologist, he was also an accomplished mountaineer.

In 1854, on the recommendation of German naturalist ALEXANDER VON HUMBOLDT, Schlagintweit and his older brothers ADOLF VON SCHLAGINTWEIT and HERMANN VON SCHLAGINTWEIT were commissioned by the BRITISH EAST INDIA COMPANY to conduct an extensive scientific survey of India. During the next two years, they traveled throughout the Deccan Plateau of south-central India, as well as the Kashmir and Himalayan regions of northern India, carrying out studies in geology and terrestrial magnetism.

In 1856–57, Schlagintweit and his brothers extended their explorations beyond India's northern border into the Karakoram mountain range, crossed into Tibet, and continued northward across the Kunlun range, entering the desert region of western China's Sinkiang (Xinjiang) province.

Upon his return to Europe in 1857, Schlagintweit accepted a professorship at the University of Giessen and wrote an account of the expedition, *Results of a Scientific Mission to India and High-Asia*, a four-volume work published in 1860–66. In 1867–70, he went on a lecture tour of universities in the United States, during which he undertook additional scientific field work on the Pacific coast.

While in the HIMALAYAS, Robert and Adolf von Schlagintweit set a new MOUNTAIN CLIMBING record by ascending Mount Kamet to a height of 21,000 feet.

Schmidt, Otto Y. (1891–1956) *Soviet scientist in the Russian and Siberian Arctic*

Otto Schmidt, a Russian scientist, became involved with the exploration of the Russian and Siberian Arctic seas in conjunction with his work in geophysics and astronomy.

In 1928, in command of the icebreaker *Sedov*, Schmidt led a scientific expedition to Franz Josef Land, the Arctic archipelago north of Novaya Zemlya, which the Union of Soviet Socialist Republics (USSR, or Soviet Union) had claimed as part of its national territory two years earlier. After establishing a scientific station there, he returned to Leningrad (present-day St. Petersburg), and, two years later, in 1930, he undertook a second voyage to Franz Josef Land.

In 1932, Schmidt, a professor at the Arctic Institute of the USSR in Leningrad, was named as head of the Central Administration of the Northern Sea Route, an agency that had been created to direct the development of the NORTHEAST PASSAGE across northern Europe and Asia as a practical shipping and communications channel, linking European Russia with northern SIBERIA and the Pacific Ocean. That year, he commanded a Soviet expedition aboard the icebreaker *Sibiriyakov*, which navigated the entire length of the Northeast Passage on a course through the Severnaya Zemlya Islands and north of Cape Chelyuskin, Asia's northernmost point. Schmidt made the voyage from Murmansk to Vladivostok in two months and four days, demonstrating that the Northeast Passage could be navigated within one season.

Schmidt soon commanded another voyage through the Northeast Passage on the icebreaker *Chelyuskin*, with plans to return westward within the same year. Sailing from Leningrad on July 12, 1933, he was accompanied by a crew of more than 100, including women and children.

In early November 1933, Schmidt and his expedition became icebound in the Chukchi Sea, north of BERING STRAIT. After drifting northward with the PACK ICE, the *Chelyuskin* reached the north coast of Alaska, where it sank on February 13, 1934, crushed by the ice. The expedition was able to abandon the ship with few losses and set up a temporary encampment on the ice, surviving sub-zero temperatures. A makeshift landing strip was soon constructed as well, and in early March, Schmidt and his party were evacuated by a fleet of rescue aircraft.

Schmidt next became involved in scientific research in the Arctic supported by aircraft. On May 21, 1937, he took off from the airfield on Rudolf Island, one of the Franz Josef Land islands, and, with a party of four others, flew to within 13 miles of the NORTH POLE, where he landed. Other air-

craft soon followed with additional supplies, and within a few days the first manned scientific station near the North Pole had been set up. Soon afterward, Schmidt flew back to Franz Josef Land. By February 1938, the base had drifted southward with the pack ice to the east coast of GREENLAND, a distance of more than 1,500 miles. Maintaining radio contact with the men at the base, Schmidt determined their position and mounted a rescue mission. In command of two Soviet icebreakers, Schmidt reached the scientific team on February 19, 1938, rescuing them just as the ice floe on which they were drifting was about to break up.

In the course of his explorations in the polar seas of Russia and Siberia, Professor Otto Schmidt undertook extensive studies of Arctic Ocean currents, as well as observations of solar radiation in high latitudes. His 1932 expedition, in which he navigated across northern Europe and Asia within one season, demonstrated that the Northeast Passage could be developed into a practical route for shipping and communication, vital for the development of the Soviet Union's Arctic region. The rescue of his 1933–34 expedition, stranded on the ice of the frozen Chukchi Sea, was the first polar airlift in history. In his 1937 expedition, Schmidt and his party became the first men to reach the vicinity of the North Pole since the 1909 voyage of Admiral ROBERT EDWIN PEARY and MATTHEW ALEXANDER HENSON. In addition, the base Schmidt established near the North Pole that year served as a radio station for a series of Soviet transpolar flights from Moscow to Washington State and California. Schmidt's later scientific work concentrated on developing a theory on the origin of the Earth. In honor of Schmidt's contribution to Soviet exploration in the Arctic, an island he located in Franz Josef Land was named after him.

Schomburgk, Sir Robert Hermann

(1804–1865) *German-born naturalist in South America, in service to Great Britain*

Robert Hermann Schomburgk was born in the eastern German city of Freiburg, the son of a minister. In 1826, after an education in Germany that included training in geology and the natural sciences, he moved to the United States, settling in Richmond, Virginia.

In 1830, after his brief career as a Virginia tobacco merchant ended when a fire destroyed his business, Schomburgk traveled to the WEST INDIES, where he undertook a natural history survey of the coast of Anegada in the British Virgin Islands. His work there came to the attention of Great Britain's ROYAL GEOGRAPHICAL SOCIETY, which, in 1831, commissioned him to explore the interior of British Guiana (present-day Guyana) in northeastern South America.

In 1831–35, Schomburgk traveled to the upper Essequibo River, the longest river in British Guiana, in the course of which he determined its source and discovered a

giant water lily, which he named the *Victoria Regia*. In 1837, he ventured into the Guiana Highlands, exploring the Kanuku Mountains, then undertook an overland journey from Lake Amicu northwestward through difficult terrain to the ORINOCO RIVER. In 1839, he nearly traced the Orinoco River to its source, in a journey that took him through the Casiquiare Canal into the Río Negro.

Back in England in 1840, Schomburgk received a gold medal from the Royal Geographical Society for his work in British Guiana. He was soon appointed to lead a British government survey to establish the colony's boundary with Venezuela. In 1841, he traveled through the Pakaraima Mountains of western British Guiana and also explored the upper Courantyne and Berbice Rivers along British Guiana's border with Brazil. Schomburgk returned to England in 1844. He had become a naturalized British subject, and that year, he was knighted by Queen Victoria.

In 1848, Schomburgk entered the British diplomatic service with an appointment as British consul to Santo Domingo. Starting in 1857, while serving as British consul in Bangkok, he undertook explorations into Southeast Asia, including a survey of the Isthmus of Kra, in connection with a proposed ship canal through the Malay Peninsula. He returned to Europe in 1864 and settled in Berlin, where he died the following year.

In his 1831–35 explorations into the interior of northeastern South America, Sir Robert Schomburgk established a line of astronomically determined points delineating the watershed region between the Essequibo and Orinoco Rivers. Along with an account of his own explorations, *Voyage in Guiana and upon the Shores of the Orinoco during the Years 1835–39* (1840), he also edited a history of the earliest British explorations into the region, *The Discovery of the Empire of Guiana by Sir Walter Raleigh* (1848). His 1841–44 survey along the Venezuela-British Guiana frontier resulted in the establishment of the Schomburgk Line, which became significant in the final resolution of the boundary in the 1890s. In addition to his discovery of the *Victoria Regia* water lily, he also classified many previously unknown varieties of orchids in South America, one of which has since been named the *Schomburgkia* orchid in his honor.

Schoolcraft, Henry Rowe (1793–1864)

American geologist, ethnologist on the upper Mississippi River
Henry Rowe Schoolcraft was born in Albany County, New York, where his father was involved in the glassmaking business. He attended Union College, then went on to Middlebury College, studying the natural sciences, especially geology and mineralogy.

Schoolcraft worked as a glassmaker for a time before 1817, then embarked on a trip down the Ohio River to Missouri. In Missouri and Arkansas, he undertook geological

and mineralogical surveys, which served as the basis for his 1819 book, *A View of the Lead Mines of Missouri*.

In 1820, Schoolcraft served as a geologist for Michigan territorial governor Lewis Cass in his expedition in the region of the upper Great Lakes in search of the source of the MISSISSIPPI RIVER. Cass's expedition explored the upper Great Lakes and incorrectly identified the source of the Mississippi River as Upper Red Cedar Lake. Schoolcraft published an account of this expedition in 1821, entitled *A Narrative Journal of Travels from Detroit through the Great Chain of American Lakes to the Sources of the Mississippi*.

In 1822, Schoolcraft undertook further geological surveys of the Lake Superior region. That same year, he was appointed Indian agent for the tribes of northern Michigan Territory and Lake Superior.

Ten years later, in 1832, Schoolcraft again ventured up the Mississippi River in search of its actual source in Minnesota. With a small party of explorers and scientists, he entered the St. Louis River at Fond du Lac in northeastern Minnesota, then portaged westward to Sandy Lake and into the Mississippi. From Cass Lake, a Chippewa (Ojibway) Indian guided him to the lake that was the Mississippi's true source, which he reached on July 13, 1832. Originally known as Elk Lake (Lac la Biche), it was rechristened Lake Itasca by Schoolcraft, from the Latin words *veritas* for "truth" and *caput* for "head." Schoolcraft wrote an account of his second Mississippi exploration, entitled *Narrative of an Expedi-*

Henry Rowe Schoolcraft (New York State Library, Albany)

tion through the Upper Mississippi to Itasca Lake, the Actual Source of the Mississippi. It was first published in 1834.

Schoolcraft became superintendent of Indian affairs for Michigan in 1836, serving until 1841. He moved back to New York, where he began a comprehensive study of the Indian tribes of the United States, a project that resulted in a multivolume study published in 1851–57.

Henry Rowe Schoolcraft is credited with locating the source of the Mississippi River. The Schoolcraft River in Minnesota, which joins the Mississippi near its source at Lake Itasca, was named in his honor.

Schouten, Willem Cornelis (Willem Cornelius Schouten, Willem Coreliszoon van Schouten)

(ca. 1580–1625) *Dutch mariner in the South Atlantic and South Pacific*

Willem Schouten was a native of the seaport town of Hoorn in the northern Netherlands. An accomplished seafarer, he served with the DUTCH EAST INDIA COMPANY and visited the WEST INDIES in 1601–03.

Schouten commanded the *Hoorn* in JAKOB LE MAIRE'S 1615–16 expedition in search of an alternative to the STRAIT OF MAGELLAN route around the tip of South America.

In addition to the European discovery of Le Maire Strait and CAPE HORN (which he named after his birthplace), Willem Schouten, with Le Maire, explored various island chains in the Pacific. Off the northwest coast of New Guinea, he located an island group that afterward became known as the Schouten Islands. He also located the Bismarck Archipelago.

Schwatka, Frederick (1849–1892) *U.S. Army officer, American lawyer, physician in the Canadian Arctic, Alaska, and northern Mexico*

Born in Galena, Illinois, Frederick Schwatka was 10 years old when he moved with his family to Salem, Oregon. He entered West Point in 1867, graduating in 1871 as a second lieutenant in the U.S. Army, attached to the cavalry. Over the next several years, he served at various posts throughout the United States and also pursued the study of law and medicine. In 1875, he was admitted to the bar in Nebraska, and, in 1876, he was granted a medical degree from New York's Bellevue Hospital Medical College.

Schwatka had in the meantime developed a keen interest in confirming the fate of SIR JOHN FRANKLIN and his expedition, which had been missing in the Canadian Arctic since 1845. After nearly three decades of search efforts, it was known that the ships had become icebound near King William Island and some of the 127 members of the expedition had perished, but remains of many of the crew had never been found.

In 1878, Schwatka secured the support of the AMERICAN GEOGRAPHICAL SOCIETY and a whaling company for a search effort of his own, hoping to finally resolve the mystery of what had happened to Franklin. He sailed from New York on June 19, 1878, accompanied by William H. Gilder, a newspaperman who covered the expedition for the *New York Herald*.

Schwatka planned to establish a base camp at Repulse Bay on the northwest corner of HUDSON BAY, then travel overland to the Back River Estuary and King William Island. Rough weather and ice conditions led to a change of plans, and the camp was set up farther to the south near Chesterfield Inlet. The expedition wintered there, making friendly contacts with Inuit.

In spring 1879, Schwatka, Gilder, and a party of 12 Inuit, including women and children, set out on a sledge journey to the northwest. They reached a river that they named the Hayes River after President Rutherford B. Hayes; they descended it northward, then went overland to the Back River Estuary. From elderly Inuit in the area, Schwatka heard eyewitness accounts of whites dying on the shores of the northern Adelaide Peninsula many years before.

As planned, Schwatka reached King William Island in summer 1879. With the ground then clear of snow and ice, he was able to find several graves and artifacts of the Franklin expedition that previous search expeditions had missed. Moreover, Schwatka learned from Inuit on King William Island that books and papers, probably the expedition's official journals, had been left abandoned on the shore at a site near Starvation Cove by the last of the dying men.

Schwatka's intensive exploration of King William Island also yielded some exposed human remains which, on the basis of personal effects found nearby, were subsequently identified as those of one of Franklin's officers. His men also scoured King William Island as far as Cape Felix, its northernmost point. After covering almost 3,000 miles in nearly a year, the expedition traveled back to the base camp on Hudson Bay. Schwatka and his expedition returned to New York in spring 1880, where his exploits were related in Gilder's stories in the *New York Herald*. Popularly known as "Schwatka's Search," the expedition had the distinction of making the longest sledge journey on record.

Schwatka explored the Yukon River in Alaska in 1883–84, and in 1886, after resigning from the army, he undertook an expedition to Alaska, sponsored by the *New York Times*. In 1890, he went to northern Mexico's Chihuahua state, where he visited the land of the Tarahumari Indians. He wrote about his Arctic experiences in his book *Children of the Cold* (1886) and described his explorations on the Yukon in his *Along Alaska's Great River* (1885). An account of his expedition into northern Mexico was published posthumously in *Land of the Cave and Cliff Dweller* in 1893.

Frederick Schwatka's 1878–80 expedition about what happened to the Franklin expedition, ended 30 years of

continuing speculation and confirmed what SIR LEOPOLD FRANCIS McCLINTOCK had determined in 1859. Schwatka also demonstrated that one could survive in the Arctic for extended periods, unaided from the outside world, with the adoption of Inuit survival skills.

Schweinfurth, Georg August (1836–1925)

German naturalist in East Africa

Born in the Latvian city of Riga to a family of German descent, Georg Schweinfurth attended universities in Heidelberg, Munich, and Berlin, where he studied the natural sciences, specializing in geology and botany.

Schweinfurth first traveled to Africa on a specimen-collecting expedition in 1862, in which he ascended the NILE RIVER as far as Khartoum in the Sudan. Based on the results of his botanical research there, he subsequently won the support of a Berlin scientific institute for an extensive exploration into the equatorial region of East Africa.

In 1864, Schweinfurth traveled down the east coast of the RED SEA, then headed inland across northern Ethiopia, returning to Khartoum after a westward trek through the Sudan.

Schweinfurth's most extensive exploration into East Africa began in 1868. He sailed south from Suez, and, after again reaching the Nile from the east, ascended the river to its northern tributaries. He continued southward, then headed westward from the White Nile toward what is now the Central African Republic and Democratic Republic of the Congo. After exploring the watershed region between the White Nile River and the upper CONGO RIVER (Zaire River), he reached the Bahr-el-Jebel River.

On March 19, 1870, Schweinfurth came upon a previously uncharted river, which he believed to be the Chari, flowing northward into Lake Chad. It was later determined that he had actually located the Uele River, a tributary of the Ubangi-Congo river system.

After 1871, Schweinfurth turned his attention to the unknown desert regions of northeastern Africa, accompanying FRIEDRICH GERHARD ROHLFS in his expedition across Libya into western Egypt in the mid-1870s. In 1875, he established a geographical society in Cairo, which served as his base of operations for a number of expeditions into the Arabian Peninsula, including an exploration into Yemen in 1888.

Georg Schweinfurth detailed his explorations in East Africa in his two-volume work *The Heart of Africa*, first published in 1873. His 1868–71 explorations along the White Nile and into the Congo marked the first time both rivers had been reached within the course of a single expedition. In his journey into the watershed region between the upper Congo and White Nile, he made the first European contact with the Mittoo and Loobah tribes, the women members of which practiced the art of lip enlargement to enhance their

appearance. He was also the first modern European to encounter the Akka Pygmies of East Africa, whose existence had been mentioned in the ancient Greek writings of Homer and HERODOTUS.

Scoresby, William, Jr. (1789–1857) *British mariner, scientist in the Arctic, son of William Scoresby, Sr.*

Born in the seaport town of Whitby in Yorkshire, England, William Scoresby, Jr., was the son of whaling captain and Arctic navigator WILLIAM SCORESBY, SR. The younger Scoresby developed an early interest in science, studying under the naturalist SIR JOSEPH BANKS of the ROYAL SOCIETY. Starting in 1803, he accompanied his father on annual whaling voyages to the polar seas between Spitsbergen (present-day Svalbard) and the east coast of GREENLAND, in the course of which he undertook field studies in meteorology, oceanography, and the natural history of the Arctic. He joined his father in an Arctic whaling expedition in 1806, during which they reached, east of Greenland, the northernmost point anyone had been until that time.

On a voyage in 1813, Scoresby's ocean-temperature readings revealed the Arctic seas to be warmer at great depths than they were at the surface. In 1817, after returning from an Arctic voyage, Scoresby and his father informed Joseph Banks that the climate in the Arctic was moderating, and that the PACK ICE north of Spitsbergen appeared to be receding. Banks related the news to SIR JOHN BARROW of the British navy, who immediately initiated a campaign of Arctic exploration, including an assault on the NORTH POLE, as well as renewed efforts to locate the NORTHWEST PASSAGE in the Canadian Arctic. In 1818, an expedition commanded by SIR JOHN ROSS, assisted by SIR WILLIAM EDWARD PARRY, set out to search for the Northwest Passage in Baffin Bay and Lancaster Sound, while another expedition, commanded by DAVID BUCHAN and SIR JOHN FRANKLIN, attempted to sail northward from Spitsbergen and cross the Arctic Ocean by way of the North Pole.

Scoresby made his last Arctic voyage in 1822, in which he reached Greenland's east coast as far as 75° north latitude, then explored southward, examining over 400 miles of coastline.

William Scoresby, Jr., pioneered the scientific study of the Arctic. In 1825, he left the whaling business to become an Anglican priest, remaining a strong supporter of British naval efforts to find the Northwest Passage. He continued his scientific work, undertaking a voyage to Australia in 1856 to study terrestrial magnetism. His 1820 book, *Account of the Arctic Regions with a History and Description of the Northern Whale-Fishery*, was the first modern geographic and scientific study of the Arctic, providing details on terrestrial magnetism, Arctic plant and animal life, climate, and ocean temperatures.

Scoresby, William, Sr. (1760–1829) *British whaler in the Arctic, father of William Scoresby, Jr.*

William Scoresby, Sr., was born in Whitby, in Yorkshire, England, the son of a farmer. He first went to sea in his early twenties, and by 1791, he was the captain of his own whaling ship, the *Resolution*.

In his career as a whaler, Scoresby made annual voyages to the Greenland Sea, between eastern GREENLAND and Spitsbergen (present-day Svalbard), accompanied after 1803 by his son, WILLIAM SCORESBY, JR. On one expedition in these waters, he set a farthest-north record, sailing his ship to 81°30' north latitude, which he reached on May 25, 1806—a point within 500 miles of the NORTH POLE.

In 1817, following another voyage to the Arctic, Scoresby and his son reported to SIR JOSEPH BANKS on the moderating ice conditions north of Spitsbergen, information that subsequently inspired renewed interest in Arctic exploration by the British navy.

William Scoresby, Sr., retired from the sea in 1823. In his years in the Arctic, he had pioneered techniques of ice navigation that proved to be essential to Arctic seaward exploration throughout the rest of the 19th century. His report with his son on ice conditions inspired the great land and sea expeditions into the Arctic regions undertaken by the British navy for the next 60 years. In recognition of the geographic and scientific reconnaissance undertaken by Scoresby and his son, the coastal region of that part of eastern Greenland is called Scoresby Land, and an arm of the Greenland Sea, which extends inland into the region for more than 180 miles, is known as Scoresby Sound.

Scott, Robert Falcon (1868–1912) *British naval officer, explorer in Antarctica*

Robert Falcon Scott was born at Davenport in Devonshire, England. At the age of 14, he entered the Royal Navy as a cadet, and later, promoted to lieutenant, served with the British fleet in the Caribbean.

In 1899, with the help of Sir Clements Markham of the ROYAL GEOGRAPHICAL SOCIETY, Scott won an appointment as commander of the British National Antarctic Expedition. Jointly sponsored by the ROYAL SOCIETY and the Royal Geographical Society, and equipped with the Royal Navy vessel the *Discovery*, Scott and the expedition departed England in August 1901.

Scott sailed to Antarctica by way of NEW ZEALAND, landing at Cape Adare on the edge of the Ross Sea in January 1902. He proceeded to Ross Island, where he established a base camp at Hut Point on McMurdo Sound.

From his McMurdo Sound base, Scott undertook several explorations of the Antarctic interior. With expedition members ERNEST HENRY SHACKLETON, EDWARD ADRIAN WILSON, and Frank Wild, he explored the coast of Victoria

Land and the Ross Ice Shelf. He reached a peninsula, which he named Edward VII Land. He also proved that Mount Erebus and Mount Terror were not on the mainland but were situated on an island, which he named Ross Island, after SIR JAMES CLARK ROSS. Additionally, his explorations revealed that McMurdo Sound, then thought to be a bay, was actually a strait between Ross Island and the Antarctic mainland.

Scott's chief accomplishment on his first Antarctic expedition was a 200-mile trek southward across the Ross Ice Shelf toward the SOUTH POLE. Accompanied by Shackleton and Wilson, Scott reached a latitude of 82° 17' south, 500 miles from the South Pole, and the farthest point south reached until then. During the Antarctic summer season of 1903, Scott explored westward from McMurdo Sound into the Ferrar Glacier and explored the Polar Plateau region to an altitude of over 9,000 feet.

With the arrival of relief ships in early 1904, Scott and the expedition left the Antarctic, returning to England with a great deal of scientific and topographic data.

Promoted to captain, Scott returned to naval service. In 1909, he began to organize another expedition, this time with plans to reach the South Pole. In June 1910, Scott sailed from England aboard the *Terra Nova*, accompanied by some veteran members of his first expedition, including scientist Edward Wilson. En route, while stopping at Melbourne, Australia, Scott received a telegram from Norwegian polar explorer ROALD ENGELBREGT GRAVNING AMUNDSEN, stating that he also was headed for the Antarctic and, like Scott, intended to make an attempt on the South Pole.

By late January 1911, Scott's second Antarctic expedition reached Ross Island on McMurdo Sound and established its headquarters at Cape Evans. Amundsen had meanwhile set up his base at the Bay of Whales, on the opposite side of the Ross Ice Shelf, 60 miles closer to the South Pole.

Over the next year, Scott and his party established a series of food and fuel depots along their proposed route to the South Pole. In June 1911, Wilson led a party investigating Cape Crozier, where they studied the breeding habits of the emperor penguins.

On November 1, 1911, Scott's team set out from McMurdo Sound, equipped with Manchurian ponies, motorized sledges (tractor-type vehicles), and dogs. He intended to reach the Polar Plateau by way of the Beardmore Glacier, a route Shackleton had pioneered several years earlier. By January 4, Scott's party reached the edge of the Polar Plateau. By then the motorized sledges had broken down. The ponies, weakened by the ordeal, had to be destroyed. The support group returned to McMurdo Sound on sledges pulled by the dogs.

Scott, Wilson, and expedition members Lawrence Oates, Edgar Evans, and Henry Bowers proceeded onward

to the South Pole, hauling sledges themselves. On January 12, 1912, they reached the South Pole, only to find a marker and letters from Amundsen, indicating that the Norwegian expedition had been there 33 days earlier. On the return journey, Scott and his party were plagued by severe weather conditions. At the end of March, they were delayed by a nine-day blizzard. Exhausted and suffering from frostbite and starvation, Scott and his men had perished when a search party located their bodies in November, at a point only 11 miles from a supply depot. Diaries and letters left by Scott and his companions revealed what had happened.

Although Amundsen won the race to the South Pole, it was Robert Falcon Scott and his party who first reached this objective solely by manpower, without sled dogs. In addition, Scott's two expeditions brought back a great deal of scientific and topographical data.

Scylax (Scylax of Caria, Scylax of Caryanda)

(fl. late 500s B.C.) *Greek mariner along the Indus River, Arabian Sea, and Red Sea, in service to Persia*

Scylax was a Greek from Caria, an ancient region settled by Greeks and located in present-day southwest Turkey. He became an accomplished mariner.

According to the Greek historian HERODOTUS of the fifth century B.C., Scylax was sent by Darius I, emperor of Persia (present-day Iran), on an exploratory expedition to determine the course of the INDUS RIVER in 510 B.C. After traveling overland through the Near East, he is thought to have entered the Indus from the Kabul River near the present-day town of Attock, Pakistan. He then reportedly followed it to the Arabian Sea, proceeded westward along the coast of what is now southwestern Pakistan and southeastern Iran, continued southwestward along the coast of present-day Oman to the Gulf of Aden, then went up the RED SEA to the Gulf of Suez from where he returned to Persia in 507.

Scylax provided valuable geographic material for Darius's military endeavors. Some of his descriptions were fantastic, such as those of one-eyed men or giant-eared men. He was the first European observer to give an account of India and the first known Greek to sail in the Red Sea.

Selkirk, Alexander (Alexander Sealchriag, Alexander Selcraig) (1676–1721) *Scottish mariner in the eastern Pacific*

Alexander Selkirk was born in Largo on the east coast of Scotland, the seventh son of a shoemaker. At the age of 19, he went to sea to avoid facing criminal charges for an incident in which he allegedly behaved indecently at church.

Selkirk returned to Largo in 1701. He soon found himself in trouble with local authorities again, reportedly for fighting in public along with his brothers. In 1703, he

joined an expedition of PRIVATEERS under WILLIAM DAMPIER to the Pacific coast of South America, serving as sailing master on the *Cinque Ports Gallery*.

In September 1704, while off Mas Tierra, one of the Juan Fernandez Islands, about 400 miles west of Valparaíso, Chile, Selkirk became embroiled in a dispute with the ship's captain, which led to his being put ashore at his own request. Although he later changed his mind, he was left behind when the ship sailed.

Selkirk managed to survive fairly well on Mas Tierra over the next four years. He built a shelter and hunted the island's wild goats. In January 1709, he was picked up by another British privateering vessel, commanded by Captain Woodes Rogers and piloted by Dampier. On Dampier's recommendation, Selkirk was made an officer on the ship. After taking part in a series of lucrative raids on Spanish shipping, he returned to England by way of the CAPE OF GOOD HOPE, completing a journey that had taken him around the world.

Selkirk landed in London on October 14, 1711. In spring 1712, he returned to his hometown in Scotland, after an absence of 10 years. His share of the booty taken on his return voyage amounted to £800, which at that time was enough money to make him a man of moderate wealth. He stayed in Largo for only a brief time, reportedly living as a recluse. He took to practicing meditation in a cave-like refuge he built in his father's garden. His behavior at this time may have been a result of his four years of isolation on Mas Tierra Island.

Accounts of Selkirk's experience marooned on an East Pacific island began to appear soon after his return to England. His story was included in Captain Woodes Rogers's *A Cruising Voyage round the World*, published in 1712. The work describes how, in the first days after his rescue, Selkirk had trouble returning to the use of speech and could not immediately get accustomed to eating the food on board the ship. Also in 1712, Selkirk's own account was published as a pamphlet entitled, *Providence Displayed, or a Surprising Account of One Alexander Selkirk . . . written by his own hand*.

By September 1713, Selkirk had left Largo with a young woman named Sophia Bruce. They first went to Bristol, where court records indicate Selkirk was charged with assaulting a shipwright named Richard Nettle. He and Sophia next went to London where they lived together in a common-law marriage for the next several years.

London journalist Sir Richard Steele interviewed Selkirk, publishing an account of the Scottish sailor's adventures in his periodical *The Englishman* in December 1713. Selkirk's story came to the attention of English journalist and novelist Daniel Defoe, who used it as a source for his 1719 novel *Robinson Crusoe*.

In about 1718, Selkirk left Sophia and married a widow named Frances Candis. He then resumed his seafaring ca-

reer, and in October 1720, he sailed as a lieutenant on a British naval vessel, the *Weymouth*. This proved to be his last ship. He died while on board in December 1721.

The island on which Alexander Selkirk was marooned became known as Isla Robinson Crusoe, and another of the Juan Fernandez islands was renamed Isla Alejandro Selkirk, after him. In 1868, the crew of a visiting British navy vessel left a plaque on Mas Tierra, proclaiming it as the site of his four-year stay. In addition, the town of Largo, Scotland, erected a bronze statue in his honor, commemorating him as the real-life inspiration for the fictional character Robinson Crusoe.

Semyonov, Pyotr Petrovich (Peter Semenov, Pyotr Semyonov-Tianshansky) (1827–1914)

Russian geographer, astronomer in central Asia

Pyotr Semyonov was born in the Russian town of Urusovo. A member of an aristocratic family, he studied geography and natural history in Russia and went on to study astronomy in Berlin, where he became acquainted with German naturalist and explorer ALEXANDER VON HUMBOLDT.

Semyonov was among the first Europeans to venture into the little-known Tian Shan Mountains along Russia's frontier with northwestern China. This range, known as the "Celestial Mountains," comprises a mountain system larger than all the mountain ranges of Europe combined. In his 1857 expedition into the region, Semyonov made an ascent of Khan Tengri, one of the highest peaks in the Tian Shan range.

In 1858, Semyonov extended his explorations into northwestern China, traveling throughout the Dzungaria region and the Altai Mountains. Thirty years later, in 1888, he took part in a scientific survey into Russian Turkestan and the territory east of the Caspian Sea.

Pyotr Semyonov initiated modern Russian exploration of central Asia. In the years when Russia was pushing eastward in its campaign of conquest and expansion in south-central Asia, his explorations provided vital geographic information about the region between the Pamirs and western China. As the first European known to have traversed the Tian Shan Mountains, he was referred to as Pyotr Semyonov-Tianshansky. He also made the first known identification of several mountains and glaciers in the Tian Shan and Altai ranges, and these were later also named in his honor.

Sequeira, Diego López de (Diego López de Sequeira) (ca. 1465–ca. 1520) *Portuguese mariner, soldier in India and the East Indies*

Diego López de Sequeira was a soldier and seafarer in service to King Manuel I of Portugal. In 1508, he was given com-

mand of a naval expedition to reconnoiter the port city of Malacca, an important center for the SPICE TRADE on the southern end of the Malay Peninsula.

Sequeira and his fleet sailed from Lisbon in summer 1508, arriving at Calicut on the west coast of India in April 1509. From there, he rounded the tip of India, and, after making an eastward crossing of the Bay of Bengal, he arrived at Malacca in September 1509.

Sequeira and his men encountered a variety of kinds of ships from Middle Eastern and Asian ports, including Arab DHOWS, Japanese or Chinese JUNKS—and outrigger CANOES from the South Pacific islands. At that time, in addition to spices, Malacca was a center for the trade in sandalwood from Indonesia, porcelain from China, precious stones from CEYLON (present-day Sri Lanka), as well as concubines from the Circassian region, east of the Black Sea.

Although Sequeira made an attempt to pose as a merchant trader, the local sultan had been warned in advance of his true purpose, based on earlier Portuguese conquests along India's Malabar Coast. A Portuguese delegation ashore was massacred in a surprise attack, and, in the ensuing battle aboard his ships in the harbor, Sequeira lost one-third of his crew. Forced to withdraw eastward through the Strait of Malacca, he rounded the southeastern tip of Sumatra and returned to the Portuguese trading settlement at Calicut on India's southwest coast, thus completing the first European circumnavigation of Sumatra.

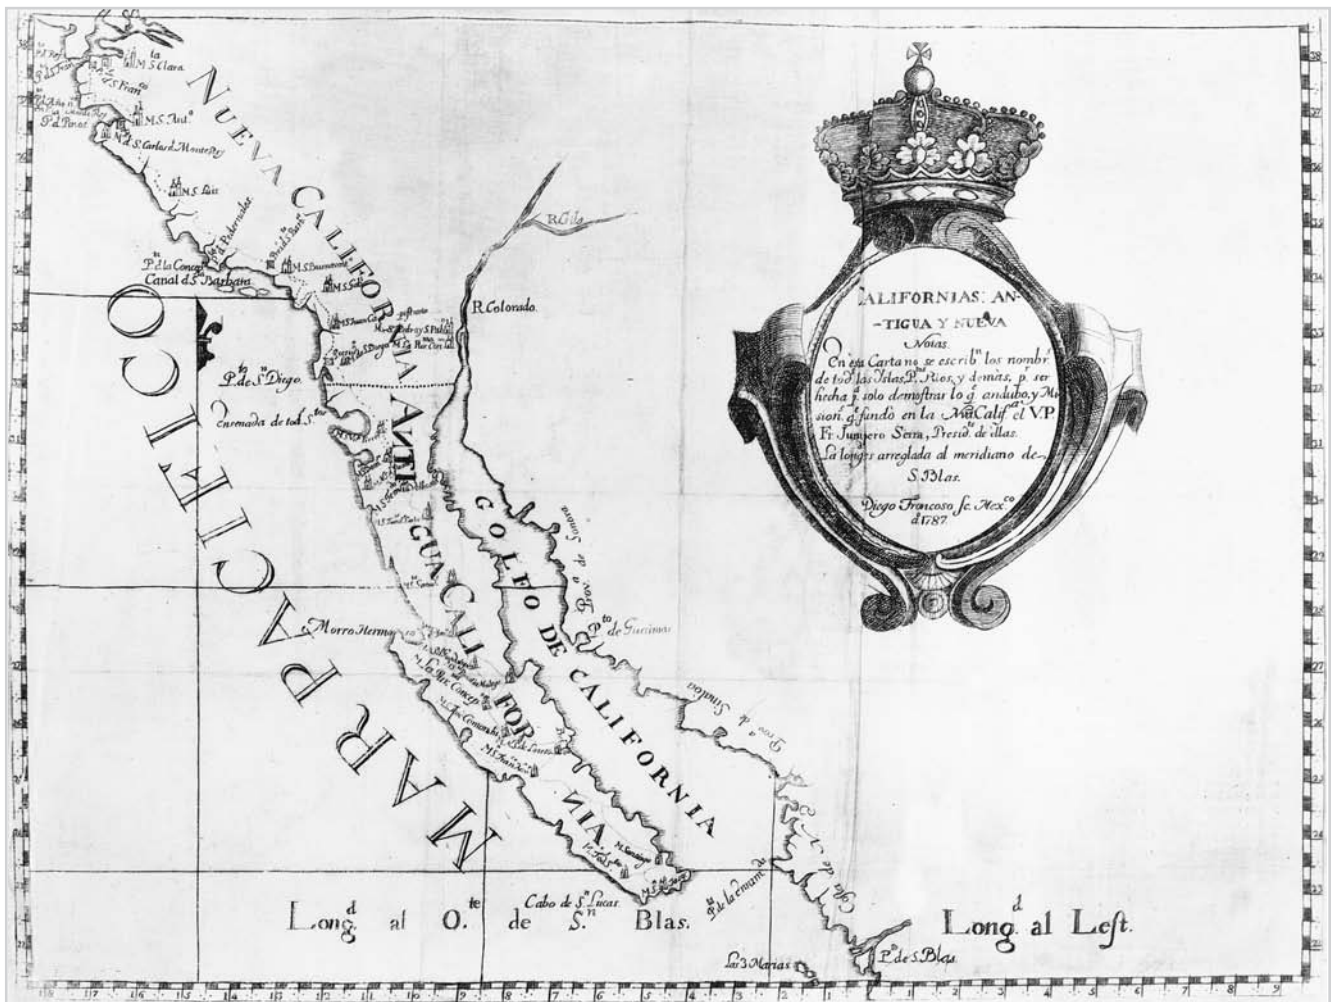

Diego López de Sequeira's expedition brought back to Europe the first news of the riches of the EAST INDIES. Among his officers were FERDINAND MAGELLAN and FRANCISCO SERRANO. Inspired by his experience in Malacca with Sequeira, Magellan launched his own expedition to the East Indies, resulting in the first round-the-world voyage in history.

Serra, Junípero (Miguel José Serra) (1713–1784)

Spanish missionary in California

Junípero Serra was born on the Spanish Mediterranean island of Majorca. Originally known as Miguel José Serra, he adopted the religious name Junípero on entering the Franciscan order in 1730. He eventually became a professor of theology and philosophy at the university in Palma, Majorca's main city.

In 1749, Serra left the academic life, sailing that year from Cádiz, Spain, for Mexico as a Franciscan missionary. He arrived in Mexico City in early 1750, and during the next 18 years, he worked among the Indians of the Sierra Gordo region and also taught at Mexico City's College of San Fernando. In 1768, following the removal of the Jesuits, Serra was named head of the Franciscan missions in Baja California.

Detail of map showing the California missions of Junípero Serra (1787) (Library of Congress)

In 1769, Serra was appointed by Spanish colonial administrator José de Galvez to lead a contingent of missionaries as part of GASPAR DE PORTOLÁ's overland expedition into what is now the state of California. From Loreto, Mexico, on the lower end of the Baja California peninsula, Serra and a small group of priests headed northward. Traveling by land and sea for six weeks, they arrived at San Diego Bay in early July 1769. There, on July 16, 1769, Serra founded San Diego de Alcalá, the first mission and church in present-day California.

Serra remained at the San Diego settlement, while Portolá explored northward in search of Monterey Bay, which supposedly had been reached by Spanish explorer SEBASTIÁN VISCAÍNO in 1602. A supply ship, the *San Antonio*, reached San Diego in March 1770. Serra sailed on it northward along the coast, joining Portolá at Monterey. There, on June 3, 1770, Serra founded the second Franciscan mission in California, San Carlos de Borromeo. In December 1771, he moved it several miles to the north near what is now Carmel, California.

In 1772, when Indian attacks led to shortages of food and other supplies at the San Diego colony, Serra walked almost 250 miles into Sonora, Mexico, to obtain aid. He was accompanied on this journey by only one Indian boy. From Sonora, Serra went to Mexico City, where he urged Spanish colonial officials to establish overland supply routes to California from northern Mexico and present-day Arizona.

Serra returned to the Carmel mission to continue his work among the Indians. Over the next decade, he established seven more missions between Monterey and San Diego. Among these were San Gabriel Arcangel, founded in September 1771, which subsequently developed into the city of Los Angeles. Other well-known missions established by Serra were San Luis Obispo in 1772, and San Juan Capistrano and San Francisco de Asis in 1776.

To link the settlements, Serra oversaw the development of a trail along the California coast, which came to be known as El Camino Real (the royal road, or king's highway). Along this route, also known as the Old Mission

Trail, the earliest established north-south road in California, Serra founded additional missions, approximately one day's journey, or 30 miles, apart, between San Diego and San Carlos de Borromeo at Carmel.

Serra died at the Carmel mission in 1784. In 1985, in recognition of his work as a missionary to the Indians, the Catholic Church beatified him, a preliminary step in elevation to sainthood.

Father Junípero Serra's successful colonizing efforts inspired JUAN BAUTISTA DE ANZA's overland expedition from Arizona to the California coast in 1774. The 500-mile-long El Camino Real that he developed became a key transportation and communication link in California and was extended by his successors northward beyond the Golden Gate of San Francisco Bay. The San Gabriel Arcangel mission at present-day Los Angeles became the western terminus for

Junípero Serra (Library of Congress)

the Old Spanish Trail and for the emigrant route from Salt Lake City.

Serrano, Francisco (Francisco Serrão)

(unknown–1521) *Portuguese mariner, trader in the East Indies*

Francisco Serrano was probably born in Portugal, although there are few details of his origins or early life. Starting in 1505, Serrano, together with his long-time friend FERDINAND MAGELLAN, took part in Portuguese voyages to the Malabar Coast of southwestern India, where he fought in the conquest of the trading centers at Goa, Calicut, and Cochin. In 1508–09, he joined Magellan in DIEGO LÓPEZ DE SEQUIRA's expedition to the Malayan port of Malacca, narrowly escaping with his life when the sultan's forces launched a surprise attack against the visiting Portuguese.

In 1511, Serrano returned to Malacca with a naval force under AFONSO DE ALBUQUERQUE and António de Abreu, which brought that strategically located port under Portuguese domination. Later that year, he commanded the *Sabaia*, one of a fleet of Portuguese vessels sent to investigate the SPICE ISLANDS (the Moluccas) of present-day Indonesia to the east. Another of the expedition's ships was captained by Magellan.

At Amboina in the Spice Islands, Serrano obtained a valuable cargo of nutmeg. On the homeward voyage, his ship was wrecked on a reef and lost, while the other vessels continued back to India. Serrano meanwhile managed to capture a Malay pirate ship with which he explored the north coast of Java, then returned to Amboina. The local sultan on Amboina appointed him as his viceroy to the island of Ternate, where he married a native princess and settled.

In 1513, Serrano established a Portuguese trading fort on Ternate. Over the next several years, he wrote letters to Magellan in Portugal describing the abundance of nutmeg in the Spice Islands and the great commercial potential for European traders.

In early 1521, soon after he had concluded a trade agreement with the nearby island of Tidore, Serrano was poisoned, either on orders of the sultan of Tidore or by rival Portuguese merchants jealous of his influence with the native rulers. Serrano died on Ternate a few days afterward. Eight months later, the remaining ships of Magellan's fleet arrived at Ternate from the Philippines, after the first navigation of the STRAIT OF MAGELLAN. Magellan, who had been killed in the Philippines several months earlier, had planned to meet his old friend on Ternate and, with his help, initiate a lucrative trade in spices.

Francisco Serrano was one of the first Europeans to visit Java, as well as the islands of Ternate and Tidore, since the homeward voyage of MARCO POLO in the early 1290s. Magellan, informed by Serrano of the latitude of Ternate and

Tidore, was inspired to seek a westward route through the Americas, and across the South Pacific Ocean, to the Spice Islands. In this way, Serrano's reports to Magellan helped lead to the first round-the-world voyage.

Shackleton, Sir Ernest Henry (1874–1922)

British mariner, explorer in the Antarctic and South Atlantic

Ernest Henry Shackleton was born in Kilkee, Ireland, the son of a doctor. At the age of 16, after attending Dulwich College in London, he went to sea with the merchant marine.

After 10 years of service on merchant vessels, Shackleton secured an appointment as one of ROBERT FALCON SCOTT's lieutenants in the British National Antarctic Expedition of 1901–04. While at the McMurdo Sound base camp in February 1902, he made a BALLOON ascent in which he took the first aerial photos of the Antarctic.

In November 1902, Shackleton accompanied Scott and the expedition's zoologist, EDWARD ADRIAN WILSON, on an exploration of the Ross Ice Shelf. Using dog sledges, they headed southward, attaining 82°71' south latitude, within 500 miles of the SOUTH POLE and setting a new record for the farthest point south ever reached. They turned back at a location on the Ross Ice Shelf known afterward as Shackleton Inlet, unable to find a pass through the high mountain barrier blocking progress toward the South Pole.

Shackleton, Scott, and Wilson all suffered from SCURVY on the journey back to McMurdo Sound. While Scott and Wilson soon recovered, Shackleton did not and, still in a weakened state, he was compelled to return to England aboard the supply ship *Morning* in March 1903.

On regaining his health, Shackleton tried without success to obtain a commission in the British navy. In 1904, he married and settled in Edinburgh. While serving as secretary to the Scottish Geographical Society, he raised support for his own Antarctic expedition. By 1907, with the financial backing of British industrialist William Beardmore, Shackleton was able to organize what became known as the British Antarctic Expedition.

In July 1907, Shackleton and his team sailed from England on the *Nimrod*. Following a stopover in New Zealand, they reached Antarctica's Ross Sea coast in January 1908, where they established a base at Hut Point, the site of Scott's former encampment. One group, which included SIR DOUGLAS MAWSON, ascended Mount Erebus and reached the SOUTH MAGNETIC POLE; Shackleton and another team set out for the geographic South Pole in fall 1908.

Using sledges pulled by Manchurian ponies, the Shackleton party headed southward across the Ross Ice Shelf. Although their progress was blocked by the 10,000-foot-high Transantarctic Range, they managed to continue southward by ascending a glacier, which Shackleton called the Beard-

more Glacier after his patron. The two-week ascent cost Shackleton and his companies valuable time. Although they continued their trek across the Polar Plateau to within 97 miles of the South Pole, on January 9, 1909, Shackleton decided to turn back, determining that, with the loss of the ponies and their food supplies running low, they would not reach their goal with enough provisions to survive a return trip to base camp.

Upon his return to England in June 1909, Shackleton was heaped with honors, including a knighthood. He had brought back fossils from deep within the interior of the Antarctic and had reported the discovery of seams of coal in the Transantarctic Range. His 1,725-mile trek inland had revealed that the South Pole was located on the 10,000-foot-high Polar Plateau. Moreover, his expedition had taken the first motion pictures in Antarctica and made the first use of an automobile on the continent.

Less than three years after ROALD ENGELBREGT GRAVNING AMUNDSEN had reached the South Pole in 1911, Shackleton set out on the Imperial Trans-Antarctic Expedition, in which he planned to cross the Antarctic continent, from the Weddell Sea to the Ross Sea. With a crew of 27 men, he sailed from England in August 1914, just days after the outbreak of World War I. His ship, the *Endurance*, entered the Weddell Sea, where ice conditions prevented a landing. In January 1915, the ship became icebound off Vahsel Bay and, after 11 months of drifting, it was crushed. Meanwhile, Shackleton and his crew had abandoned the vessel, taking to the surrounding ice floes with small boats and what provisions they could salvage. They drifted for another three months on the ice, and, in April 1915, they managed to land on Elephant Island, off the tip of the Antarctic Peninsula.

Shackleton left 22 of his men on Elephant Island and with five others undertook a hazardous voyage in the *James Caird*, a modified open boat, across almost 1,000 miles of Antarctic seas, to the whaling station on South Georgia Island. They landed on the uninhabited side of South Georgia and had to make an overland crossing of the glaciers and mountains of the island's interior to reach the whaling settlement at Stromness. Using improvised ice-climbing equipment, Shackleton made the trip and sent a ship to pick up the men on the opposite side of the island. After several attempts, he managed to reach the men he had left on Elephant Island, rescuing them with the Chilean tugboat *Yelcho* in August 1916.

Shackleton returned to England to take part in the last phase of World War I, serving with a naval expedition to northern Russia in 1917–18. In 1921, he mounted his last Antarctic expedition, intending to explore Enderby Land on the little-known Indian Ocean coast of the continent. While aboard his ship, the *Quest*, off South Georgia Island, he died of a heart attack in early January 1922.

Sir Ernest Henry Shackleton recounted his 1907–09 expedition in his book *The Heart of the Antarctic* (1909) and told the story of his exploits in the Weddell Sea and South Georgia Island in *South* (1919). The overland crossing of Antarctica, the object of his 1914–16 expedition, was not achieved until the INTERNATIONAL GEOPHYSICAL YEAR of 1957–58, by SIR EDMUND PERCIVAL HILLARY and SIR VIVIAN ERNEST FUCHS. Shackleton pioneered the Beardmore Glacier route in 1908–09, which the ill-fated Scott expedition used to reach the South Pole in 1911–12. In the course of his disastrous 1914–17 expedition, Shackleton carried out one of the most heroic and dangerous rescue missions in the history of Antarctic exploration. He made the first examination of the Atlantic coast of Antarctica since it was explored by JAMES WEDDELL in 1822. Along that section of the Weddell seacoast, he discovered an uncharted section of shoreline, which he named the Caird Coast after the small boat on which he had made his heroic voyage to South Georgia Island. On the final leg of that journey, he made the first crossing of South Georgia Island. The Shackleton Ice Shelf on the Indian Ocean coast of Antarctica was later named for him.

Sheldon, May French (Mary French Sheldon, Bebe Bwana) (1847–1936) *American publisher, writer in central Africa*

May French Sheldon (her original given name was Mary) was born in Beaver, Pennsylvania, near Pittsburgh. Her father, Joseph French, was an engineer; her mother, Dr. Elizabeth Poorman French, was a physician. After her formal education, Sheldon entered the publishing business; by 1876, she was the owner of Saxon & Company, a London publishing house. That year, she married Eli Lemon Sheldon, an American banker and publisher living in London.

In London, Sheldon became a friend of SIR HENRY MORTON STANLEY, and she was inspired by his accounts of his years of exploration and travel in central Africa. Soon after Stanley had returned from his final expedition in 1890, she resolved to undertake an African journey of her own, financed by her husband.

Sheldon's interest in Africa was not limited to exploration. She was also concerned over the impact of colonization on the native population, especially in east-central Africa, where, by 1890, both England and Germany had each established a strong colonial foothold. She hoped her expedition would demonstrate that Europeans could gain the native people's cooperation with friendship instead of force.

In 1891, Sheldon arrived in Mombasa on the coast of what is now Kenya. She planned to travel inland to MOUNT KILIMANJARO in central Africa and, along the way, establish friendly contacts with many of the tribes of the surround-

ing territory. The expedition that she organized and led inland from Mombasa included 103 porters, guides, and servants, whom Sheldon had hired with the help of the sultan of Zanzibar. He also provided her with a letter of safe conduct to ensure her peaceful passage through his domain in what is now Tanzania.

Near Mount Kilimanjaro, Sheldon visited the village of Taveta, where she found a recently established British trading post. There were also plantations producing corn, tobacco, and sugar cane. She became the first European to witness a native rite known as the "moon dance," performed by men at a funeral ceremony.

While her expedition remained at Taveta, Sheldon explored the surrounding territory with a small group of porters and an official from the British trading post. She came upon Lake Chala, a circular lake formed from the crater of an extinct volcano. In a copper boat left behind by SAMUEL TELEKI's expedition of several years before, she explored the waters, becoming one of the first Europeans to do so. She then rejoined the rest of the expedition and ascended 4,700 feet up the slopes of Kilimanjaro to the native settlement of Kimangelia, where she met with the local sultan. Sheldon became an object of great curiosity for the people from the region, who flocked to the village by the thousands to catch their first glimpse of a white woman. She became known locally as Bebe Bwana for "woman master" in Swahili.

Sheldon had contact with 35 different tribes on her African journey and distributed many gifts among them. She had intended to visit the Masai, a warlike people much feared by the neighboring tribes. Yet she was forced to turn back at the edge of their territory, when her porters and servants threatened to mutiny if she continued. Near the village of Pangani, Sheldon was hurt in a fall down a ravine. Taken to a nearby German trading post, she recovered enough to return to Mombasa, then travel home to England by ship.

Sheldon soon recovered fully from her injuries and began writing an account of her experiences in east-central Africa. Her work, *Sultan to Sultan*, published in 1892, was a great success in both England and the United States. In 1892, she was made a member of the ROYAL GEOGRAPHICAL SOCIETY. That same year, she embarked on a lecture tour in the United States and presented her experiences to the Congress of Women at the Chicago Columbian Exposition. The text of this address was published in 1894 as "An African Expedition."

Sheldon opposed the creation of plantations in the interior of central Africa and the exploitation of its peoples. Instead, she urged that European powers establish industrial training centers, medical facilities, and churches to improve the lives of its indigenous peoples. In 1903, Sheldon traveled to the Belgian Congo (present-day Democratic

Republic of the Congo), where she observed and supported the Belgian government's colonizing efforts.

Sheldon raised money for the Belgian Red Cross during World War I, and after the war, in 1921, she was awarded the Chevalier de l'Ordre de la Couronne by the Belgian government. She continued to lecture on Africa until the age of 78. She died in London in her 90th year.

May French Sheldon was the first European woman to visit many native villages in present-day Kenya and Tanzania. In addition to winning friends among them, she succeeded in gaining the obedience and support of the natives who accompanied her, with equal measures of unwavering authority and concern for their welfare.

Shelikov, Grigory Ivanovich (Grigori Shelekhov, Gregori Shelikof, Gregor Shelikhov)

(1747–1795) *Russian fur trader in Alaska*

Grigory Shelikov was born at Rylsk in European Russia, just north of the Ukraine. In 1773, he headed eastward to Irkutsk, the Siberian center of the FUR TRADE at the southern end of Lake Baikal.

At Irkutsk, Shelikov was employed by Russian fur-trading entrepreneur Ivana L. Golikov, eventually becoming a partner in Golikov's firm. In 1775, Shelikov traveled to Okhotsk on the Pacific coast of SIBERIA, using it as a base to expand his fur-trading enterprise to the Kamchatka Peninsula, the Kuril Islands to the south, and across the Bering Sea to the westernmost Aleutian Islands.

In 1783, Shelikov organized a trading expedition from Siberia to the Gulf of Alaska. Three ships were specially built at Okhotsk for the voyage. On August 27, he left Okhotsk aboard the *Three Saints*, along with Russian mariners GERASIM ALEKSEYEVICH IZMAILOV and DMITRY IVANOVICH BOCHAROV. They reached Bering Island off the west coast of the Kamchatka Peninsula, where they wintered.

The next spring, Shelikov and his expedition sailed across the Bering Sea to Unalaska Island. From there, they reached Kodiak Island in mid-August 1784.

Shelikov had married a successful Irkutsk businesswoman, Natalia Aleksievna, in 1781. His wife joined him on the 1783 voyage, becoming the first known European woman to visit Alaska.

On September 22, 1784, Shelikov established a settlement on Kodiak Island at a harbor he named Three Saints Bay. During the next two years, he initiated additional explorations of the islands and the coastline of the Gulf of Alaska.

In 1786, Shelikov returned to Irkutsk. He sought backing for a royal trade monopoly from Russian empress Catherine the Great. In 1790, he appointed ALEKSANDR ANDREYEVICH BARANOV as director of his fur-trading enterprise in Alaska.

Shelikov died at Irkutsk in 1795. Four years after his death, Czar Paul I granted his widow and son-in-law, Nikolay Petrovich Rezanov, a royal charter for the RUSSIAN-AMERICAN COMPANY.

Grigory Shelikov's fur-trading post on Kodiak Island became the first permanent non-Indian settlement in what is now the state of Alaska. His fur-trading enterprise firmly established Russian sovereignty over Alaska until 1867, when it was purchased by the United States. Shelikov Strait, which separates Kodiak Island from the mainland, is named in his honor. His book, published in London in 1795 as *Journal of the Voyages to the Coast of North America in 1783–87*, provides one of the earliest accounts of Alaska.

Shepard, Alan Bartlett, Jr. (1923–1998)

American astronaut, first American in space

Alan Shepard was born in East Derry, New Hampshire. He pursued his undergraduate studies at the U.S. Naval Academy, graduating in 1944. After service on a destroyer in World War II, he attended the Navy Test Pilot School in Patuxent River, Maryland, and the Naval War College in Newport, Rhode Island.

In 1959, Shepard was selected as one of the original seven ASTRONAUTS in the NATIONAL AERONAUTICS AND SPACE ADMINISTRATION (NASA) and soon afterward, as the pilot of the first manned American space mission, part of the MERCURY PROGRAM. The former Union of Soviet Socialist Republics (USSR, or the Soviet Union) launched the first human in space, YURY ALEKSEYEVICH GAGARIN, on April 12, 1961. Three weeks later, on May 5, 1961, Shepard became the first American in space. In the *Freedom 7* capsule, he reached a suborbital altitude of 115 miles. The flight lasted 15 minutes, 22 seconds, before the capsule's splash-down by parachute in the Atlantic Ocean, where Shepard was retrieved by helicopter. Virgil Grissom also accomplished a suborbital flight in 1961. JOHN HERSCHELL GLENN, JR., became the first American to orbit Earth in February 1962.

Following surgery to correct an ear condition, Shepard was chosen as commander on the *Apollo 14* Moon mission. The APOLLO PROGRAM had successfully put Americans on the Moon: first, NEIL ALDEN ARMSTRONG and Edwin "Buzz" Aldrin in July 1969, then Pete Conrad and Alan La Vern Bean in November 1969 in the *Apollo 11* and *Apollo 12* missions. *Apollo 13* had been discontinued prematurely. *Apollo 14* took off on January 31, 1971. Shepard and Edgar D. Mitchell landed in the *Antares* lunar module near the Moon's Fra Mauro Crater on February 5, 1971, while Stuart A. Roosa orbited in the *Kitty Hawk* command module. Shepard and Mitchell, transporting equipment in a two-wheeled cart, walked 2.1 miles, and reached a distance of some 4,600 feet from the lunar module. They spent a record

Alan Shepard (Library of Congress)

33.5 hours on the lunar surface, conducting numerous experiments. Splashdown was accomplished in the Pacific Ocean nine days after takeoff.

Alan Shepard was the first American in space and one of the first men to walk on the Moon. He especially captured the public's imagination during the *Apollo 14* mission when he hit golf balls on the Moon.

Sherley, Sir Anthony (Sir Anthony Shirley)

(ca. 1565–ca. 1635) *English soldier of fortune, diplomat in Persia, Russia, and Morocco*

Anthony Sherley was born at Wiston in Sussex, England, the son of a nobleman. He embarked on a military career, serving with the British army in the Netherlands and France in the late 1580s and early 1590s. In 1596, he commanded an expedition of PRIVATEERS against Spanish shipping and settlements in the Caribbean.

Sherley traveled to Persia (present-day Iran) with his brother Robert Sherley in 1598, where he succeeded in ob-

taining some trade concessions for English merchants. He was then made an ambassador by the Persian ruler, Shah Abbas the Great, who sent him on a diplomatic mission to Europe. In 1600, he traveled from the Persian capital at Esfahan, across the Caspian Sea to Moscow, and on to Prague and Rome. His attempts to raise military support in Europe for a proposed Persian campaign against the Turks met with little success.

In 1605, Sherley entered the service of Holy Roman Emperor Rudolf II, who sent him to Morocco. He stayed until 1606, in an abortive attempt to incite the Arabs against the Turks. In 1609, Sherley commanded a Spanish naval expedition in the MEDITERRANEAN SEA against the Turks, which also met with little success. He later retired in Madrid.

Sir Anthony Sherley (who had been knighted early in his career by Henry IV of France, much to the displeasure of his own sovereign, Elizabeth I) was one of the first Englishmen to travel in Persia. His brother Robert remained in Persia as an ambassador until 1627, when he returned to England with THOMAS HERBERT. Sherley's account of his travels in Persia appeared in London in 1613 as *Sir Anthony Sherley: His Relation of his Travels into Persia, the Dangers and Distresses which Befel him in his Passage*.

Shirase, Nobu (1861–1946) *Japanese explorer of the Antarctic*

Nobu Shirase participated in an exploration of the Kuril Islands to the north of Japan in 1893. As a lieutenant in the army, he presented a plan for the first Japanese expedition to the Antarctic and an attempt to reach the SOUTH POLE. He finally gained the support of Shigenobu Okuma, an influential statesman, and managed to raise the necessary funds.

Shirase departed from Tokyo aboard the tiny *Kainan Maru* in December 1910 and after a brief stopover in Wellington, NEW ZEALAND, headed for Antarctica the following February. The expedition sighted Victoria Land in early March but because of poor weather conditions, did not attempt to land. Continuing on through the Ross Sea, they eventually found their passage blocked by PACK ICE, leading to Shirase's decision to turn back for Australia. They reached Sydney at the beginning of May. The ship's captain and several crew members returned to Japan to raise additional funds, while Shirase and the others waited. Living in poverty, they were ridiculed in the Australian and New Zealand press and distrusted by the Australian public. Professor Edgeworth David of the University of Sydney, a former associate of SIR ERNEST HENRY SHACKLETON, became involved, however, and reassured the public regarding the scientific goals of their expedition. Shirase, meanwhile,

abandoned the idea of trying to reach the South Pole and scaled back the expedition to an exploration of King Edward VII Land and the Ross Ice Shelf.

The Japanese expedition set sail for the Antarctic once again in November 1911, reaching the Ross Ice Shelf the following January. At Kainan Bay, so named by the expedition, a party was sent ashore. The expedition then continued westward. Shirase and his men soon encountered another ship, the *Fram*, whose crew awaited ROALD ENGELBREGT GRAVNING AMUNDSEN's return from the South Pole.

While the *Kainan Maru* was moored in the Bay of Whales, Shirase headed the Dash Patrol, as it was called, consisting of seven men, two of whom stayed at a base camp at the edge of the ice shelf, while the others proceeded southward with dog sledges. At the end of January 1912, enduring blizzard conditions, Shirase and his four companions planted a Japanese flag at the top of the ice shelf some 160 miles from their starting point. In the meantime, a second party landed at Biscoe Bay in King Edward VII Land, climbed an ice slope, and reached the foot of the Alexandra Range before returning to the ship. The *Kainan Maru* then returned to the Bay of Whales to pick up the Dash Patrol. After a return stopover at Wellington, the ship reached Japan in June 1912. They were treated as heroes on their return.

Nobu Shirase had the vision to recognize a role for Japan in Antarctic exploration.

Sidi Bombay See BOMBAY, SIDI.

Silva Porto, Antonio Francisco da (1817–1890)
Portuguese trader in central Africa

Antonio da Silva Porto was born in Porto, Portugal, the son of an industrialist. He left home in his early teens, immigrating to Brazil. In 1832, he settled in Portuguese West Africa, present-day Angola.

Silva Porto became a trader, venturing into regions seldom visited by Europeans and dealing with the natives of the interior of the colony. In 1853, at the request of the Portuguese colonial governor, he undertook an expedition inland to locate the source of the ZAMBEZI RIVER. Although he penetrated the upper Zambezi country, he was unable to determine the river's source. Yet, in traveling from the Atlantic coast of Angola to the Zambezi's outlet on the Indian Ocean, he completed the first European crossing of Central Africa from west to east.

Soon after his 1853–54 exploration of the Zambezi River and his crossing of Africa, Antonio da Silva Porto provided assistance to Scottish missionary and physician DAVID LIVINGSTONE, who had also just undertaken an examination of the Zambezi.

Simpson, Sir George (ca. 1792–1860)
Scottish-Canadian director of the Hudson's Bay Company in North America, cousin of Thomas Simpson

George Simpson was born at Loch Broom in western Scotland. In 1809, he went to London, where he worked for his uncle's West Indies Trading Company. In 1820, he joined the HUDSON'S BAY COMPANY, and, that year, he traveled to Canada to take charge of the company's Lake Athabasca posts.

Simpson spent the winter of 1820–21 at Lake Athabasca, and, following the Hudson's Bay Company's merger with the NORTH WEST COMPANY in 1821, he was appointed head of the vast northern department.

In 1824–25, Simpson made his first overland journey across Canada, from York Factory on HUDSON BAY to the company's post on the COLUMBIA RIVER. In 1826, he became governor of all the Hudson's Bay Company operations in North America.

On July 12, 1828, Simpson started out from Hudson Bay on a second cross-continental trip across Canada. Traveling by CANOE with overland portages, he covered 3,260 miles in less than three months, reaching the Pacific coast of British Columbia via the Thompson and Fraser Rivers on October 10, 1828. At that time, it was the longest overland voyage across Canada attempted in one season.

In the mid-1830s, Simpson organized and supported exploring expeditions to the Canadian Arctic, including those of his cousin THOMAS SIMPSON. For his efforts in support of Arctic exploration, Simpson was knighted in 1841. That same year, he undertook a mostly overland trip around the world. Starting out from Liverpool, England, in March 1841, he sailed to Canada by way of Halifax and Boston. He then took the canoe-and-portage route across Canada to Vancouver, from where he went to Sitka, Alaska, and the Aleutian Islands. He crossed the Bering Sea to Okhotsk in SIBERIA, then traveled the length of Asiatic and European Russia to St. Petersburg on the Baltic, and sailed back to England.

After 1833, Simpson lived in Montreal, directing the Hudson's Bay Company operations. During the 1840s and early 1850s, he sponsored additional explorations of the Canadian Arctic, including JOHN RAE's 1846 journey. In his later years, Simpson was prominent in banking and railroad development.

Sir George Simpson's accounts of his overland journeys across Canada were published in 1931. His 1841–42 overland journey around the world was until that time the first such expedition. He published an account of this trip in his 1847 book, *Narrative of a Journey Round the World in 1841 and 1842*. Simpson Falls on western Canada's Peace River and Cape George Simpson in the Canadian Arctic were both named in his honor.

Simpson, James Hervey (1813–1883) *U.S. Army officer, American topographer in the American West*

James H. Simpson, a native of New Brunswick, New Jersey, entered West Point when he was 15. Four years later, in 1832, he graduated as a second lieutenant in the artillery. In 1837, he served in Florida in the campaign against Seminole Indians, and, the following year, he transferred to the U.S. Army Corps of Topographical Engineers.

Throughout the 1840s, Simpson supervised government construction projects in the East and South. In 1849, he accompanied Captain RANDOLPH BARNES MARCY's expedition blazing a wagon route from Fort Smith, Arkansas, to Santa Fe, New Mexico.

In August 1849, Simpson took part in a military expedition against Navajo (Dineh) Indians in the region northwest of Santa Fe. En route, he led a reconnaissance of the upper Chaco River and came upon the ancient Anasazi ruins of Chaco Canyon, New Mexico. He continued westward with the military expedition into present-day northeastern Arizona and accompanied the first known group of Anglo-Americans to penetrate the Navajo stronghold at Canyon de Chelly. He undertook an exploration of the canyon and located more pueblo ruins unknown to non-Indians.

In 1853, Simpson became a captain in the Topographical Corps. In August 1858, he began a series of explorations of Utah's Great Basin. From Camp Floyd, south of Salt Lake City, he led an expedition north and east into Timpanogos Canyon and the Wasatch Mountains, to Fort Bridger.

In October 1858, Simpson explored westward from the Great Salt Lake across northern Nevada and proceeded to Carson City, via Reynolds Pass. Along the way, the expedition blazed a trail along the Walker River, an alternative to the Humboldt River route into the Sierra Nevada.

In May 1859, Simpson led another expedition south and west across the Great Basin to the Mormon settlement at Genoa near Lake Tahoe.

In the Civil War, Simpson was commissioned a colonel of volunteers. Captured by Confederate forces in the Virginia campaign, he was released in a prisoner exchange in 1862. Simpson went on to serve as chief topographical engineer in the Ohio Valley and in Kentucky. After the war, he was appointed chief engineer of the Department of the Interior, and in that capacity he oversaw the construction of the Union Pacific Railroad in 1865–67. He retired from the service in 1880, after a period in which he directed road construction and harbor development in the South and Midwest.

James H. Simpson's explorations of New Mexico, Arizona, Utah, and Nevada spanned more territory in the American West than those of any other army topographer of the time. His exploration of Native American antiquities in New Mexico and Arizona contributed greatly to the archaeological understanding of the Southwest. The first drawings

James H. Simpson (Library of Congress)

of the Chaco Canyon and Canyon de Chelly ruins were made by artist-topographer RICHARD HOVENDON KERN, who accompanied Simpson in 1849. Simpson's report of his expeditions between Fort Bridger, the Great Basin, and the Sierra Nevada was published in 1876, and his findings led to the establishment of direct wagon and mail routes between Salt Lake City and California. In 1871, Simpson published *Coronado's March In Search of the Seven Cities of Cibola*, an account of the Spanish CONQUISTADORES' first journey into the region Simpson himself had explored.

Simpson, Thomas (1808–1840) *Scottish fur trader, surveyor in the Canadian Arctic and Alaska, cousin of Sir George Simpson*

Thomas Simpson was born at Dingwall in northern Scotland, a descendant of Scottish statesman Duncan Forbes. He

was educated at Aberdeen University, where he earned a master's degree. In 1829, he immigrated to Canada and entered the service of the HUDSON'S BAY COMPANY.

Simpson gained his initial experience in wilderness travel by commanding CANOE convoys between Montreal and the Hudson's Bay Company post at Fort Garry (present-day Winnipeg, Manitoba). From there, he regularly traveled on snowshoes to Fort York on HUDSON BAY, 700 miles to the northeast.

In 1836, to fulfill the Hudson's Bay Company's obligation to continue the search for the NORTHWEST PASSAGE, Simpson's older cousin, Hudson's Bay Company governor SIR GEORGE SIMPSON, sent him and a fellow company employee, PETER WARREN DEASE, to explore the remaining unknown segments of Canada's Arctic coastline.

After undergoing training in surveying techniques at Fort Garry, the younger Simpson joined Dease at Great Bear Lake, where they established a base camp, Fort Confidence. In spring 1837, accompanied by a party of VOYAGEURS, they descended the Mackenzie River to the Arctic coast, then explored westward, reaching the northernmost point of Alaska, Point Barrow, on August 4, 1837. This location was the farthest east FREDERICK WILLIAM BEECHEY had reached in his 1826 seaward exploration of the eastern entrance to the Northwest Passage; it was also the farthest west attained that same year by SIR JOHN FRANKLIN and SIR GEORGE BACK.

After another winter at Great Bear Lake, Simpson and Dease set out again in spring 1838. They descended the Coppermine River, then surveyed the coastline eastward, reaching 100 miles beyond Point Turnagain. The next year, they explored even farther to the east, reaching the south coast of King William Island and the west coast of the Boothia Peninsula. On the return journey, they explored the south shore of Victoria Island.

Although Simpson had planned to extend his explorations eastward as far as Fury and Hecla Strait and into northern Hudson Bay, by the end of 1839 he had still not received authorization for another expedition from his cousin, Sir George. He therefore resolved to return to England and there apply in person to the directors of the Hudson's Bay Company. He began the journey with a 1,500-mile hike southward to the Red River Settlement in present-day Manitoba, which he reached in February 1840. He continued his eastward journey toward Montreal in the spring, accompanied by several mixed-blood Indians. On June 14, 1840, in the lands of the Sioux (Dakota, Lakota, Nakota) Indians, he was found shot to death in his tent. The circumstances of his death are unclear, although the local U.S. territorial authorities declared it a suicide.

Thomas Simpson died without learning that the Hudson's Bay Company board of directors had already assented to his proposed expedition, and that, in recognition of his

exploits, he had been awarded the Queen's Arctic Medal. His explorations of the Canadian Arctic filled in details about the last remaining stretch of unknown coastline between the Mackenzie River delta and Point Barrow, Alaska. In the eastern Canadian Arctic, he surveyed and charted the coastline between Point Turnagain and the west coast of the Boothia Peninsula, providing vital geographic details for the British navy's subsequent attempts to navigate the Northwest Passage during the 1840s.

Sinclair, James (1811–1856) *Canadian pioneer in the Rocky Mountains and Pacific Northwest*

James Sinclair was born at Oxford House, a HUDSON'S BAY COMPANY fur-trading settlement in what is now northeastern Manitoba, Canada. His father, an official with the trading company, was from Scotland, and his mother was a Métis.

After attending school in Edinburgh, Scotland, Sinclair returned to central Canada at the age of 15, eventually becoming a partner in a trading enterprise out of the Red River Settlement. As both merchant and shipper of goods, he traveled widely in central Canada and in what is now the north-central United States, undertaking journeys by CANOE from the Red River Settlement northward to HUDSON BAY and leading wagon caravans southward to settlements in present-day south-central Minnesota.

In 1841, Sinclair was commissioned by the Hudson's Bay Company to lead a group of emigrants from the Red River Settlement westward to the Oregon Country. The project had been instigated by the British government, hoping to reinforce its claim on Oregon with a sudden influx of British settlers from Canada. There were 23 families in the party, which numbered 121 men, women, and children, with 55 wagons and several hundred head of cattle.

Sinclair and the wagon train left the Red River Settlement on June 5, 1841. With the help of the Indian guide Bras Croche, he located White Man Pass, which proved to be a suitable wagon route through the ROCKY MOUNTAINS to the upper COLUMBIA RIVER. They followed the river to Fort Vancouver, opposite present-day Portland, Oregon, arriving on October 13, 1841.

Sinclair soon returned to the Red River Settlement, where he had become a prominent voice in the Métis community. He undertook a second westward expedition in 1850, in which he returned to Oregon, again crossing the Rockies by way of White Man Pass. After two years in Oregon and California, he sailed for Panama, returning to the Red River Settlement by way of New York.

In May 1854, Sinclair set out with another emigrant wagon train, again accompanied by Bras Croche. On this expedition, which reached Walla Walla on December 24, 1854, he pioneered a wagon route through the Kananaskis

Valley and across the Rockies to the Kootenay River Valley and the upper reaches of the Columbia River.

Sinclair stayed in Oregon throughout 1855. Before he could return to the Red River Settlement, from where he planned to lead more emigrant wagon trains into Oregon by way of his newly discovered Rocky Mountain pass, he was killed by Yakama Indians in the Cascade Range in 1856.

The route James Sinclair pioneered through the Canadian Rockies, known afterward as Sinclair's Canyon, was later developed into the highway linking the cities of Banff, Alberta, and Windemere, British Columbia. While the Hudson's Bay Company had developed its network of trails across western Canada primarily as portages for the canoe routes between its various fur-trading forts, Sinclair's explorations led to new overland communication and transportation routes between central Canada and the Pacific Northwest.

Singh, Kishen (Kish Singh, Krishna Singh)

(unknown–1921) *Indian surveyor in western China and Tibet, in service to Great Britain, cousin of Nain Singh*

Kishen Singh was probably a native of northern India's Kashmir region. During the mid-1860s, he entered the service of the British colonial authorities, who trained him as one of their native surveyors, known as the PUNDITS (Hindi for "learned expert").

In 1869, Singh explored westward from the northern Indian city of Dehra Dun into the northern Punjab region of present-day Pakistan. Like other native explorers working for Great Britain at that time, such as KINTUP, he used only basic surveying instruments, measuring the distances he covered by counting his footsteps.

Singh undertook his first exploration of the HIMALAYAS in 1871. Disguised as a Buddhist pilgrim, he started out from Katmandu, Nepal, and investigated a large area of Tibet and southern China extending westward from the Tibetan capital at LHASA and Nam Tso Lake, as far as the eastern edge of Chinese Turkestan. In 1873, he joined his cousin NAIN SINGH in an expedition from the upper Indus city of Leh deep into Chinese Turkestan, to the city of Yarkand in the Taklimakan Desert.

On his own in 1874, Kishen Singh explored the region southwest of Yarkand and Kashgar into the Pamir region of south-central Asia before returning eastward to Leh in northern India. But his most ambitious journey began in 1878, when he set out from Darjeeling in extreme northeastern India to Shigatse and Lhasa in Tibet. Over the next several years, he explored northward as far as the Tsaidam Depression, the swampy region between the branches of western China's Kunlun mountain range. On reaching a point as far north as the southwestern edge of Mongolia's GOBI DESERT, he made his way back to India by

way of Tibet's Tsangpo River, arriving in Darjeeling in 1882.

Kishen Singh's explorations into western China from India provided accurate information about the northern extent of the subcontinent for the British Great Trigonometrical Survey of India, an undertaking that lasted through much of the 19th century.

Singh, Nain (ca. 1826–1882) *Indian surveyor in central Asia, in service to Great Britain, cousin of Kishen Singh*

Nain Singh was a native of the eastern Himalayan kingdom of Bhutan. In 1854–57, he served as a guide in the HIMALAYAS for the German mountaineers, the brothers ADOLF VON SCHLAGINTWEIT, HERMANN VON SCHLAGINTWEIT, and ROBERT VON SCHLAGINTWEIT.

During the early 1860s, Singh entered the British school for native surveyors at the northern Indian city of Dehra Dun. He had been recruited to carry out explorations north of the Himalayas for the ongoing Great Trigonometrical Survey formerly headed by SIR GEORGE SIMPSON. At that time, with the Chinese government forbidding Europeans entry into China and Tibet from India, the British directors of the survey had resorted to employing natives from the mountains of northern India and adjacent lands to carry out a surreptitious reconnaissance of the lands beyond the Himalayas.

In 1864, Singh set out from Bareilly, India, for Tibet, accompanied by his cousin Mani Singh, also a British-trained native surveyor. On being turned back by Chinese border guards, they disguised themselves as merchants from Ladakh and succeeded in penetrating Tibet as far as the Tashilhumpo monastery near Shigatse. Singh met with the 11-year-old Panchen Lama, then continued on to the Tibetan capital at LHASA, which he reached on January 10, 1866. Based on observations of the sun and the stars, he established the city's geographic coordinates. By noting with a thermometer the temperature at which water came to a boil, he also determined its altitude.

After three months, Singh traveled to Lake Mansowar, then traced the upper course of the Brahmaputra River and charted the range of mountains north of the Himalayas, known as the Nyenchentanglhas. He recrossed the Himalayas back to Bareilly, India, having surveyed the trade route into Tibet and having accurately measured 1,200 miles of mountainous territory by counting his footsteps.

In 1867, Singh undertook a survey of the upper Indus Valley, then entered western China by way of the 18,400-foot Mana Pass. He traversed the Tibetan Plateau to Thok-Jalung, where he observed gold-mining operations. In 1873, with his cousin KISHEN SINGH, he traveled from Leh in northern India to Khotan and the edge of western China's

Taklimakan desert. From there, they went to the city of Yarkand.

Nain Singh was the foremost of British India's PUNDITS (Hindi for "learned expert"). In fact, it was his code name, "the Pundit," which came to be used for all the Indian explorers. Along with KINTUP and Kishen Singh, he provided British geographers and cartographers with enough information to produce the first modern maps of the regions north of the Himalayas. His measurements of distances, mostly carried out by counting his footsteps, provided data on more than 3,000 miles of previously uncharted country. The Aling Kangri mountains, which he explored while on the northern edge of the Tibetan Plateau, were formerly known as the Nain Singh range. He received a medal from the ROYAL GEOGRAPHICAL SOCIETY in 1877.

Sitgreaves, Lorenzo (ca. 1811–1888) *U.S. Army officer in the American Southwest*

Lorenzo Sitgreaves was born in Pennsylvania, the son of prominent congressman and lawyer Samuel Sitgreaves. An 1832 graduate of West Point, Lorenzo served as an artillery officer for several years, then left the military to practice engineering. Rejoining the army in 1840, he was appointed a second lieutenant in the U.S. Army Corps of Topographical Engineers.

In the early 1840s, Sitgreaves took part in coastal surveys in the North and South. In September 1846, at the outbreak of the U.S.-Mexican War, he accompanied Captain George W. Hughes and a company of Topographical Engineers into Mexico from Presidio del Rio Grande in western Texas. The expedition blazed a trail south and east for advancing U.S. forces to a point between Chihuahua and Monterrey in Mexico. After participating in the Battle of Buena Vista in February 1847, Sitgreaves was breveted a captain.

In September 1851, Sitgreaves commanded a Topographical Engineers unit accompanying Colonel Edwin V. Sumner's military expedition into the Navajo (Dineh) lands west of the Zuni Indian pueblos of New Mexico. With Sitgreaves was frontier artist and topographer RICHARD HOVENDON KERN; his guide was Antoine Leroux.

Sitgreaves had been ordered to follow up the earlier explorations of Lieutenant JAMES HERVEY SIMPSON and survey a wagon route between Santa Fe, New Mexico, and San Diego, California. Starting out from Santa Fe, he went first to the Zuni pueblos of northwestern New Mexico, then southwestward along the Zuni River as far as its confluence with the Little Colorado River in present-day eastern Arizona.

Near present-day Flagstaff, Arizona, Sitgreaves was advised by Leroux that traveling farther up the Little Colorado would take him into the Grand Canyon. He left the Little

Colorado and led his command westward across a country of high tablelands and lava beds that was totally devoid of water. Suffering repeated Indian attacks along the way, Sitgreaves and his party eventually reached the Colorado River near Mojave Indian villages. With Chief IRATEBA's help they followed the COLORADO RIVER south to Fort Yuma, then crossed overland to San Diego.

In his subsequent report, published by the government in 1853, Sitgreaves provided scientifically charted maps and information on existing Indian settlements and trails in northern Arizona. Sitgreaves went on to serve in the Civil War as an engineering officer, and, by 1864, he had attained the rank of lieutenant colonel. He retired from the army in 1866.

Lorenzo Sitgreaves contributed much in the way of detailed geographic knowledge of the Southwest. His 1849 map of the route taken by U.S. forces on their 1846 drive into Mexico was one of the first to describe the little-known Chihuahua region. His 1851 expedition from Zuni, New Mexico, to San Diego, California, later provided a basis for the Pacific Railroad Surveys along the 35th parallel. Although Sitgreaves did not find a direct route across Arizona to the Pacific coast in 1851, his trail as far as the Colorado River was subsequently adopted by the Santa Fe Railroad.

Smet, Pierre-Jean de See DE SMET, PIERRE-JEAN.

Smith, James (1737–1812) *American frontiersman, guide, politician in Kentucky*

James Smith was born in Franklin County in south-central Pennsylvania. At the age of 18, he was taken captive by Indians; he lived with them until he managed to escape four years later. In the early 1760s, he served as a guide under Colonel Henry Bouquet in campaigns against the tribes of the Ohio Valley.

In 1766, Smith and four companions undertook a hunting expedition into the region beyond the CUMBERLAND GAP, even though such forays had been expressly forbidden by the British with the imposition of the Proclamation Line of 1763. They were among the few non-Indians to do so since the start of the French and Indian War in 1754.

Smith later settled in eastern Virginia, where he took part in Lord Dunmore's War of 1774 as a captain in the colonial militia. He also served as a colonel with patriot forces in the American Revolution of 1775–83, commanding frontier campaigns against the Indians. In 1788, he moved to Bourbon County in what is now northeastern Kentucky, where he became prominent in state politics, serving for many years in the state legislature. Smith's own account of his explorations beyond the Appalachian frontier,

Remarkable Adventures in the Life and Travels of Colonel James Smith, was first published in 1799.

James Smith's 1766 hunting expedition marked the resumption of exploration west of the APPALACHIAN MOUNTAINS, which had been halted by a decade of warfare between Indians and non-Indians. Soon afterward, inspired by reports brought back by Smith and others, other "long-hunters" ventured into Kentucky, most notably frontiersman DANIEL BOONE.

Smith, Jedediah Strong (Jed Smith) (1799–1831)

American fur trader, trapper in the American West

Jedediah "Jed" Smith was born near what is now Bainbridge, New York. With his family, he migrated to Pennsylvania, where he worked on a Lake Erie trading vessel before moving west to St. Louis to take part in the burgeoning FUR TRADE along the MISSOURI RIVER.

In 1822 and 1823, Smith joined WILLIAM HENRY ASHLEY's fur-trading expeditions to the upper Missouri region of what is now South Dakota. When Ashley's traders were attacked by Arikara Indians on the Missouri, Smith was dispatched upriver to seek help. In summer 1823, he took part in the punitive expedition against the tribe under Colonel HENRY LEAVENWORTH.

With the upper Missouri route to the northern Rocky Mountains cut off by Indian hostility, Smith led a group of MOUNTAIN MEN west from Fort Kiowa in present-day South Dakota, along the White River, into the Badlands and Black Hills. His group included JAMES CLYMAN, THOMAS FITZPATRICK, and WILLIAM LEWIS SUBLETTE. While exploring the Black Hills, Smith was nearly killed in an attack by a wounded grizzly bear. He soon recovered, and, after crossing the Belle Fourche River, he led his party into what is now eastern Wyoming, where they purchased horses from the Cheyenne and Sioux (Dakota, Lakota, Nakota) Indians, then proceeded westward across the Great Plains.

Smith and his men reached Wyoming's Powder River Valley, then crossed the Bighorn Mountains by way of Granite Pass into the Bighorn Basin. Heavy snows prevented further progress through Union Pass, and Smith and the others were forced to encamp for a time near what is now Dubois, Wyoming. From the Indians, Smith learned of a route to the south that led through the ROCKY MOUNTAINS. In February 1824, after following the Wind River, his men reached the Sweetwater River. By following it, they located the SOUTH PASS, which took them west to the abundant beaver hunting grounds of the Green River Valley near the present Wyoming-Utah border.

Smith and his party trapped as far south as the northern end of the Uinta Mountains. From there, they headed north and west to the Snake River, where they met up with a group of Iroquois (Haudenosaunee) Indians trapping for the HUD-

SON'S BAY COMPANY and rescued them from attack by Paiute Indians. Smith escorted the Iroquois to the Hudson's Bay Company post at Flathead Lake in what is now western Montana. There, ALEXANDER ROSS, director of the Flathead Lake post, hosted Smith and the Americans in the winter of 1824–25. From Flathead Lake, Smith headed northward as far as the Canadian border and explored the upper Snake River region of Idaho. By summer 1825, Smith and his trappers had returned to the Green River, and, at Henry's Fork, attended the first annual fur traders' rendezvous.

Smith returned to St. Louis by way of the Missouri and subsequently became a full partner with Ashley. The next summer, he, DAVID E. JACKSON, and William Sublette bought out Ashley's interests in what was known as the ROCKY MOUNTAIN FUR COMPANY. He set out for the Rockies again in August 1826, from the Cache Lake rendezvous in present-day Utah, and explored south and west to the Great Salt Lake. From the Ute Indians, he heard reports of the fabled Buenaventura River, which supposedly flowed out of the Great Salt Lake to the Pacific Ocean. David E. Jackson and a small party explored for this stream but were unable to locate it. Smith headed south to Utah Lake, then followed the Sevier and Virgin Rivers, eventually reaching the COLORADO RIVER and following it to the Mojave River. Guided by Mission Indians, Smith and his party crossed the Mojave Desert to the San Bernardino Mountains and reached the Mexican settlement of San Gabriel near Los Angeles, California, on November 27, 1826.

Smith ran into difficulties with Mexican authorities, who took a dim view of any American encroachment into their territory. At San Diego, Smith was told by the Mexican governor to leave California over the same route he had come. Instead, he led his men northward into the San Joaquin Valley, as far as the American River near Sacramento. He left some of his party there to trap, then explored for a route east through the Sierra Nevada. On finding Ebbett's Pass, Smith made the first eastward crossing of the Sierra Nevada into what is now Nevada. He traversed central Nevada, and, after nearly dying of thirst in Utah's Great Salt Lake Desert, reached the fur-trading rendezvous at Bear Lake, Utah, on July 3, 1827.

Less than two weeks later, Smith set off again for California. He retraced his earlier route to the Mojave villages on the Colorado River. While crossing the Colorado on rafts, Smith lost 10 of his men in an attack by Mojave warriors. Smith and the survivors made their way through the San Bernardino Mountains to San Gabriel, where the Mexicans jailed the trespassers for almost two months. They were finally released in the custody of an American sea captain in January 1827, who transported them north to Monterey. From there, they headed into the Tehachapi Mountains to the Sacramento Valley, where they rejoined the men left behind the previous year.

Still searching for the Pacific outlet of the Buenaventura River, Smith and his men explored the American, Merced, and Stanislaus Rivers of northern California, then headed northward into the Oregon Country. On the Umpqua River, most of Smith's 18 men were killed in an attack by Indians. Smith and three other survivors made their way to Fort Vancouver on the COLUMBIA RIVER, where JOHN MCLOUGHLIN of the Hudson's Bay Company provided them with assistance and helped recover the furs stolen by the Indians.

Smith trapped in the Wyoming-Montana region in 1828–29, then returned to St. Louis with the intention of farming and entering the mercantile business.

In 1830, Smith conferred with President Andrew Jackson's secretary of war, John Eaton, on the extent of British occupation in the Oregon Country. The following year, he joined David Jackson, William Sublette, and Thomas Fitzpatrick in a trading venture along the Santa Fe Trail to New Mexico. On May 27, 1831, while scouting ahead in the arid region between the Arkansas and Cimarron Rivers of present-day southwestern Kansas, Smith was killed in an attack by Comanche Indians. Smith's journal of his explorations, *The Travels of Jedediah Smith: A Documentary Outline* (edited by Maurice S. Sullivan), was published posthumously in 1934.

Among his contemporaries in the fur trade, Jed Smith was known as the "Knight of the Buckskin." In the course of his explorations of the West, he covered more than 16,000 miles. Smith led the first non-Indians westward through the South Pass and reported on its feasibility as a wagon route for emigrants on the way to Oregon and California. His 1826 expedition across the Southwest from the Great Salt Lake was the first known overland journey to California on that route. His route from the Colorado River to the San Bernardino Mountains developed into the Mormon Cutoff. On his return, Smith undertook the first successful crossing of the Great Salt Lake Desert, the largest desert in North America. Historians also credit Smith with locating the Old Spanish Trail and providing the first precise information about the geography of the American Southwest.

Smith, John (ca. 1580–1631) *English soldier, colonizer in Virginia, explorer of coastal North America*

John Smith was a native of Willoughby in Lincolnshire, England. He spent his early years as a merchant's apprentice in King's Lynn. In 1596, at the age of 16, he left England for the Continent, where he served as a mercenary with the French army in its wars against Spain in the Low Countries. Smith later fought along with Austrian forces against the Crimean Tartars at the Battle of Rotenthurn Pass in the Transylvania region of what is now Hungary. He was taken prisoner and sold as a slave to a Turkish pasha. According to

his own account, an influential Turkish woman saved him by having him sent to the Don River region, from where he was able to escape.

By 1604, Smith was back in England. He soon became a shareholder of the newly chartered VIRGINIA COMPANY of London, a syndicate of merchants licensed to establish a colony in North America. As military captain, he sailed from England with the company's colonizing expedition under CHRISTOPHER NEWPORT in December 1606.

Arriving on the Virginia coast in spring 1607, Smith helped establish the Jamestown colony several miles up the James River. The next year, he explored Chesapeake Bay, as well as the Potomac and Rappahannock Rivers, in search of gold and a route to the Pacific Ocean.

With food supplies dwindling and the colony facing starvation, Smith undertook an expedition up the Chickahominy River, seeking to purchase corn from Indians of the Powhatan Confederacy, headed by Chief Powhatan. He was soon taken prisoner by Indians, however. According to some accounts, he was about to be clubbed to death by Powhatan's warriors when the chief's 13-year-old daughter, Pocahontas, interceded. Smith then returned to the Jamestown settlement, and, under his command, the colony managed to survive.

In 1609, Smith returned to England because of an injury sustained in a gunpowder explosion. Five years later, in

John Smith (New York State Library, Albany)

1614, he undertook a second expedition to North America, during which he charted the coast from Cape Cod to the mouth of the Penobscot River, naming the region New England. After establishing trade relations with the Indians, he returned to England with a valuable cargo of furs and salted fish. The next year, Smith attempted to return to the New England coast, but his ship was captured by French pirates. Following a shipwreck on the French coast, Smith reached England.

In 1616, Pocahontas and her husband, Jamestown colonist John Rolfe, visited Smith in England. Smith planned another voyage to North America that year, but poor weather conditions forced him to abandon the project. He subsequently became a writer and promoter of English colonization in the New World.

Jamestown, the colony John Smith helped found and helped to survive in its early years, went on to flourish as the first permanent English settlement in North America. John Smith's 1608 book, *Generall Historie of Virginia*, provides the earliest firsthand account of the Jamestown colony. Smith was a friend of HENRY HUDSON and supplied him with information and maps vital to Hudson's 1609 explorations of the North American coast on behalf of England. Smith's descriptions of the New England coast influenced the later colonizing efforts of the Pilgrims in present-day Massachusetts. Smith also wrote the earliest English handbook for seamen, *A Sea Grammar* (1627).

Solander, Daniel Carl (1733–1782) *Swedish naturalist in South America and the South Pacific*

Daniel Solander was born at Pitea in northern Sweden. At the age of 17, he entered the University of Uppsala, where he had planned to study theology. Instead, as a student of the Swedish botanist Carl Linnaeus, he concentrated on natural history.

Starting in 1753, Solander took part in botanical research expeditions to Lapland, Russia, and the CANARY ISLANDS. In 1760, he went to London, where he introduced Linnaeus's system for naming and classifying plants and animals to British naturalists. Three years later, he was appointed to the staff of the British Museum, and he became assistant curator in 1766. In England, Solander became associated with SIR JOSEPH BANKS, a patron of naturalist studies, who engaged him as principal botanist for his scientific team accompanying JAMES COOK's first voyage of exploration to the South Pacific Ocean in 1768–71.

Solander and Banks collected plant specimens throughout the voyage, beginning on the Atlantic island of Madeira, and also in Brazil around Rio de Janeiro. He later took part in the first scientific examination and systematic classification of plant and animal life in Tierra del Fuego. While in Tahiti, he and Banks extended their studies to include the

life and culture of the island's native people. Among the animals they encountered on Tahiti was an unclassified variety of parakeet, which was to become extinct less than 75 years later.

Solander continued his naturalist studies on NEW ZEALAND's North Island, where he and Banks encountered the Kea, the only parrot known to be carnivorous. While the *Endeavor* was in southeastern Australia. Solander and the scientific team found so many unclassified species of plants at a landing site originally known as Stingray Harbor that they renamed it Botany Bay.

On their return to England in July 1771, Solander and Banks received honorary degrees from Oxford University and met with King George III to discuss the scientific results of the voyage. Of the thousands of plant and animal specimens they brought back, almost 1,000 were new to science. They also had collected artifacts of the native culture of the South Pacific islanders, including clothing, weapons, jewelry, and musical instruments, and had undertaken linguistic studies of languages unknown in Europe.

In 1772, Solander accompanied Banks on scientific expeditions to the Hebrides Islands, off western Scotland, and to ICELAND. The next year, he was appointed curator of the British Museum's natural history collection, the holdings of which were largely the result of his efforts on the Cook voyage.

Dr. Daniel Solander's work in the South Pacific set a precedent for all subsequent voyages of exploration, which thereafter regularly included at least one naturalist. The tremendous amount of plant and animal specimens collected on the 1768–71 expedition afforded him an opportunity to apply the classification and nomenclature system developed by Linnaeus. CARL PETER THUNBERG and ANDERS SPARRMAN were also Linnaeus's pupils.

Soleyman (Soleyman the Merchant, Soliman, Sulaimen el Tagir, Suleyman) (fl. 850s) *Arab trader in southern Asia*

Soleyman the Merchant, an Arab trader, was born in the Persian Gulf city of Siraf. In about 850, he undertook a sea voyage to the Far East.

After sailing to India, Soleyman traveled on a Chinese JUNK to the Laccadive and Maldivé Islands off the southwest coast of India and then went on to CEYLON (present-day Sri Lanka). He entered the Bay of Bengal, where he made stops in the Andaman Islands, and continued to Malacca and the Chinese port of Khanfu (present-day Guangzhou).

On his return to Siraf in 851, Soleyman related details of his journey to an Arab scholar, who recorded them in a book that came to be known as *Sequence of Historical Events*. It tells of the ruby mines and pearl fisheries he had seen in Ceylon, as well as the sea routes traveled by junk between Khantu and the ports of Basra on the northern end of the

Persian Gulf, and Jidda on the Arabian coast of the RED SEA. In addition to trade information, the work also provides some of the earliest commentary about the society of the Maldives, in which women held political power, and that of the Andaman Islands, in which cannibalism was practiced. Soleyman's description of Khantu includes details on Chinese society, including its sometimes brutal system of justice and the practice of legalized prostitution.

Soleyman the Merchant provided the earliest description by Muslims of India and China. His travel account and the reports of other Arab travelers, together with the works of ancient Greek geographers translated into Arabic, enabled medieval Arab geographers to develop an idea of the world beyond the Middle East. In contrast, Europe remained largely isolated and ignorant of the outside world.

Soto, Hernando de (ca. 1499–1542) *Spanish colonial official, conquistador in the American Southeast, brother-in-law of Vasco Núñez de Balboa*

Hernando de Soto was born into a minor noble family in Badajoz in Spain's west-central Estremadura region. In 1514, he arrived in the Americas and served as an officer under PEDRO ARIAS DE ÁVILA in Panama. In 1516–20, he took part in naval expeditions charting the Central American coastline.

In 1523, de Soto served as a captain under FRANCISCO FERNÁNDEZ DE CORDOBA in the conquest of what is now Nicaragua. He later took part in the conquest of both Guatemala and the Yucatán.

In late 1531, de Soto accompanied FRANCISCO PIZARRO in the conquest of Peru. At his own expense, he took armed men and horses down the coast from Panama and Nicaragua to the island of Puna off the coast of northern Peru. He was with Pizarro's forces when the Inca Empire fell in July 1533. At that time, de Soto, who would later be known for his harsh treatment of the Indians of what is now the southeastern United States, was one of the few Spanish officers who opposed Pizarro's execution of the Inca Indian emperor Atahualpa.

By 1536, de Soto was back in Spain, now wealthy from his exploits in Peru. As a reward for his service, he was appointed governor of Cuba and royal deputy of Florida by Spain's king Charles I. He was given an official license to conquer all of the uncharted lands lying north of Florida.

ÁLVAR NÚÑEZ CABEZA DE VACA had recently returned from his eight years of wandering from Florida to the Gulf of California. On hearing reports of the fabled Seven Cities of CIBOLA, de Soto was inspired to seek gold and silver, as had been found among the Aztec Indians by HERNÁN CORTÉS and among the Inca Indians by Pizarro. Cabeza de Vaca declined de Soto's offer to join a new expedition to Florida.

Hernando de Soto (*Library of Congress*)

In April 1538, de Soto's expedition left the Spanish port of Sanlúcar de Barrameda. His nine ships carried soldiers, colonists, and livestock. The ships stopped at Cuba, where de Soto spent the next year making final preparations for his expedition to Florida and the lands beyond. In early May 1539, the military portion of his expedition—600 soldiers—set sail from Havana, reaching the west coast of Florida on May 28. The exact site of his landing is not known, but it is thought to have been Charlotte Harbor, north of the present-day port of Fort Myers.

De Soto led his men along the same path PÁNFILO DE NARVÁEZ had followed 11 years earlier, heading north and west toward Apalachee Bay on the Florida Panhandle. It was during this march that de Soto encountered one of the survivors of the Narváez expedition, a man named Juan Ortiz, who had been held captive by Indians since 1528. Ortiz had learned several Indian languages and joined the de Soto expedition as an interpreter.

By fall 1539, de Soto and his men had reached the Apalachee Indian village of Apalachen, near present-day Tallahassee. As Narváez had done a decade earlier, de Soto spent the winter there. Although he had been charged by the Spanish Crown to locate suitable sites for colonization and

seek a water route to the Pacific Ocean, de Soto's main preoccupation was locating gold and silver among the Indians. He soon heard reports of a rich domain to the north, ruled by an Indian princess.

Traveling northward into what is now Georgia in spring 1540, de Soto soon reached an Indian village called Cofitachequi. The tribal leader, a woman named Cutifachiqui, whose people probably were part of the Creek Confederacy, welcomed de Soto and his men with gifts of food as well as a quantity of freshwater pearls. Even though these pearls, taken from freshwater mussels, would later prove to be worthless, de Soto interpreted them as proof of riches nearby. De Soto and his soldiers, having the advantage of horses, firearms, and crossbows, managed to take Cutifachiqui hostage, as they would do repeatedly to tribal leaders in order to force the Indians to provide food and slaves.

The CONQUISTADORES proceeded up the Savannah River into the APPALACHIAN MOUNTAINS of what is now western North Carolina. They crossed the Appalachians, probably through the Blue Ridge or Great Smoky Mountains, and entered what is now eastern Tennessee. De Soto soon heard reports of another Indian village and followed

the Tennessee River southward, reaching Chiaha at present-day Burns Island, Tennessee, in early June 1540. Finding no gold or other riches among these people, he pushed farther southward into central Alabama and reached the Indian village of Coosa near present-day Childersburg.

In addition to living off the Indians, the Spaniards bred the small herd of swine they had brought with them from Spain into a herd of some 700 during the course of the expedition. It is said that the pigs that escaped from the de Soto expedition were the ancestors of the wild hogs now inhabiting Georgia's Okefenokee Swamp.

In summer 1540, the Spanish encountered resistance among Choctaw, Alabama, and Chickasaw Indian bands as they plundered their way across Alabama. A captured Mobile chief named Tascalusa escaped from de Soto and led an unsuccessful counterattack against the Spaniards at a point north of the head of Mobile Bay.

In fall 1540, de Soto received word that relief ships from Cuba were waiting for him at Mobile Bay. Rather than turn back without any riches, he decided to keep the news of the ships secret. He led his men north and west into what is now the state of Mississippi, spending the winter of

Map based on the explorations of Hernando de Soto (1544) (Library of Congress)

Hernando de Soto's discovery of the Mississippi River (*Library of Congress*)

1540–41, at a site near present-day Pontotoc, west of the Tombigbee River.

In the spring, de Soto pushed westward, and on May 8, 1541, he came upon the MISSISSIPPI RIVER at a point south of present-day Memphis, Tennessee, making the first recorded sighting of the river by non-Indians. After constructing barges, the expedition crossed the Mississippi on June 18, 1541.

On the west bank of the Mississippi, the de Soto expedition marched northward, then westward, into what is now Arkansas. Along the way, his men came into contact with the Quapaw, Caddo, Wichita, and other Indians of the lower Mississippi and Arkansas River Valleys. Upon reaching the Arkansas River, the expedition followed it westward.

During this leg of the expedition, de Soto and his men noted the appearance of buffalo goods and heard reports of large herds of these animals to the west. De Soto sent scouting parties westward into the Ozark Mountains to see if a route to the sea could be found. At this time, Europeans knew little about the extent of the North American continent; de Soto and other explorers still believed that much of North America was an appendage of Asia.

De Soto and his men may have reached as far west as the Caddo Mountains of eastern Oklahoma by late 1541. At the same time, FRANCISCO VÁSQUEZ DE CORONADO was several hundred miles away in central Kansas, also searching for Cibola. Although both expeditions knew of each other, no attempt was made to establish contact.

Facing mountain terrain and canebrakes to the west, with supplies low and many weapons damaged, de Soto decided to head southward for the Gulf to obtain additional goods from Cuba. He traveled down the Ouachita River to what is now Camden, Arkansas, where his expedition spent the winter of 1541–42.

De Soto began to lose more and more of his men to fever and Indian attacks, including the interpreter Juan Ortiz. Near the confluence of the Red River and the Mississippi, de Soto himself succumbed to fever on May 21, 1542. To prevent the Indians from learning of the Spanish leader's death and the resulting disarray, the conquistadores weighted his body with rocks and disposed of it in the Mississippi under cover of darkness.

Command of the expedition fell to LUIS DE MOSCOSO, de Soto's chief lieutenant. He decided to lead the survivors

westward in the hope of reaching Mexico. The expedition headed into what is now Texas, reaching as far as the upper Brazos River region near the Trinity. Discouraged by the vastness of the land, Moscoso decided to try again for the Gulf of Mexico to the south and returned to the Mississippi.

After wintering on the Mississippi in 1542–43, the Spanish built seven crude barges and, when the river flooded on July 2, 1543, embarked on them, reaching the Gulf of Mexico on July 18. They followed the Texas coastline west and south, until they came to the Spanish settlement of Tampico at the mouth of Mexico's Panuco River. Of the more than 600 members of the de Soto expedition, only 311 returned to Mexico.

Hernando de Soto's failure to find Indian civilizations and riches similar to those in Mexico and Peru plus the expedition's losses halted Spanish exploration of the North American interior for the next century. The Mississippi River would not be visited by non-Indians again until the French voyages of exploration out of Canada a century later. The journals from the de Soto expedition are read for the most part for their ethnological information on Southeast Indians. In 1935–39, the United States government undertook to retrace de Soto's route, publishing its results in the *Final Report of the United States De Soto Commission*.

Spalding, Henry Harmon (1803–1874)

American missionary in the Pacific Northwest

Henry Spalding was born near Bath, New York. He graduated from Western Reserve University in 1833, then attended Lane Theological Seminary until 1836, receiving an appointment by the American Board for Foreign Missions as a Presbyterian missionary to the Indians of the Pacific Northwest.

On March 31, 1836, Spalding and his wife, the former Eliza Hart, set out from St. Louis for the West, traveling with the AMERICAN FUR COMPANY trade caravan to that year's fur-trading rendezvous on the Green River, near the present-day Utah-Wyoming state line. Missionary MARCUS WHITMAN and his wife, the former Narcissa Prentiss, along with a farmer-mechanic named William Gray, were also part of this group. From the Green River, the Spaldings, the Whitmans, and Gray continued westward with a group of HUDSON'S BAY COMPANY traders as far as Fort Boise in what is now southern Idaho.

The Spalding-Whitman party continued into the Oregon Country to Fort Walla Walla, and down the COLUMBIA RIVER to Fort Vancouver, where they were assisted by JOHN M'CLOUGHLIN of the Hudson's Bay Company. While the Whitmans went on to establish a mission at Waiilatpu, near Walla Walla, among the Cayuse Indians, Spalding and his wife journeyed to Lapwai, near what is now Lewiston, Idaho, where he established a mission to the Nez Perce Indians.

In 1842, Spalding received word of his dismissal by the American Board for Foreign Missions because of critical reports about him from Whitman and other missionary workers. Nevertheless, during his trip to the East that year, Whitman had a change of heart and succeeded in obtaining Spalding's reinstatement.

Shortly after Marcus Whitman, his wife, and others at the Walla Walla mission were killed in a surprise attack by Cayuse Indians in 1847, Spalding and his wife left Idaho and moved to Oregon's Willamette Valley, where he became a school administrator and Indian agent. He returned to Lapwai, Idaho, in 1862 and resumed his missionary work among the Nez Perce, while also serving as superintendent of schools for that tribe. He remained at Lapwai until his death in 1874.

In their 1836 overland journey from St. Louis to the Columbia River, Henry Spalding and Marcus Whitman pioneered the Oregon Trail as an emigrant route, and they were the first party to use wagons in traveling west of Fort Hall. Moreover, Eliza Spalding and Narcissa Whitman were the first non-Indian women to cross the Continental Divide. Spalding's mission at Lapwai was the first permanent non-Indian settlement in what is now Idaho. In 1839, as part of his effort to create a written version of the Nez Perce language, Spalding introduced the first printing press in the Pacific Northwest.

Sparrman, Anders (1747–1820) *Swedish naturalist in South Africa and the South Pacific, in service to Great Britain*

Anders Sparrman was born in Upplands, Sweden. At the age of 17, he served aboard a Swedish merchant ship as an assistant surgeon, returning with a large collection of botanical and zoological specimens from East Asia.

In 1768, Sparrman entered the University of Uppsala, where he studied medicine and became a pupil of the Swedish botanist Carl Linnaeus. He received a medical degree in 1770, and, the following year, he sailed to Cape Town, South Africa, as part of a scientific expedition sponsored by the Swedish government. His work included studies with fellow Swede CARL PETER THUNBERG. While in Cape Town, he met JOHANN REINHOLD FORSTER and his son, JOHANN GEORG ADAM FORSTER, the principal naturalists with JAMES COOK'S second expedition, which had stopped there on its way to the South Pacific Ocean. The elder Forster was impressed by Sparrman's abilities as a naturalist, especially his wide knowledge of birds, and soon enlisted him as his assistant aboard the *Resolution*. Over the next two-and-a-half years, Sparrman sailed around the world with the Cook expedition, collecting and identifying hundreds of specimens of flora and fauna throughout the South Pacific. In NEW ZEALAND, he discovered several birds new to science, including the New Zealand parakeet, the spotted cormorant, and

the wekas, a type of flightless rail. On the last part of the voyage, at Christmas Channel near CAPE HORN, Sparrman and the Forsters made a study of the region's seals and other marine mammals and discovered two previously unclassified varieties of penguin, the Papua penguin and the Magellan penguin.

Sparrman left the *Resolution* when it returned to Cape Town in March 1775. He resumed his naturalist studies in South Africa and also undertook ethnological research among the region's native Khoikhoi (Hottentot) people.

In 1778, Sparrman was back in Sweden, where he had been appointed president of the natural history collection of Stockholm's Academy of Sciences. In 1787, he traveled to Senegal in West Africa, where he conducted additional natural history and ethnological studies. Sparrman's map of the South African coastline proved that the southernmost tip of Africa was located at Cape Agulhas and not at the CAPE OF GOOD HOPE.

Anders Sparrman's account of Cook's voyage of 1772–75, *A Voyage round the World with Captain James Cook in H.M.S. Resolution*, first published in 1783, includes some of the earliest ethnological studies of the native peoples of South Africa. Like fellow Linnaeus disciple DANIEL CARL SOLANDER, who had sailed with Cook on his 1768–71 voyage, Sparrman helped popularize the newly devised Linnaean system of classification and nomenclature by applying it to the new varieties of plants and animals he had collected.

Speke, John Hanning (1827–1864) *British soldier, sportsman in Africa*

John Hanning Speke was born near Bath in southwestern England, the son of upper-class parents. He embarked on a career as an officer with the British army in India when he was 17, serving in the Punjab region and taking part in the Second Sikh War of 1849. While in northern India, Speke, an avid hunter and sportsman, and fellow officer JAMES AUGUSTUS GRANT undertook hunting and exploring expeditions into the HIMALAYAS in which they crossed into Tibet, later producing some of the first modern maps of the region.

On a visit to Aden in 1854, Speke met SIR RICHARD FRANCIS BURTON and joined his planned expedition into what is now Somalia and Ethiopia. Soon after landing on the Somalian coast, both Speke and Burton were wounded in a native attack at Berbera, and Speke was briefly taken captive.

Speke recovered and went on to serve with a Turkish regiment in the closing months of the Crimean War of 1853–56. In December 1856, he returned to Africa with Burton, as coleader of an expedition in search of the source of the NILE RIVER, sponsored by the ROYAL GEOGRAPHICAL SOCIETY. Starting from Zanzibar on the Indian Ocean coast of present-day Tanzania, they traveled inland. In February

1858, they reached Ujiji and the shores of Africa's second largest lake, Lake Tanganyika, becoming the first Europeans to see it.

Speke explored Lake Tanganyika in a dugout CANOE, while Burton recovered from an infected jaw in Ujiji. Nearly blind from malaria and other ailments himself at this time, Speke was unable to circumnavigate Lake Tanganyika in search of an outlet that might be the Nile. Yet he noted that the lake was scarcely 10 feet higher above sea level than the Nile at Gondokoro in the Sudan, leading him to conclude that it was not the great river's source.

In spring 1858, Speke and Burton began the return journey to Zanzibar. At Tabora, about halfway to the Indian Ocean coast, Speke decided to investigate reports he had heard from Arab slave traders of a larger lake to the north. Burton, too ill with malaria to travel, remained at Tabora, while Speke proceeded about 200 miles northward. On August 3, 1858, he came upon what the natives called Lake Ukerewe, and what he called Lake Victoria after the reigning queen of England. He mapped what he could of the lake, then rejoined Burton at Tabora.

Speke believed that Lake Victoria, by its immensity, was the source of the Nile, but his view was not shared by Burton. As it turned out, Speke arrived back in England two weeks ahead of Burton, who had remained behind for a time in Aden. Although Speke had agreed not to divulge the results of the expedition until they had both reached England, he related his findings to the Royal Geographical Society. As a result, most of the credit for the European discovery of Africa's two greatest lakes went to Speke.

Speke soon raised support for another expedition in which he planned to further examine Lake Victoria and ascertain if it was indeed the long-sought source of the Nile. Joining him was his former partner in India and the Himalayas, James Augustus Grant. In October 1860, he and Grant headed westward into the interior of East Africa from Zanzibar. After a stopover at Tabora, they traveled northward to Lake Victoria. Grant had problems with an old leg injury and remained behind at Karagwe on the west shore of Lake Victoria, while Speke explored northward around the lake.

On July 21, 1862, Speke came upon a river that appeared to flow from Lake Victoria at what he called Ripon Falls, after George Frederick Samuel Robinson, the second earl of Ripon, then president of the Royal Geographical Society. With Grant, he traced the river from the northern end of Lake Victoria, following its course into present-day Uganda. Tribal warfare slowed their progress, and, by the time they had reached Gondokoro in the Sudan, they had already made several detours away from what turned out to be the White Nile.

Near Gondokoro, Speke and Grant met up with SIR SAMUEL WHITE BAKER and his wife, FLORENCE BAKER, who

were traveling upriver on their own expedition in search of the source of the Nile. The Bakers provided Speke and Grant with fresh supplies and boats to continue the downriver journey to Khartoum. Before they departed for Europe, Speke and Grant related information to the Bakers, which led the Bakers to reach Lake Albert and Murchison Falls.

Back in England, Speke announced that he had discovered Lake Victoria to be the source of the Nile. Burton, among others, challenged his claim, arguing that Speke had not examined Lake Victoria to see if the Nile flowed into it from a point farther south. Moreover, since Speke had left the Nile at various points on his downstream journey with Grant into the Sudan, there was no certainty that it was actually the same river he had seen flowing out of Lake Victoria. The British Association for the Advancement of Science arranged for Speke and Burton to debate the issue publicly. On September 15, 1864, one day before the debate, Speke was killed in a shooting accident while hunting near his home in Bath. Some speculated his death to be a suicide.

John Hanning Speke's *Journal of the Discovery of the Source of the Nile* was published in 1863. He was the first European to see Lake Victoria, the largest lake in Africa and the second largest freshwater lake in the world. The explorations of SIR HENRY MORTON STANLEY and DAVID LIVINGSTONE in the 1870s confirmed that Lake Victoria was actually one of the principal sources of the White Nile, flowing over Ripon Falls into Lake Albert. With Burton, and later with Grant, Speke pioneered the exploration route from the Indian Ocean westward into central and East Africa.

Speyer, Georg Hohermuth von See
HOHERMUTH VON SPEYER, GEORG.

Spotswood, Alexander (Alexander Spottswood) (1676–1740) *British colonial governor on the Virginia frontier*

Born in Tangier, Morocco, Alexander Spotswood was the son of a doctor serving there with British troops. At the age of 17, he embarked on a military career and went on to serve in the War of the Spanish Succession, suffering a wound at the Battle of Blenheim in 1704.

In 1710, Spotswood was named lieutenant governor of Virginia. Although under the nominal governorship of George Hamilton, Earl of Orkney, Spotswood was the colony's principal royal administrator. As such, he instituted tighter regulations on the FUR TRADE with the Indians, and, with tax abatements as an incentive, encouraged settlement on Virginia's frontier.

In 1716, Spotswood organized an official expedition to explore the frontier region himself. With a party he called the "Knights of the Golden Horseshoe"—a group of landed gentry, frontiersmen, German indentured servants, and Indian guides—he traveled through the watergap of the James River into the Shenandoah Valley. The party descended the Shenandoah River, which they dubbed the "Euphrates," after the river of ancient Mesopotamia, and sighted a peak in the Blue Ridge they named Mount George, in honor of the British monarch, King George I.

In 1722, his last year in office, Spotswood entered into a peace treaty with the Iroquois (Haudenosaunee) in Albany, under the terms of which the Indians agreed to stay west of the Potomac River and the Blue Ridge. In addition to promoting frontier settlement, Spotswood was a major land speculator of his day, amassing an estate of over 80,000 acres near Spotsylvania, Virginia.

Alexander Spotswood's 1716 expedition with the Knights of the Golden Horseshoe marked one of the first European explorations into the Blue Ridge.

Spruce, Richard (1817–1893) *British botanist in South America*

Born at North Riding in Yorkshire, England, Richard Spruce was the son of a local schoolteacher. He became a teacher himself at a school in York, where he taught mathematics. He also had an interest in collecting and identifying botanical specimens, especially mosses and liverworts, and undertook his first collecting expeditions on the moors near his home.

Starting in 1846, Spruce spent 12 months in the Pyrenees, between France and Spain, having gone there for health reasons. He carried on additional botanical research and collecting. His work soon came to the attention of a group of leading British botanists, and, as a result, in 1849, with the support of London's Kew Gardens, he embarked on a scientific expedition up the lower AMAZON RIVER.

At Santarem, a town at the junction of the Amazon and the Tapajos River, Spruce met naturalists ALFRED RUSSEL WALLACE and HENRY WALTER BATES; at their suggestion, he continued his botanical explorations farther up the Amazon and into the Río Negro at Manaus. Over the next few years, he investigated the Uaupes River, a tributary of the Río Negro, as well as the Casiquiare, the natural canal linking the Orinoco with the Río Negro and the Amazon.

In 1854, Spruce traveled to the upper Amazon Basin by steamer, extending his botanical research to the Marañón and Huallaga Rivers. He then spent two years collecting moss specimens on the eastern slopes of the Peruvian ANDES MOUNTAINS and in the northern Ecuadorian Andes.

In 1859, after 10 years of scientific work in the Amazon Basin, Spruce was commissioned by the British Foreign

Office, on the recommendation of Wallace and CHARLES ROBERT DARWIN, to collect seeds of the cinchona, or red bark tree, the principal natural source of quinine. He was to acquire the seeds from around Chimborazo, the 20,577-foot inactive volcano in central Ecuador, then ship them from the port of Guayaquil to India, where the colonial government hoped to introduce production of the antimalarial drug.

It took Spruce the next two years to fulfill this government mission, during which he risked the hazards of traveling into the Pastaza River region of central Ecuador, a country inhabited by headhunters. An additional danger was posed by the violent revolution then going on in Ecuador. Despite these difficulties, Spruce had managed to collect more than 100,000 cinchona seedlings and send them off to India by ship by 1861. In the course of this work he had explored the little-known Puyu River, a tributary of the Pastaza, and made studies of Indian dialects.

Spruce returned to England in 1864. Although he had been paid a substantial sum by the British government for collecting the cinchona seeds in the Andes, he had lost it all as a result of a bank failure in Guayaquil. With his health weakened from his 15 years in the Amazon Basin and the Andes, he retired to his home in Yorkshire, where he lived on a small government stipend. He had collected more than 30,000 specimens of rare plants. Furthermore, he had explored and mapped three rivers of the upper Amazon Basin previously unknown to Europeans. He was elected a fellow of the ROYAL GEOGRAPHICAL SOCIETY, and, over the next three decades, he produced many scientific papers as well as a major volume on his study of mosses in South America, *The Hepatics of the Amazons and Andes*, published in 1884–85.

Along with his South American botanical and geographic discoveries, Richard Spruce's efforts in the northern Andes of Ecuador directly led to the initiation of quinine production in Asia, especially in India. In recognition of his scientific work, the *Sprucea* moss and the *Sprucella* liverwort were named after him.

Squanto (Tisquantum) (ca. 1580–1622)

Wampanoag traveler to Europe, interpreter, guide for Pilgrims in Massachusetts

Squanto was a member of the Pawtuxet band of Indians, part of the Wampanoag Confederacy, living along coastal New England. According to some sources, he was among the Indians kidnapped from the Maine coast by English navigator GEORGE WEYMOUTH in 1605. Other sources indicate Squanto was one of a group of Indians abducted by Captain Thomas Hunt in 1615, near what is now Plymouth, Massachusetts. According to still another account,

Captain JOHN SMITH captured Squanto during his 1615 expedition along the New England coast.

Squanto is thought to have been sold into slavery in Spain by the English, then to have escaped on his own or to have been ransomed by a sympathetic Englishman. In any case, he made his way back to England in 1617. Squanto reportedly lived in London for the next two years with John Slany, the treasurer of the Newfoundland Company, and then possibly made a voyage to Newfoundland and back to England with Captain Thomas Dermer.

In summer 1619, Squanto sailed to New England with Captain Dermer, serving as a pilot when their ship approached the coast north of Cape Cod. Upon reaching his homeland, he found that his people had been wiped out by an epidemic, possibly smallpox.

Squanto had learned English during his years in England, and, in 1621, he became an interpreter for Wampanoag grand sachem Massasoit in his dealings with the PILGRIMS at their Plymouth colony in present-day Massachusetts. Squanto also provided the Pilgrims with instructions in agriculture, fishing, and wilderness survival skills.

In 1622, Squanto became embroiled in a tribal power struggle. He was held as a prisoner by the Wampanoag for a short time before being released through the efforts of Pilgrim military leader Miles Standish. In the fall of that year, he served as a guide and interpreter for Plymouth colony governor William Bradford's expedition around Cape Cod. At Chatham harbor, on the east shore of Cape Cod, he became ill with fever and died.

Squanto played a vital role in maintaining peaceful relations between the Pilgrims and the Indians. The assistance he provided the settlers contributed to the survival of the Plymouth colony. He was one of the first Native Americans to travel in Europe, survive conditions of slavery and exposure to disease, then return to North America.

Stadukhin, Mikhail (Mikhailo Stadukhin)

(unknown–1666) *Russian Cossack in northeastern Siberia*

Mikhail Stadukhin was a Cossack from the Siberian town of Yakutsk. Starting in 1630, he initiated a series of expeditions of exploration and conquest northward, along the Lena River, toward the Arctic coast of SIBERIA. In 1633, with a party of Cossacks, he traveled westward across north-central Siberia to the Vilyuy River.

In 1641, Stadukhin began expanding his activities into northeastern Siberia. He sailed down the Indigirka River, then pushed eastward along the Siberian Arctic coast. In 1644, he reached the Kolyma River, and, near its mouth on the East Siberian Sea, he established the settlement of Nizhnekolymsk. From there, he returned westward by sea to the Lena, which he ascended on his return to Yakutsk.

Stadukhin next turned his attention to the Gulf of Anadyr, drawn by reports that it was an abundant source of walrus ivory. His unsuccessful attempt to reach Anadyr Island by sea in 1649 was followed by a successful land journey there the following year. In 1659, he returned to Yakutsk, where he later commanded an outlying settlement. In 1666, he died while en route to the Kolyma River.

Nizhnekolymsk, the outpost Mikhail Stadukhin had founded at the mouth of the Kolyma River, served as the starting point for SEMYON IVANOVICH DEZHNEV's 1648 voyage around the northeasternmost tip of Asia, in which he explored Cape Dezhnev and what later came to be known as the BERING STRAIT.

Stanhope, Hester Lucy (Lady Hester Stanhope) (1776–1839) *British traveler in the Middle East*

Born at Chevening in Kent, England, Lady Hester Stanhope was the daughter of British statesman and inventor Charles, third earl of Stanhope.

In 1803, at the age of 27, Stanhope went to live with her maternal uncle, William Pitt, then British prime minister, for whom she worked as official hostess and secretary. Pitt died three years later, leaving her a substantial trust that made her financially independent.

In 1809, Stanhope's brother, a major in the army, and his commanding officer, General Sir John Moore, with whom Stanhope had been romantically linked, were both killed fighting the French at the Battle of La Coruña in the Peninsular War of 1808–14. The double tragedy led her to withdraw first to Wales, then in 1810, to the Middle East. Accompanying her were her physician, Charles Lewis Meryon, and a Welsh woman named Williams.

After surviving a shipwreck in the eastern MEDITERRANEAN SEA off the island of Rhodes, Stanhope and her party arrived in present-day southern Lebanon. Stanhope made a pilgrimage to Jerusalem, then embarked on extensive travel throughout the region, often dressed in native male attire. In January 1813, she crossed the Syrian Desert to the ruins of the ancient city of Palmyra, where she lived among a band of bedouin and, according to her own later account, was proclaimed "Queen of the Desert."

In summer 1814, Stanhope acquired an abandoned convent in the country around Mount Lebanon, upon which she had built a fortress-like residence, surrounded by a garden and a wall. She soon developed a charismatic reputation among the region's Druse people, who came to regard her as a prophetess. Stanhope herself was something of a mystic, an avid adherent of astrology, and a believer in the transmigration of souls. She developed a unique system of religious thought combining elements of local Christian and Muslim sects.

During the next two decades, Stanhope held a commanding position amid the political struggles over Lebanon that periodically erupted between the Ottoman Empire, the rulers of Egypt, and the European powers. She was visited by leading literary figures from Europe, including the French poet Alphonse de Lamartine and English travel writer William Kinglake.

By 1838, Stanhope had fallen severely into debt, and her creditors in Lebanon were awarded what remained of her trust. Left virtually penniless, she walled herself up in her castle-like home, and, after almost a year of self-imposed confinement, she died there in June 1839. Her physician, Charles Lewis Meryon, published two accounts of her life, *Memoirs of Lady Hester Stanhope* (1845) and *Travels of Lady Hester Stanhope* (1846).

Lady Hester Stanhope departed England reportedly to remove herself from the constraints imposed on her by society. Her journeys in the Middle East were made at a time when most private travel into the region was fraught with difficulties and perils. Even more remarkable was her ability to live for an extended time within a culture wary of non-Muslim Europeans and disapproving of females living independently.

Stanley, David Sloan (1828–1902) *U.S. Army officer in American West*

Born in Cedar Valley, Ohio, David S. Stanley was an 1852 West Point graduate. Commissioned a second lieutenant, he began his frontier military career when he was assigned to an exploring expedition westward along the 35th parallel for a proposed transcontinental railroad route.

In 1853, Stanley, accompanying Lieutenant AMIEL WEEKS WHIPPLE and a detachment of the army's Corps of Topographical Engineers, traveled westward from Fort Smith, Arkansas, over the southern plains to Albuquerque, then continued to Fort Yuma on the COLORADO RIVER. They crossed the Mojave Desert and, traversing the Sierra Nevada by way of Cajon Pass, arrived in Los Angeles.

Stanley remained in western military posts throughout the 1850s, serving with a cavalry regiment against the Cheyenne and Comanche Indians on the southern plains. In 1862, during the Civil War, he was breveted a major general; he served with distinction in command of Union forces in Georgia and Missouri and was wounded in an engagement near Nashville.

In 1865, at the war's end, Stanley was assigned to Texas. Soon afterward, he was promoted to the regular rank of lieutenant colonel, in command of frontier garrisons in the Dakota Territory. During this posting, he commanded what was known as the Yellowstone Expedition of 1873, which explored into the unknown parts of Montana and

Wyoming, as he detailed in his *Report on the Yellowstone Expedition*, published in 1874.

Stanley's later military career took him to western Texas in 1879. He was appointed a brigadier general in the regular army in 1884.

David S. Stanley's favorable reports about the country he explored with the Yellowstone Expedition of 1873 inspired a new influx of settlers onto the northern plains.

Stanley, Sir Henry Morton (John Rowlands, Bula Matari) (1841–1904) *Anglo-American journalist, colonizer in central Africa*

Born in Denbigh, Wales, Henry Morton Stanley was the illegitimate son of John Rowlands and Elizabeth Parry. He was given his father's name at birth. He spent his early years at the St. Asaph Union Workhouse, a local charitable institution, where he received some formal education.

Stanley left St. Asaph's when he was 15 and worked briefly for a haberdasher and then a butcher before going to sea as a cabin boy on a vessel bound for the United States. In 1859, he jumped ship in New Orleans, where he found employment with cotton broker Henry Hope Stanley, who became his benefactor and from whom Stanley adopted the name by which he became known.

At the outbreak of the American Civil War in 1861, Stanley enlisted in the Confederate army; he was taken prisoner at the Battle of Shiloh in April 1862. He gained his release by joining a Union artillery unit, but he was discharged on becoming ill with dysentery. After recovering, Stanley went back to Wales, then traveled in Europe before returning to the United States in 1864. He served briefly in the U.S. Navy before deserting.

Stanley embarked on a career as a journalist in 1865. He covered General Winfield Scott Hancock's campaign against the Indians in Kansas in 1867, and, the following year, as a correspondent for the *New York Herald*, he reported on a British military expedition in what is now Ethiopia.

In 1869, while reporting on a revolution in Spain, Stanley received orders from publisher James Gordon Bennett, Jr., of the newspaper the *New York Herald* to undertake a search for the Scottish missionary and explorer, DAVID LIVINGSTONE, who had been missing in East Africa for three years. Stanley did not immediately begin his search for Livingstone, since Bennett hoped a delay might improve Stanley's chances of returning with a great story, rather than merely with the news that Livingstone was still lost.

As instructed, Stanley first traveled to Egypt, where he covered the opening of the Suez Canal and met with SIR SAMUEL WHITE BAKER, who was planning an expedition up the NILE RIVER. Stanley then traveled into the Crimea, where he reported on the battle sites of the Crimean War of 1853–56.

Stanley toured the region around the Caspian Sea before heading southward into Persia (present-day Iran). Continuing to Baghdad, he sent back dispatches on the newly developed railroad through the Euphrates Valley. He later sailed to India, from where he reached the coast of East Africa, arriving in Zanzibar on January 26, 1871, 18 months after Bennett had first commissioned him to look for Livingstone. By then, reports by Arab slave traders indicated that a white fitting Livingstone's description was at Ujiji on the east shore of Lake Tanganyika.

Stanley, who had been provided with almost limitless financial resources by his New York publisher, organized a small army of porters, guides, hunters, and armed escorts, along with pack animals. He departed Bagamoyo on the mainland of present-day Tanzania on March 21, 1871. He followed the Arab slave caravan route inland to Tabora, then continued toward Lake Tanganyika. On November 10, 1871, in Ujiji, he located the missionary, addressing the Scotsman with the now famous greeting, "Dr. Livingstone, I presume?"

Stanley soon learned that Livingstone did not consider himself lost, only temporarily weakened by disease and short on supplies. Moreover, Livingstone was still committed to exploring the great lakes of East Africa, especially in ascertaining their exact connection to the CONGO RIVER (Zaire River) and Nile River. Over the next few months, Stanley accompanied Livingstone in an examination of the northern end of Lake Tanganyika, and, although they found no evidence of a major river flowing out of the lake, they learned that the Ruzizi River flowed into it.

Stanley left Livingstone at Tabora on March 14, 1872, then traveled back to the Indian Ocean coast of present-day Tanzania, arriving there in May. His news of finding Livingstone reached Europe and New York in August 1872. He was greeted with much acclaim when he later arrived in England. His account of the exploit, *How I Found Livingstone* (1872), became an instant best-seller. In 1873, Stanley was awarded a gold medal by the ROYAL GEOGRAPHICAL SOCIETY, and, that same year, he went to what is now Ghana in West Africa to cover Sir Garnet Wolseley's military campaign against the Ashanti.

Stanley had by this time resolved to complete the exploration of central Africa begun by Livingstone. In November 1874, in command of a large expedition jointly sponsored by the *New York Herald* and the *Daily Telegraph* of London, he set out from Bagamoyo for Lake Victoria, planning to confirm whether Lake Victoria was the principal source of the Nile and to establish the exact geographic location of East Africa's other great lakes. Moreover, he planned to find the source of the Congo River and, if possible, follow it to the Atlantic Ocean. Arriving at Lake Victoria in late February 1875, Stanley undertook a circumnavigation of the lake in the *Lady Alice*, a portable

steamboat that had been carried in pieces into the interior. He then visited a native kingdom to the north in what is now Uganda, coming upon an uncharted lake, which he named Lake Edward.

Stanley headed southward along Africa's Great Rift Valley and, in spring 1876, he arrived at Lake Tanganyika, which he also circumnavigated in the *Lady Alice*. He then found the lake's principal outlet to be the Lukuga River, which he followed to its confluence with the Lualaba River. Descending the Lualaba northward, he came to Nyangwe, the farthest inland point known to both Arab traders and Europeans. There, he recruited a small armed force, under a local Arab slaver named Tippoo Tib, who guided his expedition to a series of cataracts, later known as Stanley Falls, which they portaged around with considerable difficulty.

Abandoned by Tippoo Tib and his men soon afterward, Stanley and his expedition nevertheless pushed onward, traveling on the river when they could or following its banks. Upon reaching the site of present-day Kisangani in what is now the west-central Democratic Republic of the Congo, Stanley determined that the river could not flow into the Nile, since at that point it was 14 feet lower in elevation than the larger river. He soon found that the river turned sharply west and south and widened to allow relatively easy travel by boat. After a few more months of down-river travel, he discovered a large lake-like expanse, later known as Stanley Pool. On August 9, 1877, Stanley and his party reached the Atlantic at Boma. In his 999-day journey, he had crossed Africa from east to west and had determined that the Congo flowed from the Lualaba River. With this finding, he dispelled Livingstone's theory that the Lualaba was a source of the Nile. Of the original 356 men in the expedition, only 114 remained with him when he reached Boma, the rest having died or deserted. Stanley related his 1874–77 journey across Africa in his book *Through the Dark Continent* (1878).

Stanley's exploration of the Congo in 1874–77 sparked the interest of King Leopold II of Belgium, who commissioned Stanley to direct the development of the Congo Free State. With King Leopold's support, Stanley undertook his next expedition in 1879, retracing his route up the Congo River. During the next five years, he explored the interior of present-day Democratic Republic of the Congo, making the European discovery of Lake Tumba and Lake Leopold II, and directed the construction of overland routes around the Congo River's unnavigable sections.

Stanley's last African expedition began in 1887 as a relief mission to aid MEHMED EMIN PASHA, the German-born governor of southern Sudan's Equatoria province, who had been cut off from Anglo-Egyptian forces to the north since the outbreak of a Muslim revolt six years earlier. Stanley again ascended the Congo, then marched across central Africa toward Emin Pasha's stronghold on Lake Albert. Along the

way, he lost nearly half of the 700 members of the expedition, with the survivors trailing behind him over several hundred miles. Ironically, by the time Stanley reached Lake Albert, he was critically low on provisions and had to be resupplied by Emin Pasha, the man he had come to rescue. Stanley and Emin Pasha explored the Semliki River, establishing it as the principal connection between Lake Albert and Lake Edward. In 1889, while in the region, Stanley came upon the Ruwenzori Mountains, thought to be the fabled MOUNTAINS OF THE MOON, which had been described by the second-century geographer PTOLEMY. After a 3,000-mile journey, in which he had traversed Africa from west to east, Stanley and the survivors of his expedition, along with Emin Pasha and the remainder of the Equatoria garrison, reached Zanzibar in late 1889.

Stanley settled in England and married soon after departing Africa. Although he had been naturalized as a U.S. citizen, he again became a British subject, and he served in the House of Commons from 1895 to 1900. He made a brief visit to South Africa in the 1890s, and was knighted in 1899.

Sir Henry Morton Stanley was known by the African natives as Bula Matari (breaker of bones) after the single-minded and often brutal determination with which he conducted his expeditions. In the history of exploration, he is most famous for locating David Livingstone, but he was also the first European to descend the length of the Congo River, and, after VERNEY LOVETT CAMERON, the second European to cross central Africa from east to west. In locating the source of the Congo, he completed the exploration of Africa's last remaining unknown river system, and he later encouraged its development as the main entry route into the interior of Africa. Stanley is also generally credited with having finally resolved the question of the Nile's source, confirming JOHN HANNING SPEKE's contention that the main branch of the world's longest river flowed from Lake Victoria.

Stansbury, Howard (1806–1863) *U.S. Army officer in Utah*

Howard Stansbury was born in New York City. Trained as a civil engineer, he took part in surveying projects for canals and railroads in the Ohio Valley and Lake Erie region from 1828 to 1838.

In 1838, Stansbury joined the U.S. Army Corps of Topographical Engineers as a second lieutenant, and, two years later, he was promoted to captain. During the next nine years, he supervised army topographic and engineering projects from the Great Lakes to the New England coast.

In 1849, Stansbury was directed to lead an exploring expedition across the plains from Fort Leavenworth to Utah's Salt Lake Valley, and there survey the topography as well as make a study of the Mormon settlements.

Stansbury and his 18-man party left Fort Leavenworth on May 31, 1849, heading westward along the Oregon Trail. They reached Fort Bridger in southwestern Wyoming's Green River country on August 11, where Stansbury engaged former mountain man JAMES BRIDGER as a guide.

From Fort Bridger, Stansbury sent half his party southward along the known trail to Salt Lake City, under the command of his assistant, Lieutenant JOHN WILLIAMS GUNNISON. Stansbury, Bridger, and the rest of the expedition then headed westward into the northern Wasatch Mountains. Guided by Bridger, Stansbury explored the eastern slopes of the Wasatch Mountains in search of a route to the north shore of the Great Salt Lake. He followed the Bear River to Ogden's Hole and located a pass through the mountains, which led them to the lake's east shore, near what is now Ogden, Utah. Stansbury's group then went northward to Fort Hall and explored the Cache Valley.

The two groups joined up at Salt Lake City. In October 1849, Stansbury undertook a reconnaissance of the Great Salt Lake's west shore. He led his men northward, then circled around into the Lake Bonneville salt flats. From there, they headed westward as far as Pilot Peak near the present-day Utah-Nevada border, then returned eastward across the Great Salt Lake Desert to Salt Lake City, where they wintered.

In spring 1850, Stansbury completed his surveys in Utah with explorations of Utah Lake and the River Jordan. Although he had been instructed to return via the Old Spanish Trail to Santa Fe, Stansbury instead chose to search for a new pass through the ROCKY MOUNTAINS south of the usual route through the SOUTH PASS. At Fort Bridger, he again engaged Jim Bridger as a guide; together they proceeded through the Green River Valley and across south-central Wyoming to Fort Laramie by way of Bridger's Pass and Cheyenne Pass.

Throughout the 1850s, until the outbreak of the Civil War, Stansbury was engaged in government construction projects and topographic surveys in the Great Lakes country and Minnesota. During the Civil War, he directed mustering operations in Ohio and Minnesota.

Howard Stansbury's 1849–50 Utah expedition established a more direct route from Fort Bridger to the Humboldt River by way of Salt Lake City, providing a shorter alternative to the roundabout trail north to Soda Springs and Fort Hall. Stansbury also undertook the first organized exploration of the west shore of the Great Salt Lake. His return trip from Salt Lake to Fort Laramie, through Cheyenne Pass, established a trail 60 miles shorter than the established South Pass route. In the following years, it was adopted by the Overland Stage Line, the Pony Express, and the Union Pacific Railroad. Stansbury's map of the Great Salt Lake and Great Basin region guided topographers in the Pacific Railroad Surveys throughout the 1850s. His ac-

count of his Utah expedition, *Exploration and Survey of the Valley of the Great Salt Lake Including a Reconnaissance of a New Route through the Rocky Mountains*, was first issued as a government publication in 1852 and went on to become a literary success in the United States and Great Britain. The work expresses one of the earliest views that the region around the Great Salt Lake was once the site of a great inland sea.

Stark, Freya Madeline (Dame Freya Stark)

(1893–1993) *British traveler, writer, archaeologist in the Middle East and central Asia*

Freya Stark was born in Paris, France, where her parents, Robert and Flora Stark, were pursuing careers as painters. She spent time at both her father's Devon home in England and her mother's Genoa home in Italy. For most of her childhood, she lived in the Italian village of Asolo, near Venice. She attended Bedford College in England, studying English and history. During World War I, she worked as a censor in London and as a nurse in Italy. Proficient in English, Italian, French, and German, she also decided to study Arabic in her late 20s, enrolling at the School of Oriental and African Studies in London.

In 1927, Stark visited countries of the eastern MEDITERRANEAN SEA region. She later traveled to Iraq and worked for a time as a writer for the *Baghdad Times*. She visited Turkey, Syria, Persia (present-day Iran), Kuwait, and Arabia (present-day Saudi Arabia). In 1935, she explored the fertile valley of the Wadi Hadhramaut in present-day Yemen inland from the Gulf of Aden. She frequently stayed on the island of Cyprus between travels. In 1937, she participated, along with Dr. Gertrude Caton-Thompson and Eliner Gardner, in the first archaeological excavations in Yemen, excavating the Moon Temple of Hureidha. During World War II, she worked for British intelligence in the Middle East. After the war, she spent significant time in Turkey. In later life, Stark traveled to central Asia and the Far East, visiting Cambodia, China, Nepal, and Kashmir, and crossed the HIMALAYAS.

Stark's prolific writing included *The Valley of the Assassins* (1934), *Southern Gates of Arabia* (1936), *Baghdad Sketches* (1937), and *Winter in Arabia* (1940). Stark was also known for her photography, her pictures taken with a Leica camera. She worked with and was married for a time to the Arabist and historian Steward Perowne. She lived to the age of 100, dying in Asolo.

Stark's most famous book, *Southern Gates of Arabia*, informed Europeans of the little-known Hadhramaut region. Her work mapping the routes of the Assassins, a society of bandits who traded in hashish and preyed on Europeans during the CRUSADES, as recorded in *The Valley of the Assassins*, led to a medal in 1942 from the ROYAL GEOGRAPHICAL

SOCIETY. She was knighted at the age of 82. In many of the remote places she visited, she was the first European woman to have ventured there.

Stefansson, Vilhjalmur (1879–1962)

Canadian anthropologist, historian in the Canadian Arctic
Vilhjalmur Stefansson was born near Gimli in Manitoba, Canada, the son of Icelandic immigrants. As an infant, he moved with his family to North Dakota, where he was raised.

Stefansson attended the University of North Dakota and the University of Iowa, graduating from the latter in 1903. Two years later, he took part in archaeological studies in ICELAND.

In 1906, Stefansson descended the Mackenzie River to its delta, where he lived for over a year with the region's Inuit, learning their language and Arctic survival skills. In May 1908, he journeyed with HUDSON'S BAY COMPANY supply boats northward from Edmonton, Alberta, to Canada's western Arctic coast, where he made an extensive study of the different Inuit peoples living between Point Barrow and Cape Parry. In 1910–12, he extended his study eastward to Coronation Gulf, where he lived among the Copper Inuit, a people living isolated from non-natives.

Stefansson commanded the Canadian Arctic Expedition of 1913–18, an undertaking sponsored by the Canadian government in which he explored the westernmost regions of the Canadian Arctic Archipelago. With a group of ships, he sailed northward through the BERING STRAIT, then eastward into the Beaufort Sea. He reached as far as 81° north latitude, sighting some uncharted islands to the north of Prince Patrick Island, including Meighen Island, Borden Island, and Brock Island. Some of these sightings were made while adrift on ice floes in the Beaufort Sea. Among the scientific and technical team with Stefansson was SIR GEORGE HUBERT WILKINS, the expedition's photographer, who was later knighted for his polar explorations.

From 1921 to 1925, Stefansson directed expeditions to northeastern SIBERIA's Wrangel Island and Alaska. He later created an international dispute when he attempted to claim Wrangel Island in the Siberian Arctic for Canada. Soon afterward, he settled in New York City, where he continued to lecture and write on polar exploration. The Stefansson Collection, which he established at Dartmouth College, became one of the world's most comprehensive libraries dealing with polar exploration.

Stefansson related his experiences among the native people of the Arctic in his book *My Life with the Eskimos* (1913). In his 1921 book, *The Friendly Arctic*, he made the case that the Arctic was a habitable region with abundant resources waiting to be developed. He later was a consultant

Vilhjalmur Stefansson (*Library of Congress*)

for airlines developing transpolar routes and also advised the U.S. Navy on Arctic survival techniques.

Vilhjalmur Stefansson's 1913–18 expedition set a record for Arctic exploration by spending five consecutive winters above the ARCTIC CIRCLE. The islands Stefansson found in the Canadian Arctic archipelago in the course of that expedition were among the last uncharted landmasses explored on Earth. In 1952, the Canadian government gave his name to Stefansson Island, off the northeastern corner of Victoria Island. Stefansson's approach to Arctic exploration and his ideas on the industrial development of the polar regions had a great impact on Soviet expansion into the Siberian Arctic in the 1920s and 1930s. In addition to being an explorer in his own right, Stefansson was a leading historian of exploration and edited the firsthand accounts of the major voyages in his 1947 book *Great Adventures and Explorations*.

Stein, Sir Marc Aurel (Sir Mark Aurel Stein)

(1852–1943) *Anglo-Hungarian historian, archaeologist in central Asia*

Born in Budapest, Hungary, Aurel Stein immigrated to England, where he became a scholar of ancient Asian history, culture, and art. In 1888, after attending universities in

Hungary, England, and Germany, he traveled to Lahore in what was then northwestern British India (present-day northern Pakistan), where he had been appointed principal of Oriental College.

Stein, an archaeologist as well as a historian, was a member of the Indian Archaeological Survey. In 1900, inspired by SVEN ANDERS HEDIN's reports of ancient ruins in western China, he set out on his first Indian government-sponsored archaeological expedition into central Asia. From Srinagar in northern India's Punjab region, he traveled northward to Gilgit on the edge of the Pamirs, then westward through the Hindu Kush range into northeastern Afghanistan. He turned eastward across the Pamirs into western China's Taklimakan Desert. Accompanying him were surveyors who later produced the first accurate maps of the region. His route back to India took him through Kashgar and Samarkand.

Stein's next archaeological foray into central Asia, in particular western China, began in 1906. Starting out again from the Punjab region, he crossed the Hindu Kush into northeastern Afghanistan, and, by late winter 1907, after traveling around the Taklimakan Desert, he reached Lop Nor, the shifting, shallow lake of western China. Soon afterward, Stein crossed from Russian central Asia along 3,000 miles of the ancient SILK ROAD and reached Tunhuang.

In his archaeological investigations, Stein determined that in ancient times Tunhuang had been the westernmost extent of the Great Wall of China. Outside the town, located in an oasis, he found a series of temples built into caves, known as the Caves of the Thousand Buddhas. Within a walled-up section of one of the caves, he located as many as 9,000 ancient Buddhist texts and paintings, which had been preserved in sealed jars for more than 800 years. Among these was a copy of the Diamond Sutra dating back to A.D. 868; this was later determined to be the oldest existing printed book. With the cooperation of a local official, Stein was able to acquire many of these ancient documents and paintings, which he then sent back to the British Museum in London. He later determined that many of the texts were connected to those brought back from India by the Buddhist monk and pilgrim HSÜAN-TSANG in his travels of 629–645.

From Tunhuang, Stein crossed the southern reaches of the GOBI DESERT, then headed back to India by way of the Taklimakan Desert and the Kunlun mountains. While crossing the Kunluns in 1908, he suffered frostbite and lost all the toes on one foot.

In 1909, in recognition of his discovery at Tunhuang, which has been hailed as one of the greatest archaeological finds in Asia, the ROYAL GEOGRAPHICAL SOCIETY awarded Stein its Founder's Medal. Over the next 20 years, Stein undertook several more expeditions into western China from northern India, exploring the Karakoram Mountains and

the region around the Tarim River. In 1913, he explored the Nan Shan Mountains. In 1915, he traveled from Kashgar into the Pamirs and the Hindu Kush. In 1926, he retraced the route that the army of ALEXANDER THE GREAT had followed as it returned from the Indus Valley to Persia (present-day Iran).

Sir Aurel Stein's primary archaeological interest was uncovering the links between the ancient civilizations of the MEDITERRANEAN SEA and those of central Asia. He applied the results of his travels and archaeological inquiries in central Asia to a historical interpretation of the impact that East-West contacts had on the ancient civilizations of the Indus Valley and Mesopotamia. Among his many published works on the subject are *Ruins of Desert Cathay* (1912), *Innermost Asia* (1928), and *On Alexander's Track to the Indus* (1929).

Steller, Georg Wilhelm (1709–1746)

German physician, naturalist in Kamchatka, Alaska, and the islands of the Bering Sea, in service to Russia

Originally from Germany, Georg Wilhelm Steller was a physician and naturalist, who began practicing medicine in St. Petersburg, Russia, in 1734. Three years later, he was appointed to the natural history department of the Academy of Sciences, and before long he was accepted as one of the scientists for the Second Kamchatka Expedition under the command of VITUS JONASSEN BERING.

In 1740, after an overland journey across Russia and Siberia, Steller arrived at the port of Okhotsk. He sailed from there across the Sea of Okhotsk to the Kamchatka Peninsula, where, for the next few months, he collected plant and animal specimens. He was next assigned as ship's surgeon and naturalist for a reconnaissance voyage eastward across what is now known as the Bering Sea. In June 1741, aboard the *St. Peter*, under Bering's command, Steller sailed from Avacha Bay on Kamchatka's Pacific coast.

By late July, the Alaskan mainland was sighted, and soon afterward Steller went ashore on Kayak Island, where he collected specimens of animal and plant life. On the voyage back to Kamchatka, Steller had the opportunity to make observations of the Aleut people he saw on the Kenai Peninsula. In mid-November 1741, the *St. Peter* was wrecked on an island about 100 miles east of Kamchatka, later known as Bering Island. SCURVY soon became a severe problem, and many of the crew succumbed, including Bering.

Steller kept a journal of his experience on Bering Island in winter 1741–42 and continued to carry out natural history studies. He wrote a study of the marine mammals in which he provided the first description of a type of sea lion later known as Steller's sea lion. Furthermore, he made the earliest report of a giant species of dugong, a sea mammal since identified as Steller's sea cow.

In August 1742, Steller and the survivors of Bering's voyage reached Avacha Bay in a small boat they had managed to construct with wreckage salvaged from the *St. Peter*. Of the 77 men who had set out with Bering, only 45 returned.

Steller remained in Kamchatka for the next two years, during which he undertook studies of the region's birds, identifying species later known as Steller's eagle, Steller's eider, and Steller's white raven. In November 1746, while traveling back to St. Petersburg, he died at the western Siberian town of Tyumen.

Georg Wilhelm Steller was the first scientist to make a study of Alaska's wildlife and provided the earliest ethnological details about the Aleut. His *Description of Kamchatka* was published in 1744, and his study of the animals he had observed on Bering Island, *On Sea Animals*, first appeared in 1751. Steller also wrote the earliest account of the life and habits of the sea otter, the hunting of which became the focal point of Russia's subsequent colonizing efforts in Alaska. The giant sea mammal he had discovered, Steller's sea cow, fell prey to the hunters who soon poured into the region; by 1800, it had become extinct.

Stevens, Thomas (unknown–1619)

English missionary in India

Thomas Stevens was an English Jesuit priest who was compelled to leave his native land in the 1570s. After residing in Italy for a time, he sailed from Lisbon, Portugal, aboard a Portuguese ship bound for India in 1579.

Stevens settled at the Portuguese trading port of Goa on the west coast of India, where he embarked on a career as a missionary. He later mastered the Marathi language, in which he wrote religious poetry for his native converts.

In 1583, Stevens helped gain the release of RALPH FITCH, JOHN NEWBERRY, and other members of an English trade and diplomatic mission to the Mogul emperor, after they had been detained by Portuguese authorities in Goa.

Thomas Stevens was the first Englishman known to have reached India. Soon after his arrival there in 1579, he reportedly sent back to Europe details of Portuguese sailing routes to India, information that the Portuguese government had been keeping as state secrets for almost a century.

Strabo (ca. 63 B.C.–ca. A.D. 21) *Greek traveler in Europe, Africa, and Asia, geographer in ancient Rome*

Strabo, a Greek, was born in Amasia, a city in the region south of the Black Sea in what is now northeastern Turkey and then was part of the ancient Roman province of Pontus. Strabo studied history and philosophy in his native city, as well as in Alexandria and Greece. He also traveled widely in the Middle East, North Africa, and Europe. Eventually he

settled in Rome, where he became a noted historian and authority on the geography of the Roman world.

In about A.D. 18, Strabo completed his *Geography*, a work in 17 books encompassing most of what was then known about the lands of the Roman Empire and the world beyond. In addition to his own travel experiences, Strabo drew from the works of earlier geographers, including Eratosthenes, Polybius, and Posidonius, although he rejected most of HERODOTUS. Moreover, he incorporated as fact geographic information gleaned from the epic poetry of Homer and other mythic and traditional sources.

As background for his geographic descriptions, Strabo provided historical accounts of Greeks and Romans, including NEARCHUS's voyage from the Indus River delta to the Persian Gulf. He was highly skeptical of what the Greek navigator PYTHEAS reported concerning his voyage to Britain. Ironically, it was only through the sometimes scathing criticism leveled against him in Strabo's *Geography* that any record of Pytheas's exploits as an explorer of western Europe and the Atlantic Ocean survived.

Strabo's report that the NILE RIVER's main eastern tributary, the Blue Nile, flowed from a lake in Ethiopia was confirmed by JAMES BRUCE's exploration of Lake Tana in 1770.

Strabo's works were translated into Latin in 1469, and copies began to circulate in Europe after 1472. He provided descriptions of the ancient shipping routes between the Roman Empire and India and further suggested that the Indies, the elusive origin of the SPICE TRADE, might be reached by sailing westward from Spain, although he maintained that such a voyage had never been successfully attempted because of the great expanse of open sea that had to be crossed. Nevertheless, Strabo's theories came to the attention of CHRISTOPHER COLUMBUS, and, along with the writings of PTOLEMY, helped inspire him to attempt a westward crossing to the Orient in his 1492 voyage, resulting in the European discovery of the Americas.

Strzelecki, Sir Paul Edmund (Count Paul Edmund de Strzelecki, Paweł Strzelecki)

(1797–1873) *Polish geologist in Australia*

Paul Strzelecki was born in Gluszyna, near Poznań, in western Poland, then under Prussian rule. His aristocratic parents died when he was 10, and he was raised by his mother's family. It is thought that he was educated at Piarists Fathers College in Warsaw. He served for a time in the Prussian cavalry. He traveled in eastern Europe, where he met Prince Francis Sapieha, who hired him to manage his estates in Poland and upon his death, left him a sum of money.

In 1829, Strzelecki departed Poland, traveling first to France, then England and Scotland. Over the years, he pursued an interest in geology and mineralogy. He later visited North and South America, the Marquesas, the HAWAIIAN

ISLANDS (where he studied the volcano of Kilauea), Tahiti, NEW ZEALAND, and, in 1839, Australia.

Strzelecki planned a series of geological surveys of the largely unexplored continent. His first expedition was to the BLUE MOUNTAINS west of Sydney, where he found veins of gold and silver. Although he reported his discovery, the governor of the New South Wales colony, Sir George Gipps, requested he not publicize it because of the difficulty in controlling the colonists, many of them convicts. (Edward Hargraves would receive credit for locating gold in 1851 and starting the Australian gold rush.)

Strzelecki's second Australian expedition, beginning in December 1839, took him to the Snowy Mountains in the southeast. He traveled with James Macarthur and two Aborigine guides. He named one of the peaks he climbed Mount Kosciuszko (the highest peak in Australia) in honor of the Polish patriot Tadeusz Kościuszko. In southeastern Victoria, he named the coastal plain along Bass Strait in what is now southeastern Victoria Gippsland for Governor Gipps. He named Lake King after his friend PHILIP PARKER KING and also the La Trobe River. His work included the creation of topographic and geological maps, based on astronomical observations. The party reached Melbourne in May 1840. In July, Strzelecki traveled by boat across Bass Strait to Van Diemen's Land (present-day TASMANIA).

In Van Diemen's Land, Strzelecki carried out extensive explorations, some of them sponsored by SIR JOHN FRANKLIN, then governor of the colony. One such expedition was to the islands in Bass Strait. He sailed to Sydney in September 1842, where he stayed with King. He continued his geological investigations, exploring the Hunter and Karuah river valleys.

Strzelecki departed Australia in April 1843 and reached Europe by way of the EAST INDIES and China. He settled in England, where he wrote two books about Australia: *Physical Description of New South Wales and Van Diemen's Land* (1845), the first such work on Australian geology, and *Gold and Silver* (1856), arguing his claim to having discovered gold in Australia. He received a commendation from CHARLES ROBERT DARWIN and was awarded the gold Founder's Medal of the ROYAL GEOGRAPHICAL SOCIETY for the 1845 book. In 1853, he was elected a Fellow of the Royal Geographical Society and a Fellow of the ROYAL SOCIETY. Other projects during this period included working on behalf of victims of the Irish famine of 1845–47, traveling to the Crimea on behalf of the British government in 1856, and helping JANE FRANKLIN raise funds to search for her husband, missing in the Arctic.

In addition to his geographic and geological discoveries in Australia and Tasmania, Sir Paul Strzelecki promoted a vision of development of an Australian economy with conservation of resources in mind. He was knighted in 1869 for "five years' explorations in Australia, the discovery of gold,

the discovery of new territory accessible to colonization and finally for the construction of topographical and geological maps, based on astronomical observations."

Stuart, John McDouall (John M'Doual Stuart)

(1815–1866) *Scottish surveyor in Australia*

John McDouall Stuart was born at Dysart in eastern Scotland, the son of a British army officer. Educated at a military academy in Edinburgh, he later went into business, then immigrated to South Australia in 1838.

In Adelaide, Stuart went to work for the South Australian Survey Department, serving as a draftsman with CHARLES STURT on an 1844–46 expedition in which they ventured into the interior of the continent north of Lake Eyre, as far as the Simpson Desert.

Stuart went on to become a surveyor and sheep farmer in the bush country west of Lake Torrens. In 1858, in search of new pasture lands, he explored westward to Streaky Bay on the Great Australian Bight. A year later, he undertook an examination into the region west of Lake Eyre, locating the Neales River.

On March 2, 1860, Stuart began the first of a series of attempts to cross the continent from south to north, a feat for which the South Australian government had offered a reward of £2,000. Leaving a sheep ranch at Chambers Creek, about 300 miles north of Adelaide, Stuart and a small party headed northward. Several weeks later, they reached a chain of mountains that Stuart called the Macdonnell Ranges after South Australian governor Sir Richard Macdonnell.

On April 22, 1860, Stuart reached the geographic center of Australia, and, to mark the occasion, he planted a British flag atop a nearby hill, which he had named Central Mount Sturt, after Charles Sturt. (For this achievement, the ROYAL GEOGRAPHICAL SOCIETY awarded Stuart its Patron's Medal in 1861.)

In June 1860, Stuart and his companions arrived at Tennant Creek, a place that he called Attack Creek because of a hostile encounter with Aborigines. At this point, running low on supplies, they were forced to turn back.

Within a month of his return to Adelaide in October 1860, Stuart organized a second attempt to traverse the continent, this time aided by a government grant. He set out on November 29, 1860, and, by the following May, he had reached beyond the farthest point north of his previous expedition, an area now known as Sturt Plain. There, his progress was halted by an impenetrable expanse of thorny scrublands. Although he was then only about 300 miles from Australia's coast, he had run critically short of food and water, and, unable to find a way through the scrublands, he was again compelled to return southward to Adelaide.

Stuart's next attempt to cross Australia began in October 1861, and, after traveling northward from Adelaide, he

was back at the edge of the scrublands in early April 1862. This time, he managed to find a route through the scrub to the headwaters of the Roper River. Traveling northward to the Daly River on July 24, 1862, he reached the Indian Ocean at Van Diemen Gulf, near the mouth of the Adelaide River and present-day Darwin.

Stuart's health had steadily declined on this last expedition, and, by the time he returned to Adelaide in December 1862, he was practically paralyzed and nearly blind as a result of the combined privations of over three years of continuous explorations in the outback. Just over a week after his return, a search party arrived back in Adelaide with the bodies of ROBERT O'HARA BURKE and WILLIAM JOHN WILLS, who had perished on a similar attempt to cross the continent farther to the east.

Stuart was awarded the South Australian government's prize and a grant of land for making the first south-to-north crossing of the continent. WILLIAM LANDSBOROUGH made the first north-to-south crossing that same year, 1862. Stuart returned to England in 1864 to recover his health, but he died there in 1866.

The trail that John McDouall Stuart had blazed on his trek across the heart of Australia was soon adopted as the route of the Central Overland Telegraph Line, extending northward from Adelaide, through Alice Springs, to Darwin on the Indian Ocean coast. From there, the line continued by way of an undersea cable to the East Asian mainland, providing Australia with its first direct link to British India. The hill he located near the exact geographic center of Australia was later renamed Central Mount Stuart in his honor.

Stuart, Robert (1785–1848) *Scottish fur trader in the Pacific Northwest and northern Rocky Mountains*

A native of Scotland, Robert Stuart arrived in Montreal in 1807, where he entered the FUR TRADE with his uncle, a partner in the NORTH WEST COMPANY. Three years later, he was recruited by JOHN JACOB ASTOR to lead the seaward segment of his Pacific Fur Company (a subsidiary of the AMERICAN FUR COMPANY) venture to the Oregon coast.

On September 8, 1810, Stuart and his party, including GABRIEL FRANCHÈRE, sailed from New York on the *Tonquin*. They arrived at the mouth of the COLUMBIA RIVER in March 1811, after a voyage around CAPE HORN and a stopover in the HAWAIIAN ISLANDS. He supervised the construction of the company's trading fort, Astoria, and directed fur-trading expeditions into the interior. The next year, WILSON PRICE HUNT, in command of the overland contingent of Astorians, arrived in Astoria.

Stuart, accompanied by fur traders Ramsay Crooks and three others, set out on an overland journey to the East with reports for Astor on the progress of the Oregon enterprise. They traveled through the Blue Mountains and the Snake

River Valley of what is now southern Idaho. On October 23, 1812, they located an Indian trail (later known as the SOUTH PASS) that took them eastward through a break in the mountains and around the southern end of the Wind River Range and across the Continental Divide. They spent the winter of 1812–13 in the lands of the Arapaho Indians in what is now west-central Wyoming.

In spring 1813, Stuart and his party resumed their journey eastward, traveling by CANOE down the Sweetwater River to its junction with the North Platte River, then down the MISSOURI RIVER to St. Louis, arriving in late August 1813. In St. Louis, Stuart first learned of the outbreak of the War of 1812, and that Astor's agents, anticipating British seizure of his Oregon enterprise, had sold Astoria to the British-owned North West Company.

Stuart was still with Astor's parent company, the American Fur Company, when the fur trade resumed after the war's end in 1815. Two years later, he and Ramsay Crooks became partners in that firm, directing its operations in the Great Lakes from the company's trading fort on Mackinac Island. He later expanded the American Fur Company's trade contacts to Indian tribes living across a wide area of the upper Mississippi Valley and northern plains, from the Wabash River Valley south of Michigan to the Red River Valley in what is now eastern North Dakota.

Stuart left the fur trade in 1834 when Astor sold his western fur enterprise to St. Louis fur-trading firms. Stuart settled in Detroit, where he entered the real estate business. From 1841 to 1848, he served as the federal superintendent of Indian affairs for Michigan.

By the early 1840s, the route Robert Stuart had pioneered in his 1812–13 overland trip from Oregon to St. Louis had developed into the Oregon Trail, a major wagon route for emigrants bound for the fertile valleys of Oregon and California. He is also credited with being the first non-Indian to travel through the ROCKY MOUNTAINS by way of the South Pass.

Stuck, Hudson (1863–1920) *Anglo-American clergyman, mountain climber on Mount McKinley in Alaska*

Born in London, England, Hudson Stuck immigrated to the United States in 1885. He attended the University of the South in Sewanee, Tennessee, graduating in 1892. In 1894–1904, he served as dean of the Episcopal cathedral in Dallas, Texas. In 1905, he was reassigned to Alaska as an Episcopal archdeacon, where he spent the remainder of his life.

In addition to his church responsibilities, Stuck developed an interest in the geography and native peoples of Alaska and traveled extensively. He also became proficient in MOUNTAIN CLIMBING. In 1913, along with Harry Karstens, Robert Tatum, and Walter Harper, Stuck accomplished the ascent of MOUNT MCKINLEY (named after

President William McKinley in 1897; also known as Denali, “the High One,” an Athapascan Indian name), the highest mountain in North America at 20,320 feet above sea level.

Hudson Stuck wrote a number of books about his Alaskan explorations: *The Ascent of Denali (Mount McKinley)* (1914), *Ten Thousand Miles with a Dog Sled* (1914), *Voyages on the Yukon and Its Tributaries* (1917), and *A Winter Circuit of Our Arctic Coast* (1920). Yet it is as one of the first men to reach the summit of Mount McKinley that assured his place in the history of exploration.

Sturt, Charles (1795–1869) *British colonial official in Australia*

Charles Sturt was born in India, the son of an official of the BRITISH EAST INDIA COMPANY. At the age of 18, he joined the British army, serving as an officer in the last years of the Napoleonic Wars in Spain and France, and then in Canada and Ireland.

By 1827, Sturt had reached the rank of captain. That year, he arrived in New South Wales, Australia, attached to a military unit sent to guard convicts in the penal colony. Earlier in his career, he had known the colony’s governor, Ralph Darling, who soon appointed Sturt as his military secretary.

Sturt came into contact with ALLAN CUNNINGHAM, HAMILTON HUME, and JOHN JOSEPH WILLIAM MOLESWORTH OXLEY, all of whom had undertaken explorations into the BLUE MOUNTAINS and along the lower reaches of the rivers to the west. Their reports suggested to Sturt that the interior of the continent might contain a network of westward-flowing rivers emptying into a great inland sea.

In his second year in Australia, Sturt led his own exploration in search of the source of the Macquarie River, which had been reached a decade before by Oxley. In November 1828, Sturt left Sydney in command of a small group of soldiers and convicts and, guided by Hume, made his way across the Blue Mountains to the Bogan, Castlereagh, and Macquarie Rivers. That year, the Macquarie had been reduced by severe drought conditions to a series of marshes. He followed the riverbed northwestward, still believing it might lead to an inland sea. Instead, in early January 1829, he came upon the banks of a great river flowing southwestward, which Sturt named the Darling after the colony’s governor. They then headed back to Sydney, arriving three months later.

Finding the Darling River reinforced Sturt’s belief that the rivers of southeastern Australia drained into an inland sea. In November 1829, he led a second expedition into the interior, this time to the Murrumbidgee River, southwest of Sydney. With boats built on the river’s banks, he

and some of the men from his first expedition descended the Murrumbidgee to its junction with the Murray River, which he entered in mid-January 1830. A week later, he determined that a river found flowing into the Murray further downstream was actually the outlet of the Darling River.

Sturt and his companions made an easy passage along the Murray to its outlet on a nearly landlocked tidal lagoon on the coast, south of present-day Adelaide, which he named Lake Alexandrina. Although a ship had been sent to meet them at the nearby Gulf of St. Vincent’s, Sturt’s men were unable to cross an intervening mountain range, and the rough surf made the only entrance to Lake Alexandrina un-navigable for any small craft sent to look for them. As a result, Sturt and his party decided to return the same way they had come, rowing upstream for nearly 900 miles to a supply station in the Hamilton Plains. They returned to Sydney on May 25, 1830.

The trip had weakened Sturt’s health, and his eyesight had begun to fail. After serving briefly as commandant at the penal settlement on Norfolk Island, he sailed to England in 1831. Soon afterward, he left the army. In 1834, with his health somewhat recovered, he returned to New South Wales, where he had obtained a land grant, and took up sheep farming.

In 1838, Sturt was appointed to a post with the South Australia Survey Department, directing explorations for new pasture lands north of Adelaide. On August 10, 1844, he left Adelaide in command of an expedition to explore the country west of the Darling River. His 16-man party included the young JOHN MCDOUALL STUART, who served as the expedition’s draftsman.

Sturt and his expedition ascended the Murray to the upper Darling region, where they were halted by drought for six months. In July 1845, Sturt and a small group set out westward and traversed the Stony Desert from Cooper’s Creek to the Diamantina River. Although he had hoped to make a dash into the center of Australia, territory never before seen by Europeans, he and his men were by then suffering from SCURVY and were unable to find a way around the barren expanse of the Simpson Desert. They were compelled to head back to Adelaide, arriving there on January 19, 1846.

Sturt was nearly blind after this expedition. He served as secretary of South Australia until 1851, then returned to England, settling at the health resort of Cheltenham. He died there in 1869, just before he was to be knighted.

Charles Sturt recounted his first explorations of 1828–30 in his book *Two Expeditions into the Interior of Southern Australia* (1833). The European discovery of the Darling River, the longest river in Australia, revealed that the river system, which originated in the Blue Mountains and Australian Alps and was once thought to flow into an

inland sea, actually drained into the Indian Ocean near Adelaide, by way of the Murray River. In his last expedition of 1844–46, detailed in his *Narrative of an Expedition into Central Australia* (1849), Sturt survived 18 months in the desert, explored more than 3,000 miles of territory and came close to reaching the center of the continent. The Sturt Desert, spanning the border between western Queensland and northeastern South Australia, was named in his honor.

Sublette, William Lewis (1799–1845)

American fur trader, merchant in the American West

William (“Bill”) Sublette was born in Lincoln County, Kentucky. He was a descendant of Virginia pioneers and a relative of frontiersman and explorer WILLIAM CLARK.

In about 1818, Sublette moved with his family to St. Charles in the Missouri Territory, where his father opened a tavern. William served there for a time as the local constable. Four years later, both his parents now deceased, he joined up with WILLIAM HENRY ASHLEY’s fur-trading enterprise to the upper MISSOURI RIVER.

In spring 1823, Sublette survived an attack against Ashley’s fur traders by Arikara Indians on the Missouri River in present-day South Dakota. That summer, he took part in Colonel HENRY LEAVENWORTH’s punitive military expedition against the tribe. Then, in September 1823, he joined mountain man JEDEDIAH STRONG SMITH’s overland expedition westward from Fort Kiowa across the Wyoming plains to the Rocky Mountains, in the course of which the SOUTH PASS was explored.

Sublette, Smith, and DAVID E. JACKSON bought out Ashley’s ROCKY MOUNTAIN FUR COMPANY in 1826. Over the next several years, Sublette undertook several fur-trading expeditions into the northern ROCKY MOUNTAINS, financed in part by Ashley.

In 1830, Sublette became a supplier of goods to the fur traders in the northern Rockies. That year, he organized and led the first wagon caravan from St. Louis across the plains and into the Rockies, arriving at that summer’s trappers’ rendezvous on the Wind River in what is now southwestern Wyoming.

In 1831, Sublette took part in a trading expedition along the Santa Fe Trail from St. Louis, during which Jedediah Smith was killed by Comanche Indians. The next year, Sublette attended the trappers’ rendezvous at Pierre’s Hole, where he was wounded in an attack by Gros Ventre Indians.

Later, in 1832, Sublette entered into a partnership with fur trader ROBERT CAMPBELL, with whom he established a trading post, Fort William, near the confluence of the Yellowstone and Missouri Rivers in what is now northwestern North Dakota. In 1834, he and Campbell founded another

post near the junction of the North Platte and Laramie Rivers in present-day eastern Wyoming. This post, Fort Laramie, was eventually purchased by the AMERICAN FUR COMPANY, as was Fort William.

After 1836, Sublette left the frontier and settled in St. Louis, where he became prominent in business and politics. In 1844, he married Frances Hereford. In 1845, he was stricken with tuberculosis; he was en route to Cape May, New Jersey, to recover his health, when he died in Pittsburgh, Pennsylvania.

William Sublette played an active role in the development of the Rocky Mountain FUR TRADE, taking part in expeditions to the northern Rockies. He helped open up trails that later developed into important overland routes for wagon trains. A stretch of the Oregon Trail was known for a time as Sublette’s Cutoff or Sublette’s Trace. Fort Laramie, his post on the Platte River, became one of the key stopover points on the Oregon Trail and figured prominently in the settlement of the American West. Sublette’s four brothers—Milton, Andrew, Pinckney, and Solomon—also were active in the fur trade during the 1820s and 1830s, operating throughout the West, from Santa Fe to Oregon and California.

Sueur, Pierre-Charles Le See LE SUEUR, PIERRE-CHARLES.

Sulaiman el Tagir See SOLEYMAN.

Svarsson, Gardar (Gardar Svavarsson the Swede) (fl. 860s) *Norse mariner in Iceland*

In about 860, Gardar Svarsson, a Swedish Viking, sailed from Norway on a voyage to the Hebrides. While in Pentland Firth, off the north coast of Scotland, he was driven northwestward by a storm to the east shore of ICELAND, where he made a landing.

Svarsson next sailed completely around Iceland, determining that it was an island, and he named it Gardarsholm (Gardar’s island). He spent the winter on the north coast at present-day Husavik, where he reportedly constructed the first Viking house on the island. In the spring, Svarsson sailed back to Norway, where he related his adventure.

An account of Gardar Svarsson’s voyage appears in traditional Norse literature along with a nearly identical story attributing the Norse discovery of Iceland to the Viking NADDOD. Nonetheless, Svarsson is credited with being the first Viking to winter in Iceland and with making the first circumnavigation of the island. Svarsson’s reports may have led to the Norse settlement of Iceland soon afterward.

Sverdrup, Otto Neumann (1855–1930)

Norwegian mariner in Greenland, the Canadian Arctic, and Spitsbergen

A native of Bindalen, Norway, Otto Sverdrup went to sea as a teenager, then returned to work on his family's farm. In 1888, Sverdrup, an expert Nordic skier, began his career in Arctic exploration when he was recruited by FRIDTJOF NANSEN for the first crossing of southern GREENLAND. He again joined Nansen in the 1893–96 voyage of the *Fram*, taking command of the vessel when Nansen undertook his trek over the frozen Arctic Ocean in an unsuccessful attempt on the NORTH POLE. After drifting far to the west, Sverdrup managed to free the icebound *Fram* and return to northern Norway in 1896, where he soon made contact with Nansen, who had by then safely reached Spitsbergen (present-day Svalbard).

In 1898, Sverdrup was commissioned by the Norwegian brewers Amund and Ellef Ringnes, along with the Norwegian government official Axel Heiberg, to lead an expedition to Ellesmere Island and the northwest coast of Greenland. He was again in command of the *Fram*; his 16-man expedition included mariners, scientists, and sportsmen. Sverdrup first attempted to navigate through Kane Basin, hoping to find an ice-free passage leading to Greenland's north coastline. Pushed back by the PACK ICE, he withdrew to winter at Rice Strait. In 1899, he entered Jones Sound and began the first of three summers of methodical exploration along the west coast of Ellesmere Island and the uncharted regions to the west.

Sverdrup and his companions conducted field research in all aspects of Arctic natural history. They also came upon three uncharted islands, which were named Axel Heiberg, Ellef Ringnes, and Amund Ringnes Islands, after the expedition's sponsors. In 1902, Sverdrup returned to Norway with a great number of zoological and botanical specimens, as well as samples of Arctic minerals.

In 1903, Great Britain's ROYAL GEOGRAPHICAL SOCIETY awarded Sverdrup its Patron's Medal in recognition of his achievements in polar exploration. He described his Arctic experiences in his book *New Land* (1904).

Sverdrup operated a plantation in the WEST INDIES for several years before returning to the Arctic in 1914 to take part in several rescue expeditions. In 1921, he commanded a voyage from England to seaports on the Ob River and Yenisey River deltas, in an attempt to open a commercial sea route to the Kara Sea in the Siberian Arctic. Then, in 1928, he took part in search efforts for the Italian aviator UMBERTO NOBILE after his airship the *Italia* had crashed onto the frozen Arctic Ocean, north of Spitsbergen.

The archipelago in the Canadian Arctic that Otto Sverdrup located west of Ellesmere Island later became known as the Sverdrup Islands in his honor. Together with the Parry

Islands, they comprise Arctic Canada's Queen Elizabeth Islands.

Sykes, Sir Percy Molesworth (1867–1945)

British surveyor, diplomat in Persia and southwestern Asia

In 1893, British career diplomat and surveyor Percy Sykes left the port of Baku on the Caspian Sea, and sailed south-eastward to Asterabad (present-day Gorgan) in northeastern Persia (present-day Iran). He then traveled eastward along the Atrek River to Meshed.

Sykes next made a north-to-south crossing of Persia's great central desert, the Dashti-e-Lut, to Kerman, in the south-central part of the country. In 1894, he traveled in the southern Persian province of Baluchistan, where he became the first European to climb to the top of 13,261-foot Kuhl-i-Taftan, an extinct volcano.

In 1894–96, as diplomatic consul, Sykes covered a wide-ranging area of Persia, extending from Rasht on the Caspian Sea, through central Persia, to Teheran, Yazd, Kerman, and Baluchistan. He was accompanied on this journey by his sister, Ella Constance Sykes, who chronicled her experiences in her book *Through Persia on a Side-Saddle* (1898). In 1896, Sykes took part in a government survey with the Perso-Baluch Boundary Commission, in which he explored much of southeastern Persia, along the border with present-day Pakistan.

Sykes also visited ports along the Persian Gulf, crossing the Strait of Hormuz to Muscat on the Arabian Peninsula. As a surveyor developing a route for the Central Persian Telegraph Line in 1898, he covered a wide area of territory between Kerman, in the interior of what is now southern Iran, and Bandar Abbas at the southern end of the Persian Gulf.

Sykes returned to northeastern Persia in 1906 as British consul at Meshed. During the next four years, he used Meshed as a base for a number of expeditions into the northeastern Persian province of Khorasan. Again Sykes traveled with his sister Ella, who related their journey in her book *Through Deserts and Oases of Central Asia* (1920).

During World War I (1914–18), Sykes organized a Persian military unit in support of British forces and took part in British government surveys throughout a wide area of southwestern Asia, from the Caspian Sea and Baghdad, eastward to the Hindu Kush mountain range.

In 1902, Sir Percy Sykes was awarded a gold medal from the ROYAL GEOGRAPHICAL SOCIETY in recognition of his extensive travels in Persia, which he recounted in his book *Ten Thousand Miles in Persia*, published that same year. In his more than two decades in southwestern Asia, he traveled extensively in nearly every part of Persia, presenting in his published reports geographic observations together with historical and archaeological details.

Tasman, Abel Janszoon (Abel Janzoon Tasman) (ca. 1603–1659) *Dutch mariner in Tasmania, New Zealand, Australia, and the southwestern Pacific Ocean*
Abel Tasman was born in Lutjegast, a village near Groningen in the northeastern Netherlands. A seafarer, he entered the service of the DUTCH EAST INDIA COMPANY; by 1634, he had risen to the rank of captain, commanding the trading vessel *Mocha* out of Amboina in the SPICE ISLANDS (the Moluccas) of present-day eastern Indonesia.

In 1639, Tasman served as second in command on a voyage of exploration to the North Pacific Ocean, led by Dutch East India Company sea captain Matthijs Quast. Seeking two fabled islands, Rica de Oro (rich in gold) and Rica de Plata (rich in silver), with which the Dutch East India Company hoped to open trade contacts, they sailed along the coasts of the Philippines, Taiwan, Korea, and Japan, then headed eastward into the Pacific for several thousand miles. Although they located no new lands of any commercial value, the voyage brought Tasman's abilities as a mariner to the attention of Anton van Diemen, governor general of the Dutch East Indies at Batavia (present-day Jakarta, Indonesia).

In 1642, Anton van Diemen commissioned Tasman to explore southward for the legendary GREAT SOUTHERN CONTINENT, or Terra Australis, which was then thought to occupy much of the unexplored Southern Hemisphere.

Van Diemen instructed Tasman to determine if Australia, then known as New Holland, was the northern extent of the Great Southern Continent; to discern whether New Guinea was an island or was joined to Australia; and to seek a shorter

sea route from the southern Indian Ocean to the Pacific coast of Chile.

Tasman embarked from Batavia on August 14, 1642, in command of two ships, the *Heemskerck* and the *Zeehaen*, accompanied by Frans Jacobszoon Visscher, a leading Dutch pilot and mapmaker. After sailing westward across the Indian Ocean to the island of Mauritius, he headed southward in early October 1642, hoping to strike the Great Southern Continent somewhere below 54° south latitude, a point farther south than anyone had yet reached. At about 42° south latitude, however, the prevailing winds blew Tasman's ships eastward, well beyond Australia's south coast, until November 24, 1642, when land was sighted. Although rough surf prevented sending a landing party ashore, the ship's carpenter managed to swim to the beach and plant a flag, taking possession of the uncharted land in the name of the Netherlands and the Dutch East India Company.

Tasman named the newly located land Van Diemen's Land (present-day TASMANIA), after the Dutch East Indies governor general. Finding a suitable anchorage on the southeast coast near present-day Hobart, the Dutch explorer and some of his crew briefly went ashore, where they found evidence of human inhabitants, although the natives declined to show themselves.

Continuing eastward, Tasman and his expedition approached the coastline of yet another uncharted land, sighting the peaks of a mountain range later known as the Southern Alps on December 13, 1642. Tasman made a landing at Cape Farewell on the northwestern corner of

NEW ZEALAND's South Island. He came upon what he thought was a large bay, which he named Murderers' Bay (also known as Massacre Bay) after four of his men were killed there by the Maori in the first European encounter with New Zealand's native peoples. Because he could not explore it thoroughly at the time, he was unaware that this was actually a strait (Cook Strait), separating the South Island and the North Island. Tasman continued northward along the west coast of New Zealand's North Island. He named the newly found land Staten Landt, apparently mistaking it for the western side of Staten Island, which had been discovered off the southern tip of South America by JAKOB LE MAIRE and WILLEM CORNELIS SCHOUTEN in their 1615–16 voyage. At the time, Tasman believed he had come upon the western extent of the Great Southern Continent.

Tasman sailed past the northern tip of New Zealand's North Island, which he named Cape Maria van Diemen, after the wife of the Dutch colonial governor, and, on January 6, 1643, he sighted a group of islands he called the Three Kings Islands, because he had reached them on the day of the Epiphany. From there, he sailed northeastward, soon coming upon Tongatapu in the Friendly Islands, where he took on supplies of fresh food and water.

Turning northwestward, Tasman next located the Fiji Islands, although he was unable to land there because of hazardous offshore reefs. After sighting the large atoll of Ontong Java, he made for the coast of northern New Guinea and sighted nearby New Britain and New Ireland, which he erroneously took to be one island.

By the time Tasman had returned to Batavia in June 1643, he had covered more than 5,000 miles of the southern Indian Ocean and southwestern Pacific. He had sailed around Australia without realizing it. By doing so, however, he had demonstrated that it was bounded by water on the south and thus could not be part of the much-sought-after Great Southern Continent.

Governor van Diemen, unsatisfied with these results, sent Tasman out on another voyage in February 1644, hoping he might discover new geographic details of more commercial value to the Dutch. The question of whether New Guinea and Australia were connected was still not resolved, and Tasman was directed to explore New Guinea's south coast, then continue southward into the Gulf of Carpentaria in search of a possible channel through Australia to Van Diemen's Land and the Pacific Ocean.

Accompanied again by the Dutch cartographer Visscher, Tasman sailed from Batavia in February 1644 with three small vessels, the *Limmen*, the *Zeemeeuw*, and the *Bracq*. Heading eastward along New Guinea's south coast, he missed the Torres Strait between New Guinea and Australia, which would have led him into the Coral Sea and the Pacific. Instead, he sailed southward and explored the Gulf of Carpentaria. Determining that it had no southern outlet,

he continued westward along the north coast of the Australian mainland, as far as North West Cape, Shark Bay, and Dirk Hartogs Island, where the coastline of western Australia begins to angle southward. After making the first continuous exploration along Australia's north and northwest coast, he returned northward to Batavia, by way of the Moluccas and the Ceram Sea.

Tasman soon resumed his career with the Dutch East India Company. In about 1649, while in command of an expedition of privateers against a Spanish treasure fleet in the Philippines, he hanged one of his crewmen for deserting his post, an act for which he was admonished by Dutch colonial authorities at Batavia and eventually suspended from the company. Reinstated after several years, he remained in the EAST INDIES, where he acquired great wealth as a trader.

It was not until 1798, more than a century and a half after Tasman had explored Van Diemen's Land, that GEORGE BASS and MATTHEW FLINDERS circumnavigated the island and learned that it was not attached to the Australian mainland. The island, first settled by the British as a penal colony in the early 1800s, became notorious for the cruel treatment of convicts and corrupt administration. It was opened to free settlers in 1853, and the newly organized colonial government changed its name to Tasmania in honor of Tasman, in an attempt to sever its ties with the unsavory past.

Abel Tasman's two voyages in 1642–44 were among the first scientific attempts to explore the Pacific Ocean. Nonetheless, they marked the end of major Dutch exploring efforts in that part of the world for the remainder of the 17th century. Tasman's findings, although at the time not fully appreciated by his superiors in the Dutch East Indies and in the Netherlands, greatly expanded European geographic knowledge of the southwestern Pacific, especially by revealing that the portions of the Australian coastline previously explored by Dutch navigators DIRK HARTOG and FREDERICK HOUTMAN were actually one continuous mainland. In a map of their explorations, Tasman and Visscher delineated for the first time the continental dimensions of western and northern Australia. Tasman's first expedition established the southern limit of Australia, showing that much of the Southern Hemisphere, once thought to contain a great landmass, was actually covered by the southern reaches of the Indian and Pacific Oceans. Further exploration of New Zealand did not occur until the 1769 visit of Captain JAMES COOK. The Tasman Sea, the arm of the Pacific between Australia and New Zealand, was named after the Dutch explorer.

Taylor, Annie Royle (1855–after 1907)

British missionary in India, China, and Tibet

Annie Taylor was born at Egremont in northern England. Her father was the director of a British international steam-

ship line, and a member of the ROYAL GEOGRAPHICAL SOCIETY. Her mother was a Brazilian-born French Huguenot.

In about 1876, Taylor began doing charity work in London, visiting the sick in poor areas. In 1884, she studied midwifery and basic medicine at London's Queen Charlotte Hospital and later that year she joined the China Inland Mission. In September 1884, she sailed to Shanghai, China; she stayed at a Christian mission on the lower YANGTZE RIVER (Chang) for five months, learning basic Chinese and becoming familiar with native customs. She then traveled up the Yangtze to a more remote mission, where she gave medical advice and taught the Gospel.

In 1887, Taylor took her missionary work to Kansu (Gansu) province in central China. From there, she traveled to the large Tibetan Buddhist monastery of Kum Bum, becoming one of the first Europeans to do so.

After a year in Kansu province, Taylor became ill, probably with tuberculosis. She returned to Shanghai via the Yangtze, surviving the sinking of her boat in the Han Rapids. Taylor sailed from Shanghai to Australia, where she joined her parents, who were vacationing there.

By 1889, Taylor had sufficiently recovered. From Australia, she went to join her sister in the northern Indian city of Darjeeling, remaining there as a missionary for two years and learning the Tibetan language from nomadic Tibetans. In Darjeeling, she acquired the services of a young Tibetan from Lhasa, named Pontso, who became her guide, servant, and traveling companion for the next 20 years.

In March 1891, Taylor left India for China, resolved to make a journey to Tibet, which was then forbidden to foreigners, and to enter LHASA. She returned to western Kansu province in March 1892 and crossed the border into Tibet. She and her small party were soon attacked by bandits and robbed of nearly all their possessions. Nevertheless, disguised in native dress, she pushed onward toward Lhasa for the next four months.

In January 1893, just three weeks from Lhasa, Taylor was arrested by Tibetan officials and sent back to China. She reached Szechwan (Sichuan) province in April 1893 and returned to Great Britain soon afterward. Later in 1893, she lectured on her Tibetan exploits at the Scottish Royal Geographical Society in Edinburgh.

Early in 1894, Taylor took her own missionary group, the Tibetan Pioneer Band, back to India. In Sikkim, a principality of northern India, the Tibetan Pioneer Band was soon reorganized as part of the China Inland Mission, and Taylor set out northward on her own for Tibet. She traveled through the Jelep Pass and reached the Tibetan border city of Yatung. She subsequently served as a nurse in a nearby British army field hospital.

Annie Taylor returned to England in 1907, where she presumably spent the rest of her life. Taylor's diary of her travels, later edited and transcribed by William Carey

in his *Adventures in Tibet* (1901), details the everyday life of Tibetans. Her career was also recounted in Isabel Robson's book *Two Lady Missionaries in Tibet* (1909). Although Taylor failed to reach Lhasa, her seven-month, 1,300-mile journey from western China in 1892–93 marked the first visit by a European woman into then-forbidden Tibet.

Teixeira, Pedro de (Pedro Teixeira) (1575–1640)

Portuguese army officer in South America

In 1616, Captain Pedro de Teixeira, a Portuguese army officer in Brazil, helped establish Fort Presepio, a garrison on the southern Amazon delta, which eventually became the site of the city of Belém.

Six years later, Teixeira accompanied Luis Aranha de Vasconcelos in an exploration of the lower Amazon Basin, resulting in the first detailed mapping of the region. Throughout the 1620s, he participated in military actions aimed at evicting French, Dutch, and English trading settlements encroaching upon Portuguese territory on the Xingu River, a southern tributary of the lower AMAZON RIVER, as well as in the northern Amazon delta region, near the Guianas.

In 1637, the local Portuguese colonial governor, Jacome Raimundo Noronha, appointed Teixeira commander of an expedition to explore and map the Amazon from its delta to its upper reaches in the Andes. The project had been instigated by the arrival at Fort Presepio that year of two Spanish Franciscan missionary priests, who had descended the Amazon from their mission on the Napo River in Ecuador, arousing Portuguese concern over possible Spanish designs on the entire Amazon Basin.

Teixeira's party included more than 1,200 Indians and Africans, as well as about 70 Portuguese soldiers, traveling by CANOE, the largest European expedition to embark on an upstream exploration of the Amazon to that time. The group departed Fort Presepio on October 28, 1637, accompanied by Father Domingos Brieve, one of the two Spanish priests who had arrived at the mouth of the Amazon earlier that year, and who would serve as a guide for the upriver expedition back to Quito.

Teixeira and his armada of canoes came upon the mouth of the Rio Negro in early 1638. He claimed it for Portugal, then continued to the Napo River, which he reached in July 1638, encountering another Portuguese expedition led by Pedro de Costa Favela. After ascending the Napo to the Quijos River with an advance party, Teixeira made the last leg of the journey though the ANDES MOUNTAINS to Quito on foot. His arrival in late summer 1638 marked the first time a contingent of Europeans had reached the city from the east. He was received with much acclaim in Quito, the inhabitants celebrating with fireworks, bullfights, and banquets.

Yet, just as the appearance of the two Spanish priests at Fort Presepio the year before had alarmed the Portuguese about Spanish advancement from the west, Teixeira's arrival caused concern for Spanish colonial authorities over possible Portuguese expansion into the upper Amazon from the east. The Spanish soon ordered that he retrace his route down the Amazon, escorted by a group of Spanish observers, headed by Jesuit priest CRISTOBAL DE ACUÑA, brother of Quito's colonial governor.

Teixeira left Quito for Napo and the Amazon on February 16, 1639. He rejoined the bulk of the expedition on the upper Napo, then began his down-river journey to the Amazon. Along the way, he took possession of the region around the mouth of the Rio de Oro in the name of King Philip III of Portugal (who also ruled Spain as King Philip IV). He also marked a site at the mouth of the Aguarico River, a tributary of the upper Napo in what is now northeastern Ecuador, as the point through which passed the north-south demarcation line established by the Treaty of Tordesillas of 1494, dividing Spanish and Portuguese territory in the New World. By October 15, 1639, he was back at the mouth of the Rio Negro, and, although his men wanted to undertake a slave-hunting expedition up that river, he yielded to the wishes of the Jesuit priest Acuña and continued his journey down the Amazon.

About 100 miles farther downstream, Teixeira and his expedition stopped at the large Amazon River island of Tupinambarana, where the natives reported the existence of a tribe of warrior women who lived to the north, echoing the tales of FRANCISCO DE ORELLANA of nearly a century before.

Teixeira returned to the mouth of the Amazon on December 12, 1639. For his efforts, he was rewarded with a promotion to captain major, and, in February 1640, he was appointed governor of the province of Pará. However, he had become too ill to assume the office, possibly suffering from the rigors of his more than two years of travel in the Amazon Basin and the Andes, and he died soon afterward.

Pedro de Teixeira completed the first known continuous ascent of the Amazon, and in so doing undertook the first significant Portuguese exploration into the interior of Brazil since PEDRO ÁLVARS CABRAL landed on the Brazilian coast in 1500. Unlike the earlier downriver voyages of Orellana and LOPE DE AGUIRRE, which were guided by the direction of the river's flow to the sea, Teixeira's upstream expedition had to scout ahead in order to determine whether a particular stretch was a tributary or part of the main stream. As a result of his explorations, much of the upper Amazon Basin came under Portuguese sovereignty when, in 1641, a year after Teixeira's death, Spain and Portugal again became separate kingdoms, with John IV crowned as king of Portugal as well as Brazil.

Teleki, Samuel (Count Teleki) (1845–1916)

Hungarian explorer in East Africa

Samuel Teleki was born to a noble Hungarian family in Szaromberke, located in the Transylvania region of what is now Romania. From 1886 to 1889, Count Teleki explored central East Africa's Great Rift Valley with Baron LUDWIG VON HOEHNEL, traveling from Zanzibar to Nairobi, and climbed MOUNT KILIMANJARO. In northern Kenya in 1888, they located and named Lake Rudolf as well as its major affluent, the Omo River. North and east of Lake Rudolf, the Hungarians came upon another lake in southern Ethiopia, which they named Lake Stefanie.

In locating Lakes Rudolf and Stefanie, Samuel Teleki and Hoehnel made the last major European geographic discoveries in East Africa.

Tenzing Norgay (Tenzing Norkey, Tensing Norkay, Tensing Bhotia, Namgyal Wangdi)

(1919–1986) *Nepalese mountain climber on Mount Everest in the Himalayas*

Tenzing Norgay was born in a village in Nepal; his birth name was Namgyal Wangdi. Like many of his people, the SHERPAS, he became a professional mountain porter and participated in a number of foreign-sponsored climbs in the HIMALAYAS.

In the spring of 1952, Tenzing accompanied Raymond Lambert on a Swiss expedition to within 800 feet of the summit of MOUNT EVEREST, a world record at the time. Based on his earlier climbs, he was invited to be a full-fledged member, rather than a porter, of the British Mount Everest Expedition, sponsored by the Joint Himalayan Committee of the Alpine Club of Great Britain and the ROYAL GEOGRAPHICAL SOCIETY.

The expedition approached from the south side; in 1924, a climb on the north side had cost the life of GEORGE HERBERT LEIGH MALLORY. On May 29, 1953, Tenzing and New Zealander SIR EDMUND PERCIVAL HILLARY reached Mount Everest's summit. Tenzing continued climbing for 20 more years and reached the top of Mount Everest many times, along with other peaks in the Himalayas.

Although much of the international attention went to Hillary, Tenzing Norgay was actually the first man to reach the summit. At the top of the world's highest point, at 29,028 feet above sea level, he buried food as a Buddhist offering.

Tereshkova, Valentina Vladimirovna

(1937–) *Soviet cosmonaut, first woman in space*

Valentina Tereshkova was born near Yaroslavl, north of Moscow, in the former Union of Soviet Socialist Republics (USSR, or Soviet Union); her parents were farmers. She found work in a textile factory at the age of 18. As an ama-

Valentina Tereshkova (Library of Congress)

teur parachutist with a local club, she became interested in aviation.

In 1961, on learning that the Soviet Union was seeking female cosmonauts (see ASTRONAUTS), she wrote a letter to the space agency volunteering her services. YURY ALEKSEYEVICH GAGARIN, the first human in space, oversaw the selection process. In 1963, after extensive interviewing and testing, Tereshkova was one of four women selected for training to be the first woman in space, part of the VOSTOK PROGRAM. All four women were commissioned as second lieutenants in the Soviet air force, which then ran the cosmonaut program. Amidst great secrecy, Tereshkova won the spot for the *Vostok 6* flight, which would be in space at the same time as *Vostok 5*.

Vostok 5, piloted by cosmonaut Valeriy Bykovsky, was launched on June 14, 1963. *Vostok 6*, piloted by Tereshkova, was launched two days later, on June 16, 1963. She orbited the Earth 48 times. *Vostok 5* and *6*, in different orbits, passed within three miles of each other, and Bykovsky and Tereshkova were able to communicate with each other. On June 19, after 70 hours and 50 minutes in space, Tereshkova ejected from the capsule at an altitude of about 20,000 feet and descended by parachute, landing about 380 miles northeast of Karaganda, Kazakhstan.

Tereshkova married fellow cosmonaut Andrian Nikolayev later that year. Their daughter, Elena Andriionovna, was born in 1964, the first child born to parents who had both been in space. Tereshkova was bestowed the title Hero of the Soviet Union and received the Order of Lenin. The United Nations honored her with the Gold Medal of Peace. Staying in the military, she eventually reached the rank of

colonel. She went on to graduate from the Zhuykosky Air Force Engineering Academy in 1969. In 1976, Tereshkova also earned a degree in technical science. She later served as the president of the Soviet Women's Committee and became a member of the Supreme Soviet, the Soviet Union's national parliament, and the Presidium, a governmental panel.

Valentina Tereshkova, whose radio call name was *Chaika*, Russian for "seagull," has a place in the history of exploration as the first woman in space. She proved the ability of women to function under difficult conditions by spending more time in orbit than all the astronauts of the United States's Mercury program combined. The second woman in space was Soviet cosmonaut Svetlana Savitskaya on board a Soyuz flight in 1982. SALLY KRISTEN RIDE became the first American woman in space in 1983, aboard the SPACE SHUTTLE *Challenger*.

Thesiger, Wilfred Patrick (1910–) *British traveler in the Middle East*

Wilfred Thesiger was born in Addis Ababa, Ethiopia; his father was an official for the British government and a close friend of the Ethiopian emperor Haile Selassie. Thesiger studied at Eton and Oxford University, then, at the age of 24, he returned to Ethiopia, where he explored the Awash River. He later served as a district commissioner in the Sudan, during which time he made expeditions into the Tibesti Mountains. Thesiger also served in the British army in North Africa and the Middle East.

In 1946–47, Thesiger made his first journey into the Rub' al-Khali, the EMPTY QUARTER—the 250,000-square-mile desert area of the southeastern Arabian Peninsula—dressed in bedouin clothing and with Rashid native guides, making a giant circle from Salahah in present-day Oman on the Arabian Sea. He made a second journey across it in 1947–48, also with Rashid tribesmen, from Mukalla in present-day Yemen on the Gulf of Aden to the Persian Gulf in present-day United Arab Emirates.

In the 1950s, Thesiger worked among the Marsh Arabs of southern Iraq, paddling to their homes by CANOE. With the vice consul of Basra, Iraq, Frank Steele, Thesiger explored Lake Rudolf (Lake Turkana) in Ethiopia and Kenya.

Wilfred Thesiger continued the tradition of his fellow countrymen in the Empty Quarter—BERTRAM SYDNEY THOMAS in 1930–31 and HARRY ST. JOHN BRIDGER PHILBY in 1932. Thesiger wrote about his travels and the nomads he encountered in *Arabian Sands*, published in 1964.

Thomas, Bertram Sydney (1892–1950) *British explorer in Arabia*

Bertram Thomas served as a British political officer in the Persian Gulf region for many years before entering the

service of the government of Oman, on the southeast coast of the Arabian Peninsula.

In 1926, Thomas traveled northward from Muscat on the east coast of Oman, to Ash Shariqah in what is now the United Arab Emirates. A year later, he landed at Ras al Hadd on the southeastern tip of the Arabian Peninsula, then traveled along the south coast of Oman to Salalah. From there, he undertook preliminary journeys northward in preparation for an exploration of the Rub' al-Khali, the so-called EMPTY QUARTER, a 250,000-square-mile expanse, nearly devoid of water, encompassing roughly one-quarter of the Arabian Peninsula.

Thomas headed northward from Salalah in October 1930, accompanied by Sheikh Salih Bin Yakut and a party of Rashidi bedouins, and soon began his trek northward across the Rub' al-Khali. Traveling on camels, Thomas and his Arab companions reached the waterhole at Shana, near the desert's center, in early January 1931. Continuing northeastward, they arrived at Doha on the Persian Gulf coast of Qatar a few weeks later.

Bertram Thomas was the first European known to have crossed the Empty Quarter, Arabia's last unexplored region, and he did so without the aid of motorized vehicles or aircraft.

Thompson, David (Koo-Koo-Sint) (1770–1857)

British fur trader, geographer, cartographer in western Canada and northern United States

David Thompson was born in the Westminster section of London, England. He came from a poor family of Welsh descent and was left fatherless at an early age. Despite his family's financial hardship, he managed to receive a good education, attending London's Grey Coat School, where he concentrated in mathematics and geography.

In 1784, at the age of 14, Thompson was apprenticed to the HUDSON'S BAY COMPANY, and in September of that year, he arrived at the company's trading post, Fort Churchill, on the southwest shore of HUDSON BAY. For the next three years, under the command of SAMUEL HEARNE, he worked as a trader in the region west and southwest of Fort Churchill, along the Churchill and Nelson Rivers.

In 1787–88, Thompson journeyed as far west as present-day Calgary, Alberta, where he spent the winter and established the earliest trade contacts with the Blackfoot Indians. Back at Hudson Bay in 1789, he broke his leg in a fall and, while recovering, studied surveying and "practical astronomy" under the Hudson's Bay Company's official surveyor, Philip Turnor.

Skilled as a cartographer and surveyor, Thompson was sent out in 1793 to locate a more direct route from Hudson Bay to Lake Athabasca. Over the next several years, he explored up the Saskatchewan River into the ROCKY MOUN-

TAINS and developed a CANOE and portage route to Lake Athabasca from the upper Churchill River by way of the Reindeer River, Reindeer and Wollaston Lakes, and the Black River. During this period, he also surveyed and charted the region between York Factory on Hudson Bay and Cumberland House in what is now eastern Saskatchewan.

Thompson left the Hudson's Bay Company to join the NORTH WEST COMPANY in 1797. Starting that year, he embarked on explorations that took him on an expedition from Lake Superior to Lake Winnipeg and Lake Winnipegosis. He also surveyed the upper Red River and the Assiniboine River. Thompson crossed into what is now North Dakota and explored the upper MISSOURI RIVER, where he made trade contacts with the Mandan Indians. His interpreter to the Mandan was RENÉ JUSSEAUME, who later accompanied the expedition of MERIWETHER LEWIS and WILLIAM CLARK.

In the course of his 1797–98 expedition, Thompson explored what is now northern Minnesota along the headwaters of the MISSISSIPPI RIVER. He may have located the actual source of the Mississippi, but his geographic findings were not revealed until several decades after his death, and he was never credited with the discovery. Before returning to Grand Portage on Lake Superior, Thompson descended downriver as far south as St. Louis.

Thompson set out again in 1798–99. From Île-a-la-Crosse Lake, he followed the Beaver River into what is now north-central Alberta's Lesser Slave Lake region, then explored the Athabasca River. In 1800, Thompson followed the Saskatchewan River into the Rockies, becoming the first non-Indian to find its source.

Soon after becoming a partner in the North West Company in 1804, Thompson began expanding his trade and exploration expeditions west into the Rockies. He had married Charlotte Small, the daughter of a fur trader and an Indian woman, at Île-a-la-Crosse in 1799. In 1807, Thompson, his wife, and their small children made a westward crossing of the Rockies. He was the first non-Indian to locate and use Howse Pass, which led him into the upper COLUMBIA RIVER, where he established the first trading post on the Columbia, Kootenay House.

Thompson was unaware that the Columbia at that point flowed northward before making a hairpin turn around the Selkirk Mountains. Seeking to follow what he thought was the south-flowing Columbia to the Pacific Ocean, he inadvertently explored the Kootenay, Pend Oreille, and the Clark's Fork Rivers into present-day Idaho and Montana. There, he established the earliest non-Indian trading settlements.

In 1810–11, Thompson undertook an exploration of the Columbia River Basin, possibly seeking to assert a British claim to the Pacific Northwest before JOHN JACOB ASTOR's seaward expedition could reach the mouth of the

Columbia. The Howse Pass route through the Rockies was blocked that season by hostile Piegan Indians, part of the Blackfoot Confederacy. Instead, Thompson headed northward along the eastern slopes of the Canadian Rockies until he came upon a route he called Athabasca Pass. He followed it to a south-flowing river, just above the Selkirk Mountains, which he correctly identified as the Columbia. Thompson then descended the Columbia, reaching its junction with the Snake River in what is now southeastern Washington on July 9, 1811. He set up a small marker and claimed the territory for Great Britain and the North West Company. He continued down the Columbia and, several days later, reached the Oregon coast, where he discovered that the American expedition had already established its post at Astoria. He conferred with the AMERICAN FUR COMPANY'S ROBERT STUART at Astoria for a short time, then embarked up the Columbia to undertake a survey to its source.

Thompson left the FUR TRADE at the outbreak of the War of 1812. He settled near Montreal, where he drafted the first accurately detailed map of the Canadian West. After the war, in 1816, he began 10 years of service as a surveyor with the British Boundary Commission, during which he charted the U.S.-Canada border from St. Regis on the St. Lawrence to Lake of the Woods in northern Minnesota.

After 1826, Thompson's financial situation declined. He supported himself as a surveyor, but his failing eyesight soon left him without a profession. He died in poverty near Montreal at age 86. His geographic accomplishments were not fully appreciated until the posthumous publication of his personal account, *David Thompson's Narrative*, in 1916. During the 1880s, years after Thompson's death, Canadian researchers revealed that late-18th-century London mapmaker Aaron Arrowsmith had actually based his map of North America on Thompson's charts made in 1787–1800, without crediting Thompson at all. President Thomas Jefferson subsequently used Arrowsmith's map in planning the Lewis and Clark Expedition of 1803–06.

David Thompson was the first non-Indian to travel the entire course of the Columbia River and was the first Englishman to travel southward across the 49th parallel, west of the Continental Divide. His comprehensive map of Canada revealed that although the Columbia did not provide a western outlet for a navigable Northwest Passage, there existed a canoe route through North America that, with short portages, led from the western St. Lawrence, through the Great Lakes and across central Canada into the Pacific via the Columbia. Thompson's explorations in Canada and the United States covered more than 50,000 miles. Based on his surveys, he subsequently mapped a region of North America that encompassed some 1.7 million square miles. The Thompson River in British Columbia was named in his honor by his friend and associate SIMON

FRASER. Among the Indians, Thompson was known as Koo-Koo-Sint, "the Man Who Looks at the Stars," because of his extensive use of basic surveying and astronomical instruments to determine his precise position while exploring in the Canadian West.

Thomson, Sir Charles Wyville (1830–1882)

Scottish naturalist, oceanographer on round-the-world scientific voyage

Originally from Scotland, at the age of 24, Charles Wyville Thomson became a university professor of natural history in Belfast, Ireland, specializing in marine animal life.

Thomson was especially interested in life forms existing at great ocean depths and in the deep-sea environment in general. In 1868, with the support of the ROYAL SOCIETY, he obtained the use of a British naval vessel, the *Lightning*, with which he undertook underwater studies of the North Atlantic Ocean. As a result of the deep-sea dredging operations he undertook on this voyage, he determined that life existed at far greater depths than had previously been thought. On a similar expedition in summer 1869 aboard the British navy's *Porcupine*, his dredging operations and deep-sea observations revealed that ocean temperatures were not constant beyond a certain depth, contrary to what most scientists of the time had theorized.

In 1872–76, Thomson sailed around the world as head of the civilian scientific team on the *Challenger*, a steam-driven British warship, again with the support of the Royal Society. Under the command of Captain SIR GEORGE STRONG NARES, the *Challenger* Expedition made three crossings of the Atlantic before sailing to Australia and NEW ZEALAND by way of the CAPE OF GOOD HOPE. Additional research was conducted in the waters of the EAST INDIES, Japan, Tahiti, the HAWAIIAN ISLANDS, and off the southernmost coast of Chile.

In the course of the voyage, Thomson directed depth soundings and temperature studies at more than 350 sites around the globe, undertaking comparative studies in the Atlantic, Pacific, and Indian Oceans. The zoologists aboard retrieved more than 4,000 species of marine life new to science. Thomson also initiated the first comprehensive study of ocean currents, and his deep-sea dredging operations provided a profile of the composition of the ocean floors. One of his most significant findings revealed that the Pacific was much deeper than the Atlantic, and that its bottom was covered with clay containing manganese, quartz, pumice, and mica.

The expedition returned to England by way of the STRAIT OF MAGELLAN having crossed the EQUATOR six times and having covered more than 60,000 miles of the world's oceans. It had also made the first passage across the ANTARCTIC CIRCLE aboard a steam-powered vessel.

Knighted soon after his return, Thomson was appointed director of the government's commission assigned to study and publish the results of the voyage. His two-volume *Voyage of the Challenger* appeared in 1877. From 1870 to 1882, he held a professorship in natural history at the University of Edinburgh.

Sir Charles Wyville Thomson drew upon concepts from geography, geology, physics, marine biology, and meteorology to make the first accurate scientific study of the world's oceans. His work on the *Challenger* Expedition initiated what later became known as the science of oceanography. In pioneering efforts to discover the nature of the ocean depths, he inaugurated the exploration of a region that, although covering most of the Earth's surface, still remains largely unknown.

Thomson, Joseph (1858–1895) *Scottish geologist in Africa*

Born near Thornhill in southern Scotland, Joseph Thomson attended the University of Edinburgh, where he studied under the great Scottish geologist, Sir Archibald Geikie. In 1878, on Geikie's recommendation, the ROYAL GEOGRAPHICAL SOCIETY recruited Thomson as a geologist for an expedition into East Africa, the aim of which was to seek a route from the Indian Ocean coast westward to Lake Nyasa (Lake Malawi). When Alexander Keith Johnston, the group's leader, died six months after they had set out from Dar es Salaam, Thomson assumed command of the project, and in 1879, although only 21 years old, he managed to lead the team across the breadth of what is now southern Tanzania to the north shores of Lake Nyasa.

Thomson next headed northward, making the European discovery of Lake Rukwa before reaching Ujiji on the east shore of Lake Tanganyika. He then traveled to Tanganyika's west shore and its main outlet, the Lukuga River. Although encounters with hostile natives soon led him to cut short his exploration of the Lukuga, he correctly surmised that the river was a tributary of the Lualaba River and Congo River (Zaire River) system. The expedition then returned to the coast at Bagamoyo, traveling by way of Tabora through central Tanzania.

In 1881, while Thomson was still in Africa, the sultan of Zanzibar, impressed by the young Scottish geologist's abilities as a traveler in central Africa as well as by his scientific background, commissioned Thomson to survey the Ruvuma River region of present-day southeastern Tanzania for reported deposits of coal. Although he discovered no mineral resources, he had the opportunity to further augment his understanding of the geological makeup of East Africa.

Soon after his return to England in 1882, Thomson was commissioned by the Royal Geographical Society to seek a route that could be developed into a major transportation

link between Mombasa, on the Indian Ocean coast of Kenya, and Lake Victoria.

Accompanied by a seafarer from Malta named James Martin, Thomson started out from Mombasa in March 1883, heading westward to MOUNT KILIMANJARO, which he climbed. From there, he headed northward into the country of the Masai, a nomadic and fiercely territorial people who took a dim view of foreigners traversing their range lands in central Kenya. Despite frequent encounters with openly belligerent natives, Thomson and his companion succeeded in crossing Masai country, traveling by way of Lake Naivasha, the first Europeans to do so. Turning northward, they traveled with a Swahili caravan up the Great Rift Valley, making the European discovery of Lake Baringo along the way, and traversing a group of mountains he named the Abedare Range, after Lord Abedare, a prominent member of the Royal Geographical Society.

In December 1883, Thomson arrived at the northeast shore of Lake Victoria. On the return journey, following a more easterly route, he came upon an extinct volcano, the 14,178-foot Mount Elgon, north of Lake Victoria on the present Uganda-Kenya border, which he climbed and around the base of which he explored a number of prehistoric cave dwellings. Soon afterward, Thomson was seriously injured when a buffalo gored him. After six weeks, he had recuperated enough to resume the journey, arriving back at Mombasa at the end of May 1884.

Back in England in 1885, Thomson received a gold medal from the Royal Geographical Society for being the first European to travel through the lands of the Masai. That same year, he went to West Africa and ascended the NIGER RIVER into the western Sudan, where he negotiated commercial treaties with native rulers at Sokoto and Gando in present-day northern Nigeria on behalf of a British trading firm.

In 1888, Thomson explored the Atlas Mountains in Morocco and Algeria. Two years later, in the service of Cecil Rhodes, he led a trading and diplomatic mission into present-day Zimbabwe in south-central Africa, during which he explored the upper ZAMBEZI RIVER and the southern end of Lake Nyasa, and crossed the Muchinga Mountains to Lake Bangweulu.

Joseph Thomson died when he was just 37, probably from a kidney ailment and complications from pneumonia and tuberculosis. By that time, he had undertaken extensive explorations in all parts of Africa. He detailed his wide-ranging experiences in three books: *To the Central African Lakes and Back* (1880), *Through Masailand* (1885), and *Travels in the Atlas and Southern Morocco* (1889). In his journey of 1878–79, he led the first European expedition to reach Lake Nyasa from the north. In the year after Thomson's death in 1895, construction began on the railroad linking Mombasa and Lake Victoria, which, when completed in 1901, followed portions of the route Thomson had pioneered across

Masai country in his 1883–84 expedition. Based on his geological observations, he was able to formulate one of the earliest scientific explanations for the formation of the Great Rift Valley in central East Africa. The Thomson's gazelle, a type of antelope found in central Africa, was later named in his honor.

Thorvald Ericsson See ERICSSON, THORVALD.

Thorvaldsson, Eirik See ERIC THE RED.

Thunberg, Carl Peter (1743–1828) *Swedish naturalist in Japan and South Africa, in service to the Netherlands*

Carl Peter Thunberg was born in the city of Jönköping in southern Sweden. He studied under the Swedish botanist Carl Linnaeus at the University of Uppsala. After obtaining his degree as a doctor of medicine in 1770 (which, at the time, included the fields of botany and zoology), he studied botany in the Netherlands and in France. He received a commission from the DUTCH EAST INDIA COMPANY to collect plant specimens for Dutch botanical gardens in Japan. In order to convince the Japanese that he was Dutch, however, he had to master the language and traveled first to Cape Town in Africa, arriving in 1772.

While studying the Dutch language, Thunberg carried out three expeditions into the South African interior, traveling in a covered wagon drawn by oxen. During his stay in South Africa, he worked in conjunction with fellow Swede ANDERS SPARRMAN, who had also been a student of Linnaeus. He also worked with Francis Masson, an Englishman who was in the employ of the Royal Gardens at Kew in England.

Traveling on one of the Dutch East India Company ships as a surgeon, Thunberg traveled first to Java, then on to Japan in 1775, where he carried out extensive studies of flora and fauna. He returned to Europe by way of Java and CEYLON (present-day Sri Lanka). In 1784, Thunberg was appointed to the chair of medicine and botany at the University of Uppsala, a position he held for 44 years.

Carl Peter Thunberg was a prolific writer, and his *Flora Japonica* (1784) and *Flora Capensis* (1807–13) are considered classics. He has been referred to as the “father of South African botany” for his pioneering work in that country’s natural science.

Thyssen, François (fl. 1620s) *Dutch mariner in Australia*

In a 1627 voyage from the Netherlands to the EAST INDIES on the *Gulden Zeepaard*, Dutch navigator François Thyssen

sailed eastward across the southern Indian Ocean along 35° south latitude. Following this bearing, which was somewhat farther south than the usual route used by Dutch trading vessels, Thyssen came upon Cape Leeuwin, Australia’s southwesternmost point. After rounding Cape Leeuwin, he sailed eastward into the Great Australian Bight, naming the mainland along the southwest coast Nuyts Land, after a passenger aboard the ship. With no end of the mainland in sight, however, he turned about, completing the journey to the East Indies by sailing northward along the west coast of Australia.

Had François Thyssen continued eastward, he might have determined the true dimensions of Australia. He was, nonetheless, the first European to sail into the Great Australian Bight, providing later Dutch, English, and French navigators with one of the earliest reports of the continent’s southern and eastern extent.

Timofeyevich, Yermak See YERMAK.

Tinné, Alexandrine Petronella Francina (Alexine Tinné, Alexandrina Pieterella Françoise Tinné) (1835–1869) *Dutch explorer in Africa*

Alexandrine, or Alexine, Tinné was born in The Hague into an aristocratic Dutch family. She reportedly was drawn to African exploration after the breakup of a love affair.

In 1862, Tinné went to Egypt, from where she planned to explore the NILE RIVER and take part in the search for its source. At Cairo, she engaged a small fleet of boats and embarked upriver, accompanied by her mother and aunt, a small team of scientists, a staff of European attendants, and about 200 African servants. Her voyage was conducted with some degree of luxury, her own riverboat being equipped with a grand piano.

At Gondokoro, near the head of navigation on the Nile, Tinné hoped to meet with English explorers JOHN HANNING SPEKE and JAMES AUGUSTUS GRANT, who had set out to find the river’s source from the East African coast two years earlier. She wanted to bring them assistance, believing they would pass by Gondokoro on their way north from the interior. In the course of the trip, both her mother and aunt, as well as two of the scientists, died of fever in the Nile swamps. With no sign of Speke or Grant, she began to seek the source of the Nile herself, traveling into the Mongalla Mountains of the southern Sudan and southward into the watershed region of the CONGO RIVER (Zaire River) and the Nile in what is now the Democratic Republic of the Congo.

Tinné returned to Gondokoro in September 1862. Learning that Speke and Grant had still not arrived, she headed downriver to Cairo. (The two Englishmen did eventually reach Gondokoro six months later, where they were

Alexandrine Tinné (Library of Congress)

met by SAMUEL WHITE BAKER and his wife, FLORENCE BAKER.)

In the mid-1860s, Tinné turned her attention to North Africa; she traveled to Algeria, planning to cross the SAHARA DESERT southward to the Bornu Kingdom of northern Nigeria. Her first attempt from Algiers was not successful, and, in early 1869, she went on to Tripoli, where she met the German explorer GUSTAV NACHTIGAL, who was then planning a similar journey. Meeting up again several months later in the oasis city of Murzuk in southwestern Libya, Tinné and Nachtigal agreed to travel southward together with the first Arab caravan headed that way. As before, Tinné was accompanied by a large following, this time including servants, Algerian women, and some Dutch sailors.

In the meantime, while Nachtigal went eastward on his own into the Tibesti region, Tinné went to visit with the nomadic Tuareg tribes out on the desert. Although a Tuareg chieftain had provided her with a letter of safe conduct, her camel drivers murdered her en route to the Tuareg encampment for valuables they believed she was carrying.

In her African travels, Alexine Tinné entered regions only recently explored by Europeans. Her voyage up the Nile in 1862 took her to the river's navigable limits, and her later overland journey into the Congo-Nile watershed region was into territory still not mapped. Tinné's sudden

end in the Sahara cut short a career in exploration that may have rivaled that of some of the leading male explorers of her day.

Toll, Eduard von (Baron von Toll) (1858–1902)

Russian geologist in the Siberian Arctic

Baron Eduard von Toll was born in Tallinn, Estonia. He was drawn to exploration in the Siberian Arctic by his interest in geology, especially in the study of fossil remains from earlier geological periods.

Toll took part in a scientific expedition to the New Siberian Islands in 1885–86, sponsored by the St. Petersburg Academy of Sciences. From 1892 to 1894, he undertook geological research around the deltas of eastern SIBERIA's Yana, Indigirka, and Kolyma Rivers. In the course of this expedition, he set up supply depots in the New Siberian Islands in support of FRIDTJOF NANSEN's attempt on the NORTH POLE aboard the *Fram*.

Toll's last expedition embarked in 1900 aboard the Russian research vessel *Zarya*. After two winters, he managed to navigate around Cape Chelyuskin, the northernmost point of the Asian continent. In spring 1902, Toll set out with three others in his party to explore north of the New Siberian Islands in search of "Sannikov Land," a landmass that had been reported in the early 1800s by Russian Arctic explorer Yakov Sannikov. When he did not return, a search party was sent out in spring 1903, led by NIKIFOR ALEKSEYEVICH BEGICHEV. On Bennett Island, letters left by Toll were found at his encampment, indicating that he and his party had died the previous year.

Baron Eduard von Toll made significant fossil discoveries on the Arctic coast of eastern Siberia and in the New Siberian Islands. His search for Sannikov Land was carried on by other Russian explorers for four decades after his death, and it was not determined until 1938 that the supposed Arctic landmass was nonexistent.

Tonti, Henri de (Henri de Tonty) (ca. 1650–1704)

French soldier, fur trader in the Mississippi Valley, cousin of Daniel Greysolon Duluth

Henry de Tonti was the son of Italian banker Lorenzo Tonti, originator of the life insurance annuity plan known as the "tontine." He was born in the Italian city of Gaeta, near Naples, and moved to France as a boy when his family was forced to flee Italy for political reasons.

At the age of 18, Tonti embarked on a military career as a junior officer in the French army. He subsequently was appointed a midshipman in the French navy, taking part in the 1672–78 conflict between France and Spain, the last phase of the Dutch Wars. During an engagement with the Spanish in Sicily, he lost part of his right arm in a grenade

explosion and was taken prisoner, later winning release in a prisoner exchange.

In 1678, Tonti became a lieutenant under RENÉ-ROBERT CAVELIER DE LA SALLE and accompanied him from France to Quebec. By December 1678, Tonti was at the mouth of the Niagara River, where, under La Salle's command, he supervised the building of Fort Conti, as well as the construction of the ship the *Griffon*, the first European vessel to sail the western Great Lakes.

Tonti left the Niagara Falls post in summer 1679, and, in search of deserters from La Salle's expedition, explored the north shore of Lake Erie by CANOE. At Lake St. Clair, between Lake Erie and Lake Huron, he rejoined La Salle, and aboard the *Griffon*, they sailed to Green Bay on Lake Michigan's west shore. From there, he scouted ahead to the southern end of Lake Michigan and explored the St. Joseph and upper Illinois Rivers. At what is now Fort Wayne, Indiana, Tonti established Fort Miami, and, on the Illinois River, he founded the settlement of Crèvecoeur near present-day Peoria, Illinois.

While La Salle returned to France for additional support for his proposed expedition to the mouth of the MISSISSIPPI RIVER, Tonti remained in command at the Crèvecoeur post, where he developed fur-trading contacts with the Illinois tribes. In 1681, Iroquois (Haudenosaunee) hostility forced him to leave northern Illinois, and he went to Mackinac Island at the northern end of Lake Michigan, joining up with La Salle at the end of the year. From there, Tonti led an advance party to the Chicago Portage, and, in February 1682, he set out with La Salle on his famous journey from the Illinois post down the Mississippi to the Gulf of Mexico, which they reached in April.

Tonti accompanied La Salle on his return journey up the Mississippi as far as Starved Rock on the Illinois River, where he established Fort St. Louis. The next few years, Tonti operated between this settlement and Mackinac, developing the FUR TRADE with the Illinois tribes.

In February 1686, Tonti set out from his Illinois River post and descended the Mississippi in search of La Salle, who was then stranded at Matagorda Bay on the Texas coast. In early April 1686, he reached the mouth of the Mississippi, but his efforts to locate La Salle were unsuccessful. Tonti planned to follow the Gulf Coast to the Atlantic Ocean and return to Montreal by way of New York, but at the insistence of his men, he returned up the Mississippi to Starved Rock.

In 1687, after taking part in additional campaigns against the Iroquois, he attempted another expedition in search of La Salle, this time reaching the mouth of the Arkansas River, where he established Aux Arcs, also known as Fort Arkansas. (Aux Arcs, which in French signifies "at the Arkansas," was anglicized to denote the Ozarks, the mountain range to the west.) Tonti eventually met up with

survivors of La Salle's expedition, among them La Salle's brother and nephew and his assistant HENRI JOUTEL.

In 1689, Tonti, having learned of La Salle's death, led an expedition into Texas in search of other survivors, reaching as far as what is now northern Houston County.

In 1690, back at his post on the Illinois, Tonti received a trade monopoly over the Mississippi River, and, the following year, he established a settlement at Pimitoui near what is now Peoria, Illinois. However, he was unsuccessful in gaining support for the development of the lower Mississippi as a southern outlet for the fur trade, meeting resistance from rival traders in Montreal and the Great Lakes.

In 1695, Tonti went to the Lake Superior region, established trade contacts with the Assiniboine Indians and explored the upper Nelson River, seeking a way to attack the English fur-trading posts on HUDSON BAY.

In the last years of his life, Tonti joined with PIERRE LE MOYNE, sieur d'Iberville, in establishing French colonies along the Gulf coast of what is now Alabama, Mississippi, and Louisiana. In 1704, at Fort Louis-de-la-Louisiane (present-day Mobile, Alabama), he contracted yellow fever and died.

Henri de Tonti carried out many of La Salle's plans to develop French influence in the lower Mississippi Valley. Following La Salle's death in 1687, his efforts led to French dominance over the region between the Great Lakes and the Gulf of Mexico. Among the Indians, Tonti was known as Bras de Fer, or "Iron Arm," because of his artificial right arm. His ability with this artificial limb led the Indians to believe he had supernatural powers and helped gain their loyalty in trade and in military actions against the Iroquois.

Torres, Luis Váez de (unknown–ca. 1615)

Spanish mariner in the South Pacific

Luis Váez de Torres was a leading Spanish sea captain and a friend of PEDRO FERNÁNDEZ DE QUIRÓS. In December 1605, he sailed from Callao, Peru, in command of the *Almirante*, one of the three vessels in Quirós's expedition into the Pacific Ocean in search of Terra Australis, the GREAT SOUTHERN CONTINENT.

In early May 1606, Torres and Quirós landed on the island of Espiritu Santo in the New Hebrides, which Quirós had mistaken for the mainland of the Great Southern Continent. An attempt to establish a settlement there was short-lived; Quirós abandoned the colony in early June 1606. At the start of the return voyage, the ships became separated. Torres waited offshore for 15 days; Quirós headed eastward across the Pacific toward Mexico.

Torres had been provided with sealed instructions from the viceroy of Peru for just such an event. Following these orders, he sailed southwestward as far as 20°30' south latitude, still searching for the Great Southern Continent. He may have sighted the Great Barrier Reef off the coast of

Queensland, Australia, although he reported finding no land.

Torres next turned northwestward and made the European discovery of what later became known as the Louisiade Archipelago off the east coast of New Guinea. Although he had planned to sail northward around New Guinea on his way to the Philippines, strong currents caused him to coast along the south shore of New Guinea, through the Gulf of Papua and into an uncharted passage separating southern New Guinea from northern Australia's Cape York. He then headed for Ternate in the Moluccas, then northward for the Philippines.

When Torres arrived in Manila, his ship was requisitioned by Spanish authorities, and he was compelled to remain there. In July 1607, he sent a letter to King Philip III of Spain relating that he had determined New Guinea to be an island, and that it therefore could not be the northern end of the Great Southern Continent, as had been thought.

Although Luis Vázquez de Torres had also described the passage he found along New Guinea's south coast, the information was kept secret by Spanish authorities. It was not until after the capture of Manila by British forces in 1762, in which Spanish navigational documents were recovered, that the news of the strait separating New Guinea from Australia became widely known. The first European to confirm the existence of what became known as Torres Strait was JAMES COOK, who passed through it in 1770.

Tovar, Pedro de (Pedro de Tobar) (fl. 1540s)

Spanish army officer in the American Southwest

Pedro de Tovar, a Spanish soldier, was one of FRANCISCO VÁSQUEZ DE CORONADO's lieutenants in his 1540–42 expedition into what is now the southwestern United States. A week after the Spaniards had conquered the Zuni Indian pueblo of Hawikuh in what is now northwestern New Mexico, Coronado detailed Tovar to undertake an exploration to the north and west.

Accompanied by Friar JUAN DE PADILLA, a Franciscan missionary, and a small detachment of soldiers, Tovar set out from Hawikuh on July 15, 1540, and traveled into a region known by the Indians as Tusayan. Within a few weeks, the party came upon the large Hopi Indian pueblo at Awatovi in present-day northeastern Arizona. Although the Hopi at first attacked Tovar and his party, they were quickly subdued in a brief skirmish. Five nearby Hopi pueblos also surrendered, offering the Spaniards gifts of cloth, animal skins, turquoise, and corn.

When Tovar returned to Hawikuh later that summer, he reported to Coronado that he had learned from the Hopi of a great river to the west, in a region supposedly inhabited by giants. The news prompted Coronado to send out GAR-

CÍA LOPÉZ DE CÁRDENAS to investigate, resulting in the Spanish discovery of the Grand Canyon and upper portion of the COLORADO RIVER.

Pedro de Tovar and his party were the first Europeans to make contact with the Hopi. His explorations into northern Arizona were not followed up until ANTONIO ESTEVAN DE ESPEJO visited the region in 1582–83.

Tristão, Nuño (Nuno Tristan) (fl. 1440s)

Portuguese mariner on the coast of West Africa

Nuño Tristão was a member of the royal household of HENRY THE NAVIGATOR, Prince of Portugal.

In 1441, with the support of Prince Henry, Tristão undertook a voyage of exploration along the coast of West Africa. He reached as far south as Cape Blanco. Antão Gonçalves, who was part of the expedition, returned to Portugal with a number of native people.

On a second voyage in 1443, Tristão made the European discovery of Arguin Island, just beyond Cape Blanco. The next year, he landed on the northern delta of the Senegal River, becoming the first modern European to visit West Africa south of the SAHARA DESERT.

Tristão returned in 1448 to Arguin Island, where he established the first Portuguese slaving station on the coast of West Africa.

Nuño Tristão's voyages brought about the first contacts between Europeans and non-Muslim black Africans. The Portuguese SLAVE TRADE, which he had been instrumental in initiating, became a strong incentive for later Portuguese explorations along the African coast. His exploration of Cape Blanco was a significant step in the progression of Portuguese travel along the coast of West Africa, indicating to navigators and geographers that beyond that point, the African mainland began to extend southward.

Truteau, Jean-Baptiste (Jean-Baptiste

Trudeau) (1748–1827) *French-Canadian fur trader on the Missouri River, schoolteacher*

Originally from Montreal, Jean-Baptiste Truteau had been an Indian trader in the Des Moines River region of present-day central Iowa before settling in St. Louis in 1774, where he became the town's first schoolmaster.

In 1794, the company of explorers of the upper Missouri (the Missouri Trading Company) commissioned Truteau to lead a trading and exploring expedition up the MISSOURI RIVER. The enterprise had been organized in part by the lieutenant governor of Spanish Louisiana, Zenon Trudeau, a distant relative, who wanted to drive out British fur traders encroaching on Spanish territory in the upper Missouri region. In addition to opening up fur-trading contacts with the upper Missouri tribes, Truteau had been in-

structed to travel to the source of the Missouri and determine if it led to the Pacific Ocean.

Truteau, accompanied by Jacques Clamorgan of the Missouri Trading Company and a small party, set out from St. Louis on June 7, 1794, traveling up the Missouri by CANOE with trade goods. In what is now southern South Dakota, the expedition encountered Sioux (Dakota, Lakota, Nakota) Indians, with whom they traded for beaver pelts. They continued upstream to the Arikara Indian villages at the mouth of the Grand River near the present South Dakota-North Dakota border.

Truteau and his party spent the winter of 1794–95 at a post they established on the Missouri, south of Sioux country, in what is now south-central South Dakota. In spring 1795, he again visited the Arikara and traveled with a group of them into the Black Hills. He made contact with the Cheyenne and learned of other Plains Indians with whom the French and Spanish could extend their influence in the FUR TRADE on the upper Missouri and the northern plains.

Truteau returned to St. Louis at the end of summer 1795, reporting to Zenon Trudeau that, according to the Indians, large boats could navigate far up the river to its source. He also related what he had learned about the extent of British influence in the fur trade on the upper Missouri.

Jean-Baptiste Truteau resumed his teaching career in St. Louis, serving as the village schoolmaster until the early 1800s. The journal that he had kept of his trip up the Missouri came to the attention of President Thomas Jefferson who in winter 1803–04, sent an English translation of it to MERIWETHER LEWIS at his encampment near St. Louis, where he was preparing for his expedition to the Oregon coast with WILLIAM CLARK. Along with other sources, Truteau's account may have provided the American explorers with information about the Indian tribes they could expect to encounter, as well as geographic details about the little-known country of the upper Missouri River.

Tschudi, Johann Jakob von (1818–1889)

Swiss naturalist, diplomat in South America

Born at Glaurus in northeastern Switzerland, Johann Jakob von Tschudi received his early scientific training as a student of the naturalist Louis Agassiz.

In 1838, at the age of 20, Tschudi traveled to the Pacific coast of South America. In the course of the next four years, he roamed over a wide area of Peru, studying the native culture and visiting sites of archaeological interest. He toured the mining country of the Cerro de Pasco region of central Peru and explored parts of the Peruvian ANDES MOUNTAINS never before visited by Europeans. On his second trip to South America in 1857, Tschudi landed at Buenos Aires, then made a mid-winter crossing of South America to Chile,

during which he traveled through the upper Rio de la Plata region of northern Argentina.

In 1860, Johann von Tschudi became Swiss ambassador to Brazil, and he later went on to a diplomatic post in Austria. Among his works on his experiences in South America are *Travels in Peru* and *Travels in South America* (1847), in which he relates his impressions of Spanish and Indian culture and provides descriptions of exotic animals and plants.

Tsybikov, Gombozhab (1873–1930)

Russian historian, anthropologist in Tibet

Gombozhab Tsybikov was born in Burjatija in southeastern Russia near the Mongolian border. In 1895, he joined the faculty of the Oriental Department of St. Petersburg University. Four years later, he received a commission from the Russian Imperial Geographical Society to travel to Tibet in order to counter British interests. Great Britain had successfully sponsored surveys carried out by the Indian surveyors known as PUNDITS, among them NAIN SINGH, KISHEN SINGH, and KINTUP.

Tsybikov, disguised as a Buddhist pilgrim and traveling with a Mongolian caravan, entered Tibet in 1900. He spent two years based in LHASA and traveled to a number of monasteries, including those at Tashi Lhunpo, Tsetan, and Samye. Returning to Russia, he later taught at universities in Vladivostok and Irkutsk.

Although the Russian government had hoped that Gombozhab Tsybikov's stay in Tibet would lead to political ties, his primary interest was scholarly, and his writings on Tibetan culture and history are a major contribution to the field. A subsequent visit was carried out by another Buddhist scholar, Agran Dorjiev, who proposed a Russian-Tibetan alliance. These activities led to a British military expedition headed by SIR FRANCIS EDWARD YOUNGHUSBAND.

Tudela, Benjamin of See BENJAMIN OF TUDELA.

Turk (The Turk, El Turco) (unknown–1541) *Plains*

Indian guide for Spanish under Francisco Vásquez de Coronado
The American Indian known as the Turk was probably a Pawnee from the Great Plains region of what is now Kansas or Oklahoma.

In 1540, the Turk was living as a slave to Towa Indians at their pueblo on the Pecos River, near present-day Las Vegas, New Mexico. That year, HERNANDO DE ALVARADO, leading a contingent of FRANCISCO VÁSQUEZ DE CORONADO's exploring expedition, arrived at Cicuye Pueblo (Pecos Pueblo) and conquered it.

The Turk, so named by the Spaniards because of his Turkish-style headdress, told Alvarado of QUIVIRA, an Indian land of great wealth far to the north and east.

The Turk led Alvarado and his men eastward along the Pecos and Canadian Rivers onto the Great Plains, then was taken back to Coronado's headquarters at Tiguex on the Rio Grande, near what is now Albuquerque. Coronado's efforts to find the fabled Seven Cities of CIBOLA, with their hoped-for gold and other riches, had so far been fruitless. The Turk's tales rekindled Coronado's hopes of finding an Indian civilization as rich as the Aztec of Mexico or the Inca of Peru.

In spring 1541, the Turk guided Coronado and a large company of soldiers northeastward from Tiguex into the barren Staked Plains region of the Texas Panhandle. Another Plains Indian, named Ysopete, accompanied the expedition.

The Turk led the Spanish northward from Texas, through Oklahoma, to the Arkansas River, which they crossed near what is now Dodge City, Kansas. By that time, Coronado had grown to doubt the truth of Turk's stories and had him placed in chains. The Spaniards continued into Kansas, now led by Ysopete. A small party was sent ahead to what was thought to be Quivira, near present-day Lindsborg, Kansas. The village turned out to be an impoverished settlement probably of the Wichita Indian, on the Kansas plains. Soon afterward, the Spaniards encountered a party of 200 Pawnee warriors. When Coronado learned that the Turk had attempted to incite the Pawnee against his men, he had him executed by the garrote. He then led the expedition back to the Southwest.

The Turk's death at the hands of the Spanish may have stemmed more from their disappointment at not finding gold than from his suspected treachery. Some historians suggest that the Turk may have been sincere about the "riches" of Quivira, intending to take the Spaniards to the Pawnee, whose magic and medicine were highly valued by the Plains Indians. Or he may have been part of a scheme of the Towa Indians to send the Spanish far from their homeland, where

they might perish. In any case, the Turk's knowledge of the region's geography was invaluable to the Spaniards in their explorations.

Turner, Samuel (ca. 1749–1802) *British army officer in India and Tibet*

Samuel Turner was born near Gloucester, England. He was a relative of Warren Hastings, governor general of British India and a high-ranking BRITISH EAST INDIA COMPANY official.

Turner himself entered the service of the British East India Company in 1780. In Calcutta, in January 1783, he was put in charge of a diplomatic mission to the "newly reincarnated" Tashi Lama in Tibet. From Calcutta, he followed the route GEORGE BOGLE had taken in his 1774 journey to Tibet. Turner reached Bhutan in June 1783, and, that August, he arrived in the Tibetan city of Shigatse. In December 1783, Turner was granted an audience with the Tashi Lama, who then was only 18 months old. Instructed that the child could understand him, Turner presented the Tibetan leader with greetings from the governor general of India; he then sought to establish diplomatic ties with the Tibetan regency. Turner retraced his route back to India, where he reported the results of his mission to Governor General Hastings at Patna in northeastern India in March 1784.

Throughout the 1790s, Turner took part in military engagements in India under the command of General Charles Cornwallis. In 1800, he retired from the British East India Company at the rank of captain and returned to England, where he was elected a fellow of the ROYAL SOCIETY the following year.

Samuel Turner's *An Account of an Embassy to the Court of the Teshoo Lama in Tibet, containing a Narrative of a Journey through Bootan and part of Tibet* (1800) was the first published description of Tibet written by an Englishman.

Ulloa, Francisco de (unknown–ca. 1540)

Spanish mariner in North America

Francisco de Ulloa was an officer with HERNÁN CORTÉS in the conquest of Mexico in 1519–21, commanding naval forces on Lake Texcoco in the final siege of Mexico City in 1521.

Ulloa went on to accompany Cortés in several voyages of exploration into the lower Gulf of California in the early 1530s, and, in 1535, he was left in charge at Santa Cruz (present-day La Paz), Cortés's settlement on the east shore of southern Baja California.

In 1539, Cortés placed Ulloa in command of a seaward expedition to explore northward along the west coast of Mexico, interest in the region having been sparked by ALVAR NÚÑEZ CABEZA DE VACA's reports describing the supposed riches of the fabled Seven Cities of CIBOLA. Cortés directed Ulloa to conduct a reconnaissance along the Pacific coast of Mexico as far north as possible.

On July 8, 1539, Ulloa embarked from Acapulco in command of three ships, the *Santo Tomás*, the *Santa Águeda*, and the *Trinidad*. In late August, the *Santo Tomás* became separated from the fleet in a storm and sought shelter on the Mexican coast. The vessel was soon seized by government authorities on the order of the viceroy of New Spain, ANTONIO DE MENDOZA, who had forbidden any seaward exploration without his authorization—something Cortés had neglected to obtain. Only a few months earlier, Mendoza himself had sent Fray MARCOS DE NIZA and ESTEVAN-ICO northward on an overland expedition in search of

Cibola, and he was concerned that Ulloa might find it first on behalf of Cortés.

Ulloa and his two remaining ships sailed northward to the head of the Gulf of California, making several landings in which he claimed the northern Mexican coast for the king of Spain. Upon reaching the mouth of the COLORADO RIVER, he observed that the outflow of the river made the waters of the gulf appear to be red in color, prompting him to name the area the Vermillion Sea. He explored up the Colorado River for a few miles in one of the ship's boats, reaching far enough upriver to see mountain peaks in the southeasternmost corner of what is now the state of California.

Ulloa then turned southward and surveyed the east coast of Baja. After a stopover at Santa Cruz, he rounded Cape San Lucas, Baja California's southernmost point, and proceeded up the Pacific coast, reaching and naming Cape Santo Lazaro and Punta Santa Eugenia, as well as an island he called Isla de Cedros, after the groves of cedar trees there.

In April 1540, Ulloa sent back one of his ships with a report to Cortés of what he had observed, then continued northward. After this point in the voyage, accounts vary as to what happened next. Some sources suggest Ulloa failed to return from the voyage and nothing was heard of him afterward. Other accounts indicate he sailed up the California coast to a point just south of present-day San Diego, California, and, on encountering unfavorable winds, returned to Acapulco in late May 1540, where he died soon afterward in a fight with another soldier.

Francisco de Ulloa is credited with making the first known European sighting of territory within the present state of California. He was the first to circumnavigate the Gulf of California, and, as a result, made the earliest determination that Baja California, thought to be an island since it was first sighted in 1533, was actually a peninsula. This finding did not become widely known until the 1690s, when Father EUSEBIO KINO mapped the region in his overland travels around the mouth of the Colorado River. A firsthand account of Ulloa's expedition, prepared by his secretary, Francisco Preciado, was translated into English by JAMES BURNEY and published in England in 1803, as *The Voyage of the Right Worshipful Knight Francisco de Ulloa*. . . .

Urdaneta, Andrés de (Andrés Urdaneta, André de Urdaneta, Andrys de Urdaneta)

(1498–1568) *Spanish mariner in the South Pacific, priest*
 Andrés de Urdaneta was born near Guernica in the Basque country of northern Spain. In 1525, he sailed with JUAN SEBASTIÁN DEL CANO as his page on a voyage to the SPICE ISLANDS (the Moluccas in present-day Indonesia). In the course of the expedition, intended as a follow-up to the FERDINAND MAGELLAN voyage of 1519–22, Urdaneta explored the STRAIT OF MAGELLAN in a small boat. Then, beginning in fall 1526, he undertook navigational surveys in the Spice Islands.

Urdaneta remained in the Spice Islands for the next seven years, during which he took part in military campaigns against the Portuguese and also studied mathematics and compiled geographic and navigational information about the region. In 1534, more than four years after Spain had relinquished its claim on the Spice Islands to Portugal, he sailed back to Europe on a Portuguese ship, by way of India and the CAPE OF GOOD HOPE, arriving at Lisbon in June 1536 and thereby completing a round-the-world journey begun more than 10 years earlier.

Urdaneta was detained by Portuguese authorities in Lisbon for seven months before he was permitted to continue to Spain. They also confiscated all the maps and journals he had kept of his travels in the Moluccas and the Philippines. Nevertheless, after he reached the Spanish capital at Valladolid at the end of February 1537, he recreated his work from memory and presented it to Spain's Royal Council. For his exploits in the southwestern Pacific, King Charles I of Spain (also Holy Roman Emperor Charles V) presented him with a substantial cash grant.

Urdaneta soon became known as one of Spain's leading explorers of the southwestern Pacific Ocean, and as a result he was recruited to join with PEDRO DE ALVARADO in a westward voyage to the Philippines from Mexico planned for 1540. He sailed that year to Mexico, where he soon became involved in suppressing an Indian revolt that became

known as the Mixtón War. In 1541, when Alvarado was killed in the course of that campaign, the planned expedition into the Pacific was abandoned.

Urdaneta remained in Mexico, serving in various administrative posts until 1552, when he entered the Augustinian order. He became a priest in 1557. Two years later, King Philip II of Spain called upon him to take part in another expedition to the western Pacific. Although his having become a priest excluded him from command of the voyage, he was instead named as "Prior of the Armada," and, in effect, chief pilot. On Urdaneta's recommendation, his friend and fellow Basque MIGUEL LOPEZ DE LEGAZPI was placed in charge of the expedition.

Urdaneta and Legazpi embarked from Navidad on Mexico's Pacific coast in November 1564 and, after stopping at Guam, they arrived in the Philippines in February 1565. There, on the island of Cebu, they established the first permanent Spanish settlement.

On June 1, 1565, Urdaneta sailed from the Philippines aboard the *San Pedro*, commanded by Legazpi's grandson Felipe de Salgado, in an attempt to navigate eastward across the Pacific and back to Mexico, a feat that until then had not been possible due to the adverse effect of the northeast trade winds. Urdaneta, as pilot, set a course far to the north of earlier attempts, and, at the latitude of northern Japan, picked up the prevailing easterly winds and the Japan Current, which carried the ship to the California coast, off present-day Santa Barbara. From there the expedition followed the coastline southward, arriving at the port of Acapulco on September 18, 1565.

Although Urdaneta had planned to return to the Philippines to carry on missionary work, his health began to decline. He died in Mexico City in 1568.

Andrés de Urdaneta's voyage on the *San Pedro* was the second eastward crossing of the Pacific Ocean. Another vessel of Legazpi's fleet, the *San Lucas*, under the command of Alonzo de Arellano, had returned to Mexico from the Philippines just several weeks ahead of the *San Pedro*. Only Urdaneta had kept a careful account of the course, however, and his sailing directions enabled the Spanish treasure fleet, the "Manila Galleon," to sail eastward regularly across the Pacific. The sea route he had pioneered across the Pacific, utilized by the Spanish until 1815, made the long, round-about homeward voyage by way of the Cape of Good Hope unnecessary and completed a practical, two-way link between Spain and the Orient through Mexico.

Ursúa, Pedro de (ca. 1526–1561)

Spanish conquistador in South America

Pedro de Ursúa arrived at Cartagena on the Caribbean coast of present-day Colombia in 1545, where he joined his uncle, Miguel Díaz de Armendariz, a colonial administrator of

what was then the province of New Granada. Although then only 20 years of age, he was appointed governor of what is now Bogotá by Arméndariz.

In the Bogotá area, Ursúa asserted Spanish authority, leading several successful campaigns against the Musos Indians and establishing several new settlements. He was made mayor of the coastal town of Santa Marta in 1549, where he was less successful in subduing the Tairona.

Ursúa set out for Peru in 1552, drawn there by the prospect of new adventures and possible wealth. Along the way, he stopped in Panama, where he remained for two years, taking part in the suppression of a slave revolt. In Peru, he entered the service of the Spanish viceroy, the Marquis de Cuñete, who, in 1558, commissioned Ursúa to lead an expedition across the ANDES MOUNTAINS and into the Amazon Basin in search of the fabled wealth of the Omagua Indians and the fabled land of EL DORADO.

Ursúa, in command of 300 Spaniards and a number of Indians and slaves, left Lima in February 1559. Traveling with him was his mistress, Doña Inez de Atienza. After a series of delays, caused mainly by difficulties in obtaining sufficient financing and equipment, as well as problems with

his lieutenants, he set out down the Huallaga River in October 1560. A contingent of carpenters had been sent ahead to construct boats for the main river journey down the AMAZON RIVER.

From the Huallaga, Ursúa and his expedition made their way into the Marañon and Ucayali Rivers, entering the main course of the Amazon by December 1560. On January 1, 1561, near the Amazon's confluence with the Putumayo River in present-day western Brazil, Ursúa was murdered by mutineers led by LOPE DE AGUIRRE, who soon afterward killed Doña Inez as well. Aguirre then led the expedition down the Amazon and the ORINOCO RIVER to the coast of Venezuela, intent on returning to Peru to stage a full-scale rebellion against the Spanish viceroy.

Pedro de Ursúa led one of the first organized attempts to find the fabled El Dorado, inspired by the earlier tales of FRANCISCO DE ORELLANA. After his murder, the men with whom he had set out from Lima went on to make the second European crossing of South America. Ursúa's death at the hands of Aguirre and his men marked the beginning of one of the bloodiest episodes in the history of Amazon exploration.

Valdez, Gonzalo Fernández de Oviedo y
See FERNÁNDEZ DE OVIEDO Y VALDEZ, GONZALO.

Valdivia, Pedro de (ca. 1500–1553)

Spanish conquistador in South America

Pedro de Valdivia was born at Villanueva de la Serena in the Estremadura region of west-central Spain. In his early military career, he served with the Spanish army in Italy and Flanders, and, in 1535, he left Spain for the northeast coast of South America, where he took part in the conquest of what is now Venezuela.

In 1537, Valdivia arrived in Peru, becoming an officer under FRANCISCO PIZARRO. The next year, he played a prominent role in the defeat of Pizarro's chief rival, DIEGO DE ALMAGRO. As a reward for Valdivia's support, Pizarro consented to his request to lead an expedition into the lands south of Peru in present-day Chile.

In January 1540, Valdivia set out from Cuzco in command of a party of 24 Spaniards and a contingent of 1,000 Indians. He followed the Inca Road southward along the coast, a route Almagro had previously taken in his unsuccessful

probe into Chile five years earlier. After crossing the Atacama Desert, Valdivia founded Copiapó and explored southward into the Coquimbo region, which he named Nueva Estremadura after his homeland. Joined there by another 100 Spaniards, he continued his march southward.

On February 12, 1541, Valdivia established Santiago, the first permanent European settlement in Chile. During the following years, he brought in European settlers to develop the area agriculturally after it had become apparent that the region, unlike Peru, did not contain an abundance of mineral wealth. He also undertook explorations eastward across the ANDES MOUNTAINS into the Pampas of what is now western Argentina and continued to push southward along the coast. In 1544, Valdivia reestablished the seaport at Valparaíso, and, by 1546, he had taken control of the country as far southward as the Bío-bío River.

In 1547, Valdivia returned to Peru to aid in suppressing GONZALO PIZARRO's rebellion against the Spanish viceroy. Named as Chile's first governor general in 1549, in recognition of his loyal service in Peru, Valdivia returned to Santiago and resumed his explorations southward. On October 15, 1550, he established the city of Concepción at the mouth of the Bío-bío, and soon afterward, he initiated coastal explorations by ship, which led to his founding the city of Valdivia in 1552.

Valdivia soon traveled again across the Andes, where he founded the city of Santiago del Estero in 1553, in what is now the Gran Chaco region of Argentina. That same year, he sent out ships to explore southward along the

coast, one of which located the western entrance to the STRAIT OF MAGELLAN, making the first west-to-east passage through it. Valdivia himself explored southward along the coast, reaching Reloncavi Bay, and also traversed the Andes again to examine the upper Río Negro in what is now Argentina.

Valdivia's efforts to colonize Chile were continually hampered by Araucanian Indian uprisings. One of his former Araucanian servants, Lautaro, led a rebellion in which the Indians captured Valdivia in an ambush near Concepción in December 1553 and soon executed him.

By the 1550s, Pedro de Valdivia's explorations along the coast and into the interior of Chile had delineated the last remaining geographic details of South America west of the Andes and as far southward as the Strait of Magellan. Valdivia was unique among the other early Spanish CONQUISTADORES in South America in that he established seaports and agricultural settlements rather than just seeking gold. Santiago, Concepción, La Serena, and Valdivia, all founded by him, endured to become the most important cities in Chile. He was later immortalized as the hero of Chilean poet Alonso de Ercilla y Zúñiga's epic work on the Araucanian Indian wars in Chile, *La Araucana*, completed in 1589.

Vambéry, Armin (Arminius Vambéry, Hermann Vambéry) (1832–1913) *Hungarian linguist, traveler in central Asia*

Born in the Hungarian city of Szerdahely, Armin Vambéry was a student of languages. In 1857, Turkish statesman and grammarian Fuad Pasha engaged him as his secretary and French instructor in Constantinople (present-day Istanbul), and while residing there, Vambéry learned several Turkic languages of central Asia.

From 1861 to 1864, Vambéry undertook a series of travels into Armenia, Persia (present-day Iran), Uzbekistan, and Turkistan. Using the alias Rustem Effendi and disguised as a Turkish dervish, he traveled into regions little known to Europeans. Aided by his facility with the local languages, he managed to visit Bukhara and Samarkand, cities that were then forbidden to non-Muslims.

Vambéry had journeyed into central Asia to expand his knowledge of Turkish languages. Yet published accounts of his experiences gained him world-wide renown as a traveler to exotic places. In 1865, he was appointed professor of Oriental languages at the University of Budapest, a position he held until 1905.

Armin Vambéry was one of the first Europeans to travel across Turkistan since the days of MARCO POLO, and one of the last to visit Samarkand and Bukhara before those ancient caravan centers came under Russian domination in the later 1860s.

Vancouver, George (1757–1798) *British naval officer in the Pacific and along the west coast of North America*
Born in King's Lynn on the east coast of England, George Vancouver entered the British navy in 1770. He served as a midshipman with JAMES COOK's second voyage to the South Pacific Ocean in 1772–75, as well as with Cook's third voyage of 1776–80, in the course of which he first sailed along the Pacific coast of North America.

Commissioned a lieutenant in 1780, Vancouver served on naval escorts in the Caribbean Sea and North Sea throughout the 1780s.

Promoted to commander, Vancouver sailed from Falmouth, England, on April 1, 1791, in command of Cook's former ship, the *Discovery*, accompanied by the *Chatham*, under the command of Lieutenant WILLIAM ROBERT BROUGHTON. Vancouver had been directed to survey the west coast of North America in support of British fur-trading interests and continue the search for the western entrance to the NORTHWEST PASSAGE, as well as to carry out a diplomatic mission in the region. He entered the Pacific by way of the CAPE OF GOOD HOPE, and as he sailed northward, he charted the coasts of NEW ZEALAND and Australia and established the exact positions of the HAWAIIAN ISLANDS. By spring 1792, he was off the North American coast at San Francisco Bay. Broughton, meanwhile, had reached North America and explored the mouth of the COLUMBIA RIVER.

Vancouver undertook a detailed coastal survey in which he charted the Strait of Juan de Fuca and the Strait of Georgia on the coast of present-day Washington State. He thoroughly explored a long coastal inlet, naming it Puget Sound in honor of Peter Puget, one of his officers. A glacier-covered mountain on the mainland was sighted, which he named Mount Rainier after another of his officers, Peter Rainier.

At the end of August 1792, Vancouver sailed into Nootka Sound on the coast of present-day British Columbia, where he met with Spanish naval officer JUAN FRANCISCO DE LA BODEGA Y QUADRA and conferred over the Nootka Sound Crisis of 1789, an international dispute between England and Spain concerning territorial rights in those waters.

Vancouver spent the next two summer seasons exploring and charting the coast of North America, from Cook Inlet near present-day Anchorage, Alaska, as far south as San Diego, California. He wintered in the Hawaiian Islands. In charting the coast of what is now British Columbia, Vancouver circumnavigated the largest island on the Pacific coast of North America. It was later named Vancouver Island in his honor.

Vancouver sailed eastward around the tip of South America on the homeward voyage, and, on arriving back in England in September 1795, he had completed a CIRCUM-

NAVIGATION OF THE WORLD. His account of his 1791–95 expedition, *A Voyage of Discovery to the North Pacific Ocean and Round the World*, was first published in 1798, only a few months before his death at the age of 41.

George Vancouver's explorations firmly established that no Northwest Passage linking the Atlantic and Pacific Oceans existed south of the icebound regions of the Bering Sea. The charts he produced of the lower Columbia River based on Broughton's explorations were of help to MERIWETHER LEWIS and WILLIAM CLARK in 1805, during the final stage of their overland journey to the Oregon coast. England's later claim on the Oregon Country was based partly on Vancouver's extensive survey along the coast of what is now Oregon, Washington, British Columbia, and southeastern Alaska.

Vanderburgh, William Henry (ca. 1798–1832)

American fur trader, trapper on the upper Missouri River and in the northern Rocky Mountains

Born at Vincennes in the Indiana territory, William Vanderburgh was the son of a territorial judge and former Revolutionary War army officer from New York State. He entered West Point in 1813 but left before graduation to embark on a career in the FUR TRADE along the MISSOURI RIVER.

Vanderburgh went to work for WILLIAM HENRY ASHLEY's fur company, taking part in expeditions up the Missouri into the Dakotas. In 1823, he was a captain of volunteers in Colonel HENRY LEAVENWROTH's punitive expedition against the Arikara Indians in what is now north-central South Dakota.

By 1829, Vanderburgh had joined up with JOHN JACOB ASTOR's AMERICAN FUR COMPANY and operated out of Fort Union at the mouth of the Yellowstone River, under the direction of KENNETH MCKENZIE. He was put in charge of the company's activities in the northern ROCKY MOUNTAINS, competing directly with independent fur traders such as JAMES BRIDGER and THOMAS FITZPATRICK. In 1829–30, Vanderburgh penetrated deep into Blackfoot Indian territory in western Montana, where he was involved in a skirmish with the Indians.

In 1832, Vanderburgh followed Bridger and Fitzpatrick into the Rockies, thereby learning the locations of some of the best fur-trapping areas. The two veteran mountain men soon caught on to Vanderburgh's tactic. When they left that year's annual fur traders' rendezvous at Pierre's Hole in what is now western Wyoming, they deliberately led him northward into hostile Blackfoot country. On October 14, 1832, near present-day Three Forks, Montana, Vanderburgh and his party were caught in a Blackfoot ambush. Vanderburgh was killed, along with one of his men; four others with him managed to escape, later returning to recover his remains.

William Vanderburgh's career in the fur trade took him into the upper Missouri and into the northern Rockies at a time when the region was all but unsettled and largely unexplored by non-Indians. His exploits brought him into contact with some well-known frontier figures who played key roles in the exploration of the American West.

Van Noort, Oliver See NOORT, OLIVER VAN.

Varthema, Ludovico di (Lodovico di Varathema, Lodovico de Barthema)

(ca. 1470–ca. 1517) *Italian traveler in the Middle East, India, and Southeast Asia*

Ludovico di Varthema was born in the northern Italian city of Bologna. Little is known of his life before 1502, when he sailed from Venice into the eastern MEDITERRANEAN SEA, beginning his extensive travels into the Middle East and Asia.

Varthema first visited the Egyptian cities of Cairo and Alexandria, then sailed to the coast of Lebanon, disembarking in Beirut. He headed northward to Tripoli, then entered Syria, arriving in Damascus in April 1503. Having learned enough Arabic to pass himself off as a Muslim, Varthema joined a group of Mameluke soldiers hired as armed escorts for a party of pilgrims heading for the holy cities of Mecca and Medina to the south.

Varthema arrived in Mecca with the pilgrims in late May 1503, the first European non-Muslim known to have reached that sacred city. He remained for almost three weeks. After continuing to Medina, he deserted the Mamelukes and boarded a ship at the RED SEA port of Jidda, with plans to sail to India.

At the port of Aden near the mouth of the Red Sea, Varthema was arrested on orders of the sultan, who suspected that the Italian traveler was a Christian spy. According to his own account, Varthema was at first imprisoned, then managed to gain his release through romantic involvement with one of the sultan's wives. He then traveled extensively in southwestern Arabia and Yemen, heading inland to the city of Sanaa.

After several months in Arabia, Varthema sailed from Aden by way of the Ethiopian coast and the Arabian Sea, landing at the northwestern Indian port of Diu in early 1504. Instead of continuing into India, however, he went up through the Strait of Hormuz and into the Persian Gulf. He then traveled eastward across Persia (present-day Iran) and into Afghanistan, visiting Herat in an unsuccessful attempt to reach the legendary city of Samarkand.

Back at Shiraz in Persia, Varthema befriended a wealthy Persian merchant, with whom he sailed to India, visiting the Malabar Coast city of Calicut before going on to CEYLON (present-day Sri Lanka) and the Madras region on India's

southeast coast. From Madras, Varthema and his Persian companion sailed eastward across the Bay of Bengal to Malaya, Burma, and the islands of Java and Sumatra in present-day Indonesia. They traveled into Southeast Asia, touring Siam (present-day Thailand), and probably sailed to the SPICE ISLANDS (the Moluccas) and Celebes Island, also in present-day Indonesia.

Varthema was back in India by 1505, where he entered the service of the Portuguese, taking part in military actions against the local natives at the Malabar Coast city of Cannanore. For his efforts, the Portuguese viceroy of India awarded him a knighthood.

In December 1507, Varthema sailed back to Europe on a Portuguese vessel, making stops at Moçambique and other East African coastal ports, before rounding the CAPE OF GOOD HOPE and reaching Lisbon by way of the AZORES. After a royal reception by King Manuel I of Portugal, Varthema returned to Italy in 1508.

Ludovico di Varthema settled in Rome, where he soon set to work on an account of his exploits. Published in 1510, his *Travels of Ludovico di Varthema in Egypt, Syria, Arabia Deserta and Arabia Felix, in Persia, India, and Ethiopia, A.D. 1503 to 1508* was very well received; the first English edition appeared in 1576–77. Although the Portuguese had perfected a sea route around Africa to India by the time of his visit, Varthema's travels marked the first time a European had reached the Far East by way of the Mediterranean and Red Seas and then had returned to Europe in a sea voyage around Africa. Moreover, Varthema's travel account provided 16th-century European cartographers with a better idea of the geography of Asia.

Vasquez, Louis (1798–1868) *American fur trader, merchant in the Rocky Mountains*

Louis Vasquez, a native of St. Louis, became involved in the FUR TRADE on the nearby MISSOURI RIVER at an early age. In the early 1820s, he worked for WILLIAM HENRY ASHLEY'S AMERICAN FUR COMPANY, taking part in trading expeditions up the Missouri River into present-day South and North Dakota and into the northern ROCKY MOUNTAINS in what is now northern Utah and southwestern Wyoming.

Vasquez went into business in the 1830s with ROBERT CAMPBELL, with whom he brought goods and supplies to the annual rendezvous of fur traders on the Green River in 1833. Two years later, together with Andrew Sublette, brother of WILLIAM LEWIS SUBLETTE, Vasquez established a post on the South Platte River, near the site of what later became Denver, Colorado. Known as Fort Vasquez, it soon became a trading hub in the southern Rockies; from there, Vasquez shipped furs and hides down the South Platte and Platte Rivers to the Missouri and on to St. Louis. He also pioneered an overland route southward to Bent's Fort, thereby

linking his post with the Santa Fe Trail and the Arkansas River.

In 1843, Vasquez, in partnership with JAMES BRIDGER, established Fort Bridger on Black's Fork of the Green River in present-day southwest Wyoming. Located near the SOUTH PASS, the settlement served as a key stopping and resupply point along the Oregon and California Trails throughout the 1840s and 1850s. Vasquez sold his interest in Fort Bridger to Mormons in 1855, settling with his family in Westport, Missouri.

Louis Vasquez's frontier business enterprises included the establishment of outposts vital to the development of regular travel and communication in the Rockies. The trail he blazed in the late 1830s between Bent's Fort on the Arkansas River northward and Fort Vasquez on the South Platte became a key route for prospectors in the Pikes Peak (Colorado) gold rush of 1859.

Vásquez de Ayllón, Lucas See AYLLÓN, LUCAS VÁSQUEZ DE.

Vavasour, Mervin (1819–1866) *British army officer in the Pacific Northwest*

In 1845, Mervin Vavasour, a British army officer in Canada, was directed to undertake a military reconnaissance of the Oregon Country, which was then jointly administered by Great Britain and the United States. On May 5, Vavasour, accompanied by fellow officer HENRY JAMES WARRE, left Montreal, traveling westward along the CANOE-and-portage route to the Great Lakes, the Red River of the North, and Fort Garry (present-day Winnipeg, Manitoba). On this first half of the trip, they were joined by HUDSON'S BAY COMPANY governor SIR GEORGE SIMPSON, who strongly favored establishing a transcontinental military supply route to Oregon. They continued the journey westward from Fort Garry, guided by Hudson's Bay Company officer PETER SKENE OGDEN, with whom they traveled on horseback across the plains. They then traversed the Canadian ROCKY MOUNTAINS by way of White Man Pass and boated down the Columbia River to Fort Vancouver, near present-day Portland, Oregon, arriving there on August 25, 1845.

That winter, Vavasour and Warre visited the American settlement at Oregon City and toured the Pacific coast of Oregon and Washington, including Puget Sound, Vancouver Island, and the area around the mouth of the COLUMBIA RIVER. Vavasour and Warre returned to eastern Canada the following spring, traveling by way of the Athabasca Pass to the Saskatchewan River.

Mervin Vavasour's and Warre's mission had been to determine if British troops could be rapidly deployed to the

Oregon Country in an overland march across the Great Plains and Canadian Rockies, should the need arise. To carry out this assignment without arousing American concerns, they traveled under the guise of being British sportsmen on a hunting trip in the American West. In the report they filed, they concluded that the vast distances involved, the rough terrain, and the lack of abundant food supplies en route made such a plan highly impractical.

Velásquez, Diego (Diego Velázquez de Cuéllar, Diego de Velázquez) (1465–1524)

Spanish conquistador, colonial administrator in the West Indies, uncle of Juan de Grijalva

Diego Velásquez was born into a noble family at Cuéllar in north-central Spain. He embarked on a military career in his early teens, serving in the Spanish army against the Moors in the reconquest of Spain for King Ferdinand and Queen Isabella.

In 1493, Velásquez sailed to the WEST INDIES on CHRISTOPHER COLUMBUS's second voyage of exploration. He settled on Hispaniola (present-day Haiti and the Dominican Republic) and played a leading role in the conquest of the island under Columbus's brother, Bartholomew Columbus. Velásquez prospered as a colonist, establishing the towns of Azua and Jacmel in 1502.

In 1511, Velásquez was commissioned by Hispaniola's governor Diego Columbus (Christopher Columbus's son) to begin the conquest of Cuba. Later that year, in command of a fleet of four ships, he landed on Cuba's eastern end, with a force of 300 men, including HERNÁN CORTÉS, who was one of his chief officers. Velásquez had little difficulty in subduing Cuba's natives. The only significant resistance was overcome when the leader of the uprising, the native cacique (ruler) Hatuey, who had previously fled Hispaniola to escape the Spaniards, was captured and executed by burning at the stake.

In February 1513, Velásquez founded Baracoa, the first permanent European settlement on Cuba. Aided later that year by reinforcements under the command of PÁNFILO DE NARVÁEZ, Velásquez soon completed the conquest of all of Cuba and declared himself governor general of the island—a claim that was upheld by the Spanish government. By the end of 1514, he had established the cities of Bayamo and Santiago de Cuba, which he made his capital.

In 1517, Velásquez sent out a slave-hunting expedition to the Bahamas, commanded by FRANCISCO FERNÁNDEZ DE CÓRDOBA. On that voyage, Fernández de Córdoba's ships were blown far to the south and west, and, on his return to Cuba, he reported to Velásquez the existence of the mainland of Yucatán. Prompted by this news, as well as tales of an advanced Indian civilization possessing quantities of gold and other riches, Velásquez sent out a small

fleet under the command of his nephew JUAN DE GRIJALVA in spring 1518.

When Grijalva sent back word to Cuba that he had indications of wealthy Indian civilizations on the Mexican mainland, Velásquez immediately organized a large force of CONQUISTADORES under the command of Cortés, who sailed for Mexico and the land of the Aztec in fall 1518.

In 1519, Velásquez founded the city of Havana on Cuba. That same year, he sent to the Council of the Indies in Spain one of the earliest detailed maps of the island of Cuba.

In 1520, Velásquez learned that Cortés was seeking the endorsement of King Charles I of Spain (Holy Roman Emperor Charles V) for his claim to the newly explored land of Mexico, territory that Velásquez considered to be rightfully his by virtue of having sponsored the expedition. He soon dispatched Pánfilo de Narváez and a large military force to Veracruz on the Mexican mainland, seeking the arrest of Cortés. Most of Narváez's men, after defeat by Cortés, joined him in the campaign against the Aztec.

Velásquez lost his post as Cuba's governor in 1521, the year of Cortés's great triumph in Mexico. He regained the position two years later and served for one more year, until his death.

Diego Velásquez played a vital role in establishing the initial settlements on both Hispaniola and Cuba, the first permanent European colonies in the Western Hemisphere. The seaward probes he sent out under Fernández de Córdoba, Grijalva, and Cortés helped reveal the extent of Mexico's gulf coast and led to the destruction of the Aztec Empire.

Verrazano, Giovanni da (Giovanni da Verrazzano) (ca. 1485–ca. 1528) *Italian-born mariner in Americas, in service to France*

Born into an upper-class family, Giovanni da Verrazano was a native of Val di Greve in the Tuscany region of northern Italy and was educated in Florence. Embarking on a seafaring career, he undertook several voyages across the MEDITERRANEAN SEA to the Middle East before moving to Dieppe, a seaport on the Normandy coast of France.

In 1522, on an expedition of PRIVATEERS in the service of France, Verrazano captured two of Spanish conquistador HERNÁN CORTÉS's ships, of the GALLEON design, laden with

gold and were returning from Mexico. This achievement brought him to the attention of King Francis I of France. At that time, news of FERDINAND MAGELLAN's route around the tip of South America to the Far East had just reached Europe. In 1523, Francis I commissioned Verrazano to undertake a voyage westward across the Atlantic Ocean in the hope of finding a sea passage through the Americas to Asia.

Verrazano sailed from Dieppe in command of a fleet of four ships. A storm soon drove his expedition back to the Brittany coast. In January 1524, he left Dieppe again with one ship, *La Dauphine*, and a crew of 50 men. After a stopover on the Portuguese island of Madeira, he crossed the Atlantic. A storm drove his ship northward from his intended course, causing him to reach the North American coast at Cape Fear in present-day North Carolina in early March 1524.

Verrazano made a landing and had friendly contacts with Indians. He then headed southward in search of a passage to the Pacific Ocean. Fearing an encounter with the Spanish to the south, he turned northward near present-day Charleston, South Carolina. While exploring the coast along Cape Hatteras, he saw Pamlico Sound across a narrow strip of land and took it to be the western ocean.

On April 17, 1524, Verrazano reached the entrance to New York Bay. He anchored at a point in the harbor known as the Narrows, then explored the lower Hudson River in a small boat, making contact with Indians. He and his men remained in New York Bay for two weeks before heading northward along the coast.

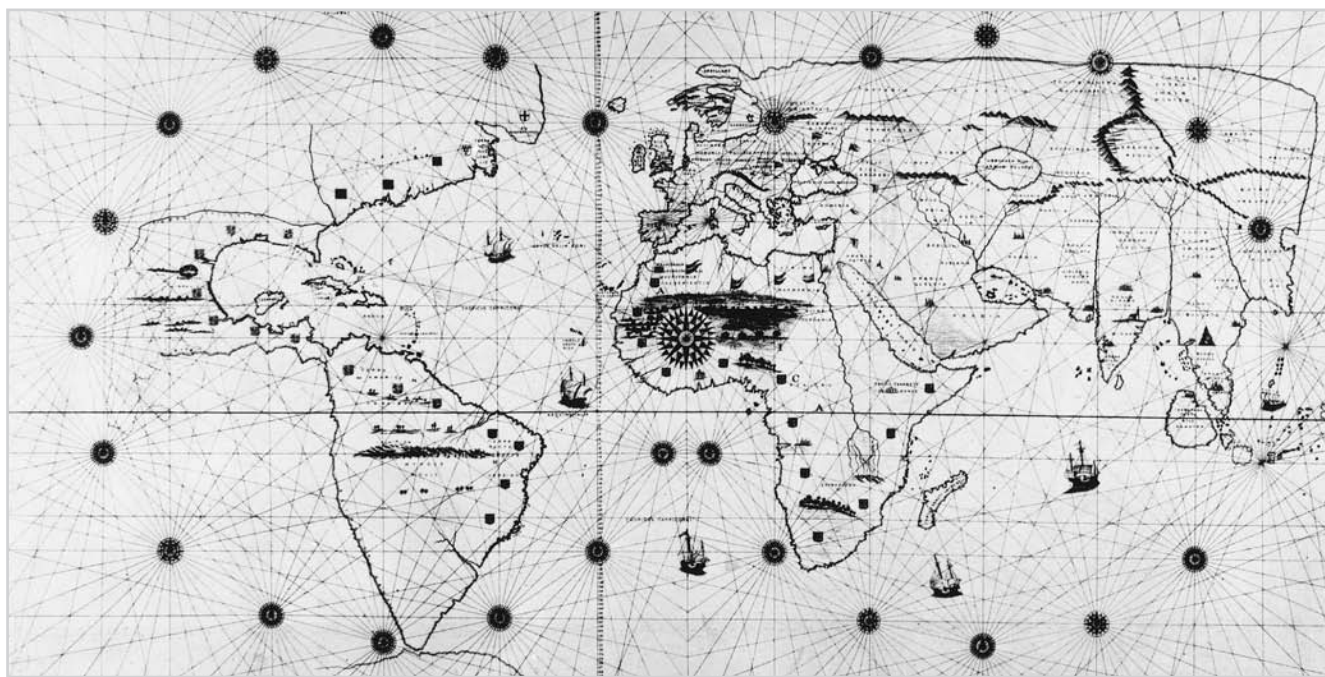

Verrazano reached Block Island, and, with the assistance of a local Indian, explored Narragansett Bay, making a landing at the site of present-day Newport, Rhode Island. He then proceeded up the coast of Maine, where he traded with the Abenaki Indians. From there, he sailed to the east shore of Newfoundland, and, from Cape Breton Island, headed back to Europe. After a two-week crossing of the Atlantic, he arrived in Dieppe on July 8, 1524. He claimed all the territory he had explored for France, calling it "Francesca" in honor of French king Francis I.

Verrazano undertook a second voyage across the Atlantic sponsored in part by French admiral Philippe de Chabot, probably in 1526 or 1527. Following a more southerly course, Verrazano reached the coast of Brazil and returned to France with a cargo of tropical lumber, which was highly valued in Europe as a source of dye.

Verrazano made his final voyage to the Americas in spring 1528. He sailed southwest from Dieppe to the Florida coast and the Bahamas, then sailed southward along the Lesser Antilles, still hoping to find a passage to the Orient.

At the island of Guadeloupe, Verrazano went ashore with a small party. They were set upon by Carib Indians; Verrazano was killed and reportedly eaten by the natives. The expedition continued on to Brazil before returning to France.

Verrazano's brother, cartographer Girolamo da Verrazano, who accompanied him on his voyages, produced the first map of North America that identified part of the coast with a Native American name—Oranbega—an Abenaki name for a site in what is now Maine.

Map of the world by Giovanni da Verrazano (Library of Congress)

Giovanni da Verrazano himself was the first to name places in the Americas after locations and people in Europe, although these names did not long endure. Verrazano brought back a description of North America as a large landmass, becoming the first European to base such an interpretation on actual exploration. As a result of his voyages, European geographers learned that the North American coastline was continuous, from the English discoveries in Newfoundland in the north to those of the Spanish in Florida to the south. His report of an inland sea at Pamlico Sound in present-day North Carolina wrongly influenced mapmakers, who, for the next 50 years, indicated the Pacific Ocean as lying not far beyond the east coast of North America. Verrazano, who inspired the explorations of JACQUES CARTIER, was the first European to visit New York Bay, predating HENRY HUDSON's expedition by more than 80 years. The Verrazano-Narrows Bridge, which spans New York Bay at the point where Verrazano anchored in 1524, was named in his honor.

Vespucci, Amerigo (1454–1512) *Italian navigator in the Americas, in service to Spain and Portugal*

Amerigo Vespucci was born in the Italian city-state of Florence, the son of prominent parents with close ties to the ruling Medici. He was educated in astronomy, geography, and natural philosophy under the supervision of his uncle, a Dominican priest and associate of religious reformer Girolamo Savonarola.

Vespucci was employed by the Medici family's banking firm, serving for more than 20 years in Italy before he was sent to Spain in 1492 to help manage the Medici's merchant-banking and ship-outfitting operations in Seville. In Spain, he became acquainted with CHRISTOPHER COLUMBUS; Vespucci, as agent for the Medici firm, provided supplies for Columbus's second voyage of exploration in 1493 as well as his third voyage in 1498.

According to his own account (as yet unsubstantiated), Vespucci sailed with Columbus as a commercial observer on the 1493 voyage, after which he embarked on a series of exploring expeditions of his own. He claimed that he sailed from the Spanish port of Cádiz on May 10, 1497, and that, after crossing the Atlantic Ocean by way of the CANARY ISLANDS, he reached the south coast of Mexico at Campeche Bay. After reportedly following the shoreline of the Gulf of Mexico north and east, he rounded Florida, then sailed northward along the coast of what is now the southeastern United States, as far as Cape Hatteras, North Carolina, before returning to Spain later that same year.

Vespucci related that he next took part in a voyage of exploration with Spanish navigator ALONSO DE OJEDA and cartographer JUAN DE LA COSA. On May 16, 1499, the expedition's three vessels sailed from Cádiz. They reached the Americas separately, with Vespucci arriving on the coast of

Amerigo Vespucci (*Library of Congress*)

Brazil near a point known as Cape São Roque, about five degrees of latitude below the EQUATOR. He then supposedly explored the coastline northwestward, locating the mouth of the AMAZON RIVER, which he explored upstream for a short distance before turning back and meeting up with Ojeda and the rest of the expedition in Santo Domingo. He then sailed back to Spain, arriving in Cádiz on September 8, 1500.

In service to King Manuel I of Portugal, Vespucci commanded an expedition aimed at following up PEDRO ÁLVARS CABRAL's European discovery of eastern Brazil in 1500. He sailed from Lisbon on May 10, 1501, reaching his supposed previous landfall at Cape São Roque on August 16, 1501. From there, the northeasternmost point of South America, he headed southward to determine the extent of the mainland. On January 1, 1502, he reached a harbor he named Rio de Janeiro in honor of New Year's Day. He also reported reaching the mouth of the Río de la Plata, and, after following the Patagonian coast due south, reaching as far as 50° south latitude, the southernmost point achieved by Europeans up to that time. If his account is true, the land he reported sighting in those waters may have been South Georgia Island, only a few degrees of latitude north of the ANTARCTIC CIRCLE.

Vespucci arrived back in Portugal on September 7, 1502. He later returned to Spain, where he became a naturalized

Spanish subject and a member of the Casa de Contratación, a government clearinghouse for geographic and navigational knowledge. In 1508, King Ferdinand II appointed him as Spain's first pilot major, a position he held until his death four years later from malaria, which he had contracted in his explorations in South America.

Amerigo Vespucci's fame in the history of exploration is largely due to the work of German geographer MARTIN WALDSEEMÜLLER. In 1507, Vespucci's accounts of his voyages, contained in his letters to Lorenzo di Pier Francisco de Medici, were included in Waldseemüller's *Cosmographia Introductio* (Introduction to cosmography), along with updated maps of the world based on the recent explorations of Columbus and other navigators. Vespucci's descriptions were the first to use the phrase *New World*, as well as the first to suggest that the newly explored lands comprised a new continent, not merely an outlying archipelago of Japan or China. For this reason, Waldseemüller named the foreign lands America, after the Latinized version of Vespucci's first name, Amerigo. When GERARDUS MERCATOR published his world atlas in the 1580s–90s, he applied the name to the northern continent as well, and the two have since become known as South America and North America. While Vespucci's actual contributions as an explorer and navigator are still not clear, he was among the first to comprehend the greater implications of the earliest European discoveries in the Western Hemisphere, and the first to conclude that the new lands were of continental proportions. More so than Columbus, who died convinced he had reached the western fringes of the Orient, Vespucci applied the principals of modern scientific inquiry, then still emerging from the constraints of medieval thought, to ascertain the significance of the geographic findings of his day.

Vial, Pedro (Pierre Vial) (ca. 1746–1814)

French-born guide, interpreter in the American Southwest, in service to Spain

Born in Lyons, France, Pedro Vial immigrated to the Louisiana country sometime before the early 1770s. He settled on the MISSOURI RIVER, where he lived and worked among the Indians as a gunsmith.

In 1786, Vial was commissioned by the Spanish government of Texas to blaze a trail from San Antonio north to Santa Fe, New Mexico; he was chosen for this assignment because of his knowledge of Indian languages and his familiarity with the geography of the Southwest. From San Antonio, Vial went northward to the Red River then headed westward, arriving at Santa Fe on May 26, 1787.

Soon afterward, the governor of New Mexico hired Vial to undertake an expedition eastward from Santa Fe and establish a route to Natchitoches in what is now western Louisiana. The trip took him across the entire width of

Texas. From Natchitoches, Vial headed back to San Antonio, then returned to Santa Fe.

In 1792, New Mexico's governor commissioned Vial to undertake an expedition in search of a route eastward across the southern plains as far as St. Louis on the MISSISSIPPI RIVER. On this trip, Vial was captured by Indians in what is now Kansas, but he managed to escape with the help of some traders, arriving in St. Louis in October 1792.

Vial subsequently settled in Santa Fe, where he served as a guide and interpreter in other explorations of the Southwest and southern plains.

Pedro Vial pioneered the first overland route between the provincial capitals of Texas and New Mexico. His 1792 expedition from Santa Fe to St. Louis was one of the earliest recorded eastward crossings of the southern plains, and it closely followed the route that later became the Santa Fe Trail.

Viale, Agostinho (ca. 1620–1667) *Brazilian colonial official in South America*

Agostinho Viale was born in São Paulo, Brazil, south of Rio de Janeiro. In 1664, King Alfonso VI of Portugal appointed him as Brazil's administrator general of mines and commissioned him to explore the dense forests of the Mato Grosso, to the north and west of São Paulo, in search of emerald mines reported to lie deep in the interior of the little-known region.

Authorized to grant pardons to fugitive outlaws who had fled into the forests of the Mato Grosso, Viale actively sought out desperados to obtain vital geographic information about the west-central Brazilian wilderness, the only other inhabitants of which were the warlike Aymora Indians.

In 1666, Viale led a force of 50 soldiers and about 150 Indians into the Mato Grosso from São Paulo. After 13 months, he managed to penetrate as far as the marshy country near the Serra das Esmeraldas, where he succumbed to malaria, as did a large segment of his expedition. His lieutenant, Barbalho Bezena, then assumed command and led the survivors back to São Paulo.

Agostinho Viale's expedition of 1666–67 was the first European probe into the inland regions of Brazil, south of the AMAZON RIVER. In the years that followed, great mineral wealth was discovered in the Mato Grosso, which led to São Paulo's becoming an important base for subsequent penetrations into the interior.

Viele, Arnaud Cornelius (Cornelissen Arnout Viele) (ca. 1620–ca. 1700) *Dutch trader, interpreter to Indians of Ohio Valley*

Born at Brabant in the Netherlands, Arnaud Cornelius Viele immigrated with his father to the Dutch colony of New Netherland, now New York State, in the early 1630s. They

settled at Fort Orange on the site of what became the city of Albany, where the elder Viele operated an Indian trading post.

From his extensive contacts with the Indians who came to trade at his father's post, the younger Viele became proficient in Indian languages and knowledgeable about Indian culture and customs. He went on to become a government interpreter, first for the Dutch, then for the British.

In the early 1680s, Viele served as British colonial governor Thomas Dongan's official envoy to the Iroquois (Haudenosaunee) Indians. Later, under the insurrectionist administration of Jacob Leisler in 1689–91, he was appointed governor of the Iroquois League of Six Nations.

Soon after Leisler's government was overthrown in New York City in 1691, Viele headed westward to the Ohio Valley. The next year, with a party of Indian traders, he traveled down the Ohio River into present-day Kentucky.

Arnaud Cornelius Viele was among the first Europeans to approach the Ohio River from the Hudson Valley, and among the first non-Indians to explore what is now northern Kentucky.

Villalón, Pedro de Rivera y. See RIVERA Y VILLALÓN, PEDRO DE.

Viscaíno, Sebastián (Sebastien Vizcaino)

(ca. 1550–ca. 1628) *Spanish mariner, merchant on the Pacific coast of Mexico and California*

Sebastián Viscaíno was born in Corcho, Spain, into a family of modest means. When about 17, he served with the Portuguese army. Then, in the mid-1580s, he settled in Mexico.

Viscaíno became a successful merchant, involved in the transpacific trade between Mexico, the Philippines, and China. He sailed from Mexico to the Philippines himself in about 1586; on the return voyage in 1587, his ship, the *Santa Ana*, was captured by one of the English PRIVATEERS, Thomas Cavendish, off the southern end of the Baja California peninsula. Viscaíno was put ashore with the rest of the passengers and crew. After making repairs to the ship, which Cavendish had attempted to burn, Viscaíno sailed back to a port on the west coast of Mexico.

Sebastián Viscaíno's landing at Monterey (painting by Albert Bierstadt) (Library of Congress)

In 1594, Viscaíno sent out an expedition under the command of his subordinate Pérez del Castillo to explore the upper Gulf of California and evaluate the region as a source of pearls. Because of dissension among the crew, the attempt was abandoned. Two years later, he led another attempt himself, sailing from Acapulco in June 1596 in command of three ships and 230 men. On this voyage, which had been commissioned by the Spanish viceroy of Mexico, Viscaíno examined the coast of Baja California in search of harbors where Spanish ships returning from the Philippines could find protection from marauding English pirates, who had recently begun to operate in those waters. He reportedly reached as far north along the coast of Baja California as 29°30' north latitude. He found no adequate anchorages and returned southward, reaching Acapulco at the end of 1596.

In 1602, Viscaíno set out again, this time to explore the Pacific coast north of Baja. Instructions from the Spanish viceroy directed him to survey and chart the coast as far northward as Cape Mendocino, as well as to locate safe harbors for Spanish shipping. He was also to carry on the search for the fabled STRAIT OF ANIAN, the mythical passage linking the Atlantic Ocean and the Pacific Ocean, which the Spanish feared had already been located by the English privateer SIR FRANCIS DRAKE, when he sailed the first English vessel into the Pacific in the 1570s.

Viscaíno sailed from the Pacific port of Acapulco on May 5, 1602, in command of a fleet of three ships. Among his crew were missionaries and cosmographers. After an extensive survey of Baja, the expedition began to explore northward; in November 1602, it reached San Diego Bay in present-day California, which Viscaíno charted and named. Soon afterward, he explored the Santa Barbara Islands, which had been visited 60 years earlier by JUAN RODRÍGUEZ CABRILLO; Viscaíno also explored and named Santa Catalina.

On December 15, 1602, Viscaíno came upon a large natural harbor he called Monterey Bay, first spotted seven years before by SEBASTIÁN MELÉNDEZ RODRÍGUEZ CERMENHO. Viscaíno later cited it as the best anchorage for large ships he had ever seen. At this point in the voyage, he sent back one of his ships with those members of the expedition who had become weakened by SCURVY. Heading northward with his two remaining vessels, Viscaíno sailed past San Francisco Bay without seeing it because of bad weather. North of San Francisco Bay, he explored Drakes Bay and sighted and named Punta de los Reyes, now known as Point Reyes.

By January 12, 1603, Viscaíno had reached as far northward as Cape Mendocino. He explored a little beyond that point to the coast of what is now southern Oregon before turning back for Mexico. En route, he charted the Farallon Islands, just west of the Golden Gate, but he again failed to see San Francisco Bay.

Viscaíno arrived at the Mexican port of Mazatlán on February 18, 1603. Soon afterward, he sailed for Spain to report on his exploration of Monterey Bay to the Council of the Indies and propose the establishment there of a permanent colony and port for Spanish ships returning from the Philippines.

Although Viscaíno's proposal to colonize Monterey Bay was approved by 1607, the planned expedition was subsequently canceled by the Spanish viceroy of Mexico, who objected to the project's excessive cost. To make up for the abandoned enterprise, Viscaíno was commissioned in 1611 to explore the Pacific Ocean in search of the fabled islands of Rica de Oro and Rica de Plata (rich in gold and in silver). In the course of the three-year voyage, he failed to find these lands. Moreover, his attempt to open up Spanish trade contacts with Japan was unsuccessful. After 1615, Viscaíno settled in the Mexican province of Avalos.

Sebastián Viscaíno's explorations of 1602–03 resulted in the production of the first reliable maps of the California coast and helped dispel the idea of the Strait of Anian. Despite the fact that he had returned with a slightly favorable description of the lands and climate of what the Spanish came to refer to as Alta California, Spanish interest in the region began to wane soon afterward. With the English maritime menace ended by a treaty between Spain and England, Spain's colonial interests began to focus more on Florida. As a result, no other serious colonization efforts in California were attempted by the Spanish until the expedition of GASPARE DE PORTOLÁ and JUNÍPERO SERRA, more than a century and a half later.

Vivaldi, Ugolino (fl. 1290s) *Italian mariner in the Atlantic*

Ugolino Vivaldi and his brother Guido (or Vadino) were navigators from the Italian city of Genoa. In 1291, they sailed from Genoa in command of two ships, intending to reach India by way of the Atlantic Ocean.

After passing through the STRAIT OF GIBRALTAR, the Vivaldi brothers followed the Moroccan coast southward to Gozara near the CANARY ISLANDS. Nothing was heard from them after that, although later accounts suggest that they may have circumnavigated Africa to Ethiopia, where they were taken prisoner by the legendary PRESTER JOHN, dying while in captivity.

It is not clear whether Ugolino and Guido Vivaldi intended to sail westward across the Atlantic, or around Africa. In any event, their 1291 voyage from Genoa was the first known attempt by Europeans to find a seaward route to India, preceding CHRISTOPHER COLUMBUS and VASCO DA GAMA by two centuries.

Waldseemüller, Martin (Martin Waltzemüller, Hylacomylus) (ca. 1470–ca. 1522) *German geographer, cartographer*

Martin Waldseemüller was originally from the city of Freiburg in northern Germany. Educated at the university in Freiburg, he became a clergyman at Saint-Die, a small town in the duchy of Lorraine in what is now northeastern France.

Waldseemüller became associated with a small college (or learned society) known as the Gymnasium Vosagense, and served as a professor of geography. The group acquired a printing press, with plans to produce a new edition of the geographic works of the ancient geographer PTOLEMY.

Waldseemüller had obtained copies of AMERIGO VESPUCCI's letters describing his explorations of the Western Hemisphere, and he included them as part of the text for *Cosmographiae Introductio* (Introduction to cosmography). Published in 1507, the book included information on winds, the distances between known places on the Earth, and geographic principles, as well as an account of the "New World," based on the voyages of CHRISTOPHER COLUMBUS, JOHN CABOT, and the brothers GASPAR CÔRTE-REAL and MIGUEL CÔRTE-REAL.

Waldseemüller also included a large map of the world, printed from 12 woodcuts, which measured 36 square feet when put together. On his world map, he cited the great landmass that Vespucci had called the "New World" as *America*, in honor of Vespucci, whom he deemed to be its discoverer. Moreover, he depicted the South American con-

continent as separated from Asia by a great sea to the west. This was a wholly new concept in Europe since most geographers considered the so-called New World to be an eastern extension of Asia.

In 1513, Waldseemüller published another geographic work in which he depicted the newly discovered lands as "Terra Incognita," or "unknown land," apparently having developed doubts about the authenticity of Vespucci's accounts. Yet his original designation "America," on more than 1,000 copies of the 1507 map, had become widely accepted throughout Europe. In the 1580s, *America* was also applied by GERARDUS MERCATOR to the landmass to the north, the two continents eventually becoming known as North America and South America.

Through his publications, Martin Waldseemüller helped disseminate geographic knowledge of European discoveries in the Americas and helped inspire further exploration.

Walker, Joseph Reddeford (Joe Walker)

(1798–1876) *American fur trader, trapper, guide in the Rocky Mountains and California*

Born in Virginia, Joseph "Joe" Walker was raised in Tennessee. By the time he was 20 years old, he had settled at Fort Osage on the Missouri frontier.

In 1820, Walker traveled with a trading caravan across the southern plains to Santa Fe. He was arrested and held for a while by Spanish authorities, but he soon won his release

by agreeing to take part in a military campaign against the Pawnee Indians.

In 1824, while operating in the FUR TRADE out of present-day Independence, Missouri, Walker guided a federally sponsored surveying expedition along the Santa Fe Trail. From 1827 to 1832, he served as the sheriff at Independence.

In 1832, Captain BENJAMIN LOUIS EULALIE DE BONNEVILLE hired Walker as a guide for his fur-trading enterprise to what is now northern Utah and southern Wyoming. On July 24, 1833, Walker led an expedition of 50 MOUNTAIN MEN westward from Fort Bonneville in Utah's Green River Valley for the Great Salt Lake, seeking the fabled Buenaventura River, which was believed to flow to the Pacific Ocean. Walker's chief clerk on this trip was ZENAS LEONARD; mountain man WILLIAM SHERLEY WILLIAMS also participated.

From the Great Salt Lake, Walker and his men traveled across Utah's Great Basin into what is now northeastern Nevada. From there, they explored the Humboldt River westward to its sink near the eastern slopes of the Sierra Nevada, where they survived a hostile encounter with Indians, possibly Paiute.

Walker and his party then headed southward in search of a route through the Sierra Nevada. In exploring part of the range, they came upon the lake that now bears his name. The party followed a river through the mountains, also named after Walker, which took them to the watershed between the Merced and Tuolumne Rivers and into the Yosemite Valley.

Walker and his men entered the San Joaquin Valley, and, by November 1833, they had reached Monterey on the Pacific coast. Soon afterward, Walker sought a more southerly route eastward through the Sierra Nevada. Guided by Indians, his party followed the Kern River's South Fork into the mountains through what is now known as Walker Pass. After descending into the Mojave Desert, Walker led his men north and east back to northern Utah, arriving at the annual fur traders' rendezvous on the Bear River on July 3, 1834.

Walker continued as a trapper and trader in the northern and middle Rocky Mountains until the decline in the fur trade in the late 1830s and early 1840s. He then worked as a guide for emigrant wagon trains traveling westward. In spring 1844, he guided JOHN CHARLES FRÉMONT in his explorations into Utah's Great Basin. Walker was again with Frémont in his 1845–46 expedition to California. During this expedition, Walker led a party through the Sierra Nevada by way of Walker Pass.

In 1849, Walker was one of the first to arrive at Sutter's Fort in California following the discovery of gold there, leading to the gold rush. He subsequently led trade caravans through Walker Pass to the goldfields of northern Cal-

ifornia. He settled in California, where he established ranches first near Monterey and then in Contra Costa County. In 1861–62, he returned to the Southwest as guide for a gold-prospecting expedition into Arizona. He spent his remaining years at his ranch near Oakland, California.

Joe Walker was among the first non-Indians to see California's Yosemite Valley and lead the first non-Indian party eastward across the Sierra Nevada. The route he pioneered across Nevada became a significant part of one of the most important emigrant wagon roads in the West, the California Trail. Walker also played a major role in John Charles Frémont's explorations of the American West.

Walker, Thomas (1715–1794) *American physician, surveyor on the Appalachian frontier*

Thomas Walker was born in King and Queen County in eastern Virginia. He attended the College of William and Mary, then studied medicine under his brother-in-law, a physician in Williamsburg, and he later opened his own medical practice in Fredericksburg.

In addition to gaining prominence as a physician and surgeon, Walker operated a general store and import and export business. From his marriage to a landed widow, in 1741, he acquired more than 11,000 acres near present-day Charlottesville, Virginia, an estate known as Castle Hill.

In the late 1740s, Walker became associated with several prominent members of Virginia's House of Burgesses who were involved with obtaining huge tracts of land in western Virginia for speculative purposes. In 1749, he was named as chief agent for the Loyal Land Company, which had received from the colonial government a grant of 800,000 acres in western Virginia.

On March 6, 1750, Walker and a small party set out from Staunton, Virginia, to survey the Loyal Land Company's claim. They crossed the Blue Ridge into the Holston River Valley, then over Powell's Mountain into Powell's Valley. In early April 1750, near the point where the present-day states of Kentucky, Virginia, and Tennessee meet, he located a natural passage through the mountain barrier, which he called the CUMBERLAND GAP in honor of William Augustus, Duke of Cumberland, a prominent British general of that time.

Walker and his expedition passed through the Cumberland Gap and descended the Cumberland River, in the hope of finding the "bluegrass" country, the fertile, level region he had heard of from the Indians, and that Walker hoped to claim as part of the Loyal Land Company's grant. On finding only mountainous, rough country, unsuitable for settlement, he turned back north and east along an ancient Indian trail known as the "Warriors' Path." North of the Cumberland Gap, he constructed what came to be known as "Walker's Cabin," to assert the Loyal Land Company's claim

to the region in the Clinch and Holston River Valleys. He returned to Staunton, Virginia, on July 13, 1750.

In 1752, Walker was appointed deputy surveyor for Augusta County, Virginia, a position he held until the outbreak of the French and Indian War. He became commissary-general for George Washington and his Virginia militia forces in 1755, taking part in Braddock's retreat from Fort Duquesne that year. He later became a member of Virginia's colonial legislature.

In the 1760s, Walker took part in negotiations with the Cherokee and Iroquois (Haudenosaunee) Indians to extend the Proclamation Line of 1763 westward, hoping to open up the lands he had surveyed in western Virginia to new settlement. In 1768, he represented Virginia at the Treaty of Fort Stanwix, in New York.

Dr. Thomas Walker's probe into western Virginia and eastern Kentucky, which he recorded in his *Journal of an Exploration in the Spring of the Year 1750, by Dr. Thomas Walker* (1888), resulted in the non-Indian discovery of the Cumberland Gap. This natural passage through the mountains became the principal avenue for westward settlement across the APPALACHIAN MOUNTAINS, as well as a vital segment of DANIEL BOONE'S Wilderness Road.

Wallace, Alfred Russel (1823–1913) *British naturalist in South America and Southeast Asia*

Alfred Russel Wallace was born near the town of Monmouth in the south of Wales into a family of limited means. His formal education ended when he was 14, after which he trained himself in the natural sciences and other subjects.

Wallace became a schoolteacher in Leicester, England, where he became acquainted with fellow self-taught naturalist HENRY WALTER BATES. Inspired by the accounts of ALEXANDER VON HUMBOLDT and CHARLES ROBERT DARWIN, they resolved to travel to the Amazon Basin in South America to collect specimens of insects, especially butterflies.

In 1848, Wallace and Bates sailed from England to the mouth of the AMAZON RIVER at Pará (present-day Belem), Brazil. From there, they traveled southward along the Tocantins River for most of that year, collecting specimens of insects. The following year, they ascended the Amazon to Manaus, where they split up. While Bates went farther up the Amazon, Wallace carried out his entomological research along the Río Negro and into the ORINOCO RIVER by way of the Casiquiare, the natural canal linking the two streams. He also traveled on the Uaupes River before returning to Manaus and the seacoast. Herbert Wallace, Alfred's brother, had joined him in 1849 but died of yellow fever at Pará in 1851.

Wallace sailed for England in 1852. He had collected thousands of specimens and made extensive notes detailing

his observations on how geography had an impact on the distribution of species throughout the Amazon. In the course of the homeward voyage, the ship caught fire and sank, and although Wallace was rescued after more than two weeks in an open boat, all of his collections and writings were lost. Despite this setback, on his return to England he published an account of his four years of research in South America, *A Narrative of Travels on the Amazon and Rio Negro* (1853).

Wallace next set out for the Malay Archipelago of Southeast Asia. Starting in 1854, he began a scientific survey of life forms, which took him more than 14,000 miles, from Timor and the Moluccas to Malacca on the Malay Peninsula. From his findings on this expedition, during which he collected more than 127,000 specimens, Wallace developed a theory of natural selection, independently of Darwin. His conclusions, jointly published with those of Darwin in 1858, laid the basis for the theory of natural selection and provided the foundation for an understanding of the distribution and evolution of species based on geographic factors.

Wallace returned to England in 1862, where he continued his scientific writings. From his research in Southeast Asia, he had developed an idea of a theoretical boundary, known as Wallace's Line, running through Asia,

Alfred Russel Wallace (Library of Congress)

the Malay Archipelago, and Australia, geographically dividing Asian and Australian fauna.

Along with the work of Darwin and Bates, Alfred Russel Wallace's scientific explorations in South America and Southeast Asia had resulted in a new perspective on Earth's life forms and the natural forces determining their development and distribution throughout the world.

Wallis, Samuel (1728–1795) *British naval officer in the South Pacific*

Samuel Wallis was born near Camelford on the northwest coast of Cornwall, England. He joined the British navy in his early teens, and by the age of 20, he had been promoted to the rank of lieutenant. Made a captain in 1756, he served throughout the Seven Years' War of 1756–63 in command of British warships off the coast of Canada and in the English Channel.

In 1766, the British Admiralty appointed Wallis to command a voyage of exploration to the South Pacific Ocean. The expedition had been planned as a follow-up to Commodore JOHN BYRON's 1764–66 voyage in search of the elusive Terra Australis, the GREAT SOUTHERN CONTINENT—the huge, theoretical landmass then thought to occupy much of the largely unexplored Southern Hemisphere.

Wallis sailed from the port of Plymouth on August 22, 1766, in command of Byron's former ship, the *Dolphin*, accompanied by the *Swallow* commanded by PHILIP CARTERET. Three months later, they reached the Atlantic entrance to the STRAIT OF MAGELLAN. During the next four months, Wallis examined the maze of channels of the strait and made landings to study the physical stature of the Patagonian natives. Contrary to reports dating back to FERDINAND MAGELLAN's voyage of 1519–22, Wallis concluded that the Patagonians were not giants, finding most to measure no more than five feet, seven inches tall.

In April 1767, shortly before Wallis and Carteret had entered the Pacific, strong winds and currents separated their ships, and Wallis continued on alone with the *Dolphin*. Instead of following the well-established sea route northward along the coast of Chile, Wallis headed northwestward, traversing a vast, little-known area of the South Pacific. He made landings for fresh provisions in the Tuamotu Islands, then continued northward to the TROPIC OF CAPRICORN, where he turned westward.

On June 23, 1767, Wallis made the first confirmed European sighting of Tahiti, which he named King George the Third's Island to honor his sovereign. After some initial skirmishes caused mainly by misunderstandings, the British established friendly relations with the natives, with Wallis being personally welcomed by Oberea, the queen of Tahiti. The Tahitians provided the expedition with fresh food, trading for nails and other goods made of iron.

Wallis and his men spent five weeks in Tahiti before continuing their voyage westward across the Pacific. Having found a place of such unique beauty and abundance, Wallis decided to return to England to report his findings rather than continue combing the Pacific in search of Terra Australis. They stopped at Tonga and Tinian Islands, then sailed to the Dutch East Indian port of Batavia (present-day Jakarta, Indonesia). Throughout the voyage, Wallis had averted the ravages of SCURVY by introducing sauerkraut and other foods rich in vitamin C into his crew's diet, and it was only in Batavia that he lost any of his men to disease, mainly tropical fever and dysentery incurred in that port.

Wallis and the *Dolphin* completed the round-the-world voyage by way of Cape Town, South Africa, and the island of St. Helena, arriving back in England on May 20, 1768. His report about Tahiti aroused the interest of the Admiralty, which decided that the island was a suitable spot from which to observe the Transit of Venus. It was there that JAMES COOK was sent that same year on the first of his three voyages of exploration.

Wallis remained on active duty with the British navy until 1772. The next year, he saw the publication of his *Account of the Voyage Undertaken for Making Discoveries in the Southern Hemisphere*, detailing his CIRCUMNAVIGATION OF THE WORLD in 1766–68.

Samuel Wallis is credited with the European discovery of Tahiti, even though a French expedition under the command of LOUIS-ANTOINE DE BOUGAINVILLE arrived there only several months afterward and claimed the island for France. Soon after he had left Tahiti, Wallis located a group of islands west of Samoa and north of Fiji, which are known today as the Wallis Archipelago in his honor. Although his voyage provided no conclusive evidence of the existence or nonexistence of Terra Australis, he had nonetheless explored a large and previously unknown portion of the South Pacific, revealing that it contained thousands of square miles of open sea.

Warburton, Peter Egerton (1813–1889)

British army officer in South and Western Australia

Peter Warburton was an officer with the British army in India before settling in South Australia in the early 1850s. In 1857–58, Warburton undertook a series of explorations into the country north of Adelaide and Spencer Gulf, traversing the region between the northern end of Lake Torrens and the southern part of Lake Eyre. From these explorations, he determined that South Australia's central region was open country, dispelling the earlier notion of SIR EDWARD JOHN EYRE who, in examining the region nearly 20 years earlier, had erroneously concluded that an impassable barrier of salt lakes and marshes lay to the north of Spencer Gulf.

Warburton extended his probes deeper into the interior of South Australia. In 1866, he explored the region northeast of Lake Eyre, locating a river flowing between Lake Eyre and Goyders Lagoon, afterward known as the Warburton River.

Warburton's most ambitious undertaking began in mid-April 1873, when he set out westward from the newly established telegraph relay station at Alice Springs, near the center of the Australian continent, in an attempt to reach the Indian Ocean coast at Perth in Western Australia. In addition to his son, two other European companions, and a young Aborigine boy, the expedition included two Afghani camel-drivers and 17 camels.

After skirting the northern edge of the Macdonnell Ranges, Warburton and his companions proceeded past Mount Wedge, then northwestward to Lake Mackay. They crossed into barren country, nearly devoid of usable water, and entered the Great Sandy Desert.

Although Warburton had planned to cross southwestward to Perth, he pushed northwestward because of the lack of water. In December 1873, after 10 months of traveling across 2,000 miles of some of the most inhospitable desert country in the world, the expedition arrived at Roebourne, about 750 miles north of Perth, on Western Australia's Indian Ocean coast.

Peter Warburton made the first successful east-to-west crossing of Western Australia, from the center of the continent at Alice Springs to the west coast. Moreover, he was the first to make extensive use of camels to explore the vast arid expanses of the plains and deserts of the Northern Territory and Western Australia.

Warre, Henry James (1819–1898) *British soldier, artist in the Pacific Northwest*

Henry James Warre, a lieutenant in the British army, served in Canada starting in the late 1830s. A sportsman, he took part in a hunting expedition to the northern plains, west of the upper reaches of the MISSOURI RIVER, in 1840.

In 1845, Warre served as aide de camp to his uncle, the commander in chief of British forces in Canada. That year, he was detailed, along with Lieutenant MERVIN VAVASOUR, on a military reconnaissance into the Oregon Country. Throughout the expedition, they pretended to be civilians on a hunting trip, hoping to avoid arousing the suspicions of U.S. officials in the region, which was then jointly governed by Great Britain and the United States.

Henry James Warre was an artist as well as a soldier, and, in the course of his 1845–46 travels through the Pacific Northwest, he produced a series of sketches of the region. Made into engravings, they were published in book form in London, as *Sketches in North America and the Oregon Territory* (1848). They provide a pictorial record of the

Oregon Country on the eve of the region's acquisition by the United States.

Watkins, Henry George (Gino Watkins)

(1907–1932) *British scientist, surveyor in Labrador and Greenland*

In 1928, Henry George "Gino" Watkins, a 21-year-old undergraduate at Cambridge University of England, began his explorations into the subarctic regions by examining the interior of Labrador, inland from Hamilton Inlet on the east coast, along the Churchill River.

In 1930, Watkins organized the British Arctic Air Route Expedition in order to survey a proposed airline link between London and Canada by way of ICELAND, GREENLAND, Baffin Bay, and HUDSON BAY. With 13 others, he landed at Angmagssalik, on Greenland's largely uncharted southeast coast, and, over the next year and a half, he directed meteorological studies and coastal surveys.

Watkins himself led a group that penetrated the Greenland ice cap 250 miles inland from Angmagssalik, while another party trekked across Greenland's southern region to Ivigtut on the southwest coast. A weather observation station was established high on the ice cap, which expedition member AUGUSTINE COURTAULD manned throughout one winter season.

Watkins's coastal explorations made use of aircraft, motorboats, and kayaks. In one survey, he traveled along 600 miles of the south coast, rounding Cape Farewell on Greenland's southern tip, to arrive at Julianehab on the southwest coast.

Gino Watkins was drowned in 1932, while hunting seals from a kayak off Angmagssalik. In his brief career as an explorer, he made extensive use of Inuit survival techniques to carry out some of the first modern meteorological studies in southern Greenland.

Webber, John (Johann Waber) (1751–1793)

British artist in the South Pacific and on the northwest coast of North America

Born in London, John Webber was the son of a Swiss sculptor who had settled in England. While very young, he was sent to Berne, Switzerland, to be raised by his aunt. He showed an early talent for art, studying under the Swiss landscape and portrait painter Johann Ludwig Aberli. In 1769–70, he was in Paris, where he continued his art training under Johann Georg Wille.

In 1771, Webber returned to London to attend the Royal Academy of Arts, and he later found work creating interior decorations for a house builder. His first show of landscapes and portraits at the Royal Academy of Arts in 1776 caught the attention of naturalists SIR JOSEPH BANKS and

DANIEL CARL SOLANDER, and, on their recommendation, he was recruited as an artist for Captain JAMES COOK's third voyage of exploration to the Pacific Ocean.

From July 1776 to August 1780, Webber sailed on the *Resolution*, sketching scenes and native people in the Tongatapu Islands, Tahiti, and the HAWAIIAN ISLANDS. On the Pacific coast of what is now British Columbia, he made extensive pictorial studies of the Nootka Indians of Nootka Sound.

Back in England in 1780, Webber's work was very well received, and many of his original drawings were engraved and published as illustrations in the official journals of Cook's voyage. He was made an associate of the Royal Academy of Arts in 1785; soon afterward, he undertook sketching trips in the English countryside and in Switzerland.

John Webber's career as an artist was cut short at the age of 41, when he died in London of a kidney ailment. His works on Cook's third voyage contained some of the first depictions of the life and culture of the Nootka, including studies of the interiors of their dwellings and ceremonial items such as masks and rattles. He produced one of the first illustrations of the sea otters of the Pacific Northwest, creatures whose fur later provided the main impetus for subsequent exploration and settlement in the region. Among his most dramatic renderings of the voyage was his "Death of Cook," later published by Florentine engraver Francesco Bartolozzi.

Weber, John H. (1799–1859) *Danish fur trader in the northern Rocky Mountains*

John Weber left his native Denmark at an early age to go to sea. In about 1822, soon after he had arrived in the United States, he joined with ANDREW HENRY and WILLIAM HENRY ASHLEY in the FUR TRADE on the upper MISSOURI RIVER.

In 1824–25, Weber commanded one of Ashley's expeditions into the northern ROCKY MOUNTAINS, which included among its members frontiersman JAMES BRIDGER. While exploring south of the Green River in what is now northern Utah, Weber and his party may have been the first non-Indians to come upon the Great Salt Lake.

John Weber was among the first fur traders to work the western slopes of the Rockies and visit the Great Salt Lake region, helping open the region to further non-Indian development.

Weddell, James (1787–1834) *Scottish mariner, sealer in the South Atlantic and Antarctic*

James Weddell was born in the Netherlands to Scottish parents. At an early age, he went to sea with the British sealing fleet; by the time he was in his early 30s, he had made two

voyages to the South Atlantic Ocean and was commander and part-owner of his own vessel.

In 1821, Weddell sailed his ship, the *Jane*, from England. After a stopover at South Georgia Island, he ventured southward into the subantarctic region of the South Atlantic, in search of richer sealing grounds. Before he returned to England at the end of the Southern Hemisphere's summer season of 1821–22, he had located and named the South Orkney Islands.

Weddell was back in South Georgia in 1822–23. Accompanied by the escort vessel *Beaufoy*, under the command of Captain Matthew Brisbane, he sailed the *Jane* farther south than any other mariner had in that longitude. In February 1823, he found the sea to be ice-free as far southward as 74°15'. He named this arm of the South Atlantic, east of the Antarctic Peninsula, King George IV Sea in honor of the reigning king of England. Weddell returned to England later in 1823, having broken the farthest-south record set by JAMES COOK in the late 1770s.

In addition to having made some of the most accurate navigational studies in the Antarctic to that time, James Weddell took back to England one of the first specimens of the leopard seal. His voyage also demonstrated that the ocean extended much farther southward than had previously been thought, greatly reducing the size of the supposed Antarctic landmass. In the early 1840s, British naval commander SIR JAMES CLARK ROSS made use of Weddell's records for his own voyages into the Antarctic. In 1900, the large, ice-free expanse of ocean that Weddell had reached was renamed the Weddell Sea. The adjoining Antarctic mainland was not explored until SIR ERNEST HENRY SHACKLETON's expedition of 1914–17.

Wegener, Alfred Lothar (1880–1930)

German geologist, meteorologist in Greenland

Born in Berlin, Germany, Alfred Wegener was educated at the University of Marburg, where he studied meteorology, astronomy, and geology. Wegener made his first trip to Greenland as a meteorologist with LUDWIG MYLIUS-ERICHSEN's expedition of 1906–08. In 1912–13, he took part in a Danish government-sponsored exploration of GREENLAND's inland ice with Johann Peter Koch. Together, they traversed the width of central Greenland, traveling 700 miles from Upernavik to the east coast. In the course of this trek, Wegener made weather observations and undertook studies of ice conditions.

In 1924, Wegener was appointed professor of meteorology at the University of Graz in Austria. Five years later, having been named leader of the German Greenland Expedition, he went to western Greenland and established two permanent weather stations. One of them, Weststation, was located on the west coast near Godhavn, north of the ARC-

TIC CIRCLE. The other base, Eismitte, was located 250 miles inland near the geographic center of the Greenland ice cap. From these stations, in 1929–30, Wegener conducted the first year-round climate and weather studies made in Greenland.

In November 1930, Wegener, along with an Inuit companion named Rasmus Willemsen, died of exposure while attempting to return to the west coast of Greenland from Eismitte.

By the time of his death, Alfred Wegener had become famous for his geological theories on continental drift, postulating that the world's oceans and continents had been created by displacements in the Earth's crust. Some of his geological ideas had been developed from his explorations in Greenland, during which he studied the thickness of the ice cap and calculated Greenland's rate of drift. His account of his last expedition, published posthumously, appeared in an English edition entitled *Greenland Journey* (1939).

Weiser, Conrad (Johann Conrad Weiser)

(1696–1760) *German-American interpreter, guide in colonial New York and Pennsylvania*

Conrad Weiser was born in the village of Astaedt in Württemberg, Germany, where his father was prominent as a local judge. In 1710, he immigrated with his family to North America, settling in Livingston Manor, New York. After being befriended by the Mohawk Indian chief Quagnant, Weiser went to live with the Indians in 1713. He became proficient in the Iroquoian language, and the next year he settled at an Indian village near Schoharie, New York.

From 1719 to 1729, Weiser aided colonists on the New York frontier as an interpreter to the Indians. In 1729, he traveled down the Susquehanna River into Pennsylvania, settling at Tulpehocken. Two years later, the Pennsylvania colonial government appointed him as its official interpreter to the Indians, and throughout the 1730s, he took part in many diplomatic conferences with the tribes of central and western Pennsylvania. In 1737, on a diplomatic trip to the Iroquois (Haudenosaunee) Indian council at Onondaga, near present-day Syracuse, New York, he located ancient Indian mounds, similar to those later found in southern Ohio.

Weiser accompanied Lutheran and Moravian missionaries to the Indians of Pennsylvania and New York, including the evangelical expeditions of Count Zinzendorf and David Zeisberger in the early 1740s. He was associated for a time with the religious community of Ephrata on the Pennsylvania frontier. In 1741, Weiser became Pennsylvania's principal Indian agent, and in that capacity he helped negotiate various treaties with the Iroquois against the French.

In 1755, Weiser was commissioned a colonel in the colonial militia, but deteriorating health prevented him

from taking an active part in the French and Indian War of 1754–63. He helped establish the settlement of Reading, Pennsylvania, where he died in 1760, the victim of a cholera outbreak.

In his time, Conrad Weiser was known as the foremost expert on the Indians of colonial New York and Pennsylvania. His diplomatic ability, his facility with Native American languages, and his knowledge of Indian trails helped open the frontier of western Pennsylvania to non-Indian settlement in the years immediately before the French and Indian War.

Wellsted, James (unknown–1836) *British naval officer in southern Arabia*

In 1834, James Wellsted, a lieutenant with the Bombay Marine, the naval branch of the British East India Company, began an extended survey along the little-known south coast of the Arabian Peninsula. The expedition had been undertaken at the behest of the BRITISH EAST INDIA COMPANY, which was then interested in establishing coaling stations along the shipping route between Suez and Bombay. To this end, it was necessary to learn the extent of the political influence that the sultan of Muscat had over the region known as the Hadhramaut.

Aboard the ship *Palinurus*, Wellsted coasted along the shore of Yemen. He landed at Bir Ali to study some ancient ruins, where he recorded inscriptions written in Hiyaritic, the Arabic language of southern Arabia. He later visited Oman, where he undertook excursions deep into the interior.

Wellsted later returned to Yemen, where he made additional archaeological investigations of the ruins at Nakab-al-Hayar. He committed suicide in 1836 while on the Hadhramaut coast.

In his journeys in Oman, James Wellsted traveled inland as far as the edge of the Rub' al-Khali, or EMPTY QUARTER, becoming the first European to see that vast desert region of southeastern Arabia. He left two accounts of his experiences, both published posthumously, *Travels in Arabia* (1838) and *Travels to the City of Caliphs* (1840).

Wen-chi (Lady Wen-chi, Wenji) (ca. 178–unknown) *Chinese poet in Mongolia*

Wen-chi was born into a noble family of the Han dynasty, her father a well-respected scholar and statesman among the Chinese. She grew up in the village of Honan (present-day Luoyang) in east-central China.

In about A.D. 190, when Wen-chi was 12, she was taken captive by the Hsiung-nu, a branch of the Huns living to the northwest beyond the Great Wall on the steppes of Mongolia. There, she became the wife of the chieftain and lived as

a nomad. She bore him two children. About 15 years after her abduction, Chinese officials arranged for her ransom, forcing her to choose between her homeland and her family. She chose the latter and henceforth wrote a series of poems about her experiences and travels. In the 12th century, her writings were transferred to a painted scroll. The work has survived as *Eighteen Songs of the Nomad Flute*.

Because of her poems, which provide details of nomadic life on the Mongolian steppes, Wen-chi is one of the earliest women known for travel writing.

Wentworth, William Charles (1790–1872)

Australian colonist in the Blue Mountains, statesman

William Charles Wentworth, among the first generation of Australian-born English, was probably born on Norfolk Island, east of Australia, the location of a British colony where his Irish father, D'Arcy Wentworth, served as an assistant surgeon. Some sources indicate he was born in Port Jackson (present-day Sydney). His mother, Catherine Crowley, had arrived in Australia as a convict. Wentworth traveled to England for studies, including the University of Cambridge. On returning to Australia at the age of 20, he worked on his father's estates on the Cumberland Plain west of Sydney.

The governor of New South Wales, Lachlan Macquarie, encouraged exploration of the BLUE MOUNTAINS, part of the GREAT DIVIDING RANGE west of Port Jackson, in order to locate new grazing lands. In 1813, Wentworth, GREGORY BLAXLAND, a surveyor by the name of William Lawson, an Aborigine guide known as James Burnes, and British convicts acting as servants and bearers departed Blaxland's farm at South Creek with packhorses. The party followed ridges, managing to make their way westward without having to descend into the valleys. Finally, from one peak (now known as Mount Blaxland), they were able to see Bathurst Plain, virgin grazing lands naturally irrigated by the Lett River.

In 1816, Wentworth traveled again to England to study law. Back in Australia in 1824, in addition to practicing as an attorney, he founded the newspaper the *Australian*. He used the newspaper and his legal skills to campaign on behalf of emancipists, as former convicts were called, as well as Australian-born colonists. His efforts helped lead to New South Wales having a representative government. As a member of the Legislative Council, he also helped create a formal constitution in 1854. In 1862, Wentworth retired to England. After his death 10 years later, his body was returned to Australia for burial.

William Charles Wentworth was part of the first significant inland exploration of Australia, one that led to expansion westward of colonists hoping to claim a homestead. His work in journalism and politics has led to his being known as the "Australian Patriot."

Westall, William (1781–1850) *British landscape artist in Australia*

William Westall was born in Hertford, England, near London. He studied art under his older brother, Richard Westall, a painter of historical scenes, and, at the age of 19, he was engaged as a landscape painter under Captain MATTHEW FLINDERS for his voyage of exploration to Australia.

In July 1801, Westall sailed from England aboard the *Investigator*. In February 1802, he joined Flinders, along with the expedition's naturalist ROBERT BROWN, and natural history artist FERDINAND LUCAS BAUER, in an expedition to the upper reaches of Spencer Gulf on the coast of what is now South Australia, north of present-day Adelaide. Near present-day Port Augusta at the gulf's northernmost end, they landed and scaled a peak Flinders had named Mount Brown.

Westall was among those shipwrecked on the Great Barrier Reef for two months; he was sent back to Sydney on a rescue vessel in October 1803, while Flinders continued on to Île de France (Mauritius). From Australia, the young artist went to China, then to India, returning to England from Bombay in 1805. Back in London, Westall went on to a long career as a landscape artist, regularly exhibiting his work until his death in 1850.

From drawings he made on Flinders's expedition, William Westall produced oil paintings of scenes of the Australian coastline. Some of the best-known of these are "Wreck Reef Bank," depicting the temporary encampment on the Great Barrier Reef, where the crew awaited rescue; "Site of Port Jackson in 1802"; and "View of Port Lincoln," one of the first artistic renderings of the area around the mouth of South Australia's Spencer Gulf.

Weymouth, George (George Weymouth)

(fl. early 1600s) *English mariner, trader on the New England coast*

English navigator George Weymouth made his first expedition to North America in 1602, during which he explored Hudson Strait in search of the NORTHWEST PASSAGE. Then, in 1605, he was commissioned by a group of merchants in Bristol, England, to explore the coast of Maine and establish trading contacts with the region's Indians.

In command of the ship the *Archangel*, Weymouth sailed from Dartmouth, England, in March 1605 and reached Nantucket Island, off the New England coast, in early May. On May 12, he landed on Monhegan Island off the Maine coast, which he explored. He then made a reconnaissance of some other islands off the south coast of Maine and explored parts of the mainland, including the mouth of the Penobscot River. He traded with the Indians, dispensing sugar candy and raisins, items that were very well received.

Weymouth and his men captured five of the Maine Indians and took them back to England in mid-July 1605. One of them is thought to have been SQUANTO, who later returned to New England and aided the PILGRIMS in their 1620 colonizing expedition in Massachusetts.

George Weymouth was one of the earliest British navigators to explore the Atlantic coast of New England, helping open up the region to European settlement in the following decades.

Weyprecht, Karl (1838–1881)

German-born Austrian army officer in the Arctic

A native of the German city of Koenig, Karl Weyprecht embarked on a military career as an officer with the army of Austria-Hungary. In 1871, Weyprecht and fellow army officer JULIUS VON PAYER became the coleaders of the Austro-Hungarian Arctic Expedition, the aim of which was to navigate the NORTHEAST PASSAGE, and, if possible, determine whether there were an ice-free polar sea between Europe and North America. After a preliminary journey to Spitsbergen (present-day Svalbard) and Novaya Zemlya in 1871, they embarked on the main expedition in 1872. Their vessel became icebound and they drifted northward for more than a year. In summer 1873, they reached an uncharted Arctic archipelago, which they called Franz Josef Land in honor of the emperor of Austria-Hungary.

After spending the winter aboard the icebound ship off Franz Josef Land, Weyprecht and Payer had the expedition abandon the ship and head southward over the ice, hauling sledges and small boats. When they reached open water, they took to the boats. After continuing southward to the coast of Novaya Zemlya, they were picked up by a passing Russian whaling vessel, which carried them to safety on the north coast of Lapland.

Throughout the 1870s, Karl Weyprecht became a leading advocate for international cooperation in Arctic exploration and was instrumental in promoting the first International Polar Year of 1882–83. The Arctic islands he explored with Payer served as a base for LUIGI AMEDEO DI SAVOIA D'ABRUZZI's expedition in 1899–1900.

Wheeler, George Montague (1842–1905)

U.S. Army engineer, American topographer in the American West

Originally from Hopkinton, Massachusetts, George M. Wheeler graduated from West Point in 1866 as a second lieutenant in the U.S. Army Corps of Engineers. From 1866 to 1871, he took part in military surveys and engineering projects near California's San Francisco Bay.

In 1871, Wheeler, now a first lieutenant, was given command of an army project to map the entire West, known

as the U.S. Geographic Surveys West of the One-Hundredth Meridian. That year, and continuing over the next eight years, Wheeler directed comprehensive surveys of the West, gathering topographic data as well as zoological, geological, and ethnological information.

In May 1871, Wheeler led one of his surveying expeditions up the COLORADO RIVER into the Grand Canyon, as far as Diamond Creek, retracing Lieutenant JOSEPH CHRISTMAS IVES's route of 1858. On subsequent explorations, Wheeler traversed Death Valley and surveyed the area of the Comstock Lode in Nevada.

Wheeler was promoted to captain in 1879, and his project was consolidated under the U.S. Geological Survey. He spent the rest of his military career involved in the preparation and publication of his official report. He retired from the army in 1888, at the rank of major.

In all, Wheeler undertook 14 expeditions covering much of California, Arizona, Nevada, Colorado, and Utah. He led his men across territory that ranged in altitude from 200 feet below sea level in Death Valley to 15,000 feet above sea level in the Sierra Nevada and Cascade Range. His subsequent maps detailed the topography of one-third of the continental United States west of the 100th meridian of longitude and south of the 40th parallel of latitude; these are the earliest contour maps of the American West. His official account, *Report upon United States Geographical Surveys West of the One-Hundredth Meridian*, included pictures derived from the earliest photographs of Death Valley and the Grand Canyon, taken by frontier photographers Timothy O'Sullivan and William Bell.

Whipple, Amiel Weeks (1816–1863) *U.S. Army officer in the American Southwest*

Amiel Weeks Whipple was born in Greenwich, Massachusetts. He attended Amherst College, then went on to West Point. Graduating in 1841 as a second lieutenant in the artillery, he was soon transferred to the United States Army Corps of Topographical Engineers.

In 1844–49, Whipple took part in a survey of the northeastern portion of the U.S.–Canada international border. In 1849–53, he served under Lieutenant WILLIAM HEMPLEY EMORY in the Mexican Boundary Commission Survey from the Rio Grande to what is now western Arizona. While engaged in this project, he led an expedition that succeeded in locating the confluence of the Gila River and COLORADO RIVER.

In 1853–56, Whipple commanded one of the Pacific Railroad Surveys. In the course of this project, he led a party of soldiers, topographers, and scientists westward from Fort Smith, Arkansas, along the Canadian River route across the southern plains to Albuquerque. He was joined there by a detachment under the command of Lieutenant JOSEPH

CHRISTMAS IVES. The Mojave Indian chief IRATEBA served as guide.

Whipple had been instructed to evaluate the feasibility of a railroad west to the Pacific Ocean along the 35th parallel. From Albuquerque, he led his command to the Zuni pueblos in what is now northwestern New Mexico, then traveled across present-day Arizona to the San Francisco Mountains and the Bill Williams Fork of the Colorado. He located a pass through the mountains and found his way to the Colorado River. Heading northward, Whipple and his party crossed the Colorado at Needles, then followed the Mojave River through the desert. For the final leg, they traveled the Old Spanish Trail and the Mormon wagon road to San Bernardino. Whipple was able to confirm an earlier report that the Cajon Pass through the southern Sierra Nevada was unsuitable for railroads.

From 1856 until the outbreak of the Civil War in 1861, Whipple participated in government engineering projects in the Great Lakes. In 1861, he was chief topographical engineer for Union forces at the Battle of Bull Run. Promoted to major and breveted a brigadier general of volunteers, he took part in balloon reconnaissances over Confederate lines. In May 1863, Whipple was wounded in the Battle of Chancellorsville; he died soon afterward in Washington, D.C.

Amiel Weeks Whipple led one of the principal military expeditions of the American West preceding extensive non-Indian settlement and development. In his official report of his 35th Parallel Survey, he provided detailed information on Indian tribes along the proposed route, describing them as distinct and diverse cultures. Moreover, he reported that the region of the Southwest he surveyed was far more suitable to agricultural development than had previously been reported.

White, Edward Higgins, II (1930–1967)

American astronaut, first American to walk in space

Edward White was born in San Antonio, Texas. He attended the U.S. Military Academy at West Point, graduating in 1952, and later earned a master's degree in aeronautical engineering from the University of Michigan. In 1959, he attended the Air Force Test Pilot School at Edwards Air Force Base in California and later served at Wright-Patterson Air Force Base in Ohio, as an experimental test pilot with the Aeronautical Systems Division. In 1962, he was selected for the team of ASTRONAUTS in the NATIONAL AERONAUTICS AND SPACE ADMINISTRATION (NASA).

White first traveled into space on June 3, 1965, as pilot of the *Gemini 4* capsule, part of the GEMINI PROGRAM. On day one of the mission, he became the first American to perform extravehicular activity (EVA), that is, floating freely in space, popularly known as a "space-

walk." Although the first human to walk in space was the cosmonaut ALEXEI ARKHIPOVICH LEONOV, on March 18, 1965, as part of the VOSKHOD PROGRAM of the Union of Soviet Socialist Republics (USSR, or the Soviet Union), White was the first human to control himself in space outside a capsule, tethered to the capsule by a lifeline that supplied him with oxygen. To move he used a handheld maneuvering unit that fired bursts of compressed oxygen. The EVA lasted about 22 minutes while *Gemini 4* was over the Pacific Ocean. *Gemini 4* orbited Earth 62 times before landing on June 7.

White's next assignment was as backup commander for *Gemini 7* the following December. He was also selected as command module pilot on the first manned orbital test of the APOLLO PROGRAM, scheduled for launch in February 1967. It would have been the first three-man U.S. flight; White's fellow astronauts on this mission were to be Virgil "Gus" Grissom and Roger Chaffee. On January 26, 1967, however, during a training simulation on the launch pad at the Kennedy Space Center in Florida, a spark led to a flash fire, which killed all three men. After the *Apollo 1* disaster, Apollo capsules were redesigned; materials were made more flame resistant, the atmosphere was under lower pressure, and the escape system was more efficient.

As the first American to walk in space, Edward White has a special place in the history of SPACE EXPLORATION. SALLY KRISTEN RIDE became the first American woman to carry out EVA in 1983.

White, John (fl. 1580s–1590s) *English artist, colonist in eastern North America*

Little is known of John White's origins and early life. By 1577, he had become an accomplished artist and cartographer, and that year, he accompanied SIR MARTIN FROBISHER on his voyage to GREENLAND and Baffin Island. On this expedition, White produced some of the earliest paintings of Inuit (Eskimos).

In 1585, White sailed with SIR RICHARD GRENVILLE as part of SIR WALTER RALEIGH's first colonizing venture to the coast of present-day North Carolina. The colonists stayed on Roanoke Island for a year, but because of conflicts with Roanoke Indians, they returned to England the following summer with SIR FRANCIS DRAKE.

Raleigh selected White as leader of a second colonizing attempt in North America. White's expedition left Plymouth, England, on May 8, 1587. His fleet of three ships sailed first to the Caribbean Sea, stopping briefly at Dominica and St. Croix, then headed through the Bahamas and along the Florida coast. White had planned to establish the new colony on Chesapeake Bay, near the mouth of the James River. But, on July 22, 1587, the pilot of the fleet, Simon Fernandes, refused to take the colonists any farther to

the north and left them at Roanoke Island in the Outer Banks of North Carolina, the site of Raleigh's earlier and unsuccessful colony.

White helped organize a plantation on Roanoke, founding a settlement known as the City of Raleigh. White's married daughter Eleanor, along with her husband, Ananias Dare, were part of the colonizing expedition. On August 18, 1587, she gave birth to a daughter, Virginia Dare, the first English child born in North America.

Chosen by the colonists to return to England and seek additional supplies from Raleigh, White sailed in late August 1587. The interceding naval war with Spain, including the battle with the Spanish Armada in 1588, delayed his return for three years.

Finally, in March 1590, White sailed from Plymouth, England, aboard the ship *Hopewell* and crossed the Atlantic Ocean by way of the CANARY ISLANDS. The relief expedition first cruised the Caribbean, pillaging Spanish settlements and capturing some Spanish ships. On August 17, 1590, White and his party reached Roanoke, but they found the colony abandoned. The only trace of the colonists was the inscription "CROATOAN"—the name of an Indian village near Cape Hatteras, North Carolina—carved on a tree. With a storm approaching and the ship in need of repairs, the captain of White's ship, John Watts, declined to investigate Croatoan and sailed for the Caribbean. Although he intended to return the following spring, no subsequent relief expeditions were made. The fate of the LOST COLONY, as it came to be known, remains unknown. It is speculated that the colonists intermarried with Native Americans and settled somewhere along the Outer Banks or inland, or were wiped out in a raid. Some may have built a boat in an attempt to reach Chesapeake Bay.

White returned to England, and in 1593, he settled in Ireland. Few details are known about his later life.

John White produced an early map of the North American coast, detailing the region between Florida and Chesapeake Bay. He also painted watercolors of the native peoples, animals, and plant life that he saw on his voyages to the Caribbean and the Virginia coast. Published by German engraver Theodore de Bry in the 1590s, they provided Europeans with some of the first pictorial renderings of the Americas.

Whitman, Marcus (1802–1847) *American physician, missionary, guide on the Oregon Trail, pioneer in the Pacific Northwest*

Marcus Whitman was born in the central New York State town of Rushville, near Ithaca. He attended the College of Physicians and Surgeons of the Western District of New York at Fairfield, receiving the degree of doctor of medicine in 1832.

Whitman practiced medicine in Canada for several years, then returned to Rushville, New York, where he operated a sawmill with his brother. He was active in the Presbyterian Church, and, by 1835, he had been appointed a deacon and authorized as a missionary. That year, he became associated with fellow missionary Samuel Parker, who arranged to have Whitman accompany him on an expedition to the Pacific Northwest to investigate sites for proposed missions to the Indians.

In April 1835, Whitman and Parker left St. Louis and traveled up the MISSOURI RIVER with that year's AMERICAN FUR COMPANY trading expedition. After reaching what is now Omaha, Nebraska, on June 22, 1835, they headed overland westward to Fort Laramie. They crossed through the SOUTH PASS of the Wind River range of the ROCKY MOUNTAINS and arrived for that summer's fur traders rendezvous at Ham's Fork of the Green River in what is now southwestern Wyoming. While there, Whitman removed the arrowhead that had been lodged in mountain man JAMES BRIDGER's back since his fight with Indians at Pierre's Hole three years earlier.

While Parker remained in the Northwest, Whitman returned to New York, where he married Narcissa Prentiss, also a missionary. In spring 1836, Whitman, his wife, and another missionary couple, HENRY HARMON SPALDING and his wife Eliza, set out from St. Louis to establish missions to the Indians of the Oregon Country. They traveled with the American Fur Company's trade caravan along the Oregon Trail to the Green River rendezvous, where they then joined HUDSON'S BAY COMPANY traders on their way to the COLUMBIA RIVER. They were guided along the Oregon Trail by THOMAS FITZPATRICK.

Following a stopover at Fort Vancouver, the Whitmans headed to the junction of the Columbia and Walla Walla Rivers in present-day southeastern Washington State, where he established his mission to the Cayuse Indians at Waiilatpu. Spalding and his wife meanwhile opened a missionary settlement to the Nez Perce Indians near present-day Lewiston, Idaho.

By 1842, Whitman's main sponsors, the American Board of Commissioners for Foreign Missions in Boston, had decided to close the Pacific Northwest missions. To regain their support, Whitman undertook a midwinter journey to the East. Traveling on horseback, he left Waiilatpu on October 3, 1842, and traveled as far as Fort Hall, Idaho. At that point, Indian hostility forced him to go south to Taos. From there, he reached Bent's Fort on the Arkansas River, then proceeded to St. Louis and Boston. Making his case in person, he succeeded in regaining support for the Oregon Country missions.

Before returning west, Whitman visited Washington, D.C., where he conferred with War Department officials on the necessity of establishing forts and supply posts for

future emigrants on the Oregon Trail. In spring 1843, at Elm Grove, Missouri, he joined the first large overland party of settlers bound for Oregon, known as the Great Migration, for whom he served as a guide along the Oregon Trail. Pioneer trailblazer JESSE APPLGATE was one of the group's leaders.

Following his return to the mission on the Walla Walla, Whitman faced increasing difficulties with the Cayuse. Blaming Whitman for an outbreak of measles among their people, warriors under Chief Tiloukaikt killed Whitman, his wife, and a number of other settlers on November 29, 1847. Frontiersman JOSEPH L. MEEK subsequently made an overland journey to Washington, D.C., to summon military aid.

Marcus Whitman was one of the few non-Indians not involved in the fur trade to play a significant role in the opening of the Oregon Country to further settlement. His 1836 expedition brought the first wagons along the Oregon Trail. His wife, Narcissa Whitman, and Eliza Spalding were the first non-Indian women to cross the Rockies and the Continental Divide.

Whymper, Edward (1840–1911) *British mountain climber in the Alps and Andes Mountains*

Edward Whymper was born in London. He pursued a career as an illustrator, and in 1860, he was commissioned by a British publisher to sketch scenes in the French Alps for the book *Peaks, Passes and Glaciers*. This experience sparked an interest in MOUNTAIN CLIMBING.

In 1861–64, Whymper scaled Mont Pelvoux and Barre des Écrins, as well as numerous other peaks in the Dauphiné Alps. He then decided to attempt the as-yet-unscaled Matterhorn (14,780 feet above sea level) in Switzerland's Western Alps, near the Swiss-Italian border. He failed to do so in six tries on the southwestern face. Attempting the eastern face, considered more difficult, he and his party finally succeeded in 1865. During the descent, however, four of his six companions died in a fall, among them Lord Francis Douglas. Whymper was heavily criticized for the Matterhorn incident, one of the most famous disasters in mountain-climbing history.

In 1880, Whymper became the first climber to reach the summit of Chimborazo, at 20,702 feet above sea level, the highest peak in the Ecuadorean ANDES MOUNTAINS. Whymper climbed other major Andean peaks, including ACONCAGUA, in Argentina, the highest mountain in South America; Tupungato, located on the Chilean-Argentine border; and Cotopaxi, in Ecuador, the world's highest active volcano. He wrote about his expeditions in *Scrambles Amongst the Alps in the Years 1860–69* (1871), with his own illustrations; and *Travels Amongst the Great Andes of the Equator* (1892). Whymper also visited GREENLAND and the Canadian ROCKY MOUNTAINS.

During his time in Ecuador, Edward Whymper made a study of mountain sickness and determined that the reason it affected humans more in the Andes than at comparable heights in the Alps was related to barometric pressure. He made recommendations for acclimatization that helped future climbers deal with this condition and for improvements in the aneroid barometer, a device for measuring air pressure. His pioneering work helped in Arctic exploration as well as mountain climbing. He also contributed to natural science with his detailed notes on flora and fauna.

Wickham, Sir Henry Alexander (1846–1928)

British traveler in South America

Born in England, Henry Wickham first traveled to the WEST INDIES and South America in 1866, at the age of 20. In South America, he explored the Orinoco River and its tributaries, the Atabapo River and Río Negro. By 1869, he was operating a rubber plantation on the AMAZON RIVER near Santarém, Brazil.

Wickham made a return visit to England in 1871, where he published an account of his travels, entitled *Rough Notes of a Journey Through the Wilderness from Trinidad to Para, Brazil, by way of the Great Cataracts of the Orinoco, Atabapo, and Rio Negro* (1872). The work contained illustrations by Wickham himself, one of which, that of a sprouting rubber tree seedling, came to the attention of SIR JOSEPH DALTON HOOKER, director of London's Kew Gardens. Hooker contacted Wickham and commissioned him to ship back a quantity of living rubber tree seedlings to England.

Wickham was back in the lower Amazon region in 1873. After a year spent organizing the project, he managed to load as many as 7,000 rubber tree seedlings aboard the British steamer *Amazonas*, at a site near the junction of the Tapajos and Amazon Rivers. Despite prohibitions by the Brazilian government against such exports, Wickham slipped his illegal cargo by customs authorities at Pará (Belém), and, several months later, he arrived in Liverpool, from where the trees were hurried to London's Kew Gardens.

Three years later, the seedlings Wickham had taken back to England had developed into trees, and, in 1876, the first group was transported to CEYLON (present-day Sri Lanka), thus initiating the rubber industry in the Far East. Wickham himself, amply rewarded for the achievement, settled in Queensland, Australia, for several years, where he had little success as a tobacco and coffee grower. He later went to Ceylon and served in the colonial government.

Henry Wickham, whose travels in the Amazon Basin had resulted in the introduction of the rubber industry to Ceylon and Malaya, was knighted for his efforts in 1920.

Wilkes, Charles (1798–1877) *U.S. Navy officer in the Antarctic, the Pacific, and South and North America*

Charles Wilkes was born in New York City, the son of a prominent businessman. After receiving an education in mathematics, modern languages, and navigation from his father, he went to sea at the age of 17. Three years later, in 1818, he was appointed a midshipman in the U.S. Navy. After attending a naval school in Boston, Wilkes took part in cruises in the MEDITERRANEAN SEA and the Pacific Ocean. In 1826, he was promoted to lieutenant.

In 1832–33, Wilkes undertook a navigational survey of Narragansett Bay and was named director of the U.S. Navy's Depot of Charts and Instruments, the precursor to the U.S. Naval Observatory.

In 1838, Wilkes took command of the United States South Sea Surveying and Exploring Expedition. The goals of this project, first proposed 10 years earlier, included the charting of Antarctic waters for U.S. merchant ships and whalers and the exploration of the islands of the Pacific and the northwest coast of North America.

Wilkes left Norfolk, Virginia, in August 1838, in command of a fleet of six ships: his flagship the *Vincennes*, the *Peacock*, the *Relief*, the *Porpoise*, the *Sea Gulf*, and the *Flying Fish*. After stops in the AZORES off Portugal and in the Cape Verde Islands off Africa's west coast, Wilkes and his expedition headed southward along the east coast of South America to CAPE HORN, where they established a base camp. From there, he undertook a survey of the islands in the waters bordering the Antarctic, including the South Orkney and South Shetland Islands. He then explored and charted part of the coast of Antarctica.

After more than a month of exploring in Antarctic waters, without sighting land beyond the PACK ICE, Wilkes headed northward along the west coast of South America. At Valparaíso, Chile, Wilkes sent a scientific party inland to explore the ANDES MOUNTAINS. During another stopover at Lima, Peru, scientists with the expedition examined the ruins of the Inca Indian civilization.

Wilkes then headed westward across the Pacific to Australia and NEW ZEALAND. He made stops at Tahiti, Samoa, and other island groups, where teams of scientists went ashore for observations. The expedition then headed southward once again and undertook a second exploration of Antarctica. In January 1840, after traveling 1,600 miles along the icebound and fog-shrouded coastline, the expedition sighted land jutting out of what appeared to be a continental landmass.

After returning to Sydney, Australia, Wilkes visited the Fiji Islands and the Sandwich Islands (Hawaii), then sailed for the northwest coast of North America. In April 1841, he reached the mouth of the COLUMBIA RIVER, where one of the ships, the *Peacock*, was wrecked.

Wilkes sent parties inland to explore the Oregon Country between the Columbia and Sacramento Rivers. One of

the parties, led by Lieutenant GEORGE FOSTER EMMONS, explored the Willamette and Sacramento River Valleys, as far south as Sutter's Fort near present-day Sacramento, California. The Wilkes expedition also undertook an exploration and survey of the Columbia River to the mouth of the Snake River in what is now southeastern Washington State. Ethnologists and anthropologists attached to the Wilkes expedition obtained some of the earliest scientific data on the life and culture of the Northwest Coast Indians. Naturalists and painters also made observations; among the artists with the Wilkes expedition was Titian Ramsey Peale.

Wilkes charted 800 miles of the coastline, from San Francisco to the Strait of Juan de Fuca and Puget Sound. The remaining ships then headed westward across the Pacific, and, accomplishing a CIRCUMNAVIGATION OF THE WORLD, arrived at New York City in June 1842. Only two of the original ships completed the entire voyage, the *Vincennes* and the *Porpoise*. The others had either been wrecked or suffered so much damage that they were sold en route.

The Wilkes expedition covered more than 80,000 miles in less than four years. Wilkes was promoted to the rank of commodore upon his return, and, over the next 17 years, he helped write the 20-volume government report of his round-the-world voyage. His account, *Narrative of the United States Exploring Expedition*, was published in 1844.

At the outbreak of the Civil War in 1861, Wilkes, in command of the U.S. warship the *San Jacinto*, stopped the British commercial vessel *Trent* in international waters and arrested two Confederate government officials. The incident, which became known as the "*Trent* Affair," raised international tensions and nearly led to war with Great Britain.

Wilkes was then assigned to command U.S. naval forces in the Caribbean Sea and provide protection for U.S. shipping. On this assignment, he also overstepped his authority and infringed upon the rights of neutral ships. He was later court-martialed and demoted. He retired from the navy as a rear admiral in 1866.

The expedition of 1838–42 led by Charles Wilkes succeeded in making the first U.S. government-sponsored circumnavigation of the world. Scientists with the expedition brought back more than 5,000 species of plants and made extensive meteorological, geological, and ethnological studies of the Pacific islanders and the Indians of the American Northwest. Among the major scientific results of the expedition were the findings of JAMES DWIGHT DANA, whose studies of marine biology confirmed CHARLES ROBERT DARWIN's theories on the formation of coral islands. Although Wilkes's reported discovery of an Antarctic landmass was disputed by both JULES-SÉBASTIEN-CÉSAR DUMONT D'URVILLE and SIR JAMES CLARK ROSS, his findings were later confirmed by SIR ERNEST HENRY SHACKLETON. In 1848, Wilkes was awarded the Founder's Medal by Great Britain's ROYAL GEOGRAPHICAL SOCIETY. Wilkes's charts of

the South Pacific island groups he visited were so accurate that they were used 100 years after his expedition to guide U.S. military operations in World War II. Wilkes's explorations also inspired the 1843–44 expedition of JOHN CHARLES FRÉMONT. The part of the Antarctic coast that Wilkes explored in 1840 was named Wilkes Land in his honor.

Wilkins, Sir George Hubert (1888–1958)

Australian photographer, aviator in the Arctic and Antarctic

Hubert Wilkins was born at Mount Bryan East, a sheep ranching settlement in South Australia. Trained in engineering and photography, he left Australia in 1908 for a career as a photojournalist.

In 1913, after service as a war correspondent in the Balkans, Wilkins was attached to the Canadian Arctic Expedition, under the leadership of VILHJALMUR STEFANSSON, as a photographer and reporter for the London *Times*. During the next five years, under Stefansson's direction, he learned polar survival skills while taking both still photos and motion pictures in the Canadian Arctic Archipelago.

A trained aviator, Wilkins was a captain in the Royal Australian Flying Corps in World War I, serving in the final months of the war as an aerial photographer in France. In 1919, he competed in an air race between England and Australia, in which his aircraft was forced down on Crete in the eastern MEDITERRANEAN SEA.

Wilkins's first venture in the Antarctic was as second in command with the British Imperial Antarctic Expedition of 1919–20. He then served as a naturalist with SIR ERNEST HENRY SHACKLETON's last Antarctic expedition of 1921–22.

Back in Australia in 1923, Wilkins undertook a study of the tropical region along the continent's north coast for the British Museum, an experience he detailed in his 1928 book *Undiscovered Australia*.

Starting in 1926, Wilkins became involved with aerial exploration of the Arctic, and, on April 15, 1928, he flew from Point Barrow, Alaska, to Spitsbergen (present-day Svalbard), north of Norway, making the first trans-Arctic flight from North America to Europe.

Later in 1928, after being knighted for his contributions to polar exploration, Wilkins returned to the Antarctic. In November of that year, he made the first airplane flight in Antarctica, flying over Palmer Land and the Antarctic Peninsula, in the course of which he sighted several uncharted islands off the Antarctic Peninsula and determined that Graham Land was actually two distinct islands.

Inspired by Jules Verne's *Twenty Thousand Leagues Under the Sea*, Wilkins next turned his attention to undersea polar exploration. He acquired a former U.S. Navy submarine he renamed the *Nautilus*, after the undersea vessel in

Sir George Hubert Wilkins (Library of Congress)

Verne's novel, and in June 1931, he embarked from Spitsbergen in an attempt to reach the NORTH POLE by sailing under the ice of the Arctic Ocean. Mechanical problems with the craft forced him to turn back from beyond 82° north latitude, the farthest north a vessel had reached under its own power until that time. He detailed the experience in his book *Under the North Pole* (1931).

From 1933 to 1936, Wilkins assisted American aviator LINCOLN ELLSWORTH in planning for aerial exploration of Antarctica. In 1938, he was in the Siberian and North American Arctic, taking part in search efforts for a downed Soviet aviator. Although no trace of the missing pilot was found, Wilkins's flights resulted in the mapping of large areas of the previously unknown Arctic Ocean. He had experimented with mental telepathy in the search, an experience he related in *Thoughts Through Space* (1942), which he coauthored with H. M. Sherman.

During World War II, Wilkins served as an adviser on arctic survival techniques for the U.S. Navy and as an intelligence officer in the Middle East and Far East.

Sir Hubert Wilkins died in November 1958. Six months later, the U.S. nuclear submarine *Skate* surfaced at the North Pole, where, according to his wishes, Wilkins's ashes were scattered. His wideranging exploits in the Arctic and Antarctic included his pioneer flight over the Arctic

Ocean and the first aerial sighting of uncharted islands off the Antarctic Peninsula.

William of Rubrouck (William of Rubruck, William of Rubruk, William of Rubrouc, William of Ruysbroeck, William de Rubrick, Willem van Rujsbroek, Willem van Rusbroeck, Wilhelmus Rubruquis, Guillaume de Rubruquis)

(ca. 1215–ca. 1270) *Flemish missionary in central Asia*
William of Rubrouck was originally from Flanders in what is now northern France. Little is known about his early life except that he entered the Franciscan Order sometime before 1250.

In 1252, William was summoned to Acre on the coast of present-day Israel to meet with King Louis IX of France (Saint Louis), then engaged in a crusade in the Holy Land. The French monarch directed William to undertake a missionary expedition to the Mongols, hoping to dissuade the central Asian nomads from continuing their eastward campaign of conquest toward Europe and to win their allegiance against the Muslim Turks.

William sailed from Constantinople (present-day Istanbul) in May 1253, accompanied by a small party that included another Franciscan friar Bartholomew of Cremona, an interpreter, and several servants. After a voyage across the Black Sea to the Crimea, he and his party traveled in carts along the Don and Volga Rivers to the Ural River, which they followed to its mouth on the Caspian Sea. In his later account of the trip, William made the first confirmed report that the Caspian was an enclosed sea and not an arm of the northern ocean, as was thought in Europe.

William and his party then made a crossing of the steppes of Kazakhstan and into the Pamir region of central Asia, where they became the first Europeans to see such creatures as the wild ass and wild long-horned mountain sheep. At the end of December 1253, after traversing the Tara Tau Range in what is now Kirghizia, he reached the encampment of the Mongol leader Mangu Khan, and soon afterward he was received by Mangu, the latest in a long line of Great Khans, at his capital at Karakorum. William later observed that the Mongol ruler, well aware of the proselytizing efforts of both Christians and MUSLIMS, was mainly interested in these religions for the purpose of political advantage.

William made an extensive study of the life and society of the Mongols, before setting out on his return journey in early July 1254. Friar Bartholomew had decided to remain behind to preach among the Mongols.

Upon reaching the city of Serai on the Volga River near present-day Volgograd, William traveled into Armenia and crossed what is now northeastern Turkey to the eastern MEDITERRANEAN SEA, hoping to meet with Louis in the

Holy Land. The French king, however, had since returned to Paris, where William eventually went after spending time at a monastery in Acre.

In Paris, William wrote an account of his travels, entitled *Journey to the Eastern Parts of the World*. One of the earliest medieval travel accounts, it includes the first suggestions that silk originated from a land to the east of Mongolia, which he identified as Cathay.

William of Rubrouck, as well as GIOVANNI DA PIAN DEL CARPINI and MARCO POLO and his father and uncle, were among the first Europeans to travel overland into central Asia, and William was one of the first Europeans to see the Mongol capital at Karakorum.

Williams, William (fl. 1830s–1840s) *British settler in New Zealand*

In 1839, William Williams, one of the earliest European settlers on NEW ZEALAND's North Island, undertook an exploration of the island's interior. From the site of the settlement of Wellington on the island's southern tip, Williams followed the Rangitikei River northward to Lake Taupo, then continued northeastward to the Bay of Plenty.

In addition to locating the Hot Springs District around Lake Taupo, William Williams was the first European known to have made a south-to-north crossing of the North Island of New Zealand.

Williams, William Sherley (Old Bill Williams)

(1787–1849) *Fur trader, trapper, interpreter, guide in the Rocky Mountains*

William "Bill" Williams may have been born in Rutherford County, North Carolina, although some sources indicate he was a native of Kentucky. He became an itinerant Baptist preacher, and, by 1813, he had settled in the then-frontier region of what is now western Missouri and eastern Kansas. He lived among that region's Osage Indians and reportedly married an Indian woman.

In 1825–26, Williams acted as an interpreter to the Osage for a U.S. government surveying expedition of the Santa Fe Trail led by Joseph C. Brown. Williams then embarked on a career as a fur trader and trapper in the ROCKY MOUNTAINS, ranging across a wide area of the West, from the Gila River in what is now southern Arizona to the Yellowstone River in what is now Wyoming.

Williams was part of JOSEPH REDDEFORD WALKER's 1833–34 expedition across Utah's Great Basin and the Sierra Nevada into California. Upon his return from the Pacific coast, Williams settled among the Ute Indians of western Colorado.

Williams returned to Missouri for a brief visit in 1841, but he set out the next year from Bent's Fort on the Arkansas

River in Colorado, accompanied by WILLIAM THOMAS HAMILTON. During the next three years, Williams and Hamilton traveled throughout the North Platte River region and Green River Valley in present-day Wyoming and Utah, before returning to Colorado and Santa Fe.

In 1846, Williams was a guide in the Rockies for JOHN CHARLES FRÉMONT's third expedition, but he did not travel to California with him. He again settled for a time with the Ute Indians, then went into the FUR TRADE out of Taos, New Mexico.

Williams's last expedition into the Rockies began in fall 1848. Again acting as a guide for Frémont, he set out from Bent's Fort and made an extremely hazardous crossing of the Sangre de Cristo Range, in search of an all-weather railroad pass through the mountains. The expedition crossed the Continental Divide and reached the headwaters of the Rio Grande, but it then became lost in a blizzard. Short of adequate clothing and supplies, 11 members of the party died of starvation or exposure. Forced to abandon the enterprise, Frémont and the other survivors retreated to Taos. Frémont reportedly blamed the disaster on Williams, who had claimed to know of a route through the San Juan Mountains.

In March 1849, Williams accompanied one of the survivors, BENJAMIN JORDAN KERN, back into the mountains to retrieve papers and equipment that had been left behind. Along the way, they were killed in an attack by a band of Ute warriors in retaliation for a recent raid on a Ute village by a U.S. Army detachment.

Bill Williams covered a wide area of the American West in his years as a trapper and guide. With Walker in 1833–34, he was among the first non-Indians to visit California's Yosemite Valley, and he took part in the first eastward crossing of the Sierra Nevada. Southern Arizona's Bill Williams River, a tributary of the COLORADO RIVER, is named in his honor.

Willoughby, Sir Hugh (ca. 1516–1554)

English mariner in the European Arctic

Hugh Willoughby was born near Nottingham, England, the son of a soldier and baronet. He became a soldier himself, serving as an officer with English forces in Scotland, for which he was knighted in 1544. After commanding a garrison on the Scottish border in 1548–49, he became associated with SEBASTIAN CABOT and the MUSCOVY COMPANY of merchants in London.

In 1553, Willoughby was named as captain-general of the company's first expedition, a voyage that was intended to navigate the NORTHEAST PASSAGE across the top of Europe and Asia to the Orient and thereby open English trade contacts with China and India. Three ships were assembled for the voyage: the *Edward Bonaventure*, captained by STEPHEN

BOROUGH and with the expedition's chief pilot, RICHARD CHANCELLOR; the *Bona Confidentia*, captained by Cornelius Durforth; and the flagship, the *Bona Esperanza*, commanded by Willoughby.

Willoughby and his fleet sailed from London on May 10, 1553, although they did not leave the English coast until more than a month later. Off northern Norway's Lofoten Islands, the ships became separated in a storm. While Willoughby's ship and the *Bona Confidentia* remained together, the *Edward Bonaventure* continued on alone into the White Sea. Willoughby then proceeded eastward. Although he made the first known sighting of what turned out to be the southwest coast of Novaya Zemlya, he was unable to land there because of ice and shallow waters along the shore. Instead, he turned back westward across the Barents Sea to the northern end of the Kola Peninsula, part of Russian Lapland. He found a harbor where he planned to winter, near the mouth of the Arzina River, east of the present-day Russian port of Murmansk.

The two ships soon became icebound, and, during the winter of 1553–54, Willoughby and all the men on both vessels died. Although the likely causes of the disaster were the extreme cold and SCURVY, some sources suggest that carbon monoxide fumes emitted from stoves used to heat the interior of the ships may have killed the crew. Meanwhile, Chancellor and Borough had landed near what is now Archangel and succeeded in reaching Moscow, where they established commercial ties with the Russian monarch, Czar Ivan IV (Ivan the Terrible).

In spring 1554, Willoughby's fate became known when Russian fishermen found his ships, containing the frozen corpses of Willoughby and the more than 60 men with him. His journal, which was recovered and sent back to England, revealed the eastward extent of his explorations in the Barents Sea, indicating that he had survived until at least January 1554.

Sir Hugh Willoughby commanded the first English expedition to sail northward across the ARCTIC CIRCLE in the first attempt to find the Northeast Passage. Although he did not survive to report his finding, he is considered the first European known to have sighted the islands of Novaya Zemlya.

Wills, William John (1834–1861) *British surveyor in Australia*

A native of Devonshire, England, William Wills immigrated to Victoria, Australia, at the age of 18. He settled in Melbourne, where he studied medicine and worked as a surveyor, eventually finding employ for the government's meteorological office.

In 1860, Wills was commissioned as second in command to ROBERT O'HARA BURKE in an expedition, spon-

sored by the government of Victoria, aimed at making the first south-to-north crossing of Australia. The group left Melbourne in August 1860, arriving two months later at Menindee on the Darling River in west-central New South Wales. From there, they pressed on to Cooper's Creek in central Queensland, from where Burke, Wills, and two others, John King and Charles Gray, headed for the north coast, reaching the estuary of the Flinders River, near the coast of the Gulf of Carpentaria, in February 1861.

Wills returned to Cooper's Creek with Burke and King in April 1861. Gray had died on the trip back from the gulf. The relief party that was supposed to have waited for them had departed only hours before their arrival. Short on food and supplies, they made a desperate attempt to reach a settlement to the south. By the end of June 1861, both Wills and Burke had died of starvation; only one member of the expedition, the camel driver John King, survived, having been kept alive by Aborigines until he was rescued by a search party from Melbourne. The search party also found the bodies of Burke and Wills and recovered Wills's extensive journal, detailing the outbound journey and the expedition's last desperate days.

Along with Robert O'Hara Burke, William Wills is credited with taking part in a south-to-north crossing of Australia.

Wilson, Edward Adrian (1872–1912)

British physician, zoologist in Antarctica

Edward Wilson was a British medical doctor who accompanied ROBERT FALCON SCOTT on his first explorations of Antarctica in 1901–04.

In addition to serving as the expedition's surgeon, Wilson, a zoologist, was part of the group's scientific team. In 1902, on the coast of Antarctica's Ross Sea, he made the first known discovery of an emperor penguin rookery.

Later in 1902, Wilson accompanied Scott and another of the expedition's members, SIR ERNEST HENRY SHACKLETON, on the first exploration into Antarctica, setting a farthest-south record in a trek across the Ross Ice Shelf.

In 1910, Wilson returned to Antarctica as the chief of the scientific team with Scott's second expedition. In June 1911, he and a small party traveled to Cape Crozier, where he obtained the first samples of emperor penguin eggs.

Wilson accompanied Scott to the SOUTH POLE in January 1912. On the return trek, he was among the last of the five-man party to perish in a blizzard two months later.

When the group's remains were found by a search party in November 1912, it was learned that just prior to his death, Wilson had continued his scientific studies, making notes on the fossils and geological specimens he had collected near the South Pole.

Winslow, Edward (1595–1655) *English colonial leader in Massachusetts, explorer in Connecticut*

Edward Winslow was born in Droitwich in Worcestershire, England, the son of affluent parents. In 1617, he moved to Leyden in the Netherlands to attend that city's university. He soon joined the English Protestant group known as the PILGRIMS, who were then living in voluntary exile in Leyden.

Winslow sailed to New England with the Pilgrims aboard the *Mayflower*, landing at present-day Plymouth, Massachusetts, on December 21, 1620. He was elected as one of the ruling council of the Plymouth colony, and in 1621, aided by SQUANTO, he negotiated an important treaty with Massasoit, grand sachem of the Wampanoag Confederacy.

Winslow returned to England in 1623, where he acted as an agent for the Plymouth colony and also wrote and published an account of the colony's progress, entitled *Good News From New England or a True Relation of Things very remarkable at the Plantation of Plimoth in New England* (1624).

Winslow returned to the Plymouth colony in 1624. Over the next 20 years, he served a number of terms as the colony's governor and made several return trips to England to obtain additional support. He also explored and traded along the New England coast.

In 1632, Winslow headed south and west from the Plymouth colony into what is now Connecticut. Although Dutch navigator ADRIAEN BLOCK had explored the Connecticut River from Long Island Sound in 1614, no steps had been taken to assert Dutch sovereignty there. The next year, 1633, Winslow sent William Holmes to establish a trading post on the Connecticut River near present-day Windsor, Connecticut.

Winslow was imprisoned in England for a short time in 1635, accused of having performed marriage ceremonies in New England without clerical authority. He won his release based on the argument that he acted in a civil capacity as a magistrate.

Winslow left the Plymouth colony for the last time in 1646. Back in England, he became prominent in the government of Oliver Cromwell after 1649 and continued to serve as the principal agent for the Plymouth colony in New England.

In 1655, Cromwell appointed Winslow one of the commissioners in a naval expedition against the Spanish in the Caribbean Sea. While en route with the fleet to attack Jamaica, Winslow contracted a fever and died.

Edward Winslow, unlike most of the Pilgrim founders, came from an upper-class background. He was the first Englishman to visit the upper Connecticut River Valley, and his explorations led to the establishment of the first European settlement in Connecticut.

Wissmann, Hermann von (1853–1905)

German army officer, colonial administrator in central Africa
Born in Frankfurt, Germany, Hermann von Wissmann was an officer in the German army. He undertook explorations in central Africa on behalf of the German Africa Society. In 1880, Wissmann set out from Luanda on the Atlantic coast of Angola, along the Lulua and Kasai Rivers, to Nyangwe in present-day Republic of the Congo. From there, he continued eastward by way of Lake Tanganyika and the region of Tabora, and reached Zanzibar (part of present-day Tanzania) on the Indian Ocean coast in 1882, completing a west-to-east crossing of central Africa.

Wissmann returned to the Congo region in 1883. During the next two years, in the service of King Leopold II of Belgium, he explored the Kasai River system. In addition to determining that the river was mostly navigable, he also came upon an uncharted branch of the Kasai, known as the Sankuru.

Wissmann made an unsuccessful attempt to reach the Lomami River in 1886–87. Soon afterward, he was appointed as a colonial commissioner in German East Africa. In this role, he succeeded in suppressing an Arab revolt in present-day Tanzania in 1889–92; during the same period, he brought the Masai people of what is now Kenya under German colonial rule.

Largely as a result of Wissmann's efforts, the region between Lake Nyasa and Lake Tanganyika was brought under German colonial administration. He also founded several settlements in the interior, including Moshi at the base of MOUNT KILIMANJARO and Langenburg on Lake Nyasa. Wissmann served as governor of German East Africa in 1895–96, before he was compelled by illness to return to Europe.

Hermann von Wissmann's exploits were recounted in his book *My Second Journey Through Equatorial Africa* (1891). His explorations resulted in the expansion of European colonial influence over a wide area of central Africa, including much of what is now the Democratic Republic of the Congo, Tanzania, and Kenya.

Wolfskill, William (1798–1866) *American fur trader, frontiersman in the American Southwest*

William Wolfskill was born in Richmond, Kentucky, which was then a settlement on the Appalachian frontier. When about 10 years old, he moved with his family to what is now north-central Missouri. As a teenager, he returned to Kentucky to attend school for several years, then was back on the Missouri frontier in the early 1820s.

In 1822, Wolfskill first visited the Southwest with WILLIAM BECKNELL's second trading expedition from Franklin, Missouri, along the Santa Fe Trail to the newly opened markets in New Mexico. He later settled in Taos, where he trapped the Rio Grande and other rivers of north-

eastern New Mexico with EWING YOUNG. In an 1824 trapping expedition north and west of Taos, Wolfskill worked alongside the first party of Americans to explore what is now southern Utah.

In 1830–31, Wolfskill, in partnership with GEORGE CONCEPCION YOUNT, led a caravan of packhorses along the Old Spanish Trail, from Taos to California along a route meandering north and west into Utah, across northern Arizona, and through the San Bernardino Mountains to San Gabriel Mission and Los Angeles. Wolfskill eventually settled in California, where he helped develop California's citrus and winemaking industries.

Although far longer and less direct than the westward route across the deserts of southern Arizona, the Old Spanish Trail route pioneered by Wolfskill and Young had abundant sources of water along the way, making it practical as a route for both caravans of goods-laden packhorses and for cattle herds being driven between New Mexico and California. Moreover, travelers along the Old Spanish Trail were less subject to Indian attacks.

Wood, Abraham (1608–ca. 1680) *English colonial military leader in Virginia, sponsor of trading expeditions*

There are few details of Abraham Wood's origins or early life. In 1646, as a captain in the Virginia colonial militia, he was commissioned by the Virginia Assembly to establish Fort Henry, a military outpost at the falls of the Appomattox River near present-day Petersburg, Virginia. This was one of a series of forts erected along the fall line of the rivers leading into the Piedmont region. Wood was granted a large tract of land near the fort, where he established a lucrative farming and trading business.

In 1650, Wood, along with James Bland and a number of other English colonists, set out from Fort Henry and explored the region between the upper James and Roanoke Rivers. They were in search of a river that, according to Indian reports, might lead them to a great "South Sea"—the Pacific Ocean—and the Spanish silver mines in Mexico. They penetrated the Piedmont for a distance of about 100 miles, then returned to Fort Henry after five days. Civil strife in England during the 1650s halted Wood's further explorations in Virginia.

It was not until 1671 that Wood, by then a major general, was able to sponsor subsequent expeditions into the APPALACHIANS. That year, he sent THOMAS BATTS and ROBERT FALLAM to explore south from Fort Henry to the Blue Ridge of what is now North Carolina. They crossed the Appalachians and returned to Fort Henry with reports of rivers flowing into the Ohio Valley.

In 1673, Wood sent out two more Englishmen, GABRIEL ARTHUR and JAMES NEEDHAM, to explore beyond the Allegheny Mountains in an attempt to expand the FUR TRADE to the Indians west of the Piedmont. They pene-

trated the interior as far as what is now western North Carolina and eastern Tennessee. Although Needham was killed by his Indian guide on this expedition, Arthur survived Indian captivity and traveled from Florida to the Ohio River before returning to Fort Henry in 1674.

Bacon's Rebellion of 1676–77 halted further efforts by Wood to send expeditions into the Appalachian frontier. Of his later life little is known.

Abraham Wood was one of the earliest settlers on the Virginia frontier. The expeditions he undertook himself, as well as those he sponsored, increased geographic knowledge of the interior of Virginia beyond the coastal plain and into the Piedmont. Two of his men, Batts and Fallam, were the first Englishmen to cross the Appalachians into the Ohio Valley from the Atlantic seaboard.

Woodward, Henry (unknown–ca. 1686)

British surgeon, colonist in South Carolina and Georgia

Little is known of the early life of Dr. Henry Woodward before 1664, when he arrived in North America at the Carolina colony near Cape Fear in what is now North Carolina. Two years later, he landed in what is present-day South Carolina, near the Georgia border, with an expedition that had originated in Barbados at Port Royal. Having a grant as a "tenant at will" of the Lord Proprietors of Carolina, he settled among the Yamasee Indians in Santa Elena, a town established by Spanish missionaries.

In 1667, the Yamasee turned Woodward over to the Spanish, who, after he professed being Catholic, let him work as a surgeon at their settlement of St. Augustine in Florida. He managed to escape the next year, however, during an attack by English pirates and returned to the north.

In 1670, Charles Town (now Charleston, South Carolina) was founded as the capital of the Carolina colony. That year, Woodward carried out an exploratory expedition from Charles Town into the interior, traveling up the Wateree River. In 1674, he cut southwestward to the site of present-day Augusta, Georgia, on the Savannah River and negotiated trade relations with Westo Indians. He returned to England three years later, where he received a commission from the Lord Proprietors to explore beyond the Savannah. In 1680, he led colonists and Westo and other Indian allies in their attacks on Spanish missions and their Indian converts in Georgia. In 1685–86, he led Charles Town traders southwestward and negotiated trade relations with the Creek (Muskogee) Indians living in the Lower Villages on the Chattahoochee River in Georgia. It is thought he died soon after his return to Charles Town.

Henry Woodward was the individual most responsible for opening up trade routes westward from Charles Town. In the ensuing years, English traders spread throughout the Southeast. JOHN LAWSON would explore the territory northwest of Charles Town, starting in 1701.

Wootton, Richens Lacy (Uncle Dick)

(1816–1893) *American trader, fur trapper, entrepreneur in the West*

Richens Lacy Wootton was born in Mecklenburg County in southern Virginia. While still a child, he moved west with his family to Kentucky and spent part of his teens on a cotton plantation operated by a relative in Mississippi.

In 1836, at the age of 20, Wootton set out for the western frontier, traveling by way of Independence, Missouri, to Bent's Fort on the Arkansas River, near present-day La Junta, Colorado. There, he became a trapper for the fur-trading firm of Bent, St. Vrain & Company, owned by CHARLES BENT and CÉRAN DE HAULT DE LASSUS ST. VRAIN.

After a year of trapping in the Colorado ROCKY MOUNTAINS, Wootton and a party of mountain men undertook an extensive trapping expedition into every major river region of the American West. Starting in 1838, they traveled from Bent's Fort to the upper reaches of the Arkansas River, then crossed the Rockies to the Green River region of what is now northern Utah and southwestern Wyoming. From there, they went on to trap in the Big Horn River region of what is now southern Montana. They hunted beaver in the upper Yellowstone River, before turning westward for the Snake River and COLUMBIA RIVER in present-day Idaho, Washington, and Oregon.

After a stopover at the HUDSON'S BAY COMPANY'S Fort Vancouver, near present-day Portland, Oregon, Wootton and his party made their way southward through central California to Los Angeles. They then returned eastward, trapping along the Colorado and Gila Rivers in southern Arizona, before traversing Utah's Great Basin and arriving at Bent's Fort on the Arkansas River in 1840.

In the early 1840s, Wootton became a rancher near present-day Pueblo, Colorado, raising buffalo cows and calves and trading in buffalo skins with the Comanche Indians. In the U.S.-Mexican War of 1846–48, he took part in Alexander Doniphan's campaign into Chihuahua in 1847, serving as a scout. At the war's end, he settled for a time in Taos, New Mexico, and, in 1852, he undertook a highly profitable cattle drive to California.

Wootton returned to Pueblo in the early 1850s, where he operated a ranch as well as several other business enterprises. During the Pikes Peak (Colorado) gold rush of 1859, he had a hotel and saloon business in Denver. Beginning in 1866, he operated a toll road that traversed 27 miles of rough terrain in Raton Pass to link the Santa Fe Trail and the Canadian River, an enterprise that lasted until he was bought out in 1879 by the Atchison, Topeka, & Santa Fe Railroad, which constructed a rail line along his right-of-way.

Richens Lacy Wootton's career as a mountain man and fur trapper was highlighted by his spectacular 1838–40 expedition, in which he traversed the entire American West, taking in much of the Rockies, the Pacific Northwest, and

California, as well as the Southwest. He was a veritable legend in his own time; his life spanned most of the major periods of the history of the American West, from the height of the FUR TRADE in the 1830s to just after the official end of the frontier period in 1890. Known familiarly as “Uncle Dick,” he related his western experiences in interviews included in *Uncle Dick Wootton* (1890), a biography by H. L. Conrad.

Work, John (ca. 1792–1861) *Irish fur trader in the Pacific Northwest*

Born in County Donegal, Ireland, where his family was known as Wark, John Work entered the FUR TRADE in 1814, as an employee of the HUDSON’S BAY COMPANY in the HUDSON BAY region. In 1823, soon after the Hudson’s Bay Company had merged with the NORTH WEST COMPANY, Work was sent west to the COLUMBIA RIVER region. Over the next seven years, under the direction of PETER SKENE OGDEN, he trapped and explored from the Oregon coast to the Fraser River in British Columbia.

In 1830, Work took charge of the Hudson’s Bay Company’s operations in the Snake River region of what is now eastern Washington and western Idaho. That year, he led an expedition eastward from Walla Walla into the Salmon River region of central Idaho, then southward to trap in the Humboldt River valley of present-day northern Nevada. He later returned to his base at Fort Spokane by way of central Oregon’s John Day River.

Work led a party of trappers into western Montana in 1831, reaching the upper reaches of the MISSOURI RIVER before being forced to withdraw because of repeated attacks by Blackfoot Indian war parties. The next year, he went southward into Oregon and northern California’s Sacramento Valley. He stopped at San Francisco Bay and the Russian settlement at Fort Ross before returning northward in 1833.

In 1846, Work succeeded JOHN MCLOUGHLIN as the Hudson’s Bay Company’s chief factor in the Pacific Northwest. He later settled in Victoria, British Columbia, where he became prominent in provincial politics.

In his career as a fur trader, John Work covered a wide area of the Pacific Northwest and northern plains. His personal account of his experiences was published in 1923 as *The Journal of John Work*, which includes a detailed account of his travels from 1830 to 1833.

Workman, Fanny Bullock (1859–1925)

American traveler, mountain climber, writer in Europe, North Africa, and central Asia

Fanny Workman, née Bullock, came from a wealthy Worcester, Massachusetts, family that was involved in trade and the manufacture of gunpowder. In 1866, her father was elected governor of the state.

Workman was educated in New York, Paris, and Dresden and became fluent in both French and German. She returned to the United States in 1879; two years later, she married Dr. William Hunter Workman, a prominent physician.

In the 1880s, Workman was introduced by her husband to mountain climbing in New Hampshire’s White Mountains. She climbed 6,293-foot Mount Washington several times. In 1888, she and her husband went to Europe and together embarked on a 20-year career of travel and mountaineering.

In the 1890s, the Workmans undertook a series of mountain-climbing expeditions in the Alps, during which Fanny climbed such peaks as Zinal Rothorn, the Matterhorn, and MONT BLANC. In 1895–96, the Workmans bicycled through Spain and also toured the Atlas Mountains of Morocco and Algeria. In 1897, they went to India and bi-

Fanny Workman (Library of Congress)

cycled through the Indian subcontinent to Burma, then traveled to Java. They returned to India the next year and undertook mountaineering expeditions into the HIMALAYAS, including the Karakoram Range.

From 1899 to 1912, Workman participated with her husband in six more expeditions in central Asia, during which she set mountain-climbing altitude records for women. The Swiss mountaineer MATTHIAS ZURBRIGGEN served as her guide. The Workmans contributed geographic data on these uncharted mountainous regions to Britain's Great Trigonometrical Survey of India.

In 1905, Workman became the second woman, after ISABELLA LUCY BIRD BISHOP, to address the ROYAL GEOGRAPHICAL SOCIETY on her travels. At the outbreak of World War I, Workman and her husband settled in the south of France, where she died in 1925.

With her husband, Fanny Workman authored a number of books detailing their travels, including *Algerian Memories: A Bicycle Tour Over the Atlas Mountains to the Sahara* (1895), *Sketches Awheel in Modern Iberia* (1897), *In the Ice World of the Himalaya* (1900), and *Through Town and Jungle: 14,000 Miles A-wheel among the Temples and Peoples of the Indian Plain* (1904). The Workmans took portable Kodak cameras on their expeditions, and their travel books were among the first to be illustrated with photographs taken en route.

Wyeth, Nathaniel Jarvis (1802–1856)

American entrepreneur, fur trader in the Pacific Northwest

Nathaniel Wyeth was born in Cambridge, Massachusetts, into a family prominent in the hotel business in nearby Boston. As a young man, he became a partner in a business that supplied ice from New England to the WEST INDIES.

In 1831, inspired by earlier efforts to promote American settlement in the Oregon Country, Wyeth organized a colonizing and trading expedition of his own to the Pacific Northwest. He sent a ship, the *Sultana*, around CAPE HORN to the Pacific Ocean; he intended to meet the vessel at the mouth of the COLUMBIA RIVER, where he planned to sell its cargo of trade goods and send it back loaded with furs.

In May 1832, Wyeth and a party of trappers and artisans left Independence, Missouri, for the Oregon Country, accompanying a supply wagon led by WILLIAM LEWIS SUBLETTE of the ROCKY MOUNTAIN FUR COMPANY. They followed the North Platte River northwestward to the Sweetwater, then traveled through the SOUTH PASS to the Teton Mountains. At the fur traders' rendezvous at Pierre's

Hole, a number of Wyeth's party decided to abandon the venture. Soon afterward, he took part in a skirmish with the Gros Ventre Indians that became known as the Battle of Pierre's Hole.

Wyeth and the remaining 18 members of his expedition continued to the Snake River without Sublette, reaching Fort Vancouver on the Columbia River, opposite the future site of Portland, Oregon, in October 1833. Wyeth learned that the *Sultana* had been wrecked in the South Pacific, causing him to curtail the enterprise for that year.

On his overland journey back to Boston in spring and summer 1833, Wyeth met with fur trader THOMAS FITZPATRICK on the Green River and entered into an agreement to supply trade goods for the summer 1834 rendezvous.

Wyeth was in Boston in winter 1833–34, where he organized the Columbia River Fishing and Trading Company. Another ship, the *May Dacre*, was sent to the Pacific Northwest in order to bring back a cargo of pickled Columbia River salmon. On his second overland journey to Oregon, which left from Boston in spring 1834, Wyeth was accompanied by naturalist THOMAS NUTTALL, as well as a group of settlers headed by Methodist missionary Jason Lee.

When Wyeth reached the summer 1834 rendezvous at Ham's Fork of the Green River, Fitzpatrick reneged on his promise to buy his goods. In response, planning to sell his merchandise to other fur traders, Wyeth, along with OSBORNE RUSSELL, established Fort Hall on the Snake River in what is now southern Idaho. He then resumed the westward journey to the Columbia River's mouth, which he reached in September 1834. Another setback occurred when Wyeth's ship arrived on the Oregon coast too late for that year's salmon fishing season, having stopped in Chile for repairs. Wyeth remained in the Pacific Northwest for another year, returning to Boston in spring 1836 to resume his career as an ice dealer. Soon afterward, he sold Fort Hall to the HUDSON'S BAY COMPANY.

Although Nathaniel Wyeth's enterprises in the Pacific Northwest were less than commercially successful, the route he blazed in his two expeditions west of the South Pass soon became well established as the Oregon Trail. Starting in the early 1840s, Fort Hall, his trading settlement on the Snake River near what is now Pocatello, Idaho, became an important stopping point for pioneers heading to California and Oregon. Jason Lee and the migrants who traveled to the West with Wyeth in 1834 went on to establish the first permanent American settlement in Oregon. Wyeth left an account of his transcontinental journeys, published in 1899 as *The Correspondence and Journals of Captain Nathaniel J. Wyeth*.

Xavier, Francis (Saint Francis Xavier, Francisco Javier, Francisco de Yasu y Javier) (1506–1552)

Spanish missionary in India, Indonesia, and Japan

Francis Xavier was born into a noble Basque family in Spain's province of Navarre. In 1525, he began studying in Paris, eventually becoming an associate of Spanish churchman Ignatius of Loyola. In 1534, with Loyola, he was one of the seven founding members of the Society of Jesus, the Jesuit order.

Ordained as a priest in Venice in 1537, Xavier spent several years in service to his order in Rome. In 1540, he was named papal nuncio to the Indies, and the following year, under the sponsorship of King John III of Portugal, he set out on a missionary expedition to India from Lisbon.

After a voyage around the CAPE OF GOOD HOPE, Xavier arrived at the Portuguese colony of Goa on the west coast of India in 1542. For the next three years, he traveled along the south coast of India, winning many converts and establishing missions. He also undertook missionary work on the island of CEYLON (present-day Sri Lanka).

In 1545, Xavier sailed for Malacca at the southern end of the Malay Peninsula, where he carried on missionary work. He continued eastward into the Indonesian archipelago, visiting Ternate in the Moluccas, then known as the SPICE ISLANDS, in 1546.

Returning to India, Xavier supervised the assignment of additional Jesuit missionaries to posts in India. In 1549, he led a group of missionaries to Japan, landing at

Kagoshima on southernmost Kyushu Island, where he met up with the Portuguese traveler FERNÃO MENDES PINTO. After two years in Japan, during which he was permitted to open a number of missions and Christian settlements, Xavier returned to India.

In 1552, Xavier was named as superior of the Jesuit Province of the Indies. With plans to take his missionary work to China, he set out from Goa. He contracted fever en route and died on Shangchuan Island near the Chinese port of Canton (Guangzhou).

Canonized in 1622, Saint Francis Xavier became known as the Apostle to the Indies. After Pinto, he was one of the first Europeans to visit Japan, providing an early description of that land and its people in his letters to his fellow Jesuits in Europe.

Xenophon (ca. 430–355 B.C.) *Greek soldier, historian in the Middle East*

Xenophon was born in ancient Athens, a son of one of that city-state's prominent families. In his youth, he studied under the Athenian Greek philosopher Socrates.

In 401 B.C., Xenophon embarked on a military career as a young officer with a Greek mercenary force in service to the Persian prince Cyrus the Younger. He was among the so-called Ten Thousand Greeks who took part in a military expedition that marched eastward across present-day Syria and Iraq in an attempt to defeat the ruler of Persia (present-day Iran), Artaxerxes II, Cyrus's older brother.

Xenophon traveled with the Greek army from Anatolia through the Cilician Gates, the pass in the Taurus Mountains of what is now southern Turkey. They followed the Euphrates River southward toward the Persian capital at Babylon. In the ensuing Battle of Cunaxa, near what is now Fallujah, northeast of present-day Baghdad, Iraq, Cyrus was killed by Persian forces. Afterward, although the Persians agreed to escort the Greeks back to the MEDITERRANEAN SEA, they instead murdered most of the remaining officers.

Command of the Greek forces then went to Xenophon. He led the army northward up the Tigris River, through the ruins of the ancient Assyrian capital at Nineveh, across the Kurdistan region of northern Iraq and southern Turkey, and into the mountains of present-day Armenia and Georgia. Eventually, the forces reached Trabzon on the central Black Sea coast of what is now northern Turkey. From there, they sailed back to Greece, arriving

at Lake Scutari on the northern border of Albania. The five-month journey had taken them through more than 2,000 miles of territory unknown to the Greeks.

Xenophon continued his military career in the service of Sparta before returning to Athens, where he settled in 365 B.C. Thereafter, he devoted himself to historical writing. Among his work was his *Anabasis* (Upmarch), chronicling his experiences leading the Ten Thousand Greeks back from the Persian campaign.

As a result of Xenophon's report on the retreat across Persia, Greek geographic knowledge was extended eastward to include much of present-day Turkey and large portions of southeastern Europe and the Middle East. His east-to-west march back to Greece was followed some 70 years later by the west-to-east campaign of conquest by ALEXANDER THE GREAT.

Yaqut al-Rumi, Shihab al-Din Abu Abd Allah (Yaqut al-Hamawi) (1179–1229) *Greek-born traveler in the Middle East*

Yaqut al-Rumi was born a Christian to a Greek family in what is now western Turkey, at that time a province of the Byzantine Empire. As a child, he was taken captive by Muslim maidens and sold into slavery.

Purchased by a Baghdad merchant named al-Hamawi (whose name he apparently adopted), Yaqut was raised and educated as a Muslim. He later undertook commercial journeys on behalf of his owner, traveling widely into the regions of Persia (present-day Iran) and Arabia adjoining the Persian Gulf.

Granted his freedom in 1196, Yaqut continued to travel in the Middle East for his former owner, operating out of Baghdad until al-Hamawi's death in 1213. By that time, he had developed an interest in geography, and, over the next 20 years, he extended his travels in the Middle East to include visits to cities and small villages in Egypt and Mesopotamia (present-day Iraq and Syria).

Yaqut al-Rumi eventually settled in Aleppo, where, in 1228–29, he completed his great geographic work *Muʿjam al-Buldan* (Dictionary of countries). In it, he provided an index of place names he had compiled in his travels, along with topographic, historical, and economic details. One of the most comprehensive geographic works of the Islamic medieval period, it was also the first gazetteer-type geographic study ever produced.

Yermak (Timofeyevich, Timofeevich, Timofeiev, Ermak) (unknown–ca. 1584) *Russian Cossack in western Siberia*

Details of Yermak's origins and early life are obscure. By the 1570s, he was a leading commander among the Cossack bands of the Volga and Don Rivers. His name sometimes appears as Yermak Timofeyevich in historical writings.

In about 1579, Yermak and some 1,000 of his followers, who had been raiding merchant vessels along the Volga River, withdrew up the Volga, pursued by a Russian government military expedition. They reached the region of the upper Kama and Chusovaya Rivers, where the Stroganov family had established a series of trading settlements on the extensive land grants they had received from Czar Ivan IV (Ivan the Terrible).

Yermak and his Cossack army were soon engaged by the Stroganovs to defend their lands against the Tatar tribes from the east. In 1581, Yermak led as many as 1,600 Cossacks eastward across the Ural Mountains in a campaign of conquest against the Khanate of Siber. With superior military force, he soon succeeded in overthrowing the Tatar ruler, Kuchum Khan, and, in 1582, occupying his capital on the Irtysh River, known then as the Tatar city of Siber. The Stroganovs sent news of Yermak's victory to Ivan in Moscow, along with furs from the newly conquered lands. Accepting the territory as part of his domain, the Russian monarch dispatched an army to occupy the region.

Probably in 1584 or 1585, before Russian reinforcements reached Yermak at Sibir, he was killed in a native uprising. Nonetheless, within two years, the region had come under Russian control, and Sibir was replaced by nearby Tobolsk, the new capital city that the Russians established in 1587.

The conquests of Yermak marked the beginning of Russian eastward expansion across central Asia to the Pacific Ocean. The Sibir region, which he had brought under Russian rule, gave its name to the vast land stretching eastward to the Pacific, known thereafter as SIBERIA. Yermak's route eastward from the Stroganov settlements at present-day Perm, through the Urals to present-day Tobolsk, was adopted by the Trans-Siberian Railroad in the 1890s.

Young, Brigham (1801–1877) *American religious leader, territorial governor of Utah*

Brigham Young was born to a farming family in Whittingham, Vermont. He had little formal education, and by the time he was 16, he was self-employed as a painter, carpenter, and glazier. By 1824, he had moved into western New York, settling at Mendon, near Rochester. In 1832, Young became a member of the Church of Jesus Christ of Latter Day Saints—the Mormons—which had been established in nearby Palmyra, New York, two years earlier by Joseph Smith.

Throughout the 1830s, Young rose to prominence as a leader in the Mormon movement, organizing a settlement at Kirtland in northeastern Ohio and taking part in evangelical expeditions to England. He was instrumental in the establishment of the large Mormon settlement at Nauvoo, Illinois, and, in 1844, following the murder of Joseph Smith, he became the church's principal leader.

Facing persecution by civil authorities and resentful non-Mormon settlers in Illinois, Young evacuated the 16,000 Mormons from Nauvoo, crossed the MISSISSIPPI RIVER into Missouri, then set up temporary settlements at Council Bluffs, Iowa, as well as at Winter Quarters, Nebraska, on the MISSOURI RIVER not far from present-day Omaha.

In April 1847, Young led an advance party of 148 Mormon men and women, known as the "Pioneer Band," westward from Winter Quarters to the Platte River. Influenced by the recently published reports by JOHN CHARLES FRÉMONT, Young had decided to establish a homeland for the Mormons in the remote and arid Great Salt Lake Valley. They traveled in 72 wagons and drove a large cattle herd with them across the Nebraska plains.

Young followed the north bank of the Platte, a departure from the south bank route usually taken by emigrants heading for the Oregon and California Trails. They proceeded along the Platte and North Platte Rivers north and

Brigham Young (New York State Library, Albany)

west into what is now Wyoming. Near present-day Casper, Wyoming, they crossed the North Platte in a boat they had carried with them, the *Revenue Cutter*. A small group from the Pioneer Band party remained at this point, where they established a profitable ferry service that charged non-Mormon emigrants a fee to cross the river, an enterprise that would continue for the next 20 years.

Young and the Pioneer Band arrived at Fort Laramie in June 1847 and from there followed the Oregon Trail to Fort Bridger. Mountain man JAMES BRIDGER warned Young that the route he planned to take to the Great Salt Lake led into mountains and deserts that would be difficult to cross with wagons. Nevertheless, Young led his party southwestward from Fort Bridger into the Uinta and Wasatch Mountains, making a perilous crossing of 120 miles of desert. In early July 1847, the first Mormons reached the tablelands southeast of the Great Salt Lake. Young, stricken with mountain fever, did not arrive until July 24, 1847, at which time he reportedly declared, "This is the place."

Young oversaw the establishment of the Mormon settlement at Great Salt Lake, and soon afterward, he headed back East to organize the subsequent migration of the bulk of the Mormons who had begun to follow his route westward from the Missouri River. As a result of Young's efforts, thousands of Mormons poured into the Great Salt Lake settlement during the next several years. In 1851, he was named governor of the newly organized territory of Utah.

Seeking to provide the Mormon settlement with an outlet to the Pacific Ocean, he organized parties of Mormon emigrants that established communities south and southwest of the Great Salt Lake—from Utah Lake, across northern Nevada, to Cajon Pass into the Sierra Nevada, where the Mormons established San Bernardino. By that time, the rest of the route westward to San Diego and the Pacific coast was well known, having been blazed in 1826 by JEDEDIAH STRONG SMITH.

Although conflicts with federal authorities led to Young's removal as Utah governor in 1858, he remained a dominant force in the Mormon community until his death in 1877.

The route along the north bank of the Platte established by Brigham Young in 1847 became known as the Mormon Trail. It provided expanded access to the Oregon and California Trails for westbound emigrants until the advent of the transcontinental railroad in 1869. The route across the Great Basin established in the 1850s became known as the Mormon Corridor.

Young, Charles Denton (1864–1922) *U.S. Army officer, American cartographer in Haiti and Liberia*

Charles Young was born in Mays Lick, Kentucky; both his parents were African-American slaves. They gained their freedom at the end of the Civil War, in which his father, Gabriel Young, served in the Fifth U.S. Colored Artillery. After the war, the family moved to Ripley, Ohio, where Young graduated from high school with honors, then taught at his grammar school. He later applied to the U.S. Military Academy at West Point and was admitted in 1884. He graduated in 1889, despite the hostility of some of his peers, becoming the ninth African American to be enrolled and the third to graduate.

Young's first assignment was as a second lieutenant with the Buffalo Soldiers in the Ninth Cavalry in Nebraska, then in Utah. In 1894, he was assigned as a teacher of tactics and military science at Wilberforce University in Ohio. In 1898, with the outbreak of the Spanish-American War, he was given training duty at Camp Algiers in Virginia. In 1901–02, he saw active duty in the Philippines. In 1903, he was acting superintendent of Sequoia and General Grant National Parks in California, then a troop commander at the Presidio of San Francisco.

In 1904–07, Young, at the rank of captain, served in Port-au-Prince, Haiti, as one of the army's first military attachés for the newly founded Military Information Division, observing the training of Haitian troops and writing reports on the political situation and geography as well as producing maps. He also traveled to the Dominican Republic. During his time there, he wrote his book *Military Morale of Nations and Races*, published in 1912.

Subsequent postings included Washington, D.C., the Philippines, Wyoming, and Texas. In 1912–15, Young was sent to Liberia in West Africa as a military attaché and helped reorganize the Liberian Frontier Force and Constabulary. He traveled throughout the country, again drafting maps. For his work there he was given the Spingarn Medal by the National Association for the Advancement of Colored People (NAACP), awarded annually to an African American for distinguished achievement.

In 1916–17, Young served in Mexico, commanding a cavalry squadron in pursuit of the bandit Pancho Villa, whose forces had crossed the border and murdered American citizens. His successes in battle led to a promotion to lieutenant colonel, the first African American to reach that rank.

Although Young was the highest-ranking African-American officer in the army, he was denied a leadership role in World War I on grounds of high blood pressure. Despite his protests and those of others who believed the decision to be racially motivated, he was retired in 1917. He was returned to active duty the next year, and, in 1919, he went again to Liberia as a military attaché. In 1921, he reported to the U.S. government on mistreatment of Liberians by non-natives. He died in Lagos, Nigeria, three years later, while on an inspection visit. He was buried at Arlington National Cemetery.

In addition to his many academic and military accomplishments, as well as his firsts as an African American, Charles Young became accomplished in mapmaking and helped chart wilderness areas in Haiti, the Dominican Republic, and Liberia.

Young, Ewing (ca. 1792–1841) *American fur trader, pioneer in the Southwest, California, and Oregon*

Ewing Young was born in eastern Tennessee; his parents were among the original frontier settlers of the region. When about 18, he moved westward himself, settling for a time in north-central Missouri, where he took up farming.

In 1822, Young became a trader, traveling westward with WILLIAM BECKNELL's wagon caravan along the Santa Fe Trail to New Mexico. He remained in Taos, where, in the 1820s, he became associated with GEORGE CONCEPCION YOUNT and WILLIAM WOLFSKILL, with whom he trapped beaver along the rivers of northeastern New Mexico.

By 1826, Young had become a seasoned fur trapper as well as a veteran trader, plying the Santa Fe Trail between St. Louis and the settlements of northern New Mexico. That year, he embarked with a large brigade of trappers southward from Taos into the Gila River and Salt River region of what is now south-central Arizona. On this expedition, he rescued JAMES OHIO PATTIE and Michel

Robidoux, a brother of ANTOINE ROBIDOUX, survivors of an Indian attack.

After trapping along the Gila to the lower COLORADO RIVER, Young turned northward to the Green River region of what is now northern Utah. He returned to Taos in 1827, by way of the Old Spanish Trail, where local New Mexican authorities confiscated his furs, charging him with having operated in the Gila River region without proper authorization.

Young's next major fur-trapping expedition left Taos in August 1829. The young CHRISTOPHER HOUSTON CARSON (Kit Carson) was among the party of MOUNTAIN MEN he led across Arizona by way of the Mojave River, and through Cajon Pass to San Gabriel Mission, near Los Angeles, California. He spent the next year leading his trappers into central California's San Joaquin River region. In 1831, he drove the first herds of mules and horses from California back to New Mexico along the Old Spanish Trail.

In 1832, Young duplicated this expedition, this time in partnership with DAVID E. JACKSON. He remained in California to hunt sea otters in the islands off the southern California coast, then undertook additional beaver-trapping expeditions into northern California as well as eastward along the lower Colorado River.

In San Diego, in summer 1834, Young met Oregon settlement promoter Hall Jackson Kelley, who induced Young to head northward with him to Oregon. When he and Kelley arrived at Fort Vancouver in October 1834, they had with them a small herd of horses they had brought from California. JOHN M'CLOUGHLIN, the HUDSON'S BAY COMPANY factor there, having been incorrectly informed that the livestock had been stolen in California, refused to allow Young to stay at the post, making him one of the few travelers ever to have been refused his assistance and hospitality at Fort Vancouver. Undaunted, Young established a ranch in the Oregon Country, which soon developed into a small community of American settlers, complete with a gristmill and a sawmill.

In 1837, Young returned to California to drive the first large cattle herd back to Oregon. At the time of his death in 1841, he had considerable holdings in both land and cattle. Because Young had died without a will, the American community was prompted to organize an ad hoc probate court to administer his estate, an event that marked the first official action of what was to become Oregon's provisional government.

In his westward journeys from St. Louis to New Mexico and California, Ewing Young was instrumental in developing several central routes. He revived the Old Spanish Trail as a cattle trail to California and developed the trail along the Gila River, in effect extending the Santa Fe Trail westward to Los Angeles.

Younghusband, Sir Francis Edward

(1863–1942) *British army officer and diplomat in central and Southeast Asia*

Born to a British colonial family at Murree in what is now northern Pakistan, Francis Younghusband attended schools in England before entering the British army as a commissioned officer in 1882.

In 1886, Younghusband began his travels in Asia with a journey to Peking (Beijing). From there, he went northward into Manchuria, and, the next year, he made an east-to-west crossing of China and Mongolia, traversing the GOBI DESERT and skirting the Altai Mountains to the Tarim Basin and the ancient SILK ROAD cities of Kashgar and Yarkand. He then headed southward into the Karakoram range, where he made the European discovery of the Mustagh Pass, which he followed into northern India's Kashmir region.

In 1888, while serving with British forces in Burma, Younghusband traveled the length of the country, from Moulmein, up the Salween River and across to the upper reaches of the Mekong River, into southeastern China.

Back in India in 1889, Younghusband repeated his earlier journey across the Karakoram range in reverse, traveling from Rawalpindi northward to Yarkand in western China. He then undertook a topographic survey in the Pamir region.

Younghusband was awarded a gold medal by the ROYAL GEOGRAPHICAL SOCIETY in 1890, and transferred that same year to the political department of the army. He continued to travel and explore, extending the Great Trigonometrical Survey of India into the Hindu Kush, Karakoram, and Pamir mountain ranges. In 1892–94, he undertook a two-year exploration and survey expedition along the Amu Darya River in northern Afghanistan.

In 1902, Younghusband was sent on a diplomatic mission to Tibet, the British foreign office having become concerned over Russian designs on the remote Himalayan principality. When Russian expansion into Tibet seemed imminent, Younghusband was placed in command of a large military force that occupied the country. On August 2, 1904, he led his command into Tibet's capital at LHASA, a city forbidden to outsiders.

While in Lhasa, Younghusband directed the first scientific survey of the area, making the first accurate determination of the city's precise geographic position. Other surveying teams under his command explored the Tsangpo and Brahmaputra Rivers, upstream from Shigatse.

Younghusband retired from the army after 1908, at the rank of lieutenant colonel. He had recounted his explorations in Asia in his books *Heart of a Continent* (1898) and *India and Tibet* (1912). He served as president of the Royal Geographical Society in 1919–22. During the 1920s, he turned his attention to the ascent of MOUNT EVEREST, making three unsuccessful attempts.

In his 1904 expedition into Tibet, Sir Francis Younghusband became the first European to enter Lhasa since the visit of ÉVARISTE-RÉGIS HUC in 1846.

Yount, George Concepcion (1794–1865)

American fur trader, trailblazer in the American Southwest

George Yount was born in western North Carolina's Burke County, the son of an American Revolutionary War veteran. At the age of 10, he moved west with his family to the newly acquired Louisiana Territory and settled in Cape Girardeau on the MISSISSIPPI RIVER in what is now southeastern Missouri.

During the War of 1812, Yount and his father and brothers served with a local militia unit, defending the surrounding region against attacks by British-allied Indians. Married in 1818, Yount moved with his new wife to Howard County in north-central Missouri, where he became a cattle rancher.

As a result of a severe financial setback in 1825, Yount was compelled to leave his family and seek his fortune in New Mexico. He traveled with a trading caravan along the Santa Fe Trail into the Southwest, and, after establishing himself in Taos, became a trapper with EWING YOUNG.

In 1827, Yount accompanied JAMES OHIO PATTIE and his father, Sylvester Pattie, in a fur-trapping expedition to the Gila River, which they followed to its mouth on the COLORADO RIVER in western Arizona. The next year, he trapped in the northern ROCKY MOUNTAINS, attending the 1828 fur traders' rendezvous near Bear Lake on the present Utah-Wyoming border. He trapped for beaver around the upper reaches of the Yellowstone River in northwestern Wyoming, where a mountain in the region was named Younts Peak in his honor.

While in the northern Rockies, Yount met JEDEDIAH STRONG SMITH, from whom he heard accounts of his 1826–29 explorations across the Great Basin and the Sierra Nevada into California and Oregon.

Back in Taos in 1830, Yount joined with mountain man WILLIAM WOLFSKILL in a packhorse expedition along the Old Spanish Trail to California. In September 1830, they left Taos and traveled northwestward to the Green River, then turned southwestward across Utah and into Arizona. After crossing the San Bernardino Mountains by way of Cajon Pass, they arrived at the San Gabriel Mission, near Los Angeles, in February 1831.

Yount decided to remain in California, where he worked in the early 1830s as a carpenter in the settlements along the south coast. In 1834, he moved to northern California, where he obtained a land grant from the Mexican government in the Napa Valley region. In honor of his converting to Catholicism, he adopted the middle name Concepcion. In 1844, he was joined in northern California by his two daughters from Missouri, although his wife, believing that he had died, had since remarried.

In his 1830–31 expedition with William Wolfskill, George Yount made the first known journey along the entire length of the Old Spanish Trail. More than 50 years after it had first been explored by Spanish missionaries FRANCISCO SILVESTRE VÉLEZ DE ESCALANTE, FRANCISCO ATANASIO DOMÍNGUEZ, and FRANCISCO TOMÁS HERMENEGILDO GARCÉS in the 1770s, Yount and Wolfskill demonstrated that the trail was suitable for packhorses carrying trade goods from New Mexico to California. Their efforts led to the development of the first direct overland link between the settlements of northern New Mexico and southern California.

Z

Zagoskin, Lavrenty Alekseyevich **(Lavrenti Alekseev Zagoskin)** (1807–1890)

Russian naval officer in Alaska

Lavrenty Alekseyevich Zagoskin grew up to become a lieutenant in the Russian navy. In 1838, he joined the RUSSIAN-AMERICAN COMPANY. After an overland journey from European Russia to the Pacific coast of SIBERIA, he sailed to Alaska in command of the company's vessel the *Okhotsk*, arriving in Sitka in summer 1839.

During the next three years, Zagoskin commanded company ships in voyages between the fur-trading settlements in the eastern Gulf of Alaska and in northern California, and back to Siberia. In 1842, he won approval for a plan to explore the two great rivers of Alaska's interior, the largely unknown Yukon and Kuskokwim.

In summer 1842, Zagoskin sailed to St. Michael on the south shore of Norton Sound, where he explored the Unalakleet River. The next winter, he traveled inland by dogsled to Nulato, near the confluence of the Yukon and the Koyukuk Rivers. In spring 1843, he examined the Koyukuk, the Yukon's main northern tributary, and that summer, he undertook the first of a series of extensive explorations by kayak along the middle and lower reaches of the Yukon River, exploring its course from the mouth of the Tanana River to its great bend westward near Anvik. In summer 1844, he turned his attention to the Kuskokwim and the lower Yukon Rivers. The next year, he left the Russian-American Company, returning to European Russia by way of Okhotsk and Siberia.

Lavrenty Alekseyevich Zagoskin's account of his inland journeys, published in 1847–48, provides a contemporary view of the later period of Russian settlement in Alaska. He is credited with making the most extensive explorations into the interior of Alaska until that time, and, by his own account, he made the European discovery of the Yukon River in 1842.

Zheng He See CHENG HO.

Zhu Siben See CHU SSU-PEN.

Zurbriggen, Matthias (1856–1917) *Swiss mountain climber and guide in the Alps, Himalayas, Southern Alps, and Andes Mountains*

Born in the village of Macugnaga in northern Italy, Matthias Zurbriggen was a Swiss citizen. He developed skills as a mountain climber in the Alps and found work as a guide to expeditions.

In 1892, Zurbriggen and the British mountaineer Sir William Martin Conway set the record for altitude by reaching the summit of Pioneer Peak in the Karakoram Range of the HIMALAYAS. In 1894, Zurbriggen, as part of British climber Edward Fitzgerald's expedition, made climbs in NEW ZEALAND's Southern Alps. He made a solo ascent of Mount Cook, the highest peak in New Zealand, only three

months after the New Zealanders T. C. Fyfe, Peter Graham, and J. Clark first conquered it. Zurbriggen and Fitzgerald made the first ascents of Mount Tasman and Mount Haidinger that same year.

In 1897, Zurbriggen, once again as part of a Fitzgerald expedition, completed a solo ascent of ACONCAGUA, the highest peak in the ANDES MOUNTAINS and the entire Western Hemisphere, at 22,834 feet above sea level. He later worked for the American FANNY BULLOCK WORKMAN in

the Himalayas and helped her set an altitude record for women.

Matthias Zurbriggen became legendary as a mountain climber and guide for completing ascents that his employers and companions could not. He was also the first mountaineering guide to publish his autobiography, *From the Alps to the Andes: Being the Autobiography of a Mountain Guide* (1899).

Appendix A

EXPLORERS BY MOST RELEVANT OCCUPATION

Some of the “occupations” listed below might be better described as “activities,” nor are they exclusive since many individuals had more than one occupation. Those indicated are most relevant to exploration. Some individuals are listed under “explorers” because they considered exploration as their only or primary calling. Since many of the individuals wrote about their explorations, there is no separate entry for writers other than “travelers and travel writers.”

 Gilbert, Sir Humphrey
 Gutiérrez, Diego
 Hakluyt, Richard
 Idrisi, Abu Abd Allah Muhammad ash-Sharif al-
 Indicopleustes, Cosmas
 Kropotkin, Peter
 Linschoten, Jan Huyghen van
 Llewellyn, Martin
 Mercator, Gerardus
 Ortelius, Abraham
 Petermann, August Heinrich
 Pliny the Elder
 Ptolemy
 Pytheas
 Semyonov, Pyotr Petrovich

Strabo
 Waldseemüller, Martin
 Yaqut al-Rumi, Shihab al-Din Abu Abd Allah

Geologists

Hind, Henry Youle
 Mawson, Sir Douglas
 Newberry, John Strong
 Nordenskjöld, Nils Otto Gustaf
 Overweg, Adolf
 Powell, John Wesley
 Richthofen, Ferdinand Paul Wilhelm von
 Schoolcraft, Henry Rowe
 Strzelecki, Sir Paul Edmund
 Thomson, Joseph
 Toll, Eduard von
 Wegener, Alfred Lothar

Historians

Bingham, Hiram
 Burckhardt, Johann Ludwig
 Charlevoix, Pierre-François-Xavier de
 Hecataeus of Miletus
 Herodotus
 Masudi, Abu al-Hasan Ali al-
 Tsybikov, Gombozhab

Linguists

Vambéry, Armin

Naturalists (including Botanists and Zoologists)

Akeley, Carl Ethan
 Akeley, Delia Denning
 Akeley, Mary Leonore Jobe
 Audubon, John James
 Azara, Félix de
 Baikie, William Balfour
 Banks, Sir Joseph
 Bartram, John
 Bartram, William
 Bates, Henry Walter
 Berlandier, Jean-Louis
 Bradbury, John
 Brown, Robert
 Burchell, William John
 Catesby, Mark
 Chamisso de Boncourt, Louis-Charles-Adélaïde
 Commerson, Joseph-Philibert
 Cunningham, Allan
 Dana, James Dwight
 Darwin, Charles Robert
 Dietrich, Koncordie Amalie Nelle
 Eschscholtz, Johann Friedrich
 Fedchenko, Aleksey Pavlovich

Fedchenko, Olga
 Ferreira, Alexandre Rodrigues
 Forbes, Edward
 Forster, Johann Georg Adam
 Forster, Johann Reinhold
 Gaimard, Joseph-Paul
 Gaudichaud-Beaupré, Charles
 Gmelin, Johann Georg
 Harriot, Thomas
 Hooker, Sir Joseph Dalton
 Humboldt, Alexander von
 Kern, Benjamin Jordan
 Krashennikov, Stepan Petrovich
 La Billardière, Jacques-Julien Houtou de
 La Condamine, Charles-Marie de
 Langsdorff, Georg Heinrich Ritter von
 Leichhardt, Friedrich Wilhelm Ludwig
 Lesson, René-Primevère
 Lesueur, Charles-Alexandre
 Martius, Carl Friedrich Phillipp von
 Maximilian, Alexander Philipp
 Mertens, Karl Heinrich
 Messerschmidt, Daniel Gottlieb
 Moorcroft, William
 Moreno, Francisco
 Mouhot, Henri
 Muir, John
 Nuttall, Thomas
 Orbigny, Alcide-Charles-Victor Dessalines d'
 Oudney, Walter
 Pavy, Octave
 Péron, François
 Porte, François de la
 Przhevalsky, Nikolay Mikhailovich
 Quoy, Jean-René-Constant
 Richardson, Sir John
 Riche, Claude-Antoine-Gaspard
 Schomburgk, Sir Robert Hermann
 Schweinfurth, Georg August
 Solander, Daniel Carl
 Sparrman, Anders
 Spruce, Richard
 Steller, Georg Wilhelm
 Thomson, Sir Charles Wyville
 Thunberg, Carl Peter
 Tschudi, Johann Jakob von
 Wallace, Alfred Russel
 Wilson, Edward Adrian

Oceanographers

Beebe, Charles William
 Cousteau, Jacques-Yves
 Marsili, Luigi Ferdinando

Maury, Matthew Fontaine
 Piccard, Jacques Ernest-Jean

Religious Scholars

Ch'ang-ch'un
 Fa-hsien
 Hsüan-tsang
 Ibn Battutah, Abu Abd Allah Muhammad
 Ibn Fadlan, Ahmad
 Ibn Hawqal, Abu al-Qasim ibn Ali al-Nasibi
 Ibn Jubayr, Abu al-Hasan Muhammad
 I-ching

Surveyors and Topographers

Beale, Edward Fitzgerald
 Brunner, Thomas
 Christie, Charles
 Dunbar, Sir William
 Everest, Sir George
 Foureau, Fernand
 Freeman, Thomas
 Gosse, William Christie
 Gregory, Sir Augustus Charles
 Gregory, Francis Thomas
 Hayden, Ferdinand Vandever
 Kern, Edward Meyer
 King, Clarence
 Kintup
 Lawson, John
 Niebuhr, Carsten
 Palliser, John
 Rice, Alexander Hamilton
 Sarmiento de Gamboa, Pedro
 Singh, Kishen
 Singh, Nain
 Stuart, John McDouall
 Walker, Thomas
 Watkins, Henry George
 Wills, William John

TRAVELERS AND TRAVEL WRITERS

Adams, Harriet Chalmers
 Atkinson, Lucy
 Baret, Jeanne
 Beltrami, Giacomo Costantino
 Bishop, Isabella Lucy Bird
 Blunt, Anne Isabella
 Blunt, Wilfrid Scawen
 Bonin, Charles
 Brackenridge, Henry Marie
 Cheadle, Walter Butler
 Ctesias of Cnidus
 David-Néel, Alexandra

Doughty, Charles Montagu
Du Chaillu, Paul Belloni
Eberhardt, Isabelle
Evliya, Çelebi
Fiennes, Celia
Franklin, Jane
Godin des Odanais, Isabela
Herbert, Thomas
Irving, John Treat
Kingsley, Mary Henrietta
Livingstone, Mary Moffat
Manning, Thomas
Mazuchelli, Elizabeth Sarah

Milton, William-Wentworth Fitzwilliam
Pethahia of Regensburg
Pfeiffer, Ida Reyer
Pigafetta, Francesco Antonio
Pinto, Fernão Mendes
Ritchie, Joseph
Sheldon, May French
Stanhope, Hester Lucy
Stark, Freya Madeline
Thesiger, Wilfred Patrick
Varthema, Ludovico di
Wen-chi
Wickham, Sir Henry Alexander

Appendix B

EXPLORERS BY REGION OF ACTIVITY

Note: Certain individuals appear on more than one list.

EUROPE, ICELAND, AND EASTERN ATLANTIC ISLANDS

Agricola, Gnaeus Julius
Balmat, Jacques
Banks, Sir Joseph
Bar Sauma, Rabban
Behaim, Martin
Brendan, Saint
Brunel, Olivier
Cabral, Gonçalo Velho
Caesar, Gaius Julius
Eric the Red
Evliya, Çelebi
Fiennes, Celia
Forbes, Edward
Gore, John
Hecataeus of Miletus
Herodotus
Himilco
Ibn Battutah, Abu Abd Allah Muhammad
Ibn Fadlan, Ahmad
Ibn Hawqal, Abu al-Qasim ibn Ali al-Nasibi
Ibn Jubayr, Abu al-Hasan Muhammad
Ibn Rusta, Abu Ali Ahmad
Idrisi, Abu Abd Allah Muhammad ash-Sharif al-
Jenkinson, Anthony
Jörgenson, Jörgen

Kropotkin, Peter
Masudi, Abu al-Hasan Ali al-
Naddod
Paulinus, Suetonius
Peck, Annie Smith
Pethahia of Regensburg
Pfeiffer, Ida Reyer
Pytheas
Sargon
Squanto
Stefansson, Vilhjalmur
Strabo
Svarsson, Gardar
Whymper, Edward
Zurbriggen, Matthias

NORTH AFRICA

Alexander the Great
Arculf
Barth, Heinrich
Blunt, Anne Isabella
Blunt, Wilfrid Scawen
Burckhardt, Johann Ludwig
Clapperton, Hugh
Covilhã, Pero da
Denham, Dixon
Duveyrier, Henri

Eberhardt, Isabelle
 Evliya, Çelebi
 Flatters, Paul-Xavier
 Foureau, Fernand
 Gallus, Gaius Aelius
 Hecataeus of Miletus
 Herodotus
 Hornemann, Friedrich Conrad
 Ibn Battutah, Abu Abd Allah Muhammad
 Ibn Hawqal, Abu al-Qasim ibn Ali al-Nasibi
 Ibn Jubayr, Abu al-Hasan Muhammad
 Idrisi, Abu Abd Allah Muhammad ash-Sharif al-
 Indicopleustes, Cosmas
 Leo Africanus
 Lyon, George Francis
 Masudi, Abu al-Hasan Ali al-
 Maternus, Julius
 Nachtigal, Gustav
 Oudney, Walter
 Overweg, Adolf
 Paulinus, Suetonius
 Richardson, James
 Ritchie, Joseph
 Rohlf, Friedrich Gerhard
 Sherley, Sir Anthony
 Stark, Freya Madeline
 Strabo
 Tinné, Alexandrine Petronella Francina
 Workman, Fanny Bullock

COASTAL AFRICA

Albuquerque, Afonso de
 Almeida, Francisco de
 Baldaya, Afonso Gonçalves
 Beechey, Frederick William
 Belcher, Sir Edward
 Cadamosto, Alvise da
 Cão, Diogo
 Cheng Ho
 Covilhã, Pero da
 Dias, Bartolomeu
 Dias, Dinís
 Eannes, Gil
 Eudoxus
 Fernandes, Álvaro
 Gama, Vasco da
 Gomes, Diogo
 Gomes, Fernão
 Hanno
 Hannu
 Indicopleustes, Cosmas
 Masudi, Abu al-Hasan Ali al-
 Pacheco, Duarte

Tristão, Nuño
 Vivaldi, Ugolino

SUB-SAHARAN AFRICA

Abruzzi, Luigi Amedeo di Savoia d'
 Akeley, Carl Ethan
 Akeley, Delia Denning
 Akeley, Mary Leonore Jobe
 Álvares, Francisco
 Baikie, William Balfour
 Baines, Thomas
 Baker, Florence
 Baker, Sir Samuel White
 Baptista, Pedro João
 Barth, Heinrich
 Baumann, Oskar
 Bent, James Theodore
 Beutler, August
 Binger, Louis-Gustave
 Bombay, Sidi
 Brazza, Pierre-Paul-François-Camille Savorgnan de
 Bruce, James
 Burchell, William John
 Burton, Sir Richard Francis
 Cadamosto, Alvise da
 Caillié, René-Auguste
 Cameron, Verney Lovett
 Campbell, John
 Chaillé-Long, Charles
 Clapperton, Hugh
 Denham, Dixon
 Diogenes
 Du Chaillu, Paul Belloni
 Emin Pasha, Mehmed
 Foureau, Fernand
 Fuchs, Sir Vivian Ernest
 Galton, Sir Francis
 Gordon, Robert
 Grant, James Augustus
 Grenfell, George
 Herkhuf
 Hoehnel, Ludwig von
 Hornemann, Friedrich Conrad
 Houghton, Daniel
 Ibn Battutah, Abu Abd Allah Muhammad
 Ibn Hawqal, Abu al-Qasim ibn Ali al-Nasibi
 Johnston, Sir Harry Hamilton
 Junker, Wilhelm Johann
 Kingsley, Mary Henrietta
 Krapf, Johann Ludwig
 Lacerda, Francisco de
 Laing, Alexander Gordon
 Lander, Richard Lemon

Lenz, Oskar
 Leo Africanus
 Livingstone, David
 Livingstone, Mary Moffat
 Lobo, Jerónimo
 Marchand, Jean-Baptiste
 Meyer, Hans
 Moffat, Mary
 Moffat, Robert
 Nachtigal, Gustav
 Oudney, Walter
 Overweg, Adolf
 Páez, Pedro
 Park, Mungo
 Pascoe, William
 Rebmann, Johann
 Richardson, James
 Schweinfurth, Georg August
 Sheldon, May French
 Silva Porto, Antonio Francisco da
 Sparrman, Anders
 Speke, John Hanning
 Stanley, Sir Henry Morton
 Teleki, Samuel
 Thomson, Joseph
 Tinné, Alexandrine Petronella Francina
 Thunberg, Carl Peter
 Wissmann, Hermann von
 Young, Charles Denton

Appendix C

EXPLORERS BY SPONSORING COUNTRY OR BY NATIONALITY/NATIVE LAND

Explorers are listed by countries sponsoring their most important expeditions or activities relating to exploration, or they are listed by their ancestry when their expeditions or activities relating to exploration were not government-backed. (Government sponsorship in some instances means official sanctioning or partial support.)

SPONSORING COUNTRIES (GOVERNMENT-BACKED EXPLORATION)

Appendix D

EXPLORERS IN CHRONOLOGICAL ORDER BY BIRTH DATE

Names are listed under century or, later, decade of birth, unless information is incomplete; incomplete dates, marked by asterisks, are listed at end of centuries, except B.C.

B.C.

Hannu (fl. 2750s)*
 Sargon (fl. 2340s–2300s)*
 Herkhuf (fl. 2270s)*
 Hatshepsut (1501–1479)
 Necho II (unknown–593)*
 Hecataeus of Miletus (fl. 520s–490s)*
 Scylax (fl. late 500s)*
 Herodotus (490–420)
 Himilco (fl. 480s)*
 Hanno (fl. 470s)*
 Xenophon (ca. 430–355)
 Ctesias of Cnidus (fl. 420s–410s)*
 Nearchus (ca. 360–312)
 Alexander the Great (356–323)
 Pytheas (fl. 320s)*
 Megasthenes (fl. 290s)*
 Eratosthenes (ca. 276–ca. 195)
 Hipparchus (ca. 190–ca. 120)
 Eudoxus (fl. 120s–110s)*
 Chang Ch'ien (unknown–ca. 107)*
 Caesar, Gaius Julius (100–44)

Strabo (ca. 63 B.C.–ca. A.D. 21)
 Gallus, Gaius Aelius (fl. 20s)*

A.D. 1–99

Pliny the Elder (ca. 23–79)
 Agricola, Gnaeus Julius (ca. 37–93)
 Ptolemy (ca. 90–ca. 150)
 Paulinus, Suetonius (unknown–ca. 70)*
 Hippalus (fl. 40s)*
 Diogenes (fl. 40s–50s)*
 Maternus, Julius (fl. 50s)*
 Kan Ying (fl. 90s)*

100–199

Wen-chi (fl. 190s)

300–399

Fa-hsien (319–414)

400–499

Brendan, Saint (ca. 484–ca. 578)

500–599

Indicopleustes, Cosmas (fl. 540s)*

600–699

Hsüan-tsang (ca. 600–664)

I-ching (634–ca. 700)

Arculf (fl. ca. 680s)*

700–799

Beatus of Valcavado (fl. 770s)*

Izmailov, Gerasim Alekseyevich (fl. 770s–790s)*

800–899

Soleyman (fl. 850s)*

Svarsson, Gardar (fl. 860s)*

Naddod (fl. 860s–870s)*

900–999

Eric the Red (ca. 950–1010)

Biruni, Abu ar-Rayhan Muhammad ibn Ahmad al- (973–1048)

Ericsson, Leif (ca. 975–ca. 1020)

Ibn Rusta, Abu Ali Ahmad (fl. 900s–920s)*

Ibn Fadlan, Ahmad (fl. 920s)*

Ibn Hawqal, Abu al-Qasim ibn Ali al-Nasibi (fl. 940s–970s)*

Masudi, Abu al-Hasan Ali al- (unknown–ca. 956)*

Kupe (fl. ca. 950)*

Herjulfsson, Bjarni (fl. 980s)*

1000–1099

Idrisi, Abu Abd Allah Muhammad ash-Sharif al- (ca. 1099–ca. 1165)

Ericsson, Thorvald (unknown–ca. 1007)*

Eiríksdóttir, Freydis (fl. 1010s)*

Karlsefni, Thorfinn (fl. 1010s)*

1100–1199

Ibn Jubayr, Abu al-Hasan Muhammad (1145–1217)

Ch'ang-ch'un (1148–1227)

Genghis Khan (ca. 1162–1227)

Yaqut al-Rumi, Shihab al-Din Abu Abd Allah (1179–1229)

Carpini, Giovanni da Pian del (1182–1252)

Benjamin of Tudela (unknown–1173)*

Pethahia of Regensburg (fl. 1180s–1190s)*

1200–1299

Hollywood, John (ca. 1200–ca. 1250)

William of Rubrouck (ca. 1215–ca. 1270)

Bar Sauma, Rabban (1220–1294)

John of Montecorvino (1247–1328)

Polo, Marco (1254–1324)

Odoric of Pordenone (ca. 1265–1331)

Chu Ssu-pen (1273–1337)

Marignolli, Giovanni de (ca. 1290–unknown)*

Polo, Maffeo (fl. 1260s–1290s)*

Polo, Niccolò (fl. 1260s–1290s)*

Vivaldi, Ugolino (fl. 1290s)*

1300–1399

Ibn Battutah, Abu Abd Allah Muhammad (1304–1378)

Cheng Ho (1371–1435)

Cabral, Gonçalo Velho (ca. 1386–ca. 1447)

Henry the Navigator (1394–1460)

Eannes, Gil (ca. 1395–ca. 1445)

Conti, Niccolò di (ca. 1395–1469)

Cresques, Abraham (fl. 1370s)*

1430–1439

Cadamosto, Alvise da (1432–1488)

Behaim, Martin (ca. 1436–ca. 1506)

1440–1449

Gomes, Diogo (ca. 1440–ca. 1482)

Pinzón, Martín Alonso (ca. 1441–1493)

Ávila, Pedro Arias de (ca. 1442–1531)

1450–1459

Cão, Diogo (ca. 1450–1486)

Cabot, John (ca. 1450–ca. 1499)

Dias, Bartolomeu (ca. 1450–1500)

Côrte-Real, Gaspar (ca. 1450–ca. 1501)

CARL WALDMAN
AND
JON CUNNINGHAM

®
Facts On File, Inc.

For Dylan Sikelianos . . . with his exploring mind
—Carl Waldman

For Frieda C. Hall, Eloise Cunningham,
Allan Cunningham, and Linda Cunningham . . . in appreciation
—Jon Cunningham

Note on Photos

Many of the illustrations and photographs used in this book are old, historical images. The quality of the prints is not always up to current standards, as in some cases the originals are from old or poor quality negatives or are damaged. The content of the illustrations, however, made their inclusion important despite problems in reproduction.

Preface

The term *exploration* comprises the concepts of traveling and seeking. *Discovery*, a term associated with exploration, refers to “finding.” But the latter term has often been misused. One cannot “find” or “discover” a land that is already inhabited. But one can “discover” knowledge of that land and take it back to one’s place of origin and pass on that knowledge. The history of exploration can therefore be characterized as the record of the diffusion of knowledge. The knowledge most relevant to exploration is geographic; how the world came to be mapped is thus central to chronicling exploration. In exploratory expeditions, information passes back and forth between continents and between cultures, affecting the realities both of the exploring and of the explored.

People have participated in exploration for a variety of reasons over the ages. Two basic human traits—curiosity and the desire for personal accomplishment—must be taken into account in all types of exploration. More specific motives include geographic and scientific inquiry, seeking a new homeland, conquest and/or colonization, commerce and profit, religious zeal, finding others who have gone missing, and searching for new literary or artistic themes. Those who explore come from diverse social and vocational backgrounds, among them, navigators, sailors, soldiers, officials, diplomats, colonists, missionaries, religious scholars, merchants, hunters, fur trappers, whalers, sealers, pirates, guides, interpreters, tribal leaders, cartographers, writers, painters, naturalists, geologists, historians, archaeologists, oceanographers, astronomers, aviators, astronauts, and mountain climbers. Some individuals contributed to exploration by promoting, organizing, and financing expeditions or by making technological breakthroughs, although they themselves may not have ventured far from their homelands.

Explorers lead fascinating, driven lives, and the stories of their expeditions are filled with adventure and danger. Many individuals have died in the pursuit of their dreams. Some have inflicted death, either directly or indirectly, on fellow explorers and especially on indigenous peoples. It can be said that explorers are at the head of the historical curve, the forerunners of good or bad. It also can be said that exploration is the starting point of many historical and cultural themes.

The explorers and the particular expeditions discussed in this work are only part of the story of exploration. Many more individuals have a role in the exploring and charting of the Earth and, in recent decades, outer space.

Map of the world by John Speed (1626) (Library of Congress)

The general topics examined and the terms defined offer some context to the field of exploration, but it is important to remember that the scope of the story of exploration includes the entire historical record, and its sphere of action encompasses the entire world and the solar system. So, in chronicling exploration, particular time periods, cultures, activities, and technologies are given great weight. But one should perceive exploration as a single window into humankind's larger journey through time.

Volume I of the *Encyclopedia of Exploration* presents biographical entries about explorers, organized alphabetically. Volume II, also organized alphabetically, presents various subjects related to exploration: types of exploration, activities relating to exploration, groupings of peoples known for exploration, historical periods, organizations, legends, places, routes, natural phenomena, cartographic terms, oceanographic equipment, navigational tools, and crafts used in transportation.

In the biographical entries of Volume I, expeditions are more likely to be described in detail than in Volume II's entries. At the beginning of each biographical entry can be found the following: alternate names and spellings of names, birth and death dates (when known), nationality (and, if different, the country for whom explorations were carried out), occupations, places of the

world explored, and familial relationships to other explorers with entries. After an opening discussion of the individual's background, there follows a description of his or her career in exploration and, if applicable, voyages and routes. Each entry closes with a summary of the person's accomplishments and his or her broader relevance to the history of exploration.

Some of the entries in Volume II provide overviews of historical or geographic information; others are definitions of terms relating to exploration. Geographic terms include continents, regions, islands, capes, oceans, straits, mountain ranges, mountains, mountain passes, deserts, rivers, cities, and routes. In addition to the obvious choices for geographic entries on continents and oceans, which provide overviews, some places have been selected as entries because they generated many expeditions or are central to periods of exploratory history. It should be kept in mind that other such places without their own entries have fascinating stories of exploration attached to them; many such stories can be found in Volume I (see the cumulative index).

Cross-references, indicated by a term set in SMALL CAPITAL letters the first time it appears in an entry, are meant to guide a reader/researcher through the complex material in both volumes. The cross-references run across both volumes; the reader should remember to look for entries on people in Volume I and all other entries in Volume II. A reader should understand that for the sake of convenience, not all terms that are discussed in entries in Volume II are presented as cross-references. For example, the terms *Africa* and *Atlantic Ocean* are mentioned in passing throughout the book, yet their entries appear as "Africa, exploration of" or "Atlantic Ocean, exploration of the" and are not necessarily cross-referenced. It is unlikely that a reader will choose to look up Africa for a general discussion of its geography and exploration every time the term relates peripherally to an entry. But the reader should know that Volume II includes overview entries of every continent, as well as the Arctic region and the Atlantic, Pacific, and Indian Oceans. More-specific places that have their own entries, such as the Himalayas and the Mississippi River, are cross-referenced. Certain terms, such as *colonization*, are not cross-referenced since the heading might appear as "colonization and exploration." A glance at the appendices organized by categories or the List of Entries for Volume II will help clarify questions of organization. Each volume also lists all the entries in both volumes in the "List of Entries" in the front matter.

Appendices in Volume I include a list of explorers with entries organized by region explored (with some names listed more than once, plus a section on cartographers, geographers, and sponsors where relevant); a list of explorers with entries organized chronologically by birth date; a list of explorers with entries organized by sponsoring country, or, when no sponsoring nation can be cited, by nationality or native land; and a list of explorers with entries organized by most relevant occupation. Appendices in Volume II include a chronology based on the explorations of all the individuals in Volume I, a general bibliography, and the already mentioned list of the entries organized by categories. Each volume contains a general index of the material in that volume.

Maps are essential tools in studies of exploration. The photographs of period maps that accompany some of the entries in both volumes offer a glimpse of the evolving cartographic view of the world. Original maps in an appendix in Volume II serve to illustrate the subject matter. A bibliography, in which books are listed by geographic and other general groupings, is provided to encourage and facilitate additional study of the vast and fascinating subject matter.

Acknowledgments

The authors would like to thank Nicole Bowen, editor, and Laura Shauger, editorial assistant, for their vision, attention to detail, and patience, plus all the other talented people at Facts On File who helped with this project.

Aconcagua

Aconcagua is a peak in the ANDES MOUNTAINS of western Argentina, near the border with Chile. At 22,834 feet above sea level, it is the highest mountain in South America and in the Western Hemisphere. Fourteen other peaks in the Andes are more than 20,000 feet above sea level and taller than Mount McKinley (see MCKINLEY, MOUNT), the highest peak in North America, at 20,320 feet.

In 1897, Italian mountaineer MATTHIAS ZURBRIGGEN first reached Aconcagua's snowcapped summit by the north face. His British companions, Edward Fitzgerald and Stuart Vines, had abandoned the climb because of altitude sickness. The Englishman EDWARD WHYMPER summited Aconcagua soon afterward. Being the tallest peak in the Americas—taller than Ojos del Salado by 295 feet—Aconcagua has represented a special challenge in the history of MOUNTAIN CLIMBING.

aerial photography

Aerial photography involves taking photographs from aircraft or spacecraft. It is used in mapmaking; studying weather, wildlife, agriculture, urban areas, road systems, and pollution; and locating mineral resources and archaeological ruins. Yet another application is military surveillance and documenting events, such as disasters. The related term *aerial survey* refers to the study of Earth's surface using photographic or other images from aircraft. The term *photogrammetry* refers to the science of making measurements and maps from photographs.

Sometime in the early 20th century, this photographer, apparently hanging from a crane, attempted to obtain an aerial view. (Library of Congress, Prints and Photographs Division [LC-USZ62-61731])

2 AFRICA, EXPLORATION OF

Early aerial photography, starting in the mid-19th century, was conducted from a kite or a BALLOON. Along with advancements in aviation and SPACE EXPLORATION in the 20th century came those in aerial photography. Aerial photography, in conjunction with computers, is especially effective in the making of topographic maps and has allowed for the accurate mapping of most of Earth's surface. Aerial photography has also been used to map the surface of the Moon and other planets and to record geological data.

Africa, exploration of

Africa, the second-largest continent after Asia, covers some 11,677,000 square miles, including its adjacent islands, and makes up almost one-quarter of the world's total land area. It is bounded by the Atlantic Ocean on the west and south; the Indian Ocean and RED SEA on the east; and the MEDITERRANEAN SEA on the north. It lies in both the Northern and Southern Hemispheres, with the EQUATOR running through it. The largest island is Madagascar off the southeast coast in the Indian Ocean.

The African coastline has few indentations, and the coastal plain is generally narrow except on the Mediterranean. The continent consists mostly of a rolling plateau with an average height of some 2,000 feet above sea level. Mountain ranges include the Atlas Mountains in the northwest, the Ruwenzori Mountains in the east, and the Drakensberg Mountains in the southeast. The High Veld, an arid plateau, covers much of South Africa. The Eastern Highlands, with an average height of more than 5,000 feet, are the highest portion of Africa; Mount Kilimanjaro (see KILIMANJARO, MOUNT), the continent's tallest peak, is part of them.

Major rivers include the NILE RIVER in the north, the CONGO RIVER (Zaire River) in equatorial Africa, the NIGER RIVER in the west, and the ZAMBEZI RIVER in the southwest. The largest lakes in eastern central Africa—Lakes Albert, George, Tanganyika, Rudolph, and Victoria—feed the Nile or the Congo. Lake Nyasa in the southeast has an outlet to the Zambezi. Lake Chad in northern central Africa has no outlet but, since it is fed by many streams, remains fresh.

Although mostly in the Tropics, Africa has a variety of climates. Arid regions include the SAHARA DESERT and the Kalahari Desert in the south. Open savannas flank the arid regions. In the western equatorial regions, where there is an abundance of rainfall, can be found dense jungle.

Africa's animal life can be separated into two zones: that in the north, including the Sahara Desert, and the sub-Saharan zone. The northern area has animals similar to those in Europe, such as deer, sheep, hare, and fox. It is south of

the Sahara that the large African mammals are found, such as the elephant, rhinoceros, giraffe, zebra, lion, leopard, cheetah, hyena, baboon, and gorilla.

Some 3,000 ethnic groups have been identified in Africa, speaking more than 1,000 languages. The indigenous Negroid peoples were hunter-gatherers, often organized in villages or tribes. Some of these tribes developed into powerful kingdoms. The most powerful and wide-ranging African people in ancient times were the Egyptians, who farmed along the Nile Valley and delta. North of the Sahara, the aboriginal groups came to be replaced by Arabic peoples migrating from the east and Berbers, a non-Arabic people thought to be from the eastern Mediterranean region. In other parts of Africa many different peoples established powerful kingdoms, such as the kingdoms of Ghana in the fifth century, Mali in the 13th and 14th centuries, and Songhai in the 15th and 16th centuries, all in West Africa. In the 19th century, the Fulani were dominant in the western Sudan, and the Zulu in South Africa.

The exploration of North Africa's coastal areas, separated from Europe by the 36-mile-wide Strait of Gibraltar (see GIBRALTAR, STRAIT OF) in the northwest and actually linked to Asia by the Sinai Peninsula in the northeast, is part of the story of the entire Mediterranean region, with extensive contacts among ancient peoples. In the 15th century, during the EUROPEAN AGE OF EXPLORATION, other coastal areas became charted. Yet much of Africa's interior remained a mystery to other than indigenous peoples until the late 19th century, leading to Africa being known historically as the "Dark Continent."

Ancient Exploration and Migration

Africa holds a special place in the story of humankind since the earliest human life has been traced to there. Moreover, one of the first written languages was developed in North Africa in Egypt in about 6000 B.C., and the wheel was invented there 3,000 years later. HANNU, the first individual explorer known to history, from relief carvings with hieroglyphic text, was from Egypt. In about 2750 B.C., Hannu, sent by Pharaoh Sahure, journeyed 400 miles by way of the Nile River south to the land of PUNT, which extended beyond the southern end of the Red Sea. Even then, Punt was already a center of trade. Hannu arranged for a ship to be built there, then returned home to Egypt and to the king, who had sponsored his trip, bearing gold, silver, myrrh, and ebony (see EGYPTIAN EXPLORATION).

Another early journey of the ancient Egyptians dates to about 2270 B.C., when HERKHUF, a governor in the southern part of Egypt, traveled the Nile to explore central East Africa and trade for the luxury goods that Egypt could not produce itself. Seven centuries later, in about 1492 B.C., the Egyptian queen HATSEPSUT commissioned a trading expedition to the land of Punt. The ancient Egyptians also traded

with the Minoans of the island of Crete. Minoan pottery dating from about 2000 B.C. has been found in Egypt, indicating Minoan voyages along Africa's north coast (see MINOAN EXPLORATION). As for the ancient Greeks, it is known that, by the seventh century B.C., they had established an outpost in the Egyptian port city of Naucratis on the Nile's delta (see GREEK EXPLORATION). Over the next several centuries, the shifting course of the Nile and the ascendancy of the city of Alexandria led to the decline of Naucratis as both a colony and a trading post. There is some evidence to suggest the Greeks were familiar with areas farther west on the north coast of Africa as well. In the mythological *Odyssey*, for example, Homer refers to the "Lotus Eaters." Lotus grows in and is eaten on the Tripoli coast.

Other early voyages to Africa were undertaken by Phoenicians from the eastern Mediterranean, their homeland located roughly where Lebanon is today (see PHOENICIAN EXPLORATION). Known as wide-ranging mariners and traders, as well as colonizers, by the sixth century B.C., they controlled much of Africa's north shore. They also reportedly ventured much farther. In the writings of fifth-century Greek historian HERODOTUS appears an account of a journey commissioned in about 600 B.C. by Pharaoh NECHO II of Egypt. The expedition reportedly traveled down the Red Sea, around the African continent, through the Pillars of Hercules (the modern Strait of Gibraltar), and along the north coast until they arrived home. The crew went ashore to grow provisions, and the trip was said to have lasted three years. Not only does the length of the journey make sense but so do their observations on the relative position of the Sun. Furthermore, the winds and OCEAN CURRENTS would have been favorable for an east-to-west circumnavigation as described by Herodotus. Other ancient explorers reportedly had tried and failed to circumnavigate Africa in the opposite direction, from west to east. In about 485 B.C., a Persian nobleman named Sastapes attempted to atone for a crime by such a journey; his failure to do so resulted in his execution. In the latter part of the second century B.C., Greek EUDOXUS of Cyzicus disappeared during an attempt to sail around Africa from the west.

The fifth-century B.C. Carthaginian HANNO, from the city of Carthage, founded by the Phoenicians near present-day Tunis, was another ancient explorer of Africa. According to his account, as passed down in Greek translation, in about 470 B.C., he commanded 60 GALLEY ships carrying some 30,000 Carthaginians on a mission to establish cities along the West African coast. At present-day Mehdia, Morocco, Hanno founded the city of Thymiaterium. At Cape Cantin, he built a temple to Poseidon, Greek god of the sea. The Carthaginians encountered elephants farther down the coast, passed the Sahara Desert, and went on to establish another colony on what is probably the modern island of Herne. In all, Hanno founded seven cities and is thought to

have voyaged as far south as modern-day Sierra Leone (see CARTHAGINIAN EXPLORATION).

One of the earliest accounts of an expedition to Africa's interior comes from the Greek DIOGENES of the first century A.D. A merchant trading along the east shore of Africa, he claims to have been caught in a storm. Unable to control his direction for 25 days, he eventually managed to land ashore at what is now Dar es Salaam, Tanzania. Diogenes traveled from there into the interior, where he saw two great lakes (probably Lake Victoria and Lake Albert) and snow-covered mountains (probably the Ruwenzori Range), which the second-century PTOLEMY, from the North African city of Alexandria, referred to as the MOUNTAINS OF THE MOON.

The Romans had more extensive contacts with Africa than did the Greeks, in their case through conquest rather than commerce (see ROMAN EXPLORATION). At the conclusion of the three Punic Wars (which ended in 146 B.C. with the burning of Carthage), Rome assumed Carthage's dominance over its territories along much of the Mediterranean. They then consolidated their power by trading with and exacting tribute from conquered peoples. Many of the most significant forays by the Romans into Africa took place during the Augustan Age (48 B.C. to A.D. 68). In 31 B.C., Octavian defeated Marc Antony and Cleopatra and incorporated Egypt into the Roman Empire. In A.D. 29, Petronius led a military campaign to the upper Nile to quell tribal infighting and to assert control in Ethiopia. In A.D. 42, SUE-TONIUS PAULINUS crossed the Atlas Mountains on the northwest coast and explored the fringes of the Sahara. A Roman military expedition of A.D. 61–63 may have gone farther down the Nile than any other previous European trip did, returning with a variety of goods. At its peak in the second century A.D., the Roman Empire controlled the entire North African coast bordered by the Mediterranean, from Egypt to the land just beyond the Strait of Gibraltar, modern-day Morocco.

The first evidence of the movement of peoples in the equatorial regions of Africa dates to the first century A.D. In their drive to dominate the lower portion of the continent, the Bantu-speaking peoples pushed the Mbuti and the San cultures away from the Benue River Valley of modern-day Nigeria. This is the time period when villages developed into powerful political units, such as the kingdoms of Monomotapa and Kongo. Written records are scarce, and knowledge must be reconstructed from ethnographic studies and archaeological findings, but there is little doubt that these migrations and conquests helped shape the present-day ethnic composition and distribution on the African continent.

The Spread of Islam

The next great chapter in the exploration of Africa began with the establishment of Islam in A.D. 622 by the Prophet

4 AFRICA, EXPLORATION OF

Muhammad and continued into the 1300s (see MUSLIM EXPLORATION). The breakup of the Roman Empire by the fifth century had left North Africa vulnerable to conquest. By A.D. 641, the Muslims had taken control of Egypt and begun their trek along the north coast. By the eighth century, they had invaded Morocco. Their zeal came partly from the promise of paradise after death (if death came in the service of Allah), but there is no doubt the missionaries also were spurred on by the prospect of trade. Although Arabs gained control of the lands around Ethiopia, the established Christian communities within that enclave resisted conversion and became isolated. The Arabs introduced camels (and methodical breeding methods) into the Sudan Desert, and they reinvigorated trading routes, increasing trade between Arabia, Egypt, and the Sudan. Islam also expanded into Turkey, Persia, India, and beyond while retaining its foothold in northern Africa.

Increased traffic by mariners along the African coast and the large number of caravans traversing the desert solidified the Arab hold on African trade. Africa had been a source of slaves through ancient times, and the Muslims joined in this trade. Other commodities that proved economically viable to the Arabs included gold and ivory. Salt was so highly valued that it was traded for gold. A source of gold was the western kingdom of Mali. In 1324, after the mansa (or ruler) of Mali, Mansa Musa, an Islamic convert, had made his pilgrimage to Mecca, he gave away so much of the precious metal he caused its value to decrease by 25 percent in Egypt. The Arabs and their fellow Muslims, the Moors of North Africa (who also, from 711 to 1492, held territory on the Iberian Peninsula), had a monopoly on the gold trade. Although they jealously guarded their routes, they faced increasing challenges from Europeans.

One of the great unifying forces of Islam is the obligation of the faithful to make a pilgrimage to the holy city of Mecca in what is now western Saudi Arabia at least once during their lifetime. This Islamic tenet thus broke down barriers of world travel and helped create a cosmopolitan culture. Two Arab travelers known to history, from the 10th century, are historian ABU AL-HASAN ALI AL-MASUDI, who visited Islamic cities in North Africa; and merchant and scholar ABU AL-QASIM IBN ALI AL-NASIBI IBN HAWQAL, who reportedly traveled across the Sahara Desert. ABU ABD ALLAH MUHAMMAD IBN BATTUTAH, active in the 14th century, is the most renowned of all Muslim travelers. Born in Tangier in 1304, by the time of his death in 1378, he may have been the most widely traveled person to that date, covering an estimated 75,000 miles, including all the regions where Islam was practiced. Traveling overland along Africa's north coast, Ibn Battutah made his pilgrimage to the Holy Land in 1325. After studying in Mecca for three years, he visited the port cities on the east coast of Africa. In

1352–53, he made an excursion to Mali, which was then at the height of its powers, and he wrote a detailed account of the trip, *Rihla*, published in 1357.

LEO AFRICANUS was another widely traveled Arab. In the early 16th century, as a diplomat in the service of the sultan of Morocco, he visited countries in North and central Africa. An English edition of his writings on Africa, now commonly known as *Description of Africa*, published in 1600, became the primary source for information on lands south of the Sahara in the Sudan and the city of TIMBUKTU.

Early Portuguese Expeditions

HENRY THE NAVIGATOR, prince of Portugal, was born in 1394, 17 years after King Fernando I had begun intensive efforts to enhance Portuguese trading enterprises. Among other achievements, that king had developed an innovative form of maritime insurance and had distributed free lumber for the production of any ships over 100 tons. Before he was 20, the young prince had helped capture the Moroccan city of Ceuta; by the time he was 26, Henry had been named Grand Master of the Order of Christ, a neo-Crusader group sponsored by the pope. His association with the Order of Christ aided two of Henry's goals: It gave him the opportunity to advance religious conversion (all Henry's ships bore sails with red crosses), and it provided him with funds to finance further explorations.

Henry established a school of navigation and geographic research at Sagres, and he set to work gathering information on the seas beyond his homeland (see NAVIGATION AND EXPLORATION). The school had strict policies on secrecy, and violators faced death. This interest in secrecy was born in nationalism; the Portuguese thought they needed to control their hard-won knowledge if they were to compete with other, more powerful European nations. Records of some expeditions were entirely destroyed by the Portuguese, and data on others remains known only to a small academic community to this day.

Prince Henry faced both physical barriers and psychological barriers in persuading his sailors to explore the unknown reaches of the west coast of Africa. To the medieval mind, Europe was a temperate land placed between the eternal cold of the north and the intense heat of the south, where the Sun came so close to Earth that the sea was at a continuous boil. These boiling waters of the middle were considered an impenetrable barrier to the lands of the Southern Hemisphere. In fact, the West African coast off the Sahara was dubbed the "Green Sea of Darkness" by the Arabs. The currents struck the shore in a manner very dangerous to ships, and the wind-borne sand of the desert often decreased visibility.

By the 14th century, the existence of the CANARY ISLANDS, 70 miles from Africa's northwest coast, was well known. Among the first accomplishments of Henry's

mariners was the discovery in 1418 of the Madeira Islands to the northwest of the Canaries, much farther out to sea. The founding of his school and these early expeditions can be considered the start of the European age of exploration.

A major goal of the Portuguese of this period was to sail beyond Cape Bojador—the “Bulging Cape”—located on a particularly dangerous stretch of coast on what is now Western Sahara, and then known to Arabs as Abu Khatar, “the father of danger.” Henry recruited an international crew of experienced seamen and sent them off. It took at least 14 attempts before the Portuguese navigator GIL EANNES finally succeeded in 1434. The fact that the “Green Sea of Darkness” could be navigated reinvigorated Prince Henry’s naval academy, and Eannes was sent out again. This time he landed at a bay where he saw tracks of humans and camels. In 1435, AFONSO GONÇALVES BALDAYA traveled even farther, encountering native people, who injured one of his crew. Baldaya retreated, then continued to an area south of the TROPIC OF CANCER, to the north of Cape Blanco. In 1441, NUÑO TRISTÃO reached Cape Blanco.

In 1443, Prince Henry obtained special dispensations from the pope, including the exclusive right to sail past Cape Bojador. Determined to beat back the Muslims, bring Christianity to pagan tribes, and establish direct links with the gold trade, Henry sponsored even more ambitious maritime expeditions. Another dream of his was to locate PRESTER JOHN, a legendary Christian ruler whose name had endured for centuries as possibly sympathetic to European interests in Asia and Africa.

In 1444, Nuño Tristão reached the Senegal River Delta, the green part of Africa beyond the barren desert coastline. It was there that Muslim power ended and tribal cultures held sway. In 1444–45, DINÍS DIAS reached the westernmost point of Africa and named it Cape Verde. It was during this period that the Portuguese entered the institutionalized SLAVE TRADE. Slave ships would begin frequenting these coastal areas.

One of the first interior journeys of this period, in 1455, was made by the Venetian ALVISE DA CADAMOSTO. Prince Henry commissioned him to explore the trade routes that wound through Mauritania. In Mauritania, silver and copper were exchanged for slaves and gold from farther inland, and salt was traded for gold. When he sailed even farther south, to the mouth of the Gambia River, Cadamosto became one of the first Europeans to see the Southern Cross, a constellation not visible from the Northern Hemisphere. The next year, on a subsequent expedition, Cadamosto reached an island group directly to the west of Cape Verde, to which he gave the same name.

The last significant Portuguese journey under Prince Henry’s sponsorship took place in 1458, when DIOGO GOMES traveled up the Gambia River. He met a king interested in Christianity, obtained some gold, and learned about

gold mines in Sierra Leone. This trip resulted in an influx of Portuguese missionaries and brought new life to the hope of profitable commercial ventures in Africa.

By the time of Prince Henry’s death in 1460, Portuguese explorers had reached as far south as Sierra Leone. The next Portuguese explorer of note was FERNÃO GOMES, who was granted exclusive trading rights along the coast of Guinea by King Alfonso in 1469. The contract was a privilege of unknown value, and it was up to Gomes to make it lucrative. But sailing south of the Gambia River below Cape Verde proved difficult. For five years, Gomes tried to explore the coastline south of Africa’s western bulge. He encountered intense winds, tornadoes, and unpredictable fog, and his attempts to land were hampered by heavy surf and the shallow coastal waters of the continental shelf. Although Gomes succeeded in describing the south coast of Africa’s bulge, his contract with the king was not renewed.

The Portuguese success in Africa led other European countries to challenge Portugal’s monopoly there. The 1470s saw incursions into Africa by the English, the Flemish, and, most vexing of all to the Portuguese, the Spanish. In 1479, after losing a war with Spain, Portugal negotiated the Treaty of Alcacovas, which allowed it to retain its possessions in Africa. Portugal soon moved to assert control of its territories by building factory-fortresses, facilities where ships were repaired and resupplied and trade goods gathered from the African interior were stored for shipment back home. Among the most important of these were Elmina, located just east of Cape Three Points on the Gold Coast, and Gato, built in Benin. These ports soon became profitable centers where gold, ivory, pepper, and palm oil changed hands. These ports also were associated with such frightening diseases as malaria, and they inspired one of Europe’s enduring nicknames for Africa: “the white man’s grave.”

The next significant travels by the Portuguese were credited to DIOGO CÃO, sponsored by King John I, in 1482 and 1485. A member of Prince Henry’s retinue, Cão had studied at Henry’s school at Sagres and was an experienced seaman by the time he was given command of these two expeditions. Sailing farther down the coast in the Southern Hemisphere than any before him, he came upon the mouth of the Congo River. He sent a small group of men up the river, where he hoped to make contact with Prester John and to acquire gold. Cão continued sailing southward while the men traveled inland. He found Africa to be larger than imagined and, after traveling 500 miles beyond the Congo, decided to backtrack. He returned to the river but could not find his men. Instead, he took several princes from the region back with him to Portugal, where they were well treated. On the follow-up trip in 1485, the African princes were returned home, and Cão recovered his men. He then traveled even farther down the coast, giving subsequent

6 AFRICA, EXPLORATION OF

explorers an idea of the great distances involved in sailing around the continent.

Because of rumors of a Christian ruler in the interior, interest in the fabled Prester John was once again revived. Under the auspices of King John II, a delegation of two was formed to try to locate him. PERO DA COVILHÃ would travel first to the Arab lands, then to India, and finally back to Africa, while Afonso de Pavia, an Arabic speaker from the Canary Islands, would scout in Ethiopia. While traveling through Egypt, disguised as Muslims, they arrived in Suakin, Sudan's main port. Pavia disappeared there; Covilhã sailed on to India. Upon his return to Africa, Covilhã made his way to Ethiopia in 1493, where he was detained by a ruler—a Coptic Christian, but not the legendary figure Prester John. Twenty-seven years later, a Portuguese official reported seeing Covilhã there, apparently living comfortably.

Around the Cape of Good Hope

Even in the 1400s, it was still unclear to Europeans whether Africa was entirely surrounded by water. Earlier geographers had speculated the southern part of the continent might be connected to another large landmass, possibly the GREAT SOUTHERN CONTINENT, or Terra Australis. However, the dream of a sea route to the SPICE ISLANDS (the Moluccas) of the East, bypassing Arab merchants controlling the trade—a possibility envisioned by Henry the Navigator—remained extremely alluring.

In 1487, the experienced mariner BARTOLOMEU DIAS set out with three ships to find the southernmost point of Africa and possibly a route to India. By early January 1488, Dias and his crew found themselves in inhospitable southern waters. After being battered about, they eventually made land at Mossel Bay, an inlet of the Indian Ocean, then continued on to the Great Fish River. At that point, his men became restless and persuaded him to turn back. On the return trip, observing a cape and taking notice of the readings in his logbook, Dias realized he had rounded the southern tip of Africa. He set up a marker at the CAPE OF GOOD HOPE, claimed the land for Portugal, and returned to Lisbon in December 1488.

Instability between Portugal and the recently united lands of Aragon and Castile (Spain) delayed the next voyage by several years. In 1494, King John II of Portugal signed the Treaty of Tordesillas with Spain, securing (at least on paper) the rights for the sea lane to India. John died the following year and was succeeded by Manuel I. King Manuel I selected VASCO DA GAMA, a high-ranking naval officer and member of the royal staff, to establish ties with the rulers of the Orient. Da Gama decided the expedition needed larger vessels than those used by Dias if the men were to successfully round the tip and make the long journey.

The expedition of four ships set sail in July 1497. After the first leg of the journey, they spent a week in the Cape

Verde Islands taking on fresh supplies and repairing damage to their ships. Next, to avoid the DOLDRUMS at the equator, the explorers cut a wide circular path southward, away from the coastline. In early November, they made landfall at Mossel Bay. The expedition had been on the open ocean for 96 days, a new record for Europeans. The ships then stayed closer to shore, meeting and exchanging small items with the native peoples. The winds and the weather made it slow going, and then SCURVY struck. The disease was not well understood at the time, and da Gama advised his men to cut out their sores with a knife. Many died during this part of the journey. In February 1498, they landed at Mozambique and took on much-needed fresh food. The Portuguese were now in Arab territory. They continued on to the port of Malindi in present-day Kenya, an active trading hub, where the visitors were well received and where they hired a Moor to guide them to India, their final destination. After waiting for the monsoon winds to become favorable, the fleet set out across the Indian Ocean and reached the west coast of India in May. Unfortunately for the Europeans, the experienced merchants in Calicut, the trading center on the Malabar Coast, were uninterested in the goods they had brought to trade. After trying unsuccessfully for three months to establish an outpost, da Gama and his entourage eventually gave up and set sail across the Indian Ocean in August.

The winds were not so favorable on this leg of the trip. Scurvy killed another 30 sailors, and it was only with luck that they made it back to Malindi. They then abandoned one of the ships, continued down the east coast of Africa, reaching the Cape of Good Hope in March 1499 and making it back to Portugal in September 1499. Da Gama and his remaining crew were warmly welcomed, not only because they had succeeded at reaching (and returning from) India, but also because they could offer a rough picture of Africa's east coast.

King Manuel I did not wait to take advantage of the route his country had been seeking for nearly a century. The next year, 1500, he sent out a fleet of 13 ships under the command of PEDRO ÁLVARS CABRAL. After traveling farther west than instructed (there is some debate about whether this detour was deliberate), Cabral reached the continent of South America, becoming the first European to land in Brazil, which he duly claimed for Portugal. In any case, Cabral continued on and came upon stormy weather at the Cape of Good Hope. Four ships were lost, including one with Bartolomeu Dias, who had sighted and identified the southernmost tip of Africa a dozen years earlier. Making several stops on the way, the remaining ships landed in Calicut, India. Again, the Portuguese were rebuffed in their efforts to trade with Arab merchants, and a post they established was attacked. In response, Cabral destroyed Arab trading vessels and bombarded Calicut. Farther south at the

port of Cochin, he did manage to secure a cargo of spices before returning home to Portugal. Trade had been opened with the East, but so had warfare. The Portuguese then turned their attention to applying their naval power to establish their dominance in the Spice Islands and their interest in Africa waned.

The Growing Slave Trade

European exploration and colony building on the other side of the world fostered interest in the African slave trade. The Europeans looked to Africa for cheap labor for their newly established plantations and mines in the WEST INDIES and the Americas. Beginning in the 1560s, the English and French began to raid Portuguese slave ships; after Portugal was sufficiently weakened, other European countries established their own “legitimate” trading posts on the African coast. SIR JOHN HAWKINS, an Englishman, was one of the early innovators of the slave trade. In 1562, he took a shipload of slaves from Sierra Leone to the island of Hispaniola (present-day Haiti and the Dominican Republic), where he traded them for sugar and other goods. He then set sail for England, thus inaugurating the infamous triangular trade. In the last two decades of the 16th century, Queen Elizabeth I chartered a number of companies to do business on the African coast from the Mediterranean to Sierra Leone. The Dutch established their first outpost in 1612 in Guinea. Other European nations built trading centers in Africa throughout the 1600s, and the African slave trade continued for centuries.

The Challenge of the Interior

When it comes to understanding the subsequent exploration of interior Africa, it is instructive to recall the formidable barriers facing the Europeans. The vast Sahara Desert, spreading over 3.3 million square miles, covered almost all of northern Africa, extending 3,000 miles west to east and between 800 and 1,200 miles north to south. The temperature could vary by 80 degrees over a 12-hour period, and water was scarce. Travelers needed to know where the next oasis could be found, and they needed to know which foods and clothes were appropriate. Arab explorers, accustomed to a similar climate in the Middle East, had the advantage over Europeans. In addition, because Muslims in the Sahara were hostile to Europeans, European visitors were forced to disguise themselves as Muslims to travel in the region.

Africa’s tropical regions imposed another set of hardships on Europeans. The heat and humidity demanded new approaches to dress and equipment, and the dense vegetation made clearing trails for exploratory expeditions (which typically included soldiers, native guides, porters, and pack animals) quite difficult. Most devastating of all, the African climate provided fertile breeding grounds for insects harboring diseases new to Europeans. These included yellow

fever, encephalitis (sleeping sickness), and the dreaded malaria. It was not until the second half of the 19th century that Europeans learned to use quinine and mosquito netting to manage this often fatal disease. Moreover, the tsetse fly carried a protozoan that was destructive to the native livestock used to carry supplies, and frequently all the animals on an expedition would succumb to it (see DISEASE AND EXPLORATION).

The fact that much of Africa is located on a plateau did not make traveling any easier. While it is true the rivers wound their way from the highlands to the sea, they did not provide easy access to the continent’s interior. As many explorers discovered, the rivers and their environs could be maddening barriers. The Falls, or Cataracts of Aswan, presented a challenge to would-be explorers of the Nile. The Nile also clogged with sudd (literally, “obstruction” in Arabic), large masses of rotting vegetation floating downstream. The Niger River proved just as confounding. Europeans were familiar with certain inland portions of that 2,600-mile river, but locating its outlet proved difficult. In fact, the Niger empties into a vast delta region, a swamp where it is nearly impossible to discern the direction of the current. The Congo River could be navigated from its mouth, but, after 100 miles, it formed a long stretch of falls known as the “Cauldron of Hell,” where boats smashed on its rocks or were sucked into whirlpools. The Zambezi River was particularly uninviting at its mouth, where the pounding surf and swirling coastal waters created shifting sandbars. Upstream, explorers faced dangerous rapids and waterfalls.

Europeans also faced resistance from aboriginal peoples. Africans had been victimized by Arabs for millennia and were naturally suspicious of outsiders. The prejudices of Europeans, along with their guns and diseases (especially smallpox), confirmed native peoples’ suspicions.

After the sea route to the Spice Islands was established in 1500, European exploration of Africa’s interior slowed for more than 150 years. The exception to this was Catholic missionaries. In the early 1600s, the Spanish Jesuit PEDRO PÁEZ was active in Ethiopia and searched for the source of the Nile, while other Jesuits explored parts of present-day Zimbabwe and Angola.

Mysteries of Africa

During the 18th century, the concept of the “noble savage” came into vogue in Europe, and the British became fascinated with Africa, not for economic reasons, but out of intellectual curiosity. Much of the credit for this new enthusiasm belongs to JAMES BRUCE. A Scotsman who grew up in England, Bruce headed to Africa in 1768 with the goal of resolving the mystery of the source of the Nile. He and his assistant, Italian artist Luigi Balugani, traveled from Alexandria to Aswan, where the presence of hostile tribes caused them to head eastward across the desert to the Red

Sea. They then took a boat down the Red Sea to Ethiopia. The pair then resumed their inland trek to the Ethiopian capital of Gondar, where Bruce earned royal favor by instituting sanitary measures that helped stem an outbreak of smallpox at the palace. In late 1770, he left Gondar, moving northwestward until he came upon the Springs of Geesh emerging from underground streams. He mistakenly took this to be the source of the Nile and named it the Fountains of the Nile. In fact, he had located the source of the Blue Nile, a principal tributary of the Nile. Bruce returned home in 1774, where his findings were received skeptically. Nonetheless, he was elected a fellow of the ROYAL SOCIETY, England's oldest scientific organization, and his five-volume work, *Travels to Discover the Source of the Nile*, was praised.

In June 1788, nine members of an exclusive dining club in London founded the Association for Promoting the Discovery of the Interior Parts of Africa, which is better known as the AFRICAN ASSOCIATION. The leader of the organization, SIR JOSEPH BANKS, had excellent exploration credentials: He was then president of the Royal Society, and he had been a naturalist on JAMES COOK's first expedition. The questions that most interested members of the African Association concerned Timbuktu and the nearby Niger River. Timbuktu, the locus of trade for the kingdom of Mali, had been described in writings centuries earlier, but no European had ever seen it. The Niger captured the imagination because neither the source nor the outlet of that long river were known.

That year, 1788, the African Association soon dispatched two explorers. American JOHN LEDYARD was sent to travel westward from Cairo, and Englishman Simon Lucas was directed to begin his journey in Tripoli and head southward across the Sahara. Both trips relied on the spirit of the travelers, since the gentry of the African Association were parsimonious with their resources. Unfortunately, spirit could not make up for the lack of planning and modest size of these expeditions. Ledyard took ill and died in Cairo. Regional conflicts waging several hundred miles south of Tripoli forced Lucas into an early retreat. These initial failures mobilized the African Association to change its approach, and the group decided to avoid Muslim-controlled territory whenever possible.

The first expedition under their sponsorship to explore new territory was made by British army officer DANIEL HOUGHTON in 1790. Houghton began his journey at the mouth of the Gambia, which he took upstream for more than a hundred miles. He then crossed overland to the Senegal River. At this point, he was taken into the desert, robbed, and killed, but the reports that came back to his sponsors suggested he had penetrated the region farther than had any European before him. Information he had gathered on the Niger also helped subsequent explorers.

The Niger River and Timbuktu

MUNGO PARK, a Scottish surgeon, was the African Association's next recruit. The adventure-loving Park had acquired navigational skills on a trip to Sumatra while in the employ of the BRITISH EAST INDIA COMPANY. In May 1795, he began retracing Houghton's footsteps in search of the Niger. Despite resistance from Moors, who controlled this region, as well as local African tribes, he successfully traveled eastward and reached the Niger River at Segou in July 1795. He became the first European to see the Niger that far inland, which he described as "broad as the Thames at Westminster." He also noted that the Niger flowed eastward. Continuing in his mission to find Timbuktu, Park again followed the river into lands controlled by Moors. In August 1796, he was robbed of everything he had, including his clothes. In Silla, only 400 miles shy of his goal, but lacking supplies, Mungo Park turned back. After nearly a year, the explorer arrived at the mouth of the Gambia, where he boarded a vessel bound for America. In South Carolina, he secured passage on a ship to England, where he landed in December 1797.

Park had been gone for two and a half years and had been given up for dead, so his reappearance was greeted with delight by the British public. Two years later, his book, *Travels in the Interior Parts of Africa*, became a best-seller. Park married, had children, and opened a medical practice in Scotland. He also set to work developing a theory on the course of the Niger. Integrating his personal experiences and geographic knowledge with ideas from fellow Scotsman George Maxwell, Mungo surmised the Niger River first flows east for a distance, then turns south and then, farther on, turns southwest. Park's hypothesis was correct, although he would perish before proving it.

In an effort to test his theory, Park, with some help from the British government, put together a large expedition consisting of carpenters, soldiers, and sailors, many of whom were convicts who were to receive pardons upon the completion of the expedition. They were unable to induce any native people to accompany them as they made their way up the Gambia in March 1805. At the town of Kayee, they found and hired Issaco, an English-speaking guide who proved invaluable. Nonetheless, as they traveled east, the rainy season, disease, and an attack by the Moors took their toll. By the time the expedition made it to the Niger, only 10 of the original 40 men were still alive. Finally arriving in Segou, the group came into contact with unfriendly tribesmen, and Park's brother-in-law succumbed to illness. Issaco was sent back to the coast with the news in November 1805, and Park and the remaining members of his expedition set sail, never to be heard from again. In 1808, Issaco agreed to retrace their journey and attempt to learn what had become of the expedition. According to his reports, Park had suffered continual assaults along the course of the river but

had managed to add 1,500 miles to the trek. His travels ended at the Bussa Rapids (now covered by Lake Kainji), where he and his group were overcome and killed by tribesmen. There was no physical evidence to support Issaco's accounts, but even if the final leg of the trip had been shorter, Park would still be counted one of the great pioneers in the history of African exploration.

British naval officer HUGH CLAPPERTON continued the European efforts to master the Niger River. As part of the Bornu Mission of 1821–25, sponsored by the British government, Clapperton, together with WALTER OUDNEY and DIXON DENHAM, pioneered the use of Tripoli as a staging area for African exploration. Although their primary objective was to study the Niger, the Bornu Mission covered a great deal of other territory. Traveling south and west across the Sahara, the expedition first investigated the Ahaggar Mountains. In February 1823, they made the European discovery of Lake Chad. The following year, on his way to the Niger, Clapperton reached the city of Sokoto, where slave traders prevented him from further exploration. He returned to England by traveling back through the Sahara, then mounted a second expedition later the same year, 1825. This time he made the approach from the Bight of Benin in the south. This new route led him to the Niger River at Bussa. He then explored inland, revisiting Sokoto, where he died from illness in 1827.

Clapperton had been accompanied on his last journey by RICHARD LEMON LANDER. Together with his brother John, Lander traveled to Bussa in 1830. They first traveled 100 miles up the Niger River and then began a dangerous CANOE trip down it. They followed the river to its outlet, a swampy delta with no discernible flow. Although Richard Lander was then held captive by native peoples of the delta until a large ransom was paid, he had determined the exact mouth of the Niger River. Four years later, Lander was attacked and killed on a trading mission up the Niger.

Meanwhile, in 1825, ALEXANDER GORDON LAING, a Scottish-born British army officer, was sent to make contact with the ancient city of Timbuktu. Laing followed Clapperton's route from Tripoli on the north coast of Africa and crossed the Sahara Desert. Attacked and severely wounded just outside Timbuktu, he pressed on, becoming the first European known to reach that city. After spending a month there, he headed home but was murdered en route, probably by Tuareg tribesmen. Although Laing had reached Timbuktu in 1826, reports of his visit did not reach Europe until two years after his death.

Its remote location and centuries of strong Muslim control had made Timbuktu more legendary than real to Europeans, and rumors of the city captured the European imagination. Frenchman RENÉ-AUGUSTE CAILLIÉ learned Arabic, studied Islam, and disguised himself as an Egyptian who had been held captive in France in order to make

his way there in 1828. His ruse gave him safe passage through various lands, and he spent two weeks in Timbuktu before returning home, disappointed by the humble state of the city. His compatriots had difficulty accepting his accounts.

In 1830, the ROYAL GEOGRAPHICAL SOCIETY was founded in England by SIR JOHN BARROW and others. The next year, it merged with the African Association. The European exploration of Africa would continue, with much of the activity British-sponsored.

Southern Africa

Of all the lands of Africa, the countryside and climate most familiar to the European were those in South Africa. During the centuries that the major European powers had been preoccupied with trade, the southernmost region of Africa was viewed as a way station for the repair and resupply of ships. To do this effectively meant persuading farmers and craftspeople to establish settlements there, but the chartered companies who needed the way station were slow to invest. Finally, in 1657, with their colony on the verge of failure, the DUTCH EAST INDIA COMPANY worked out a plan allowing their settlers to own land in exchange for provisioning ships. These Dutch and French settlers came to be known as the Boers (literally "farmers" in Dutch). Once the Boers were permitted to own land, they enslaved the native Hottentots, claiming this was justified—even a divine right—according to their Calvinist religion. The Boers then proceeded to use native slave labor to create farms and establish cattle herds, and they developed their own subculture, including their own language, Afrikaans. In 1806, after the Napoleonic Wars, Britain assumed control of the Boer territory. Twenty-seven years later, in 1833, Britain outlawed slavery in its colonies. This, combined with the British move to physically circumscribe Boer lands, resulted in rebellion. Between 1835 and 1843, more than 10,000 Boers left the cape and headed northward in what came to be known as the Great Trek. During these years, the Boers defeated the Bantu-speaking Zulus in a series of battles, and they went on to establish more settlements.

Scotsman DAVID LIVINGSTONE arrived on the continent in 1841, a few years after these battles. A strict Presbyterian with some medical training, Livingstone came to Africa as a missionary. After arriving at the Kuruman mission on the southern border of the Kalahari Desert, Livingstone established his own outpost among the Kwena at Kolobengto to the northeast. Considerable tension existed between Livingstone and the Boers: He strongly disapproved of their slavery, and the Boers destroyed his house, threatened his friends, and pushed him north. By 1842, he had traveled farther north into the treacherous Kalahari region than any other European to date, and he had learned a great deal about local languages and customs.

Livingstone began his first true journeys of exploration in 1849, when he moved north across the Kalahari Desert in search of new territory to conduct his missionary activities and influence politics. That year, accompanied by British sportsman William Oswell, he made the European discovery of Lake Ngami. Two years later, this time accompanied by his wife, MARY MOFFAT LIVINGSTONE, daughter of the British missionaries to Africa, ROBERT MOFFAT and MARY MOFFAT, he made a second crossing of the Kalahari and reached a tributary of the upper Zambezi River. Livingstone received recognition and money from the British Royal Geographical Society for having reached Lake Ngami, and he began his lifelong association with that group.

In November 1853, Livingstone began the first known European crossing of the southern portion of Africa from west to east. Starting from Linyanti, the capital of the Makololo kingdom, he followed the Upper Zambezi north and then west to the port of Luanda on the Atlantic Ocean. The expedition traversed more than 1,500 miles of uncharted land over six months, but it was a very difficult trip, with food in short supply and fever plaguing the members of the party, including Livingstone. Livingstone was impressed, however, with the friendliness of many of the tribes he encountered. After a three-month rest in Luanda, he headed eastward in fall 1854. A year later, he was back in Linyanti, again beset by fever. However, he pressed on, again heading east. In November 1855, on the Zambezi River, Livingstone made the European discovery of what he named Victoria Falls. He then crossed the Kafue and Luangwa tributaries and ended his journey near the mouth of the Quelimane River in May 1856. In December 1856, Livingstone returned to England, where he was lauded as the new hero of African exploration. Accounts of his travels were instant best-sellers, and his missionary zeal at public appearances inspired future explorers.

In 1858, Livingstone and his family returned to Africa. Outfitted with a paddle-wheel steamer named the *Ma-Robert* (in honor of Livingstone's wife, mother of Robert), the well-equipped expedition, sponsored by the British government, began investigating the Zambezi River. They were halted at the Quebrabasa Rapids but continued their explorations on the Shire River, another Zambezi tributary. In 1859, accompanied by the naturalist John Kirk, Livingstone traveled overland and made the European discovery of Lake Nyasa (present-day Lake Malawi). The next goal was the exploration of the Ruvuma River, east of Lake Nyasa. In 1862, while on the Zambezi, his wife succumbed to tropical fever. With his basic work on the Zambezi completed, Livingstone again returned to England to rest.

Source of the Nile

Other explorers meanwhile had been continuing the search for the source of the Nile. The well-traveled Englishman

SIR RICHARD FRANCIS BURTON and a former soldier in the British army, JOHN HANNING SPEKE, commissioned by the Royal Geographical Society, set about the task in 1856 with a new approach. Instead of following the river from its mouth, which had been done many times in the previous century, they used reports of lakes to the south to estimate the location of its source and then traveled inland from the east coast. After becoming the first Europeans to see Lake Tanganyika, the world's longest freshwater lake, and visiting Ujiji in spring 1858, they headed back to the coast. While Burton was recovering from illness in Tabora, Speke struck out on his own and made the European discovery of Lake Victoria, Africa's largest freshwater lake. Although he had little evidence, Speke declared this to be the source of the Nile. Burton and Speke had never been close, and their relationship rapidly deteriorated after Speke's claim, which Burton disputed. Speke returned to England before Burton, telling of his findings and igniting a controversy.

Speke's flimsy evidence necessitated another expedition. In 1860, Speke, accompanied by JAMES AUGUSTUS GRANT, retraced his path and returned to Lake Victoria. In July 1862, after traveling along the lake's shores, they discovered where the Nile left the lake and named it Ripon Falls. The men followed this outlet, the Victoria Nile, as far as Lake Kyoga, but left the river before seeing it connect with Lake Albert. This gap in information perpetuated the controversy. Speke did not live to be proven correct. On the eve of an 1864 debate over the Nile with his former partner Burton, he was killed in a hunting accident. It fell to the British couple SIR SAMUEL WHITE BAKER and FLORENCE BAKER to describe the river's course between the Victoria Nile and the Albert Nile, after they completed their own expedition in 1865.

While David Livingstone is most closely associated with the Zambezi River, his disciple, Anglo-American journalist SIR HENRY MORTON STANLEY, is linked to the Congo, as both explorer and developer. Livingstone's final years in Africa, from 1866 to 1873, involved a number of journeys around the lakes north of the Zambezi River. He was interested in describing their relationships with the major rivers, particularly the Nile. In April 1867, he reached Lake Tanganyika. Despite recurring bouts of illness, Livingstone continued exploring and came upon Lake Mweru in November 1867. In July 1868, he made the European discovery of Lake Bangweulu, a reservoir between the Chambezi and Lualaba Rivers, which form the Upper Congo. He next visited Ujiji, a center of the slave trade on the east shores of Lake Tanganyika, which reenergized his commitment to eradicate such trafficking. In November 1871, low on supplies and without European contact for more than three years, Livingstone was found in Ujiji by Stanley. Together the men explored Lake Tanganyika and determined it was not the source of the Nile. Stanley went back to England to write his

adventures while Livingstone labored on. In May 1873, near Tabora on the Lualaba River, Livingstone died of dysentery. His African companions Susi and Chuma carried his body to the east coast, where it was returned to England and buried in Westminster Abbey.

That year, Englishman VERNEY LOVETT CAMERON was sent by the Royal Geographical Society to take supplies to the missing Livingstone and to do some exploring. While in Tabora in October, Cameron learned Livingstone had died five months earlier. Cameron arranged to have the late explorer's journals returned to England, and then he continued to investigate the regions containing the Nile and Congo watersheds. He learned that the Lukuga River was the outlet to Lake Tanganyika, and he helped define the separation between the two great rivers. His work on the Lualaba River, which converges with the Lukuga, helped set the stage for Stanley's later exploration of the Congo River. His mapping skills were excellent, and, in the course of his travels, he became the first European to make an east-to-west equatorial crossing of the African continent.

After Livingstone's death, Stanley returned to Africa in 1874 to complete work on his mentor's projects. He traveled to Lake Victoria, where he confirmed Speke's claim that it was indeed the source of the Nile, and then circumnavigated Lake Tanganyika, confirming that lake was not linked to the Nile. Stanley then headed west to follow the Congo River from its headwaters at the Lualaba River to its outlet in the Atlantic. This task was rife with dangers ranging from cannibalistic and hostile native peoples along the river's banks to a 200-mile stretch of rapids. But Stanley persevered. He named Livingstone Falls and arrived on the west coast of Africa in August 1877, more than two and a half years later.

Stanley went on to even more arduous adventures in the Congo region. In 1879, after England revealed it had little interest in the region, Stanley signed on with Belgium's King Leopold II to build a road. In the meantime, Italian-born Frenchman PIERRE-PAUL-FRANÇOIS-CAMILLE SAVORGNAN DE BRAZZA had convinced France that the area was worthy of attention, if for no other reason than to keep other countries from claiming too large a territory. Exploring from the north of the Congo River, he arrived at the north shore of Stanley Pool (now Malebo Pool) as Stanley was building a road up from the lower Congo to that same point, hacking his way through the jungle. The Frenchman's treaty with the local chief formed the basis for the colony of French Equatorial Africa. The lands where Leopold retained control, which became the Belgian Congo, experienced a period of ruthless enslavement, where nearly 1 million Africans were killed in Leopold's quest to harvest rubber.

Natural Science

A number of explorers made their contribution to African exploration through a focus on science (see NATURAL SCI-

ENCE AND EXPLORATION). Swedes CARL PETER THUNBERG and ANDERS SPARRMAN, both students of renowned Swedish botanist Carl Linnaeus, conducted studies north of Cape Town in South Africa, in the early 1770s. Thunberg would become known as the "father of Cape Botany."

The Englishman SIR FRANCIS GALTON, a cousin of CHARLES ROBERT DARWIN, traveled in southwestern Africa along with amateur naturalist Karl Johan (Charles) Anderson, in 1850–52, to pursue studies in geography and wildlife. Galton's work *Narrative of an Explorer in Tropical South Africa* was widely read in Europe.

German GEORG AUGUST SCHWEINFURTH had a broad education in botany, zoology, and geology, and he became interested in other disciplines, such as anthropology, as his career progressed. Schweinfurth was also an artist who made drawings of plants and animals he encountered on his travels in the 1860s–70s. In his expedition of 1868–71, he explored the central tropical regions of the continent. He delineated the watersheds between the Nile and the Congo and made the European discovery of the Uele River (which feeds the Congo). Schweinfurth was the first to make contact with the Mbuti of the Congo, and he studied a number of other tribes as well. His two-volume book, *The Heart of Africa*, represented a significant leap forward in the European understanding of the diversity of life in Africa.

The travels of another German, OSKAR LENZ, a geologist, also added to the European knowledge of Africa. After three years in central Africa, he turned his attention to the Sahara Desert. In 1879, he traveled from Casablanca in Morocco, over the Grand Atlas Mountains and south through the Sahara to Timbuktu. In 1885, he made a two-year exploration of the Congo region, and he is noted as one of a handful, along with the Scottish geologist JOSEPH THOMSON, who traveled widely between 1879 and 1890, to visit both tropical and desert regions on the continent.

From Exploration to Colonization

In 1886–89, Hungarians LUDWIG VON HOEHNEL and SAMUEL TELEKI made the European discovery of Lake Rudolf, the Omo River, and Lake Stefanie in northern Kenya and southern Ethiopia, helping in the mapping of the "Dark Continent." By this time, Africa's major geographic mysteries had been solved, and the era of colonization had begun. From 1880 to 1912, the entire continent came under the domination of one European country or another. The French sought to build a railway across the Sahara, encountering fierce resistance from the nomadic peoples they tried to dominate. The British consolidated their control over South Africa by winning the South African War (1899–1902). Until the treaty ending World War I, Germany possessed Togoland, the Cameroons, German South-West Africa, and German East Africa. Italy held Libya, Eritrea, and Italian Somaliland. Many of the borders of these

countries appear arbitrary, negotiated in Europe without consideration of geography or the ethnicity and history of the native peoples. Undoubtedly, the strategy of “divide and conquer” was employed to keep tribes from united action and to encourage in-fighting among subjugated groups. The refugee movements and political turmoil of today are the continuing legacy of colonial Africa. Although the last of the African colonies gained their political independence in the mid-1970s, the economic independence of most of the countries on the continent has yet to be achieved.

African Association (Association for Promoting the Discovery of the Interior Parts of Africa)

Due to the excitement generated by the explorations of the Scotsman JAMES BRUCE, and with the recent loss of their colonies in America, a number of Englishmen of high position founded the Association for Promoting the Discovery of the Interior Parts of Africa in London on June 9, 1788. It would become known simply as the African Association. The principal founder was SIR JOSEPH BANKS, a naturalist who had been the chief scientist on JAMES COOK’S first expedition to the South Pacific Ocean in 1768–71 and was then president of the ROYAL SOCIETY, Great Britain’s oldest and most prestigious scientific organization.

The immediate goals of the organization were the mapping of the NIGER RIVER and locating the city of TIMBUKTU in the kingdom of Mali, the supposed center of trade in West Africa. The British government, seeking opportunities for colonization as a result of British explorations, worked closely with the African Association. The first two expeditions dispatched to Africa—that of American JOHN LEDYARD and Englishman Simon Lucas—failed in their intended goals, with the death of Ledyard and Lucas being forced to turn back because of a regional conflict.

The first important expedition sponsored by the African Association was that of British army officer DANIEL HOUGHTON in 1790–91. He traveled on the Gambia, Senegal, and Niger Rivers and is credited with being the first to record that the Niger flowed from west to east. FRIEDRICH CONRAD HORNEMANN, a German who had long been fascinated with Africa, headed up another important trip for the association in 1798–1801. Leaving from Cairo, he was the first European in modern history to cross the SAHARA DESERT, and, based on accounts from his journals, found after his death in the field and later published, he was probably the first European to see Lake Chad in the northwestern corner of present-day Nigeria.

Perhaps the most famous explorer to work under the auspices of the African Association was MUNGO PARK, a Scottish surgeon. He made two trips sponsored by the group. The first, in 1795–97, started with ascending the

Gambia. He fell into the hands of hostile Muslims but managed to escape, making his way to the Niger. Battling fever, he returned to the Gambia and made it back to England after 30 months, having been given up for dead. His subsequent book, *Travels in the Interior Districts of Africa* (1799), helped further interest in African exploration. His second journey, in 1805–06, was much more extensive and better financed, yet more tragic in its outcome. Taking the Gambia to the town of Kaiaf, then traveling overland to the Senegal, and on to the Niger at Bamako, the entourage took heavy losses from disease. After continuing on the Niger, Park was not heard from again. The best information indicates that his party was ambushed at Bussa, and that, in attempting escape, he drowned.

The travels of Swiss-born JOHANN LUDWIG BURCKHARDT on behalf of the African Association—on the NILE RIVER in Syria, Egypt, the Sudan, and Arabia in 1809–15—yielded much new information to Europeans, including the rediscovery of the city of Petra (Wadi Musa) in present-day Jordan.

Although resulting in many insights into the topography and human populations of Africa, the expeditions sponsored by the African Association were filled with bad luck and often the death of their leaders. In 1831, the African Association merged with the recently formed and more broadly defined ROYAL GEOGRAPHICAL SOCIETY, which went on to sponsor many expeditions to Africa as well as to other parts of the world.

airship (dirigible)

An airship is a self-propelled and steerable BALLOON. Like a balloon, an airship uses lighter-than-air gases to create lift. The main body, the bag or envelope containing gas, is elongated, however, for aerodynamics. The engines plus propellers are suspended from the bag, as are the gondolas (cabins), carrying crew, passengers, and cargo. As in the case of a balloon, the ballast, usually sand or water, is released to increase lift; gas is released to decrease it. *Dirigible*, or *dirigible balloon*, the alternative term for an airship, is from the Latin *dirigere* for “to direct, to steer,” in reference to the airship’s directional capabilities, provided by one or more vertically hinged rudders. Horizontally hinged elevators give additional control for climbing or descending.

There are three basic types of airship construction: non-rigid, semi-rigid, and rigid. In the nonrigid class of airships, also known as *blimps*, the shape of the body is maintained by the pressure of the gas. In the semi-rigid class, referred by the

general name *airship*, the shape of the body is also maintained by the gas, but in conjunction with a keel running the body's length. In the rigid class of airships, known as *zeppelins*, a rigid scaffolding-like frame maintains the body shape, with lift provided by individual gas cells. The earliest airships used the highly flammable hydrogen for their lighter-than-air gas; later ones used the safer helium.

A French engineer by the name of Henri Gifford constructed the first airship, drawing on balloon technology. It was a nonrigid type, with a cigar-shaped envelope and a single screw propeller driven by a steam engine. In 1852, he flew over Paris at about six miles per hour, though his craft could not be steered in a breeze. Two other Frenchmen, Charles Renard and Arthur Krebs, built a blimp that was steerable in light winds. In a flight in 1884, they proved that it could successfully return to its starting place. Airship technology developed rapidly over the next decades. A German, Count Ferdinand von Zeppelin, completed his first rigid air-

ship in 1900. For a time afterward, zeppelins were used for commercial transportation in Germany.

Germany used rigid craft in World War I; France developed semi-rigid airships. All proved vulnerable to airplanes, however. Nonrigid airships proved the most useful because they could best hover over a location for aerial observation and were often used to patrol coasts. In 1919, after the war, a British-developed rigid airship made the first transatlantic crossing, from East Fortune, Scotland, by way of Newfoundland to Mineola, New York, on Long Island; it completed a transoceanic return flight to Pulham, England.

Airships have played a part in the history of polar exploration. After the war, an Italian, UMBERTO NOBILE, became an accomplished pilot and designer of airships. In 1926, in the *Norge*, a semi-rigid craft he had designed, he flew from the Norwegian islands of Spitsbergen (present-day Svalbard) over the NORTH POLE, to Teller, Alaska,

Umberto Nobile's airship *Norge* is tethered in its hangar in 1926. (Library of Congress, Prints and Photographs Division [LC-USZ62-107120])

where the ship was dismantled. The expedition had been organized by the Norwegian polar explorer ROALD ENGELBREGT GRAVNING AMUNDSEN and the American aviator LINCOLN ELLSWORTH, who had purchased the craft from the Italian government and hired Nobile as pilot on the expedition.

Nobile organized another flight two years later with plans to land at the North Pole. He designed another semi-rigid craft, the *Italia*, with polar conditions in mind. His crew consisted mostly of Italians with mountaineering experience in the Alps; three scientists went along for polar studies. Again departing from Spitsbergen, the *Italia* successfully circled the North Pole, but because of ice buildup on the craft, plans were abandoned to land there. The airship broke apart and was wrecked on the ice. Nobile and eight others in the gondola survived a crash landing; one of the crew later died before being rescued. Seven others perished, however, when the airship's bag drifted out of control. Amundsen, although not part of this expedition, died when his airplane crashed as he was on his way to Spitsbergen to join the search for survivors.

For a time, airships were used for commercial transatlantic crossings. But the frequency of crashes—including the 1937 disaster, in which the German-built *Hindenburg*, a rigid airship containing hydrogen gas, was enveloped in flame in Lakehurst, New Jersey, killing 36 of its 92 passengers—led to a decline in the use of airships following their heyday earlier in the 1930s. The nonrigid class, with helium as gas, became the norm. Some were used in World War II in the 1940s for observation purposes. Today blimps are used primarily for advertising as well as camerawork at sporting events. In 1997, the Zeppelin Company of Germany unveiled a new generation of airships, the first of the rigid class to fly since 1940.

alidade

The term *alidade* is derived from an Arabic phrase meaning “the revolving radius of a circle.” First appearing in English in the 1400s, the term came to be applied to specific surveying and navigational instruments. One early device known as an alidade consisted of a surveying rule equipped with simple or telescopic sights; it was used to determine direction. An early navigational alidade was a straight bar with sights on both ends and a pivot in the middle; it was used to measure the angle of a celestial body in relation to the observer.

The term *alidade* is also applied to the central measuring component of other instruments. These include the ASTROLABE used in navigation; the plane table, a drawing board on a tripod, with a ruler for plotting the lines of a survey directly from observations; the theodolite, or transit,

a telescope mounted on a tripod used in surveying; and a number of modern sighting tools.

An early astronomical alidade was described by PTOLEMY, a second-century Hellenized Egyptian living in Alexandria; it was referred to in some texts as “Ptolemy’s ruler.” During the Middle Ages, the Arabs used versions of the alidade in a variety of applications. In the early 17th century, telescopic sights were added to alidades.

Amazon River

The Amazon River is the longest river in South America and the second-longest in the world (after the NILE RIVER), extending some 4,000 miles across the continent. The Amazon drains 2.7 million square miles, from near the Pacific Ocean on the inter-Andean plateau to the Atlantic Ocean. It flows through Peru, eastward across Brazil, and enters the Atlantic at the EQUATOR, where it discharges roughly a fifth of all the freshwater that drains into the oceans. The river has hundreds of tributaries; of these, 17 are more than 1,000 miles long. The main headwaters of the Amazon, the Ucayali and Marañón Rivers, have their source in the snows of the high ANDES MOUNTAINS of Peru. During the wet season, the Amazon varies in width from five to 40 miles. Near the Atlantic, it opens into an estuary about 150 miles wide, scattered into many branches by islands formed from silt deposits. Often called the “Ocean River” because of its vastness, the Amazon is highly navigable, and large ships can reach Iquitos in northeastern Peru, 2,300 miles from the sea. Before the European conquest of South America, the Amazon had no single name; its different sections were known to native peoples by specific names. The name of the river is probably derived from the native word *amassona* for “boat destroyer,” although others claim it was named by Europeans after the Amazons of Greek mythology.

Early Expeditions

VICENTE YÁÑEZ PINZÓN, a Spanish navigator, was the first European to visit the Amazon River Delta, in 1500. Pinzón accompanied CHRISTOPHER COLUMBUS on his first voyage to the Americas, as captain of the *Niña*. In November 1499, he set out on his own voyage with four ships. He landed in northeastern Brazil toward the end of January 1500, then sailed along the coast to the northwest. Pinzón ascended the river about 30 leagues, calling it the “Freshwater Sea,” because of its size and amount of freshwater. Later reports by Pinzón’s companions refer to the Amazon as the Río Marañón, a name later applied to one of its tributaries. Marañón is either a native word or perhaps is derived from the Spanish *maraña* for a “tangle.” For explorers of the Amazon, the latter was appropriate, for the river’s tangle of

streams and islands is a challenge to the best navigators. Pinzón's landing in Brazil was long disputed because the Portuguese claimed discovery of Brazil with PEDRO ÁLVARS CABRAL's landing in April 1500.

The second exploration of the Amazon occurred almost a half-century later and from the other end of the river. GONZALO PIZARRO, the half brother of FRANCISCO PIZARRO, who took part in the Spanish conquest of Peru, was named governor of Quito in 1539, in what is now Ecuador. In 1541, Pizarro set out for an expedition into the forests to the east of the Andes in search of La Canela, the "Land of Cinnamon," which was reportedly rich in spices, and EL DORADO, a famed city of gold according to native stories. FRANCISCO DE ORELLANA, a Spanish explorer and relative of Pizarro, accompanied the expedition as second in command. When provisions ran out, Orellana and 50 to 60 companions broke off from the expedition with commands to search for food but did not return, as Orellana's ships were swept into the fast-flowing Napo River. Orellana and his men followed it into the Amazon. Along the way to the Atlantic, they encountered tribes whose women fought alongside the men (like the mythical Amazons, leading to one interpretation of the river's name). Orellana's expedition was the basis for the description of the Amazon River included in the Spanish cartographer DIEGO GUTIERREZ's 1562 map of South America, the first description of the continent's interior.

The Amazon River runs through wet and densely forested plain and to this day remains one of the most sparsely populated areas on Earth. Parts of the river system today still remain unexplored. For the Spanish settlers of Peru, the Amazon valley was a source of mystery and possessed the lure of hidden treasure, spurred on by native accounts and the reports of explorers such as Orellana. In 1558, the Spanish conquistador PEDRO DE URSÚA was commissioned by Marquis de Cunete, the Spanish viceroy in Peru, to find the fabled city of El Dorado in the forested Amazon basin of Peru. In command of 300 Spaniards and a number of native people and slaves, Ursúa left Lima in 1559, but due to delays he was unable to sail until October 1560. A mutiny erupted, led by LOPE DE AGUIRRE, and Ursúa was murdered. Aguirre led the men down the river and laid waste to several Indian villages along the way. The next year, the expedition became the second to cross South America from the Andes to the Caribbean.

Politics and Exploration

Politics played an important role, with and above the lure of treasure, in spurring on exploration. Budding empires such as Spain and Portugal attempted to spread their spheres of influence in South America, which promised to provide not only riches of spices and precious metals but also new outlets for trade and the simple commodity of free land—

the supply of which had been long lost in Europe. After Christopher Columbus landed in the Americas in 1492, Spain petitioned Pope Alexander VI for a monopoly on trade in the western Atlantic, which resulted in a line of demarcation to the west of which Spain was given trading rights, and to the east of which rights were granted to Portugal, Spain's chief rival. After the Treaty of Tordesillas, this longitudinal line was fixed at 370 leagues west of the AZORES.

The landing of Pedro Álvares Cabral in Brazil in 1500, in territory allowed to the Portuguese, seemed to give them rights to Brazil, while the headwaters of the Amazon were planted firmly in Spanish territory. In 1545, King Charles I of Spain sent Francisco de Orellana back to the Amazon to act as governor to assert Spanish control over the river and halt Portuguese expansion. But Orellana died while exploring the mouth of the river, and the expedition dissolved in failure. Meanwhile, among the Portuguese was a great effort to gain control of the Amazon, first by PEDRO DE TEIXEIRA. Originally part of an effort to expel British, Dutch, and French from encroaching on Portuguese territory in South America, Teixeira became, in 1618, the governor of the territory of Pará at the mouth of the Amazon. He made expeditions on the lower Amazon, mapping and aiming to remove French, Dutch, and British trading settlements for Portugal. In 1629, he commanded a major expedition up the Amazon with 120 Portuguese and 1,600 native people. After the expulsion of other European rivals, Portugal turned its attention to Spanish holdings in South America; the arrival of two Spanish friars from Peru in Pará raised concerns among the Portuguese that the Spanish had designs on the Amazon River. In 1637 Teixeira was sent by the new colonial governor, Jacome Raimundo Noronha, to explore and map the length of the Amazon and especially to scout locations for Portuguese fortification. Teixeira followed the reverse of Orellana's route, using one of the missionaries for a guide, and, in 1638, claimed for Portugal the Río Negro, one of the main northern tributaries of the Amazon with its source in the Colombian Andes. He sailed up the Napo in July 1638. After traveling to Quito on foot, he and his party became the first Europeans to reach that city from the east, and the first to sail up the Amazon.

Increasing Knowledge

The Spanish viceroy in Peru, perhaps unnerved by Teixeira's arrival, sent two Jesuits to accompany him on his return journey. Jesuit father CRISTÓBAL DE ACUÑA made surveys and kept a record of his voyage down the Amazon, and, in 1639, his account of the journey, *New Discovery of the Great River of the Amazons*, was printed, becoming the first published account of the river.

The Amazon was frequented by Portuguese slavers and by missionaries, but maps and descriptions of the river

continued to be inaccurate and contained tantalizing blanks even a little more than a century later. Discoveries were often made by accident, as when Jesuit Father Roman in 1744 accompanied a group of Portuguese slavers through a passage called the Casiquiare Canal that connects the ORINOCO RIVER, another major South American river, to the Río Negro, a tributary of the Amazon, and which had been mentioned by Cristobal de Acuña but never verified. Roman's description was one of the many pieces of information reported by French explorer CHARLES-MARIE DE LA CONDAMINE to the French Academy of Sciences.

La Condamine first set out in 1734 for the equatorial region of South America as part of a French expedition to measure the difference of the curvature of the Earth at the equator and the polar region to determine the true shape of the Earth. When the project had been completed, La Condamine resolved to voyage down the Amazon to its mouth, obtaining maps of the Amazon from the Jesuits. He set out in 1743, traveling through the treacherous Andes to the Marañón River, one of the Amazon's tributaries, on which he set sail. The Marañón is a river extremely difficult to navigate, filled with dangerous reefs, dozens of arduous rapids, and high cataracts. Finally, La Condamine passed through the Pongo de Manseriche, a narrows three miles long. The Pongo de Manseriche is about 2,000 feet deep, surrounded on both sides by high precipices and narrowing to a width of as little as 100 feet. The Marañón squeezes through the pass rushing up to 12 miles an hour.

La Condamine made the first systematic scientific observations of the river, and the native peoples. He even applied his skills to resolving the boundary established between Spanish and Portuguese territory by the Treaty of Tordesillas, which almost 300 years later still remained disputed. On his return to France in 1745, he wrote an account of his explorations in South America, including a map of his journey along the Amazon, which was published in 1751.

Almost a half-century later, German naturalist and geographer ALEXANDER VON HUMBOLDT and French botanist Aimé Bonpland were given permission by the king of Spain, Charles IV, to explore Spain's possessions in the Americas. Humboldt had undertaken a geological survey of Spain's central plateau region, and, with his knowledge of geology, astronomy, and biology, he was well suited and driven to make a thorough investigation in South America. After some exploration along the coasts, Humboldt and Bonpland traveled into the Orinoco Basin, studying in detail the unique flora and fauna of the region as well as fixing the many geographic discrepancies of maps of the region. Humboldt crossed the Casiquiare Canal, which had been reported by La Condamine in a CANOE, proving finally that it connected the Orinoco and Río Negro, the only known connection between two major river systems. Throughout 1800, Humboldt explored this

region, vastly increasing scientific knowledge of the lower Amazon Basin.

Inspired by Humboldt's account, as well as Englishman CHARLES ROBERT DARWIN's account of the voyage of the *Beagle*, two other British naturalists, ALFRED RUSSEL WALLACE and HENRY WALTER BATES, endeavored to collect insect specimens in the Amazon Basin. In 1848, they sailed to the mouth of the Amazon in Pará, Brazil. In 1852, Wallace sailed for England with his notes and specimens while Bates remained. Wallace's ship, however, caught fire and sank, along with his notes and specimens. Wallace himself was rescued after spending two weeks in an open boat on the sea. He published his account of his travels and research as *A Narrative of Travels on the Amazon and Río Negro* in 1853. Bates meanwhile had explored the Amazon 400 miles west from Manaus, the Amazon's juncture with the Río Negro. Afterward, he remained between Manaus and the mouth of the river at Pará, collecting specimens until 1855. In 1859, Bates returned to England and published *The Naturalist on the River Amazon* in 1863. In 10 years on the Amazon, Bates collected 14,000 insect specimens, including 8,000 newly discovered species. While Wallace's observations in the Amazon and southeast Asia led him to formulate a theory of natural selection independently of Darwin, which was published at the same time, Bates's collections lent strong support to the idea of natural selection.

Since then, the Amazon River and its basin have prompted much scientific exploration. However, many native tribes still live in relative isolation. The tropical rain forests house amazing biological diversity, with new species still to be discovered.

American Fur Company

Established in 1808 to take advantage of reports from the 1804–06 MERIWETHER LEWIS and WILLIAM CLARK expedition to rich beaver country west of the ROCKY MOUNTAINS, the American Fur Company and its various subsidiaries—the Pacific Fur Company, founded in 1810, and the South West Fur Company, founded in 1811—were an ambitious operation. The founder, JOHN JACOB ASTOR, born in Germany, had migrated to America from England. He had made his first profits in the FUR TRADE in 1784 by exporting furs from America to England. Over time, he perfected his business by brokering furs from Montreal and the Great Lakes region in America, but he was unhappy with the control his rivals—the HUDSON'S BAY COMPANY and the NORTH WEST COMPANY—had over prices.

The findings of Lewis and Clark inspired the plan of a chain of trading posts gathering furs from inland to the mouth of the COLUMBIA RIVER on the Pacific coast. Taking advantage of his contacts in Canton, Astor stood to reap

handsome profits from the Chinese, who were especially fond of sea otter pelts. This venture was carried out by a new subsidiary, the Pacific Fur Company, with its immediate goal of establishing a trading post at the mouth of the Columbia River. To accomplish his mission, Astor outfitted two expeditions, one by sea and one overland. On September 8, 1810, Astor's ship, the *Tonquin*, set out from New York City, sailing around South America and arriving at the mouth of the Columbia in March of the following year. The captain, Jonathan Thorn, was a strict disciplinarian and did not get along with investors, who were members of the expedition. Upon arrival, a crew of builders under ROBERT STUART began construction of Fort Astoria while Captain Thorn commenced trading with the Nootka Indians. Relations deteriorated, however, when the quick-tempered captain slapped the face of an Indian chief at Nootka Sound, leading to the destruction of the vessel.

Meanwhile, the overland expedition had problems of its own. Led by businessman and the less-than-experienced woodsman WILSON PRICE HUNT, the group of 56, plus Indian guides, including Ioway MARIE DORION and her husband, PIERRE DORION, JR., had set out from St. Louis in spring 1811. They had intended to follow the trail of the Lewis and Clark Expedition, but fear of the unfriendly Blackfoot Indians caused them to take a less direct path. Upon reaching the Snake River, they sought to continue by CANOE and managed to trade with Indians for craft. After several days, however, the river proved unnavigable, and several members of the party drowned. The expedition split into groups and continued on foot. Those who survived reached Astoria in February 1812. Despite their hardships, they managed several important geographic discoveries, which included charting the Green River, Union Pass, and SOUTH PASS, a shortcut through the southern end of the Wind River Mountains.

Although the establishment of Fort Astoria resulted in the first permanent American settlement in the Pacific Northwest, the post did not fulfill Astor's ambitions. By June 1812, America was at war with England—in the War of 1812. Interference from the British navy and likely loss of their property led Astor's men to sell the outpost to the North West Company. A treaty with Britain in 1818 returned possession of Astoria to the American Fur Company, but, by that time, the Nor'westers (as the employees of the North West Company were known) were established in the area, and Astor's company was concentrating its efforts in the Great Lakes region.

With the help of a law barring foreigners from trading with American Indians, Astor consolidated his holdings. He bought out the assets of his partners in the South West Company. Then, pursuing the goal of monopoly power, he proceeded to buy out strong competitors and to crush weaker ones. Independent traders were also targeted.

The American Fur Company soon turned to the lucrative market in American bison (buffalo) hides harvested from the Great Plains. Through the formidable personality of KENNETH MCKENZIE at Fort Union in the 1830s, permission was secured from the formerly intractable Blackfoot to exploit the buffalo.

In 1834, Astor, having anticipated the turn of fashions in Europe, sold out his interests in the American Fur Company. The trade in beaver soon crashed, and the company was forced to scale back its operations. Astor went on to concentrate his efforts in real estate and became one of the richest men in the country.

American Geographical Society (AGS)

The American Geographical Society (AGS), founded in 1851, is the oldest geographic society in the United States. Its headquarters are in New York City, and its archive is located at the University of Wisconsin in Milwaukee. Its members have included both professional geographers and nonprofessionals interested in the subject of geography. Unlike many other 19th-century organizations, such as the ROYAL GEOGRAPHICAL SOCIETY, it has been open to women as well as men from its inception.

AGS activities include scientific research relating to geography; the sponsoring of expeditions, lectures, and conferences; the awarding of honors to scholars and explorers; cartography; and magazine and book publishing. Present-day publications include *Focus*, a quarterly magazine for the general public; *Geographical Review*, a scholarly journal; *Ubique*, a semiannual newsletter; and a variety of books on geographic topics, among them *Around the World Program*, a book series on countries of the world with a companion guide for teachers. In the course of its history, the AGS has worked under contract with various branches of the U.S. federal government, academic institutions, and corporations.

An impetus for the founding of the AGS, in addition to the great interest in world exploration at the time, was the publicity surrounding the search for Englishman SIR JOHN FRANKLIN, who disappeared in the Canadian Arctic on an 1845 expedition, and the efforts of his wife, JANE FRANKLIN, to encourage rescue efforts. A number of scholars, businessmen, and statesmen created the organization to support exploration, support geographic research, and promote education. One early expedition that the AGS helped underwrite was an early exploration attempt of the NORTH POLE in 1860–61 by American ISAAC ISRAEL HAYES. In 1878–80, American physician and lawyer FREDERICK SCHWATKA, with AGS backing, led a team overland by sledge from HUDSON BAY to King William Island while searching for evidence of the Franklin expedition.

One of various explorers to receive a gold medal from the AGS was CHARLES CHAILLÉ-LONG in recognition of his contributions to geographic knowledge of Africa, such as determining in the 1870s that Lake Kioga was one of the principal sources of the White Nile, a branch of the NILE RIVER.

A number of famous 20th-century American explorers were associated with the AGS as well. ROBERT EDWIN PEARY, who led the first successful expedition to the North Pole in 1909, served as the society's president for a time. In 1951, MATTHEW ALEXANDER HENSON, who traveled to the North Pole with Peary, was honored at the AGS centennial banquet in 1951. LOUISE ARNER BOYD received AGS backing for her 1933 expedition to GREENLAND's east coast. The AGS was also an early promoter of AERIAL PHOTOGRAPHY in mapmaking, as applied in both the Arctic and Antarctic.

Andes Mountains

The Andes Mountains are the second-highest mountain range in the world, after the HIMALAYAS. The range contains many of the highest peaks in the Western Hemisphere. The Andes probably received their name from the word meaning "high crest" in the Quechuan language of the Inca Indians. The Andes rise abruptly from the Pacific Ocean coast, thrust up by the collision between the Pacific Ocean and South American continental plates during the Cretaceous period, from 65 to 138 million years ago. The tectonic activity along this plate boundary continues to cause volcanic activity and earthquakes throughout the Andes and along the Pacific coast. The mountains run in a narrow band, generally about 200 miles wide, along the west coast of South America, from the Caribbean Sea in the north to the island of Tierra del Fuego in the south, a distance of about 4,500 miles. The Andes can be divided into three regions, generally referred to as northern, central, and southern.

The northern Andes, which rise in present-day Venezuela, Colombia, and Ecuador, are composed of three narrow ranges known as the Western, Central, and Eastern Cordilleras, so called by early Spanish explorers because of the resemblance of their long thin parallel ranges to ropes. The highest mountain of the northern ranges is Cristóbal Colón in Colombia, at a height of 18,947 feet. Many other peaks are higher than 15,000 feet.

The central Andes are made up of two Cordilleras, the range's broadest region, reaching a maximum width of 400 miles, and the highest region, with many peaks over 20,000 feet. The peaks of the central Andes include Pissis, at 22,241 feet; Huascarán, at 22,205 feet; Illampu, at 21,276 feet; Chimborazo, at 20,561 feet; and Cotopaxi, an active volcano at a height of 19,347 feet above sea level. Between the two ranges of the central Andes, in Bolivia and southern Peru, lies an elevated plain called the Altiplano. Rains falling

on the Altiplano flow into Lake Titicaca at 12,500 feet, making it the highest navigable lake in the world, and a lake with no outlet to the ocean.

The Andes are generally smaller to the south. Close to the central Andes is ACONCAGUA, the highest mountain in the Western Hemisphere, at 22,834 feet, but, near the tip of South America the mountains rise to about 10,000 feet above sea level, and Cerro Yogan, the highest peak of Tierra del Fuego, an extension of the Andes, is 8,100 feet. Many of the highest peaks in the southern Andes are volcanic, and a good number of them are active.

Rain falling on the western slopes of the Andes runs into the Pacific Ocean. The heavy rains brought by the trade winds against the eastern slopes form the tributaries of the three major river systems in South America, the AMAZON RIVER, the ORINOCO RIVER, and the Río de la Plata.

The Andes, especially the plateau regions of the central Andes, were inhabited by native peoples for many hundreds of years before the rise of the Inca Empire in the 15th century. The first Inca emperor, Manco Capac, led an attack on the people living in a fertile valley some miles to the north of Lake Titicaca; the Inca settled there and made Cuzco their capital. The Inca spread throughout the Andes, and, in the 15th century, under the rule of Pachacuti Inca Yupanqui and his son, Topa Inca Yupanqui, the Inca Empire came to include an area of 350,000 square miles, with an extensive system of roads and rope bridges.

Early Expeditions

It is thought that the first European to reach the Andes overland was ALEJO GARCÍA, a Portuguese sailor who had been shipwrecked south of Rio de Janeiro, taking part in JUAN DÍAZ DE SOLÍS's 1515 expedition in search of a passage through South America. García and others who had been shipwrecked befriended the natives. García accompanied them, exploring the interior of the continent and reaching the Andes. He heard tales of the Inca Empire and even obtained several bars of silver for himself. The tales and silver came to the attention of Europeans, when a number of sailors were rescued by SEBASTIAN CABOT, an Italian sailing for England, and taken back to Europe in 1530.

The Spanish conquistador FRANCISCO PIZARRO, who had established himself in Panama, became partners with another Spaniard, DIEGO DE ALMAGRO, to find and conquer the Inca kingdom in the Andes. After taking an outlying Inca town, Pizarro sailed to Spain to seek support for a larger expedition. This support was granted to him, and, in 1531, he began his effort to conquer the Inca.

Pizarro led his forces over the Royal Inca Road, eastward through the Andes and the Piura Valley, entirely without Inca resistance. Finally, on November 15, 1532, the Spanish arrived in the deserted city of Cajamarca, where just out of town the Inca emperor Atahualpa encamped, with re-

portedly 50,000 men. The Spanish made a surprise attack on the Inca, charging with horses, which the Inca had never seen, and firing upon them with their cannon. The Spanish suffered few casualties, though they killed thousands of Inca, and took Atahualpa prisoner. Afterward, Pizarro marched through the Andes on the roads created by the Inca, capturing Cuzco, enslaving many of its inhabitants, and seizing its gold.

During their travels in the Andes, the Spaniards found amazing wealth in gold and other precious metals. The Andes Mountains are rich in precious metals and stones and had been mined by the native peoples for centuries. Attempting to obtain his release, Atahualpa offered to fill a room with gold, which Pizarro allowed him to do before killing him.

The Andes continued to be explored by the Spanish CONQUISTADORES searching for remnants of the Inca Empire and for other kingdoms with equivalent wealth. In 1534, SEBASTIÁN DE BENALCÁZAR set out to capture Quito, an Inca provincial capital in the north. Benalcázar gained the support of Canari Indians as he traveled and was met by the forces of Inca chief Ruminahui in present-day Ecuador, near its highest peak, Chimborazo, where he defeated them.

Diego de Almagro quarreled with Pizarro over their respective positions and power, and, in 1535, after appointment as governor of a new Peruvian province called New Toledo, to the south of Cuzco, he set out with 750 Spaniards and thousands of native allies. He embarked in the middle of winter, and his men suffered in the severe cold of the high Andes. After traveling through the central Andes, Almagro turned westward and reached the coastal Copiapo Valley, then followed the coastal plain of modern Chile into the Central Valley. Repeatedly attacked by native peoples and unable to find another civilization like the Inca, Almagro turned back.

The wet, eastern slopes of the Andes in the north were part of the area rumored to contain EL DORADO, and this story along with other tales of legendary wealth, such as a "Land of Cinnamon," inspired Spanish conquistadores to cross the eastern range of the Andes from Quito into present-day Colombia. These expeditions were headed by Sebastián de Benalcázar, out of Quito, in 1536; GONZALO PIZARRO, in 1541; and PEDRO DE URSÚA, who embarked from Lima, the Spanish capitol of Peru, in 1559. A German explorer, NIKOLAUS FEDERMANN, began his search for the land of El Dorado in Venezuela and Colombia. He became the first to cross the Andes from east to west in 1536.

Modern Exploration

The search for El Dorado died out for the most part in the 17th century, but Spaniards continued to scour the mountains for riches. The first modern scientific surveys of the Andes were made by Frenchman CHARLES-MARIE DE LA

CONDAMINE in the first half of the 18th century. La Condamine was part of a French scientific expedition to measure the curvature of the earth at the EQUATOR. La Condamine traveled through the Andes inland to Quito from the South American coast, becoming the first European to see the process of rubber extracted from rubber trees. La Condamine spent several years around Quito making surveys and conducting work on the natural history of the region.

The next important modern explorer of the Andes was German naturalist ALEXANDER VON HUMBOLDT at the turn of the 19th century. Along with the French botanist Aimé Bonpland, he was granted permission by Spanish king Charles IV to explore Spanish possessions in the New World. Humboldt explored the effects of high altitude in the Andes, making observations on the boiling point of water, and, with Bonpland, attempted to climb Mount Chimborazo. The two reached to within 1,400 feet of the summit before having to turn back, establishing a height record for climbing of 19,000 feet not to be broken for 30 years. Humboldt crossed the Andes five times, as he explored the lands from Ecuador to Peru.

Much important exploration of the Andes was carried out in the first half of the 19th century as part of surveys, especially in the northern and central ranges. The southern Andes were explored in 1876 and 1877 by Argentinian Francisco Moreno. Moreno earned a doctorate in natural sciences at the University of Buenos Aires in 1854, before becoming a professor there, concentrating in anthropology. After many years teaching, he embarked on expeditions into areas south and west of Buenos Aires. In 1876, he explored the southern Andes and studied the Patagonian native peoples, visiting several lakes at high elevations and exploring Cerro Chaltel (Mount Fitzroy). He made another expedition to explore the Andes from 1882 to 1883.

With many of the world's highest peaks, the Andes are important in the history of MOUNTAIN CLIMBING. British mountaineer EDWARD WHYMPER summited Chimborazo in 1880. Italian mountaineer MATTHIAS ZURBRIGGEN climbed Aconcagua in 1897. In 1906, a pioneering woman climber, ANNIE SMITH PECK, reached the top of Huascarán. Today, the range remains a big draw to climbers. The Andes also continue to supply valuable minerals and gems to miners. The mountains are also an area of activity for archaeologists. In 1911, American historian HIRAM BINGHAM located the Inca stronghold of Machu Picchu.

Anian, Strait of

The Strait of Anian is the name of a mythical waterway separating Asia and North America, extending from the northeast coast of North America to the west coast. Its name is derived from a reference in the writings of MARCO POLO, a

13th-century Italian traveler to the Far East. The search for the strait was, for a time, one and the same with the search for the NORTHWEST PASSAGE, although, as was discovered in the 19th century, a Northwest Passage does in fact exist in Arctic waters to the north of the North American continent. The hope of a more southerly waterway endured for centuries, not only for the advantages it would offer as a shortened trade route, but because a southerly route would make it accessible year-round in ice-free waters.

East and West Coasts

The search for the Strait of Anian occurred in several stages involving both the east and the west coasts of North America. Mariners of varying nations searched for a Northwest Passage along the northeast coast of North America, the first, in 1497, by Italian JOHN CABOT, sailing for England, in a voyage during which he made the European discovery of Newfoundland and Labrador. Portuguese GASPAR CÔRTE-REAL claimed to have found the outlet to the Strait of Anian in an undocumented voyage two years later. In his subsequent two voyages—in 1500 and 1501—he failed to back up his claim, which he perhaps fabricated to receive backing.

On the west coast, the Spanish carried out a number of expeditions in search of the outlet of such a strait. HERNÁN CORTÉS imagined the benefits of a water route, especially in terms of consolidating the Spanish hold over territories in Mexico. In 1535, he explored the California coast, but, in his haste, failed to recognize that Baja California was a peninsula and that California was not an island, as had been believed. The geography of the region was somewhat clarified by the 1539–40 explorations of FRANCISCO DE ULLOA, who ventured to the end of the Gulf of California (named by him the Sea of Cortés). There, he located the mouths of the Gila River and COLORADO RIVER. These discoveries left open the question of the Strait of Anian, however. In 1542, JUAN RODRIGUEZ CABRILLO explored as far as modern-day San Diego, becoming the first European to venture that far north.

In England, during the mid-1560s, a debate began concerning the relative merits of a Northwest Passage versus a NORTHEAST PASSAGE. The chief promoter of the former was SIR HUMPHREY GILBERT. He was a believer in the Strait of Anian, and, using the best knowledge available at the time, argued that it would start from the north coast of Labrador, and wind gradually to the southwest, where it would reach the Pacific Ocean about where Seattle, Washington, is today. After considerable effort, Gilbert managed to organize financing for an expedition to test his theory. His chief patron was Michael Lok. Their partnership led to the 1576 expedition of SIR MARTIN FROBISHER, which failed to locate any such passage. The English had a presence on the west coast as well at this time in the person

of SIR FRANCIS DRAKE. In addition to raiding Spanish ships and settlements, he searched for the strait, sailing as far north as Vancouver Island. Meanwhile, the Strait of Anian appeared on various maps of the period. On a 1584 map, Flemish cartographer ABRAHAM ORTELIUS placed Japan in the middle of the strait, equidistant from Asia and America.

Hardship and Fraud

The next chapter in the search for the Strait of Anian involved an outright fraud. Spaniard Lorenzo Ferrer Maldonado claimed to have sailed along the north coast of North America, through the Strait of Anian to the Pacific, and back to the Atlantic, all in summer 1588. The story was taken seriously at the time, especially by Michael Lok. In 1596, Lok's hope for finding the strait was again given new impetus when he met an elderly Greek who had taken the name JUAN DE FUCA while in the service of Spain. De Fuca claimed that, in 1592, he had explored an inlet on the northwest coast of North America, where he had sailed for 20 days to a region of icebergs. He believed it to be the Pacific outlet to the fabled strait. Lok's enthusiasm to raise funds for an expedition was great, but he was unable to convince his peers. De Fuca died before the trip could be arranged. A real strait to the south of Vancouver Island bears his name.

Inspired by de Fuca's story and anxious to complete the navigation of the reported strait, JENS ERIKSEN MUNK led a Danish expedition to the Arctic in 1619. His journey is notable more as a tale of the will to live than for discoveries made. With a crew of 63, he sailed into Hudson Strait. After an arduous journey through the ice of HUDSON BAY, the expedition landed on the west shore near present-day Churchill. In winter 1620, an outbreak of trichinosis from eating undercooked polar bear meat took hold, with horrific consequences detailed by Munk in his journals. SCURVY is also assumed to have taken its toll. Munk and two others were the only ones to survive the winter and, with the warm weather, ate new shoots of plants poking through the ice, regaining strength enough to sail back to Europe.

Another interesting tale in the search for the strait involved a rivalry between two English cities and their commercial interests. LUKE FOXE sailed for London and THOMAS JAMES headed Bristol's expedition. Both set out in May 1631, and both managed to reach Hudson Bay. Foxe had no desire to test his will against the winter and returned to England in the fall of the same year. James and crew spent a dreadful winter trapped in the ice, with scurvy becoming a major problem, yet he and his crew made it back to England in October 1632. They brought back with them the understanding that Hudson Bay was enclosed and not a gateway to the long-sought strait.

While expeditions were making little headway in the search for the strait, news came of an incredible voyage. It was another fraud, this time claimed on behalf of one Admiral Bartholomew de Fonte. The account of his voyage, *Memoirs for the Curious*, published in London in 1708, relates a 1640 trip in the Pacific from Peru to the north in search of a Northwest Passage. He claimed that, by navigating a maze of inland rivers in North America, he came upon a trading ship from Boston. Such was the art of the tale that it was accepted by no less than American statesman Benjamin Franklin.

End of the Myth

The man responsible for helping lay the myth to rest was Englishman SAMUEL HEARNE of the HUDSON'S BAY COMPANY. In 1770, with the help of Chipewyan Indian MATON-ABBEE, he worked his way northward, looking for gold and copper. By July 1771, he and his party had reached the Coppermine River, which they followed northward to its mouth in the Arctic Ocean. The return trip was arduous, and it took another year to make it back to Fort Prince of Wales. By cutting across the land and failing to find a waterway of sufficient size for oceangoing trading vessels, Hearne had determined the fallacy that was the Strait of Anian. Yet search for a passage would continue well into the 19th century in the Arctic waters to the north.

See also LEGENDS AND EXPLORATION.

animals and exploration

Animals have a special place in the history of exploration as a means of transportation, as economic incentive, as an area of study in natural science, and as sustenance.

The Horse and the Donkey

The horse, domesticated in Eurasia about 6,000 years ago, is part of the story of movement over all the continents. Some of its use was for the purpose of conquest. The Mongols, under GENGHIS KHAN and other leaders, became known as masterly cavalrymen as they swept throughout much of Asia (see MONGOL EXPLORATION). The Spanish CONQUISTADORES reintroduced the horse to the Americas—early species having been extinct since the end of the Pleistocene. By the end of the 18th century, the *sunka wakan*, or “mystery dog,” as it was known to some Sioux (Dakota, Lakota, Nakota) bands, had altered the way of life of many Native Americans, especially in the American West, and would affect subsequent expeditions of nonnative peoples, who used horses for travel and at times did battle with mounted Plains Indians.

Donkeys, classified with horses in the family Equidae, played a major role as pack animals, especially the small variety known as the burro and especially in the American

West. Mules, hybrids of jackasses (male donkeys) and mares (female horses), were also utilized.

The Dog

Another animal central to exploration was the dog, especially the breeds best suited to frigid lands, such as the Siberian husky, the Alaskan malamute, and the Eskimo dog. Ponies and dogs actually competed with one another on the final continent explored, Antarctica (see ANTARCTIC, EXPLORATION OF THE). For his attempt on the SOUTH POLE in 1910–12, the Englishman ROBERT FALCON SCOTT chose to use Manchurian ponies along with sled dogs and motorized sledges. His rival, the Norwegian ROALD ENGELBREGT GRAVNING AMUNDSEN, who had studied Inuit (Eskimo) travel methods, used only sled dogs and was willing to eat them if they gave out, not as a last resort, but as part of the plan. Amundsen won the race to the Pole. Until mechanized equipment became the norm, the sled dog made long-distance travel possible over the frozen deserts of the Arctic (see ARCTIC, EXPLORATION OF THE) and Antarctic.

Robert Falcon Scott took the sled dog Chris with him to the Antarctic in his expedition of 1910–12. (Library of Congress, Prints and Photographs Division [LC-USZ62-101001])

The Camel

The camel, especially the Arabian, or dromedary, camel, which has one hump, and the Bactrian camel, which has two humps, also played a small part in the annals of exploration, particularly in the Near East, North Africa, and central Asia among Arabs and other Muslims (see MUSLIM EXPLORATION), as well as Europeans in those regions, such as Englishman THOMAS EDWARD LAWRENCE (Lawrence of Arabia). Camels were also used on other continents. In 1857–58, American EDWARD FITZGERALD BEALE headed a U.S. wagon road-building project from western Texas to California, using camels as draft animals. Also, they were regularly used by Englishmen in the deserts of Australia, on such expeditions as those of ROBERT O'HARA BURKE and WILLIAM JOHN WILLS in 1860–61; PETER EGERTON WARBURTON in 1873; and ERNEST GILES in 1875–76.

Hunting

The pursuit of animals for meat and pelts led to travel to uncharted lands. An American, DANIEL BOONE, who traveled across the APPALACHIAN MOUNTAINS into what is now Kentucky, was a “longhunter” in search of deer, sale of the hides of which supplemented his income. The beaver helped shape North America beyond its own altering of waterways, because of all the expeditions for the purpose of the FUR TRADE. Its pelts became favored for felt in the making of hats with brims, a fashion style that began in Europe in the late 16th century and endured nearly to the mid-19th century. Other animals, such as muskrat, mink, marten, and fox, were also sought, bringing humans to their domain. Sea mammals—seals, sea otters, and whales—also spurred on many expeditions to extreme northern and southern waters (see WHALING AND SEALING). In the early 19th century, for example, a whaler father from England, WILLIAM SCORESBY, SR., and his scientist son WILLIAM SCORESBY, JR., explored the Arctic regions of GREENLAND and pioneered new methods of Arctic navigation.

Sealers—American NATHANIEL BROWN PALMER, Scot JAMES WEDDELL, and Englishman JOHN BISCOE—were among those men who first viewed the Antarctic continent in 1820s–1830s.

Natural Science

Animals also prompted exploration as subjects of natural science studies. Naturalists wrote about them and sketched and painted images of them (see NATURAL SCIENCE AND EXPLORATION). In the first half of the 19th century, for example, American JOHN JAMES AUDUBON undertook numerous expeditions in order to record images of North American wildlife. Other naturalists—such as Americans CARL ETHAN AKELEY, DELIA JULIA DENNING AKELEY, and MARY LEONORE KOBE AKELEY—collected specimens for museums in the early 20th century. Carl Akeley also helped found

Africa's first wild game preserve, now known as the Virunga National Park, as a sanctuary for mountain gorillas and other animals.

Legendary Animals

Legendary animals also are part of the history of exploration. Sea serpents, supposedly giant snakelike creatures, and other sea monsters were part of the culture of early mariners, a believed threat of unknown waters for destroying wooden ships. Some of the reported stories served to scare off mariners from competing countries. KUPE, a 10th-century Polynesian, as legend has it, pursued the Squid King in the South Pacific Ocean, leading to the discovery and settlement of NEW ZEALAND and the resulting Maori descendants (see LEGENDS AND EXPLORATION).

Animals and Space Exploration

Animals were directly involved in the act of exploration as experimental passengers in early SPACE EXPLORATION. On November 3, 1957, the Union of Soviet Socialist Republics (USSR; Soviet Union) launched the SATELLITE Sputnik 2, carrying the first animal—a female dog named Laika—into space. Laika survived for several days, eventually dying from heat exhaustion due to high temperatures within the capsule. The Soviets continued launching dogs as part of the Sputnik program. The United States later launched monkeys to test the effects of zero-gravity conditions on life.

Antarctic, exploration of the

The Antarctic continent, or Antarctica, the world's fifth-largest continent, is centered on the SOUTH POLE, the southernmost place on Earth, and is largely contained within the ANTARCTIC CIRCLE, the point at which the Sun neither sets on the day of summer solstice, nor rises on the day of winter solstice. The southern limits of three oceans—the Atlantic, Pacific, and Indian Oceans—meet at Antarctica. The term *Antarctic*—for “opposite the Arctic,” Earth's northernmost region—applies both to the surrounding waters and to the continent.

Up to 7 million square miles of the Antarctic Convergence, or the “Southern Ocean” (waters of all three oceans with lower temperatures and greater concentrations of salt), turns to PACK ICE in wintertime. An ice sheet—which, in certain areas, is as much as three miles thick—covers about 99 percent of the Antarctic continent. Ice accumulation and the force of gravity and pressure leads to glacial flows from higher elevations to lower. The flows, on reaching the sea, form floating ice shelves, which fringe about half of Antarctica's coastline, and parts of which sometimes break off into massive icebergs. The Antarctic continent is divided into two main regions: West Antarctica, which is the smaller region, contains the Antarctic Peninsula, Ellsworth Land, and

Marie Byrd Land; East Antarctica faces the Indian Ocean and contains Queen Maud Land, American Highland, Wilkes Land, and Victoria Land.

Antarctica was not always in its present location on the globe. Fossils of plants, insects, fish, and other animals date from the Triassic and Jurassic periods (during the Mesozoic era, the Age of Reptiles) and indicate that Antarctica broke away from the ancient landmass known as Gondwanaland (consisting of the present continents of South America, Africa, and Australia as well) about 65 million years ago. Antarctica is rich in mineral deposits and coal; these resources, however, have not been commercially exploited due to the difficulty of extracting them.

Antarctica is the coldest place on Earth, surrounded year-round by stormy seas and pack ice. In fact, parts of the coast are free of ice only several weeks at the end of summer. Average winter temperature is minus 70 degrees Fahrenheit. The lowest temperature ever recorded on the planet—minus 126.9 degrees Fahrenheit—was recorded in East Antarctica. In addition to extremely low temperatures, Antarctica's climate is characterized by rapid changeability, strong winds, and blizzards. There were no human inhabitants of Antarctica until modern times. Plant life on the continent is limited to moss, lichen, and only two kinds of flowering plants. Small insects live among the plants. Larger animals in the region, such as the emperor penguin and seals, spend only some of their time on land in Antarctica.

Early Exploration of Southern Waters

Antarctica was the last continent of Earth's seven continents to be explored and, without a native population, it can be said to have actually been "discovered." Long before humans first sighted Antarctica, Greek geographers of the fifth century B.C. hypothesized the existence of a frigid southern continent containing the southernmost place on earth, the South Pole. They later expanded this theory into the idea of the GREAT SOUTHERN CONTINENT, or Terra Australis, which was thought to occupy more temperate latitudes. It was not until the early 18th century, however, that physical evidence of Antarctica was indicated, when sealing and whaling voyages reached the edge of the pack ice surrounding the continent. In fact, the early story of the exploration of Antarctica is more about its margins—people seeing ice around it, touching on islands near it, seeing evidence that it exists, but not actually setting foot on the continent for many more years.

In the 18th century, several French expeditions to southern latitudes were undertaken in search of the fabled Great Southern Continent, including one in 1738–39 by JEAN-BAPTISTE-CHARLES BOUVET DE LOZIER, who discovered Bouvet Island. In 1772–73, YVES-JOSEPH DE KERGUELEN-TRÉMAREC led two expeditions to southern waters; in the course of the first, he located the Kerguelen Islands

in the southern Indian Ocean, close to the parallel of latitude referred to as the Antarctic Circle. The credit for determining Antarctica's boundaries falls to JAMES COOK, who circumnavigated the southern region of the globe on his second Pacific expedition of 1772–75. He attempted to sail as far south as possible but was blocked by pack ice on three different occasions. He did manage to cross the Antarctic Circle three times, however, reaching as far south as 71 degrees, 11 minutes. He also discovered the South Sandwich Islands. Somewhat ironically, Cook, the man who determined Antarctica's boundaries, never saw the land of the continent itself.

Early Sightings

Following Cook's probes, European interest in Antarctica languished for nearly 50 years. In 1819, inclement weather drove British sailor William Smith 480 miles southeast of CAPE HORN, where he discovered the South Shetland Islands. British naval officer EDWARD BRANSFIELD charted this island group, landing on King George Island. On January 30, 1820, farther to the south, he spotted snow-covered mountains on an expanse of land, which later explorers would chart as the northwest coast of the Antarctic Peninsula. The following November, American sealer NATHANIEL BROWN PALMER—who, for a time, was credited with the first sighting of the mainland before Bransfield's journey came to world attention—also sighted the Antarctic Peninsula.

Another early trip to the region was made by Baron FABIAN GOTTLIEB BENJAMIN VON BELLINGSHAUSEN, a German-born Russian naval officer in search of Terra Australis. He crossed the Antarctic Circle in early 1820. On January 28, he came within 20 miles of Princess Martha Coast of Greater (East) Antarctica and sighted the edge of the ice sheet (which some claim constitutes the first sighting of the continent). After backtracking to Australia, he made another foray south at 41 degrees east longitude, where threatening icebergs and blowing snow turned him back. In December 1820, he entered waters now known as the Bellingshausen Sea. He reached his farthest point south at 69 degrees on January 21, 1821, and discovered Peter I Island the following day. He also saw the peaks of the mountains on Alexander I Land, an island near the Antarctic Peninsula.

Another sealer, JAMES WEDDELL, was also seeking new hunting grounds in the Antarctic waters at this time. A Scot sailing for the English, he discovered the South Orkney Islands in 1822. In February 1823, benefiting from mild weather, Weddell was able to go beyond 74 degrees south latitude, but contrary winds forced him to return north shortly afterward. The southernmost point he reached in the Weddell Sea was not surpassed until the next century.

In the 1830s, the Enderby brothers, who had a business in whaling ships operating out of England since the

18th century, became interested in scientific exploration. Charles Enderby became a member of the ROYAL GEOGRAPHICAL SOCIETY in 1830, the year of its founding. Also that year, the society commissioned Englishman JOHN BISCOE to look for land south of the Indian Ocean. He achieved a latitude of 69 degrees south on January 28, 1831, off Queen Maud Land, but did not sight land until February 24, when he saw sheer ice cliffs, which he correctly guessed to be covering the land of the continent. He named the region Enderby Land after his employers. Biscoe carried out some of the first extensive mapping of Antarctica.

In 1837, JULES-SÉBASTIEN CÉSAR DUMONT D'URVILLE embarked on an exploration of the Antarctic for France and King Louis Philippe. The king suggested that Weddell's record of exploring farthest south should be bested. Dumont d'Urville's ships, the *Astrolabe* and the *Zélée*, were small and poorly equipped for polar exploration, but he managed to discover Joinville Island and to chart the channels and islands along Graham Land on the Antarctic Peninsula. After a rest and meetings with SIR JOHN FRANKLIN and John Biscoe in TASMANIA, he returned to the southern latitudes to look for the SOUTH MAGNETIC POLE, a location determined by terrestrial magnetism and in a different location from the South Pole. On January 20, 1840, Dumont d'Urville sighted ice cliffs on the shore, and, behind them, a mountain of snow and ice that rose thousands of feet into the sky. He named the new territory Adélie Land (also known as Adélie Coast), after his wife. He also determined that the South Magnetic Pole was nearby. An explorer with a strong scientific orientation, Dumont d'Urville painstakingly illustrated the 49-volume set of his explorations in the Pacific and Antarctica with drawings and maps, all of which added greatly to current knowledge of the regions. His was the first French expedition inside the Antarctic Circle as well as the last French one in the 19th century.

After much planning, the U.S. government launched the United States South Sea Surveying and Exploring Expedition in the 1830s. Naval officer CHARLES WILKES commanded the expedition of six ships, which left Norfolk, Virginia, in August 1838. After establishing a base camp at Cape Horn, he headed southward. Unfortunately, Wilkes's ships were ill-suited for their task. After surveying the Strait of Magellan (see MAGELLAN, STRAIT OF) on their return to Valparaíso, one of the ships and all her crew were lost. Later, in January 1840, another was badly damaged by pack ice off the Antarctic coast. That same month Wilkes navigated the icebergs of Piner's Bay and came within a half mile of the shore. Shortly thereafter, he encountered Dumont d'Urville's expedition, and controversy ensued as to who had seen the mainland first. It was later calculated that both had seen land on January 19. Wilkes went on to explore the edge of the Shackleton Ice Shelf. The expedition eventually circumnavigated the world, the first American expedition to do so.

Upon returning to the United States in 1842, Wilkes faced a court martial for endangering his men, but was cleared of all charges except for that of illegal punishment of some of his crew. Later explorers questioned the accuracy of Wilkes's maps upon finding an ocean where he had plotted land. Despite this controversy, Wilkes had accomplished much in biological, geological, and meteorological data collection.

SIR JAMES CLARK ROSS, who had made four journeys to the frigid waters of the north, ventured to the south in 1839. The British naval expedition's main interest was in the South Magnetic Pole. In contrast to other explorers at the time, Ross used ships that were well designed for navigating through pack ice: the *Erebus* and the *Terror*. On January 5, 1841, he entered the ice of the Ross Sea but was blocked from reaching the South Magnetic Pole by the sheet of ice that came to be called the Ross Ice Shelf. He mapped the region extensively, however, discovering Victoria Land, Mount Erebus, and Mount Terror at the base of the Transantarctic Mountain chain. He also set a new record for reaching the farthest point south, at 78 degrees, 4 minutes. The following year, he explored the Weddell Sea on the other side of West Antarctica and discovered the Ross Islands.

During the 1800s, numerous other ships made voyages to Antarctic waters, many of them for whaling purposes. In 1873, for example, EDUARD DALLMAN led a German whaling expedition to Antarctica, considered the first voyage that far south by that country.

On the Mainland

For all the trips that had been made to Antarctica, and the understanding that land existed under the ice, no known landing occurred until January 23, 1895. While on a commercial venture, Norwegian whaling captain CARSTEN EGE-BERG BORCHGREVINK and members of his crew were the first to set foot on Victoria Land. On a subsequent expedition in 1899, sponsored by the British newspaperman GEORGE NEWNES, Borchgrevink took a ship called the *Southern Cross*, which had been specially retrofitted for polar exploration, and a crew of scientists to explore the land. Traveling on land by dog sled, they investigated the Newnes and Murray Glaciers. They then sailed to Mount Erebus and Mount Terror. They found the Ross Ice Shelf had retreated 30 miles since its discovery by Ross some 60 years prior. Borchgrevink and his crew suffered both physical and psychological hardships on the trip, including anemia, malnutrition, and depression. The creaking of the boat in pack ice also reportedly disturbed the crew. Perhaps the greatest accomplishment of Borchgrevink's exploratory expedition was proving that it was possible to spend the Southern Hemisphere's winter on Antarctica, thus setting the stage for a push inland to the South Pole.

The Belgians reached Antarctica in 1897. The leader of their expedition was ADRIEN-VICTOR-JOSEPH DE GERLACHE

This photograph of the midnight sun in the Antarctic was taken during Robert Falcon Scott's expedition of 1910–12. (Library of Congress, Prints and Photographs Division [LC-USZ62-88392])

DE GOMERY, aided by first mate ROALD ENGLEBREGT GRAVNING AMUNDSEN, a Norwegian. They explored the outer coast of the Antarctic Peninsula for three months until the *Belgica*, their ship, was trapped in pack ice. They drifted with the ice for over a year into the Bellingshausen Sea. The Belgians suffered from SCURVY but managed to catch several seals as sustenance. In spring 1899, they managed to free themselves of the ice by dynamiting a canal, and eventually returned to Belgium.

In the early 20th century, many nations launched expeditions to Antarctica. In 1901, ERICH DAGOBERT VON DRYGALSKI led a German expedition to the Indian Ocean coast of Antarctica, locating and naming Kaiser Wilhelm II Land and Mount Gauss. NILS OTTO NORDENSKJÖLD explored the South Shetland Islands, Graham Land, and Mount Haddington on Weddell Sea for Sweden. Between 1901 and 1904, ROBERT FALCON SCOTT explored Victoria Land and the Ross Ice Shelf, and he located Edward VII Land in the British National Antarctic Expedition, setting a southernmost record. Beginning in 1902, WILLIAM SPIERS BRUCE, on the Scottish National Antarctic Expedition, made the first

systematic oceanographic exploration of the Weddell Sea and charted Coats Land. And, between 1903 and 1905, JEAN-BAPTISTE-ÉTIENNE-AUGUSTE CHARCOT mapped the Antarctic Peninsula, Loubet Coast, and Adelaide Land for France. Several years later, Charcot surveyed the Palmer Archipelago and located the Fallières Coast.

To the South Pole

In the early 20th century, reaching the North Pole and the South Pole was considered to be the two greatest goals in exploration. SIR ERNEST HENRY SHACKLETON, who had been part of Scott's 1901 expedition, organized an expedition to the South Pole, the British Antarctic Expedition, which set out in July 1907. After locating the Beardmore Glacier and crossing the Polar Plateau, Shackleton missed claiming this prize by only 97 miles, turning back on January 9, 1909. On January 16, a second party, including the Australian scientist SIR DOUGLAS MAWSON, reached a point 190 miles inland from the west shore of the Ross Sea, where it was determined by COMPASS readings that they had reached the South Magnetic Pole.

That spring, on April 6, 1909, at the other side of the world, two Americans—ROBERT EDWIN PEARY and MATTHEW ALEXANDER HENSON—reached the North Pole (or within a couple of miles of it) by sledge from Cape Columbia on the north coast of Ellesmere Island. (Another American FREDERICK ALBERT COOK claimed he had reached the North Pole on April 21, the year before, but this claim is disputed.)

The British organized another attempt on the South Pole, to be led by Antarctic veteran Robert Falcon Scott, who departed England in June 1910. The plan was to set out from McMurdo Sound and follow the route pioneered by Shackleton (across the Beardmore Glacier and Polar Plateau), with preestablished food and fuel depots along the way. Motorized sledges, Manchurian ponies, and dog sleds were to provide transportation. In the interim, the Norwegian Roald Amundsen, who had intended to attempt to reach the North Pole, learned of Peary's success and decided to make an attempt on the South Pole instead. His approach, also supported by food and fuel depots, was to be launched from the Bay of Whales on the edge of the Ross Ice Shelf, 65 miles closer to the Pole, and across the Axel Heiberg Glacier. The Amundsen expedition, in contrast to Scott's expedition, made use of sledges pulled by dogs alone. Amundsen's party of five men, which set out on October 19, 1911, reached the South Pole on December 14. Scott's party, also of five, set out on November 1, 1911, and reached the Pole on January 17. To their great disappointment, upon reaching the Pole, Scott's party found a marker flag and other items left by the Norwegians. Tragically, Scott and his men—one of them physician and zoologist EDWARD ADRIAN WILSON, who had been with Scott on his earlier Antarctic expedition—all perished upon running out of supplies while trapped in a blizzard.

Others mounted expeditions during this period. Between 1910 and 1912, WILHELM FILCHNER led the Second German Antarctic Expedition, during which he located the Filchner Ice Shelf on the Weddell Sea and Luitpold Land. In 1911, Douglas Mawson led an Australian expedition to Antarctica which located George V Land. In 1912, NOBU SHIRASE led a Japanese expedition to Antarctica, which explored the Ross Ice Shelf and King Edward VII Land. And, beginning in 1914, Ernest Henry Shackleton led the British Imperial Trans-Antarctic Expedition in an attempt to make the first crossing of the Antarctic continent, from the Weddell Sea to the Ross Sea. After the expedition's boat was trapped in ice and sunk in the Weddell Sea, the crew managed to take refuge on Elephant Island. In a now-famous incident, Shackleton and five others made a hazardous open boat voyage to South Georgia Island, crossed the island overland to a whaling settlement on the other side, and eventually rescued the rest of the crew, remarkably with no loss of life.

Aerial Exploration

Much of the subsequent Antarctic exploration was by air. In 1929–30, American RICHARD EVELYN BYRD, who had recorded the first flight over the North Pole in 1926, repeated the accomplishment over the South Pole on November 29, 1929, during the First Byrd Antarctic Expedition. Other aviators who contributed to the aerial exploration of Antarctica were Australian Douglas Mawson, who undertook aerial surveys from 1929 to 1931, and American LINCOLN ELLSWORTH, who completed the first flight across the Antarctic continent in 1935.

Byrd's Antarctic career continued into the 1950s. In the Second Byrd Antarctic Expedition of 1933 to 1935, he became the first man to survive a winter alone in Antarctica. Between 1939 and 1941, during the early years of World War II, he established bases to counter German encroachments on territory claimed by Norway. From 1947 to 1948, after the war, Byrd carried out additional aerial reconnaissance for the United States, as part of Operation Highjump, a major fleet exercise; a total of 70,000 aerial-mapping photographs were taken by the fleet's aircraft.

International Cooperation

In 1956, Byrd served as senior adviser to the U.S. Navy's Operation Deep Freeze, conducted in preparation for the INTERNATIONAL GEOPHYSICAL YEAR (IGY) of 1957–58, with Antarctic geography a primary focus. One IGY undertaking was the Commonwealth Trans-Antarctic Expedition, headed by the Englishman SIR VIVIAN ERNEST FUCHS and the New Zealander SIR EDMUND PERCIVAL HILLARY. They accomplished the first successful crossing of Antarctica. The spirit of cooperation generated around IGY led to an Antarctic Treaty, declaring the continent a nonmilitary area to be used only for scientific study; the treaty was drafted in 1959 and has been in effect since 1961. Seven nations have active land claims—Argentina, Australia, Chile, France, Great Britain, NEW ZEALAND, and Norway. The treaty did not resolve these claims, but it did put a moratorium on future claims.

Under the treaty, Antarctic research has been ongoing, with 17 nations maintaining some 40 year-round bases with rotating staffs, on the continent. Today, Antarctica serves as a laboratory of sorts for geological, biological, and environmental research. The study of Antarctica's core samples provides information to scientists and geologists regarding the evolving world climate and the effects of pollution. In 1980, the discovery of the thinning of the ozone layer, the atmospheric gas that shields Earth from harmful ultraviolet radiation, by the British Antarctic Survey has helped make the world aware of the fragility of ecosystems and has led to a reduction in the production of chlorofluorocarbons (CFCs), pollutants linked to ozone depletion. In 1990, an international team with members from

This engraving shows a scene from James Cook's expedition on January 9, 1773, just before the crossing of the Antarctic Circle. It appeared in the explorer's book *A Voyage towards the South Pole*, published in 1777. (Library of Congress, Prints and Photographs Division [LC-USZ62-77398])

six countries, led by American Will Steger and Frenchman Jean-Louis Etienne, used dog sleds to complete the first unmechanized crossing of the Antarctic continent—a journey of about 4,000 miles. A central purpose of the expedition was scientific research, including the measurement of ground-level ozone levels and the pollutants concentrated in Antarctic mosses and lichens.

Although most of Antarctica has now been visited, its harsh environment has preserved it as one of Earth's remaining vast wilderness areas. Despite the conveniences of modern technology, travel, and research there remains a challenge similar to that faced by early explorers.

Antarctic Circle

The Antarctic Circle is a parallel of latitude, a cartographic feature based on natural phenomena, situated at 66 degrees and 33 minutes south of the EQUATOR. The circle, as defined on Earth's surface at the southern end, marks the northern limit of the area in which the Sun does not rise on the summer solstice, on or about June 22, or does not set on the winter solstice, on or about December 22. The pe-

riod of continuous night or day increases from one day along the Antarctic Circle to six months at the SOUTH POLE. The equivalent cartographic feature at the opposite northern end of Earth is the ARCTIC CIRCLE.

The Antarctic Circle was not crossed until late in the history of exploration, despite numerous expeditions in search of the GREAT SOUTHERN CONTINENT. The first recorded crossing was made by Englishman JAMES COOK on January 17, 1773. The regions within the Antarctic Circle were uninhabited until the 20th century, when outposts for scientific research were built.

Apollo program (Project Apollo)

The modern concept of human landing on the Moon can be traced to early writers. One such dreamer was Lucian of Samosota, a Greek, who, in A.D. 160, wrote a story of flight to the Moon on artificial wings. Another was French science fiction writer Jules Verne. In 1865, he published *From the Earth to the Moon*, in which a three-man capsule is propelled into space by an aluminum cannon. An early scientist who

began to entertain the notion of space flight was Konstantin Eduardovich Tsiolkovsky (1857–1935), a Russian inventor who was intrigued by the idea of putting an artificial SATELLITE into orbit around Earth. He is credited with understanding that, in order to escape Earth's gravitational pull, a series of booster rockets would be necessary, each stage falling away after its fuel was spent. In the 20th century, many important advances in the ROCKET were made, including American physicist Robert Hutchings Goddard's liquid-fuel rocket of 1926 and the German V2, the direction of which could be controlled, developed during World War II. As the cold war between Russia and the United States came into being, so too did the "space race." The Union of Soviet Socialist Republics (USSR; Soviet Union) scored a major victory with the first successful launch of an artificial satellite in October 1957, when *Sputnik 1* was deployed. The United States launched its first satellite, *Explorer 1*, in January 1958. The following July, the United States established the NATIONAL AERONAUTICS AND SPACE ADMINISTRATION (NASA) for the purpose of research and to carry out programs in the areas of SPACE EXPLORATION. In April 1961, Russian YURI ALEKSEYEVICH GAGARIN became the first man in space, as part of the VOSTOK PROGRAM.

In 1961, President John F. Kennedy called for the United States to land a man on the Moon and return him safely to Earth before the end of the decade. NASA organized the Apollo program in that year; it would last until 1972. Meanwhile, NASA conducted a number of programs: the MERCURY PROGRAM of 1961–63, during which ALAN BARTLETT SHEPARD, JR., became the first American in space and JOHN HERSHELL GLENN, JR., the first American to orbit the Earth; the GEMINI PROGRAM of 1964–66, which developed techniques for the trip to the Moon; and the unmanned Surveyor Program of 1966–68, which probed the lunar surface.

Among the complex problems to be solved were the acceptable range of acceleration speeds so ASTRONAUTS would not be crushed during liftoff, and the safe return through Earth's atmosphere, since friction created by air molecules would tend to incinerate a spacecraft.

Experiments and missions were carried out continuously by both the United States and Soviet Union. The Soviet Union had several firsts, but American technology slowly gained the advantage. The United States launched its own first successful Lunar Orbiter in August 1966, taking pictures of the Moon with the goal of charting appropriate landing sites for the manned mission. Through November 1968, 12 Lunar Orbiters and Surveyors were launched.

To propel the astronauts into orbit, a three-stage Saturn V rocket was used. The Apollo Spacecraft itself also consisted of three parts: the command module, the service module, and the lunar module. The total apparatus was 363 feet high and weighed 3,000 tons.

Once Moon orbit was achieved, the lunar module disconnected from the command module and service module, descending to the Moon's surface. After exploration, the ascent stage of the lunar module detached from the descent stage, re-docking with the command module. The service module was released just prior to reentry into Earth's atmosphere.

The loss of the three-person crew of *Apollo 1* by fire on the launching pad in 1967 did not lessen the resolve of the United States to be first in placing a human on the Moon. The goal was achieved on July 20, 1969, with the *Apollo 11* mission. NEIL ALDEN ARMSTRONG became the first human to walk on the Moon's surface, followed closely by Edwin "Buzz" Aldrin, Jr., while Michael Collins orbited the Moon in the command module.

There were a total of 17 missions that went under the Apollo name. Of the 12 manned missions, two went into Earth orbit (*Apollo 7* and *Apollo 9*); two went into lunar orbit (*Apollo 8* and *Apollo 10*); six landed on the Moon (*Apollo 11*, *Apollo 12*, *Apollo 14*, *Apollo 15*, *Apollo 16*, and *Apollo 17*), the final three making use of the Lunar Roving Vehicle (LRV) for wide-ranging exploration; one was lost during a test on the launch pad (*Apollo 1*); and one returned to Earth without having made its scheduled lunar landing (*Apollo 13*). Much scientific knowledge was gathered over the course of the Apollo missions, including information on seismic activities, magnetic fields, heat flows, and volcanic history. Close to 900 pounds of rocks and other physical samples were brought back to Earth, as well as 30,000 high-resolution photographs of the Moon from orbit and from the surface. The landing on the Moon and video footage of other Apollo missions has also created historic television moments.

Appalachian Mountains

The Appalachian Mountains, the second-largest mountain system in North America after the ROCKY MOUNTAINS, extend 1,500 miles from the St. Lawrence Valley in Quebec to the Gulf Coast plain in northern Alabama. The range's width varies from 100 to 300 miles. An old mountain range and much eroded, the greatest elevations are found along eastern parts, with plateau formations to the west. Peaks range in height from about 1,500 feet to 6,684 feet above sea level.

The Appalachians are discussed as three subdivisions: northern, central, and southern. The northern division extends from the Notre Dame and Shickshock Mountains of Quebec and includes the Highlands of Maine, the White Mountains of New Hampshire, and the Green Mountains of Vermont. The central division contains the Catskill Mountains of New York; the Blue Ridge Mountains of western Virginia, eastern West Virginia, western North Carolina,

and northern Georgia; the Great Smoky Mountains of western North Carolina and eastern Tennessee; and the Allegheny Mountains of Pennsylvania, Maryland, Virginia, and West Virginia (to the west of the Blue Ridge). The southern division includes the Cumberland Plateau running along the southwestern border of Virginia and southeastern Kentucky, eastern Tennessee, northern Georgia, and northeastern Alabama; and the Cumberland Mountains, the high narrow mountains forming part of the Kentucky state line and separated from the Cumberland Plateau by the Cumberland River Valley. The Black Mountains, a spur of the Blue Ridge in western North Carolina, contain the highest peaks in the Appalachian chain; Mount Mitchell near Asheville, North Carolina, at 6,684 feet, is the tallest.

The Appalachians include a number of valley systems. The Hudson River Valley in New York is one of the largest valleys. The Great Valley extending southward from the Hudson River Valley comprises a number of smaller valleys in Pennsylvania, Maryland, Virginia, Tennessee, and Alabama. What is known as the Ridge-and-Valley Province, with long sharp ridges and narrow valleys, is bordered on the west by the Cumberland and Allegheny Mountains, on the north by the Alleghenies, and on the south by the Blue Ridge and Great Smoky Mountains.

The Appalachians are divided by both water gaps and wind gaps. Water gaps are valleys with rivers running through them; wind gaps are dry valleys. The CUMBERLAND GAP in the Cumberland Plateau is one of the most famous wind gaps because of its role as a natural pass for the westward movement of pioneers.

In terms of watershed, the Appalachians serve as the eastern Great Divide. Rivers on the eastern side empty into the Atlantic Ocean; those on the western side empty into the Gulf of Mexico. Among the largest are the Connecticut, Delaware, Hudson, James, Potomac, Rappahannock, Schuylkill, and Susquehanna Rivers, which flow eastward or southeastward; and the Alleghany, Cumberland, Kanawha, Monongahela, and Tennessee Rivers, which flow westward.

The Appalachians presented an obstacle to western expansion. The earliest European explorers followed narrow Indian trails across them. In the north, rivers and the Great Lakes provided access to the west of the Appalachians. The first European crossing of the Appalachians was accomplished by the Spanish under HERNANDO DE SOTO during their meandering trek through the Southeast in 1539–43. After wintering near the Gulf of Mexico in northern Florida in 1539–40, the CONQUISTADORES headed northward through present-day Georgia and South Carolina into North Carolina. In May and June 1540, they crossed a section of the great range into what is now eastern Tennessee. Their exact route is unknown; they may have journeyed through the Great Smoky Mountains or south of them across the Blue Ridge. From there, they followed the Ten-

nessee River southwestward, crossing through the northwest corner of Georgia into Alabama, and eventually reached the MISSISSIPPI RIVER far to the west.

17th Century

Europeans did not venture into the Appalachians again until the next century. In the far north, starting in 1603, the French established a presence in what is now eastern Canada under SAMUEL DE CHAMPLAIN and explored parts of the northern extent of the mountain chain. In 1615–16, ÉTIENNE BRÛLÉ, working for Champlain, explored the entire length of the Susquehanna River from present-day New York to Chesapeake Bay in Maryland and viewed other sections of the mountain system on his return to Montreal. Over the next decades, French Jesuit missionaries pushed into Indian lands in part of the Appalachian system, such as ISAAC JOGUES, among the Mohawk in the northern Catskills. The French, however, for the most part explored westward from their settlements along the St. Lawrence River to the western Great Lakes, then southward, thus bypassing the Appalachians. In the same period, some Dutch traders also ventured westward into the Catskills, but on a limited basis.

The English, who settled to the south along the Atlantic coast, where the Appalachians are the tallest, had no easy route westward. After the founding of Jamestown, Virginia, in 1607, it took many years for colonists to travel beyond the Piedmont Region between the coast and the mountains. An early expedition was headed by German-born physician JOHN LEDERER in 1669–70; he explored the Piedmont and Blue Ridge of Virginia and North Carolina on behalf of the Virginia colony. In the early 1670s, colonial military officer ABRAHAM WOOD sponsored a number of exploratory expeditions out of Fort Henry near present-day Petersburg, Virginia, to the Appalachian frontier of Virginia and North Carolina. In 1671, THOMAS BATTS and ROBERT FALLAM crossed the Blue Ridge and reached the Kanawha and New River Valleys of present-day West Virginia for him. Two years later, GABRIEL ARTHUR and JAMES NEEDHAM reached Tennessee. Over the next years, it was mostly traders to Indian tribes who traveled into the highlands.

18th Century

Travel into the Appalachians was rare until the 18th century. In 1716, ALEXANDER SPOTSWOOD, lieutenant governor of Virginia, headed an expedition through the James River gap in the Blue Ridge to the Shenandoah Valley of western Virginia. From 1713 until the 1740s, German-born CONRAD WEISER traveled throughout western New York and Pennsylvania as an interpreter, guide, and Indian agent. Traders and frontiersmen such as JAMES ADAIR, DANIEL BOONE, THOMAS CRESAP, GEORGE CROGHAN, JOHN FINLEY, CHRISTOPHER GIST, SIMON KENTON, JAMES ROBERTSON,

and JAMES SMITH explored the Appalachian and trans-Appalachian country starting in the mid-17th century. Hunters sought game to the west of the mountains; with time, settlers sought lands.

As trails and passes were located, land grants were assigned. In the 1750s, Gist and Cresap developed an Indian trail from the Potomac in western Maryland through the Alleghenies to the Monongahela River in western Pennsylvania, which, soon afterward, during the French and Indian War of 1754–63, became known as Braddock's Road when widened to wagon width, after British general Edward Braddock (the first leg would become known as the National Road). In 1758, also during the French and Indian War, British general John Forbes built another road north of Braddock's Road, to advance on Fort Duquesne (present-day Pittsburgh) through the Alleghenies. A postwar extension joined the eastern end of the road with Philadelphia. In 1750, physician THOMAS WALKER led a surveying party through the Cumberland Gap of the Blue Ridge into what is now eastern Kentucky. In 1775, the Transylvania Land Company hired Daniel Boone and 30 others to open the Wilderness Road, from Fort Chiswell in the Shenandoah Valley through the Cumberland Gap, as a route to the Ohio Valley.

These days the Appalachians are widely used for camping and hiking. Modern-day trails give a sense of exploration in prior centuries.

archaeology and exploration

Archaeology, a branch of anthropology involving the study of material remains of human cultures, is a form of exploration in its own right—exploration of the material past. In its search for physical evidence, archaeological studies provide the only source of information for the prehistoric period and supplement the written record for the historic period. Yet, since archaeology potentially looks at every part of the world ever inhabited or traveled by humans and since the discipline requires fieldwork, including surveys of possible sites and excavation of them, it has taken its practitioners to remote places, thereby contributing to world exploration in the broader sense. And, in some instances, archaeological discoveries resulted from exploration for other purposes.

The fields of archaeology include the following: prehistoric archaeology, archaeology of early and classical civilizations, historical archaeology, and underwater archaeology.

Studies are made of a variety of antiquities: human fossils; food remains; ruins of buildings; and artifacts such as tools, pottery, and jewelry. Some archaeologists use skills from other disciplines—chemistry, zoology, botany, geology, and geography—in specialized fields of archaeological studies. Paleoanthropology, the study of ancient human remains, uses archaeological methods. Archaeology began taking shape in the 18th century, became defined as a formal discipline in the 19th century, and was refined in the 20th century with more exacting methods of excavation and statistical sampling.

Most early archaeological studies were conducted in Europe, the Middle East, and the Americas. As early as the 15th century, excavations of Greek sculpture were carried out in Italy. Pioneers of classical archaeology include the German Johann Joachim Winckelmann, who, in the 18th century, laid the foundation for modern scientific archaeology with studies of the ancient Greeks and Romans, and the Italian Ennio Quirino Visconti, who studied Greek and Roman antiquities in the 18th century and into the 19th century. Heinrich Schliemann, the German who located the ruins of Troy in Turkey in the 19th century, and Sir Arthur Evans, the Englishman who uncovered the remains of an Aegean civilization of the Minoans in Crete in the early 20th century, captured the public's imagination with their discoveries. The finding in 1799 of the Rosetta Stone, an inscribed basalt slab giving the key to hieroglyphics of the ancient Egyptians, by troops accompanying Napoléon Bonaparte to North Africa, is considered the beginning of Egyptology, a branch of classical archaeology that centers its studies solely on ancient Egyptian culture.

Another important event in the shaping of archaeology is Danish archaeologist Christian Thomsen's classification in 1836 of three ages of human development in Europe, based on the principal materials used for tools: the Stone Age, the Bronze Age, and the Iron Age.

In the first part of the 19th century, there was a growing awareness of ancient American civilizations. In 1820, Caleb Atwater of Massachusetts published *Description of the Antiquities Discovered in the State of Ohio and Other Western States*, leading to increasing studies of earthworks and, over the next decades, an awareness of the Adena and Hopewell Indian mound-building cultures. In 1849, U.S. Army lieutenant JAMES HERVEY SIMPSON came upon Anasazi Indian ruins at Chaco Canyon in New Mexico and Canyon de Chelly in Arizona while on a military reconnaissance in New Mexico.

In 1911, American historian HIRAM BINGHAM located ruins of the great Inca civilization at Machu Picchu in Peru. The publication, in 1941 and 1943, of John Lloyd Stephens's accounts of his travels to Central America generated interest in the Maya and other pre-Columbian civilizations of the Americas and helped lead to growing archaeological activity.

Beginning in the late 19th century and early 20th century, British archaeologists, such as JAMES THEODORE BENT and GERTRUDE MARGARET BELL, carried out pioneering studies in the Middle East. In 1906–08, SIR MARC AUREL STEIN, an Anglo-Hungarian archaeologist, followed a stretch of the ancient SILK ROAD into western China and discovered the Caves of the Thousand Buddhas, a series of temples built into caves, at Tunhuang. The 1947 discovery of the Dead Sea Scrolls, fragments of the Hebrew Bible written by members of an early Christian sect, gave biblical archaeology new impetus.

The youngest branch of archaeology is underwater archaeology, in which shipwrecks and ruins of buildings lying beneath water are investigated. The development of specialized diving equipment, such as the SUBMERSIBLE, SUBMARINE, and the remotely operated vehicle (ROV), has made such studies possible.

Archaeology is now conducted around the world, with remarkable discoveries and new insights gained on a regular basis. Modern archaeologists, who travel widely and spend time in harsh landscapes on an endless quest, continue the spirit of world exploration.

Arctic, exploration of the

The Arctic, unlike the Antarctic at the opposite end of the Earth, is a region and not a continent. It includes the northernmost of Earth's four oceans—the Arctic Ocean—as well as land areas, including the northern parts of three continents—North America, Europe, and Asia—and numerous islands. Most of the Arctic Ocean and many of the land areas are covered in ice year round, making it resemble the ice-covered landmass of Antarctica.

The term *Arctic*, derived from the Greek word *arktos* for “bear”—because the region is under the constellation known as the Bear—is applied variously. One definition is the area north of the ARCTIC CIRCLE, the parallel of latitude situated at 66 degrees 33 minutes, marking the point at which the Sun neither sets on the day of summer solstice nor rises on the day of winter solstice. Another broader definition is the area north of the summer isotherm, a shifting cartographic line where the average annual temperature is 32 degrees Fahrenheit or less and the mean temperature for the warmest summer month is 50 degrees Fahrenheit. The Arctic is also defined as the area north of the tree line, beyond which trees do not grow. (The tree line corresponds roughly to the summer isotherm.)

Arctic winters are long and severe, with few hours of daylight. Although there is little precipitation, gale-force winds stir up surface snow and create blizzard conditions and enormous drifts. Coastal regions generally have warmer

temperatures and heavier precipitation than colder and drier inland regions.

The ancient continental shields—regions composed mostly of the igneous rock granite and the metamorphic rock gneiss—of North America, Europe, and Asia surround a large basin occupied by the Arctic Ocean, the smallest of the Earth's four oceans. The Arctic Ocean extends south from the NORTH POLE, the northernmost place on Earth, to the north coasts of the three continents. It opens to the Atlantic Ocean between northern Europe and eastern GREENLAND, with ICELAND in the middle; and between northern North America (and its islands) and western Greenland through the Davis Strait. It opens to the Pacific Ocean through the BERING STRAIT between northwestern North America and northeastern Asia. Among the larger rivers emptying into the Arctic Ocean are the Mackenzie and Coppermine Rivers in North America, and the Ob, Yenisey, and Lena Rivers in Asia. The total surface area of the Arctic Ocean is 5.4 million square miles. The following seas are part of the Arctic Ocean: Norwegian, Barents, Kara, Laptev, East Siberian, Chukchi, Beaufort, and Greenland. HUDSON BAY, linked to the Arctic Ocean via the Foxe Channel and the Atlantic Ocean via the Hudson Strait, can be considered an arm of either ocean. The deepest point in the Arctic Ocean is 17,880 feet, but the average depth is a relatively shallow 4,300 feet because of the shallow expanses on the continental shelves. Most of the Arctic Ocean is frozen all year, other than an area north of Scandinavia and northeast of Iceland. During the brief summer, the PACK ICE thaws and open water, containing some DRIFT ICE, appears along much of coastal Alaska, Canada, and SIBERIA.

The islands of the Arctic Ocean lie on the continental shelves extending from the continents. Greenland, to the northeast of North America, is the largest island in the region. Part of Greenland, as well as all of Iceland to its east, lies south of the Arctic Circle. The Canadian Arctic Archipelago—including Victoria Island, Ellesmere Island, Baffin Island, and the Queen Elizabeth Islands—extends north and east along the northern North American mainland. North of Scandinavia lies the archipelago of Svalbard (formerly known as Spitsbergen). North of Russia are Franz Josef Land, Novaya Zemlya, Severnaya Zemlya, the New Siberian Islands, and Wrangel Island.

The treeless coastal plains known as tundra extend throughout much of the Arctic. The subsoil remains frozen all year in a condition known as permafrost. As a result, surface water does not drain, creating numerous lakes, ponds, marshlands, and mud, along with fog. Little vegetation grows other than mosses, lichens, and scrub brush. Mountain ranges and low plateaus rise up from the plains especially in northern Alaska, the Yukon territory, and northeastern Siberia. Of the islands, Ellesmere Island, Baffin Island, Iceland, and Greenland consist predominantly of

Frederick Albert Cook took this photograph during his travels to Arctic regions in the late 19th or early 20th century. (*Library of Congress, Prints and Photographs Division [LC-USZ62-128023]*)

highlands; Greenland in fact is a high plateau covered year round by an ice cap, except along its coasts.

Arctic fauna include many species of fish; aquatic mammals, such as the whale, walrus, and seal; and land mammals, such as moose, caribou, reindeer, musk ox, polar bear, wolf, fox, hare, and squirrel. In springtime, birds migrate to Arctic regions. Insects breed during the short summers, especially in marshlands.

Because of its harsh conditions, the Arctic has been sparsely populated over the centuries. Yet, long before the region came to be mapped, humans survived there for centuries. It is thought that the Arctic's earliest inhabitants, various peoples of Mongolic stock, migrated northward from central Asia and spread westward into Europe and eastward into North America. Major groups include the Sami (Lapps) and Komi (Zyrian) of Europe; the Samoyed (Nentsy) of western Russia; the Yakut, Tungus, Yukaghir, and Chukchi of eastern Russia; and the Inuit (Eskimo) and Aleut of North America.

Earliest Voyages to the Arctic

Greek scholar PYTHEAS of the fourth century B.C. was the first known European traveler to extreme northern latitudes.

His account of his journey six days north of the British Isles, perhaps near or across the Arctic Circle, has not survived, but later geographers, such as Greek STRABO and Roman PLINY THE ELDER of the first century A.D., commented on his observations regarding ULTIMA THULE, supposedly the northernmost lands. Strabo was skeptical in regard to Pytheas's claims.

During the Middle Ages, Irish monks, such as SAINT BRENDAN, ventured out into the Atlantic on sea pilgrimages. Some of them established colonies on the uninhabited Iceland by A.D. 800. Yet, they were not known to have reached the Arctic Circle just to the north of Iceland.

The VIKINGS, accomplished navigators, explored northern waters and very likely crossed into the Arctic waters from their Scandinavian lands. Two early Norsemen known to have reached Iceland are NADDOD and GARDAR SVARSSON in the ninth century. The Norse presence drove away the Irish settlers. In the late 10th century, ERIC THE RED reached Greenland. Both Iceland and Greenland were colonized. His son LEIF ERICSSON is thought to have reached the Arctic regions of North America at the start of the 11th century. He came into contact with a people the Vikings referred to as *Skraelings*, who were very likely Inuit.

At about the same time, Norwegians and Russians reached the Arctic coast of northern Europe and established contacts for purposes of taxation and trade with indigenous peoples.

Passage to the Far East

Arctic exploration during what is known as the EUROPEAN AGE OF EXPLORATION, beginning in the 15th century, revolved primarily around the search for practical trade routes from Europe to the Far East. Some mariners sought an eastward route from the Atlantic to the Pacific north of Europe and Asia by way of the Arctic Ocean—a NORTHEAST PASSAGE. Others sought a westward route through the Americas—a NORTHWEST PASSAGE. All the great European powers of the time—Portugal, Spain, the Netherlands, England, and France—launched expeditions in search of one or both passages. With the geography of much of Europe and Asia well known, expeditions in search of the Northeast Passage traveled directly to northern latitudes. In the decades after the European discovery of the Americas in 1492 by CHRISTOPHER COLUMBUS—an Italian mariner sailing for Spain—many expeditions explored the coasts of both North and South America—exploring bays and rivers—before narrowing down the search for a Northwest Passage to the extreme north.

Early Portuguese Expeditions

Portuguese mariner GASPAR CÔRTE-REAL claimed to have made a voyage in 1499, in the course of which he explored the seas to the west of Greenland. He also claimed he had found the entrance to the Strait of Anian (see ANIAN, STRAIT OF), another name for the Northwest Passage. In 1500, he carried out a documented voyage into Davis Strait along the west coast of Greenland before being forced back by pack ice. On this journey he very likely crossed the Arctic Circle, becoming the first European to do so since the time of the Vikings. Côrte-Real's ship disappeared after heading southward.

Another Portuguese explorer, JOÃO FERNANDES, is thought to have led a Portuguese maritime expedition to North America, also in 1500 and also reaching Greenland. Other Portuguese for a time carried voyages to northeastern North America to reach the fishing grounds off Newfoundland but, having established an eastward water route to Asia around the tip of Africa and having established a foothold in the Americas in Brazil, carried out no more explorations to the Arctic. Spain, Portugal's chief competitor at the time, also concentrated its efforts to the south, fanning out from the Caribbean Sea.

Early British Expeditions

Italian JOHN CABOT, who made the earliest transatlantic voyages for England and reached northeastern North America, also neared Arctic waters. John Cabot possibly explored

southwestern Greenland in his voyage of 1497, and one of his three sons, SEBASTIAN CABOT, possibly entered the Hudson Strait between the North American mainland and Baffin Island, and perhaps even reached eastern Hudson Bay, while in search of the Northwest Passage in 1509, although there is no documentation to determine how far west he actually reached.

Sebastian Cabot was the first governor of the London-based MUSCOVY COMPANY, the primary purpose of which was to locate the Northeast Passage. As such, he sponsored expeditions under HUGH WILLOUGHBY, RICHARD CHANCELLOR, and STEPHEN BOROUGH to the Arctic Ocean north of Europe in the 1550s, during which the two islands of Novaya Zemlya ("New Land" in Russian) north of Russia were reached. Willoughby also became the first Englishman to cross the Arctic Circle. The Muscovy Company continued to back other expeditions over the next years, among them a 1607 expedition headed by HENRY HUDSON. Hudson sailed westward to Greenland, exploring its east coast, then, returning east and north, he came upon Spitsbergen. On a second trip in 1608, he took the more conventional route—directly north and east—and explored Novaya Zemlya but was forced back by ice.

In the meantime, in the latter part of the 16th century, geographer SIR HUMPHREY GILBERT once again promoted the idea of a Northwest Passage. In 1576–78, SIR MARTIN FROBISHER headed three British expeditions to northern Canada, just south of the Arctic Circle, during which he made the European discovery of Frobisher Bay on southeastern Baffin Island. He also entered the Hudson Strait. In 1585–87, JOHN DAVIS also headed three expeditions to some of these same waters, exploring the strait named after him, reaching the northernmost latitude known attained until that time.

British expeditions to the region continued into the 17th century. In 1605–07, JAMES HALL, who had carried out three expeditions to western Greenland for Denmark and drafted charts of Greenland's west coast, also headed one for British merchants in 1612, during which he was killed by an Inuit for having kidnapped other Inuit on an earlier voyage. Henry Hudson sailed all the way through Hudson Strait and made what is considered the European discovery of Hudson Bay in 1610–11. Both are named for him. After wintering on James Bay, the southern extent of Hudson Bay, the crew mutinied; Hudson, his son, and some ailing crew members were set adrift in a small boat and were never seen again. SIR THOMAS BUTTON headed a follow-up expedition to the Hudson Bay in 1612–13, reaching the mouth of the Nelson River and exploring the coast of Southampton Island. WILLIAM BAFFIN, who had sailed with James Hall in 1612, and ROBERT BYLOT carried out two expeditions. The first, in 1615, took them to Hudson Bay's northwest coast and Foxe Basin, leading to a determination that Hudson Bay provided no navigable outlet for a Northwest Passage

(although later explorers would search the region again). The second, in 1616, took them along the west coast of Greenland into Baffin Bay and along the northeastern Baffin Island (both were named for Baffin) as far north as Lancaster Sound between Baffin Island and Devon Island. They found the sound impassable because of ice conditions. Their northernmost record would endure for 200 years. (It would later be determined that Lancaster Sound was in fact the eastern entrance to a water route between the Atlantic and the Pacific.) In 1631, LUKE FOXE, and, in 1631–32, THOMAS JAMES, further explored Hudson Bay.

Danish Expeditions

Denmark launched its own expeditions to the Arctic regions in the early 17th century, sponsored by King Christian IV, known as the Danish Sailor King because of his efforts to make Denmark a maritime power. The Danish monarch hoped to reestablish contact with the Viking colonies after a lapse of two centuries. British mariner James Hall sailed for him in 1605 and again in 1606, reaching the west coast. No Scandinavian colonists were found, but the Danes had contact with the Inuit. An expedition the next year failed to reach Greenland. In 1619–20, Danish mariner JENS ERIKSEN MUNK sailed to Hudson Bay in search of the Northwest Passage and explored the Churchill River region.

Dutch Expeditions

Beginning in the late 16th century, the Dutch launched expeditions to the northern waters for purposes of trade and in the hope of navigating the Northeast Passage. The White Sea Trading Company, founded in 1565, backed a number of attempts. OLIVIER BRUNEL led two of them in 1584–85. Having reached the Ob River overland from Moscow, he hoped to reach its mouth by way of the Kara Sea. His passage was blocked by ice both times around Novaya Zemlya.

The Dutch launched many other expeditions to the region, three of them in the 1590s involving the navigator WILLEM BARENTS. Geographer JAN HUYGHEN VAN LINSCHOTEN, a principal backer, participated in the first two. The waters around Novaya Zemlya proved the westernmost limits of the Dutch expeditions of the period, although, during the first expedition in 1594, Linschoten's ship managed to pass along the southern end of Novaya Zemlya and enter the Kara Sea. On his third expedition in 1596–97, Barents headed north of Norway, charted Bear Island, and reached Spitsbergen, the first European to do so since the Vikings. He proceeded eastward and entered the Kara Sea north of Novaya Zemlya. After a difficult winter, Barents perished from SCURVY.

In 1609, after his earlier expeditions for the Muscovy Company, Englishman Henry Hudson, in the employ of the DUTCH EAST INDIA COMPANY, carried out another attempt to locate the Northeast Passage. He approached Novaya

Zemlya once again, but, because of icy conditions, he headed westward across the Atlantic to the Americas and investigated the coast of Newfoundland and the Hudson River. As these expeditions seemed to prove the Kara Sea un-navigable, both the Dutch and the English turned their attention to the rich fishing and whaling grounds near Spitsbergen.

Russian Expeditions

In the mid-17th century, the Russians—especially Russian Cossacks—began exploring Arctic regions of Siberia overland from the west. In the 1640s–50s, MIKHAIL STADUKHIN, with a party of Cossacks, explored the Arctic coast of Siberia around the Kolyma River and on the Gulf of Anadyr. The earliest recorded sighting of the BERING STRAIT was by Cossacks led by SEMYON IVANOVICH DEZHNEV in 1648.

The following century, Czar Peter the Great sponsored a number of expeditions to northeastern Siberia and both the Arctic and Pacific Oceans, among them the First Kamchatka Expedition of 1725–30, under VITUS JONASSEN BERING, a Danish explorer in service to Russia, and Russian naval officer ALEKSEY ILYICH CHIRIKOV. Bering first charted the Bering Strait in 1728; the strait was subsequently named for him. Starting in 1733, Bering and Chirikov also led the Great Northern Expedition to the Arctic and Pacific coasts of Siberia, during which they explored the Gulf of Anadyr and the Chukchi Sea, crossed the Bering Strait, and, in 1741, made the European discovery of Alaska. Bering, along with 18 of his crew, perished from scurvy in the fall of that year. In 1742–43, SIMEON CHELYUSKIN, also part of the Great Northern Expedition, explored along the Arctic coast from the White Sea to the Leptev Sea, in the course of which he rounded Cape Chelyuskin, the northernmost point of Asia.

The Russians continued explorations of northern Siberia and the Arctic Ocean. In 1760–62, IVAN BAKHOV navigated from the Lena River eastward to the mouth of the Kolyma River. The next year, STEPAN ANDREYEV traveled overland from Fort Anadyr on the Bering Sea to the Arctic coast. While exploring the Bear Islands opposite the mouth of the Kolyma River, he sighted New Siberia Island, part of the island group known as the New Siberian Islands, thus making the European discovery of that group. In the Northeastern Secret Geographical and Astronomical Expedition of 1785–93, searching for the Northeast Passage, Englishman JOSEPH BILLINGS, along with ANTON BATAKOV and GAVRIIL ANDREYEVICH SARYCHEV, explored the Chukchi Peninsula and the Bering Strait.

The Fur Companies

The late 18th century saw renewed activity in the Arctic, especially by fur companies. The establishment of the HUD-

SON'S BAY COMPANY in 1670 to develop the FUR TRADE with Native Americans and the settlement of Hudson Bay led to a number of expeditions; among them were ones led by JAMES KNIGHT and HENRY KELSEY to the Marble Island region off the bay's northwest coast, in 1719–21. All members of Knight's expedition perished, leading to Kelsey's subsequent search expeditions. In 1741, CHRISTOPHER MIDDLETON explored Wager Bay and Repulse Bay on the west coast. And, in 1746–47, WILLIAM MOOR explored Chesterfield Inlet and reexplored Wager Bay.

In the 1760s–70s, SAMUEL HEARNE led a number of overland expeditions from the west coast of Hudson Bay for the Hudson's Bay Company. The company's charter included an obligation to search for the Northwest Passage as a shipping route to the Pacific Ocean. On his third expedition, with the help of Chipewyan Indian guide MATON-ABBEE, Hearne followed the Coppermine River northward, reaching its mouth on the Arctic Ocean in July 1771. On the return journey Hearne made the European discovery of the Great Slave Lake.

The NORTH WEST COMPANY, organized in 1779, also sponsored northern expeditions. In 1789, ALEXANDER MACKENZIE, a fur trader for the North West Company, explored from Great Slave Lake along the Mackenzie River, named after him, to its mouth on the Arctic Ocean.

Also in the late 18th and early 19th centuries, the RUSSIAN-AMERICAN COMPANY sent out expeditions, exploring coastal and interior Alaska.

Renewed British Efforts

Starting in the late 18th century and well into the 19th century, Britain began looking to the Arctic once again, in large part in the hope of navigating the Northwest Passage. The government continued to have a role as a sponsor. The ROYAL SOCIETY, a scientific organization founded in 1670, also played a part as did the Hudson's Bay Company.

The Royal Society was the principal backer of the first scientific attempt on the North Pole. In 1773, naval officer CONSTANTINE JOHN PHIPPS headed an expedition of two ships with reinforced hulls to resist ice. Although passage north was blocked by ice east of Greenland and the expedition fell far short of its goal, Phipps's writings on Arctic navigation proved useful to later explorers. A British whaler and his son, WILLIAM SCORESBY, SR., and WILLIAM SCORESBY, JR., reported to the Royal Society, at the time headed by SIR JOSEPH BANKS, about their findings relating to Arctic navigation and natural science during whaling expeditions in 1806–17.

Beginning in 1818, SIR JOHN BARROW, second secretary of the Admiralty and later one of the founders of the ROYAL GEOGRAPHICAL SOCIETY, organized a number of expeditions for the British government to the Arctic. Among those who sailed for him were SIR JOHN ROSS, DAVID BUCHAN,

SIR WILLIAM EDWARD PARRY, SIR JOHN FRANKLIN, SIR GEORGE BACK, and FREDERICK WILLIAM BEECHEY. In 1818, Ross explored Lancaster Sound in the Canadian Arctic, and Buchan led an attempt on the North Pole by a hoped-for seaward passage due north. Ross mistakenly concluded that the sound was enclosed by a mountain, and Buchan would be repelled by ice. In 1819–27, Parry led four Arctic expeditions, the first three to the Canadian Arctic. He passed through Barrow Strait and reached as far west as Melville Island; explored Hudson Bay and Foxe Basin and the Fury and Hecla Strait between the Melville Peninsula and Baffin Island; explored the Gulf of Boothia and Prince Regent Inlet; and set a northernmost record in an attempt to reach the North Pole by small flat-bottom boats and sledges from Spitsbergen. In 1819–22, Franklin headed a British naval overland expedition eastward along Canada's Arctic coast from the mouth of the Coppermine River, along Coronation Gulf, to Kent Peninsula. Beechey, in his 1825–28 expedition to the Pacific, reached Point Barrow on the north coast of Alaska. And in 1833–35, Back led an overland expedition north and east of the Great Slave Lake, locating what became known as the Back River and exploring the Arctic coastline.

John Ross and his nephew, SIR JAMES CLARK ROSS, headed a privately funded expedition in 1829–33, during which they explored the Boothia Peninsula and determined the location of the NORTH MAGNETIC POLE (the exact northern point of Earth's magnetic polarity). In 1837–39, THOMAS SIMPSON and PETER WARREN DEASE, in the employ of the Hudson's Bay Company, surveyed much of the Arctic coastline of Alaska and Canada.

In Search of Franklin

In 1845, the year of Barrow's retirement from the Admiralty, Sir John Franklin led another British naval expedition to the Canadian Arctic in an attempt to navigate the Northwest Passage from east to west. The *Erebus*, under Franklin's command, along with the *Terror*, under Lieutenant FRANCIS RAWDON MOIRA CROZIER, sailed from England on May 29, 1845; the ships were last seen by a Scottish whaling vessel on July 26, 1845, in upper Baffin Bay, west of Greenland, near the approach to Lancaster Sound. By 1847, without any word from or of the expedition, concern began to mount. Over the next decades, some 50 expeditions, involving approximately 2,000 men, were launched to solve the mystery of what happened to the Franklin expedition (see SEARCHES FOR MISSING EXPLORERS).

In 1847–49, SIR JOHN RICHARDSON, along with JOHN RAE of the Hudson's Bay Company, led a British land-based expedition that reached Canada's Arctic coastline by way of the Mackenzie River, then proceeded eastward to Dolphin and Union Strait. In 1849–50, Rae continued the search on his own, reaching Victoria Island. In 1848–49, Sir James

Clark Ross led a British naval expedition that traveled through Lancaster Sound as far as Barrow Strait and southward from Somerset Island into Peel Strait. In 1850–51, Sir John Ross returned to the Arctic on a privately funded expedition and wintered in Barrow Strait. In 1850–54, SIR ROBERT JOHN LE MESURIER MCCLURE led an expedition that entered Arctic waters from the west by way of the Bering Strait. While proceeding eastward, he located Prince of Wales Strait between Banks Island and Victoria Island; he also reached a point far enough west—Melville Island, which had previously been reached from the east—to prove that the Northwest Passage did in fact exist. At about the same time, in 1850–55, SIR RICHARD COLLINSON, also approaching from the west, explored the Arctic coasts of Alaska and Canada as far east as Victoria Island. Spending the winter of 1852–53 there, he retrieved some pieces of iron from Inuit that had probably come from one of Franklin's ships. Also during this period, in 1852–54, SIR EDWARD BELCHER headed an expedition from the east that navigated west of Lancaster Sound. SIR FRANCIS LEOPOLD MCCLINTOCK located Eglington Island and Prince Patrick Island at the edge of the Beaufort Sea.

Meanwhile, in 1848, Lady JANE FRANKLIN had offered a reward for the rescue of her husband or for information as to his fate. She later gained the support of American shipping magnate Henry Grinnell, who, in 1850–51, sent out an expedition under EDWIN JESSE DE HAVEN, a U.S. naval officer. While trapped in the pack ice north of Baffin Island and Lancaster Sound and drifting with it for some 1,000 miles, De Haven located Grinnell Land on northern Devon Island. Lady Franklin paid for a number of expeditions from her own funds as well. In 1853–55, ELISHA KENT KANE, another naval officer who had sailed with De Haven, led the second U.S. Grinnell expedition in search of John Franklin. On this voyage, expedition members explored Greenland's Humboldt Glacier and Ellesmere Island.

The expedition that located the first irrefutable proof of the missing Franklin expedition was headed by John Rae. In his expedition of 1853–54, during which he explored the Boothia Peninsula and located a strait (Rae Strait), thus proving that King William Island was not connected to the Canadian mainland, he interviewed an Inuit who told him of a story of Europeans marching southward from King William Island toward the estuary of the Back River and eventually perishing. Rae also found relics from the Franklin expedition. Yet, Rae also reported that evidence indicated expedition members had practiced cannibalism in their final days.

In 1857, Lady Franklin sponsored another expedition, headed by Francis McClintock. McClintock approached from the east and Baffin Bay. While in Arctic waters, he erected a monument on Beechey Island commemorating Franklin's Arctic exploits. He also circumnavigated King

William Island, confirming that it was an island. On King William Island, a party under McClintock found a sledge and several skeletons. Another party led by Lieutenant W. R. Hopson crossed Simpson Strait to the Boothia Peninsula and found letters written by Franklin's men indicating that Franklin and other expedition members had died while the ship had been icebound and that the survivors under Lieutenant Crozier had perished while heading for Fort Resolution, a Hudson's Bay Company's post on the Back River. McClintock returned to England with his reports in 1859.

Other expeditions continued to search for more clues. In 1860–62, CHARLES FRANCIS HALL, backed by Henry Grinnell, explored Frobisher Bay, where he found evidence of Frobisher's expedition centuries before. On still another expedition funded by Grinnell in 1864–69, Hall sailed to King William Island and Boothia Peninsula, and, from Inuit in the region, he obtained relics of the Franklin expedition. He also located a skeleton. In 1878–80, FREDERICK SCHWATKA, sponsored by the AMERICAN GEOGRAPHICAL SOCIETY and a whaling company, traveled overland by sledge from Hudson Bay to King William Island, covering more than 3,000 miles. He, too, found artifacts and human remains from the Franklin expedition.

Many Nations

The search for John Franklin was international news and helped inspire Arctic exploration by a number of nations. The major goal now was to reach the North Pole. In 1860–61, during the period he helped underwrite voyages in search of Franklin, Henry Grinnell also sponsored an expedition under American ISAAC ISRAEL HAYES, which explored the Greenland ice cap and attempted to find an open polar sea north of Greenland and Ellesmere Island, Canada's northernmost point, in the hope of reaching the North Pole. In 1868, a Swedish expedition under geologist NILS ADOLF ERIK NORDENSKJÖLD set out from Spitsbergen for the Pole but was turned back by pack ice; he failed again in 1872–73. Meanwhile, in 1871, American Charles Francis Hall, again backed by Grinnell, reached as far as the Lincoln Sea from northern Ellesmere Island, setting a new northernmost record. In 1875–76, SIR GEORGE STRONG NARES sailed beyond northern Ellesmere Island in still another failed attempt but broke the northernmost record.

Germany became active in Arctic explorations with two expeditions to Greenland under KARL CHRISTIAN KOLDEWEY in 1868–70. German geographer AUGUST HEINRICH PETERMANN still promoted the idea of an "open polar sea." His ideas also helped inspire the Austro-Hungarian Arctic Expedition, under Austrian JULIUS VON PAYER and German-born KARL WEYPRECHT, which made the European discovery of Franz Josef Land, an archipelago north of Novaya Zemlya.

In 1878–79, Swedish geologist Adolf Nordenskjöld led the Vega Expedition, which made the first successful navigation of the long-sought Northeast Passage from Norway along Asia's Arctic coast to the Bering Strait. By returning to Europe by way of the Suez Canal in 1880, it also completed the first circumnavigation of Europe and Asia.

An American attempt at reaching the North Pole and making an east-to-west crossing of the Northeast Passage in 1879–81, headed by GEORGE WASHINGTON DE LONG, resulted in the eventual death of De Long and 12 expedition members after the ship had become trapped in ice north of Wrangel Island.

For the International Polar Year of 1882–83, a number of nations dedicated themselves to studying natural phenomena in Arctic regions of the world. Among the expeditions was the U.S. Army's Lady Franklin Bay Expedition headed by ADOLPHUS WASHINGTON GREELY in 1881–84, with the participation of OCTAVE PAVY. This expedition explored the northwest coast of Greenland and Ellesmere Island and set a new northernmost record. Relief vessels were unable to break through the ice of Smith Sound and reach Greely's base, however, and 17 members of the expedition perished from cold and starvation. In 1886–1900, another American explorer, ROBERT EDWIN PEARY, carried out five expeditions to the same regions. It was in 1900 that Peary, on reaching Greenland's northernmost point, Cape Morris Jesup, demonstrated conclusively that it was an island and not a land mass extending to the North Pole. In 1888, Norwegian FRIDTJOF NANSEN made a crossing of southern Greenland. In 1893–96, he headed a Norwegian expedition that attempted to approach the North Pole by purposely having a ship become icebound and drift northward from the New Siberian Islands, then continuing by kayak and sledge. The expedition failed to reach the Pole but set a new northernmost record. A British expedition under FREDERICK GEORGE JACKSON rescued Nansen on Franz Josef Land. In 1892–94, Estonian geologist EDUARD VON TOLL led a Russian expedition to the Siberian Arctic by way of Cape Chelyuskin and explored the deltas of the Yana, Indigirka, and Kolyma Rivers. In 1897, Swede SALOMON AUGUST ANDRÉE tried to reach the Pole from Spitsbergen by air, in a BALLOON, perishing in the attempt. In 1898–1902, Norwegian OTTO SVERDRUP, after exploring the west coast of Ellesmere Island, reached the Sverdrup Islands, which are named after him. At the turn of the last century, in 1899–1900, LUIGI AMEDEO DI SAVOIA D'ABRUZZI led an Italian expedition that attempted to reach the Pole from Franz Josef Land; it failed to do so but set a new northernmost record.

Denmark sent out a number of expeditions to Greenland, to which it had a territorial claim. In 1902–04, LUDWIG MYLIUS-ERICHSEN, accompanied by Danish-Inuit ethnologist KNUD JOHAN VICTOR RASMUSSEN, explored the

northwest coast. In 1906–07, Mylius-Erichsen explored the northeast coast, locating the peninsula known as the Northeast Foreland, losing his life to the extreme conditions. Rasmussen continued his studies in the Arctic into the 1920s.

It was a Norwegian who made the first successful navigation of the Northwest Passage—ROALD ENGELBREGT GRAVNING AMUNDSEN. Departing Norway in June 1903, he sailed past Greenland to Baffin Bay and Lancaster Sound, then down Peel Strait into Franklin Strait. The expedition wintered at a bay on the south coast of King William Island, and he and his crew made measurements in the area until August 1905. In making the passage, he then proceeded through Rae Strait, staying close to the shore in Queen Maud Gulf, through Dease Strait and Coronation Gulf, into what came to be known as Amundsen Gulf. On September 2, the group became trapped in ice near King Point. In July 1906, when the ship was finally freed from the ice, the expedition continued along the northern Canadian border, around Alaska and into the Bering Strait.

The North Pole Attained

Robert Peary's expeditions to Greenland helped prepare him for an assault on the North Pole and convinced him the best route was from northern Ellesmere Island. In 1902, he made an unsuccessful attempt to reach the North Pole by way of Robeson Channel, the northernmost stretch of water between Greenland and Ellesmere Island; and, then again, in 1905–06, from Cape Columbia on Ellesmere Island's north coast. On both expeditions, he set northernmost records.

In July 1808, Robert Peary departed New York for a third attempt, again from Cape Columbia. Peary, his assistant, MATTHEW ALEXANDER HENSON, and four Inuit departed the next spring, on March 1, and, after a month-long trek across the frozen sea with sledges and dogs, reached the North Pole on April 6, 1909. In the meantime, another American, FREDERICK ALBERT COOK, claimed to have reached the North Pole by the Ellesmere Island route on April 21, 1908. The controversy on who actually had been first to the Pole lasted for some time. Peary, with more geographic data to support his claim, received official recognition from the U.S. Congress in 1911. (He may have in fact missed the exact geographic North Pole by a couple of miles; it is now thought that Cook never even came close.)

Ongoing Explorations

Although the Northeast Passage, Northwest Passage, and North Pole had all been conquered, much of the Arctic still remained unexplored. Arctic exploration continued to be an international effort, although nations with Arctic lands became especially active. In 1904–11, Quebecois mariner JOSEPH ELZÉAR BERNIER maintained that any country adjacent to the Arctic had rights to any islands within a triangle

from the north shore of its mainland to its apex at the North Pole and led a number of expeditions to chart northern islands and assert Canadian sovereignty. In 1913–18, Canadian-born anthropologist VILHJALMUR STEFANSSON, of Icelandic ancestry, led an expedition to the Beaufort Sea and located uncharted islands in the Canadian Arctic Archipelago north of Prince Patrick Island. In 1908, Russian mariner and fur trader NIKIFOR ALEKSEYEVICH BEGICHEV determined that Bolshoy Begichev in central Siberia is an island and not part of a peninsula.

A new phase of Arctic exploration began in the 1920s, as a result of progress in aviation (see AVIATION AND EXPLORATION). American RICHARD EVELYN BYRD, after making a series of flights over the Greenland ice cap in 1924–25, carried out the first flight over the North Pole in 1926. Several days later, Norwegian Roald Amundsen, American LINCOLN ELLSWORTH, and Italian UMBERTO NOBILE flew over the Pole in an AIRSHIP. In 1928, eight men died in the course of Nobile's abortive attempt to land at the Pole by airship. Roald Amundsen died on his rescue flight. In 1930, HENRY GEORGE WATKINS led a British expedition that made use of aircraft as well as watercraft to survey the coasts of Greenland. American Arctic explorer LOUISE ARNER BOYD made the first flight by a woman over the North Pole in 1955.

In 1931, Australian SIR GEORGE HUBERT WILKINS attempted unsuccessfully to reach the North Pole from Spitsbergen by SUBMARINE. The U.S. atomic submarine *Nautilus* under Commander William R. Anderson did so in 1958.

Various nations also began establishing permanent scientific bases in Arctic regions. For example, in 1929–30, ALFRED LOTHAR WEGENER of Germany established the first permanent weather stations on the interior of the Greenland ice cap, and, in 1937, OTTO Y. SCHMIDT of the Union of Soviet Socialist Republics (USSR; Soviet Union) set up the first manned scientific post near the North Pole. During the INTERNATIONAL GEOPHYSICAL YEAR of 1957–58, different nations established more than 300 Arctic observation stations, some of them on ice floes. Most of the Arctic has now been surveyed by AERIAL PHOTOGRAPHY and remote sensing by aircraft and artificial SATELLITE.

The exploration of the Arctic, with its harsh climate and ice-choked waters, has been one of the great challenges humankind has faced, with many lives lost. Some remote regions have now been settled, many of them for the development of mining and fishing. Animal husbandry is practiced in some northern lands, especially reindeer herding. Roads provide access to some communities; others are reached only by air. Icebreakers now keep many of the waterways open. The Arctic is also a valuable laboratory for scientists studying Earth's history and monitoring pollution.

Arctic Circle

The Arctic Circle is a parallel of latitude, a cartographic feature based on natural phenomena, situated at 66 degrees and 33 minutes north of the EQUATOR. The location of the Arctic Circle is determined by the fact that Earth is tilted on its axis by 23 degrees and 27 minutes as it revolves around the Sun. Above the Arctic Circle the Earth's relationship to the Sun is different than it is for the rest of the Northern Hemisphere, with a 24-hour period each year when the Sun does not set and a 24-hour period of continuous darkness.

From December 22 to June 22, the amount of daylight within the Arctic Circle is on the increase. On or about June 22, the summer solstice, the entire region experiences 24 hours of daylight, as Earth is tilted toward the Sun for a complete revolution. From June 22 until December 22, the amount of daylight is decreasing, and, on or about December 22, the winter solstice, the area is in darkness for 24 hours, while the region is in Earth's shadow. The situation is more extreme at the NORTH POLE, which sees the sun continuously from March 20 until September 23, with no sunlight from September 23 to March 20. These effects are mitigated by the transmission of light through the atmosphere, and the fact that the North Pole is a single point, and the land surrounding it has less extreme conditions.

The annual pattern of daylight has led to the region of Scandinavia north of the Arctic Circle being dubbed "the land of the midnight sun." Such a name tells only half the story, for there is the equal period of time when the sun is not to be seen. While these solar relationships are taking place in the north, the reverse take place in the ANTARCTIC CIRCLE, with the same net amount of sunlight in the annual cycle.

It is believed that the first European who is thought to have traveled near or north of the Arctic Circle and recorded the event was 4th century B.C. Greek PYTHEAS, during his search for ULTIMA THULE. Pytheas was an astronomer as well as an explorer and remarked on the extended length of days in the region. During the EUROPEAN AGE OF EXPLORATION, the first explorer to venture near the Arctic Circle—and perhaps beyond it—was Portuguese GASPAR CÔRTE-REAL, who, in 1500, explored the west coast of GREENLAND. In 1553–54, SIR HUGH WILLOUGHBY commanded the first English expedition to cross it. The question of the Arctic Circle as a barrier to be crossed by humanity is not important, since the lands within its border were well populated: by the Sami (Laplanders) in Scandinavia; the Samoyed, the Yakut, and the Tungus in SIBERIA; and the Inuit (Eskimo) in North America. It did take time, however, for the rest of the world to be aware of these communities.

Asia, exploration of

Asia, Earth's largest continent, with its outlying islands included, covers some 17,139,000 square miles, almost one-third of the planet's total land area. It is situated in the Eastern Hemisphere and almost entirely in the Northern Hemisphere.

The western limits of Asia are not readily defined since it is not entirely surrounded by water, being the eastern four-fifths of the landmass Eurasia (see EUROPE, EXPLORATION OF). To its north is the Arctic Ocean (the chief subdivisions being the Kara Sea, Laptev Sea, and East Siberian Sea); to its east, the BERING STRAIT and Pacific Ocean (the chief subdivisions being the Bering Sea, Sea of Okhotsk, Sea of Japan, Yellow Sea, East China Sea, and South China Sea); to its south, the Indian Ocean (the chief subdivisions being the Bay of Bengal, Arabian Sea, Persian Gulf, and Gulf of Aden); and to its southwest, the MEDITERRANEAN SEA and the RED SEA (an arm of the Indian Ocean). In the west, in order to distinguish Asia from Europe, most geographers use an imaginary line running from the northern extent of the Ural Mountains on the Kara Sea, then south along the Ural River to the Caspian Sea, then west along the Caucasus Mountains to the Black Sea, then along the Bosphorus Strait (linking the Black Sea and the Sea of Marmara, both forming an arm of the Mediterranean), and the Dardanelles (a strait linking the Sea of Marmara with the Aegean Sea, also part of the Mediterranean). The Isthmus of Suez (including the human-made Suez Canal) separates Asia from Africa. The most northerly point of Asia's continental mainland is Cape Chelyuskin; most southerly, the southern end of the Malay Peninsula; most westerly, Cape Baba in northwestern Turkey; and most easterly, Cape Dezhnyov.

This vast region has varied topography, consisting of plains, plateaus, and mountains. On the Asian mainland are found both the lowest and highest points on Earth's surface: the shore of the Dead Sea, at 1,340 feet below sea level, and Mount Everest (see EVEREST, MOUNT), at 29,035 feet above sea level, part of the HIMALAYAS. Extending from Arctic to equatorial regions, Asia also has a wide variety of climates—from tundra to tropical—and a variety of vegetation and animal life.

Animals found on other continents have adapted to the varying climatic and vegetation zones of Asia, such as reindeer, deer, antelope, gazelles, tigers, elephants, rhinoceroses, wolves, hyenas, monkeys, sables, foxes, marmots, hares, peacocks, and crocodiles. Some animals unique to Asia are the orangutan, the second-largest of the apes after gorillas, found on the islands of Borneo and Sumatra; the giant panda, a type of bear, in southwestern China; the snow leopard, on the plateaus and mountains of central Asia; and the Komodo dragon, the world's largest lizard, in Indonesia.

The exact derivation of the name *Asia* is not known. The Greek form may be derived from the Assyrian word *asu*,

meaning "east" or "sunset," or from a local name for the plains of Ephesus in western Anatolia (Asia Minor), eventually meaning all the lands to the east.

Realms of Asia

Because of its vast size, geographers and historians discuss Asia as comprising various realms, such as East Asia, central Asia, Southeast Asia, South Asia, and Southwest Asia. Other terms that appear in the historical record are *Near East*, originally used for the area occupied by the Ottoman Empire of the Turks, then applied to any parts of Southwest Asia situated close to Europe, from the Mediterranean Sea to the Persian Gulf and even beyond in South Asia, including Afghanistan and Pakistan (and sometimes Egypt, Libya, and other Arabic nations of North Africa, as well as the Sudan); the *Middle East*, originally used for the area extending from the Persian Gulf to India and other countries of the Indian subcontinent, then, in the 20th century, used synonymously with the *Near East*; and the *Far East*, or the *Orient*, generally used for those East Asia and Southeast Asia nations facing the Pacific Ocean (and sometimes for the *Indian subcontinent* as well).

Southwest Asia, or the Middle East (or Near East), consists primarily of arid lands, much of it desert. The most fertile land is situated around the Tigris and Euphrates river valleys in present-day Iraq, part of a region once referred to as the Fertile Crescent. The Anatolian Peninsula, the Asian part of modern-day Turkey, has been referred to as Asia Minor. Other modern-day nations in western Asia are Iraq, Iran (formerly Persia), Syria, Lebanon, Israel, Jordan, Armenia, Azerbaijan, Georgia, and the eastern part of Turkey. Saudi Arabia and a number of smaller countries are situated on the Arabian Peninsula, in the south of which is the desert known as the Rub' al-Khali, or EMPTY QUARTER. Farther to the west in South Asia lie the more mountainous countries of Afghanistan and Pakistan.

The nations of Kazakhstan, Kyrgyzstan, Tajikistan, Turkmenistan, and Uzbekistan (comprising a region once referred to as Turkistan), lying north of Afghanistan, were once part of the Union of Soviet Socialist Republics (USSR; Soviet Union). These, like central Russia, central China, Mongolia, Tibet, Nepal, and Bhutan are often referred to as part of central Asia.

To the east of Afghanistan sits the high Tibetan Plateau (Qing Zang Gaoyuan) of western China. The Himalayas stretch along the southern side, while the Tian Shan mountains extend on the north from the Pamir range of Tajikistan to the border between western China and Mongolia. To the north and east are great deserts, the Takla Makan and the GOBI DESERT. To the northwest are the steppes of central Asia. In northernmost Asia, stretching from the Ural Mountains to the Pacific Ocean, is found the generally flat region of some 5 million square miles known as

SIBERIA, mostly in Russia with a small part in northern Kazakhstan.

To the south of the Himalayas is the Indian subcontinent, with the present-day nations of India, Bangladesh, and Pakistan (Pakistan sometimes is grouped as part of the Middle East). The GANGES RIVER and INDUS RIVER traverse parts of it. The southern part of the subcontinent includes the Deccan Plateau. The island of Sri Lanka (CEYLON) lies in the Indian Ocean to the southeast, and the Maldives, to the southwest.

Crossing from central Asia to the Indian subcontinent is made difficult by the Himalayas and other mountain ranges. The main passes are located in the mountains of northern Pakistan, the most famous of these being the KHYBER PASS through the Safed Koh mountain range, extending from the Hindu Kush range, which connects to Kabul in Afghanistan.

East Asia includes eastern Russia (known as Far East Russia), North Korea, South Korea, eastern China, Japan, and Singapore. Southeast Asia includes Vietnam, Laos, Cambodia, Thailand, and Myanmar, as well as the islands of the Malay Archipelago (historically referred to as the EAST INDIES). The eastern rim of the continent of Asia has a number of plateaus dissected by the YANGTZE RIVER (Chang) and YELLOW RIVER (Huanghe).

Early Contacts between East and West

Before written records, the earliest hints of exploration of Asia come from the myths and folklore of the Babylonians, Egyptians, and Greeks. Recent archaeological finds support the conclusion that many of these stories are mythological versions of early voyages undertaken for conquest and to establish trade routes. The voyage of Jason and the Argonauts to find the Golden Fleece has been represented as the story of initial Greek journeys through the dangerous Bosphorus Strait to establish trade with Black Sea ports. This theory is buttressed by the discovery of ancient Greek shipwrecks along the mythical route. The story of the Trojan War may represent an early Greek attempt to gain full control of this trade route through the Bosphorus. The Babylonian epic of Gilgamesh contains an account of early Sumerian voyages similar to Akkadian voyages in the historical accounts of the region.

Civilization grew and flourished in the fertile regions of the Middle East in the third millennium B.C. Rulers began to dispatch explorers on diplomatic and military missions with the goals of expanding territory, developing commerce, and enhancing their own prestige. In about 2450 B.C., Egyptian HANNU, the first explorer of record, navigated the Red Sea along the coast of the Arabian Peninsula (see EGYPTIAN EXPLORATION). The next known exploratory efforts date to 2340 B.C., when SARGON of Akkad, who had consolidated his rule over Mesopotamia, sent out missions

establishing trade contacts throughout Arabia and as far east as the Indus River. Along the fertile banks of the Indus, the Harrapa culture, the earliest known settled civilization to rise in Asia was flourishing. Harrapa people built cities, with populations of up to 40,000, and dug complex irrigation channels for their agriculture. In addition to Mesopotamia, the Harrapa civilization had trade contacts with lands to the west as far as the southeastern border of Afghanistan.

The greatest extent of the Akkadian Empire lasted only 40 years before it contracted under political pressure and finally collapsed, splitting into smaller states including Babylonia and Assyria. The Hittites who were living in Anatolia gradually expanded their power, most famously through the use of the chariot in warfare. By the 14th century B.C., they had conquered much of the area in modern Turkey and in the northern regions of Mesopotamia. They later developed extensive trade relations with the Greeks, one of the earliest historical instances of the exchange of ideas between East and West. This transfer process continued over the centuries through both trade and military incursions.

The Harrapa civilization disappeared sometime about 1800 B.C. In about 1500 B.C., a group of nomads called Aryans, who were living in central Asia, migrated southward through Afghanistan into northern India and settled in the northern Indus Valley as well as the northwestern part of the Gangetic Plain. By 800 B.C., the Aryans ruled most of northern India. They spread westward to the Iranian plateau, an area almost completely surrounded by high mountains and deficient in navigable rivers. The most significant of these tribes were the Medes in the northwest and the Persians in the south. The Assyrian Empire expanded to the west by the ninth century B.C. and came to include the entire Fertile Crescent region; it flourished until 612 B.C., when the Medes (with the help of the Babylonians) conquered the Assyrian capital of Ninevah. Then, in 550 B.C., Persian Cyrus the Great overthrew the Medes and established the Persian Empire. The Persians spread their conquests eastward, through the mountain passes of Afghanistan into the Indus Valley.

During the sixth century B.C., Greek society, although centered in Greece, was fragmented into small city-states throughout the Mediterranean region and into the Middle East. Among the Greeks were many capable and memorable seafarers (see GREEK EXPLORATION). Many Greek people lived in colonies on the coast of Anatolia. The expanding Persian Empire eased the difficulties of traveling and brought together merchants and mariners from all over the world. In about 548 B.C., Egyptian COSMAS INDICOPLEUSTES, having become a Christian, wrote an account known as *Topographia Christiana* (Christian Topography), based in part on his travels as a merchant to India and Ceylon. In about 520–494 B.C., Greek HECATAEUS OF MILETUS traveled in Asia Minor and Egypt. He later wrote what

is considered the earliest systematic description of the known world, *Tour Round the World*.

The Persians, seeking further economic and military success, hired expert mariners—especially from among the Greeks—to explore the uncharted regions of their empire. In 510 B.C., Persian emperor Darius I sent Greek mariner SCYLAX to determine the course of the Indus River. Greek historian HERODOTUS of the fifth century B.C. reports that Scylax followed the Indus to the Arabian Sea, explored the coasts of present-day southwestern Pakistan and Iran, and then the Gulf of Aden and the Red Sea, finally returning to Persia in 507 B.C. Like many travelers in the mountainous regions of the east and the Arabian coasts, Scylax came back with fantastic descriptions of natives, describing people with giant ears or only one eye.

In the late fifth century B.C., Greek physician CTESIAS OF CNIDUS served as court doctor to Darius II of Persia. During that time, he traveled throughout the Persian Empire and India. Ctesias aimed to discredit much of what Herodotus had reported about the lands of the east. In Herodotus's account, the lands beyond the Indus River were unpopulated, the home of giant animals and birds. By this time, however, Aryans in the Gangetic Plain had established powerful kingdoms, the westernmost of which had common interactions with the Persians. Ctesias may have visited as far east as the Ganges, or relied on reports from the Aryans. Ctesias's account was no less fantastic than that of Herodotus, detailing men with giant feet and others with doglike faces, as well as huge worms in the Ganges that devoured camels and oxen.

Knowledge of this territory was crucial for the maintenance and expansion of the Persian Empire. It was also essential to Macedonian king ALEXANDER THE GREAT. In 334 B.C., he had consolidated his rule over the Greek city-states. Inspired by the writings of Herodotus and other accounts of the East, he made a military assault on the Persian Empire. Alexander advanced onto the Anatolian plateau, conquering all of Asia Minor. He then moved southward and conquered peoples of present-day Lebanon and Israel and, after crossing into Africa, he gained control of Egypt as well. In 331 B.C., Alexander crossed into present-day Syria and pushed on to the Tigris and Euphrates Rivers and defeated Darius III. He continued eastward through present-day Iran and Afghanistan in pursuit of Persian forces. In 329 B.C., he crossed the Hindu Kush into present-day Pakistan and headed northwestward into present-day Uzbekistan. The region at the time was known as Bactria, part of the Persian Empire. Alexander eventually recrossed the Hindu Kush, proceeding to India in 327 B.C.

Earlier, in 329 B.C., Greek NEARCHUS had traveled through Bactria to provide reinforcements for Alexander's campaign. By 325 B.C., Alexander's army had halted in India, unable or unwilling to cross the Jhelum River.

Alexander decided to return to the west but put together a voyage of exploration under Nearchus, consisting of 5,000 men and 150 ships. Alexander hoped that such an expedition would find a route to connect the eastern and western portions of his empire. Nearchus reached the Indus delta and then continued westward along the coast of present-day Pakistan. His ships sailed into the Gulf of Oman and into the Persian Gulf along the coast of present-day Iran. Nearchus reported meeting primitive people he called "hairy men," who used their long fingernails as tools, and other people who lived entirely on fish, building their dwellings from whalebones. The expedition also encountered whales, creatures hitherto unknown to Mediterranean sailors. At the head of the Persian Gulf, Nearchus sailed up the Euphrates to the Tigris, where he rejoined Alexander. Nearchus went on to plan additional voyages around the Arabian Peninsula and even Africa. Alexander's death in Persia in 323 B.C. and the subsequent breakup of the empire put a stop to such ambitious plans of exploration.

By this time, the ancient kingdom in India known as Magadha had expanded, absorbing neighboring kingdoms until it was the most powerful kingdom east of the Indus. In about 321 B.C., Chandragupta Maurya became king of Magadha, establishing the Mauryan dynasty. In 305 B.C., Chandragupta extended his control up to the border of Afghanistan, destroying one of the Hellenistic kingdoms that remained after the collapse of Alexander's empire. The ruler of another Hellenistic kingdom sent a Greek diplomat, MEGASTHENES of Ionia, in about 302 B.C., as ambassador to the Mauryan Empire. Megasthenes traveled throughout northern India, making observations of Hindu culture and the natural history of the region. He was the first Westerner to make accurate observations of the Ganges River and to correctly surmise its source. The Mauryan dynasty extended its control to nearly the entire Indian subcontinent in the third century B.C., except the tip and the lands beyond the Brahmaputra River.

Meanwhile, in the mid-third century B.C., the Greeks established a kingdom in Bactria. By about 150 B.C., this kingdom had encroached on Mauryan territory, expanding to meet the Ganges River in the east. An early Greek visitor to India was EUDOXUS of Cyzicus, who, in about 120 B.C., made one of the earliest known sea voyages from Egypt to India and established coastal trade links.

The Roman Empire, centered in Rome in what is now Italy, became a power in the Middle East during the second century B.C. (see ROMAN EXPLORATION). The Romans conquered territory along the eastern Mediterranean coast to the borders of Persia by 62 B.C. After conquering Egypt, they turned their attention to the southern end of the Arabian Peninsula (present-day Yemen), to an area they dubbed Arabia Felix ("Happy Arabia") because of its wealth. Arabia Felix had been well known to Egyptians as a principal source

of incense and spices, precious commodities valued alongside gold. The incense was taken from the sap of frankincense and myrrh trees, and the spices, such as cinnamon, were imported over sea from India. (The wealth of the kingdoms in Arabia Felix is thought to have inspired the first recorded Egyptian voyager, Hannu.)

In about 25 B.C., a Roman officer in Egypt, GAIUS AELIUS GALLUS, began an expedition in an effort to conquer this region and establish Roman control of the SPICE TRADE. Gallus continued his expedition to the east bank of the Red Sea and then proceeded overland to the Sabaeans city of Marib. Unable to subjugate the Sabaeans, Gallus returned to Roman Egypt, with new geographic knowledge. In A.D. 18, Greek geographer STRABO published his work *Geography* in Rome, based on his own travels in Europe, Africa, and Asia as well as on the work of earlier writers. In A.D. 45, HIPPALUS, a Greek in service to Roman-ruled Egypt, navigated a practical route out of sight of land from the mouth of the Red Sea to India.

The Chinese Empire

The first archaeological evidence for a kingdom among the Chinese is that of the Chang (Shang) dynasty, which arose in about 1570 B.C. In control of the central part of China, the Chang dynasty consisted of a number of smaller states. One of them, Chou, revolted in about 1045 B.C., and the Chang dynasty collapsed. The subsequent Chou (Zhou) dynastic period was marked by contention between the states, with interstate warfare leading to the downfall and annexation of certain states. By the third century B.C., there were only seven states in China. The state of Ch'in conquered the rest of the Chou states and began the Ch'in (Qin) dynasty, from which the name *China* is thought to be derived. Although a short-lived empire, it had a tremendous impact on Chinese civilization. A unified system of weights and measurements and a system of writing were introduced throughout the empire. A revolt in the state of Han led, after a brief interregnum, to the Han dynasty, which lasted more than 400 years, from about 206 B.C. to A.D. 220, during the period the Roman Empire became dominant in the West.

The extension of the Han dynasty through China made travel easier and safer (see CHINESE EXPLORATION). In addition, there became a need for communication throughout all of eastern Asia for military and trading alliances. In 128 B.C., CHANG CH' IEN, an officer in service to the emperor Wu Ti, was sent westward on a diplomatic mission to the Yue-chi (also known as the Scythians), a nomadic people living in present-day Afghanistan. Chang was captured by the Hsiung-nu (Xiongnu, known in the West as the Huns) but escaped 10 years later. In about 118 B.C., Chang resumed his westward journey and finally arrived at Bactria in northern Afghanistan. There, he heard reports of civilizations farther to the west, including Persia, Mesopotamia,

and Rome. He also discovered Chinese bamboo and cloth there, which had been shipped over the SPICE ROUTE, through India, a land of which the Chinese reportedly had no contacts. For some time, the southern end of India had been an important link in the spice trade, with mariners bringing spices and other goods from China, Southeast Asia, and the SPICE ISLANDS (the Moluccas), while overland caravans traveled up the west coast of India and through the Khyber and other passes into Afghanistan. Arab seafarers from the kingdoms of southern Arabia sailed through the Arabian Sea, then bringing Chinese and Indian goods to Alexandria in Egypt and throughout the Mediterranean world. Chang Ch'ien took reports of his findings back to the Han emperor. In 115 B.C., he was again sent out to make an alliance with nomads in western China. Although unsuccessful in this mission, he in turn sent envoys laden with silks and gold from there to Persia and to the eastern Roman provinces. This initial opening of trade links between China and the Hellenized lands of the eastern Mediterranean marked the birth of the trade route known as the SILK ROAD.

KAN YING was another early Chinese explorer, sent out in A.D. 97 on a diplomatic mission to meet with the Romans regarding threats to travel along the Silk Road from central Asian peoples. It is not certain how far east he reached, but his was one of the few voyages made by Chinese through central Asia. For much of Chinese history, the Chinese emperors discouraged travel outside of the empire, relying on nomadic peoples in central Asia and the Persians and others to carry their trade to the West.

What might be considered as early travel writing was recorded by WEN-CHI, a Chinese woman born into a noble family of the Han dynasty in the late second century A.D. As a child of about 12, she was abducted by the Hsiung-nu (Huns) and lived as a nomad on the Mongolian steppes. She wrote about her experiences in *Eighteen Songs of a Nomad Flute*.

The Han empire collapsed into smaller states in A.D. 220. Many of these, especially those in the south, prospered, but the disunity hindered any kind of travel. During this turbulent time, however, Buddhism, which had its origin around the Ganges River in India, slowly grew in influence. Arising as a monastic offshoot of the ancient Hindu religion in the northeastern Gangetic Plain, Buddhism is identified with Siddhartha Gautama, called the Buddha, the son of an Aryan king, generally agreed to have been born in 563 B.C. Buddhism made its greatest gains in India when Ashoka, the king of the Mauryan Empire, after a bloody campaign in 261 B.C., renounced warfare and adopted the religion. Ashoka sent missionaries throughout his kingdom and beyond, even into central Asia.

By the fourth century A.D., Buddhism had taken root in China. But there were many doctrinal disputes among the Chinese Buddhists because of a lack of religious texts. In

A.D. 399, Buddhist monk and scholar FA-HSIEN set out to reach India and obtain Buddhist texts in Sanskrit, which he planned to translate. He traveled with three other monks westward through China and along the Silk Road. He crossed the Takla Makan desert and over the Pamir plateau and into Afghanistan. From there, he followed the Kabul River to the upper Indus Valley, before setting off eastward across the Gangetic Plain. Fa-hsien spent three years copying Buddhist documents and visited many important Buddhist shrines. He also spent two years on Ceylon, which had been among the first lands converted by Ashoka's zeal. He began his homeward journey in about 413 by sea, through the islands of Southeast Asia. Upon his return, he translated the texts he had copied and wrote an account of his journey.

The reunification of China occurred in 581, under the Sui dynasty, during which Buddhist philosophy, rather than the traditional philosophies of Confucianism and Taoism (Daoism) from earlier dynasties, was promoted. The Sui dynasty was short lived and was followed by the T'ang (Tang) dynasty, which lasted hundreds of years, from about 618 to 907.

New political stability and a new religious philosophy inspired new journeys. Buddhist monk HSÜAN-TSANG made his own attempt to resolve further doctrinal problems, convinced of the feasibility of a trip to India by Chang Ch'ien's and Fa-hsien's earlier journeys. But travel outside the empire was forbidden. In 629, Hsüan-tsang embarked in secret from Lanchow, at the western extent of China's Great Wall. He crossed the Gobi Desert, entered the Sinkiang province, crossed the Tian Shan mountains, traveled through the Kirghiz region of central Asia and the lands southeast of the Aral Sea, then crossed the Hindu Kush into Afghanistan. He remained there for two years at a Buddhist monastery. Hsüan-tsang then reached India through the Khyber Pass and crossed plains in the north to the upper Ganges River Valley. He followed the valley until he reached the Nalanda, a Buddhist University in Baragaon. He studied there for five years, collecting Buddhist texts and relics. Hsuan Tsang later followed the Ganges to its mouth. He was deterred from setting out by sea to Ceylon due to political instability, so he then traveled inland to the Deccan Plateau. He followed the Indus River Valley, then joined a trade caravan. When he finally returned to China in 645, though he had defied the emperor's orders, he was warmly welcomed, all recognizing his achievement. His travels in India had been the most extensive in Chinese history.

Another early Chinese traveler to India was I-CHING, in an effort to obtain and translate accurate Buddhist texts to answer lingering metaphysical problems. In 671, he sailed southward along Asia's coast, from Canton to Sumatra, then to eastern India. He ended up spending almost two-and-a-half decades in India and the East Indies.

In the meantime, the West was in a state of collapse. The Roman Empire had converted to Christianity and was

split into two realms, the western part weakened by barbarian invasions, and the eastern part threatened by the Persians and the Turks. While the West decayed into feudalism, and travel became extremely dangerous, if not impossible, the T'ang empire was flourishing. Its two main cities, the capital Chang'an and Louyang, grew to be metropolises, while states in central Asia paid the T'ang empire tribute, and travelers, merchants, and envoys visited from Japan, Korea, and Tibet. The T'ang dynasty was cosmopolitan and had an unparalleled influence throughout the East.

The first European explorer of record who claimed to have reached China—its western frontier—was Rabbi BENJAMIN OF TUDELA, a Spaniard who, in the second half of the 12th century, reached central Asia via Persia. He later visited India and Ceylon.

In the first half of the 15th century, during the Ming dynasty, Admiral CHENG HO led seven Chinese maritime expeditions composed of a JUNK fleet, sailing from China to the Indian Ocean, the Persian Gulf, and the Red Sea, reaching East Africa. His voyages opened up Chinese trade with foreign peoples.

Early Christian Influence in Asia

During his reign of A.D. 98–117, Roman emperor Trajan annexed parts of the Middle East including Assyria and Mesopotamia. Yet Hadrian, who succeeded Trajan in 117, released the eastern conquests. Hadrian also ordered the construction of Hadrian's Wall around the boundaries of the empire. This was also the era that Christianity began its expansion from Jerusalem throughout the Roman Empire. In 330, Roman emperor Constantine I (Constantine the Great) recognized Christianity as the official religion and established a new capital, Constantinople (present-day Istanbul, Turkey). In 395, the Roman Empire was divided into the Western Roman Empire and the Eastern Roman Empire (also known as the Byzantine Empire), the latter influential in the Middle East for centuries.

Adherents of the Christian religion undertook pilgrimages to the Holy Land to fulfill vows. One of the earliest pilgrimages on record dates to 217, when Bishop Alexander traveled from Cappadocia to Jerusalem. The tone of the account of that voyage suggests such pilgrimages were common before then. After Constantine's conversion to Christianity, and especially after his mother, St. Helena, took a trip to the Holy Land and, according to legend, recovered what was claimed to be the true cross of Jesus's crucifixion, pilgrimages to visit holy sites and to recover holy relics grew even more popular.

The most detailed early description of the Holy Land comes from sixth-century Scottish abbot Adamnan, who wrote a detailed account of the journey of Frankish pilgrim ARCULF. His three-volume geography, *De Locis Sanctis* (Concerning Sacred Places), described various biblical

sites, including the Dead Sea, Jordan River, and such cities as Jerusalem, Bethlehem, and Damascus. The work was presented to Aldfrith, the king of Northumbria (in Britain), in 698.

Islamic Expansion

Islam was founded on the Arabian Peninsula by the Prophet Muhammad in A.D. 622. By the time of his death in 632, the entire Arabian peninsula had been united under Islam. Armies of Arab Muslims soon crushed Persia, already weakened by its long conflict with the Eastern Roman Empire, and expanded into neighboring regions, including Jerusalem. By the next century, the Islamic Empire expanded eastward to the edge of the Chinese Empire in central Asia and westward through North Africa. And Islamic learning and trade flourished, with discoveries in mathematics, science, and navigation (see MUSLIM EXPLORATION).

In 711, Mohammed bin Qasim, entering the Indian subcontinent from Afghanistan, much as Alexander had done, conquered Sind, the area of modern-day Pakistan around the Indus River. The Muslims did not press on beyond Pakistan by land at that time. In 758, Muslim seafarers, who were routinely sailing all through the Indian Ocean, ransacked the port of Canton, which led to the closing of the city for 50 years. In 850, Arab trader SOLEYMAN sailed from the Persian Gulf to India, then embarked by Chinese junk through the Bay of Bengal to the Chinese port Khanfu in present-day Canton. Soleyman's extensive observations of India and China were later recorded along with descriptions of other lands in a document known as the *Sequence of Historical Events*.

Muslim rule extended even farther eastward in later centuries. Afghan sultan Mahmud of Ghazni conquered the region of Punjab in India in the early 11th century and made Lahore his capital. Between 1175 and 1186, Turkish Muhammad of Ghur conquered the regions of Sind and Punjab. He was assassinated in 1206. That year, his general, Qutubuddin Aybak, established the Delhi Sultanate, an independent Muslim kingdom in India, which endured until 1526. The sultanate included most of Punjab and Sind during this period.

The emphasis on acts of devotion and on Islamic studies, along with the duty of every Muslim to make at least one pilgrimage to the holy cities of Medina and Mecca, inspired a new emphasis on travel. In 914–34, Arab historian ABU AL-HASAN ALI AL-MASUDI visited every country in the Islamic world, which by then included most of North Africa. In 943–73, ABU AL-QASIM IBN ALI AL-NASIBI IBN HAWQAL made his own similar journeys. In 1017, Arab scholar ABU AR-RAYHAN MUHAMMAD IBN AHMAD AL-BIRUNI traveled to India for the first time. Among his many works was the book *India*. In 1182–1217, ABU AL-HASAN MUHAMMAD

IBN JUBAYR, a Muslim official and scholar, made four pilgrimages from Moorish Spain to Arabia.

In 1325, ABU ABD ALLAH MUHAMMAD IBN BATTUTAH, a Muslim born in Morocco, began his travels throughout the Islamic world, including a pilgrimage to Mecca, where he settled for a time in order to study Islamic law. He eventually traveled eastward, reaching Delhi in India, where he served Islamic sultan Mohammed Tuglaq for seven years. He was then assigned as the sultan's ambassador to the Mongol emperor of China but, on his way to China, was robbed of the gifts he had been given for the emperor. After staying in the Maldives for two years, he returned to India, then sailed to the Malay Peninsula and the island of Sumatra, before reaching China. In 1346, he set out for home, returning to Tangier in 1350. He later traveled southward in Africa. Ibn Battutah's writings about his extensive travels provide vivid details of the lands that Europe would "discover" more than a century later.

In the mid-11th century, as the Turks began to take control of the lands controlled by the Arabs, the conquerors themselves converted to Islam. The Turks were more zealous in some ways than their predecessors: They halted Christian pilgrimages to Jerusalem and began new assaults on Constantinople. Byzantine leader Alexius I Comnenus appealed to the West for help defending against them. In 1095, Pope Urban II gave a speech encouraging aid to Byzantium against Islamic attackers. This instigated what became the first of the European CRUSADES to the Middle East. European nobles mustered armies and advanced beyond Constantinople. They captured Jerusalem and established what were known as Crusader states, Christian nations in Palestine. Crusaders carried home both goods and ideas from the East and helped spur on interest in more trade. Europeans maintained a presence in the Middle East for about 200 years—in the course of which a number of other Crusades were launched—until the region was ultimately retaken by Ottoman Turks. The Turks went on to capture Constantinople in 1453, which resulted in the breakup of the Eastern Roman Empire.

Mongol and European Contacts

In 1206, GENGHIS KHAN consolidated his rule over the nomadic Mongols (see MONGOL EXPLORATION). With his establishment of a capital at Karakorum in the northern Gobi Desert, he began to threaten the domination of the Turks, and embarked on a path that would spur unprecedented contact between the East and West. His armies overran the Ch'in empire of northern China in 1215 and pushed west and south. Like Alexander the Great, Genghis Khan sought geographic information to aid in subjugation of the peoples of Asia. In 1219, CH'ANG-CH'UN, a Chinese Daoist priest and scholar, carried out a mission of reconnaissance for the khan through central Asia. By the time of his death in 1241,

Genghis Khan had established the largest empire ever to exist in human history, from the Caspian Sea in the west to the Pacific coast of China. In fact, the Mongol armies had reached as far west as Hungary.

In 1245, Pope Innocent IV summoned GIOVANNI DEL CARPINI, an Italian born in Perugia and one of the first Franciscans, to undertake a diplomatic mission to Genghis Khan to see if the Mongols might be persuaded to assist the Europeans against the Islamic Turks. Carpini and an interpreter traveled through eastern Europe, across Ukraine, to the Volga River, where they encountered a Mongol party. They were granted safe passage and hardy Tartar horses and crossed the steppes of central Asia, reaching Karakorum in 1246. The new khan, Kuyuk, was no more ill-disposed to the Islamic Turks than he was to Christians, and Carpini left without any alliance or even promise of peace. In 1253, King Louis IX of France sent Flemish WILLIAM OF RUBROUCK on a diplomatic mission to the Mongols at Karakorum. He met with the khan Mangu but achieved no lasting political settlement. Both Carpini and Rubrouck wrote accounts of their journeys, some of the first European reports of the Orient.

The Mongol Empire, although now fragmented after Genghis's death, maintained considerably powerful kingdoms called khanates. After these diplomatic missions from the west to the east, the next travelers were mercantile. MAFFEO POLO and his brother NICCOLÒ POLO were minor noblemen and merchants in Venice. The Polo brothers traded in jewels and precious stones out of Constantinople. In 1260, Maffeo and Niccolò sought a better price for their jewels, traveling to the court of Barka Khan near the mouth of the Volga River. As they prepared to return across the Crimea to the Black Sea, a war between Barka Khan and the khan of Persia erupted, and the Polos were forced to travel eastward in 1263, to Bukhara in present-day Uzbekistan. Bukhara was an important outpost along a main caravan route, and the Polos remained there, unable to travel west until 1266. Then, they encountered a group of Tartar envoys on their way to the court of Kublai Khan, one of the inheritors of the empire of Genghis Khan, who ruled China from Cambaluc (near present-day Beijing). The Polos traveled with the Tartars along the Silk Road. Kublai Khan welcomed the Polos, the first Europeans he had encountered, and expressed interest in Western culture. He hoped to have Western missionaries convert the Mongols, who were without a strong faith, to Christianity, which he thought would have a civilizing and unifying effect on them. After a year, the Polos were allowed to return home, and with the aid of a passport—a large slab of gold—they traveled westward through China.

The Polo brothers returned to Venice in 1269, remaining for only two years before they embarked again, eager to reestablish ties with the Mongol emperor. Niccolò's 17-year-

old son, MARCO POLO, accompanied them as they sailed from Venice to Acre on the east coast of the Mediterranean. Niccolò, Maffeo, and young Marco crossed Mesopotamia through Persia to Hormuz, a port on the Persian Gulf coast, where they hoped to find oversea passage to Cambaluc. They could find no boats on which they were willing to embark, however, and set off overland in 1272. The three crossed southern Persia into Afghanistan, where Marco fell ill. Maffeo and Niccolò remained with Marco for a year in the mountains until he recovered, before following the Oxus River, onto the Pamir plateau. They reached Lop Nor, an important trading city on the far western edge of China, and joined a caravan into Mongolia, where, after three years of travel, they reached the court of Kublai Khan.

The khan was so impressed with Marco, just 21 years old at the time, that he appointed him to a diplomatic post. As part of his official duties, Marco traveled throughout China and Southeast Asia. He visited the Chinese provinces along the Yellow River, Yangtze River, and upper Mekong River. He visited the interior of what is now Myanmar, Thailand, and Vietnam. He also sailed to the islands of Indonesia. In 1292, anxious about their fortunes because of Kublai Khan's advanced years, Marco, Maffeo, and Niccolò sought a way to return to Italy. An opportunity presented itself to escort to Persia a Mongolian princess who was betrothed to the khan of Persia. The three Polos and the princess traveled by sea, the land route being blocked by warfare. They arrived safely back at Hormuz in 1294. Marco Polo's account of the East, known in short as *The Travels of Marco Polo*, became one of the most influential works in European exploration.

Kublai Khan's tentative approval of Christianity and curiosity about the West led to further exploration in the East, this time by Franciscans, dedicated Roman Catholic missionaries. JOHN OF MONTECORVINO was a Franciscan friar from Italy. After serving as an emissary to the pope for the Byzantine emperor in the 1270s, Pope Nicholas IV assigned John to be his representative in the Persian capital at Tabriz. After two years, John sailed by way of the Arabian Sea to the southern tip of India. After founding the first Catholic missions there, he embarked into the South China Sea, following it into the Yellow Sea to Cambaluc, where he met Kublai Khan in 1294. He continued his missionary work in China under the khan's approval, establishing a cathedral and a church school in the Chinese capital, and China's first permanent Christian settlements. In 1307, he became Cambaluc's first archbishop and was named patriarch of the Orient. He reported on his experiences in letters to the Vatican.

In 1280, RABBAN BAR SAUMA, a China-born Christian descendant of Turks who had been aligned with the Mongols, set out on a pilgrimage to Jerusalem. He and a companion followed the Silk Road below the Takla Makan desert and arrived in Mongol-held territories in Persia two

years later. Reports of danger along the route kept Bar Sauma from reaching Jerusalem, but he went on to be appointed to a delegation representing Mongol interests in the West and visited Constantinople and other European cities.

In about 1318, Franciscan missionary ODORIC OF PORDENONE set out overland across Asia Minor and Persia to the port of Hormuz at the mouth of the Persian Gulf. From there, he sailed to India, where he collected the bones of recently martyred Christians. After visiting islands in the Indian Ocean, he sailed to the Chinese port of Hangchow in about 1322. He proceeded along the Great Canal, inland to Cambaluc, where he met and stayed with John of Montecorvino. Odoric interred the bones of the martyrs there, remaining about six years before returning overland to Europe, traveling north from the Great Wall into Mongolia, then south and west. His route took him along the northern slopes of the Himalayas and into Tibet. He later wrote an account of his travels in the Far East, detailing the spice trade in India and Sumatra, as well as the size and marvels of Chinese cities such as Hangchow and Zaiton. His travels provided Europeans with important geographic information, which Spanish geographer ABRAHAM CRESQUES incorporated into his *Catalan Atlas* of 1375.

Another early overland traveler to the Far East was Italian missionary GIOVANNI DE MARIGNOLLI, who traveled to China, India, and Indonesia in 1339–53. Early the next century, in 1403–06, RUY GONZALEZ DE CLAVIJO headed a diplomatic mission for Spain to meet with Mongol emperor Tamerlane in his capital of Samarkand in present-day Uzbekistan in central Asia.

In about 1419, after the Mongols had been expelled from China, NICCOLÒ DI CONTI, a Venetian merchant, traveled to Damascus. He remained there for several years learning Arabic, then traveled to Baghdad and Hormuz at the southern end of the Persian Gulf. Conti learned Persian and studied the peoples living on the Persian coast before continuing his journey eastward. After traveling through India and Southeast Asia, Conti returned by boat to the Arabian Peninsula. He landed in Aden, then traveled up the Red Sea coast to the port city of Jidda in 1444.

Reports of the travels of diplomats, merchants, and missionaries continued building the growing interest in the Far East among Europeans during the RENAISSANCE.

Growing Contacts between East and West

Through much of the 15th century, the first part of the EUROPEAN AGE OF EXPLORATION, the Portuguese, under the influence of HENRY THE NAVIGATOR, prince of Portugal, sought a sea route around Africa. In 1492, Italian mariner CHRISTOPHER COLUMBUS proposed to the king and queen of recently united Spain to sail westward to reach the Orient, a route many thought far too long. Columbus, while wrong

about the distance around the globe to Asia, reached the Americas in 1492 and obtained for Spain trading rights in the Atlantic Ocean. Soon afterward, in 1497–99, Portuguese mariner VASCO DA GAMA sailed around Africa's CAPE OF GOOD HOPE into the Indian Ocean and reached India, gaining access by sea to the lucrative Asian trade.

Their voyages led to a period of extensive maritime activity between Europe and India and the East Indies. In 1503–09, Portuguese admiral FRANCISCO DE ALMEIDA led a number of naval expeditions to the southwest coast of India, where he established Portuguese trade dominance. His son LOURENÇO DE ALMEIDA explored Ceylon and the Maldives.

The islands of the Malay Archipelago and the city of Malacca on the Malay Peninsula occupied an important point in the routes in trade from China, Japan, and the Malay Peninsula to India and countries bordering the Arabian Sea. Some of the islands—such as the Spice Islands—were themselves an important source of spices. The first known European visitor to the Spice Islands is thought to have been an Italian, LUDOVICO DI VARTHEMA, in 1505. He reported finding pepper, mace, cloves, and nutmeg. By this time, people on many of the larger islands had converted to Islam, although they preserved their native cultures on smaller islands.

In 1509, a fleet of Portuguese ships commanded by DIEGO LÓPEZ DE SEQUIRA arrived off the coast of Sumatra. FERDINAND MAGELLAN and FRANCISCO SERRANO sailed under the command of de Sequira. The Portuguese made an unsuccessful attempt to conquer the important port city of Malacca on the southern end of the Malay peninsula. In 1511, AFONSO DE ALBUQUERQUE and Serrano managed to occupy Malacca. An expedition was soon sent out under Antonio de Abreu to find a route to the Spice Islands. While unsuccessful in that purpose Abreu explored the islands of Java, Madura, and Sumbawa. When another Portuguese fleet arrived in 1514, Portuguese control of the region was solidified. In Malacca, the Portuguese encountered Chinese ships, and, that year, Portuguese traders reached Canton on the mainland. Although not permitted to land, they made a heavy profit trading their goods. In 1517, Portuguese envoy TOMÉ PIRES traveled by ship from India to China. He is thought to have stayed in China for about 20 years. The Portuguese also conquered the Persian Gulf port of Hormuz in 1514.

The English meanwhile hoped to develop trading contacts with Persia. ANTHONY JENKINSON, a merchant and member of the MUSCOVY COMPANY, traveled from Russia to Persia in 1562–63. Another English merchant, SIR ANTHONY SHERLEY, traveled to Persia in 1598. Sherley managed to obtain some trade concessions for English merchants and then became employed by Persian shah Abbas the Great. After serving as an ambassador to Moscow and other

countries for the shah, Sherley attempted to garner support for a Persian expedition against the powerful Turks. Later, under the aegis of the Holy Roman Emperor Rudolf II, Sherley unsuccessfully agitated the Arabs to rise against the Turks.

Ferdinand Magellan had returned to Portugal from the East in 1512. He fell out of favor with the Portuguese king despite his military service. When he conceived of a plan to reach the Far East and the Spice Islands by sailing westward, as Christopher Columbus had hoped to do, he sought out support from Charles I of Spain. He proposed that the Spice Islands actually lay in the region allotted to Spanish trade by the 1494 Treaty of Tordesillas, which under the authority of the pope had established spheres of influence to adjudicate rival claims of the Portuguese and the Spanish. Magellan departed Portugal in 1519 with an expedition of five ships. After sailing southward along the coast of South America, he managed to navigate through a strait—which became the Strait of Magellan (see *MAGELLAN, STRAIT OF*). Setting out westward, he expected to sight the Spice Islands after a short time. However, it was not until after more than three months sailing that the expedition sighted land. After landing for a short time on the island of Guam, Magellan sailed 10 more days, reaching the Philippines and claiming the islands for Spain. Magellan was killed by natives in the Philippines on April 27, 1521. Two of the ships finally reached the Spice Islands; one of them under Spaniard JUAN SEBASTIÁN DEL CANO subsequently completed the first *CIRCUMNAVIGATION OF THE WORLD*.

The Spanish route westward broke the Portuguese monopoly on trade with the Far East. Spain sent reinforcements to claim the Spice Islands and to solidify its possession of the Philippines in 1525 and 1528. But, in 1529, Spain relinquished its claim to the Spice Islands to Portugal for a payment of 350,000 gold ducats. The Spanish retained their control of the Philippines despite a longitudinal boundary line that was fixed in the treaty.

At this time, although foreign merchants were not allowed in China, missionaries were given free access. Italian missionary MATTEO RICCI joined the annual fleet of merchant vessels departing from Portugal and bound for India around the Cape of Good Hope, reaching Goa on the west coast of India in late 1578. He engaged in theological studies there for four years. Ricci eventually sailed to the Portuguese island of Macao, where he studied Chinese for a short time. He then sailed to Canton, where he was given permission to establish a Christian mission. With another Jesuit, Father Michele Ruggieri, Ricci remained there for seven years, studying Chinese, and introduced into China Western scientific and geographic knowledge. In 1591, the two Jesuits were eventually driven away by townspeople suspicious of their motives. They traveled northward to the capital at Peking (Beijing) and

met with the Chinese emperor Wan-Li in 1601. Ricci became the court astronomer and mathematician, was granted a mission in Peking, and was allowed to move freely throughout China.

It still was unknown among Europeans whether the land that Marco Polo had called Cathay and reached overland was the same as the lands visited by the Portuguese. In 1603, BENTO DE GÖES, a Portuguese Jesuit at a mission in north-central India, set out to cross Asia overland and attempted to reach Matteo Ricci in Peking, in an attempt to prove that Cathay and China were one and the same. Gões traveled into Afghanistan, passing through Kabul before crossing the Hindu Kush. By 1605, he had reached the western edge of the Takla Makan desert. He joined a trade caravan heading eastward crossing the entire width of northern China in a single year. He reached Suchow, some 200 miles inland from the Yellow Sea, where he was stopped by Chinese authorities. He sent a message to Ricci in Peking, but it was not until April 1607 that he received a reply. He died several days later, after finally having solved an age-old geographic mystery, proving that Cathay and China were indeed the same.

In the East Indies, the English and the Dutch began to encroach on the Spanish and Portuguese spice trade. During the first English circumnavigation of the world, SIR FRANCIS DRAKE, after crossing the Atlantic and Pacific Oceans, arrived in the Spice Islands in 1579. By concluding a trade agreement with the sultan of the Spice Islands, Drake challenged the Spanish and Portuguese monopoly on the East Indies trade.

The first Englishman known to have reached India, the Jesuit missionary THOMAS STEVENS, traveled there on a Portuguese ship and settled at Goa. In 1583, he helped gain the release of RALPH FITCH and JOHN NEWBERRY, part of an English trade and diplomatic expedition to the Mogul (Mughal) Empire, which had been founded by Babur, a central Asian Turk—a Muslim descendant of both Tamerlane and Genghis Khan—in 1526 (and lasted into the 19th century). In the second half of the 16th century, under Akbar, Babur's grandson, the empire was at its height, extending in northern India from Afghanistan to the Bay of Bengal.

In 1600, to develop trade in the region, the BRITISH EAST INDIA COMPANY was founded. In 1601–03, SIR JAMES LANCASTER conducted the company's first maritime trading voyage. Other British East India Company voyages would follow in the ensuing years, including those of JOHN JOURDAIN in 1608–12, CHRISTOPHER NEWPORT in 1613–17, and THOMAS ROE in 1615–19.

In the meantime, the Dutch became active in the East Indies trade. In 1595–97, the brothers CORNELIUS HOUTMAN and FREDERIK HOUTMAN led the first Dutch trade expedition to the East Indies. The DUTCH EAST INDIA COMPANY was chartered in 1602 to follow up on trade

agreements in the region. In 1641, the Dutch captured the important port city of Malacca.

The French, also interested in the region, founded the FRENCH EAST INDIA COMPANY in 1664. Most of its trading activity was carried out from coastal ports in India and from the island of Bourbon (present-day Réunion) in the Indian Ocean.

European colonial powers remained constantly at odds as the power of each expanded, until the Napoleonic Wars in the early 19th century, after which the islands of the Far East were carved up into spheres of influence.

Early European Travel to Japan

In about 1537, Portuguese FERNÃO MENDES PINTO, while traveling with one of Vasco da Gama's sons to India, was captured and sold into slavery by Turks. He escaped in Malaya, and, in 1541, he arrived in Peking with a European trading expedition, entering into diplomatic service with the Chinese government. He accompanied the Chinese to Vietnam and the Mekong Delta, and, sailing across the South China Sea, he became the first known European to reach Japan in 1542. On his return to Portugal in 1558, he wrote an account of his travels, *Periginacoes* ("Peregrinations" or "Wanderings"), which was not published until 1614, 30 years after his death. His stories, many of them too fanciful to be believed, earned him the title "Prince of Lies."

Spanish missionary FRANCIS XAVIER traveled as a missionary to India in 1541, sailing around the Cape of Good Hope with the Portuguese. After spending time in the Portuguese-held Goa, Xavier continued eastward, sailing to the Malay Peninsula and the Spice Islands. In 1549, he embarked on a missionary expedition to Japan and became one of the first Europeans to visit there. He met Fernão Pinto in Kagoshima on Japan's southernmost island, Kyushu.

In 1600, WILLIAM ADAMS, an Englishman in the employ of the Dutch, reached Japan for the purpose of trade. Forced to spend the rest of his life in Japan by the military ruler of Japan, he acted as a consultant on shipbuilding and navigation. He also negotiated with Englishman JOHN SARIS in 1613, granting trading privileges in Japan for the British East India Company.

European Circumnavigators and Scientists in Far Eastern Waters

Ferdinand Magellan and Sir Francis Drake are considered the first circumnavigators of the world with their 16th-century voyages from the Atlantic to the Pacific. OLIVER VAN NOORT, following a similar route taking him through the East Indies, completed the first Dutch voyage around the world at the start of the 17th century. In the 18th century, a number of other British ships made the long journey. ROBERT GRAY carried out the first American voyage

around the world in 1787–90, while on a trading expedition from Boston around South America to British Columbia and then to China and around Africa back to Boston. And, in 1767–69, LOUIS-ANTOINE DE BOUGAINVILLE headed the first French expedition to circle the world, during which he searched for the mythical GREAT SOUTHERN CONTINENT.

In the late 18th and 19th centuries, such long voyages became commonplace—following routes around the world, or to the Pacific, then back over the same waters. They were often undertaken for scientific purposes, with surveyors, cartographers, and naturalists aboard, leading to new geographic information about Far Eastern coastlines. The search for the eastern outlet of a NORTHEAST PASSAGE through Arctic waters north of Europe and Asia, as conducted by Englishman JAMES COOK in his final voyage of 1776–80, also took expeditions to the Asian side of the North Pacific and through the Bering Strait. In 1793–95, Frenchman THOMAS-NICOLAS BAUDIN headed a scientific expedition to China, the East Indies, and India for the Museum of Natural History in Paris, retracing his route on the way back to Europe. In the course of the first Russian circumnavigation of the world, in 1803–06, ADAM IVAN RITTER VON KRUSENSTERN and YURY FYODOROVICH LISIANSKY surveyed parts of Asia's North Pacific coast. In 1825–28, FREDERICK WILLIAM BEECHEY headed a British expedition to the Pacific, during which he explored the Bering Strait, proving beyond any doubt that Asia and North America were not connected by land.

Growing British Activity in the East

The British East India Company became a political as well as an economic force in Asia and directed colonial activity. In the second half of the 18th century, the British government came to play a more direct role in Asian affairs. The Regulating Act of 1773 made the appointment of the governor of the region of Bengal subject to British government approval. The East India Act of 1784 set up a board of control to handle political, military, and financial matters.

The British East India Company's monopoly in Indian trade was taken away by acts of Parliament in 1813 and 1833. The Indian Mutiny (also known as the Sepoy Rebellion) of 1857, in which native soldiers (sepoys) in the Bengal army revolted against the British, led to assumption of full political control over India by the British Crown the next year.

The Turks and Persians maintained both overland control of trade from the East and control of various sea routes from their homelands to India. Until the late 18th century, when European influence in the East, especially that of the British in India, was rekindled, very little European exploration of these regions occurred. That which did occur was undertaken by colonial powers in order to understand and secure their holdings. The British worried that Napoléon

and the French, supported by the Persians and the Russians, would attack India. This concern led them to send SIR HENRY POTTINGER, a British army officer, and CHARLES CHRISTIE, a military surveyor, to explore the interior of present-day Pakistan and Afghanistan and across Persia in 1810. The men developed an accurate understanding of the geography of the region, essential to the British defense of India. Some years later, in 1832, Englishman SIR ALEXANDER BURNES, posing as a native Afghan, explored Afghanistan in more detail. He also traveled into Persia to the Persian Gulf.

In 1802, the British organized the Great Trigonometrical Survey to map the Indian subcontinent and the mountain country to the north. SIR GEORGE EVEREST, after whom Mount Everest was named, played a part, as did native explorers working for the British later in the century. These native explorers were known as the PUNDITS and included NAIN SINGH, KISHEN SINGH, and KINTUP.

Meanwhile, in China at the end of the 18th century, the only port open to foreign traders was Canton. It served as a hub for trade silk, tea, and opium. The British sent emissaries in 1793 and 1816, but both times were unable to obtain the trading concessions they desired. Conditions under which the British traded continued to decline, the principal concern of the Chinese being the spread of opium by British merchants to much of the population. In 1839, after negotiations, the British turned over all the opium then in traders' hands. Yet, opium played a key position in British trading strategy, and, using the excuse that further Chinese demands were untenable, Great Britain went to war with China in the First Opium War of 1839–42, which was settled when the Chinese agreed to pay a large indemnity, and more important, to open four new ports for foreign trade. In 1856, the British again went to war with China—the Second Opium War—this time giving aid to a Chinese aspirant to the throne who had been converted to Christianity. In 1860, the British marched into Peking. The Chinese paid another indemnity, the import of opium was legalized, freedom was granted to preach Christianity, and the interior of China was opened to European travelers.

In 1872–73, Englishman NEY ELIAS, who worked as a civil servant in a foreign office in China took advantage of the new travel freedom and journeyed from China across the Gobi Desert, Altai Mountains, and Siberia to Europe. In 1885–86, he became the first Englishman to cross the Pamir range.

Russian Exploration Eastward and Southward

The exploration of Siberia followed a different course of history than that of the rest of central Asia and the Far East since most of it was carried out by Russians and Russian Cossacks traveling overland from the west. The Cossack YERMAK commanded a military campaign across the Urals

in 1581–82, on behalf of Russian czar Ivan IV Vasilyevich, or Ivan the Terrible, and initiated Russian expansion into Siberia (see COSSACK EXPLORATION).

In 1631–33, PYOTR BEKETOV established Russian dominion to the Yenisey, Lena, Aldan, and Amur Rivers of central Siberia, and, in 1652–60, he expanded Russian interests into southeastern Siberia, south of Lake Baikal. Not long afterward, in 1643–48, VASILY DANILOVICH POYARKO led a military expedition to explore the Amur River, which fed the Sea of Okhotsk, and other rivers of southeastern Siberia.

Meanwhile, in 1641–44, MIKHAIL STADUKHIN explored the Arctic coast of eastern Siberia, reaching the mouth of the Kolyma River. In 1648, SEMYON IVANOVICH DEZHNEV led an expedition in small boats from the mouth of the Kolyma River eastward along the Arctic coast of Siberia and succeeded in rounding the Chukchi Peninsula of northeastern Siberia and making the earliest recorded sighting of the Bering Strait. In 1695–96, LUKA MOROZKO and VLADIMIR VASILYEVICH ATLASOV led expeditions onto the Kamchatka Peninsula.

In 1713–14, fur trader SEMYON ANABARA explored the Shantar Islands in the Sea of Okhotsk. In 1726–33, EMELYAN BASOV led a series of expeditions along Siberia's Lena River in search of a seaward route to the Pacific Ocean.

In 1719–27, German naturalist DANIEL GOTTLIEB MESSERSCHMIDT headed a scientific expedition to central Siberia—from the Lena and Yenisey Rivers in the north to Lake Baikal and the Amur River in the south—on behalf of Russian czar Peter I (Peter the Great). He reported on the geography, peoples, and wildlife of the region.

Starting in 1725, VITUS JONASSEN BERING, a Danish mariner in service to Russia, headed the First Kamchatka Expedition to the Pacific coast of Siberia for Czar Peter. Part of his mission was to determine if there were lands connecting northern Asia and North America. His explorations of the Bering Strait proved tentatively that there was not until conclusive proof in the early 19th century. In 1733–40, Bering and Russian ALEKSEY ILYICH CHIRIKOV commanded the Great Northern Expedition (including the Second Kamchatka Expedition) for the Russian navy to the Arctic and Pacific coasts of Siberia, the Kuril Islands, and inland areas of eastern Siberia; Germans JOHANN GEORG GMELIN and GEORG WILHELM STELLER and Russian STEPAN KRASHENINNIKOV served as naturalists. In 1741, the expedition made the European discovery of Alaska. Russians soon expanded the FUR TRADE from Siberia to North America.

Russians also explored southward to the Caspian Sea, bordered by present-day Russia, Kazakhstan, Azerbaijan, Turkmenistan, and Iran. In 1715–17, ALEKSANDR BEKOVICH-CHEKASSKY and, in 1819–26, GRIGORY GAVRILOVICH BASARGIN led military expeditions to the Caspian Sea, which helped determine the geography and watershed of the

world's largest landlocked body of water (which loses more of its water to evaporation than it receives from rivers, such as the Ural and Volga).

Arctic Asia and the Northeast Passage

The search for the Northeast Passage led to the exploration of Arctic Asia. The earliest voyages in the mid-16th century—many of them sponsored by the London-based Muscovy Company—failed to navigate beyond the island group known as Novaya Zemlya because of icy conditions, thus in effect only exploring the European Arctic. In 1594, geographer JAN HUYGHEN VAN LINSCHOTEN, in one of two ships of a Dutch expedition with WILLEM BARENTS managed to pass along the southern end of the Novaya Zemlya into the Kara Sea, the start of the Asian Arctic. In 1596, Barents himself rounded Novaya Zemlya's northern end.

Russians also explored the Arctic coastline of Siberia from both land and sea. In the 1640s, MIKHAIL STADUKHIN explored the Arctic coast of Siberia around the Kolyma River. And, in the 18th century, Vitus Bering, the Dane exploring for Russia, explored Arctic regions as part of the Great Northern Expedition. Other nations sent expeditions in search of the eastern outlet of the Northeast Passage, such as the British expedition under James Cook in 1776–80.

On a voyage in 1878–79, a Swede, NILS ADOLF ERIK NORDENSKJÖLD, backed by Sweden and Norway, attempted the Northeast Passage using a combination steamship-sailing ship. In August 1878, his expedition sailed past the northernmost point of the Asian Continent at Cape Chelyuskin and, the next month, reached North Cape, where it was icebound through the winter. With the melting of the ice, the expedition continued westward, and, in July 1879, entered the Bering Strait, having completed the passage. It later visited Japan and Ceylon before making use of the Suez Canal to return to Sweden in 1880.

The Mystery of Tibet

Tibet is one of the most isolated regions in the world, surrounded by the Himalayas, with the Karakoram range on the west, and the Kunlun range on the north. Referred to as the “Roof of the World,” it is the highest region in the world, with an average elevation of 16,000 feet. Moreover, for much of its history the last two centuries, it has been under Chinese control and forbidden to foreign travel. Its capital, LHASA, became known as the “Forbidden City.”

The first known European to reach Tibet was Italian missionary ODORIC OF PORDENONE, along the northern edge of the Himalayas, on his return trip from China in the 1320s. He may have reached Lhasa, but documentation is inadequate. The next European visitors to the region, three centuries later, were also missionaries. In 1624–25, Portuguese (or Spanish) Jesuit ANTONIO DE ANDRADE traveled twice across the Himalayas from northern India into Tibet,

where he founded a mission at the Tibetan town of Tsaparang. Soon afterward, in 1626, Portuguese Jesuits JOÃO CABRAL and ESTEVÃO CACELLA also reached Tibet from India and founded a mission at Shigatse. In 1631–35, Portuguese (or Spanish) Jesuit FRANCISCO DE AZEVADO, continued the work Andrade had begun at Tsaparang. Three decades later, in 1661–62, German Jesuit JOHANN GRUEBER and Flemish Jesuit ALBERT D'ORVILLE traveled from Peking across western China to Tibet, becoming the first Europeans known to visit Lhasa for certain; they stayed only a month before proceeding to India. The next century, in 1716, Italian Jesuit IPPOLITO DESIDERI and Portuguese Jesuit Emmanuel Freye reached Lhasa. Desideri remained there five years, studying the Tibetan language.

The next visits by Europeans were diplomatic in nature, by GEORGE BOGLE in 1774 and by SAMUEL TURNER in 1783, both Englishmen in the employ of the British East India Company. The British attempt to establish trade contacts with Tibet and counter the Chinese claim to the region proved largely unsuccessful, as a result of a failed Nepalese invasion of Tibet in the 1790s, encouraged by the British.

European visits to Tibet were also uncommon in the 19th century. In 1811–12, the Englishman THOMAS MANNING was turned down by the British East India Company for a proposed visit to Tibet but traveled there anyway in Asian disguise, reaching Lhasa in 1811 and managing an audience with the seven-year-old Dalai Lama, the spiritual leader of Tibetan Buddhism. In 1812, Englishmen HYDER JUNG HEARSEY and WILLIAM MOORCROFT, in seeking to locate the source of the Ganges River, managed to cross into Tibet, disguised as wandering holy men, and to explore part of the Himalayas.

In 1845–46, French Lazarist missionaries ÉVARISTE-RÉGIS HUC and Joseph Gabet, disguised as Tibetan monks, managed to enter Tibet from China and reach Lhasa, but they were forced to leave by the Chinese ambassador after two months. In the 1850s, German brothers ROBERT VON SCHLAGINTWEIT, ADOLF VON SCHLAGINTWEIT, and HERMANN VON SCHLAGINTWEIT carried out explorations of the Himalayas in India and Tibet. In the second half of the 19th century, the pundits, in their surveying work for the British, traveled inside Tibet in disguise, hiding their measuring tools.

In 1879, a Russian explorer of much of central Asia, NIKOLAY MIKHAILOVICH PRZHEVALSKY, crossed Sinkiang and entered Tibet from the north, reaching within 125 miles of Lhasa before being forced to turn back by Tibetan officials. ANNIE ROYLE TAYLOR, a British missionary in the China Inland Mission and a member of the ROYAL GEOGRAPHICAL SOCIETY, in the course of her travels in central Asia, became the first European woman to enter Tibet in 1892, crossing the border from China. She, too, failed to reach Lhasa, sent back north by officials. She tried again two

years later from India but reached only as far as the Tibetan border city of Yatung. Swedish explorer SVEN ANDERS HEDIN, who traveled throughout Asia, entered Tibet on two different occasions in the late 19th and early 20th centuries, carrying out geographic studies. But he, too, was refused entrance into Lhasa.

In the early 20th century, in 1900, a young Russian student, GOMBOZHAB TSYBIKOV, entered Lhasa disguised as a Buddhist. He remained there a year and visited a number of monasteries. He was soon followed by another Russian, Agran Dorjien. Dorjien became the Dalai Lama's teacher and political adviser. The British, competing with the Russians for economic control of central Asia, sent a military expedition into Tibet under SIR FRANCIS EDWARD YOUNGHUSBAND in 1904, which led to the Treaty of Lhasa with the Tibetans. In 1910, Chinese troops occupied Lhasa, although Tibet again became independent after the Chinese revolution of 1911–12.

Frenchwoman ALEXANDRA DAVID-NÉEL, a student of eastern philosophy and frequent traveler in India and China, moved to India in 1912, and, from there, made several trips into Tibet, never reaching Lhasa. In Japan, she met Ekai Kawaguchi, a Japanese philosopher and monk who had managed to spend 18 months in Lhasa disguised as a Chinese Buddhist monk. In 1924, after more than three years traveling through China and Mongolia, David-Néel, disguised as a beggar at Kawaguchi's side, finally reached Lhasa, becoming the first European woman to do so. She remained there two months, visiting all the holy sites.

In 1951, Tibet again lost its independence with the invasion of Communist China. Travel there has continued to be restricted.

19th-Century French Explorers of Southeast Asia

In 1861, the French navy conquered Cochin China, the area that is now southern Vietnam in Southeast Asia. MARIE-JOSEPH-FRANÇOIS GARNIER accompanied the expedition and was named governor of Saigon (present-day Ho Chi Minh City). Garnier later obtained support from the French government to explore the Mekong River, hoping to find an easy trade route into Southeast China. ERNEST-MARCOLOUIS DE GONZAGUE DOUDART DE LAGRÉE, a French officer who had served as the French ambassador to the king of Cambodia, was appointed to lead the expedition. The expedition of 1866–68 determined that because of rapids and falls along the Mekong it would never make a practical waterway. Doudart de Lagrée later died from illnesses contracted on the expedition. Garnier, for his part, explored the Angkor ruins and the upper Red and Yangtze Rivers.

Another early French explorer in the region was the trader JEAN DUPUIS. In 1871–73, he traveled down the Red River from Yunnan to the northeast coast of Vietnam in search of a practical trade route. His arrest by Vietnamese of-

ficials led to French intervention. In 1891–95, AUGUSTE-JEAN-MARIE PAVIE headed the Pavie Mission with the assigned task of surveying Indochina (present-day Cambodia, Thailand, Laos, and Vietnam). The French would maintain a colonial presence in Southeast Asia through much of the 20th century.

19th- and 20th-Century European Explorers of the Middle East

Beginning in the early 19th century, increasing numbers of Europeans traveled to Arabia and other parts of the Middle East for a variety of purposes. After studying Arabic and the culture and history of the Middle East in Germany, Swiss-born JOHANN LUDWIG BURCKHARDT obtained a commission from England's AFRICAN ASSOCIATION to explore in Africa. In 1809, he traveled to Aleppo in present-day Syria to prepare for the journey. He visited ancient Palmyra and lived with the Bedouin for two years, perfecting his Arabic and arranging to travel across the Sahara with a group of Muslims returning to their homelands after a pilgrimage. In June 1812, he headed southward through the valley of the Jordan River. Along the way, he explored the ancient city of Petra, which had not been seen by Europeans since the Crusades. Unable to obtain caravan passage in Cairo, Burckhardt explored northeastern Africa then crossed back into Arabia via the Red Sea. In 1814, he made a pilgrimage to Mecca and Medina to improve his credentials as a Muslim. On his way back to Cairo, he explored the Sinai Peninsula. In 1817, Burckhardt died of dysentery before he was able to find a caravan to take him south in Africa. His writings were published by the African Association, however, and influenced later European travelers to the region.

A diplomatic mission resulted in the first European east-west crossing of Arabia. In 1819, GEORGE FOSTER SADLIER, a British army officer in India, was sent to negotiate with Ibrahim Pasha, a Turk engaged in consolidating Turkish power over Arabia. Sadlier landed at Qatif, north of Bahrain on the Persian Gulf coast of Arabia, and headed inland to meet with Pasha. In the course of the expedition, he learned Pasha had moved on to Medina. Sadlier continued on across the desert to Medina, and finally met with the leader. Afterward, he continued to the Red Sea coast and returned to India.

The British East India Company, interested in improving travel across the Arabian sea route from Suez to Bombay in India, sought to establish coaling stations on the south coast of the Arabian Peninsula. To that end, in 1834, it sent British officer JAMES WELLSTED to survey the region. Wellsted, landing in what is now Yemen and Oman, undertook excursions into the interior. He made archaeological studies of ancient ruins and became the first European to glimpse the vast interior desert, the Rub' al-Khali (or the Empty Quarter).

British officer, adventurer, and linguist SIR RICHARD FRANCIS BURTON, who would go on to become renowned for his explorations in Africa, also explored in Arabia. In 1842–49, he had spent time in the Sind region of Pakistan as interpreter for his regiment. Intrigued by his encounters with Muslims and bolstered by his growing knowledge of Islam and Arabic, Burton planned his own journey into Arabia. He proposed to undertake a pilgrimage to Muslim holy cities, then continue southwestward to the Empty Quarter, which had been spotted by Wellsted but remained completely unexplored by Europeans. In 1853, he sailed to Suez. Disguised as an Afghan physician, he joined up with a caravan of pilgrims. He reached Mecca in early 1854 and Medina shortly thereafter. After becoming sick, he was forced to abandon his plans and return by steamer to Cairo. His account of his pilgrimage was immensely popular in England.

Hoping to expand French power in the Arabian Peninsula, Napoléon III sponsored a missionary expedition into Arabia by WILLIAM GIFFORD PALGRAVE, a London-born Christian missionary. Palgrave's expedition was also backed by various business interests seeking to increase imports of cotton and pureblood Arabian horse breeding stock. Palgrave left Europe for the Middle East in June 1861. After arriving on the Arabian Peninsula in present-day Jordan, he disguised himself as a Syrian doctor. He then traveled for 13 months over 1,500 miles, heading east over the Nafud desert and finally arriving on the Persian Gulf coast at Qatif, completing the first west-to-east European crossing of Arabia.

In 1893, SIR PERCY MOLESWORTH SYKES traveled to Persia. Sykes, a British diplomat and surveyor, sailed across the Caspian Sea to Asterabad in northeastern Persia. From there he followed the Atrek River eastward to Meshed. He made a north-south crossing of the great central desert in Persia, the Dashi-e-Lut. In 1894, Sykes explored the southern province of Baluchistan and became the first European to climb the extinct volcano Kuh-i-Taftan. He traveled extensively through central Persia as diplomatic counsel from 1894 to 1896. As a participant in a government survey, he explored southeastern Persia on the border of present-day Pakistan. He made visits to Persian Gulf ports and visited the Arabian Peninsula. In 1898, he took part in a surveying expedition, looking for a suitable route to connect a telegraph wire from Kerman (in the interior) to Bandar Abbas (on the Persian Gulf). In 1906, he returned to northeastern Persia as the British consul at Meshed. During World War I, he took part in British survey expeditions throughout southwestern Asia and organized a Persian military unit in support of British forces.

Englishman THOMAS EDWARD LAWRENCE (Lawrence of Arabia) began his travels in Arabia with a walking tour of Syria in 1910. The next year, he took part in an archaeological dig with the British Museum in Mesopotamia and,

two years later, spent a year digging in the northern part of the Sinai Peninsula. Having learned to speak colloquial Arabic and having become acquainted with day-to-day Bedouin life, he joined the British army's intelligence department at Cairo at the outbreak of World War I in 1914. He spent some time assessing the potential for an Arab uprising against the Turks in Arabia, who were aligned with Germany and the Axis powers. In 1915, Lawrence met with the Arab leaders Hussein Ibn Ali and his son Faisal Ibn Hussein. He helped these leaders raise an Arab army, then commanded a force that attacked Turkish rail lines in the Hejaz region of northeastern Arabia. Lawrence made many geological observations and determined the longitudinal locations of important landmarks. After the war, he worked on Arab affairs. Eventually his disappointment with the replacement of Turkish colonial rule by British and French colonial rule drove him to retire from public life. In 1929, he proposed that the Royal Air Force explore the Empty Quarter by AIRSHIP, but that plan was never put into action.

HARRY ST. JOHN BRIDGER PHILBY, a British officer in Baghdad at the outbreak of World War I, who had studied Persian and Arabic, was also involved in supporting the Arab rebellion. In 1917, he traveled to the Arabian Peninsula to meet with local Arab ruler Ibn-Saud to generate support. He ventured on to the ancient ruins at Dariyan, then followed the Muslim pilgrim route toward Mecca, arriving on the Red Sea coast at Jidda. Philby's journey completed the first east-to-west crossing of Arabia by a European in almost a century. He continued to travel through Arabia, exploring the southern provinces of the Nejd region as far as the boundaries of the Empty Quarter. He explored Arabia in the following years and resigned from the British Diplomatic Corps in 1924 in order to become an agent for mining and oil interests in the area.

Another Englishman, BERTRAM SYDNEY THOMAS, was the first known European to cross the Rub' al-Khali. First a British political officer in the Persian Gulf region, Thomas later entered service for the government of Oman as a minister of the Sultan of Muscat. In 1927, he landed at Ras al Hadd on the southeastern tip of the Arabian Peninsula and began making preliminary journeys northward in preparation for his expedition. Accompanied by a party of Bedouin, Thomas and his party headed northward from Salalah in October 1930. In early January 1931, the expedition reached the waterhole at Shana, roughly halfway through the desert. Several weeks later, it arrived at Doha on the Persian Gulf coast of Qatar, Thomas thus becoming the first European to cross the Rub' al-Khali.

About a year later, in January 1932, Harry Philby made his own expedition into the Empty Quarter. In March 1932, he arrived at the mouth of the Wadi Dawasir, near the Arabian oasis settlement at Sulaiyil. Philby's east-to-west expe-

dition is regarded as a more accurate and thorough investigation of the region than that of Thomas.

WILFRED PATRICK THESIGER, who served with the British in North Africa and Syria during World War II, was also known for his photography. After the war, he journeyed to the Arabian Peninsula to investigate locust control measures. Perhaps inspired by his contact with the Bedouin, Thesiger also traveled to Arabia. In 1946, he embarked on his first expedition into the Empty Quarter. With native guides, he traveled in a giant circle, beginning and ending at Salahah in present-day Oman on the Arabian Sea. Thesiger made a second journey across the Rub' al-Khali in 1947–48, again with native guides, traveling from Al Mukalla in present-day Yemen on the Gulf of Aden to the Persian Gulf in present-day United Arab Emirates.

Scholarly Pursuits in the 19th and 20th Centuries

Some expeditions by Europeans in Asia advanced knowledge of the land, its peoples, and wildlife. Among the Europeans who traveled there were renowned 19th-century naturalists (see *NATURAL SCIENCE AND EXPLORATION*). In 1829, late in his career, German ALEXANDER VON HUMBOLDT traveled across Siberia to the Yenisey River and the Chinese frontier on a mineralogical research expedition for the Russian government. In 1847–51, British botanist SIR JOSEPH DALTON HOOKER, who had conducted studies around the world, studied the plant life of Nepal and Bengal, then of the Middle East in 1860. In 1854, ALFRED RUSSEL WALLACE, a British naturalist, after studies in South America, embarked on an expedition to the Malay Archipelago in the Far East. Over the next eight years he traveled more than 14,000 miles through the Malay Archipelago, exploring Timor and the Moluccas and all the way to Malacca on the tip of the Malay Peninsula. He collected more than 127,000 specimens and, from his observations, postulated a boundary line separating Asian and Australian types of animals. He also developed a theory of evolution by natural selection, which spurred CHARLES ROBERT DARWIN to publish his own theory. The two theories were published jointly in 1858, while Wallace was still in Asia.

In 1854–57, German brothers Robert, Adolf, and Hermann von Schlagintweit carried out studies in geology and terrestrial magnetism studies in India, Tibet, and western China. Another German, geologist FERDINAND PAUL WILHELM VON RICHTHOFEN, conducted studies in China—in the eastern, central, and southern regions—in 1868–72.

In 1857–58, Russian geographer and astronomer PYOTR PETROVICH SEMYONOV made the first European crossing of the Tien Shan mountains between Russia and China and explored the Dzungaria region and the Altai Mountains of China. Russian ALEKSEY PAVLOVICH FEDCHENKO, who specialized in anthropology and zoology, and

his Russian botanist wife, OLGA FEDCHENKO, led a series of scientific expeditions into the Pamir region in 1868–71. Another Russian, Nikolay Mikhailovich Przhevalsky, made four scientific expeditions to central Asia in 1870–85, reporting on geography and wildlife.

Europeans carried out linguistic, anthropological, and archaeological studies as well (see *ARCHAEOLOGY AND EXPLORATION*). In 1833, Sir Henry Rawlinson, a British officer in service to the British East India Company, was sent to Persia where he remained until 1839, attempting to reorganize the Persian Army. While there, he began copying ancient inscriptions—a decree of the Persian emperor Darius I—that had been carved into a cliff face at Behistun. These were written in cuneiform, the written language of the ancient Sumerians, later utilized by the Akkadians as well. Although Rawlinson was honored by the Royal Geographical Society for his exploration in Persia, he is best known for the first decipherment of cuneiform inscriptions, which brought to life the history and culture of the ancient civilizations in Mesopotamia.

In 1860, while conducting studies in Southeast Asia, French naturalist HENRI MOUHOT located the ruins of an ancient Hindu temple complex—Angkor Wat—built by the Khmers at Angkor in Cambodia. In 1861–64, Hungarian linguist ARMIN VAMBÉRY traveled in Armenia, Persia, Uzbekistan, and Turkestan, managing to visit the cities of Bukhara and Samarkand, forbidden to non-Muslims. In 1876, Englishman CHARLES MONTAGU DOUGHTY visited the ruins of the ancient city Petra in Arabia, examining inscriptions there, as well as at Mada' in Salih and on an ancient wall at Tayma, where he discovered an inscription corresponding to the biblical tale of Job.

A student of Richthofen, Swedish explorer Sven Anders Hedin, while mapping much of central Asia during the late 19th and early 20th centuries, made archaeological findings along the Silk Road. In 1906–08, Hungarian archaeologist SIR MARC AUREL STEIN followed the Silk Road into western China and located the Caves of the Thousand Buddhas at Tunhuang. Among his other travels was an expedition retracing the route followed by Alexander the Great's army on its return from the Indus Valley to Persia.

Russian painter NICHOLAS KONSTANTINOVICH ROERICH and his wife, writer Elena Blavatsky, carried out studies in both natural science and anthropology, after founding the Urusvati Himalayan Research Institute in northern India in 1928. His some 500 paintings also serve as a record of Asian geography and life.

European Women in Asia

Many European women traveled in Asia in the 18th and 19th centuries, especially in the Middle East, in search of adventure or for intellectual and spiritual pursuits. In 1810, Englishwoman Lady HESTER LUCY STANHOPE made

a pilgrimage to Jerusalem. After traveling in the region disguised in native male attire, she crossed the Syrian Desert to the ruins of the ancient city of Palmyra in 1813. She first lived among a band of Bedouin before building herself a large fortress atop Mount Lebanon, where she practiced a unique system of religion, combining elements of local Christian and Muslim sects, until her death in 1839.

British couple ANNE ISABELLA BLUNT and WILFRED SCAWEN BLUNT traveled in the Arabian Peninsula as undisguised Christians. Wilfred Blunt was first a diplomat and then a poet and anti-imperialist activist; his wife, Lady Anne, was the granddaughter of Lord Byron and an accomplished artist. A breeder of Arabian horses, Blunt traveled deep into the Arabian Peninsula with his wife to purchase purebred stock in 1878. The two continued from Arabia into present-day Iraq, starting from Iskenderun on the southeast coast of Turkey. After following the Euphrates River down to Baghdad, the Blunts followed the Tigris River northward. Befriending an Arab sheik in Damascus, they reentered Arabia, studying the Bedouin in the Nefud region. Outspoken against European colonialism, the Blunts were well received by local peoples. Lady Blunt wrote about her experiences as the first European woman to travel undisguised in Arabia.

Other European women traveled to Asia and shared their experiences with the public through their writings, as the Chinese woman Wen-Chi had done centuries before. Among these was Austrian IDA REYER PFEIFFER, who traveled around the world twice in the mid-19th century, including overland in parts of Asia, and wrote about the lands she visited in two books, *A Woman's Journey Round the World* (1852) and *A Woman's Second Journey Round the World* (1856). Also in the mid-19th century, Englishwoman LUCY ATKINSON and her husband, painter THOMAS WITTLAM ATKINSON, traveled in Siberia, Mongolia, and central Asia. Later 19th-century travel writers were Englishwomen ELIZABETH SARAH MAZUCHELLI and ISABELLA LUCY BIRD BISHOP. Mazuchelli traveled throughout the eastern Himalayas with her husband, Anglican clergyman Francis Mazuchelli. Bishop traveled throughout much of Asia, including Japan, China, the Malay Peninsula, India, the Middle East, and Korea. And Englishwoman Annie Royle Taylor and Frenchwoman Alexandra David-Néel wrote about their experiences in Tibet. American FANNY BULLOCK WORKMAN, after traveling throughout Europe and North Africa and mountaineering in the Alps, toured India, Burma, and Java by bicycle and countries of the Far East. She also climbed in the Himalayas and other mountain ranges in central Asia. With her husband, she wrote a number of books about her travels, including *In the Ice World of the Himalaya* (1900).

After mountaineering expeditions in Europe, Englishwoman GERTRUDE MARGARET BELL began to study the ancient heritage of Persia. In the late 19th century, Bell

traveled extensively there, becoming fluent in Persian. In 1900, she made a trip through present-day Israel, Turkey, Syria, and Iraq. By that time fluent in Arabic, she joined a native trade caravan in Damascus in 1913, intending to travel to Riyadh in present-day Saudi Arabia. Muslim opposition forced her back at Ha'il, and she returned to Damascus through Palmyra. Bell made archaeological excavations throughout the Middle East. She worked for British intelligence during World War I and was instrumental in organizing the modern nation of Iraq.

Russian botanist Olga Fedchenko continued her studies in central Asia in the late 19th and early 20th centuries after the death of her husband, Aleksey Pavlovich Fedchenko. She traveled in the Pamir region, along the Caspian Sea, in the Caucasus Mountains, and in the Ural Mountains.

FREYA MADELINE STARK, an Englishwoman born in France, worked on a newspaper in Iraq. She visited Turkey, Syria, Persia, Kuwait, and Arabia. In 1935, she explored the fertile valley of the Wadi Hadramawt in present-day Yemen, inland from the Gulf of Aden. In 1937, she participated in the first archaeological excavations in Yemen, excavating the Moon Temple of Hureidha. Later in life, Stark traveled to central Asia and the Far East. She was a photographer as well as an author.

Climbing the Himalayas

The Himalayas, with nine of the world's 10 tallest peaks, have attracted mountain climbers from around the world. In 1909, Italian LUIGI AMEDEO DI SAVOIA D'ABRUZZI attempted to climb K2 (formerly known as Mount Godwin-Austen), the world's second highest peak at 28,250 feet, in the Karakoram range of the western Himalayas. Fanny Bullock Workman, for a time, held the altitude record for a woman, which helped set in the Himalayas with the help of Italian mountaineer MATTHIAS ZURBRIGGEN.

Mount Everest, the tallest peak in the world, is considered the greatest prize in MOUNTAIN CLIMBING. In the 1820s, the British, with assistance from Nepalese SHERPAS as guides and porters, made several unsuccessful attempts to reach the summit. During an attempt in 1924, GEORGE HERBERT LEIGH MALLORY and Andrew "Sandy" Irvine lost their lives. Nepalese TENZING NORGAY and Englishman SIR EDMUND PERCIVAL HILLARY summited Mount Everest on May 29, 1953.

In 2000, the continent of Asia had an estimated 3.73 billion inhabitants, three-fifths of the world's population. Many of the themes of ancient times—numerous cross-cultural contacts and political turmoil—still hold true in Asia. Economic development has led to accelerating change. Outside nations, such as the United States and Great Britain, still play a part in Asian affairs.

ASSOCIATION.

astrolabe

The astrolabe is an obsolete tool used for measuring the angle of a celestial body above the horizon. With this measurement, along with knowledge of the day of the year and a table of figures, latitude as well as time of day can be determined.

The astrolabe consists of a disk with graduated markings, a sighting arm that pivots from the center of the disk—an ALIDADE—and a plumb line. By adjusting the sighting arm to view a celestial body and taking a measurement in relation to the plumb line, an angular measurement may be recorded. A table or tables, specific to the celestial body itself, having been compiled from previous measurements throughout the year, yields information on latitude and time of day based on the angular measurement (see EPHEMERIS). For navigation at sea, the astrolabe was modified to improve accuracy. The mariner's astrolabe was made of heavy metal and had a ring on top for a person's thumb or finger so the device could be suspended to keep it plumb. Still, with the constant motion of a ship at sea, multiple readings would be needed for a useful measurement. Properly used, the mariner's astrolabe was accurate to within half a degree. Astrolabes were made in varying sizes and were often ornate, with maps of stars, signs of the zodiac, and other artistic embellishments imprinted on the disk.

The invention of the astrolabe is credited either to Apolonius of Perga, a Greek mathematician of the third century B.C., or to HIPPARCHUS, a Greek astronomer of the second century B.C. It may, however, predate them. Arab Muslims (see MUSLIM EXPLORATION) reinvented or rediscovered the device in about A.D. 700, but used it mostly in the desert where it could be stabilized. Europeans used the device, along with the more recently designed CROSS-STAFF, during the EUROPEAN AGE OF EXPLORATION in the 15th century. In 1484, German cartographer MARTIN BEHAIM was knighted by the king of Portugal for having developed an improved version of the astrolabe. The device remained important until the invention of the SEXTANT in the 1730s.

See also LATITUDE AND LONGITUDE; NAVIGATION AND EXPLORATION.

astronauts (cosmonauts)

The term *astronaut* refers to a crew member on piloted spaceflights. Derived from the Greek words *astron* for “star” and *nautes* for “mariner,” the term is used in the United States and other English-speaking countries. The equivalent Russian term is *cosmonaut*, which has the Greek root word

kosmos for “world.” The French use the term *spationaut*. The term *astronautics* refers to the science and technology of spaceflight.

Although the International Astronomical Federation defines space travel as beginning 62 miles above earth, the U.S. Defense Department applies the rating of pilot-astronaut to those pilots who fly higher than 50 miles. The U.S. agency, the NATIONAL AERONAUTICS AND SPACE ADMINISTRATION (NASA), uses the term *nonastronaut* for payload specialists launched into space—as for the SPACE SHUTTLE program—typically scientists conducting experiments, but also physicians, politicians, journalists, and teachers with assigned tasks. In preparation for missions, they receive much of the same training as astronauts.

The earliest human involvement in the conquest of space took place from Earth. But humans in space can adapt to changing situations, repair technology, and perform more experiments than computerized machines, such as spacewalks. Moreover, in addition to demonstrating how humans can function in space, studies of the effects of space on astronauts have led to new medical knowledge relevant to all humans. During the earliest piloted space missions, the spacecraft was completely or mostly controlled from Earth, but the role of astronauts has increased as missions have become more complex. Politicians who have pressed for space programs, scientists and engineers who helped develop the technology, and technicians who have monitored equipment all played and continue to play a part in SPACE EXPLORATION. Yet it is the astronauts and cosmonauts who have put a face on the shared endeavor and are perceived as modern explorers.

The first human in space and to orbit Earth was Russian cosmonaut YURI ALEKSEYEVICH GAGARIN in 1961, as part of the VOSTOK PROGRAM of the former Union of Soviet Socialist Republics (USSR; Soviet Union). The first woman in space, Russian VALENTINA VLADIMIROVNA TERESHKOVA, in 1963, also was a Vostok cosmonaut for the Soviet Union. The United States meanwhile organized the MERCURY PROGRAM to develop its manned spaceflight. In 1961, American ALAN BARTLETT SHEPARD, JR., accomplished the first U.S. suborbital spaceflights. The first American to orbit Earth was JOHN HERSCHELL GLENN, JR., in 1962. Years later, in 1977, he became the oldest man in space on a space shuttle. The first human to walk in space was the cosmonaut ALEXEI ARKHIPOVICH LEONOV, in 1965, as part of the VOSKHOD PROGRAM. That same year, EDWARD HIGGINS WHITE, II, became the first American to walk in space, as part of the GEMINI PROGRAM. As part of the APOLLO PROGRAM, American NEIL ALDEN ARMSTRONG became the first human to walk on the Moon in 1969. Edwin “Buzz” Aldrin, Jr., also walked on the Moon during this mission, while Michael Allen Collins orbited it. In 1983, astronaut SALLY KRISTEN RIDE became the first American woman in space on a space

shuttle. But these names and events only represent the milestones. Many others have participated in space exploration, and some have given their lives. In 1967, three astronauts died in a fire during a prelaunch checkout of their Apollo spacecraft. In 1971, four cosmonauts died in two SOYUZ PROGRAM missions. In 1986, seven astronauts and nonastronauts perished during the launch of the *Challenger* space shuttle. And another seven crew members died in February 2003 when the *Columbia* space shuttle broke up on reentry.

The first U.S. astronauts were all male and selected from military test pilots, seven in 1959. The first astronauts had to be younger than 40, no taller than 5 feet 11 inches, and physically fit. They also had to have a Bachelor of Science degree in engineering, to have graduated from a test-pilot school as a qualified jet pilot, and have a minimum of 1,500 hours of flying time. In 1965, NASA established a new category, the scientist-astronaut who was required to have a doctorate in medicine, engineering, or science. Women also came to be included as astronaut candidates. The roles of pilots and of mission specialists now have separate requirements. In addition to rigorous physical training equal to that of top athletes, astronaut and cosmonaut training includes studies in physics, astronomy, meteorology, computer science, and guidance and navigation. Every aspect of the mission, from liftoff to recovery, is covered; space conditions, such as restrictive spacesuits, cramped quarters, and weightlessness, are simulated; and responses to possible malfunctions and difficulties are practiced.

The Soviet Union also chose its first cosmonauts from the air force, choosing 21 men in 1960. The first cosmonauts had to be younger than 30, no taller than 5 feet 7 inches, and physically fit. They also had to be military officers who had graduated from the Soviet air force. With time, age and fitness requirements were relaxed, but education requirements were stiffened. The Soviet Union chose its first female cosmonauts in 1962 and first civilian cosmonauts in 1963. The Soviet Space Agency has evolved into the much smaller Russian Space Agency.

Other countries have contributed to the pool of astronauts and cosmonauts and payload specialists for U.S. and Soviet/Russian spaceflights. In the 1970s, the Soviet Union trained individuals from other countries as cosmonauts. In the 1980s, European scientists first flew aboard the space shuttle as part of the Spacelab SPACE STATION program. Canada, France, Germany, Italy, and Japan all have developed astronaut programs. In 1991, the EUROPEAN SPACE AGENCY created a pool of astronauts, mostly scientists, from 11 member nations and Canada.

Atlantic Ocean, exploration of the

The Atlantic Ocean is the second-largest of Earth's four oceans, after the Pacific, covering more than 32 million square miles. If adjoining seas are included—the North Sea,

Baltic Sea, MEDITERRANEAN SEA, Black Sea, Gulf of Mexico-Caribbean Sea, and HUDSON BAY—the total area is more than 35 million square miles. (Hudson Bay, linked to the Atlantic Ocean via the Hudson Strait and to the Arctic Ocean via the Foxe Channel, is discussed as an arm of both oceans.) The Atlantic has an average depth of about 12,000 feet. Forming an S shape, it is bounded by North America and South America on the west and Europe and Africa on the east. It extends in the north to the Arctic Ocean and in the south to the Antarctic continent, the Weddell Sea being a part of it. (Sometimes the waters surrounding the Antarctic Ocean—the southern limits of the Atlantic, Pacific, and Indian Oceans—are referred to as the Southern Ocean.) It is connected with the Arctic Ocean by the Greenland Sea and Smith Sound; and with the Pacific Ocean by Drake Passage, the Strait of Magellan (see MAGELLAN, STRAIT OF), and, in modern times, the Panama Canal. The Atlantic and Indian Oceans merge in the expanse between the tip of Africa and Antarctica. In modern times, the Suez Canal provides a water route between the Mediterranean Sea and the RED SEA, a branch of the Indian Ocean. The name *Atlantic* is derived from Atlas, a deity from Greek mythology who supposedly bore the heavens and Earth on his shoulders.

The portion north of the EQUATOR is known as the North Atlantic; the portion south of the equator, the South Atlantic. Each has distinct OCEAN CURRENTS. The North Atlantic generally has currents flowing clockwise, one of them known as the GULF STREAM; South Atlantic currents generally flow counterclockwise.

The Atlantic has relatively few islands, many of them in the Caribbean Sea (see WEST INDIES). Many of the world's largest rivers drain into the Atlantic, including the AMAZON RIVER and ORINOCO RIVER of South America; the MISSISSIPPI RIVER and St. Lawrence River of North America; and the CONGO RIVER (Zaire River), NIGER RIVER, and NILE RIVER (which drains into the Mediterranean) of Africa. The Atlantic has the highest salinity of the world's oceans, in large part as a result of the salty undercurrent from the Mediterranean. The Atlantic Ocean also offers some of the world's most productive fishing grounds, in particular off northeastern North America, the British Isles, and ICELAND.

The Ancients and the Atlantic

The oceans served as the highways of world exploration between continents and islands. Yet, understanding them and charting them is a story unto itself. People living along the Atlantic coasts of Europe, Africa, and the Americas knew of the great body of water from one perspective, but they were not known to have navigated the waters in primitive craft any great distance from the shorelines. What becomes noteworthy regarding ancient times is extended journeys. The Mediterranean Sea, an arm of the Atlantic, was navigated by ancient peoples long before it is known they ventured into

the Atlantic. Yet, some of those same ancient peoples are known as the first navigators of the Atlantic, by GALLEY ship. The writings of fifth-century B.C. Greek historian HERODOTUS indicate that, sailing for the Egyptian pharaoh NECHO II in about 600–597 B.C., Phoenicians followed the Red Sea southward from the Gulf of ‘Aqaba to the Indian Ocean and possibly rounded Africa, returning to the Mediterranean by way of the Atlantic and Strait of Gibraltar (see GIBRALTAR, STRAIT OF). It is also possible that the Phoenicians, or even the Minoans of the island of Crete before them, ventured westward through the Strait of Gibraltar long before the historical record indicates. It is in fact recorded by Greek and Roman writers that Carthaginians—HANNO and HIMILCO of Phoenician descent—passed through the Strait of Gibraltar into the Atlantic in the fifth century B.C. and explored along parts of the coasts of Africa and Europe respectively and established trade routes. The Carthaginians may have even reached the AZORES, an island group 900 miles west of Portugal. The Greeks were among the early mariners to explore Atlantic waters. In a fourth-century B.C. voyage, probably to establish trading contacts, a scholar PYTHEAS traveled from the Mediterranean into the North Atlantic and may have even reached the ARCTIC CIRCLE. The Romans, who rose to power in the Mediterranean region after the Greeks, also dispatched ships into the Atlantic, at first for purposes of conquest. In the first century B.C., GAIUS JULIUS CAESAR led a Roman military expedition to the British Isles, as did SUETONIUS PAULINUS and GNAEUS JULIUS AGRICOLA in the first century A.D. (see CARTHAGINIAN EXPLORATION; GREEK EXPLORATION; MINOAN EXPLORATION; PHOENICIAN EXPLORATION; ROMAN EXPLORATION).

Northern European peoples are also part of the story of the Atlantic navigation. According to legend, in the sixth century A.D., Irish monk SAINT BRENDAN sailed westward from Ireland into the Atlantic in a type of small craft known as a CURRAGH, reaching ST. BRENDAN’S ISLE, which has been theorized as a number of different islands in the North Atlantic, among them Iceland, the Azores, the CANARY ISLANDS, and even the Bahamas off North America. It is thought that there were Irish colonies in Iceland by the early seventh century. The Vikings also explored Atlantic waters throughout northern Europe (see VIKING EXPLORATION). By the ninth century, two different Norse mariners, NADDOD and GARDAR SVARSSON, had reached Iceland. By the late 10th century, ERIC THE RED had reached GREENLAND. And, by the early 11th century, LEIF ERICSSON had reached northeastern North America.

European and African Waters

The sources describing early Atlantic voyages are vague. Much concerning another voyage of the late Middle Ages—that of Italian UGOLINO VIVALDI at the end of the 13th century—is also uncertain. He hoped to reach India by way of

the Atlantic, but it is not known whether he hoped to circumnavigate Africa or travel westward across open waters. It is known that he disappeared near the Canary Islands. That island group, only 70 miles off the coast of Africa, was definitely known to mariners as early as the first century B.C., as reported by Roman historian PLINY THE ELDER. The recorded exploration of the Azores, 900 miles west of Portugal, dates from the 14th century, when seafarers from Genoa in Italy and the Spanish Island of Majorca ventured into the Atlantic.

In the 15th century, with the many maritime voyages sponsored by HENRY THE NAVIGATOR, prince of Portugal—the start of what has become known as the EUROPEAN AGE OF EXPLORATION—the Azores came to be thoroughly charted by GONÇALO VELHO CABRAL. Both the Canaries and Azores became important stopover points for European voyages in the Atlantic over the next centuries.

Prince Henry also sent out voyages of exploration along the African coast in the type of ship designed by his shipbuilders, the CARAVEL. Soon after his death in 1460, his mariners reached Cape Palmas, where the African coast turns eastward. By the end of the century, with the Portuguese voyages of BARTOLOMEU DIAS and VASCO DA GAMA, the extent of Africa was known to Europeans.

Transatlantic Voyages

Spain also began sponsoring Atlantic expeditions at this time. By the 1480s, Italian mariner CHRISTOPHER COLUMBUS had conceived of a plan to sail westward across the Atlantic to the Orient. Portugal turned down his request for backing, but King Ferdinand II and Queen Isabella I of Spain provided support. In August 1492, Columbus set sail, reaching the West Indies in October. Columbus carried out three more transatlantic voyages; in the course of the third, he reached the coast of South America. Other Spanish expeditions, many of them led by men who had originally sailed with Columbus, explored waters of the Caribbean Sea and the Gulf of Mexico, which came to be known as the SPANISH MAIN.

Other European nations began sponsoring transatlantic voyages, and Atlantic crossings along both northern and southern sea-lanes became commonplace over the next decades. In 1497, Italian mariner JOHN CABOT, sailing for England, reached Newfoundland and the east coast of Labrador in northeastern North America. In 1501, Portuguese GASPAR CÔRTE-REAL, after reaching the west coast of Greenland the year before, made the second documented voyage to North America, exploring coastal Labrador and Newfoundland in the hope of finding the NORTHWEST PASSAGE to the Pacific Ocean. In 1524, Italian mariner GIOVANNI DA VERRAZANO, exploring for France, while also seeking the Northwest Passage, explored North America’s east coast from South Carolina to Newfoundland. Meanwhile, in 1513, Spaniard VASCO NÚÑEZ DE BALBOA became the first

European to see the Pacific from the west coast of the Americas, and, in the course of the first CIRCUMNAVIGATION OF THE WORLD in 1519–22, headed by Portuguese mariner FERDINAND MAGELLAN sailing for Spain, the extent of South America was determined.

The North Atlantic came to be well charted in the 16th century. The continuing search for the Northwest Passage took mariners, such as SIR MARTIN FROBISHER and JOHN DAVIS, both sailing for England, to its northern extent at the Arctic Circle in the 1570s and 1580s. (Davis also probably was the first European to reach the Falkland Islands off South America in an expedition in the early 1590s.) Early in the 17th century, in 1610–11, HENRY HUDSON, also sailing for England, explored the Hudson Bay, an arm of the Atlantic.

Southern Latitudes

Much of the South Atlantic was still unknown, however. The search for the GREAT SOUTHERN CONTINENT, also known as Terra Australis—a continent theorized by the ancients to exist in the Southern Hemisphere balancing out landmasses of the Northern Hemisphere—took expeditions mostly to the South Pacific, but also to the South Atlantic far from the coasts of Africa and South America. In 1739, Frenchman JEAN-BAPTISTE-CHARLES BOUVET DE LOZIER came upon Bouvet Island in the South Atlantic Ocean near the ANTARCTIC CIRCLE while looking for Terra Australis. The 1772–75 expedition of Englishman JAMES COOK, during which he circumnavigated Antarctica, proved that the fabled land did not exist in southern waters. While encircling Antarctica, he crossed the Antarctic Circle three times. He also charted South Georgia Island and the South Sandwich Islands east of South America.

An English mariner by the name of William Smith first reached the South Shetland Islands between CAPE HORN at the tip of South America and the Antarctic Peninsula. Early sightings of the Antarctic mainland were made by British naval officer EDWARD BRANSFIELD and American sealer NATHANIEL BROWN PALMER in 1820—on the Antarctic Peninsula near where the Atlantic and Pacific waters meet. That same year, German-born Russian naval officer FABIAN GOTTLIEB BENJAMIN VON BELLINGSHAUSEN sighted the edge of the Antarctic ice sheet from Atlantic waters. In 1821–23, Scottish sealer JAMES WEDDELL located the South Orkney Islands and reached the Weddell Sea east of the Antarctic Peninsula. The southernmost point he reached in the South Atlantic was not surpassed until the next century.

Oceanography

The study of the world's oceans—oceanography, a branch of geography—is a part of the saga of world exploration. By the mid-19th century, the discipline had evolved from the largely speculative to the scientific. The British voyage of the *Chal-*

lenger under SIR GEORGE STRONG NARES and SIR CHARLES WYVILLE THOMSON in 1872–76, the first of such oceanographic voyages, brought back a great deal of information, including the observation that the Atlantic was generally shallower than the Pacific, and led to other such research voyages, including that of the *Challenger II* in 1948. During the INTERNATIONAL GEOPHYSICAL YEAR (IGY) of 1957–58, 37 nations contributed the use of 80 ships to study the world's oceans (see OCEANOGRAPHY AND EXPLORATION).

The Atlantic Ocean holds a special place in the history of exploration because ancient expeditions into it and early crossings of it changed humankind's view of the world. It became the link between what was defined as the New World and the Old World.

Atlantis

Atlantis is the name of a mythical island or continent, believed to have been sunk beneath the ocean by an earthquake. An account of Atlantis was written by Greek philosopher Plato in about 350 B.C. in his dialogues *Timaeus* and the *Critias*. The name Atlantis is derived from “Island of Atlas,” Atlas being the Titan condemned to hold the sky on his shoulders after defeat by the Olympian gods. Athenian statesman Solon, an ancestor of Plato, reportedly heard the story from an Egyptian priest and named the land. Plato may have also drawn on Greek folktales.

According to Plato, Atlantis existed in the 10th millennium B.C. He described it as a large island in the Western Ocean, a body of water beyond the known world, west of the Pillars of Hercules (see GIBRALTAR, STRAIT OF). With powerful kings, the Atlanteans supposedly extended their domain deep into Europe and Africa and amassed great wealth. They succumbed to greed, however, and attempted to enlarge their empire to the east. When their armies reached Athens, they met with defeat. The Athenians then liberated Atlantis. In a night of divine judgment, however, storms and earthquakes caused Atlantis to be swallowed up by the sea. The occupying Athenians were also drowned, leaving only a remnant from which Greek civilization was to be rebuilt.

Atlantis is sometimes associated with the island of Crete to the southeast of the Greek mainland in the MEDITERRANEAN SEA and the Minoans. Minoan civilization had been the center of culture and military power from about 3000 to 1000 B.C., before the ascension of the Greeks, and an earthquake or earthquakes may have contributed to its decline. Plato may have heard stories of this earlier civilization, and used an account of it to demonstrate the superiority of a republican form of government over a monarchy.

This map, showing the hypothetical continent of Atlantis, appeared in Athanasius Kircher's 1665 book, *Mundus Subterraneus*. (Library of Congress, Prints and Photographs Division [LC-USZ62-76292])

Proclus, a philosopher who was a follower of Plato, appeared to believe in the literal existence of Atlantis. He wrote in the fifth century A.D. of three great islands and seven lesser islands, which could arguably be the Greater and Lesser Antilles of the Caribbean Sea. His writings may be evidence of knowledge of this area by ancient seafarers. Another ancient writer who wrote about Atlantis was Roman PLINY THE ELDER of the first century A.D.

The story of Atlantis has parallels to the story of the Garden of Eden, a utopia gone wrong. Sir Francis Bacon, the English philosopher of the 16th and 17th centuries, wrote *The New Atlantis*, in which he uses the name of the mythical land for an ideal state founded on scientific principles.

The legend of Atlantis has continued to resonate with the human imagination, and societies still exist committed to proving its existence. In addition to Crete, Thera (Thíra) in the Aegean Sea, which is thought to have experienced a massive volcanic eruption in about 1640 B.C., has been cited as the origin of the legend. Other theories associate Atlantis with the CANARY ISLANDS, the Scandinavian Peninsula, and the Americas.

See also GREEK EXPLORATION; LEGENDS AND EXPLORATION; MINOAN EXPLORATION.

Australia, exploration of

The continent of Australia is located southeast of Asia, entirely in the Southern Hemisphere, between the Indian Ocean and Pacific Ocean. It is almost 3 million square miles, the smallest landmass classified as a continent. It is also one of the flattest landmasses, with an average elevation of about 1,000 feet descending to coastal plains. The GREAT DIVIDING RANGE, running north to south in the east, separates an eastern coastal plain from a series of low plateaus to the west. The most fertile regions are along the east and southeast coasts. Much of Australia's interior—or outback—is arid and sandy, but the river systems flowing from the highlands create some swamplands as well. The north's climate is tropical, and the south's temperate. The flora and fauna of Australia evolved in relative isolation over the course of thousands of years, giving rise to such unique animals as the kangaroo, the platypus, and the emu. Australia was the last inhabited continent explored by Europeans.

The Aborigines

Australian native peoples are known as Aborigines, a term that has its origin in Latin meaning “from the beginning.” As long as 40,000 years ago, the ancestors of the Australian Aborigines traveled from the island of Java to Australia, perhaps by a LAND BRIDGE. They were equipped with small boats, they could swim, and they were nomads, wandering from place to place in search of food and water. Historians are uncertain if their migration was precipitated by a traumatic event, by curiosity, or by a gradual change in conditions.

The Aborigines lived in isolation on Australia, and their culture changed little. They took shelter where they could find it. They gathered or hunted food and did not cultivate crops or raise animals. They made tools of wood and stone. Their most famous tool was the boomerang, a curved piece of wood crafted to return to its thrower if it missed its target. Aboriginal clothing was minimal to nonexistent. Yet, their culture was complex. Europeans discovered more than 500 distinct Aboriginal languages. Their animist religion had a strong connection to the world of dreams, and their cave paintings demonstrated abstraction.

Ancient Exploration

Some artifacts suggest Australia had received foreign visitors before its indisputable discovery by Europeans in the 16th century. In 1909, a coin from the second-century B.C. era of Egyptian pharaoh Ptolemy was discovered near Cairns on the continent’s northeast coast. In 1879, a statuette of a Daoist god believed to date from seventh-century-China was found in northern Australia. In 1948, a fragment of china from the 15th-century Chinese Ming dynasty was discovered on the ocean floor in the Gulf of Carpentaria. These finds—and the proximity of Australia’s north coast to New Guinea and other islands—suggest that the ancient Chinese (see CHINESE EXPLORATION), who explored and traded in that area, traveled to Australia after the aboriginal migrations and before the modern European trade took hold.

Portuguese Exploration

There is some confusion about precisely when Europeans discovered Australia. Since the time of the ancient Greeks (see GREEK EXPLORATION), Westerners had believed that a GREAT SOUTHERN CONTINENT balanced the rotation of the earth. Terra Australis (Latin for southern land) was envisioned as a lush land, rich in resources and densely populated, and it fired the European imagination for centuries. But it was participants in the SPICE TRADE who made the first European sightings of a continent in the Southern Hemisphere. The Portuguese, who had established an eastward maritime route around Africa to the SPICE ISLANDS (the Moluccas of present-day Indonesia), controlled shipping from the Malay Archipelago, and they were probably

the first to see the coast of Australia. Between 1510 and 1530, the Portuguese explored the region to see what goods of value could be found in their colonial domain. They were highly secretive, with severe penalties for anyone who revealed the charts of their profitable routes. The best evidence of a Portuguese discovery of Australia comes from the Dieppe Maps, a collection of French-made maps, the earliest dating from 1541, which accurately describe a portion of Australia’s north coast and which feature many Portuguese names.

Dutch Exploration

The European credited for the earliest definitive sighting of Australia is Dutchman WILLEM JANSZ. In 1605, he sailed for the DUTCH EAST INDIA COMPANY with two goals: to look for gold in New Guinea and to search for Terra Australis. After exploring the south coast of New Guinea and discovering it dry and uninviting, Jansz turned southward. He entered the Torres Strait, came upon Cape York Peninsula in Australia’s northeastern corner. He followed the shoreline for some 150 miles, not convinced the landmass was distinct from New Guinea. Jansz and his crew eventually landed, and several sailors were killed by Aborigines. Jansz claimed the territory for his country and named it New Holland. (Soon afterward, LUIS VÁEZ DE TORRES, sailing for Spain, charted the strait, now known as Torres Strait, separating New Guinea from Australia.)

The Dutch were soon making regular visits to the various shores of Australia, particularly once they mastered the “Roaring Forties,” the strong and constant winds which blow between 40 and 50 degrees latitude. In 1616, DIRK HARTOG located Dirk Hartog’s Island and reached the west coast of the mainland. (The pewter plate he left behind to claim the island was retrieved in 1801 by French naval officer LOUIS-CLAUDE DE SAULCES DE FREYCINET and is presently on display in the States Museum in Amsterdam.) In 1619, FREDERICK HOUTMAN also sighted the west coast, and a Dutchman named Edel landed near Perth in southwest Australia. Three years later, in 1622, another Dutch expedition continued the coastline exploration even farther southward. After being blown off course in 1623, Jan Carstensz saw the coast of Arnhem Land, which he named after his ship. In 1627, FRANÇOIS THYSSEN located the south coast, also by accident. He followed it for some 1,000 miles, but saw only desert lands, and turned back to the west just before vegetation increased to the southeast.

The first Europeans to make their home in Australia did so involuntarily. In June 1629, the Dutch East India ship the *Batavia* was wrecked on the rocky islets of the Houtman Abrolhos off the west coast. Captain François Pelsaert moved as many of the passengers and crew as he could to two islands, then sailed for help in a small boat. While he was away, seaman Jerome Cornelis attempted to seize con-

trol. Several battles ensued between the people on the two islands, with much loss of life. When Pelsaert returned with help, the mutineers were interrogated, leading to executions. Two men, whose lives were spared, were put ashore on the mainland, never to be seen again.

Dutch navigator ABEL JANSZON TASMANTASMAN opened the next chapter in the exploration of Australia and its related territories. In 1642, he was sent by the Dutch East India Company to find Terra Australis. He took a more southerly course than was usual, but soon found himself directed by the winds to a latitude of 42 degrees. On November 24, 1642, he sighted the shores of what he named Van Diemen's Land, after the governor-general of the Dutch East Indies. (It was later renamed TASMANTASMANIA by the English in honor of Tasman.) On the same journey, Tasman made the European discovery of NEW ZEALAND.

In 1644, Tasman returned to southern waters to explore the coasts of New Guinea and Australia. After sailing through the Moluccas and past New Guinea, he came to the western side of Cape York Peninsula and explored the Gulf of Carpentaria. He proceeded westward along the north coast, traveling as far as the Northwest Cape, establishing the continuity of the coastline and proving that Australia and New Guinea were distinct places. His findings were of great importance to geographers, but the desolate nature of the land he described did not inspire Dutch commerce.

English and French Coastal Exploration

The first known Englishman to set foot on Australia was WILLIAM DAMPIER. His first landing was by chance. In 1688, his ship of PRIVATEERS was forced to the barren north shore by a typhoon. The crew went ashore and spent five weeks investigating the land and its people. Dampier's account, published in 1697 as *A New Voyage Round the World*, was read by King William III, who commissioned Dampier to make a second journey to New Holland, this time supported by the Royal Navy. On July 31, 1699, Dampier and his crew of the *Roebuck* sighted Dirk Hartog's Island. The expedition sailed some 900 miles northward along the west coast, looking for river outlets along the way. Both water and food were in short supply, and his men suffered from SCURVY. The sailors also had unfriendly encounters with the Aborigines. On the return voyage, the ship fell apart at Ascension Island, forcing a return to England in a British naval vessel. Dampier reported that Australia was a collection of large islands separated by straits. His information about the dry climate and poor soil discouraged further British exploration for some time to come.

Many questions remained about the coastal outline of Australia. When the French and British returned in search of new colonial territories in the last decades of the 18th century, the best land on the east shores had not yet been reached.

In 1768, LOUIS-ANTOINE DE BOUGAINVILLE, exploring the Pacific for France, saw the endless breakers of the Great Barrier Reef off the east shore of Australia. Recognizing the danger, he proceeded to the calmer waters of New Guinea.

That same year, the British ROYAL SOCIETY prepared a voyage to Tahiti under the command of JAMES COOK. He was charged with studying the transit of Venus, information which permitted scientists to measure the distance between Earth and the Sun. After making his astronomical observations, Cook unsealed his orders for the remainder of the expedition and learned he was to search for Terra Australis. He sailed in the southern latitudes and first came upon New Zealand before reaching Cape Howe on the southeast coast of Australia. He then proceeded northward, charting the coastline and taking note of accessible harbors. When he came to the Great Barrier Reef, he attempted to navigate its shoals, a decision with nearly disastrous consequences. After safely passing through nearly 1,000 miles of the reef, the *Endeavour* (Cook's ship) ran aground on sharp coral in four feet of water. Although Cook jettisoned 50 tons of ballast, cannon, and supplies, the ship would not move and began to leak badly. Eventually, the crew managed to beach the *Endeavour* and, over a six-week period, made repairs to it. Continuing northward, Cook again hugged the shore, rounding Cape York Peninsula before heading northwest to England. During the three-year expedition, Cook's scientific staff, including SIR JOSEPH BANKS, collected much information and many specimens. In his report he foresaw better prospects for settlement than had earlier explorers. He also reported favorably about the way of life and friendliness of Aborigines.

A French expedition embarking in 1785 under JEAN-FRANÇOIS DE GALAUP, comte de La Pérouse, to the Pacific Ocean, one of its assignments to chart the north coast of Australia, went missing in 1788 on leaving Botany Bay on Australia's west coast. A 1791–94 expedition under ANTOINE-RAYMOND-JOSEPH DE BRUNI, chevalier d'Entrecasteaux, while searching for de Galaup, explored the coast of Van Diemen's Land and the Great Australian Bight along the south coast.

Colonization

The loss of its colonies in America, along with an ever-growing population of convicts, inspired Great Britain to turn its attention to Australia for development and as a disposal site for its unwanted subjects. In 1788, Captain ARTHUR PHILLIP arrived at Botany Bay with more than 1,000 British settlers. Finding the anchorage unsuitable and the land uninviting, he sailed northward to Port Jackson and founded Australia's first permanent settlement at the location of present-day Sydney. Life was difficult for the nearly 800 convicts, 200 soldiers, and handful of wives and children who made up the colony. The lack of rain and poor soil

meant poor farming conditions, and the settlers suffered from persistent scurvy. As a result, during the first years of the New South Wales colony's existence, the British settlers mounted few exploratory expeditions.

Continuing Coastal Exploration

The seemingly insurmountable barrier of the BLUE MOUNTAINS, part of the Great Dividing Range flanking Sydney, discouraged overland expeditions, but some exploration of the coastline continued. In 1795, GEORGE BASS, a young surgeon, and naval officer MATTHEW FLINDERS sailed the eight-foot boat *Tom Thumb* south to Botany Bay and Georges River. The following year, Governor John Hunte gave them a slightly larger boat—which they also named *Tom Thumb*—and they traveled on it to Port Hacking. The shores of Van Diemen's Land were not known fully, and, in 1798, Bass and Flinders carried out another expedition, circumnavigating that island and discovering the Bass Strait, which separates Van Diemen's Land from the mainland, cutting the travel time for ships from the south by a week.

In 1801, Flinders was commissioned by the British Admiralty to make a detailed survey of the uncharted coastline of the continent. He began his expedition on the south coast and slowly proceeded westward from Cape Leeuwin to King George Sound. It was still not known if Australia consisted of one large landmass or smaller islands separated by ocean. Flinders was also on the lookout for rivers draining the land west of the Great Dividing Range. In spring 1802, he entered Spencer Gulf and, for a time, mistakenly thought he had found a gap between islands. In early April, he encountered a French ship sailing from the opposite direction and joined the captain, THOMAS-NICOLAS BAUDIN, on board for dinner. The two men exchanged findings, and Flinders went on to make a complete circumnavigation of Australia. The map he produced had only a small stretch of coastline left blank to the south of Cape York Peninsula, where the reef kept him from shore. In later years, 1826–29, a French expedition under JULES-SÉBASTIEN-CÉSAR DUMONT D'URVILLE surveyed the entire south coast.

Beyond the Great Dividing Range

The crossing of the Blue Mountains was spurred on by a desperate need for more grazing lands. An 1810 drought in Sydney increased pressure on the settlers. Three years later, with the drought still on, farmer and landowner GREGORY BLAXLAND sought help from Governor Lachlan Macquarie. Together with William Lawson and WILLIAM CHARLES WENTWORTH, Blaxland headed into the Blue Mountains with the strategy of keeping to the ridge tops instead of going up and down the mountains as previous explorers had done. This approach worked, and they eventually reached a peak affording a view of grasslands to the west ideal for pasture. Governor Macquarie quickly followed up on Blaxland's

work by sending surveyor George Evans to the region and, in 1815, Evans located the Lachlan River. That same year, Macquarie had a road built through the mountains to an area he named Bathurst, after the British Secretary for the colonies. In 1817, surveyor general JOHN JOSEPH WILLIAM OLESWORTH OXLEY began his own investigations into Australia's interior, intending to travel on the Lachlan River. When swampland halted his party, he headed northwestward along the Macquarie River, only to be confronted again by swamp. Turning eastward, he then located the Liverpool Plains.

British botanist ALLAN CUNNINGHAM sought not only grazing lands for sheep and cattle, but also routes for moving livestock to market. In 1823, Cunningham made the European discovery of Pandora's Pass, between the Liverpool Plains and the Hunter River Valley, north of Sydney. Cunningham's most celebrated accomplishment was the European discovery of the agricultural tablelands, which became known as the Darling Downs in 1827. New lands were settled almost as quickly as they were located, as people migrated from Great Britain and as the European market for fine wool expanded.

In 1828, HAMILTON HUME and WILLIAM HOVELL traveled through the Great Dividing Range to explore the land ranging from beyond the mountains to the south coast. The trip was marred by fighting between Hume, who was experienced in the bush, and Hovell, who was accustomed to giving orders. Mosquitoes, ticks, and leeches added to their discomfort. Nonetheless, while on a southwestern course, Hume and Howell made the European discovery of the Murrumbidgee and Murray Rivers and eventually reached the coast at Geelong, the site of present-day Melbourne.

The desire for new land continued. Ralph Darling, new governor of the New South Wales colony, turned his attention to the rivers and swampland Oxley had reached earlier. In 1828, Darling charged CHARLES STURT with seeking the secret to the drainage of the Lachlan and Macquarie Rivers. Once again, the swamplands were difficult to cross. At times, Aborigines attempted to halt the Europeans' progress by torching the reeds in front of them. In February 1829, Sturt and his group, which included Hamilton Hume, came to the broad, slow, salty Murrumbidgee River. The following November, Sturt returned and followed the Murrumbidgee to its junction with the Murray. The expedition traveled another 400 miles along the Murray before reaching Lake Alexandrina, the river's outlet. By this time, the challenging climate and insects had taken their toll. Provisions were scarce. Exhaustion set in, and crossing the mountains was beyond the explorers' strength. Sturt decided they should return the way they had come. Fighting the current proved difficult, but, by April 1830, the group had come close enough to the settlement of Wantabadgery to send for relief. The explorers were rescued the same day they consumed

the last of their food. The major accomplishment of the expedition was discovering fertile land in the Murray River Valley, and, within a few years, that region was settled.

River Systems

Perhaps the most determined—and eventually, most successful—explorer of Australia's rivers was SIR THOMAS LIVINGSTONE MITCHELL. In 1831, Mitchell and a crew of 15 convicts headed northward from the Liverpool Plains to explore new territory. The expedition located the MacIntyre River, one of the tributaries of the Upper Darling. On the return trip, however, supplies ran low, and several men were killed by Aborigines. In 1835, Mitchell explored the lowlands northwest of Bathurst. He followed the Bogan River for 100 miles and then turned westward, traveling overland to the Darling River. Mitchell's group remained on the Darling River for some 150 miles until it joined with the Murray. The expedition had several hostile encounters with Aborigines, killing several of them.

Europeans had yet to understand the relationship of the various rivers. In 1836, Mitchell set off from the upper reaches of the Lachlan River, followed the Lachlan to where it joined the Murrumbidgee, then proceeded along the Murrumbidgee to its junction with the Murray. Mitchell's historic journey debunked many misconceptions and established the connections between the Murray and its tributaries, Australia's only major river system.

Looking Westward

Once the various tracts of grassland had been found in New South Wales, and trails between them and the Adelaide and Melbourne settlements were established, officials began to look westward. British army officers SIR GEORGE GREY (then a captain) and Lieutenant Lushington made the first journey in this next phase in Australian exploration. In 1837, they left Brunswick Bay, intending to travel overland to Perth (a journey of some 1,200 miles). They explored the Prince Regent River and the King Leopold Range. In a mountain cave east of the Glenelg River, they made their most famous discovery—a series of colorful paintings of 10-foot-high people, aboriginal works now known as the Wondjina figures. After four months, because of intense heat and dwindling supplies, Grey and Lushington returned to their starting point. The following year, they departed from Perth and explored the Swan River.

Sheep rancher EDWARD JOHN EYRE carried on the exploration of the interior of the continent. His first trip, in 1839, took him to Lake Torrens, a salt lake north of Adelaide. The next year, he traveled beyond that lake and made the European discovery of the largest lake in Australia, a body of water that would later be named Lake Eyre. In late February 1841, together with his assistant John Baxter, three Aboriginal guides, and nine horses, Eyre began a westward

journey from Fowler's Bay across the Nullarbor Plain. The expedition suffered in the blowing sand. Water was in short supply. At the end of April, two of the Aborigines killed Baxter and made off with some of the expedition's provisions. Eyre and Wylie, his remaining companion, continued their trek. Just over a week later, they reached land where water was plentiful and kangaroos could be found. In early July, more than four months after they had begun, the two men arrived in what is now Albany, completing the first east-to-west crossing of southern Australia.

Eyre's discovery of the lakes north of Adelaide inspired Charles Sturt to search for an inland sea on a south-to-north crossing of the continent. Sturt's belief in such a sea influenced him to take a boat with him when he left Adelaide in August 1844. He and his crew of 16, including JOHN MCDOUALL STUART, followed first the Murray and then the Darling River before heading northward. Drought conditions forced the party to spend six months at Depot Glen, where there was a waterhole. The punishing heat undermined the men's health and spirits. After a rain, the group finally pushed on to the northwest for another 450 miles until conditions again deteriorated. After retreating and setting up camp, Sturt and Stuart once more attempted to reach the center of the continent. This time they were stymied by the difficult terrain of the Simpson Desert. The party turned back and, suffering from scurvy, reached Adelaide in January 1846. Sturt himself had come close to total blindness and never fully recovered.

In order to connect New South Wales with the shipping lane to India, the settlers needed to find a land route to Port Essington in northwestern Australia. Two explorers competed for the glory of first mapping this route: Sir Thomas Livingstone Mitchell, who had previously explored the Darling and Murray Rivers, and FRIEDRICH WILHELM LUDWIG LEICHHARDT, who, in 1843, had walked 500 miles along the east coast from the Sydney area to Moreton Bay. Leichhardt had intended to join Mitchell's party, but that expedition was delayed by problems with government funds. In August 1844, Leichhardt got the jump on his rival by sailing first to Moreton Bay, then proceeding northward through the Great Dividing Range. Leichhardt had not planned wisely, and his party ran low on food. At Cape York Peninsula, after much difficulty and demonstrating more courage than sense, his expedition pressed on to the west. In the end, he and his party succeeded in being the first to reach Port Essington. On their return to Sydney, they were greeted as heroes and Leichhardt was given a large cash award. In 1848, Leichhardt set out from McPherson Station with seven others on an expedition to cross Australia from east to west but was never heard from again, prompting a number of searches over the next decades.

Mitchell, who had learned of Leichhardt's triumph after commencing his own journey, decided upon a different

route through the Great Dividing Range. Exploring previously uncharted territory, he located the Barcoo River and fertile grazing lands in the interior of Queensland.

EDMUND KENNEDY, who had been a member of Mitchell's expedition, led an expedition back to the Barcoo in 1847. He studied that intermittent river before heading northward with the goal of reaching Cape York at the Torres Strait. Once again, scarce food and hostile Aborigines made for a difficult journey. In fact, Kennedy was killed by Aborigines after he broke away from his group on the expedition's final leg. Of the 13 original explorers, only three survived. Cape York Peninsula was not fully explored until 1865, when Frank and Alexander Jardine forged through the territory.

Exploring from the West

SIR AUGUSTUS CHARLES GREGORY, an employee of the Western Australia Survey Department, opened new lands for sheep and cattle grazing on the west coast. In 1846, accompanied by his brother FRANCIS THOMAS GREGORY, Augustus Gregory attempted unsuccessfully a west-to-east crossing from Perth. On this trip he found coal in the Irwin River Valley and located pasturelands in the Champion Bay region. In 1848, traveling eastward from Shark Bay, he discovered mineral deposits and more grasslands in the Murchison Basin. In 1855, Augustus Gregory explored northern Australia from Pierce Point in Arnhem Land. He had two goals: to search for remains of Leichhardt's ill-fated 1848 expedition and to find additional grazing lands. This lengthy journey over varied terrain yielded the European discovery of Sturt's Creek and Gregory Lake and an exploration of the northern border of the Great Sandy Desert. Gregory then proceeded eastward and crossed the rivers that empty into the Gulf of Carpentaria. On the last section of his journey, he traversed the Great Dividing Range and the Belyando River before finally reaching Australia's Pacific coast near the modern-day city of Rockhampton, thus completing the first west-to-east crossing of northern Australia.

Gregory conducted another noteworthy expedition in 1858, during which he explored central Australia along the Barcoo River, Cooper's Creek, and Flinders Range. In addition to discovering more useful land, this trip also discredited the myth of a great horseshoe lake, which made the center of Australia impassable. Gregory's findings were confirmed by PETER EGERTON WARBURTON's travels in 1857–58. Warburton mapped the lakes north of Adelaide and found much open country.

In the meantime, in April 1851, the discovery of gold at Summer Hill Creek in New South Wales led to an accelerated settlement of that region. Other gold strikes occurred in Victoria and Queensland, leading to additional migrations of people from coastal settlements.

South-to-North Crossing

The government of South Australia, intent on establishing a telegraph line, offered a £2,000 prize to the first person to make a south-to-north crossing. Two teams vied for the honor: the Great Northern Exploration Expedition, commissioned by officials in Victoria and led by ROBERT O'HARA BURKE and WILLIAM JOHN WILLS, and a private expedition led by John McDouall Stuart, who headed out first from his sheep ranch north of Adelaide. In August 1860, Burke and Wills left Melbourne with the most well-equipped group Australian exploration had ever seen. Unfortunately, the two lacked experience, and their journey was plagued with trouble from the start. When they reached Menindee in late September, squabbling broke out, and party leader Burke decided to press on before the rear guard arrived with additional supplies. He took seven men with him and they arrived at Cooper's Creek on November 11. After establishing a base camp there, Burke, Wills, and surveyor assistant John King made a dash for the north coast on December 16. They arrived near the Gulf of Carpentaria on February 9, 1861, but swampland prevented them from actually sighting it. On April 21, when Burke, Wills, and King returned to Cooper's Creek with very little food left, they discovered that the camp had been recently abandoned. The situation went from bad to worse: They headed southward, only to circle back to camp a month later; once again, they had narrowly missed a relief party. Burke and King went on for help, leaving Wills behind. He died of starvation. Burke also soon died, but King was given food by Aborigines. He was reached in September by Alfred William Howitt. The four expeditions sent out to rescue Burke and Wills were responsible for many of the discoveries made along the route.

The trail that became the route for the Central Overland Telegraph Line was blazed by John McDouall Stuart, although it took that experienced explorer four tries. On his first attempt in 1859, he explored west of Lake Eyre and made the European discovery of the Neales River. On his second attempt, the next year, he made the European discovery of the Macdonnell Ranges, north of the Great Victoria Desert, and he also reached the geographic center of the continent. He turned back at Attack Creek because of the harshness of the land and a lack of food and water. In late November 1860, Stuart embarked on his third attempt to cross the continent. By the following summer, he had pressed farther north to Newcastle Waters, but the scrub was too brutal to penetrate, and he turned back, less than 300 miles from the north shore. He began his fourth effort in October 1861. This time, he succeeded in finding a route through the scrublands, and he also found relief when he reached the Roper River. His journey ended at Van Diemen Gulf in July 1862. The government of South Australia paid him the £2,000 prize and also awarded him a land grant. But his years in punishing conditions and his bouts of

scurvy had left him partially paralyzed and blind. In 1864, he returned to England, where he died two years later at age 51. The telegraph line that followed his trail took another 10 years to build.

The Western Deserts

The explorers who investigated the center of the continent found useful ranch lands, but they also found great and uninhabitable deserts, which presented a final frontier. JOHN FORREST and his brother ALEXANDER FORREST took up the challenge of exploring the western deserts. In 1869, John Forrest trekked eastward from Perth to look for evidence of the last Leichhardt expedition, which had vanished 20 years earlier. This trip led him to the periphery of the Great Victoria Desert. In 1871, Alexander Forrest explored the Swan River, from which he made a loop through the southwestern portion of the Great Victoria Desert.

The Forrest brothers, exploring from the west, soon had a rival in ERNEST GILES, who made his approach from the east. In 1872, Giles made his first westward trip from Charlotte Waters to Lake Amadeus, south of the MacDonnell Ranges, where the desert country forced him back. In 1873, Giles attempted another crossing and came upon the Gibson Desert, which he named for his assistant who perished within its limits. John and Alexander Forrest mounted another expedition in 1874, which succeeded in crossing the southern portion of the Gibson Desert. After proceeding to Lake Eyre and south to Adelaide, they became the first Europeans to make a west-to-east crossing of the western half of the continent. But Giles was not to be outdone, and, in 1875, using camels, he made a daring east-to-west crossing of the Great Victoria Desert from Adelaide to Perth.

Another explorer of Australia's final frontier was WILLIAM CHRISTIE GOSSE. Gosse explored central Australia in 1873 and reached the giant sandstone formation known as Ayer's Rock.

The last region of Australia to be reached by Europeans was the Kimberley Plateau and its mountains, first traversed by Alexander Forrest in 1879. Shortly thereafter, gold was discovered in Western Australia, and adventurers quickly learned techniques for traveling and surviving in the desert.

There was still much work yet to be done in surveying the continent, but, by the late 19th century, the usable grazing lands had been mapped. In 1896, two south-to-north crossings of the western deserts were made independently by Lawrence Wells and David Carnegie. The Simpson Desert, which had been declared too dangerous to cross, was finally conquered in 1936 by C. T. Madigan. He waited seven years to travel, until heavy rains brought the desert to life and provided food for his camels. Today, there are still vast expanses of unpopulated desert in Australia. Every year, motorists who run out of gas and leave their vehicles lose their lives in the heat.

The Australian continent is unique in that it is home to just one nation, the Commonwealth of Australia, which includes the island of Tasmania. Established in 1901, Australia is a self-governing member of the Commonwealth of Nations. The sixth-largest nation in the world, it consists of six states—New South Wales, Queensland, South Australia, Tasmania, Victoria, and Western Australia—and two territories—the Australian Capital Territory and the Northern Territory. Australia also has a number of island dependencies.

aviation and exploration

The term *aviation* applies to the science and operation of heavier-than-air craft, such as gliders, airplanes, and helicopters. Lighter-than-air craft, such as the BALLOON or AIRSHIP (dirigible), are generally classified separately. Both types of aircraft—heavier-than-air and lighter-than-air—have been used in aerial exploration. Lighter-than-air craft offered a new means of viewing unknown areas of Earth, starting in the 19th century. Airplanes revolutionized exploration and cartography in the 20th century, especially in conjunction with AERIAL PHOTOGRAPHY. Spacecraft, such as the SPACE SHUTTLE, that have been developed using techniques of aviation have made SPACE EXPLORATION possible as well. The science and practice of all types of flight are classified under the general term *aeronautics*.

The Dream of Flight

The concept of human flight is part of the mythology of many ancient peoples. Its practical application can be traced back to at least the fifth century and the first known experiments with kites, a rudimentary airfoil. In the 13th century, English monk Roger Bacon theorized about the properties of air, which he believed could support a craft as water does boats. Another early visionary who explored the concept of human flight was Italian artist and inventor Leonardo da Vinci, who, in the 16th century, studied the flight of birds and drafted designs of various types of human-bearing craft involving the use of muscular power.

First Human Flight

Theories and designs of heavier-than-air craft were put into effect in the 19th century. British inventor Sir George Cayley is considered the founder of aerodynamics, the science of air flow. Many other scientists and engineers of different nationalities experimented with models of aircraft and muscle-powered craft. German inventor and aeronautical engineer Otto Lilienthal made some 2,000 glider flights, starting in 1891, before crashing to his death in 1896. On December 17, 1903, American Orville Wright flew the first airplane, that is a heavier-than-air craft under power and

control, off the beach near Kitty Hawk, North Carolina, in a flight that lasted 12 seconds. He flew a second time that day. His brother, Wilbur Wright, also made two flights that day, including one lasting 59 seconds and carrying him 852 feet. With more practical designs and more powerful engines, subsequent airplanes managed to stay aloft for more than just short distances. On July 25, 1909, Frenchman Louis Blériot flew from France to England.

Early Challenges

Aviation research and development accelerated during World War I (1914–18), and airplanes played a role in surveillance and in attacking targets. After the war, on June 14–15, 1919, British aviators John William Alcock and Arthur Whitten Brown made the first nonstop transatlantic flight, from St. John's, Newfoundland, to Clifden, Ireland. On May 20–21, 1927, American aviator Charles A. Lindbergh made the first nonstop solo crossing of the Atlantic Ocean, from New York City to Paris. In May 1928, exactly one year after the Lindbergh flight, American aviator Amelia Earhart became the first woman to fly solo across the Atlantic Ocean. In 1937, she disappeared while attempting a flight around the world. In the mid-1920s, airmail service was initiated. The transportation of passengers began in 1937.

Aerial Exploration

While many flew to test the capabilities of aircraft and to set distance records, or for commercial purposes, others saw the potential of aircraft in the exploration of remote parts of the Earth, especially the Arctic and Antarctic regions. In 1924–25, American RICHARD EVELYN BYRD, with pilot Floyd Bennett, made a series of flights over the GREENLAND ice cap. In 1925, Norwegian ROALD ENGELBREGT GRAVNING AMUNDSEN and American LINCOLN ELLSWORTH failed in an attempt to fly over the NORTH POLE in two seaplanes. The next year, on May 12, accompanied by Italian UMBERTO NOBILE, they managed to do so in an airship. However, Byrd, again with Bennett piloting, had passed over the Pole three days earlier in an airplane (if his calculations were correct). Other of Byrd's accomplishments include the first flight over the SOUTH POLE in 1929–30, and a general aerial reconnaissance of Antarctica in 1947–48.

Australian photographer and aviator SIR GEORGE HUBERT WILKINS also contributed to polar aerial exploration. In 1928, he made an airplane flight over the Arctic from North America to Europe, and, in 1933–34, he joined Lincoln Ellsworth in flights over Antarctica. In 1929–31, Australian SIR DOUGLAS MAWSON conducted aerial surveys of Antarctica. In 1930, HENRY GEORGE WATKINS (Gino Watkins) led a British expedition, which made use of aircraft as well as watercraft to survey the coasts of Greenland.

American Arctic explorer LOUISE ARNER BOYD made the first flight by a woman over the North Pole in 1955.

Yet, it was not just the polar regions that were explored and mapped from the air. In 1924–25, American ALEXANDER HAMILTON RICE made the first use of aircraft to explore South America. The world's tallest waterfall, Angel Falls, located in the rain forest of southeastern Venezuela, was first mapped in 1935 by American aviator and adventurer James C. Angel. Flights have also been used to increase knowledge of mountains and mountain ranges, such as Mount Everest (see EVEREST, MOUNT) in the HIMALAYAS in 1933. Aerial photography has been central to aerial exploration and modern cartography.

Azores

The Azores are a group of nine (main) islands about 900 miles to the west of Portugal in the Atlantic Ocean. Along with the CANARY ISLANDS and the Madeira Islands to their southeast, their presence encouraged early maritime explorations. In ancient times, sailing out of the sight of land in unknown waters was a new and frightful undertaking. The discovery and mapping of the Azores coevolved with basic techniques of navigation and led to determining the wind systems of the Atlantic.

The earliest knowledge of the Azores is highly speculative. In an account of Carthaginian HAMILCO's journey in about 480 B.C., there is mention of islands that could be the Azores. Some have postulated that the seafaring Irish clerics of the fifth and sixth centuries A.D., such as SAINT BRENDAN, visited the Azores.

The recorded exploration of the Azores dates from the 14th century, when seafarers from Genoa in Italy and the Spanish island of Majorca ventured into the Atlantic. The sailors who made these trips remain nameless for the most part, yet their findings have been passed down through maps that have been reliably dated. After the Canary and Madeira Islands off the northwest coast of Africa were located in the 1330s, travels in the area expanded greatly. Portugal and Spain joined in the exploration of the region. The earliest map showing one island from the group dates from 1351, while maps from the 1380s show greater knowledge, omitting only the two westernmost islands.

Portugal, the closest European nation, came to show the greatest interest in the Azores. When HENRY THE NAVIGATOR, prince of Portugal, was beginning to encourage the exploration of the African coastline, he sent GONÇALO VELHO CABRAL westward to chart the Azores. Cabral's first journey of 1431 ended 25 miles short of the island group at the Formigas Rocks. In 1432, he was sent out again and located Santa Maria. He charted the rest of the islands on subsequent trips. These journeys entailed some of the earliest European applications of the magnetic COMPASS for ocean

navigation. The Azores were named Ilhas dos Acores, or Isles of Hawks, by Prince Henry. Cabral was made master of the islands, which he began to colonize with people from Portugal and Belgium in 1445. In 1486 a Flemish community was organized on the island Fayal by German cartographer

MARTIN BEHAIM, in service to Portugal. In subsequent years, during the continuing EUROPEAN AGE OF EXPLORATION, the Azores served as a convenient stopover point for transatlantic voyages.

balloon

A balloon is an aircraft that consists of one or more large spherical, fabric bags, containing air heated by a small gas burner or a lighter-than-air gas to provide lift. Some balloons have gondolas suspended below the bag to carry people; other balloons carry scientific equipment. Hydrogen or helium serve as the lighter-than-air gases. Altitude is gained by discarding ballast, typically bags of sand, or lost by releasing some of the hot air or gas. Unlike an AIRSHIP (also known as a dirigible or dirigible balloon), a balloon has no propulsion system or steering mechanism. A “captive balloon” is fastened to a mooring cable to prevent free flight, as opposed to a “free balloon.” The term *aviation* is generally not used in reference to balloons, but to heavier-than-aircraft, such as airplanes.

A number of men began experimenting with balloons in the late 18th century, many of them Frenchmen who conducted their first ascents in 1783. Two brothers, Jacques Étienne Montgolfier and Joseph Michel Montgolfier, papermakers from the village of Annonay, sent up a linen balloon lined with paper and filled with heated air to 6,000 feet; Jean-François Pilatre de Rozier and Marquis d’Arlandes made the first ascents by humans in Montgolfier hot-air balloons, first in a captive balloon and later in a free balloon; and Jacques Alexandre César Charles, a physicist and chemist, used hydrogen instead of hot air to travel with as-

sociates 27 miles in a two-hour flight. The next year, aeronaut Jean Pierre Blanchard, with John Jeffries, an American physician, successfully crossed the English Channel from Dover to Calais, the first sea voyage. Also in 1784, James Tytler, a Scottish writer, made the first balloon ascent in England. In 1793, Blanchard made the first ascent in America at Philadelphia.

Balloon technology kept improving, and ballooning was undertaken for practical purposes. In 1804, physicist Joseph Louis Gay-Lussac ascended on a number of occasions to study magnetic forces and to observe the air composition and temperature at varying altitudes. Also in the 19th century, photographers first took pictures with cameras suspended in balloons, the beginnings of AERIAL PHOTOGRAPHY. Balloons, especially captive balloons, were used in warfare for observation, starting in the American Civil War of 1861–65, and, in the 20th century, were also used as obstacles against low-flying aircraft.

In 1893, Swedish engineer SALOMON AUGUST ANDRÉE began developing ballooning for the purpose of polar exploration. He developed a steering mechanism that enabled him to follow a course not entirely limited by wind direction. In 1897, accompanied by Nils Strindberg and Knut Fraenkel, he attempted to reach the NORTH POLE in a balloon, the *Ornen* (the Eagle), with hydrogen providing lift. When the steering device failed on takeoff, the balloon drifted uncontrollably. Ice buildup eventually forced it down after about 400 miles, far from the Pole. Andrée and his companions, after a three-month trek across the

Published in 1884, these illustrations celebrated the first centenary of ballooning. (Library of Congress, Prints and Photographs Division [LC-USZ62-12734])

ice, perished, their bodies not being found for another 33 years.

Swiss physicist AUGUSTE PICCARD pioneered the use of the airtight gondola for high-altitude ascents. In 1931, he and Paul Kipler, using hydrogen for lift, set a new world balloon record of 51,793 feet, becoming the first humans to penetrate the stratosphere. In 1932, Piccard reached 55,577 feet. His twin brother, Jean-Félix Piccard, ascended with his wife to an altitude of 57,564 feet in 1934. Manned balloons have since reached an altitude of 100,000 feet; unmanned balloons have reached as high as 140,000 feet.

In 1978, Americans Ben Abruzzo, Maxie Anderson, and Larry Newman accomplished the first successful transatlantic balloon flight, from Presque Isle, Maine, to Miserey, France, also setting a distance record of 3,000 miles and an endurance record of 137 hours 6 minutes, using helium. The first nonstop circumnavigation of the earth by balloon, from Switzerland to Egypt, was achieved in 1999 by Bertrand Piccard, Auguste Piccard's grandson, and Brian Jones, a British pilot, in a hybrid gas and hot-air balloon.

Most scientific ballooning now involves unmanned ascents, for meteorological purposes. Manned sport balloon-

ing has enjoyed a resurgence in recent years. In Europe, hydrogen is favored for buoyancy; in the United States, hot-air ballooning is more common.

Barbary Coast

The term *Barbary Coast* was once used to describe the coastal areas of northwestern Africa, from Ceuta at the Strait of Gibraltar (see GIBRALTAR, STRAIT OF) to Egypt. What became known as the Barbary states—independent states controlled by Muslims (see MUSLIM EXPLORATION)—were Morocco, Algeria, Tunisia, and Tripolis, also known as Tripolitania (Oea, a city in Tripolis, also became known as Tripoli, the name of a specific city in present-day Libya). Barbary was named for Khayr ad-Din Barbarossa, a Turkish pirate. In 1518, Barbarossa captured the port city of Algiers from Spain and turned it over to Turkish control. He regularly plundered the shores of Greece, Spain, and

Italy. In 1533–44, he was appointed an admiral in the Turkish navy.

In 1541, when Charles I of Spain (Holy Roman Emperor Charles V) failed in his final attempt to rout the Turks from North Africa, the era of the Barbary pirates, or corsairs, had begun (see PRIVATEERS). They would sail from their protected harbors into the Atlantic Ocean and take gold, silver, slaves, and other plunder from the Spanish treasure ships—mostly of the GALLEON type—as well as goods from European ships trading in the MEDITERRANEAN SEA. Their thievery was so costly that most countries found it less expensive to pay them tribute than to suffer a complete loss of their cargoes. The tribute and the goods of the pirate industry became the basis of the economy in North Africa.

After the British and the French enlarged their navies, they occasionally engaged the centers of piracy with blockades and bombardments. These tactics proved ineffective. In 1800, the tribute system between the Barbary states and the United States broke down, and the United States entered into a war with them. The United States eventually triumphed and, after 1815, no longer paid tribute. In 1830, France successfully completed a three-year blockade of Algiers and began the domination of Algeria. In 1835, Turkey asserted control of Tripolitania and, because of international pressure, ended pirate activities. At the same time, France, England, and Austria clamped down on Morocco's support of corsairs. Thus ended the larcenous careers of the Barbary pirates.

The name *Barbary Coast* also has been used to refer to the old waterfront neighborhood of San Francisco, known for its saloons, brothels, and gambling dens; it was destroyed in the earthquake of 1906.

bathyscaph

The bathyscaph (also spelled *bathyscaphe*) was the first successful deepwater diving vessel, an early SUBMERSIBLE with its own pressurized oxygen supply and not tethered to a ship on the water's surface. The name is derived from Greek and means "deep boat." The fourth-generation bathyscaph, *Trieste II*, was the first manned vehicle to explore the MARIANAS TRENCH, the deepest place in the ocean, nearly seven miles down.

In 1947, the bathyscaph was invented by Swiss physicist and high-altitude balloonist AUGUSTE PICCARD, improving on the design of the BATHYSPHERE, designed by Americans CHARLES WILLIAM BEEBE and Otis Barton. Piccard's first bathyscaph was named the *FNRS-2*, after the Fonds National de la Recherche Scientifique, the Belgian National Scientific Fund, which sponsored the project (the first *FNRS* was a BALLOON). The *FNRS-2* was an unmanned vessel with a limited mission. It was designed simply to descend to a great depth (4,500 feet), to unballast via a timed opera-

tion, then resurface. This it accomplished successfully in November 1948, validating Piccard's engineering and testing the strength of materials used. The *FNRS-2* was bought by the French navy, which reconstructed it for additional projects and rechristened it the *FNRS-3*.

After his work on the *FNRS-2*, Auguste Piccard designed a manned vehicle for much deeper diving. His son, JACQUES ERNEST-JEAN PICCARD, oversaw the construction of this bathyscaph, which would come to be named *Trieste*, after the town in Italy where it was assembled. The *Trieste* had the primary design consideration of being able to resist the enormous water pressure that occurs at great depths. To accomplish this with maximum efficiency and minimum weight, only the capsule that the operators occupied would be required to withstand the force. The manned capsule was made in the shape of a sphere as had been earlier submersibles, since this shape causes pressure to be distributed evenly on its surface. Holes were drilled into the sphere for Plexiglas windows and wires used to control the vessel. The rest of the craft was designed to be open to the ocean; in other words, it would not be required to resist water pressure. Such was the case with the gasoline flotation tanks and the holds for iron shot, which served as ballast. The ship could be maneuvered at approximately one knot per hour via small propellers driven by electric motors.

The mechanisms for controlled submersion and resurfacing were unique and ingenious. For buoyancy previous to diving, a combination of gasoline and air was used. When diving, the air tanks were flooded with seawater, and gasoline was discharged in limited quantities. The process of drifting to the ocean floor is an intrinsically unstable operation, and so the careful release of gasoline, which is lighter than seawater, was a revolutionary aspect in the design of the bathyscaph. Resurfacing was accomplished through the jettisoning of ballast in the form of iron shot, about the size of BBs. There were two compartments where the shot was kept, both in a funnel-type arrangement. The release of shot was controlled by an electromagnet at the funnel's neck. While the magnet was charged, the shot was held in place like a plug. This design had a built-in safety feature, in that, if power failed to the magnets, the shot would be dumped automatically and the vessel would return to the surface.

The first test dive of the *Trieste* took place on August 11, 1953, at the Harbor of Castellammare and was manned by both Piccards, father and son. The first deep-water dive took place two weeks later off the Island of Capri to a depth of 3,540 feet. On September 30 of that year, they reached a depth of 10,300 feet south of Ponza Island. The *Trieste* performed exceptionally well, with only minor problems. The holes in the sphere where wires ran to the rest of the vessel leaked slightly, but these leaks corrected themselves with increased depth. The Plexiglas portholes for viewing never let so much as a drop of water into the capsule. In 1954, the

bathyscaph accomplished a descent to a depth of 13,125 feet.

After 22 dives, the U.S. Navy eventually purchased the craft and contracted Jacques Piccard as adviser and pilot. More dives were conducted in the MEDITERRANEAN SEA in 1957–58, after which the *Trieste* was brought to San Diego Harbor for exploration in the Pacific Ocean.

In 1958, the navy undertook Project Nekton, with the goal of reaching the greatest depth in the ocean. This involved the retrofitting of the *Trieste*. Designed for a depth of 10 miles, the *Trieste II*, as it was renamed, weighed 13 tons. It had a thicker personnel capsule and larger flotation tank. The new sphere was five inches thick, except around the portholes, where it was seven inches thick. The gasoline float was increased from a capacity of 28,000 gallons to 34,200 gallons. The first test dive for Project Nekton took place November 4, 1959, off Guam. On January 8, 1960, the *Trieste* attained a new record of 23,000 feet at a location called Nero Deep.

The attempt at Challenger Deep, the name given to the deepest place in the Marianas Trench, was made on January 23, 1960, by Jacques Piccard and navy lieutenant Don Walsh. Despite instruments damaged from the tow to the location, Piccard made the decision to go ahead with the dive. Timing was important because of limited oxygen for the dive and for retrieval of the crew. Poor weather delayed the trip by one hour. At eight in the morning, Piccard and Walsh began their descent. They encountered several thermoclines, places where one layer of water meets another of differing density, causing the ship to be repelled. These were penetrated, and, by 1:06 P.M., they had settled to the bottom at 35,800 feet. They had navigated the narrow chasm that formed the trench and found the bottom, a brown mud consisting largely of the remains of diatoms, a type of algae. A lone flatfish was sighted, proving that chordates (animals with a spinal chord) were able to survive in such an environment.

Although there is a curiosity and motivation regarding exploration of the most extreme depths of the globe, most of the ocean presents more moderate depths. For this reason, and because of the limited tasks that the bathyscaph was able to perform, it has been replaced by the SUBMARINE, which is designed for a wide variety of applications.

See also OCEANOGRAPHY AND EXPLORATION.

bathysphere

The bathysphere is a container constructed of steel, designed for deep-sea observation and study, at depths not able to be reached by a DIVING BELL. In 1926, American CHARLES WILLIAM BEEBE made the claim of having designed a craft that could descend one mile below the ocean's surface, a SUBMERSIBLE with its own pressurized oxygen supply.

Beebe was a zoologist and bird expert who had bought a copper diving helmet and accompanying apparatus prior to a trip to the Galapagos Islands to study fish (see DIVING SUIT). The helmet worked well and inspired him to design a craft to hold humans. He and the engineer Otis Barton decided on the shape of a sphere rather than a cylinder, which had been Beebe's original idea. A sphere would be able to resist water pressure evenly, whereas any other shape would have weak points. Their vessel weighed 5,400 pounds and measured four feet nine inches in diameter. It was tethered by a steel cable to a winch aboard a ship, but had its own supply of oxygen in tanks inside the sphere.

The bathysphere's first dives were conducted in 1930 off the coast of Bermuda. Beebe and Barton encountered problems that needed fixing, but, by 1932, they were confident enough to make a live radio broadcast as they attempted their deepest dive ever, which exceeded 2,000 feet. On a subsequent dive, they reached the limit of their length of steel cable, 3,028 feet, five times deeper than ever before accomplished. Barton continued to work with the invention and to make underwater films. In 1949, Barton attained a depth of 4,500 feet, the ultimate depth for the bathysphere. A more advanced type of bathysphere was the BATHYSCAPH, designed by Swiss AUGUSTE PICCARD and first used in 1947.

Bering Strait

The Bering Strait is the waterway between the northeastern end of the continent of Asia, that part of Russia known as SIBERIA, and the northwestern end of the continent of North America, present-day Alaska. It is located at a latitude of 65 degrees and 30 minutes north and a longitude of 169 degrees west. The strait connects the Bering Sea, a northern arm of the Pacific Ocean, with the Arctic Ocean. The narrowest part of the strait—51 miles wide—is between Cape Dezhnev in Russia and Cape Prince of Wales in Alaska. The Diomed Islands lie between the capes. Part of the strait is normally frozen over from October to June.

The Bering Strait forms the western outlet of the NORTHWEST PASSAGE and the eastern outlet of the NORTHEAST PASSAGE, water routes sought by European nations for centuries. There were reports of such a strait—the western outlet of the fabled Strait of Anian (see ANIAN, STRAIT OF)—in the mid-16th century, with representations of it on early maps. The earliest recorded sighting of the strait was by a party of Cossacks under SEMYON IVANOVICH DEZHNEV in 1648; they are thought to have passed through it as well. VITUS JONASSEN BERING, a Danish explorer in service to Russia, first charted the strait in 1728; the strait was subsequently named for him. It was further explored by Englishmen JAMES COOK in 1778 and FREDERICK WILLIAM BEECHY in 1826.

It is theorized that at times during Earth's last ice age in the millennia before 8000 B.C., when more of Earth's water was frozen in glaciers and now-submerged land was exposed, there was a LAND BRIDGE where the Bering Strait is today. Archaeological evidence indicates that Paleo-Indians, tracking big game, migrated to the Americas across the Bering Strait land bridge and are ancestral to the Native American population.

Blanc, Mont

Mont Blanc is a mountain in the Alps of Europe, located in southwestern France in the Haute-Savoie Department, formerly the Duchy of Savoy. The name is also applied to the massif or range of which the mountain is a part, along the border between France and Italy. The French *Mont Blanc*, or Italian *Monte Bianco*, translates as "white mountain." At 15,771 feet above sea level, Mont Blanc is the highest mountain in the Alpine system. From the summit to about 8,000 feet high, an ice cap, 75 feet thick, covers the mountain. The Mont Blanc massif is considered part of the Savoy Alps of the Western Alps (the Western and Eastern Alps being delineated by a furrow that leads from the Rhine Valley in northern Switzerland to Lake Como in northern Italy).

Mont Blanc is important in the history of exploration since concerted attempts to climb it laid the foundations of modern MOUNTAIN CLIMBING, from 1760, when Swiss naturalist Horace Bénédict de Saussure offered a reward to reach the top, until 1786 when Savoy natives JACQUES BALMAT and Michel Paccard did so.

Blue Mountains

The Blue Mountains of Australia are a collection of high sandstone mountains, 40 miles to the west of Sydney. Named for a blue haze produced by the oils of abundant eucalyptus trees, they are part of the GREAT DIVIDING RANGE, a continuous chain of mountains forming a crescent along the eastern edge of the continent. They rise up more than 3,000 feet above the lowlands. On the eastern side, canyons and ravines end in dead ends, some in the form of waterfalls cascading from high above. Past the easternmost wall of ridges, there is a succession of peaks and valleys, covered with scrub brush. The Blue Mountains present a formidable barrier and hemmed in the settlement of Sydney for 25 years before explorers were able find routes through them to usable land in the interior.

The first explorers of the Blue Mountains were escaped convicts and their pursuers. Legend held that non-Aborigine communities lay beyond the mountains in lands with boun-

tiful food sources. Another myth held that it was but a short distance to China over the mountains. To debunk this latter myth, New South Wales colony governor John Hunter (the second governor after ARTHUR PHILLIP) sent out a party of convicts and soldiers under John Wilson, an ex-convict who had become an experienced bushman, in January 1798. Many of the expedition members were quickly discouraged and returned to base, but Wilson and his guides pushed on and came upon a large but slow river, probably the Lachlan. Ensign Barrallier led another early expedition in 1802. A skilled surveyor, he made a map of his route into the mountains. Yet, since he failed to locate suitable land for development, his accomplishments were disregarded.

In 1813, after a drought of nearly three years, the settlers' need for farm and grazing lands became acute. GREGORY BLAXLAND, a farmer, became determined to cross the mountains in search of arable land. On May 11, 1813, he left South Creek with a fellow farmer, WILLIAM CHARLES WENTWORTH; surveyor William Lawson; an Aboriginal guide named James Burnes; and several convict servants. They decided on a novel strategy. Instead of setting a straight course up and down the mountains, they followed the high ridges. On May 28, they came to Mount York, from which they could see pastureland dotted with trees. Blaxland estimated that these lands would be sufficient to absorb settlers for the next 30 years.

With these encouraging findings, Lachlan Macquarie, now governor, commissioned surveyor George William Evans to investigate later in 1813. Evans proceeded to Mount Blaxland, from where he proceeded to the Fish River, past the Great Dividing Range. He followed the Fish River to the Campbell River, which joins the Macquarie River, named after Governor Macquarie. Evans's explorations inspired Macquarie to build a road to the fertile new lands. It was built in only six months and enabled the town of Bathurst to be established in the Blue Mountains' western foothills. With Bathurst as a staging area, Surveyor General JOHN JOSEPH WILLIAM MOLESWORTH OXLEY charted the Lachlan River in 1817 and the Macquarie River in 1818.

Although developed, especially for vacation use, the Blue Mountains include a number of designated wilderness areas.

British East India Company (East India Company)

The British East India Company (known in Great Britain simply as the East India Company), founded in 1600 and active until 1874, was the largest and longest-lasting of the joint-stock East India Companies of various nations, formed to conduct trade between Europe and the East. With a charter from the British Crown, the British East India

Company enjoyed monopoly privileges in the Eastern Hemisphere. It also came to act as the government of India, prosecuting crime, dispensing punishment, and seizing land. Members of the British government encouraged these activities because of their many benefits: a favorable balance of trade, cash payments, loans to finance warfare, and aid in the conquest of the Indian subcontinent.

Early Conflicts

Queen Elizabeth I granted the charter under the title “The Governor and Company of Merchants of London Trading into the East Indies” in 1600, with a monopoly on trade in the region (see EAST INDIES). A governor and 24 directors chosen from its stockholders managed the company. Merchants RALPH FITCH and JOHN NEWBERRY had established the original diplomatic contacts between England and India in the 1580s. After the founding of the company, the queen sent her envoy, John Mildenhall, to India to negotiate trading privileges, but he was rebuffed by the Mogul (Mughal) ruler, who had a prior trade relationship with the Portuguese. In the meantime, a fleet of three ships, laden with goods to trade, was sent to the ports of Achin on Sumatra and Bantam on Java. The fleet returned in 1603, carrying a cargo of pepper and other spices. That same year, the English fought the Portuguese at the port of Surat in northwestern India and gained the right to trade there as well. In 1610–11, it established its first factories—that is, trading posts—in India in the Indian provinces of Madras and Bombay.

At that time, trade in India, Malaysia, Indonesia, and the SPICE ISLANDS (the Moluccas) was dominated by the Portuguese. The Portuguese did not have sufficient military power to keep out challengers, however, and the Dutch, French, and English were all active in the region, forming alliances with native kings at various trading centers. In 1612, Thomas Best was sent with letters from English king James I, asking the ruler of India to cooperate with England against Portugal. In a legendary naval battle, Best, with two small ships, outmaneuvered a Portuguese fleet of 29. In 1615, the British government sent another emissary to firm up relations between India and England. SIR THOMAS ROE arrived in Surat in September of that year, and, from there, made a difficult overland journey to Ajmer, where the Mogul capital was located at the time. Roe spent three years at the court of King Jahangir; his diplomatic efforts set the stage for future advances in English-Indian trade.

With its long tradition of trade with the Middle East, India had developed a wide variety of finished products to export and expected to receive high-quality products in exchange. England exported velvets, satins, fine tableware, saddles, spyglasses, and enamel work, among other fine goods. In return, India traded silks (both raw and finished), diamonds, medicines, and brass and bronze work. India used

some of these items, in particular the silk cloth, to barter for spices with nations farther to the east.

In 1620, the Raja of Golconda agreed to allow the East India Company to build an outpost near the Dutch settlement of Pulicat on the Coromandel Coast. Originally called Fort St. George, this became the bustling city of Madras and a major hub of activity for the East India Company. As profits began to swell for the company, discontent grew among merchants who were shut out of the Indian trade, and they petitioned Parliament for their fair share. In 1623, to strengthen the East India Company’s position, King James granted it the power of law enforcement on both land and sea. Conflict with the Dutch came to a head that same year with the Amboina Massacre. The British and the Dutch had shared trading rights with the tiny island of Amboina, just off the coast of New Guinea. To consolidate their hold on the Spice Islands, the Dutch fabricated charges of conspiracy against the English stationed there, convicting and executing 10 of them, along with nine Japanese. Henceforth, the British concentrated on its trade with India.

With the ascension of Charles I to the throne, the British East India Company encountered more difficulties. The new king was sympathetic to those merchants who made trips to India and back without official sanction. In 1635, Charles went so far as to create his own company to challenge the exclusive privileges of the older concern. His venture was a disaster, however, and the East India Company responded by continuing to refine its operations. Skirmishes with the Dutch remained a vexing problem for the company until the 1654 English peace treaty with Holland. The company was also sustaining increasing losses from piracy. It was widely understood that complicity between pirates and local sultans enabled this thievery to exist, and, in 1657, Oliver Cromwell, the Puritan leader who ruled England in 1653–58 under the title of Lord Protector, restored trading powers to the company that Charles had eroded. In 1661, a completely rewritten charter expanded the trading company’s rights even further.

Issues at Home

As the company entered the latter half of the 17th century, trouble in the Pacific diminished and dissent at home increased. The silk weavers of London complained that their position was being undercut by the importation of finished cloth, and British merchants continued to voice their arguments against monopoly protections. Events came to a head in 1694, when it was revealed that the East India Company had paid £80,000 for “secret services,” including the renewal of their charter with favorable terms. In 1698, Parliament authorized the establishment of a new trading company, and this event brought chaos to the India trade. The businessmen of both concerns suffered, and, in 1702, the two com-

panies were merged into the “United Company of Merchants of England trading to the East Indies” but still were popularly known as the East India Company. At the time of its final consolidation, the new company lent £1,200,000 to the British government in 1708, and, as a result, for a time, disagreements were quieted.

The 18th century saw the rise of the importance of tea for the East India Company. Introduced by the Dutch in Europe the previous century, tea had become an essential commodity in many British households. Great Britain had gone so far as to pass a law in 1745 requiring the company either to supply tea at reasonable prices or to face sanctions.

Great Britain was at war with France during much of the 18th century, and the conflict extended to the Far East. In mid-century, Robert Clive led British forces on victories over the French and Dutch. In 1761, the British gained control of the French trading port of Pondicherry, thus circumscribing the ambitions of the FRENCH EAST INDIA COMPANY in India. The 1763 Treaty of Paris gave some trading privileges back to the French, but the British would no longer be defied by other European powers in India.

In the waning years of the 18th century, with outside conflict quashed, the power and profits of the British East India Company increased steadily. Seeing their enormous trading profits disappearing into private hands, the British government levied an annual payment of £400,000 on the company and limited its dividends to 12.5 percent.

The incident that motivated the British government to begin to assert legal control in India came to be known as the Tanjore question. The raja of Tanjore had been deposed by his rival, the nabob of Arcot, Muhammad Ali. Without the consent of his superiors, the president of Madras was complicit in this coup. The raja was subsequently reinstated,

but, in the meantime, the nabob had mortgaged the assets of Tanjore, leading to financial repercussions in England.

The Regulating Act of 1773 made the appointment of the governor of Bengal subject to British government approval. The first to hold the post was Warren Hastings, who had a great influence in the future organization of the country. The East India Act of 1784 made the British government even more responsible for activities in India by setting up a board of control to handle political, military, and financial matters. The East India Company’s monopoly in Indian trade was taken away by acts of Parliament in 1813 and 1833. The Indian Mutiny (also known as the Sepoy Rebellion) of 1857, in which native soldiers (sepoys) in the Bengal army revolted against the British, led to assumption of full political control over India by the British Crown under the terms of the Act for the Better Government of India the next year. The assets of the company were finally dispersed in 1874 with the East India Stock Dividend Redemption Act.

The activities of the British East India Company contributed to the spread of geographic knowledge about Asia to Europeans. It also actively promoted the exploration of lands. The Great Trigonometrical Survey of India, headed for a time by British officer and surveyor SIR GEORGE EVEREST, was initiated by the British East India Company.

Canary Islands

The Canary Islands are a group of seven volcanic islands 70 miles off the coast of Africa in the Atlantic Ocean near the border of present-day Morocco and Western Sahara, about 600 miles to the southwest of the Iberian Peninsula. They mark the beginning of the Canary Current, part of the circular system of currents in the Northern Hemisphere that are generated by the northeast TRADE WINDS.

The record of the discovery of the Canaries predates the EUROPEAN AGE OF EXPLORATION of the 15th through the 17th centuries; consequently, the islands served as a point of reference in the unknown seas to the west of Africa, along with the Madeira Islands, and later the AZORES. These islands became a testing ground as explorers learned to navigate the open seas. The Canaries also became a way station for longer voyages.

PLINY THE ELDER, a Roman historian, demonstrated definite knowledge of the Canary Islands in 40 B.C., and subsequent writers, such as Plutarch, referred to the “Fortunate Islands,” probably the Canaries, although they were possibly confused with the Madeiras and Azores. In the early first century A.D., King Juba of Morocco sent explorers to the islands. They brought back a detailed record of their flora and fauna. It was also noted that there were signs of previous human habitation, although no living people were found at the time. It has been theorized that Irish monk SAINT BRENDAN reached the Canaries in the sixth century.

In the late Middle Ages, merchant ships began to pass routinely beyond the Strait of Gibraltar (see GIBRALTAR,

STRAIT OF)—from the MEDITERRANEAN SEA into the Atlantic Ocean—and the Canary Islands were rediscovered. Arab Muslims reached the Canaries in the 12th century. There were a number of voyages in the early 14th century, including one by French mariners in 1334 and one, about the same time, by an Italian, Lanzarotto Malocello, who gave his name to the Island Lanzarote; a map indicating his findings dates to 1339. In *Teseida*, published in about 1341, Italian storyteller Giovanni Boccaccio relates trips by Spanish, Italian, and Portuguese seamen. Some of the visitors attempted to seize power but failed to maintain control for long. In the second half of the century, the islands were regularly visited by Franciscan missionaries, yet attacks on them by the inhabitants halted missionizing attempts for a time.

The peoples who lived on the Canary Islands at the time of the European rediscovery were the Guanches. Like the Berbers of North Africa, they were an ethnically mixed population of varying height, hair, and skin color. Their exact place of origin is unknown; cultural and linguistic evidence traces their origins to the Middle East. Through isolation over time, the society of the Guanches had come to a state that the Europeans deemed as savage. Their extermination was carried out by 1496.

In the early 15th century, the Canaries became the object of closer scrutiny, as various European nations sought exploitable resources. In 1402, the Gadifer de la Salle and Jean de Béthencourt, both Normans, explored the islands in search of gold. No gold was found, but Béthencourt made himself king with the backing of Spain. From 1427 until

mid-century, Portugal was most active in exploring the Canaries. They also used them to aid in sailing westward, which led to the charting of the Azores. In 1479, after a war between Spain and Portugal, the Treaty of Alcacovas established Spanish dominion over the islands. Portugal managed to keep its possessions on the coast of West Africa, the more profitable side of the bargain.

As Europe entered the era of transoceanic travel, the Canary Islands became an important point of launch for numerous voyages of exploration. In 1492, an Italian, CHRISTOPHER COLUMBUS, exploring for Spain, made a stop at the islands to resupply his ships and to make repairs. Since they are located at a latitude where the weather is pleasing, it was his intention to sail due westward from the Canaries to Asia. Another voyage of note that gained assistance from the islands was Portuguese FERDINAND MAGELLAN's first CIRCUMNAVIGATION OF THE WORLD, also for Spain, which was begun in 1519.

canoe

A canoe is a type of small, light boat, with a watertight hull shaped for speed and navigability, typically propelled by at

least one paddle. Predating the historical record, it evolved from the RAFT, which does not have a watertight hull or a streamlined shape. The canoe has many variations around the world. The term *canoe*, from an Arawak (Taino) Indian word, is most often applied to narrow boats with identically shaped bows and sterns and curved sides and that are propelled by a paddle. But, the term encompasses boats with varying shapes as well, some of them with sails. In the broader classification of the term can be included such craft as the kayak, umiak, baidarka, CORACLE (bullboat), OUTRIGGER, and reed-bundle boat.

Canoes are made from a variety of materials, depending upon what is available in the local environment. In the South Pacific islands and the Americas, where wood is plentiful, the craft began as the simple dugout canoe (also called "dugouts"), fashioned from a log with the inner core hollowed out. On the west coast of North America, where cedar trees grow very large, early Native American dugouts were sometimes 100 feet long and were propelled by numerous paddlers. The Haida and Tlingit Indians would fell a tree near the ocean's shore, where they would build seaworthy vessels for use along the coast. The PIROGUE, used in the 19th-century FUR TRADE in North America, was a dugout.

Also in North America, light birch-bark canoes of varying designs were developed among Algonquian-speaking

Shown here, in a photograph from about 1900, is a Native American dugout canoe on the Columbia River. (*Library of Congress, Prints and Photographs Division [LC-USZ62-101283]*)

peoples and other tribes. Pieces of birch bark were stretched over a framework of saplings, then sewn together with root fibers and sealed with pitch or tar. These remarkably light canoes were practical for portages, that is, the carrying of the craft between waterways. The Iroquois (Haudenosaunee) Indians used elm bark as a covering.

For the kayak, Inuit (Eskimo) traditionally covered a frame of bone (often whalebone) or driftwood with sea mammal skins; the deck was also covered, except for a cockpit; the paddler typically used a double paddle. The umiak is a larger, open variation. The Aleut variation of the kayak is known as the baidarka. Another hide boat found in North America among some tribes of the northern plains is the bullboat, made from buffalo hides stretched over a circular frame. The similarly made coracle of parts of Europe and Asia were also round or oval in shape.

Pacific Islanders invented the double canoe—two canoes placed parallel and lashed together with rods. This made the resulting boat more stable and was related to the OUTRIGGER, which had a float parallel to the main body of the craft, also for stability. Sails were typically added. In the shape of a crab claw, they were woven from palm fronds and other fibrous material. The Englishman JAMES COOK observed double canoes with crab-claw sails in Hawaii. There is evidence that the peoples of the Pacific islands conducted much inter-island travel with these highly evolved craft.

Another variation is what is known as the reed-bundle canoe or reed-bundle boat, made from plants of the sedge family. Those found in Africa on the NILE RIVER and made from papyrus are also called papyrus boats; those on lakes in the ANDES MOUNTAINS of South America and made from tule, a type of bulrush, are known as bulrush boats. To make these craft, reeds are tied together into bundles; the bundles are then stacked on one another. The reed bundles become waterlogged after use, but dry out in the sun. Reed boats have two main variations in their appearance. Some are double-ended, with two raised ends like a typical canoe, while others have a single raised prow and a broad stern, like a modern rowboat. Reed canoes were probably first propelled with poles, then later with paddles or oars. Sails were also sometimes used.

Canoes, in general, are used for navigating the lakes and rivers in the interior of continents or along coastlines rather than for transoceanic voyages. They played a part in countless expeditions—especially in Africa, South America, and North America. In North America, they were central to the FUR TRADE, used by Indians and non-Indians alike.

Modern canoes are made from molded plastic or fiberglass, aluminum and magnesium alloys, rubber, canvas, and other materials as well as wood. The catamaran, a refinement of the double canoe, is one of the fastest small sailboats.

Cape Horn

Cape Horn is the southernmost point of land off the coast of South America. Its importance in the history of exploration is that it marked the gateway between the Atlantic Ocean and Pacific Ocean in the west, similar to the CAPE OF GOOD HOPE at the southern end of Africa between the Atlantic Ocean and the Indian Ocean. The European discovery of Cape Horn took place in three stages. The first to cross from the Atlantic into the Pacific was Portuguese FERDINAND MAGELLAN, in service to Spain, in 1520. The passageway he used, which came to be known as the Strait of Magellan (see MAGELLAN, STRAIT OF), was actually north of Cape Horn, between the main continent and a large island. Magellan observed fires burning on this island, maintained by the Native Americans, and named it Tierra del Fuego, meaning “Land of Fire.” There had been speculation for centuries that the South American continent was connected to a southern landmass referred to as the GREAT SOUTHERN CONTINENT, or Terra Australis, with Atlantic and Pacific waters separated. Magellan’s passage from the Atlantic to the Pacific solved a crucial question of the geography of the region.

The second stage of discovery took place much later and by chance. In 1578, after he had sailed through the Strait of Magellan, Englishman SIR FRANCIS DRAKE was blown south and east by strong westerly winds and found open sea. After returning to his intended course, he found time to check his logbooks and chart his location. It was then he realized that he had found a whole new expanse of ocean. The sea between Cape Horn and Antarctica is now known as Drake Passage.

The final stage of finding and describing Cape Horn did not come until 1616. It was then that Dutch merchant JAKOB LE MAIRE and mariner WILLEM CORNELIS SCHOUTEN found South America’s southernmost point of land. They named it Cape Horn, not because the area resembled a horn, but after their home port of Hoorn in the Netherlands.

There is some confusion concerning the place names of Cape Horn and Tierra del Fuego. The area referred to by these names contains many islands. The largest, originally named Tierra del Fuego, is now called Isla Grande de Tierra del Fuego, part of the Tierra del Fuego Archipelago. The island occupying the most southern latitude—known as Horn Island—is about 45 miles from the largest island. The southernmost point on Horn Island is Cape Horn.

Cape Horn/Tierra del Fuego has the distinction of being the most southerly location of regular human habitation. The latitude where it is located (56 degrees) is mirrored in the north by the coast of Labrador. With the winds that circulate, unimpeded by land, and the frigid currents from Antarctica, the region has some of the worst weather on the planet.

See also SOUTH AMERICA, EXPLORATION OF.

Cape of Good Hope

The Cape of Good Hope is a formation of land along the south coast of Africa. Rounding it by ship has come to represent the transition from the Atlantic Ocean to the Indian Ocean in the east, as CAPE HORN at the southern end of South America does so between the Atlantic Ocean and Pacific Ocean in the west.

There is some confusion as to the identity of the first nonnative peoples to round the Cape of Good Hope. A fifth-century B.C. Greek historian, HERODOTUS, made the claim of an expedition by the Phoenicians, sponsored by NECHO II of Egypt, in about 600–597 B.C. A 15th-century cartographer, Fra Mauro, gave credit to the Chinese for accomplishing the feat in 1420.

The first European known to have sailed around the southern extent of Africa is Portuguese BARTOLOMEU DIAS. Hoping to find a sea-lane around Africa to the SPICE ISLANDS (Moluccas) in the Indian Ocean, he embarked on his voyage in 1487. After encountering unfavorable winds along Africa's south coast, he sailed southward and, when the winds shifted, continued eastward. He made landfall at Mossel Bay. By checking his navigational measurements, he realized that he had passed the southern tip of the continent. He continued up the coast as far as the Great Fish River. On the return trip to Portugal, in the summer of 1488, he set up a *PADRÃO* (pillar) at the place that is now known as the Cape of Good Hope. Sources vary as to whether he gave it that name, or named it Cabo Tormentoso, for "Cape of Storms," after the weather he encountered there, and that King John II of Portugal renamed it Cabo da Bõa Esperança, or "Cape of Good Hope." In 1497, VASCO DA GAMA, also sailing for Portugal, rounded the Cape of Good Hope and continued on to India, establishing a new trade route between Europe and Asia. From that time, such journeys became routine.

The Cape of Good Hope is referred to in general usage as the southern tip of Africa. Yet, the southernmost point on the African continent is actually located at Cape Agulhas, 34 degrees and 52 minutes south latitude, some 40 miles southeast of the Cape of Good Hope. Moreover, on the projection of land referred to as the Cape of Good Hope, there are actually two points equally to the south, about a mile apart with a stretch of water between them.

Although the Cape of Good Hope is located in the most temperate zone of the African continent, it is not easy to navigate its waters. The winds in the region circulate fiercely from the west, much like the winds around Cape Horn, and the weather is unpredictable and the seas often rough. The surrounding land is inhospitable. It was not until the mid-16th century that settlements were established to reprovision ships sailing past on their way to other destinations. The modern city of Cape Town, South Africa, is situated to the north of the Cape of Good Hope.

caravel

The term *caravel*, originally derived from *karabos* for a kind of light boat, has been applied in a variety of spellings to small boats from different countries. In the history of exploration, it has come to be used for European boats extensively used in the 15th and 16th centuries.

Caravels were light and maneuverable ships with two or, more commonly, three masts. They typically had a LATEEN RIG, but their front two masts could be square-rigged to take advantage of the prevailing winds in open seas. They were most often carvel-built, a type of construction in which planks are shaped to be flush edge to edge, with caulked seams, rather than overlapping planks as in clinker-built technology. This design feature reduced friction between hull and water. Caravels had flat sterns and center rudders like other European ships. Their sizes varied, the smallest about 60 tons and the largest exceeding 200 tons.

The caravel was developed by the shipbuilders of HENRY THE NAVIGATOR, prince of Portugal. It combined elements of the European ships of the day, such as the COG and the ROUNDSHIP, with those of the Arab DHOW. Other European ships, although sturdy, were clumsy in navigating shorelines and ports. Dhows had maneuverability, yet were vulnerable in high seas. The caravel's hull could resist the pounding of waves; its shallow draught allowed for coastal navigation; and its triangular sails could take advantage of a variety of winds. While the caravel was easy to control and dependable in rough weather, it was not the most comfortable of ships. Crews slept on deck or with the supplies in the hold. Captains had small cabins on the rear deck. Lack of space also made the caravel less suitable for trading voyages.

The invention of the caravel proved a great help to the Portuguese in the 15th-century exploration of the African coast. Italian CHRISTOPHER COLUMBUS, exploring for Spain, used two caravels, the *Niña* and the *Pinta*, for his first transatlantic journey. In the 16th century, Spanish explorers VASCO NÚÑEZ DE BALBOA and HERNANDO PIZARRO built caravels in the Americas to sail the Pacific Ocean. The Monument of the Discoveries in the Portuguese city of Lisbon contains a parade of explorers on an artistic representation of a caravel.

carrack

The *carrack*, as it was called in northern Europe, or *nao* as it was known in Spain and Portugal, was a large oceangoing ship, descended from the COG of the Middle Ages. It evolved from ships that were clinker-built, a design feature

The 42-foot *Niña II* is a replica of one of Christopher Columbus's caravels that crossed the Atlantic Ocean in 1492. (*Library of Congress, Prints and Photographs Division [LC-USZ62-99661]*)

Roman soldiers scale the walls of Carthage in 146 B.C., as shown in a 1539 engraving by George Pencz. (Library of Congress, Prints and Photographs Division [LC-USZ62-88804])

utilizing overlapping planks, to those that were carvel-built, with flush planks. As its size increased, it came to accommodate three or more masts. The foremasts were typically square-rigged, while the mizzenmast (rear mast) had a LATTEEN RIG. Because of its size and square mainsails, the carrack was at its best on the open seas running with the wind.

A distinctive characteristic of the carrack was its high decks at bow and stern, on which structures known as castles were constructed. They provided quarters for the captain, offered points of observation, strengthened the ship against wind and wave, and gave shelter and comfort to officers and crew.

Carracks were merchant vessels, designed to maximize cargo capacity (see MERCHANT SHIP). Their roomy holds made them attractive for long voyages of exploration as well. They ranged from about 80 tons to more than 1,000 tons displacement.

The carrack ascended in importance over the smaller CARAVEL during the EUROPEAN AGE OF EXPLORATION. With the increasing number of transoceanic voyages of exploration and trade, the storage capacity of the carrack became a crucial factor, as did its durability in stormy seas in a range of latitudes. The carrack was the prototype for the massive GALLEON.

See also SHIPBUILDING AND EXPLORATION.

Carthaginian exploration

Carthaginians were inhabitants of the ancient city of Carthage, situated on a peninsula in the Bay of Tunis in what is now Tunisia on the north coast of Africa. Legend holds that a queen by the name of Dido founded the city, but it is thought to have been established by Phoenicians from Tyre (Sur) as a trading post in the late ninth century B.C. The city had two harbors, connected by a canal; a walled fortress overlooked the harbors from a hill. The name *Carthage* is from the Latin *Carthago* or *Cartago*, derived from a Phoenician word for “new city.”

The colony of Carthage evolved into a city-state under an aristocracy of nobles and wealthy merchants. Through conquest and trade, it came to be influential throughout the MEDITERRANEAN SEA region and competed first with the Greeks, then the Romans. By the sixth century B.C., Carthaginians had subjugated the Libyan tribes and earlier Phoenician colonies and controlled the coast of North Africa from the western extent of Egypt to the Atlantic Ocean, as well as various islands. The Carthaginians failed in their attempt to conquer all the Greek city-states in Sicily, however.

Rome challenged Carthage’s control of the western Mediterranean in the third century B.C., in a series of three wars known as the Punic Wars, after the Roman name for the Phoenicians, *Poeni*. In the First Punic War (264–241

B.C.), Rome sought to gain control of Carthaginian trading posts in Corsica, Sardinia, and Sicily. The Carthaginian general Hamilcar Barca was forced to make peace with the Romans after a naval defeat by the Roman consul Gaius Lutatius Catullus and to give up holdings in Sicily. Deprived of revenue, the Carthaginians developed their trading interests on the southern Iberian Peninsula, which they had inherited in the fifth century B.C. from their kinspeople the Phoenicians after the collapse of the Phoenician cities of Tyre and Sidon in the eastern Mediterranean. In 237–228, the Carthaginians, under Hamilcar Barca, campaigned in southern Spain against indigenous Iberians and Celtiberians (Celtic tribes who had settled among the Iberians). In 227, Carthage founded the city of Cathago Nova (present-day Cartagena) on the southeast coast. It served as the major Carthaginian supply base on the Iberian Peninsula for northward expansion through Roman contacts. Rome and Carthage negotiated a treaty in 226 in which Carthaginian influence extended as far as the Ebro River, with Roman interests to the north of the river. One exception was the seaport of the Roman-allied Saguntum (modern-day Sagunto), 100 miles south of the Ebro.

In 219, the Carthaginian general Hannibal laid siege to and captured Saguntum. In 218, the Roman senate declared Spain a Roman province, marking the official start of the Second Punic War (218–201). Two Roman legions sent to engage Hannibal's forces failed to intercept the Carthaginians, who in a remarkable journey with a full baggage train and elephants, proceeded to cross the Pyrenees, march along the Mediterranean's north coast, and cross the Alps into Italy. The struggle continued on two fronts, with the Romans in Spain tying up the Carthaginian forces that might have reinforced Hannibal's force in Italy. Hannibal had early successes, such as the Battle of Cannae in 216, one of the worst defeats in Roman history, but Rome itself held against his forces. Roman victories elsewhere, such as at Cathago Nova in 209, led to Hannibal's recall to Africa in 203. In 202, Publius Cornelius Scipio defeated Hannibal at Zama in North Africa, after which he was known as Scipio Africanus. With the end of the Second Punic War, in 201, the Carthaginians gave up any claim to lands on the Iberian Peninsula.

The Third Punic War (149–146) evolved out of the ambitions of Rome's growing mercantile community and designs on Carthaginian commercial enterprises, which led to military action and treaty violations. In 146 B.C., Roman legions under Scipio Aemilianus Africanus Numantinus, the adopted grandson of Scipio Africanus, captured and sacked Carthage.

A new city, also named Carthage and founded by the Romans in 29 B.C., became an important center of Roman administration. In A.D. 439–533, Carthage was the capital of the Vandals, a Germanic tribe, who overran Rome in 455.

In 533, it became part of the Byzantine Empire. It was again sacked, this time in 698. But the site continued to be inhabited and is presently a suburb of Tunis.

Carthage, although originally a Phoenician colony, was a melting pot, and the role of Carthaginians in the history of exploration is typically discussed on its own as distinct from that of the Phoenicians. Their most famous exploratory expeditions took place in the fifth century B.C., by which time Carthage was a maritime power. In about 470 B.C., statesman and admiral HANNO led as many as 60 GALLEY ships from Carthage westward along Africa's north coast, through the Strait of Gibraltar (see GIBRALTAR, STRAIT OF) into open Atlantic waters, then southward along Africa's west coast, establishing colonies along the way. He founded one settlement at the mouth of the Senegal River and perhaps explored as far as Cape Verde and the Gambia River, or even beyond to the Gulf of Guinea. In about 450 B.C., another Carthaginian, HIMILCO, perhaps Hanno's brother, also explored Atlantic coastal areas, including the Iberian Peninsula and northward along what is now France's coast and possibly as far north as the British Isles, considered the first such voyage beyond dispute. He may have explored the AZORES as well. In any case, it is known that Carthaginians came to maintain a trade monopoly in the Atlantic Ocean beyond the Strait of Gibraltar and continued the Phoenician tradition of maritime commerce and the resulting exploration and colonization.

Cathay Company

The Cathay Company, or Company of Cathay, was a short-lived venture established for the purpose of mining gold from the shores of Frobisher Bay on Baffin Island in the North Atlantic Ocean, part of what is now northern Canada. The beginnings of the Cathay Company stem from the English expedition by SIR MARTIN FROBISHER in search of the NORTHWEST PASSAGE that set out in spring 1576, in which he secured a small quantity of ore that he believed contained gold. He arrived back in England that October. His rock was initially analyzed by two scientists, who reported it to be nothing more than worthless pyrites, or FOOL'S GOLD, but an Italian alchemist by the name of Aque- llo claimed he had found a speck of gold in the samples.

With this meager evidence, Michael Lok, who had been involved with a joint-stock company known as the MUSCOVY COMPANY, and other investors formed the Cathay Company to extract the riches from this newly visited land (Cathay was the medieval name for China). Queen Eliza-

both I also invested and, by refusing a royal charter and appointing a royal commission to oversee additional voyages, kept greater control. A contingent of three ships was funded, which sailed in spring 1577. On this trip they mined about 200 tons of the ore, which was then analyzed by a pair of German chemists who found that it contained some quantities of gold and silver. The calculation was made that a profit of five pounds per ton could be made from the retrieval of the ore, and a much larger expedition was planned.

In spring 1578, without waiting for the conclusive results of the smelting of the initial shipment of ore, Frobisher left Harwich with 15 ships and a staff of professional miners. Their trip was fraught with difficulties. Frobisher still had an interest in finding the Northwest Passage, but the onset of winter compelled him to return to England with his cargo, which had been laboriously acquired while he had been exploring.

Frobisher arrived back in England with 1,350 tons of ore. Upon his arrival it was learned that the previous shipment had proved worthless, and all that was to be done was to dump the new load. The Cathay Company had lost £20,000 of investors' money. Without a royal charter as legal protection, Michael Lok became the principal target for lawsuits and ended up in debtor's prison. Martin Frobisher, however, remained a favorite of Queen Elizabeth I, who subsequently knighted him for his efforts against the Spanish Armada in 1588. He died from a wound received while fighting against the French in 1594.

Central America, exploration of

Central America is the narrow stretch of land, in effect a LAND BRIDGE—some 201,300 square miles—connecting North America to South America and separating the Caribbean Sea from the Pacific Ocean. It extends from the southern boundary of Mexico to northwestern Colombia at the northern extent of South America and includes the nations of Guatemala, Belize, El Salvador, Honduras, Nicaragua, Costa Rica, and Panama. (Based on varying rock formations, Central America is sometimes defined as beginning at the Isthmus of Tehuantepec in southern Mexico, extending to the Atrato River Valley in Colombia.) Geographers consider Central America to be part of North America (see NORTH AMERICA, EXPLORATION OF). The history of its exploration and colonizing is more closely tied to that of South America, however (see SOUTH AMERICA, EXPLORATION OF). The term *Middle America* refers to Mexico and Central America, and sometimes the WEST INDIES as well.

Much of Central America is mountainous. The forested highlands in the north are part of the mountain system of western North America; those in the south are an extension of South America's ANDES MOUNTAINS. Active volcanoes can be found between those two ranges. Tajumulco, a volcano in Guatemala, is Central America's highest peak, at 13,846 feet above sea level. Earthquakes are common in Central America. The Nicaragua Depression is centrally situated; the region's two largest lakes, Lake Nicaragua and Lake Managua, can be found there. Numerous rivers and streams flow down from the mountains, the longest rivers draining into the Caribbean, and mostly smaller streams draining into the Pacific. The coastal plain on the Caribbean side is generally broader than on the Pacific side. Central America's climate is tropical, except in higher altitudes. The Pacific coast and western mountain slopes receive about half the rainfall of the rain forest of the Caribbean side because of conditions of cold stable air created by the cold California Current as opposed to relatively warm ocean waters to the east. The land bridge of Central America connects two previously isolated ecosystems and has flora and fauna typical of both.

Native Peoples

In pre-Columbian times, Central America was a densely populated area. Native peoples of a variety of different language families, with infusions from both the north and the south, lived in autonomous bands united politically and religiously under chieftains. For subsistence, they farmed as well as hunted and fished, living a life similar to peoples of the West Indies. The Maya developed the most complex civilization in the region with autonomous city-states, located around ceremonial centers, situated on the Yucatán Peninsula in present-day Mexico, as well as in present-day Belize, Guatemala, and western Honduras and El Salvador. Its civilization consolidated before A.D. 300 and flourished from A.D. 300 to 900, a cultural phase sometimes referred to as the Classic period and involving the Lowland Maya of Belize, central Guatemala, and southeastern Mexico. The Highland Maya of southern Guatemala flourished in post-Classic times, as did the Maya to the north on the Yucatán Peninsula, who experienced a new flowering of culture after invasion by the Toltec from the west after about 1000. More than 100 Maya sites are known, consisting of magnificent stone structures: temple pyramids, astronomical observatories, palaces, monasteries, baths, plazas, bridges, aqueducts, reservoirs, and ball-courts.

Conquistadores

The first Europeans to reach Central America were Spanish, part of an expedition under RODRIGO DE BASTIDAS in 1501. He explored South America's northeast coast along present-day Venezuela and Colombia and reached the

Gulf of Darién, the eastern extent of Panama. Italian mariner CHRISTOPHER COLUMBUS more thoroughly explored the Central American coastline the next year from the other direction, during his fourth voyage to the Americas for Spain. He first reached the Islas de la Bahía (Bay Islands) in the Gulf of Honduras. He landed near present-day Trujillo, Honduras, where he encountered Maya from the Yucatán. He explored southward along the coast of Nicaragua, Costa Rica, and the Isthmus of Panama, making contact with other indigenous peoples at various landfalls.

In 1508, DIEGO DE NICUESA was granted a license by the Spanish king to found a colony west of the Gulf of Urabá (with ALONSO DE OJEDA granted the rights to a colony east of the gulf in Colombia). The next year, Nicuesa launched an expedition from Hispaniola (present-day Haiti and the Dominican Republic). He was unable to reach his proposed site at the mouth of the Darién River and landed at Nombre de Dios to the west. In the meantime, VASCO NÚÑEZ DE BALBOA, who had been part of Bastidas's expedition, founded a colony at Santa María la Antigua del Darién, the original site. Nicuesa eventually traveled there to claim his governorship, but Balboa and his followers refused to cede power and sent Nicuesa and 17 others out to sea in an unworthy vessel, never to be heard from again. In 1513, Balboa set out to the west with an expedition of nearly 200 Spaniards and 1,000 natives and slaves. Crossing through the rugged mountains and thick jungle of the Isthmus of Panama, the expedition came to a hill that seemed to offer an unobstructed view to the south and west. Balboa and his dog ascended the hill, and he became the first European to sight the Pacific Ocean on September 25. Four days later, Balboa and his men reached the shore of the Pacific Ocean.

In 1514, PEDRO ARIAS DE ÁVILA traveled to Darién to assume governorship of the colony. In 1519, the same year he had Balboa executed, he founded Panama City on the Pacific coast, making it the colony's principal settlement. (Since Nombre de Dios and Darién were abandoned for part of their history, Panama City is considered the oldest permanent European settlement on the mainland of the Americas.) Arias de Ávila sponsored expeditions to surrounding regions. Among them were those of FRANCISCO PIZARRO and DIEGO DE ALMAGRO along the west coast of South America.

In the meantime, in 1522, ANDRÉS NIÑO led the seaward part of an expedition northward—with Gil González de Ávila leading an overland contingent. Niño, with four ships constructed on the Bay of San Miguel in the Pacific, explored along the Pacific coast of Panama, Costa Rica, Nicaragua, and Honduras as far north as Mexico. On rejoining González de Ávila, he helped him fight off an attack by Indians, then explored coastal regions of Costa Rica and

Honduras as well as interior parts of Nicaragua, including Lake Nicaragua. Soon afterward, in 1522–24, the region they had explored was colonized by FRANCISCO FERNÁNDEZ DE CÓRDOBA, under the command of Pedro Arias de Ávila. He founded León near Lake Managua and Granada on Lake Nicaragua. Fernández renounced his allegiance to Arias de Ávila and tried to establish his own colonial domain. Arias de Ávila, who had recently been replaced as governor in Panama, led forces against him and installed himself as governor of the region, maintaining control until his death in 1521.

Other CONQUISTADORES invaded Central America from the north. In 1523–26, PEDRO DE ALVARADO, who had fought under HERNÁN CORTÉS against the Aztec in Mexico, led an expedition southeastward to Guatemala and El Salvador and established Spanish dominion over that region. The European conquest of Central America, as that of other parts of the Americas, was aided by the rapid spread of European diseases, including smallpox, dysentery and influenza (see DISEASE AND EXPLORATION). Those who survived disease and warfare were forced into serfdom as farmers.

Modern Nations and Peoples

The opening of the Panama Canal across the Isthmus of Panama in 1914 provided a practical passage between the Atlantic and Pacific Oceans. Central American nations achieved independence from Spain in the 19th century, although Panama was considered part of Colombia until the early 20th century. Belize was the exception, colonized in 1638 by English logwood cutters out of Jamaica, as well as by Spanish settler. The British defeated the Spanish in 1798. Formerly known as British Honduras, Belize achieved independence in 1981.

The present inhabitants of Central America are an ethnic mix, including European, especially Spanish; Native American; mestizo (people of mixed heritage, chiefly of Spanish and Native American ancestry); African; and mulatto (people of mixed European and African backgrounds). Agriculture is still central to the various economies, although they are becoming increasingly diversified.

Ceylon (Sri Lanka)

Ceylon (or Sri Lanka, as it has been known since 1972), is an island nation of 25,332 square miles just to the east of the southern tip of India. The climate is subtropical and humid, especially during the monsoon season. The island exports a variety of agricultural products, such as tea, rubber, and coconut. A number of spices are grown there as well, including cinnamon, pepper, cloves, nutmeg, and cardamom. Ceylon has also been the source of numerous precious stones and minerals over the centuries. The fertility of its soil and its

abundance of natural resources led to Ceylon acquiring the label “Pearl of the Orient.”

The earliest known inhabitants of Ceylon descended from the Veddas, an aboriginal group of which several thousand still exist. Today they make their home in the isolated mountainous regions. The Veddas were conquered in the sixth century B.C. by the Sinhalese of northern India. The introduction of Buddhism in the third century B.C. led to a cultural renaissance in Ceylon, and the island became a center for the religion. With its proximity to the mainland, Ceylon has been vulnerable to invasion from India, and Hindu Tamils have made regular incursions since the 12th century, a conflict which continues to this day. The population of Ceylon is about two-thirds Sinhalese and one-third Tamil.

Trade between Ceylon and the Coromandel coast (the east coast) of India took place for many centuries. A favorite commodity of India was the betel nut, which grew in large quantities and helped make the island prosperous. In the 12th and 13th centuries, Arab Muslims established a strong presence on the island as they developed the SPICE TRADE. Ceylon was particularly important as the source of cinnamon, found there exclusively at the time.

Ceylon was important not only for spices but also because of its strategic location. Situated in the center of the shipping lanes of the Indian Ocean, the island offered many advantages to those who could maintain forces at her ports. The first Europeans to come were the Portuguese in 1505. Because of rivalry from Arabs, they made a pact with the reluctant Sinhalese ruler to provide military protection in exchange for cinnamon. In 1557, King Dharmapala converted to Christianity and fell further under the control of the Portuguese. This sparked rebellion among the Sinhalese, who were led most effectively by Raja Sinha. Sinha laid siege to the port city of Colombo for six years, until he was eventually defeated by Portuguese naval power. In 1597, Dharmapala died and his crown was surrendered to Portugal. This inspired another uprising, led by Wimala Dharma Suriya.

The Portuguese did not only have to contend with rebellion from the inhabitants of the land. The Dutch, who had grown in their sea power, began casting a jealous eye toward Ceylon and first arrived in 1602 in an expedition headed by Jons Van Spillbergen. Hoping to replace the Portuguese, who were hated, a Dutchman by the name of Sebald de Weert made friendly contact with Wimala Dharma Suriya at the port of Batticaloa the next year. His agreement to aid the people of Ceylon in expelling the Portuguese in exchange for cinnamon turned violent, however. He butchered several cows to feed his crew, in defiance of the taboo against killing these animals, and Wimala had him killed. The Portuguese continued their profitable trade. In 1614, from their base in Goa, they managed to monopolize the cinnamon trade. The tide turned again, though, in 1628 with the ascension of Raja Sinha II to the throne. He formed

an alliance with the Dutch in 1636, who proceeded to move on the most important ports. In 1639, the port of Trincomalee was handed over to them. With help from native allies, they captured the ports of Negombo and Galle in 1640. The most difficult prize was Columbo, which fell to them in 1656.

The Dutch controlled Ceylon and its lucrative spice trade through the DUTCH EAST INDIA COMPANY until 1795, when the British took over their possessions. The British established plantations to grow tea, rubber, and coffee. They also brought unity to the government of the island and established schools. During World War I (1914–18), there arose a movement for independence among the island’s inhabitants, which was finally achieved on February 4, 1948.

Chinese exploration

The political center of China throughout its history has been the basins of the YELLOW RIVER (Huanghe) and YANGTZE RIVER (Chang). From this agricultural region, a uniform culture spread to the south and west, throughout much of eastern Asia, consisting of various peoples with diverse languages. The name *China*, applied by foreigners, is thought to be a corruption of Ch’in (Q’in or Qin), the name of a dynasty in the third century B.C.; the modern Chinese refer to their nation as Zhongguo, for “Middle Kingdom” or “Central Country.”

The history of China is traced through a succession of dynasties. Little is known of the most ancient of them, information being semilegendary—relating to the culture hero Huang Ti—with some archaeological evidence confirming emerging Bronze Age civilizations. Evidence of the use of writing and the historical record begins with the Chang (Shang) dynasty, from about 1570 to 1045 B.C. During the subsequent Chou (Zhou) dynasty, from about 1045 to 256 B.C., the use of iron and the activities of merchants are documented. The Chou dynasty also saw the flowering of Chinese literature and philosophy. Confucius and Lao Tzu (Laozi) developed philosophies that would influence the Chinese for generations to follow, known as Confucianism and Taoism (Daoism). During the later Ch’in (Qin) dynasty, from about 221 to 206 B.C., a centralized government was organized and the Great Wall, a fortification protecting China from northern invaders, was started. The subsequent Han dynasty, from about 206 B.C. to A.D. 220, was an expansionist period, with foreign trade flourishing and Chinese power and influence in the East rivaling that of the

Romans in the West. Buddhism was introduced into China during the Han dynasty.

A pattern in the long procession of these early and later dynasties was a period of outward expansion from the heart of the country and then an eventual period of withdrawing because of internal corruption and stagnation or military pressure, as from the militaristic Hsiung-nu (Xiongnu; Huns) from the north. Native dynasties were at times supplanted by outsiders. The Mongols, starting under GENGHIS KHAN, ruled China in the 13th and 14th centuries A.D. (see MONGOL EXPLORATION).

China, especially during the periods of expansion, has a rich history of travelers who ventured across and beyond China's varied terrain. In about 138–109 B.C., during the Han dynasty mentioned above, CHANG CH' IEN undertook two Chinese diplomatic missions to western lands. His travels took him to the Altai Mountains of central Asia and Afghanistan and to Sinkiang in western China. On two different occasions, he was captured and held by the Hsiung-nu. In A.D. 97, also during the Han Dynasty, another diplomat, KAN YING, was sent on a mission to Rome in an effort to secure the SILK ROAD for Chinese interests. He reached the Middle East, not Rome, yet probably had contact with Europeans. In about A.D. 190, a Chinese woman, WEN-CHI, was abducted by the Hsiung-nu and lived as a nomad on the Mongolian steppes. She later wrote *Eighteen Songs of a Nomad Flute* about her experiences.

In later years, a number of Buddhist monks traveled south from China to India, to see the founding place of Buddhism along with its sacred sites. One such pilgrim was FA-HSIEN, who, in A.D. 399–414, during the T'sin (Jin) dynasty of 265–420, a period of fragmented political control, headed west and south across China, crossing the Takla Makan Desert, Pamir Plateau, and HIMALAYAS into Afghanistan and northern India. From there, he sailed to CEYLON (present-day Sri Lanka).

In 629–645, during the more centralized T'ang (Tang) dynasty of 618–907 (which followed the Sui Dynasty of 581–618, a period of reunification), HSÜAN-TSANG explored much of central Asia and the Indian subcontinent. I-CHING also traveled to India during the T'ang dynasty, in 671–695. He traveled by sea, however, in the type of boat known as a JUNK. His writings include information on the islands of the EAST INDIES and the Malay Peninsula.

Centuries later, in 1221–22, another Chinese scholar embarked on a different kind of mission: CH'ANG-CH'UN traveled from China to Afghanistan to report about the lands and peoples of central Asia to Genghis Khan, then camped in Afghanistan. During the rule of Genghis's grandson Kublai Khan, founder of the Yuan dynasty of 1279–1368, Italian merchant MARCO POLO visited China and, in 1275–92, served as a diplomat to the Mongol emperor, traveling throughout the Mongol Empire, exploring

China, Tibet, Southeast Asia, Indonesia, Mongolia, and possibly SIBERIA. (Reports of contacts between Chinese and Romans date from 100 B.C. The first European who claimed to have reached China—its western part—was the Spanish rabbi BENJAMIN OF TUDELA in the 12th century.)

The geographic information gathered in the course of these travels and those of other diplomats, merchants, and scholars was recorded by cartographers. In 1311–20, CHU SSU-PEN, during the Yuan dynasty, produced a world map with accurate information on China and surrounding lands, including the continent of Africa.

Perhaps the most famous Chinese explorer of all was CHENG HO, who, in 1405–34, during the Ming dynasty of 1368–1644, carried out seven Chinese maritime expeditions, exploring the Indian Ocean, the Persian Gulf, and the RED SEA, as well as coastal East Africa. By the early 16th century, contacts between East and West, especially by sea, became a more routine occurrence.

chronometer

The term *chronometer* has been applied to a variety of instruments that keep relatively accurate time. The motivation to invent a dependable chronometer had its origins in a need to determine longitude for purposes of navigation.

Since longitude is an angular measurement between a fixed location (the meridian) and a variable location on Earth, and since Earth rotates every 24 hours through the entire 360 degree range of longitude, a time difference of one hour between the fixed and variable location is equivalent to 15 degrees of longitude (360 divided by 24). The time of a chronometer is set to that of a fixed location; the time at the location to be measured is calculated (typically using the Sun for such a calculation); the two times are then compared for a reading of longitude. Of course the accuracy of a longitude measurement would be dependent on the accuracy of the chronometer set to the time at the fixed location.

Sailors had used numerous means over the centuries to keep time. Water clocks (clepsydra) were especially vulnerable to the motion of a ship at sea, and, while the hourglass was less so, both required constant human supervision. The first spring-driven clocks of the 16th century were an obvious improvement, yet variations in temperature and humidity compromised their readings.

The first accurate chronometer was invented by John Harrison, a carpenter in Yorkshire, England. In 1735, he completed his first model, then refined it over the next years. The breakthrough he made was the use of several different metals to compensate for changes in temperature. The first extended voyage using his mechanism was made by Englishman JAMES COOK in 1772, who used a duplicate of Harrison's fourth version, completed in 1760.

The Washington Meridian Conference, held in 1884, established Greenwich, England, as the location of the PRIME MERIDIAN, the reference point from which angles of longitude were to be measured. Previously, most countries favored their own capital city as the reference point for navigators. Advances in chronometers have also been made since the 18th century. Inexpensive devices that keep time using the vibration of a quartz crystal are highly reliable.

Cibola (Seven Cities of Antillia, Seven Cities of Cibola)

The legend of the Seven Cities of Cibola originated in Europe in about 1150 as the Seven Cities of Antillia (also Antilia or Antilla). According to the legend, during the eighth century when the Moors were invading Spain, there were seven Portuguese bishops who fled their oppressors, sailing to the west with their parishioners. On encountering new lands, they established seven cities, each of which became fabulously wealthy.

The discovery of American Indian civilizations with precious metals by the Spanish CONQUISTADORES furthered the legend. In 1519–21, HERNÁN CORTÉS conquered the Aztec and appropriated their gold and other wealth; in 1531–32, FRANCISCO PIZARRO did the same among the Inca. Neither of these peoples' homelands or cities fit the description of Antillia, but the possibility of finding the proof for the Antillia legend grew in the Spanish imagination. The name *Cibola*, originally referring to the land of the Zuni Indians, came to be associated with Antillia; the legend evolved into the "Seven Cities of Cibola," where the streets were supposedly paved with gold and houses were set with precious stones.

The first reports of Cibola came from Spaniard ÁLVAR NÚÑEZ CABEZA DE VACA during his wanderings in North America starting in 1528. After being stranded in Texas during a voyage of exploration, he made his way westward through the American Southwest. In the course of his travels, he came in contact with Native Americans who told him of settlements in the region with great wealth. Cabeza de Vaca reported these rumors to ANTONIO DE MENDOZA, the viceroy of New Spain, upon his arrival in Mexico City in 1536.

Mendoza sent a small reconnaissance expedition to investigate these reports. In spring 1539, Friar MARCOS DE NIZA and the North African ESTEVANICO (who had accompanied Cabeza de Vaca on his previous trek) made their way to the north in search of the Seven Cities of Cibola. At one point, Niza sent Estevanico ahead, with instructions to send him back a cross, the size of which would indicate the wealth to be found in the city. Estevanico reached a Zuni Indian

pueblo, probably Hawikuh, and, possibly because of the turquoise he saw there (assuming such turquoise was indicative of great wealth), sent back a large cross. Estevanico was killed by the Zuni before reuniting with Niza. Niza approached himself and, from a distance, saw Hawikuh. It is thought that its glistening in the Sun with decorative stones led Niza to make an overly optimistic assessment of the prospects for plunder.

In early 1540, FRANCISCO VÁSQUEZ DE CORONADO set out from Mexico with a formidable army and entourage to conquer the newly discovered kingdom. On July 7, they reached Hawikuh and overcame the inhabitants with little difficulty. There were no gold, silver, or precious stones to speak of, yet Coronado maintained his hope that other locations would prove more profitable. To this end, he sent out PEDRO DE TOVAR with the missionary JUAN DE PADILLA—an advocate of the Antillia legend of the seven bishops. Heading northwestward, Friar Padilla encountered the Hopi Indians, the homeland of which indicated no great riches. Another excursion was made by GARCÍA LÓPEZ DE CÁRDENAS, who reached the Grand Canyon. HERNANDO DE ALVARADO, while scouting to the east for Coronado, met two captive Plains Indians, the TURK and Ysopete, at the Cicuye Pueblo (Pecos Pueblo) on the Pecos River. The Turk spoke of QUIVIRA, a wealthy Indian land to the northeast, which prompted Coronado's subsequent explorations of the southern plains. Yet, again, no wealthy cities were found.

Such legends persisted among the Spanish explorers of North America. Similar legends in South America, that of EL DORADO and LOS CÉSARES, spurred on explorations of that continent. As the lands of more and more native peoples were reached without ever producing wealth comparable to that of the Aztec and Inca civilizations, the legends faded.

City of los Césares See LOS CÉSARES.

Cipangu (Cipango)

The name *Cipangu*, also spelled *Cipango*, refers to an island east of Asia described by Venetian merchant MARCO POLO in his work *The Book of Ser Marco Polo, the Venetian, Concerning the Kingdoms and Marvels of the East* (which came to be known as the *The Travels of Marco Polo* and various other titles), published at the end of the 13th century after his return from extensive travels in the Far East over two decades.

Marco Polo described Cipangu as an island containing palaces with roofs of gold and streets paved in marble, one of more than 7,000 islands in an archipelago in the Sea of China, off the Pacific coast of Asia. Later explorers studied

the work as a source of geographic information. In the 1490s, Italians CHRISTOPHER COLUMBUS, who sailed for Spain, and JOHN CABOT, who sailed for England, hoped to reach Cathay (the name for China at the time) and Cipangu by way of the Atlantic Ocean. They believed the island a major source of spices. Columbus calculated that Cipangu must be about 1,500 miles off Asia. On reaching the WEST INDIES in the Americas in 1492, believing the islands to be off the Asian mainland, Columbus associated them with Cipangu. Cabot, after reaching North America in an expedition in 1497, raised money for a second voyage the next year, promoting Cipangu as the goal for the sake of the SPICE TRADE. The outcome of that expedition is uncertain: Some reports describe it as lost at sea off North America; others maintain Cabot returned to Europe after exploring northeastern North America as far south as Chesapeake Bay, dying soon afterward.

The fabled island of Cipangu has been most often associated with Japan, which contains the largest islands east of China. Japan has three main islands and more than 3,000 smaller islands. At the closest point to Asia, off present-day South Korea, Japan is only 120 miles distant from the mainland. The widest point of the Sea of Japan between Asia and Japan is just over 600 miles. It is not known what Marco Polo meant by the Sea of China. What is now known as the China Sea (which includes the East China Sea and the South China Sea) extends from southern Japan to the southern end of the Malay Peninsula. There are many islands east of Asia in this region, including those of the EAST INDIES and OCEANIA. In the East Indies are the Moluccas, now part of the Republic of Indonesia, which were once known as the SPICE ISLANDS because of the number of spices produced there. In his account, Marco Polo's geographic descriptions are at best inexact, leaving much room for speculation.

circumnavigation of the world

It is not known when humans first dreamed of circling the world. The ancient Greeks made the case that the Earth was a sphere as early as the fifth century B.C. (see GREEK EXPLORATION). The first known GLOBE, a spherical representation of the Earth, dates from the second century B.C. in Greece. In the second century A.D., hellenized Egyptian PTOLEMY presented his ideas on a curved Earth in his influential work *Geographia*. Yet, although various scholars and mariners, especially among the Muslims (see MUSLIM EXPLORATION), maintained the idea of a curved Earth in the Middle Ages, it did not become a fully accepted concept among Europeans until a route was established south and east around Africa in the 15th century during the RENAISSANCE. Believing in the Earth's curvature, European mariners, such as Ital-

ian mariner CHRISTOPHER COLUMBUS, promoted the idea of reaching the Orient westward from Europe rather than the earlier established eastward route. Columbus, in his expeditions for Spain in the late 15th century, of course never did reach the Orient, making the European discovery of the Americas instead. But a Spanish expedition under Portuguese mariner Fernão de Magalhães, known in Spain as FERDINAND MAGELLAN, did so some years later, and, continuing westward, completed the first circumnavigation of the world.

The First Circumnavigator

After Columbus's voyages, a water route beyond the Americas remained illusive with all inland waterways proving to be bays or rivers, and not the hoped-for NORTHWEST PASSAGE or Strait of Anian (see ANIAN, STRAIT OF) to the Pacific Ocean. Magellan, who had participated in Portuguese expeditions to India and the EAST INDIES early in his career, sought to enter the SPICE TRADE with an expedition to the SPICE ISLANDS (Moluccas). On falling out of favor with Portuguese king Manuel I and failing to receive backing for an expedition, he renounced his Portuguese citizenship and moved to Spain in 1517. Knowing that Portugal controlled the route around Africa to the Far East and that the coast of South America appeared to curve southwestward, he sought support from Spanish king Charles I (Holy Roman Emperor Charles V) for an expedition westward around South America. Magellan reportedly used a copy of the globe designed in 1492 by German cartographer MARTIN BEHAIM to present his case. Magellan received backing, and an expedition of five ships was launched from Sanlúcar de Barrameda, south of Seville, on September 20, 1519.

After crossing the Atlantic, Magellan and his men explored the coasts of present-day Brazil, Uruguay, and Argentina. After the destruction of one ship, the remaining four continued around South America, attempting the passage through what came to be known as the Strait of Magellan (see MAGELLAN, STRAIT OF), north of CAPE HORN. The crew of one ship mutinied and turned back. The remaining three continued westward and, in November 1520, reached the Pacific Ocean, which Magellan named for its apparent calmness. He and his men sailed along the west coast of South America for a time, then, without any awareness of the vastness of the Pacific, began the westward crossing of that ocean as well. After being out of sight of land for more than three months, and with SCURVY affecting a number of the crew, the expedition finally made landfall in the Mariana Islands, part of Micronesia (see OCEANIA), in March 1521. Magellan and his men went on to make the European discovery of the Philippines. There, on April 27, Magellan was fatally wounded in a skirmish with native peoples on the island. The first two commanders to replace him were also killed by natives, and command of

the expedition eventually fell to JUAN SEBASTIÁN DEL CANO, a Spaniard of Basque ancestry. After burning one of the ships because of crew shortages due to death and desertion, the two remaining ships proceeded westward, finally reaching the intended destination, the Spice Islands, in November 1521. The Spanish obtained a cargo of cloves and set sail in January 1522. One under del Cano continued westward into the Indian Ocean. The other, not considered seaworthy enough to make the passage around Africa, turned back eastward in the hope of reaching a Spanish port in present-day Panama in Central America. Del Cano's ship, the *Victoria*, successfully crossed the Indian Ocean, journeyed around the CAPE OF GOOD HOPE back into the Atlantic Ocean, not making a landfall until reaching the Portuguese-held Cape Verde Islands off the coast of West Africa. After detention for a time by the Portuguese, the *Victoria*, carrying 18 survivors, reached Sanlúcar de Barrameda on September 6, 1522.

Although Magellan himself did not complete the voyage, as its initiator, he is honored as the first circumnavigator of the world. That he had traveled from Europe around Africa to the East Indies and back on earlier expeditions in addition to organizing the historic westward voyage means that he, too, in effect traveled around the world. FRANCESCO ANTONIO PIGAFETTA, Magellan's private secretary, kept a record of the westward circumnavigation, published as *Primo Viaggio Intorno al Mondo* (First journey around the terrestrial globe).

Other 16th-Century Circumnavigators

The second circumnavigation of the world occurred nearly a half-century later, led by Englishman SIR FRANCIS DRAKE. Its purpose was to locate the GREAT SOUTHERN CONTINENT, or Terra Australis, believed to exist in southern waters, as well as a water route through the Americas. Drake also had a secret military commission from Queen Elizabeth I to conduct raids against Spanish colonies and ships along the Pacific coast of the Americas. Drake set sail from Plymouth, England, on December 13, 1577, with five ships and 166 men. Unlike Magellan, Drake passed south of Cape Horn in what became known as Drake Passage and headed along the west coast of South America. By then, two of the ships had been abandoned, one had sunk, and one had turned back, leaving only Drake's flagship, originally called the *Pelican*, now known as the *Golden Hind*. After managing to capture a Spanish treasure ship off Callao, Peru, Drake proceeded along the coast of North America, seeking the western outlet of the Northwest Passage as far north as Vancouver Island near the present United States–Canada border. In July 1578, almost a year after entering the Pacific Ocean, Drake headed westward across the Pacific. In the Philippines, he again made successful attacks on Spanish ships. It is not known whether Drake purposely continued westward or intended to return to England by the route he had come

and was forced westward by the pursuit of Spanish ships. In any case, he headed for and reached the Spice Islands in October 1579, where he traded for spices, then sailed across the Indian Ocean and around the Cape of Good Hope into the Atlantic. The *Golden Hind* returned triumphantly with a cargo of Spanish treasure and spice to England on September 26, 1580, whereupon Drake was knighted by his queen. Francis Fletcher, the chaplain on the expedition, wrote an account of the expedition in *The World Encompass'd*.

The first expedition with the express purpose of circumnavigating the world was by another Englishman, navigator Thomas Cavendish, who sought to retrace Drake's exploits. He did so in 1586–88, although his passage around South America was by way of the Strait of Magellan. Afterward, he plundered Spanish settlements and ships as far north as California, then continued westward by way of the Philippines, East Indies, and Cape of Good Hope. His second attempt at a circumnavigation led to his death at sea in 1592.

The Dutch, another maritime power of the EUROPEAN AGE OF EXPLORATION, launched a commercial venture around the world soon afterward. In September 1598, two fleets under OLIVER VAN NOORT departed Rotterdam and followed the routes traveled by earlier circumnavigators. Noort's return to the Netherlands in August 1601, despite a perilous journey, was the first Dutch circumnavigation of the world.

17th-Century Circumnavigators

Sailing around the world was still a rare accomplishment in the 17th century. Englishman WILLIAM DAMPIER did so while conducting privateering raids and explorations in 1683–91 (see PRIVATEERS). His book *A New Voyage Round the World* helped him gain sponsorship for a 1699 expedition to the Pacific, during which he and crew members became the first Englishmen to land on Australia, before returning to England in 1701.

18th-Century Circumnavigators

The British continued to use the route established in earlier centuries in their actions against Spain. In 1740–44, GEORGE ANSON commanded a military fleet in a voyage around the world. Some of the ships were lost in stormy weather off Cape Horn, and many of his men were lost to scurvy, but Anson managed to explore islands along the coast of Chile and raid Spanish ships off Peru and the Philippines. JOHN BYRON, who was part of Anson's expedition and was shipwrecked off Patagonia and imprisoned by Indians who turned him over to Spanish authorities, headed a subsequent naval expedition in search of the Great Southern Continent, circumnavigating the world in 1764–66, during which he made the British claim to the Falkland Islands in the South Atlantic and explored South Pacific island groups.

Meanwhile, JAKOB ROGGEVEEN completed a voyage around the world in 1721–22. He also set out westward from the Netherlands in search of the Great Southern Continent on an expedition sponsored by the DUTCH WEST INDIA COMPANY. His ships were confiscated by officials of the DUTCH EAST INDIA COMPANY in the Dutch port of Batavia (present-day Jakarta, Indonesia) for trespassing, and he was sent home via the Indian Ocean and the Cape of Good Hope.

In 1766–69, LOUIS-ANTOINE DE BOUGAINVILLE commanded the first French expedition around the world. The purpose of the government-sponsored scientific expedition was to locate the Great Southern Continent as well as chart islands in the Pacific. In the western Pacific, Bougainville explored the Solomons and other island groups. His account of the expedition was published as *A Voyage Around the World*.

About the same time, in 1766–68, a British expedition under SAMUEL WALLIS and PHILIP CARTERET, again searching for the Great Southern Continent, sailed around the world, in the course of which Wallis made the European discovery of Tahiti, and Carteret located Pitcairn Island. In his first Pacific expedition of 1768–71, Englishman JAMES COOK returned home by way of a westward route, thus encircling the globe. It was also Cook who ended speculation about the existence of a Great Southern Continent. In the course of his second voyage, in 1772–75, he made a circumnavigation of Antarctica—traveling from the Atlantic into the Indian Ocean, then into the Pacific and back into the Atlantic—demonstrating that no other continent existed in southern waters. In doing so, he again circumnavigated the globe, albeit by a shortened route in southern latitudes. In 1791–95, another British expedition, headed by GEORGE VANCOUVER, with the participation of WILLIAM ROBERT BROUGHTON, made an eastward circumnavigation of the world. He traveled around the Cape of Good Hope to Australia, then to NEW ZEALAND, the HAWAIIAN ISLANDS, and the Pacific coast of North America. Charting the Gulf of Alaska to southern California, Vancouver proved that no outlet to the Northwest Passage existed in that region. He returned to the Atlantic by way of Cape Horn. His account was published as *A Voyage of Discovery to the North Pacific and Round the World*.

The first circumnavigation of the world by a U.S. flagship occurred in 1787–90, when ROBERT GRAY, an American captain on a trading expedition, sailed from Boston to British Columbia and then to China and back to Boston.

19th-Century Circumnavigators

The first official U.S. circumnavigation did not take place until 1838–42. Headed by CHARLES WILKES, with the participation of GEORGE FOSTER EMMONS, the United States South Sea Surveying and Exploring Expedition explored coastal regions of South America, Antarctica, Pa-

cific Ocean island groups, and North America's Pacific Northwest.

Earlier in the 19th century, in 1803–06, ADAM IVAN RITTER VON KRUSENSTERN and YURY FYODOROVICH LISIANSKY completed the first Russian circumnavigation of the world. Sailing from Kronstadt in the Baltic Sea, the expedition took the westward route, as related in Krusenstern's account *Voyage Around the World in the Years 1803, 1804, 1805, and 1806*. OTTO VON KOTZEBUE, who participated on this voyage as a 15-year-old, led a Russian expedition of his own in 1815–18, in which he searched for outlets of the NORTHEAST PASSAGE and Northwest Passage off Asia and North America in the North Pacific. Other Russian expeditions around the world soon followed, headed by MIKHAIL PETROVICH LAZAREV in 1813–16 and 1822–25; VASILY MIKHAILOVICH GOLOVNIN in 1817–19; and FYODOR PETROVICH LITKE in 1826–29. In 1819–21, German-born FABIAN GOTTLIEB BENJAMIN VON BELLINGSHAUSEN, who had sailed around the world with Krusenstern, circumnavigated Antarctica for Russia.

The French also carried out a number of expeditions circumnavigating the world in the first half of the 19th century, for both military and scientific purposes: LOUIS-CLAUDE DE SAULCES FREYCINET in 1817–20, LOUIS-ISADORE DUPERREY in 1822–25, HYACINTHE-YVES-PHILIPPE POTENTIEN DE BOUGAINVILLE in 1824–26, and ABEL-AUBERT DUPETIT-THOUARS in 1836–39. All these French explorers wrote about their journeys.

By Sea, Land, and Air

By the mid-19th century, such maritime voyages were commonplace, and the fact that they circumnavigated the globe was not the primary goal. Another kind of voyage, some of it by land, gained attention at this period of history. In 1847–48 Austrian travel writer IDA REYER PFEIFFER accomplished a westward journey around the world, most of it by sea, but some by land. She wrote about her experiences in *A Woman's Journey Round the World*. In another work, *A Woman's Second Journey Round the World, from London to the Cape of Good Hope, Borneo, Java, Sumatra, Celebes, Ceram, the Moluccas etc., California, Panama, Ecuador, and the United States*, she wrote about her world travels of 1851–55.

There have been other firsts relating to the circumnavigation of the world in the 20th century. From April 6 to September 28, 1924, four American aviators in two Liberty-engined Douglas Cruiser airplanes flew around the world; Seattle, Washington, was the point of departure and arrival. In 1964, American Jerrie Mock became the first woman to pilot a plane, a Cessna 180, around the world. (American Amelia Earhart's attempt in 1937 ended in her disappearance.) In 1967, Sir Francis Charles Chichester, a British aviator and yachtsman, completed the first solo maritime journey around the world in his yacht *Gipsy Moth*

This title page of an 1854 book by Ida Pfeiffer about her trip around the world shows Cape Horn. (*Library of Congress, Prints and Photographs Division (LC-USZ62-108115)*)

IV; in 1999, Bertrand Piccard, AUGUSTE PICCARD's grandson, and Brian Jones, a British pilot, completed the first nonstop circumnavigation of the earth by BALLOON in the *Breitling Orbiter 3* after many other unsuccessful attempts by other aviators.

cog (coque, kogge)

The cog (or coque or kogge) was a ship developed along the north coast of Europe in about 1200 for the purpose of trade. It was stout in its shape, like the ROUNDSHIP, in order to hold a maximum amount of cargo. It had elevated decks at the bow and stern—the forecastle and the sterncastle. In its standard form, it had a single mast holding a single square sail. Wind power was supplemented by a modest number of oars. The original form of the cog was double-ended with a side rudder, like the LONGSHIP of the VIKINGS, from which it was descended. Also, like the longship, it was clinker-built, meaning that the planks forming its hull over-

lapped, with caulking added to make a watertight seal. The cog was of modest size in comparison with the largest ships of the day. Its length was probably no more than 80 feet, and its width (beam), no more than 30 feet. This was due to a combination of the bulky shape of the vessel and the limitations imposed by the clinker construction.

A number of embellishments of the cog and roundship as they coevolved would become important features in later vessels. Just as in the roundship, the side rudder of the cog was replaced by a center-mounted rudder for better control. Primarily a trading ship without great agility, the cog was not practical in warfare. Yet, with its high hull and sturdy construction, it could withstand attacks from smaller, lower, more maneuverable boats. The castles at bow and stern could be used as platforms for fighting, as well as shelter.

The dependability of the cog helped make trading profitable for the HANSEATIC LEAGUE, an association of commercial interests rising from Germany and active especially in the region of the Baltic Sea. When Hanseatic League merchants traveled to the MEDITERRANEAN SEA, the efficiency of their ships was recognized by the merchants of the region, and cogs came into wide use there as well. The hulk—a ship reportedly developed in the Mediterranean—may have been in fact a version of the cog.

During its period of common use, from 1200 to 1450, the cog offered shipbuilders the opportunity to experiment with numerous features of design and construction. These included the keel, the hull, the rigging, and the previously mentioned castles and rudder. The lessons learned with the cog and the roundship gave shipbuilders the knowledge necessary to shape seaworthy ships with larger storage capacity and maneuverability in a variety of conditions, such as the CARRACK and the CARAVEL, used in transoceanic voyages of exploration.

See also SHIPBUILDING AND EXPLORATION.

colonization and exploration

The term *colonization* refers to the act of establishing a colony, that is, a group of people settling in a new region and forming a community fully or partly subject to their original homeland. In some instances, colonization evolves slowly through the actions of individuals or small groups of people and evolves over a long period of time. In other instances, colonizing expeditions are sponsored by the mother country—or an agency, typically a commercial entity working in conjunction with the government—with an organized plan of settlement. Conquest is often the first stage of colonization, yet not necessarily on a large scale (see CONQUEST AND EXPLORATION).

In addition to domination, *colonization* implies exploitation, with countries developing and controlling provinces to promote their own economic, political, mili-

tary, cultural, and religious interests, typically over indigenous peoples but also in competition with other nations. The related terms *colonialism* and *imperialism* imply a philosophy and policy of colonization by the parent nation. *Colonialism* is sometimes used to indicate a policy of strictly regulated political and economic control, and *imperialism*, to indicate a less formal policy, although some scholars associate imperialism with the economic expansion of capitalist states, or for European expansion after 1870. Treaties and alliances were often shaped—sometimes against the will of local inhabitants—to “legalize” whatever the relationship between colonizer and the colonized.

The two main types of colonies are those of settlement and those of exploitation. The concept of migration is implicit in colonies of settlement, with people making new homes and starting new lives (see MIGRATION AND EXPLORATION). Typically native peoples were excluded from such colonies (see NATIVE PEOPLES AND EXPLORATION). In colonies of exploitation, sometimes also called dependencies, the primary purpose of maintaining the colony was economic, with citizens of the parent nation traveling there as administrators and/or military officers along with merchants, workers, and very likely missionaries (see COMMERCE AND EXPLORATION). In these colonies, native peoples typically were considered a labor resource, either through hiring or by force. Sometimes a newly established colony had been part of a preexisting empire—either the controlling nation or the subject people—with a new nation seizing control. Sometimes one political or ethnic group of a region came to exert control over another group or other groups in that same region, sometimes referred to as an “internal colony.” And, elements of all the above colonial variations might exist to some degree in a sphere of influence as held by one nation over another region rather than as a defined colony. A people might be forced to pay tribute or taxes to another people, for example.

Colonization and exploration are related in a number of ways: Colonization served as an incentive to exploratory expeditions to uncharted lands, with governmental and commercial sponsors devising plans to develop new regions; as a result of explorations, with emigrants deciding to travel to distant lands based on the reports of explorers; or as a natural outgrowth of the establishment of colonies, with colonists themselves traveling beyond original settlements.

Ancient Colonizers

Most of the ancient peoples of the MEDITERRANEAN SEA discussed in this book as especially important to the history of exploration in opening up contacts with regions beyond their homeland—Egyptians, Phoenicians, Greeks, and Romans—founded colonies (See EGYPTIAN EXPLORATION;

GREEK EXPLORATION; PHOENICIAN EXPLORATION; ROMAN EXPLORATION). That they were either merchants who established commercial centers far from home or empire builders seizing territory relates to both exploration and to colonization.

From their homeland along the NILE RIVER, the Egyptians pushed into other parts of Africa, and, during the 18th century B.C., under the pharaoh Thutmose III, conquered territory in Asia as far east as the Euphrates River, including some Phoenician cities and all of what is now Syria. They themselves were colonized for parts of their history, by Libyans, Nubians, Assyrians, Persians, Greeks, and Romans.

Spreading out from present-day Lebanon, the Phoenicians founded trading posts throughout the Mediterranean area and came to control surrounding regions politically. One such center was Carthage in North Africa, founded in the late ninth century B.C.; the Carthaginians also established dominion over other regions.

The Greeks came to control most of the islands in the eastern Mediterranean and also founded settlements in coastal regions of present-day Italy and France, the Iberian Peninsula, parts of Asia Minor and other coastal regions of the Black Sea, and present-day coastal Libya in North Africa. By 500 B.C., they had some 700 settlements under their control. Macedonian ruler ALEXANDER THE GREAT of the fourth century B.C. united the Greek city-states under him and led Greco-Macedonian forces beyond the Mediterranean into Asia as far as India. In the course of his short reign, he founded more than 70 cities in foreign lands.

By A.D. 117, at its greatest extent, the Roman Empire included territory from Italy eastward to Constantinople (present-day Istanbul, in Turkey) and Palestine, southward to North Africa, and northward to Gaul (France) and Britain. At their military posts in foreign lands, the Romans devised a system of colonization in which Roman women were sent along to grow crops and for handiwork and to bear children, so that the post would be self-sufficient and grow.

In addition to these Mediterranean peoples, the ancient Chinese were known as both explorers and colonizers, ever seeking to expand their interests beyond the heart of their territory, the YELLOW RIVER (Huanghe) in eastern Asia. The period of the Han dynasty, from about 206 B.C. to A.D. 220, was an expansionist period, with foreign trade flourishing and Chinese power and influence in the East rivaling that of the Romans in the West.

Medieval Colonizers

The creation of the new religion, Islam, on the Arabian Peninsula in the 620s–630s led to the ascendancy of Arab Muslims in the region. Over the next years, Muslim forces conquered much of the Near East, parts of central Asia, and all of North Africa (see MUSLIM EXPLORATION). In 711, they invaded the Iberian Peninsula, where the Moors—a

Muslim people out of North Africa—maintained a colonial presence until 1492. Travel throughout Muslim lands and beyond became commonplace. For example, the most famous Arab traveler, ABU ABD ALLAH MUHAMMAD IBN BATTUTA, traveled throughout Egypt, Arabia, central Asia, North Africa, and Spain in the 15th century.

From about 800 to 1100, the Vikings out of Scandinavia were active in Europe as traders, raiders, and settlers (see VIKING EXPLORATION). They came to have settlements in the British Isles and neighboring islands in the North Atlantic, western and eastern Europe, ICELAND, GREENLAND, and northeastern North America. The successful large-scale colonizing expedition of ERIC THE RED to Greenland in 985 or 987 led to explorations farther westward to northeastern North America by his son, LEIF ERICSSON, and eventual attempts at colonies in what is referred to in Viking texts as VINLAND, thought to be in Newfoundland. Later descendants of the Vikings—generally referred to in texts as Normans—also established colonies, such as Roger I, who captured Sicily from the Arabs in 1061–91.

In the case of both the Muslims and Vikings, the colonies were not politically regulated by rulers in the original homelands but came to be ruled locally yet maintaining cultural and commercial ties.

With the CRUSADES—the series of religion-inspired incursions into the Near East of the late 11th century to the late 13th century—to counter the expansion of the Seljuk Turks (Muslim people in the Near East), Europeans from a number of different nations established colonies. Yet, they did so without necessarily a political center at home—rather a religious one, the seat of the Catholic Church in Rome. During those centuries the Venetians and Genoese established commercial colonies along trade routes to the East and regulated them for the task at hand—the free flow of goods.

It was the rise of the Mongols, who created a vast empire throughout most of Asia and into eastern Europe in the 13th century under GENGHIS KHAN—with numerous ethnic groups as tribute peoples—that enabled new trade contacts between East and West (see MONGOL EXPLORATION). Merchants, such as Venetian MARCO POLO in the 1270s, could travel the SILK ROAD, parts of which had been controlled by Muslims in earlier centuries.

The European Age of Exploration

Starting in the 15th century, at the beginning of what is referred to as the EUROPEAN AGE OF EXPLORATION, a number of European nations developed oceangoing ships and began seeking new trade routes to the East. There resulted from their wide-ranging maritime voyages a new understanding of world geography, including the extent of Africa and the existence of the Americas between Europe and Asia. Numerous colonies were founded in the years to come, many as

trading posts but others evolving into or founded as permanent settlements: by the Portuguese in Africa, Asia, and South America in the 15th century and 16th century; by the Spanish in South America, Central America, and North America in the 16th century; and by the Spanish, English, French, and Dutch in North America in the 17th century (after some failed attempts by the French and English in the 16th century, including what is known as the LOST COLONY). In fact, much of the exploratory activity of this period of history directly relates to the claiming of territory and the founding of colonies—from Italian CHRISTOPHER COLUMBUS's founding of Santo Domingo on Hispaniola in the present-day Dominican Republic in the WEST INDIES in 1496, the oldest permanent settlement in the Americas, to the founding of Plymouth colony by the PILGRIMS in present-day Massachusetts in 1620.

The various European powers enacted laws to manage their foreign holdings. The Spanish in particular developed a complex system of governance relating to the CONQUISTADORES and the native population in the early 15th century. A royal decree known as the *requerimiento* was read by conquistadores to Indian tribes informing them of their duty to the Catholic Church and the Spanish Crown and their right to freedom if they submitted, along with the threat of war and enslavement if they did not. To achieve anything resembling freedom, however, the Indians had to prove themselves “civilized” in terms of religion, language, shelter, and dress. Because of reports by missionaries of the widespread abuses of the system (even if Indians managed to work out a translation of the decree and reacted peacefully, they were still often brutalized and taken as slaves for personal use or profit), the pope and the Crown further structured Indian policy. In 1512, the Laws of Burgos established the *encomienda* system, which required male Indians to work nine months out of each year in return for entry into Spanish society. In 1542, the *repartimiento* replaced the *encomienda*; this was a system of land grants, giving the grantee the right to exploit the native population with an annual levy for labor and produce. These various laws enabled the creation of a *hacienda*—a large estate typically used for farming and ranching.

The Colonial Age

Out of the exploration and colonization of the 15th and 16th centuries there developed the trade empires of the major European powers—Portugal, Spain, the Netherlands, England, and France—and the beginning of modern colonialism. The overseas colonies served as a source of raw materials and as markets for manufactured goods, leading to the rapid growth of maritime traffic between parent companies and their colonies. In the late 16th and early 17th centuries, chartered companies, such as the BRITISH EAST INDIA COMPANY, DUTCH EAST INDIA COMPANY, and FRENCH EAST INDIA

Jacques Le Moyne depicted the French arrival at Port Royal in South Carolina in 1562 in this map. It was published by the Flemish engraver Théodore de Bry in 1591. (*Library of Congress, Prints and Photographs Division [LC-USZ62-380]*)

COMPANY, working in conjunction with governments, became a primary instrument of colonization. Through them, the English and Dutch came to dominate the trade of the EAST INDIES, wresting control of it away from the Portuguese and founding numerous colonies. The French also came to establish a colonial presence there.

Economic growth was promoted by the policy of mercantilism, a trade policy of state intervention in economic matters, especially to maximize exports and increase a nation's store of gold and silver. Thus, in a mercantile system, colonial possessions did not compete economically with the controlling countries but were regulated in order to provide wealth to them.

Great Britain grew into the largest colonial power through naval power. In the mid-18th century, the British had gained control of the Indian subcontinent, most of which had been part of the Mogul (Mughal) Empire, centered in northern India. Soon afterward, however, it lost control of many of its colonies in North America during the American Revolution of 1775–83, prompted in part

because of legislation known as the mercantilist Navigation Acts, passed in 1651, which restricted shipping to and from colonies to British companies, ships, and crews.

Yet, Great Britain continued to establish colonies in other parts of the world, such as Australia. The first permanent British settlement there, a penal colony for prisoners from the British Isles, was founded in 1788 under ARTHUR PHILLIP. Over the next decades, the growth of Australia as a colony led to expeditions. About the same time, European interests began moving inland from Africa's coastal regions and settling new lands. In 1752, for example, AUGUST BEUTLER led a group of Dutch colonists from the Cape Town colony into the Transkei region. Colonial ambitions in Africa led to numerous expeditions well into the 18th century, and the continent would come to be carved up among European nations. In what is called the "Scramble for Africa," European nations partitioned Africa at the Berlin West Africa Conference (1884–85).

The colonial, or imperial, age lasted until the mid-20th century. National liberation movements arose especially

after World War II of 1941–45, when subject peoples demanded self-determination and were granted or won independence from the imperial powers through negotiations and violence. Remnants of the centuries of colonization still exist, but as self-governing dependencies.

Many explorers who had expeditions financed to further colonization and/or helped bring about colonization themselves did not regard themselves as colonizers. Some responded to exploration as a calling unto itself, or traveled to foreign lands for other ideals, such as missionaries who sought to protect native peoples from the effects of colonization even as they converted them and thus facilitated additional settlement by outsiders. Yet colonization has been a historical current since ancient times and, as such, has to be studied at the very least as context to exploration in general.

Colorado River

At 1,450 miles long, the Colorado River is the longest river west of the ROCKY MOUNTAINS in North America, and one of the major rivers of the United States. Originating just west of the Continental Divide in the Rockies of northern Colorado, it follows a southwesterly course across Colorado and southeastern Utah. After the Green River, its chief tributary, joins the Colorado in southeast Utah, the river then flows westward through the Grand Canyon, and then southward, where it functions as the lower section of the border between Arizona and Nevada and the entire border between Arizona and California. It then flows approximately 90 miles across northwestern Mexico, where the border lies between the states of Sonora and Baja California, and empties into the Gulf of California.

In addition to the Green River, the Colorado River receives a number of other sizable tributaries, including the Gunnison, Yampa, Dolores, San Juan, Virgin, Little Colorado, Salt, and Gila Rivers. The entire system drains about 245,000 square miles in seven states (Colorado, Wyoming, Utah, New Mexico, Nevada, Arizona, and California) and an additional 2,000 square miles in Mexico.

The Colorado's powerful current has carved a series of deep canyons and gorges through its first 1,000 miles. The best known example is the Grand Canyon, where the river cut through consecutive layers of rock and gradually enlarged and deepened its own course. The effects of the current, in combination with the wind and weather, created a canyon 277 miles long, 18 miles wide, and up to a mile deep. Its course there is marked by a series of rapids and waterfalls. The large amounts of sediment carried by the Colorado have created an extensive delta in Mexico. Along its lower course, because of the great amount of sediment, the

water seems reddish in color, leading to the name given by the Spanish, *colorado* for “reddish.”

Spanish Exploration

It is thought that the first European to see the Colorado was Spaniard FRANCISCO DE ULLOA in 1539–40. He headed an expedition sent out from Mexico by HERNÁN CORTÉS, which explored the Pacific coast of Mexico, the Gulf of California, and the mouth of the Colorado. Using one of his ship's boats, he traveled far enough north to see mountain peaks in the distance, situated in present-day California. In 1540, a Spanish overland expedition under FRANCISCO VÁSQUEZ DE CORONADO out of Mexico entered what is now the American Southwest and set up headquarters at the Zuni Indian pueblo of Hawikuh in present-day western New Mexico. One of his lieutenants, PEDRO DE TOVAR, exploring to the northwest, reached the Hopi pueblo of Awatovi in present-day northeastern Arizona. There he learned of a great river to the west. Based on this information, Coronado sent out another expedition under GARCÍA LÓPEZ DE CÁRDENAS, who with his contingent became the first known Europeans to see the Grand Canyon. Meanwhile, HERNANDO DE ALARCÓN, with the seaward portion of Vásquez de Coronado's expedition, sailed northward with supplies. After exploring the Gulf of California, he traveled a good distance up the Colorado—about 200 miles to the vicinity of its confluence with the Gila River, near present-day Yuma, Arizona, where he left a marker. MELCHIO DÍAZ, another one of Vásquez de Coronado's lieutenants, later found the marker.

In 1582–83, a Spanish merchant by the name of ANTONIO ESTEVAN DE ESPEJO financed his own expedition to western New Mexico and eastern Arizona in search of missing missionaries, during which he reached the Little Colorado River in Arizona. Two decades later, in 1604–05, JUAN DE OÑATE, who had founded the first permanent Spanish settlement in New Mexico in 1698, explored westward and explored the lower Colorado, reaching the Gulf of California. The man who charted much of the region of the lower Colorado, as well as the Gila River, was Italian Jesuit missionary EUSEBIO FRANCISCO KINO, trained in astronomy and mathematics, who led some 50 exploratory expeditions in northern Mexico and southern Arizona out of a mission in what is now Sonora, Mexico, in the late 17th and early 18th centuries. He dispelled the myth once and for all that the California Peninsula was an island. Later in the 18th century, in 1774–76, JUAN BAUTISTA DE ANZA followed the Gila River to the lower Colorado on two expeditions to California. Franciscan missionary FRANCISCO TOMAS HERMENEGILDO GARCÉS accompanied him on the first expedition and part way on the second. In 1776, Garcés, seeking native converts, reached the Grand Canyon. In 1776–77, Franciscan missionaries FRANCISCO ATANASIO

DOMÍNGUEZ and FRANCISCO SILVESTRE VÉLEZ DE ESCALANTE, in an unsuccessful effort to create a route between the Spanish settlements of Santa Fe, New Mexico, and Monterey, California, explored parts of the Colorado itself, as well as the Dolores River in western Colorado and the Green River in Utah.

U.S. Exploration

In the mid-19th century, after the United States assumed control of the Southwest from Mexico with the Mexican Cession of 1848, following the U.S.-Mexican War, U.S. Army Corps of Topographical Engineers launched a number of surveying expeditions to the West, among them one under JOSEPH CHRISTMAS IVES in 1857 to determine the navigable limits of the Colorado. Geologist JOHN STRONG NEWBERRY was part of this expedition as was Mojave Indian IRATEBA as a guide. From the river's mouth, Ives and his party reached as far north as the Black Canyon along the border between Arizona and Nevada. In another military expedition, in 1859, JOHN N. MACOMB, also of the Corps of Topographical Engineers, again joined by Newberry, located the junction of the Grand and Green Rivers in eastern Utah, which they determined as the source of the Colorado. The Grand River is now considered part of the Colorado, and its name has been dropped. Grand Lake far to the northeast in northern Colorado is now considered the Colorado River's source.

In 1869, geologist JOHN WESLEY POWELL made the first detailed scientific exploration of the Colorado River, the Green River, and surrounding territory. During that expedition, Powell and his party navigated through the Grand Canyon in wooden boats. In 1871, Powell embarked on another descent of the Colorado. He wrote a report of his journey for the government in which he suggested that the land could support only a limited amount of irrigated agriculture.

The Colorado River and its tributaries are the primary source of water for much of the American West, especially the Southwest, and a part of northern Mexico as well. About two-thirds of the system's water is used for irrigation; much of the rest of it supplies urban areas. Numerous dams have been built along the system, which serve to generate hydroelectric power, store water, and control floods. Along the border of Arizona and Nevada, where the Colorado runs through Black Canyon, the construction of Hoover Dam has created the reservoir known as Lake Mead. The lakes formed by dams also provide recreational activities, as do sections of the rivers for fishing and whitewater rafting. Yet population increases in the vast Colorado River region have already begun to strain the water supply.

Columbia River

About a third of the course of the Columbia River, one of the longest rivers in western North America, is in Canada, the rest in the United States. From its source at Columbia Lake in southeastern British Columbia, it travels 1,214 miles before it empties into the Pacific Ocean at Astoria, Oregon. In British Columbia, the river flows northwesterly for about 200 miles between the ROCKY MOUNTAINS to its east and the Selkirk Mountains to its west. This section is also known as the Rocky Mountain Trench. After flowing along the northern edge of the Selkirk Mountains, it turns southward and widens into the Upper and Lower Arrow Lakes. It is joined by the Kootenai (spelled Kootenay in Canada) and Pend d'Oreille Rivers. Continuing southward, it flows into the state of Washington in the United States.

The Columbia continues its southerly course across Washington for about 100 miles until its juncture with the Spokane River. From there, it curves westward in an arc known as the Big Bend, then follows a generally southerly route until its juncture with the Snake River, at which point it turns westward again and forms the border between the states of Washington and Oregon. It crosses the Cascade Range through the Columbia River Gorge. Along its route, it passes through several canyons and deep valleys of both the Cascades and the Coastal Range as well. Numerous rivers feed the lower Columbia, among them the Deschutes and Willamette flowing from the south, and the Cowlitz from the north. The lower Columbia angles to the northwest on its final stretch and eventually opens up to a broad estuary and Gray's Bay, 20 miles from open ocean, the Pacific. Including its tributaries, the Columbia River drains nearly 260,000 square miles.

The upland country between the Rockies and the Cascades is known as the Columbia Plateau after the river. Native Americans of this region, who depended on the Columbia and its tributaries for sustenance—especially for the salmon spawning runs upriver—are sometimes grouped together as Plateau Indians.

From the Sea

Early explorations along the Pacific coast of North America were motivated in large part by the hope of finding the outlet to the NORTHWEST PASSAGE. Spanish naval officer BRUNO HECETA was the first European to discern the Columbia River from the sea. While exploring the Pacific coast in August 1775, he entered a bay, where he noticed strong currents, making him believe a river fed it. He named the river Río San Roque. The currents drove his ship out to sea before he could explore upriver, and he returned to Mexico.

In April 1792, an American sea captain named ROBERT GRAY, who had earlier completed the first CIRCUMNAVIGATION OF THE WORLD by a U.S. flagship, the *Columbia*, was off the Pacific Northwest coast on a second trading expedition

out of Boston. His goal, as in the earlier expedition, was to exchange trade goods for furs from Indian tribes, then sail to China and barter the furs for tea. While sailing southward along the coastline, he located a point where the current and waves seemed to indicate a river emptying into the Pacific, which he thought might be the large river reported by Indians—the Oregon, as it was known (a Native American word, the derivation of which is unknown). A sandbar made passage dangerous. After exploring to the north—during which time he met up with a British ship and conferred with its captain, GEORGE VANCOUVER—he returned south and crossed a sandbar into what was known as Deception Bay, now known as Gray’s Bay. After trading with Indians along the bay, he entered the river—which he renamed the Columbia after his ship—sailing about 36 miles into it. The United States made a claim to the region based on his findings. England also claimed the region. Later that year, British naval officer WILLIAM ROBERT BROUGHTON, sailing a second ship under Vancouver’s overall command, navigated 119 miles upriver and made the first accurate charts of the area over a period of three weeks.

Lewis and Clark

The Columbia River also was an important route of transportation for the Lewis and Clark Expedition of 1804–06, sent out by U.S. President Thomas Jefferson, which departed St. Louis on May 14, 1804. One of Jefferson’s hopes was that the expedition would find a water route all the way to the Pacific. While MERIWETHER LEWIS and WILLIAM CLARK and their Corps of Discovery were forced to travel much of the way overland, after crossing the Rockies and the Continental Divide, they reached the Clearwater River, and, under the guidance of Nez Perce Indians, they carved dugout CANOES. The Clearwater took them to the Snake River, which took them to the Columbia on October 16, 1805. They continued by canoe, navigating through rapids and around waterfalls. On November 7, the explorers reached the mouth of the Columbia in Gray’s Bay on the Pacific. They built Fort Clatsop on the south shore, where they spent the winter, exploring the region and setting out back eastward on March 23, 1806, arriving in St. Louis on September 23.

Trade and Settlement

In 1810, JOHN JACOB ASTOR of the AMERICAN FUR COMPANY, and its subsidiary the Pacific Fur Company, sponsored a maritime expedition to the mouth of the Columbia, where the settlement of Astoria was built the next year, also on the south shore. An overland party, known as the Astorians, under WILSON PRICE HUNT, departed St. Louis soon afterward in 1811, traveling the Columbia on the last leg, arriving at Astoria early in 1812. In 1810–11, DAVID THOMPSON, a British-born fur trader of the NORTH WEST COMPANY, who had already mapped large areas of Canada,

became the first known non-Indian to follow the Columbia River from its source to its mouth and visited Astoria. In 1813, during the War of 1812, the Astorians sold the post to the North West Company rather than make a stand against a British warship.

Following the war, by the terms of the Treaty of Ghent—based on the activities in the region of Robert Gray, Lewis and Clark, and Astor—the British returned Astoria to American possession. In 1818, the United States and Great Britain signed a treaty, agreeing that for 10 years their subjects and citizens of both nations could jointly occupy the Oregon Country (which comprised much of the Pacific Northwest at the time, from the Continental Divide to the Pacific Ocean and from the present border between California and Oregon to Russian Alaska).

Other traders worked the region over the next years. In the 1820s–30s, JOHN MCLOUGHLIN of the HUDSON’S BAY COMPANY was based at Fort Vancouver (present-day Vancouver, Washington, opposite Portland, Oregon) on the Columbia for operations throughout the Pacific Northwest, including expeditions under PETER SKENE OGDEN and JOHN WORK. In 1827, American traders JEDEDIAH STRONG SMITH and JOSHUA PILCHER visited the post. In the 1830s, Boston merchant NATHANIEL JARVIS WYETH led two fur-trading expeditions to the region; Methodist missionary Jason Lee, who later founded schools in Oregon, accompanied him on the first. The establishment of the Oregon Trail brought more settlers to the Columbia River region, including Presbyterian missionaries MARCUS WHITMAN and HENRY HARMON SPALDING. In 1843, Kentucky-born JESSE APPLGATE helped lead a wagon train with about 1,000 emigrants, known as the “Great Migration of 1843.” Many of them settled in the Willamette Valley.

In 1846, Britain ceded Oregon Country to the United States, paving the way for the establishment, over the years, of the present international, state, and provincial boundaries of Columbia River country.

commerce and exploration

The term *commerce* refers to the exchange of goods or services between peoples. It is used interchangeably with the term *trade*, although the former in some usage indicates the exchange of goods on a large scale, such as commercial dealings between nations, as well as traffic in goods that have to be transported over a distance.

The theme of commerce runs through the history of exploration. A desire for commerce helped spur on voyages to distant lands, and new forms of commerce resulted from voyages. Exploration was often a moneymaking endeavor.

Many SPONSORS OF EXPLORATION, whether merchants or rulers of nations, hoped to profit from their investments in expeditions, as did the explorers themselves.

Ancient Peoples and Commerce

The ancient peoples most studied with regard to exploration were in many cases known as merchants, in particular the Minoans, Phoenicians, and Greeks, who developed markets along the coasts of the MEDITERRANEAN SEA and beyond through maritime exploration (see GREEK EXPLORATION; MINOAN EXPLORATION; PHOENICIAN EXPLORATION). Yet commerce is a part of the story of some of the other ancients, such as the Egyptians (see EGYPTIAN EXPLORATION). When Queen HATSHEPSUT sent out an expedition to the southern land of PUNT by way of the RED SEA in about 1492 B.C., it was in the hope of locating sources of goods, such as gold and spices.

The Egyptians also hired proven mariners—the Phoenicians and Greeks—to seek out sources of goods on their behalf, as did the Romans (see ROMAN EXPLORATION). A Greek, HIPPALUS, for example, sailed to India in the first century A.D. on behalf of Egypt, then under Roman domination.

The Chinese also sent out expeditions for purposes relating to commerce (see CHINESE EXPLORATION). That which first established what became known as the SILK ROAD, the route over which silk was transported from the Far East to Europe, was carried out by the diplomat CHANG CH'EN in 115 B.C., during which his envoys made trade arrangements with peoples of the eastern Mediterranean. In A.D. 97, another diplomat, KAN YING, was sent on a mission to Rome in an effort to secure the Silk Road. And the seven journeys of the admiral CHENG HO in the early 15th century, although they may have been initiated for political and military purposes, had the effect of opening up coastal regions of the Indian Ocean to Chinese trade.

Medieval Commerce

After the breakup of the Roman Empire in the fifth century A.D., new trade relations developed between Europe, Africa, and Asia in the Middle Ages. A people who became active in trade during this period were the Arabs, who traveled the Indian Ocean between the Near East, East Africa, and Southeast Asia. After the rise of Islam in the seventh century A.D., Arab Muslims ranged even farther for purpose of trade. In many instances, they acted as middlemen between Asian and European interests. Much of the commercial activity surrounded the SPICE TRADE, with the West's demand for spices that were produced in the East. Arabs also controlled the African SLAVE TRADE, capturing or trading for slaves and selling them in European and Asian markets. Salt was another valued commodity produced in Africa. A 10th-century merchant ABU AL-QASIM IBN ALI AL-NASIBI IBN

HAWQAL wrote about the trade routes of the SAHARA DESERT. Another Arab merchant, ABU ALI AHMAD IBN RUSTA, wrote about his travels in Europe.

Commerce between Asia and Europe slowed down in the mid-11th century, however, when the Turks, who also came to adopt the Islamic religion, conquered many Arab lands and threatened Constantinople (present-day Istanbul), the seat of the Eastern Roman Empire (Byzantine Empire). The resulting CRUSADES—military actions by Europeans against the Muslims of the Near East from the late 11th century to the late 13th century—thus had a commercial purpose of reopening trade routes as well as the religious one of spreading Christianity. The Crusades in turn had the effect of sparking new commerce because returning Crusaders had a new interest in Eastern goods.

During the Crusades, Italian port cities took on a central role in East-West commerce. Venice and Genoa, port cities in northern Italy, became primary launching points for trade. It was from Venice that Venetian merchants NICCOLÒ POLO, his brother MAFFEO POLO, and Niccolò's son MARCO POLO set out for the East in the late 13th century, in order to develop trade contacts with the Mongols, who then controlled China and much of central Asia. Marco Polo's writings about his extensive travels led to even greater interests in Eastern products.

In the meantime, trade with foreign interests had become safer because merchants began to form associations for the protection of travelers abroad. The HANSEATIC LEAGUE, a commercial union of German cities and towns and their merchants, was active by the mid-12th century. The Baltic Sea became a hub of trade to other parts of Europe and the eastern Mediterranean. Europe was known as a source of raw materials, such as tar, timber, tin, furs, and wool; some manufactured goods, such as woolen garments and linens; and prepared foods, such as salted fish, wine, oil, and fruit. Asia was known as a source of luxury items, especially spices, tea, textiles, and jewelry.

Commerce during the European Age of Exploration

Because of Muslim domination of overland trade routes and the expense of overland expeditions, European powers hoped to develop water routes. The fall of Constantinople to the Turks in 1453 made it even more economically imperative that European nations bypass Muslim strongholds. HENRY THE NAVIGATOR, prince of Portugal, had earlier begun the process of a maritime solution when he had founded a naval depot, an observatory, and a school of navigation at Sagres near Cape St. Vincent in Portugal, and had assembled together astronomers, mapmakers, and mariners. One of his main goals was to make a seaworthy vessel, combining sturdiness and maneuverability, the result of which was the CARAVEL (see SHIPBUILDING AND EXPLORATION).

Navigational instruments were also refined (see NAVIGATION AND EXPLORATION). Before long, Henry was sponsoring expeditions along the coast of Africa, and, by the turn of the century, the Portuguese were sailing in the Indian Ocean. In 1498, VASCO DA GAMA reached India, where he traded a load of European goods for a cargo of pepper.

In the meantime, in 1492, Italian mariner CHRISTOPHER COLUMBUS, funded by and sailing for Spain, had reached the Americas by making a westward crossing of the Atlantic Ocean. Although he was disappointed in his hope of finding spices and gold, his four voyages back and forth between Europe and the Americas started the process of creating a desire for new products, such as tobacco, unknown in the rest of the world at the time, and creating new markets and trade relationships.

Subsequent Spanish expeditions—in particular those of HERNÁN CORTÉS among the Aztec Indians of Mexico in the 1520s and FRANCISCO PIZARRO among the Inca Indians of Peru in the 1530s—revolutionized the economy of Europe in that they led to an infusion of great amounts of plundered gold to Spain and prompted other expeditions for the purpose of colonization (see TREASURE AND EXPLORATION). The mining of silver by American Indians for the Spanish also contributed to the Spanish economic ascendancy. There was a demand for the commodity of precious metals in Asia as well as in Europe. In addition to the Portuguese and Spanish, the English, French, and Dutch began sailing the Atlantic for the Americas, with investors hoping for a return from these ventures in the form of wealth appropriated from native peoples or in the FUR TRADE.

Out of the explorations along the African coast and the colonization of the Americas, there also expanded the commerce in human lives. In 1562–63, Englishman SIR JOHN HAWKINS completed the first voyage in what became known as the “triangular trade” between Europe, Africa, and the Americas. European ships would transport manufactured goods to Africa’s west coast, where they would be bartered for slaves. The slaves would then be taken to the North and South American colonies, where they would be exchanged for mostly agricultural goods, especially cotton, tobacco, sugar, and molasses, as well as rum, which would then be transported back to Europe.

The Merchant Companies

Starting in the 15th century, many exploratory expeditions were launched by merchants, organized in syndicates and legal partnerships. For example, a number of merchants of Bristol in England, who had been active in commerce since the Middle Ages, organized a syndicate to back the expedition of Italian mariner JOHN CABOT—who had earlier participated in the spice trade in the Mediterranean—across the Atlantic in 1497, in the hope of reaching the spice markets of the Far East. Cabot headed a second such expedition the next year, again with Bristol backing, and searched for a

water route through North America from the Atlantic Ocean to the Pacific Ocean—the NORTHWEST PASSAGE.

In the 16th century, a number of merchant companies were formed to back expeditions, often with shareholders. These companies would purchase their own ships and hire captains and crews to man them. Governments went into the business of chartering these privately owned and managed companies and sometimes investing in particular expeditions. The royal charters granted the merchant companies a monopoly over trade with certain regions.

One of the earliest of the merchant companies was the London-based MUSCOVY COMPANY, founded in 1551, with SEBASTIAN CABOT, John Cabot’s son, as the first director, which became involved in the search for a route eastward north of Europe, the NORTHEAST PASSAGE. Although it was unsuccessful in that purpose, with expeditions encountering ice conditions time and again, the Muscovy Company’s activities led to the charting of northern coastal regions and islands and opened up new markets in Russia.

The CATHAY COMPANY was a short-lived company, created in the winter of 1576–77 as result of an expedition headed by SIR MARTIN FROBISHER that had been launched the prior spring to find the Northwest Passage. On southeastern Baffin Island off the North American mainland near the ARCTIC CIRCLE, Frobisher had discovered what he believed to be gold, but which turned out to be FOOL’S GOLD, or pyrite, a worthless mineral.

The LEVANT COMPANY, which was granted a royal charter in 1581, then reorganized in 1607 as a joint-stock company, was created to develop trade between the British Isles and the countries of the LEVANT, the eastern Mediterranean, in order to circumvent the Venetians, who had had a monopoly on the traffic between Europe and that region.

At the beginning of the 17th century, both the English, in 1600, and the Dutch, in 1602, founded an East India Company—differentiated now as the BRITISH EAST INDIA COMPANY and DUTCH EAST INDIA COMPANY—to develop trade with India and the SPICE ISLANDS (the Moluccas), as well as other islands in the EAST INDIES and other lands in the Far East. In 1621, the Dutch founded the DUTCH WEST INDIA COMPANY for trade in the Americas. The French set about developing the Asian trade with the founding of the FRENCH EAST INDIA COMPANY later in the century, in 1664.

Among the other companies formed to develop foreign trade in the 17th century was the COMPANY OF MERCHANTS OF LONDON DISCOVERERS OF THE NORTHWEST PASSAGE in 1612, which sponsored a number of unsuccessful expeditions to find the passage, and the HUDSON’S BAY COMPANY in 1670, organized to develop the fur trade around North America’s HUDSON BAY.

The VIRGINIA COMPANY is a name used for both the Virginia Company of London and the Virginia Company of Plymouth. They were granted royal charters at the same

time in 1606, leading to the founding of Jamestown in present-day Virginia in 1607 by CHRISTOPHER NEWPORT and JOHN SMITH and the founding of Plymouth Colony by the PILGRIMS in present-day Massachusetts. Although the purpose of these companies was to colonize North America, it was hoped that discoveries of precious metals or the development of new agricultural products would make the ventures profitable. At Jamestown, the colonists grew tobacco, which was shipped back to Europe and other parts of the world over the years. The Pilgrims participated in the fur trade with Indians.

In addition to supplying raw materials, the establishment and subsequent growth of colonies—in Africa and Australia as well as the Americas—also meant the creation of new markets for manufactured goods (see COLONIZATION AND EXPLORATION).

The North American Fur Trade

The fur trade led to the early exploration of North America more than any other activity. Much of it was in the direct form of trade with Native Americans, but non-Indians also came to hunt and trap animals for their furs. Some of the most famous names in the history of North American exploration were fur traders. French fur traders included JACQUES CARTIER, who explored along the St. Lawrence River in the early to mid-16th century; SAMUEL DE CHAMPLAIN, who explored parts of the Northeast in the early 17th century; RENÉ-ROBERT CAVELIER DE LA SALLE, who explored along the Great Lakes and MISSISSIPPI RIVER; and MÉDARD CHOUART DES GROSEILLIERS and PIERRE-ESPRIT RADISSON, involved with the founding of the already mentioned Hudson's Bay Company in 1670 to develop the fur trade in the Hudson Bay region. French-Canadian fur traders included LOUIS-JOSEPH GAULTIER DE LA VÉRENDRYE and his brother François, and PIERRE-ANTOINE MALLET and his brother Paul, among the first non-Indians to reach the Great Plains in the 1730s–1740s.

Fur traders of English and Scottish ancestry for the Hudson's Bay Company included HENRY KELSEY, who explored the Canadian plains in 1690–92; ANTHONY HENDAY, who traveled even farther west on the Canadian plains in 1754–55; SAMUEL HEARNE, who reached the Arctic Ocean in 1770–72; and DAVID THOMPSON, who explored the ROCKY MOUNTAINS in 1793. Thompson went on to chart COLUMBIA RIVER country for the NORTH WEST COMPANY, first organized in 1779, which was responsible for many expeditions in the Canadian and American West. SIR ALEXANDER MACKENZIE, the first known non-Indian to travel across North America north of the Rio Grande in the 1780s–1790s, was also a trader for the North West Company.

American entrepreneurs also became the first non-Indians to travel widely in the American West. In the years after the expedition under MERIWETHER LEWIS and WILLIAM

CLARK from St. Louis to the Pacific Ocean and back in 1804–06, a number of traders developed the MISSOURI RIVER and Rocky Mountain fur trade. JOHN JACOB ASTOR founded the AMERICAN FUR COMPANY in 1808; MANUEL LISA and a number of partners founded the ST. LOUIS FUR COMPANY in 1809; and WILLIAM HENRY ASHLEY and ANDREW HENRY founded the ROCKY MOUNTAIN FUR COMPANY in 1822. Many of the men who worked in Ashley's fur brigades as trappers—such as JEDEDIAH STRONG SMITH and THOMAS FITZPATRICK—became known as MOUNTAIN MEN and had much to do with pioneering the routes in the American West, all the way to California.

Other traders worked the region to the south. In 1822, WILLIAM BECKNELL pioneered a wagon route from present-day Missouri via the Cimarron Cutoff of the Santa Fe Trail to Santa Fe, New Mexico. In 1833, CHARLES BENT and WILLIAM BENT established Bent's Fort as a trade center on the Arkansas River in what is now southeastern Colorado.

In the meantime, traders for the RUSSIAN-AMERICAN COMPANY, founded in 1799 and headed by ALEKSANDR ANDREYEVICH BARANOV, explored parts of Alaska.

The activities mentioned above are some of the obvious connections between commerce and exploration. Yet, the profit motive has played a part in exploration in other, less apparent ways. For example, those creating the technologies surrounding exploration, such as shipbuilders and the makers of navigational equipment, expanded their commercial activities because of it. Writings about exploration and travel have been a solid area of publishing over the centuries. Images from expeditions—paintings and photographs—have also been marketed. Mapmaking firms grew with new geographic findings. The findings of natural scientists who traveled into wilderness areas led to new medicines that could be sold worldwide. Churches sponsoring missionaries in distant lands increased their followings and their coffers. In recent times, the exploration of the ocean depths and space has also led to the development of new technologies.

Company of Merchant Adventurers See MUSCOVY COMPANY.

Company of Merchants of London Discoverers of the Northwest Passage (Company of Merchants of London, Discoverers of the North-West Passage; North-West Company; Northwest Company)

The Company of Merchants of London Discoverers of the Northwest Passage, a joint-stock company, was given a royal charter in England in 1612. Its name also appears as the

Company of the Merchants of London, Discoverers of the North-West Passage, or simply the North-West Company, also spelled as Northwest Company (but not to be confused with the NORTH WEST COMPANY, founded in Canada for the FUR TRADE).

Investors, some of whom had been part of the MUSCOVY COMPANY, formed the company because they believed HENRY HUDSON's expedition of 1610–11 had located the hoped-for NORTHWEST PASSAGE from the Atlantic Ocean to the Pacific Ocean, based on information brought back by ROBERT BYLOT after a mutiny and Hudson's death. Such a water route would give access to the commerce of the Orient. Bylot became a member of the company as did the reputable geographer RICHARD HAKLUYT.

The company sponsored subsequent expeditions under SIR THOMAS BUTTON in 1612–13, William Gibbons in 1614, and WILLIAM BAFFIN in 1615 and 1616. Bylot participated in all four voyages. The failure to locate a western outlet from HUDSON BAY caused the eventual disbanding of the company.

compass

The compass is an instrument to determine direction, taking advantage of the Earth's magnetic polarity. It consists of a small bar magnet—a magnetized needle—allowed to spin freely so as to point in the direction of magnetic north. A disc under the needle or around the edge of the device displays markings for north, south, east, and west. When the marking for north is aligned with the needle, a direction may be read.

In addition to revolutionizing navigation, the magnetic compass—variations of which came to be known as the mariner's compass—made surveying and cartography more accurate, being the first tool used to make charts from direct observation. While drawing a coastline, a mapmaker could take multiple readings from a compass to determine its direction. This did not represent ultimate accuracy, but it was an improvement over freehand methods.

The origins of the compass are lost to history. It probably was by accident that the Chinese, sometime before A.D. 1040, discovered that an iron needle rubbed on a lodestone (a variety of magnetite with natural magnetism), if allowed to float freely on water on a piece of straw, would always point to the same direction (the Chinese aligned their compasses to the south). The Chinese themselves did not use the compass for navigation but for feng shui, a practice that assigns spiritual properties to the four different directions; compasses were used to align buildings in the most propitious direction. The Chinese may have introduced the compass to Arabs and other Muslims, who made use of it before Europeans.

One of the earliest accounts of European contact with the compass comes from Petrus Peregrinus de Maricourt, a French Crusader, who wrote of it in the mid-13th century. For the ancient seafarer it was more important to understand the winds than to make abstract calculations, so early mariner's compasses were marked with the 12 primary winds instead of the four directions. It was in Amalfi, Italy, between 1295 and 1302, that the compass as we know it was developed. Yet, when first introduced, its functioning was so mysterious that many Europeans thought it a work of the devil or of evil spirits, and captains sometimes had to keep the presence of a compass on board ships secret from crews.

As use of the compass became more advanced, navigators came to understand the difference between true north and magnetic north, and to recognize regional variations in Earth's magnetic field. A variation on the compass, the GYROCOMPASS, an electronic device using a gyroscope, can determine true north as opposed to magnetic north. Compasses are sometimes mounted in other instruments, such as the transit used in surveying.

Congo River (Zaire River)

With a length of 2,720 miles, the Congo River, also known as the Zaire River, a modification of the local word *mzadi*, which means "great water," is the second-longest river in Africa, after the NILE RIVER. (The name of the river was changed from Congo to Zaire in 1971 at the same time the nation known as the Congo became Zaire. In 1997, when the nation of Zaire became the Democratic Republic of the Congo, the Congo name once again was applied to the river.) Its major tributary, the Lualaba, is considered the Upper Congo. Together, the Congo and the Lualaba Rivers drain 1,425,000 square miles of land in central Africa, largely in the country of the Democratic Republic of the Congo, but also including parts of the Republic of the Congo, Cameroon, Burundi, Tanzania, Zambia, and Angola. The river is navigable for 1,000 miles along its center, where it has a width of between four and 10 miles. With its tributaries included, this section forms a navigable system of 8,000 miles. The river is unusual in that it crosses the EQUATOR twice, which led to some confusion over its course, since early geographers thought this impossible. The Congo discharges 1.5 million cubic feet of water per second into the Atlantic Ocean. This massive outflow helped create speculation that the Congo was connected to the NIGER RIVER. It was also theorized for a time that the Congo was part of the Nile River or the ZAMBEZI RIVER. The Congo's relative

navigability and size played an important part in early European contact with the interior of Africa and subsequent African exploration. The former name of the river, the *Congo*, is also applied to the region in general.

Portuguese Exploration

DIOGO CÃO made the European discovery of the Congo (Zaire) River in 1482. He sailed for King John II of Portugal, who sought a water route around Africa for the SPICE TRADE of the EAST INDIES. When Cão came upon the mouth of the river, he placed a PADRÃO, a limestone pillar, to claim the land for his sovereign. (For a time, the Congo River would be known to Europeans as the Rio de Padrão or "Pillar River.") The native peoples were friendly and participated in simple trade. Cão learned that upriver there existed a center of power, the kingdom of the Kongo, ruled by Mani Kongo from his city of Mbanza. Cão had been instructed to search for a legendary Christian king PRESTER JOHN, sought by Europeans for centuries, and the Kongo offered a starting point. Cão deployed four Africans among the crew, who had been educated for just such a mission, then continued on his primary task of exploring the African coast. After traveling some 500 miles to the south, Cão headed back northward, stopping at the river on the return trip. Failing to meet up with his emissaries, he continued on to Portugal with four local potentates as hostages. In 1485, Cão made a second journey to the Congo. Since he returned the four African princes to their homeland, the native peoples once again greeted him with hospitality. On this expedition Cão sailed upriver in his CARAVEL. He made it 100 miles inland, where he was prevented from further exploration by the last of the Livingstone Falls, also known as "The Cauldron of Hell." A delegation was dispatched to Mbanza, bearing gifts from King John along with a request for representatives of the kingdom to visit Portugal.

The next record of Portuguese contact with the kingdom of the Kongo at Mbanza comes from the 1491 expedition of Gonçalo de Sousa. He was dispatched with three ships and a complement of soldiers, builders, and farmers to establish a settlement and trading post in the region. The result of this undertaking was disastrous, with many, including de Sousa, dying of disease. The survivors straggled into Mbanza under the command of Gonçalo de Sousa's nephew, Rui de Sousa. The Mani Kongo along with a large throng of fascinated people welcomed them. The king very quickly embraced Christianity, although he may have done so to form a political alliance with the Portuguese against his enemies rather than through sincere religious devotion. Whatever his motivation, a church was constructed, and the king was baptized as were the members of his court. Not all the local population were willing to go along with the new order, however, and conflicts later arose.

The kingdom of the Kongo was perhaps the largest highly developed civilization in Africa at the time, eclipsing Mali, which had gone into decline. The political structure of the Kongo was advanced, with a system of local rulers, governors, and the king, who was able to obtain cooperation among the various tribes in the realm. There were several types of cloth produced by these peoples; it was of such a high quality that the Portuguese mistook it for satin and taffeta of European origin. Native artisans were able to smelt iron thus enabling them to fashion weapons, tools, and musical instruments. They used copper for jewelry, statuettes, and other ornaments. Although the concept of a "cash crop" had not been formulated, the agricultural system was advanced. Trade was a local affair and not an industry carried out with surplus goods.

The prehistory of the peoples of the Congo Basin is intertwined with the Bantu migrations, which probably began early in the first century A.D. The Bantu came from the Upper Nile Valley, where they grew sorghum and millet using a form of slash-and-burn agriculture. As a result of their successes, there came rapid population growth. The combination of increased population and decreased fertility of their lands created pressure to seek new homelands. Over the course of centuries, the Bantu migrated to the south, interbreeding with and displacing other tribes. They found new sources of food, such as the banana and the yam, which had been transplanted from the Pacific Islands to Africa's east coast. Bantu power was consolidated in about A.D. 1000 through new techniques in warfare, which helped them stay in power. Over time, a mythology developed concerning the origins of the Bantu people.

The death of the christianized Mani Kongo resulted in a war of succession between two of his sons, one pagan and the other Christian. The Christian son, Affonso (his Portuguese name), proved victorious. Innocent of the potential motives of Portugal, he encouraged their missionaries, soldiers, and traders. The Portuguese goods were so irresistible that the people of his kingdom were willing to trade slaves for them.

From 1511, there survives a letter Affonso wrote to King Manuel of Portugal appealing for help in curbing the abuses of the slave traders on the island of São Tomé. His appeals were ignored, and the situation in Mbanza and the entire kingdom degenerated rapidly under the pressures of the SLAVE TRADE. With little oversight from the Portuguese, the soldiers of fortune and profiteers plundered the Kongolese culture. Even the priests who had come to "civilize" these people sought profits through the commerce in human life. Affonso continued to trust his Christian brethren overseas. He asked for ships to wage his campaigns against neighboring tribes, and, when these were not forthcoming, he asked for shipbuilders. Assistance was withheld,

however, and, when Affonso died in 1542, his country was in turmoil.

Various Nations

The latter half of the 16th century saw increased conflict in the region of the Congo Basin. The Portuguese installed puppet governments, and a fierce tribe called the Yakas staged raids against them. The factional violence of other European peoples active in the region—British, French, and Dutch—also increased. The Dutch conquered the Congo region for a short time. In 1641, they took the port of Mpinda at the mouth of the river. The reigning Mani Kongo at the time sought to drive a wedge between the Protestant Dutch and the Catholic Portuguese. This Dutch possession was fleeting, however, and the Congo reverted back to Portugal in 1648. As Europeans capitalized on the slave trade for the colonies in the Americas, they relied on native peoples to provide captives, trading for the most part in coastal ports, and the interior regions of the river remained largely a mystery to them for almost three centuries.

England became interested in Africa from a scientific point of view during the Age of Enlightenment. The idea of the “noble savage” caught on, and government-sponsored expeditions to the continent were mounted. James Kingston Tuckey headed the first of these to the Congo in 1816. Tuckey’s was one of two expeditions to trace the course of the Niger River. His instructions were to investigate the tributaries he found as he sailed up the Congo River to the Niger. His expedition was beset by malaria and dysentery. Tuckey was able to map 150 uncharted miles of the river before he died in the effort. Fewer than half of his men made their way back to England.

In 1868, after studying the sources of the White Nile in the southern Sudan, German naturalist GEORG AUGUST SCHWEINFURTH made his way to the Congo Basin. He made the European discovery of the Uele River, part of the Congo system. His drawings of wildlife along with his scientific observations added much to the early understanding of the region. He was the first European to come in contact with Mubuti, who dwelt in the forests to the north of the river.

The expeditions of DAVID LIVINGSTONE and HENRY MORTON STANLEY finally led to the charting of the entire river. In 1871, with sponsorship from his newspaper, the *New York Herald*, Stanley went to Africa in search of Dr. David Livingstone, who had been incommunicado for some time. Livingstone was investigating possible connections of the Nile and the Congo Rivers to lakes in modern-day Tanzania. When Livingstone died in May 1873, Stanley took up the work that his mentor had failed to complete. Among the goals on his subsequent 1874 expedition was to find the Congo River’s source, then follow the river all the way to the Atlantic Ocean. In 1876, after successfully circumnavi-

gating Lakes Victoria and Tanganyika, he turned his attention to the Congo River.

Stanley had a rival in his exploration of the Congo. VERNEY LOVETT CAMERON, a British naval officer, had been sent by the ROYAL GEOGRAPHICAL SOCIETY to relieve Livingstone. In 1873, Cameron began his journey from Bangamoyo in Tanzania. By the time Cameron had retraced Livingstone’s route, Livingstone had already died. Rather than head home, Cameron struck out to the west to make new discoveries. After exploring and mapping Lake Tanganyika in 1874, he reached Nyangwe, a center of the slave trade on the Lualaba River. Cameron guessed that the Lualaba was a Congo River tributary, so following its flow downstream by CANOE would have been a productive plan. Yet, the people of Nyangwe were hostile and would not sell him the necessary boats. When he realized the futility of the plan, Cameron accepted the offer of the half-Arab, half-black slave trader Tippoo Tib to join his caravan on its way to the west coast. The expedition left Nyangwe in August 1874 and arrived at the Angola coast more than a year later. Cameron had beaten out Stanley in being the first European to make an east-to-west crossing of the southern part of the continent, but since he had been compelled to travel overland, the Congo River remained largely unexplored.

In 1876, Stanley also landed in Nyangwe, but knowing where Cameron had failed, he did not depend on the city’s inhabitants for canoes. Instead, it was Stanley’s strategy to follow the Lualaba by land until he came to a place where he could obtain transport. Since the plan was still quite hazardous because of the warring tribes along the route, Stanley convinced the same Tippoo Tib to provide the services of his small army. On November 5, 1876, the group set off from Nyangwe on this untested path. Making headway was very difficult as they hacked their way through the jungle. Many died from disease. On Christmas Day, Stanley and Tippoo Tib spent their last day together. They had only progressed 200 miles along the river but, by this time, Stanley had acquired more than 20 canoes, mostly by theft. Stanley and his men traveled down the river and, on January 4, 1877, came to Stanley Falls. These cataracts took them three weeks to portage. Although the next 1,000-mile stretch of river was easy to navigate, passage was fraught with danger because the banks of the river were lined with warriors. Stanley fought 24 battles with tribes along the river and many more brief skirmishes. In the village of Rubunga, he had a short rest but was soon ambushed. On the Bateke Plateau the river once again turned difficult, but the tribes of the region were more hospitable. In March, Stanley reached a 200-mile stretch of cataracts, which would end at Livingstone Falls and “The Cauldron of Hell.” Bypassing the rapids was extremely difficult, and, in doing so, Frank Pocock, the last of Stanley’s European companions, was killed. On August 1, 1877, Stanley and his guides came to

the furthest point that Captain Tuckey had reached approaching from the opposite direction 60 years earlier. Stanley soon straggled back into the settlement of Boma, where he was treated grandly by Portuguese inhabitants. After a journey of more than 7,000 miles, he had proven the Nile's independence of the Congo River as well as the Lualaba's connection, and had followed the great river to its outlet.

Stanley had witnessed many of the horrors of the slave trade while on his travels. Livingstone had worked on replacing it with a more benign commerce. Indeed, by the late 19th century, the eradication of slavery was a cause in England at the time. It was understandable then that Stanley felt some frustration when, returning to England in 1878, his plans to develop the Congo fell on deaf ears. King Leopold II of Belgium saw the region's potential for profit, however. In 1876, he had sponsored a conference concerning the region, portraying himself as having only the highest humanitarian motives. He actually hoped to create his own African country. For assistance in this endeavor, he hired Stanley.

Possession of the Congo was not to go uncontested. The colonial scramble for Africa was beginning. France, which was wary of King Leopold, sponsored an expedition by PIERRE-PAUL-FRANÇOIS-CAMILLE SAVORGNON DE BRAZZA, a 26-year-old naval officer. Exploring along the Ogoewe River to the north of the Congo, de Brazza came near its source, then set out across the land to find the larger river. In early 1878, de Brazza made it to the Bateke Plateau. He then reached the Alima River, which turned out to be a Congo River tributary. Using these rivers, he returned to the coast.

By the end of 1878, Stanley was planning his expedition for Leopold, and de Brazza was organizing on behalf of France. In August 1879, Stanley arrived at the Congo River with his crew and supplies, with the intention of building a road past Livingstone Falls. De Brazza followed the same route as on his previous journey, but now with the goal of reaching Stanley Pool above the rapids. In September 1880, de Brazza arrived in the village of Mbe (which would become Brazzaville) on the banks of the Congo and negotiated a treaty with the tribal leader Makoko. While he was there, he encountered Stanley.

From 1879 to 1884, Stanley worked for Leopold and established the Congo Free State. Leopold became the personal sovereign of the land. In 1891–92, he issued a number of decrees, which allowed him to extract the wealth of the country. The carnage that followed stands as one of the darkest periods of colonial history. Mercenaries were recruited to compel the population to harvest latex from rubber trees. Those who failed to meet their quota were enslaved on plantations or had their right hands cut off. In fact, hands became a form of currency the soldiers used for payment from the king. Leopold became extraordinarily rich, buying mansions throughout Europe and living in lux-

ury. There were investigations into his abuses, and, in 1908, he was forced to turn control of the Congo over to Belgium.

It is worth noting that Stanley made another journey through the Congo region in 1887–89 on a mission to rescue German official MEHMED EMIN PASHA. Another explorer of the Congo region who bears mentioning is OSKAR LENZ, a German geologist who, in the 1870s–80s, explored both the Saharan and sub-Saharan regions of the continent.

Today, the Congo region produces copper, palm oil, cotton, sugar, and coffee. There is steamer traffic between Kinshasa and Kisangani, the main river ports, and interest in the hydroelectric potential of the river has been increasing.

conquest and exploration

Since prehistory humans have been creating and expanding territory and political power through conquest, and one people conquering another people is part of the history of exploration. Sometimes expeditions were launched with conquest in mind; in other cases, military expeditions were primarily exploratory, but were the only safe ways to travel because of possible armed responses or banditry, and often preceded the travels of others. Conquest thus helped expand geographic knowledge and led to opening routes and enabling further travels. The aftermath of conquest was often colonization, although colonization sometimes occurred in lands where no military action was necessary (see COLONIZATION AND EXPLORATION). The imperatives of conquest were not just territorial and political, but also sometimes economic (see COMMERCE AND EXPLORATION) and sometimes religious (see RELIGION AND EXPLORATION).

Much of history is about empire building, and, in order to understand the context of all exploration, one has to understand the ebb and flow of civilizations and their evolving territorial holdings. Yet, some peoples and certain individuals are especially studied as explorers because their military efforts took them to lands not yet mapped and led to a dramatic increase in geographic knowledge.

Because exploration on all the continents except Antarctica involved travel through native lands, native peoples have been butchered and enslaved, and their homes and lands have been laid to waste (see NATIVE PEOPLES AND EXPLORATION). The spread of diseases against which indigenous peoples had little resistance proved more deadly than military action in the history of conquest (see DISEASE AND EXPLORATION). Many of the outbreaks of violence between explorers and aboriginal peoples were on a small scale and did not involve armies or navies. Yet, they too can be viewed as a form of conquest in that lands were appropriated and

peoples displaced. The SLAVE TRADE, since it involved the commerce in human life, can also be viewed as another form of conquest associated with exploration.

Alexander the Great

One historical figure recognized as an explorer as well as a conqueror is ALEXANDER THE GREAT, or Alexander III, of Macedonia. He succeeded his father, Phillip II, to the throne at the age of 20, whereupon he outmaneuvered his rivals and consolidated his power over the Greeks. In 334 B.C., he embarked upon his Persian expedition, conquering much of Asia Minor. In 332 B.C., his Greco-Macedonian forces defeated the Phoenicians at Tyre on the eastern MEDITERRANEAN SEA and subjugated the Egyptians. That same year, he founded the city of Alexandria in North Africa. In the next years, he pushed eastward into Asia, reaching as far as India by 327 B.C., eventually crossing the INDUS RIVER. His troops had traversed much of the Middle East and Central Asia, overcoming resisting peoples and founding new cities. His purpose was to expand his empire, but, in doing so, he sought knowledge of conquered lands. Surveyors traveled with his troops, recording information as they went, as did scientists, who sent specimens of flora and fauna back to Greece. He also sent out exploratory expeditions to neighboring regions, such as that under NEARCHUS in 325–324 B.C., which explored along the coasts of Pakistan and Iran from the Indus Delta to the head of the Persian Gulf.

Genghis Khan

Another conqueror/explorer was GENGHIS KHAN of the Mongols (see MONGOL EXPLORATION). After uniting the Mongol tribes and defeating the Chinese, he pushed westward and southward bringing much of central Asia, including southern Russia, and the Near East under Mongol domination. He sought geographic information as well as cultural and sent out emissaries on exploratory expeditions to learn about geography and peoples. Among them was the Taoist sage CH'ANG-CH'UN in 1221, who traveled from eastern China through central Asia to Afghanistan. His conquests had the added effect of breaking the monopoly held on the SILK ROAD through Asia held at the time by Muslims and started a period of contact between East and West by diplomats and merchants, including Venetian merchant MARCO POLO, who reached the court of Genghis's grandson Kublai Khan in 1275.

Roman Generals

The Romans, in the expansion of their empire, provided geographic knowledge that came to be disseminated through the writings of geographers (see ROMAN EXPLORATION). One Roman geographer, PLINY THE ELDER, had even served as a Roman cavalry officer in both Europe and Africa, before writing *Historia Naturalis*, published in A.D.

77. Another geographer, PTOLEMY, a hellenized Egyptian living in Alexandria while it was under Roman rule, published *Geographia*, a description of world geography, in A.D. 127–147, drawing on information brought back from expeditions of conquest.

Roman generals whose expeditions are discussed as part of the history of exploration include GAIUS JULIUS CAESAR, who, in 58 B.C., led troops into Gaul (present-day France) and, in 55–54 B.C., to Britain; GAIUS AELIUS GALLUS, who, in 25 B.C., invaded the Arabian Peninsula; SUETONIUS PAULINUS, who, in A.D. 42, led a military expedition from the coast of North Africa southward across the Atlas Mountains to the northern edge of the SAHARA DESERT; JULIUS MATERNUS, who, in A.D. 50, led troops across the Sahara, possibly reaching Lake Chad; and GNAEUS JULIUS AGRICOLA, who, in A.D. 80, led a military exploration into Scotland.

Vikings

The Scandinavian peoples known as Vikings or Norsemen—Danes, Norwegians, and Swedes of the Middle Ages—traveled widely and were known as raiders by the people of Europe because of their numerous attacks (see VIKING EXPLORATION). In the ninth, 10th, and 11th centuries, they spread southward and carried out raids on other Europeans, especially those in coastal areas in western Europe, but also inland in eastern Europe. They also traveled to ICELAND, GREENLAND, and northeastern North America. They did not have organized armies and generals but were leaders of small groups of warriors. Warfare was carried out and plunder taken for individual prestige, but it also enabled settlement in new homelands. Many of those Viking explorers traveled beyond Europe—ERIC THE RED in Greenland or his son, LEIF ERICSSON, in VINLAND in North America—and are known primarily as colonizers rather than as conquerors.

Conquistadores

Much of the Spanish exploration of the Americas involved individuals known as CONQUISTADORES, the Spanish word for “conqueror.” The name is applied to them because of their actions against native peoples—for their territory, wealth, or labor. The two most famous conquistadores are HERNÁN CORTÉS, who conquered the Aztec Indians in Mexico in the 1520s, and FRANCISCO PIZARRO, who conquered the Inca Indians in Ecuador and Peru in the 1530s.

The Great Navies

Exploration, conquest, colonization, and commerce throughout history have been dominated by those peoples with the best ships (see SHIPBUILDING AND EXPLORATION). The LONGSHIP of the Vikings gave them an advantage in medieval Europe, as the JUNK gave the Chinese an advan-

tage in the Far East in the 15th century, and as the CARAVEL, CARRACK, and GALLEON facilitated the exploration and empire building of the Portuguese, Spanish, English, and Dutch during the EUROPEAN AGE OF EXPLORATION, from the 15th into the 17th century, and afterward. Warships enabled conquest and merchant ships enabled the building and maintaining of trade empires.

Rival Powers

Military actions were carried out against other colonial powers as well as against native peoples. For example, PRIVATEERS—such as Englishman SIR FRANCIS DRAKE, commissioned by England in the 16th century to raid Spanish ships and ports in the Americas while undertaking explorations—relate to the subject of conquest. And, on a larger scale, the history of exploration over the centuries has played out against a backdrop of competition of rival nations, with warfare often resulting from lands explored and colonized far from home, such as in the French and Indian Wars of the 17th and 18th centuries in North America.

Not all expeditions by organized militaries were for the purpose of conquest. For example, the navies of many nations sponsored or played a part in expeditions strictly exploratory in nature, such as the first French CIRCUMNAVIGATION OF THE WORLD under the naval officer LOUIS-ANTOINE DE BOUGAINVILLE in the 1760s. And armies had surveying units, such as the U.S. Army's Corps of Topographical Engineers, which helped map the American West, and the British army's Bengal Engineers, who directed the work of the PUNDITS—native Indian explorers—in the Great Trigonometrical Survey of India, both in the 19th century.

conquistadores (conquistadors)

The term *conquistador* (plural form, *conquistadores* or *conquistadors*) is Spanish for “conqueror,” from the Spanish verb *conquistar*, “to conquer.” It has come to be applied historically to any one of the Spanish conquerors of the Americas, especially of Mexico and Peru in the 16th century. It refers both to the leaders and to the men who served under them. Because of association with brutality toward native peoples, as well as against Spanish rivals, the term has also come to be used in reference to any ruthless adventurer.

Some of the conquistadores had served against the Moors—Muslims (see MUSLIM EXPLORATION) out of North Africa who had invaded the Iberian Peninsula in A.D. 711 and occupied parts of it until final defeat in 1492—or in other European campaigns. Many came from the Estremadura region of the kingdom of Castile and had originally served under Spanish monarchs Ferdinand II

and Isabella I, who helped unify Spain and sponsored the 1492 voyage to the Americas by Italian mariner CHRISTOPHER COLUMBUS. Many of the most famous conquistadores were active in the Americas during the reign of Charles I (Holy Roman Emperor Charles V). Many of the men filling out the ranks were not professional soldiers, however.

There was no standing Spanish army or navy in the Americas. The exploratory expeditions and military actions were often planned by and paid for by the conquistadores themselves. Or the conquistadores sought backing from commercial companies who might provide ships, horses, weapons, and clothing against possible profits from plunder. The leader and main investor typically held the title of “captain” and was often a man of high position, such as an appointed government official or nobleman (*hidalgo*) or any *encomendero*, that is someone holding an *encomienda*, a royal land grant. Participants came from a variety of backgrounds and social classes. Freed slaves sometimes joined the force. Priests often traveled with the expedition so that the Catholic Church was also represented (see RELIGION AND EXPLORATION). The conquistadores were armed with swords, lances, crossbows, and at least a few small cannons. They wore armor that could repel native arrows. They utilized horses in battle when the landscape permitted. They often sought the support of native peoples against rival peoples. They also regularly used the strategy of capturing an indigenous leader and holding him hostage in order to pacify his followers. The attainment of gold and silver from native peoples became the primary objective and, when successful, led to royal approval and the granting of huge tracts of land (see TREASURE AND EXPLORATION).

Hernán Cortés

HERNÁN CORTÉS is one of the most famous conquistadores. His father, a noble of modest means, served in the military. The young Cortés had studied law before entering the army himself. He served in campaigns in Italy before traveling to the Americas in 1504, becoming a minor official in the WEST INDIES. He served in the conquest of Cuba under conquistador DIEGO VELÁSQUEZ, a veteran of Moorish campaigns, in 1511. Seven years later, Cortés received a commission from Velásquez for an expedition to the Yucatán Peninsula. Following a dispute, Velásquez dismissed Cortés, but Cortés proceeded on the expedition anyway. Velásquez sent professional soldier PÁNFILO DE NÁRVAEZ—cited as one of the cruelest of conquistadores by Spanish missionary Bartolomé de las Casas, based on his actions against the Arawak (Taino) Indians of Cuba—to arrest Cortés, but Cortés defeated Nárvaez on the Mexican mainland. Nárvaez was imprisoned, and most of his men joined Cortés in the conquest of the Aztec,

which he accomplished in 1521. In the course of his conquest, he took Aztec ruler Montezuma hostage. The great riches obtained from the Aztec and shipped to Spain led to Cortés's being named Captain General of New Spain (the original Spanish name for Mexico). BERNAL DÍAZ DEL CASTILLO, who served under Cortés, went on to write an account of the conquest of the Aztec, entitled *Crónica de la conquista de Nueva España* (*The True History of the Conquest of New Spain*), which is an essential source of information about conquistadores.

Francisco Pizarro

Another famous conquistador, FRANCISCO PIZARRO, was born out of wedlock and raised outside his father's aristocratic family, and he may have served in the military under his father in Italy. In 1502, he traveled to the West Indies in the service of Nicolas de Ovando, the appointed governor of Hispaniola (present-day Haiti and the Dominican Republic) after Christopher Columbus. In 1509, Pizarro later traveled to the South American mainland as part of ALONZO DE OJEDA's expedition to what is now Colombia and was left in charge of a colony at San Sebastián. He moved the colony to present-day Panama, where he participated in explorations of the region as the lieutenant under VASCO NÚÑEZ DE BALBOA. In 1519, Pizarro arrested Núñez de Balboa on behalf of Panama's governor, PEDRO ARIAS DE ÁVILA. Pizarro eventually was appointed mayor of Panama City and received grants of land. Reports of a wealthy Indian civilization to the south led to Pizarro's expeditions to present-day Ecuador and Peru and the conquest of the Inca in the 1530s. In the course of his actions, he held Inca leader Atahualpa captive as part of his strategy.

De Soto and Coronado

Two famous conquistadores in North America were HERNANDO DE SOTO, who had served under Pizarro and traveled through much of the American southeast in 1540–42, and FRANCISCO VÁSQUEZ DE CORONADO, who explored much of the American Southwest and southern plains, also in 1540–42. They too sought wealthy Indian civilizations and, although they failed to locate great riches as Cortés and Pizarro did among the Aztec and Inca, their expeditions led to Spanish colonization and development of native lands.

Lope de Aguirre

One of the most brutal of all the conquistadores was LOPE DE AGUIRRE, who turned his violence against fellow Spaniards as well as against indigenous peoples. He had first worked in the Americas as a horse trainer but later served as a soldier under other conquistadores. In 1560, while part of an expedition on the AMAZON RIVER in search of the fabled wealthy kingdom of EL DORADO, he led a mutiny

against PEDRO DE URSÚA and had him killed along with his mistress Doña Inez de Atienza. The expedition went on to lay waste to native villages. Aguirre later killed his own daughter rather than have her be captured by rival Spanish forces.

It was not just the weaponry of the Spaniards and political rivalries of indigenous peoples themselves that enabled relatively small Spanish forces to defeat Native Americans. The Spaniards were helped in their conquest by the destructive force of European diseases, especially smallpox, against which native peoples had no resistance (see DISEASE AND EXPLORATION).

coracle

A coracle is a small, round or oval boat, typically made with a frame of wood—typically wicker—covered with either animal hide or canvas. It is designed to carry a single person and a small amount of cargo. The use of the coracle certainly predates the historical record. One of the earliest existing models of a boat is a clay sculpture—in the shape of a coracle—from the fourth millennium B.C., found in Eridu in Mesopotamia. Later versions of round boats appear in relief carvings from Assyria.

The coracle has had a long history in the British Isles as well. It was used for fishing, as well as interisland transportation and trading trips. The coracle is thought to be the prototype of the larger CURRAGH, which SAINT BRENDAN used to travel the Atlantic Ocean to the north and west of Ireland. The coracle continues to be used today in England and Ireland for fishing and river travel.

The Arikara, Hidatsa, and Mandan Indians of the upper MISSOURI RIVER shaped similar circular craft out of buffalo hide stretched over a willow frame and sealed with animal fat and ashes. Their version is known as the bullboat.

Cossack exploration

The Cossacks are a peasant people of mixed descent, who have inhabited, over the course of their history, parts of the Russian czarist empire, the Union of Soviet Socialist Republics (USSR, Soviet Union), and presently Russia and other former Soviet republics. The name is associated with those peoples inhabiting steppe country, extending from the region north of the Black Sea and the Caucasus Mountains eastward to the Altai Mountains in SIBERIA. Some Cossacks were descended from Ukrainians and Poles in addition to

Russians; many Cossack ancestors were runaway serfs. They became known for military prowess and horsemanship. The name *Cossack* is derived from the Turkish word *kazak*, for “free person.”

The formation of Cossacks is traced back to the 14th and 15th centuries. By the early 16th century, Cossack villages were situated along the Dnieper River and eventually the Don and Ural Rivers as well. The villagers, who owned land in common, were governed by assemblies, presided over by elected elders with one elder overseeing several communities, especially in times of war. Starting in the 16th century, the Russian czarist government extended its control to frontier regions and subjugated the Cossacks, who had earlier helped conquer the Tartars (peoples of Turkic origin who had invaded parts of Asia and Europe under the Mongols in the 13th century). The Cossacks came to be organized for the most part as cavalry units and carried out numerous expeditions into Siberia. By the late 18th century, following their participation in failed peasant revolts against czarist rule, the Cossacks had lost most of their political autonomy, yet they had become a privileged military class. In the 19th and early 20th centuries, they were used by the czarist government to quell uprisings but refused to do so in the Bolshevik Revolution of 1917. In the subsequent civil war of 1918–20, they opposed the Red Army. Under the Soviet system, the Cossacks lost their special status in the military. They also lost much of their wealth and were forced to relocate and farm collectively. In World War II (1941–45), a number of Cossack cavalry divisions were formed to fight the invading Germans. Since the dissolution of the Soviet Union, they have experienced a cultural revival as well as newfound unity and influence.

Because of their location on the edge of the frontier, their mobility, and their skill in warfare, the Cossacks played a significant role in the history of Russian exploration. It was YERMAK (also known as Yermak Timofeyevich or Yermak Timofeiev), who, in 1581–82, led a force across the Ural Mountains and conquered the Tartars at Sibir (from which the name *Siberia* is derived). His activity marked the beginning of Russian expansion eastward. By 1610, Russian fur traders had reached the Yenisey River, and, by 1638, the Sea of Okhotsk, opening up on the Pacific Ocean. But it was often Cossack forces that gained control of a region and established permanent settlements, which led to further exploration.

In 1631–33, PYOTR BEKETOV established Russian dominion to the Yenisey, Lena, Aldan, and Amur Rivers of central Siberia, and, in 1652–60, he expanded Russian interests into southeastern Siberia, south of Lake Baikal. In 1643–48, VASILY DANILOVICH POYARKOV led a military expedition and explored the Amur River, feeding the Sea of Okhotsk, and other rivers of southeastern Siberia.

Meanwhile, in 1641–44, MIKHAIL STADUKHIN explored the Arctic coast of eastern Siberia, reaching the mouth of the Kolyma River. In 1648, SEMYON IVANOVICH DEZHNEV led an expedition of Cossacks in small boats from the mouth of the Kolyma River eastward along the Arctic coast of Siberia and succeeded in rounding the Chukchi Peninsula of northeastern Siberia and entering the BERING STRAIT. In 1695–96, LUKA MOROZKO and VLADIMIR VASILYEVICH ATLASOV led expeditions onto the Kamchatka Peninsula.

Cossack activity eastward continued in the 18th century. In 1713–14, fur trader SEMYON ANABARA explored the Shantar Islands in the Sea of Okhotsk. In 1726–33, EMELYAN BASOV led a series of expeditions along Siberia’s Lena River in search of a seaward route to the Pacific Ocean.

The exploration of Siberia was carried out by non-Cossacks as well, but the Cossack role as pioneers, soldiers, and fur traders pushing eastward was critical to the region’s history.

See also MONGOL EXPLORATION.

coureur de bois

The French term *coureur de bois*, which translates into English as “runner of the woods,” was originally applied to unlicensed entrepreneurs, mostly in the FUR TRADE in northeastern North America during the 17th century. In order to control trade with Native Americans, the colonial government of New France issued a limited number of licenses. As a result, many men defied the regulations and went into business on their own as trappers or traders in the wilderness. Their number is not known, but it has been estimated that one-third of adult able-bodied men in New France by the end of the century were *coureurs de bois*, leaving many of the eastern settlements deprived of male support. Efforts by royal representatives and the Roman Catholic Church failed to curtail them, and they played an intrinsic part in the history of the fur trade and in the exploration of North America, much like the later MOUNTAIN MEN, who worked the ROCKY MOUNTAINS in the 19th century.

The French term VOYAGEURS, for “travelers,” was applied to those men who worked for licensed traders and who traveled by CANOE Indian-style—paddling and portaging—on trade routes. Many voyageurs went into business for themselves—thus becoming *coureurs de bois*—or in conjunction with other unlicensed traders. The *coureurs de bois* adopted many Indian customs. Some settled among and intermarried with Indians. Their descendants—typically of French and Cree ancestry as well as Scottish and other tribal ancestry, such as Chippewa (Ojibway) and Assiniboine—became known as Métis, or “mixed-blood.” The trade in liquor and firearms developed by some *coureurs de bois* led

to outbreaks of violence between non-Indians and some native peoples, however.

The *coureurs de bois* were wide-ranging. Much of their activity was in the region of the western Great Lakes, but some ventured down the MISSISSIPPI RIVER into French Louisiana and farther westward onto the Canadian and American plains. Frenchmen MÉDARD CHOUART DES GROSEILLIERS and his brother-in-law PIERRE-ESPRIT RADISSON, who developed the fur trade around Green Bay in the 1650s and explored much of the country around Lake Michigan and Lake Superior, were *coureurs de bois*. On their return to Montreal in 1660, their furs were confiscated for unlicensed trading, leading to their work for the English and the founding of the HUDSON'S BAY COMPANY in 1670. The large fur-trading companies dominated the western fur trade in subsequent years.

cross-staff (balestila, Jack's staff, Jacob's staff)

The cross-staff, also known as Jacob's staff, Jack's staff, or balestila, like the earlier invented ASTROLABE, is an obsolete navigational instrument used for measuring the angle of a celestial body above the horizon. With this measurement, along with information about the celestial body based on earlier measurements, the user can determine latitude and time of day. The device was probably invented in one of the Low Countries (the region of present-day Belgium, Luxembourg, and the Netherlands) and probably in the early 15th century.

A cross-staff consists of two pieces of wood, the staff about three feet long with a sliding crossbar attached to it. On the staff is mounted a sight, and on each end of the crossbar, a hole. To measure the altitude of the celestial body, a navigator looks along the staff with the crossbar aligned vertically, then slides the crossbar to the point at which the celestial body appears through the upper hole and the horizon through the lower. The intersection of the crossbar and a scale written on the staff indicates altitude. A reading of the NORTH STAR, for example, would gauge its height in the sky; the lower it is, the farther south a ship was.

The cross-staff came into favor over the astrolabe with some mariners in the 15th century. CHRISTOPHER COLUMBUS, the Italian navigating for Spain, possibly carried as navigating equipment a magnetic COMPASS, a primitive triangular QUADRANT, an astrolabe, and perhaps one cross-staff. He also had a table of figures to give meaning to the readings from these early navigational tools (see EPHEMERIS).

English navigator JOHN DAVIS modified the design of the cross-staff in the late 16th century by adding a reflector so that the user would not have to look directly into the Sun but could take readings with his back to it. This became known as the backstaff, the antecedent of a type of quadrant known as the Davis Quadrant. The SEXTANT, invented

in the 1730s, became the favored tool of celestial navigation, but people went on making cross-staffs until the end of the century.

See also LATITUDE AND LONGITUDE; NAVIGATION AND EXPLORATION.

Crusades

The Crusades were any of the military expeditions undertaken by European Christian powers, from the late 11th century through the late 13th century, to recover the Holy Land in the Near East from the Muslims. The first Crusades are relevant to the history of exploration since they marked the first attempt at expansionism and colonialism by Christian nations beyond Europe. They also led to increased contacts among differing cultures and growing geographic awareness.

Background

Palestine, the historic region on the east coast of the MEDITERRANEAN SEA (presently controlled by Israel), was at the center of trade routes linking three continents—Asia, Europe, and Africa. Adherents of the Jewish, Christian, and Islamic religions consider it a Holy Land; the city of Jerusalem in particular has sacred sites central to the belief systems of all three religions. In addition to the ancient local peoples—such as the Canaanites (related to the Phoenicians), Philistines, and Israelites—Palestine had been occupied at times by Hittites, Egyptians, Assyrians, Babylonians, Persians, Greeks, and Romans. It fell to the Arab Muslims in A.D. 638. Yet the region remained relatively open—a center of commerce and religious and intellectual activity until the late 11th century when the Seljuk Turks became the dominant Islamic people in Asia Minor (the Anatolian Peninsula) and took control of Jerusalem. Their harassment of Christian pilgrims to Jerusalem and their aggressive stance toward Constantinople (present-day Istanbul), the seat of the Eastern Roman Empire (Byzantine Empire), became a concern to Christian leaders. Alexius I Comnenus, the Byzantine emperor, appealed to the West for help defending against invaders. Soon afterward, in 1095, Pope Urban II gave a speech at the Council of Clermont in France encouraging aid to Byzantium against the Islamic threat.

Wandering preachers, such as Peter the Hermit (Peter of Amiens), helped spread the message of a “holy war.” Some of those who would become involved over the next years did so for the sake of territorial and economic interests in addition to religious ideals. The prosperity and growing populations in Europe at that time prompted a looking outward to distant lands with curiosity, ambition, and dreams of adventure: Religious leaders wanted to make inroads into Muslim lands and unite the Latin and Orthodox branches of Catholicism; nobles saw the potential for territorial expansion; merchants recognized trade possibilities; knights saw the

opportunity of using their skill in battle; and peasants saw the opportunity for a new life in *Outremer*, a French term for “beyond the seas.” In any case, for varying reasons, the call to conquest was heard by people of many different social backgrounds and callings over the subsequent centuries.

Different numbering systems have been applied to the numerous Crusades. In addition to the nine Crusades sanctioned by the Catholic Church, there are a number of other endeavors, some of them with names, such as the “Peasants’ Crusade” and the “Children’s Crusade.”

Peasants’ Crusade

In the so-called Peasants’ Crusade of 1095–96, not an officially sanctioned endeavor, several thousand French and German peasants gathered and headed to Jerusalem by way of Constantinople. Peter the Hermit was one of several leaders. On the way, some of them sacked Belgrade; others attacked Jewish communities. Soon after their arrival in Constantinople, Alexius I provided them with boats to Jerusalem, where they were easily defeated by the Turks. Some managed to escape, returning to Europe; others, such as Peter the Hermit, joined the gathering Crusader forces.

First Crusade

What is known as the First Crusade consisted of organized armies under a number of nobles. Other people joined them en route or traveled to port towns, then sailed to Constantinople on their own to meet up with the Crusaders, creating a force of an estimated 25,000 to 30,000 in late 1096 and early 1097. The majority were Franks, descended from those peoples united in France under Charlemagne in the eighth and ninth centuries. From Constantinople, the Crusaders crossed to Asia Minor and traveled southward overland through Muslim states and principalities in present-day Turkey, Syria, Lebanon, and Israel. Major victories in the First Crusade included the capture of Nicea (present-day Iznik, Turkey) in 1097; the capture of Antioch (a site in present-day Turkey) in 1098; and, in a bloody massacre in which the Crusaders massacred most of the Arab and Jewish inhabitants, the capture of Jerusalem in 1099. Godfrey of Bouillon became the first ruler—known as defender of the Holy Sepulcher—of the Latin Kingdom of Jerusalem. Other Crusader states founded at this time were the County of Edessa (in northern Syria and southern Turkey); the Principality of Antioch (in Syria); and the County of Tripoli (in Lebanon). Some Crusaders thus maintained a presence in the region, in particular members of the military orders, the Knights Hospitallers and the Knights Templars; others returned home.

Second, Third, and Fourth Crusades

The later Crusades were intended to offer support to the Crusader states and expand Christian-held territory. After the fall of Edessa to the Turks in 1144, Bernard of Clair-

vaux called for another crusade. In the Second Crusade of 1147–49, armies under Holy Roman Emperor Conrad III and then king of France Louis VII failed to take Damascus in Syria.

The Third Crusade was declared in 1187 by Pope Gregory VIII and was carried out in 1189–92. Leaders included King Richard I Lionheart of England, King Philip II Augustus of France, and Holy Roman Emperor Frederick I Barbarossa. In battle with Muslim forces under the renowned commander Saladin, a Kurd serving as vizier of Egypt, the Crusaders managed to fight to a truce. They retained Acre (Akko) in Syria and Jaffa, 35 miles northwest of Jerusalem in Palestine, and a narrow strip of coast and the right of free access to Jerusalem. Meanwhile, Tripoli and Antioch were controlled by Christians.

A number of expeditions to the Holy Land in subsequent years are not all listed as major Crusades. That known as the Fourth Crusade, in 1202–04, never reached the Holy Land. Its Frankish leaders joined the Venetians in retaking Zara (Zadar) on the Adriatic coast of present-day Croatia, then part of the Kingdom of Hungary. The Franks then joined in a dynastic struggle for Constantinople itself. After seizing and looting the city, they deposed the Byzantine leaders and established the Latin Empire of Constantinople, with Venice now controlling the sea route between the two cities. Even though Pope Innocent III condemned their acts of violence against fellow Christians, the Fourth Crusade led to increased distancing between the Roman Catholic and Greek Orthodox churches.

Children’s Crusade

In the so-called Children’s Crusade of 1212, a visionary French shepherd teenager, Stephen of Cloyes, inspired other children to try to liberate the Holy Land, a cause that their elders had betrayed in the Fourth Crusade. A group traveled to Paris to seek the support of French king Philip II. On his refusal to help, some of the youth returned to their homes, but others remained devoted to the cause. A youth from Cologne named Nicholas similarly inspired German children. Some of them reached Italy and others, Marseilles. It is thought that some of the youth perished from hunger and disease, and that others set out from Marseilles and other ports by ship, only to be sold into slavery by the crews.

Final Crusades

Soon afterward, in 1217–21, the Fifth Crusade, the final one sponsored by the papacy, was launched against Muslim forces in Egypt. Christian forces captured Damiatta (Dumyāt), at the mouth of the NILE RIVER, but evacuated it two years later after failing to capture Cairo.

In the Sixth Crusade of 1228–29, Holy Roman Emperor Frederick II moved on Jerusalem with the support of the Teutonic Knights, a military order, and, through negotiations, reached a truce with Muslim leaders granting the

Franks control of Jerusalem, except for Islamic holy places. Feuding between the Knights Hospitalers and Knights Templars led to a weakening of the Crusader states, and the Turks retook Jerusalem in 1244.

In the Seventh Crusade of 1248–50, King Louis IX of France attacked Cairo but was captured. Freed by ransom, he stayed in the Near East to rebuild Jaffa and Acre. After his return to France, Jaffa and Antioch fell to Muslim forces. Louis organized the Eighth Crusade of 1270, but he died in northern Africa after invading Tunis. Prince Edward (later King Edward I of England) launched the Ninth Crusade of 1271–72, reaching Acre, where he negotiated an 11-year truce. Yet, in 1271, Tripoli fell to the Muslims. And in 1291, so did Acre, the last Christian stronghold in the Near East. In the meantime, the Byzantines retook Constantinople in 1261, ending the Latin Empire of Constantinople as well.

Economic Outcome

The Crusades had no lasting territorial effect after the fall of the Crusader states to the Muslims. Yet, they did have a lasting economic effect. During the Crusades, Italy became the primary route for travel from Europe to the Near East and North Africa. As a result, Italian cities prospered, and Italian merchants replaced Byzantines and Muslims as the dominant traders in the Mediterranean. Italian port cities remained the commercial center of activity in the region—and the link between East and West—for years to come. And a growing number of Italian merchants, such as MARCO POLO, would travel from Europe to the Far East in the late 13th and 14th centuries. Italian commercial power and expanding worldview helped bring about the start of the period of history known as the RENAISSANCE. Italian control of trade routes helped set the stage for the EUROPEAN AGE OF EXPLORATION, starting in the 15th century, when other European nations began seeking Atlantic Ocean and Pacific Ocean routes to the Far East.

In the years after the Crusades to the Holy Land, other military expeditions against non-Christians were promoted as “Crusades,” such as in eastern Europe. Some of the Crusader military orders even participated. But the term, used historically—and certainly in the context of world exploration—generally refers to the expeditions mentioned above.

Cumberland Gap

The Cumberland Gap is a pass through the Cumberland Mountains, a range of the APPALACHIAN MOUNTAINS, in

northeastern Tennessee near its juncture with Virginia and Kentucky. The walls flanking it are more than 500 feet high; its altitude is 1,640 feet; along some stretches it is only wide enough for a small road. Formed naturally, the Cumberland Gap is a wind gap—that is, a dry valley—one of the gaps that separate the Blue Ridge Mountains into smaller sections.

In 1750, Virginia-born THOMAS WALKER, a physician appointed chief agent of the Loyal Land Company, led a surveying party westward from Staunton, Virginia, and crossed the Blue Ridge into the Holston River Valley, then over Powell’s Mountain into Powell’s Valley. It was there he located the mountain pass that he named the Cumberland Gap after the Duke of Cumberland, a British general.

In 1769, DANIEL BOONE, sponsored by the Transylvania Company, who hoped to develop lands to the west, traveled through the Cumberland Gap with JOHN FINLEY and a number of other frontiersmen on a hunting expedition to Kentucky, which lasted until 1771. In 1773, Boone led a colonizing expedition into the pass but was turned back by Indians. In 1775, the Transylvania Company hired Boone to establish a road from Fort Chiswells in the Shenandoah Valley through the Cumberland Gap into Kentucky; Boone and a party of about 30 axmen cleared and marked the route. This became known as the Wilderness Road or Boone’s Trace. Most of the early immigrants to Tennessee and Kentucky journeyed over this road.

curragh (curach, currach, skin-boat)

The curragh (also *currach* or *curach*) is a type of boat constructed from oiled animal hides covering a light wooden frame. It is also called a skin-boat. Pointed at both ends, it resembles a large CANOE. Although normally propelled by oars, it can be rigged with a sail. The curragh, used especially in waters off Ireland, is thought to have evolved from the British CORACLE.

Used for ocean fishing to this day in Ireland, the curragh is a vessel more seaworthy than its appearance would indicate. The experienced sailor is able to handle rough seas in this vessel due to its maneuverability and stability, thus making transoceanic voyages possible, although perilous.

Curraghs were in common use in the fourth century A.D. They were larger than today’s versions and could carry 70 persons or more. It would have been in one of these curraghs that Irish monk SAINT BRENDAN and other monks traveled westward into the Atlantic Ocean in the sixth century A.D.

dead reckoning

The navigation term *dead reckoning* refers to the act of determining the position of a watercraft or aircraft from the following data: a known starting point; records of the courses sailed or flown; distance made (which may or may not be estimated from velocity); and the drift (the velocity of the current, either known or estimated). By definition, dead reckoning does not include celestial observations. Yet the principles of dead reckoning are part of virtually every navigation system.

There is a mistaken belief that *dead* in the term *dead reckoning* derives from the word *deductive* rather than from *dead* having the meaning of “directly” or “exactly,” as in “dead ahead” or “dead center.” Yet it can be said that information “deduced” from dead reckoning often is combined with information determined from fixing a position through celestial navigation in order to more accurately ascertain the position of a craft. Celestial navigation names the process of using observed positions of heavenly bodies to determine the position of a craft. It is more useful with north-south latitudinal mapping because the elevation of the NORTH STAR is always equal to the observer’s latitude (given an average error of less than half a degree, or 35 miles); thus, a navigator may determine the craft’s north-south position by the apparent height of the North Star. Dead reckoning, however, requires precise calculations.

In order to navigate by dead reckoning, early mariners used a COMPASS to determine the ship’s direction. They then measured speed with a chip log—a wooden float attached to a long rope with knots in it. As the float entered the water, they overturned a sandglass, and they then counted the number of knots the rope pulled off a reel behind the ship during the time in which the sand passed from the top to the bottom of the glass. (The term *knot*, or one nautical mile per hour, originated with the chip log: if the first knot appeared as the sand ran out, speed was determined to be one nautical mile per hour, or one knot.) Time, distance, and direction were measured each time the ship tacked because of wind direction. A TRAVERSE BOARD was used to keep track of the zigzag course. Dead reckoning took other information into account, such as wave patterns and directions, floating debris, cloud formations, and birds.

Careful and consistent record keeping can result in an accuracy rate of 90 percent for dead reckoning. Although it is not considered especially useful over large distances, an Italian mariner of the late 15th century, CHRISTOPHER COLUMBUS, is believed to have used dead reckoning throughout his travels.

Dead reckoning contrasts not only with celestial navigation but also with pilotage (navigation by visible landmarks or by radar). Navigating by such modern pilotage methods as the SATELLITE-based Global Positioning System is highly precise, but dead reckoning navigation remains a useful low-technology fallback.

dhow (baggala, boom, sambuk)

Dhow is a traditional term, used by Europeans, referring to a ship of Arab design with a LATEEN RIG. In places where the dhow is still in use, it is called variously the *sambuk*, the *baggala*, and the *boom*, each distinguished by the shape of its hull.

The dhow is constructed with planking set edge to edge. In the past, the planks were held together with cordage; in modern practice, nails are used. The bow has a long overhang, and the poop is raised. Sails were originally made of palm or date leaves; cotton was later introduced. The lateen rig allowed the boats to point up close to the wind and move at a relatively fast pace. Dhows are typically single-masted, but larger versions might have three or more masts with sails shaped to maximize use of the wind.

The earliest dhows were used for local fishing, transportation, and trade. Records exist of their movement between the RED SEA and India as early as the first century B.C. As Arab trade grew in the Middle Ages, larger and larger dhows could be found from the Middle East to East Africa and China. According to accounts from the ninth century A.D., the dhow grew to a size capable of transporting 800 people. Modern versions of the dhow range from a small handful of crew and passengers to a maximum of about 200.

disease and exploration

Disease has been a significant factor in the history of exploration; it has both impeded the efforts of explorers and been spread by them. Diseases suffered by explorers at sea or in the field slowed and sometimes halted their journeys. The meeting of hitherto isolated groups of humans engendered and intensified disease. And, in the case of the epidemic known as the Black Death, it created economic conditions that affected the course of exploration.

The Black Death

Expansion of human groups into new lands goes hand in hand with the expansion of diseases; explorers carry their diseases with them and suffer diseases in the lands they explore or conquer. One of the most devastating pandemics in European history probably resulted from this process of contacts between peoples of distant lands, that of the bacterial infection resulting in the bubonic plague or the Black Death, known at the time as the “Pestilence” or “Great Mortality.” The bubonic plague was carried by a number of mammals, especially rats, and passed to humans by fleas. It is thought to have originated in China and spread as a result of expansion by the Mongols in the 13th century (see MONGOL EXPLORATION), when trade routes were opened between East and West. The first known European outbreak occurred in southern Russia. Then, probably first in 1347, Italian merchant ships from the Black Sea carried it to the Mediterranean region. It spread widely throughout Europe until 1351, with recurrences well into the 18th century. The plague devastated Europe’s population; it is estimated that a quarter to a third perished. Cities were particularly hard hit because of the concentration of people. In Italy, for example, almost two-thirds of the population of Venice died, and three-quarters of that of Florence.

Ecclesiastics, whose vocation to go among the sick giving comfort and last rites, were at great risk of infection; university scholars were also decimated. For a time, living standards for the survivors rose considerably as they benefited from the economic wealth built up for a population that had been cut by a third. Laborers leaving the land, which was growing increasingly unproductive because of a long-term climate change called the Little Ice Age, moved to the cities where, because of work shortages, wages rose. Food prices fell, even with the crop losses, because of low population levels. Many laborers were thus able to accumulate some wealth and enter the middle class. With more capital available to invest in ships and trading ventures, the economic importance of trade increased, while at the same time the decrease in the value of much agricultural land diminished the wealth of the landed nobility. The laboring and

merchant classes to some extent began to fill the political vacuum once dominated by clerics and nobles.

Despite these gains, the recurrence of the plague for centuries caused continuing economic and social instability, and population levels did not begin to recover until the 18th century. The plague originally slowed down the development of foreign trade and exploration. However, the new opportunities that had opened up in an economic, social, and political fabric, which had existed for centuries, resulted, by the 15th century, in an energized European society. Ironically, this energy helped lead to European expansion, which was to cause the spread of European diseases to the Americas.

European Diseases in the Americas

Native Americans of every region suffered decimating outbreaks of European diseases. Loss of life ranged from 25 to 50 percent and caused the near extinction of some peoples. They suffered far more even from diseases such as measles, which in Europe were seldom fatal. It has been theorized that the difference was caused by the greater number of domesticated animals, the progenitors of many diseases in humans, in Eurasia than in the Americas, in combination with continental isolation and lack of the necessary antibodies to fight off infection.

Smallpox was the most destructive of the European diseases. It aided HERNÁN CORTÉS in his conquest of the Aztec Indians in present-day Mexico in the 1520s. When FRANCISCO PIZARRO arrived in the Inca city of Tumbes in present-day Ecuador in 1530, only 11 years after Cortés had arrived in Mexico, he saw that smallpox had been there before him. It had killed Emperor Huayna Capac along with his heir apparent, leading to a bitter civil war between adherents of two of his sons for possession of the empire. It was this conflict, decimating the population and crippling the Inca armies, along with smallpox, that primarily enabled Pizarro to conquer the Inca with an army of 180 men. The Mandan of the upper MISSOURI RIVER in North America are said to have declined from 1,600 to 131 during the smallpox epidemic of 1837. Smallpox ravaged neighboring people in repeated outbreaks; from 1837 to 1870, at least four different epidemics struck other Plains Indians of North America.

Other diseases of Europe, such as dysentery, measles, scarlet fever, typhoid, typhus, influenza, tuberculosis, cholera, diphtheria, chicken pox, and venereal infections, swept through the Americas with incredible speed, far in the vanguard of Europeans themselves. It is possible that the great Temple Mound Culture of the Mississippi Valley and Southeast died out as a result of a pandemic that started with the contact of a few Indians with the earliest European explorers of the late 15th or early 16th century. Settlers in New England, as they moved through the forests prospecting for land, often found signs of wholesale depopulation in nu-

merous deserted villages and ceremonial sites, prepared fields, and even stored food.

European Diseases in Other Lands

The pattern of indigenous peoples succumbing to European illnesses continued with the exploration and colonization of Australia and NEW ZEALAND. Illnesses such as smallpox, venereal disease, measles, and influenza—some of which were not life-threatening to the British—devastated the Aborigines in Australia. The Maori population of New Zealand declined rapidly, from about 120,000 in 1769 to 42,000 in 1896, as a result of European diseases, such as influenza, measles, and whooping cough.

From America Back to Europe

Contacts among Europeans and Native Americans led to new forms of disease being carried back to Europe, in particular syphilis. Based on evidence from skeletons, it had been known in Europe from prehistory. Yet it appeared in a far more virulent form immediately after the European discovery of the Americas. An outbreak occurred in Barcelona in 1493 soon after the celebrations of Columbus's return and quickly became an epidemic throughout Europe, differing from the hitherto common form of syphilis in rapidly causing mortality. The most probable theory for this occurrence is that it resulted from sexual relations between Native Americans and the European explorers. Perhaps the syphilis bacterium assumed a new form as a result of its success among the native peoples with their lack of resistance.

Cholera was a severe infectious disease endemic in India and some other tropical countries. Characterized in severe cases by violent diarrhea, vomiting, thirst, muscle cramps, and sometimes circulatory collapse leading to death, cholera caused severe epidemics in Europe in the late 18th century as a result of British colonization of India, and later in the Americas. The horror of cholera lay in the speed with which death often followed its first onset, sometimes within hours.

Diseases among Explorers

SCURVY was a scourge of explorers for centuries and is a recurring theme in the saga of world exploration. This deficiency disease results from the failure to supply the body with the required amount of vitamin C. A weakening of the capillaries results in hemorrhaging, leading to a multitude of symptoms and eventually death. Scurvy is thought to have caused more loss of life during the EUROPEAN AGE OF EXPLORATION than shipwrecks. It took its toll on numerous crews on open-sea voyages. Even after it came to be understood in the 18th century, it caused death on expeditions when food supplies ran low.

Malaria, a debilitating infectious disease caused by single-celled parasites, characterized by chills, shaking, and

periodic bouts of intense fever, which had been known in Europe from Roman times, reached the Americas soon after the first European explorers arrived. It affected native peoples and colonists alike, such as the first settlers of Jamestown in Virginia. Spanish Jesuits in South America discovered a treatment for malaria in cinchona bark, the ingredient of quinine, which they brought back to Europe in 1638. Nevertheless, it continued to be a problem for centuries. Englishman SIR GEORGE EVEREST, for example, who, in the early 19th century, laid the groundwork for topographic mapping of northern India and the HIMALAYAS (and for whom Mount Everest [see EVEREST, MOUNT] is named), was hampered in his work by malaria. Englishmen SIR RICHARD FRANCIS BURTON and JOHN HANNING SPEKE had bouts of malaria and other ailments in Africa in the 1850s. Scottish missionary DAVID LIVINGSTONE died in Africa in 1873 from dysentery, an acute or chronic disease of the large intestine of humans, characterized by severe diarrhea and abdominal cramps.

Dysentery was common on ships, especially slavers, where unsanitary conditions prevailed. Many Africans transported to the Americas for the SLAVE TRADE died in transit, chiefly because of dysentery. It has been theorized that a large proportion of Africans who survived their horrific journey had a genetic condition called “salt-sensitivity,” perhaps the result of ancestors who survived droughts in Africa, which made them able to withstand the loss of salts accompanying the diarrhea of dysentery. Two-thirds of the English population of Jamestown was wiped out by dysentery. SIR FRANCIS DRAKE and SIR JOHN HAWKINS, 16th-century English maritime explorers, suffered from dysentery and also malaria. JOHANN LUDWIG BURCKHARDT, a 19th-century Swiss explorer in the Middle East, died in Cairo of dysentery.

Yellow fever, a noncontagious, infectious disease caused by a virus, and characterized in severe cases by high fever and jaundice, originated in Africa and came to the Americas and Europe via the slave trade. It delayed the exploration and colonization of Africa by Europeans until the latter part of the 19th century, when it was realized that it spread by mosquito bites; thereafter improved methods of sanitation, including draining of swamps and quarantine of ships, helped to bring it under control.

In global terms, the increasing contact between population groups resulted in a more uniform level of contact and exchange of diseases and immunity. Moreover, knowledge and treatment of the diseases that attacked explorers in the field, both infectious and dietary, grew with time. Great plagues like the Black Death became less common by the end of the 18th century, although pandemic diseases still have the ability to decimate populations.

diving bell

A diving bell is a device used to supply air to and convey a diver or group of divers to a desired location. The evolution of this device charts humankind's problems of exploring the ocean's depths, namely regarding air supply and water pressure. The technical challenges of these factors and how slowly they were solved demonstrates humankind's coming to terms with the physical world.

Mention of such a device is found in Greek philosopher Aristotle's *Problematum* from about 360 B.C. In this work, he describes a “kettle,” which is lowered into the sea to supply air to sponge divers. The detail he furnishes makes clear that the device was a workable model of the diving bell. The only other indication of such a contraption in ancient history comes from ALEXANDER THE GREAT's attack on Tyre in 322 B.C., as reported in medieval texts about his campaigns. The Phoenicians had placed obstacles in the water to defend the port city in the eastern MEDITERRANEAN SEA. Alexander ordered them removed so the campaign could commence. To observe the progress of the work, he was reportedly lowered into the sea in some sort of device. From an Arab historian in the seventh century A.D., there exists a detailed description of this device as a wooden box sealed with wax, having glass windows, and weighted with stone. It was tied to a cable and attached to a pole placed between two ships, then lowered and raised according to a message given by a signal rope controlled by the occupants of the box. A 13th-century illustration depicts the same incident with Alexander using a giant glass jar. The actual truth of the matter will never be known of course, but these varied conceptions of the diving bell give some sense of the longstanding interest in the device.

The next record of a diving bell-like invention is from 1531. Italian physicist Guglielmo de Lorena constructed a large barrel that could be used to walk along the bottom of a body of water. It was assisted by people with ropes on the surface and could provide enough air to maintain the diver underwater for about an hour. The motivation for this invention was the exploration of Lake Nemi, which was thought to have the remains of ships and treasure belonging to Roman emperor Caligula. A diver using Lorena's creation was successful in locating these ships where others had failed. A short time later, a larger diving bell was produced by a pair of Greek inventors. In 1538, they demonstrated it to Charles I of Spain (Holy Roman Emperor Charles V) and a large crowd of spectators in Toledo. Their bell carried both inventors to the bottom of the river and back with a burning candle remaining lit.

The sensation caused by the demonstration in Toledo gave rise to interest in such devices throughout Europe. A number of people made versions, and their use in salvaging treasure became more widespread. In 1616, a German named Franz Kessler tested a model that was unencumbered

by ropes. He sunk to the bottom with weights and resurfaced by detaching them. Yet the task proved too cumbersome for his design to gain widespread use.

A breakthrough in the design of the diving bell was made by French physicist Denis Papin in 1689. He thought to supply his apparatus with fresh air from the surface pumped through a tube. The diver would not be limited by the quantity of air in the bell or the compression of air that took place as the bell descended. At a depth of 33 feet, the weight of water is twice that of the weight of atmospheric pressure. Since gas is compressible, this causes the air inside the bell to be reduced by half in volume. This holds true for each additional 33 feet of descent. As a result, in practical operation, the volume of air a diver has access to becomes significantly reduced. The theory of Dr. Papin's device was sound, but he was limited by the power of the pumps of the day, which were unable to generate a pressure of more than three atmospheres, and his diving bell did not break records for depth beyond 70 feet. Still, his contribution was important.

Edmund Halley, an English astronomer and mathematician and a contemporary of Papin, was responsible for another advance in the diving bell. He used lead casks filled with air and regulated by the diver with a valve. This solution to the problem of air supply proved practical and was in use until 1788, when stronger pumps were invented, thus reviving the ideas of Papin.

John Smeaton, an English engineer who invented a pump powerful enough to supply a Papin-type bell, is also responsible for the last great chapter in the history of the diving bell. His device, known as a caisson, was considerably larger than anything that had come before. Designed for underwater construction and capable of holding 12 men, the caisson ushered in a new era in underwater exploration, salvage, and construction. It also revealed new problems caused by working at great depths. Divers using the caissons would be subject to a mysterious cause of death, which was only later diagnosed as the bends, a painful release of nitrogen gas into the bloodstream. This problem was initially solved by slowing the time of ascent to the surface.

The diving bell had limited use in direct exploration. The scientific discoveries to which it contributed were tangential to its practical uses, such as salvaging operations, due to the capital-intensive nature of its operation. With a boat, its crew, and experienced divers required, it was expensive to use. It could also be dangerous. Because of invisible currents and numerous underwater entanglements, there were still many ways for divers to lose their lives.

Diving bell technology, with an attached supply of air, led to that of the SUBMERSIBLE, such as the BATHYSPHERE, BATHYSCAPH, and the SUBMARINE, which maintain surface air pressure inside while descending deep into the ocean, allowing for extensive exploration. Remotely operated vehicles (ROVs) are now also utilized. Yet diving bells, of improved

design and material and with better lighting, heating, and communication systems than earlier models, are still in use, especially in construction, such as on submerged portions of bridges, piers, and jetties, and in transporting divers to underwater work stations. As the diving bell has evolved so has the DIVING SUIT.

See also OCEANOGRAPHY AND EXPLORATION.

diving suit

A diving suit, equipment for underwater diving, is a water-proof outfit, including a helmet and breathing apparatus allowing air to be supplied from the surface pumped through a tube. Early references to diving are found in writings of the ancient Greeks and Romans. In the *Iliad*, the epic poem probably of the eighth century B.C. and attributed to the Greek poet Homer, divers are described as playing a part in the Trojan Wars. Ancient divers used stones as weight and ropes as guides. The invention of the diving suit and other diving gear enabled divers to spend more time underwater for a variety of tasks: gathering sponges, coral, and pearls; examining and repairing the underwater parts of ships; working on underwater supports for structures such as bridges and docks; salvaging sunken ships and their contents; military operations, in particular reconnaissance and sabotage; and scientific studies.

The development of the diving suit paralleled that of the DIVING BELL, as inventors sought means to supply air below the surface. Various attempts were made at watertight suits in the 17th century with piped air. In 1819, German inventor Augustus Siebe developed the first efficient diving suit, consisting of a copper helmet attached to a watertight canvas and leather jacket with weights attached around the chest. A surface pump pushed air to the diver through hoses attached to the helmet. The pressure of the pumped air kept the water level below the diver's chin, and the air could escape through vents at the bottom of the jacket. The fact that a diver had to remain vertical to prevent water from entering the vents led to refinements—a full closed suit with valves that let air exit without letting water enter. The suit proved more practical than the diving bell in that divers could walk along the bottom and could look in all directions rather than just through fixed windows.

Siebe's basic design for helmet diving suits has endured to this day. Improvements include the use of rubber for the suit. Leaded boots keep the diver on the bottom and leaded weights around the chest help to maintain equilibrium. Additional valves help regulate buoyancy. The attached lifeline to the surface in addition to the air pipe also includes a line of communication. Armored steel suits are also used for deeper dives along with a special mixture of gases added to oxygen to help prevent decompression sickness on surfacing.

A deep-sea sponge diver climbs back into a boat in his diving suit, as shown in this 1940s photograph. (Library of Congress, Prints and Photographs Division [LC-USW3-043126-C])

Helmet diving, despite modern improvements, restricts lateral movement because of the necessary connection to the surface, and inventors sought an alternative, leading to the development of the scuba (for “self-contained underwater breathing apparatus”), in which the diver carried an air supply. In 1865, French inventors Benoît Rouquayrol and Auguste Denayrouze developed a combined system. In addition to surface-supported hoses, it included cylinders worn by the diver containing compressed air. Yet a helmet and suit were still required, and the cylinders functioned poorly. Modern scuba diving began with the invention of the Aqua-Lung (or aqualung) by Frenchmen JACQUES-YVES COUSTEAU and Émil Gagnon, first successfully used in 1943, consisting of a cylinder of compressed air connected through a pressure-regulating valve to a face mask. Scuba divers, although they have reached depths of about 300 feet, usually do not descend below 130 feet because of the effects of nitrogen narcosis (popularly known as “raptures of the deep”), caused by the narcotic effects of nitrogen in the air at high pressure. The condition is marked by a loss of judg-

ment that often causes the diver to discard equipment or engage in other dangerously foolish behavior. Helmet divers can avoid nitrogen narcosis until a depth of about 200 feet.

Scuba diving, which replaced helmet diving in many practical applications much as the SUBMERSIBLE replaced the diving bell, also has become a recreational activity. A recent invention granting even greater freedom to the scuba diver is the rebreather, a device that recycles air exhaled by the diver. Moreover, the rebreather does not emit noisy bubbles the way open-circuit scuba does, enabling a greater interaction with marine life.

See also OCEANOGRAPHY AND EXPLORATION.

doldrums

The term *doldrums* refers to ocean regions slightly north of the EQUATOR where there is no regular system of cross-oceanic winds. These regions are also known as the “equatorial belt of calms.” Because of the relative intensity of the sunlight in the doldrums, a continuous updraft of air is created. Evaporation occurs simultaneously, and the air is especially humid, leading to squalls. Since the doldrums are an area of low pressure, weather systems from the Northern Hemisphere and Southern Hemisphere are able to converge, and hurricanes form with regularity.

For centuries, fear of the doldrums gripped the crews of sailing ships that might drift for days, weeks, and even months. Among the earliest observations of the phenomenon of the doldrums came from Portuguese expeditions along the west coast of Africa, such as those sponsored by HENRY THE NAVIGATOR, prince of Portugal, in the 15th century. His expeditions experienced the doldrums at about the latitude of Cape Verde.

One example of a voyage affected by the doldrums was the first CIRCUMNAVIGATION OF THE WORLD headed by Portuguese FERDINAND MAGELLAN, exploring for Spain, in 1519–22. While crossing the Atlantic Ocean westward, the expedition’s progress was slowed significantly. On the second leg of the voyage in the Pacific Ocean, his ships drifted for 96 days.

drift ice (drifting ice)

The term *drift ice*, or *drifting ice*, refers to any floating and moving ice in a body of water. It is generally used, however, as distinct from an extensive, fixed ice field, or to the annually created PACK ICE, which also drifts but at much slower rates.

Different names are applied to different kinds of drift ice. Relatively small fragments of ice, less than seven feet in diameter, typically found near pack ice, are known as *brash ice*, or *brash*. The term *growler* is applied to larger pieces of ice floating low in the water that make a growling noise

when waves wash over them. *Bergy bits* refers to pieces of ice between seven and 16 feet in diameter. *Pan* refers to a fragment of the uniformly chunk of flat ice at the surface of water. *Ice floe*, or *floe*, refers to a relatively flat and low expanse of ice detached from an ice field. *Iceberg*, or *berg*, refers to a larger mass, tabular, rounded, or irregular in shape, which has calved, or broken off, from an ice shelf (a huge slab of permanent ice that floats on water near the edges of Arctic and Antarctic landmasses) or from the face of a glacier (a formation of ice on land where snowfall exceeds melting and the resulting mass moves downward from above the snowline under the force of gravity and pressure). Thousands of icebergs are calved each year. They can be huge; the largest one on record, sighted in the Ross Sea off Antarctica in 1956, was 208 miles long and 60 miles wide. Only a small percentage of these various kinds of drift ice are underwater, about one-fifth.

Drift ice occurs in the relatively short summer thaws in Arctic and Antarctic waters. When the water freezes over

again in wintertime, drift ice from the previous season or seasons becomes trapped in it, giving the pack ice irregular shapes. Some drift ice travels great distances before melting. Icebergs last on average about four years. Arctic icebergs, many of them from GREENLAND, have been sighted as far south as 30 degrees latitude north; Antarctic icebergs have been sighted as far north as 27 degrees latitude south.

Because of the range of icebergs, they have proven a hazard to navigators over the centuries. Between 1870 and 1890, for instance, more than 50 ships collided with icebergs, 14 of them sinking. After the sinking of the British ocean liner *Titanic* in 1912 due to a collision with an iceberg, an International Ice Patrol, consisting of ships and aircraft from a number of countries, have monitored northern waters. Yet drift ice, like pack ice, can offer refuge to stranded explorers. For instance, during the British expedition to Antarctica in 1914–17 led by SIR ERNEST HENRY SHACKLETON, his men survived part of the time on ice floes after their ship was crushed in the pack ice. And, starting in

This photograph of drift ice at the edge of the Ross Ice Shelf in the Antarctic was taken during Richard E. Byrd's 1947 expedition. (Library of Congress, Prints and Photographs Division [LC-USZ62-101004])

the 20th century, scientific stations have been located temporarily on ice floes and icebergs.

drift voyage

The term *drift voyage* refers to a transoceanic journey between continents by primitive boat or RAFT, propelled by OCEAN CURRENTS. With the extensive sea travel carried out over the centuries along coastlines for fishing and trading—plus the westward current in the South Atlantic Ocean, the westward current north of the EQUATOR in the Pacific Ocean, and the eastward current in the North Pacific—it is theorized that some unintentional drift voyages occurred, or perhaps even intentional ones. Norwegian anthropologist THOR HEYERDAHL, in his *Kon-Tiki* voyage across the Pacific from Peru to the Tuamotu Islands in 1947, and his *Ra* voyage across the Atlantic from Morocco to Barbados in 1970, demonstrated that small wooden or reed crafts could make such ocean crossings.

Scholars have used cultural similarities of artifacts on different continents to make the case for prehistoric drift voyages—from Europe, Africa, and Asia to the Americas. Yet there is no conclusive archaeological evidence of such early transoceanic contacts. Some ancient transoceanic voyages, such as the legendary sixth-century voyage of SAINT BRENDAN and the archaeologically proven 11th-century journeys of the Vikings (see VIKING EXPLORATION), are not considered drift voyages because the mariners controlled their courses.

The term *drift voyage* has also been applied to the motion of ships in the Arctic and Antarctic while trapped in PACK ICE.

Dutch East India Company

The Dutch East India Company, one of the various European East India Companies, chartered in 1602, was the premier joint-stock trading company of the Netherlands during the 17th and 18th centuries. The company routed the Portuguese from their possessions in the SPICE ISLANDS (the Moluccas) and, with monopoly protection from the Dutch government, made enormous profits in the SPICE TRADE and other commerce. In search of even greater riches, the company sponsored explorations throughout the Pacific Ocean.

What is now the Netherlands had been inherited by Charles I, who became king of Spain in 1516 and Holy Roman Emperor in 1519. Over the years, the Dutch had gained more autonomy from Spain, and Charles's son King Phillip II had continued to try to assert control over the region. Holland, which had been a territory of Spain, declared its independence in 1581. In 1588, the Spanish Armada was defeated by the English. The Dutch, who had

a tradition of seamanship, worked hard to build a fleet of ships to strengthen their position of independence. The greatest navies soon belonged to the British and the Dutch. The Dutch East India Company was formed in 1602 to reap profits from the Indian Ocean and Pacific trade. It was also allowed to engage the Spanish and Portuguese on the high seas and at their trading posts. In 1594, Phillip had closed the Portuguese port of Lisbon, part of his domain, to Dutch merchant vessels. This had acted as an incentive to the Dutch to develop other markets. They had sent a trading mission to the EAST INDIES the following year under CORNELIUS HOUTMAN. Houtman had succeeded in forming relations at Bantam, Bali, and Sumatra.

Competing Nations

The East Indian trade became very competitive very quickly, and with various European companies bringing about a lowering of prices, the various Dutch interests decided to merge. In 1602, the General United East India Company was granted a charter by the government of the Netherlands, which gave broad powers, including the exclusive right to trade between the CAPE OF GOOD HOPE and the Strait of Magellan (see MAGELLAN, STRAIT OF), the right to make war on other European countries, to form alliances with the princes of the east, and to perform various administrative and judicial functions. The government reserved the right to revoke privileges if necessary and to share in the profits.

The Dutch were aided in their trading endeavors by extensive experience as merchants and bankers, and they had become accomplished shipbuilders and mariners. They also had goods that could be exchanged for the spices and textiles of the East. These goods included high-ticket items such as porcelain, velvets, and marble work, along with more mundane items such as soaps, oils, and cured herring. Convoys were sent from the Netherlands three times a year, accompanied by heavily armed naval ships.

The ascendancy of the Dutch in the Spice Islands, and in Malaysia, Sumatra, and Java to the west, did not come without military action. The Portuguese had spread themselves thin militarily in the East Indies. In 1615, the Dutch drove the Portuguese from Amboina. In 1619, Jan Pieterszoon Coen conquered Jacatra and founded the city of Batavia in Java (present-day Jakarta, Indonesia) as the headquarters of the company. From Batavia, the Dutch East India Company conducted business throughout the East Indies to parts of China, Japan, India, and Iran in Asia, as well as the Cape of Good Hope in Africa, where they founded the first European settlement in South Africa. In the 1650s–1660s, the Dutch captured Malacca, CEYLON (present-day Sri Lanka), and Celebes. (In the meantime, in 1648, the Dutch had achieved independence from

Spain, as the United Provinces.) The English and the BRITISH EAST INDIA COMPANY also were making inroads in the region. It was eventually resolved that the Dutch would control the Spice Islands, and the English would dominate India. Despite the expenses of waging war, the Dutch East India Company's stock rose to six times its original capitalization and paid annual dividends of between 12 and 75 percent.

Exploratory Expeditions

The Dutch East India Company had launched exploratory expeditions from its inception. In 1605, WILLEM JANSZ, sailing for the company, had made the first recorded sighting of Australia by a European. Having become established in the East Indies, the company launched a number of expeditions to locate the GREAT SOUTHERN CONTINENT, the fabled Terra Australis. In 1642, ABEL JANSZON TASMAN sailed from Batavia to the South Pacific and made the European discovery of an island south of Australia, naming it Van Diemen's Land, after the governor general of the Dutch East Indies (it has since been renamed TASMANIA). Later that year, Tasman made the European discovery of NEW ZEALAND, Fiji, and other islands. Another important explorer in the employ of the Dutch East India Company was JAKOB ROGGEVEEN, who made the European discovery of Easter Island in 1722.

18th Century

In the 18th century, Dutch strength in the East Indies began to decline. The English had solidified their position in world trade by putting more efforts into colonization. The French and the FRENCH EAST INDIA COMPANY had also developed trade in the region. Rampant corruption overtook the Dutch East India Company, and, by 1724, it was unable to pay dividends to investors and survived by taxing the native population. The British successfully attacked Dutch possessions in the Far East in 1780. As of 1795, the French were in control of the United Provinces—known as the Batavian Republic (until 1806 when the Kingdom of Holland was established)—and dissolved the Dutch East India Company in 1798.

See also COMMERCE AND EXPLORATION.

Dutch West India Company (West India Company)

The Dutch West India Company, or the West India Company, a joint-stock trading and colonizing company, was chartered by the States-General of the Dutch republic in 1621 to develop new commercial interests in the Americas and Africa. It began its commercial activity two years later. The DUTCH EAST INDIA COMPANY had been active in Asia since 1602.

By the terms of the charter, the company regulated all Dutch trade along the African coast from the TROPIC OF CANCER to the CAPE OF GOOD HOPE and along the American coast from Newfoundland to the Strait of Magellan (see MAGELLAN, STRAIT OF). Within these regions, the company had administrative and judicial independence, but it needed approval from the States-General for declarations of war.

North America

In North America, following the explorations of the Englishman HENRY HUDSON in New York Bay and the Hudson River, Dutch fur traders (*swanneken*) had begun to trade for fur with Native Americans of the region. The United New Netherland Company held a charter to develop the region in 1614–17, then lost it, leading to a period of activity by independent traders from 1617 to 1624. The next years, the Dutch West India Company occupied Fort Orange on the site of Albany, Fort Nassau on the Delaware River, Fort Good Hope on the site of Hartford on the Connecticut River, and Fort Amsterdam on the southern tip of Manhattan Island. The region taking in all of Manhattan Island became known as New Amsterdam.

During the early years of Dutch colonization, traders negotiated with Native Americans for small tracts of land to build isolated trading posts and village sites. Starting in the 1630s, with the depletion of fur resources in coastal areas and the threat of British expansion out of New England, the Dutch embarked on a course of agricultural colonization requiring more lands. The patroon system was devised to expedite development. Like seigneurs in New France and proprietors in the British colonies, patroons were colonial landlords who collected rent from tenant farmers. In return for purchasing available tracts of land from American Indians and settling at least 50 Europeans on each, patroons received deeded title from the Dutch West India Company. During this period, the company lost its trade monopoly. Independent traders, whose activity on the frontier was more difficult to regulate, began taking greater advantage of native peoples, leading to violence, with repeated outbreaks until England wrested control of New Netherland from the Dutch in 1664.

South America

The Dutch West India Company, in competition with Spanish and Portuguese interests, hoped to develop regions of northern and eastern South America. In 1623, the company established a presence in east Brazil—in Bahia and Pernambuco—but, by 1661, had been driven out from the last of its posts. It also was active in Suriname (also called Surinam, Dutch Guiana, Netherlands Guiana) starting in the 1620s, and in the Netherlands Antilles, part of the WEST INDIES, starting in the 1630s. The Dutch maintained colonies in this part of the world for centuries.

Reorganization

With lands lost and profits dwindling, the Dutch West India Company was reorganized in 1674 under a new charter. Much of its subsequent activity was in the African SLAVE TRADE. The charter expired in 1791, and, largely because

of warfare with France, it was not renewed. Another West India Company, organized in 1828, lost investors money and never had an impact on world trade.

East Indies

The term *East Indies* has changed in meaning over the centuries. During the EUROPEAN AGE OF EXPLORATION, starting in the 15th century, the phrase had its broadest meaning, referring to the lands from coastal India, CEYLON (Sri Lanka), the Malay Peninsula, and other coastal regions of Southeast Asia, plus all the islands in the region as far east as New Guinea and as far north as the Philippines. It later came to be used specifically for the islands of the Malay Archipelago, the largest island group in the world at 1.1 million square miles—that is, the Sunda Islands, which include Sumatra, Java, Sulawesi (Celebes), Borneo, Bali, and Timor; the Moluccas (once known as the SPICE ISLANDS); New Guinea; the Philippine Islands (including Mindanao and Luzon); plus thousands of smaller islands. The term *Indonesia* has also been used historically as synonymous with *East Indies*. Nowadays, the term *East Indies* is most often used to mean specifically the islands of the nation known as the Republic of Indonesia. Geographically speaking, the East Indies form a natural barrier between the Indian Ocean and the Pacific Ocean. Most of the larger islands have central volcanic mountains with surrounding coastal plains. The climate is tropical.

As home to the Harrapa civilization along the INDUS RIVER, India gave rise to one of the earliest organized societies on Earth, starting in about 2500 B.C. The islands to the southeast were settled many millennia before then. As the source of spices and other unique goods, the region was a draw for merchants from China and Arabia long before the Christian era. In about the first century A.D., the movement of Hindu and Buddhist monks from India into the East Indies had a profound cultural impact on the region. The Chinese developed commerce in the region, especially in the early 15th century. The Arab Muslims, who had always traded there, made their most successful efforts at religious conversion in the 15th century, with the result that the majority of Indonesians are Muslim. The peoples who live in Indonesia are of two basic groups—the Malayan and the Papuan. There are many subgroups and people of mixed ancestry.

Of the historical journeys to the East Indies from other places, one of the earliest is that of Italian MARCO POLO, who visited the islands of Indonesia in the course of his 1275–92 adventure. Chinese CHENG HO traveled among the islands during his “Seven Voyages” and mapped coastlines from China to the Red Sea and Africa between 1405 and 1433. Portuguese VASCO DA GAMA made the first contact with the East Indies from Europe by sea when he arrived in the Indian port of Calicut in 1498. In subsequent years, ships of numerous other European nations—the Netherlands, England, Spain, and France—developed commerce

with the peoples of the East Indies, especially the SPICE TRADE. Trading companies—such as the DUTCH EAST INDIA COMPANY, BRITISH EAST INDIA COMPANY, and FRENCH EAST INDIA COMPANY—became economically and politically important in the region. The Moluccas, central to trade, even became known as the Spice Islands. The islands of the East Indies also served as a convenient stopover point for European ships sailing on a CIRCUMNAVIGATION OF THE WORLD.

Egyptian exploration (ancient Egyptian exploration)

Ancient Egypt was a civilization that flourished along the valley and delta of the NILE RIVER in northeastern Africa for more than three millennia, from before 3300 B.C. until 30 B.C. Many of the themes associated with ancient Egyptians are familiar: the great pyramids and their burial chambers; sphinxes and other statues combining human and animal forms; large temple complexes; and hieroglyphics. Their place in the history of exploration is not so widely known, however.

Egyptian history is divided into periods for purposes of study. In prehistoric times, the people who became the ancient Egyptians migrated from western Asia to the Nile and settled among indigenous Africans. By about 3500 B.C., in predynastic Egypt, two kingdoms competed with each other, referred to as Lower Egypt of the Nile's northern delta area, and Upper Egypt to the south. Their unification in about 3000 B.C. led to a succession of 30 dynasties of native pharaohs (or monarchs) and an expanding empire.

For purposes of study, the dynasties are grouped into the Old Kingdom (or Old Empire), the First Intermediate Period, the Middle Kingdom (or Middle Empire), the Second Intermediate Period, the New Kingdom (or New Empire), the Third Intermediate Period, and the Late Period. In the Second Intermediate Period, the Hyksos, a Semitic people from Syria, ruled Egypt; and, in the last two stages, after a long-term war with the Hittites of Asia Minor, which weakened the Egyptian Empire despite a treaty in about 1290 B.C., other peoples held power for a time—the Libyans, Nubians, Assyrians, and Persians—but native leaders did manage to come to power once again. The conquest of the region by Macedonian ALEXANDER THE GREAT in 332 B.C. led to a hellenized culture in Egypt (that is, a culture influenced by the Greeks). A succession of Greek rulers known as the Ptolemies—Ptolemy I to Ptolemy XIV—ruled through 30 B.C., when the Romans annexed the region.

In the course of their history, the Egyptians developed their maritime skills on the Nile River and eventually ventured into the MEDITERRANEAN SEA and the RED SEA as well, although their GALLEY ships were not as seaworthy as those of other ancient exploring peoples in the region, and

they did not apparently venture as far west as did the Minoans and Phoenicians. The Egyptians sought raw materials and products from ancient kingdoms to the east into Asia and to the south and west into Africa, such as lumber, precious metals, and spices, as well as slaves and exotic animals. They also engaged in conquest and, under Thutmose III during the 18th dynasty (during the New Kingdom) in the mid-15th century B.C., controlled territory eastward into Asia as far as the Euphrates River, including some Phoenician cities and all of what is now Syria.

The earliest recorded sea voyage (although there had no doubt been countless beforehand) involves the Egyptians of the Old Kingdom. In about 2780 B.C., according to their picture writing known as hieroglyphics, Snefru, the first pharaoh of the fourth dynasty (during the Old Kingdom), sent a trading expedition—probably across the eastern Mediterranean to the Phoenician city of Byblos near present-day Beirut, Lebanon—to trade for cedar logs. Moreover, the earliest actual explorer on record was an Egyptian, HANNU, who in about 2450 B.C., during the fifth dynasty (during the Old Kingdom), journeyed southward for the pharaoh Sahure via the Nile to the land of PUNT—the exact location of which is unknown—for precious metals and spices. Another early explorer was HERKUF, an Egyptian governor of a southern province, who, in about 2270 B.C., during the sixth dynasty (of the Old Kingdom), led a trading expedition for the pharaoh Menera from the upper Nile River southward to the interior of central East Africa. In about 1492 B.C., during the 18th dynasty (during the New Kingdom), Egyptian queen HATSHEPSUT (Thutmose III's stepmother), who had assumed the power of pharaoh after the death of her husband, sent a trading expedition under her lieutenant Nehsi down the Red Sea to what is again identified as the land of Punt. And, in about 600–597 B.C., during the 26th dynasty (during the Late Period), the pharaoh NECHO II commissioned a Phoenician maritime expedition into the Red Sea and Indian Ocean, which perhaps circumnavigated Africa.

During the reign of the Ptolemies, there were other expeditions as well that helped unite the ancient world. In 120–115 B.C., EUDOXUS, a Greek navigator in service to Egypt, made two trips across the Arabian Sea to India. On the second journey, he made a landing on the coast of East Africa. Eudoxus also attempted a circumnavigation of Africa. And, in A.D. 45, HIPHALUS, another Greek in service in Egypt, located a more direct route from across the Arabian Sea out of sight of land to India.

El Dorado

El Dorado means “the gilded man” in Spanish and refers to a legendary place of great wealth in South America. The

term *El Dorado* is credited to Spaniard SEBASTIÁN DE BENALCÁZAR, who, in 1535, reportedly heard tales of the land from a captured Native American of present-day Colombia. The idea of the land predated de Benalcázar's information by several years, however. Germans, who had settled the coastal region that is now Venezuela, had also heard from the inhabitants of lands or cities of treasure.

The earlier explorations of Spaniard ALEJO GARCÍA were driven by the stories of a "White King," who possessed a large quantity of silver. Traveling through the mountains of Colombia to the site of present-day Bogotá, with a contingent of Indian conscripts sometime between 1522 and 1526, he managed to secure a small quantity of silver—from an unknown people—spurring on Italian SEBASTIAN CABOT in his 1526–30 explorations of the Río de la Plata and its drainage for England, as did a similar legend of a city in the south known as LOS CÉSARES. Spaniard DIEGO DE ORDAZ, who explored the ORINOCO RIVER, heard stories of a people, the "Guiana," who lived in a fabulously wealthy land, supposedly with a capital city called Manoa, paved with gold and which glittered with jewels.

The riches of the Inca Indians, which probably formed the basis of these stories, would elude the Spanish for seven more years. The origin of the El Dorado myth is thought to have come from an annual ceremony of the Chibcha Indians—living on the upper Magdalena River near present-day Bogotá—who reportedly applied their king with a resin, then sprinkled him with gold dust. He floated out on a lake, where the gold was washed off while people threw offerings of emeralds and other precious items around him. As this story became embellished and fictionalized, people claimed this ceremony took place weekly, and then daily. In actuality the practice had died out long before Europeans arrived in the area.

In the North

An early official search for El Dorado was conducted by AMBROSIUS ALFINGER in 1531–33. The German head of a colonizing expedition to Venezuela for Charles I, king of Spain (Holy Roman Emperor Charles V), he explored the lowlands surrounding the Magdalena River in northern Colombia. He died in 1533, but the search was taken up by his fellow countrymen. GEORG HOHERMUTH VON SPEYER traveled through the same area and farther southward to the plains of Colombia and Venezuela in 1535–38. The German with the most extensive journeys in the area, from 1530 to 1539, was NIKOLAUS FEDERMANN. Spanish conquistador GONZALO JIMÉNEZ DE QUESADA, also seeking El Dorado, explored the region in 1536, which led to some disagreements over boundaries between the Spanish, Federmann, and his sponsor, the Welser family.

The explorations continued, conducted mainly by the Spanish. FRANCISCO PIZARRO had had great success with the subjugation of the Inca Empire in the 1530s, and this

naturally whetted Spain's appetite for gold and precious stones. The brother of Jiménez de Quesada, Hernán Pérez de Quesada, traveled in the plains of the Orinoco River in Venezuela in 1541. Years later, in 1569–72, Jiménez de Quesada himself led a second expedition in search of El Dorado in eastern Colombia as far as the confluence of the Orinoco and Guaviare Rivers.

South and East

Without results in the north, the search area was expanded. ALVAR NÚÑEZ CABEZA DE VACA, another Spanish military officer, explored the regions of the upper Paraguay River with 400 soldiers in 1543–44. His efforts were impeded by thick jungle. In 1541, GONZALO PIZARRO, brother of Francisco Pizarro, set out eastward from present-day Quito to find the land of cinnamon, which was also purported to have a wealth of gold. It was on this journey that his lieutenant, FRANCISCO ORELLANA, separated from the expedition with a group of men and traveled down the AMAZON RIVER to its mouth. Along the way, he heard tales of a land with great riches to the north. The 1560 expedition of PEDRO DE URSÚA was inspired by such reports, which resulted in the exploration of the Huallaga, Marañón, and Ucayali Rivers. This was the expedition on which Ursúa was murdered by LOPE DE AGUIRRE and his coconspirators. The quest for El Dorado was also conducted in the region of Guiana, east of Venezuela. DIEGO DE ORDAZ had heard rumors of great wealth in the region in 1532. Decades later, in 1584, ANTONIO DE BERRÍO traveled on the Orinoco looking for El Dorado and, failing to find it, moved across to Guiana and other places to the east.

The last great chapter in the search for El Dorado involved Englishman SIR WALTER RALEIGH in 1595. In his zeal for treasure and with his country in competition with Spain, he led a royal expedition of five ships to find the elusive land. Landing in Trinidad, he attacked the Spanish settlement there and interrogated Antonio de Berrío concerning what he knew of El Dorado. Raleigh proceeded to the mainland, where he, too, explored the Orinoco River and Guiana. After his return to England, he became involved in political intrigues, which resulted in a death sentence. In a desperate attempt to save his life, he proposed a second expedition to find El Dorado, which was undertaken in 1617. In Trinidad, Raleigh became sick with fever while his son ventured into Spanish territory. He and his men engaged the Spanish army at San Thomé, where Raleigh's son was killed. Consistent with his previous sentence, for disobeying orders not to attack the Spanish, and for failure to find El Dorado, Raleigh was executed soon after his return to England.

An Enduring Legacy

The stories that grew around the legend of El Dorado have had an enduring character. British poet John Milton made reference to it in *Paradise Lost*, French writer Voltaire used

the concept in *Candide*, and American writer Edgar Allan Poe made it the subject of a poem. To this day, the phrase is synonymous with a place of luxury and ease. The lure of El Dorado for Europeans was based in reality, given the treasures of the Inca Empire. It is likely that the indigenous peoples who told the wondrous tales of the golden kingdom were anxious to have their foreign conquerors move along to other territories. Yet evidence indicates that the myth of El Dorado was believed to some degree by these peoples, who traded precious objects made with gold and jewels from region to region.

Empty Quarter (Rub' al-Khali, Arabian Desert, Great Sandy Desert)

The Empty Quarter (Rub' al-Khali in Arabic), also called the Arabian Desert and the Great Sandy Desert, is one of the largest sand deserts in the world. It occupies the southern regions of the interior of the Arabian Peninsula, stretching over an area of about 225,000 square miles. The desert accounts for about one-quarter of the land area of present-day Saudi Arabia, from highlands in Nejd to the north to the plateaus of Hadhramaut in the south. Its western edge rises to an altitude of more than 660 feet and slopes nearly to sea level in the east. The Rub' al-Khali receives hardly any precipitation, making it one of the driest places on Earth. During the summer, daytime temperatures regularly exceed 100 degrees Fahrenheit; during the winter, they fall into the 50s. Today, the Rub' al-Khali is a major source of oil deposits, including the world's largest oil field. Yet the vast desert remained largely unknown and untraversed by Westerners until the mid-20th century.

Ancient Exploration

As early as about 2450 B.C., Egyptian explorer HANNU sailed in the RED SEA along the Arabian coast, looking to improve trade with the kingdoms to the south in the land of PUNT. His exact place of landing is not known, but it is assumed that he visited lands of the Arabian Peninsula, possibly including the fringes of the Empty Quarter.

The Romans (see ROMAN EXPLORATION) perceived Arabia as three geographic parts: Arabia Petrea (or "Stone Arabia") to the west, including Egypt; Arabia Felix (or "Happy Arabia") to the south; and Arabia Deserta ("Desert Arabia"), the vast desert region of the Arabian Peninsula, including the Empty Quarter. On gaining control of Arabia Petrea in the first century B.C., they turned their attention to Arabia Felix, a cluster of prosperous kingdoms situated at the far southern extreme of the peninsula at the edges of Arabia Deserta. These kingdoms were intermediaries in the

important and lucrative SPICE TRADE between India and Egypt. In addition, the highly valued incenses frankincense and myrrh were obtained from trees growing in remote desert mountains.

In about 25 B.C., GAIUS AELIUS GALLUS, a Roman officer in Egypt, set off with an expedition into the southern kingdom of Saba and its principal city, Marib. Saba was one of the primary kingdoms involved with trade in incense and spices. Gallus hoped to conquer the Sabaeans and open direct trade contacts with India and the rest of the Orient. He returned to Egypt unsuccessful, but with a wealth of geographic knowledge about the areas south and east of the Red Sea. For nearly the next two millennia, the interior region of the peninsula and the overland trade routes that brought incense and spices from Arabia Felix remained unexplored and unknown to outsiders.

The desert regions of Arabia, including the Empty Quarter, have been inhabited since ancient times by nomadic people called Aribi by the Akkadians. Probably in the 10th century, these nomads domesticated the camel, which allowed them to cover the long desert stretches between oases. The desert regions are known to Arabs as el-Badieh ("Great Wilderness" in Arabic), and the nomadic inhabitants as Bedouin. Traversed with impunity by the Bedouin, the Rub' al-Khali remained mysterious even to other inhabitants of the Arabian Peninsula. With the rise of Islam in the sixth century A.D., the Rub' al-Khali was known as the location of mythical cities destroyed by fire from heaven or buried in sands for excess and sin (see MUSLIM EXPLORATION).

19th Century

As European power and influence grew, travel into Arabia for various reasons increased. Some went fulfilling quests for knowledge, both geographic and cultural, such as JOHANN LUDWIG BURCKHARDT of Switzerland, who lived with the Bedouin and took a pilgrimage to the Islamic holy cities of Mecca and Medina in present-day Saudi Arabia as a Muslim in 1814–15. Eventually, with military and political influence in the Orient growing, countries such as Great Britain sent diplomatic missions tracking across largely uncrossed territory to meet with native leaders.

GEORGE FOSTER SADLIER, a British army officer in India, was sent in 1819 on a diplomatic mission to Ibrahim Pasha, a Turk who was engaged in consolidating Turkish power over Arabia. Sadlier landed at Qatif on the Persian Gulf coast of present-day Saudi Arabia, then headed inland. By the time he had crossed much of the Arabian Peninsula, he learned that Pasha had moved on to Medina. Sadlier continued on to that city. From there, he headed to the Red Sea port of Yenbo, north of Jidda, becoming the first European to cross the Arabian Peninsula, although to the north of the Empty Quarter.

A Bedouin caravan travels the desert country of Arabia in this late 19th- or early 20th-century photograph. (*Library of Congress, Prints and Photographs Division [LC-USZ62-76262]*)

The BRITISH EAST INDIA COMPANY, interested in improving travel across the Arabian sea route from the Isthmus of Suez to Bombay, India, sought to establish coaling stations on the south coast of the Arabian Peninsula and, in 1834, sent British army officer JAMES WELLSTED to survey the region. Wellsted undertook excursions into the interior from present-day Yemen and Oman and became the first European to glimpse the vast interior of the Empty Quarter.

WILLIAM GIFFORD PALGRAVE, an Englishman who had done missionary work in India and Lebanon, conceived a plan to make a missionary expedition into the heart of the Arabian Peninsula. Hoping to expand French power over the region, which would become vitally important with the building of the Suez Canal, Napoléon III of France supported Palgrave's expedition, as did various business interests looking to increase imports of cotton and pure-blood Arabian horse-breeding stock. Palgrave left Europe for the Near East in the summer of 1861. Arriving in present-day Jordan, he traveled eastward over some 1,500 miles into present-day Saudi Arabia. Crossing the Nafud Desert, he reached the Persian Gulf coast at Qatif, becoming the first European to cross Arabia from west to east.

Despite these northern crossings of the Arabian Peninsula, the Empty Quarter to the south remained for Europeans what SIR RICHARD FRANCIS BURTON called a "huge white blot on our maps." A British officer and adventurer

and a talented linguist, Burton obtained a year's leave of absence in 1853. He proposed to undertake a journey to the Muslim holy cities of Medina and Mecca, then continue into the southwest to explore the Empty Quarter. Disguised as an Afghan physician, Burton traveled with Muslim pilgrims to the Islamic holy sites. Before he could embark into the Empty Quarter, however, he was struck ill and had to return by steamer to Egypt.

20th Century

HARRY ST. JOHN BRIDGER PHILBY, more than a half-century later in 1914, was a British officer sent from India to Baghdad at the outbreak of World War I. He journeyed for the first time through Arabia in 1917 to meet with Ibn-Saud to generate support for an Arab rebellion against the Turks. He ventured on to explore ancient ruins at Dariyan, then followed the Muslim pilgrim route toward Mecca, arriving on the coast of the Red Sea at Jidda. With that, Philby completed the first east-to-west crossing of Arabia by a European in almost a century. Philby continued to travel through Saudi Arabia, exploring the southern provinces of the Nejd region as far as the boundaries of the Empty Quarter. He continued to explore Arabia in the following years, resigning from the British diplomatic corps in 1924 to become an agent for mining and oil interests in the area. Philby became a political adviser to Ibn Saud, pressing for permission to

lead an expedition into the Empty Quarter. He received approval in 1931 to search for the ruins of the legendary city of Wabar, which according to Muslim tradition was destroyed by God for its wickedness. However, another Englishman, BERTRAM SYDNEY THOMAS, would become the first European to cross the Empty Quarter.

Thomas, first a British political officer in the Persian Gulf region, later entered service for the government of Oman as a minister of the Sultan of Muscat. In the mid-1920s, he journeyed by camel to and along the east coast of Oman from Muscat. In 1927, he landed at Ras al Hadd on the southeastern tip of the Arabian Peninsula and began making preliminary journeys northward to prepare to cross the Empty Quarter. Accompanied by Sheikh Salih Bin Yakut and a party of Rashidi Bedouin, Thomas headed northward from Salalah in October 1930. In early January 1931, the expedition reached the water hole at Shana, roughly halfway through the forbidding desert. Several weeks later, they arrived at Doha on the Persian Gulf coast of Qatar, completing the crossing.

About a year later, in January 1932, Harry St. John Philby set out from the wells at Dulaiqiya, west of Qatar near Hofuf in Saudi Arabia, to travel southward into the Empty Quarter. His expedition located several large craters near a site in the middle of the wastes known as Al-Hadida. At the craters, he discovered quantities of iron, which he later determined were fragments of a giant meteor. Some Muslim authorities judged them to be remnants of the fabled Wabar. From this site, Philby headed westward over the sands. In March, he arrived at the mouth of the Wadi Dawasir, near the Arabian oasis settlement at Sulaiyil, completing the crossing. Philby's expedition, while not the first to cross the Empty Quarter, is regarded as the most thorough scientific exploration of the region up to that time. Spending more time in the desert, he brought back many samples of the scarce plant and animal life of the region and made accurate meteorological and geological observations.

WILFRED PATRICK THESIGER, another Englishman, worked as a British civil servant in the Sudan in the 1930s. During World War II, he served in North Africa and Syria. After the war, he journeyed to the Arabian Peninsula to investigate locust control measures. Inspired perhaps by his contact with the Bedouin, Thesiger made subsequent trips in Arabia, taking pictures and writing. In 1946, he embarked on his first expedition into the Empty Quarter. With Rashid native guides, Thesiger made a giant circle from Salalah in Oman on the Arabian Sea. He made a second journey across the Empty Quarter in 1947–48, also with Rashid tribespeople, from Al Mukalla in Yemen on the Gulf of Aden to the Persian Gulf in United Arab Emirates. His first book, *Arabian Sands*, was hailed and continues to remain as haunting and accurate a portrait of the peoples and lands of the Arabian Desert as the photographs he took. Thesiger's

two journeys were the last European expeditions to use camels and Bedouin guides.

With improved technology and the discovery of oil in the Empty Quarter, the area was mapped by SATELLITE and explored thoroughly in the latter half of the 20th century.

ephemeris

The word *ephemeris* (plural form, *ephemerides*) is both Greek and Latin for “diary.” The Greek root word from which *ephemeris* derives, *ephemeros*, means “daily.” For a time, the English term *ephemeris* was used to refer to a diary, or, more generally, to that which exists only for a day or a short time, the concept associated with the adjective *ephemeral*. But the term came to be used specifically for a list of tables, or for a compilation of such tables in an almanac or publication relating to astronomical data. The information in an ephemeris might include the position of celestial bodies—the Sun, Moon, planets, stars, comets, and asteroids—for each day of the year, or for other regular intervals, along with related facts, such as time of sunrise, sunset, moonrise, and moonset. As such, an ephemeris is a tool of astronomy and navigation.

Ephemerides have been standardized and published in different countries. The oldest such publication is the *Connaissance de Temps* of France, first published in 1679. In England, the British Royal Observatory at Greenwich began publishing the *Nautical Almanac and Astronomical Ephemeris* (or the *Nautical Almanac*) in 1767. Its original purpose was to provide astronomical data necessary to determine longitude at sea. In 1852, the U.S. Naval Observatory began publishing *American Ephemeris and Nautical Almanac*, adjusted for the meridian at Washington, D.C., rather than the PRIME MERIDIAN at Greenwich.

The term *ephemeris time* (ET), formerly applied to astronomical time, is defined by orbital motions of celestial bodies to correct inaccuracies caused by the fact that Earth does not rotate at uniform speed, making the solar day an imprecise unit of time. Ephemeris time is now known as dynamical time, from terrestrial dynamical time (TDT or TT) or barycentric dynamical time (TDB), two different systems of measurement.

See also LATITUDE AND LONGITUDE; NAVIGATION AND EXPLORATION.

equator

Equator is a geographic and cartographic term for an imaginary east-west circle on Earth's surface, everywhere equidistant from the NORTH POLE and the SOUTH POLE, and

dividing Earth into regions defined as the Northern Hemisphere and the Southern Hemisphere. The largest of all such imaginary east-west lines, it is that from which terrestrial latitudes are measured and is thus considered the prime parallel or zero latitude. The equator, as it appears on a map or a GLOBE, intersects northern South America, central Africa, Indonesia, and stretches of the Pacific, Atlantic, and Indian Oceans.

Celestial equator (also *equinoctial circle* or *equinoctial line*) is an astronomical term for the circle on the celestial sphere, lying midway between the celestial poles in the same plane as the geographic equator. (*The celestial sphere* is the imaginary sphere of infinite radius used for defining the positions of celestial bodies, with Earth considered the center of the sphere.) When the Sun's path intersects the celestial equator, twice a year, on March 21, the vernal equinox, and September 23, the autumnal equinox, day and night are of equal length. The equatorial coordinate system is the most commonly used astronomical coordinate system for indicating the positions of celestial bodies, thus relating to navigation.

The equator, the TROPIC OF CANCER, the northern limit of the Sun's apparent annual path across the sky, and the TROPIC OF CAPRICORN, the southern limit of the Sun's apparent path, were the first three reference lines on maps. Ancient cartographers had conceived of this system, based on the Sun's motion, some time before the third century B.C. Greek astronomer and geographer ERATOSTHENES used it to help determine Earth's circumference and tilt with a high degree of accuracy.

Europe, exploration of

At about 4 million square miles, Europe, including adjacent islands, is the sixth largest continent. It is actually the western fifth of Eurasia (see ASIA, EXPLORATION OF). To distinguish Europe from Asia, most geographers use an imaginary line running from the northern extent of the Ural Mountains on the Kara Sea, then south along the Ural River to the Caspian Sea, then west along the Caucasus Mountains to the Black Sea, then along the Bosphorus Strait (linking the Black Sea and the Sea of Marmara, both forming an arm of the MEDITERRANEAN SEA), and the Dardanelles (a strait linking the Sea of Marmara with the Aegean Sea, also part of the Mediterranean). The Mediterranean Sea and the Strait of Gibraltar (see GIBRALTAR, STRAIT OF) separate Europe from Africa.

To the west of Europe is the Atlantic Ocean (with the North Sea and Baltic Sea as subdivisions) and to the north is the Arctic Ocean (with the Norwegian Sea, Barents Sea, and

White Sea as subdivisions). The British Isles are part of Europe. Mediterranean islands include the Balearics, Corsica, Sardinia, Sicily, Crete, Malta, and Cyprus (which is actually closer to Asia). The archipelago of Novaya Zemlya and the Faeroe Islands are also defined as part of Europe, as are ICELAND, about 600 miles west of northern Europe in the North Atlantic, and the archipelago of Svalbard (Spitsbergen), about 400 miles north in the Arctic Ocean. The AZORES, about 900 miles west of southern Europe in the Atlantic, although politically tied to Europe, are typically discussed as a separate entity.

Much of Europe, which can be viewed as a large peninsula of Eurasia itself, consists of peninsulas, the largest being the Scandinavian, Iberian, Italian, Balkan, Kola, and Jutland Peninsulas. The northernmost point of the European mainland is Cape Nordkinn (North Cape) in Norway; the southernmost is Punta de Tarifa in southern Spain near the Strait of Gibraltar; the westernmost is Cabo da Roca in Portugal; and the easternmost is the Ural Mountains in Russia.

A west-east mountain chain—the Alpine—traverses Europe; the Pyrenees, the Alps, the Carpathians, the Balkans, and the Caucasus are all part of it. The highest point in Europe is Mount Elbrus in the Caucasus, at 18,481 feet above sea level. The lowest point is located along the Caspian Sea's north shore, at 92 feet below sea level. Between the mountainous Scandinavian Peninsula in the north and the Alpine chain in the south, and extending from the Atlantic Ocean to the Urals, lies the Great European Plain. The Central European Uplands, consisting of a number of ranges, break up the plain. In the east is some steppe country. The largest rivers in Europe, from west to east are the Tagus, Garonne, Loire, Rhône, Rhine, Elbe, Oder, Vistula, Danube, Dnieper, Don, and Volga.

The prevailing westerly winds from the Atlantic Ocean that pass over the North Atlantic Drift lead to a moderating effect and significant rainfall, especially in the west, with cooler and drier weather to the east. Part of the continent lies above the ARCTIC CIRCLE. Mediterranean regions have hot and dry summers and rainfall generally only in winter. Most of Europe, except the tundra regions in the extreme north and the grasslands of the Great European Plain, was originally forested.

Large mammals including bears, wolves, bison, boars, deer, and elk were native to Europe, along with the smaller mammals still found there. Europe has a wide variety of birds, among them the eagle, falcon, finch, nightingale, owl, pigeon, and sparrow. European waters have a wide variety of fish, such as cod, mackerel, herring, and tuna; sturgeon are found in the Black Sea and Caspian Sea.

Europe is commonly discussed as seven geographic regions: Scandinavia (present-day Denmark, Finland, Norway, Sweden, and Iceland); the British Isles (present-day United Kingdom and Ireland); western Europe (present-day

Belgium, France, Luxembourg, Monaco, and the Netherlands); southern Europe (present-day Andorra, Italy, Malta, Portugal, San Marino, Spain, and Vatican City); central Europe (present-day Austria, the Czech Republic, Germany, Hungary, Liechtenstein, Poland, Slovakia, and Switzerland); southeastern Europe (present-day Albania, Bosnia and Herzegovina, Bulgaria, Croatia, Greece, Macedonia, Romania, Slovenia, Yugoslavia, and the western part of Turkey); and eastern Europe (present-day Belarus, Estonia, Latvia, Lithuania, Moldova, Ukraine, and the western part of Russia). An eighth region, Transcaucasia (Armenia, Azerbaijan, and Georgia), is sometimes included as part of Europe (and sometimes as part of Asia).

The etymology of the name *Europe* has been variously explained. Europa is a figure of Greek mythology, seduced by Zeus in Phoenicia and taken to Crete where she gave birth to Minos, the supposed ancestor of the Minoans. The name has also been associated with the Phoenician word *Ereb*, “sunset” or “west” in contrast to the word *Asia*, possibly meaning “sunrise” or “east.” The Hellenes—people of ancient Greece—used *Europe* to describe their lands west of the Aegean Sea. In its root form, *Europe* might simply have meant “mainland.”

The Flow of Peoples

Because so much of world exploration, as the saga is generally presented, involves the travels of Europeans and their descendants to and on other continents, far fewer of those individuals defined as “explorers” in this and other works are known for exploration of Europe than of elsewhere. One has to expand the definition of “exploration” to include migration to tell the entire story of how Europe was “discovered” by outsiders (see MIGRATION AND EXPLORATION). Since there are no written records regarding many of these migrations, and geographic knowledge was not necessarily disseminated as a result of them, these movements of peoples are not exploration in the strict sense—that of mapping the world. But to understand how Europe came to be perceived as a geographic entity distinct from the rest of Eurasia, it is necessary to touch upon the flow of at least some of the larger groupings on the continent in prehistoric as well as historic times.

Early Migrations and Civilizations

By the sixth millennium B.C., farming was established in Europe; Neolithic (New Stone Age) cultures were replacing earlier Paleolithic (Old Stone Age) hunting and gathering cultures. It is thought that it was peoples from western Asia who brought agricultural knowledge with them to the new lands. By about 2200 B.C., during the Bronze Age, Indo-European-speaking peoples arrived in the Balkans—probably originally from the Black Sea region of eastern Europe or western Asia—and spread from there to the rest of Europe,

displacing or merging with native descendants of earlier Neolithic peoples.

Three highly developed Bronze Age cultures emerged in the region, known collectively as Aegean: the Mycenaean culture on the mainland; the Cycladic culture on the Cyclades island group; and the Minoan culture on the island of Crete. Based on the dispersion of artifacts, archaeologists have determined that the Minoans, who flourished from about 3000 to 1000 B.C., were active mariners and traders throughout much of the Mediterranean region, reaching as far west as the east coast of present-day Spain (see MINOAN EXPLORATION). They also had contacts with ancient Egyptians of North Africa, who became knowledgeable about Mediterranean navigation as well, although more along the African and Asian coasts than European coasts.

About the same time Indo-Europeans were spreading westward, in about 2340–2305 B.C., SARGON, the ruler of Akkad in Mesopotamia, established trade contacts with peoples of both the east and west, including of the eastern Mediterranean Sea; he may have even launched naval campaigns in the Mediterranean, which, if true, would make his men among the earliest known Asian visitors in European waters and along European shores.

Another ancient people who are regarded as explorers of the Mediterranean region are the Phoenicians of present-day Lebanon in Asia, who, by the mid-13th century B.C., had begun displacing the Minoans as the most wide-ranging Mediterranean maritime traders (see PHOENICIAN EXPLORATION). They established a number of trading centers far from their home in coastal Europe—present-day Italy, France, and Spain—as well as in North Africa. They also developed an alphabet and a standardized system of weights and measures.

By the early Iron Age, beginning about 1000 B.C., the European population was growing, with Indo-European and other peoples migrating to new homelands along major river routes. Among the peoples who would move about Europe over the ages were Indo-Europeans speaking Baltic, Celtic, Germanic, Hellenic, Illyrian, Italic, Phrygian, and Slavic languages, as well as non-Indo-European-speaking Bulgaric, Caucasian, Finnic, Mongolic, Ugric, and Turkic peoples. Some of them migrated there from the Asian steppes. Other groups, such as the Basques and Etruscans, spoke languages not seemingly related to any of the above.

Carthaginian Explorers

Among the outposts founded by the Phoenicians was Carthage in present-day Tunisia in North Africa, probably in the late ninth century B.C. It became a thriving city over the next centuries. Its people are discussed historically as Carthaginians, even though most were presumably of Phoenician ancestry. Two generals out of Carthage are the first individuals of record to have crossed through the Strait

of Gibraltar into the Atlantic Ocean (see CARTHAGINIAN EXPLORATION). In about 470 B.C., HANNO headed an expedition from the strait southward along Africa's west coast; and, in about 450 B.C., HIMILCO headed an expedition northward along Europe's coast. It is not known how far north Himilco reached in his journey of four months—possibly only the northern extent of the Iberian Peninsula, but even possibly the British Isles. Other ancient mariners venturing out of the Mediterranean—accounts of whom did not survive—may have explored Europe's Atlantic coast even earlier.

The Hellenistic Period

Over the centuries, starting sometime after 2200 B.C., various peoples speaking related Greek (or Hellenic) dialects reached the Balkan Peninsula from the north and competed with indigenous peoples. One group, the Achaeans, are thought to have been ancestral to the Mycenaeans who replaced the Minoans as dominant in the region. Other Greek-speaking peoples followed, sometimes classified as Aeolians, Dorians, and Ionians. Their descendants came to be known collectively as Hellenes or Greeks. The Mycenaean civilization broke up after 1200 B.C. From about 1000 to 750 B.C., after the Mycenaean collapse, the region suffered what is sometimes referred to as the Greek Dark Age. During what is known as the Archaic Age, from about 750 to 480 B.C., independent city-states formed and eventually united against the threat from Persia (present-day Iran). The period from about 480 to 323 B.C., in which Greek influence spread throughout the region, is known as the Greek Classical Age. Like the Minoans and Phoenicians, the Greeks developed a trade network throughout the Mediterranean and into the Black Sea as well, founding hundreds of coastal settlements (see GREEK EXPLORATION). Having adopted the Phoenician alphabet, they too spread a uniform culture.

During both the Archaic and Classical Periods, a number of individual Greeks began gathering geographic information. In the early fifth century, in the 490s B.C., an Ionian Greek HECATEUS OF MILETUS published an account of his travels known as *Tour Round the World*, in which he described his travels throughout the Mediterranean region. It was used as a source by Greek historian HERODOTUS, who, later in the fifth century B.C., also traveled extensively to parts of Europe, Asia, and Africa and published a work known as *History*.

A people living to the north of Greece, the Macedonians, rose to power in the mid-fourth century B.C. under Phillip II and his son ALEXANDER THE GREAT. Although not Greek-speaking, the Macedonian rulers came to think of themselves as part of the Greek tradition and furthered Greek culture through Alexander's conquests in North Africa and Asia. During this period, in about 325 B.C.,

Greek scholar PYTHEAS headed a maritime expedition through the Strait of Gibraltar and northward along Europe's Atlantic coast, reaching the British Isles and exploring parts of the North Sea and Baltic Sea.

The Roman Period

A number of different Indo-European peoples meanwhile had occupied the Italian Peninsula, among them the Italics and Villanovans. One of the Italic group—the Latins—founded Rome on the Tiber River in the eighth century B.C. They absorbed cultural elements from the Greek colonies to the south, including their alphabet, which they altered to fit their Latin language. In its early stages, until the end of the sixth century B.C., Rome was occupied by the Etruscans out of the north. In the fourth century B.C., they defended their city against invading Gauls, a subgroup of the Celts who had settled in France. By the second century B.C., the Romans had conquered the Carthaginians, Macedonians, and Greeks and had become the dominant power in the Mediterranean, eventually expanding their empire into northern Africa, southwestern Asia, and northern Europe. In the late second century B.C., the Romans defeated the Teutons and Cimbi, Germanic peoples from the Jutland Peninsula who had migrated southward.

A number of Roman generals are discussed as explorers because of their expeditions to unmapped regions of Europe (see ROMAN EXPLORATION). In the first century B.C., GAIUS JULIUS CAESAR invaded Gaul (present-day France) and Britain. His reports, along with those of other military leaders, helped Greek geographer STRABO publish *Geography*, a description of lands of the Roman Empire, in A.D. 18. In the decades to come, other Roman military leaders, such as Suetonius Paulinus and Gnaeus Julius Agricola, further explored the British Isles.

At the end of the fourth century A.D., the Roman Empire was divided into the Western Roman Empire and the Eastern Roman Empire (or Byzantine Empire), with its capital at Constantinople (present-day Istanbul). The Western Roman Empire gradually broke up by the fifth century because of economic decline, internal political unrest, and the continuing pressure of the Huns as well as Germanic peoples from the north. The Franks came to control much of Gaul, with the Alemanni in Switzerland their subjects; the Ostrogoths controlled most of Italy; the Visigoths had reached Spain; the Angles, Frisians, Jutes, and Saxons had invaded the British Isles; and the Vandals had occupied the Roman provinces of North Africa. These peoples came to adopt many Roman customs. In the sixth century, many of these lands were retaken by the Byzantine emperor Justinian. Yet other waves of peoples would come to power for a time, such as the Lombards, a Germanic people in Italy; and the Avars, a Mongolian-Turkic people, and the Slavs in the Balkans.

Muslims in Europe

Muslims, the followers of Islam, a religion founded by the Prophet Muhammad (or Mohammed) on the Arabian Peninsula in the seventh century A.D., played a part in the exploration of Europe as migrating peoples and as individual travelers, many of them Arabs but not all (see MUSLIM EXPLORATION). Moving westward from Asia, Muslims conquered peoples of North Africa, including the Berbers, and from there, in 711, crossed the Strait of Gibraltar in an invasion of Spain, eventually gaining control of most of the Iberian Peninsula and even land across the Pyrenees in southern France. Those Muslims occupying parts of Europe were a mixture of Arab and Berber peoples, known as Moors. The Moors, although unable to push farther into Europe because of a Frankish kingdom united under Charlemagne, who defeated them in northern Spain in 778, maintained a presence on the Iberian Peninsula until 1492.

The Muslim world, although not a political entity like the Roman Empire, manifested religious and cultural unity, and, over the centuries of the late Middle Ages and early RENAISSANCE, individuals traveled widely for religious, commercial, and scientific reasons. Among those who visited parts of Europe and helped disseminate geographic and cultural information concerning it were merchant ABU ALI AHMAD IBN RUSTA, historian ABU AL-HASAN ALI IBN AL-HUSAYN AL-MASUDI, religious scholar AHMAD IBN FADLAN, and merchant and geographer ABU AL-QASIM IBN ALI AL-NASIBI IBN-HAWQAL in the 10th century; cartographer ABU ABD ALLAH MUHAMMAD ASH-SHARIF AL-IDRISI and official and religious scholar ABU AL-HASAN MUHAMMAD IBN JUBAYR in the 12th century; and religious scholar and geographer ABU ABD ALLAH MUHAMMAD IBN BATTUTAH in the 14th century.

Most of the Turkish population also converted to Islam. The Ottoman Turks became the dominant people in the Middle East and captured Constantinople in 1453, bringing the Eastern Roman Empire to an end. The Ottoman Empire, although weakening over time, endured until 1923, when the republic of Turkey was established.

Vikings out of the North

The Vikings, or Norsemen, of Scandinavia traveled widely as traders, raiders, and settlers from about 800 to 1100 (see VIKING EXPLORATION). Some groups settled the east coast of the Baltic Sea and, from there, traveled inland into eastern Europe as early as the eighth century. Some groups followed the Neva River, which took them to Lake Ladoga. Some eventually reached the south-flowing Dnieper River, along which they had access to the Black Sea and Constantinople, which they raided in 860, and into the Mediterranean. Vikings also followed the Volga River to the Caspian Sea. The Vikings invaded coastal settlements in the British Isles by the end of the eighth century and established a num-

ber of settlements. They also came to control surrounding islands, such as the Hebrides, Orkneys, Shetlands, and Faeroes. In the early ninth century, Vikings also gained control of parts of coastal France and traveled up rivers on raids. A group attacked Paris in 845. Those Vikings who settled in the region became known as Normans, a derivation of "Northmen," and the region they controlled became known as Normandy.

Vikings from these settlements launched expeditions to the south. In 858, one expedition passed through the Strait of Gibraltar into the Mediterranean. Normans came to expand their holdings; in the second half of the 11th century, William I the Conqueror invaded England, and Roger I, Sicily.

The Vikings reached Iceland in the ninth century. The Irish had already settled the island by 800 and possibly earlier. According to one Norse saga, in about 860, NADDOD, a Norwegian Viking, was blown off course while traveling from Norway to the Faeroes and reached the east coast of Iceland. Another Norse saga holds that, about the same time, GARDAR SVARSSON circumnavigated Iceland and built the first Viking house on its north coast.

From Iceland, the Vikings ventured even farther to the west. Norwegian Viking ERIC THE RED is considered the European discoverer of GREENLAND (geographically defined as part of North America) in about A.D. 982. His son LEIF ERICSSON and other Viking explorers reached VINLAND on the North American mainland soon afterward.

Mongol Inroads

During the Middle Ages, in the 13th and 14th centuries, the Mongols, a people out of eastern Asia, in the expansion of their vast empire, penetrated as far west as Germany and Hungary, leading to a growing knowledge of European geography among Asian peoples (see MONGOL EXPLORATION). A number of European nations established diplomatic relations with the Mongols, and east-west travel increased along the SILK ROAD.

In 1280, soon after Venetian merchants MAFFEO POLO, NICCOLÒ POLO, and MARCO POLO arrived in China, a Turk by the name of RABBAN BAR SAUMA, raised as a Nestorian Christian, traveled throughout the Middle East and Europe. (The Nestorians were a sect of Eastern Christians who followed the teachings of Nestorius, patriarch of Constantinople, condemned as a heretic in 431 for believing in two distinct natures, God as a divine being and Jesus as a man.) He visited Armenia and Georgia as well as Constantinople and a number of cities in Italy and France as part of a Mongol delegation.

Arctic Europe

During what is known as the EUROPEAN AGE OF EXPLORATION, from the 15th century into the 17th century, when

European nations developed water routes around the world, Arctic Europe came to be explored in the course of the search for the **NORTHEAST PASSAGE**—a sea route between the Atlantic Ocean and Pacific Ocean, from along the north coast of Norway to the eastern edge of **SIBERIA** at the **BERING STRAIT** (see **ARCTIC, EXPLORATION OF THE**). Many of the important expeditions to northern waters in the 16th century were those sponsored by the London-based **MUSCOVY COMPANY**, in the hope of establishing trading contacts with the Far East.

In 1553–54, **HUGH WILLOUGHBY**, **RICHARD CHANCELLOR**, and **STEPHEN BOROUGH** headed an expedition that rounded Cape Nordkinn and entered the White Sea. Chancellor and Borough traveled overland to Moscow; Willoughby, continuing westward, sighted the archipelago of Novaya Zemlya. In 1556–57, Willoughby led another expedition, which sailed even farther east, reaching the entrance to the Kara Sea south of Novaya Zemlya. In 1557–64, another representative of the Muscovy Company, **ANTHONY JENKINSON**, undertook two expeditions to Russia, using the White Sea route, from where he continued overland, exploring parts of eastern Europe and central Asia. In 1584–85, Dutch mariner **OLIVIER BRUNEL** headed two expeditions in search of the Northeast Passage, also reaching Novaya Zemlya. Later expeditions would sail past Novaya Zemlya, reaching Arctic Asia.

In 1607, during a Muscovy Company expedition to find the **NORTHWEST PASSAGE**, Englishman **HENRY HUDSON**, after sailing westward and exploring Greenland's east coast, returned east and north, and came upon Svalbard, or Spitsbergen, the archipelago in the Arctic waters north of Norway.

The Northeast Passage would not be navigated in its entirety for three centuries. In 1878–79, Swede **NILS ADOLF ERIK NORDENSKJÖLD**, with the backing of both Sweden and Norway, crossed from the Atlantic to the Pacific through Arctic waters.

Travel Writing and Natural Science

The tradition of traveling and writing about it—as both ancient Greeks and medieval Muslims had done—continued in later centuries and is part of the story of the exploration of Europe. In the mid-17th century, a Turkish writer by the name of **ÇELEBI EVLIYA** traveled throughout the Ottoman Empire, including lands in eastern Europe and the Balkans as well as in western Asia and northern Africa. He described geography and customs of diverse peoples in a 10-volume work known as *Seyahatname* (Travel Book). Another early travel writer was Englishwoman **CELIA FIENNES**, who, in the late 17th and early 18th centuries, traveled throughout England, writing about her experiences in a journal, which was published as *Through England on a Side-Saddle*.

Other individuals traveled in parts of Europe to advance scientific knowledge. Among these were the 19th-century Scotsman **EDWARD FORBES**, who studied the fauna and flora of the waters around the British Isles and in the Mediterranean, and 19th-century Russian **PETER KROPOTKIN**, who studied the geography, wildlife, and native culture of northern Finland in addition to parts of Asia.

Mountain Climbing in Europe

MOUNTAIN CLIMBING came of age in the Alps in southern central Europe, where many modern techniques developed. In the late 18th century, Frenchmen **JACQUES BALMAT** and Michel Paccard made the first ascent of Mont Blanc (see **BLANC, MONT**), the highest peak in the Alps, and the second-highest in Europe, at 15,771 feet. Englishman **EDWARD WHYMPER** climbed the Matterhorn in 1865, the last high alpine peak to be conquered. Later renowned climbers undertook climbs in the Alps in the late 19th and early 20th centuries, among them Italian **MATTHIAS ZURBRIGGEN**, who became a guide in expeditions around the world, and American **ANNIE SMITH PECK**, one of the women pioneers of mountaineering.

Because of their geographic remoteness as well as political isolation, the other high ranges in Europe—the Caucasus and Urals—are not central to the early history of mountain climbing as an international activity. In the 20th century, the Urals became a training ground for climbers of the Union of Soviet Socialist Republics (**USSR**; Soviet Union). And, in more recent times, the high peaks in both ranges have served as challenges to climbers.

With the flow of so many diverse peoples to and in Europe, the continent has been a melting pot over the centuries, and its political map has been redrawn time and again. Peoples from other continents—in particular Africa and Asia—continue to migrate there. Europe presently has the second-highest overall population density of the continents, after Asia. Peoples of many nations with varying languages and traditions live in close proximity to one another. The founding of the European Union in 1993, a confederation of 15 nations formerly known as the European Economic Community, most of which now use the same euro currency, has led to greater economic unity.

European age of exploration

Starting in the 15th century and into the 17th century, various European nations launched many important maritime voyages, among the most famous in history, which led to a new understanding of world geography. These explorations are associated with the **RENAISSANCE**, the cultural phase between medieval and modern times in Europe. Many texts on

the subject of exploration speak of an “Age of Discovery” in reference to this period of great activity. The concept of “discovery” as it relates to exploration is problematic, however, in that it marginalizes the historic role of indigenous peoples. The Renaissance was indeed a time of intellectual discovery—in geography as well as other cultural pursuits—but it is misleading when applied to Europeans visiting already inhabited lands. Other texts cite an “Age of Exploration.” Yet this phrase ignores the periods of great exploring activity among other cultures. One might, for example, be referring to a Muslim age of exploration, from the ninth to the 14th century, when Muslims from a number of different nations ventured beyond the lands along the MEDITERRANEAN SEA into other parts of Europe, Africa, and Asia (see MUSLIM EXPLORATION). Or one might be referring to a Chinese age of exploration, such as during the Han dynasty, from about 206 B.C. to A.D. 220, an expansionist time with new contacts established by the ancient Chinese in distant lands, or during the Ming dynasty of 1368–1644, when their mariners explored coastal East Africa (see CHINESE EXPLORATION).

Other texts speak of a “European Age of Exploration.” This is the most accurate phrase in that it distinguishes itself from the cultural contributions of other peoples, making it the least Eurocentric in implication. There were other great periods of exploration among European civilizations, in particular the ancient Greeks and Romans (see GREEK EXPLORATION; ROMAN EXPLORATION). But they were specific to these peoples and their patterns of expansion and might better be called the “Greek Age of Exploration” and the “Roman Age of Exploration.” The European age of exploration was just that. It involved many European nations—Portugal, Spain, Holland, England, and France—and many individuals of different nations, often sailing for countries other than their place of birth. And it was a momentous time in Europe, where it led to an understanding of the true extent of the Earth and extensive contacts among peoples of the Eastern and Western Hemispheres.

Foundations

Many developments led up to and contributed to the European Age of Exploration. First, there was a movement away from feudalism, the system based on obligation, toward the centralized nation-state. Exploration thus became a national purpose. The related decline of seigniorialism, the system of political, economic, and social relations between seigneurs, or lords, and their dependent farm laborers, also was in decline as merchant capitalism took hold. There were new incentives to obtain products and expand markets.

Since the time of the CRUSADES of the late 11th to late 13th centuries, Italians controlled trade routes in the eastern Mediterranean Sea and trade with the Far East, leading other European nations to seek out new routes. These early stirrings of European expansion in the 13th and early 14th

centuries came to an end when the “Black Death,” the bubonic plague, arrived in Europe in the mid-14th century, probably brought by Italian merchant ships from the Black Sea (see DISEASE AND EXPLORATION). The economic and social dislocation caused by the loss of as much as a third of Europe’s population, many of them city dwellers, ecclesiastics, intellectuals, and merchants, who had been in the forefront of commercial and political efforts outside of Europe, made such ventures far more difficult to mount. As living conditions for survivors of the plague rose as a result of rising wages and falling food prices, the need and desire for expansion beyond Europe diminished. During this hiatus, however, the seeds of future expansion were being sowed; many of the laborers attracted to the depopulated cities were able to save enough money to enter the middle class and to invest in overseas trading ventures; they also created a market for spices and other foreign goods. At the same time the decrease in the value of much agricultural land caused by a dramatic climate change called the “Little Ice Age,” which began after 1300, steadily diminished the wealth of the landed nobility. The laboring and merchant classes to some extent began to fill the political vacuum once dominated by clerics and nobles.

The growing Muslim power in the Near East, culminating in the fall of Constantinople (present-day Istanbul) to the Ottoman Turks in 1453—which, in effect, was the end of the East Roman Empire (or Byzantine Empire) centered there—along with the earlier breakup of the empire of the Mongols to the east, meant that established overland trade routes to the Orient, critical to the SPICE TRADE, were no longer secure, and a sea route to Asia became a necessity for merchants. Moreover, the economic system of mercantilism or bullionism, in which a nation’s wealth and power are determined by its quantities of gold and silver, became dominant. Europeans hoped to divert the Muslim trade in African gold and ivory to their homelands, or to find new sources of gold. New sources of furs were also sought. And there was a new crusading spirit among the Christian nations of Europe—as there had been during the Crusades to the Mediterranean region in previous centuries—to conquer Muslim-held territory and spread the Christian doctrine. The Reformation and resulting establishment of Protestant churches, with governments eventually adopting official religions, led to growing competition to convert native populations.

The fall of Constantinople to the Ottoman Turks had intellectual ramifications as well, some of which are also discussed as leading up to and defining the encompassing concept of the Renaissance. It had the effect of driving Byzantine scholars to western Europe and leading to greater awareness of Greek and Roman classical studies such as that of hellenized Egyptian PTOLEMY of the second century A.D., as well as of Muslim studies and technologies.
