British military historian and strategist General J. F. C. Fuller wrote that Napoleon said, “When in the fire of battle I rode down the ranks and shouted, ‘Unfurl the standards! The moment has at length come!’ it made the French soldier leap into action” (quoted in Fuller 1970, 194). The art of leadership has rarely had a more able exponent.

### Officers and Headquarters

The Revolution brought with it almost universal liability to serve in the French Army, and the decree of the new military constitution of February 1790 declared that every citizen of the new French Republic was admissible to every rank and appointment. Many officers (some two-thirds of the original 10,000 of 1789) left to join the émigrés at Trier or Coblenz (Koblenz), unwilling to serve the new government and wary of their prospects in view of the anti-aristocratic stance of the Revolutionaries. However, some officers stayed, loyal now to the new system, and they saw how an army could be increased by forced growth.

Perhaps the best example of the continuity of command was that of Louis-Alexandre Berthier, Napoleon’s chief of staff. In 1780 he was aide-de-camp to the comte de Rochambeau (who commanded the French army in North America during the American Revolutionary War), in 1789 he was a lieutenant colonel and chief of staff to the baron de Besenval (commander of the French army around Paris), and by the end of that year he was assistant quartermaster general on the staff of the new National Guard. He held a number of staff appointments thereafter, and was appointed chief of staff to Napoleon in 1796, a post he held until the end of the campaign of 1814.

Nor was Berthier the only professional in Napoleon’s officer corps. General Jean-Baptiste Jourdan was another whose staff work was exemplary. Jourdan was known for the efficient manner in which he drew up and issued orders for the following day in a timely manner, each division receiving information on its objectives and movements, yet with the divisional commander left to sort out the finer details of the task given him: A perfect example of *Auftragstaktik* (leaving execution of a task to the recipient of an order) long before the word was coined.

Napoleon’s headquarters were divided into the Maison and Army Headquarters. Within the Maison were his immediate court (some 800 during the Jena-Auerstädt campaign in 1806) and his personal military staff. The Emperor’s court also included the imperial cabinet, whose few members were of great importance in assisting Napoleon to formulate his plans. The cabinet included the chiefs of the Topographical Office and the Statistical Office, which supplied Napoleon with the analysis and maps of the ground over which he would operate and the details of the strengths of allies and enemies, respectively.

Army Headquarters, which was sited alongside the Maison, consisted of Berthier as chief of staff, his aides, and the General Staff of the Army. The General Staff was itself subdivided into the offices of the chief of the General Staff (who directed the work of the whole), the assistant chief (the quartermaster of the army, responsible for accommodation and marches), and the assistant chief (who had the Survey Department under him). The task of this last officer was to provide daily situation maps. Also included in the headquarters were the intendant general, the commander of artillery, the commander of engineers, and the colonels general of the Imperial Guard.

When Napoleon was at the planning stage of any operation he had behind him a professional staff able to move his army, concentrate it where needed, and also able to provide logistical support and operational engineering units to ensure that bridging and other transport matters were taken care of. Many countries and armies later adopted the structure of Napoleon’s headquarters, with varying degrees of success, and today, as then, the smooth operation of headquarters can determine the success or failure of a campaign or mission. Napoleon chose men who could make things happen for him, not men who were timeservers or egocentrics.

### Napoleon’s Doctrine

Napoleon inherited a functional army from his predecessors, and upon it he imposed a very functional staff system. But what of his doctrine of war? Once more the fact that he was rarely an innovator is apparent, but what he did do would make the French Army into a fighting force that won battles.

Tactical doctrine after the Seven Years’ War and the defeat of France focused on discussions of new ways of deploying and maneuvering infantry. Fighting could be conducted in line (where the majority of the infantry was spread out to face the enemy) or in column (where the shock and weight of the column was used to break an enemy line). Many officers were skeptical about the effect of musket firepower, regarding the massed bayonets of the column as more effective. The duc de Broglie tried out the new tactic of deploying men in line in 1778, but at that time the results were not conclusive. Nevertheless the drill books of 1788 (provisional) and 1791 showed the advantages to be gained from using *l’ordre mixte*, a combination of line and column. This method was successfully used by Napoleon’s troops right through to the end of the First Empire.

Napoleon himself had learned much from books, and very little initially from experience. In 1788–1789, however, he was given charge of the demonstration unit of the Artillery Training School at Auxonne, where he had the job

of trying out new ideas in artillery. Napoleon's extensive reading led him to base his plans on maneuvering and flexibility. Whenever possible he attacked before his enemies were ready, defeating the component parts of his enemy's armies before they could combine to create a dangerous mass. He pushed his men to move as fast as possible, working on the principle that if the French arrived unexpectedly they would always have the advantage of surprise—perhaps the fundamental element of good campaigning.

### Infantry

By the time of the French Revolution, a properly handled infantry was undoubtedly the master of the battlefield. Training and drills had improved the infantry's rate of firing their flintlock muskets, although the weapon had limited accuracy at ranges greater than 100 yards. Fitted with the bayonet however, the weapon became formidable at close quarters, and when allied with the thrusting column it was a danger to any force arranged against it in line. A rapid penetration of the ranks of the line could lead to lateral envelopment and the destruction of the defender.

Ranged in front of the main force in any battle were the light infantry, whose task was to skirmish—that is, to establish where the enemy was and to pin him down until the main body should arrive. The light infantry also had the task of screening the main body from enemy fire until the main body could form into its line of battle. Light infantry were considered somewhat superior, in that they were entrusted with more detached operations, for they could also be used as reconnaissance troops, as raiders, or as security troops. This gave Napoleon more flexibility in preparing for battle, because his light infantry, or skirmishers, could be used to deceive the enemy as to the whereabouts of his main body and to hide movement. Between 1793 and 1795 these tactics had been more of the nature of “horde” tactics—by which undirected masses of men hurled themselves at the enemy, often with the bayonet—but after 1795 the light infantry troops were put on a more regulated footing, with men training and operating as a unit of formation. Unlike British light infantry regiments, French skirmishers were formed from the regiments of the main body, and the ethos of the army changed from brutal discipline and rigid control to a more flexible approach, in which pride in one's regiment, Revolutionary élan, and nationalistic fervor had a significant place.

In battle the French skirmishers could be reinforced from their parent regiment at any time and could effectively engage the enemy while their regiment maneuvered to outflank the enemy. They could even drive through to the enemy's rear, where the appearance of French troops would immediately cause consternation and possibly even a retreat. Furthermore, should the skirmishers meet heavy

resistance, they could re-form as a tactical unit with the parent regiment to present a firing line that would continue the advance as soon as the enemy wavered in the face of French firepower and élan.

French commanders rarely used the column as an attacking formation. Instead, it was used to move men around the battlefield with surprising speed, and it could transform itself into a firing line on demand. The majority of the damage done to the enemy on the battlefield was by skirmisher fire and artillery; the battle column actually served as a reserve for the skirmishing line and as a means of getting men to the right place at the right time in good order.

Up to 1791 the French Army had seventy-nine French and twenty-three foreign regiments, each of two battalions. Each battalion had five companies. Four of the companies were fusiliers; in the first battalion, the fifth company was the grenadier company, and in the second battalion it was a chasseur (or light) company. Company strengths were approximately 120 men. In 1791 the old regimental titles were discarded, and each battalion was increased to eight fusilier companies and one grenadier company.

By 1793 the *levée en masse* had produced an army that ranged from reasonably proficient troops (the National Guard battalions) to a rabble of men inducted under the *levée*. This mass of untrained personnel made it mandatory to create an amalgamation of the two, the *amalgame*, so that one regular battalion was organized to serve with two new battalions, passing on a legacy of steadiness and disciplined musketry to the new, untrained conscripts.

These formations were known as demi-brigades, for the old title of *regiment* was considered elitist, as was the rank of colonel. However, in 1803 the then-existing 110 demi-brigades were once more reorganized into 90 regiments. By 1808 a further reorganization resulted in regiments having one depot battalion of four companies (training replacements and reinforcements) and four *bataillons de guerre*, each consisting of four fusilier companies, one grenadier company, and one *voltigeur* (light) company. Regimental strength was 108 officers and 3,862 men. As manpower demands increased, regiments had as many as seven battalions, and new regiments were formed, with the last creations being the 135th to 156th Regiments, formed from the National Guard.

The Imperial Guard achieved a status second to no other formation in the French Army at the time, and it was more and more seen as Napoleon's “firemen,” able to turn an unfavorable situation into a victory. This they often did, until Waterloo. The Imperial Guard began as the Consular Guard, made up of the most experienced troops in the army of 1799. By 1804 they were renamed the *Garde Impériale*, and from then on they served as the reserve. In fact,

they were not often committed in battle, to the disgust of the rest of the army, but a large number of them died together at Waterloo in 1815 trying to stop the Allied advance that threatened the retreating main body of Napoleon's army. They were paid and quartered better than the rest of the army, which heightened resentment among the rank and file.

Higher formations for infantry were the division and the corps. The division, a mix of infantry and artillery, was created in 1759 by the duc de Broglie. In 1794 Lazare Carnot, Revolutionary minister of war, developed the idea further to include cavalry, and this created an all-arms formation capable of carrying out independent operations. By 1796 this system was universal throughout the French Army.

Napoleon now developed this potential of the basic system and used it in his concept of mobile warfare, made possible by fast maneuver between and in battles. The infantry was trained in marching, and now could move rapidly with its artillery. While both were engaged in maneuver, the cavalry ranged out in front and on the flanks of the rest of the division, establishing enemy positions and movements and harassing the enemy whenever and wherever required.

Armies were now growing in size, and it was seen that groups of divisions needed a superior command; to this end the corps command was created, and in 1800 General Jean Victor Moreau commanded an army of four corps of eleven divisions. By 1804 Napoleon had made the corps official, although the division remained the major tactical unit that would be entrusted with a specific mission. The corps included cavalry as well, and Napoleon also formed cavalry divisions and corps.

The division normally consisted of two or three infantry brigades (each with two to five battalions in one or more regiments) plus an artillery brigade (of one or more batteries of four to six field guns and two howitzers) and cavalry as required.

### Cavalry

Cavalry, the *arme blanche*, was under the *ancien régime* regarded as the realm of rich, aristocratic officers, but this soon changed. French cavalry was categorized as either heavy or light. The light cavalry was used for reconnaissance and skirmishing, and the heavy cavalry was employed in the charge, backed by the dragoons (once mounted infantry, but increasingly reinforcements of the heavy cavalry). This arm naturally suffered most from the emigration of its officers, as a large proportion of them came from the aristocratic families of France. By 1796, however, they were once more on the way to becoming a well-organized force.

The heavy cavalry, armed with a straight saber, constituted the shock arm. Napoleon equipped his cavalry with

horse artillery as well, which increased its effect on the battlefield. He used it in large numbers, particularly against enemy cavalry and infantry, especially when the latter was shaken or had not formed square. The heavy cavalry was also effective against retreating infantry. French cavalry leaders were acknowledged to be the best, and Napoleon exploited their ability and speed of maneuver. However, later in the Napoleonic period—and particularly after the catastrophic losses in horses during the Russian campaign—the French cavalry began to lose its edge, unable any longer to maintain the previous high standards.

The cavalry included a number of different types: cuirassiers, heavy cavalry equipped with cuirasses (breastplates) and heavy straight sabers meant for thrusting; carabiniers, heavy cavalry with similar blades, but also armed with carbines; dragoons, the backbone of the French cavalry, medium-sized men carrying sabers and also possibly armed with muskets and bayonets, valuable as antiguerrilla troops as well; hussars, elaborately dressed light cavalry, armed with a light, curved sword, and a pistol, generally used for scouting and pursuit but also used in battle; *chasseurs à cheval*, light cavalry, armed like the hussars; and *cheval-légers-lanciers*, lancers mounted on small, nimble horses.

### Artillery

Napoleon benefited from the improvements in French artillery brought about by the Gribeauval system. Jean-Baptiste de Gribeauval revolutionized artillery in Europe in 1765 when he simplified and standardized French guns into 4-, 8- and 12-pounder guns (all so-called because of the weight of shot they fired) and 6-inch howitzers. Guns were lightened (by having their barrels shortened), carriages were strengthened, horses were no longer harnessed singly in tandem (one behind the other), but in pairs in tandem, and soldiers rather than civilians were assigned to drive them, the important distinction being that the former were more receptive to taking orders and less likely to flee under fire. Accuracy was improved by means of screw-thread elevating mechanisms, tangent-scale sights, better barrel-making technology, and more precisely manufactured round shot (cannonballs). The 4-pounder gun was withdrawn from the artillery and allocated to infantry battalions to provide permanently attached fire support, but the experiment was not a success and the guns were eventually withdrawn.

French troops used Gribeauval's guns as noted above, plus 16-, 24-, and 36-pounder guns. Maximum ranges were 480 yards for the 4-, 8-, and 12-pounders. The guns weighed between 1,792 pounds for the 8-pounder to 8,260 pounds for the 36-pounder. The calibers varied from 3.315 inches for the 4-pounder to 6.90 inches for the 36-pounder.

Later in his career Napoleon created the *grande batterie*, massed artillery support for his main effort, blasting

French cuirassiers charge into the Great Redoubt during the Battle of Borodino, 7 September 1812. (Print after Albrecht Adam from *Die Grosse Zeit: Ein Jahrhundertbuch* by Theodor Rehtwisch. Leipzig:Verlag Georg Wigand, 1913)

the enemy line to allow his infantry to advance. This was a necessary result of the decline in the quality of the army over the years it had spent fighting, and the ratio of guns to men rose from 2 guns per thousand to about 5 by 1812.

Initially Napoleon had seven regiments of foot artillery, rising to nine by 1810. Each regiment had twenty companies (of eight guns each) at the start, rising to twenty-eight later on. In addition to the eight guns in each company there were some thirty horse-drawn vehicles, and personnel of four officers, ten noncommissioned officers, and seventy-nine men. In addition, after 1791 the French Army had nine regiments (of six to eight companies each) of horse artillery. In 1801 the number of horse artillery regiments was reduced to six, each of three squadrons (with two batteries each). Each battery had either six or eight guns including one or two howitzers. Their role was to give fire support to the cavalry.

### Engineers

Originally part of the artillery, the Engineer Corps of the French Army was formed in 1793, and in 1799 there were two sapper (*sapeur*) battalions and six mining companies.

The engineers of the period were in part a continuation of the engineers of the days of siege warfare, but with artillery more mobile the need for bridging in particular rendered these men more functional all over the battlefield, rather than occupying them solely with walls and fortified positions. By 1812 there were eight sapper battalions—units composed of experts in field fortification, entrenching, mining, and demolition—plus two of miners, but losses in Russia reduced the number of sapper battalions to five, with two understrength battalions of miners remaining. The engineers also provided the expert topographers mentioned above.

Napoleon's grasp of the needs of the French Army extended even to education. He realized that there was a need for centralized training of military engineering, and to provide this he set up the Ecole Polytechnique in Paris. "The advancement and perfection of mathematics are intimately concerned with the prosperity of the state," he is reported to have said (quoted in Chandler 1998, 235). Thus, French mathematicians were to dedicate themselves to the solution of ballistic and hydraulic problems.

### Supply

Immediately after the Revolution, with French armies ranging across Europe, there was no method of supplying the men in the field. For this reason the troops took to foraging, a method of supply accepted by the army, and even during the Empire there was no creation of a supply system until the troops in the 1807 campaign came close to starvation. The Breidt Company had been used to transport supplies to the army, but it was so inefficient that after the Battle of Eylau Napoleon created the Train d'équipages, a military supply command that had eight battalions of four companies, each with about 140 wagons. By 1812 this had risen to twenty-two battalions of six companies, but these were still insufficient. Losses in Russia cut the total to nine battalions. The system was never fully effective, and foraging never completely stopped.

### Medical Services

Attached to the Train d'équipage was a medical company for each corps to evacuate casualties, but these were never more than a token service. Surgeons and doctors worked where they could near the battlefield, but the survival rate of casualties remained low throughout the Napoleonic Wars because there were no antiseptic treatments available; amputation was the standard treatment in many cases involving wounds, which nevertheless often turned septic or gangrenous, leading to many deaths.

### The Foreign Element in the French Army

The French Army included some foreign regiments, the best of which were the Swiss. Napoleon formed four such regiments in 1805, which served with great distinction. Portuguese troops served in the Portuguese Legion, Poles in the Polish Legion (formed in 1799), later joined by Italians in 1807, and renamed the Vistula Legion of infantry and cavalry. Germans also served alongside French troops, as did Irish and small numbers of Albanians, Greeks, and Egyptians, although the last of these were of questionable quality, as they were pressed prisoners of war.

### Enlistment

The regular infantry regiments were originally manned by volunteers, who signed on for eight years and could reenlist thereafter for two-year extensions up to a total of twenty-four years. In 1791 the National Assembly decreed that 169 battalions of volunteers should be raised, and this resulted in an army of well-trained troops, for many of the volunteers had originally served in provincial units that had been disbanded. However, more demands for men were made in 1792, which produced an intake of unwilling and untrained men, chosen by ballot, who were essentially

of no military value whatsoever. Desertion was later a factor for the French, as it was for the other nations of Europe. The *amalgame* was intended to put a stop to the rot. Three-battalion regiments comprised a core of one regular battalion and two volunteer battalions, as already mentioned, and it had an improving effect.

However, to ensure that adequate numbers of men were available for military service, conscription was introduced by the 1798 Conscription Laws. These laws required that all men between the ages of eighteen and forty register, and those between eighteen and twenty-five (later thirty) years of age were called for service. Depending upon need, an annual class (the year in which men reached the age of eighteen) could be called early or on time. In 1809 demand was so great that the classes of 1806–1807 and 1810 were called, the class of 1806–1807 having been unneeded originally. By 1813 even younger men (affectionately known as “Marie Louises”) were being called, and many failed to appear. In all, over 4 million men were called to serve their nation, and over 2.8 million actually went to war.

### Conclusion

The French Army was, for many years, able to defeat its enemies by virtue of its ability to move quickly about the theaters of war. However, the demand for manpower eventually began to outstrip the supply, and Napoleon was forced more and more to rely upon his cavalry to bring a decision in battle. The army, however, always remained loyal to the Emperor, and there can be no doubt that it was, under Napoleon, the single decisive factor in his campaigns, except at the every end.

## French Navy

In 1789 the French Navy was at the peak of its strength for the eighteenth century, but with only 60 ships it was not even close to the 120 it had had during the reign of Louis XIV. During the American War of Independence (1775–1783) it enjoyed a number of successes, particularly in the Indian Ocean and above all in Chesapeake Bay, thus making possible the decisive victory at Yorktown. Nevertheless, that conflict was very expensive for France—costing a billion livres—and the inability to repay this debt was one of the main causes of the French Revolution. Nonetheless, Louis XVI's navy pursued a course of modernization by adopting the construction of classes of 74-, 80-, and 116-gun ships, following the plans of the engineer Jacques Noel Sané.

The navy was seriously affected by the outbreak of revolution in 1789, first at the dockyards and then among the crews and their officers. Dockyard workers, who were badly paid, revolted in Toulon in December 1789 and then at Brest in June 1790. The seamen, in turn, rose up at Brest the following month. In the face of this instance of disorder and of similar instances elsewhere, most officers returned to their homes until, after the arrest of Louis XVI, they emigrated. Thus, in January 1792 only 210 officers out of 610 were still at their posts. To solve the manpower shortage and open the naval service to a wider spectrum of society, the National Assembly offered posts to officers of the merchant marine, who had not attended any professional schools, and gave command of the dockyards to ordnance officers in lieu of career officers.

Unrest occurred at Toulon, the principal Mediterranean port, when on 10 September 1792 the commander of the fleet was hanged by Revolutionaries. The Republic was nonetheless able to outfit a small squadron under the command of Rear Admiral Laurent Jean François Truguet, who was able to support General Jacques Bernard d'Anselme's troops during their attack on Nice, the site of more pro-royalist unrest. Nice capitulated on 29 September, but in the meantime royalists took control of Toulon, including the naval shipyards. The British hoped to profit from these circumstances, and on 27 August 1793 Vice Admiral Lord Hood entered the port in support of the revolt. The problems faced by the Republic were compounded when, in the Atlantic, Admiral Justin Bonaventure Morard de Galle's squadron revolted on 12 September. As of that date, France had only the squadron at the port of Rochefort, a dozen ships, against the 135 ships of the line of the Royal Navy.

The crisis spread to Paris, as well, where navy ministers succeeded each other without being able to reinstate their authority. Gaspard Monge, a famous mathematician

but an incompetent minister, was succeeded by Jean Dalbarade, a brilliant privateer who was overcome by the size of the task before him. On 18 December 1793 the British evacuated Toulon, menaced by artillery that the young Napoleon Bonaparte had situated above the port. They took three ships with them but burned ten others and destroyed the stocks of the naval arsenal. The French Mediterranean fleet had effectively ceased to exist. The Republic was under attack on all fronts—in Holland, along the Rhine, in Italy, and along the Pyrenees, while royalist revolts within France multiplied, especially in the Vendée.

The Convention tried to reestablish order by sending representatives on mission (political commissars) to the ports. Representative Jean Bon Saint-André turned out to be outstanding in this role and appealed for aid from the few pre-Revolution professional officers who had continued to serve the Revolution. The changes wrought in the officer corps were obvious, with experience and training woefully lacking: At Brest in 1794, of twenty-six captains, only three had served as lieutenants (the preceding rank) and eleven as second lieutenants; the others had come from the merchant marine. Half the crews had never even been to sea in a warship. Not surprisingly, the first encounter between British and French fleets during the war, the Battle of the Glorious First of June (known as such by the British, in any event), was a tactical victory for the British, who captured seven ships. However, the accompanying convoy of 150 ships bearing desperately needed grain, commanded by Admiral Pierre Jean Vanstabel, entered Brest safe and sound. It may be said with some justice that on this occasion the French Navy saved the Revolution, and Maximilien Robespierre remained in power.

The slow reconstruction of the French Navy then began, but it lacked an officer cadre, crews, and supplies; worst of all, its orders originated in Paris, issued by a government with no experience of naval administration. France had neither an admiralty nor a naval staff capable of formulating policy. Indeed, the Convention in Paris was so utterly ignorant of naval affairs that it considered the navy a kind of "naval army" that could be easily moved from one sea to another depending on immediate strategic needs. Some of the handicaps experienced by the navy are instructive: Admiral Pierre Martin's squadron, for instance, tried to convey troops to Corsica, but money and resources were lacking, and some of his ships carried supplies sufficient for only fifteen days.

The paradox for the navy was that it was not totally eliminated from the sea by Britain's all-powerful Royal Navy. Indeed, the French Navy had its share of successes. In 1794 the French recaptured Guadeloupe thanks to a successful landing by Victor Hugues. The Directory restarted the privateer war on 15 August 1795, sending out large

numbers of these vessels, together with warships themselves, to prey on British commerce. Admiral Zacharie Jacques Allemand's squadron patrolled off the African coast, Corentin-Urbain de Leissegue's operated in the Antilles, Honoré Ganteaume's in the Levant, Joseph de Richery's off Newfoundland, and Pierre-César Sercey's in the Indian Ocean. The success of the French Navy forced the British to evacuate Corsica and to abandon the Mediterranean altogether in 1796.

In that year, too, the Directory prepared for a landing in Ireland. The military forces to be disembarked were commanded by General Louis Hoche, who had no knowledge of naval affairs. Thanks to the efforts of his deputy chief of staff, Admiral Eustache Bruix, the squadron of seventeen warships and twenty-two transports left Brest on 15 December 1796 under the command of Morard de Galles. The ships were poorly provisioned, and the crews were poorly trained. The landing in Ireland failed, but it caused considerable consternation in Britain. The French tried again in May 1798, during the Irish Rebellion. They succeeded in landing 1,000 men in Donegal, but Hoche was captured together with Wolfe Tone, one of the principal rebel leaders, who was aboard his ship.

Even as these threats were averted, the Royal Navy had implemented its traditional strategy against France: the close blockade of the naval ports of Brest, Rochefort, and Toulon, the last of which contained only about twenty ships, all in poor condition. This strategy was hard on the men and ships, as well as costly, but it succeeded in ensuring that the French could not combine their various squadrons into a substantial fleet. This was essential, for only a fleet was capable of protecting Britain against a French landing. This threat was real: In March 1798 the Directory assembled a flotilla for precisely this purpose, composed primarily of small transports and merchantmen. Bonaparte was appointed commander of this optimistically named Army of England, but he abandoned the project in favor of an expedition to Egypt. Mistakes made by Rear Admiral Sir Horatio Nelson allowed the sortie of the fleet and 36,000 troops on 19 May. Malta was taken on 9 June, and Bonaparte landed virtually unopposed at Alexandria. The destruction of the French fleet at the Battle of the Nile, fought in Aboukir Bay on 1 August, did not prevent Bonaparte's victories on land, but, crucially, it left his army stranded in Egypt.

In 1799 the Directory dispatched the Atlantic fleet from Brest, consisting of only twenty-five ships of the line, commanded by Bruix. He was able to resupply General Jean Moreau's army in Liguria and managed to return before the British reinstated the blockade of his home port. In 1800 the Directory failed to resupply the army in Egypt and resumed preparations for the planned invasion of England, conceived by the naval engineer and minister of the navy,

Pierre Alexandre Laurent Forfait, and to be carried out by Louis-René Levassor de Latouche-Tréville. Eight hundred flat-bottomed boats, gunboats, and barges needed for the landing were constructed. On two occasions Nelson suffered setbacks at Boulogne at the hands of Latouche-Tréville, most notably in August 1801. With the Peace of Amiens in on 15 March 1802, the French Navy resumed its program of reorganizing its shipyards and dispatched an army of 35,000 to recapture St. Domingue (shortly thereafter to become independent Haiti). The navy's budget was 130 million francs, but by the end of 1803, France had only 37 ships of the line, of which only 16 were actually serviceable and 6 were under construction. Britain, on the other hand, had 189 ships of the line, of which 95 were ready for service and 17 were under construction.

There was a significant gap in frigates, the type of intermediate-size warship that helped train future captains for the larger ships of the line. France had 20 frigates, while Britain had 197, of which 128 were at sea. In view of this discrepancy in naval forces, it was impossible for France to hope to defeat Britain at sea. Ganteaume observed that it was foolish to think that the British would abandon their watch on the Pas de Calais (from whence an invasion would have to originate)—a true enough statement, but one that lost him the command of the Toulon fleet. In a similar vein, in 1805 Admiral Pierre de Villeneuve declared that he would never be able to reach the English Channel with the combined Franco-Spanish forces that Napoleon ordered him to concentrate there. Napoleon would therefore have to take the risk of a landing in Britain without the protection of all his warships. The efforts made to effect a landing were real and extensive: A flotilla of hundreds of small vessels was built along the Channel coast. The cost exceeded 250 million francs, but those funds contributed also toward building up the port of Boulogne and a network of coastal fortifications. Napoleon conceived several invasion plans, but he continued to hesitate, waiting for the right moment, which he believed might be in any season except winter. The alliance with Spain provided additional ships for France, yet at the same time, in the summer of 1805, Napoleon rightly suspected that Austria was preparing to form a new coalition against him.

Thus, the Boulogne flotilla became first a stratagem to entice Britain to sue for peace, then a ruse to hide the preparations of the Grande Armée for a winter campaign that would end with the victories at Ulm and Austerlitz. In August 1805, with the army at Boulogne ready to march against Austria and the priority of operations shifted to land, Napoleon abandoned his interest in the fate of Villeneuve's fleet. The ensuing defeat at Trafalgar on 21 October 1805 thus seemed to France to be totally pointless, both tactically and strategically.

Napoleon nevertheless sought to maintain ties with his few remaining colonies. The naval squadrons under admirals Leissegues and Jean Willaumez were provisioned and sent to Santo Domingo (the eastern portion of the island of Hispaniola, ceded by Spain in 1795) and to the Antilles in 1806, while Allemand was sent to the Indian Ocean in 1808. On 23 February 1809 the navy landed troops on Corfu in the Ionian Islands and Admiral Pierre Dumanoir Le Pelley's squadron successfully escorted a troop convoy from Toulon to Barcelona. On balance, however, the navy's capabilities had been seriously impeded by Trafalgar, and from 1805 to 1810 the French lost twenty ships of the line and fifty frigates. Vice Admiral Denis Decrès, with Napoleon's support, undertook the administrative reorganization of the navy and actively saw to the improvement of the naval arsenals at Cherbourg, Antwerp, and Flushing. He also launched a program of naval construction at all the major dockyards, as well as at Antwerp, Venice, Genoa, and La Spezzia. By 1815 French naval strength had increased to 70 ships of the line, though even this figure could not compare with the impressive British total of more than 200.

As a result of shortages, notably of seasoned wood and tar, the ships suffered from numerous defects, including wood rot caused by the use of insufficiently dried timber. Moreover, as a result of the blockade of its ports, the navy continued to suffer from a chronic lack of well-trained crews and officers. Napoleon was quite aware of this, so he employed the strategy of a "fleet in being"—maintaining a naval force sufficiently large to keep the Royal Navy ever vigilant and requiring constant manpower and financial resources, yet never actually sending a substantial French fleet into battle when the prospect of victory remained unrealistic.

The reconstruction of the French Navy was also disrupted by a serious shortage of trained sailors. International trade and fishing off Newfoundland, both of which served as means of training merchant sailors who could then serve in the navy, came to a standstill as a result of British naval supremacy. In 1811 Marseilles had only nine seagoing ships. With thousands of men idle in French ports, on 2 August 1808 Napoleon created fifty battalions of marines and twenty-five naval battalions. Each battalion was equivalent to the crew of a 74-gun ship of the line. Not including the officers, the crew consisted of 450 men, both able seamen and new recruits drawn from line infantry regiments, plus marines.

As under the *ancien régime*, the marines helped maneuver the ships, fired their muskets from the topmasts, hurled grenades, and had charge of maintaining discipline aboard ship. This training remained sound in principle, but the British blockade prevented proper training at sea.

In September 1810 these battalions took on the name of "crew." In March 1813 the naval battalions were disbanded, and the majority of the men were integrated into the army. In the face of the Royal Navy, Napoleon never took the initiative and failed to show much persistence, instead always sacrificing his navy to his fundamentally land-based continental strategy.

The strategy of blockade was very costly to Britain, but it succeeded in preventing the rebuilding and recovery of the French Navy after Trafalgar. By bottling up their opponent's ships, moreover, the British were able to support their Allies who confronted France on land: Austria, Prussia, Russia, Spain, Portugal, and others. As is well known, it was in Spain and subsequently in Russia that Napoleon lost his best commanders and his best troops.

## French Revolution (1789–1799)

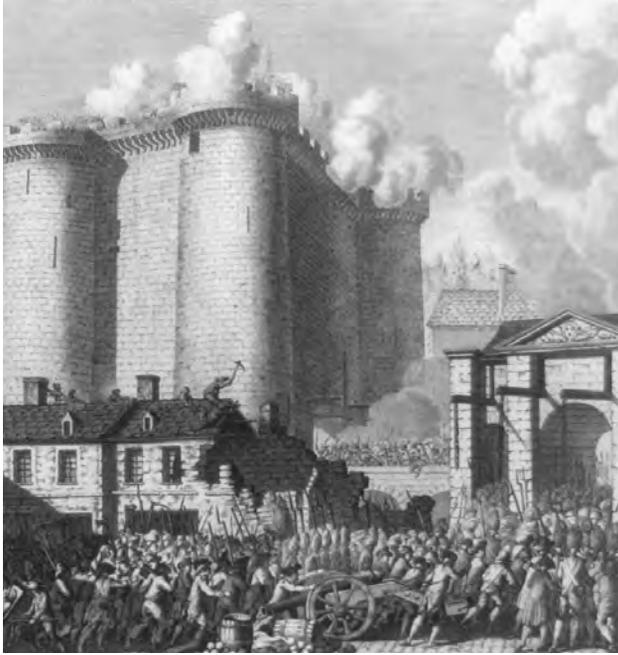

One of the great events in world history, the French Revolution has attracted and repelled in equal measure. With results ranging from the Declaration of the Rights of Man and the Citizen to the Terror, it was the best of times and the worst of times, as Charles Dickens memorably put it. For better or for worse, the Revolution laid the foundations of modern politics, creating concepts and terms still employed today. Historians continue to debate and examine it from every point of view, but the perspective adopted in this short survey will explore the theme of war and revolution. These twin phenomena were inextricably intertwined during the 1790s, and an understanding of one is impossible without a comprehension of the other. This did not appear to be the case in 1789, though the bankruptcy of the French monarchy, which precipitated its downfall, was largely a product of military expenditure. However, the leaders of the National Assembly, who assumed responsibility for reshaping the French state and society between 1789 and 1791, were convinced that the advent of democracy would bring universal peace: Nations would not wage war in the manner of dynasties. This pious hope was shattered when France declared war on Austria and Prussia in 1792, and the conflict that was unleashed became a global war of unprecedented proportions that lasted for the next quarter of a century, only ending at Waterloo in 1815. It has been rightly said that this war revolutionized the Revolution, but the reverse was equally true.

Few observers in the 1780s predicted the demise of so-called absolute monarchy in France, yet for historians it is the weaknesses rather than strengths of the French Crown that stand out. Finance and administration were chaotic; there was no proper budgeting, and the famous *compte rendu* (statement of accounts), published by Jacques Necker in 1781, was the first time that any figures had been produced, even if they were misleading and deliberately designed to attract fresh loans. For the monarchy had become dependent on borrowing to survive. It proved impossible to reduce expenditure, not because of a bloated court and a spendthrift Austrian-born queen but on account of military commitments that engaged France in a battle for both continental and maritime hegemony. When it managed to separate these two commitments and fight an essentially naval war, in the American War of Independence (1775–1783), France succeeded in defeating its long-standing enemy, Britain, for the first time in a century. Yet the financial strain was immense, and the aftermath of the war demanded urgent reforms, which ministers were unable to deliver. Belying the absolutist principle, the tax system only functioned with a measure of consent from various privileged and provincial bodies, according to the traditional,

unwritten constitution. Controller general Charles-Alexandre de Calonne convened an Assembly of Notables in 1787, hoping it would underwrite his proposals for fiscal and administrative reform, but even this handpicked body proved obstructive. A more authoritarian approach was adopted, but it produced stiff resistance. The monarchy was obliged to back down and recall the long-dormant Estates-General, which had last met in 1614.

The old monarchy was not overthrown; rather, it collapsed as a result of its own shortcomings. The question was, what would replace it? For most Frenchmen the Estates-General was too antiquated to serve a modern parliamentary function. Its division into three chambers, for clergy, nobility, and the Third Estate (everyone else), provoked particular controversy during the winter of 1788–1789, for it appeared to give the first two orders a built-in majority over the third estate—hence the demands for voting by head rather than by order. The issue was still unresolved when the Estates-General met at Versailles in May 1789, and it was ultimately a group of radicals, mostly but not exclusively from the Third Estate, who decided to break the deadlock and declare themselves the National Assembly. The king and many nobles naturally demurred, but growing unrest in town and country, which owed a good deal to harvest failure and high bread prices as well as the unprecedented political situation, brought riots that worked to the advantage of the National Assembly by persuading their opponents to call off countermeasures. The taking of the Bastille in Paris on 14 July was symbolically significant, but in order to pacify rebellious peasants, it was necessary to abolish the seigneurial system on the momentous night of 4 August, at which point the term *ancien régime* was coined to describe the former state of affairs, now swept away.

It seemed a new era was dawning, not just for France but for the world as a whole; the Declaration of the Rights of Man issued later in August 1789 was cast in universal terms. The Revolution assumed a European dimension from the outset, inspiring admiration in many quarters and posing an implicit challenge to the old order everywhere. Yet the great continental powers remained much more preoccupied with the fate of Poland than with their western rival, which was deeply absorbed in domestic affairs. Virtually every institution in France awaited reform, and turning principles into practice was a huge undertaking. Ordinary people were anxious for real reform, yet government resources remained in short supply. Above all, the consensus in favor of change did not prevent the emergence of deep disagreements over its precise configuration. The bitter debate over the king's role as a constitutional monarch is a good illustration of this. It led to Louis XVI's attempt to flee the country in 1791, confirming suspicions

A Parisian mob storms the Bastille on 14 July 1789, the date traditionally marking the beginning of the French Revolution. (Library of Congress)

that he rejected the Revolution. A split within the Catholic Church, the subject of substantial reform, forced thousands of dissident clergy into opposition, while even priests who accepted the Civil Constitution of the Clergy became increasingly suspect.

In this turbulent atmosphere, external affairs began to have a decisive impact on the development of the Revolution. The emperor of Austria was naturally concerned that his brother-in-law (Louis) and sister (Louis's queen, Marie Antoinette) were at risk, while other countries bordering France offered haven to aristocratic émigrés, many of them military officers. The Revolutionaries took the plots and proclamations of these aristocrats and their foreign supporters at face value, worried that they would attract support among disaffected elements inside France. As a result, the prospect of war increasingly appealed to Revolutionary politicians as a means of flushing out traitors and uniting patriots behind the Revolution. There were few objections when, in April 1792, the French parliament declared war on Austria and Prussia. Yet the successful campaign everyone anticipated failed to materialize, and defeat brought deeper division rather than unity. The search for a scapegoat inevitably indicted the king, whose removal seemed essential to improve military fortunes. On 10 August 1792, as Prussian invasion menaced the capital, the people of Paris stormed the Tuileries palace; Louis was dethroned and incarcerated for his own

safety. With him fell the constitutional monarchy and all hope of a moderate settlement.

The course of the Revolution lurched in a radical and violent direction. It was overshadowed by the war, which initially took a turn for the better (a victory at Valmy on the day the Republic was officially declared), then worsened as Britain and the maritime powers joined the anti-French coalition early in 1793. By then Louis had been executed, but his death did nothing to unite opposing factions in a new parliament, the National Convention, that was elected on the basis of virtually universal male suffrage in September 1792. On the contrary, the fate of the king drove individuals further apart, and the war raised the stakes by making dissenters into traitors. Any hope of establishing a democratic regime was dashed by renewed crisis in the summer of 1793, when the regime was faced by a deadly combination of civil war and invasion. The Republic was thoroughly beleaguered, with foreign troops massed on every frontier, while Britain ruled the waves. The major cities outside Paris rose up in revolt against the dictatorship of the capital after Jacobin radicals in the Convention purged rival deputies with the assistance of militant, lower-class *sans-culottes*. Several parts of the countryside were also in flames, notably the west, where an area known as the Vendée, which was seething with religious tension and conflict between urban and rural dwellers, experienced a bloody uprising that was triggered by hostility to the military draft.

The odds seemed overwhelming, but the Republic benefited from its enemies' divisions: Only once, at Toulon, did foreign and domestic opponents make common cause, yet they failed to exploit the opportunity. Republicans resorted to a policy of coercion known as the Terror. One might describe the emergency powers that galvanized the government as a "war dictatorship," mobilizing the country's resources in unprecedented fashion. It was no longer possible to rely upon the persuasion that had characterized relations between center and locality. Instead of the weak executive that had replaced the monarchy, a Committee of Public Safety was created, made up of twelve deputies from the Convention. They ruled by decree and oversaw the representatives on mission, who were dispatched to the provinces to control the local authorities. There was a growing inclination, *in extremis*, to employ the weapons of repression: imprisonment by watch committees, and execution by Revolutionary tribunals or military commissions.

Given the substantial contingents employed in suppressing internal revolt, not to mention duty on the frontiers, much effort during the period 1793–1794 was devoted to recruiting and supplying a vast army that probably totaled 750,000 men. This mass levy, which

placed the resources of the nation at the disposal of the government, drew on the vast demographic reserves that France possessed but had never harnessed so effectively. A series of talented generals rose from the ranks to replace the old noble officer corps. The tide of war duly turned and, by the spring of 1794, there were calls for a slackening of the repression. By now, however, the Terror had acquired its own momentum, and there were some, like Maximilien Robespierre, who saw it not simply as a means of defending the Revolution but, instead, as a means of raising it to new heights: The supreme sacrifices of the past year would usher in utopia.

The Terror represented the most radical phase of the Revolution, not least in a social sense. If ordinary people were to support the war effort, they had to be rewarded with the vote, and also with the abolition of compensation payments for seigneurial dues or with price controls on foodstuffs. In 1793 the Declaration of the Rights of Man were extended to include entitlement to education and poor relief. In view of the unwillingness of wealthier citizens to continue assuming responsibility at the local level, modest peasants and humble artisans were given office. Representatives on mission dispensed these appointments, and they sponsored schemes for employment and land redistribution in addition to doses of repression.

The Year II, according to the Republican calendar, was also a great period of cultural experimentation, much of it consciously anti-Christian. Besides renumbering the years from the foundation of the Republic in 1792, this campaign to establish a secular republican culture divided months of thirty days into three “weeks” (*décades*) of ten days apiece. Sunday disappeared, as did a host of holidays and saints’ days. Churches were closed, and priests were encouraged, or obliged, to renounce their vows. This was partly a reaction to ecclesiastical opposition, but popular anticlericalism, as well as Enlightenment skepticism, were given free rein. Simultaneously, monarchical insignia were effaced, titles were abolished, and citizens were encouraged to greet each other informally. Rooting these changes in the popular mentality was a long-term project, and though the momentum was maintained in the wake of the Terror, the Napoleonic regime reverted to tradition. Nonetheless, cultural upheaval left a lasting imprint on religious practice.

Robespierre himself attempted to introduce a civic religion of the Supreme Being, but the lavish celebration of the cult in Paris in June 1794 only hastened his downfall. The whole edifice of Terror was subsequently dismantled. For just as military defeat had justified emergency measures, so a slackening of the crisis, following victory on the northeastern frontier at Fleurus in June 1794, led to more demands for a relaxation of authoritarian government.

Robespierre and his colleagues insisted on still more sacrifices, but the onset of the reign of virtue only seemed to uncover more vice. With no end in sight it was essential to oust Robespierre, once called “the Incorruptible,” and he was overthrown in the Convention on 9 Thermidor (27 July 1794). Once again the Revolutionaries were compelled to return to first principles. There was no question of resurrecting the monarchy, since those who remained in power were all regicides. But if the Republic was to prosper, it would need to be moderate and to embrace the wealthier elements in society—in short, to rest on consent rather than coercion. The Directory, as the new regime was called after its five-man executive, aimed to chart a middle way between royalist reaction and the despotism of liberty. It sought to draw on the lessons of the past six years and preserve freedom by establishing a system of checks and balances that had not seemed necessary in the heady days of 1789 or 1792. Two houses of parliament were accordingly created, elected on an annual basis and via a restricted franchise, while the latitude granted to local authorities was limited by the attachment of centrally appointed *commissaires*.

One can fault the basic design of the Constitution of 1795, the third to be drafted during the Revolutionary decade, but its application would pose a difficult task in a country that had been torn apart by civil war. Election results from 1795 onward suggested there was insufficient consensus around this moderate republican regime; it was only consolidated with fresh recourse to force. Indeed, the voters’ choice in the inaugural elections of 1795 was largely confined to former members of the Convention, among whom two-thirds of the new deputies had to be selected, in order to guarantee a parliamentary majority for the Directory. This restriction, the law of two-thirds, provoked an insurrection in Paris, not from the sans-culottes, who were now a spent force, but from well-heeled elements who sought a more conservative solution to the Revolution. Not that radicalism was completely dead, for monarchist victory in the elections of 1797 was followed by neo-Jacobin success in those of 1798 and 1799. In order to survive, the Directory was obliged to violate its own rules, annul elections, and circumscribe freedom afresh. In the absence of support from the electorate it turned to the army, not only to supervise the expulsion of deputies but also to police the country and to try criminals in military courts. The army was regarded as a solid bastion of republican commitment, and inevitably its generals began to entertain political ambitions: Several serving soldiers were elected to the Legislative Councils and even the Directory itself.

This militarization of the Republic was also fuelled by the continuation of the war. To be sure, the Directory was generally successful in the field, to the extent that Prussia

and Spain made peace in April and September 1795, respectively, followed by Austria in October 1797. Only Britain remained stubbornly at odds thereafter, but in many ways war had become an integral part of the regime, which depended on the conflict to stimulate patriotic support and obtain essential resources from conquered peoples. Territorial gains in the Low Countries and the Rhineland expanded the original eighty-three departments to ninety-nine, while sister republics were created in Holland and Italy.

Yet the continuation of the war, like the persistence of internal division, made it difficult for the Directory to “normalize” its rule. Above all, a bellicose foreign policy put the nation at risk of defeat. This specter was raised in 1799, when Bonaparte’s Egyptian campaign revived an anti-French coalition that now encompassed Russia and Turkey (strange bedfellows) as well as Austria and Prussia. The Polish question, which had divided eastern from western diplomatic systems, was now settled (at the expense of the Poles, whose state disappeared from the map). This left the eastern states free to sink their differences and combat the resurgent French menace. In the face of huge odds, the French were forced onto the defensive and were threatened with invasion for the first time since 1793. In 1799 the increased war effort, which demanded full-blown conscription in 1798, once again sparked peasant uprisings. There were understandable fears that the Terror would be repeated as a result. In the event, emergency measures were less than draconian, and the pressure was reduced when summer victories halted the Allied advance. But confidence in the Directory, which had lasted longer than any previous revolutionary regime, was fatally undermined. Even before Bonaparte returned, unauthorized, from Egypt, plots were afoot to revise the constitution in a more authoritarian direction. The experienced Emmanuel Sieyès, who entered the Directory in 1799, was determined to make changes, though they turned out to be more dramatic than he had envisaged.

However, after a decade of upheaval enthusiasm for liberty was waning, and many people were prepared to accept stability at any price. The task of replacing the old monarchy with a viable alternative had proved far more difficult than anyone had imagined. The war had complicated that task immeasurably, and it was no accident that Bonaparte should be seen as an answer to the conundrum since, as a successful general, he could offer security both within and without. His rise to power, like the achievements of his regime, can only be assessed and appreciated against the background of the French Revolution that inspired and appalled in equal measure, a mixture of triumph and tragedy that constituted one of the seminal events in modern history.

### **Friant, Louis, comte (1758–1829)**

Louis Friant, the son of a wax-maker, was born in France on 18 September 1758 in the village of Morlancourt near the river Somme. Friant’s career is archetypal of the transformation of the French military. During a period of almost-constant warfare from 1792 to 1815, the armies of the French Republic and then of the Empire became the most effective fighting forces on the Continent. Friant was a lifetime soldier whose first stint in the French Army, during the *ancien régime* under Louis XVI, ended in 1787 when he left with the rank of corporal. By the end of his career, after Waterloo, he had risen to the rank of general and acquired the title of count. Friant was involved in some of the most significant battles of the French Revolu-

tionary and Napoleonic Wars. Well respected by his men, he was wounded many times and proved himself an excellent tactician.

In September 1789 Friant joined the National Guard, fighting on the Rhine front, in northern Italy, and in Egypt, where he was taken prisoner in 1801 along with other French soldiers and repatriated a short time later. After completing a term as inspector general of the infantry from 1801–1803, he joined III Corps under Marshal Louis Davout, his brother-in-law, at Bruges. During the campaign of 1805 it was Friant's troops, the second division of III Corps, who swept in at the crucial moment to provide the support for Napoleon's army to be victorious at the Battle of Austerlitz. With the average for a daily march for the Grande Armée being between 10 and 22 miles, Friant's division's 70-mile march from Vienna to Austerlitz in thirty-six hours is all the more impressive.

Continuing his outstanding service, Friant led troops during the War of the Fourth Coalition, in which he distinguished himself at Auerstädt (14 October 1806). The following year he was wounded at Eylau, and was made a Count of the Empire in 1808. In the war against Austria in 1809 he served at Eggmühl and the storming of Ratisbon, and was badly wounded at Wagram. He led a division in I Corps during the Russian campaign in 1812, during which he was wounded, yet again, at Smolensk and twice at Borodino. His service continued during the campaigns in Germany (1813) and France (1814), where he led contingents of the Imperial Guard. Considered by Napoleon as one of his most reliable generals, Friant was well liked by his men, and always returned to battle, even when he was wounded. After Napoleon's first exile in 1814, Friant was retained for military service by the new government. Friant's last command took place during Napoleon's Hundred Days, as colonel in chief of the Grenadiers of the Imperial Guard, the most senior infantry regiment in the army. After Napoleon's defeat, Friant retired from military service on the return of Louis XVIII.

Friant was a recipient of the Grand Eagle of the Legion of Honor in 1805, the highest military award given in the First Empire. This award required long years of military service in times of both war and peace and required the demonstration of bravery and extraordinary service. Friant was later made a count of the Empire. In addition to his military service, Friant served as military governor of Luxembourg in 1795 and of Alexandria in 1800. He died on 24 June 1829 at the age of seventy, and his name is inscribed on the Arc de Triomphe. There is also a street named after him in Paris, the Rue Friant, in the Fourteenth District, running northeast from Boulevard Brune to Avenue Jean Moulin.

### Friedberg, Battle of (24 August 1796)

The Battle of Friedberg marked the high point of the French invasion of southern Germany by the Army of the Rhine and Moselle during the War of the First Coalition. The French, under General Jean Victor Moreau, defeated a delaying force of Austrians and prepared to march toward Vienna. Their further advance was prevented by a defeat suffered by the neighboring Army of the Sambre and Meuse.

French armies successfully invaded southern Germany during the summer of 1796, crossing the Rhine under the command of Moreau and of General Jean-Baptiste Jourdan to the north. Their victories over the opposing Austrians caused many of the smaller German states to drop out of the war against France. The French advance was rapid, but the Austrians had put some distance between themselves and the French. Directly opposing Moreau was an Austrian army under Archduke Charles. Charles was a resourceful commander, determined to turn back the French. He decided to concentrate most of his army and that under *Feldzeugmeister* Wilhelm Graf Wartensleben against Jourdan. They expected their overwhelming numerical superiority to ensure a victory. Charles planned to leave a delaying force to hold up Moreau until after the victory.

On 13 August Charles moved his army to the southern bank of the river Danube at Donauworth. Moreau shadowed Charles, crossing to the right bank as well. Moreau failed to close the distance between his army and Charles's, however, giving the Austrian commander time to break away. On the seventeenth, Charles crossed back to the northern bank of the Danube and marched to join Wartensleben. The two Austrian forces successfully joined and defeated Jourdan at the Battle of Amberg on the twenty-fourth. Jourdan was forced to retreat, ending the threat to central Germany.

Moreau continued to follow the southern bank of the Danube, reaching the Schmitter River, about halfway between Ulm and Munich, on 21 August. The next day he

received confirmation that Charles had taken most of his army back across the Danube. Moreau was reluctant to follow with his whole army. A plan to send only part of the army in pursuit was also vetoed because of the danger that Charles would turn on it with his whole force. Moreau decided instead to attack the covering force left around Friedberg to try to draw Charles back across the Danube.

Moreau was opposed by *Feldmarschalleutnant* Maximilian Graf Baillet von Latour with 30,000 men. Latour had scattered his units in a cordon, trying to keep between the French and Charles. Moreau had 59,000 men, while Latour had only 6,000 men under his immediate command. The French left and right flanks quickly enveloped the Austrians and cut the roads leading east and north from Latour's position. A direct assault on Friedberg drove the Austrians from the town. Latour managed to open the road to Ingolstadt after desperate fighting, and he drew the shattered remains of his command off to the north. The Austrians lost 1,800 men and seventeen guns, while French losses were considerably smaller. Latour withdrew to the Danube, where he joined with the remainder of his army.

Moreau made little effort to follow up his victory. He remained on the Isar while trying to determine whether or not Jourdan had lost the battle. It was not until 10 September that German newspapers confirmed that Jourdan had been defeated and was in retreat. Moreau then abandoned his advanced position and started withdrawing to the Rhine.

### **Friedland, Battle of (14 June 1807)**

A major engagement between French forces under Napoleon and the Russian army under General Levin Bennigsen Friedland was the decisive battle of the campaign of 1807. Following the bloody stalemate at Eylau in February, the Russian and French armies spent the spring recuperating and preparing for a new round of fighting. The Russians launched their offensive on 5 June, threatening Marshal

Michel Ney's corps around Guttstädt. However, the Russian attack was poorly executed, allowing Ney to make a fighting retreat to the Passarge River. Napoleon quickly concentrated his forces at Deppen on the Passarge and counterattacked on 7 June, driving the Russians out of Guttstädt. Three days later, the French attacked the Russian fortified camp at Heilsberg and suffered heavy casualties. However, Bennigsen feared a flanking maneuver by Napoleon and ordered further retreat toward the Russian frontier.

Late on the afternoon of 13 June, the Russian advance guard approached Friedland and found it already occupied by the advance guard of Marshal Jean Lannes's corps. After a cavalry skirmish, the Russians carried the town and established a cavalry screen on the left bank of the river Alle. The French prisoners indicated that only Lannes's advance guard was some 2 miles from Friedland waiting for the rest of V Corps to arrive. The leading units of the main Russian army arrived after 8:00 P.M., and Bennigsen moved General Dmitry Dokhturov's 7th and 8th Divisions to the left bank to support the Russian Imperial Guard and cavalry already deployed there. During the night, the rest of the army concentrated on the right bank. Bennigsen initially did not intend to give battle around Friedland but wanted to secure his march northward to Wehlau, whence he planned to attack Napoleon's flank and rear if the French advanced to Königsberg.

Bennigsen was exhausted and in poor health, so on the evening of 13 June he left the army to spend the night in a town house in Friedland. He had barely received any rest when, at 11:00 P.M., he was informed that General Nicolas Oudinot's troops were deployed near Postehnen. Concerned about his positions, Bennigsen moved additional troops across the river and took up positions near the forest of Sortlach. By late evening there were some 25,000 Russians on the left bank of the Alle. Furthermore, that same evening two pontoon bridges were constructed, and additional forces moved to the left bank to secure the flanks. Ataman Matvei Platov's Cossacks, supported by the Preobrazhensky Guard, the cavalry of the Guard, Finnish Dragoons, and Olivopol Hussars, were dispatched northward to seize crossing sites at Allenburg and on the Pregel River. Bennigsen moved most of his cavalry to the left flank and posted Prince Peter Bagration with his advance guard on the left. Thus, the Russian troops were deployed in a half-circle around Friedland. This position was extremely unfavorable for several reasons. First, a deep ravine, Muhlen Teich, in the center divided the Russian forces into two parts and complicated communications between them. Second, the troops were deployed on marshy terrain with their backs to the Alle. In case of defeat, the Russians could escape only through the narrow streets and across one small wooden bridge and three

Adapted from Chandler 1987, 154.

pontoon bridges at Friedland. No attempt was made to reconnoiter the river for fords or to examine the terrain on the flanks.

Late on the night of 13 June, Lannes learned about the Russian occupation of Friedland. He instructed Oudinot to reconnoiter the Russian positions and to recapture the town if he found himself faced only by small Russian detachments. Oudinot reached Posthnen, where he encountered a Russian cavalry screen and observed the enemy main columns in the distance. As he was reading Oudinot's report, Lannes also received instructions from Napoleon to prevent Bannigsen from crossing the Alle and was told that General Emmanuel marquis de Grouchy was en route with his dragoon division to reinforce V Corps for this mission. Around midnight, Lannes received reinforcements, increasing his forces to some 13,000 men. He deployed these troops between Posthnen and Heinrichsdorf, with the light cavalry deployed on the right flank and Grouchy's dragoons kept in reserve near Posthnen.

Some time after 2:00 A.M., Oudinot, supported by General François Ruffin's troops, reached Posthnen and engaged the Russian outposts in the woods of Sortlach.

The fighting rapidly grew intense, and an hour later Grouchy arrived with his cavalry; he was initially driven back by the numerically superior Russian cavalry, but new French reinforcements (Dutch cavalry of General Adolphe Mortier's corps) arrived and forced the Russians back. Simultaneously, General Andrey Gorchakov's troops advanced toward Heinrichsdorf, forcing Lannes to shift part of his cavalry to the right flank. The fighting continued for the next three hours, in the course of which Heinrichsdorf changed hands several times.

On the Russian left flank, Bagration arrived at Sortlach shortly after 3:00 A.M. and deployed his infantry in two lines. In addition, he deployed most of his *Jäger* regiments (some 3,000 men) as skirmishers in the woods of Sortlach; two battalions, five squadrons, and four guns were placed behind them as reserves and another two battalions, five squadrons, and four guns were placed at Sortlach. As the French attacked, the fighting on the left flank was particularly violent as the French *tirailleurs* (skirmishers) and Bagration's *Jäger* regiments stubbornly contested the ground in the woods. Bagration launched a series of attacks against Oudinot, but French grenadiers repulsed him

each time. The 9th Hussars and the Saxon cavalry also counterattacked but suffered heavy losses.

Lannes skillfully used the terrain and protected his troops with a dense screen of skirmishers in the woods. He had mobile columns moving between the lines to create the illusion of arriving reinforcements. He was already told that Napoleon was hurrying with the rest of the army, so he had to pin down Bennigsen for as long as possible. Bennigsen ordered more troops to cross the Alle to support forces already there. The Russian troops crossed the river and, by 9:00 A.M., Bennigsen had most of his cavalry deployed on the right flank, supported by the 3rd, 4th, 6th, 7th, and 8th Divisions; Gorchakov commanded these forces. On the left flank, the 1st and 2nd Divisions reinforced Bagration. The 14th Division and the Imperial Guard were kept in reserve.

Around 7:00 A.M. Bagration launched another assault. He spread General Nikolay Rayevsky's 20th Jägers in a skirmish line and arranged the Life Guard Jäger Regiment, with the Rostov Musketeers in reserve, in two columns behind them. A battalion of the 20th Jägers, spearheaded the attack. In hand-to-hand combat, the Life Guard Jägers captured three officers and forty-eight men, but lost two officers and six men themselves. As the French counterattacked, Bagration committed the Moscow Grenadiers, the Pskov Musketeers, and the Alexandria Hussars and deployed Colonel Aleksey Ermolov's horse artillery battery. The 3rd and 7th Jäger Regiments were ordered to hold their ground in the center while the 5th Jägers remained at Sortlach. Bagration also instructed Rayevsky to disengage the 20th and Life Guard Jägers and rally them in the valley behind the forest. The Jägers slowly retreated, pursued by the French, who stopped on the edge of the woods and continued harassing the Russian lines.

At the same time, Oudinot moved part of his division to seize Sortlach on Bagration's left, but he was beaten back by the 5th Jäger Regiment. Simultaneously, Rayevsky rallied his troops (20th Jägers and Life Guard Jägers) on the plain behind the Sortlach woods. The French cavalry soon charged him there, but a squadron of the Life Guard Horse Regiment drove them back. Early in the morning, Bagration called up General Karl Baggovut's detachment. He wanted to make a decisive attack to clear and secure the woods, where Oudinot's grenadiers had found good positions from which to harass Bagration's troops. Bagration deployed the 26th Jägers in line, followed by the 4th and 25th Jägers in column. The Russians overwhelmed Oudinot's troops and drove them out of the Sortlach. To secure his position in the forest, Bagration reinforced Baggovut with a battalion of Olonetsk militia.

Hearing of this success, Bennigsen ordered the rest of his army to adjust the line with the front held by Bagra-

tion's troops. As a result, the Russians advanced 1,000 paces. At the same time, several major cavalry actions took place around Heinrichsdorf, where regular cavalry under General Fedor Uvarov and the Cossacks threatened to envelop the French flank. However, the cavalry of I and VI Corps arrived in time to repulse the Russians and secure the flank. Shortly after 9:00 A.M., Mortier's corps also arrived on the battlefield near Heinrichsdorf in time to counter a new Russian attack.

It was an important moment in the battle. Unable to defeat Lannes's corps, Bennigsen could have recalled his army and safely retreated across the Alle before Napoleon's entire army arrived. However, he decided to remain at Friedland, though he took no precautions to protect his exposed army.

The Russian troops, already exhausted by the previous days' marches and the early fighting, lapsed into a brief lull between 2:00 and 5:00 P.M. Both sides exchanged artillery fire, but no major actions took place. Bagration, meantime, met Bennigsen in Friedland and turned his attention to the arrival of the French corps. He urged Bennigsen to take measures to strengthen the positions around Friedland. Furthermore, Bagration anticipated that Napoleon would direct a main attack against his flank, so he requested more reinforcements; his appeals were all turned down. Finally, shortly after 4:00 P.M., Bennigsen observed the French corps taking up new positions from which to attack and realized the danger to his exposed army. He ordered a retreat, but Gorchakov argued it was better to defend the current positions until night. Bagration disagreed with this suggestion and began preparing his troops to withdraw to Friedland.

Napoleon, meanwhile, was rapidly concentrating his corps at Friedland. He personally arrived near the town shortly before noon, declaring to his troops "Today is a happy day—it is the anniversary of Marengo" (Chandler 1966, 577). Examining the Russian positions, he realized that he had a chance of destroying the Russian army in a single battle. He urged Ney, General Claude Victor, and the Imperial Guard to accelerate their march to the battlefield as he prepared new dispositions for the battle. He rested his troops in the woods of Sortlach and made sure they had enough ammunition. He then placed Victor's troops and part of the cavalry in reserve near Postehnen. On the left flank, Mortier's corps, supported by most of the French cavalry, defended Heinrichsdorf and the road to Königsberg. However, Mortier was instructed not to advance, as the movement would be by the French right flank, pivoting on the left. Napoleon had two corps designed for this flanking attack. Ney was ordered to move to the right flank, passing Postehnen toward the woods of Sortlach. Lannes would form the center in front of Postehnen, while Oudinot's troops were to turn to the left in order to draw

The Battle of Friedland, the decisive blow inflicted on Alexander's forces that led to the Franco-Russian rapprochement at Tilsit the following month. (Painting by Edouard Detaille from *Life of Napoleon Bonaparte* by William M. Sloane. New York: Century, 1906, vol. 3)

upon themselves the attention of the enemy. Napoleon's planned maneuver was aimed at destroying the bridges at Friedland and cutting the Russian line of retreat.

At 5:30 P.M. a salvo of twenty French guns signaled the renewal of battle. Ney's corps advanced from Postehnen to the woods of Sortlach, where Bagration had posted his Jägers. After an hour of vicious fighting, Bagration had to withdraw his exhausted Jägers, allowing the French to occupy the woods and open fire on his main forces. Ney organized his troops in columns in three broad clearings in the forest; General Jean Gabriel Marchand's division was on the right, General Baptiste Bisson on the left with the cavalry of General Marie-Charles Latour-Maubourg following them behind. The superior French forces drove Bagration's Jägers out of the woods and carried Sortlach, which was partly abandoned on Bagration's orders. As the French advanced, several Russian batteries on the right bank opened fire at them, while Bagration deployed his troops in new positions. He then moved the Life Guard Ismailovsk and Semeyonovsk Regiments forward.

The advancing French came under fire from Bagration's troops and from the batteries on the opposite bank. General Alexandre Antoine Senarmont, chief of artillery of Victor's corps, later recalled that the Russian batteries, deployed on the opposite side of the Alle, fired on the French

flanks and decimated them. Bagration initially counterattacked with the Life Guard Horse Regiment and then moved the Pavlovsk and St. Petersburg Grenadier Regiments forward. The Russians drove the French columns back and captured the eagle of the 69th Line in the process. Ney's troops fell back in confusion but were quickly rallied when General Pierre Dupont moved his division with the cavalry under generals Armand Lahoussaye and Antoine Auguste Durosnel closely behind. The Russian cavalry continued its attack but came under fire from Dupont's batteries and was counterattacked by Latour-Maubourg's cavalry. As the Russians fell back, Dupont changed the direction of his troops to the right and covered the gap on Ney's left.

Simultaneously, Senarmont moved his twelve guns forward and organized two companies of fifteen guns, with six pieces in reserve, and placed them on both flanks of Dupont's division. As the French advanced, Senarmont outpaced the infantry and opened fire on Bagration's troops from close range. The fire was very effective because the Russians were massed in a narrow defile between the Muhlen Teich and the Alle. Realizing the danger of these batteries, Bagration directed his artillery against them. Senarmont disregarded the Russian artillery and concentrated his fire on the enemy infantry. His guns initially fired at 600 paces, then moved to 300

paces; Senarmont's guns operated with remarkable intensity, firing over 3,000 rounds into the Russian troops. Bagration sent his cavalry to destroy the French guns, but Senarmont calmly awaited their advance before ordering canister fire, which in the event literally mowed down the enemy ranks. The Russians then attacked with the Life Guard Izmailovsk and Pavlovsk Grenadier Regiments, but the French fire virtually wiped out these regiments as well; the third battalion of the Izmailovsk Regiment lost some 400 men out of 520. Realizing the utter futility of his orders, Bagration finally fell back to Friedland, where he unsuccessfully attempted to delay the French advance. By 8:00 P.M. Bagration had withdrawn into Friedland and had the houses in the southern suburbs set on fire to slow down the French. At the same time, as he approached the river, Bagration found the bridges had already been set ablaze by the Russians.

On the Russian right flank, Gorchakov made a desperate assault with his four divisions on Lannes and Mortier. The French contained General Dmitry Golitsyn's efforts with the support of the cavalry of the Imperial Guard. However, senior French commanders did not exploit their numerical superiority in cavalry (forty squadrons against twenty-five) and allowed the Russians to retreat. The French artillery on the left bank of the Muhlen Teich soon engaged Gorchakov's forces in flank. The arrival of Gorchakov's troops in the crowded streets of Friedland created havoc at the bridges, which were already on fire. Bagration and Gorchakov dispatched numerous officers to look for fords along the river, which were quickly found.

The Battle of Friedland was the final engagement of a long campaign. The Russian army had suffered a crushing defeat and could not field another army. The casualties were staggering, as the Russians lost some 20,000 killed and wounded; the French lost 7,000–8,000. Bennigsen had undertaken some effective operations in the early months of 1807, but he committed a fatal blunder at Friedland. Furthermore, the Russian high command played virtually no role in the battle, since Bennigsen was in poor health, his quartermaster general, Fadey Steingeldt, and his duty general, Ivan Essen, were wounded and unavailable for duty, and the Russian headquarters were full of incompetent officers and observers.

Friedland was a decisive military and diplomatic victory for Napoleon. It proved the superiority of French military organization: A single corps had repulsed attacks of the Russian army and allowed the rest of the French to concentrate for a counterattack. It put an end to the Fourth Coalition and led to rapprochement between Russia and France. The meeting between Napoleon and Tsar Alexander at Tilsit and the subsequent treaty of alliance was a direct result of

this victory. In addition, Napoleon spread his sphere of influence to the territory between the Oder and the Niemen rivers and found eager supporters in Poland.

## Frigates

Frigates were the eyes and ears of the fleet, and admirals frequently complained that they had too few of these useful general-purpose vessels. Many of their functions were performed independently of major battle fleets, and so they were popular commands for more enterprising naval officers.

The frigate was large enough to mount significant firepower and at the same time fast enough to evade larger

Table F.1 Frigates in use in the Royal Navy, 1793–1815

Rate	Frigate Type	Armament	Crew	Period of Use
5th rate	44-gun	20 × 18-pounders 22 × 12-pounders 2 × 6-pounders	250–280	An eighteenth-century vessel, the last one was built in 1787. In the French Revolutionary period they were used mainly as transports. This class had disappeared by 1815.
5th rate	40-gun	28 × 24-pounders 12 × 9-pounders (six of these often replaced with 6 × 32-pounder carronades)	320	Originally copied in 1797 from a captured French vessel. Many were prizes, while a few were <i>razées</i> (cut-down two-deckers). Further vessels were built in 1813–1814 in response to the large American frigates.
5th rate	38-gun	28 × 18-pounders 10 × 9- and 12-pounders	250	Few of this type were in service in 1793, but eighty were in service by 1813. Most common type of frigate in the Royal Navy. Many had been captured or copied from the French.
5th rate	36-gun	26 × 12-pounders (or later 18-pounders) 10 × 9- and 12-pounders	240	First designed in the 1750s, this type became common in the 1770s. Seventy vessels were in service by 1813.
5th rate	12-pounder, 32-gun	26 × 12-pounders 6 × 6-pounders	220	This vessel, which originated in 1757, was the standard British frigate for thirty years until it was outgunned by larger French 38-gun frigates. Thirty-eight were in service in 1810, many dating from the American Revolutionary War.
5th rate	18-pounder 32-gun	26 × 18-pounders 6 × 6-pounders	220	These vessels, a response to the larger French frigates of the 1780s, were not a common type, there being only twelve in service in 1810.
6th rate	28-gun	28 × 9-pounders	200	This class was introduced in 1748, and no further vessels were added to this class after 1793. Its armament rendered it weak against the larger frigates of thirty-two guns or more. Seven remained in service by 1808.
6th Rate	22-gun	22 × 9-pounders 8 × 24-pounder carronades 2 × 6-pounders	160	This class developed in 1805. A number of prizes were added to this class, resulting in fifty-two in service by 1813.

enemy vessels. They were designed with an unarmed lower deck, meaning that the guns were higher above the waterline than on other vessels. Frigates could therefore be allowed to heel quite considerably, and in heavy seas and strong winds they could carry more sail. Larger ships could not open their lower gun ports in such weather, but a frigate could use its guns safely under such conditions. They were not part of the line of battle but were used for convoy escort, commerce raiding, and patrols, and they provided the main reconnaissance force for battle fleets.

Many of the frigates used by the Royal Navy were captured from the French, Spanish, and Dutch, with some of the French designs being copied. The U.S. Navy had large

frigates such as the *Constitution*, which had forty-four guns, mainly 24-pounders (see Table F.1).

### Fuentes de Oñoro, Battle of (3–5 May 1811)

A bitterly fought action of the Peninsular War. After a series of clashes with Viscount Wellington's advance troops, notably at Pombal, Redinha, Casal Nova, and Foz de Arouce, Marshal André Masséna's starving army limped back across the Portuguese border and into Spain in March 1811. Nevertheless, the French still held the vital frontier fortresses of Ciudad Rodrigo, Badajoz, and Almeida, and as long as they remained in French hands, Wellington could never rest easy in the Peninsula. It was vital that he take these fortresses, and in April he set in motion his plan to do so.

The strongest of the fortresses was Badajoz, which lay to the south in Extremadura (Extremadura). This town was to be the object of a siege conducted by 20,000 troops under Marshal (his Portuguese Army rank) Sir William Beresford. Wellington, meanwhile, turned his attention to the two fortresses in the north, Almeida and Ciudad Rodrigo, which lay opposite each other on either side of the border.

Wellington had some 38,000 troops close to Almeida, and by the end of April he was able to begin its blockade. On 2 May, however, he received news that Masséna, having revictualled his army, was on his way forward from Ciudad Rodrigo with 48,000 troops with the intention of relieving Almeida. The French line of approach lay through the village of Fuentes de Oñoro, and it was to this sprawling, jumbled maze of a village that Wellington and his army marched to take up positions on 2–3 May.

Wellington's position at Fuentes de Oñoro certainly lacked the impregnability of that of Busaco, for instance, but it did afford him the defensive features he usually sought and that became so characteristic of his battles in the Peninsula. His position stretched for well over 5 miles on the left bank of the Dos Casas River, which flows through the village itself. On the extreme right of the Allied position was the small village of Nave de Haver, and Wellington's left flank rested upon the strong Fort Conception. The position centered on Fuentes de Oñoro, with the right bank of the river leading down to the village being heavily wooded. The village itself was situated on the left bank of the Dos Casas, and a maze of old, single-story houses nestled about the river.

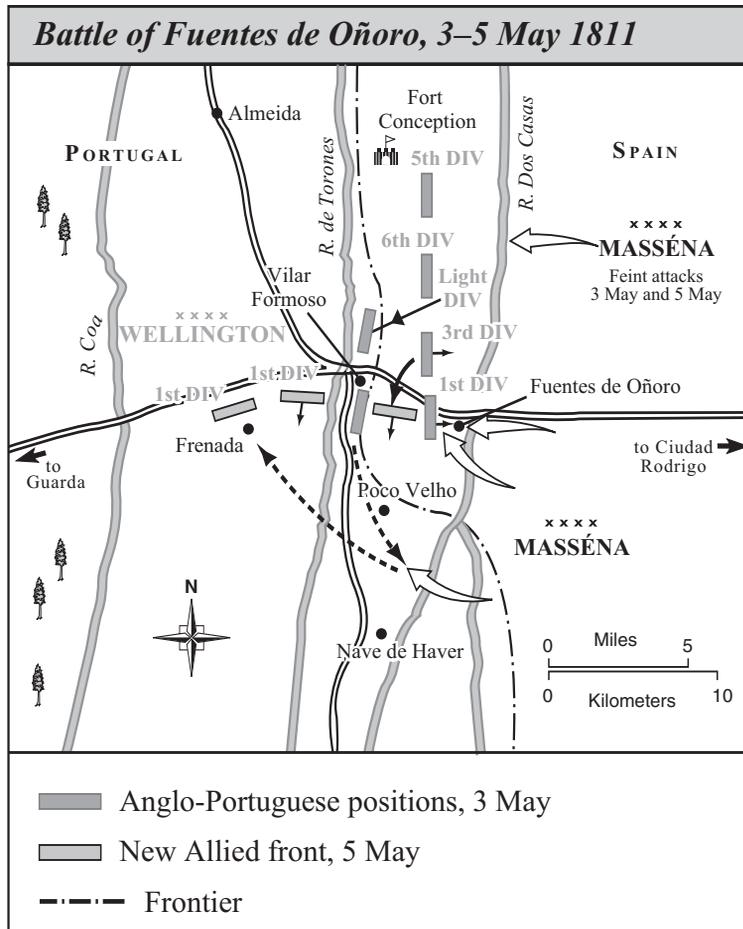

Wellington detached his 5th and 6th Divisions to a position in front of Fort Conception and centered the main part of his force in and around the village of Fuentes de Oñoro, the majority of the troops being hidden out of sight behind a ridge that lay to the west of the village. The Light Division was posted in reserve on the right flank.

The battle began on the afternoon of 3 May when General Louis Henri Loison—in Masséna's absence—launched five infantry divisions against the Allied position. The French columns loomed out of the woods on the right bank and plunged across the Dos Casas to attack the village, which changed hands several times during some heavy and at times savage fighting. Indeed, at one point Wellington himself rode forward and personally ordered the 71st and 79th Regiments into the attack. But by nightfall all French attacks had been repulsed, and Fuentes remained in Allied hands.

There was little or no fighting on 4 May, and both sides took the opportunity to gather and tend their wounded. The only real movement in the French lines came when they held a grand parade during the early evening.

On the morning of the fifth Masséna resumed his attack, throwing several heavy infantry columns against the Allied right flank. Masséna hoped that Wellington would be drawn into weakening his left flank in order to meet the threat and by so doing would allow the French to relieve the beleaguered garrison of Almeida. Wellington held his nerve, however, and refused to fall for the ruse. Instead, he ordered Brigadier General Robert Craufurd's Light Division to replace the hard-pressed 7th Division, which it did in a magnificently controlled withdrawal, all the time surrounded by enemy cavalry. Craufurd's division retired across a plain for more than 3 miles before reaching the safety of the main Allied position. With this move the threat to Wellington's right flank was removed, although he was forced to pull back and realign this part of the line, the 1st Division taking up a position at right angles to the main Allied line.

The fight for the village itself now flared up once more with renewed and increased violence in fighting—and this perhaps typifies the Battle of Fuentes de Oñoro, the cruel tide of battle flowing one way and then the other as the opposing armies were in turn thrust from the village. Ten French infantry battalions thrust Wellington's men from the village and pushed them back as far as the old church on the front slope of the ridge behind, but again the first battalion of the 71st Foot (1/71st) and the 1/79th, supported by the 2/24th, ejected them. Masséna's patience thinned faster than the ranks of his own infantry until, at around midday, he threw in a full eighteen fresh battalions, who succeeded—as much by sheer numbers as by

Adapted from Paget 1997, 126.

courage—in clearing the village of the British and Portuguese defenders. Their triumph was short-lived though, for Wellington ordered the 74th and the 1/88th to counter-attack.

The 88th were the fighting furries of Thomas Picton's 3rd Division, and with a bloodcurdling cheer they sent the French reeling from the streets into the alleyways and passages in the village. Here there was no escape for hundreds of Masséna's men, who died at the hands of the 88th who launched into them with a frenzied and frantic bayonet charge. The 88th and 74th threw the French back and, supported by the 1/71st and 1/79th, finally ended any French thoughts of victory. A final French attack was launched at about 2 P.M., but this was not pressed home with any real conviction and with it ended the last serious fighting on 5 May. The battle petered out in an artillery duel and with another reckless British cavalry charge, this time by the 14th Light Dragoons.

There was no fighting on 6 May, although Masséna's cavalry prodded and poked away at the Allied line to the north and west in a vain attempt to find a way through

Wellington's line. To the north fresh troops, who had not been involved in any of the fighting of 3–5 May, sat quietly confident of being able to fend off any French attack, while to the west the rocky chasm of the Coa proved impassable and Masséna was forced to call back his men.

Masséna had failed in his attempt to relieve Almeida, and while the battle had not been an entirely satisfactory one for Wellington, it had, nevertheless, resulted in another victory at a cost of 1,545 men killed and wounded; Masséna's army suffered 2,192 casualties.

### Fulton, Robert (1765–1815)

An American inventor, born in Little Britain Township, Pennsylvania, on 14 November 1765, Robert Fulton moved with his family to Lancaster, Pennsylvania, in 1766. His father died two years later, leaving a widow and five children. Never an exceptional student, Fulton early demonstrated a genius for invention. Apprenticed to a silversmith, by 1778 he was an expert gunsmith and artist. In 1782 he moved to Philadelphia, where he enjoyed success as a painter.

In 1786 Fulton traveled to Britain, where he stayed with a close friend, celebrated American artist Benjamin West. Fulton's greatest success came as an inventor, however. Over the next several years he secured numerous patents for inventions in canal construction, including machinery, a double inclined plane for raising canal boats, and a power shovel for digging channels.

In 1797 Fulton moved to Paris, where he worked on military inventions, including steam vessels, submarines, and mines. He tried to interest Bonaparte in deploying mines to disrupt traffic on the Thames. Fulton secured financial support from the French government and in 1801 successfully tested a 21-foot-long submarine, the *Nautilus*, in the Seine and then off Brest in the English Channel. Dissatisfied with his invention, he dismantled it, an action that ended French government financial support. In 1802 Fulton, with the help and later the partnership of Robert Livingston, then U.S. minister to France, tested a steam-driven paddle-wheel boat on the Seine, although he was unable to convince Bonaparte that such vessels might transport a French army to England.

In 1804, his financial support gone, Fulton traveled to Britain to try to interest the Admiralty in the same schemes. He met with the prime minister, William Pitt, who agreed to provide money for "submarine bombs" with which to attack French shipping gathering across the Channel for a possible invasion of England. Attempts to employ the mines against the French port of Boulogne in October 1804 and October 1805 were largely unsuccessful. On 15 October 1805, however, Fulton blew up a captured Danish brig, the *Dorothea*, before skeptical Royal Navy officials, the first time in history that such a large vessel had been destroyed by a mine. With the death of

Pitt three months later, however, Fulton lost both his patron and his funding.

Based on the earlier experiment with a steamboat, Fulton and Livingston began plans for a full-size steamship to ply the Hudson River from Albany to New York, and Fulton constructed several successful prototypes. He returned to New York and began work on the *Clermont*. Completed in 1807, she was the world's first commercially successful steamboat.

Fulton successfully tested another mine for the U.S. Navy, and during the War of 1812 he designed a steam-powered warship, the *Demologus* (later renamed *Fulton the First*). Launched in October 1814, she was a large catamaran with a central paddle wheel protected by the twin hulls. Essentially a large floating battery, the *Demologus* was intended to carry the heaviest guns in the defense of New York harbor. His invention came too late to be of service in the war, but it is notable as the world's first steam-powered warship. Fulton died in New York City of pneumonia on 24 February 1815.

# Glossary of Military Terms

The terminology associated with warfare on land and at sea during the period 1792–1815 is very large and can fill several books. Siege warfare alone produced a unique language of its own, mainly connected with the parts of fortifications and the craft associated with their defense or reduction. Below are some of the technical terms referred to in this work, as well as others commonly associated with the period.

*à cheval*: mounted

*à pied*: on foot

*abatis*: barricade of felled trees or interwoven branches

adjutant-general: staff colonel sometimes assigned to serve as a chief of staff at division or corps level

*Afrancesados*: Spanish Francophiles, associated with those who supported the French occupation of Spain from 1808

aide-de-camp: junior staff officer attached to a general or marshal

*Amalgame*: amalgamation of regular French infantry regiments and volunteer units to form a composite units

approaches: trenches or siege lines dug toward the enemy positions

*arme blanche*: generic term for cavalry

ataman: senior Cossack officer

Bashkirs: primitively armed and equipped light cavalry from Asiatic Russia

bastion: four-sided fortification

battery: gun emplacement or company of artillery; batteries could number six, eight or twelve guns

breaking ground: beginning a siege

breastplate: steel plate worn by cuirassiers to protect their fronts; badge worn on the shoulder-belt

breastwork: parapet, usually on a field fortification, to protect the defenders

brigade: tactical formation consisting of two or more battalions of infantry or regiments of cavalry

*cadre*: important officers, enlisted men and other staff needed to organize and train a unit

caisson: ammunition wagon

caliber: the internal diameter of the barrel of the weapon, and approximately the diameter of the projectile fired

canister: artillery ammunition consisting of small lead balls encased in a tin

cannon: informal term for artillery piece

carbine: short cavalry musket

carabinier: type of heavily-armed cavalryman, similar to a cuirassier

carbine: type of musket carried by cavalry, shorter and lighter than the standard infantry musket

carriage: wooden frame which supports the barrel of a cannon

cartouche: cartridge box

case shot: type of artillery ammunition, effectively the same as canister

*chasseurs à cheval*: light cavalry

*chasseurs à pied*: light infantry

*chef*: colonel-proprietor of a regiment in the Russian Army

*chef de bataillon*: major; commander of a French battalion

*chef d'escadron*: major; commander of a cavalry squadron

*cheval-de-frise*: planks or beams studded with spikes or blades, used as a barricade

*chevaléger/cheval-léger*: light cavalry, usually French

*chevauxléger*: light cavalry, usually German

chouan: Royalist insurgent from Brittany

citadel: component of a fortification, consisting of four or five sides

class: annual proportion of the population liable

cockade: rosette bearing the national colors worn on a hat or helmet

color/colour: infantry flag, battalion or regimental

commissariat: army department responsible for supply

company: small tactical unit of infantry or cavalry, or

battery of artillery; a subdivision of a battalion

cornet: lowest officer rank in the cavalry; second lieutenant

- corps: self-contained formation, and the largest tactical unit in an army, containing elements of infantry, cavalry, artillery, and staff; a corps consisted of two or more divisions
- Cortes*: the parliament of Spain
- Cossack: generic name for irregular Russian cavalry
- court-martial: military court
- cuirass: metal breastplate or backplate worn by heavy cavalry
- cuirassier: heavy cavalymen wearing a steel cuirass and helmet
- debut: to issue from a ravine or wood into open ground
- defile: narrow way through which troops can only march on a very confined front
- demi-brigade: French unit of the Revolutionary period consisting of one regular and two volunteer or conscript battalions
- department/*département*: geographical sub-division of France used for administrative purposes
- division: military formation comprising two or more brigades, comprising several thousand infantry and cavalry supported by artillery
- dragoon: medium cavalry capable of fighting mounted or on foot, though almost invariably playing the former role
- eagle: standard consisting of an bronze Imperial eagle mounted on a staff and presented to most units of the French Army from 1804
- embrasure: opening of a parapet of a fortress or field fortification through which artillery (or small arms) could be fired
- émigrés*: Royalists who fled France after the outbreak of Revolution in 1789
- enfilade: to fire on the flank of an opponent
- ensign: the lowest rank in the infantry; second lieutenant
- Erzherzog*: Archduke; an Austrian title
- escadron*: squadron of cavalry
- esplanade: open area separating a citadel from surrounding buildings
- état-major*: regimental staff
- evolution: drill movement, including marching and weapons handling
- facings: distinctive colors on a uniform, usually the collar and cuffs, which differentiate units
- fascine: bundle of brushwood used to fortify a position or to fill ditches during an assault
- field marshal: highest rank in the British, Russian, and Prussian armies
- foot: infantry
- flèche* (modern spelling, *flèche*): V-shaped fortification whose rear is left open, from the French for “arrow”
- flintlock: most common form of musket of the eighteenth and early nineteenth centuries
- forlorn hope: advance storming party, usually that sent ahead of the main assault into the breach of a city or fortress wall
- Freiherr: title used throughout German-speaking territories, roughly equivalent to *Baron*
- Freikorps*: independently-raised units, usually from Prussia or Austria; bands of volunteers
- Fürst: title used in German-speaking territories, roughly equivalent to *Prince*
- fusil: musket
- gabion: wicker basket filled with earth used in fortification
- général de brigade*: rank in the French army usually accorded to the senior officer commanding a brigade; brigadier general
- général de division*: rank in the French army usually accorded to the senior officer commanding a division; major general
- glacis: slope leading up to a fortification
- Graf: Title used in German-speaking territories, roughly equivalent to *Count*
- Grapeshot: type of artillery ammunition, only effective at short range, consisting of a cloth bag filled with musket balls which spread on leaving the barrel
- grand battery: tactical amalgamation of several artillery batteries in order to produce a massive concentration of fire
- Grande Armée: From 1805, the main body of the French army and any allied forces serving under Napoleon’s personal command
- grenadier: elite infantry, no longer armed with hand grenades, often used to spearhead an attack; they could operate as entire units or form a single company of a battalion
- Grenzer*: troops serving on the Austrian frontiers with the Ottoman Empire
- guard: term accorded to elite troops, usually regarded as the best in the army; in both French and German, spelled “Garde”
- guerrilla: irregular fighter
- guidon: cavalry standard
- gun: an artillery piece (cannon); not to be confused with small arms, which were known by type, that is, musket, fusil, rifle, pistol, etc.
- handspike: metal lever used to manhandle a cannon into a desired position
- haversack: bag carried by an infantryman containing food and personal effects, usually worn slung on the hip, as opposed to a knapsack
- hornwork: part of a fortification comprising the front of a bastion and two side extensions

- horse artillery: light caliber guns drawn by horse teams whose crew either rode on the limbers or on horseback, thus giving them greater speed over the foot artillery
- howitzer: short-barrelled cannon used to lob shells using a high trajectory
- Hundred Days, The: term used to describe the period of Napoleon's short reign between March and June 1815
- hussar: type of elaborately costumed light cavalry; originally Hungarian
- Imperial Guard: elite formation of the French and Russian armies, in the case of the former divided into the Young, Middle, and Old Guard. This formed Napoleon's tactical reserve and was seldom committed to battle until the campaign of 1813
- invest: in siege warfare, to surround a town or city in preparation for the establishment of formal siege works
- Insurrection: militia from Hungary and Croatia
- Jäger/jäger*: literally, huntsman, in German; rifleman or other type of light infantryman, usually from a German-speaking area
- Junker*: East Prussian aristocracy
- Kalmuk: type of light cavalry from Asiatic Russia
- knapsack: pack worn by infantry on the back
- Korps*: Austrian army corps
- Krümper*: Prussian reservist serving between 1808 and 1812
- lancer: light cavalryman armed with a lance
- Landwehr*: militia or newly-recruited infantry unit, from German-speaking states
- légère*: light, indicating types of infantry or cavalry
- legion/*légion*: a military formation usually consisting of a combination of infantry, cavalry and artillery, often of foreign troops forming part of another army
- levée en masse*: universal male conscription introduced by the French during a period of national emergency in 1793
- light dragoon: type of light cavalry
- ligne*: line; standard form of (usually) infantry meant to fight in the battle line
- light infantry: equipped like line infantry, but employed in a more mobile capacity on the battlefield, especially by operating in open, or skirmish, order
- limber: two-wheeled carriage with ammunition box which connects a team of horses to a cannon to facilitate movement
- limber up: to attach a cannon to a limber in order to move the former
- line: in French, *ligne*; for example, standard form of (usually) infantry meant to fight in the battle line
- "line infantry" or "infantry of the line" (*infanterie de la ligne*)
- line of communication: route behind an army, either by road or river or both, by which supplies, reinforcements, and couriered messages traveled
- line of march: general route taken by an army on the march
- line operations: as with line of march, but normally applied to enemy territory
- line of retreat: general route of withdrawal taken by a (usually defeated) army
- loophole: opening made in a wall to enable the defenders to fire through with small arms
- lunette: triangular fortification atop a glacis or beside a ravelin
- magazine: place of storage for ammunition
- Mameluke: from the Turkish *mamluk* (slave), a type of Egyptian horseman, variously and elaborately armed, though also referring to those serving in the French Imperial Guard
- marines: troops specifically trained to fight at sea
- marshal: highest rank in the French Army from May 1804
- militia: forces raised for home defense
- National Guard: troops raised in France (*Garde Nationale*) for home defense
- Oberst*: colonel
- opolchenye*: untrained Russian militia
- Ordenança*: Portuguese militia
- outpost: infantry or cavalry occupying an advanced position to facilitate observation of the enemy or early warning of its approach
- palisade: sharpened wooden stakes used mainly for defense against cavalry
- parallel: large trench dug during siege operations which runs parallel to the enemy fortification; manned by troops and supplies in anticipation of the assault
- parapet: stone wall or bank of earth offering protection to troops occupying a fortified position
- partisans: guerrillas; irregular troops
- piece: a cannon, regardless of caliber
- picket/*picquet*: sentry or a small outpost
- pioneer: regimental carpenter or other skilled craftsman
- pontoon: boats specifically designed to be laid adjacent to one another to form a bridge
- pontonier: engineer trained to build pontoons or temporary bridges
- quarters: soldiers' accommodation, whether barracks or civilian lodgings
- rampart: wall of earth or stone comprising the main part of a fortress
- ravelin: detached, triangular-shaped fortification positioned in front of a fortress wall

- redoubt: field fortification, usually dug just prior to battle, armed with infantry and often artillery
- representative on mission/*représentant en mission*: deputy of the Convention or other Revolutionary government official, armed with sweeping powers, sent on specific missions to various regions or armies; political commissars
- rifle: infantry firearm with a grooved or “rifled” bore, thus providing spin—and therefore greater accuracy—than its smooth-bore counterpart, the ordinary musket
- round shot: the most common form of artillery ammunition, consisting of a solid cast-iron sphere, now commonly referred to as a “cannonball”; the weight of the ball varied according to the caliber of the gun from which it was fired
- saber/sabre: cavalry sword with a curved blade, generally used by light cavalry and general officers
- sap: narrow siege trench
- sapper/*sapeur*: combat engineer; often used to construct or demolish field fortifications, and to dig saps during siege operations
- sans-culottes*: extremist revolutionaries in France, generally associated with Paris
- Schützen: German riflemen
- shako: cylindrical military headdress, usually of leather, with a peak and usually a chin-strap
- shell: explosive projectile
- shot: abbreviation for round shot, the most common form of artillery ammunition
- shrapnel: type of artillery ammunition, unique to the British Army, consisting of a hollow sphere packed with musket balls and powder, which when detonated in the air by a fuse showered its target with its contents
- skirmisher: soldier operating in open or extended order to snipe at the enemy individually or as part of a screen to mask friendly troops
- spiking: the means by which a cannon can be made inoperable by the hammering of a spike down the touchhole
- squadron: subdivision of a cavalry regiment, usually consisting of two companies or troops
- square: infantry formation assumed as a defense against cavalry
- standard: cavalry flag, usually rectangular in shape
- sutler: camp-follower who sells food and drink to soldiers, either on the march or in camp
- tirailleur*: skirmisher or light infantryman, usually French and serving together as a unit rather than in the light company of a line regiment
- train: transport service of an army, responsible for conveying supplies, artillery, bridging equipment, and all the other paraphernalia of war
- Tricolor: French national flag, adopted during the Revolution, consisting of blue, white and red bands
- troop: unit of cavalry smaller than a squadron, usually the equivalent of an infantry company
- uhlan*: Polish for *lancer*, usually applied to those serving in German-speaking states or in the Russian Army
- vedette*: cavalry sentry or scout
- vivandière*: female sutleress who accompanies an army on campaign and provides food and sundry services, such as cooking and clothes washing, for a fee
- voltigeur*: from the French for “vaulter,” a light infantryman usually serving in the light company of a line regiment, usually deployed in extended order to form a skirmisher screen ahead of infantry or cavalry
- winter quarters: the quarters occupied by an army during that season, when fighting usually entered a period of hiatus until spring

# Glossary of Naval Terms

- aloft: up in the masts or rigging  
*amiral*: admiral in the French Navy  
astern: behind the vessel  
boarding: coming aboard an enemy vessel by force  
bow: the forward (front-most) part of a vessel  
brig: a lightly-armed (ca. 14 guns), maneuverable, square-rigged, two-masted vessel, smaller than a sloop  
broadside: the simultaneous firing of all the guns positioned on one side of the ship  
canister shot: a type of ammunition consisting of a cylindrical tin case packed with many iron balls which when fired from a cannon at short range spread out to kill and maim enemy personnel  
carronade: a short-barrelled, heavy calibre gun used only at close range for devastating results against the enemy's hull and crew; only the Royal Navy carried such weapons, which were not counted in the rating of vessel  
chain shot: a type of ammunition comprising two iron spheres or half-spheres, connected by a short length of chain, mainly used to damage rigging and sails  
*contre-amiral*: rear admiral in the French Navy  
double: to attack an enemy vessel from both sides simultaneously  
fireship: vessel packed with combustibles, steered into the enemy, and set on fire  
flagship: the ship of the officer commanding a squadron or fleet, usually a vice- or rear-admiral, and flying his flag  
fleet: a force of more than ten warships  
flotilla: a force of small vessels, sometimes troop ships and gun boats  
frigate: a single-decked warship mounting between 24 and 44 guns  
grapeshot: a type of ammunition consisting of a canvas bag filled with small iron balls which when fired from a cannon spread out to kill and maim enemy personnel  
grog: drink made from a mixture of rum and water  
gun: a cannon; these fired round shot weighing between 12 and 36 lbs; small arms, technically speaking, were not "guns," but referred to by their specific type, for example, musket, pistol, etc.  
line ahead: formation by which all vessels follow one another in a line, bow to stern; the standard formation for attack  
line of battle: the positioning of warships in a line with their broadsides facing an enemy against whom they intend to engage in battle  
line of battle ship: ship of the line; vessels carrying at least 64 guns and thus large enough to sail in the line of battle, as opposed to frigates and other, smaller vessels  
magazine: place of storage for ammunition  
marines: troops specifically trained to fight at sea  
port: the lefthand side of a ship when looking toward the bow; opposite of "*starboard*"  
prize: a captured enemy vessel  
rake: to fire at an enemy ship's bow or stern when it is at right angle to one's own vessel, so enabling the shot to travel down the length of the enemy ship  
ship: in distinction from a boat, a square-rigged vessel with three masts  
ship of the line: warship carrying a minimum of 64 guns that by virtue of its size and armament could fight in a line of battle; the standard type was the 74  
sloop: a single-decked warship slightly smaller than a sixth-rate (frigate) but larger than a brig  
starboard: the right-hand side of a vessel as one looks forward; opposite of "*port*"  
stern: the rear-most part of the hull, usually ornamented and especially vulnerable to enemy fire  
strike (one's colors): to haul down the national flag to indicate a desire to surrender  
tack: to change course by turning the bow through the wind  
*vice-amiral*: vice admiral in the French Navy  
wear: to change a ship's course by turning her stern to windward; opposite of tacking

# G

## **Gaeta, Sieges of (1799, 1806, 1815)**

Gaeta during the period of the French Revolutionary and Napoleonic Wars was a small port 50 miles to the north of Naples. It possessed very strong fortifications and was besieged on three occasions. In 1799 Gaeta was taken by a force led by General Louis Emmanuel Rey when a French army invaded the Kingdom of Naples and established the Parthenopean Republic. The fortress was handed back to Ferdinand IV later that year. In 1806 Gaeta was blockaded by a French army under the command of Marshal André Masséna. It took a couple of months for Masséna to assemble enough artillery to be able to begin the bombardment of the fortress. A combination of support from the Royal Navy and vigorous sorties from the garrison meant that Masséna was not able to complete his preparations until July. However, after a short bombardment, the garrison surrendered. The third siege of Gaeta took place after the defeat of the former French marshal Joachim Murat in 1815 at Tolentino, when the garrison commanded by General Alessandro Begani continued to hold the city in Murat's name. Gaeta was besieged by Austrian troops with the help of the Royal Navy from late May. The garrison put up a spirited defense until early August, when Begani surrendered.

In 1799 the Kingdom of Naples declared war on the Roman Republic, a French satellite, and French troops withdrew north after preliminary Neapolitan attacks on the outskirts of Rome. Although the capital was occupied for a short time, the Neapolitan army fell back. French forces then invaded the Kingdom of Naples in three columns, the third column, under Rey, having orders to take Gaeta. On arriving before the city Rey called on the garrison, 4,000 troops under Baron Charles de Tschoudy, to surrender. Despite being well supplied, Tschoudy chose to surrender the fortress intact. Gaeta was handed back to the Bourbon dynasty later in the year.

In 1806 Joseph Bonaparte became King of Naples and sought to impose his authority over his new territories. In

February a small force of French troops therefore called on the garrison to surrender, though this call was rejected. By March General Jacques-Nicolas Lacour had assumed command over operations against Gaeta, though he was only able to deploy ten guns in the siege lines, compared to the eighty that the garrison possessed. The garrison itself was composed of approximately 6,000 troops under the command of the Prince of Hesse-Philipstadt. The prince conducted a series of sorties against the French, which damaged the siege lines and inflicted serious losses on the sappers. Hesse also regaled the French using a bullhorn. The French continued with the siege, and in June Lacour was replaced by General Jacques David Martin Campredon, who established more artillery positions until he too was replaced by Masséna. Masséna was anxious to end the siege quickly, for he believed that the 8,000 French troops in the siege lines could be better employed elsewhere.

On 28 June the French began a heavy bombardment of the walls, with mortars shelling the interior of the fortress. On 3 July, however, the garrison was reinforced by naval guns and troops brought and landed by the Royal Navy. The fire from the newly arrived artillery was particularly effective in silencing a number of French pieces. On 10 July Hesse was wounded and was replaced by Colonel Johan Conrad Hotz. Hotz lacked Hesse's resolve, and Masséna, realizing this, increased the volume of fire directed against the breaches. Masséna had also heard of the French defeat at Maida and knew that he must quickly bring the siege to a successful conclusion. On 18 July Masséna formed up storming parties in front of the breaches. Hotz, seeing the French massing against him, agreed to surrender. The French had lost around 1,500 men, but, crucially, the siege had denied the French the opportunity to invade Sicily with the troops otherwise occupied outside Gaeta.

The last siege of Gaeta took place in 1815. After former French marshal Joachim Murat had surrendered his Neapolitan army to the Austrians on 22 May, Begani resolved to hold Gaeta in Murat's name. On the twenty-eighth

Austrian forces under the command of General Matthias von Rebrovich arrived to blockade the city. They were supported by the Royal Navy, which maintained a continuous bombardment on the defenses. Many of Begani's men began to desert, and he was forced to disarm mutinous officers. On 8 June Begani mounted a sortie on the siege lines, destroying a number of trenches and damaging some of the guns. For the next two days the garrison withstood a heavy bombardment, and Begani rejected the continual demands to surrender. By 2 July the Austrians had been reinforced by Neapolitan troops now loyal to the restored Bourbon monarch, King Ferdinand IV (who now styled himself Ferdinand I). By 8 July news of the catastrophic French defeat at Waterloo had reached Begani, but he still refused to surrender. On 16 July a combined Anglo-Neapolitan naval force of sixty-one gunboats bombarded Gaeta, using heavy-caliber shot and Congreve rockets. Begani defiantly continued to issue counterbattery fire, destroying two guns and killing a number of Austrian gunners. On the thirtieth Begani raised a huge flag bearing Murat's emblem, though he was aware that further resistance was futile, not least after a heavy bombardment on 5 August. Three days later Begani surrendered and on the following day marched out with the 800 remaining troops of the garrison. Murat's Neapolitan kingdom was no more.

### **Gamonal, Battle of (10 November 1808)**

The Battle of Gamonal was one of the few actions at which Napoleon was personally present during the Peninsular War. Following the Battle of Bailén, the Emperor was determined to take revenge for what had occurred, and he poured large numbers of reinforcements across the Pyrenees. Joining the bulk of the existing army of occupation in a strong position behind the river Ebro in the province of Navarre, by late October 1808 these troops made up a mass of some 110,000 men. On 5 November, meanwhile, Napoleon, who had resolved to come to the Peninsula himself, reached French headquarters at Vitoria. Four days later 67,000 men were heading for Burgos under the Emperor himself, while other columns pressed deep into the Basque

provinces and Aragón. The Spanish, assembled in four different armies, were spread out in a great horseshoe around the perimeter of the French forces and were helpless in the face of this attack.

Facing Napoleon himself there stood only the first two divisions of the Army of Extremadura (Extremadura) under the Conde de Belveder, a young officer who appears to have owed his command chiefly to family connections. Consisting of no more than 9,000 men, this force had no chance. Deploying to meet the French in a thin line between the village of Villimar and the river Arlanzón, early in the morning of 10 November it was struck by the infantry division of General Georges Mouton and the cavalry division of General Antoine Lasalle. Covered by an extensive area of pine woods that masked the Spanish center, Mouton's forces broke through almost immediately and captured the bulk of the Spanish artillery. Lasalle's cavalry overwhelmed two regiments of hussars that tried to oppose it under General Juan Henestrosa and then rolled up the defenders' right wing. Faced by complete catastrophe, Belveder's army then fell to pieces, the only unit that put up much of a fight being a single battalion of the Walloon Guards, which held out in square for some time and lost 226 of its 300 men. (In fairness to Belveder, it should be noted that he repeatedly tried to rally other regiments, but none would stand for him.) In all, Spanish casualties came to 3,000, while many other men disappeared into the countryside and never returned to the ranks. The French losses amounted to 50 dead and 150 wounded, and the way was now clear for them to march on Madrid and roll up the Army of Extremadura's neighbors on its right and left.

### **Ganteaume, Honoré Joseph Antoine, comte de (1755–1818)**

Honoré Joseph Antoine Ganteaume was born in La Ciotat, Bouches-du-Rhône, on 13 April 1755 into a naval family and began his life at sea in 1769 helping his father's business. In 1778 Pierre-Augustin Caron de Beaumarchais, a peculiar character of many guises—businessman, spy, dramatist, and arms dealer—was with French government connivance secretly engaged in procuring weapons for the American rebels through a bogus company he had estab-

lished for the purpose. In order to escort vessels carrying weapons and supplies across the Atlantic, Beaumarchais recruited Ganteaume as an auxiliary officer on board the armed vessel *Fier Roderigue*.

When the *Fier* was commandeered by Admiral Charles Hector, comte d'Estaing, Ganteaume, under the command of Admiral Jean-Guillaume-Toussaint de la Motte-Picquet, participated in convoy escort duty and was present at the Battle of Grenada (6 July 1779), during which his captain was killed. His ship then participated in the expedition to Savannah, Georgia, prior to his return to France. As a result of his outstanding conduct, Ganteaume was given command of a frigate for the duration of the campaign. Thereafter he was placed in charge of the store ship *Marlborough*, a prize ship attached to Admiral Pierre de Suffren's squadron from April 1781 to October 1782. Suffren then assigned him to the frigate *Surveillante*. On his return to France, and as a reward for his good service, Ganteaume was promoted to the rank of junior lieutenant. Between 1786 and 1793 he was not employed in the navy.

During the Revolution the government appointed Ganteaume a lieutenant on 1 September 1793. Then, owing to the shortage of naval officers, he was promoted to captain on 27 February 1794. While in command of the ship *Le trente-et-un mai*, he gained renown in the Battle of the Glorious First of June in 1794, in the course of which he was wounded three times. The vital wheat convoy from America, escorted by Admiral Pierre Jean Vanstabel and present with the fleet on that day, arrived safely at Brest, and thus the Republic was saved from famine. Ganteaume next participated in the fight off Hyères in 1795 and later, at the head of a small force, captured several British vessels in the Aegean Sea. In 1796 he successfully escorted a large convoy to Brest. He became a rear admiral on 7 November 1798, then chief of staff to Admiral François Brueys during the expedition to Egypt, where he escaped during the disastrous French defeat at the Battle of the Nile in which Brueys was killed. After being placed in charge of what remained of the fleet after the battle, Ganteaume assisted the land forces in the sieges of Jaffa and Acre on the coast of Syria. While aboard the frigate *Muiron* he commanded the detachment of ships that brought Bonaparte back to France in October 1799. He served as a senior member of the Council of State in 1800, during which time he cruised the Mediterranean for ten months, unable, however, to re-supply the expedition in Egypt, which had been stranded there after Commodore Sir Horatio Nelson's victory.

Loyal to Bonaparte, Ganteaume commanded the Mediterranean squadron from 1800 to 1802, when he was made naval prefect of Toulon in 1802. Promoted to vice admiral on 30 May 1804, he was placed in command of the Brest fleet. Unable to break the British blockade, he failed

to join Admiral Pierre de Villeneuve as part of Napoleon's grand plan to unite several squadrons to seize control of the Channel and move his army from Boulogne to the coast of southern England. From 1808 to 1810 Ganteaume commanded the Mediterranean fleet. In 1810 Napoleon granted him the title of Count of the Empire, and on 1 August 1811 he was made the colonel commanding the battalion of Marines of the Guard.

During the Restoration, Ganteaume transferred his allegiance to Louis XVIII, who made him a peer of France in 1815 and then *inspecteur général des classes*. He voted for the death penalty for Marshal Michel Ney at the conclusion of that officer's trial. Ganteaume died in 1818. He was a good seaman, but he lacked decisiveness.

## Garay y Perales, Martín de (1771–1822)

An Aragonese nobleman and official of the Ministry of Finance, in 1808 Martín de Garay was intendant of the province of Extremadura (Estremadura). Appointed to the junta of that province following the Spanish uprising of 1808, he was chosen as one of its representatives to the Junta Suprema Central. When the new government met at Aranjuez, Garay was immediately elected to be its secretary general. Being a man of great ability, moreover, Garay quickly came to dominate the junta's proceedings, all the more so because the Conde de Floridablanca's successor as its president, the Marqués de Astorga, was a nonentity ridiculed as the "little king." For most of the period from September 1808 to January 1810, then, Garay was the mainstay of Spanish resistance to Napoleon. In that capacity he showed great vision and courage, and his efforts to ensure continued British support and to pave the way for a new national assembly are particularly noteworthy.

Following the fall of the Junta Central in 1810, he remained in Cádiz and in 1812 became a member of the Council of State. In 1814 King Ferdinand VII, in recognition of his services to the royal administration prior to 1808, exonerated him of the charges of collaboration with the liberals that might have been laid against him

and appointed him director of the Canal Imperial in Aragón, and at the end of 1816 he became minister of finance. In this capacity he struggled for the next two years to introduce a new system of taxation modeled on that brought in by the Cortes of Cádiz in an attempt to solve the monarchy's increasingly desperate financial problems, but his measures alarmed the ever-cautious Ferdinand, and in September 1818 he was summarily dismissed. Rallying, in consequence, to the Revolution of 1820, he again became a member of the Council of State, only to fall sick and die at the end of 1822.

### **García de la Cuesta, Gregorio (1740–1812)**

A tough and vigorous soldier from Santander, Gregorio García de la Cuesta first came to prominence in 1795 when forces under his control drove the French from the border district of Puigcerda. Thereafter, however, he fell out with the royal favorite, Manuel de Godoy, and in 1800 he was dismissed from his post as president of the Council of Castile (the most important of the various councils of administration that had traditionally overseen the governance of Spain) and banished to his home province. Rehabilitated by King Ferdinand VII when he came to the throne in March 1808, Cuesta was then appointed captain general of Old Castile. However, Ferdinand's favor did not mean that Cuesta instantly rallied to the uprising. On the contrary, when his capital of Valladolid rose in revolt, Cuesta opposed the insurrection on the grounds that, first, it was politically illegitimate and, second, it was militarily futile. In the end, however, he surrendered (though tradition has it that only the threat of death sufficed to get him to do so), while he went on to display considerable energy and devotion.

Quickly driven from Valladolid after a disastrous action at Cabezón in which his efforts were ruined by the indiscipline of the mob, within a few weeks he built up an army of 9,000 men in León with the aid of a few regular cavalry who had fled to his headquarters (in 1808 Old Castile had been almost devoid of troops). At the same time, through sheer force of personality he succeeded in imposing his authority over the juntas that had emerged in such towns as León, Salamanca, and Zamora. Despite the

arrival of part of General Joaquín Blake's Army of Galicia, however, most of Old Castile was lost as a result of the Battle of Medina de Río Seco. A severe defeat for the Spanish, this loss has often been attributed to Cuesta's incompetence, but it was, rather, the result of general confusion and clever maneuvering on the part of the French.

Yet Cuesta cannot be said to have acted at all wisely in the aftermath of the battle. In the first place he fiercely resisted suggestions that he should unite his forces with those of Blake, despite the fact that it was quite clear that his army was just too weak to stand alone against the French. And in addition, a serious quarrel broke out between Cuesta and the Junta of León, the upshot of which was that Cuesta ended up arresting the representatives that the junta dispatched to the new provisional government known as the Junta Central, which was in the process of formation at Aranjuez. According to Cuesta, indeed, this body was not legitimate at all, responsibility for the governance of Spain having fallen to the Council of Castile.

In the atmosphere of 1808, however, such a stance was unrealistic. Denounced by several of his fellow generals, Cuesta was summoned to Aranjuez and was left with no option but to surrender his command. Still at Aranjuez when the French forced the Junta Central to flee in December 1808, Cuesta made his way to Badajoz, where the frightened local authorities asked him to take charge of the remnants of the Army of Extremadura. The Junta Central had no choice but to accept this decision, and Cuesta was soon back in action. Conscious of the fact that he had many political enemies in Seville, he sought to consolidate his position through gaining a military victory, only to suffer a major reverse at Medellín.

Again, however, his generalship was by no means so insensate as has often been claimed, while he showed considerable personal courage and narrowly escaped death when he was ridden down by some fleeing cavalry. Once his army had been reconstituted, there followed the infamous campaign of Talavera, for which Cuesta again did not deserve the opprobrium heaped on him by British sources: The actual battle saw the Spanish general do all that Lieutenant General Sir Arthur Wellesley (later the Duke of Wellington) asked of him. By this time, however, age and infirmity were taking their toll, and on 12 August 1809 Cuesta suffered a serious stroke. Eventually he recovered sufficiently to accept a position as captain general of Mallorca (Majorca), but in 1812 he suffered a second stroke and died.

**Gay-Lussac, Joseph-Louis (1778–1850)**

Joseph-Louis Gay-Lussac was among the young men who took advantage of the social mobility of Revolutionary and Napoleonic France to build a scientific career. From a legal family that suffered in the Revolution, Gay-Lussac entered the Ecole Polytechnique in 1797 and the Ecole des Ponts et Chaussées in 1800. The same year Gay-Lussac, already planning a scientific career, met the chemist Claude-Louis Berthollet, who adopted him as a lab assistant and protégé. Working from Berthollet's home at Arcueil, Gay-Lussac almost immediately made an important discovery: that all gases expand by the same proportion for an equivalent rise in temperature, given constant pressure. This discovery is now referred to as Charles's Law, after Jacques-Alexandre-César Charles, whose previous work had been much sketchier and unpublished. Gay-Lussac's approach to chemistry was deeply influenced by the mathematical culture of French Newtonian physics, and unlike many of his contemporaries, he defined the chemist's primary task as the establishment of mathematically expressed laws. Gay-Lussac also made the highest balloon ascensions to date on 24 August and 16 September 1804 to measure the atmosphere at high altitudes. These ascensions are considered to mark the beginning of scientific ballooning.

In 1806 Gay-Lussac was elected to the First Class of the Institute of France. He was also a member of the exclusive scientific body the Society of Arcueil and was appointed teacher of physics at the Faculty of Science in the newly established University of France in 1808. In 1809 he justified the institute's faith in him by announcing another law, Gay-Lussac's Law of combining volumes of gases. This law states that gases that combine chemically always do so in simple ratios. Gay-Lussac viewed the key measurement in the chemical combination of gases to be the volume, rather than the weight, of the gases. Gay-Lussac's position at the center of Parisian chemistry was further enhanced in 1810, when he received the chair of chemistry at the Ecole Polytechnique.

From 1807 to 1815 Gay-Lussac's great rival in European chemistry was the Englishman Humphry Davy. The two were often working on similar projects, and accusations of poaching occasionally flew back and forth across the Channel. (The situation was exacerbated by the poor communications between the two warring countries.)

Gay-Lussac had the advantage of working in Paris, Europe's scientific capital, but he lacked Davy's intellectual daring. Although Gay-Lussac hinted at the elemental nature of chlorine, then known as oxymuriatic acid, it was Davy who boldly proclaimed it and gave the new element its name. On the other hand, while Davy and Gay-Lussac quarreled over priority in the description of iodine, it was Gay-Lussac's exhaustive memoir on the subject in 1814 that laid the basis for the subsequent development of chemical studies of the element.

Never as identified with the Napoleonic regime as were the older leaders of Arcueil—Berthollet, Jean Antoine Chaptal, and Pierre-Simon Laplace—Gay-Lussac adjusted easily to the Restoration, succeeding Berthollet as France's leading chemist.

**Geisberg, Battle of the (26 December 1793)**

The Battle of the Geisberg, fought in mountainous terrain, ended the First Coalition's 1793 invasion of France across the Rhine. The French victory convinced the Austrians to retreat into Germany, forcing the Prussians to quickly follow them. The battle also firmly established General Lazare Hoche as one of the rising commanders among the republicans, who stressed the élan of his men as a key element of victory.

By November 1793 Austrian forces under *Feldmarschalleutnant* Dagobert Graf Würmser and the Prussians under the Duke of Brunswick planned to go into winter quarters. The opposing French armies of the Rhine and of the Moselle, under General Jean-Charles Pichegru and Hoche, respectively, opened an offensive against them, hoping to relieve the fortress of Landau. While Pichegru engaged the Austrians to the south, Hoche tried unsuccessfully to drive the Prussians from Kaiserslautern on 28–30 November. Undiscouraged by his failure, Hoche reorganized the Army of the Moselle. Using diversionary frontal attacks to mask a turning column, Hoche defeated Brunswick on 22 December at Froschwiller (Froeschwiller). The Prussians retreated toward the Rhine.

The Prussian retreat forced Würmser to fall back as well. He assumed a new position around Weissenburg, whose key was the Geisberg heights. Owing to Hoche's success, the representatives on mission with the armies (who

served as a kind of political commissar), promoted him to commander in chief over both armies on 24 December. His rival Pichegru was furious but unable to prevent the change.

Hoche was determined to push the Austrians out of Weissenburg. The knowledge that unsuccessful commanders ended up on the guillotine gave extra urgency to his decision. He massed approximately 35,000 men in five divisions and launched an attack on 38,000 troops under Würmser on 26 December. The French right, under General Louis-Charles Desaix, helped hold Austrian reserves in place, but the main effort took place in the mountains around Weissenburg. The French assault caught a 4,000-man Austrian detachment making a reconnaissance in force at the Geisberg River. They were swiftly overwhelmed and thrown back on the Austrian main body. When the Austrians rallied around the fieldworks on the Geisberg heights, Hoche responded by ordering a bayonet charge. His men, driven by their early successes, overwhelmed the three battalions on the Geisberg and pierced the Austrian line.

Abandoning many cannon and baggage, Würmser ordered a general retreat. Despite Brunswick's best efforts, Würmser was determined to recross the Rhine. He did so at Philippsburg on 30 December and took up winter quarters in the Palatinate. Brunswick realized Prussian forces could not remain in Alsace without support. He ordered a general retreat and crossed the Rhine at Mainz on the same day. A small Prussian force remained at Fort Vauban and were the only Allied troops on French soil at the beginning of 1794.

## Genoa, Siege of (April–June 1800)

The defense of the last French stronghold in Italy beginning in late April 1800 played a key role in pinning down substantial Austrian forces while Bonaparte, the First Consul, crossed the Alps with his army. Despite his promises to relieve the siege, Bonaparte abandoned the defenders

under General André Masséna, who surrendered in early June after enduring considerable hardship.

With promises of resupply, Bonaparte persuaded Masséna to take command of French forces on the Mediterranean coast in early February. On 6 April, the Austrian commander *Feldmarschalleutnant* Michael Freiherr von Melas swept south, cut the French left wing under General Louis Suchet off from Masséna, and closed the ring around the walled city on 19 April. Left with 9,600 fit troops, the French attempted forays to obtain food, but they were usually frustrated by the Austrians and their local supporters. On 24 April the Allies demanded Masséna's surrender. He responded that he "would rather be buried under the ruins of Genoa than surrender" (Masséna 1966–1967, 3–4: appendix). Three days later, Melas left *Feldmarschalleutnant* Peter Freiherr Ott von Bar-tokez with 24,000 troops, but without heavy siege guns he could only maintain a blockade to starve the French out. The British mounted a steady naval bombardment.

The city was able to eke out meager food supplies for a month, and some local merchant ships ran the blockade to deliver highly priced corn. Bread was being sold to local inhabitants, but this was stopped on 20 May when the Austrians cut the aqueduct, which supplied waterpower for the flour mills. The military ration was reduced to 153 grams of bread—made from flour, sawdust, starch, hair powder, oatmeal, linseed, rancid nuts, and cocoa—and an equal quantity of horseflesh. However, wine was plentiful, so each man received a daily liter. Once the horses had been eaten, the city's cats, dogs, and rats were consumed. Townspeople resorted to boiled leaves and grass, seasoned with salt, before being reduced to boiling old bones, leather, and other skins. Each day, up to 400 emaciated bodies were dumped in an open grave. The civilian population of 120,000 was reduced by more than 30,000. Austrian prisoners aboard the prison hulks received a quarter ration. They resorted to eating their shoes and leather equipment before starting on canvas sails.

On 14 May Masséna mounted one final attempt to break the blockade through Monte Creto, but he was defeated and General Nicolas Soult was captured. That night, a naval bombardment conducted by gunboats spread disorder through the population until calm was restored at dawn, when Masséna ordered any group of larger than four to be shot. A British raid on 21 May was followed by popular insurrection. On 31 May rations ran out and desertions started. Seeing no sign of relief, Masséna offered to surrender on 1 June. His parley coincided with Melas's order to Ott to lift the blockade and march north, but the Austrians delayed his departure until 4 June, when the surrender was signed and they took possession of the city.

### Gentz, Friedrich von (1764–1832)

Political thinker and publicist. Born a Prussian, Friedrich von Gentz's nationalist ideas, expressed in fluid prose, found favor in Austria. There he supported the war party, and later the Austrian foreign minister, Klemens Fürst Metternich, with various publications.

Born into a family of officials in Breslau (now Wrocław, Poland), Gentz studied law at Königsberg (where the philosopher Immanuel Kant taught) and developed his literary abilities. In Berlin, he worked for Minister Friedrich Graf von der Schulenberg-Kehnert and received his title as a royal secretary. Initially an enthusiastic supporter of the French Revolution, his first public essay, "On the Origins and Main Principles of Justice," appeared in 1791. His views were changed when he translated Edmund Burke's "Observations on the French Revolution" in 1792, while his own work was translated into English. Now a noted antirevolutionary, he joined the Prussian military General Directorate in 1793. He continued to translate French émigré pamphlets and was introduced to Friedrich von Schiller's ideas of a single German people. Gentz established *Die neue deutsche Monatschrift* (the New German Monthly) to publish essays with an atheistic-political emphasis, but by 1795 he had abandoned it to focus on opposing the French Revolution. When Frederick William III became king in November 1797, he naively directed a *Sendschrift* (open letter) to the new bureaucratic monarch, who disliked intellectuals. In 1799 he established *Das historische Journal*, which was pro-British, a stance that brought him further conflict with the censor's office.

Despite British financial support, he looked increasingly to Austria. In October 1802 he moved to Vienna, where with Matthias Fassbender's support in his capacity as civilian adviser to Archduke Charles he was appointed a *Hofrat in ausordentliche Diensten* (imperial adviser without portfolio), following which he visited Britain to further Anglo-Germanic links. Back in Austria in 1803 with the sponsorship of joint foreign ministers Johann Ludwig Graf Cobenzl and Franz Graf von Colloredo, he published pam-

phlets supporting the war party's policies. Following the Battle of Austerlitz in 1805, he unsuccessfully attempted to aid Prussian policy to draw Austria into renewed war before joining the Prussian royal family at Naumburg in October 1806. Proscribed by Napoleon after the Battle of Jena, he fled to Prague until the Austrian foreign minister, Johann Philipp Graf Stadion-Warthausen summoned him to Vienna in 1808. In the following year, he composed the proclamation issued by Archduke Charles on 15 April, which called for Austria and the various states of Germany to unite against France in 1809.

In 1813 he published more works in support of Metternich, although the proclamation "An die deutschen Fürsten" (To the German Princes), which bears his name, was not his. During the Congress of Vienna, he worked tirelessly to promote his ideas and explained his political philosophy in "Verfechter der Restaurations-Tendenzen und Bekämpfer des Liberalismus" (Champion of the Tendency to Restoration and Opponent of Liberalism). Supported by the Vienna censor, he set up the *Wiener Jahrbuch* (Vienna Annual) in 1818 and advocated control of the press. A close associate of Metternich, he wrote many pamphlets in support of the chancellor's conservative policies against the European revolutions.

### George III, King (1738–1820)

King of Great Britain during the American Revolution, the French Revolutionary Wars, and the Napoleonic period, George III's prowar policy in 1803 following the Treaty of Amiens deprived Napoleon of the peace he sought to rebuild France. George was the first son of Frederick Louis,

Prince of Wales, and Princess Augusta of Saxe-Gotha and succeeded his grandfather George II in 1760 as the third Hanoverian monarch, his father having predeceased him in 1751. In 1761 he married a German princess, Charlotte of Mecklenburg-Strelitz, by whom he had fifteen children, nine sons and six daughters.

George III wished to increase the power and authority of the monarchy and attempted to weaken the cabinet and Parliament. Early in his reign he appointed several prime ministers: the Earl of Bute, George Grenville, the Marquis of Rockingham, the Earl of Chatham, the Duke of Grafton, and Lord North. George successfully oversaw the defeat of the French in the Seven Years' War (known as the French and Indian War in America) (1756–1763), adding Canada to his realms. His commitment to having the American colonists pay taxes to support British army garrisons in the thirteen colonies for their own protection led to the American Revolution (1775–1783) and to the Declaration of Independence in 1776. The king supported North's policies, which ultimately resulted in the loss of the American colonies. Many members of Parliament, including Charles James Fox and William Pitt the Elder, viewed the government's treatment of the colonies as unjust. North's government fell in March 1782 and was succeeded by governments formed by Rockingham, Lord Shelburne, and the Duke of Portland.

William Pitt the Younger became prime minister in 1783 following the peace and was aided by his cousin, Lord Grenville, as foreign secretary from 1791 to 1801. Britain went to war against France in 1793, joining the First Coalition which was determined to bring an end to the French Revolution and its threat to European monarchs. George oversaw British naval victories at Camperdown (1797), St. Vincent (1797), the Nile (1798), and Copenhagen (1801) and expeditions marked by mixed success to the West Indies, Egypt, and the Continent before finally agreeing to a treaty of peace concluded at Amiens in 1802. Pitt and Grenville had resigned in 1801 over the issue of Catholic emancipation, which the king violently opposed, and the new prime minister, Henry Addington, had overseen the conclusion of peace. But the king and Pitt, working behind the scenes, maneuvered to keep Malta, a vital strategic possession that was to have been evacuated under the terms of the treaty.

War between France and Britain resumed in 1803 over the issue of Malta after George's bellicose speech from the throne on 8 March, in which he recommended calling out the militia and adding 10,000 sailors to the navy. As before, the king continued to fear French power on the Continent and the spread of Revolutionary ideology. Since the Revolution began, he had also welcomed French émigrés to Britain and had supported their claims to property and the restoration of the Bourbons in France, though Pitt no

longer sought a return of royalist power as a requirement of peace with France. While George accused Napoleon of undertaking military preparations in French and Dutch ports, Napoleon claimed he had actively negotiated to preserve peace so as to provide an opportunity to rebuild his country. His naval preparations, he added, were to suppress the revolution in St. Domingue (now Haiti).

Britain regarded this as a ruse and declared war on 18 May 1803 in an effort to restore the balance of power on the Continent and thus preserve Britain's security from invasion. Addington left office a year into the war, to be replaced by Pitt, who would serve until his death in January 1806. Apart from a short period in office for the Whigs under Grenville (1806–1807), the Tories held power (under the Duke of Portland [1807–1809], Spencer Perceval [1809–1812], and Robert Banks Jenkinson, second Earl of Liverpool [1812–1822]) until the end of the Napoleonic Wars in 1815, with the king an unswerving supporter of his nation's war effort. A fit of madness, brought on by porphyria, rendered George unfit to serve as king, thus obliging ministers to appoint his son George as Prince Regent from 5 February 1811. George III died in 1820, succeeded by his son.

## Gérard, Maurice Etienne, comte (1773–1852)

Maurice Etienne Gérard was a distinguished French military commander who participated in many of the key battles of the Revolutionary and Napoleonic Wars.

The son of a royal huntsman, Gérard was born at Damvillers on 4 April 1773. At the age of eighteen he enlisted in the 2nd Battalion of the Meuse and saw extensive action during the Revolutionary Wars. In 1795 he was appointed to the staff of General Jean-Baptiste Bernadotte and acted as his aide-de-camp until 1806 when, having served gallantly in a number of important battles including Austerlitz, was promoted to *général de brigade*.

After a brief time spent fighting in Spain, Gérard was given command of the 3rd Division of Marshal Louis Davout's I Corps in time for Napoleon's Russian campaign. He once again proved his mettle at the Battle of Borodino (7 September 1812) and was promoted to *général de division*. Gérard was a tower of strength during the retreat from Moscow, and he continued to fight tenaciously throughout the campaign of 1813. For his efforts he was made a Count of the Empire.

Gérard grudgingly accepted the Bourbon restoration, but the return of Napoleon in 1815 rekindled his republican loyalties and once more he took up arms for the Emperor. He was given command of IV Corps during the Waterloo campaign and played an essential role in the defeat of the Prussians at the Battle of Ligny (16 June).

Though Ligny had been a French victory, much of the Prussian army had been able to withdraw. Following the battle, Gérard's IV Corps was placed under the command of Marshal Emmanuel, marquis de Grouchy, who was ordered to intercept and destroy the remaining Prussians before they could join the main Allied force under the Duke of Wellington. However, Grouchy proved inadequate to the task and eventually lost contact with the Prussians. Late on the morning of 18 June, Grouchy's senior officers heard the low rumble of artillery, which signaled the opening of the Battle of Waterloo. Gérard immediately urged his commander to march toward the sound of the guns in order to reinforce Napoleon in what was sure to be the decisive battle of the campaign. Grouchy promptly refused and insisted on engaging only the Prussian rear guard at Wavre. Not only did this decision deprive the Emperor of desperately needed reinforcements, but had Grouchy immediately followed Gérard's suggestion, they would have almost certainly intercepted the Prussian army before it was able to smash into Napoleon's right flank.

After Napoleon's second abdication, Gérard spent a short time in exile before returning to France in 1817. There he resumed his military career, becoming both minister of war and a marshal of France. Near the end of his life he was made a senator by Napoleon III. He died in Paris on 7 April 1852.

## German Liberation, War of

See Germany, Campaign in

## Germany, Campaign in (1813)

The campaign in Germany in 1813 was Napoleon's final struggle to maintain his dominance of Europe. The great Battle of Leipzig in October of that year was the largest military confrontation in history until then, and it was overshadowed only by the fearful slaughter of World War I a century later. Leipzig, also known as the Battle of the Nations, was the climax of the Napoleonic Wars, and it marked the end of Napoleon's attempts to retain control over central Europe. After the battle for Germany in 1813 came the battle for France in 1814 and Napoleon's first abdication.

The destruction of Napoleon's Grande Armée of 600,000 men in Russia in 1812, until then the largest army ever assembled, dramatically altered the balance of power in Europe. Instead of Napoleon bringing Russia into line, Europe now had the chance of bringing Napoleon to bay. The crossing of the Berezina River in November 1812 by the last miserable remnants of a once-proud army symbolized the end of Napoleon's Russian adventure. The signing of the Convention of Tauroggen with the Russians by the Prussian general Johann von Yorck marked the next phase of the struggle against Napoleon. This act of rebellion, in which the Prussian contingent in Napoleon's army was declared neutral, opened what later became known to Germans as the War of Liberation.

After the catastrophic defeat in 1806 and the French occupation of the territories left under Prussian rule, a growing group of patriotically minded people prepared for a war against France. Fearing Napoleon might use this unrest to justify a dismemberment of Prussia, the king, Frederick William III, discouraged such activities, leading to several disputes and the resignations of senior officials and army officers. The events of the winter of 1812–1813 gave these groups new encouragement and led to Prussia's declaration of war on France on 17 March 1813, after an alliance with Russia had been agreed on in the Convention of Kalisch a month earlier.

Adapted from Fremont-Barnes 2002B, 31.

Napoleon had not been idle. When it became clear to him that his army had been totally destroyed, he departed for Paris to secure his regime against any attempt to overthrow it, and with characteristic energy he set about raising a new army in the hope of reversing the setbacks of 1812. Although resources were being rapidly exhausted, all of Europe set about raising new forces for the forthcoming campaign, which was fought largely by raw levies and callow youths lacking many of the basics of training and equipment.

### The Spring Campaign

In the early months of 1813 the French forces remaining in Germany were under the command of Napoleon's stepson, Eugène de Beauharnais, the Viceroy of Italy. He attempted to keep hold of as much of Germany as possible, but rebellions in various parts of the north made his position difficult. Napoleon's original intention—for Beauharnais to hold both Warsaw and Posen and to relieve the garrison of Danzig—proved unattainable. Regular forces, both Prussians and Russians, took advantage of the situation, moving gradually toward the Elbe River. Beauharnais abandoned Berlin and fell back across the Elbe, maintaining a

bridgehead at Magdeburg. With Berlin now free, the Prussians accelerated their mobilization.

The Allies moved westward in three columns. The right, under the command of General Peter Graf zu Wittgenstein (a German in Russian service), consisted of Prussians (including the corps of Yorck and Friedrich von Bülow), Russians, and Swedes. It was to march on Magdeburg. The center column was led by Field Marshal Mikhail Kutuzov, the hero of the campaign of 1812. Not only was he reluctant to continue the war, since Napoleon had been driven out of Russia, but also he fell ill and died, which delayed the movements of his column. On the Allied left the Army of Silesia, consisting of Prussians and Russians, was under the command of General Gebhard von Blücher. He marched to Dresden in the hope of winning over the Saxons to the Allied cause, entering the city in March. However, the Saxons were reluctant to commit themselves, so Blücher continued to Leipzig, where he waited for Kutuzov.

A Russian free corps entered Hamburg to a jubilant welcome. The citizens of this great trading city had suffered particularly severely under the Continental System, Napoleon's embargo on trade with Britain. Eugène now

massed around Magdeburg, while Marshal Louis Davout was posted to Hamburg, which the French later reoccupied, ruling its rebellious residents with an iron fist.

Meanwhile, Eugène engaged Wittgenstein's advancing Prussians and Russians in and around Möckern, to the east of Magdeburg, fighting a battle on 5 April. The French were driven back, losing over 2,000 men, while the Allies lost only 500. Another Prusso-Russian army, under the command of Blücher, moved on Dresden, on the Elbe River in Saxony, forcing Eugène to abandon further territory. The Austrians maintained a position of neutrality and awaited further events. The Saxons also hesitated, although there were calls for war with Napoleon. His position in Germany was precarious, and all of Europe's eyes were focused on the events to come there.

When Napoleon returned to Germany at the end of April at the head of a new army, the balance tipped in his favor again. At first he had hoped to be in a position to carry the war back deep into central Europe, operating between the Elbe and Oder rivers, using the fortresses he still held there as bases. The events of the previous weeks now made that impossible. Instead, he decided to cross the Elbe in Saxony and press on to the Oder. By occupying substantial parts of Prussian territory, he would throw their mobilization into chaos.

Although outnumbered, the Allies sought a battle with Napoleon, hoping to beat him. A victory at this stage of the campaign would have restored Prussia as a great power and ensured Russia's expansion westward, leaving Austria on the sidelines. They chose the area around Leipzig for making this challenge, as the flat terrain would allow them to use their superiority in cavalry to its full.

Napoleon marched into Saxony, having taken full control of the theater of operations on reaching Erfurt on 25 April. He was operating largely without ears and eyes, as it had not been possible to replace enough of the vast numbers of cavalry he had lost in Russia. He no longer had an army of veterans, and he was not facing green troops. He blundered into a trap set by the Allies, who had placed their forces close to his line of movement. On 2 May the Allies, a Prusso-Russian army under the command of Wittgenstein, sprang a trap at Lützen (Grossgörschen), a village near Leipzig. This battlefield was only a short distance from Jena and Auerstädt, where Napoleon had won his great victories of 1806. Here, the Allies caught Marshal Michel Ney's corps in its camp, surprising the troops. They had the opportunity of dispatching Ney and dealing with each of Napoleon's corps piecemeal as they marched up the road from Weissenfels to Leipzig. However, as a result of poor staff work—the Allied staffs had yet to develop a sufficiently close collaboration—they missed this one opportunity of inflicting a crushing blow on Napoleon and

ending the campaign at this stage. The war in Germany would now continue for much of the rest of the year.

Lützen was a hard-fought battle and a very confused affair. Much of the fighting took place in and around four villages that formed a quadrangle in the center of the battlefield. The bloodbath here was horrific, and equally bitter fighting was to characterize the rest of the campaign. Caught off balance by this surprise attack, Napoleon soon regained his footing and turned the tables, bringing around 78,000 of his men into action. About 34,000 Prussians and 36,000 Russians fought here. The Allied attacks failed because of their lack of coordination and because of Ney's determined defense. This bought Napoleon time to bring up more men and use his advantage in numbers. The fighting continued into the night, leaving the French in control of the battlefield and the Allies beaten but not broken. The superior Allied cavalry prevented any sort of pursuit taking place. The French lost around 22,000 men killed and wounded; the Allies about 20,000.

General Gerhard von Scharnhorst, the leading Prussian military reformer, was wounded at Lützen, although not seriously. He was serving as Blücher's chief of staff. After the battle he was sent to Austria as an ambassador, hoping to persuade it to join the Allies. However, his wound became infected, and he died.

Napoleon followed up, but the hard marching was taking a toll on his youthful army. The Allies fell back eastward, toward Russia and reinforcements. Napoleon's line of communication, which ran through hostile territory, lengthened. The Austrians continued to hesitate. Napoleon put pressure on Frederick Augustus, the king of Saxony, to open his fortresses to Napoleon's army and to declare his continued membership in the Confederation of the Rhine. Frederick Augustus gave way and returned to Dresden from his refuge in Austrian-ruled Bohemia. Johann Adolph Frieheerr von Thielmann, the Saxon general commanding the vital fortified crossing of the Elbe at Torgau, resigned his post in protest and went over to the Allies. The situation in Germany remained fragile.

Napoleon now needed a decisive victory to bring Germany back into line and to ensure that Austria did not enter the war. The Allies needed at least to hold their own and show they had the mettle to defeat Napoleon. At best, a battlefield success would strengthen their position considerably. Napoleon's military objective remained to reach the line of the Oder River, to relieve the besieged garrison of the crossing at Glogau, to take both Berlin and Breslau (now Wrocław, Poland), the capital of Silesia, and to enable Davout to regain control of Hamburg and from there march into Pomerania.

The Allies decided to offer battle west of the Oder. They prepared a position in and around the town of

Bautzen, on the river Spree and close to the Bohemian border. Here they hoped to fight Napoleon to a standstill before enveloping his left flank, driving him against the mountains along the Bohemian border, and trapping him with Austrian territory to his rear.

The Battle of Bautzen was a two-day affair, fought on 20–21 May. Napoleon started the battle with 115,000 men against 66,000 Russians and 31,000 Prussians under Wittgenstein. Ney came up to support Napoleon with a further 84,000 men, although not all of them were committed to the battle. Napoleon's plan was to tie down the Allies with a frontal assault on the first day, while Ney enveloped their right flank on the second day. Napoleon hoped to deal a crushing blow and win the campaign.

After softening up the Allies with a heavy artillery bombardment, Napoleon crossed the Spree on the first day, forcing the Allies to commit many of their reserves to shore up their line. Ney's approach was known to the Allies, but they underestimated his strength. On the second day, Napoleon continued his assaults on the Allied line, hoping to distract their attention long enough for Ney to accomplish the planned envelopment. However, Napoleon did not communicate his intentions to Ney clearly enough, which led to delays and errors in the implementation of this maneuver. Blücher and General Friedrich von Kleist, on the Allied right, were able to fight their way out of the trap, and the day ended with the Allies withdrawing. Each side lost around 20,000 men. While Napoleon was the victor, he was far from achieving the decisive blow he had intended, and the Allies slipped away, with their superiority in cavalry ensuring that no effective pursuit took place.

So far in this campaign Napoleon had shown he was capable of winning battles, but despite a significant superiority in numbers he was not much nearer to winning the war. The Allies had shown themselves capable of fighting Napoleon but not of beating him. The war was very much in the balance. Both sides had suffered heavy losses and were exhausted. A respite was necessary for all to bring up fresh forces, so on 4 June the Armistice of Pleischwitz was agreed on. It lasted seven weeks, enabling the Prussians to complete their mobilization and the Russians to bring up more men.

Now that the soldiers were resting and recuperating, the diplomats began working feverishly. All eyes now focused on Vienna, for the balance of power and the likelihood of success would be tipped toward whichever side Austria might join. In the Treaty of Reichenbach of 27 June, Austria agreed with Russia and Prussia that the Grand Duchy of Warsaw and the Confederation of the Rhine should be abolished, that Austria should receive Illyria on the Adriatic coast, that all territory seized from Prussia in 1806 should be returned, and that France should

return all the north German territory it had annexed in 1810. If Napoleon refused these terms, Austria would declare war on him.

At the Congress of Prague, which ran from 15 July to 10 August, Napoleon's representative, Armand-Augustin, marquis de Caulaincourt, refused these terms. They would have left Napoleon with Italy, Belgium, and the west bank of the Rhine. On 12 August Austria declared war, and by the Treaty of Teplitz concluded with Russia and Prussia the following month, the Habsburg Empire formally joined the Sixth Coalition. The campaign in Germany now entered its final phase.

### The Autumn Campaign

The Allies were organized into three armies. The Army of the North, a mixture of Prussian, Russian, and Swedish troops, was under the command of the crown prince of Sweden, Napoleon's former marshal Jean-Baptiste-Jules Bernadotte. It was deployed in and around Berlin. The main Allied force, known as the Army of Bohemia and consisting largely of Austrians but with contingents from both Russia and Prussia, assembling in Bohemia, was under the command of Austrian *Feldmarschall* Karl Philipp Fürst zu Schwarzenberg. Blücher was at the head of the Army of Silesia, a mixed force of Russians and Prussians stationed in the area around Breslau. A fourth army under the Russian general Levin Bennigsen, the Army of Poland, was in the process of formation. The three field armies numbered around 440,000 men.

Napoleon's center of operations and main base was in Saxony. From here through to the Elbe, he had deployed around 240,000 men. Just south of Berlin, Marshal Nicolas Oudinot commanded an army of 66,000 men. On the lower Elbe, near Hamburg, Davout, with 35,000 men, faced a very mixed bag of 25,000 regulars and irregulars under General Ludwig Graf von Wallmoden-Gimborn, an Austrian officer in Russian service. The Bavarian general Karl Philipp Freiherr von Wrede, with 30,000 men, faced a similar number of Austrians in southern Germany. Napoleon was outnumbered, so he sought to take on and destroy the Allied armies individually. Strategically, he enjoyed the advantage of the central position. He could seal the passes from Bohemia into Saxony with relatively few men, concentrate his remaining forces against one Allied army and achieve a local superiority in numbers. However, the Allies had agreed on a strategy of avoiding battle with Napoleon himself, the Trachenberg Plan, and wanted to wear him down by taking on his subordinates. Once Napoleon was sufficiently weakened, they would then unite their armies for the decisive battle.

The armistice was broken prematurely when Blücher's army crossed the armistice line on 14 August. Napoleon

decided to deal with Blücher first, then cross into Bohemia and press on to Prague. He sent Oudinot to take Berlin. While Napoleon was chasing the elusive Blücher, Schwarzenberg's army debouched from the mountain passes and marched into Saxony. Napoleon rushed back to Saxony, leaving Marshal Jacques Macdonald in charge of the Army of the Bober, to pursue Blücher.

The dilemma Napoleon was facing now materialized. While he moved to meet Schwarzenberg's Army of Bohemia, his subordinates floundered. On 23 August Oudinot was defeated at Grossbeeren and thrown back from Berlin. On the twenty-fifth Blücher defeated Macdonald on the Katzbach and expelled the French from Silesia. Napoleon's victory over Schwarzenberg at Dresden on 26–27 August went some way toward making amends, but Napoleon had to concentrate on restoring order in his two defeated armies, so he left General Dominique Vandamme in charge of the pursuit of Schwarzenberg. By a stroke of misfortune, Vandamme got himself surrounded at Kulm on 30 August, and his command practically annihilated. These events more than offset the gain made at Dresden.

Leaving Schwarzenberg to lick his wounds from Dresden, Napoleon sent Ney to take another stab at Berlin. This too failed when Ney was defeated at Dennewitz on 6 September. While Napoleon was chasing Blücher back into Silesia, Schwarzenberg again advanced into Saxony. Because he was continually striking at air, Napoleon decided to concentrate his forces in Saxony and wait for the Allies to advance to meet him. He hoped to defeat each army in turn in rapid succession.

Blücher fought his way over the Elbe at Wartenburg on 3 October. Following in Blücher's wake, Bernadotte's Army of the North also crossed the Elbe, linking up with Blücher.

The ring was closing around Napoleon. Napoleon struck out at Blücher, hoping to cut his communications. The Army of Silesia, however, adroitly sidestepped, and the blow fell wide. Meanwhile, Schwarzenberg moved cautiously in the direction of Leipzig.

On 8 October the Bavarians went over to the Allies. Napoleon was losing what little control he had left in Germany.

On the fourteenth a great cavalry battle took place at Liebertwolkwitz, south of Leipzig. This was the preliminary to the great battle, fought in and around Leipzig itself, which started two days later. For four days, a great slogging match took place here. Napoleon faced 200,000 men under Schwarzenberg on the first day, having 178,000 men at his disposal. Understandably, Schwarzenberg made little progress at first. However, Blücher was moving up, having routed Marshal Auguste de Marmont at Möckern that day. On 17 October Bennigsen's Army of Poland approached. The next day, the Saxon and Württemberg contingents

crossed over to the Allies, while the Army of the North closed in. The weight of numbers prevailed when, on 19 October, the Allies stormed Leipzig itself and the remnants of the Grande Armée followed Napoleon westward, toward France. Napoleon lost 70,000 men, including 30,000 prisoners. The Allies suffered 54,000 casualties. On 30 October Napoleon brushed aside a force of Bavarians at Hanau, but he never returned to Germany.

In little more than a year, two French armies amounting to nearly a million men had perished. Napoleon's empire was approaching its end.

### Gerona, Siege of (24 May–11 December 1809)

A minor fortress in northern Catalonia, Gerona was the object of the longest regular siege of the Peninsular War. Despite being attacked by the French on two separate occasions in the course of 1808, it steadfastly refused to fall, and the early summer of 1809 therefore saw a large number of French troops concentrated against the city under General Jean-Antoine Verdier. Operations began on 24 May, the French plan being to seize the chain of forts that crowned the heights that towered over the eastern and northern walls of the city. Progress, however, was extremely slow: On the one hand, the French trenches had to be hacked out of bare rock, and on the other, the governor, Mariano Alvarez del Castro, who was both a very determined man and an extremely good soldier, launched attack after attack on their positions. Not, then, until 11 August did the chief fort fall to the French. An attempt to storm it in July had been repulsed with heavy losses, and it eventually had to be blown apart with the aid of twenty-three mines.

At this point, Gerona should in theory have fallen: The walls beneath the heights lacked proper bastions and could be breached with ease, while the defenders had suffered heavy losses and were increasingly short of food. However, Alvarez del Castro refused to give up, and on 1 September

the Spanish forces in Catalonia, which were then commanded by General Joaquín Blake, succeeded in piercing the French lines and throwing a large convoy into the city. With the invaders by now suffering terrible losses from disease, the siege therefore dragged on into the autumn. Desperate to bring matters to an end, on 19 September Verdier ordered his troops to assault several breaches that had been opened in the northern walls, but the French were yet again beaten off.

For all his gallantry, however, Alvarez del Castro could not raise the siege single-handed, and in the absence of any further help from the Spanish forces outside the city, Gerona once again began to starve. As winter set in, moreover, rain and cold began to exact a heavy toll. Indeed, the governor himself fell desperately ill. On 11 December, then, the garrison surrendered. Only 3,000 of the 9,000 troops involved in the defense survived, and almost half the 14,000 inhabitants also perished. French losses, however, came to some 14,000 men, while Alvarez del Castro (who died just after the city had fallen) had succeeded in tying up their operations in Catalonia for an entire year.

### Gillray, James (1757–1815)

An English caricaturist, James Gillray produced many satirical cartoons that mocked Napoleon and the French. He was also critical of George III and the political system of Britain throughout the Napoleonic Wars.

Gillray was the son of a soldier who had been injured at the Battle of Fontenoy in 1745 and was a pensioner at Chelsea Hospital. He trained as a letter engraver but grew tired of this occupation and became part of a traveling theater company. He returned to London in 1775 and made engravings for a number of print shops. In 1778 he became a student at the Royal Academy. By 1791 he worked for a print seller called Hannah Humphrey and lived above her shop in London for the rest of his life. Due to his artistic training Gillray often drew on different styles of painting as a basis for his cartoons. He frequently

made use of contemporary historical paintings and replaced the faces of the characters in them with the people he wanted to satirize.

Gillray was critical of all forms of extremism and of the establishment. His first target was the royal family; he helped dub George III “farmer George” on account of his interest in agriculture. He also criticized the sexual and extravagant activities of other royals. The political situation in Britain at the time lent itself to the growth of caricature. Political debate often centered around personal attacks on opponents. Gillray attacked both Tories and Whigs, but it was believed that his sympathies were generally with the Tories. He was, however, very critical of the British government and the prime minister, William Pitt, for the introduction of an income tax to finance the war against Napoleon. In 1797 it was generally believed that the Tory Party actually paid Gillray a pension so that he would not criticize them in his work.

On the outbreak of the French Revolution, Gillray sympathized with some aspects of the changes taking place in France, but he was against the atrocities of the Terror and portrayed Napoleon as a midget verging on the edge of madness. In one of his best-known cartoons, “Plumb Pudding in Danger,” he depicts Napoleon and Pitt carving out spheres of influence on a globe during a fictitious dinner, all with little regard for other nations. Gillray also helped establish the personification of Great Britain in the figure of John Bull. Gillray was a prolific artist, and more than 1,000 cartoons have been attributed to him.

In about 1810 Gillray began to suffer from bouts of mental instability. This was not helped by his frequent drunkenness and depression caused by his failing eyesight. For the last two years of his life he was effectively confined above the shop of his employer.

## Girondins

The identity of the Girondins, a political grouping in the Legislative Assembly and Convention, has been much debated as historians have sought to grasp the nature of politics in the Revolution. No organized political parties existed, and the term *faction* was employed pejoratively to suggest an affront to national unity, not least in 1792–1793, a time of crisis and division. Thus the description “Girondins” only became established in the nineteenth century, supplanting other labels, such as “Brissotins” or “Rolandins,” based on

the names of prominent leaders. The Girondins were composed of at least two entities: One comprising deputies from the department of the Gironde, based in Bordeaux, which included orators such as Pierre Victurnien Vergniaud and Marguerite Elie Guadet, the other formed by writers and journalists involved in Parisian politics, such as Jacques-Pierre Brissot or Jean-Baptiste Louvet de Couvray.

These groups came to prominence when war with Austria loomed toward the end of 1791, and they welcomed conflict as a means of rallying the French people and flushing out traitors. They came to command a majority in the Legislative Assembly, and in March 1792 Louis XVI was obliged to choose ministers from their ranks. Relations with the court soon reached a breaking point when the military situation rapidly deteriorated, and the Girondin ministry was dismissed, though not before it had become tainted by office and unpopular with the Parisian crowd. The overthrow of the monarchy in August 1792 put Girondins back in power, but pressure from the streets sharply escalated. Indeed, their removal from the Convention in the parliamentary purge of 2 June 1793 was a sop to the sans-culottes, since even opponents, such as Maximilien Robespierre, were reluctant to take this step.

The twenty-nine deputies who were subsequently outlawed formed the core of Girondin lists that contemporaries and historians have compiled. Another seventy who protested against proscription are usually added, but coherent group policies are difficult to discern. Personalities predominated, and deputies’ voting behavior on key issues, notably the king’s fate, indicates a dogged individualism and nothing resembling a party line. The Girondins shared the same background as most members of the assemblies: They were middle-class professionals, aged in their thirties and forties, who had risen to local renown in the earlier years of the Revolution. These men were not elected on a partisan basis; rather, they forged affinities after they arrived in Paris and began sitting near one another in the Convention. They were scarcely more moderate than their Jacobin rivals, not simply supporting the Republic but espousing the abolition of slavery and equal rights for women besides. The key distinction resided in their relationship with the people of Paris: Economic liberalism, concern for law and order, and provincial sympathies left them badly exposed to the wrath of the sans-culottes. The Girondins’ enjoyment of authority brought allegations of treason, and many were killed as a consequence, though survivors returned to work after the Terror and enhanced their reputation as Revolutionary idealists in a turbulent age.

Sydenham, Michael. 1961. *The Girondins*. London: Athlone.**Glorious First of June, Battle of the  
(1 June 1794)**

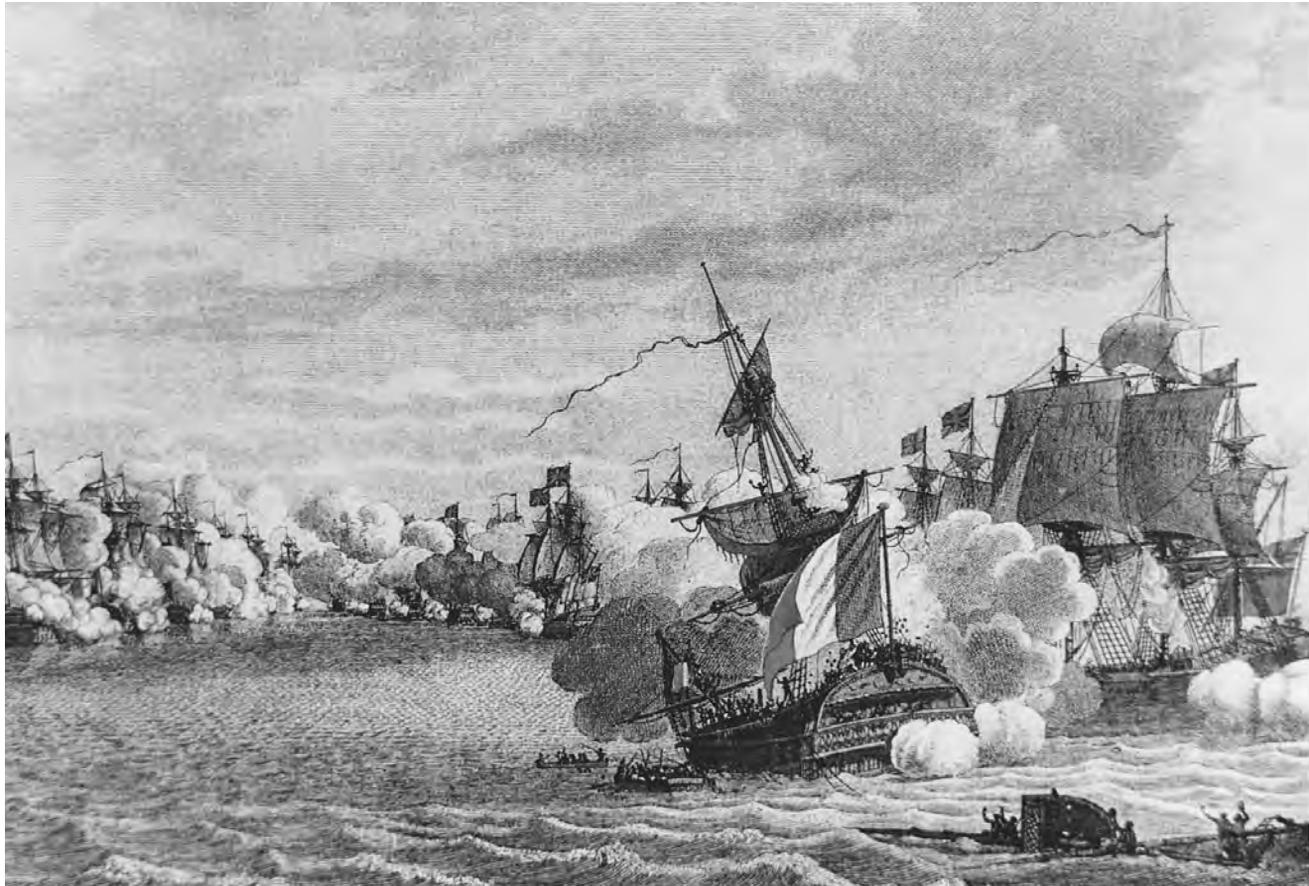

The first major fleet action of the French Revolutionary Wars, it is known by this name in Britain, the French referring to it as the Bataille du 13 prairial an II, after the equivalent date in the Republican calendar.

In the spring of 1794 the Royal Navy learned that an important grain convoy was sailing from North America to France. A French fleet stationed at Brest was to sail and escort the convoy to port. Admiral Richard, Lord Howe, commanding the Channel Fleet, set sail in May, intending to interpose his force between the convoy and its covering force, which was still in Brest. The convoy was escorted by a squadron under Rear Admiral Joseph Marie Nielly which

had itself captured a British Newfoundland convoy and its escort HMS *Castor*. Howe's fleet retook some of these vessels on 21 May, including two French frigates that mistook his fleet for their own. These captures gave the British valuable information about French movements.

On 28 May the enemy fleet was spotted, commanded by Admiral Louis Thomas Villaret-Joyeuse (or Villaret de Joyeuse). The French had the weather gage—that is, they were upwind of the British—making it difficult for Howe's force to get into action. Only a squadron of frigates was able to reach the rear of the French fleet, whereupon the 110-gun ship *Révolutionnaire* fell back to cover the withdrawing French fleet. This ship was attacked by a succession of British frigates, supposedly striking her colors, but owing to a misunderstanding among the British she was allowed to escape to Brest.

Battle was resumed the following day with Howe breaking through the enemy line and cutting off three French ships. The French fleet came to the rescue of these vessels. Twelve British ships were heavily engaged, sustaining some damage, while the seriously damaged French ves-

The Battle of the Glorious First of June. Although a tactical British victory, Admiral Howe failed to achieve the broader strategic aim of intercepting a vital grain convoy bound for the famine-ridden French populace. (Print by Bousson, Valadon, Paris, after Ozanne from *Victoires et Conquêtes des Armées Françaises, 1792–1801*. Paris: Sanard & Derangeon, n.d.)

sels were replaced by Nielly's squadron, which reached the main fleet the following day.

These skirmishes gave the British the advantage. Fog over the next few days allowed the French to retire, although Howe managed to keep in touch with the enemy. After seeing his damaged ships get away safely, Villaret-Joyeuse had twenty-six ships of the line, opposing twenty-five under Howe. The fog cleared on the thirty-first, but Howe decided to wait until 1 June before attacking, seeking a full-scale and decisive battle.

Howe's fleet approached the French early on the first with the British ships in a slanting line. The aim of this tactic was for each vessel to break through the enemy line and fight from the leeward side. This would produce a general action and prevent any French ships from escaping. Only six of Howe's ships actually obeyed this instruction, but the French fleet stood firm and by 9:30 A.M. a full-scale engagement ensued. The battle consisted mainly of single-ship actions, fought fiercely by both sides, with the most famous of these duels being that between the *Brunswick* and the *Vengeur*. These vessels became locked together by their rigging and pounded each other at point-blank range for over four hours until in the early afternoon the *Vengeur* struck her colors. She was so badly damaged below the waterline that she rapidly sank, allowing only her captain and 150 of her crew to be rescued.

By about 1:00 P.M. the fire slackened, to reveal nine French ships totally dismasted, and two French three-deckers retaining only their foremasts. Many British vessels also bore various degrees of damage. At this stage the French attempted to extricate as many of their ships from the action as possible. Villaret-Joyeuse formed a line of eleven ships 2 miles away and used this to cover his disabled vessels that were either under sail or being towed away from the British.

Howe considered pursuing the enemy but was advised against this by his captains, who thought that the French might use their reformed fleet to attack the badly damaged British ships. In fact, their concern was misplaced: Villaret-Joyeuse was conducting a purely defensive maneuver. The battle was over. The British lost 287 killed and 811 wounded, while their opponents suffered nearly 3,500 casualties, and an equal number were taken prisoner.

The Glorious First of June was a great British victory, with one French vessel sunk and six more carried triumphantly to Spithead. Howe had won by a combination of tactical skill, superior gunnery, and a well-trained and disciplined fleet. The victory was a great morale booster for Britain, and King George III came to Portsmouth to greet the victors and present Howe with a diamond-encrusted sword. Other honors were bestowed upon the other admirals present, and many of the officers received a special gold medal commemorating the action.

Paradoxically, on the French side, Villaret-Joyeuse also had cause to be satisfied. He had saved the grain convoy, vitally needed in France, and had shown great tactical skill against a formidable opponent. A very heavy defeat had been prevented from becoming a total disaster.

### **Gneisenau, August Wilhelm Anton Graf Neidhardt von (1760–1831)**

Prussian reformer and chief of staff to General, later Field Marshal, Gebhard Lebrecht von Blücher, who provided well-reasoned operational planning that was essential to Prussia's resurgence and to the defeat of Napoleon. If, during the later stages of the Napoleonic Wars, Blücher was the heart and soul of the Prussian Army, then August Graf Neidhardt von Gneisenau was its mind. His ability to advise Blücher soundly and to coordinate the actions of Prussian and Allied forces on the campaign trail freed Blücher to act decisively on the battlefield.

Gneisenau was born on 27 October 1760 at Schilda. After a stint as a student at the University of Erfurt, he served in an Austrian cavalry regiment (1778–1780), went to Canada to serve as an infantry officer (1782–1783) in a force provided by Ansbach-Bayreuth during the American Revolutionary War, and in 1786 obtained a commission in the Prussian Army from King Frederick II. Until the battles of Jena and Auerstädt (14 October 1806) he languished as a company commander on garrison duty in Silesia. While many officers of the Prussian Army were disgraced in those battles and in the numerous capitulations that followed, Gneisenau's career was reinvigorated

General August Graf Neidhardt von Gneisenau, chief of staff of the Prussian army under Blücher during the campaigns of 1813–1815. An indifferent field commander, he proved an accomplished administrator. (Print by P. E. Gebauer from *Illustrierte Geschichte der Befreiungskriege* by Julius von Pflugk-Harttung, 1913)

as he won recognition for his courage under fire. Subsequently he was promoted to major, and in April of the following year he was entrusted with the defense of the fortress of Kolberg. When the French attacked later that spring, he and his force held out against repeated attacks until the Treaty of Tilsit ended hostilities in July.

Gneisenau's reputation as a fighting man had been greatly enhanced by his response to the crises of 1806 and 1807. Prussia's defeat, however, provided him with the additional opportunity of bringing his mental abilities to bear on the problem of reforming the nation's army. Gneisenau joined with General Gerhard von Scharnhorst and the other members of the Military Reorganization Commission in trying to provide Prussia with an army of citizen-soldiers capable of rendering service in a manner more like that of Napoleon's army. During the period between hostilities Gneisenau was second only to Scharnhorst in contributing to the work of the commission.

After Scharnhorst was wounded at Lützen (also known as Grossgörschen, 2 May 1813), Gneisenau assumed the duties of chief of staff to Blücher. In this capac-

ity Gneisenau built upon the model established by his predecessor and continued to provide well-reasoned guidance as a counterweight to the impetuosity of Blücher. Indeed, his outstanding service as chief of staff was critical to numerous victories, but never more so than at the Battle of Waterloo. When Blücher was put out of action two days earlier at Ligny (16 June 1815), it was Gneisenau who set in motion the Prussian army's retreat on Wavre. Retreating away from the safety of his own lines of communication, Gneisenau delivered the Prussians to the field of battle in time to frustrate Napoleon's hopes of defeating the Anglo-Allied army under the Duke of Wellington.

With the crisis of the Napoleonic Wars at an end, Gneisenau and the reformers lost their influence with Frederick William III. Promoted to field marshal in 1825, Gneisenau died of cholera on 23 August 1831 while protecting the Prussian frontier during the Polish revolts.

### Godoy y Alvarez de Faria, Manuel de, Príncipe de la Paz, Duque de Alcudia (1767–1851)

A petty noble from Extremadura (Extremadura), from 1792 to 1808 Manuel de Godoy was the leading figure in the court of King Charles IV of Spain. Arriving at the court as a trooper in the Guardias de Corps in 1787, Godoy quickly came to the notice of the then-heir to the throne, Prince Charles, and his wife, María Luisa, as a man of courage, intelligence, and energy. Thus, alarmed at the constant factional fighting in the Spanish court, when Charles and María Luisa came to the throne in 1788 they decided to make him a strongman who would be entirely dependent on their patronage.

By 1792 Godoy had therefore been raised to the rank of captain general and had been created a grandee of Spain and endowed with a fortune to match. According to legend, all this was really due to his having become the lover

of the queen, but there is no evidence of any such relationship, and the story is almost certainly an invention of the favorite's many enemies. Moreover, if Godoy's star now rose still further, it was due not to his supposed prowess in the bedchamber but, rather, to the growing concerns raised by the French Revolution. With tension escalating in the court—tension that the king and queen seem genuinely to have feared might produce a Spanish version of the events in France of 1789—in November 1792 Godoy was appointed secretary of state. As such, he went to war with France in March 1793 and then negotiated the peace settlement that ended the conflict in July 1795. Obtaining reasonable terms as he did, he was now given the title “Prince of the Peace.”

He knew, however, that the war had been a hopelessly unequal contest. Reform was therefore essential, but in the meantime British hostility made it vital to revive the old Franco-Spanish alliance. While Godoy struggled to push through reform at home, then, in 1796 Spain joined France in its war against Britain. The goal was in the end to throw off the French yoke, but in practice the contradictions of the situation were too great. Although domestic reform made considerable strides, especially with regard to the expropriation of the lands of the church, Godoy's plans were never fully realized, for he could neither rely on the support of the Crown nor shake off his own reputation for corruption.

Meanwhile, matters were made still worse by natural disaster and by Britain's control of the seas, while Spain became less and less able to break free. With Godoy increasingly exposed, a coterie of disgruntled nobles and churchmen opposed to enlightened absolutism took advantage of the situation to plot his overthrow, working in conjunction with the future Ferdinand VII, whom they persuaded that Godoy intended to seize the throne. Desperate to escape, Godoy sought safety in an invasion of Portugal that would bring him an independent principality, and therefore he willingly collaborated with the French occupation of that country in late 1807. Before his plans could be put into effect, however, after several months of confusion, he was overthrown in a military coup at Aranjuez in March 1808. Rescued from almost certain execution by Napoleon, he spent the rest of his life in exile and eventually died in poverty in Paris in 1851.

## Goethe, Johann Wolfgang von (1749–1832)

The most celebrated German man of letters, comparable to Dante or Shakespeare; along with Friedrich von Schiller, the leading exponent of Weimar Classicism. In 1774 Johann Wolfgang von Goethe published his first novel, *Die Leiden des jungen Werthers* (The Sorrows of Young Werther), written as a series of letters and in which Werther, cast as a Romantic hero, eventually commits suicide when he fails to win the love of the beautiful Charlotte. As an administrator at the court of Saxe-Weimar, Goethe accompanied Imperial (Holy Roman Empire) troops in the campaigns of 1792–1793. His response to the Revolution was at once more fragmented and more extensive than Schiller's explicitly philosophical one, though it was part of an equally well-integrated worldview. A polymath whose scientific endeavors ranged from mineralogy to evolutionary biology to optics, Goethe sought to discover, in nature, society, and culture, the regularities beneath the turbulence of appearances.

Whereas many German intellectuals reacted to the Revolution first with enthusiasm and then with disillusionment, Goethe was skeptical from the start. To be sure, he attributed revolutions to the failings of governments and insisted that he was no friend of the status quo, as such. His famous declaration that the French victory at Valmy marked a new era in history was a diagnosis rather than a eulogy for the *ancien régime*. But for Goethe, revolution was the greater and more avoidable evil, one that released animal instincts and shattered institutions that should be cautiously reformed rather than demolished. He regretted injustice but abhorred disorder.

Goethe grappled with the Revolution in contemporaneous literary works and later autobiographical reflections. Several comic dramas (1791–1793) were not convincing as either art or political commentary. The novella “Conversations of German Emigrants” (1795) and the verse epic “Hermann and Dorothea” (1797), though no less antirevolutionary, were more satisfying and nuanced. The latter conferred a Homeric dignity on bourgeois domestic life and celebrated its triumph over threats from above and below.

The foe of revolution was, however, no friend of nationalism. Because German identity was for Goethe cultural—he described his fatherland as everywhere and nowhere—he could view even the collapse of Prussia with equanimity. His belief in a reform conservatism based on bourgeois-aristocratic partnership also led him to hail Napoleon as a world-historical visionary capable of restoring order. An audience at Erfurt (1808), at which the Emperor expressed his admiration for Goethe's talents, confirmed

that judgment. Goethe could evince no enthusiasm for the German War of Liberation in 1813 (or indeed, any form of chauvinism) and continued to admire Napoleon even after his exile and death.

Goethe spent much of his life working on his most famous work, *Faust*, an extremely complex and tragic drama in two parts, the first of which appeared in 1808, the second shortly after his death, in which the hero is obliged to make various compromises with the Devil (Mephistopheles) to secure his happiness on earth. *Faust* was meant to be read, rather than performed, and is considered by many to be the greatest piece of German literature ever produced.

Ironically, the rarefied Weimar literary environment that Goethe valued as a sanctuary from politics became a political topic thanks to the visiting Mme. Germaine de Staël, whose idealized portrait of Teutonic cultural vigor, *On Germany*, was taken as a critique of France and banned by Napoleon (1810). The only lasting harm done by the book was to confuse in the minds of generations of foreigners the distinction between Weimar Classicism and Romanticism.

### **Golitsyn, Dmitry Vladimirovich, Prince (1771–1844)**

Russian general and corps commander. Dmitry Vladimirovich Golitsyn was born to the Moscow branch of the prominent Golitsyn family and enlisted in the Life Guard Preobrazhensk Regiment in 1774. He studied at the University of Strasbourg and traveled extensively in Germany, Britain, and France in 1786. In 1786–1789 he studied in the Ecole Militaire in Paris. Simultaneously, Golitsyn was promoted to *vakhmistr* (a rank in the Guards roughly equivalent to ensign, the lowest officer rank) and transferred to the Life Guard Horse Regiment on 22 December 1785.

While he studied abroad for six years, Golitsyn was promoted to cornet (12 January 1786), sub-lieutenant (12 January 1788), lieutenant (12 January 1789), and second *rotmistr* (a junior officer rank) (12 January 1791). In 1794 he became *rotmistr* and fought the Polish confederates, dis-

tinguishing himself at Praga. He was promoted to colonel on 12 May 1797, rose to major general on 16 August 1798, and to lieutenant general on 2 September 1800. He also served as *chef* (colonel-proprietor) of the Prince Golitsyn 5th Cuirassier Regiment (later renamed the Military Order Cuirassier Regiment) between 3 May 1800 and 20 April 1809.

In 1805 Golitsyn served in General Levin Bennigsen's corps but did not participate in major operations. In 1806 he was given command of the 4th Division and participated in the campaign against the French in Poland, fighting at Golymin in December. In January 1807 he commanded the cavalry of the left wing and, at Eylau the following month, led a series of cavalry charges. He then distinguished himself at Wolfsdorf, Heilsberg, and Friedland. In late 1807 Golitsyn remained at Vilna, and in 1808 he was dispatched to Finland, where he commanded a corps at Vaasa during the Russo-Swedish War. In 1809 he made preparations to cross the Gulf of Bothnia, but he was replaced by General Mikhail Barclay de Tolly. Upset by this replacement, Golitsyn retired on 20 April and traveled in Germany before going back to Moscow.

In 1812 Golitsyn returned to the army and commanded the 1st and then the 2nd Cuirassier Divisions in the 2nd Western Army. He fought at Shevardino, Borodino, Tarutino, Maloyaroslavets, Vyazma, and Krasnyi. In 1813 he remained with his cuirassier divisions in reserve at Lützen and Bautzen but fought at Dresden, Kulm, and Leipzig. In 1814 Golitsyn participated in the battles at Brienne, Malmaison, Arcis-sur-Aube, La-Fère-Champenoise, and Paris. He was promoted to general of cavalry on 14 April and became commander of the 1st Reserve Cavalry Corps on 21 August. He was also given command of the 1st and 2nd Guard Divisions on 14 September 1814 and of the Guard Light Cavalry Division on 14 March 1815. On 24 July 1818 he became commander of the 2nd Infantry Corps, with which he served for two years.

Golitsyn was appointed the military governor of Moscow on 18 January 1820. He was instrumental in rebuilding Moscow after it was devastated by the great fire of 1812. While serving in this position, Golitsyn became a member of the State Council on 12 November 1821. He became *chef* of the Military Order Cuirassier Regiment on 2 November 1834. However, Golitsyn became seriously ill in late 1830 and traveled extensively in Europe for treatment. He resigned from his governorship on 20 January 1841 but remained a member of the State Council. He died on 8 April 1844 in Paris. His body was transported back to Moscow, where he was buried with great honors on 31 May. Golitsyn's literary legacy includes *Manuel du volontaire en campagne* (Manual for the Volunteer on Campaign, 1794) and *Opyt nastevlenii*,

*kasaushikhsia do ekzertsitsii i manevrov kavaleriiskogo polka* (Manual Concerning the Tactics and Maneuvers of Cavalry Regiments, 1804).

### **Golitsyn, Sergey Fedorovich, Prince (1749–1810)**

Russian general and army commander. Sergey Fedorovich Golitsyn descended from one of the most prominent families of Russian princes. He enlisted as a corporal in the artillery on 1 January 1757, rose to sergeant in 1757 and then to *shtyk junker* (officer candidate) on 12 March 1761. Graduating from the University of Moscow and the Infantry Cadet Corps, he received a rank of lieutenant and became an adjutant to a *général en chef* (probably *général en chef* Jacob Bruce) on 14 May 1764 and a captain on 3 February 1766. During the Russo-Turkish War in 1768–1774 he fought at Rachev Cape, Kagul, and Silistra. His actions earned him quick promotions, and he received the rank of second major on 30 December 1769 and premier major on 1 August 1770. Golitsyn became a lieutenant colonel of the Smolensk Dragoon Regiment on 5 December 1771. On 3 October 1775 he became a *flügel-adjutant* and colonel of the Smolensk Dragoon Regiment. Three years later, on 3 October 1778, he transferred as a brigadier to the Life Guard Preobrazhensk Regiment, and on 16 May 1779 he was promoted to major general. The same year, he married Varvara Vasilievna Engelhardt, niece of Prince Gregory Potemkin. In 1782 he served in the Crimea. He was decorated and received the rank of lieutenant general on 25 July 1788.

During the Russo-Turkish War of 1787–1792 Golitsyn fought at Ochakov, where he commanded the reserve of the left flank, on the Prut River, where he commanded a re-

serve corps, at Macin, and at Braila. In 1794 he commanded a corps in General Nikolay Repnin's army in Poland. In 1796–1797 he served as a battalion commander of the Life Guard Preobrazhensk Regiment and briefly commanded the whole regiment. He was promoted to general of infantry on 21 April 1797. The following year he had an argument with Tsar Paul I due to the intrigues of Count Alexander Kutaisov, whom Golitsyn detested because of his low origins. Golitsyn was discharged from the army on 12 September 1798 and retired to his estate in the Kiev *gubernia* (province). While preparing for the campaigns against France in late 1798, Paul recalled Golitsyn on 29 December 1798 and gave him command of a corps. However, as the corps marched to Italy, Golitsyn was relieved of command on 18 January 1799 because of his criticism of Paul.

Golitsyn remained at his estate of Zubrilovka in the Saratov gubernia until the assassination of Paul in March 1801, when the new tsar, Alexander I, recalled him and appointed him governor general of Riga and infantry inspector for the Lifland gubernia on 17 July 1801. Golitsyn retired for the third time in September 1804. During the 1806–1807 campaigns, he became commander in chief of the militia (*zemskoe voisko*) of the 3rd Region. He returned to military service on 8 April 1809 and took command of a corps in Galicia against the Austrians. However, he adamantly opposed the war against Austria and avoided actions with Habsburg forces. After the campaign he was appointed a member of the State Council on 13 January 1810, but he died of a stroke on 1 February 1810 at Tarnopol.

### **Golymin, Battle of (26 December 1806)**

In this engagement during the War of the Fourth Coalition, Prince Dmitry Golitsyn, in command of a Russian division, held off a considerably larger French force. Marshal Pierre-François-Charles Augereau with his corps attacked first and the assault was then renewed by Marshal Joachim Murat and elements of Marshal Louis Davout's corps. However, the Russians beat off all attacks and withdrew in good order.

This battle was fought on the same day as Pultusk and in the same poor weather conditions. The town of Golymin, 12 miles to the northwest of Pultusk, was surrounded by woods and marshes, thus providing Golitsyn's troops with a good defensive position. Golitsyn was covering the withdrawal of General Fedor Buxhöwden's army, and Golymin was at an important crossroads. Augereau began the attack at about 10:00 A.M. from the west. Owing to the poor weather he was unable to bring up any artillery support. His two divisions advanced but were rapidly brought to a halt by being forced into square by enemy cavalry and then coming under fire from Golitsyn's artillery. Augereau's troops were to play little further part in the battle. Golitsyn now took the chance to move some of his troops in front of Augereau to face a new threat from the south. In so doing these troops exposed their flank to the French and suffered many casualties. The threat was due to Murat's pushing his cavalry forward. Within a short space of time the Russian defenders were forced into the woods south of Golymin. However, without infantry support Murat could advance no further.

This impasse changed, however, with the arrival of General Louis Morand's division from Davout's corps. Morand began his attack shortly after 3:00 P.M. Because of the poor weather and the fact that neither side could bring up artillery support, the fighting in the woods was effectively hand-to-hand. Morand's numbers shifted the balance in his favor, and after a fierce engagement he drove the Russian defenders from the woods. Murat now moved his cavalry forward in order to complete the defeat of the Russian force, believing that the Russians were retreating across open ground. He was in fact wrong in his appraisal, as the ground was actually very marshy. Indeed, it was reported that the Russian infantry were standing up to their waists in the marsh. Their fire was effective enough to halt the French advance, and General Jean Rapp, an imperial aide-de-camp, was wounded. Morand, seeing the cavalry repulsed, decided not to renew his attack and was content to hold onto the woods that had cost him so many men to take.

Murat is reported to have estimated the strength of the Russians as being 50,000, whereas in fact Golitsyn's force amounted to only 18,000. As night fell Golitsyn withdrew northward with both sides having around 800 casualties.

### **Gouvion St. Cyr, Laurent, comte (1764–1830)**

Marshal of the Empire. Though his surname is properly styled as Gouvion St. Cyr, he is often known merely as St. Cyr (not to be confused with Claude Carra St. Cyr). He proved a successful general during the republican period, particularly at the Battle of Biberach, before embarking on a short ambassadorial career. In 1812 he led VI Corps during the invasion of Russia where, following the Battle of Polotsk, he was made a marshal. He fought at Dresden in 1813 but did not rally to Napoleon in 1815.

St. Cyr volunteered for the 1st Chasseurs Republicains in 1792. Prior to that he had been an artist in Italy. St. Cyr served in the Army of the Rhine under General Adam de Custine. At one point Custine saw St. Cyr sketching an enemy position and promoted him onto his staff. While serving there he developed a close friendship with General Louis-Charles Desaix and generals (later marshals) Michel Ney and Louis Davout. In 1793 St. Cyr proved himself by defeating an Austrian attack at Landremont. He served with the Army of the Rhine until 1797, his greatest success coming at the Battle of Biberach on 2 October 1796.

In March 1798 St. Cyr was sent to Italy to take command of the Army of Rome from General André Masséna. He dealt very successfully with a near mutiny among his troops and with guerrilla resistance from the local population. He was then ordered back to the Army of Mayence (Mainz) under the command of General Jean-Baptiste Jourdan, whom he disliked. French forces were obliged to withdraw. St. Cyr was granted leave until June, when he was placed under the command of General Jean Moreau. At the Battle of Novi on 16 October he proved that he had the tactical skill to enable the defeated French to retreat in good order. His troops possessed sufficient confidence in his leadership that they took an oath of allegiance to Bonaparte and the Consulate. In late 1799 he took command of troops around Genoa and was able to hold back superior Austrian forces. At the end of 1799 St. Cyr was ordered back to the Army of the Rhine, where he clashed with Moreau. However, in May 1800 St. Cyr won the second Battle of Biberach, shortly after which he sought permission to return to France.

From 1801 to 1803 he served as ambassador to Spain, in the course of which appointment he negotiated the cession of Louisiana to France. In March 1804 St. Cyr refused to sign the document proclaiming the Empire. It is possible that Napoleon did not include him in the marshalate, established in May 1804, because of this. By late 1805, during the War of the Third Coalition, St. Cyr persuaded King Ferdinand IV of Naples to sign a treaty of neutrality, and he marched northward to form part of Masséna's forces. St. Cyr won the Battle of Castelfranco and blockaded Venice.

However, he was then placed under the direct command of Masséna and, resenting this, resigned his command and returned to Paris. Napoleon ordered his immediate return to field command. By December St. Cyr was in command of the invasion camp at Boulogne and I Reserve Corps stationed on the Channel coast in preparation for an invasion of England. He spent most of the next two years improving the fortifications of the port.

In August 1808 he was sent to Spain to command the (French) Army of Catalonia. He succeeded in defeating the Spanish in the field, but he failed to take the city of Gerona by siege and assault. Napoleon, displeased by this failure, ordered him to be replaced by Augereau. Augereau was slow to take up this command, and St. Cyr, who was ill, left his forces and arrived in Perpignan to personally transfer his command to his successor. Napoleon had St. Cyr arrested for desertion. He received no command until February 1812, when he led the all-Bavarian VI Corps in the invasion of Russia. Soon after the campaign began, St. Cyr was ordered to Polotsk to support the corps under Marshal Nicolas Oudinot, who was facing the Russian general Peter Graf zu Wittgenstein. The Russian forces had pushed Oudinot back to Polotsk, and the position of the French forces was not strong. On the first day of the battle St. Cyr followed orders, but he did not provide as much aid to Oudinot as he could have done because he resented being commanded by a man who had been subordinate to him in the republican period. The French had the worst of the first day of battle, and both St. Cyr and Oudinot were wounded. St. Cyr assumed command and on the following day inflicted a severe defeat on the Russians. As a reward for his success he received a marshal's baton on 27 August. St. Cyr held Polotsk for the next two months. However, owing to wounds, he was forced to hand over command to Oudinot. By December he had rejoined VI Corps and together with the forces of Eugène de Beauharnais covered the retreat of the Grande Armée from Russia.

In early 1813 he was ill with typhus, but by August he was in command of the garrison at Dresden. He held off Allied attacks for two days until Napoleon arrived. During the Battle of Dresden, St. Cyr led his corps very effectively, and the Emperor concluded that there were few better defensive generals. After Dresden St. Cyr was left to garrison the city. Following the decisive French defeat at Leipzig, Napoleon ordered St. Cyr to escape from the encirclement being conducted by the Allies. He was unable to effect this and surrendered early in November. Until the abdication of Napoleon, he was a captive at Karlsbad. He returned to France in June 1814. St. Cyr did not rally to Napoleon in 1815 and later served as minister for war, in which capacity he was instrumental in reorganizing the French Army.

### **Goya y Lucientes, Francisco José de (1746–1828)**

The greatest Spanish painter of the Revolutionary era, and, indeed, one of the greatest Spanish painters of all times, Francisco de Goya was born in the Aragonese town of Fuendetodos, and he established such a reputation that in 1799 he was made official painter to the Spanish court. In Napoleonic terms, his chief importance lies in the fact that he left a series of works that provide a detailed commentary on the history of Spain between 1789 and 1814. First of all, there are his famous paintings of the king and queen, the rest of the royal family, and the court favorite, Manuel de Godoy. Next, there are the two great paintings that Goya produced as a record of the rising of the Dos de Mayo in Madrid, an event he witnessed (2 May 1808) firsthand and in which at least one of his students took part. And, finally, there is the terrifying series of etchings known as *Los Desastres de la guerra* (The Disasters of War).

Even in the context of the televised horrors of the current age, these etchings are still deeply shocking. Dismembered bodies hang from trees; men are strangled, torn apart, sawn in half, or hacked to pieces; women are raped,

or they slash at the enemy with babies in their arms; starving civilians huddle in dark corners or beg for aid in the streets; and there is on all sides nothing but savagery, murder, and brutality. A fitting answer to those who revel in the glories of the Napoleonic age, these depictions of the Peninsular War have become a symbol of the supposed heroism of the Spanish people in the face of Napoleonic aggression.

Yet in reality the work of Goya in this respect is far more complex than it at first seems. In the earlier series of etchings known as *Los caprichos* (The Caprices) the painter is shown to have been deeply scornful—fearful even—of the common people, and his depiction of the atrocities of the Peninsular War reflects these feelings. In very few of the works concerned is it possible to tell one side from the other with any certainty, and it is therefore very clear that Goya was as anxious to highlight Spanish brutality as that of the French armies. Nor did he follow the example of many other intellectuals and flee the French zone of occupation; on the contrary, he remained in Madrid throughout the war and painted several portraits of Joseph Bonaparte. This equivocal conduct did not lead to punishment after the war—he was in fact reinstated in his old role of official painter to the court—but growing disillusionment with the state of Spain led him to go into voluntary exile in France in 1824, death coming four years later on 16 April 1828.

### Graham, Sir Thomas (1748–1843)

A British general, Thomas Graham played an active role in the French Revolutionary Wars. Graham was born on 19 October 1748, probably in Perthshire, Scotland. His father was Thomas Græme, laird of Balgowan, and his mother was Lady Christian Hope. Books and learning were important to Graham. One of his early tutors was James Macpherson, who in the 1760s was famous for his supposed discovery of the *Poems of Ossian*. Graham later attended Christ Church, Oxford. In 1774 he married. He traveled extensively before purchasing, in 1787, Lednoch, an estate in Methven near Perth. Graham was known to

contemporaries for his improving abilities, which included cultivating turnips and breeding livestock. He was also an avid deer hunter, thereby, he said, sharpening skills that proved useful to his military career.

Some argue that Graham turned to the military to help relieve the emptiness that accompanied the loss of his wife in 1791. Whatever the reason, he soon distinguished himself in action. In the summer of 1793 Graham was aide-de-camp to Lord Mulgrave, who was defending against the French at the siege of Toulon. Later, in Scotland, Graham raised a battalion known as the “Perthshire Volunteers.” Graham was appointed lieutenant colonel of this, the 90th Foot, in 1794, the same year in which he was elected to represent Perth in Parliament. In 1796 Graham was at Mantua to help *Feldmarschall* Dagobert Graf Würmser defend against the French, unsuccessfully despite Graham’s heroic efforts to carry intelligence to the Austrian general Joseph Alvinczy Freiherr von Berberек, at Bassano—a feat he accomplished by traveling over treacherous territory and in disguise. In 1797–1798 Graham was at Gibraltar, Minorca, and Messina. In late 1799 he was sent, as brigadier general, to Malta, which had been occupied by the French who were gathered at Valetta, which Graham blockaded. The French capitulated in September 1800, shortly after Graham’s command had been assumed by General Henry Pigot. Graham joined his regiment in Egypt and traveled through Turkey, spending time at Constantinople before passing through Vienna and Paris while returning home.

Graham was stationed in Ireland in 1804–1805 and spent three years in the West Indies before accompanying Sir John Moore to Sweden and then Spain, where Graham was present at the Battle of Corunna, in which Moore died. Promoted to major general in 1809, Graham was brigade commander at Walcheren, under Lord Chatham, and at the siege of Flushing. Promoted to lieutenant general in 1810, Graham took charge of the British and Portuguese forces at Cádiz, in southern Spain. On 5 March 1811 Graham won an important and celebrated victory over the French at Barrosa. In 1811 he was appointed second in command, under Viscount (later the Duke of) Wellington, whom Graham assisted at the capture of Ciudad Rodrigo in early 1812, for which he was knighted three months later. Problems with his sight forced Graham’s return to Scotland in July 1812. By May 1813 he had rejoined the British army in Portugal in time to command a large British force during the Battle of Vitoria on 21 June. Wounded at Tolosa, in early July, Graham was sent to besiege San Sebastian, which surrendered on 9 September. He crossed the Bidassoa, passing into France, before health problems again caused his return to Britain, where he received many honors. In the spring of 1814 Graham was

back in the field, briefly, in Holland, where he won a victory at Merxem but failed at Bergen-op-Zoom.

Graham was deservedly praised and promoted at the conclusion of the war. He was officially recognized in Parliament, created Baron Lynedoch of Balgowan, promoted to full general (1821), and appointed governor of Dumbar-ton Castle (1829). Graham's long retirement was divided between foreign travel, London politics, and improvements at Lynedoch. He died at age ninety-five on 18 December 1843.

## Grand Strategy

Grand strategy integrates the political objectives and the military resources of a nation in times of war and peace. It is distinguished from tactics, which are only concerned with utilizing troops on the battlefield. Grand strategy also extends beyond winning a war because the goal is to project long-term national interests through the coordination of national policies and the resources necessary to achieve those interests.

Historians of military strategy have concluded that a successful grand strategy is incumbent upon various considerations. The first component of grand strategy is the management of a country's limited resources (manpower, natural resources, infrastructure, economic productivity, and the like), which has challenged monarchs and statesmen from ancient times to the twenty-first century. The second component of grand strategy consists of diplomacy conducted during war and peace, in which a nation advances its relative geopolitical position through forming alliances and coalitions, recruiting neutral actors, and isolating opponents. Third, and no less important to grand strategy, is correctly gauging national morale. For a nation's objectives to be met, its population must support its

leaders' policies and be willing to accept the sacrifices necessary to achieve those ends. Because these components are often at odds with one another, formulating grand strategy remains a difficult task.

The Napoleonic Wars are a classic example of the employment of grand strategy. Britain and France utilized their national resources, formed coalitions, and engaged in economic warfare with one another in order to achieve their respective national objectives, whether it was to preserve the European balance of power or to spread the ideals of the French Revolution. How each country employed its grand strategy will be considered here.

### French Grand Strategy

The French Revolution threw France and all of Europe into chaos. The momentum of the Revolution accelerated from 1789, with the convening of the Estates-General, to 1793, with the execution of Louis XVI. Alarmed by the turn of events in France, the monarchs of Europe assembled their forces to restore the *ancien régime* of the Bourbons. From 1792 until 1815 France entered into a series of conflicts against the European powers, beginning with its declaration of war against Austria and the Holy Roman Empire, in order to save its Revolution and to spread it across the Continent.

In addition to altering the political landscape of Europe, the French Revolutionary and Napoleonic Wars transformed modern warfare. Before the wars of the French Revolution, the officer corps of the European armies consisted of noblemen who purchased their commissions, while soldiers in the ranks were enlisted or conscripted from the lowest rungs of society. The monarchs of Europe waged limited warfare to achieve their aims. The Revolution purged the French Army of its royalist elements and added a new dimension to tactical warfare. The biggest change wrought by the Revolution was the introduction of the *levée en masse*, which conscripted every able-bodied French male. The *levée en masse* reflected the revolutionary ideal of citizen participation in all aspects of French society, including warfare. Total mobilization of its population allowed France to meet the challenges of confronting coalitions of hostile neighbors bent on destroying the Revolution. Along with its citizenry, the economic resources and labor force of France were mobilized to suit its war aims.

On 19 November 1792, in the face of foreign intervention, the National Assembly declared that France would extend its assistance in liberating all the oppressed peoples of Europe, inaugurating more than twenty years of warfare. In 1793 the execution of Louis XVI pushed Austria, Prussia, Britain, and Holland to form the First Coalition against France and put 400,000 troops into the field. France

averted disaster through the *levée en masse*. Even before this critical stage in the war, at the decisive Battle of Valmy in September 1792, French forces had halted those of the Duke of Brunswick. Republican France then pushed forward into the Rhineland and the Austrian Netherlands in its bid to reassert the dominance in western Europe that, ironically, the Bourbons had once enjoyed under Louis XIV, though even the Sun King never achieved the kind of territorial gains later to be made by Revolutionary and Napoleonic France.

A new chapter in the Revolution turned as Bonaparte rose to power, beginning in 1799 and culminating in his coronation as Emperor Napoleon I in 1804. Napoleon radically transformed the organization of the French Army by introducing the corps. Each corps contained all types of formations used on the battlefield, that is, several infantry divisions, cavalry, and artillery. Each corps had its own command structure, which allowed it to act with initiative. Napoleon also laid strong emphasis on artillery by increasing the number of field guns. In addition, he improved the effectiveness of the cavalry by a combination of increased numbers and knowledge of exactly when to employ it. Napoleon's strategy was also revolutionary in the way he divided an opposing army into smaller parts and overwhelmed them with his artillery while cutting their lines of supply and retreat. Thus, at the dawn of the nineteenth century, Europe faced a new enemy who changed the whole notion of strategy.

After 1803 Napoleon reorganized the map of Europe through an aggressive foreign policy. In securing the borders of France, he created buffer states at its eastern frontiers and installed his siblings on the thrones of the countries he conquered. His brother Louis, for example, became King of Holland. Out of the ruins of the Holy Roman Empire Napoleon consolidated some 300 German states into the 30 states of the Confederation of the Rhine, where his brother Jérôme became King of Westphalia. Northern Italy was divided into the Cisalpine Republic and the Ligurian Republic, while Naples was given to Napoleon's brother, Joseph, who then became King of Spain after 1808. In the east, Napoleon wrested the Illyrian Provinces from Austria and carved out the Duchy of Warsaw from Prussia's Polish holdings after decisively defeating a mixed Prusso-Saxon force at the Battle of Jena. At the Treaty of Tilsit in 1807, Napoleon made peace with Tsar Alexander I by allowing Russia to gain territory at the expense of Turkey and Sweden; in turn, Russia would cooperate in the Continental System against Britain.

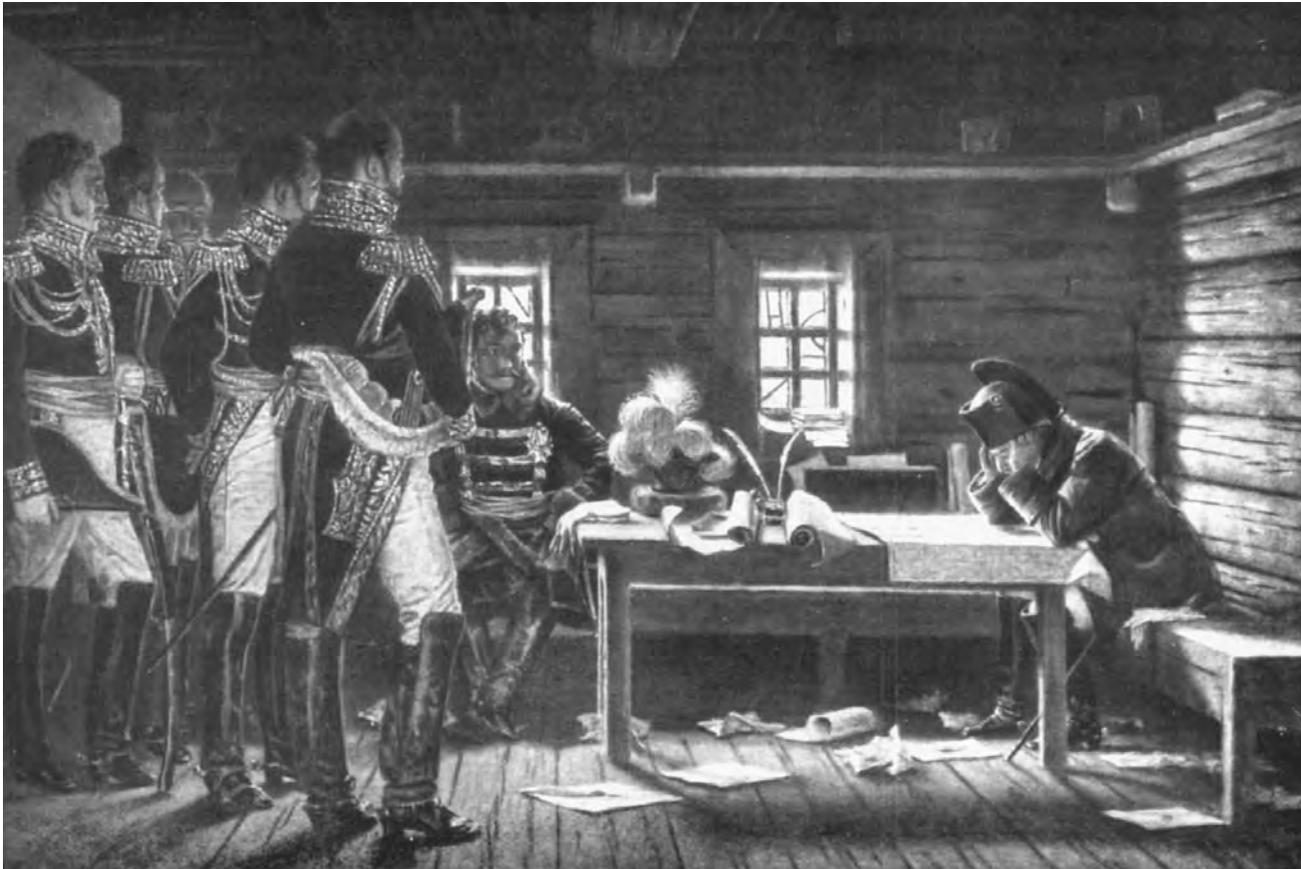

Britain was Napoleon's constant enemy, for it was Britain's naval and commercial supremacy that challenged the position of France in Europe. As early as 1797 there had been plans by the Revolutionary government to invade

Britain with 120,000 troops through Ireland, where anti-British sentiment was widespread. However, Napoleon took a gamble by striking at Britain's interests in the eastern Mediterranean. In 1798 he brought an expeditionary force to Egypt to block Britain's access to India and the Orient. However, this disastrous campaign forced Napoleon to consider another plan. Between 1803 and 1805 the fleets of France and Spain (from 1804) were assembled to destroy the Royal Navy in preparation for an invasion of Britain. The Battle of Trafalgar, however, ended Napoleon's hopes of defeating the British and marching to London.

Since a direct invasion of Britain remained impractical, Napoleon decided to launch an economic war. An 1802 French survey of the British economic system concluded that Britain's ability to finance its war against France would be endangered if its access to markets was closed off through a combination of conquest and diplomacy. In 1806, but particularly from 1807 onward, the Continental System was applied to choke off Britain's access to capital in Europe, making it difficult to subsidize allies and necessitating budget cuts in its military. The Berlin and Milan Decrees of 1806 and 1807, respectively, forbade neutral nations, under threat of seizure, from purchasing British goods and from transporting cargoes through British shipping. The British responded with its Orders in Council forbidding trade with French shipping. In 1807 Russia agreed to participate in the Continental System, and in the same year the Royal Navy bombarded Copenhagen and captured the Danish fleet to prevent Denmark from participating. In 1808 France invaded Portugal because of its refusal to boycott British commerce. While the Continental System had an immediate effect of raising prices and encouraging smuggling, it proved difficult to drive Britain into bankruptcy, for the British looked outside Europe for potential markets. Moreover, it was the British Orders in Council that ignited the War of 1812 with the United States. By 1810 Russia withdrew from the Continental System, rendering it ineffective.

### **British Grand Strategy**

Britain went to war against France in 1793, not so much out of opposition to the Revolution but for traditional security concerns, which included protecting the Low Countries from French aggression. Beginning with the ministry of William Pitt, the British government formed seven coalitions with other European powers to restore the balance of power on the Continent, with the ultimate goal of restoring the Bourbons to the throne with a constitutional government (though from 1803 the return of the Bourbon dynasty ceased to be a *sine qua non* of peace). The British gained support of French royalists and émigrés and recruited a small number for the ranks of its own army. As

Napoleon and his corps commanders considering the next strategic move during the Russian campaign in 1812. (Print by W. Wereschtschagin from *Illustrierte Geschichte der Befreiungskriege* by Julius von Pflugk-Harttung, 1913)

early as 1799 Pitt envisioned that the borders of France would be rolled back to those of 1789, surrounded by strong buffer states, particularly in northern Italy, backed by Austria, and in Belgium, backed by Prussia and Holland. Despite the numerous setbacks from Napoleon's victories, Britain tirelessly crusaded to restore the balance of power in Europe.

Crucial to the British war effort was the Royal Navy's command of the sea, which deterred any attempts at invasion of the British Isles. In 1793 Britain went to war with a relatively new fleet in prime condition, which, however, had deteriorated by 1807. In 1803 the Royal Navy had 82 ships, of which 32 were ships of the line. By 1809 the navy had 108 ships of the line, 150 frigates, and 424 sloops. The cost of maintenance and construction of naval vessels rose over the years and peaked at £20 million in 1813. Aside from spectacular naval engagements such as the Battle of the Nile and the Battle of Trafalgar, the Royal Navy's contribution to British victory over Napoleon came in the form of the blockade of French ports (and those of its allies) from 1803–1815, a blockade that could not be broken by Napoleon's navy. Naval supremacy in numbers and ef-

fectiveness was assured after the victory at St. Vincent against the Spanish on 14 February 1797; at Camperdown against the Dutch on 11 October 1797; at the Nile against the French on 1 August 1798; at Copenhagen against the Danes on 2 April 1801; and above all at Trafalgar against the French and Spanish on 21 October 1805. The Royal Navy's presence in the Baltic, the Mediterranean, the North Sea, and the Atlantic gave Britain a projection of power that facilitated the dispatching of expeditions anywhere on the Continent and to much of the world besides.

The British Army was no less impressive. In 1804 Britain's regular army consisted of 150,000 troops, which grew to 260,000 in 1813. The army was also augmented by foreign troops from Hanover known as the King's German Legion. Britain itself was protected by a regular militia, which consisted of 60,000–90,000 men. The Volunteers, numbering around 300,000 men, were a part-time reserve who trained for twenty-eight days out of the year and were maintained in case of an invasion. The regular army generally remained in Britain for home defense, to maintain a strong army in Ireland, and to garrison the Channel Islands. The colonies also required large numbers of troops.

As a result of these concerns about home defense, Britain's forces never reached the size of its allies' forces, and thus the island kingdom depended on alliances with the major continental powers to defeat Napoleon.

In the course of twenty years, Britain assembled seven coalitions to defeat France. However, assembling those coalitions was not easy, nor did it guarantee immediate success. The first and biggest challenge to British foreign policy was convincing the other European powers of Britain's goodwill and constantly reminding them of the threat Napoleonic France posed to the security of Europe. As early as 1794 Prussia and Austria were more suspicious of each other than of France, and both eyed Russia warily in their designs for central and eastern Europe. Second, all the other powers were jealous of Britain's commercial wealth. Austrian, Prussian, and Russian envoys often reported that they were suspicious of Britain's call to arms out of concern that in overthrowing Napoleon, Britain would become a threat to their respective governments' interests. Moreover, they resented the fact that while the continental powers suffered in terms of men and resources, Britain was merely paying for the service of ridding the world of Napoleon by furnishing subsidies to its allies.

At the beginning of the Napoleonic Wars Britain suffered reverses, particularly in the Low Countries and the Mediterranean. The British government expected a short conflict that would result in the restoration of the Bourbons. The prime minister, William Pitt, promised the Prussians a foothold in the Rhineland and pledged to restore Flanders to the Austrians. The First Coalition, consisting of Austria, Prussia, Britain, Spain, Holland, Sardinia, and other minor powers, collapsed in 1797 in the wake of French victories in Italy, though Prussia and Spain had already withdrawn from the war two years earlier. On 24 December 1798 Britain formed the Second Coalition, which included Austria, Russia, Naples, Portugal, and the Ottoman Empire. The Second Coalition collapsed in the wake of Napoleon's defeat of Austria, ending with the Treaty of Lunéville on 9 February 1801, Russia having effectively withdrawn in 1799. On 27 March 1802 Britain concluded peace with France through the Treaty of Amiens, in which Britain surrendered all the colonial possessions it had captured except for Trinidad and Ceylon (Spanish and Dutch possessions, respectively).

The peace that resulted lasted only a year, and in 1805 Britain formed the Third Coalition with Austria, Russia, and Sweden. Even though Britain was safe from invasion after the Battle of Trafalgar, Napoleon decisively defeated the Austrians and Russians at the Battle of Austerlitz on 2 December 1805, resulting in the granting of considerable concessions from the Austrians. In 1806 Prussia, Russia, and Sweden joined Britain in the Fourth Coalition, high-

lighted by Prussia's crushing defeats at the twin Battles of Jena and Auerstädt on 14 October of that year and Russia's defeat in the Battle of Friedland on 14 June of the following year. Both powers made great concessions in the landmark Treaty of Tilsit, which marked the zenith of Napoleon's power. Undeterred, Britain continued to prosecute the war, and, unbeknownst to contemporary observers, the beginning of Napoleon's defeat lay in Spain.

Napoleon's overthrow of the Spanish royal family and the occupation of their country under his brother Joseph sparked a popular uprising that would ultimately cost France heavily in men and resources, inaugurating a bitter conflict known as the Peninsular War (1807–1814). Britain sent troops to Spain in 1808, but they were evacuated at Corunna early the following year. Another expeditionary force under Sir Arthur Wellesley (later the Duke of Wellington) landed in Portugal. Wellesley's forces, combined with Portuguese and Spanish regulars and supported by guerrillas, inflicted heavy casualties on Napoleon's army. Throughout his six years in the Iberian Peninsula, Wellesley never commanded more than 60,000 men, yet he was able to use them very effectively against far larger opposing armies. Tactically, he preferred to position his troops on high ground and to invite attack. In all, Napoleon lost about 400,000 troops from his "Spanish ulcer," which contributed substantially to his final defeat.

Britain's persistence in prosecuting the war against Napoleon was possible because of its commercial and economic supremacy. To compensate for its small military presence on the Continent, the British government gave substantial loans and subsidies to its allies. Yet British economic policy also raised tensions with other European powers. In order to generate the funds necessary to grant loans and subsidies on the scale required, Britain demanded that its allies provide access to their markets, which threatened their domestic economies. Between 1793 and 1802 the British government furnished £9.5 million in subsidies and £6.25 million in loans. Between 1803 and 1812 successive British governments provided a total of £23.25 million in subsidies and £600,000 in loans. Between 1813 and 1815 Britain spent £26.25 million in subsidies and loans (Duffy 1989, 139–142). Yet even these immense sums the continental powers thought insufficient, convinced as they were that Britain possessed endless financial resources. However, as the war continued, the continental powers grew more dependent on British money and materiel in order to continue the war against Napoleon.

The British government had to raise the revenue to subsidize its allies without alienating the British population. Successive governments raised revenue through taxes and by increasing the national debt, at which by this time the Bank of England had become most adept. Between

1793 and 1815 the British government's revenue from taxes totaled £1.217 billion, plus £440 million in loans. In the last few years of the war the government borrowed more than £25 million a year (Kennedy 1987, 130). The decision by the Bank of England to go off the gold standard and issue paper currency opened a reserve of funds that could be devoted to the war effort. Inflation was at a moderate level, and the burden of taxation, particularly the income tax, fell not on the poor but on the rich, who stood most to gain from victory.

Britain emerged from the Napoleonic Wars more powerful than ever. Its colonial empire grew larger as a result of territories it acquired during the war, such as Tobago, St. Lucia, Mauritius, the Cape of Good Hope, Malta, and Guyana (Guiana). At the conclusion of the Napoleonic Wars, foremost for Britain and the European powers was the question of containing France. The chief architect of the British plan for post-Napoleonic Europe was the foreign secretary, Lord Castlereagh. The borders of post-Napoleonic France were rolled back to its 1790 borders. The Bourbons were restored, with Louis XVIII on the throne. Belgium was ceded to Holland, while Prussia received territory on the Rhineland. After his defeat at Waterloo, Napoleon was exiled to the remote British possession of St. Helena in the South Atlantic, where he could never again threaten the peace of Europe. Britain entered into the Quadruple Alliance with Austria, Prussia, and Russia to maintain the principle of legitimacy and to maintain the balance of power.

However, aside from Britain, Russia stood most to gain from the postwar settlement, potentially threatening British interests, for Russian troops had occupied Paris after the fall of Napoleon. Castlereagh abandoned the previous policy of drawing Russia into the European alliance system by allying with France and Austria to check Russian influence and ambitions in central Europe and by favoring closer cooperation between Austria and Prussia. Notwithstanding the shifting winds of continental politics, after the Congress of Vienna Britain was secure in its naval and commercial supremacy, neither of which were to be challenged for most of the nineteenth century.

The Napoleonic Wars influenced the study of grand strategy. Napoleon's tactics and strategy are still studied by military officers today. Karl von Clausewitz, who served in the Prussian Army, wrote his treatise *On War* based on his observations. He maintained that war was an extension of political policy and that military strategy must coincide with political objectives. Clausewitz envisioned "wars of the people" as the wars of the future, which would be more destructive than the dynastic wars of the eighteenth century. The Napoleonic Wars presaged the era of total warfare that would emerge with the world wars of the twentieth

century. Even with the technological advances of the last two centuries, the study and formulation of grand strategy remains as pertinent today to national decision makers as it did to those of the Napoleonic era.

## Grand Tactics

Among the principles of war the first is perhaps the most important: The aim must be selected and maintained. This applies at all levels of military planning, from grand strategy down to minor tactics. The levels are:

- *Grand strategy*: What the aim of the whole is. Napoleon's aim was to conquer Europe.
- *Strategy*: The means of achieving the grand strategy. Napoleon conquered individual nations or armies whenever possible and then imposed satellite rule.
- *Grand tactics*: Now known as the operational level. Napoleon used speed of maneuver and surprise as his method of defeating his enemies piecemeal or before they had time to form an army capable of defeating him.
- *Tactics*: The method of fighting the enemy face to face.
- *Minor tactics*: The methods used by individuals and units to defeat the enemy locally.

All the levels are dependent on each other both up and down, and Napoleon himself made the decisions relating to matters down to the grand tactics level, leaving tactics and minor tactics to his corps and divisional commanders and those in the units below that level—right down to the individual soldier.

Napoleon was one of the few great generals who was consistently flexible. He never had any rules to bind him in his operations, but he did adhere to certain maxims. Critical to him was observation of the principles of war to the extent that commanders would adapt themselves to the principles, which resulted in making war as much a science as an art. He believed there was much to be learned from such great commanders as Alexander the Great, Caesar, and others, who by imitating he hoped to achieve success on the same scale. His operational concept was grounded in the economical use of the forces available to him and the concentration of all his effort at the decisive point of the campaign or battle. He sought at all times to catch the enemy off balance and then pick off the parts of his army at will. He believed too that one must “make war offensively” (Napoléon 1858–1870, 4: no. 281), the only way to become a master of the art of war.

It is at the operational level that great generals become great. The higher regions of strategies are often quite simple to formulate, but putting the right force in the right place and at the right time will almost inevitably lead to victory in battle. To this end Napoleon trained his infantry in marching at speed over long distances. By this means he was able to ensure that he was almost always ready to fight before the enemy was strong enough to resist his attack, and he could undertake campaigns of a size that lesser generals with slower armies could not comprehend. Napoleon sought to force his enemies to react to his operations rather than to plan for themselves.

Napoleon was a planner; he said that he always worked out his proposed courses of action some months ahead. He also carried out assessments both of what his enemies were capable of doing in the situation presented to them by his actions and of what they were most likely to do. At the same time he was acutely aware of the operation of chance on the best-laid plans. All eventualities had to be carefully considered, with seemingly inconsequential factors sometimes carrying disproportionate weight.

His operational planning was superb, and he employed every method of deceit and stratagem to conceal his plans from the enemy. He closed the borders of France, had Joseph Fouché's secret police search for traitors, and moved troops in one direction only to have them change direction at night or once they were out of sight. In one celebrated maneuver during the campaign of 1805 he moved his cavalry ahead of his main army to create the impression of a frontal attack through the Black Forest, only to redeploy them as a flank guard for an attack further north.

He appreciated the whole picture of war; he understood the art of maneuver better perhaps than any of his contemporaries, whose armies were more ponderous and unable to alter direction once set upon a particular move. Further, he understood the value of the components of his army—infantry, cavalry, artillery, engineers, and commissariat—and he used them in a concerted fashion that laid down precepts of the operational art that are still valid today.

Napoleon said, “If you lose a battle your army is lost. . . . An army superior in cavalry will always have the advantage of being able to cover its movements, of being well informed as to the enemy's movements, and giving battle only when it chooses. Its defeats will have few evil consequences and its successes will be decisive” (Napoléon 1858–1870, 6:346). This was the heart of his operational or grand tactical concept: He knew that without cavalry he would have less intelligence of the enemy, would be less able to control conditions on the battlefield, and would be limited in his ability to secure the final destruction of the enemy. On the battlefield itself

cavalry could protect his flanks, guard against enemy cavalry attacks, and deliver a final, demoralizing charge or pursue the beaten enemy until the opposing force was of no threat to his future operations.

Time was, to Napoleon, a fundamental factor in operations. "I may lose a battle," he said, "but I shall never lose a minute." To this end he realized that his rapid movement of troops contributed much to his success: "Marches are war" (Napoléon 1858–1870, 6:346). As a highly intelligent commander he also realized that to press his men too much was to send them exhausted into battle. For this reason he chose (or had chosen) routes that were the shortest or the easiest to negotiate. His men moved on average about 12 miles per day, but in crises he could ask for more. The smoothness with which whole armies changed direction on a single order shows that his method was practical and was backed by good staff work and training.

Napoleon's staff supported him to the hilt, allowing him to choose operational options that suited his aim: to bring the enemy to battle in a place of his choosing and at the time he planned. On the eve of battle Napoleon had his troops assembled so that they could, on the day of battle itself, outflank the enemy on either side without any major realignment. They were assembled, not concentrated, so that his operational flexibility was maintained until the very last moment before they were committed to the fight.

## Grant, Colquhoun (1780–1829)

One of the most famous of the Duke of Wellington's exploring (intelligence) officers during the Peninsular War, Colquhoun Grant was known for his honesty, ability to handle tough situations, and outstanding ability to learn languages and customs. Although Grant's adventures behind enemy lines are legendary, his major achievement was organizing intelligence as an overt function of war.

Grant was born into a military family, and at the age of fourteen he began his military career as an ensign. Within two years he purchased his lieutenantcy (the only promotion by purchase in his career). Grant participated in the 1798 expedition to Ostend, was captured, and spent a year in a French prison. Following his release, he spent six years in the Caribbean, reaching the rank of captain. In 1807 he was stationed on the Portuguese island of Madeira and in 1809 was transferred to Lisbon.

The Battle of Busaco (27 September 1810) was Grant's first and last major battle as an infantry officer. Grant's unique skills, which enabled him to procure large quantities of cattle and food while a hungry British army was at Torres Vedras, caught Wellington's attention. Grant was subsequently always employed by Wellington on special duties.

Wellington made Grant an exploring officer whose duties included riding behind enemy lines, in full uniform, collecting information and developing networks of informers. (Because spying was considered unseemly and was punishable by death, exploring officers always wore their uniforms.) Wellington had numerous exploring officers, but Grant was considered the duke's best source of intelligence.

On 16 April 1812 Grant and his local guide, Leon, were captured. Leon was immediately shot as a spy, while Grant was treated as an officer and gentleman, even dining with Marshal Auguste de Marmont. Grant later accepted parole, believing it would give him the opportunity to continue sending information to Wellington. Marmont, in a violation of the parole, arranged to have Grant turned over to the French secret police. Grant saw a copy of the letter confirming the arrangements and, knowing it amounted to a death sentence, escaped. Instead of heading south to rejoin the British army, he claimed to be an American officer and headed to Paris.

After spending several months in Paris, sending intelligence back to Wellington, Grant escaped from the Continent on a French fishing boat. He rejoined Wellington in time for the Battle of Orthez in 1814. During Napoleon's Hundred Days, Wellington appointed Grant head of field intelligence. While out in the field, Grant received information that Napoleon had left Paris and was moving north. Grant immediately sent the intelligence to Wellington, but

the courier was intercepted by a cavalry patrol. Major General Sir William Dornberg, commander of the cavalry, did not believe the information and refused to let the courier take the message to Wellington. By the time Grant delivered the information himself, it was too late. In the famous words of Wellington, Napoleon had “humbugged” him (Wooten 1999, 31). If Grant’s message had arrived, Wellington would have had twenty-four hours to concentrate his army to meet Napoleon, and the Waterloo campaign might have been decisively different.

After four years on half-pay, Grant took a position in India, participating in the First Burmese War (1823–1826) and attaining the rank of lieutenant colonel. The years of campaigning in India took a toll on Grant’s health, and he died in Aachen.

## Great Britain

The abbreviated form of what became known, after the Act of Union in 1801, as the United Kingdom of Great Britain and Ireland, consisting of England, Scotland, Wales, and Ireland—though contemporaries, both Britons and foreigners alike—often erroneously referred to the collective whole as “England.”

The period of the French Revolutionary and Napoleonic Wars saw Great Britain establish the foundations of its preeminent position in the nineteenth century. Economically, Britain created the world’s first industrial economy while it dominated world trade. Politically and militarily it built the largest empire the world had ever seen while it established unquestioned dominance over the world’s oceans. Facing the external challenge of Revolutionary and Napoleonic France, Britain remained its most consistent and successful foe. Facing the domestic challenge of revolutionary ideas, the British elite weathered opposition from radical movements for religious equality, parliamentary reform, more frequent elections, and, in the most extreme formulations, the question as to whether all

adult males should be granted the right to vote. It also faced and met the difficult challenge of maintaining control over Ireland.

The British economy was being transformed by the so-called Industrial Revolution, a term not used at the time. The first surge of industrialism was in the manufacture of textiles, particularly cotton. Economic expansion in textiles was initially based on a series of technical and organizational innovations in spinning and weaving, including the spinning mule, the spinning jenny, the power loom, and the steam engine with separate condenser. The British textile trade, particularly in cottons, was export oriented, and it was so efficient that despite Napoleon’s attempts to exclude British goods from the European continent, even the French Army was clothing soldiers in English cotton cloth. In addition to Europe, colonial markets were very important, as were exports to India and Africa. Even the United States, despite its Anglophobia, continued to be a major market for British manufactured goods. Other British industries that were expanding included iron and coal, both of which would receive a powerful stimulus from the demands of war.

Most of the British populace were members of the established Church of England or the established Church of Scotland. Protestant Dissenters, many influenced by the Enlightenment, often opposed what they saw as the rigidity and exclusiveness of the established churches as well as corruption and despotism within the British state. Some of the most influential early sympathizers with the French Revolution, such as Richard Price and Joseph Priestley, were Dissenting ministers. Catholics were barred from most forms of political participation in both Britain, where they were a small minority, and Ireland, where they were an overwhelming majority, but their opposition to the British state would be tempered by hostility to “anti-Christian” Revolutionary France.

Although the social impact of the Industrial Revolution was manifest in such centers of industry as Manchester and Birmingham, Britain remained a society whose ruling class derived its power from the land. The political center of Britain’s ruling elite was the unreformed Parliament, both of whose houses, the House of Lords and the House of Commons, were dominated by landowners. The prime minister for the early period of the wars was William Pitt, who held the post from December 1783 to his death in 1806, with one interruption from 1801 to 1804. Pitt relied principally on his own great ability and the support of King George III rather than appealing to the public. Pitt’s great rival, Charles James Fox, whom the king loathed, was forced to ally with the heir to the throne, the future George IV. Fox had briefly come within sight of power in the “Regency Crisis” of 1788, when George III’s

madness nearly made his son the regent. Fox's shrinking body of followers (many went over to Pitt) kept the designation "Whig," while Pitt's followers were referred to by the revived term "Tory" and later as "Conservatives." Largely excluded from high politics were the radicals, often Protestant Dissenters, who continued to charge the British constitution with subservience to royal despotism and, more credibly, with corruption. A more moderate movement with some elite support, which did not challenge the legitimacy of the British state, fought for the abolition of the slave trade.

The French Revolution further polarized British politics. Many people, including Fox, first greeted the Revolution with the hope that France would now adopt a parliamentary government on the British model, but horror at French excesses, including the Terror and the execution of the king and queen, accelerated the conservative reaction that had begun with Pitt's coming to power. This reaction extended to religion as well as to politics as many Britons turned away from the more secularist culture of the Enlightenment. Sympathy for the exiled French Catholics and Catholic priests in Britain even moderated some British anti-Catholicism. Not all Britons were repulsed by the French Revolutionaries, however. Some British radicals—the so-called British Jacobins—openly sympathized with the Revolutionary cause. Radicals, including the young William Wordsworth, sympathized with the French and made Thomas Paine's *The Rights of Man* (1791–1792) a bestseller, selling over 200,000 copies, far exceeding the still very successful *Reflections on the Revolution in France* (1790) by the antirevolutionary Edmund Burke.

On 1 February 1793 Pitt's government declared war on France, so opening a conflict that would last, with one break (the Peace of Amiens, March 1802–May 1804), until 1814, and again briefly in 1815. At the same time, the prime minister responded domestically to the popularity of the French Revolution in Britain by repressing dissenters, suspending habeas corpus, and crushing the radicals in what came to be called "Pitt's reign of terror" in 1793–1794. The repression was particularly harsh in Scotland, which had a code of law and legal structure different from England's, with fewer safeguards for the accused. The government had less success in England, but it still managed to cow reformers or drive them underground. Not all of the opposition to radicals was directed from above, however. British sympathizers with the French Revolution also inspired popular opposition, partly because they were revolutionary and partly because they were associated with France, the "traditional enemy." Loyalist "Church and King" mobs, encouraged by local gentry and Church of England clergy, attacked Dissenting chapels and individuals suspected of sympathy

with France, the most notable example being Priestley, who was eventually driven out of the country.

The outbreak of the war in 1793, precipitated by the French conquest of the Austrian Netherlands, caught Britain militarily unprepared. The army had fewer than 50,000 men, though this was partially offset by the unmatched power of the Royal Navy, which enjoyed a substantial numerical superiority over its French counterpart notwithstanding Britain's far-flung imperial commitments. Both the creation and maintenance of a large military force and the endless subsidies required by Britain's continental allies would strain the British treasury, forcing the adoption of an income tax in 1799. British assets in the war with France included its geographical position, which meant that any French invasion would have to be seaborne, its navy's control of the seas, and its dynamic economy, which made it the paymaster of the anti-French coalitions. Revolutionary France faced the same disadvantage at sea that Bourbon France had faced in its eighteenth-century wars, and it never successfully challenged British naval supremacy. A planned French invasion across the Channel in 1797, for which Napoleon Bonaparte was appointed commander of the Army of England, was abandoned as impractical owing to Britain's naval power.

The same year, however, saw a much more dangerous threat to British naval supremacy from a different quarter: its own sailors. Mutinies in April and May conducted by the sailors at the naval stations at Spithead and the Nore were precipitated less by sympathy with the French Revolution than by low pay, often made in arrears, and poor food and working conditions. The government resolved the crisis by making concessions to the sailors and punishing the ringleaders of the Nore fleet, which had actually blockaded London and proclaimed its sympathy with the French.

The naval mutinies and the Irish revolt of 1798 precipitated another wave of repressive legislation, including the Unlawful Oaths Act of 1797 aimed at secret societies, the 1798 Newspaper Act establishing tight controls over the press, and the 1799 Corresponding Societies Act suppressing political committees of correspondence (groups organized by letter-writing). The Combination Acts of 1799 and 1800 were aimed at workers' organizations and combined the government's desire to repress popular organization with employers' desire to crush workers organizing for improved wages and working conditions.

The need to effectively control Ireland, whose restiveness with British rule made it both a site of rebellion and a target of French invasion, led to the Act of Union of 1801, which joined Great Britain and Ireland into the United Kingdom. The incorporation of Ireland into the British polity made Catholic emancipation an issue in British

politics. Pitt and much of the political elite, including the Whig opposition, supported the granting of political rights to Catholics as a quid pro quo for Irish Catholics' acceptance of the union, but they were firmly and effectively opposed by the king and most of the Protestant population.

The navy, recovering from the mutinies, won an important victory under the greatest admiral of the war, Horatio Nelson, at the Battle of the Nile in 1798. The battle forced Napoleon to abandon his Egyptian expedition. Napoleon would organize another attempt at an invasion of England in 1805, this time with Spanish aid. Nelson's greatest victory, at Trafalgar in 1805, cost the admiral his life but destroyed any possibility of a French invasion and established Britain's complete domination of the seas.

The struggle by land was initially far less successful. At the outset of the French Revolutionary Wars, British forces initially played only a minor role in the war in Europe. In the Caribbean the British lost many soldiers in an unsuccessful intervention in the Haitian revolution and, above all, as a result of tropical disease. The relatively minor role of the British Army in the nation's war effort only changed after 1808 with the Peninsular War, in which Sir Arthur Wellesley (later the Duke of Wellington) established his reputation as Britain's leading general despite inadequate support from the British government. The British Army still played a relatively minor role compared to those of the great continental powers. Even Wellington's victory at Waterloo, which ended the wars, was achieved with an army containing a substantial non-British element, not to mention vital assistance from the Prussians.

The confrontation between Britain and France was economic as well as military. A key front was trade. The importance of the export trade for the British economy was also a weakness. Although Napoleon could do nothing to prevent Britain from exporting outside Europe, he did attempt to close the European market to British exports with his Continental System, by which the ports of French-controlled Europe were closed to British trade. The British also had difficulty exporting to the United States, which under President Thomas Jefferson attempted to isolate itself from the European war. (Shipping-related disputes between Britain and the United States would eventually lead to the War of 1812.) Britain responded to Napoleon with a series of Orders in Council, which essentially put all French-ruled Europe under a blockade, demanding that all exports to Europe pass through Britain first. The Orders in Council aroused fierce opposition from the British business community, however, and were abandoned in 1812.

Politically, after the death of Pitt no one figure was dominant. A coalition including Fox, the so-called Min-

istry of All the Talents, proved short-lived. The most successful prime ministers in the later period of the wars were Tories, Spencer Perceval and Robert Banks Jenkinson, the Earl of Liverpool. George III's final descent into madness in 1810 brought his son into power as Prince Regent the following year, but by that time the future George IV had lost most of his sympathy with the Whigs, and his ascent had little impact on the war effort.

The wars cost Britain approximately £15 billion and 210,000 lives. Victory in the French Revolutionary and Napoleonic Wars enabled the British to vastly expand their empire. The British acquired many new territories, including the Dutch colonies in Ceylon and South Africa, the Spanish Caribbean colony of Trinidad, and the Mediterranean island of Malta. They also expanded their possessions in India. Britain's imperial predominance would not be seriously challenged until the late nineteenth century.

## Grenville, William Wyndham Grenville, Baron (1759–1834)

British foreign secretary and prime minister who continued the wars against the French Revolution and Napoleon, William Grenville was born on 25 October 1759 at Wotton House, Wotton-under-Bernewood, Buckinghamshire, the youngest son of former prime minister George Grenville (in office 1763–1765) and cousin of William Pitt the Younger, who served as prime minister from 1783 to 1801 and from 1804 to 1806. Grenville was educated at Eton and Christ Church, Oxford, before being elected a Member of Parliament for Buckingham in 1782. Grenville married Anne Pitt, the daughter of Thomas Pitt, First Baron Camelford. He served as chief secretary for Ireland (1782–1783), paymaster and joint paymaster of the forces (1783–1789), and vice president of the Board of Trade (1786–1789), and in 1787 he was sent to The Hague and to Versailles to discuss economic and political matters related to Holland as a champion of free trade.

In 1789, as the French Revolution was breaking out, he became speaker of the House of Commons, and was appointed home secretary (1789–1791), responsible for law and order across the country. Grenville oversaw policing, criminal justice and prisons, immigration, and internal security. He became leader of the House of Lords (November 1790–February 1801) after being raised to the peerage as Baron Grenville of Wotton-under-Bernewood in 1790.

As an ally of Pitt, Grenville became foreign secretary (1791–1801), handling foreign relations for Britain during the French Revolutionary Wars and playing a significant part in raising the First and Second Coalitions against France. His decade as foreign secretary was a dramatic one as a prominent member of a government in favor of prosecuting the war, and he supported Pitt’s measures for domestic security. His policies supported British forces fighting on the European continent while endeavoring to maintain control of the seas. Grenville and Pitt resigned in 1801 over the question of Catholic emancipation when King George III refused to grant political rights to Roman Catholics.

Pitt was replaced by Henry Addington (prime minister from 1801 to 1804), who negotiated the Treaty of Amiens in 1802. However, the king and the Addington government refused to evacuate Malta, precipitating a crisis that resulted in the resumption of war with Napoleon in 1803. Grenville befriended the Whigs, allying himself with Charles James Fox and refusing to reenter the ministry when Pitt returned as prime minister in May 1804.

Following Pitt’s death in January 1806, Grenville was asked by the king to form a government (February 1806–March 1807). Grenville became prime minister, and his

cabinet included Fox (who, however, died in September 1806), to be replaced by Viscount Howick (shortly thereafter to become Earl Grey on the death of his father in 1807) as secretary of state for foreign affairs. Grenville's government was a coalition of his own followers, Foxite Whigs, and friends of Addington (Lord Sidmouth), who became Lord Privy Seal and president of the council in this political coalition known as the "Ministry of All the Talents." The Grenville ministry was responsible for the abolition of the slave trade in 1807. Grenville reformed the treasury's accounting system, strengthened the armed forces while continuing to prosecute the war against Napoleonic France, and reorganized the governing of Scotland to ensure support from the Scottish members of Parliament for the war effort. He was leader of the House of Lords for a second time from February 1806–March 1807.

Grenville's support for the Catholic Relief Bill in opposition to George III led to his government's resignation in March 1807. Grenville had attempted to repeal the Test Laws and allow Catholics to serve as officers in the British Army and the Royal Navy, but the king viewed this as an attempt to undermine the Church of England, whose preeminence he was sworn to uphold. Grenville became chancellor of the University of Oxford from 1810 until his death on 12 January 1834. He continued to support the Whigs, led by Earl Grey in Parliament, although in 1815 he supported the prowar position of Robert Banks Jenkinson, second Earl of Liverpool. A stroke in 1823 ended his political career, but he continued as chancellor of Oxford until his death.

## Gribeauval System

As a young officer Napoleon Bonaparte was a gunner, and when he took command of the Army of Italy in 1796 he in-

herited an artillery that had been reorganized by Jean-Baptiste Vaquette de Gribeauval. Gribeauval had served as first inspector of artillery in the 1770s, during the reign of Louis XVI, but his substantial reforms were still of value to the Revolution and, later, to Napoleon. Gribeauval concentrated on making artillery much more mobile and on standardizing calibers. Field guns were issued in three "natures," which were the 4-, 8-, and 12-pounder guns, plus a 6-inch howitzer. For siege operations 18- and 24-pounder guns were used, but the mobility of these guns could never be greatly improved and they were never seen on the main battlefield. To improve mobility Gribeauval reduced the length and weight of the gun barrels and also of the gun carriage. Gun carriages were fitted with iron axle trees and larger-diameter steel-rimmed wheels.

To improve the accuracy of the guns, the manufacture of shot was also standardized. Shot was now made truly spherical and to the correct caliber, which in turn reduced the amount of powder needed to fire the shot. Gribeauval also introduced the system of issuing powder and shot in one composite shell, making the work of the gun crews much simpler and easier. As noted, guns fired shot, simple round iron balls, but they could also fire canister shot, which consisted of thin tin cylinders, in diameter slightly less than the caliber of the gun, filled with musket balls. A typical canister shot contained about 180 musket balls, which sprayed from the muzzle of the gun in the same way that shot spreads from a shotgun cartridge. At short ranges canister was a devastating weapon, but it was limited in effectiveness to approximately 300 yards. It is interesting to note that British gunners soon adopted canister, and when attacked by cavalry, they loaded canister in front of round shot so that the balls would disable the leading cavalry and the round shot would penetrate further. By the Battle of Waterloo both the French and the British were using "common shells" in their howitzers. These were fused hollow metal spheres with a range of between 750 and 1,300 yards. To be effective the fuses that exploded the charges in the spheres had to be cut accurately, a skill that continued to elude French gunners.

Gribeauval's contribution to the development of artillery was significant: He made it more mobile so that it could offer direct fire in infantry support. Napoleon, toward the end of his command, used a large quantity of artillery to compensate for the decreasing quality of his conscript army. The Duke of Wellington used artillery more as a scalpel than as a hammer.

### Grossbeeren, Battle of (23 August 1813)

The Battle of Grossbeeren was fought between the (French) Army of Berlin under Marshal Nicolas Oudinot and Prussian forces under generals Friedrich von Tauentzien and Friedrich Wilhelm von Bülow. Oudinot's objective was to seize Prussia's capital city, but he suffered a defeat in the first major action of the autumn campaign of 1813 and was thrown back. This defeat, along with that on the Katzbach on 26 August, canceled out Napoleon's success at Dresden on 26–27 August. Oudinot's forces consisted of IV (General Henri-Gatien Bertrand), VII (General Jean Louis Reynier), and XII (Oudinot) Corps along with III Cavalry Corps (General Jean Toussaint Arrighi de Casanova), a total of 66,000 men and over 200 guns. A substantial part of Oudinot's forces, particularly the infantry, consisted of contingents from the Confederation of the Rhine and from Italy. Both their quality and their reliability were questionable. The training of the cavalry was particularly inadequate.

The Prussian forces involved were part of the (Allied) Army of the North under the command of the Crown Prince of Sweden, formerly Napoleon's Marshal Jean-Baptiste-Jules Bernadotte. The Prussian III Army Corps (Bülow) was around 40,000 men strong. The IV Army Corps (Tauentzien) was around 33,000 men strong, but it consisted almost entirely of untried militia. Only part of this corps was involved in the battle. The motivation of these troops was high, as they were in part Brandenburgers defending their homes.

Oudinot's orders were to push aside the troops defending Berlin, seize the city, disarm its inhabitants, and disperse the militia. If Berlin resisted, Oudinot was authorized to destroy the city. By doing this, Napoleon hoped to severely disrupt Prussia's mobilization.

Grossbeeren lies just to the south of Berlin in what was heavily wooded and marshy terrain. The wooded area contained many undulations, and the marshes were cut by many drainage ditches, so wheeled traffic was largely confined to the few roads that passed through it, restricting Oudinot's lines of advance.

On 23 August Oudinot approached Berlin. Bertrand marched down the Blankenfelde road, Reynier moved

through Grossbeeren, while XII Corps took the route through Ahrensdorf. The woods prevented lateral communications, and there was a danger that the corps could be isolated and defeated individually. Furthermore, Oudinot's cavalry lacked the skills necessary to gather adequate intelligence, so he was operating without accurate information on the strength and dispositions of the forces facing him. He expected to brush aside the half-trained and ill-equipped militia and enter Berlin the next day.

Bertrand, on the right, was the first to make contact with the Prussians, as he moved along the road from Jühnsdorf to Blankenfelde. About 9:00 A.M. he clashed with Tauentzien's vanguard, men of the division of General Leopold Wilhelm von Dobschütz, just south of Blankenfelde. Bertrand's 20,000 men outnumbered the 13,000 Prussians, but the terrain prevented Bertrand from deploying all of them. The Prussian vanguard fought in the woods south of Blankenfelde for several hours, eventually forcing Bertrand to withdraw. He started falling back about 2:00 P.M. Both sides lost about 200 men. For the Prussians, holding off so many Italians for so long at such a small price was considered a remarkable success.

Reynier, in the center and commanding a mixed force of French and Saxons, moved off about noon. The vanguard, General von Sahr's division of Saxons, reached Grossbeeren about 2:00 P.M. The Prussian artillery exchanged shots with them for a short while, before limbering up (hitching the ordnance to a gun carriage) and withdrawing. The three battalions defending the burning village held on for a while, but the Saxons ejected them. Considering the battle over, Reynier's men pitched camp. While they were doing this, Bülow's artillery moved up and fired on them. Meanwhile, Reynier's rear divisions arrived, and the battle now started in earnest.

Bülow's men were exhausted, having been marching in the pouring rain since 7:00 A.M. They too were intending to camp in the area, but news of the earlier combat at Grossbeeren reached them, and since part of Reynier's men were still in the woods, the decision was made to go over to the offensive.

The heavy rain hid the Prussians' movement from Reynier. The divisions of Prince Ludwig von Hessen-Homburg and Colonel Karl von Krafft marched off, with General Heinrich von Thümen and the cavalry and artillery reserves following behind in support. Advancing rapidly to surprise Reynier, the Prussians did not have time to conduct a detailed reconnaissance of his positions. Instead of flanking him, they plunged forward with a frontal assault that was more costly. This attack began with an artillery duel that lasted one and a half hours. Bülow had over 100 guns against Reynier's 68, so he gained the upper hand. The Prussian infantry formed up 300 paces to the

rear of the artillery, waiting for the opportune moment. When the French fire slackened, General Karl von Borstell's division advanced on Grossbeeren from the east, having moved through the village of Kleinbeeren. Krafft approached the windmill west of Grossbeeren, threatening the rear of Sahr's Saxons, who now withdrew rapidly. Their rear guard was involved in close combat with the Prussians; bayonets and musket butts were being used, since the heavy rain hindered the use of small arms.

Reynier now brought up fresh formations to stage a counterattack, employing the divisions of General Pierre Durutte and General Lecoq. The retreating Saxons panicked Durutte's men, two-thirds of them raw conscripts, and they fled without coming into action. Lecoq's men advanced toward the windmill hill, but they did not get halfway before being ordered to withdraw. They turned round and took refuge in the Genshagen wood, along with Durutte's men. Reynier decided not to risk using his last reserve, Colonel von Brause's brigade, in another attack. Instead, he disengaged his men.

Oudinot's column advanced toward the sounds of the guns. General Fournier-Sarlovèze's light cavalry division, from the left column, made some headway, advancing as far as Kleinbeeren and arriving there about 8:00 P.M. Its intervention helped Reynier extract his endangered men and prevented the retreat from becoming a rout. After losing around 100 men, the French cavalry also retired. The bad weather and the general exhaustion of the troops prevented the Prussians from staging a pursuit. The Army of Berlin fell back the following day as well.

The French lost around 3,000 men, along with thirteen guns and sixty ammunition wagons. The Prussians lost around 1,000 men. Although this was a relatively minor affair, it was the first Prussian victory since 1806.

## Grouchy, Emmanuel, marquis de (1766–1847)

An aristocrat and soldier whose courage and outstanding career as a cavalry officer and administrator have been largely ignored, owing to the blame he received for the French defeat at Waterloo. Although he was the last mar-

shal appointed by Napoleon, few French officers served on as many fronts or in as many major battles or received as many wounds as did Grouchy.

Grouchy, of noble birth, was one of many aristocrats to embrace the ideals of the Revolution. He started his military career at age thirteen, attending the Strasbourg Artillery School. Lack of interest in artillery led him to transfer to the cavalry in 1784. Within two years he was a lieutenant in the Royal Guard. His embracing of republican principles put him at odds with his superior officers, but the Revolution saved him from expulsion from the army.

After the Revolution began Grouchy's skills and belief in the Revolutionary cause enabled him to rise quickly in rank, reaching brigadier general of the cavalry in the Army of the Alps (1792). He participated in the suppression of the royalist counterrevolts in the Vendée and Brittany, but the following year he was forced to leave the army as a result of a decree by the Convention, which excluded nobles from military employment. Due to his strong belief in the republican cause, he enlisted in the National Guard as a private.

With the fall of Maximilien Robespierre, Grouchy was reinstated, serving as chief of staff for the Army of the West and playing a significant role in the ill-conceived expedition to Ireland (1796–1797). The following year Grouchy was transferred to the (French) Army of Italy, and during the Battle of Novi (15 August 1799) he received fourteen wounds before being captured. Upon his release, he returned to military service and served with generals Jean-Victor Moreau and Michel Ney in the decisive battle against the Austrians at Hohenlinden (3 December 1800).

Although harboring substantial reservations about the coup of Brumaire, Grouchy served loyally and with great courage in every one of Napoleon's campaigns. His pursuit of the Prussians after Jena-Auerstädt (14 October 1806) is considered one of the greatest in history. His command of the cavalry at Eylau (7–8 February 1807), where he was wounded, was nothing short of brilliant. After his exemplary conduct at Friedland (14 June 1807) Grouchy was sent to Spain to serve as governor of Madrid (1808), where he was responsible for the suppression of the rebellion of 2 May. The following year, his leadership and daring at Wagram (5–6 July 1809) so impressed Napoleon that he was selected to succeed (future marshal) Auguste de Marmont as colonel general of the Chasseurs à Cheval de la Garde Impériale. After receiving numerous other awards, including the Grand Cross of the Order of Bavaria, the Grand Eagle of the Legion of Honor, and others, Grouchy went on the semi-active list from 1809 to 1811.

Grouchy returned to service in time to command one of the four corps of cavalry in the Grande Armée, which

Marshal Grouchy, an accomplished French cavalry officer, served in every major campaign of the Napoleonic Wars including the last, when his refusal to march to the sound of the guns at Waterloo proved fatal to his emperor. (Print by Jean-Sébastien Bouillard from *Life of Napoleon Bonaparte* by William M. Sloane. New York: Century, 1906, vol. 4)

invaded Russia in 1812. At the Battle of Borodino he was hit in the chest by a blast of grapeshot, but he made a quick recovery and served brilliantly as commander of the Emperor's bodyguards covering the retreat from Russia. The physical strain of the retreat left Grouchy temporarily unfit for duty in 1813, but he returned the following year to fight in every major battle (being wounded several times) during the invasion of France. Under the Bourbon Restoration, he was stripped of all titles and honors.

During Napoleon's Hundred Days (the Waterloo campaign) Grouchy rallied to his Emperor's side and was rewarded, on 3 June 1815, by being made the twenty-sixth and last Marshal of the Empire. He commanded the forces that crushed the royalist uprising in southern France, was appointed commander of the cavalry in the Army of the

North, and later led Napoleon's right wing at the Battle of Ligny against the Prussians.

Napoleon's plan for the campaign in Belgium was to leave Paris unnoticed, move up with the Army of the North, and occupy a central position between the Duke of Wellington's Anglo-Allied army and Field Marshal Gebhard von Blücher's Prussian army. That accomplished, he attacked and defeated Blücher at Ligny (16 June) and ordered Grouchy to lead 33,000 men in pursuit of the retreating Prussians. The key was for Grouchy to prevent the Prussians from reorganizing and to keep pushing Blücher's forces north and east—toward Liège—away from Wellington. This would allow Napoleon to turn on Wellington's smaller army, crushing it. If Blücher and Wellington were able to combine their armies, Napoleon was finished.

Everything seemed to be going well for Napoleon. The mauling he gave the Prussians at Ligny was pushing them in the desired direction, and Grouchy was in pursuit. Grouchy, however, lost contact with the Prussians on 17 June, and when he reestablished contact the next day at Wavre, he was unaware that Blücher had reorganized his army and was marching toward Waterloo. On the eighteenth Grouchy heard the sound of the guns at Waterloo, but lacking orders to reinforce Napoleon, he adhered to his existing orders to pursue the Prussians. When Grouchy attacked the Prussian rear guard at Wavre, he thought he was hitting the rear of an army retreating east away from, not moving west toward, Waterloo. Although Wavre constituted a tactical victory for Grouchy, it sealed Napoleon's doom at Waterloo. Grouchy's decisions or lack thereof allowed Napoleon to pin the blame for the defeat on his most recently appointed marshal.

In the two days following Waterloo, Grouchy conducted a masterful retreat back to Paris, where he handed control of the army over to the minister of war, Marshal Louis Davout, and fled to America. He was amnestied in 1821 and restored to the rank of marshal in 1831, but he spent the rest of his life a broken man, reviled by royalists and Bonapartists alike, trying to justify his actions and regain his good name.

**Guerrilla Warfare**

Guerrilla warfare was not a new phenomenon in the Napoleonic period: In most of the conflicts of the eighteenth century, raiding and skirmishing had been a frequent occurrence. However, it was the Revolutionary and Napoleonic periods—or, more specifically, the Peninsular War—that gave the phenomenon of small-scale warfare designed to harass and wear down an opponent by means of constant raids and ambushes its modern name (the term comes from the Spanish word *guerrilla*, meaning “little war”).

At the same time, it was also the Napoleonic period that saw the phenomenon escape the control of the state and start to become an affair of armed civilians acting on their own account in response to the social and economic pressures generated by military occupation or an intrusive regime. From the beginning of the French Revolutionary Wars, in fact, popular resistance was a frequent phenomenon in the French sphere of influence. This was the result of two factors. In the first place, French armies were both much larger and much less disciplined than their eighteenth-century predecessors, with the result that occupation at their hands tended to be particularly unpleasant for the populace. In the second place, with the French and their satellites wedded to the notion of imposing at least the principle of universal conscription, the demands of the state for manpower became much more severe. And in the third place, far from being associated with liberation, the reforms associated with the French Revolution brought great social disruption, an assault on traditional patterns of belief and popular custom, and, in some instances, more exploitation by the propertied classes.

Only in some instances, however, was the response the formation of rebel bands of armed civilians. More commonly, indeed, the response was mass revolt. Thus, in the Vendée (1793), Belgium (1798), and Tuscany and Calabria (1799), spontaneous armies of peasants took on the forces of the state in desperate bids to throw off its yoke. But guerrilla bands did take the field. In the wake of the defeat of its Royal and Catholic Army, the Vendée used this tactic to continue to resist the Revolution, while in both Brittany

and Normandy the period from 1793 to 1800 was marked by the activities of peasant guerrillas known as the Chouans. And on the frontiers of France both the Spanish and the Piedmontese made use of traditional rural home guards—the *somatenes* and the *barbetti*—to harass the invading French armies by means of guerrilla warfare.

It was, however, the Napoleonic period that made the phenomenon famous and produced what may justly be described as the first guerrilla wars in history. When the French invaded Naples in 1806, Calabria again exploded in revolt, except that this time the method chosen was not an insurrectionary army but rather gangs of brigands. When the French intervened in Spain in 1808, they were harassed from the very beginning of hostilities by armed bands known as *partidas*. And, finally, when the Tyrol revolted against Bavarian occupation in 1809, both the mountainous terrain and traditional patterns of military organization—above all, the fact that the Tyrol had always relied for its defense on a peasant militia known as the *Schützen*—made partisan operations an obvious option. Meanwhile, guerrilla war was also to be found outside the French sphere of influence. When revolt broke out against the Ottoman Turks in Serbia in 1804, the fighting was almost entirely the work of bands of irregulars referred to in English as *hadjuks* or *chetniks*, and in Finland the Russian invasion in 1808 was met by the formation of such forces.

As all regular soldiers engaged in the resultant conflicts recognized, the consequences of this phenomenon were very serious. In the first place, the fighting tended to be very protracted: The bands' mobility and knowledge of the difficult terrain in which they usually operated made them hard to hunt down, while they themselves could strike at will (and often proved adept at choosing the spots where the occupying forces were most vulnerable). In the second place, the ability of forces harassed by guerrillas to engage in conventional operations at the same time was severely compromised—hence the enormous problems faced by the French in the Peninsular War. And in the third place, such conflicts, which were inevitably accompanied by atrocities of all types, had a serious impact on the discipline and morale of the troops, while at the same time they eroded collaboration among the civilian population and impeded the imposition of political and social reform. And, last but not least, the losses inflicted by the guerrillas were by no means insignificant.

Yet in reality the problem of guerrilla warfare was not as severe as has often been portrayed. As time went on, strategies were evolved that ensured the eventual defeat of such insurgencies: The Tyrol was overwhelmed in less than a year, and Calabria was pacified by 1810, while even the Spanish *partidas* would probably have been suppressed had the invasion of Russia in 1812 not cut off the supply of

troops to the Iberian Peninsula. Meanwhile, detailed study of the Spanish guerrillas, at least, has suggested, first, that comparatively few civilians took up arms in this fashion; second, that much of the fighting was actually the work of regular troops or organized militias; third, that there was a steady decline in the incidence of organized irregular resistance (as opposed to mere banditry); fourth, that the successes of the *partidas* has often been greatly exaggerated; fifth, that the motivation of many of the combatants had little to do with patriotism; and sixth, that most of the commanders who emerged from the civilian population were at best adventurers who had seized on the war as a means of escaping poverty and obscurity.

In the end, then, guerrilla fighters did not shake the preeminence of conventional warfare; rather, they remained an adjunct to it. Indeed, if one moves away from the special conditions presented by the Iberian Peninsula and the Balkans, the picture that emerges is one that was little changed from the eighteenth century. In both the Russian campaign and the campaign in Germany in 1813, for example, guerrilla warfare was used against the French, but the forces concerned turn out to have been Cossacks, hastily raised volunteer *Freikorps*, and detachments of regular light cavalry—in other words, precisely the same sort of troops as those who had waged the less formal aspects of, say, the Seven Years' War (1756–1763).

## Gulf of Genoa, Battle of the (13–14 March 1795)

A minor Anglo-French naval action fought between approximately equally matched squadrons under Vice Admiral William Hotham, commander in chief of the British fleet in the Mediterranean, and Rear Admiral Pierre Martin commanding the French.

Over the winter of 1794–1795 Hotham maintained a rather ineffective blockade of Toulon from his base in the bay of San Fiorenzo, on Corsica. When the *Berwick* (74 guns) received damage in a swell on 16 January Hotham took his ships to Leghorn (Livorno) to undertake repairs. The French therefore took advantage of his absence to dispatch a force for the recapture of the island. On 3 March a French fleet of fifteen ships of the line and six frigates, together with transports carrying 5,000 men, left Toulon under Martin. Four days later they were within sight of the island. When three of Martin's frigates sighted the jury-rigged *Berwick* leaving San Fiorenzo Bay, they chased, engaged, and captured her.

On 8 March Hotham, lying at Leghorn, received intelligence of a French sighting off Isle St. Marguerite and sent a brig to San Fiorenzo to order the *Berwick* to meet Hotham off Cape Corse. On the ninth Hotham put to sea with a large force. In the van were the *Captain* (74 guns), *Bedford* (74), *Tancredi*, a Neapolitan (74), *Princess Royal* (98), and *Agamemnon* (64). The frigates and smaller vessels included two Neapolitan ships, the *Minerva* (32), and *Pilade* (32). There were also the British ships *Lowestoft* (32), *Poulette* (26), and the brig *Tarleton* (14). In the center were the *Illustrious* (74), *Courageux* (74), *Britannia* (100), *Egmont* (74), and *Windsor Castle* (98). These were accompanied by the *Inconstant* (36) and *Meleager* (32). In the rear were the *Diadem* (64), *St. George* (98), *Terrible* (74), and *Fortitude* (74). There were also the *Romulus* (36), *Moselle* (18), and the diminutive cutter *Fox*.

The enemy fleet of fifteen line-of-battle ships, six frigates, and two brigs were sighted to the south on the eleventh by part of Hotham's force. The enemy was seen again at daybreak on the twelfth, but light winds prevented the two sides from closing. When fresh winds arrived that evening, Hotham approached and formed his order of battle on a westerly course. Poor weather that evening inflicted damage to one of the French 74s, the *Mercure*, which made for the safety of Gourjean Bay with a frigate as her escort.

Shortly after dawn on the thirteenth Hotham perceived that the French had no thoughts of fighting, and he ordered a general chase. The wind was brisk and favored him. Around 8:00 A.M. the *Ça Ira* (80), being third from the enemy rear, became fouled with the *Victoire* (80), in the process losing her own fore-topmast and main topmast. Profiting by this mishap, the *Inconstant*, at about 9:00 A.M., neared the *Ça Ira* on her port quarter and fired into her. The *Vestale* (36), in turn, closed, fired from a distance at the *Inconstant*, and began to tow the injured *Ça Ira*. Notwithstanding this, the *Inconstant* tacked and engaged the *Ça Ira* again with a broadside on the enemy's lee. The *Ça Ira* had by now thrown her damaged masts overboard

and began to fire. This proved sufficient to force the *Inconstant* to bear up.

Around 10:45 the *Agamemnon* took up the fight against the *Ça Ira*, assisted for a while by the *Captain*. Around 2:15 P.M., however, several enemy vessels approached in support, obliging the *Agamemnon* to assume her place in the line. Meanwhile the *Bedford* and *Egmont* were busy with the three rear-most enemy ships, but the British disengaged when the *Agamemnon* ceased her own fire in order to bear up. The French changed to a port tack and kept close to the wind, propelled under full sail by a moderate breeze. Hotham pursued with all sail on a port bearing. Sometime that evening, through negligence or injury, the *Sans Culotte* (120) left Martin's main body. The French also transferred responsibility for towing the *Ça Ira* to the *Censeur* (74), both of which fell astern and to leeward of their consorts.

At dawn on the fourteenth the French were sighted to windward on a port tack, about 20 miles southwest of Genoa. When the breeze changed direction to the northwest at 5:30 A.M., Hotham's ships were then to windward of the enemy, and an hour later the *Captain* and *Bedford* began to engage the *Censeur* and *Ça Ira*. The *Captain*, however, had to take punishment from both vessels for fifteen minutes before she received assistance from the *Bedford*, which increased sail to reach the scene quickly. After an hour and a half of fighting, the *Captain* was seriously damaged in her rigging, sails, hull, and boats. Both the *Captain* and the *Bedford* were towed to safety, both being heavily damaged.

In the meantime the *Illustrious* and *Courageux* had come to assist the *Captain* and *Bedford* and stood ahead and to leeward of Hotham's line. The French responded by wearing in succession (that is, the changing—one after another—of each ship's course by turning its stern to windward) and forming a line with the *Duquesne* (74) leading the van. Martin intended to pass to leeward of Hotham's line, which was sailing to windward of the vulnerable *Censeur* and *Ça Ira*. The *Duquesne* slowly came round, but a light breeze rendered almost all the contending ships incapable of much speed or maneuver. The *Duquesne* now was able to fire from a distance at the stern of the *Lowestoft*, whose captain ordered the deck cleared of everyone save the officers and the sailor at the wheel. This unusual measure prevented serious loss, and before more damage could be inflicted on the *Lowestoft's* sails and rigging, the *Duquesne* was distracted by the *Minerva*, a Neapolitan frigate. When the *Duquesne* finally came round she began, whether by accident or design, to lead the line to windward of Hotham's van instead of to leeward.

At 8:00 A.M. successive engagements began between the *Illustrious* and the *Duquesne* and the *Victoire*, which

were about a quarter of a mile from one another. HMS *Courageux* fought these vessels, as well as the French 80-gun *Tonnant*. An hour later, however, the foremast of the *Illustrious* came down, and fifteen minutes later her mainmast collapsed, taking the mizzenmast with it. She had by then also suffered considerable damage to her spars and hull. The *Courageux* was scarcely better off, having had her mainmast and mizzenmast shot away. Though rendered extremely vulnerable by such injuries, these vessels nevertheless were protected by the becalmed conditions, which meant their enemy could not bear down on them. When the three French vessels eventually drifted away, the stricken British were saved from probable capture.

Soon thereafter Martin decided to leave behind the disabled *Ça Ira* and *Censeur* and to take advantage of a fresh breeze to make full sail westward. Firing ceased around 2:00 P.M. and owing to the damage incurred by the ships of his van, Hotham decided against pursuit. He therefore took the heavily damaged *Ça Ira* and *Censeur*, both of which had fought tenaciously, as prizes. The two vessels had between them lost around 400 killed and wounded.

French losses are not known. The Neapolitans lost one killed and nine wounded. The British lost 73 killed and 275 wounded. Although Hotham took two line-of-battle ships, the victory was a minor one. The prizes and dismasted friendly ships were towed to Spezzia Bay, but the *Meleager* ran aground in Valence Bay and was wrecked. Moreover the *Illustrious* was beyond repair; her men and stores were removed to other ships and she was set on fire. On 26 March Hotham anchored near San Fiorenzo in order to refit. On 18 April, he sailed for Leghorn, which he reached on the twenty-seventh, having left the prizes behind.

## Gustavus IV, King (1778–1837)

King Gustavus IV of Sweden lost much of the once-mighty Swedish Empire, largely owing to his deranged policies based on his fanatical hatred of French Revolutionary ideals and Napoleon.

Gustavus was born in Stockholm on 24 June 1778 as the son of King Gustavus III and his wife, Queen Sophia Magdalena; rumor had it that his real father was stable master Adolph Munck. Gustavus was tutored under Nils

von Rosenstein. He was a serious and abnormally moral young boy. He was mentally unstable all of his life, although no one realized it until much later. As an adult he hid his instability under a cloak of extreme piety. He married Frederica Dorothea, a daughter of the Grand Duke of Baden, on 31 October 1797. They had five children.

Gustavus inherited the throne in 1792 upon his father's assassination. His uncle, the future Charles XIII, ruled as regent. Gustavus came of age in 1796, took over governing, and dismissed his uncle's talented ministers. He refused to be crowned until 3 April 1800. Gustavus adopted reactionary domestic and foreign policies aimed against the ideas of the French Revolution. His implacable revulsion to Napoleon obscured reasoned judgment. This was exacerbated during his presence at Karlsruhe, in Baden, during the abduction of the duc d'Enghien, who was murdered on 21 March 1804 on Napoleon's orders. Gustavus was outraged when his aide-de-camp went to Paris to protest but was dismissed. His violence and incompetence alienated the majority of Swedes, many of whom believed Gustavus was insane.

In the autumn of 1805 Gustavus joined the Third Coalition—consisting of Austria, Russia, and Britain—against France. He believed that Britain's importance to Sweden's foreign trade far outweighed Napoleon's displeasure. Instead, his catastrophic policies resulted in humiliation when he lost Swedish Pomerania to France and Stralsund to Denmark. In 1808 the Swedes were angered even further when they lost a war with Russia and were forced to sign a peace treaty at Fredrikshamn (now Hamina) on 17 September 1809. The treaty recognized the loss of Finland to the Russians, who in July had concluded their war with France by the Treaty of Tilsit. The various wars and treaties left Sweden defeated, vulnerable, isolated, and unable to fight Napoleon.

As a result, on 13 March 1809 Gustavus was overthrown by his officers in a coup d'état that had been legalized by a diet decree. The officers seized him from the palace and transported him to the chateau at Gripsholm. His family was permanently barred from succession to the throne. Gustavus's frail uncle, the senile Duke of Södermanland, who had no legitimate children, succeeded him as Charles XIII on 5 June. The new constitution that was promulgated specified that the Riksdag (the parliament) had equal power with any monarch.

As the last member of the three-century-old Vasa dynasty, Charles designated French marshal Jean-Baptiste-Jules Bernadotte as his successor to the throne. In 1818 Bernadotte was crowned as Charles XIV John (Carl XIV Johan).

Gustavus was initially sent to Germany with his family, but he eventually went into exile in St. Gall, Switzer-

land, and was known as Colonel Gustafsson. Gustavus occupied himself by writing. His wife divorced him in 1812. He lived in abject poverty but had a son by one of his mistresses. He died of a stroke on 7 February 1837. Gustavus was interred in the Riddarholmskyrkan.

### Gyulai, Ignaz Graf von Maros-Nemeth und Nadaska (1763–1831)

From a distinguished noble military family from Siebenbürgen (Transylvania), Ignaz Gyulai led his *Freikorps* against the Turks and French during the 1790s. A successful advance guard and corps commander, he won several victories throughout the French Revolutionary and Napoleonic Wars. An able administrator, as ban (viceroy) of Croatia, he directed the implementation of the 1807 reforms of the Military Frontier.

Born in Hermannstadt (Sibiu), Gyulai joined *Infanterie Regiment* 32 as a cadet at age eighteen, rising to major with the 2nd Banal Grenz Regiment in 1788, which he commanded during Austria's war with Turkey (1788–1791). Promoted to *Oberstleutnant* (lieutenant colonel) in 1790, he established the Gyulai Croat *Freikorps*, which he led at Cetin, where he climbed the walls at the head of his men. Under *Feldmarschalleutnant* Dagobert Graf Würmser in 1793, he led them in the assault on the Weissenburg lines in October, for which he won the Cross of the Order of Maria Theresa. He joined the Austrian corps under *Generalmajor* Friedrich Fürst zu Hohenlohe-Ingelfingen which was attached to General Gebhard von Blücher's victorious Prussians at Kaiserslautern in September 1794. Gyulai was promoted to *Oberst* (commanding colonel) of *Infanterie Regiment* (IR) 31 in 1795, although he retained command of his *Freikorps*. In Germany in 1796, he led *Feldmarschalleutnant* Michael Freiherr von Frolich's advance guard protecting the Tyrol. Following a reconnaissance to Menningen on 22 September, he held his position for eight hours, despite being outnumbered 5 to 1, before fighting in the siege of Kehl. Returning to IR 31, he commanded the Holy Roman Empire contingent in Germany in April 1797, following his promotion to *Generalmajor*.

In the War of the Second Coalition, he commanded an advance guard brigade under Archduke Charles, storming Ettinghosen village at Ostrach in March 1799. After a successful raid on the Breisach bridgehead on 22 April, he organized the Breisgau *Landsturm* (militia). In the following year he led a corps forming Paul Kray Freiherr von Krajova's right wing, falling back on Donaueschingen to protect the main army's retreat after Kray was defeated. Victorious at Günzburg and Krumbach, he fought several rearguard actions against General Jean Moreau in June 1800, which won him promotion to *Feldmarschalleutnant*, before he fought at Hohenlinden in December. Appointed *Inhaber* (honorary colonel) of IR 60 in 1801, he assisted Fürst Johannes Liechtenstein in the negotiations after Austerlitz and was appointed ban of Croatia, where he played a key role in reforming the Military Frontier.

In 1809 he commanded IX Korps in Italy, directing the crossing of the Tagliamento. On the retreat he defended Croatia and defeated General (soon to be Marshal) Auguste de Marmont's attempt to take Graz on 26 June. Promoted to *Feldzeugmeister* in 1813, he commanded the left wing at Dresden and formed the connection between *Feldmarschall*

Karl Philipp Fürst zu Schwarzenberg and Blücher at Leipzig. At Brienne in 1814, he captured the village of Lesmont. Resuming his duties as ban, he was later *General Kommandant* of Bohemia and then Austria before appointment as president of the Hofkriegsrat (Imperial War Council) in 1830.

## Haiti

Haiti, known formally as the *partie française de l'île de Saint-Domingue* (St. Domingue) until 1804, was France's most valuable colony during the Revolutionary and Napoleonic eras, and the scene of an exceedingly bloody slave revolt.

### Geography, Economy, and Population

In colonial times, Haiti occupied the western third of the island of Hispaniola and corresponded to the borders of the present-day Republic of Haiti minus the central plateau around Hinche. The largest city was Cap Français on the northern coast; it also was commonly called "Le Cap" or "the Paris of the Antilles" and was renamed Cap Haïtien in 1804. The second-largest city was Port-au-Prince (known as Port-Républicain during the French Revolution) in the western province; it was the capital of the colony from 1751 on.

France officially obtained Haiti from Spain at the Treaty of Ryswick (1697), though French hunters, planters, and pirates had been occupying the territory *de facto* for half a century before that date. Haiti's sugar and coffee plantations grew in the eighteenth century because of a steady influx of African slave labor, particularly after the Treaty of Paris (1763) forced France to surrender most of its other colonies in the Americas. By the late 1780s, at the height of Haiti's prosperity, the island provided half of the tropical products consumed in Europe, and "rich as a Creole" had become a term for the suddenly wealthy. Le Cap was one of the busiest ports of all the French colonial possessions, and the Haitian trade alone employed 15,000 sailors and more than 1,000 ships. Trade diminished and became dominated by British and American merchants in the 1790s.

The population was composed of three major groups at the outset of the French Revolution. The 30,000 white Frenchmen were divided between rich planters (or *grands blancs*) and soldiers, vagrants, and small professionals (or

*petits blancs*). Locals also differentiated between Creoles born in Haiti and Frenchmen. As in France, being a member of a specific estate also had an impact on one's social status.

The 30,000 free-colored (Haitians of full or partial African ancestry who had been manumitted) formed a second group. Many were descendents of illegitimate unions between a French planter and a female black slave. Many owned slaves and coffee plantations and some were very rich. The Code Noir of 1685 specified that freed slaves were full-fledged citizens, but in the 1780s a series of local regulations discriminated against free-colored.

Haiti's 500,000 slaves formed the third and numerically largest group. They suffered from a low birthrate and an annual attrition rate of about 5 percent, but their numbers grew through continued slave imports. Slaves were divided according to their tasks, with skilled slaves, foremen, and servants ranked higher than field slaves. The former were often second-generation (or Creole) slaves, while the latter were frequently African-born slaves, called *Congos* (regardless of their country of origin) or *bossales*. Slavery was regulated by the 1685 Code Noir, though implementation of its more merciful clauses often fell victim to the arbitrariness of individual slave owners and judicial racism.

### History (1789–1804)

The white and free-colored minorities were the first to be affected by the French Revolution. The *petits blancs* and French-born whites were inspired by news of radical change in France. The rich planters generally favored the monarchist camp. Among the planters' demands were the abandonment of the mercantilist trade system (or *exclusif*), the preservation of slavery and racial inequality, an end to ministerial dictatorship, and self-government. Parisian Revolutionaries were divided on the colonial question. In Paris the Société des Amis des Noirs demanded an end to the slave trade and eventually to slavery itself, while the Club Massiac acted as a lobby for Creole planters. The Barnave Decree (March 1790) authorized the planter-dominated colonial assemblies to administer local affairs

and thus preserve slavery and racial discrimination. Vincent Ogé and Julien Raimond, both of them free mulattoes, demanded full citizenship rights, first from colonial assemblies in Haiti, then from the National Assembly in Paris, but failed in both cases. A subsequent revolt in Haiti led by Ogé resulted in a free-colored defeat and Ogé's execution (1791).

In August 1791 rebellious slaves led by Dutty Boukman, Jeannot, Georges Biassou, Cécile Fatiman, and Jean-François Papillon met in Bois Caïman in Haiti's north and, according to the oral tradition, in a nighttime voodoo ceremony sealed a pact to destroy slavery. Within a month, the slave revolt had enlisted 100,000 slaves and destroyed Haiti's rich northern plantations. The French National Assembly convinced the free-colored to join counterinsurgency efforts by granting them legal equality (4 April 1792), but the revolt was not yet fully subdued when a general European war resulted in a Spanish and British attack on Haiti (1793).

Faced with white monarchist opposition, internal slave revolt, and foreign invasion, French civil commissioner Félicité-Léger Sonthonax abolished slavery in Haiti on 27 August 1793 (the Convention ratified his decision and extended it to other French colonies on 4 February 1794). The abolition of slavery convinced several black generals, including Toussaint Louverture, to support the French and contributed to the ultimate withdrawal of Spanish (1795) and British (1798) troops.

A period of relative peace followed in 1798–1802 as Toussaint Louverture emerged as virtual dictator of Haiti. Most black slaves were forced to resume plantation labor as semifree serfs (called *cultivateurs*). Toussaint Louverture forced French agents Philippe Roume de Saint-Laurent, Sonthonax, and Gabriel Hédouville into exile and defeated rival mulatto general André Rigaud in the War of the South (1799). Toussaint Louverture also took over (Spanish) Santo Domingo (1800), the eastern side of the island, and implemented a new constitution (1801) that made him governor-general for life with the right to choose his successor.

Toussaint Louverture's unilateral moves convinced First Consul Napoleon Bonaparte that he might be readying Haiti for independence. Bonaparte, who might also have been motivated by racism and the influence of the planter lobby, ordered his brother-in-law General Charles-Victor Emmanuel Leclerc to head an expedition to Haiti that would disarm black troops, jail or exile black officers, and prepare the ground for the restoration of slavery. French troops landed in February 1802, then defeated Toussaint Louverture's men at the battles of Fort Dauphin, Ravine à Coulevres, and Crête à Pierrot. Toussaint Louverture was captured and sent to France in May 1802 (he died in the Fort de Joux in April 1803). A series of setbacks

followed for the French troops. A yellow fever epidemic broke out that eventually accounted for 90 percent of the 50,000 Frenchmen who died during the expedition. A general uprising started in the summer of 1802 when a rumor spread that slavery would soon be restored. Most black and mulatto troops still loyal to France defected in November 1802, the same month Leclerc died of yellow fever. Britain blockaded French troops from July 1803 on and supplied black rebels. Finally, the French defeat at the Battle of Vertières near Le Cap forced the remnants of the French expeditionary force under General Donatien Rochambeau to leave Haiti (November 1803).

General Jean-Jacques Dessalines declared Haiti's independence on 1 January 1804 and ordered the remaining French civilians and soldiers to be exterminated (January–April 1804). France retained control of (Spanish) Santo Domingo until 1809 and continued to claim sovereignty over Haiti until 1825.

### Halle, Battle of (17 October 1806)

This engagement was fought during the War of the Fourth Coalition between French forces under Marshal Jean-Baptiste-Jules Bernadotte and Prussians under Prince Eugen of Württemberg, three days after the battles of Jena and Auerstädt. Bernadotte attacked across the bridges at Halle and inflicted a significant defeat on the Prussian forces.

Bernadotte's pride had been wounded by Napoleon's criticism of his absence from both Jena and Auerstädt, and he was determined to attack the Prussians at the first opportunity. Württemberg was in command of the Reserve Corps of the Prussian army, and after the defeats at Jena and Auerstädt he was prepared to hold Halle in order to allow the Prussian army to continue its retreat to the north. Each commander had approximately 13,000 men.

The town of Halle stood on the eastern bank of the river Saale and could only be reached by a causeway that crossed two bridges, across a braided section of the river. Although the town was surrounded by a wall, this offered little protection. In order to defend this position Württemberg placed a dragoon regiment to the west of the river near the village of Passendorf. The bridges were defended by infantry with their own battalion guns under the command of General Johann Freiherr von Hinrichs. Württemberg then deployed his main force outside of the town on the eastern bank. Bernadotte advanced to the attack at around 8:00 A.M., and his cavalry pushed the enemy dragoons out of Passendorf. Two hours later he ordered forward the 32nd Line to take the bridges across the Saale, led by General Pierre Dupont. These troops were supported by skirmishers from the 9e Légère (9th Light Infantry). The attack quickly pierced the Prussian center and Dupont took control of the bridges. Hinrichs's remaining force was now unable to retreat, being on the wrong side of the river, and surrendered.

Dupont now occupied Halle and attacked a battalion that Württemberg had sent forward at the Galgenthor gate. The French quickly deployed strong parties of skirmishers on the city wall and in the gardens near the gate. Dupont now awaited support to reach him before attacking the main Prussian force. The French skirmishers inflicted heavy casualties, and Württemberg decided to withdraw northward toward Dessau. However, this action exposed his flank to the French in Halle. Bernadotte had managed to get the whole of Dupont's division into Halle, and these troops now attacked through the two gates facing the Prussians. The French attack split the Prussian force, obliging some to retreat to the north toward Dessau, and the remainder to retreat toward Bitterfelde. These troops were not able to reunite for a full day, but they then retreated toward Magdeburg. Württemberg's corps had been effectively destroyed with the loss of over 5,000 killed, wounded, and captured. After resting for a day, Bernadotte continued his pursuit of the Prussian army, having lost around 700 men.

### **Hamburg, Defense of (1813–1814)**

This city on the river Elbe was defended by Marshal Louis Davout for almost a year against Allied troops following Napoleon's disastrous Russian campaign. Davout conducted an aggressive defense, despite the fact that he was completely surrounded. After Napoleon abdicated, Davout continued to hold the city until he received a personal message from King Louis XVIII to surrender to the Allies.

At the start of the 1813 campaign Davout was given orders to capture Hamburg in late spring. He achieved this on 30 May. Until the armistice in June Davout spent his time reorganizing his command. Many of the troops of his XIII Corps were inexperienced or composed of foreign troops of dubious loyalty. When the campaign was renewed in August, Davout was ordered to support Marshal Nicolas Oudinot in his attempt to take Berlin. Davout was successful at an engagement at Lauenbourg, but after the French defeats at Grossbeeren and Dennewitz, Davout withdrew back to Hamburg. There he worked tirelessly to improve the defenses of the city, and to ensure that as many supplies as possible were collected; he also occupied the bank in Hamburg. He conducted an active defense against the surrounding Allies, and it was not until 3 December that the city was completely invested. His garrison numbered around 34,000 troops. The blockading forces were commanded initially by the Russian general Levin Bennigsen and by the crown prince of Sweden, and former French marshal, Jean-Baptiste-Jules Bernadotte.

The harsh winter weather made conditions within the city very difficult. Davout sent 25,000 civilians out of the city to extend his supplies and was forced to melt ice in order to find enough water. The Allies wanted to take the city quickly, and there were a series of assaults made in February 1814. These attacks failed, primarily owing to Davout's skill in observing the movements of the enemy prior to their launch and the personal inspiration he showed in being present where crises arose. However, the strength of his garrison was being constantly drained by action and disease. Davout was nevertheless able to launch a well-planned sortie on 23 March in order to gain supplies from the Allied lines. This attack was launched from the fort of Haarburg and took the enemy by surprise. However, the campaign of 1814 was now reaching its end far to the west in France.

After Napoleon's abdication the Allies expected the immediate surrender of Hamburg. Davout, however, rejected

two demands by Bennigsen to surrender, arguing that he would only take instructions from Napoleon. Davout continued to conduct the defense of the city until 11 May, when General Maurice Etienne Gérard arrived as Louis's representative. He carried with him a personal note from the king ordering Davout's surrender. Even then Davout sought to delay capitulation, and it was not until 27 May that the remaining 26,000 troops of the garrison began to leave the fortifications. Davout was not ordered to return to Paris but was sent to Savigny-sur-Orge to await further instructions.

### Hamilton, Emma, Lady (c. 1765–1815)

Emma Hamilton was the disgraced mistress of Horatio, Viscount Nelson, Britain's great naval hero. Her adulterous relationship with Nelson was condemned by British society and has overshadowed her contributions to the struggle against Napoleon.

She was born as Emily Lyon in Great Neston, in Cheshire. She was the daughter of a blacksmith, Henry Lyon, who died shortly after her birth; her mother was a maid. Emily was not educated and worked from the age of twelve in London as a maid and as a painter's model. Possessing great beauty and a sparkling personality, she was also mistress to a succession of men. In 1782 she had an illegitimate child, who was raised in Wales. She then changed her name to Emma Hart.

Emma was introduced to Sir William Hamilton, a noted archaeologist and the British ambassador to the Court of Naples, by his nephew, who had been her lover. The latter, unbeknownst to Emma, had asked Hamilton to pay his debts in exchange for her. To be received at the various courts, Hamilton and Emma married on 6 September 1791. Her pleasant personality made her popular in court circles. She learned Italian and became an intimate friend of Queen Maria Carolina of Naples, who was the sister of Marie Antoinette. On her travels through France, she couriered messages from the former to the latter.

In her capacity as British ambassadress, Emma met Nelson during his brief official visit to Naples in 1793 but did not see him again until 1798, when the Mediterranean Fleet arrived in port in the wake of its victory at the Battle of the Nile. A romantic relationship developed between

Emma and Nelson during the admiral's extended stay at the Hamiltons' house, where Emma nursed him back to health from exhaustion brought on by his six-month tour at sea and a head injury he had sustained at the Nile. Emma treated him as a hero, which appealed to his vain-glorious personality. He was soon besotted with her; they became lovers despite both being married. Nelson repudiated his wife in 1801 and deemed himself above the societal customs of his day. The couple flaunted their affair, which infuriated British high society.

Emma played an important role in the Napoleonic era because her court connections bound Naples and Britain, already allies, closer together and facilitated the supply of victuals and other provisions to Nelson's fleet, particularly prior to the Battle of the Nile. By effectively saving Naples from invasion, Nelson was decorated by King Ferdinand IV as Baron of the Nile, named Duke of Brönte on 13 August 1799, and given a huge payment for his service. Emma's behind-the-scenes contributions, however, were not acknowledged.

In 1800 Emma, Hamilton, and Nelson moved to England where they lived at Merton, in Surrey, as a threesome. Emma had two children with Nelson; only Horatia, who was born in January 1801, survived. Hamilton died on 6 April 1803. On 21 October 1805 Nelson was shot by a marksman during the Battle of Trafalgar, where he decisively defeated the Franco-Spanish fleet and broke Napoleon's maritime power, thus securing British naval supremacy. Nelson's dying request was that the nation look after Emma. However, she was reviled for her strong hold over Nelson and received no financial support from Parliament.

Although Emma was left with adequate financial resources by her late husband and by Nelson, she squandered her fortune. Horatia proudly acknowledged that Nelson was her father but never recognized Emma as her mother. Emma became indigent and was imprisoned for her debts. To escape creditors she moved to Calais, where she died on 15 January 1815. Her secret services to the British cause in the French Revolutionary Wars have scarcely been acknowledged.

### Hanau, Battle of (30–31 October 1813)

The Battle of Hanau took place near the town of that name, situated on the river Main in Hesse, between an Austro-Bavarian army of 30,000 men under the Bavarian general Karl Freiherr von Wrede and Napoleon's Grande Armée, about 60,000 men strong, which was withdrawing after its defeat at Leipzig toward the Rhine. Wrede thought he was facing only part of Napoleon's forces and attempted to hinder their withdrawal to allow their pursuers to gain ground. Napoleon, however, brushed this force aside and continued his movement without significant delay.

Napoleon's army consisted of the Imperial Guard, II Corps (under Marshal Claude Victor), III and VI Corps (Marshal Auguste de Marmont), IV Corps (General Henri-Gatien Bertrand), V and XI Corps (Marshal Jacques Mac-

donald), VIII Corps (General Sierakowski), I Cavalry Corps (General Edouard Milhaud), II Cavalry Corps (General Horace François Sébastiani), and III Cavalry Corps (General Jean Arrighi de Casanova). The Allied army consisted of the Austrian divisions of *Feldmarschalleutnant* Graf Fresnel, *Generalmajor* Freiherr von Bach, and *Feldmarschalleutnant* Freiherr von Trautenberg and the cavalry division of Splény, a total of 13,000 men, plus the Bavarian divisions of Beckers and Lamotte and three cavalry brigades, a total of 17,000 men.

On 29 October, Sébastiani took control of the defile at Gelnhausen, securing Napoleon's line of retreat. Wrede believed that Napoleon was moving further to the north and that he was facing only an isolated corps. The forces at his disposal initially included the troops under Beckers, Lamotte, and Bach, as well as some cavalry and other formations. He drew them up to the northeast of Hanau and waited for the French. Macdonald led their column. The fighting began around daybreak on 30 October and continued into the afternoon, with the French making little headway. Wrede continued to believe he was facing a small French force until cries of "Vive l'empereur" indicated Napoleon's presence.

The Battle of Hanau. Grenadiers à Cheval of Napoleon's Imperial Guard, distinguished by their bearskin bonnets, cross swords with Bavarian cavalry. (Painting by Richard Knötel from *Die deutschen Befreiungskriege* by Hermann Müller-Bohn, 1913)

Once reinforcements arrived, about 4 P.M., Napoleon went over to the offensive. The French artillery gained the upper hand, and the Bavarians withdrew their guns when they ran out of ammunition. Wrede then committed part of his cavalry in an attempt to stabilize the situation. These troops penetrated the French artillery line, but French cavalry to the rear repelled them. The cavalry battle continued, with the Bavarians suffering heavy losses.

Part of the Old Guard was then committed to the battle, and Lamotte fell back. The French cavalry turned a retreat into a rout, with the broken Bavarians rushing for the safety of the walls of Hanau. More of the Old Guard was then committed, forcing Beckers to withdraw as well. The French advance stalled in the swampy terrain south of Hanau. The Bavarians counterattacked, securing the area between Hanau and the Lamboi Wood to the east.

That night, much of Napoleon's army continued its march toward Frankfurt, leaving Marmont behind with III, IV, and VI Corps to ensure that Wrede did not interfere with this movement.

Clashes continued throughout the night and into the next morning, with Cossacks and partisans harassing the French. Bertrand attacked Wrede on the morning of 31 October, but the fighting was inconclusive. That afternoon, Bertrand disengaged and withdrew. The French lost around 6,000 killed and wounded, and 4,000 captured. The Austrians lost 1,400 killed and 2,000 wounded. The Bavarians lost 300 killed, 1,200 wounded, and 1,400 missing. Napoleon continued his march to Frankfurt.

## Hanover

Hanover was formerly a German electorate and kingdom. It contributed the Royal House of Hanover to the British monarchy in 1714. Hanover had been governed by the dukes of Brunswick from 1137 to 1692, when it became an electorate. The Hanoverian rulers were descended from Henry the Lion (1129–1195), and they thus belonged to the Welf dynasty that competed for power with the Hohenstaufen dynasty. In geographical terms, Hanover had expanded considerably, in stages, since the Welf lands were partitioned in 1569. By 1602 it consisted of the principalities of Göttingen,

Calenberg, Lüneburg (Celle), and Grubenhagen. In 1636 Hanover replaced Calenberg as the capital city. The title Elector of Hanover was granted to the Duke of Hanover in 1692. Hanover expanded again, gaining the additional territories of Brunswick-Lüneberg, Celle, and Bremen in 1705 and Verden (from Sweden) in 1719. Protestantism had been practiced since the mid-sixteenth century.

The British Protestant queen Anne left no children, despite seventeen pregnancies, and thus the immediate Protestant line of the House of Stuart expired. Parliament applied the Act of Settlement of 1701. This barred Catholics from the throne and thus excluded claimants such as James Edward Stuart and Charles Edward Stuart. Since no Catholic could ascend the throne, the remedy was to find a suitable Protestant Stuart family member. One of the daughters of James I was Elizabeth Stuart. She had married King Frederick of Bohemia on 14 February 1613. Their daughter Sophia married the Protestant elector of Hanover Ernest Augustus. Sophia had one surviving son, George Louis, the second Elector of Hanover. He accepted the throne and created the personal and political union between Hanover and Britain and reigned as George I. He was unpopular, never learned to speak English, and brought all of his Hanoverian entourage with him. His son reigned as George II.

It was only during the reign of George III, who was born in England and who spoke English, that the House of Hanover enjoyed some popularity. The personal connection allowed Hanoverian troops to fight in the First Coalition against Revolutionary France. The Hanoverians were renowned for their superior military training, but for a variety of reasons in 1803 Napoleon succeeded in conquering Hanover, which he occupied until 1813.

In order to put George III on an equal basis with the king of Württemberg, Hanover was made into a kingdom in 1814 by the Congress of Vienna, thus enabling him to govern as king of two countries. George IV and William IV also served in this capacity. A new constitution was promulgated in 1819, although it was amended several times, in 1833, 1840, and 1848.

Under the succession legislation known as the Salic law, females are not allowed to govern. Until Victoria, granddaughter of George III, succeeded to the throne in 1837, this had not posed a problem, since all the previous successors had been male, but the restriction now became problematic. The thrones of Hanover and Britain were therefore separated. The Kingdom of Hanover was granted to a son of George III, Ernest Augustus, Duke of Cumberland. Hanover remained a kingdom until it was annexed as a province of Prussia in 1866. Hanover retained provincial status until 1946.

## Hanoverian Army

The Hanoverian Army fought from 1793 alongside the British Army until Hanover was occupied in 1803. Many of the soldiers in the army escaped to Britain, and the King's German Legion was formed. This formation established a fine reputation in the Peninsular War. In 1814 Hanover regained its sovereignty and provided a considerable part of the Duke of Wellington's forces in the Waterloo campaign.

As King George III was also the Elector of Hanover, the Hanoverian Army was closely modeled on the British Army, with its light infantry enjoying a high reputation. The Anglo-Hanoverian army was defeated at the Battle of Hondschoote. After this defeat, General Gerhard von Scharnhorst, who began his military career in the Hanoverian Army but who would later distinguish himself in Prussian service, suggested a number of reforms, the main one being an insistence on higher educational standards for the officer corps. However, his suggestions were rejected. In 1803 the Hanoverian forces were obliged to surrender to the French at Artlenberg. The Hanoverian Army was disbanded, and the French formed a Hanoverian Legion that was to fight in Spain. Nevertheless, a large number of Hanoverian troops were evacuated by the Royal Navy and made their way to England.

An infantry regiment was formed and given the title of the King's German Regiment, but the number of recruits were sufficient to enable British military authorities to form cavalry and artillery formations as well. Thus, on 19 December 1803, the King's German Legion was formed. From its inception 15,000 men were enrolled in the Legion, 75 percent of them from Hanover. The Legion first saw action in the British expedition to Hanover in November 1805. In June 1807 some units took part in the expedition to Swedish Pomerania, and in November of the same year the Legion distinguished itself in the attack on Copenhagen. In 1808 the unit began what would become an extended period of service in Spain. The Legion fought its

first major battle at Talavera, where its conduct ensured that it was accepted as an integral part of the British Army. For the next five years units of the Legion took part in all the major battles of the Peninsular War.

By early 1813 Hanover itself had been liberated from the French yoke, and a new army was formed. The recruits to these regiments were generally young and inexperienced. Until February 1814 these units were considered to be part of the British Army. The King's German Legion remained in existence throughout this period. During the Waterloo campaign, both Hanoverian units and the Legion formed part of the Anglo-Allied army under Wellington. These forces were engaged at Quatre Bras and Waterloo. The troops of the Legion fought with their customary bravery in both actions and were instrumental in holding the farmhouse of La Haye Sainte. However, the Hanoverian troops' performance was variable. The majority of units fought well, though the Duke of Cumberland's Hussars fled from the field without really having been engaged. In December 1815 the legion started to be disbanded.

## Hardenberg, Karl August Fürst von (1750–1822)

A statesman and leading German reformer from 1790, Prince Karl August von Hardenberg did much to modernize Prussia's administration. Following a successful career in the service of Hanover and Brunswick, Hardenberg joined the Prussian service to reorganize the administration of the Franconian principalities of Ansbach and Bayreuth. During the French Revolutionary Wars, in which Prussia participated from 1792 to 1795, he negotiated the supply of Prussian troops from the imperial districts. His activities in foreign affairs continued when he unwillingly signed the Treaty of Basle with France in 1795, ending Prussia's participation in the War of the First Coalition. With Frederick William III's ascension to the throne in 1797, Hardenberg, now based in Berlin, started to play a

more active role in reforming Prussia. He became acting foreign minister in 1803 and was confirmed in this post a year later. He resigned from this position in 1806, after Prussia failed to join the Third Coalition.

In 1807 he became Prussia's leading minister for a short time, but Napoleon insisted on his dismissal with the signing of the Treaty of Tilsit. Nevertheless, Hardenberg continued to play an active role in the reforms of the now-truncated Prussian state, particularly with Heinrich Freiherr vom und zum Stein. This program concerned itself with both economic and political affairs, including the constitution, the ending of the last vestiges of feudalism, free trade, and a modernization of taxation.

After the collapse of the administrations of Stein (1808) and Alexander von Dohna-Altenstein (1808–1810), Hardenberg became the state chancellor of Prussia in 1810. Continuing the reform process, he modernized both the educational system and economic policy, introducing legislation on taxation, agriculture, and the emancipation of the Jews. He faced considerable opposition from more conservative elements.

Forced into an alliance with France, Hardenberg also assisted with the secret preparations for war against Napoleon. The destruction of the Grande Armée in Russia in 1812 significantly changed the political landscape, and Prussia finally declared war against France in March 1813. After the first Peace of Paris in May 1814, Hardenberg represented Prussia at the Congress of Vienna along with Wilhelm von Humboldt, the great educational reformer. In addition to securing territorial gains for Prussia in Saxony, Poland, Westphalia, and the Rhineland, Hardenberg and Humboldt endeavored to introduce to the new German Confederation a constitution that favored Prussia's interests. They faced opposition from Austria and the smaller German states, which sought a looser union.

Hardenberg made another unsuccessful attempt to introduce constitutional monarchy to Prussia during the Hundred Days in 1815. He devoted much of his time after 1815 to the administrative and economic integration of the newly acquired provinces into Prussia. However, a number of his reforms were rolled back, and his influence was restricted. In 1821 he lost his office as chairman of the Constitutional Commission.

Once Prussia joined the Holy Alliance after the second Peace of Paris in November 1815, Hardenberg continued as a representative on the international stage. He participated in the congresses of Aachen (1818), Troppau (1820), Laibach (1821), and Verona (1822). He died in 1822 in Genoa, shortly after the congress there. With his death, the office of state chancellor was abolished.

### **Harrowby, Dudley Ryder, First Earl of (1762–1847)**

Lord Harrowby (Dudley Ryder until 1803) was almost a permanent member of British governments from 1789 to 1827. All his offices save one were insignificant, but he was a good orator, his views were moderate, and he was widely respected by his colleagues. The diarist Charles Greville praised him as “the top of the second-rate men” (*Journal*, 1 January 1848), and there were important events in his career both in and after the wars against Revolutionary and Napoleonic France.

From 1789 he held minor posts in the government of his friend William Pitt and in 1801 was one of those persuaded by Pitt to remain in the government of Henry Addington. When Pitt returned as prime minister in May 1804, a year after the resumption of war with France, Harrowby was appointed foreign secretary. The most urgent issue was to find allies to attack France and protect Britain from invasion by Napoleon's army assembling at Boulogne. Before any significant progress had been made, Harrowby (who may have been epileptic) resigned in December after falling down a flight of stairs. He rejoined the cabinet six months later in the nominal office of Chancellor of the Duchy of Lancaster. Russia had by now joined the Third Coalition, and Austria and Sweden did so a month later. In November 1805 Harrowby was sent to try to persuade Prussia to enlist, but this overture, and indeed the coalition, was destroyed on 2 December by Napoleon's great victory over the Russian and Austrian armies at Austerlitz.

In April 1815, by then Lord President of the council, Harrowby was sent on another delicate mission on behalf of Lord Liverpool's cabinet. He, William Wellesley-Pole (Master of the Mint and the Duke of Wellington's brother), and the commander in chief of the Army's secretary met the distrustful Wellington, who had just arrived in Brussels

from the Congress of Vienna to take command of the Anglo-Allied army, and assured him that the British government would do everything in its power to supply what became the Waterloo campaign. Six years later, in February 1821, Wellington was one of the cabinet ministers whom the Cato Street conspirators plotted to murder (but were betrayed) at dinner in Harrowby's house.

When Liverpool resigned following a stroke in 1827, Harrowby continued as lord president under George Canning, but he retired when Canning died in August. In 1831–1832 he made his last but major political contribution, working with Lord Wharncliffe, whose son was married to Harrowby's daughter, to persuade wavering opponents in the House of Lords to accept parliamentary reform in return for concessions from Lord Grey's government and to avoid diluting the peerage by creating new peers in order to pass the bill. One of the last survivors of his political generation, frail to the end, he outlived most of his more robust contemporaries.

## Haugwitz, Christian August Heinrich Kurt Graf von (1752–1832)

A key figure in the formulation and implementation of Prussian foreign policy, Christian Graf von Haugwitz played a significant role in international affairs from the early 1790s to the collapse of Prussian power after the Battle of Jena in October 1806. His policies included a range of approaches to the French threat against Prussia, from a diplomatic alliance with France to armed resistance. But French diplomacy and military power prevailed. Before the French assault on Prussia in the fall of 1806, Haugwitz saw his country isolated, repeatedly humiliated by Napoleon, and reduced to little more than a French satellite.

Haugwitz was born at Peuke bei Oels in the Prussian province of Silesia on 11 June 1752. He attended the universities of Halle and Göttingen, traveled widely, and then settled down to live on his country estates. At the start of the 1790s he was called to serve the Prussian court, first as envoy to Austria in 1791, then, starting in September 1792, as a member of the royal cabinet. He played a dominant role in directing Prussian foreign policy under King Frederick William II and after 1797 under Frederick William III.

The crucial problem for Haugwitz at the start of the nineteenth century was the overwhelming power of France under Napoleon. French inroads into German territory had begun during the previous decade, but Napoleon's occupation of Hanover in May 1803 put France on a collision course with Prussia. Nonetheless, the Prussian monarch opposed a course of action that might lead to war. Disagreeing with this policy, Haugwitz resigned from government service in August 1804.

Haugwitz remained a key unofficial adviser to Frederick William, and in October 1805 he returned to government, sharing the responsibilities of foreign minister with Karl August von Hardenberg. After Napoleon's triumph in capturing an Austrian army at Ulm, the French advance to Vienna and beyond seemingly put Napoleon in military difficulties. The situation, as Haugwitz saw it, gave Prussia a chance to pressure the French and secure northern Germany from French control. While trying to negotiate with Napoleon, Haugwitz found Prussia's hopes demolished by the French victory at Austerlitz in early December 1805. Later that month, the Prussian diplomat felt compelled to sign a humiliating alliance with France (the Treaty of Schönbrunn), and when he tried to get revisions the following February, Haugwitz had to accept an even more demeaning agreement with Napoleon (the Treaty of Paris).

As war with France approached in the fall of 1806, Haugwitz shifted his position to one of armed resistance. After Prussia's disastrous defeat at the Battle of Jena in October, he accompanied the royal family to East Prussia, then retired to private life. His deteriorating health forced him to move to Italy in 1820, and he died in Venice on 9 February 1832.

**Haydn, Joseph (1732–1809)**

The old-fashioned, cozy, and conservative connotations of his nickname “Papa Haydn” notwithstanding, the Austrian composer Joseph Haydn was a cultural (albeit not political) revolutionary who shaped not just the musical genres—symphony, string quartet, sonata—but also the musical language that would predominate in the new century. He was moreover the first composer to attain true international celebrity in his lifetime, able to please both the connoisseurs and the new commercial audience. His fame led to two extended visits to England (January 1791–June 1792, and February 1794–August 1795), where he was feted as a hero and in turn acquired an appreciation for massed performance forces, the oratorio, and the “national” element in music. It would stand him in good stead during the final, Viennese phase of his long career, devoted in particular to vocal compositions. Henceforth the Revolution and war increasingly impinged on his music as well as on his life.

Echoes of the conflict already appear in the London Symphony 100 (*Military*) and Symphony 103 (*With the Drum Roll*). The strife figures explicitly in the *Mass in Time*

Joseph Haydn, a noted Austrian composer who influenced the conventional approach to classical symphonies and string quartets. (Library of Congress)

*of War* (1796), and perhaps implicitly in the even more innovative and ominous *Mass in Straitened Times* (1798), although the appellation *Nelson Mass* refers to the presence of the admiral at a later performance rather than to the date of composition. The political situation prevented Haydn from traveling to Paris to conduct his works in person, but they found enthusiastic local performers and audiences. French musicians and their organizations honored Haydn with medals and memberships. Indeed, it was on the way to the Paris premiere of *The Creation* on Christmas Eve 1800 that Bonaparte narrowly escaped assassination by a bomb. Although devoid of all chauvinistic sentiment, Haydn was a loyal Austrian subject. He allowed his works to be performed in concerts to benefit the war effort, and he composed a number of patriotic pieces: most notably, the popular song (*Volkslied*) “God Preserve Francis the Emperor” (1797)—better known in its later incarnation as the German national anthem—which served as an echo of the British and a reply to the French.

The shock occasioned by the French bombardment of Vienna (12–13 May 1809) is said to have hastened Haydn’s demise. The elderly composer, whose house was furnished with an honor guard at the orders of Napoleon, died on 31 May. Haydn is usually credited with a conventional piety, but his was a tolerant and reasonable faith, free of credulity or obscurantism. His oratorios (*The Seasons* and *The Creation*), in particular, emphasized his optimistic view of the human species, a rational universe, and the beauties of nature. Although banned from performance in churches, they therefore could appeal equally to Revolutionaries and enlightened believers in a more conservative order, and they thus entered the patrimony of the cultured European—regardless of social or national origin—in the nineteenth century.

**Hegel, Georg Wilhelm Friedrich (1770–1831)**

Idealist philosopher. Born in Stuttgart, Württemberg, Hegel was a student of Baruch Spinoza, Immanuel Kant, and Jean-Jacques Rousseau. His theories are held by many to represent the summit of Germany’s nineteenth-century philosophical Idealism movement.

Born on 27 August 1770, Hegel was educated in theology at Tübingen. He was a private tutor at Berne and

Frankfurt and in 1805 became a professor at the University of Jena, where he observed Napoleon's October 1806 defeat of the Prussians at the battle fought there. "I saw the Emperor, that worldsoul" Hegel later wrote, "riding through the city to reconnoitre. It is in truth a strange feeling to see such an individual before one, who here, from one point, as he rides on his horse, is reaching over the world, and remoulding it" (Caird 1883, 66). Hegel considered the French Revolution an organic connection with the history of the world, noting that through its outward diffusion its principle gained access to almost all modern states, either through conquest or by express introduction into their political life.

During the Napoleonic occupation Hegel edited a newspaper, which he left to become rector (1808–1816) of a Nuremberg secondary school that prepared pupils for the university. He then returned to professorships at Heidelberg (1816–1818) and Berlin (1818–1831). A prolific writer, among his major works were *Science of Logic* (1812–1816); *Encyclopedia of the Philosophical Sciences* (1817), an outline of his whole philosophy; and *Philosophy of Right* (1821). He also wrote books on ethics, aesthetics, history, and religion. His interests were wide and were incorporated into his unified philosophy.

Hegel attempted, throughout his published writings as well as in his lectures, to elaborate a comprehensive and systematic ontology from a logical starting point. His approach, influenced by Kant, rejects the reality of finite and separate objects and minds in space and time and establishes an underlying, all-embracing unity that Hegel defines as an absolute. The quest for greater unity and truth is achieved by the famous dialectic, positing something (a thesis), denying it (an antithesis), and combining the two half-truths in a synthesis that contains a greater portion of truth in its complexity. His works exerted considerable influence on subsequent European and American philosophy. He died on 14 November 1831.

After Hegel's death, his followers divided into two major and opposing camps. The Right Hegelians were the direct disciples of Hegel at the University of Berlin and advocated evangelical orthodoxy and the political conservatism of the post-Napoleonic Restoration period. The Left became known as the Young Hegelians, and they interpreted Hegel in a revolutionary sense, leading to the advocacy of atheism in religion and liberal democracy in politics. Left Hegelians included Bruno Bauer, Ludwig Feuerbach, David Friedrich Strauss, Max Stirner, and Karl Marx. The multiple schisms in this faction eventually led to Stirner's anarchistic variety of egoism and Marx's version of communism. For most of the twentieth century, the logical side of Hegel's thought was largely forgotten, but his political and social philosophy continued to find

interest and support. However, since the 1970s a degree of more general philosophical interest in Hegel's systematic thought has also been revived.

## Heilsberg, Battle of (10 June 1807)

Major battle between French and Prusso-Russian armies in the closing days of the War of the Fourth Coalition. After the bloodbath at Eylau on 7–8 February 1807, both the French and Russian armies spent several weeks regrouping and preparing for a new campaign. On 5 June, the Russian army under General Levin Bennigsen resumed its campaign by launching an offensive around Guttstädt. After a series of rearguard actions, Marshal Michel Ney's corps successfully withdrew across the Passarge River near Deppen, where Napoleon quickly concentrated the rest of his army. On 9 June, as Bennigsen ordered his army to retreat, Napoleon moved his forces across the river and pursued the retreating Russians. General Peter Bagration's skillful command of the Russian rear guard delayed the French advance and allowed the Russian army to retreat toward Heilsberg, where Bennigsen took up positions along both banks of the river Alle in front of the town. During the previous weeks, various fortifications had been constructed there, turning the surrounding area into a fortified camp. Bennigsen deployed his troops with the 1st, 2nd, 3rd, 7th, and 14th Divisions on the right flank and the 4th, 5th, 6th, and 8th Divisions, supported by some twenty-seven squadrons of Prussian cavalry, on the left flank between Heilsberg and Grossendorff. The Russian Imperial Guard was kept in reserve while Ataman Matvei Platov's Cossacks covered the extreme right flank. The rest of the cavalry was divided into two parts under General Fedor Uvarov on the right flank and General Dmitry Golitsyn in the center.

Bennigsen was unaware of the direction of the French offensive and had deployed two advance guards, General Mikhail Borozdin at Launau, some 6 miles from Heilsberg, and Bagration at Reichenberg.

Napoleon advanced from Guttstädt with Marshal Joachim Murat's reserve cavalry leading the way. Marshal Nicolas Soult's corps marched immediately behind the cavalry, followed by marshals Jean Lannes and Ney and the Imperial Guard. The French soon encountered Borozdin's detachment at Launau, where, early in the morning on 10 June, Murat's cavalry drove the Russians back to Bewernick. Bennigsen immediately reinforced Borozdin and ordered Bagration to proceed by forced marches from Reichenberg to Bewernick. Having crossed the Alle on the pontoon bridges at Amt-Heilsberg, Bagration joined Borozdin around 2:00 P.M. and rallied his forces in the valley between Bewernick and Langwiese, deploying them in a chess formation with the right wing extended to Langwiese and the left covered by the Alle. For the next couple of hours, Bagration's troops repulsed several French charges, forcing Murat to bring up Soult's infantry. Superior French artillery soon silenced the Russian guns and cleared the way for the infantry charge.

The French advanced around 3:00 P.M., with General Claude Legrand's division and General Anne Jean Savary's grenadiers on the left near Bewernick. In the center, General Laurent Gouvion St. Cyr's division was in the first line followed by General Louis St. Hilaire's division while Soult's cavalry covered the right flank. Bagration's troops initially halted St. Cyr's division, but St. Hilaire reinforced it and fighting continued in the valley. Seeing the French advance, Bennigsen dispatched Uvarov with twenty-five squadrons and three *Jäger* regiments to reinforce Bagration. Although a Russian charge was initially successful in driving the French back to Langwiese, the French soon counterattacked and swept away the exhausted Russian cavalymen.

By late afternoon Bagration was unable to hold his ground and began a gradual withdrawal to Heilsberg, where the Russian batteries protected him. With darkness approaching, Murat and Soult decided to attack the fortified Russian positions. St. Cyr and St. Hilaire marched against Redoubt Number 1, while Legrand's division advanced toward Redoubt Number 2. The French came under canister and musket fire and their casualties rapidly mounted. Nevertheless, the 26th Line carried Redoubt Number 2 and held out there for the next hour until overwhelming numbers of Russian infantry and Russo-Prussian cavalry virtually annihilated it. The 55th Line, sent to rescue the 26th, was also routed. The rest of the divisions of Legrand and Savary formed squares and repulsed the cavalry charges until the arrival of French cavalry. The fighting continued for over an hour before

Legrand and Savary slowly retreated back across the Spibach. However, their withdrawal exposed the left flank of St. Cyr and St. Hilaire, who were engaged around Redoubt Number 1. Finding themselves in a cross fire, they retired with heavy casualties.

It was already around 10:00 P.M., and the Allies considered the battle over and victory theirs. Yet shortly after ten, Lannes arrived on the battlefield, and carried by incredible impetuosity, he launched another attack on the Russian positions in complete darkness. The Russians were prepared for the assault, thanks to a deserter. As General Jean-Antoine Verdier's division, reinforced by the 75th Line of Legrand's division, approached Redoubt Number 2, it was met by canister fire and suffered appalling losses before fleeing in disorder.

The Battle of Heilsberg is often overshadowed by other Napoleonic battles, although it was a bloody fight and both sides suffered enormous casualties. Soult lost 8,286 men while Lannes's recklessness cost his troops 2,284 dead and wounded. In total, the French casualties were estimated at 12,000 men. Russian losses were equally severe, mostly from Bagration's advance guard. Russian casualties are often estimated at some 2,000–3,000 killed and over 5,000 wounded, including eight generals. The Russian commander in chief, Bennigsen, himself was so exhausted physically and mentally that he collapsed on the battlefield and only regained consciousness some time later.

## Heliopolis, Battle of (20 March 1800)

Site of a French victory in Egypt under General Jean-Baptiste Kléber against the Ottoman ruler, Selim III. By rat-

ifying the Convention of El Arish (24 January 1800), Kléber agreed to be repatriated to France. The French fell back on Alexandria, Aboukir, and Rosetta and were about to evacuate Cairo when, on 13 March, Kléber received a letter from the British admiral, Lord Keith, dated 8 January. It announced that the British government would not ratify the treaty and that instead Kléber was to surrender unconditionally and remain in Egypt until a prisoner exchange.

The situation was further complicated by the presence of a large Turkish army in Egypt. Selim had 48,000 troops at El-Hanka, with an advance guard of 6,000 elite Janissaries and sixteen guns at Mataria, two hours' march from Cairo. Kléber wrote to Selim asking if he would retire on Belbeis while a political solution was found with Britain. Believing the French too weak to resist his forces, the Ottoman ruler refused. Furious, Kléber decided to fight and issued a formal declaration of hostilities: "Prepare for battle" ended his rallying address to the French army.

At 3:00 A.M. on 20 March Kléber assembled 10,000 men and advanced on Mataria. The infantry formed four squares, with their angles reinforced with grenadiers and regimental artillery. The left wing was commanded by General Jean Reynier, the right by General Louis Friant. The French cavalry under General Charles-Victor Emmanuel Leclerc was drawn up in the center interval, flanked by its artillery supported by soldiers of the dromedary regiment. Behind the left, in a second line, was a small, two-battalion square in reserve. The reserve artillery was in the center, supported by grenadiers and sappers, while skirmishers covered the whole front.

While Reynier marched head-on and Friant moved to cut off the Janissaries' line of retreat, the French cavalry engaged a body of Turkish infantry and cavalry, supported by Mamelukes. The Ottoman advance guard was soon defeated and its camp captured. The French advance continued to the ruins of ancient Heliopolis, where, led in person by Selim, the Turks launched themselves without regard for order or formation in a general attack. This was repelled by French artillery fire and the Ottoman army plunged into headlong retreat. A fruitless stand was made at El-Mark, before the Ottoman forces fell back on their camp at El-Hanka. As the French pushed their advantage, resistance collapsed, and the Turkish camp and baggage was abandoned. The fugitives were pursued through the night to Belbeis.

French casualties were very light, at 50 men, against an estimated 8,000 Turks. Once again, as at the Battle of the Pyramids, the French had stamped their military superiority on Egypt. As the shattered Ottoman army headed back into Syria, Kléber put down a second revolt in Cairo and was able to retake all the garrisons he had abandoned after signing the treaty.

## Hill, Sir Rowland (1772–1842)

British general who fought mainly in the Peninsular War and was one of the Duke of Wellington's most reliable divisional commanders. He was well liked by his men, who nicknamed him "Daddy Hill."

Rowland Hill joined the 38th Foot in 1790. He then spent two years in the military school in Strasbourg. In 1793 he served at the siege of Toulon. His bravery was recognized by General Thomas Graham, who made him a major in the regiment the former had just formed—the 90th Foot. In 1794 Hill became colonel of the regiment and took part in the expedition to Egypt in 1801, where he was wounded at Alexandria. During 1805 he was part of the Hanover expedition and was promoted to major general. He then commanded a brigade in Portugal at Lieutenant General Sir Arthur Wellesley's (later the Duke of Wellington) victories at Roliça and Vimeiro in 1808. He took part in the Corunna campaign and fought in the operations around Oporto. At the Battle of Talavera he led the 2nd Division, holding the commanding position of the Cerro de Medellin. In 1810 he held an independent command defending the Portuguese frontier. He became ill in the winter and had to return home.

In May 1811 Hill took command of the British forces in Extremadura (Estremadura) who were protecting Wellington's forces besieging Badajoz. In August, while the British were besieging Ciudad Rodrigo, in a surprise attack at Arroyomolinos de Montánchez, Hill routed a French

force, taking 1,300 prisoners for the loss of only 71 casualties of his own. During early 1812 his troops formed part of the covering force in Extremadura, while Wellington completed the capture of Badajoz. In May Hill destroyed the bridge at Almaraz and the French forts that had been built to protect it. He then led his corps in protecting the advance of Wellington's forces toward France. At the Battle of Vitoria Hill's forces began the attack on the southern flank of the French. Later, when Marshal Soult tried to relieve Pamplona, Hill was defeated at Sorrauren. During the invasion of France he fought first at the Battle of the Nivelle. Later he fought Soult to a standstill at St. Pierre, despite the fact that he was considerably outnumbered. At Toulouse, Hill's troops were involved in house-to-house fighting in one of the last actions of the Peninsular War.

Upon Napoleon's return from Elba in 1814, Hill was sent to Brussels to supervise the Prince of Orange in raising his forces. In the Waterloo campaign he commanded the 2nd Corps, composed of Anglo-Allied forces. Hill's troops formed much of the center of Wellington's position on the ridge at Mont St. Jean during the Battle of Waterloo. Toward the end of the action Hill helped lead the counter-attack that broke the Imperial Guard. His horse was shot from under him, and he was severely concussed. Hill was second in command of the army of occupation in France until it was finally withdrawn in 1818.

### Hoche, Louis Lazare (1768–1797)

Born 24 June 1768 in Montreuil, a suburb of Versailles, Louis Lazare Hoche went from very humble beginnings to become one of the premier generals of Revolutionary France. Though Hoche is little known outside of the study of the wars of the French Revolution, his rapid rise

through the ranks reflected the high esteem in which Revolutionary France held merit.

Hoche was educated by the brothers of Saint-Germain-en-Laye from 1773 until 1782. In his youth he also worked as a stable boy. At age sixteen he joined the army and was accepted in the Gardes Français in October 1784. After serving for a time in the depot battalion, he was made a fusilier in the colonel's company. On 25 November 1785 he was admitted into the grenadier company d'Artaignan. He remained with the Gardes Français through the early months of the Revolution. On 16 May 1789 Hoche was promoted to the rank of sergeant in the company of grenadiers d'Ancourt. On 31 August 1789 the Gardes Français were incorporated into the National Guard, then under the command of the marquis de Lafayette.

Later that year Hoche was promoted to sergeant by his comrades—this being the democratic method of promotion in use at the time—the elevation in rank becoming effective on 1 September. In many ways, Hoche's rise in rank is indicative of the opening of the paths to promotion that occurred during the early years of the Revolution. He was made adjutant underofficer of the 104th Line effective 1 January 1792. On 28 May he received the brevet rank of lieutenant in the 58th Line and was placed in charge of the 2nd Battalion, then garrisoned at Thionville. Shortly thereafter the town was blockaded by Austrian troops under the command of Fürst zu Hohenlohe-Kirschberg. During the siege, Hoche led a sortie that led to the capture of 600 prisoners. When the siege was lifted as a result of the Prussian retreat in the wake of Valmy, Hoche, along with his 2nd Battalion, was attached to the Army of the Ardennes.

In this capacity he and the troops under his command distantly followed the retreating Austrians through the winter of that year. One example of the daring that aided in his rise comes from this period. On the night of 23–24 November, Hoche led a detachment in a successful night attack to take Fort Camus which defended Namur, at the confluence of the rivers Sambre and Meuse.

In February 1793 Hoche was put in charge of provisioning a mixed unit of infantry and hussars. He succeeded in this staff work and was promoted to the post of aide-de-camp by General Jacques Le Veneur on 3 March. He was later sent to Paris to explain the recent reverses of the army. His honesty and patriotism won him the support of the government, and he was made *adjutant général*. He returned to the army in command of his former superior.

Next, Hoche participated in the attack on Dunkirk to retake the city from the insurrectionists and the British. Hoche recaptured the city and then invested the troops under the command of the Duke of York. On 30 October 1793 Hoche was promoted to the rank of general and given

command of the Army of the Moselle. Shortly thereafter he was defeated by the Duke of Brunswick in the three days of fighting at Kaiserslautern at the end of November. In the following month he joined forces with General Jean-Charles Pichegru and pushed back the Austrians. While these two commanders coordinated their efforts, there was no clear subordination of one to the other until Hoche was promoted over Pichegru on Christmas Day 1793. His troops went on to take the heights of Geisberg on 26 December.

On 18 March 1794 Hoche was dismissed and imprisoned, his command being taken over by General Jean-Baptiste Jourdan. Hoche was held in the Conciergerie in Paris and was only saved from the guillotine by the fall of Maximilien Robespierre on 9 Thermidor. Part of the reason for his imprisonment lay in his disregard for the orders of Lazare Carnot, the minister of war, at the start of the campaign. At this time, he was entrusted with the pacification of the rebels in the Vendée.

There Hoche took command of the Army of the Côtes de Cherbourg on 5 September 1794. In this capacity he played a number of roles, including military commander, diplomat, administrator, and politician. All of these were necessary in that his principal objective lay in the restoration of order to the region. In accomplishing this task, Hoche used small, mobile columns of roughly 200 men under an officer. These proved very effective at pursuing the insurgents through the difficult terrain.

While in the Vendée, on 17 February 1795 Hoche signed the Treaty of La Jaunaye with one of the insurgent leaders, François Athanase Charette. This agreement soon broke down, however, and through the rest of the year Hoche continued to restore order to the region. In order to defend against a royalist landing at Quiberon Bay, he was made commander of the Armée des Côtes de l'Océan when the landing came on 26 June. The rest of the year saw him hard at work concluding the pacification of the area.

As a result of these experiences, between January 1794 and March 1795 Hoche wrote *Instructions for Those Troops Employed in Fighting the Chouans*, a work describing the methods he utilized to bring the area under effective governmental control.

In 1796 he was placed in command of the invasion force destined to sail for Ireland. On leaving Brest on 16 December, his ship was separated from its consorts. Hoche never reestablished contact with any of the other vessels of the expedition, which was timed to coincide with an uprising in Ireland led by Wolfe Tone. Because of Hoche's separation from the rest of his troops, the French support never materialized in earnest, and the insurrection was suppressed.

In 1797 Hoche was named commander of the Armée de Sambre-et-Meuse. On 17 April he defeated the Austri-

ans at Neuwied. Hoche died of a blood infection on 18 September in the area around Wetzlar.

## Höchstädt, Battle of (19 June 1800)

The encounter at Höchstädt, Bavaria, between 60,000 French troops under General Jean Victor Moreau and 70,000 Austrians under *Feldzeugmeister* Paul Kray Freiherr von Krajowa marked the beginning of the end of Austrian power in the War of the Second Coalition. In 1800, as in 1796, the French attempted a knockout blow against Austria with simultaneous invasions of Italy and Germany. After successive defeats at the hands of Moreau's Army of the Rhine and Switzerland at Engen, Stockach, Mösskirch, and Biberach, Kray withdrew to the fortified supply city of Ulm on the left bank of the Danube (11 May). Moreau, realizing that he could neither prevent the reinforcement of Italy nor pursue the Rhine campaign as long as Kray remained secure there, decided to cross the Danube downstream in hopes of cutting him off from magazines at Donauworth and Ratisbon (Regensburg) and thus forcing him to fight or flee.

For several weeks the French methodically prepared for contingencies by securing themselves against attack from the south and then blocking routes of escape between the rivers Iller and Lech. The main battle commenced at 5:00 A.M. on 19 June with a bold French crossing at Blindheim and Gremheim; it lasted eighteen hours. The Austrians, though caught off guard, fought hard and stood their ground, even managing to bring in reserves. The French, however, defeated both the corps of Anton Graf Sztáray,

covering the Lower Danube, and two counterattacking forces sent by Kray from Ulm. Although Austrian losses were only some 1,000 casualties and perhaps 5,000 prisoners, Kray abandoned the city and garrison of 12,000 men, retreating with the bulk of his forces—eventually to the river Inn and the Austrian border—as Moreau pushed deeper into Bavaria and occupied Munich. In the meantime, Bonaparte had defeated the Austrians at Marengo. A truce took effect in the north in late July.

Capping a series of victories, Höchstädt was a personal and symbolic triumph for Moreau. Compensating for a somewhat uneven performance in Italy in 1799, it left him poised to attain the goals that had eluded him in 1796 and moreover offered the sweetness of historical revenge: recompense for the fateful French defeat there—known in English as the Battle of Blenheim—in 1704. Greater success lay ahead: Both sides took advantage of the truce to rebuild their forces, and soon after fighting recommenced, Moreau scored the greatest victory of his career at Hohenlinden (3 December), which in essence drove the Austrians back to the bargaining table and won the war but, by overshadowing Marengo, contributed to the worsening of his already tense relations with Bonaparte, the First Consul.

## Hofer, Andreas (1767–1810)

Leader of the Tyrolean revolt against Bavarian rule during the War of the Fifth Coalition.

Andreas Hofer was born in St. Leonhard (Passeiertal) in the Tyrol (now simply “Tyrol”) on 22 November 1767. He attended some years at the newly established school but had to take charge of the inherited Sandhof Inn very early. He married Anna Ladurner in 1789. Hofer’s main business was agriculture within the mountainous region of his home valley. His wife worked as a landlady of the inn, which was part of the farm. These different activities were not a sign of economic success; rather, they were necessary for a very modest income to feed a family with seven chil-

dren. For financial reasons Hofer engaged in trade with horses and wine, whereby he became acquainted with the region that is now part of Austria and northern Italy. His first contact with the French came in 1796, when he took part in the Austrian defense against Bonaparte’s campaign in Italy. There is some documentary evidence that Hofer became a small local army supplier, but what is known about the role Hofer played during the several Franco-Austrian conflicts in Italy of that time is very sketchy.

In 1805 Bavaria sided with France during the campaign against Austria. Under the terms of the Treaty of Pressburg Austria had to cede the Tyrol to Bavaria. The Bavarian administration of the Tyrol introduced all those administrative measures that were part of the modernization process of the imperial French model. This process received a hostile reception from the locals; it seems that Hofer was engaged in anti-Bavarian activities beginning in 1807. He participated in the secret meeting of Tyrolean peasants in November 1807 and was questioned by police a month later. The Austrian government prepared to revenge its 1805 defeat and secretly established contact with locals in the Tyrol who were willing to oppose Bavarian (and thereby French) rule. Hofer himself traveled to Vienna during that period.

In April 1809 Austria declared war on Bavaria and France. Austrian troops invaded the Tyrol, and Hofer served as part of a fifth column that aided the Austrian cause. Habsburg military victories with their irregular Tyrolean allies were short-lived; by mid-May Napoleon once again entered Vienna (as he had in 1805). Although the Battle of Aspern-Essling is often interpreted as an Austrian victory, the Habsburg war effort collapsed between the end of May and the Battle of Wagram on 5–6 July. On 21 May the Austrians had to leave the Tyrol to support their troops elsewhere, and Hofer assumed local command. The Tyroleans were successful in the fighting at Berg Isel at the end of May, which led to a tactical retreat by Franco-Bavarian forces. This and some more Pyrrhic victories were a recipe for disaster for the Tyrolean irregulars. When the Austrians asked for an armistice in mid-July, Hofer incited his fellow Tyroleans to continue further resistance. The Austrians, for their part, remained ambiguous: They still morally supported the Tyrolean resisters, but in the Treaty of Schönbrunn Austria reasserted Bavarian control over the Tyrol. The Austrian government informed Hofer about that decision, and the Tyrolean resisters were granted an amnesty by the Bavarians.

The Tyrolean resistance nevertheless continued, and for a while the fortunes of war changed from day to day. Hofer himself first accepted the peace treaty, but then reengaged in combat. Whether he actually incited this partisan activity or was forced to continue it is not clear. In any

event, Tyrolean resistance finally collapsed in November and December 1809, forcing Hofer to flee to a distant Alpine hut. On 28 January 1810 he was betrayed and arrested. Napoleon ordered his execution, and he was condemned by a French military court in Mantua. The Austrians tried to intervene by diplomatic means but probably did so only halfheartedly. Hofer was executed for his partisan activities on 20 February 1810. The Tyrol was restored to Austria after the defeat of Napoleon in 1814.

During the nineteenth century Hofer was transformed into a Tyrolean hero of mythic proportions. When large parts of the Tyrol became Italian after World War I, Hofer was seen as a symbol of resistance. Today a more rational view of Hofer is slowly emerging, but he is still an icon both for the local tourist industry and for extreme right-wing militants in Tyrol and Austria.

## Hohenlinden, Battle of (3 December 1800)

Fought in wooded terrain around the small Bavarian village of Hohenlinden, 50 miles east of Munich and just north of the river Inn, this decisive French victory over the Austrian army and its German allies ended the War of the Second Coalition. It was the last military success for the Republic, already under the rule of Napoleon Bonaparte as First Consul, but its importance has been overshadowed by Bonaparte's propaganda surrounding his victory at Marengo the previous June.

In late April 1800 the French Army of the Rhine under General Jean Moreau had crossed into Germany with 137,000 troops, many of whom were veterans of previous campaigns. The sheer size of this army had prompted Moreau to group his divisions into corps, each forming a component in the usual eighteenth-century arrangement: two wings, a main body, advance guard, and reserve. Moreau had quickly defeated the smaller Austrian army under *Feldzeugmeister* Paul Kray Freiherr von Krajoiva in a series of engagements, including the second Battle of Stockach, and Höchstädt, before an armistice was signed on 15 July. Moreau took up position along the river Lech in eastern Bavaria. Across the autumn the Austrian army was reinforced, but morale remained low. After

Kray's resignation, command was nominally passed to 18-year-old *Feldzeugmeister* Archduke John, although in reality it was directed by his military adviser, 65-year-old engineer and *Feldzeugmeister* Franz Freiherr von Lauer, and his chief of staff, *Oberst* (Colonel) Franz Freiherr von Weyrother, to whom John was required to defer when making key decisions.

When the armistice ended on 28 November, both sides planned to take the offensive. Moreau's simple plan envisaged an advance by his 80,000 troops to the Inn and then down the Danube toward Vienna, in conjunction with the French army in Italy under General Guillaume Brune. The Austrian plan, devised by the optimistic Weyrother, was for a complicated flank march against the French line of communications. Sixty thousand men would march toward Landshut in just three days, cross the Inn, then wheel south around Moreau's left to cut his line of communications and force him to abandon the northern bank of the Danube. A second force comprising Bavarian, Württemberg, and French émigré troops (about 15,000 men) would guard the lines of communication. The march would have to be conducted in cold, rainy weather along forest roads.

Nevertheless, the initial Austrian advance caught the French by surprise and put the cautious Moreau on the defensive. However, the Austrians had little intelligence about French positions and, as the rain fell incessantly, turning the dirt roads into quagmires, the Austrian advance slowed to a crawl. Weyrother and Lauer now advised the archduke to abandon his sweep around the French left in favor of a direct advance on Munich, a move aided by better roads, which passed through Hohenlinden, some 18 miles from their present position. The village of Hohenlinden itself was a key strategic objective for both sides as it was the hub for the local roads, which would be required for the movement of artillery in the heavily wooded and hilly terrain. The local geography offered the French an important advantage as their veterans were skilled in fighting in such broken ground, while the Austrians were desperately trying to raise volunteer *Freikorps* to offset their chronic shortage of light infantry.

The armies made first contact on 1 December at the village of Ampfing, immediately to the east of Hohenlinden. The French advance guard, under the command of General Michel Ney, engaged about two-thirds of the archduke's army but after six hours was forced to withdraw 7 miles west, despite inflicting about 2,000 casualties on the Austrians. Buoyed by this initial success, John believed that the French were in full retreat, perhaps back west of Munich, although there was only a halfhearted pursuit of the French rear guard, as John wanted to rest his troops around Haag on the following day. The

Bavarian force under General Christian Zweibrücken was ordered forward and the plan envisaged joining *Generalmajor* Michael Freiherr von Kienmayer's brigade at Hohenlinden on 3 December.

Both armies were on the move on 2 December, the Austrians marching west to reach Haag and the French taking up their positions around Hohenlinden in a combination of rain, sleet, and snow. Kienmayer's column drove General Paul Grenier from Lengfeld toward Hohenlinden, but this limited engagement seemed to confirm the Austrians' belief that they only faced a rear guard. The plan drawn up at Haag that evening therefore called for a three-column advance starting at 5:00 A.M., led by *Generalmajor* Franz Löppert's advance guard, the left under *General der Kavallerie* Johann Graf Riesch, the center under *Feldmarschalleutnant* Johann Graf Kollowrat-Krakowsky, and the right under *Feldmarschalleutnant* Maximilian Graf Baillet de Latour. All these formations were to join Kienmayer, who was marching south from the Isar River valley but failed to consider any possible sustained French resistance. There was moreover only one significant road and the general advance would entail the flank columns using poor sideroads, which also ran east-west and thus made cooperation between the columns difficult.

Having always intended to offer battle only with his main army concentrated, Moreau was at first assembling his troops back in their former armistice period encampments but quickly realized his opportunity. He ordered his units to abandon the higher, wooded ground immediately in front of Hohenlinden and take position on the lower, open ground to meet the Austrians as they debouched from the forest, which would force them to attempt to deploy under fire. The Austrian artillery would be toward the rear of the columns and so would be unlikely to become involved in the fighting. Grenier's corps on the French left flank—comprising the divisions of generals Claude Legrand, Louis Bastoul, and Ney, supported by those of Emmanuel de Grouchy and Jean d'Hautpoul, a total of 32,000 men—would hold the Austrian main advance, while a flank attack, comprising 20,000 troops under generals Antoine Richepanse and Charles Decaen, would assail the Austrian left wing through the towns of St. Christoph and Maitenbeth to cut the main and threaten their rear. The flank attack would involve considerable risk of delay in the adverse weather, as it would have to be conducted along side roads and woodland tracks leading to the main road.

The battle developed at four points: In the north between Harthofen and Forstern, the French under Grenier would engage Kienmayer. From Preisdorf through Kronacker and Hohenlinden, the divisions under Ney and Grouchy would take on the Austrians under Baillet and Löppert. While d'Hautpoul's reserve cavalry was kept at

Hohenlinden, the French division under Decaen plus two brigades from Richepanse's division would tackle Riesch's Austrians around St. Christoph, while around Maitenbach the rest of Richepanse's division faced Kollowrat's reserve column.

The difficult forest roads made a coordinated Austrian attack difficult as snow fell. Löppert, whose advance guard had no artillery, was soon some way ahead and would only have the support of the lead units of Kollowrat's column moving along the main road, as the opening phase of the battle began in the center against Grouchy. The other Austrian columns were meanwhile struggling to move along the treacherous side roads. As the fighting continued around the edge of the forest, Kollowrat threw in increasing numbers from his column but could make no progress. However, from 10:00 A.M. Kienmayer was making ground against Grenier around Isen in the north and together with Baillet (whose men stood between him and Kollowrat) he assaulted the line of hamlets guarding the approach to Hohenlinden. Baillet managed to reach Krocknacker, defended by Ney and just 1 mile from Hohenlinden, which took some pressure off Löppert and Kollowrat. His advance also forced Moreau to commit his reserve cavalry under d'Hautpoul between Legrand and Ney.

In the center, Moreau established by late morning that the Austrians were not pressing their attack and were becoming uncertain of the situation. The reason was that Kollowrat was becoming increasingly anxious about the nonappearance of Riesch and was obliged to send detachments back south-east to link up with him around Albaching. At the same time, Richepanse was making progress with his flank march and by 10:00 A.M. was engaging some of Kollowrat's detachments around St. Christoph. The Austrian left was now dangerously exposed, as Riesch was still struggling through the forest, far behind schedule. Richepanse was thus able to strike right into the gap between Kollowrat and Riesch, splitting the Austrian army in two and putting the Bavarian detachment to flight. At around 10.30 A.M. Riesch finally reached Albaching and decided to head directly to St. Christoph to outflank Richepanse, but the other French division under Decaen was able to switch its axis of advance to pin Riesch down before he reached his target, while Richepanse reached the main road at Maitenbeth. From there Richepanse attempted to engage the Austro-Bavarian reserve cavalry under *Feldmarschalleutnant* Fürst Johannes Liechtenstein and its supporting artillery. Quickly defeated, Richepanse turned his attention to Kollowrat's rear and marched his infantry up the main road toward Hohenlinden. As reports reached the Austrian headquarters of events in the rear, Weyrother rode off to observe the situation himself. Hastily assembling what troops he could,

he led the mainly Bavarian infantry in halting Richepanse's advance before being wounded.

By noon it was clear to Moreau that, despite having no direct reports from him, Richepanse must be getting into position, albeit several hours behind schedule. So the French commander in chief ordered a general advance. Ney, who had halted Baille's attack, would advance along the main road toward the entrance to the Haag Forest. Grouchy was to march toward the same point and increase the pressure on the Austrian center's left flank, where Kollowrat committed his last fresh infantry. The Austrian center attempted to mount a defense against Ney's advance in the narrow defile leading into the forest, but this resistance soon collapsed and within a short time, Ney had already captured 10 guns and 1,000 prisoners, as Kollowrat's command began to break up. Ney pressed on into the forest and the Austrian army, pressed from all sides now, fell into disorder.

On the snow-covered ground, individual fugitives sought protection amid the trees, but many were cut down as the melee swirled about them. Although Kienmayer was able to drive Legrand and d'Hauptoul back on Forstern, due north of Hohenlinden, the Austrian left and most of the center collapsed as Grouchy's men followed Ney. They fled north toward Baille's column and back down the main road toward the reserve cavalry under Liechtenstein, whose troopers did what they could without artillery support to halt the French advances in the forest. The retreat had dissolved into a rout, with much of the artillery and baggage being abandoned as troops fled or surrendered. General Jean-Baptiste Drouet, who had fended off Riesch with Decaen's help, now led his part of Richepanse's division toward Maitenbeth, forcing Archduke John to flee to avoid capture. The battle was over by 4 P.M. and only night-fall two hours later saved the Austrian army from complete destruction. Kienmayer could only withdraw to the north.

The Austro-German army had suffered 4,485 casualties and lost more than 7,000 prisoners, together with 50 guns, compared with French losses of approximately 3,000. After this decisive victory, Moreau continued his advance toward Vienna, forcing the Austrians to seek peace by signing the Armistice of Steyr on 25 December, and the war formally ended early in 1801 with the Treaty of Lunéville. Moreau, a committed republican and potential rival to the First Consul, would be forced into exile in 1804. Attempts by the Austrian command to blame the Bavarian contingent only worsened strained relations between the two states, and Bavaria would side with France in 1805.

### **Hollabrunn, Action at (15–16 November 1805)**

A rearguard action between Russian and French forces on 15–16 November 1805. Despite their success at Dürnstein, the Austro-Russian army was still in a dangerous position since the fighting had delayed their march eastward. Meanwhile, Napoleon's forces had gathered on the southern side of the Danube and reached Vienna. Napoleon assumed that after the fighting at Dürnstein, General Mikhail Kutuzov would feel secure and rest his troops at Krems. Based on this assumption, Napoleon decided to move two French corps (under marshals Jean-Baptiste-Jules Bernadotte and Adolphe Mortier) across the river at Melk (southeast of Dürnstein) to pursue the Allies. Simultaneously, marshals Joachim Murat and Jean Lannes crossed the Danube over the Tabor Bridge that had been captured intact and cut the Russian army's line of retreat at Hollabrunn, where Napoleon intended to engage Kutuzov.

Surprised by the news of the capture of the Tabor Bridge, Kutuzov, in Vienna, immediately broke up his camp and marched eastward, instructing General Peter Bagration to cover the retreat. Bagration's detachment was some 7,500 men strong and included Austrian troops under Count Nostitz. After crossing the Hochfeld heights, Bagration arrived at Hollabrunn on 15 November. He found the terrain there disadvantageous and moved his troops 3 miles northward to a small village of Schöngrabern, where the terrain was better suited for defensive action. Two creeks cut across the ground, low heights overlooked the terrain, and a vast vineyard provided effective cover from enemy cavalry. Bagration arranged his main forces in defensive positions at Schöngrabern while Nostitz with his Austrian troops was moved to Hollabrunn as an advance guard.

Late on the afternoon of 15 November, Murat's advance guard of 1,200 men under General Horace François Sébastiani approached Hollabrunn. Later in the day, Murat himself arrived there with three cavalry divisions, while the divisions of IV Corps (under Marshal Nicolas Soult) and V Corps (under Marshal Jean Lannes) were en route. In total, Murat commanded approximately 30,000 men at Hollabrunn. As they encountered Austrian troops, the French declared to Nostitz that an armistice had been concluded between the French and Austrians, citing their unopposed crossing over the Tabor Bridge as proof. Nostitz believed the French and withdrew from Hollabrunn with his detachment. Bagration and later other Russian generals were furious at Nostitz's actions, which they believed exposed Allied positions.

Once within sight of Schöngrabern, Murat observed Bagration's troops, which he thought to be the entire Russian army. Therefore he decided to repeat his trick with the armistice that he had used in Vienna, and he sent his staff officer with an offer to the Russians to negotiate an armistice, claiming that the French and Austrians were already at peace. Bagration realized that the French proposal was a bluff and exploited this chance to gain time for the main Allied army. He agreed to the French offer and informed Kutuzov of the situation. Kutuzov was delighted by this news and immediately sent two aides-de-camp, general-adjutants Baron Ferdinand Winzregorode and Prince George Dolgoruky, with instructions to discuss the armistice and prolong the negotiations for as long as possible while the Allied army marched to Znaim. After brief negotiations, the armistice was concluded on condition that the Russians would leave Austrian territory, while the French would remain in Moravia. Both sides agreed to give four hours' notice before resuming hostilities. The agreement was to be sent to Napoleon and Kutuzov for ratification. Learning about the armistice, Napoleon was furious at Murat and severely reprimanded him, ordering him to immediately attack the enemy.

Murat received this letter on the afternoon of 16 November and informed Bagration that hostilities would soon resume. Around 4:00 P.M. the French artillery opened fire and bombarded the first line of the Russian positions. The Russian right flank was the first to receive the French assault, where General Karl Ulanus repulsed two French charges and then moved back to Guntersdorf. At the same time, Lannes's corps launched a formidable attack on Bagration's left flank. The Pavlograd Hussars and the Podolsk and Azov (infantry) Regiments were surrounded and suffered heavy casualties before they cut their way back to Russian positions. As evening approached, flames from the blazing village of Schöngrabern lit up the battlefield. Bagration directed part of his artillery against the

French batteries, while the rest engaged General Nicolas Oudinot's troops advancing in the center. Oudinot arranged his division in three checkerboard lines and charged through the vineyards against Major General Alexey Selikhov's troops. Selikhov had kept his troops under arms since the afternoon without any water rations, and before the attack he made the serious mistake of allowing the troops to run to the nearby stream for water. The soldiers broke ranks and were already in confusion when Oudinot's grenadiers attacked them. Simultaneously, General Louis Suchet's division continued its attack on Bagration's right flank. The Russians repulsed the initial assault and counterattacked, capturing the eagle and flag of the 40th Line.

Late in the evening, facing superior French forces, Bagration slowly began to withdraw with troops of the left flank. He made another stand at Grund, where he repulsed a series of French attacks and then personally led the counterattack, cutting his way toward Guntersdorf, where two battalions of the Novgorod and 6th *Jäger* Regiments covered his retreat. By midnight, after almost eight hours of savage fighting, Bagration finally disengaged and marched in the wake of the main Allied army. The French troops bivouacked on the battlefield and around Hollabrunn.

Although technically the action at Hollabrunn and Schöngrabern was a French victory, it was also a major Russian success since it gained precious time for the main Allied army to break off the French pursuit. Yet the Russians paid a heavy price for it. Bagration reported eight guns lost, 1,479 men killed or missing, and 931 wounded, with 737 of them left behind to the mercy of the French. The officer corps was hit particularly hard, with 30 killed, 24 missing, and 39 seriously wounded left on the battlefield. The French lost approximately 1,500 men, mostly from Oudinot's division. Bagration reported one French colonel, two officers, and fifty privates captured.

The news of Bagration's escape caused widespread celebration in the Allied army. The troops were welcomed as heroes while Bagration was venerated. As the Russians saw it, Bagration had successfully engaged the French army and had not only halted it but had defeated it, capturing prisoners and colors. Later it would be claimed that Napoleon himself had been present at the battlefield. Bagration was promoted from major general to lieutenant general and awarded the Order of St. George (2nd class) and the Commander Cross of the (Austrian) Order of Maria Theresa, the first of this kind to be given to a Russian officer. Tsar Alexander I also generously rewarded the Russian troops present, awarding the Pavlograd Hussars and Chernigov Dragoons with St. George standards, while the Kiev Grenadiers, Sysoev III's, and Khanzhikov I's Cossack Regiments received St. George colors. The 6th *Jäger* was the

first regiment in the Russian Army to be awarded the silver trumpets of St. George. In addition, 300 Orders of St. Anna were requested for men of the lower ranks who had distinguished themselves at Schöngrabern.

## Holy Alliance (26 September 1815)

Signed on 26 September 1815, the Holy Alliance was a treaty among the sovereigns of Austria, Prussia, and Russia—Emperor Francis I, King Frederick William III, and Tsar Alexander I (who initiated it)—in which they agreed to employ Christian principles in administering their nations and guiding their relations with other states. They agreed to take as their political guides “the precepts of that Holy Religion, namely, the precepts of Justice, Christian Charity, and Peace, which, far from being applicable only to private concerns, must have an immediate influence on the councils of Princes, and guide all their steps” (Hurst 1972,

1:96). These tenets were to be followed in settling European affairs following the defeat of Napoleon in June 1815.

The three contracting monarchs joined in “bonds of a true and indissoluble fraternity” (Hurst 1972, 1:97), pledging to work together to redraw the map of Europe and administer it justly. According to the terms of Article I, they promised to do so with a sense of “Religion, Peace, and Justice” rooted in Christianity and to “lend each other aid and assistance” (Hurst 1972, 1:97). They promised reciprocal service to each other, united as they were in one Christian world (Article II). Additional nations that ascribed to the tenets of the Christian faith in ruling their countries would be “received with ardour and affection into this Holy Alliance,” as provided in Article III.

The Holy Alliance was signed in triplicate in Paris and copies were given to each signatory. It was to complement the Quadruple Alliance of 1814 (later the Quintuple Alliance after the admission of France) as a statement of a policy of ruling righteously in the postwar period in order to preserve peace. Conservative in nature, it was intended to strengthen monarchical rule and rights through divine guidance. It reinforced the sovereign’s right to rule when he did so through Christian principles and was viewed as a necessary religious underpinning to government to counter the liberal and atheistic elements of the French Revolution.

This alliance led to cooperation between Austria, Prussia, and Russia at various postwar European conferences—Aix-la-Chapelle (1818), Troppau (1820), Laibach (1821), and Verona (1822)—where European national boundaries were settled and trade agreements were signed. In practice, the Holy Alliance was reactionary and sought to maintain the authoritarian status quo of the victorious powers. Klemens Fürst von Metternich used the Holy Alliance to sanction the strong rule of Francis I and to underscore Habsburg privilege and policies. Britain, whose foreign policy was the responsibility of Lord Castlereagh, attempted to liberalize European policies and refused to sign the Protocol of Troppau, which would have supported Spain’s claim to its former colonies in the New World, preferring to develop free trade with the newly liberated nations of South America.

At a time when European politics were reactionary and turning the clock back on liberalism, the Holy Alliance attempted to humanize and legitimize monarchical governments without relinquishing any political powers. Austria used the Holy Alliance to strengthen Habsburg control over those parts of Italy that sought independence. All the ruling princes of Europe eventually signed the Holy Alliance except the Prince Regent (later George IV) of Britain, Pope Pius VII, and the sultan of Turkey, because of constitutional or religious constraints.

## Holy Roman Empire

The term *Holy Roman Empire* was used to describe the territories of the German empire from the Middle Ages to 1806. This collection of territories and institutions evolved and developed over a period of centuries, but it proved unable to effectively resist the French invasions of the Revolutionary Wars and early years of the Napoleonic Wars and finally collapsed. It was in part replaced by the Confederation of the Rhine under Napoleon's domination.

When the Frankish king Charlemagne was crowned in 800, Pope Leo III regarded him as the successor to the Roman emperors. After the collapse of the Frankish empire, King Otto I established a German kingdom in 962. In 1157 this kingdom received the designation “holy,” and in 1254 the title “Holy Roman Empire” was first used. From the fifteenth century onward, the First Reich became known as the “Holy Roman Empire of the German Nation.” This empire was not a state but a group of central European organizations led by the emperor and the imperial estates that included a number of imperial institutions, such as an imperial court, council, and administration. There was no imperial government as such, but there was a legislature, an imperial army, and imperial taxes. The emperor's powers were restricted by the historic Peace of Westphalia of 1648, concluded at the end of the Thirty Years' War.

The emperor's position was not hereditary; rather, he was elected by the princes of a number of territories. Most of the emperors had come from the House of Habsburg, the rulers of Austria. In the eighteenth century, and particularly under Frederick the Great, Prussia had challenged Austria's hegemony. This rivalry continued throughout the French Revolutionary Wars and played a role in the col-

lapse of the First Reich. While Austria did much to lead a coalition of German forces to face the threat of the French Revolution, it was constantly looking over its shoulder, particularly toward Poland, where both Prussia and Russia had territorial ambitions. As the First Reich was unable to concentrate its resources against a France that was successfully mobilizing, its efforts to win this war were hampered.

Prussia's withdrawal from the war and the signing of a separate peace with France at Basle in 1795 effectively deprived the First Reich of the chance of defeating France. Europe would now be at war for another two decades. In March 1798 the German territories on the left bank of the Rhine were ceded to France, effectively giving France a say in German affairs. The Imperial Recess of February 1803 decided to indemnify the German princes who had lost their territory by providing them with secularized church lands, sweeping away the role of the prince-bishops. Fifty-one imperial cities were mediatized—that is, they lost their direct allegiance to the emperor and instead came under the control of a larger, secular ruler. The medium-sized states were augmented at the expense of the petty states, and a reordering of the electorates gave the Protestants a majority over the Catholics, further weakening the position of the Habsburgs.

Napoleon's victory over Austria and Russia at Austerlitz in December 1805 further weakened Austria's role, and in August 1806 Francis II abdicated as Holy Roman Emperor, becoming Emperor Francis I of Austria. This ended the thousand-year existence of the Holy Roman Empire.

## Hondschoote, Battle of (6–8 September 1793)

Hondschoote was the site of a decisive defeat inflicted on the forces of the First Coalition by the reformed army of the French Republic; it led to the lifting of the siege of Dunkirk and the retreat of the Allies.

Hondschoote, now in southwestern Belgium, is a village 20 kilometers from Dunkirk (which then lay on the French side of the border between France and the Austrian Netherlands). Seven foreign armies, among them

the British, the Austrians, and Hanoverians, were present on the northern French border to defend the Low Countries and to invade the French Republic to bring the Revolution to an end. The continental monarchies of the First Coalition—Austria, Prussia, and Spain—genuinely feared the loss of their thrones, while Britain was more concerned with excluding the French from the strategically important Channel coasts.

The broad objective of French military commanders was to stave off Allied invasion, so preserving the Republic's sovereignty and the Revolution from its enemies. While the French had achieved some initial victories during the early stages of the conflict, some humiliating military reversals had occurred in 1792 and 1793. Under General Charles François Dumouriez the French had won the Battle of Jemappes, near Mons, on 6 November 1792. He continued his successful invasion of the Austrian Netherlands but was forced to relinquish it after his defeat at the hands of the Austrians at the Battle of Neerwinden, which resulted in 4,000 French casualties. Disillusioned by events, and failing to convince his troops to join the enemy side, he defected to the Austrians. This defection was a major blow to the French. General Adam-Philippe de Custine, a veteran of the American Revolutionary War, had been minister of foreign affairs, and had signed the declaration of war against Austria on 20 April 1792. Custine was defeated at Mainz on 23 July and at the Battle of Valenciennes on 28 July, where his forces suffered 4,500 casualties. He also lost the Condé. He was executed for his failures on 28 August 1793.

With France devoid of competent commanders, these military reverses threatened the Republic, which badly needed a major victory. Because the army was in a disastrous state, the Committee of Public Safety, created on 6 April, instigated major reforms. The defense of France and the subsequent reorganization was made the responsibility of the demanding and uncompromising military genius Lazare Carnot. As minister of war this expert mathematician and strongly committed republican held responsibility for the formulation of strategy. Carnot expended considerable energy in rejuvenating the French Army. He removed a large number of commanders, many of them inept and incompetent leaders and poor strategists. Some veteran commanders refused to change their techniques and were dismissed. A number of generals were imprisoned. In their places Carnot brought in young and enthusiastic officers open to innovative strategies and tactics who were confident and willing to take the necessary risks to ensure victory.

Carnot mobilized France by skillfully manipulating patriotic ideals to ensure quotas through mass conscription. He used nearly every French citizen at his disposal to create

a Revolutionary military machine. He raised a million men in two general conscriptions: one on 23 February 1793, to be effective as of 7 March, and the other—famously known as the *levée en masse*—on 23 August, to be in place by October. Carnot called up able-bodied men aged between eighteen and twenty-five, with those twenty-five to thirty years old designated reserves. Middle-aged and married men were obliged to manufacture ammunition. He charged some women with the sewing of military materials such as uniforms. Other women were relegated to providing first-aid materials. Children were engaged in making medical supplies such as bandages. Recruitment became the responsibility of the elderly and disabled. Carnot's major military innovation was to order his commanders to use flanking techniques to overwhelm the enemy. He rightly earned the sobriquet "the Organizer of Victory."

In early August 1793 British forces laid siege to Dunkirk. The plan was to use it as a permanent supply base to support the expected conquests and occupations made by the First Coalition. The close proximity to the English coastline was a crucial factor in the decision to take Dunkirk. The powers of the First Coalition could then fight the Revolutionaries across the Continent without having to protect their lines of supply. The Anglo-Hanoverian forces were under the dissolute commander in chief of the army, General Frederick Augustus, Duke of York and Albany, son of King George III. Despite many years of military training in Hanover, he was inept and tactless, a disastrous commander, and neither a natural leader of men nor a good tactician; he was simply unfit for command. He achieved victories because of his capable subordinates.

York arrived outside the walls of Dunkirk on 23 August with 33,000 British, Hanoverian, Hessian, and Austrian troops at his command. He was fortunate to be supported by the exceptional Hanoverian general Heinrich Wilhelm von Freytag, stationed at Ost Capell, and by William V, the Prince of Orange, at Menin.

Since there were insufficient numbers of French troops to defeat York, the Committee of Public Safety ordered the troops at the Moselle River and at Metz to the Dunkirk area. By 6 September the 42,600 combined regular and volunteer French troops were ready to confront the Allies. The French, whose slogan was "attack and attack in mass," were under the command of General Jean Nicholas Houchard, a veteran of the Seven Years' War (1756–1763). Trained as an engineer, Houchard was appointed commander of the Army of the Rhine to replace Custine. However, to his credit, Houchard realized his leadership shortcomings and a proclivity to poor judgment that could lead to ruinous mistakes. He had extreme difficulty in maintaining discipline among his intractable troops.

Like York, Houchard was forced to rely heavily on his intelligent and competent staff officers. The raw recruits were ill disciplined, ill equipped, and untrained—completely new to the military experience. They did not use traditional drill-book tactics; rather, they used horde tactics, attacking a particular point in the enemy line and instigating hand-to-hand combat into which were drawn superior numbers of troops to effect a breakthrough. Some of the troops were trained as *tirailleurs*, who deployed in open order and sniped at the enemy individually. These troops soon became adept at shooting from behind such natural cover as trees, dykes, and hedges.

Realizing the magnitude of their task and the improbability of success, Houchard and his officers canceled their original plans to engage the Allies throughout Flanders. They had hoped to crush the forces under York and the Prince of Orange, but instead they chose to defend Dunkirk, which could only withstand a siege for a few days. A protracted siege was likely to result in an Allied invasion of France. Carnot placed a strong emphasis on the importance of Dunkirk, which took on great political symbolism for the French.

Meanwhile, York split his army into two parts, one under himself at Dunkirk and the other under Freytag, who was put in charge of ten divisions. York's troops proceeded to besiege Dunkirk while Freytag set up headquarters at Hondschoote to cover York.

On 6 September Houchard's five columns were led by the ill-tempered General Dominique Vandamme and the experienced war veteran General Jean-Baptiste Jourdan. The French advanced on Hondschoote and attacked York's regulars, who still deployed in traditional formations. Jourdan was severely restricted in his movements; many of his troops were poorly trained and inexperienced, and they possessed no supply train, no battering train, and no naval gunnery support.

French forces advanced in five columns, two of them led by Jourdan. Confused fighting by the green recruits occurred on the first day of the battle, resulting in a French retreat. Freytag was wounded on 6 September and was replaced by General Ludwig Georg Graf von Wallmoden-Gimborn, who commanded the 13,000 Hanoverians. Houchard's troops had spent their strength and ammunition and had depleted their food rations. Consequently, on 7 September the French command occupied itself in rectifying the situation. Houchard was eager to save Dunkirk and was not as involved with the battle as he should have been. He sent three divisions to various places, leaving him with 20,000 men.

However, on 8 September the French, now recovered, moved into flanking positions on both sides of Hondschoote, where the Allies were entrenched, with a morass

on their right and the village of Leysele on their left. This provided the French the opportunity to use Carnot's tactic of attacking in a mass. They fought ferociously, but general confusion regarding orders reigned due to Houchard's indecisiveness. Whereas many troops had left the French line and resorted to uncoordinated mass charges, the exceptionally well-trained Hanoverians used the ceremonial slow march and disciplined volleys against the French.

Houchard eventually ordered a retreat, but one of his officers assumed command and revoked the order. Jourdan, in command of the reserves, was wounded. A bayonet charge nearly halted the Hanoverians, who regrouped after Houchard arrived with 500 fresh troops and hurled his men into the fray. The French were reinvigorated upon realizing they might still achieve victory by employing horde tactics and covering fire. The Hanoverians, although steady and highly disciplined, proved no match for the numerically superior French, whose enthusiasm for victory led to a final, fanatical assault against the weakened points of the enemy's lines. After prolonged fighting, the French emerged victorious.

Shortly thereafter York had little choice but to raise the siege of Dunkirk and retreat, abandoning his siege guns in the process, but saving his army. The French had lost 2,500 men, as had the Anglo-Hanoverians.

Over the six-week period since his appointment, Houchard had showed himself an ineffective commander. His subordinates won the Battle of Hondschoote; he was merely a bystander. The main objective of destroying the Allied forces was not achieved. After Hondschoote, through defective reasoning and incorrect conclusions respecting Allied movements and intentions, Houchard lost the battles of Courtrai and of Menin, where his troops suffered severe losses. This left the roads leading to Paris unprotected, and the Allies could easily have threatened the French capital. As a result, Houchard was recalled to Paris, where his enemies, Carnot among them, colluded to put him on trial before the Revolutionary Tribunal, which charged him with military failure and treachery. After being accused of cowardice by the Tribunal, Houchard was unable to redeem his reputation and abandoned himself to his fate. Found guilty of military inefficiency on 15 November and succeeded by Jourdan as commander of the Armée du Nord, Houchard was guillotined the following day, a scapegoat for the mistakes of others. The Committee of Public Safety had certainly erred in appointing him, but a close investigation would have exposed wider political and military failings.

### Hood, Alexander, First Viscount Bridport (1726–1814)

A British admiral who gained fame as second in command to Admiral Lord Howe at the Battle of the Glorious First of June in 1794, Alexander Hood later commanded the Channel Fleet during the blockade of France from 1797 to 1800. Although his father, Samuel Hood, was a vicar, several members of Hood's family became famous British naval officers. His older brother, Vice Admiral Samuel, Lord Hood, commanded the fleet at the siege of Toulon, and two of his cousins also gained fame while serving in the Royal Navy.

Alexander Hood was born on 2 December 1726 in Butleigh, Somerset. He joined the Royal Navy in 1741 as a midshipman. After six years he was promoted to lieutenant, a rank he held for ten years. He was given command of the 32-gun frigate *Minerva* in 1759. That same year, while in command of this ship, Hood fought at the Battle of Quiberon Bay (20 November) in a major victory that ended a planned French invasion of Britain. The young captain's frigate was part of the scouting squadron that discovered the French fleet as it set sail. Hood gained wide fame in 1761 when his ship recaptured the British vessel, the much larger and more powerful 60-gun *Exeter*, which had been taken by the French in the Mediterranean. Following the conclusion of the Seven Years' War (1756–1763), Hood served in a variety of posts in the Mediterranean and at the Admiralty in Whitehall.

With the outbreak of the American Revolution in 1775, Hood was appointed to command the 74-gun ship of the line *Robust* and participated in the inconclusive action off Ushant on 27 July 1778, in which the British and French fleets only fired at each other for a few minutes. After the battle, the British commander, Admiral Augustus,

Viscount Keppel, was charged with cowardice in what became known as the "Keppel Affair." Hood vigorously defended Keppel's conduct during the latter's court-martial, even though this proved unpopular with fellow officers. Keppel resigned as commander of the Channel Fleet in order to defend himself and his reputation, and he was acquitted. He later became First Lord of the Admiralty. Hence, Hood's actions did not adversely impact his career. In 1780 Hood was promoted to rear admiral. In 1782 he commanded a division of the fleet under Admiral Richard, Earl Howe during the relief of Gibraltar. In the interwar years Hood served briefly as a member of Parliament. While in the House of Commons, he became friends with many of the leading politicians of the day, including the prime minister, William Pitt. The admiral's political connections would greatly enhance his career over the next decade. In 1787 he was promoted to vice admiral, and a year later he was knighted by George III.

When war broke out with France in 1793, Hood was appointed as Howe's second in command. At the Battle of the Glorious First of June (1794), Howe divided his fleet into three divisions, with Hood commanding the rear group from his 100-gun flagship, the *Royal George*. Over several days, Howe's squadron was able to destroy one French ship and capture six others. The battle was not a great strategic victory (the British failed to exploit their success, allowed the enemy fleet to escape, and failed to prevent an important grain convoy from reaching France), but it did, however, mark the first major British naval triumph of the war and was met with popular acclaim. For his actions during the battle, Hood was granted a peerage and became Baron, and later Viscount, Bridport.

After the battle, Hood exercised great autonomy and essentially held an independent command. However, his actions off Ile de Groix on 23 June 1795 attracted significant criticism. Although the British were able to capture three French vessels, Hood's management of the action was called into question. After the battle he transferred his command ashore and helped direct British naval strategy, although he personally took command of the operations during the abortive French invasion of Ireland in 1796–1797. Hood's role was significant, since that winter was one of the coldest in memory and the Channel Fleet remained idle in port. Nonetheless, Hood was able to oversee the operations that led to the failure of the invasion plans.

He took command of the Channel Fleet at Spithead in March 1797, on the eve of the great mutiny in April of that year. The crews of sixteen ships of the line rebelled over pay, conditions, and the cruelty of some officers. Although Hood was initially able to suppress the mutiny aboard his flagship, the insurrection quickly spread throughout the fleet, and within a week he had lost control of both his

flagship and the other vessels. For a time Britain's main line of defense lay immobile in port. Howe's intervention brought a relatively peaceful conclusion to the mutiny. Sailors received their first pay rise since 1658 and were promised better food and rations. In addition, a royal pardon was issued. However, the mutiny at Spithead sparked another uprising among the ships at the Nore in the Thames Estuary, in which the crews called for even more ambitious terms. The action at the Nore resulted in several hangings.

After the mutiny, Hood spent his remaining years in service directing the naval blockade of the French coast. He centered the blockading forces off the port of Brest, and over a three-year period he tightened the blockade as successive Orders in Council restricted trade with France and its continental allies. One result was that Hood's ships increasingly stopped and captured neutral vessels as official definitions of contraband products were expanded.

Hood retired in 1800 after almost sixty years in uniform. In honor of his accomplishments and service, he was made a viscount. He spent his remaining years at his estate, Cricket St. Thomas, in Somerset. He died on 3 May 1814.

## Howe, Richard, Earl (1726–1799)

Richard, Earl Howe was commander of the British Fleet on the North American station during the American Revolution (1775–1783), after which he served as First Lord of the Admiralty for five years. He is remembered as one of Britain's most distinguished naval commanders, and he was responsible for key naval victories during the American and French Revolutionary Wars. His most famous triumph occurred against the French in 1794 in an engagement known (by the British) as the Battle of the Glorious First of June. Horace Walpole, the famed writer and youngest son of the prime minister, Robert Walpole, once described Howe as “undaunted as a rock, and as silent” (quoted in Jackson

1899, 321). This portrayal points to the paradoxical nature of Howe's personality. He has been lauded as a great leader and strategist (seamen called him “Black Dick” out of respect for his courage), but many contemporaries decried his lack of charisma and poor communication skills, which often led to political rows or enquiries into his professional fitness throughout his naval career.

Howe was born in London in 1726 to a socially prominent family. His grandfather had been an Irish peer, and his father was the royal governor of Barbados. His mother, a German aristocrat, was allegedly the illegitimate daughter of George I. Howe was educated at Westminster under the famed scholar John Nicholl and at Eton. He entered the navy in 1739 as a protégé of Commander George Anson, and his first major assignment was aboard the ship *Severn*. The *Severn* was slated to sail around the world, but the voyage ran into trouble when five of Anson's eight vessels were lost while trying to round Cape Horn at the tip of South America and Howe was forced to return home. Despite this disappointment, Howe's love of the sea was solidified. Just five years later, he achieved the rank of lieutenant and was given command of his first ship, the *Baltimore*. The young commander was seriously wounded in the head when two French privateers engaged the *Baltimore* in 1745 during the War of Austrian Succession (1740–1748). He nonetheless survived, and for his gallant conduct he was promoted to captain in 1746.

He was given command of the *Dunkirk* in 1755 and sent to North America to patrol the waters during a time of increasing tension with the French. While touring the St. Lawrence River, Howe's crew captured the French ship *Alcide*, marking the beginning of the Seven Years' War (1756–1763). He commanded numerous ships, including the *Magnanime*, throughout the duration of the war, and for his valor during the conflict he was named a lord of the Admiralty in 1763. This honor came upon the heels of his elevation in the peerage to Viscount Howe, as a result of the death of his elder brother, George, who had been killed in action. He was promoted to Rear Admiral of the Blue in October 1770 in further recognition of his service during the war.

After the outbreak of revolution in the American colonies, Howe was appointed commander in chief of the fleet in North American waters in February 1776. He provided naval support to his brother, Sir William Howe, commander in chief of the army in the thirteen colonies (in distinction to Sir Guy Carleton, who commanded forces in Canada), and Parliament had empowered the brothers to make a final attempt jointly to negotiate peace with the colonies. However, those efforts failed, despite Howe's close relations with colonial leaders, including Benjamin Franklin. Hostilities therefore continued, lead-

ing to the eventual capture of New York City, Long Island, and Philadelphia during late 1776 and early 1777.

With the rebellion's fortunes waning, rebel forces sought the aid of the French government, and by March 1778 the French had formalized a defensive alliance against Britain. Howe quickly found his squadron confronted by a French fleet under Admiral Charles Hector, comte d'Estaing, with the two forces engaging in a test of wills over control of Rhode Island in the summer of 1778. The British eventually outmaneuvered the French through Howe's superior seamanship. Citing exhaustion, as well as possible resentment over failed promotions under Frederick, Lord North's ministry, Howe nonetheless resigned his commission in September 1778.

With the advent of Charles Watson-Wentworth, second Marquis of Rockingham to power in 1782, Howe assumed command of the Channel Fleet, with the rank of Admiral of the Blue, as well as being granted an earldom. His first assignment was to bring some relief to the beleaguered British garrison on Gibraltar—a key strategic possession in the Mediterranean—which was under siege by a Franco-Spanish force. On a ship aptly named the *Victory* (Lord Nelson's flagship at Trafalgar more than twenty years later), Howe engineered the landing of provisions and supplies that enabled the British to successfully hold out against the besiegers. In recognition of his work Howe was made First Lord of the Admiralty in January 1783. He held this post for five years until parliamentary complaints over his fiscal frugality and questionable regulation of the promotion lists prompted his resignation in 1788.

Howe briefly returned to service in 1790, but a case of gout forced him into semiretirement. He resumed active duty in 1793 with the outbreak of war between Britain and Revolutionary France as commander of the Channel Fleet, in which capacity he directed numerous cruises around the Channel Islands through late 1793 and early 1794 in search of enemy ships. Little action was seen during these months, which generated criticism at home over the squandering of tax money, but by May 1794 Howe's fleet finally made contact with a sizable opponent. The French, under the direction of Admiral Louis Villaret-Joyeuse, engaged Howe's ships beginning on 29 May. Dense fog interrupted the fighting over the next two days, but it resumed on the morning of 1 June. In a battle remembered as the Battle of the Glorious First of June, Howe resoundingly defeated the French and returned to Britain a hero, with six captured enemy ships in tow.

Howe was made a full admiral in 1796. Plagued again by ill health, he officially retired in March 1797, though as recent commander of the Channel Fleet and a respected, paternalistic naval figure, he received the petitions of the Spithead mutineers for improved working and living con-

ditions. He ignored the first petitions but later visited various ships involved in the mutiny in an attempt to quell discontent. He and other delegates sent by the Admiralty managed to end the revolt through personal appeals, backed by parliamentary concessions to some of the mutineers' demands. He spent the remainder of his life perfecting the new naval signal system he had instituted while serving in the Admiralty. Howe's numeric signal code, which streamlined the number of pennants used, was designed to improve communication within the fleet. As evidenced by "the Glorious First," this system was invaluable. In fact, a revised version of the code became the basis of the Admiralty's 1790 *Signal Book for the Ships of War*, the guide used until 1799, the year of Howe's death, when signals and instructions were amalgamated to form the Admiralty's first official signal book, which served the Navy throughout the Napoleonic Wars and the War of 1812.

### Humboldt, Wilhelm Christian Karl Ferdinand Freiherr von (1767–1835)

Prussian scholar, brother of naturalist Alexander von Humboldt, associated with the Weimar Classicists Johann Wolfgang von Goethe and Friedrich von Schiller.

Wilhelm von Humboldt struggled to find a vocation and proper outlet for his formidable talents, but his greatest achievement lay in the totality of his interrelated endeavors. Although he deeply valued the contemplative life, he was anything but apolitical, and during some two decades in government service he worked tirelessly for liberal reforms. Indeed, the problem of human nature and the relation between the individual and the state was at the

heart of much of his literary and philosophical scholarship as well.

Beginning in 1810 he was ambassador to Vienna, taking part in most of the diplomacy that prepared and accompanied the defeat of Napoleon. In 1813 he persuaded Austria to join Prussia and Russia against France in the Sixth Coalition. At the Congress of Vienna he achieved only some of his goals and had to settle for a weaker and less liberal German Confederation—though he still viewed it as a foundation for greater unity and institutional growth. By contrast, his principled struggle for Jewish emancipation bore fruit. His attempt to introduce more representative institutions in Prussia was stymied first by his personal rival, Karl August von Hardenberg, and then by the wave of repression that came in 1819 with the Carlsbad Decrees following the assassination in Mannheim of the reactionary propagandist August von Kotzebue by a radical student. He retired to his estate, where he dedicated himself to scholarship in classical literature and his greatest work, on world linguistics.

Humboldt's most familiar legacy is his creation, from 1809–1810, during the era of Prussian reforms, of the modern German educational system. His innovations operated on two tripartite levels: first, in finance, universal access, and curriculum; and second, in primary, secondary, and tertiary schooling.

In Humboldt's system, education was financed by the state and open to all, allowing social mixing impossible in society as a whole. The key was the neohumanist concept of *Bildung*, or total cultivation of the individual, in a context of freedom: "Persons educated to be free individuals will ultimately be better citizens than men educated to be citizens, just as science left to its own devices will be more fruitful than science supervised by the state" (Sorkin 1983, 64).

In Humboldt's revision of the levels of education, elementary schooling inculcated fundamental skills. Secondary education taught pupils to apply those skills in independent intellectual activity. The humanistic *Gymnasium*, by emphasizing the supreme heritage of classical Greek and Latin, acquainted the individual with universal humanity. In the university, teachers and students constituted themselves as a community of scholars. The guiding principles of the university came to be principles now often taken for granted: academic freedom and the unity of research, teaching, and learning. The new University of Berlin (1810) has since 1945 borne Humboldt's name.

## Hundred Days

*See* Waterloo Campaign

## Hungary

Collective name for the eastern territories of the Austrian (Habsburg) Empire, based on flat, open lands, surrounded by mountain ranges or, in the south, the Danube-Save river system. Composed of the Kingdom of Hungary (including the northern Banat), the Kingdom of Croatia (including Slavonia), and the Principality of Siebenburgen (Transylvania), it was protected to the south by the Military Frontier (*Grenz*). The agricultural economy was feudal and dominated by the great landowning magnates, who wielded considerable influence in the diets (noble assemblies). Hungary enjoyed greater autonomy than other provinces, dealing directly with the Habsburg monarch as its king. Vienna ruled these provinces through viceroys and maintained Hungarian and Siebenburgen chanceries as administrative offices, although the frontier was under direct rule through the Hofkriegsrat (Imperial War Council).

As king of Hungary and Croatia-Slavonia, and at the same time grand prince of Siebenburgen, the Habsburg monarch ruled through a viceroy called the *palatine* in Hungary (Archduke Alexander until 1795, then Archduke Joseph) and the *ban* elsewhere (including the Banat), who was advised by a *gremium* (selected council). Although Hungary's official capital was Pressburg (now Bratislava), Buda was the seat of government, while Croatia was ruled from Agram (now Zagreb) and Siebenburgen from Kolozvar. Each had its own diet (noble assembly, called the Sabor in Croatia), but the Hungarian body enjoyed considerable autonomy since it both controlled financial and military manpower contributions and had the right of *ius resistendi* (the right to oppose regulations from Vienna considered to be in breach of the ancient Hungarian constitution). The provinces were composed of *comitate* (counties) with their own diets (*congregationes*), headed by a Crown representative, the *föispan*, who also sat in the national Diet.

Ninety percent of the economy was agricultural; industry was limited to mining and initial crop processing, and craftsmen were rare. The peasants bore the burden of taxation, as the nobles were exempt. The largest towns had

fewer than 30,000 inhabitants. The population was concentrated in the north and west: Hungary and the Banat totaled 6.5 million; Transylvania, 1.5 million; and Civil Croatia/Slavonia, 650,000, with 700,000 in the Military Frontier. Magyars (Hungarians) were dominant in Hungary, and there were large populations of Slovaks in the north and Germans in the western towns. Hungarians made up only 28 percent of Transylvania's population, which was primarily Romanian, while Croats constituted 73 percent of Croatia's population, which also had a large Serb component. The 135,000 gypsies and 90,000 Jews were spread across all areas (Macartney 1969, 81).

The Military Frontier was divided into six districts, subdivided into administrative regiments. The first five made up the regulated frontier, guarding the Adriatic coast and Danube-Save river system. It was mostly inhabited by large households (*zadruga*), Croats to the west, Serbs in the center, and a mix of German settlers with Wallach-Romanians in the east. The unregulated district (where Military Frontier laws were not implemented) protected Siebenburgen's Carpathian Mountains and was populated by Szekels, Wallachs, and German settlers.

## Hyères, Action off (13 July 1795)

Second naval encounter between the British and French Mediterranean fleets in 1795. While lying at anchor in San Fiorenzo Bay in Corsica, Admiral William Hotham, commanding the British fleet in the Mediterranean, detached a squadron under Commodore Horatio Nelson on 4 July 1795 to cruise along the coast west of Genoa. While off Cape del Melle on the seventh Nelson sighted the Toulon fleet under Vice Admiral Pierre Martin at a distance of about 15 miles. This force consisted of seventeen ships of the line, six frigates, and three smaller vessels. The French gave chase and nearly caught Nelson's rearmost vessel, but on the morning of the eighth Nelson was able to warn Hotham of Martin's approach. The French ceased their pursuit on sighting Hotham's fleet in the bay. Hotham had twenty-three ships of the line, three frigates, and five smaller vessels. The following day Hotham's fleet weighed anchor and proceeded westward in search of the French. The French were sighted at dawn on the thirteenth off the

Hyères Islands, east of Toulon, and by 8:00 A.M., when it was clear the French were trying to avoid contact, Hotham ordered a general chase. In the course of the morning the winds shifted in direction and strength, so that both fleets became widely scattered and the British center and rear fell behind.

At 12:30 P.M. the three rearmost French ships opened starboard broadsides on the leading ships of the British van, consisting of the *Victory* (100 guns), *Culloden* (74), and *Cumberland* (74). Soon a French 74, the *Alcide*, was severely damaged, and by 1:30 the *Culloden* had lost her main-topmast. Around 2:00 P.M. the *Alcide* surrendered to the *Cumberland*, but the latter ship, instead of sending aboard a prize crew, proceeded to engage the second ship from the French rear. The French attempted to tow the *Alcide* to safety but were driven off. About this time several more vessels from Hotham's fleet joined the fight: the *Agamemnon* (64), *Blenheim* (90), *Captain* (74), and *Defence* (74). But around 3:00 P.M., just as the *Cumberland* was engaging yet another vessel in the opposing rear column, Hotham, for fear of being blown ashore, signaled the fleet to disengage. So astonished were the officers and crews of the van, and so reluctant were they to obey it—the officers on board the *Cumberland* in particular—that the flagship had to repeat the command.

It was true that as a result of shifting winds the French were outdistancing the British center and rear, whose progress was delayed by becalmed conditions, but later that evening the winds shifted again, and Martin made slow progress in his flight to Fréjus Bay. It appears that if Hotham had continued to pursue the French along the same course, he might have at least prevented them from reaching land and might possibly have sunk or captured much of Martin's numerically inferior force. Thus, a precious opportunity was irresponsibly lost. British losses aboard the six vessels actually engaged amounted to eleven killed and twenty-eight wounded. French losses are not known, but the *Alcide*, shortly after striking her colors, caught fire and blew up at 3:45 P.M., losing over half her crew in the process. Martin returned to Toulon, while Hotham made first for San Fiorenzo and then Leghorn (Livorno).

# I

## **Iashvili (Yashvili), Leo Mikhailovich, Prince (1768–1836)**

Russian general and artillery commander, born to a prominent Georgian noble family and the brother of Major General Vladimir Iashvili, one of the conspirators in the murder of Tsar Paul I. Leo Iashvili studied in the Artillery and Engineer Cadet Corps and was appointed as *shtyk junker* (roughly speaking, an officer candidate) in the Bombardier Regiment on 23 May 1786. He was promoted to sub-lieutenant for Ochakov in December 1788 and participated in the Russo-Turkish War from 1788 to 1791, fighting at Akkerman, Bender, and Ismail. In 1792–1794 he served in Poland and distinguished himself at Warsaw and Praga. Promoted to lieutenant in July 1794, he joined the 4th Horse Artillery Company on 29 December, rising to captain three years later. He transferred to the Life Guard Artillery Battalion in April 1799 and was promoted to colonel of Bogdanov's horse artillery battalion in May 1800, which was transformed into the 8th Artillery Regiment that September.

In 1801 he took part in the conspiracy against Tsar Paul I. Under Alexander I, Iashvili was transferred to the Life Guard Artillery Battalion in April 1801 and to the 1st Horse Artillery Battalion in June 1803. He participated in the 1805 campaign, distinguishing himself in rearguard actions in the action at Wischau and at the Battle of Austerlitz. In 1806–1807, Iashvili served with the 4th Artillery Brigade in Poland and took part in the battles of Pultusk, Eylau, Guttstädt, and Friedland. For his actions he was promoted to major general in March 1808. In April 1809 he became commander of the artillery brigade of the 4th Division.

In 1812 Iashvili commanded the 1st Reserve Artillery Brigade of General Peter Graf Wittgenstein's corps, fighting at Dunaburg, Jakubovo, Klyastitsy, Golovchin, Smolyani, and Borisov. For his actions he was promoted to lieutenant general in October 1812. He distinguished himself in both battles at Polotsk in August and October 1812,

and he also took part in the pursuit of the French forces fighting at Borisov and on the Berezina. In 1813–1814 he served as head of artillery in the main Russian army and participated in most of the major battles in Germany and France. In 1816 he became commander of artillery of the 1st Army and was promoted to general of artillery three years later. He served as artillery commander of the 1st Army from 1816 to 1833 and took part in the suppression of the Polish uprising in 1830–1831.

## **Ibrahim Bey, Al Kabir Al-Muhammadi (17?–March 1816)**

Prominent Mameluke statesman and military commander, also known as al-Kabir (the Great). Ibrahim Bey was born as Abram Shinjikashvili to a priest's family in the village of Martkopi near Tbilisi, the capital of Georgia. He was kidnapped at an early age and was raised as a Mameluke of Muhammad Bey Abu l'Dhahab. In 1768–1769 he became bey, serving as *amir al-hadjdj* (official in charge of issues relating to pilgrimage) in 1772–1773 and *daftardat* (record-keeper or registrar) in 1773–1774. In March 1775 he was appointed *shaykh al-balad* (the official holding supreme authority in the country), and after the death of his patron Abu l'Dhahab Ibrahim became co-ruler (with

Murad Bey) of Egypt. He and Murad Bey were forced to flee to Upper Egypt during a brief civil war, but they returned to power in February 1778, when Ibrahim Bey assumed position of *shaykh al-balad*. However, the conflict between numerous Mameluke factions continued, leading to a rupture between Ibrahim Bey and Murad Bey. The two rulers soon reconciled, and Ibrahim was restored as *shaykh al-balad* in February 1785. Nevertheless, another civil war led to the disruption of pilgrimages to the Muslim holy places and to a decline in agriculture.

In late 1785 Ibrahim and Murad received Ottoman demands for tribute but refused to comply. On 18 July 1786 Murad Bey failed to contain an Ottoman expeditionary force sent as a result, and the Turks installed a new government in Cairo in August 1786. Ibrahim Bey withdrew to Upper Egypt, where he fought the Ottoman-backed administration in Cairo for the next five years. In July 1791 Ibrahim Bey finally seized power in Cairo and ruled with Murad Bey for the next seven years. He kept close contact with his family in Georgia and, despite having converted to Islam, contributed significant sums of money to the construction of the Christian church and fortifications at his native village of Martkopi. He even invited members of his family to visit him and had close relations with King Erekle II of Kartli-Kakheti (Eastern Georgia).

On 2 July 1798 Ibrahim Bey faced the invasion of a French expeditionary force under Bonaparte. Within the next three weeks, as Murad Bey's Mameluke forces were defeated at Shubra Khit (10–13 July) and Inbaba (Embaba) (21 July), Ibrahim Bey fled to Syria. Although he continued to mount resistance against the French, Ibrahim Bey never fully regained his authority, and his forces were depleted. After Muhammad Ali became viceroy of Egypt, Ibrahim remained in Upper Egypt, distrustful of Muhammad Ali. Thus, he declined an invitation to visit Cairo in early 1811 and survived the massacre of the Mamelukes of 1 March 1811. The same year, Ibrahim Bey left the country and settled at Dongola in Sudan, where he died five years later.

## Idéologues

The Idéologues were a group of French intellectuals who had scientific and political influence during the French Revolutionary and Napoleonic eras. The origins of this group go back to the pre-1789 *ancien régime*, when the salon of Madame Anne-Catherine Helvétius (née de Ligniville) may be seen as the birthplace of the Idéologues as a scientific movement. The core representatives of the Idéologues consisted of such intellectuals as Jean d'Alembert, André-Marie Ampère, François Andrieux, Pierre Cabanis, Sébastien Chamfort, André-Marie de Chénier, Etienne de Condillac, the marquis de Condorcet, Pierre Daunou, Joseph Marie Degérando, Antoine Destutt de Tracy, François Droz, Claude Fauriel, Benjamin Franklin, Dominique-Joseph Garat, Pierre-Louis Ginguené, Paul d'Holbach, Pierre Laromiguière, Maine de Biran, Chrétien de Malesherbes, Alessandro Manzoni, André Morellet, Emmanuel Sieyès, François Thurot, Anne-Robert-Jacques de Turgot, and the comte de Volney. This group is usually identified with Sensualism, which was a French philosophical answer to the philosophical schools of Rationalism and Empiricism. Because the careers and the activities of members of the Idéologues extended from the peak of the Enlightenment period in the mid-eighteenth century to the end of the Napoleonic era in 1814–1815 (and sometimes even beyond that), the term as a label for a philosophical movement cannot be regarded as very precise.

However, the term *Idéologues* as a name for a politically active group becomes more readily applicable during the Revolutionary period (1789–1799) and the early stages of Napoleonic rule (1799–1804). The Idéologues were not confined to a special Revolutionary party, but they did hold important offices during the 1790s. They were responsible for many of the constitutional changes and organizational matters during the institution-building period of the emerging First (French) Republic (from 1792). The Idéologues symbolized the new self-confidence of science and scientists created during the Enlightenment, which tried to apply scientific methods to government and to the state. The Idéologues are not as famous as the Jacobins, the Hébertists, or other political factions, but they probably exerted much more influence on the creation of the political and scientific institutions of modern France than these better-known groups.

Bonaparte had shown his interest in modern science during his campaign in Egypt in 1798–1799, when he took a whole contingent of scientists, known as Savants, with

him to study this ancient land. When he came to power as a result of the coup of Brumaire in November 1799, many of the Idéologues were behind him. They constituted the scientific element of those Bonapartist supporters who were labeled “Brumaireans” or the “elite of Brumaire.” The state organization and the institutions that ran the state during the period of the Consulate (1799–1804) all suited the mutual interests of Bonaparte and of the surviving Idéologues. Relations cooled, however, when Bonaparte proclaimed himself Emperor Napoleon I and established the First Empire in December 1804.

Both the scientific and the political views of the Idéologues remain vague, as they were not organized as a coherent group or party with a clearly defined membership. Nevertheless, the term *Idéologues* is a good label for those French scientists and intellectuals who became involved in politics for the purpose of creating a government and state based on scientific knowledge and the employment of scientific methods. This was only possible in a post-absolutism environment, when the principle of the divine right of kings as a means of legitimizing the government or state had vanished.

## Ile de Groix, Action off (23 June 1795)

Minor Anglo-French naval action off Brittany, fought in the wake of the royalist landings at Quiberon Bay. The Channel Fleet, under the temporary command of Admiral Alexander Hood, Lord Bridport, while Admiral Richard, Earl Howe, was ill, left Spithead on 12 June to escort an expedition to Quiberon Bay. They encountered a French fleet bound for Brest under Admiral Louis Villaret-Joyeuse. However, a violent storm dispersed their ships and obliged Villaret-Joyeuse to seek protection off Belle Isle. Meanwhile, the British expedition left its escort on the nineteenth, also near Belle Isle, at which time Bridport then sought to protect the landings and subsequent operations

by watching for ships out of Brest, for Bridport was unaware that Villaret-Joyeuse was not in fact there. However, he was soon informed of the French presence by Sir John Warren, commander of the *Pomone* (40 guns), and on the twentieth Bridport ordered Warren to send him reinforcements in the shape of three of his ships of the line: the *Robust* (74), *Thunderer* (74), and *Standard* (64).

Bridport himself had fourteen ships of the line already, and he kept them between Warren and Villaret-Joyeuse while he awaited the reinforcements. Bridport sighted the French on the twenty-second, and by 6:45 A.M. he had signaled his whole force to give chase. By noon they had come within 12 miles, though the winds were then very calm. At 7:25 P.M. Bridport ordered his ships to engage the French as they came into range. By nightfall the British were nearly upon them until the winds calmed. At 3:00 A.M. the following day, however, the wind picked up, and by dawn the French were clearly in view, with all but three or four ships clustered together. The British, less than 3 miles from the enemy yet scattered about, were lead by the *Irresistible* (74), with the *Queen Charlotte* (100) on her starboard quarter and the remainder of the ships proceeding astern. Following the *Queen Charlotte* were the *Orion* (74), *Sans Pareil* (80), *Colossus* (74), and *Russell* (74).

Around 5:00 A.M. the rearmost French vessel, the *Alexandre* (74), which, formerly named the *Alexander*, had been captured from the British the year before, was found to be lagging behind and was taken in tow by one of the French frigates. An hour later this vessel and several others nearby opened fire on the *Irresistible*, which returned fire against the *Alexandre* (24), obliging the frigate towing her to leave her behind. At about 6:15 A.M. the *Queen Charlotte* (100) and the *Formidable* (74) exchanged fire, an exchange in which the *Sans Pareil* took part, and it was not long before the *Formidable* caught fire. The flames spread rapidly and caused such considerable damage that the ship was forced to fall astern. When, finally, her mizzenmast was lost, the *Formidable* surrendered.

Meanwhile, the bulk of the opposing vessels had joined the engagement, with the exception of the 74-gun French ships *Zélé*, *Fougueux*, *Jean Bart*, and *Droits de l'Homme*, which were well outside the scene of action and could therefore take no part in the fighting. On the British side the *Royal George* (100), *Prince of Wales* (98), *Prince* (98), *Barfleur* (98), *Prince George* (98), *Valiant* (74), *Colossus* (74), and a number of frigates were too far astern to join the fight. In the course of the action the *Queen Charlotte* suffered so much damage to her rigging that she could hardly maneuver, though just after 7:00 A.M. she still managed to fire a broadside into the stricken *Alexandre*, which thereupon struck her colors. To this prize was added the *Tigre* (74), which, having already fought with the *Queen*

*Charlotte* and *Sans Pareil*, succumbed after the *Queen Charlotte* and *London* (98) began to add their own fire. Shortly after 8:00 A.M. the British flagship, the *Royal George*, with Lord Bridport aboard, finally came into action, overtaking the *Queen Charlotte*, then in the process of making repairs to her sails and rigging.

Yet at 8:15, although Bridport was in a position to sink, seize, or drive ashore his opponent's vessels, he squandered the opportunity and signaled to the *Colossus*, and soon thereafter the *Sans Pareil*, to cease firing. The *Royal George* fired her broadsides into the massive 120-gun *Peuple* and the *Tigre*, unaware that the latter had already surrendered. She then disengaged from the French fleet, followed by the remainder of Bridport's ships. The *Prince*, *Barfleur*, and *Prince George* took the prizes in tow, and Bridport's fleet bore away to the southwest. The French, taking advantage of this narrow escape, made for the channel between Ile de Groix and the port of Lorient. Later that evening, advised by his captains that the British might attack his anchorage, Villaret-Joyeuse withdrew into the safety of Lorient itself.

Damage to Bridport's ships was generally slight, and his losses amounted to 31 killed and 113 wounded. French casualties are unknown, but the figures known for the three prizes—*Tigre*, *Alexandre*, and *Formidable*—alone totaled 670 killed and wounded. All three ships were commissioned into the Royal Navy. While this action was a British victory, it was not as complete as it might have been. Bridport's excessive caution denied him the chance to capture or destroy Villaret-Joyeuse's entire fleet. Thus, although the French were obliged to remain in port for the winter, eventually they all managed to slip past the blockade and reach Brest or other ports.

## Ilovaysky (Ilovaysky XII), Vasily Dmitryevich (1788–1860)

Russian general and cavalry leader. Vasily Ilovaysky was the son of General of Cavalry Ataman Dmitry Ilovaysky and

was enlisted in the Ataman Cossack Regiment in 1792. Ilovaysky then studied in the Artillery and Engineer Cadet Corps in 1798–1801 and served in the Ataman Cossack Regiment in 1801 before joining Ilovaysky II's Cossack Regiment in October 1802. In 1806–1807 Ilovaysky and his six brothers served in Poland. He commanded Cossack detachments at Pultusk, Jankovo, Eylau, Guttstädt, Heilsberg, and Friedland.

In 1808–1810, during the Russo-Turkish War, Ilovaysky served with Ilovaysky II's Cossack Regiment in the Army of Moldavia, fighting at Braila, Macin, Babadag, and Girsov, in two combats at Rassevat, Silistra (where he commanded a Cossack regiment), Tataritsa, Bazardjik (where he was promoted to a lieutenant colonel), Shumla, Batin (where he was promoted to a colonel on 7 December 1810), and Nikopol. In 1811 he distinguished himself at Ruse, where General Mikhail Kutuzov surrounded the entire Turkish army.

During the 1812 campaign Ilovaysky initially commanded a Cossack regiment in the 2nd Western Army, serving at Romanovo and Smolensk. In August–September Ilovaysky led Cossack detachments at Velizh, Porechye, Surazh, and Khimki (where he was promoted to a major general on 28 September 1812). He was one of the first to enter Moscow after the French abandoned the city. During the French retreat Ilovaysky distinguished himself at Dukhovshina, Orsha, and Kovno. In the spring of 1813 he commanded Cossack detachments in General Ferdinand Winzgorode's corps, fighting at Nordhausen, Naumburg, Weissenfels, Lützen, Königswartha, Bautzen, and Görlitz. In June 1813 he took command of all reserve Cossack regiments in the main Russian army. During the autumn phase of the campaign he distinguished himself at Kulm, and later served at Pegau, Leipzig, and Hanau.

During the 1814 campaign Ilovaysky took part in the actions at Vassy, Nogent, Bar-sur-Aube, Labrusselle, Troyes, Arcis-sur-Aube, La-Fère-Champenoise, and Montmartre. Returning to Russia, Ilovaysky was appointed ataman of the Don Cossack regiments in the Caucasus in 1823 and rose to lieutenant general on 7 September 1826. During the Russo-Persian War in 1827, he commanded Cossack detachments in General Ivan Paskevich's corps, fighting at Shulaveri, Abbas-Abad, Djavan-Bulah, Echmiadzin, and Sardar-Abad, where he became seriously ill and returned to the Don Host. Ilovaysky spent another thirteen years in the service before retiring on 6 April 1840.

## Imperial Guard (French)

The Imperial Guard was the backbone of Napoleon's army and an elite fighting force whose mere presence could bolster French morale on the battlefield.

The genesis of the Imperial Guard can be traced back to the turmoil of the Revolution and to several units in particular: the Garde du Corps Legislatif, the Garde du Directoire executif, and sections of the Guides d'Etat-major de l'Armée de l'Orient. These guides and bodyguards of the legislature and the Directory were united to form the cornerstone of the Consular Guard, or the Garde des Consuls, in 1799 (although the consular decree was dated 3 January 1800). After Bonaparte was elevated to Emperor as Napoleon I in 1804, the Consular Guard became the legendary Imperial Guard.

During this period, the Imperial Guard grew at a tremendous rate. In 1804 it numbered approximately 8,000 men, but by 1812 and the Russian campaign there were 56,169 Imperial Guardsmen. By 1814, as Napoleon's career neared its apogee, some 112,482 soldiers were part of the Imperial corps d'elite. However, these numbers could not be reestablished in the brief period known as the Hundred Days in 1815, when just 25,870 men could claim membership in the Guard (Chandler 1995, 338).

The Guard was a heterogeneous mix of different types of infantry, cavalry, and artillery, and the organization of this "army within an army" was quite complex, since it was divided into three sections: the Old Guard, the Middle Guard, and the Young Guard.

Foot grenadiers (the famed *grogards*, or grumblers), chasseurs, horse grenadiers, *chasseurs à cheval*, dragoons, lancers, Mamelukes, engineers, a detachment of gunners, military police, and Marines of the Guard made up the Old Guard. In 1806 two fusilier regiments formed the nucleus of the Middle Guard. Two regiments of sharpshooters

(flankers) were added in 1812–1813. By 1809 the Young Guard had been established, consisting of light infantry and skirmishers.

Velite (cadet or trainee officer) squadrons acted as a training school for young men who served with the Imperial Guard cavalry at their parents' expense with a view to becoming an officer. Entry requirements for the Consular Guard were stringent and remained largely unchanged for its imperial successor. Men had to be at least twenty-five years old and between 5 feet, 6 inches and 6 feet tall. They were required to have at least ten years' service and to have fought in a minimum of three campaigns; they had to be literate and had to have displayed exemplary bravery, discipline, and devotion to *la patrie*. As years of war took their toll and the shortage of manpower became acute, some of the requirements were dropped or amended.

As well as prestige, membership of the Imperial Guard had a number of benefits. These included higher rates of pay, as officers and men of the Guard could receive almost double the wages of equivalent ranks in the ordinary regiments of the line. Their uniforms, rations, and even weapons were usually superior to those issued to the rest of the army. Other factors separated members of the Guard from their comrades, including a system of ranks that did not exist in other units. As colonels general of the Guard (*colonels généraux de la Garde*), four marshals headed the various arms: Louis Davout, the foot grenadiers; Nicolas Soult, the *chasseurs à pied*; Jean-Baptiste Bessières, the cavalry; and Adolphe Mortier, the artillery and sailors.

Although the Imperial Guard was never far from Napoleon, it was seldom committed to battle. Until 1809 the Emperor was extremely protective of what Henry Lachouque has called his "gilded phalanx" (Lachouque 1997, 177). Indeed, at Jena in 1806 soldiers of the Guard grumbled at the Emperor's refusal to place them in the thick of the action, prompting the following retort from Napoleon: "Only a beardless youth would presume to judge in advance what I should do. Let him wait until he has commanded in thirty pitched battles before he dares to give me advice" (quoted in Chandler 1995, 486). Napoleon's reluctance to commit the Guard has been heavily criticized, although it was more than just favoritism toward an elite corps. The Guard could be kept in reserve to administer a much-needed coup de grâce as a battle reached its denouement.

The actions in which the Imperial Guard were involved, such as at Somosierra in 1808, have become part of military mythology. A case in point was the Battle of Austerlitz, where the cavalry of the French Imperial Guard decimated the pride of the Russian Imperial Guard. As Napoleon's personal escort, the Guard on occasion had to save the Emperor's life. At Eylau in 1807 their courageous

Wearing their distinctive bearskin caps, Napoleon's Imperial Guard was the most famous of many elite military formations of the day. (Print after Hippolyte Bellangé, ca. 1900)

intervention ensured that Napoleon lived to fight another day, despite some 6,000 Russian infantry coming too close for comfort.

The Imperial Guard has been criticized for having drawn good troops away from the line regiments and for possibly having created a sense of resentment among the rank and file. However, it could also be argued that the Guard gave line soldiers something to which to aspire and created a greater esprit de corps within the army as a whole.

One thing is certain: In the annals of military history few units have as prestigious a reputation as the Imperial Guard. As Lachouque wrote: "The Old Guard breathed its spirit into the Young Guard, and both breathed it into the Line, until the spirit of the Guard animated the whole Imperial army and continued to inspire those that came after it in 1854, 1870 and 1914" (Lachouque 1997, 505).

### Imperial Recess (1803)

The Imperial Recess (*Reichsdeputationshauptschluss*) was a fundamental and far-reaching restructuring of the map of Germany under Napoleonic auspices. Made necessary by French territorial expansion to the Rhine and carried out in order to satisfy France's promise to indemnify German princes who had incurred losses on the left bank of that river with territory on its right bank, the Recess also served Bonaparte's broader purpose of establishing French hegemony over Germany. The indemnification took place through the processes of secularization and mediatisation, that is, the assimilation by the larger German states of, respectively, ecclesiastical and secular principalities (the latter primarily imperial free cities). In conjunction with the further restructuring of Germany under the Confederation of the Rhine (1806), following the Peace of Pressburg (1805), the Recess reduced the number of sovereign principalities in Germany from over 1,000 to 39. In the short term these two events, taken together, prepared the way for the dissolution of the Holy Roman Empire, finalized by the forced abdication of the Holy Roman Emperor (Francis II, who became Francis I of Austria) on 6 August 1806, after a Napoleonic ultimatum. In the long term they determined the geopolitical map of Germany until 1866–1871, during the Wars of Unification, and indeed until 1945.

The French conquest of territory on the left bank of the Rhine had been formally ratified with Prussia in the Peace of Basle of 5 April 1795 and with Austria in the Peace of Campo Formio (18 October 1797). According to Article VII of the Peace of Lunéville (signed with the Holy Roman Empire on 9 February 1801), those princes who had incurred losses during this expansion would be compensated. The Imperial Diet therefore decided, on 2 October 1801, to appoint a committee to elaborate plans for such compensation. Composed of representatives of Mainz, Bohemia, Brandenburg, Saxony, Bavaria, Württemberg, Hesse-Cassel, and the *Hoch- und Deutschmeister* (master of the German order), this deputation formally rubber-stamped decisions already taken by France and Russia on 3 June 1802, after consultation with the key interested parties. These negotiations had taken place in Paris between Bonaparte as First Consul and Foreign Minister Talleyrand on the one hand, and Austria, Prussia, and the German middle states on the other, resulting in a series of bilateral agreements. Bonaparte wanted to weaken the Habsburgs both territorially in Germany and politically within the

Holy Roman Empire, and as a counterweight to Austria he wanted to create a group of middle-sized German states that would be strong but dependent on France. The aim of the Russian tsar, Alexander I, was to territorially enhance Württemberg, Baden, and Hesse-Darmstadt, all of whom were dynastically linked to the House of Romanov. France and Russia imposed their plan quite effortlessly through the exploitation of Austro-Prussian rivalry and that among the medium-sized German states, which were maneuvering for territorial expansion at the expense of the weaker. The end result was a Franco-Russian draft based on these agreements and accepted by the deputation on 23 November 1802—in spite of the Holy Roman Emperor's protest. The draft was finalized on 25 February 1803, ratified by the Imperial Diet on 24 March, and by the Holy Roman Emperor on 27 April.

The Recess, which eliminated 112 sovereign estates—including 66 ecclesiastical principalities and 41 free cities—and caused 3 million German subjects to change allegiance, has frequently been termed a *territorial revolution*. The main winners were Bavaria (which gained a third more than it had lost), Württemberg (which gained 4 times what it had lost), Prussia (which gained 5 times what it had lost, mainly in the northwest), Baden (which gained 7.5 times what it had lost), and (to a much more limited extent) Austria.

The consequences of the Recess for Germany and the Holy Roman Empire were enormous. Because of the departure of the secularized archbishops of Cologne and Trier, both of whom had sat on the Imperial Electoral College, and the arrival of the new electors of Württemberg, Baden, Hesse-Cassel, and Salzburg, six Protestants now opposed four Catholics, which meant the next Holy Roman Emperor could very well be a Protestant. Yet secularization meant not only the end of the political independence of ecclesiastical principalities but also the outright confiscation of church property by the beneficiary. In total the German Catholic Church lost 95,000 square kilometers of territory. This had not only major economic consequences but also significant social consequences, for example, in the areas of education and welfare, traditionally almost exclusively the responsibility of the church. Drove of previously ecclesiastical peasants became state peasants, especially in Bavaria. Much church land was also acquired by private individuals, ranging from peasant smallholders to wealthy urban burghers. Secularization clearly had a positive impact through the enabling of de-feudalization and general administrative modernization. Its cultural impact, however, was perhaps less fortunate, since many Catholic universities disappeared, as did important centers of scholarship in the abolished abbeys and monasteries.

Mediatization, in contrast, did not mean the confiscation of the property of the mediatized territory, just loss of sovereignty (and, of course, loss of the income that had resulted from the exercise of sovereign rights, for example, collection of taxes). After the Recess, the only imperial free cities left were Lübeck, Frankfurt, Bremen, Hamburg, Augsburg, and Nuremberg—the only towns with enough funds to bribe Bonaparte. Of these, Frankfurt and Nuremberg did not survive the next wave of mediatization of yet another seventy estates, by the Confederation of the Rhine.

## India

South Asian subcontinent forming a peninsula between the Indian Ocean and Arabian Sea, bordered to the north by the Himalayas and Afghanistan. Indian history between 1789 and 1815 is most notable for the internal collapse of the Mogul Empire and British expansion in the subcontinent under a succession of governors-general: Charles Cornwallis, first Marquis Cornwallis (1786–1793 and 1805); Sir John Shore (1793–1797); Richard Wellesley, second Earl of Mornington (also known from 1799 as Marquis or Marquess Wellesley, his title in the Irish peerage) (1797–1805); Sir George Barlow (1805–1807); Gilbert Elliot, first Baron Minto (1807–1813); and Francis Rawdon-Hastings, first Marquis of Hastings (1813–1823).

Since the mid-seventeenth century the British East India Company had been established in Bengal, Madras, and Bombay. Until the Seven Years' War (1756–1763) the company's main European rival for trade with India was

France. After the Treaty of Paris (1763) French influence was mainly limited to its trading post at Pondicherry and the East India Company was able to achieve its ambition of a trade monopoly.

The most noted opponent to Britain was Tipu Sultan (ruled 1782–1799), the ruler of Mysore. He appealed to France for aid in 1788, but the Revolution the following year overtook any commitment for assistance. Cornwallis began the Third Mysore War in 1789, forcing Tipu to terms on 22 March 1792. Cornwallis annexed half of Tipu's kingdom and imposed a large indemnity against which his two sons were taken hostage. Tipu remained hostile, repaying the indemnity while quietly rebuilding his army. Embracing revolutionary principles, Tipu opened a Jacobin Club and intensified his contacts with the French, the Turks, and the Afghans.

As Bonaparte invaded Egypt (1798), Tipu's correspondence with the French was discovered. Thinking more of empire building than of trade monopolies, the governor-general, Marquis Wellesley, wasted no time in launching a Fourth Mysore War (1798–1799), which was notable for the early campaigns of his brother Arthur, the future Duke of Wellington. It culminated in the storming of Seringapatam (4 May 1799), where Tipu was killed, leaving the British in control of all southern India.

The next phase of British expansion came in the Second Maratha War (1803–1805), which, although waged ostensibly in support of the ousted Peshwar of Pune, was seen by the governor-general as a means to expand into northern and central India. While General Gerard Lake captured Delhi on 14 September 1803, Arthur Wellesley triumphed against the Marathas at Assaye (23 September) and Argaum (29 November 1803). A year later, Holkar of Indore defeated a British force under Colonel William Monson as it retired to Agra (24–31 August 1804). Holkar then went on to lay siege to Delhi, a siege that was not relieved by Lake until 15 October 1804. The protracted conflict finally ended with a treaty favorable to Holkar (24 December 1805), restoring to him his territories.

It was not until Hastings opened the Third Maratha War (1817–1819) that the Hindu Marathas were finally defeated and Pune was annexed. Raids from the Gurkhas of Nepal also troubled the British. It took an eighteen-month campaign (1814–1816) in the Nepalese mountains to convince the Gurkhas to abandon their incursions into British territory. Most of Nepal was left as an independent state, with the Gurkhas remaining allied to Britain ever since.

**Infantry**

In 1793 the French Revolution brought about a much-needed social and constitutional change in France, and with it was born the modern nation-state, in which allegiance was to the state itself rather than to a king, president, or prime minister. In the other countries of Europe this caused alarm, even fear that similar changes might occur if the virus from France were to spread. The French Revolution made many royal houses, which considered kings supreme, insecure. The military of every nation had hitherto been subject to the command of the head of state, although actual command was normally delegated to the generals. Armies consisted of infantry, cavalry, artillery, and services, of which cavalry and artillery regarded themselves as superior to infantry by virtue of the equipment they fought with: horses and guns.

Infantry were very much the poor relations in these armies, sometimes badly equipped, subject to draconian systems of discipline, and forced to fight in line, where casualties could be frightful. There was little provision for medical treatment in the field, and soldiers who were discharged wounded had no hope of a pensioned retirement. Maneuver for the infantry was a simple matter: They marched to the place of battle in column and then formed into line, where they stood to fire and be fired upon. Advance or retreat depended on the state of the fighting and morale, and retreating troops were often cut to pieces by cavalry.

Following the Revolution there was no immediate reformation either of the French Army or of its tactics. The old Royal Army was broken up, but no replacement was created. Of the officers, some two-thirds were discharged (of a total of 10,000 in 1789). Regional National Guard

units did not collectively constitute an army in any sense of the word, but they were the first of the national conscripts raised by France, initially for internal police duties. The decree of February 1790 laid down that all Frenchmen were entitled to any rank and employment in the new army and that their oath was to be to France and the constitution, not to the king. Initial moves were made toward forming a small, professional army, but with the reaction from the rest of Europe to the fall of the French monarchy, it was felt necessary to raise a much larger army. No fewer than 100,000 men were called for in the summer of 1791, and by 1792 the number had risen to 300,000. Between 1800 and 1812 Napoleon raised 1,100,000 men, and he fielded in addition a number of foreign units.

French infantry consisted of the regiments of the line (there were seventy-nine French and twenty-three foreign regiments in 1793), light infantry (twelve battalions in 1791), and the infantry of the Imperial Guard (formed from the Consular Guard, and so named in 1804). Originally line infantry regiments were organized with two battalions, each having five companies, of which four were fusilier companies and one was a grenadier or chasseur company. In 1791 the battalions were reorganized to have eight fusilier companies and one grenadier company. Lazare Carnot, the minister for war during the Revolution, was responsible for the reorganization of the French Army, and he soon realized that despite the enormous increase in numbers the new army would have little skill. To alleviate the problem he allied one old battalion with two new ones, which was known as the *amalgame*. There were 110 of these formations, known as *demi-brigades de bataille*, in March 1796.

A further reorganization took place in 1808, in which each regiment had one depot battalion of four companies and four *bataillons de guerre*, in which were four fusilier, one grenadier, and one *voltigeur* (light infantry) company. Recruitment was by conscription for the simple reason that far too few Frenchmen volunteered, and those who did failed to renew their contracts when they expired. In general Frenchmen between the ages of twenty and twenty-five were liable to serve for a period of five years. Napoleon kept these rules in force, but he only called up men as they were needed, in view of the costs of maintaining large standing armies. Only in the last years of Napoleon's reign were all the men of a class called up, such as the class of 1815, which was called up in 1813 to replace losses incurred in the campaign in Russia.

The Prussian Army, in contrast, benefited from the social and political reforms instituted after the Treaty of Tilsit (July 1807) in that conscription was introduced, which increased manpower on a regular basis. However, King Frederick William III saw conscription as a threat to

the efficiency of a professional army, and in 1808 Napoleon imposed a limit of 42,000 men on the Prussian Army. By 1813, however, the minister of war, General Gerhard von Scharnhorst, had established an army that could be quickly mobilized. In 1813 universal conscription was applied to all of Prussia for men aged eighteen to forty-five. By the end of 1813 the Prussian Army had a strength of 300,000 men. Surprisingly, from 1808 onward officers were chosen by merit, not by background.

In Russia Tsar Alexander I succeeded to the throne in 1801. The Russian Army that faced the French invasion in 1812 was well armed and equipped and the troops were very like Prussian troops in their bearing and manner. However, deplorably bad supplies and services and a total disregard for the well-being of the individual soldier had a degrading effect on effectiveness. Russian infantry, when Alexander came to power, consisted of musketeers, grenadiers, and light infantry (known by the German term *Jäger*). The regiments consisted originally of two battalions but were soon increased to three (two ordinary and one grenadier battalion). Each battalion had three musketeer (fusilier) companies and one grenadier company. Regimental strength was 1,128 musketeers and 564 grenadiers, and in 1805 there were seventy-seven musketeer regiments, thirteen grenadier regiments, and twenty *Jäger* regiments. By 1811 reforms had grouped the regiments into divisions (of two musketeer brigades and one *Jäger* brigade, each brigade having two regiments). Further, the musketeers were renamed “infantry,” and the grenadier companies consisted of grenadiers and *tirailleurs*, or light infantry. The Russian infantry did not really distinguish between ordinary infantry, grenadiers, and *tirailleurs*, however, and were never skilled in skirmish tactics, unlike the French. Traditionally Russian infantry attacked en masse with the bayonet, a habit perpetuated until World War II. Nevertheless, the *Jäger* regiments were increased; by 1811 there were fifty, and further small increases were made in 1813.

The British Army had a general staff of sorts, headed by Lord Amherst from 1793 to 1795 and then by the Duke of York—a poor field commander yet a very able administrator—until 1827. York was in control except for the years 1809–1811, when Sir David Dundas took over while a scandal over York’s mistress and her influence over the granting of commissions was resolved. The army was administered by Horse Guards (named for the building the headquarters occupied), which controlled everything except the artillery and engineers, who were supervised by the Board of Ordnance. Officers could purchase their commissions or could be granted one. Promotion, however, did depend upon a vacancy and money.

The rank and file of the infantry were divided into Foot Guards and the regiments of the line. The Foot

Guards held themselves aloof from the rest of the infantry by virtue of the aristocratic background of almost all their officers and their rigid discipline. Organizationally, however, although Foot Guard battalions and regiments were numerically stronger, there was little difference between them and the line regiments. There were normally two battalions per regiment (although some regiments did raise third and even fourth battalions), and each battalion had ten companies (including one company each of grenadiers and light infantry). Although rarely up to strength, the companies consisted of approximately 100 rank and file. One battalion was the “service” battalion, drawing replacements and reinforcements from the “home” battalion, which was also responsible for recruiting and training.

As the war against Napoleon went on, some battalions in the field fell well below nominal strength (and battalions were never withdrawn because of low numbers), so that the 2nd battalion of the 38th Foot (later the 1st battalion, South Staffordshire Regiment) could muster only 263 officers and men for active service in 1811 (compared to over 900 at full strength). Light infantry regiments appeared in 1803, sometimes named fusiliers. The Rifle Corps itself had been formed in 1797, and eventually the 95th Foot emerged as the first light infantry line regiment, serving with distinction in the Peninsular War. Other units were formed, superior in marksmanship to the line regiments but still capable when necessary of fighting in the line rather than skirmishing. The King’s German Legion, formed in 1803 from George III’s exiled Hanoverian subjects, enjoyed a fine reputation among the many foreign units of the British Army and eventually served with ten line battalions and two light (rifle) battalions. Some of the other foreign units were not as well regarded. At home there were numerous militia and fencible battalions, none of which was obliged to serve with the operational army. Militia men could provide a substitute for themselves if called for service, but fencibles were not to be called. All of these home units were manned by volunteers and were used most often to assist in the suppression of unrest within Britain.

In all, some seventeen countries were involved in the Napoleonic Wars, and apart from those mentioned above, Austria, the Netherlands, Portugal, Spain, Baden, Bavaria, Hesse, Naples, the north German states, Saxony, Venice, Württemberg, Denmark, and Sweden were involved, some always against Napoleon, some at times against and at times for the Emperor. All had armies organized in a fashion similar to the armies of France, Austria, Russia, Prussia, or Britain, but these latter countries—but above all France and Austria—bore the brunt of the conventional fighting.

Every army was equipped mainly with the musket, a long-barreled, single-shot, muzzle-loading weapon that

was not very accurate. The rate of fire was slow (perhaps one round per minute), so fire was by ranks. This meant that discipline in line had to be severe. Companies were lined up lengthwise in two or three ranks, and the front rank (half the company) fired. In the two-rank system, as practiced in the British Army, the rear rank then advanced through the front rank to replace them in front, where they then fired, while the men previously in the front rank reloaded. This was repeated as often as necessary. In withdrawal the front rank fired, then withdrew behind the rear rank to reload. This resulted in a very slow rate of advance or withdrawal, with fire covering every movement. The range at which the infantry engaged the enemy was short, for the simple reason that musket fire had an effective range against a massed enemy of no more than 100 yards. Further, individual fire was a complete waste of time because the muskets were so inaccurate that no man could aim at another at 100 yards' distance and hope to hit him except by chance. The result was that infantry were forced to stay in close-knit masses to allow their fire to be effective—meaning in turn that the receiving troops stood in great danger from the massed fire brought against them.

The answer to the problem of massed troops was the recently invented military (as opposed to the lighter, less durable hunting) rifle. Even though loading this weapon was a slow process, the gun's increased accuracy meant that individual soldiers could pick their targets and hit them at up to 200 yards. The British Army had had the opportunity of acquiring Colonel Patrick Ferguson's rifle (first tested in 1776), but thanks to lack of vision the chance was lost. The Ferguson was a breech-loading rifle that could be used in the prone position, and had British troops been so armed their enemies would have been cut to pieces as they advanced in their lines. The Baker rifle, with which the light infantry were equipped, was good for the first two or three shots but thereafter it fouled in the barrel, which meant that it could only be reloaded with the aid of a heavy mallet, used to force the ramrod and ball into the barrel.

The other armament of the infantry was the bayonet, which was fixed to the muzzle of the musket. These weapons were long blades that transformed the musket into what was in essence a pike. As infantry advanced they could only fire two or three rounds before they came into close contact with the enemy, when the bayonet became the close-fighting weapon. Reloading on the move was impossible, even for the best-trained troops, and so the bayonet became the final weapon of a charge, leading to European reliance on the bayonet right up to World War II.

In the Napoleonic period there was no substitute for the bayonet in close-quarter fighting. Even decades later, when rifles had become standard issue, the conservatism of armies and particularly of the generals led them to re-

fuse to acknowledge that soldiers could kill without coming belt buckle to belt buckle. Tactics had begun to change as soon as firearms were invented, but they were unable to develop quickly because firearms were slow to load and inaccurate. For this reason massed infantry were still needed to ensure that sufficient firepower was delivered to the enemy to be effective. The invention of the rifle was to change this, albeit slowly, but the rifles of the Napoleonic period took longer to reload than muskets and were far too expensive for general issue. With the mass of the infantry using smooth-bore, single-shot muskets, they were confined to the maneuvers and battle formations of archers, yet they had none of the rapidity or weight of firepower that archers had been able to provide 300 years previously.

The firearm had brought one change that was manifest during the Napoleonic period: the ability to arm large national armies and field them after a relatively short period of training. Napoleon did not change tactics, but he brought rapid maneuver to a high art, moving troops so fast across country that he was able to achieve surprise and attack enemies when they were unprepared. In battle light infantry were used as protection for the slower-moving line infantry while they formed. French skirmishers (light infantry) paved the way in this field, and in 1793 all infantry acted as skirmishers; but the line formations made their return by 1795, protected by a forward screen of the more independent light infantrymen. When equipped with a rifle, these men were able to disrupt the enemy preparations for battle and could often operate independently behind the lines.

The main body of infantry remained, however, in the line. The British (like the Prussians and the Russians, for example) relied upon this formation in battle to give steadfastness and to deliver a heavy weight of fire on an advancing enemy. The French Army, on the other hand, was initially composed largely of poorly trained masses, and tactics involving the frequent use of the column began to be developed by Carnot, later to be perfected by Napoleon, though this formation had been employed regularly in the wars of the eighteenth century. The column could bring men into the line of battle to attack an enemy, already demoralized by artillery and skirmisher fire. The column then burst through the rigid lines and swept around enemy troops to encircle them or drive them to flight. The French column lacked firepower, however, and the British evolved tactics to defeat it.

The British Army formed up behind cover whenever possible and then arrayed itself in only two ranks. The fire from these two ranks was devastating and, because of incessant drills, extremely rapid for the period. The Duke of Wellington also increased the number of light infantry

available to him, and they proved to be effective against all French troops. For defense against cavalry the British square was nearly unbreakable, and on one occasion infantry advanced against cavalry and drove it from the field. Whenever possible, the British Army used volley fire—in which companies would discharge their weapons in succession, pouring continuous musket fire on the target—partly to ensure continuity of fire and partly to sufficiently weaken the enemy's resolve so as to render effective the bayonet charge which invariably followed the fusillade. When a French column advanced on a British line it was fired on from the front and from the flanks, which made it a costly tactic for the attacker. The drills of all line units in all the armies concentrated on forcing the men to stand their ground and to load and fire their muskets in an orderly manner. Untrained troops frequently forgot that they had reloaded and not fired, leading to multiple loadings of muskets, which was still a problem fifty years later during the American Civil War.

Infantry were organized in companies, battalions, and regiments, but as the Napoleonic Wars progressed the French divisional system became universal. Carnot improved the existing divisional system, which combined elements of infantry, cavalry, and artillery. Napoleon then trained his divisions to move quickly, and he improved logistics so that his troops were always supplied in the field. The British adopted the division in 1807 but were still using brigade formations in the Peninsula in 1809. Wellington's divisions did not include the light infantry, however; they were commanded independently, as was his cavalry. His regular line battalions did have skirmishers organic to them, as an answer to the French skirmishers, but these men were part of the battalion or regiment, not part of the light infantry division.

Throughout the Napoleonic Wars infantry were essentially present in battle to hold a line. The opposing armies formed up facing each other, and the infantry of one side would advance against the enemy line. Artillery would prepare the attack for the infantry (or cavalry) or defend the line, while the skirmishers attempted to interfere with enemy maneuver and to shoot officers and senior ranks. Cavalry was often held on the flanks to exploit any weakness at the ends of the enemy infantry line. The French column, advancing almost at the run, was often able to break enemy infantry lines, after which the bayonet, as a hand-to-hand weapon, came into play. British infantry, however, being formed of well-trained volunteers, was a match for the French. The training, albeit quite brutal, ensured that the British infantry line had the discipline and morale to withstand a frontal assault even by Napoleon's best infantry or cavalry, and to defeat that attack by controlled and effective firepower.

The real lesson for the infantry was that training was paramount, that no matter how many men were put into battle, unless they were well drilled and trained (which led in itself to higher morale), they were useless against a well-disciplined army that had practiced its musketry until firing and reloading became automatic. Unfortunately, not all the participants in the Napoleonic Wars learned this lesson well.

## Inkovo, Action at (8 August 1812)

A minor action near the village of Inkovo in the province of Smolensk, also referred to as the Battle of Molevo Boloto. After a council of war of 7 August, the Russian army began its offensive from Smolensk to Rudnya. Ataman Matvei Platov's Cossack corps was deployed in the advance guard of the 1st Western Army. The advance guard

of the Cossack corps under Major General Vasily Denisov attacked the French outposts near the village of Loshnya. Early on the morning of 8 August, Platov arrived with the rest of his corps and engaged the French, including troops under General Horace Sébastiani from II Cavalry Corps under General Louis Montbrun. The French brought in reinforcements and the 5th Hussars were able to drive back the Cossacks. However, as they approached the village of Molevo Boloto, the French encountered Platov's main forces (six regiments with twelve guns), and Montbrun ordered a retreat. Platov reinforced his advance guard with the 2nd Brigade under Lieutenant Colonel T. Grekov and 200 Bashkirs under Lieutenant Zhilin. The French 8th Brigade under General André Burthe withdrew from Molevo Boloto for 2 miles and was reinforced by the 7th Brigade, which soon engaged the Bashkirs.

Platov now decided to make flanking attacks and dispatched General Dmitri Kuteynikov's brigade to the right and General Nikolay Ilovaysky's brigade to the left, while he personally led the remaining forces in the center. The fighting continued for over an hour, in the course of which the Cossacks were able to capture a company of *voltigeurs* of the 4th Battalion of the 24th Légère. The 24th Légère repulsed several charges of the Cossacks led by Lieutenant Colonel Melnikov, who was killed in action. Kharitonov's Cossack regiment pursued the 3rd Württemberg Chasseurs and captured its colonel. However, the French 16th Brigade arrived in time to halt the Russian success on the left flank. Around noon, General Peter Pahlen arrived with three hussar regiments, and, supported by the 2nd Horse Artillery Company, they took part in the pursuit of the French forces toward Inkovo. The French called for reinforcements, including General Ernest Beurman's 14th Light Cavalry Brigade of III Corps, and succeeded in containing the Russian pursuit. Action ended near the village of Zalozye (3 miles from Rudnya) around 3:00 P.M.

The French moved across the Berezina River and Pahlen's forces withdrew to Loshnya. The French lost some 600 men, including 11 officers and 300 other ranks captured. Platov reported: "The enemy did not surrender so the raging Cossacks slaughtered them" (*Donskoe kazachestvo* 1942, 16–17). Russian losses were light, though no accurate information is available.

The action at Inkovo demonstrated that the French command was unaware of the Russian offensive and was caught off guard. While searching Sébastiani's headquarters at Molevo Boloto, the Russians found a message from Marshal Joachim Murat with information on the Russian offensive, which was believed to have been provided by a spy in Russian headquarters. This discovery revived the deep-seated aversion between the Russians and "foreign-

ers" at headquarters. Later it became known that Polish Prince Lubomirski, one of the adjutants at the Russian headquarters, had accidentally overheard generals discussing Russian offensive plans and had sent a message to his mother urging her to flee the coming bloodshed. Murat, who was billeted at Lubomirski's house, had intercepted this letter. Nevertheless, based on the captured documents, General Mikhail Barclay de Tolly mistakenly believed that the enemy was aware of the Russian offensive and erroneously predicted that the French would march from the direction of Porechye to cut the vital Smolensk-Moscow route. Thus, instead of attempting to exploit this initial success by mounting a major attack toward Rudnya as the council of war had planned, Barclay de Tolly remained idle on the Porechye route for the next three days.

## Ionian Islands

The seven islands off the western coast of Greece have always been of great strategic importance. Corfu, the northernmost and largest, with its great harbor, commands the entrance to the Adriatic Sea. The islands to the south were known to the British as Paxo (now Paxos), Santa Maura (Levkás), Ithaca, Cephalonia, Zanta (Zákynthos), and Cerigo (Kíthira) off the southern tip of the Peloponnese, well separated from the others. After the fall of Constantinople to the Turks in 1453, these former possessions became valuable outposts of Venice. Although the law and the language and culture of the elite became Italian in the next four centuries, the Ionians continued to regard themselves as the pure descendants of the classical Greeks.

In 1797, after he had conquered northern Italy for the Directory, Bonaparte insisted that the islands be ceded to

France, regarding them as a stepping stone to an empire in the east. The French imposed new taxes and were contemptuous of Orthodox Christianity, leading the self-styled liberators, as elsewhere, to be regarded as exploiters. In 1798–1799 the islands were captured in a combined operation by the British, Russians, and Turks and formed into the Septinsular Republic under the management of Russia. In 1807 they were returned to Napoleon by the Treaty of Tilsit. In response to the appeal of the inhabitants, the Royal Navy in 1809 recaptured all the islands save Corfu and Paxos; the latter fell in February 1814, but Corfu held out until ordered to surrender by the restored French king, Louis XVIII, a few months later.

The British secretary of state for war and the colonies, Lord Bathurst, was eager to retain control of the islands and was much gratified when the Congress of Vienna, in order to prevent them from becoming a Mediterranean base for Russia, assigned them as a protectorate to Britain. Despite an elaborate constitutional arrangement for the United States of the Ionian Islands, which was ratified by the Prince Regent in 1817, the protectorate was in practice administered as a crown colony with the high commissioner being in effect the governor. The British concepts of efficient government and impartial justice were regarded as alien intrusions by the islanders, who were accustomed to being able to influence both.

In the Greek revolt against the Turks that began in 1821 the British government further antagonized the inhabitants, and liberals in Britain proclaimed the neutrality of the Ionian Islands in the hope of preventing the uprising from escalating into an international war by the intervention of Russia on the side of its fellow Orthodox Christians. This impartiality, however, was compromised by allowing Greeks fleeing the Turks to find refuge in the islands, as they had for centuries past. In 1864 Britain transferred the islands to Greece, which had become independent in 1830. The Order of St. Michael and St. George, devised originally as an honor for local service, continues to use the symbols of the Ionian Islands.

## Ireland

The French Revolutionary and Napoleonic Wars radicalized and reshaped Irish politics. The French, following a long tradition of Britain's continental enemies, saw Ireland as Britain's weak point, while Catholic and Protestant Irish people opposed to British rule looked to French support. Irish Catholics outnumbered Protestants by about five to one, but they were disarmed and were barred from political participation. In the Protestant community, there was disaffection between the ruling gentry, mostly members of the established Church of Ireland who supported the British government, and the Presbyterian Dissenters in the north. Presbyterians and Catholics, along with some disaffected members of the Church of Ireland, came together in 1791 in a radical secret society, the United Irishmen, led by the Dublin Protestant lawyer Wolfe Tone. The United Irishmen agitated for an independent republic free from English control and published dozens of newspapers and hundreds of pamphlets.

Lack of unity contributed to the failure of the United Irishmen. The gap between Catholic and Protestant in Ireland was widening with the formation of militant sectarian groups, the Catholic Defenders and the Protestant Orange Order. Alliances that the United Irishmen formed with France and with the Defenders were rejected by many Protestants, and by the later part of the decade few Protestants were involved in the group. Nor were all Catholics supporters. Many Catholic prelates preferred Protestant rule to domination by anticlerical and republican France, even going so far as to excommunicate Catholic members of the United Irishmen and the Defenders. A French invasion under General Louis Lazare Hoche in 1796 was prevented by bad weather, and the rising of 1798, despite the landing of a small French force, was defeated by the British, who captured Tone. Tone committed suicide in jail.

Before 1798 William Pitt's government sought to base British-Irish relations on violent repression of revolution and a conservative alliance between the Protestant rulers and the leading and wealthiest Irish Catholics. Pitt encouraged the Irish Parliament to pass a Catholic Relief Act in 1793 that gave Catholics the right to vote on the same economic basis as Protestants and to hold office in the civil

and military administration of Ireland but not the right to stand for Parliament or to serve at the very top level, such as lord lieutenant of Ireland or general in the army. The rising of 1798 convinced Pitt that the Irish Protestants could no longer control the island in the English interest and that the best solution was to unite Britain and Ireland politically. The Act of Union in 1801 created the United Kingdom with one Parliament sitting at Westminster. (George III, citing his coronation oath to defend Protestantism, refused to allow Pitt's plan to complete the policy of union by allowing Catholics to stand for Parliament to pass.) The Union aroused widespread resentment, and there was a brief violent rising under the young Robert Emmet in Dublin on 23 July 1803. Emmet was executed. Emmet's rising, however, was much smaller and less broad-based than the revolts of the late eighteenth century. The Union also broadened the opportunities the British Empire and the British political system offered to Irish people. British recruiting in Ireland accelerated after the Union; thousands of Irishmen served in the British Army during the wars.

## **Irish Rebellion (1798)**

A rebellion led by the United Irishmen against British rule. Despite some early success and the landing of a small French force, the rebels were defeated within a month.

The rebellion was organized by the Society of United Irishmen, which had been formed in 1791 by Wolfe Tone, who was inspired by the ideals of the French Revolution. The British government under William Pitt outlawed the organization in 1794 and by 1798 believed that it was no longer a threat. However, a rising had been planned for 24 May 1798. The rebels at first came from the area around Dublin, but the rebellion quickly spread to Wexford. Here there had been a number of examples of brutality carried out by the local loyalist militia, including the execution of prisoners. In an engagement at Oulart 100 men of the militia were defeated. On 29 May the United Irishmen stormed the town of Enniscorthy. The rebels were now led by a priest named Father John Murphy. They succeeded in taking the county town of Wexford but were then pushed back in three skirmishes to Enniscorthy.

In the north, news of the rebellion had spread. On 7 June in Antrim a new rebel force began to assemble under the leadership of Henry McCracken. McCracken almost managed to capture Antrim, but his men began to disperse immediately after this failure. In County Down on 10 June a rebel force formed under the leadership of Henry Monro. This event became known as "Pike Sunday." However, two days later this force was defeated at Ballynahinch, near Belfast, by government forces led by Lieutenant General Gerard Lake. Both McCracken and Monro were captured and executed without proper trial. Lake now moved his forces toward the camp of the Wexford rebels at Vinegar Hill. On 21 June Lake attacked, and in a short but hard fight he routed the United Irishmen, mainly due to the effect of his artillery. There now followed a period of retribution in which many prisoners on both sides were killed or tortured. Murphy was caught and executed, and his body was burned in a barrel.

The rebellion seemed at an end until on 22 August a French army landed at Killala, led by General Jean Joseph Humbert. This force was formed mainly because of the influence of Tone, who had long campaigned for French help. The French won a surprising victory over Lake at Castlebar, and this encouraged many Irishmen to renew resistance. Humbert was now hoping for further reinforcements, but these did not arrive owing to poor weather at Brest. British troops led by Lord Cornwallis, the Lord Lieutenant of Ireland, now closed in on Humbert, and he was forced to surrender at Ballinamuck after a brief engagement. The defeat of Humbert marked the end of the rebellion that had led to the death of around 20,000 Irishmen and had dashed the hopes for independence from British rule.

**Irun, Battle of (25 July–1 August 1813)**

Irun is a small coastal town that sits astride the Franco-Spanish border in the Basque country in the Valle de Bajo Bidasoa. The population is primarily Basque, and the town falls under the jurisdiction of the district of San Sebastian. The Battle of Irun is one of the three battles fought in the summer of 1813 that are usually referred to collectively as the Battle of the Pyrenees.

As the Marquis (later Duke) of Wellington advanced in his campaign in the Pyrenees that was quickly bringing the Peninsular War to a close, he reached the Franco-Spanish border in three locations where he could cross into France: Roncesvalles, Maya, and Irun. The full brunt of the Allied offensive, however, had been delayed by the strong French resistance offered at San Sebastian and Pamplona, to which, in both cases, Wellington was forced to lay siege.

The far left of Wellington's line was anchored at Irun, which was held by Spanish troops, including guerrillas, and he had gathered the bulk of his forces there, since it was one of the few places passable by the guns and artillery trains. The French had been fighting a rearguard action under the command of Marshal Nicolas Soult (who had recently replaced the Emperor's brother Joseph Bonaparte), but when the border was reached, Soult, suspecting Wellington had overextended his line, turned and launched a counteroffensive through the Pyrenees in a last ditch effort to save France from invasion. Soult's estimation was correct: With troops detached for siege duty, Wellington's forces were spread thin, with 60,000 troops along a 50-mile front.

Wellington expected Soult to attack to relieve San Sebastian, but Soult had another strategy in mind. He intended to break through Wellington's forces at Roncesvalles and Maya and relieve Pamplona, before turning to attack Wellington's forces around San Sebastian.

Soult launched his attack on the morning of 25 July, catching the British at Roncesvalles and Maya by surprise. A light diversionary assault was undertaken at Irun to hold in place Wellington's forces located there. The 115th Line under General René-Joseph Dupeyroux and Colonel Pros-

per Poret made a feint in front of Irun as part of Soult's overall plan. The Spanish troops easily held, as the attack on Irun was largely diversionary and was conducted without any real support.

Soult's main attacks at Maya and Roncesvalles met with initial success but were ultimately repulsed after four days of bitter fighting. It was in this series of battles that the 400 men of the 92nd Foot (the Gordon Highlanders) took a legendary stand against an attacking French division of some 7,000 men. The Highlanders were forced to give way grudgingly only after almost a full day's combat. On the thirty-first the only real fighting to take place at Irun occurred as part of a rearguard action fought to cover the retreat of Soult's right.

Soult's offensive failed to achieve its objectives, as a result of which French troops all along the front, including those at Irun, were obliged to pull back. Wellington's inexorable advance into France thus continued.

**Italian Army**

At the outbreak of the French Revolutionary Wars, Italy was not a national state: A great part of northeastern Italy belonged to the Austrian Empire, and the rest of the peninsula was divided into several small and medium-sized states (among them, Sardinia, Venice, Naples, and the Papal States). Italian soldiers could, therefore, be found in a number of different military establishments, including, after the annexation of some territories in 1802, the French Army.

The term *Italian Army*, however, conventionally refers to the armies of the Cisalpine Republic (1797–1799 and 1800–1801), the Italian Republic (1802–1805), and the Kingdom of Italy (1805–1814), the political entity that developed from the former republics in northern and part of central Italy. Basically organized along French patterns and since 1798 based on compulsory conscription, these armies took part in most Napoleonic campaigns, not only in Italy itself, but throughout Europe (1798, 1799, 1800,

1805, 1806–1807, 1809, 1812, 1813–1814) and in the Peninsular War, 1807–1814, and they were to become the incubators of Italian nationalism. Though plagued—like any other Napoleonic army—with high rates of desertion and failure to report for military service, in the field they on average showed a remarkable degree of professionalism, courage, and steadiness, and Napoleon often publicly acknowledged the military skills and reliability of the soldiers serving the Republic, and later Kingdom, of Italy—in sharp contrast to their counterparts to the south in the army of the Kingdom of Naples.

During his first Italian campaign in 1796–1797, Bonaparte had encouraged the formation of a few Italian volunteer units, which took part in the final stages of the campaign in northern and central Italy. After the formal institution of the Cisalpine Republic in the summer of 1797, the Directory asked the government in Milan to provide a military establishment of around 40,000 men (34,000 Cisalpine troops and 6,000 auxiliary Poles), based on eight infantry legions (on paper, larger than French demibrigades), one autonomous light infantry battalion, one cavalry regiment, and one artillery battalion. The structure and organization of this Cisalpine army changed several times, however, in those chaotic months, more regular units often being intermixed with rather ephemeral bodies of troops.

Compulsory conscription was introduced in the autumn of 1798 with a first levy of 9,000 men (2.5 percent of the population), which immediately aroused widespread discontent among the people. Cisalpine troops took part in the 1799 campaign in northern Italy as well as in General Jean-Etienne Championnet's campaign of 1798–1799 against the Neapolitans. The Austro-Russian victory in northern Italy and the fall of the Republic forced hundreds of Cisalpine soldiers to repair to France, where they were reorganized in the Italian Legion, which, under General Giuseppe Lechi, fought gallantly in the campaign of 1800. The military establishment of the second Cisalpine (and later Italian) Republic in 1800 provided for a smaller army (around 15,000 men), including four (later five) line infantry demi-brigades, two (later four) light infantry battalions, one (later three) light cavalry regiments, and two foot and one horse artillery companies (later a regiment). The Italian Guard (two battalions) was formed in 1803. To give a stronger military identity to the new army, Bonaparte in his capacity as First Consul deliberately fostered the spreading of Italian nationalism, especially among the officers. Most of them were veterans of the first Revolutionary legions and represented all Italian regions.

On 15 March 1805 the Italian Republic became the Kingdom of Italy. Napoleon was the sovereign, but the state was actually ruled by his stepson, Viceroy Eugène de

Beauharnais. The institutions of the Italian military administration, created in 1802 and directed by the minister of war, were now expanded in order to run an enlarged army and thus meet Napoleon's incessant demand for manpower. From a strength of about 20,000 men in 1805, the army of the Kingdom of Italy rose over the years to 80,000 in 1812. New infantry, cavalry, and artillery units were formed by conscription, and the number of battalions per infantry regiment increased to five. At the outbreak of the Russian campaign, it comprised seven line and four light infantry regiments, two dragoon (Napoleone and Regina) and four light cavalry regiments, and three foot and one horse artillery regiments. The Italian Royal Guard was also considerably expanded along the patterns of its imperial counterpart.

Throughout the years, the Italian Army's internal organization followed the development of the French model. Its basic uniform color was green, later white. The military record of the army of the Kingdom of Italy is remarkable. Though several units did constitute a permanent part of the Armée d'Italie, significant bodies of Italian troops were to be found in the other major formations of the French Army. Italian regiments particularly distinguished themselves in the 1805 and 1809 campaigns in Italy and Austria (such as at the battles of Piave, Raab, and Wagram) and in the 1806–1807 campaign in Poland. Thousands of Italians served in the Peninsular War against both regular Anglo-Portuguese and Spanish armies and the guerrillas, most of them serving in Catalonia up to 1813. In 1812 the army of the Kingdom of Italy contributed a contingent of about 27,000 men to the campaign in Russia, gallantly fighting at Borodino and Maloyaroslavets. Fewer than 2,000 survived the disaster. In the spring of 1813, the gaps were partially filled by a new influx of conscripts that allowed the Italian regiments, though often severely understrength, to take part in the ensuing campaign in Germany and Italy. After Napoleon's abdication and the fall of the Kingdom of Italy in April 1814, the army was dissolved and most units were pushed into Austrian service. Though several officers agreed to keep their rank in the Habsburg army, many others were to form the bulk of the leaders involved in the patriotic movements that gave rise to the political and military struggle for Italian independence known as the Risorgimento.

### Italian Campaigns (1792–1797)

The campaigns in Italy between France and members of the First Coalition from 1792 to 1797 were initially regarded as occurring in a secondary theater of operations to the campaigns fought along France's borders with the Low Countries and Germany. However, in March 1796 a young general, Napoleon Bonaparte, was placed in command of a dispirited French army along the Riviera and began a one-year campaign that forced Piedmont-Sardinia out of the war and obliged Austria to accept peace, ending the War of the First Coalition in France's favor.

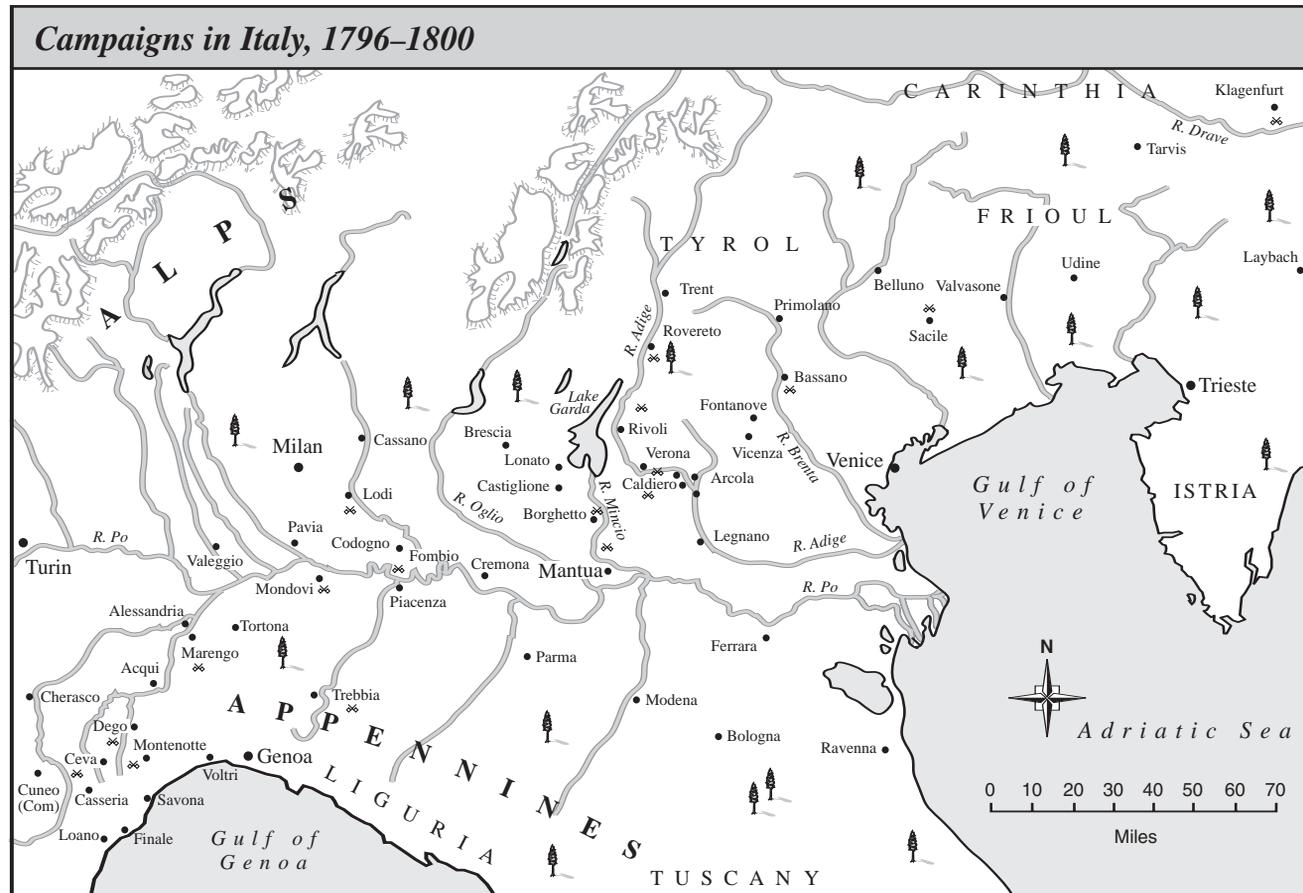

French troops opened the Italian campaign by annexing Nice and Savoy in the autumn of 1792. The next year those troops had to be withdrawn to help put down an internal revolt in France, and Piedmontese forces recovered this region. However, the Piedmontese army of about 18,000 retreated after a smaller French army of 12,000, commanded by General François Kellermann "the Elder," defeated them in mid-September at Argentines and in early October at St. Maurice.

Before the French could enjoy these small successes, Austrian and Neapolitan troops combined with these Piedmontese forces to drive the French from Savoy. British

warships also blockaded the Italian Riviera. Yet the French army, now commanded by General Pierre Dumerbion, surprised its opponents. Dumerbion, on the verge of retirement when he accepted the appointment, listened to his young artillery commander, Bonaparte, who recommended an aggressive campaign that relied on overwhelming the separate contingents of this Allied army. After victory at Saorgio in April 1794, the French moved along the coast, avoiding the Piedmontese forces operating in nearby mountains. While the Piedmontese believed they had the French pinned along the coast, the main French advance proceeded north through an unguarded pass, moving around and behind the Piedmontese forces and cutting their lines of retreat and communications. The Piedmontese army lost its will to fight and surrendered rather than seeking to hold out until relief forces could arrive. Bonaparte recommended a follow-up campaign, but the French government showed caution: There had been serious outbreaks of resistance in the Vendée, Lyons, Marseilles, and Toulon, and the government wished to keep this army closer to France should it be needed to help suppress any remaining royalist revolts at home.

The Austrians used the French pause to re-form and renew their drive into the Savoy region around Savona. Once again Dumerbion followed a plan of Bonaparte's, and the army moved up the banks of the Bormida River in mid-September 1794, separating the Austrians advancing on Savona from their Piedmontese allies. The Austrians were surprised and fell back on Dego, where on 21 September they were defeated and retreated overnight. Meanwhile, Dumerbion overruled Bonaparte, ended this brief and minor offensive, and withdrew to defend Savona.

In 1795 the Franco-Italian front was rather quiet until the Austrians attacked again in late June, forcing the French, now commanded by Kellermann since Dumerbion's retirement, to retreat toward France. General Barthélemy Schérer's victory at Loano over Austrian troops under *Feldzeugmeister* Josef Freiherr de Vins in late November stabilized the front, and both sides went into winter quarters. In what was intended to be a diversion to draw Austrian troops from Germany, the Directory on 27 March appointed Bonaparte commander of the ill-supplied and dispirited (French) Army of Italy, with orders to advance into Piedmont. Bonaparte soon transformed this army into an effective fighting machine and began the remarkable campaigns of 1796 and 1797, bringing to bear his useful experience in artillery and innate understanding of the key principles of war, combined with an emphasis on rapid and audacious movements. His army would move along multiple axes of advance, but all would be diversionary feints aside from the main force, which would then concentrate quickly to achieve mass and firepower at the main point of

Adapted from Chandler 1966, 58–59.

attack, to achieve victory on the battlefield by having local superiority over the enemy. Expanding on Schérer's original system, Bonaparte expanded his espionage activities led by the Piedmontese spies, Angelo Pico and Francesco Toli, which were supported by the Bureau Secrète under *chef de brigade* Landrieux, whose agents stirred up pro-French agitation in Austrian and Venetian cities.

Bonaparte quickly drove Piedmont-Sardinia out of the war. Leaving Nice, he began his offensive on 10 April, again marching into the Bormida valley with an army nominally 45,000 men strong, but in reality having 34,000 fit for duty. He faced the Piedmontese-Sardinian army of 25,000 under the Austrian *Feldmarschalleutnant* Michael Freiherr von Colli on one side and an Austrian army of 35,000 commanded by *Feldzeugmeister* Johann Peter Freiherr von Beaulieu on the other. These Allied armies had divided themselves to block all the valley routes leading north. Bonaparte sought to concentrate his forces against each formation in turn, in order to overwhelm first one and then the other.

Bonaparte first attacked the Austrians and won his first victory by defeating a small Austrian force under *Gen-*

*eralmajor* Eugene, comte d'Argenteau at Montenotte on 12 April. Despite an initial defeat at Dego for General André Masséna's troops against *Oberst* (Colonel) Joseph Vukassovich's Austrian advance guard two days later, Bonaparte reinforced Masséna to drive the Austrians away to the east on 15 April and separate them from Colli. He could then shift the focus of his attack to the northwest to defeat Colli's Piedmont-Sardinian army at the Battle of Mondovi over 21–22 April. Piedmont-Sardinia signed an armistice at Cherasco on 28 April, which was confirmed with a formal peace in May.

The next stage of Bonaparte's plan was to take Milan, capital of Austrian Lombardy, and then its key fortress of Mantua, to secure French control of northern Italy. After a siege lasting 8 months and the defeat of four Austrian attempts to relieve it, Mantua fell in February 1797, following which Bonaparte defeated the newly arrived Austrian commander, Archduke Charles, and forced Austria to seek an armistice at Leoben in April 1797.

In Lombardy the Austrian commander Beaulieu concentrated his 25,000 men at Valenza on the upper Po River, where he expected Bonaparte to attempt to cross. However,

Bonaparte simply marched along the southern bank to Piacenza, 50 miles downstream, where he actually crossed. This surprise move threatened Beaulieu's communications and forced him to make a hasty retreat across the Adda River, leaving Milan open. After a morale-boosting but strategically unnecessary victory at Lodi over Beaulieu's rear guard on 10 May, the French entered Milan on 15 May, although the Austrian defenders in the citadel held out until 29 June.

Beaulieu retreated and organized his defense along the Mincio River from Lake Garda in the north to Mantua in the south, leaving 15,000 men to defend the latter key fortress. Bonaparte concentrated his troops and broke through Beaulieu's line at Borghetto on 30 May, forcing the Austrian field army to retreat into the Tyrol while Bonaparte laid siege to Mantua.

Bonaparte faced the difficult task of maintaining the siege while controlling the civilian population—who were becoming increasingly restless as French troops looted the nearby towns—and defending a line along the Adige River to defeat Austrian relief forces. The first two Austrian attempts were led by *Feldmarschall* Dagobert Graf Würmser, each attempting to advance down several narrow Alpine valleys, while another force would come in from the east to tackle the French siege troops. Bonaparte would attempt to maintain a central position to move his forces to the key point. In July 1796 Würmser advanced in several parallel columns on either side of Lake Garda, with a third, smaller column moving through the Brenta valley. Bonaparte deployed a small force to block Würmser's advance on the east side of the lake, while he concentrated on the Austrian force moving down the west side. He shattered this force at Lonato on 3 August. Two days later Bonaparte moved against Würmser's forces, turned both his flanks near Castiglione and forced the Austrians to retreat.

In September Würmser tried again, moving down the Brenta valley around Lake Garda to divert Bonaparte's attention. Bonaparte was informed by his key spies that the Austrian forces had divided, so that Masséna could defeat *Feldmarschalleutnant* Paul Freiherr von Davidovich at Rovereto on the eastern shore of Lake Garda on 4 September, while Bonaparte hastily marched farther east to concentrate against Würmser, to defeat him at Bassano in the Brenta River valley on 8 September. Although Bonaparte was able to turn the Austrian flanks, Würmser with much of his cavalry was able to break through to Mantua, increasing the strength of the defenders to 28,000, although the siege could not be lifted.

The Austrians continued their efforts to break the siege with two more attempts led by *Feldzeugmeister* Joseph Alvinczy Freiherr von Berberek, but they would again be defeated in succession. In November 1796 the first

attempt involved a diversion down the eastern shore of Lake Garda under Davidovich, while Alvinczy came in from the east, but the main Austrian advance was halted as it attempted to cross the Adige at Arcola over 15–17 November. The final attempt, in very poor weather, came in January 1797, with the main advance coming over Monte Baldo to head south for Mantua, while a diversion came in from the east. A very complicated plan, devised by chief of staff *Oberst* Franz Weyrother, involved an advance in six columns to fix General Barthélemy Joubert's troops in position, send flanking columns around the French wings, and push a final column deep behind them to block their line of retreat.

Warned by local agents on 10 January of the Austrian advance, Bonaparte massed his main force around Verona, while Joubert was ordered to hold his positions in the north. As Joubert was attacked on 13 January, Napoleon's chief spy, Toli, brought him a copy of the Austrian plan, enabling the French to concentrate their forces to the north to defeat Alvinczy in a two-day engagement at Rivoli on the fourteenth and fifteenth. Bonaparte then hurried to Mantua to help the French besiegers, and together they defeated the Austrian relief column, under *Feldmarschalleutnant* Giovanni, Marquis di Provera, marching from the east. Würmser surrendered Mantua and its starving garrison on 2 February. Bonaparte now decided to take his army into the Tyrolean Alps and head for Vienna, while Landrieux's agents got to work raising supposedly pro-French rebellions in the Venetian cities of Bergamo and Brescia.

Facing a broken Austrian army whose command had devolved to Archduke Charles, the French quickly penetrated the first line of defense on the river Tagliamento and by mid-March had crossed the Alps to reach the Semmering Pass in early April, just 70 miles from Vienna. The Austrian government hastily sought peace, and armistice preliminaries were signed at Leoben on 18 April, followed by a formal peace agreed at Campo Formio on 17 October. In the meantime, Bonaparte's own efforts to organize a supposed revolt in Venetian-owned Verona ended in the Verona Massacre of 17 April, which gave Bonaparte the excuse to take over Venice completely and use it as an exchange for Belgium in the peace treaty.

## Italian Campaigns (1799–1800)

The War of the First Coalition had hardly ended by the Treaty of Campo Formio in 1797 when the struggle for control of northern Italy resumed. In 1798 the French Revolutionaries seized control of Rome, Piedmont, and Switzerland, establishing puppet republics, while Bonaparte captured Malta and invaded Ottoman-held Egypt. Britain was still at war with France and was joined by Russia, the two nations then being joined by Ottoman Turkey, Austria, and Naples in the Second Coalition. The French invaded Naples but were later driven out by Anglo-Neapolitan forces; in the north, meanwhile, Austro-Russian forces evicted the French until Bonaparte's campaign of 1800 restored the status quo; and after a brief autumn campaign, France recovered control of northern Italy at the Peace of Lunéville in 1801.

Despite the Treaty of Campo Formio, fighting soon resumed in Italy. General Louis-Alexandre Berthier captured Rome in February 1798, dethroning Pope Pius VI. In November, General Barthélemy Joubert occupied Piedmont and declared a republic. Although the Second Coalition was formed in December, the Neapolitans—whose army was commanded by the Austrian *Feldmarschalleutnant* Karl Mack Freiherr von Leiberich—opened hostilities before their allies could assist. Mack took Rome but was defeated by General Jean-Etienne Championnet, whose

French troops captured Naples in January 1799 and established the Parthenopean Republic.

In spring 1799 the French commander in the north, General Barthélemy Schérer, wanted to attack the small Austrian army commanded by *Feldmarschalleutnant* Paul Kray Freiherr von Krajova before a much larger Austro-Russian army commanded by 70-year-old Field Marshal Alexander Suvorov could arrive. However, it was Kray who emerged victorious after crushing Schérer at Magnano, south of Verona, on 5 April. As Schérer retreated westward with 35,000 troops, Suvorov arrived on 14 April, swelling Allied numbers to 70,000 men, although Kray was detached to besiege the key fortress of Mantua. At Cassano d'Adda the combined Austro-Russian army forced its way across the Adda River on 27 April, defeating the new French commander, General Jean Moreau; two days later, Suvorov entered Milan.

The defeat at Magnano had already prompted the French government on 14 April to order the commander of the (French) Army of Naples, General Jacques Macdonald, to return north to help Moreau. By mid-May Macdonald was in Rome, but his departure allowed Anglo-Neapolitan forces to recapture Naples and restore King Ferdinand IV in June. Suvorov was unconcerned about Macdonald and had seen Moreau withdraw to Genoa. The Allies entered Turin unopposed on 26 May, but the first cracks appeared in the coalition when Suvorov proclaimed the restoration of King Victor Emmanuel IV. This led to a sharp rebuke from the Austrian foreign minister, Johann Freiherr von Thugut, warning him not to become involved in politics; but that only made the Russian government anxious about Austrian war objectives.

Meanwhile, Allied troops continued the sieges of various French garrisons in northern Italy. Macdonald reached the theater of operations in early June and attacked Austrian troop detachments guarding the Allied southern flank around Modena on 12 June. Although Moreau only detached a small force to aid Macdonald, Suvorov realized the danger of a combined French attack and moved his main forces quickly south, defeating Macdonald in three days of bloody fighting at the Trebbia over 17–19 June. The following day, Moreau attacked the Austrian flank force under *Feldmarschalleutnant* Heinrich Graf Bellegarde at San Giuliano, but both French armies then withdrew into Genoa.

The French launched a renewed attack under their new commander, Joubert, who marched north from Genoa to engage Suvorov at Novi on 15 August. However, the fall of the fortress at Mantua and the surrender of the French garrison there on 30 July released Kray with 17,000 troops to reinforce the Allied army, which numbered 51,000 against Joubert's 35,000. Kray led the key assault by

the Allied right, while the rest of the army stormed the hills to shatter the French army, leaving Joubert and four divisional commanders dead.

Thugut now arranged for Suvorov and the Russians to march north to secure Switzerland, while the Austrian forces under *General der Kavallerie* Michael Freiherr von Melas dealt with the last French army—the Army of the Alps, commanded by Championnet, based in Nice. The French advanced across the Col di Tenda, attempting to relieve their garrison at Cuneo. However, forewarned by his spies, Melas massed his army to launch a successful surprise attack to defeat Championnet at Genola on 4 November to complete the eviction of the French from all of Italy except for Genoa.

Meanwhile Bonaparte had returned from Egypt and seized power as First Consul in the coup of 18–19 Brumaire (9–10 November 1799). However, he needed a military victory to secure his political position. His campaign strategy, agreed with Moreau, was for two advances from eastern Switzerland: north into Germany by Moreau's Army of the Rhine (120,000 men based in northern Switzerland), and south into Italy by Berthier's Army of the Reserve (60,000 men massing north of Lake Geneva), each severing the communications of the respective Austrian army in those theaters with Vienna.

Initially Bonaparte focused on Germany and intended to direct operations there, but in late March 1800 he opted to command in Italy, although he ordered Moreau to dispatch reinforcements to him once Moreau was north of the Rhine valley. The Austrians struck first, marching in early April to lay siege to Genoa. While *Feldmarschalleutnant* Karl Ott Freiherr von Bartokez besieged General André Masséna in the city from 19 April, Melas drove the rest of the French troops, under General Louis Suchet, back to the Var River by 11 May. Wrongfooted, Bonaparte decided to take the most direct route into Italy and headed for Turin. In snowy weather, the Army of the Reserve crossed the Great St. Bernard Pass from 14 May onward, although the artillery went over the Little St. Bernard and a diversionary attack was made on the Mont Cenis Pass.

Austrian intelligence had warned Melas of Bonaparte's advance but was uncertain of its main axis of advance. On 26 May the French advance guard under General Jean Lannes was able to overwhelm *Feldmarschalleutnant* Karl Hadik Graf von Futak at the Chiusella. However, the return of Bonaparte's spy, Francesco Toli, had revealed to the First Consul that Milan was only lightly defended by *Feldmarschalleutnant* Joseph Freiherr von Vukassovich. Moreau had defeated Kray at the second Battle of Stockach, so he had dispatched 15,000 men under General Bon de Moncey over the St. Gotthard Pass. Abandoning Masséna to pin down Austrian forces at Genoa, Bonaparte

and Moncey launched a two-pronged attack on Milan, which fell on 2 June. Meanwhile, Suchet began an advance from the Var.

As the Austrians hastily concentrated at Turin, Bonaparte then turned south and his advance troops, led by generals Joachim Murat and Lannes, crossed the great river Po to take Piacenza on 7 June. Bonaparte thereby achieved his original objective of placing his army across Melas's line of communication with Vienna. Although the starving French garrison of Genoa had finally surrendered on 4 June, Masséna had been able to march out to join Suchet for an advance from the south, while General Louis-Marie Turreau advanced on Turin, effectively surrounding the Austrian army. The French advance guard under Lannes turned west from Piacenza but was surprised to encounter an Austrian force under Ott, which had hastily marched up from Genoa. Reinforced by General Claude Victor, Lannes attacked at Casteggio-Montebello on 9 June, defeating Ott and forcing him to withdraw on Alessandria, whence Melas was moving his army.

The Austrians used the double agent Toli to mislead Bonaparte into believing that they would try to break out north across the Po, while the Austrian garrison of Genoa marched north. Partially misled, Bonaparte spread his forces out and attempted to catch the supposed Austrian rear guard as it left Alessandria. On 14 June Bonaparte actually engaged Melas's entire army at Marengo, where the French army was saved by the last-minute return of General Louis Desaix's troops. Reinvigorated, the French turned a near defeat into a rout, forcing Melas to sign an armistice on the following day and withdraw to the river Mincio. Bonaparte had recovered his conquests of 1796–1797 and thereby secured his grip on power.

Moreau's victorious campaign in Germany had ended with the Armistice of Parsdorf in July, but the cessation of hostilities only lasted until mid-November. Although the autumn campaign was decided by Moreau's victory at Hohenlinden on 2 December, General Guillaume Brune had been given command in Italy. At the end of that month, he forced the line of the Mincio, defeating Bellegarde at Pozzolo and Valeggio over 25–26 December. After reaching Verona on 2 January 1801, Brune crossed the river Adige and in a series of small actions reached the river Piave before agreeing to the armistice of Treviso on the sixteenth. The formal Treaty of Lunéville of 9 February 1801 returned Italy to its position in 1798, with the French in firm control of the center and north of the peninsula through a belt of satellite states.

## Italian Campaigns (1813–1814)

From September 1813 to April 1814, while Napoleon was facing the Allied armies in Germany and France, the Armée d'Italie, under Napoleon's stepson and Viceroy of Italy Eugène de Beauharnais, fought a delaying campaign in northern Italy against overwhelming Austrian and Neapolitan forces. Never seriously defeated, Eugène was eventually forced to surrender as a result of Napoleon's abdication.

After the Russian campaign the Armée d'Italie was reformed in the spring of 1813 by summoning new levies and pushing depot units into active service. Its mission was to defend the Illyrian Provinces (now Slovenia) and the Kingdom of Italy. Throughout the closing months of 1813, Eugène led his French and Italian conscript army in a

fighting retreat over the plains north of the Po River, from the Illyrian Provinces up to the Mincio River. In January 1814 things grew worse, as the King of Naples, Joachim Murat, passed over to the Allied camp and opened a new front south of the Po, invading Emilia with an Austro-Neapolitan army. British landings on the upper Tyrrhenian coast also threatened the French territory in northern Italy. After Napoleon's abdication, on 6 April Eugène signed the military convention of Schiarino-Rizzino, which required the French evacuation of Italy. A few days later an uprising in Milan convinced him to abdicate. The French troops returned home, and the Kingdom of Italy was dissolved and most of its army incorporated into Austrian service. With the end of the campaign and the restoration of pre-Revolutionary states, the emerging spirit of Italian nationalism was not to result in a unified Italian state until after midcentury.

The 1813–1814 Italian campaigns can be divided into four stages:

**September–October 1813.** Eugène deployed his army along the Drava (in Styria) and the Sava (in Slovenia) valleys. On 6 September the French under General Paul, comte Grenier won the first notable engagement, at Feistritz on the Drava, in the vicinity of Klagenfurt. Other minor actions took place in mid-September around Laibach (now Ljubljana). By mid-October, *Feldmarschalleutnant* Johann Hiller's pressure from the east as well as the pending threat of another column advancing southward from Tyrol (the action at Bassano on 31 October, where Grenier defeated *Generalmajor* Freiherr von Eckhardt) forced Eugène to retreat to northeastern Italy.

**Early November 1813–early February 1814.** For three months Beauharnais easily maintained a defensive position behind the Adige River, since bad weather and Hiller's lethargy prevented the Austrians from making further progress. After the landing in the Po delta of a small Austro-British force under *Generalmajor* Laval Nugent on 15 November, minor actions took place around Ferrara and Rovigo.

**February 1814.** Eugène, realizing that Murat's army was threatening his lines of communication south of the Po, withdrew behind the Mincio to shorten his front and maintain a central position between *Feldmarschall* Heinrich Graf Bellegarde (who had replaced Hiller as Austrian theater commander) and Murat. On 8 February the main battle of the campaign was fought along the Mincio River. Tactically a draw, it was a French victory at the strategic level, as the Austrians failed to force the Mincio line.

**March–April 1814.** The Franco-Italian corps in Emilia slowly retreated before a hesitating Murat (the actions at Parma and Reggio Emilia, 2 and 7 March). Meanwhile Venice came under siege, and Lord William Bentinck's

British expeditionary force, after landing in Leghorn (Livorno) on 9 March, reached Genoa in mid-April. With the military convention of Schiarino-Rizzino, the war in Italy was over.

### "Italian Independence," War of (1815)

In the spring of 1815 the King of Naples, Joachim Murat, waged a short campaign against Austria in central and northern Italy in the hope of keeping his throne. Sometimes misleadingly called the "First War of Italian Independence," the campaign ended with Murat's defeat and abdication.

In the autumn of 1813, after the Battle of Leipzig, Murat reopened diplomatic negotiations with the Allies, trying to escape Napoleon's fate. On 11 January 1814 a treaty of alliance between Naples and Austria was signed, whereby the Habsburg emperor committed himself—with British approval—to recognizing Murat as the legitimate king. The Bourbons were to keep Sicily and would obtain an adequate reward for their territorial losses in continental Italy. A secret article also guaranteed an expansion of the Kingdom of Naples, with the incorporation of 400,000 subjects from the Papal States. Murat's flimsy military contribution to the Allied cause in 1814, however, disappointed both Austria and Britain. By the end of 1814 Murat had given up any hope of increasing his territory and had failed to obtain Pope Pius VII's support.

Napoleon's return from Elba, as well as rumors that the Allied powers were moving in favor of restoring the Bourbons to the Neapolitan throne, prompted Murat to break the alliance and declare war against Austria on 15 March 1815. Two weeks later he decided to play an even more ambitious game by proclaiming himself the liberator of Italy and summoning from Rimini all Italian patriots to join in the fight for national unity and independence.

Recently expanded to approximately 40,000 men, the Neapolitan army was of dubious quality, with mostly green troops and officers of little experience. Murat hoped, however, to ignite patriotic insurrections in central and northern Italy and to rally national militias to his standard, with

the support of those Italian generals who had fought under Napoleon. The Austrians retired before the Neapolitan advance, and the first phase of the war ended in mid-April, with Murat in control of central Italy, Emilia, and Tuscany. By that time, Pius VII had left Rome.

As Murat's plea for an insurrection went unheeded, the Austrians started their counteroffensive. After a failed attempt at forcing the line of the Po at Occhiobello, Murat decided to slowly retreat down the Adriatic coast to Ancona in the Marche. An Austrian column of 11,000 men under *Generalmajor* Adam Adalbert Neipperg pursued the Neapolitan army. Meanwhile, another column (13,000 men) under *Feldmarschalleutnant* Friedrich Freiherr von Bianchi took a more westwardly route under the cover of the Apennines in an attempt to outflank Murat. By the end of April this column debouched from the mountains and made for Tolentino in the Chienti River valley. Relying on his overwhelming numerical superiority and probably planning to defeat the two enemy columns while they were still separated, on 2 May Murat turned to confront Bianchi. Moving from Macerata, his army advanced up the Chienti valley. The outcome of the Battle of Tolentino (2–3 May) saw a discouraged Murat in full retreat to his borders. A treaty was signed at Casalanza on 20 May whereby Murat abdicated, thus paving the way to a Bourbon restoration in Naples.

Murat made a last desperate attempt to regain his throne, landing at Pizzo Calabro in October 1815. He was arrested and shot on 13 October.

### Italy, Kingdom of

In January 1802 Bonaparte established the Republic of Italy and was elected as its president by an assembly of Italian notables who gathered in the city of Lyons. In March 1805, after becoming Emperor, Napoleon transformed the Republic into the Kingdom of Italy with himself as its king. He appointed his faithful stepson, Eugène de Beauharnais, as his viceroy in Milan. The kingdom lasted until April 1814, when it fell shortly after Napoleon's abdication. Initially it comprised Lombardy, the Novarese, and Emilia-Romagna. In the Treaty of Pressburg (December 1805) the Austrians ceded Venetia to the Kingdom of Italy. The

Marche and South Tyrol were added in 1808 and 1810, respectively. At its peak, the kingdom covered an area of 35,000 square miles and had 6.7 million inhabitants, about one-third of the peninsula's population. As a Napoleonic satellite state, the kingdom paid for the upkeep of French troops, provided Napoleon with tens of thousands of soldiers, and had to adhere to the Continental System.

The Napoleonic government transformed the Kingdom of Italy more profoundly than any other part of the peninsula, possibly even than any other part of Europe. The relatively long duration of French domination in northern Italy, the cooperation of the local elite, and the Habsburg reforms in pre-Napoleonic Lombardy contributed to a successful reform policy. Northern Italy experienced a successful *amalgame* between the old nobility and the wealthy bourgeoisie, which created a new elite that would remain in power throughout the nineteenth century. Napoleon succeeded in unifying the diverse regions, formerly belonging to five different states, into a centralized state, with uniform legal, administrative, and financial structures modeled on the French system. The constitution created a powerful executive and a weak legislature. Napoleon, who tolerated no opposition, had the final say on internal policy, nominated state administrators, and ran foreign policy. The viceroy and seven ministers were responsible to the Emperor and ran the government's daily business.

The kingdom was divided into twenty-four departments with a uniform bureaucracy. Prefects ran the departments, vice prefects managed the smaller districts, and mayors governed the cities. Greater centralization made the administration more effective and reliable. A growing number of officials were selected on the basis of competence and were gaining in experience and professionalism. Most of them originated from the ranks of property owners, both nobles and bourgeoisie. The authorities instituted a regular police force and introduced the French legal system, most notably the Napoleonic Code, which reaffirmed legal equality and property rights.

The authorities also set up centralized and uniform education modeled on the French system. The minister of the interior controlled public education. The language of instruction was Italian. Every community was ordered to have an elementary school. The number of elementary schools increased, but many suffered from a shortage of resources and qualified teachers. The government laid the foundation of a modern secular secondary school (*licei*) system. It established a uniform curriculum, assigned books, and appointed teachers. Three universities operated, in Pavia, Bologna, and Padua.

Fiscal policies increased the state's revenues. Over 50 percent of the state's budget was spent on the military,

while the rest paid for the construction of roads and waterways, public debt, and administrative costs. Giuseppe Prina, the loyal and efficient finance minister, augmented taxes and improved tax collection. In 1807 he launched a property survey designed to erase differences among taxpayers. These new policies, along with an increase in the number of taxpayers, nearly doubled state revenues. Yet the increasing efficiency of the tax system meant a rising fiscal burden, particularly on the lower classes.

In August 1802 the government proclaimed an annual military conscription. Men between the ages of twenty and twenty-five were drafted for four years. Conscription aroused widespread opposition. Desertion and draft dodging were rife. The government tightened the draft machinery, dispatched the *gendarmerie* to arrest deserters, and proclaimed harsher penalties. Despite popular resistance, the government drafted 155,000 men between 1802 and 1814. Italians fought in Spain, Germany, and Russia, suffering high casualties.

In September 1803 the authorities of the Republic of Italy signed a Concordat with the pope. It recognized Catholicism as the state religion, confirmed freedom of religion, and authorized the republic to nominate bishops and the pope to consecrate them. It also ratified the new owners of church land. The government continued to confiscate and sell church land, reorganized parishes, and introduced civil marriage and divorce.

Economically the government formed a national market by eliminating internal tariffs and promulgating a uniform commercial code and a single currency (the lira). Highways and canals were improved and extended. Wishing to control the kingdom economically, Napoleon ordered it to export raw silk exclusively to France and forbade the import of foreign products, other than French ones, into the kingdom. Naturally the kingdom had to join the Continental System, which had adverse effects on its economy. The ban on trade with Britain nearly paralyzed the ports of Venice and Ancona and caused shortages of colonial raw material. Opposition to Napoleonic rule in northern Italy was mostly limited to resistance to conscription and to brigandage, which disrupted law and order but posed no threat to French domination. In 1809 a new milling tax provoked revolts in rural communities in the Veneto and in Emilia-Romagna. They were, however, fairly quickly suppressed.

During the campaigns of 1805 and 1809 the Kingdom of Italy constituted a secondary theater in the war, whose principal fronts were in Germany and Austria. In November 1805 Marshal André Masséna and Archduke Charles clashed in an indecisive battle at Caldiero. In April 1809 Eugène suffered a defeat at Sacile, but a month later, while the Austrians were retreating from northern

Italy, he decisively beat them at the Battle of the Piave. Italian troops then fought at Wagram.

The huge Italian casualties in Russia—fewer than 2,000 out of 27,000 soldiers from the Kingdom of Italy returned home—the heavy tax burden, and the damage caused by the Continental System increased discontent in the kingdom. In October 1813, after occupying Illyria, the Austrians invaded northern Italy, forcing Eugène to evacuate Venetia. By early April 1814 he had lost most of his territory. Anti-French sentiment culminated on 20 April 1814 when a Milanese crowd lynched Prina, the hated minister of finance. Eugène left Italy shortly thereafter, and the Austrians entered Milan and established a provisional government. The Congress of Vienna upheld the incorporation of Venetia and Lombardy into the Habsburg Empire and recognized Austrian hegemony in the peninsula.

## Jacobins

The term *Jacobin* describes an organization and a worldview and their adherents. The phenomenon must therefore be studied on the institutional and cultural levels alike. The Jacobin Club (1789) was the most influential of the voluntary groupings that sprouted from the associational practices of the *ancien régime* and flourished in the political culture of the French Revolution. Nicknamed after its Parisian quarters in a Dominican (*Jacobin*) convent, the Society of Friends of the Constitution eventually spawned some 5,300 affiliates, with several hundred thousand members.

The club that once welcomed both the marquis de Lafayette and Maximilien Robespierre moved steadily leftward, as dissenters resigned or were expelled. Under the Republic, the Society of Jacobins, Friends of Liberty and Equality, allied itself with leftists from the Convention and from popular movements. Never part of the government, it served as a training school, caucus, and pressure group, which agitated for increasingly radical measures and led the way in demanding and supporting the Terror. Robespierre and the Committee of Public Safety relied on the club network to send and enforce directives. Although the alliance was never entirely harmonious, they fell together. The Thermidorian regime closed the clubs in November 1794.

Jacobinism was less a doctrine than a set of ideals: a republic of virtue, whose civic-minded members cultivated middle-class values of productivity and decency in private and public life; a secular political republic based on legal equality, individual freedom, social solidarity, and property, without extremes of wealth or poverty. Existential threats to this order justified strong central government, full mobilization, and the severest measures against enemies, both internal and external.

Neo-Jacobinism briefly emerged in new societies and factions of the army between the purges of 18 Fructidor Year V and 22 Floréal Year VI (4 September 1797 and 11

May 1798, respectively). Napoleon, erstwhile Jacobin, however, firmly distanced himself from the movement and used fears of Jacobinism to consolidate his power—perhaps not only out of cynicism but because it posed a greater threat than royalism, having sprung from the Revolutionary legacy that he claimed both to embody and to transcend.

Governments elsewhere were, if anything, more suspicious of Jacobinism, applying the term (like *red* in later generations) indiscriminately to anyone deemed subversive, but Jacobinism was a real though limited phenomenon. Admittedly, French occupiers and native radicals often disappointed one another. The German and Italian cases are the best documented. Although many critics blame Jacobinism for the excesses of subsequent radical movements as well as the Terror, one could also argue that Jacobinism saved the Revolution and laid the foundations, however imperfect, for a modern democratic culture that still struggles with the relation between individual and collectivity.

## Janissaries

The Janissaries constituted a part of the standing Ottoman Army, first organized in the late fourteenth century and lasting until 1826. The need for the Janissary corps came from the dependence of Ottoman rulers on tribal leaders who were often tempted to oppose the power of the sultan. By the late eighteenth century, the Ottoman Army consisted of two main branches: irregular troops, and regulars on pay (*kapikulu*), which included Janissaries. The Janissaries constituted the major force in the empire and were drafted through a *devshirme*, conscription system. They were originally drawn from Christian youths from the Balkan and Caucasian provinces, who were converted to Islam and rigorously trained. The Janissaries were subject to strict rules, limiting their freedom and demanding higher moral standards than usual in society. In their first couple of centuries they were forced to practice celibacy, but this would later change. The Janissaries were not allowed to grow beards, which was the sign of a free man. After the completion of their training, they were organized into units commanded by *aghas*.

After the sixteenth century, the Janissaries became a powerful force within the empire as the sultan became dependent on them to counter other internal elements. As a result the Janissaries were frequently involved in palace coups and stubbornly resisted any reforms that undermined their status. The opposition between the sultan and the Janissaries was particularly evident under Sultan Selim III, who attempted to modernize the army by launching a series of reforms called *nizam-i cedid* (*new system*). This reform agenda led to a rebellion of the Janissaries and the deposition of Selim in 1807. The end of Janissary dominance came in June 1826, when Sultan Mahum II annihilated the entire corps during the so-called Auspicious Incident.

The Janissary corps was divided into *ortas* (regiments) and *odas* (barracks). As a result of reforms under Sultan Suleyman I, the Janissaries were arranged in three classes of *ortas*: *jemaat*, *beuluk*, and *sekban* (or *seimen*, peasant soldiers). The *beuluk* Janissaries guarded the sultan, while the *jemaat* were deployed on the frontiers. The strength of *ortas* varied from 100 to 500. In addition, there were the *ajami* *ortas* of apprentices, as well as the *yamaks*, or auxiliaries, who performed some of the Janissaries' duties. Some Janissary *ortas* eventually received the right to certain privileges and duties such as policing harbors, acting in fire brigades, or guarding foreign embassies.

## Jankovo, Battle of (3 February 1807)

Minor battle between Russian and French forces during the War of the Fourth Coalition.

Following the indecisive battles at Golymin and Pultusk in December 1806, the Russian and French armies withdrew to their winter quarters to regroup. In early January 1807 the Russians decided to launch an offensive into East Prussia against the French left flank and hoped to force Napoleon to withdraw from the left bank of the Vistula River. Advancing on 6 January 1807, the Russian army surprised the advanced elements of Marshal Michel Ney's corps on 19 January and engaged Marshal Jean-Baptiste-Jules Bernadotte's corps at Mohrunen six days later. Informed of the Russian attacks, Napoleon seized the chance to counterattack and destroy the opposing army. He anticipated that by proceeding further to the west; General Levin Bennigsen would inevitably expose his left flank and rear to an attack by the main French army. Therefore, French troops would make a sweeping flanking maneuver on the right from Thorn, driving Bennigsen into the angle between the lower Vistula and the Frisches Haff.

Russian headquarters remained under the false impression that its offensive would drive Napoleon across the Vistula, but Bennigsen halted his army at Mohrunen, a fortunate decision for him since any further advance would have moved the army directly into Napoleon's trap. On 31 January a Russian patrol captured a French courier delivering instructions to Bernadotte including important details of Napoleon's plan of campaign. Bennigsen was stunned by the captured correspondence and immediately ordered a withdrawal to Jankovo.

Unaware of the Russian retreat, Napoleon proceeded with his plan and moved most of his army in a grand counterclockwise wheeling movement. Bennigsen, meanwhile, with 40,000 men, concentrated his forces at Jankovo (Jonkendorf), where he deployed his troops along the river Alle. The Russian center was arranged at Jankovo, while the right flank rested in a marshy wooded valley and the left

was anchored at Mondtken on the frozen Alle. Count Nikolay Kamenski's 8th Division, supported by the 3rd Division, was deployed at Bergfried to prevent any French flanking maneuvers. On 3 February Ney and Marshal Pierre-François-Charles Augereau attacked the Russian rear guard under General Mikhail Barclay de Tolly on the road from Allenstein and observed the Russian positions at Jankovo.

Napoleon was delighted by this news, and although he did not have his main forces at Jankovo, he decided to attack immediately to prevent Bennigsen from retiring farther to the north. On 3 February Ney's corps, still on the march, was ordered to form the French left flank, while Augereau was in the center and Marshal Nicolas Soult's corps was on the right flank; the Imperial Guard and Marshal Joachim Murat's cavalry were kept in reserve. Napoleon ordered Bernadotte to proceed by forced marches to assault the Russian right flank. Simultaneously, he directed Soult and Marshal Louis Davout to make a flanking maneuver toward Bergfried to cut off the Russian line of retreat. The French initially attacked at Bergfried, where Soult's flanking column assaulted Kamenski's positions. Fierce fighting continued for hours, and the bridge over the Alle changed hands several times. Snow made the French artillery bombardment more difficult, since the round shot could not ricochet off the ground.

After a series of failed attempts Soult finally dislodged the Russians, who suffered considerable losses. The town of Bergfried was captured, and part of Soult's corps dashed onward to Guttstädt, where it seized the Russian baggage train. Meantime, in the center, Napoleon confined his activity to an artillery bombardment. He hoped Soult would easily advance through Bergfried into the Russian rear. Because this flanking movement was delayed, Napoleon decided to postpone his combined assault on Bennigsen's positions until the next morning. During the night, Bennigsen abandoned his positions and withdrew his main forces in the direction of Landsberg and Preussisch Eylau.

## Jemappes, Battle of (6 November 1792)

Jemappes was the first of the victories achieved by a mass republican French army, enabling it to conquer the Austrian Netherlands (now Belgium and Luxembourg). In a new style of warfare, the French used column attacks supported by massed artillery to steamroll through a smaller professional force as French armies assumed the strategic offensive.

After the Battle of Valmy, France launched its first offensive campaign against the Austrian Netherlands in late October 1792. The 40,000-strong Armée du Nord (including 13 Volunteers of 1792 battalions) under General Charles Dumouriez marched from Valenciennes toward Mons, reinforced by General François Harville with 10,000 men (mainly Volunteers) protecting his right wing.

The Austrian governor of the Netherlands, Duke Albert of Saxe-Teschen, withdrew from Lille to block the Brussels road, taking up on 5 November a defensive position on the 8-kilometer-long Cuesmes ridge with 11,600 infantry, 2,170 cavalry, and 56 guns. The position was narrow and sloped back to marshland around the Trouille and Haine rivulets, which could be crossed by two raised causeways through which culverts had been cut to allow water to flow.

On the far right, defending Jemappes village, were seven *Freikorps* (volunteer) companies; on the right wing *Feldmarschalleutnant* Franz Freiherr von Lilien had four infantry battalions on the hills, supported by three cavalry squadrons. In the center, *Feldzeugmeister* Franz Sebastian de Croix Graf Clerfayt positioned three battalions on the hill west of Cuesmes village with four squadrons; *Feldmarschalleutnant* Johann Peter Freiherr von Beaulieu on the left wing held the hills south of Bertaimont with three battalions, his flank protected by five companies and a squadron. Ten squadrons held the gap between the center and left on the Cuesmes-Frameries road. Two companies held Mont Palisel to protect the left wing, and a battalion was at Mons.

Having 3,800 poor-quality cavalry, Dumouriez would rely on his 32,000 infantry and hundred guns, including twenty-four heavy guns, eighteen 6-pounders, and several heavy howitzers. Harville would reinforce the right wing with 4,000 men and fifteen guns. On 6 November the French left wing under General Marie Louis Ferrand de la Caussade faced Quaregnon; the center under General Egalité (the republican name assumed by the duc de Chartres, the future King Louis-Phillipe of France) was east of Wasmes; the right wing under General Pierre de Riel, marquis de Beurnonville was west of Frameries. Harville and Beurnonville were to surround the Austrian left and once Ferrand had secured Quaregnon, Beurnonville and the center-right would attack

the central ridgeline, while Harville would seize Mont Palisel to cut off the Austrian retreat.

At dawn, Dumouriez directed thirty-six heavy artillery pieces to pound the Austrian earthworks, which met a response from twenty guns. Harville's first attack on Ciply was repelled, and the rest of his troops only reached the Bertaimont hills. The advances of both French wings forced Albert to commit his reserves, sending a battalion to reinforce the center. On the left Beaulieu received a battalion and ten squadrons to launch a counterattack, but the French on the Frameries plateau were quickly reinforced and Beaulieu was driven back. At 10:00 A.M. the French left attacked Quaregnon, forcing the Austrian *Freikorps* back to Jemappes village, but then halted. Clerfayt took command of the Austrian center and right, sending four battalions to attack the Jemappes hills, and reinforced the right wing with two grenadier battalions. The French center was still in its original position, but the Austrian center was very weak after the bombardment.

Knowing Harville was advancing, Dumouriez ordered Ferrand to take Jemappes, while at noon he launched his hammer blow. Supported by the cavalry and led by several artillery batteries, Egalité's center and Beurnonville's right advanced toward the ridgeline, formed in attack columns deployed *en echequier* (chessboard style). When they reached a range of 160 meters, Beurnonville deployed eight battalions and charged the Austrian center, taking several guns. Three Austrian cavalry squadrons countercharged, putting the French infantry to flight as reinforcements were rushed to the center.

The French commanders rallied Beurnonville's fleeing infantry, while Egalité reordered his men to form the massive *bataillon de Mons* column. Followed by two regiments, the column advanced and retook the Cuesmes ridge, beating off Austrian counterattacks. On the French left Ferrand, with a 4-to-1 advantage, was encircling Jemappes with fifteen infantry battalions and cavalry. After initial slow progress south of the village, he took the small hill, although two grenadier battalions halted the next French advance on the village.

The Austrians believed their right wing was secured by the Haine, but local sympathizers helped three French battalions construct some bridges and attack the village from the rear. Two grenadier companies reinforced the defenders of Jemappes until the whole Austrian right was forced to evacuate the area. The center followed them over the bridge across the Trouille toward Mons. The exhausted French center secured the ridgeline and halted around 2:00 P.M., depriving Dumouriez of complete victory. The Austrian left withdrew during the afternoon.

The Austrians sustained 828 casualties, mostly from canister rounds, plus 413 prisoners; the French lost 2,000.

Albert abandoned the Austrian Netherlands, and on 10 November Dumouriez entered Brussels. The victory gave the French republican government greater confidence, and Louis XVI was executed in January 1793. However, Jemappes demonstrated that inadequately trained infantry could not deploy from columns properly, so the French often tried to smash through enemy lines by lowering bayonets at close range. Larger armies and effective artillery rendered this tactic increasingly costly. This did not deter General Jean-Baptiste Drouet (a senior commander at Jemappes and later the comte d'Erlon) from leading the last assault at Waterloo, twenty-three years later and 50 kilometers to the northeast.

## Jena, Battle of (14 October 1806)

Fought 15 miles south of the simultaneous battle at Auerstädt, where Marshal Nicolas Davout was confronting the numerically superior main Prussian army, the Battle of Jena took place between an army under the command of Napoleon and a mixed Prusso-Saxon force under the command

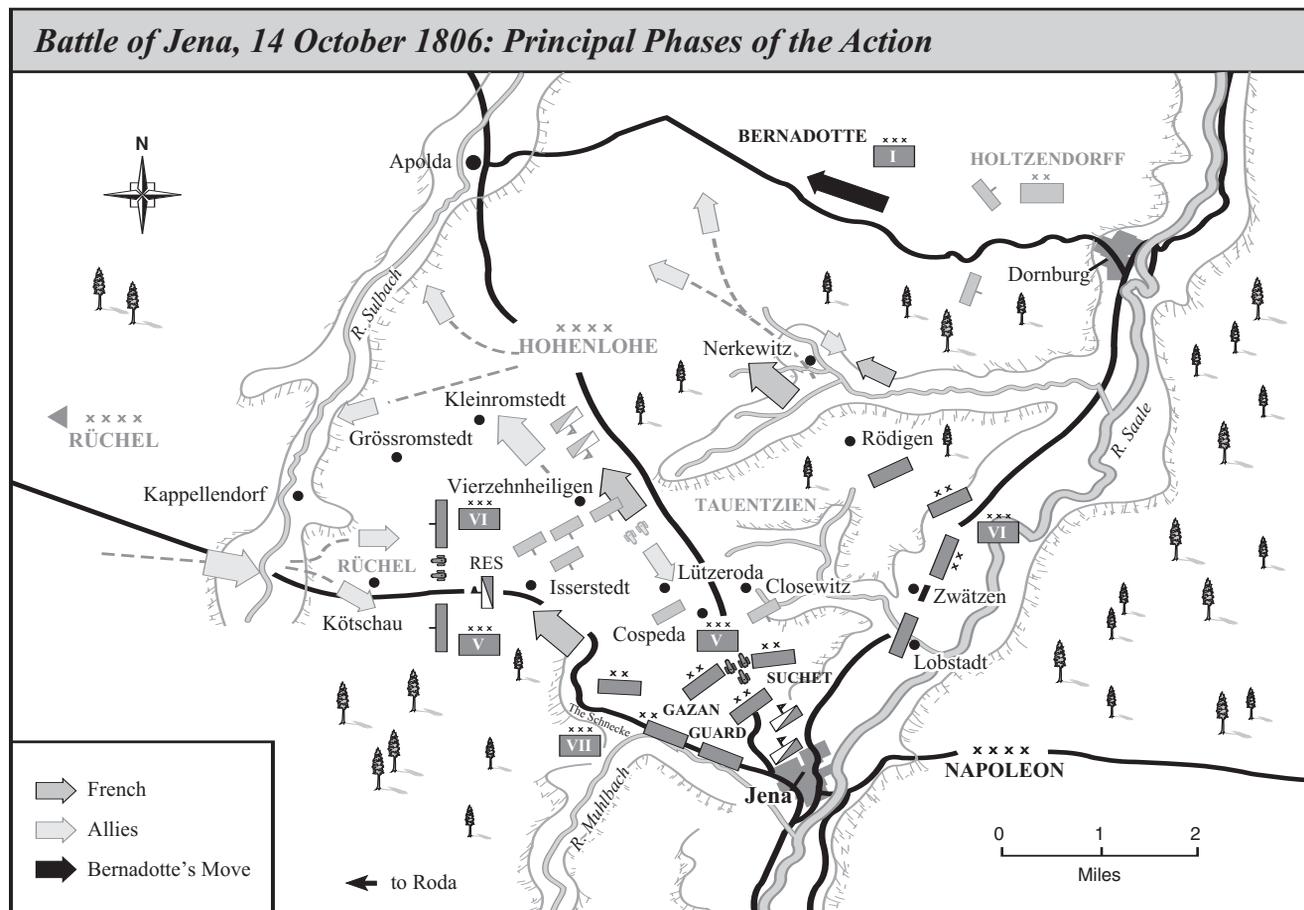

of Friedrich Ludwig Fürst zu Hohenlohe-Ingelfingen (known as Hohenlohe). This was one of Napoleon's most dramatic victories and played a major role in the destruction of Prussia as a great power. It expanded and consolidated Napoleon's control of central Europe.

On 13 October Napoleon's center column included the Imperial Guard, IV Corps (under Marshal Nicolas Soult), VI Corps (under Marshal Michel Ney), and three cavalry divisions moving from Roda to Jena. He sent Marshal Joachim Murat with two cavalry divisions and I Corps (under Marshal Jean-Baptiste-Jules Bernadotte) toward Dornburg. Napoleon was concerned that his opponent might slip away, avoiding the decisive battle he sought, and fall back on the fortress of Magdeburg.

On the afternoon of the thirteenth, Napoleon reached Jena and observed that the vanguard of V Corps (under Marshal Jean Lannes), part of the left column, had already taken control of the important heights of Landgrafenberg. Seizing the opportunity, he had his artillery manhandled up the steep slopes onto the plateau. That evening, IV, VI, and VII Corps (under Marshal Pierre-François-Charles Augereau) reached the vicinity of Jena. Their rear echelons

arrived the next day along with the Reserve Cavalry. Marshal Louis Davout was ordered to take his III Corps via Apolda to operate against the flank and rear of the Prussians. Napoleon, who drew together around 96,000 men on 14 October at Jena, thought that he was facing the main body of the Prussian army.

Hohenlohe, commander of the Prusso-Saxon corps, was aware that he was facing Lannes and Augereau. He had around 38,000 men at his disposal, including the divisions of generals Friedrich von Tauentzien, Julius August Reinhold von Grawert, and Rudolf Gottlieb Frieheirr von Dyherrn and the Saxon contingent. His objective was to cover the flank of the Prussian main body under Charles, Duke of Brunswick, that was moving from Weimar to Auerstädt. The force under General Ernst Friedrich Wilhelm von Rüchel, now about 13,000 men strong, spent the night of 13–14 October east of Weimar. Its intention was to follow the main body, but Hohenlohe requested and was granted his assistance to deal with Lannes. The Prussians did not consider that Napoleon might cross to the west side of the river Saale and attempt to disrupt their movement.

Adapted from Chandler 1966, 487.

Napoleon moved more troops onto the Landgrafenberg that night. Hohenlohe's outposts sent him reports of the movement of wheeled traffic, but he did not attach particular importance to this. There was nothing evident in these movements to indicate that Napoleon was assembling a large force in the vicinity.

Napoleon's immediate objective, once that morning's mist had lifted, was to ensure that he was in control of a large enough part of the plateau to be able to deploy his forces. Lannes was ordered to attack the village of Closewitz on Napoleon's signal. Soult was to move on the right through the valley of the Rau, while Augereau was to move through the Mühl valley up to the plateau. Ney was ordered to the right of Lannes but actually deployed on his left. The Imperial Guard remained in reserve. At the start of the battle Napoleon had fifty battalions of infantry and thirty cavalry squadrons at his disposal, around 56,000 men. Around 11:00 A.M. a further 15,000 men arrived; around noon, another 18,000.

At 5:30 A.M. Tautzien deployed his division of around 8,000 men between Lützeroda and Closewitz. The mist prevented either side from getting a clear view of the other, and General Louis Suchet's division of Lannes's corps slowly felt its way forward after beginning its attack at 6:00 A.M. The firefight continued for about two hours, by which time it was getting light. This enabled Tautzien to observe that he was heavily outnumbered. The French pressed forward, and the Prussians began to run low on ammunition. Hohenlohe then ordered Tautzien to retire on Klein Romstedt. The Prussian skirmishers in the Isserstedt Forest fell back to the village of Isserstedt. The two battalions of Saxons on the right retired to the Isserstedt Forest. This withdrawal was made in good order.

The French, however, followed up with determination, overtaking from two sides and breaking a battalion of Prussian fusiliers (light infantry). Another battalion fell apart, and two more lost contact, falling back to Apolda. A Saxon howitzer battery became stuck in a ditch and was abandoned. Lannes seized the opportunity, sending forward his combined battalion of grenadiers and *voltigeurs* and the 34th Line in two waves. Tautzien unexpectedly turned to face them, joined by four battalions of Saxons. Napoleon sent the 40th Line to take the village of Vierzeñheiligen, but it was driven off. He then sent General Jacques Desjardin's division from VII Corps to attack it, supported by eighteen guns from the Guard Artillery and V Corps firing from the southeast. Having halted his pursuers for a while, Tautzien now continued his withdrawal, abandoning Vierzeñheiligen.

General Friedrich Jakob von Holtzendorff's detachment, 5,000 men, which had been marching toward the sound of the guns, then appeared. It had General Louis St.

Hilaire's division of Soult's corps hard on its heels. He attempted to hold off the French by deploying in echelons from the right, with his skirmishers to the fore. General Etienne Guyot's cavalry brigade of IV Corps then attacked the Saxon *cheveaulégers* (light cavalry), throwing them back and riding down parts of the Prussian cuirassiers (heavy cavalry). The infantry, however, maintained their order and continued their march. Around this time, French troops moved through Krippendorf, and Holtzendorff now believed it impossible to rejoin Hohenlohe. Instead, he withdrew toward Apolda, taking away 5,000 men that Hohenlohe would soon desperately need.

These first clashes gave Hohenlohe little cause for alarm. General Niesemeuschel's Saxon infantry had occupied a winding road known as the Schnecke, "Snail," southwest of the Isserstedt Forest. About 8:00 A.M. Grawert had his Prussian division march off from its camp southwest of Kapellendorf, deploying its left on Klein Romstedt. Shortly after that Hohenlohe arrived, and he now appreciated the seriousness of the situation. He ordered Rüchel to join him. Grawert advanced on Vierzeñheiligen with cavalry covering his flanks. His horse artillery engaged the French guns. All that could be seen of the French between Vierzeñheiligen and the Isserstedt Forest was a skirmish line. However, Ney had brought up his vanguard, and his 10th Chasseurs surprised a Prussian horse battery and captured it. A cavalry fight then developed, with both sides throwing in more men. The Prussians recaptured the lost battery, but as the French had taken away its limbers, they were not able to recover it. The Prussian infantry followed to within 500 paces from Vierzeñheiligen.

Although Hohenlohe's orders were to refrain from getting involved in a serious conflict, he decided to use his initiative and drive off what appeared to be weak forces. He had his light infantry clear the French from Vierzeñheiligen. Prussian skirmishers were also posted in a copse on Grawert's right, with four battalions of Saxons behind them. Tautzien's battalions, now resupplied with ammunition, moved up behind the Prussian left. Five battalions of Saxons under Rudolf Gottlieb Freiherr von Dyherrn were in reserve. The cavalry re-formed behind the flanks of the infantry.

Meanwhile, French skirmishers of Lannes's corps counterattacked in Vierzeñheiligen and expelled the Prussians. They also cleared the copse. The French artillery bombardment grew in intensity, inflicting increasing losses.

About 9:30 A.M. Hohenlohe decided on the offensive. His infantry drove the French back along the entire line. However, when the Prussians came close to Vierzeñheiligen, they were greeted with a heavy fire that brought the attack to a halt. Hohenlohe was about to send in a couple

Napoleon at the Battle of Jena, one of two battles fought on the same day that broke Prussian resistance and revealed the obsolescence of forces still clinging to the methods of eighteenth-century warfare. (Hulton Archive/Getty Images)

of battalions to clear the village when Grawert pointed out that he had no reserves. Hohenlohe decided to wait for Rüchel to come up. Holtzendorff's arrival was also anticipated, and Hohenlohe intended to use him against the flank of the French. Meanwhile, the Prussian artillery commenced a bombardment of the village, setting it alight. Their infantry engaged the French in a firefight.

Lannes tried to flank Grawert with two battalions from General Honoré Théodore Gazan's division, but Saxon cavalry forced them to fall back. Desjardin's division now drew up between Vierzehnheiligen and Isserstedt, forcing Grawert to extend his right flank by committing a brigade of Saxons. The Prussian light infantry in the village of Isserstedt ran low on ammunition and was withdrawn. The Prussian volleys had little effect, and the French artillery pounded their lines.

Napoleon had used this time to bring up his reserves. St. Hilaire's division, having chased off Holtzendorff, approached Vierzehnheiligen from the north, supported by Guyot's cavalry, and flanked Grawert on the left. The two other divisions of Lannes's corps moved on Krippendorff, with the Imperial Guard following up in support. South of Vierzehnheiligen, Desjardin's division attacked Grawert's right, forcing it back and opening a gap in the Prusso-Saxon line. General Etienne, comte Heudelet de Bierre's division of Augereau's corps moved against the Saxons in the Snail. Ney followed up in support of Desjardin. A large body of French cavalry was visible south of Krippendorff. It was now afternoon. Napoleon now judged it opportune to go over to the offensive.

The French now made their decisive attack along the entire front. They were threatening the Prussian left flank

and had outflanked the right. Their artillery deployed at canister range and fired at the depleted Prussian line. The Prussians had already suffered heavy losses and were low on ammunition. Three corps closed in on ten battalions. Order broke down in the Prussian line and could not be restored. Hohenlohe now decided to withdraw. Grawert was ordered to fall back in a northwesterly direction over the river Ilm to link up with the main body of the army. The Saxons were ordered to retire along the road to Weimar. Covered by cavalry, this withdrawal was conducted in an orderly fashion. Napoleon now committed his great cavalry reserve under Murat.

Murat's troopers struck the right of the Prusso-Saxon line, breaking into it and causing considerable disorder. The heavy artillery was soon abandoned to the French. Hohenlohe sought refuge in a steady square of Saxon grenadiers. Most of Grawert's men fell back to Tauentzien's position, still under the control of their officers, in the Werlitz gorge north of Kapellendorf, although parts did go in the direction of Weimar. Grawert, now wounded, fell back with Sack's grenadier battalion to Kapellendorf, where the point of Rüchel's corps was now visible.

Rüchel is considered to have taken much longer than necessary to reach the battlefield. However, it was just before 9:00 A.M. that he received orders to march to support Hohenlohe. At this point, there was no indication of any urgency. He moved off shortly after, covering the 5 kilometers to Umpferstedt in about one hour. Here, he spent an hour deploying his corps. While he was doing this, he received a second message informing him all was going well in the battle. His columns covered the next 4 kilometers in about an hour, their points reaching Kapellendorf about midday. Shortly afterward a request for urgent assistance arrived. Redeploying to pass through the bottleneck at Kapellendorf, Rüchel marched on, sighting the church spire of the burning village of Vierzehnheiligen.

Moving up onto a ridge, Rüchel formed up for the attack. It was now around 1:00 P.M.; Hohenlohe arrived and ordered Rüchel to make that attack, and half an hour later he did so, advancing toward Soult's artillery that was deployed south of Gross Romstedt. Two brigades of French cavalry rode to meet him, but volleys of musketry drove them off, and Prussian hussars chased them away. The infantry continued its advance, forcing the French artillery to limber up and withdraw. Then St. Hilaire, coming around to the left of Gross Romstedt, took the infantry's flank. The artillery of the Guard and Lannes's corps then deployed and opened up, inflicting heavy casualties. Rüchel and several other senior officers were wounded. Control was lost. The infantry tried to continue its advance, but French infantry outflanked it and French cavalry pressed home, taking full advantage of the confusion. Order broke down,

with each battalion being left to fight its way out alone. An exhausted and wounded Hohenlohe reached Vippach that night.

Prussian losses were around 11,000 dead and wounded, 15,000 prisoners, 200 cannon, and 30 flags. The French lost about 5,000 men.

## Jena-Auerstädt Campaign (1806)

The stunning speed with which Napoleon overthrew the much-vaunted Prussian army in the fall of 1806 was dramatic, even by the standards this great captain set. Following on from his decisive defeat of the Austro-Russian army at Austerlitz in December 1805, Napoleon now established himself as master of central Europe with the Jena-

Auerstädt campaign, ending attempts by Russia to play a significant role in European affairs for several years.

Since the Treaty of Basle of 1795, Prussia had maintained a policy of neutrality with France, but the incessant expansion of the Napoleonic Empire caused friction in government circles in Berlin and led to increasing calls for war with France. The war party in Prussia grew in influence.

When war broke out between Britain and France in 1803, General Adolphe Mortier occupied Hanover and disbanded its army. Prussia, supposedly the defender of north Germany, did not oppose this act. Effectively, the Treaty of Basle had ceased to have force. King Frederick William III did everything he could to avoid giving Napoleon cause for a confrontation and ignored suggestions that he should mobilize a corps of observation. When the War of the Third Coalition of Austria, Russia, Britain, and Sweden began in 1805, Napoleon sought to ensure Prussia's neutrality by offering it Hanover. Frederick William was tempted but rejected this offer, as Napoleon made recognition of his conquests in Italy a prerequisite. Russia also put pressure on Frederick William, demanding the right of passage through Prussian territory for its forces. Caught in the middle, part of the Prussian army was mobilized that September.

Hardly had this mobilization begun when a French corps under Marshal Jean-Baptiste-Jules Bernadotte violated Prussian neutrality. This corps marched from Hanover southward through the Prussian enclave of Ansbach on 3 October, looting and pillaging as it went. This caused considerable outrage in Prussia and led to calls for war. The Russians were finally allowed passage through Prussian territory. Around 180,000 Prussian troops were placed on a war footing.

Napoleon needed to act quickly, and act quickly he did. His rapid maneuvers caused an Austrian force in southwest Germany under *Feldmarschalleutnant* Karl Mack Freiherr von Leiberich to capitulate at Ulm. While Prussia was trying to negotiate an armed peace, the French moved on Vienna. By the Treaty of Potsdam, concluded on 3 November, the Prussians agreed to enter the war with an army of 180,000 men, including contingents from Saxony and Hesse, should Napoleon refuse to make peace within four weeks of the departure from Berlin of the Prussian envoy Christian Graf von Haugwitz. Napoleon kept him at arm's length until after his victory at Austerlitz on 2 December. The strategic situation now having been so fundamentally changed, Haugwitz agreed to an exchange of territory with Napoleon, ceding the Prussian possessions of Ansbach, Cleves (Kleve), and Neuchâtel (a Prussian enclave in Switzerland) in return for Hanover. But peace had come at a price. The acquisition of Hanover led Prussia

into a dispute with Britain, its only potential ally in Europe now. Prussia was now isolated.

Seeing his chance, Napoleon started to goad Prussia into war. Joachim Murat, a French marshal and the Grand Duke of Berg, seized Prussian territory at Verden and Essen, in western Germany. French troops massed in Berg, threatening Prussia. Napoleon had suggested that Prussia should form a North German Confederation, but he then prevented it from carrying this out. Having induced Frederick William to accept Hanover, Napoleon then commenced peace negotiations with Britain, offering to return this territory. He did so without Prussia's knowledge, but the Prussian ambassador in Paris discovered it. This was the final provocation and the immediate cause for war.

Despite the gravity of the situation and the obvious, growing threat from France, Prussia entered this war ill prepared, and it lacked unity both in the government and in the higher command of the army. Frederick William did not have the strength of character or the authoritative demeanor necessary to impose his will on the arguing generals and politicians. The constant bickering hampered all operations. Nevertheless, Tsar Alexander I of Russia, irritated by the failure of his negotiations with Napoleon, promised to help, but his forces were far away. Britain too offered aid but moved slowly. Sweden declared its support but could do little. All that joined Prussia immediately was a contingent from Hesse and the reluctant Saxon army.

On 9 August 1806 the Prussian forces were ordered to mobilize. They entered this conflict with great expectations. Although the army had not been to war for ten years, its leaders had observed the development of warfare in the ensuing campaigns and had introduced a number of reforms. However, these attempts at modernization were underfunded and achieved less than was necessary. Napoleon's army had been fully trained at the camp at Boulogne, and its veteran cadres were flushed with the great victories of 1805. Napoleon's well-honed forces faced the army Europe respected above all others. The stage was set for the forthcoming War of the Fourth Coalition.

Strategically and politically, Prussia's position was not straightforward. France was one of Europe's most populous countries at this time, with a population of nearly 30 million. Prussia had the resources of only 8.7 million people, 2.5 million of whom were Poles, many of whom had only become Prussian subjects through the recent partitions of their country. Russia's support was essential, but Russia was considered an unreliable ally. There were rumors it was discussing peace with Napoleon, but these rumors were quashed on 3 September when a report arrived in Paris that Alexander had rejected Napoleon's overtures. As a result, Napoleon now refused to remove his troops

from southern Germany and began his preparations for war.

The Prussians feared Napoleon would strike first. France's occupation of the left bank of the Rhine left General Gebhard von Blücher's men in Westphalia out on a limb. The fate of Mack's Austrians the previous year must have been fresh in everybody's minds. Plans were made to withdraw Blücher's men over the river Elbe, but this would have left the Hessians in an exposed position and caused the Saxons consternation. Blücher also considered that his Westphalians would be reluctant to leave their home area, and he feared many would desert. Instead, the Prussians decided to concentrate to the fore, furthest away from the Russians. This would exacerbate the general strategic weakness of their position.

The Prussians raised a field army of seven corps of varying strengths: the Westphalian, the Hanoverian, the Magdeburg, the 1st Reserve, the Silesian, the West Prussian, and the Pomeranian. The fortresses of Magdeburg, Hamlin, and Nienburg were placed in a state of defense. To increase the mobility of the army, much of the heavier artillery pieces were left behind and the baggage train was reduced to a minimum. However, these measures were taken too far, for large parts of the army ran out of ammunition. The East Prussians were not mobilized, as they were needed to keep an eye on the Russians.

After some deliberations, the main part of the Prussian forces, around 65,000 men, were placed under the command of Charles, Duke of Brunswick, while Friedrich Ludwig Fürst Hohenlohe-Ingelfingen (known as Hohenlohe) was given command of a Prusso-Saxon corps of around 45,000 men. A corps of 34,000 men was left to cover Westphalia and Hesse, and 18,000 West Prussians were left in reserve. Brunswick and Hohenlohe were deployed facing Napoleon's forces concentrating in southern Germany.

On 26 September 1806 Prussia sent an ultimatum demanding the immediate withdrawal of the French armies across the Rhine and Napoleon's assent to the formation of the

promised North German Confederation under Prussian leadership. Napoleon did not bother to respond, so on 8 October Prussia declared war. Napoleon was better prepared for this eventuality, having kept the Grande Armée in Germany for that very purpose. He concentrated his 180,000 men on the river Main, determined to strike at Berlin before help could arrive from Russia.

Napoleon was now assembling his IV (under Marshal Nicolas Soult), VI (under Marshal Michel Ney), and VII (under Marshal Pierre-François-Charles Augereau) Corps in Franconia. On 3 October Marshal Louis Davout's III Corps arrived in Bamberg and Marshal François Lefebvre's

Adapted from Chandler 1966, 461.

V Corps was moving to join them. The Prussians moved into Saxony to meet them. Napoleon's plan was simply to locate and destroy the Prussians before any assistance from the Russians could arrive. An advance from southern Germany on Berlin would isolate the Prussians in the west, forcing them to withdraw.

The Prussians, only 145,000 strong, decided to seek victory alone rather than fall back toward the east and await the arrival of the tsar's forces. The difference in numbers was not in itself decisive, but there is only one thing worse than dividing one's army into two before the enemy, and that is dividing it into three, which is precisely what the Prussians did. Frederick William had not been able to get Brunswick to collaborate with Hohenlohe, so each was allowed to take the measures he considered appropriate. A third force of 15,000 men under General Ernst Friedrich Wilhelm von Rüchel was also formed. They faced 180,000 of Napoleon's veterans under a unified command. The resulting confusion diminished the chances of a successful outcome.

Napoleon now moved into Saxony marching in three columns. Soult (IV Corps) led the right column, about 40,000 men strong, with Ney (VI Corps) and the Bavarian contingent following him. It moved via Hof on Plauen. Bernadotte (I Corps) led the center column, about 70,000 men, with Davout (III Corps), much of the Reserve Cavalry, and the Imperial Guard following him. They moved from Kronach in the direction of Schleiz. The V Corps, now under Marshal Jean Lannes, led the left column, about 50,000 men, followed by Augereau (VII Corps). They moved toward Saalfeld and crossed the frontier on 8 October.

Fortunately for Napoleon, the Prussians had neglected to block the passages through the Thuringian Forest. The Grande Armée's three columns formed into a *bataillon carré* (battalion square), which would allow it to counter any offensive actions from the Prussians. The column attacked would simply fight a delaying action, falling back if necessary, allowing the remaining columns to swing into action against the Prussian flank. That day ended with Lannes's column moving toward Saalfeld and Soult's moving toward Hof. Matters were going well for Napoleon. The unity of command and the greater experience of recent warfare gave the French a considerable advantage.

The lack of a single command and of a clear objective hindered Prussian countermoves. The first sign of what was to come took place at Saalfeld on 10 October. Here, Lannes overwhelmed and defeated an exposed Prusso-Saxon force of around 8,000 men under the youthful and impetuous Prince Louis Ferdinand of Prussia, who was killed in action. This body of men was the vanguard of Hohenlohe's corps. It had been outnumbered 2 to 1 in this combat, so the result was to be expected. However, the

death of the popular prince at the hands of a French hussar caused consternation in both the army and the nation. The frictions between the Prussians and the Saxons increased. The rot began to set in.

Expecting the Prussians to fall back on Gera to cover Leipzig, Napoleon marched north in the hope of catching the Prussian corps individually. His cavalry patrols located the main Prussian force further to the north or west, not to the northeast. No Prussians were sighted in Gera or on the river Elster. Napoleon concluded that the Prussians were to the west and would offer battle around Erfurt, so he ordered his columns to wheel to the left.

Brunswick declined to hold the line of the river Saale. Hohenlohe fell back on Jena, while Brunswick advanced on Weimar. Bernadotte wheeled toward the center column, while Davout passed through Naumburg. By taking this crossing at the river Unstrut, the French had cut off the Prussians' intended line of retreat and their communication with Berlin. Their council of war now decided to fall back on Leipzig via Auerstädt, the Kösen Pass, Freyburg, and Merseburg. Hohenlohe was ordered to protect the flank of the main body, occupying the village of Kapellendorf, halfway between Weimar and Jena.

Not expecting to face the Prussians in battle for a few days yet, Napoleon reacted quickly to news of sightings of their actual positions and movements. Believing the main body of the Prussians was on the far side of Jena, he decided to strike, calling in the support of parts of the right column to join the left and center.

The battles of Jena and Auerstädt were confused affairs. At Auerstädt, Brunswick, with 50,000 men, bumped into Davout's force of 27,000 men blocking his line of retreat. Davout's successful defense of Hassenhausen is legendary. He repelled Brunswick, who was mortally wounded, leaving his men leaderless.

Napoleon met what he considered the main Prussian force at Jena. He started the affair with around 55,000 men against Hohenlohe's 40,000 Prusso-Saxon corps. Another 40,000 men had joined Napoleon by noon, and weight of numbers told. Rüchel's force of 15,000 men arrived too late to play much of a part other than to get caught up in the confusion of retreat. Although driven back in disorder, the Prussians had not disgraced themselves, but Napoleon pursued with vigor, turning the retreat into a rout. Napoleon considered that his victory at Jena had expunged the stain of the French defeat at Rossbach during the Seven Years' War (1756–1763).

The destruction of the Prussian forces in these twin battles caused considerable demoralization. While certain battalions and squadrons did everything possible to hold together, the army no longer had a leader to reverse its fortunes. What made matters worse was that the great

fortresses that might have checked the French advance and given the field army a chance to rally and reorganize capitulated without so much as firing a shot. Spandau, Stettin, Küstrin, and Magdeburg surrendered, breaking Prussia's back. On 25 October the French entered Berlin. Three days later, the remnants of Hohenlohe's force, 10,000 men, capitulated at Prenzlau. The only force that had shown much spirit was one that gravitated toward Blücher. It fought its way to the Baltic coast before being forced to surrender at Rackau near Lübeck on 7 November. Only East Prussia and some fortresses along the Baltic coast now held out against Napoleon.

Prussia was now utterly broken. The losses the Prussians suffered in the two battles are difficult to determine exactly. However, the Prussians lost around 10,000 killed or wounded at Jena, along with 15,000 prisoners, 34 colors, and 120 guns, against a loss to Napoleon of around 5,000 men. At Auerstädt, the Prussian losses were around 15,000 dead and wounded, 3,000 prisoners, and 115 guns, while the French lost 7,000 dead and wounded. After the whirlwind pursuit, the Prussians no longer had an army and had lost control of all their territory west of the Oder River.

Immediately after the Battle of Jena, Napoleon had demanded the cession of all Prussian territory west of the Elbe River. However, after the ignominious capitulation of so many key fortresses, he further demanded that Prussia accept French occupation of all Prussian territory up to the Vistula River and that all uncaptured fortresses should surrender. Frederick William refused these terms and fell back into East Prussia, hoping to secure the help of Russia.

The Prince Elector of Saxony, Frederick Augustus (Friedrich August) III who had supported the Prussians previously, now submitted to Napoleon. In return, he was made king of Saxony as Frederick Augustus I and joined the Confederation of the Rhine.

Napoleon now entered East Prussia, having gained a large number of Polish recruits by promising the restoration of their country's independence. He besieged the important fortress of Danzig (now Gdansk) at the mouth of the Vistula. It held out until 24 May 1807. The Pomeranian fortress of Kolberg under General August von Gneisenau successfully resisted until the end of the war.

In the Battle of Eylau of 8 February 1807 Napoleon lost 35,000 of his veterans in a bloody stalemate with a Russian army under General Levin Bennigsen, supported by a corps of Prussians. The relatively easy victories of Napoleon's earlier campaigns were not to be repeated. The Allies undertook to continue the war by the Treaty of Bartenstein of 26 April. However, Prussia was too weak to do much, Britain was committed to various colonial adventures, and Sweden hardly got involved. As Austria re-

mained neutral, Napoleon now concentrated on dealing with Russia. His victory over Bennigsen at Friedland on 14 June ended the military phase of the war. It was concluded with the Treaty of Tilsit of 9 July 1807.

Napoleon took the opportunity of reducing the nation that had once been his greatest threat to the status of a second-rate power. Prussia lost all its territory west of the Elbe, which was included in a new Kingdom of Westphalia with Napoleon's brother Jérôme Bonaparte as king. Much of its Polish territories were included in the new Duchy of Warsaw under the king of Saxony. Prussian ports were closed to British commerce, extending the Continental System established by the Berlin Decrees of 21 November 1806. The tsar could have argued for more lenient treatment for Prussia, but secret clauses to the treaty allowed Russia to gain territory at the expense of Sweden and the Ottoman Empire. That compensated for Napoleon's gains in central Europe.

This peace settlement was payment to Prussia for its pursuit of a policy of neutrality with France. For over ten years, Prussia had allowed the burden of the defense of Germany to fall on Austria's shoulders. Even then, it was not too late to change this. Had Prussia wholeheartedly committed itself to supporting Austria and Russia in 1805, then Napoleon's empire may well have ended then. Even in 1806 Russia was considered a potential enemy, so an inappropriate strategy of an aggressive defense was implemented, allowing Napoleon to strike first, quickly and decisively. Prussia played into Napoleon's hands and paid the price.

The Treaty of Tilsit marked the zenith of Napoleon's power. Russia and France had effectively divided the continent of Europe between them. Only Britain, master of the seas, remained opposed to Napoleon. As a result of its folly, Prussia was to suffer several years of humiliation and was not to resume its opposition to France until 1813.

**John, Archduke (1782–1859)**

Thirteenth child of the Holy Roman Emperor, Leopold II, and brother of Emperor Francis I of Austria, Archduke

John had a mixed military career but proved to be an able administrator, both in his direction of the raising of the *Landwehr* (home defense militia) in 1808 and in the province of Styria, where he achieved lasting popularity.

An able student of history and science, John aspired to emulate his brother Archduke Charles as a military commander. After only a basic military education, in August 1800 he was appointed, at age eighteen, to lead the Army of Germany, advised by *Feldzeugmeister* Franz Freiherr von Lauer. He displayed personal bravery, leading a successful attack against General Jean Moreau's French army around Ampfing on 1 December, but he was decisively defeated at Hohenlinden two days later. After the Peace of Lunéville in 1801, John became *Generaldirektor des Genie- und Fortifikationswesen* (general director of the engineering and fortification service) and, later, director of the military academies. In 1805, at the request of the Tyrol assembly, John was put in charge of defending the Tyrol. By calling out the Tyrolean militia to augment his own small force, he was able to support the retreating *Feldmarschalleutnant* Franz Freiherr von Jellacic and direct the defense of several key passes until ordered to evacuate the Tyrol by Charles.

A supporter of popular militia, John persuaded the emperor to order the creation of the *Landwehr* in June 1808 and took charge of the Austrian battalions. For the campaign of 1809 he was appointed commander of the Army of Italy (VIII and IX Korps) against General Eugène de Beauharnais. Victorious at Sacile on 16 April against a larger Franco-Italian army and at the third Battle of Caldiero on 27 April, news from Germany forced him to retreat, and he was defeated on the Piave on 8 May. Reaching Hungary, he was reinforced by the Hungarian Insurrection (militia) but was again defeated by Eugène at Raab on 14 June and failed to reach Wagram on 6 July to reinforce the main Austrian army. After a botched plan to lead a popular rebellion in 1813 and declare himself king of Rhaetia (for which he was banned from Tyrol for twenty years), John directed the siege of Hüningen in 1815.

His failed support for expansion into the Balkans prompted him to retire to his estates in Styria (southeast Austria), where he became very popular following hismorganatic marriage to Anna Plochl, a postmaster's daughter. He also supported cultural and scientific activities in Styria and founded the Joanneum Archive in Graz. During the upheavals of 1848 John was elected *Reichsverweser* (imperial regent) by the Parliament of the German Bund on 28 June and then became representative to Emperor Ferdinand (Francis's successor) in Vienna. In this capacity, John opened the first Austrian Parliament on 22 July and attempted to mediate in Hungary. He resigned from all posts in December 1849 and retired to Styria (now southeast Austria).

### Jomini, Antoine Henri, Baron (1779–1869)

Antoine Henri Jomini was born in Payerne, Switzerland, on 6 March 1779 to a prominent Swiss family. He followed his family tradition by becoming a banker's apprentice in Basle and then began service as a lieutenant in the Swiss forces in 1798. He rose to captain in 1799 and to *chef de bataillon* (major) the next year. Taking a discharge in 1802, Jomini returned to business and wrote his *Traité des grandes opérations militaires*. In 1804 he entered French service as an aide-de-camp of Marshal Michel Ney. He served with VI Corps during the 1805 campaign, fighting at Elchingen and Michelsberg. His service was noted, and Jomini received rapid promotions, to adjutant commandant in late 1805 and to first aide-de-camp to Ney in September 1806. He served on the General Staff of the Grande Armée in 1806 before becoming the chief of staff for VI Corps in November 1807.

In 1808–1809 Jomini served in Spain, where he received the title of baron in July 1808. However, disillusioned with the French service, he considered entering Russian service in 1810. He rose to *général de brigade* in December 1810 and became director of the historical section of the General Staff in 1812. During the 1812 campaign he served as the governor first of Vilna (11 August) and later of Smolensk. In 1813 he joined the General Staff of the Grande Armée in March and became the chief of staff of VI Corps that May. He then fought at Bautzen and was nominated for promotion to *général de division*. However, Napoleon's chief of staff, Marshal Louis-Alexander Berthier, with whom Jomini had strained relations, rejected the promotion. In response Jomini defected to the Allies in August 1813, and he entered Russian service with the rank of lieutenant general two weeks later.

Jomini advised Tsar Alexander I on military matters throughout the campaigns of 1813–1814, and after the war he accompanied the tsar to the congresses at Vienna, Aix-la-Chapelle, and Verona, held throughout the period 1815–1822. After living in Paris in 1817–1821, Jomini returned to Russia, and between 1822 and 1825 he tutored Grand Duke Nicholas, becoming his adjutant with a rank

of general of infantry in 1826. He was instrumental in organizing the Russian military academy in 1832. Although he soon took a discharge, Jomini was appointed military tutor to Crown Prince Alexander (1837), for whom he wrote his greatest work, *Précis de l'art de la guerre* (1838). During the Crimean War (1854–1856), Jomini advised Tsar Nicholas I on military affairs. After the war he returned to France, where he served as a military adviser to Emperor Napoleon III during the campaigns in Italy in 1859. He died on 22 March 1869 in Passy.

During his long career Jomini established himself as one of the most influential military theorists. Among his thirty volumes of military writings were *Principes de la stratégie*, *Histoire critique et militaire des campagnes de la révolution de 1792 à 1801*, and *Vie politique et militaire de Napoléon*.

### Josephine, Empress (1763–1814)

Empress Josephine was the first wife and consort of Emperor Napoleon I of France. Her inability to produce an heir for him gave Napoleon the excuse to divorce her. Josephine's considerable social contribution to Napoleon's career facilitated his successes to a large degree. She acted as his hostess and set the fashions and the decorating styles of his era. He would probably not have reached the exalted heights he did without her assistance.

Josephine was born Marie-Rose de Tascher de la Pagerie on 23 June 1763 in Martinique, West Indies, to an impoverished plantation owner, Joseph-Gaspard Tascher de la Pagerie, and his wife Rose Claire. The paternal family traced its noble lineage to the Loire valley in the twelfth century. The maternal side also had noble ancestry. Josephine, called Yvette as a child, had two sisters, Catherine, who died at age fourteen, and Minette. Her childhood on the plantation engendered a lifelong love of plants and animals.

Yvette's formal education consisted of four years of convent schooling at Dame de la Providence at Fort-Royal in Martinique. She took the teachings to heart and learned the rigid rules of social etiquette, such as deportment, hostessing, letter writing, and the other necessary accoutrements of her class. She left the convent at age fifteen. Yvette's pleasant personality was her greatest strength. She was kind, naturally warmhearted, and sweet tempered, and she exhibited an acutely accurate intuition. She was not classically beautiful, but her graceful demeanor was alluring to those who met her. Her melodious voice and Creole accent added to the glamour she exhibited even at that early age. She retained these traits during all her travails.

To help the family fortunes, Rose, as she became known, was married at age fifteen to a family acquaintance from Martinique, Alexandre, vicomte de Beauharnais. They moved to Paris in 1779. The couple was extremely unhappy; they were incompatible and unsuited to one another. They produced two children, Eugène Rose (future Viceroy of Italy) and Hortense (future Queen of Holland as wife of King Louis Bonaparte, and mother to the future Emperor Napoleon III). Beauharnais became a general but abandoned Rose, leaving her to find resources to raise her children. During the Terror Beauharnais was arrested, found guilty based on his aristocratic background, and guillotined in 1794.

Rose was also arrested and endured horrific conditions in prison. Prior to these events, however, she had been an eminent socialite in Paris; she had established a huge network of friends and contacts who arranged for her release. As was common for the times, Rose survived by becoming a mistress to a succession of leading political figures, a circumstance that afforded her increasingly wide political connections. Some of her liaisons were financially beneficial, although some business connections were questionable. Rose's greatest failing was that she led a financially extravagant lifestyle and was seldom out of debt.

Rose met Napoleon Bonaparte in Paris in 1796. He was awkward in Parisian society, gauche, usually disheveled and with ragged clothing, and self-conscious about his short stature and lowly Corsican origins. He had little use for women but was searching for a rich heiress to

Empress Josephine. Prominent in Parisian social circles during the 1790s, she married the young General Napoleon Bonaparte. The relationship never blossomed and the couple divorced in 1809 despite Josephine's popularity as empress. (John Clark Ridpath, *Ridpath's History of the World*, 1901)

marry. Their relationship was based on friendship. Rose became Bonaparte's social mentor, teaching him to dress properly and to speak less belligerently and giving him the confidence to overcome his low self-esteem in social situations. He in turn enjoyed her stately deportment, social finesse, and voluptuous figure.

The twenty-five-year-old Bonaparte married thirty-two-year-old Rose in a civil ceremony on 9 March 1796, blatantly attempting to advance his career and gain access to a fortune he discovered she did not possess. He changed her name to Joséphine (generally bereft of the accent in English-language sources). Although his family had vehemently opposed the union, Josephine's huge network of connections made her an asset to his lofty ambitions. The expedient union benefited both; it offered her children some security, and she enjoyed being the center of attention.

Josephine was influential in Bonaparte's obtaining command of the army in Italy, where he obtained brilliant military victories for France. Marital fidelity was anathema in the upper echelons of French society, and Josephine proved no exception to the general rule. She had an affair

with Hippolyte Charles, a dashing officer. In retaliation an enraged Bonaparte also engaged in extramarital sexual dalliances, which he continued throughout their marriage. Bonaparte threatened to divorce her in 1799, but the couple reconciled their differences.

Josephine's widespread popularity was an advantage when she offered her husband staunch support on the night of 9–10 November 1799 when he overthrew the Directory in the coup of Brumaire. Her role as hostess extraordinaire heightened his importance. Josephine single-handedly revived the stagnant social life of Paris, throwing massive balls and parties. Her refined tastes transformed the style of society while Bonaparte acted as First Consul.

Shortly before Bonaparte became emperor (thereafter styled "Napoleon I"), the pope decreed that the couple must marry in a religious ceremony; they complied. Napoleon crowned himself on 2 December 1804 and made Josephine empress. She rose to the task by performing her onerous royal duties flawlessly; her style was greatly admired. Josephine played a superb role at formal ceremonies, her numerous functions were staged impeccably, and she set the stage for many trends in French society. She charmed the French and many foreigners with her attentive and warm personality.

The misogynist Napoleon retained his grudge against Josephine's infidelity and used psychological warfare against her for the remainder of their marriage. He flaunted his own affairs and forced her to travel wherever and whenever he commanded despite her physical frailties, which included debilitating migraine headaches. He often demeaned her by ignoring her in public. Napoleon believed it was his destiny to create a dynasty. He realized he could sire children after one of his mistresses bore him a son. He openly searched for a new wife while still married to Josephine. He divorced her and forced her isolation and retirement to Malmaison, her country residence near Paris, though they remained friends.

Josephine remained popular after the divorce. Up until her death she received numerous visitors from all levels of society, from Tsar Alexander I, who had played a decisive role in Napoleon's downfall, to her friends who had not abandoned her. She occupied herself with her massive garden, her animals, and her grandchildren.

Josephine contracted a cold that quickly turned into pneumonia. She died at Malmaison on 29 May 1814 only two months after the Allies had entered Paris and forced Napoleon's first abdication. She was genuinely mourned by the French people. Josephine had helped Napoleon rise to his exalted position, but after he divorced her his fortunes declined. Upon his death on 6 May 1821 his last word was "Josephine."

## Joubert, Barthélemy Catherine (1769–1799)

A French general, the son of a lawyer from Pont de Vaux (Ain), Barthélemy Catherine Joubert was born on 14 April 1769. In 1784 he left school to enlist in an artillery unit, but his father brought him back to study law at Lyons and at the University of Dijon. The Revolution of 1789 revived his hopes for a military career, and Joubert became a sergeant in the National Guard of Dijon. In 1791 he joined the volunteer unit of the Ain and served on the lower Rhine. In 1793–1794 he served with the Army of Italy and distinguished himself by the heroic defense of a redoubt at the Col di Tenda. Wounded and captured, Joubert was later released on parole by the Austrians.

Returning to France, Joubert continued in military service, becoming adjutant general in 1794. Serving in the army of General François Kellermann, he again distinguished himself against the Austrians at Melagno (for which he was promoted to colonel), Borghetto, Loano, and Monte-Lingo, earning promotion to *général de brigade* in 1795. During Bonaparte's Italian campaigns in 1796–1797, Joubert distinguished himself commanding a brigade in General Pierre-François-Charles Augereau's division at Montenotte, Millesimo, Cosseria, Mondovi, Lodi (in General André Masséna's division), La Corona, Castiglione (under General Charles-Henri Vaubois), Arcola, and Rivoli.

His abilities soon attracted the special attention of Bonaparte and Joubert was promoted to *général de division* in December 1796. In early 1797 he commanded the de-

tached left wing of Bonaparte's army in Tyrol. Later that year he replaced General Jacques Macdonald as commander in chief of the (Franco-Dutch) Army of Batavia, and the following year he briefly commanded the (French) Armies of Italy and Rome. Resigning the post after a dispute with the civil authorities, Joubert returned to France and married in June 1799. However, he was almost immediately summoned to the field and was appointed commander in chief of the Army of Italy, which suffered a series of reverses at the hands of Russo-Austrian troops under Field Marshal Alexander Suvorov.

Joubert took over command from General Jean Moreau in August 1799 but persuaded his predecessor to remain with the army. As the army marched northward, Joubert encountered the superior Austro-Russian army at Novi and was killed leading a charge early on the morning of 15 August. After the battle his remains were brought to Toulon and buried in Fort La Malue, and the Revolutionary government paid tribute to his memory by holding a public mourning.

## Jourdan, Jean-Baptiste (1762–1833)

Jean-Baptiste Jourdan was one of the first heroes of the French Revolutionary Wars and a general whose career continued into the Napoleonic and post-Napoleonic eras. Jourdan was promoted to *général de brigade* by 1793 and

took over the command of French troops in Belgium. He won key victories at Wattignies (September 1793) and Fleurus (July 1794), but he was less effective in the second half of the decade, campaigning in Germany against Archduke Charles, the talented young Austrian general.

In 1797–1798, while serving in the lower house of the French legislature, Jourdan helped establish a permanent form of military conscription. Created a marshal in May 1804, Jourdan spent the bulk of the Napoleonic era as adviser to Napoleon's brother Joseph Bonaparte, first in Naples and then, after 1808, in Spain. Following the fall of Napoleon's empire, Jourdan rallied to the Bourbon kings of France, whom he served for two decades.

Jourdan was born at Limoges on 29 April 1762, the son of a surgeon. His father's occupation was a modest one in the society of pre-1789 France, and Jourdan took one option open to young men without great career prospects: barely sixteen years old, he joined the army. Jourdan served in the ranks for several years, and his experiences included campaigning in North America during the American War of Independence (1775–1783).

Released from the army, he became the owner of a shop in Limoges in the early years of the 1790s. In late September 1793, after serving as a divisional commander under General Jean Nicolas Houchard at the Battle of Hondschoote, Jourdan rose to command the Armée du Nord (Army of the North). It was a dangerous period for French commanders. Houchard, who had won at Hondschoote but failed to pursue the retreating forces, was removed from command, tried, and executed. Jourdan took over aware that not only Houchard but two other commanders before him had paid with their lives for their lack of acceptable military success.

Much of the fighting in this region resulted from French efforts to drive off enemy forces besieging various strongholds. The French found themselves opposed to Austrian, Prussian, Dutch, and British forces as well as to units from several small German states. In October 1793 Jourdan advanced against the Austrian and Dutch troops at Wattignies to relieve the siege of French forces at Maubeuge. In a two-day battle Jourdan, with a series of frontal assaults, defeated an enemy he outnumbered 2 to 1. Never a brilliant leader, he was calm, intelligent, and capable. He insisted on the importance of training his inexperienced forces, and he risked Houchard's fate when, insisting that his troops required further drilling, he refused to pursue the defeated enemy. Unlike Houchard, Jourdan only suffered the loss of his command for several months, and in June 1794 he became the leader of a mélange of units that became the famous Armée de Sambre-et-Meuse.

In July 1794 Jourdan led his forces to take the strategically located fortress at Charleroi. When an Austrian army

under *Feldmarschall* Friedrich Josias Graf Saxe-Coburg-Saalfeld (generally known as Saxe-Coburg) moved against the French, the two armies met in the largest battle since the start of the war in 1792. With approximately 70,000 troops on each side, Jourdan went on the defensive. Poorly coordinated attacks by several separate Austrian columns combined with the growing tactical skill of French units brought Jourdan a victory at Fleurus. It proved to be decisive for the entire campaign, as Austrian forces evacuated the Austrian Netherlands (present-day Belgium and Luxembourg), and French troops quickly took Brussels and Liège.

But Fleurus was Jourdan's final victory on the battlefield, and he soon found his military reputation clouded. Many in the army believed that Lazare Carnot, a member of the Committee of Public Safety in the government known as the Convention, devised the plan that brought victory and helped win it by his actions in key parts of the fighting. In the summer of 1796 the Directory, which had succeeded the Convention after the end of the Terror, ordered a new offensive into southern Germany led by Jourdan on the French right and General Jean Moreau on the French left. Yet Jourdan soon found himself out of his depth when he faced an energetic opponent like Archduke Charles. The two French armies were to converge on Vienna. Jourdan pushed Charles back, but, reinforced by troops he had earlier detached under General Wilhelm von Wartensleben, Charles administered a pair of stinging defeats against Jourdan—at Amberg in August and at Würzburg the following month. This forced both French armies into a humiliating retreat across the Rhine.

In March 1799 during the War of the Second Coalition, Jourdan again drove into southern Germany. He managed to get through the Black Forest, but once in the Danube valley he suffered a new series of defeats at the hands of Charles in late March, including at the first Battle of Stockach near Lake Constance. Jourdan was driven back to French territory, and only a shortage of Austrian cavalry capable of pursuing the retreating French saved Jourdan from complete disaster. Jourdan had repeatedly shown himself incapable of reacting to an opponent who used rapid and daring maneuvers to strike at the French flank and rear. His hasty retreat across the Rhine in 1799 exposed the northern flank of General André Masséna's Army of Switzerland. Only brilliant leadership on Masséna's part kept Jourdan's failure from opening the gates for an invasion of France.

Despite his weak reputation as a general, Jourdan played an important role in civil and military affairs. In 1797, as the president of the lower house of the French representative assembly, the Council of Five Hundred, he reshaped France's crumbling system of military conscrip-

tion. The techniques embodied in the original call-up of 1793 were failing to maintain the army France required. Jourdan's new conscription act was adopted in September 1798. All Frenchmen were made subject to military duty in time of war. In peacetime volunteers would be encouraged to fill the ranks, and conscription for men aged twenty through twenty-four would be applied if the number of volunteers proved inadequate. Although Jourdan wished to exclude the use of substitutes, political pressure forced him to accept a version of the law that permitted this form of legalized draft dodging. Nonetheless, this legislation, combining a role for volunteers and an elaborate system for conscripting others, set the pattern for French military recruiting through the end of the Napoleonic era.

As a figure on the political left, Jourdan refused to support the coup by which Bonaparte overturned the Directory. He was threatened with banishment to a distant French colony, but he was saved from this fate when Bonaparte decided to pursue a policy of moderation toward the left in the interest of national unity. Nonetheless, Jourdan was one of more than sixty deputies who lost their legislative seats as Bonaparte purged France's representative bodies. In 1804, however, Jourdan's Revolutionary pedigree got him included in the first list of candidates to receive the title of Marshal of the French Army.

When Napoleon placed his brother Joseph on the throne as King of Naples in 1806, the French emperor sent Jourdan to serve as the key military figure advising Joseph. Technically, Jourdan commanded the Naples garrison, but in fact he filled the role of minister of war. The close tie he formed with Joseph at this point led to their partnership in Spain two years later. After Joseph was named King of Spain by Napoleon in June 1808, Jourdan accepted the new monarch's invitation to become his chief of staff.

Jourdan and Joseph faced insuperable military problems in Spain. Their plans ran into the opposition of powerful French military leaders in various regions. Such figures as marshals Claude Victor, Michel Ney, and Nicolas Soult refused to accept directions from the king and Jourdan, both of whom the marshals considered militarily incompetent. Although Napoleon never visited Spain after January 1809, from a distance he gave orders that flew in the face of reality. He insisted, for example, that French armies could march rapidly on Spanish roads and feed themselves off the surrounding countryside. He likewise insisted that large numbers of French troops be used to contain Spanish guerrillas in regions close to the French border.

When Lieutenant General Sir Arthur Wellesley (later the Duke of Wellington) advanced on Madrid in July 1809, French forces met him at the Battle of Talavera. Jourdan objected to Victor's battle plan for a direct assault on the

enemy lines, but Victor went ahead, with costly and unsuccessful results. Suffering from ill health, Jourdan returned to France, where he remained for two years.

Jourdan returned to Spain in September 1811. The following year Napoleon made Joseph and Jourdan the nominal commanders of all French forces in Spain, but the powerful generals in charge of various regions paid little attention to their directions. Wellington's victory at the Battle of Salamanca (July 1812) came partly because Soult refused to remove troops from his bailiwick in Andalusia for use in northern Spain.

Jourdan and Joseph failed for the last time in the Battle of Vitoria in June 1813. Napoleon had weakened the forces in western Spain in order to secure the region near the Pyrenees. When this opened the way for a dangerous offensive by Wellington, Jourdan offered Joseph the promising suggestion of an offensive westward into Portugal to cut the enemy's lines of communication and to compel the British leader to retreat. Instead, Joseph chose to stay on the defensive, and both the king and Jourdan made a serious error in assessing the direction of Wellington's advance.

The British general consistently maneuvered around the French northern flank, establishing a base of operations at the port of Santander and then surprising French leaders when he struck southeastward against Vitoria. Joseph placed the French forces there in an untenable position, and Jourdan was unable to correct these dispositions in time to prevent a British victory. Wellington's success in this key battle crippled the entire French position in Spain. Jourdan received the blame from Napoleon, and he was recalled in disgrace.

Jourdan survived the rapid changes in French government in 1814 and 1815, serving first Napoleon, then Louis XVIII, then Napoleon again, finally settling in after Waterloo as servant of the new order under the restored Bourbon king. He held a variety of positions over the next two decades, including command of a military district and the governorship of the Invalides. Jourdan died in Paris on 23 November 1833.

### Jovellanos Jove, Baltasar Melchor Gaspar María de (1744–1811)

One of the foremost intellects produced by eighteenth-century Spain, Gaspar Melchor de Jovellanos, as he is usually called, was born in Gijón in 1744. Of noble origin, he was educated at the University of Alcalá de Henares, and in 1768 he was appointed to a minor legal post in Seville. It was not, however, as a lawyer that Jovellanos was destined to make his name. On the contrary, publication of a series of poems and dramas brought him much royal patronage, and by 1790 he had been named a member of the Academies of History, Fine Arts, Canon Law, and Public Law of the Royal Spanish Academy.

As a recognized government adviser, he was in a position to urge his liberal economic beliefs on the regime. In

that capacity he wrote two major reports, of which the first championed the abolition of all restrictions on occupation and the second—by far the more famous—the introduction of a free market in land. In 1797 he was also appointed minister of justice, but the temporary fall from grace of Manuel de Godoy a year later led to Jovellanos's being replaced. At this point, indeed, his previous good fortune came to an end.

A leading light of the Spanish Enlightenment, he had openly denounced the Inquisition, and opponents at court used this pretext to have him arrested and imprisoned in 1801. Confined in the castle of Bellver in Mallorca (Majorca), he was only released on account of the fall of Charles IV in 1808. Caught by the uprising en route to Madrid from Barcelona, he took shelter with friends at Jadraque and at first took no part in events other than repeatedly refusing to take service with the French.

According to tradition, the only reason he did not immediately join the revolt was his desire to recuperate after his long imprisonment in Asturias, but this seems a little naive, it being more likely that he was waiting to see which way the wind blew. Decided in favor of the Patriot cause by the French capitulation at Bailén, he became a member of the Junta Central for Asturias, in which capacity he continued to serve the Patriot cause until January 1810. However, Jovellanos appears to have been ill at ease in this new situation. Thus, his political ideas were frequently contradictory, while his well-meaning efforts to encourage the Patriot generals were sometimes little short of risible.

Old and tired, on the fall of the Junta Central he retired from public life (other than writing a powerful apologia on behalf of himself and his colleagues) and sailed for northern Spain, where he died a year and a half later at the Asturian town of Puerto de Vega.

## **Junot, Jean Andoche, duc d'Abrantès (1771–1813)**

A dashing cavalryman and a personal favorite of Napoleon, Jean Andoche Junot served the Revolutionary general, First Consul, and later Emperor with mixed success for two decades, from the siege of Toulon until the gen-

eral's tragic death by suicide in 1813. Junot did well at the rank of colonel in Italy and Egypt, and he became a *général de division* in 1801. Nonetheless, Napoleon had doubts about Junot's abilities and for years refrained from assigning him senior positions.

In 1807 Junot conducted his first independent large-scale mission. Leading French troops into the Iberian Peninsula, he advanced rapidly into Portugal. Although he took Lisbon and set up a French government, he failed humiliateingly to maintain his conquest in the face of a British counterattack. Junot participated on a secondary front during the Wagram campaign of 1809, then served again in the Peninsula as a corps commander under Marshal André Masséna. In his last campaign, the invasion of Russia in 1812, Junot failed at a crucial moment during the Battle of Smolensk.

Junot had a volatile and unstable personality that led colleagues to nickname him "the Tempest." Possibly suffering from complications of syphilis, Junot also showed the effects of a series of wounds to the head received during his years of service. Junot's behavior became increasingly erratic, and in 1813, after serving as military governor of Venice, he took his own life.

Junot was born on 24 September 1771, at Bussy-Légrand, a town near Dijon. His father was a government official; his mother's family included a priest who later rose to the rank of bishop. Serving in the National Guard after the Revolution of 1789, the young man abandoned his law studies to volunteer for the army in 1791. Early in his military life Junot exhibited a fiery temper and an excessive taste for alcohol. After service as a noncommissioned officer in several of France's northern armies starting in 1792, Junot was transferred to Toulon in the summer of 1793. By then he had suffered several battle wounds, including one from a musket ball that struck him in the head.

The siege of Toulon brought the young sergeant to the attention of the unknown Captain Napoleon Bonaparte. Junot volunteered to carry out dangerous missions for the future emperor and was promoted to officer's rank. His ability to transform Bonaparte's rapid-fire verbal orders into clear, written form quickly led Junot to be elevated to Bonaparte's military secretary and aide-de-camp. Their association continued during the Italian campaigns of 1796–1797, in which Junot took on combat duties as well as work on Bonaparte's staff.

At the head of a cavalry charge against the Austrians at Lonato, Junot displayed his customary recklessness on the battlefield. He wounded and captured the Austrian commander, but Junot himself was wounded six times in the encounter, including serious injuries to his head. Bonaparte liked and admired the young officer, but he apparently found Junot less promising as a potential sen-

ior commander than others, such as Jean Lannes and Masséna.

Nonetheless, Napoleon chose Junot as a member of the officers' circle that participated in the expedition to Egypt in 1798. At the start of 1799 Junot achieved the rank of *général de brigade*, and his exploits as a cavalry leader—plus a number of new battlefield wounds—added to his reputation as a tough if unsophisticated warrior. Junot remained in Egypt while Bonaparte returned to France in October, and he was captured during his own sea voyage home two months later. Junot did not obtain his release until June 1800. Absent from Bonaparte's side during these crucial months, Junot was unable to take part in the coup that put Bonaparte into power in December 1799, and he missed the subsequent Marengo campaign.

For the next seven years Junot occupied a position outside the limelight. He commanded the garrison in Paris, served as ambassador to Portugal, and suppressed anti-French uprisings in northern Italy. His personal reputation continued to feature stories of drinking, abusive behavior, and marital infidelity. For a time he was romantically linked to Caroline Bonaparte, Napoleon's sister.

Junot's first opportunity for military distinction came in the summer of 1807 when Napoleon named him commander of the French army designated to invade Portugal. This Army of Observation of the Gironde, with three divisions, was stationed at Bayonne in southwestern France, and Junot's forces became the first French troops Napoleon sent into the Iberian Peninsula. In October Junot's army crossed the border into Spain and raced westward. Napoleon intended to cut the tie between Britain, his last remaining European antagonist, and the Kingdom of Portugal. He may have chosen Junot for the mission in part to remove him from any contact with Caroline. It also seemed unlikely that Junot would face serious military opposition.

The race to Lisbon showed Junot at his best. Driving his force of 25,000 men through bad weather and across poor roads, he reached the border of Portugal by 19 November and took Lisbon at the close of the month, a feat which led to his being made duc d'Abrantès. By then he had only half his original force and his army lacked both artillery and cavalry. Moreover, Junot's success was clouded almost immediately by British naval power. With a hostile squadron under Sir Sidney Smith facing him just offshore, he was unable to capture either the Portuguese fleet or the Portuguese royal family.

British maritime power combined with growing Portuguese opposition to cripple Junot's efforts to control the country and maintain his army. He attempted to set up a benign government of occupation and even resisted some of Napoleon's extreme demands to exploit Portuguese resources. Nonetheless, his relatively small army proved inca-

pable of dominating the countryside. When the French occupation of Spain provoked open rebellion against the occupying forces there in the spring of 1808, armed resistance spread to Portugal as well. Meanwhile, the Royal Navy prevented Junot from obtaining vital food supplies. From the time he arrived in Lisbon, British naval power also raised the threat of landing an amphibious force to challenge Junot's small army.

In early August 1808 a British amphibious landing took place as Lieutenant General Sir Arthur Wellesley (the future Duke of Wellington) led a British army onto Portuguese soil at Mondego Bay north of Lisbon. Junot now faced his first important battlefield challenge since he had led French forces in Palestine in 1799. He countered the British move by drawing together his scattered army of occupation, but his frontal attack on Wellesley's forces at the Battle of Vimeiro on 21 August failed with heavy French losses.

Only disagreements among the ranking British generals on the scene prevented the enemy from pursuing Junot's troops all the way to Lisbon. Nonetheless, the results of Vimeiro destroyed the French leader's willingness to continue the campaign. Cut off from reinforcements and unwilling to risk defending Lisbon or retreating back to Spain, Junot opened negotiations with the enemy. The result was the Convention of Cintra, signed on 31 August, which provided for the evacuation of Portugal by the French army. British vessels transported the French home.

Junot survived this humiliating outcome to the invasion of Portugal, and at the close of the year he returned to the Peninsula to fight in Spain. Put in charge of the siege of Saragossa, a key enemy stronghold in northeastern Spain, Junot quickly found himself superseded by a more distinguished and respected commander, Marshal Jean Lannes. The episode put nearly unbearable pressure on Junot's shaky mental equilibrium, and he spoke openly of committing suicide.

But once again Junot saw his career survive. In the 1809 campaign against Austria he received command of a corps in Germany. He missed participating in the climax of Napoleon's campaign, the Battle of Wagram, but in October Junot received orders to return to Bayonne in preparation for a third tour of duty in the Peninsula. His personal life remained a source of concern to those who knew him. Rumors that his wife had been romantically involved with Prince Klemens Graf von Metternich, Austria's ambassador to France, provoked Junot to stab her repeatedly in the chest with a pair of scissors.

Junot's force of 40,000 men entered Spain in February 1810 and set up camp at Valladolid. Two months later, Junot and two other corps commanders came under the control of Masséna, who arrived to launch a new invasion of Portugal that summer. Junot performed competently

during Masséna's ill-starred venture, although predictable friction arose between the erratic cavalryman and his distinguished superior. Junot opposed Masséna's orders for a frontal attack on the strong British defenses at the Battle of Busaco on 27 September, and Masséna was critical of Junot for permitting his troops to pillage freely during the campaign. Junot also suffered a severe bullet wound to the face in January 1811.

Napoleon's plans for an attack on Russia in 1812 seemed to offer Junot a new opportunity for battlefield success and promotion to the rank of marshal, but he was to fail on both counts. He received command of an army corps in northern Italy with orders to march it into Poland in preparation for the forthcoming campaign. But Junot's less admirable characteristics—such as his shoddy personal behavior—soon intervened. He drank heavily as his troops made their way eastward from their base in southern Germany, and much of the time he did not bother to keep in direct touch with the units under his command.

When the French army went into action, Junot displayed a fatal lack of competence and initiative. Ordered to place his corps to the east of the Russian army fighting at Smolensk in August 1812, Junot had an opportunity to cut off the enemy retreat and to produce a decisive French victory. The inability of one of his divisional commanders to move promptly contributed to Junot's failure, but he himself, in a visibly drunken state, refused to attack a weak enemy screening force and left the door open for a Russian withdrawal.

Junot spent most of the remainder of the campaign guarding Napoleon's lines of communication. When the French retreated from Moscow, his rear echelon forces led the withdrawal of the Grande Armée. By the time Junot reached Poland, he was emotionally devastated, believing correctly that his performance in 1812 had cost him Napoleon's goodwill. In fact, only a personal appeal by Junot's wife to the Emperor secured a new assignment for the general.

Barred from any future in combat, Junot became governor of Venice and provisional commander of Napoleon's Illyrian provinces along the Adriatic coast. Even before leaving for his new assignment, he showed signs of an accelerating mental breakdown. Junot's conduct featured crying spells, bouts of insomnia, and violent nightmares. Ordered by his doctor to take limited doses of opium to help him sleep, Junot quickly became addicted to the drug. Meanwhile, his old alcoholic habits persisted.

In Venice Junot's behavior became so bizarre that he was unable to carry out his duties. He physically assaulted members of the civilian population, and this representative of the dignity of France appeared nude at formal balls and in the streets of Venice. When Napoleon ordered him to re-

turn home, it took physical force to remove him from his post. After arriving home, the deranged general threw himself from a window and fractured his leg. The ensuing infection led to gangrene, and Junot himself added to his physical problems by tearing off his bandages and trying to amputate his own leg. He killed himself at Montbard on 29 July 1813.

## Junta Central (1808–1810)

In full, the Junta Suprema Central de Gobierno—the Supreme Central Junta of Government—played a central role in the history of the Peninsular War.

When Spain rose against Napoleon in May 1808, it did so on a purely provincial basis: The French were in occupation of Madrid, while the institutions of central government were firmly under their control. At the same time,

meanwhile, the uprising lacked any central leadership; in a number of cities conspiratorial cells had emerged, but beyond that there was nothing in the way of organization, and certainly no national revolutionary committee that might have formed the basis of a provisional government.

In the wake of the uprising, then, the political leadership of the Patriot cause was assumed by a network of provincial committees, or *juntas*, comprising a variety of clergy, army officers, and local notables. Such a structure could not survive for very long, however: The different *juntas* were soon vying with one another for control of Spain's military resources, while there were constant disputes about strategy.

Faced with this fractious situation some began to press for the formation of a new national government, a task that became still more urgent in the wake of the recapture of Madrid after the Battle of Bailén. After much argument in which a number of the provincial *juntas* and other vested interests strove to advance solutions that suited their own objectives, a compromise was adopted whereby each of the main provincial *juntas* would send two representatives to a new national committee that it was decided should meet at the neutral site of Aranjuez. But at this small town (chosen on account of its central location and substantial royal palace), the delegates mounted a coup when they first assembled there, in September 1808. Although the provincial *juntas* had intended to retain sovereignty for themselves, their representatives turned on them and stripped them of their claims to be the untrammelled rulers of their domains.

Instead of a coordinating committee, in short, the Junta Central set itself up as a national government. From this, however, stemmed many problems. Around the country many of the provincial *juntas* were outraged, and they did all that they could to sabotage its authority, as did a number of prominent generals, who, as aristocrats, wanted

the formation of a council of regency in which they would play a major part. With the growing disaffection redoubled by the series of military disasters that beset the Patriot cause from November 1808 onward, the Junta Central was soon in a very difficult position, and all the more so as December saw it forced to flee from Aranjuez to Seville.

Though the Junta Central promised the convocation of a *cortes* or parliament, this did nothing to pacify its critics, and it therefore embarked on a desperate search for military victory that served only to incur fresh defeats and alienate the British. The end came in January 1810, when the French invaded Andalusia (Andalucía). Headed by Seville's provincial *junta*, revolution broke out against the Junta Central's authority and it was forced to abdicate in favor of a new council of regency.

At the time this news was greeted with universal rejoicing, but in reality the Junta Central does not deserve the evil reputation that has stuck to it ever since. Though dogged by internal divisions, by no means wisely constituted—it was fairly said of it that it was too large for a council of regency and too small for a parliament—and including some members of little worth or ability, the *junta* nevertheless had to grapple with immense problems and showed much energy in trying to do so. And, if it did not succeed in this respect, it at least kept Spanish resistance alive, while at the same time initiating the process of political debate that eventually produced the famous constitution of 1812.

See Rhine Campaigns (1792–1797)

## **Kalisch, Convention of (28 February 1813)**

An agreement between Russia and Prussia on joint operations against France to commence in the spring of 1813. Following the Convention of Tauroggen of 30 December 1812, Prussia ceased hostilities against Russia and exposed French troops to Russian attacks. Although King Frederick William III of Prussia initially rejected the convention, he soon conceded to public pressure and the demands of Tsar Alexander I and began negotiations.

The Prussian chancellor, Karl August Fürst von Hardenberg, and Russian field marshal Mikhail Kutuzov signed the convention at Kalisch, in the Duchy of Warsaw (now Kalisz, in Poland) on 28 February 1813. The agreement consisted of a preamble, twelve articles, and two secret provisions. The first two articles declared a cessation of hostilities between Russia and Prussia and established a military alliance against Napoleon. Both sides pledged to deploy 150,000 men for the impending campaign and agreed not to negotiate or sign unilaterally any agreements with Napoleon.

The terms also covered the restoration of trade between the two states (Article IX) and the supply of Russian forces with provisions in Prussia (Article X). Although Article XI stated that both sides would keep the convention a secret for two months, Russia made the agreement public less than one month later. The secret provisions of the treaty had important features. Russia pledged to assist Prussia in regaining the territory it had lost in the campaigns of 1806–1807 by the terms of the Treaty of Tilsit, except for the territories ceded to the Duchy of Warsaw. With regard to Poland, Russia agreed to permit Prussia to retain only those Polish territories it had received in 1772 during the First Partition, together with a strip of territory

to connect it with Silesia. Thus, the convention virtually surrendered to Russia territories Prussia had gained in the Partitions of Poland of 1793 and 1795 and promised to replace them with territories taken from northern German states allied to France. The treaty laid the foundation for the creation of the Sixth Coalition against France.

## **Kamenski (Kamensky), Mikhail Fedorovich (1738–1809)**

Russian general and army commander. He was born to a prominent noble family of Polish origin that had settled in Russia in the seventeenth century. His father, Fedot Mikhailovich Kamenski, had served under Peter the Great. He graduated with the rank of lieutenant from the Cadet Corps in 1756 and briefly served in the chancellery of constructions. In 1757 he began military service as *unterzeilmeister* (deputy to the noncommissioned officer in charge of regimental funds) in the Russian artillery, but during 1758–1759 he served in the French Army and was promoted to captain.

After his return to Russia, Kamenski was appointed to the artillery company in Moscow. In 1761 he transferred to the army with a rank of premier major, and later the same year he rose to colonel and was appointed quartermaster general to Count Peter Rumyantsev's corps. Kamenski participated in the concluding phase of the Seven Years' War

(1756–1763) and then commanded the 1st Moscow Infantry Regiment. In 1765 he was sent on a mission to study the Prussian military system and met Frederick the Great. Upon his return, he presented a report entitled *Opisanie prusskago lageria* (Description of the Prussian Camp), in which he praised the Prussian army and its regulations. Kamenski was promoted to brigadier in 1766 and to major general in 1769.

During the Russo-Turkish War of 1768–1774 Kamenski commanded the 4th Brigade and fought at Khotin and Janchintsy. The following year, he commanded the 1st Brigade of the 1st Division at Bender. After briefly commanding troops in Poland in 1772, he returned to the Danube valley and participated in operations against the Turks between Craiova and Banat. He was promoted to lieutenant general in 1773 and in 1774 given command of the left wing of the Russian Army, participating in actions at Bazardjik, Kozludji, Yeni Bazaar, and Shumla. However, he intrigued against General Alexander Suvorov, who promptly had him recalled from the army.

In 1775–1785 Kamenski served in various positions, including military adviser to the Prussian Army in 1779 and governor-general of the Ryazan and Tombov *gubernias* (provinces) in 1783–1785. During the Russo-Turkish War of 1787–1790, he was given command of the 2nd Corps but was compromised after yet another intrigue, this time against Field Marshal Peter Rumyantsev, was revealed. He transferred to the 4th Division (Reserve Corps) and took part in operations around Khotin and Bender. He distinguished himself at Gankur in December 1788. He briefly commanded the (Russian) Army of Ukraine but was involved in a dispute with Gregory Potemkin. After Potemkin's death, he claimed command of the army and refused to transfer authority to his successor, General M. Kakhovsky. He resigned only after the other corps commanders refused to comply with his orders and supported Kakhovsky.

After being disgraced by Tsarina Catherine II, Kamenski retired to his estate and spent the next five years there. He returned to active service in 1796 when Tsar Paul I gave him command of the Finland Division and an appointment as *chef* of the Ryazan Musketeer Regiment. Kamenski was promoted to general of infantry in 1796. The next year he received the title of count as well as further promotion to general field marshal in April. He soon fell out of favor, however, and was discharged from the army in 1798. Under the new tsar, Alexander I, Kamenski became the military governor of St. Petersburg in 1802 but was dismissed for incompetence late in the same year. He spent the next four years on his estate at Saburovo.

In 1806, faced with serious tension between commanding generals Fedor Buxhöwden and Levin Bennigsen,

Alexander conceded to public pressure to appoint Kamenski as the commander in chief of the Russian army (22 November). However, Kamenski was in poor health, and by the time he reached the forces in the field he had lost his ability to see and was largely immobilized. However, this did not stop him from ordering an offensive against Napoleon. Despite his enthusiasm, he demonstrated poor judgment and incompetence throughout the ensuing operations. He concentrated his forces at Pultusk and planned to fight a major battle there. Before that transpired, however, he resigned his command owing to poor health; indeed, he was no longer capable of reading and writing and was at times scarcely able even to move. Kamenski spent the next three years on his estate in Saburovo and became notorious for his severe treatment of the local peasantry. He was murdered by one of his peasants in August 1809.

### **Kamenski, Nikolay Mikhailovich, Count (1777–1811)**

Nikolay Kamenski was born on 7 January 1777 to a prominent Russian family, the son of Field Marshal Mikhail Kamenski. He was educated in the Cadet Corps, and his active duty began as adjutant to General Hantwig in 1785. Two years later, he became adjutant to his father. In 1795 he transferred as a lieutenant colonel to the Simbirsk Grenadier Regiment, then to the 10th *Jäger* Regiment, and to the Ryazan Musketeer Regiment in 1797. Kamenski was promoted to colonel later that year and became a major general and *chef* of the Arkhangelogord Musketeer Regiment in 1799. He served under Field Marshal Alexander Suvorov in Italy and Switzerland, fighting at St. Gotthard, Devil's Bridge, Altdorf, Muothatal (Muttental), Netstal, Nafels, and the retreat across the Panixer Pass. However, after returning to Russia, he misappropriated regimental funds and was suspended for several months, after which he was restored to his position in the Arkhangelogord Musketeer Regiment in 1802.

In 1805 Kamenski served in General Fedor Buxhöwden's corps and participated in actions at Wischau and Raussnitz. He distinguished himself at Austerlitz, but his

regiment suffered horrendous losses; Kamenski barely escaped when a roundshot (cannonball) killed the horse under him. Kamenski then took part in the 1807 campaign in Poland during the War of the Fourth Coalition. He fought at Bergfried and commanded the 14th Division at Eylau. Through May and June, he fought at Launau, Danzig, and Heilsberg. He was promoted to lieutenant general later that year.

In January 1808 Kamenski was given command of the 17th Division and participated in the invasion of Finland. That spring he took part in the siege of Sveaborg and protected the southern coast of Finland. In July he assumed command of General Nikolay Rayevsky's corps and fought against Swedish forces at Alavo, Kuortale, Salmi, and Oravais, and in a series of lesser actions. In 1809 he commanded a corps at Uleaborg and launched an offensive around Umea, fighting at Savar and Ratan.

In February 1810 he replaced Prince Peter Bagration as commander in chief of the (Russian) Army of Moldavia. In the initial stages of the war against the Turks, he captured the fortresses of Silistra, Razgrad, and Bazardjik. He fought the main Turkish army at Shumla, made an unsuccessful assault on Ruse, losing almost 9,000 men, and annihilated the Turkish army at Batin on 7 September. During August 1810–February 1811, he captured Ruse, Turnu, Plevna, Lovech, and Selvi. However, he became seriously ill in March and left the army to recuperate in Odessa. He died there on 16 May 1811 and was buried in the village of Saburovo in the Orel *gubernia* (province).

### **Kamenski, Sergey Mikhailovich, Count (1771–1834)**

Kamenski was born on 17 November 1771 to a prominent Russian family, the son of Field Marshal Mikhail Kamenski and the brother of Nikolay Kamenski. He studied at the Cadet Corps and by 1777 was an ensign in the Life Guard Preobrazhensk Regiment (19 April). In May 1789 he be-

came a lieutenant colonel of the Ekaterinoslavl Grenadier Regiment. He participated in the Russo-Turkish War in 1789–1790 and fought at Maximeni and Galati. During 1792–1794 Kamenski served against the Polish confederates and fought at Shekochin, Pesochna, and Maciejowice and received a minor wound to the stomach at Praga. In 1794 he was given command of the 3rd Battalion of the Ekaterinoslavl *Jäger* Corps. Kamenski was promoted to colonel in 1797, and in 1798 was advanced to major general and appointed *chef* (colonel-proprietor) of the Polotsk Musketeer Regiment. Yet Tsar Paul I soon disgraced him and had him discharged from the army that June.

After Paul I's assassination, Kamenski returned to service in April 1801 and became *chef* of the Phanagoria Grenadier Regiment that August. He participated in the 1805 campaign and fought in General Louis Langeron's column at Austerlitz. Promoted to lieutenant general in June 1806, he took command of the 12th Division and participated in the 1807–1809 campaigns against the Turks. He distinguished himself at Braila and took part in the actions at Constanta, Babadag, and Varna. In late 1809 he commanded a corps at Girsov.

In 1810 Kamenski served under his younger brother, General Nikolay Kamenski, and distinguished himself at the Battle of Bazardjik, for which he was promoted to general of infantry (26 June 1810). He failed to coordinate his actions with his brother at Shumla in July, but still defeated the Turkish army there on 4 August. He commanded the Russian left wing at the Battle of Batin on 7 September. In 1812 Kamenski commanded the 3rd Corps of the 3rd Reserve Army of Observation of General Alexander Tormasov and took part in the battles of Kobryn and Gorodechna. However, he had an argument with Tormasov and took a prolonged furlough in late 1812. He was discharged from the army in 1822 and spent the rest of his life at Orel, where he died on 20 December 1834.

### **Kant, Immanuel (1724–1804)**

Revolutionary philosopher whose ideas of transcendental idealism both summed up and superseded contemporary

German thought. His achievement is often likened to a Copernican revolution that paved the way for modern philosophy. Immanuel Kant was born in Königsberg on 22 April 1724. He came from a craftsman's family, but his intellectual capabilities allowed him to study at Königsberg University at the age of sixteen. From 1746 he had to earn his living as a private tutor with wealthy families. In 1755 he went back to university and earned both his doctorate and the other qualifications necessary for a professorship (a process known as habilitation) within a very short period.

In his qualifying thesis he introduced the major theme of his later works: the conditions of the possibilities of knowledge. As a professor at Königsberg University he outlined the goals of a whole generation of German philosophers and scientists with his famous *Response to the Question: What Is Enlightenment?* in 1784. His most famous works are the three critiques: *Critique of Pure Reason* (1781), *Critique of Practical Reason* (1788), and *Critique of Judgement* (1788).

Apart from these achievements, he also engaged in political philosophy: In 1795 he published his *On Perpetual Peace*. In this book he outlined which theoretical approaches and practical steps have to be taken to guarantee eternal peace. His concept has been interpreted as a forerunner of the League of Nations and the United Nations, as he regarded international law and institutions as a necessary tool to achieve peace on a permanent basis. Critics have argued that Kant himself, as merely a provincial professor, had no personal experience in politics and that he neglected social inequalities as a basis for conflict.

It is difficult to judge how Kant saw himself in terms of political allegiance. He had sympathy with the French Revolution, at least in its initial phases, but had to remain silent because of public pressure in the 1790s. As a professor at Königsberg he was a Prussian subject and could not freely argue against his enemies, who described him as an atheist fostering revolutionary ideas. Given this context, it is not easy to determine his real political thoughts within his publications of that decade.

Kant was by the 1790s already an old man with fading health, which was not helped by the public attacks, although he already had a large number of pupils and followers. In 1796 he ended his teaching career. He died on 12 February 1804, his last years overshadowed by ill health. He was a highly respected scholar during his lifetime, but the intellectual power of his major writings developed only after his death. The name *Kant* today is a synonym for German Enlightenment, and many—both in Germany and abroad—regard Kant as the most important and influential German philosopher of all time.

### **Katzbach, Battle of the (26 August 1813)**

The Battle of the Katzbach took place in Silesia, along the river Katzbach, a tributary of the Oder, in what is now Poland. Here, a Prusso-Russian force, the Army of Silesia, under the Prussian general Gebhard von Blücher, defeated the (French) Army of the Bober, commanded by Marshal Jacques Macdonald. This defeat, and that at Grossbeeren three days earlier, canceled out the gains made by Napoleon in his victory at Dresden.

Macdonald's army consisted of the corps of generals Joseph, comte Souham (III), Jacques, comte Lauriston (V), Maurice, comte Gérard (XI), and the cavalry corps of Horace, comte Sébastiani (II). His infantry were a mixture of conscripts from France, Italy, and Germany. His cavalry lacked experience. This force totaled around 100,000 men, although some 70,000 were engaged in the battle. Blücher's army consisted of the Russian corps of generals Louis de St. Priest, Louis Langeron, and Fabian Osten-Sacken, and Johann von Yorck's Prussians, around 95,000 men.

At the beginning of the fall campaign of 1813 Napoleon first moved against Blücher, but on hearing that the (largely Austrian) Army of Bohemia was moving toward Dresden, he left Macdonald in charge of the Army of the Bober and left for Dresden. Macdonald continued to pursue Blücher, who was avoiding Napoleon in line with the strategy contained in the Trachenberg Plan. The two armies made contact on 26 August.

The fighting started around 12:30 P.M. when Lauriston and Gérard encountered Langeron. Yorck's vanguard was in action by 12:30 P.M. but withdrew in the face of Sébastiani's horse artillery. The French followed up toward Hengersdorf, and Langeron deployed along the heights above this village.

About 2:00 P.M. Macdonald marched toward the sound of the guns. He met up with Souham, who was moving toward Kroitisch, where there was a bridge over the Katzbach. Blücher decided to push him back toward the rivers, swollen because of heavy rain, and ordered

Yorck to attack. The rain prevented the use of small arms, so the butt and bayonet were preferred. General Rémi-Joseph-Isidore, comte Exelmans's cavalry division and General Michel-Sylvestre Brayer's infantry crossed the Neisse River at Niederweinberg and deployed. Yorck, believing the French to be wavering, ordered in his reserve cavalry under Colonel von Wahlen-Jürgass. It captured a battery of artillery before Brayer repelled it. Exelmans counterattacked and drove Jürgass back to his starting positions. The crisis of the battle had now been reached. Yorck's second line countercharged, while his cavalry flanked Exelmans's, driving him down the hillside into the valley.

Osten-Sacken then advanced through Eichholtz, unlimbering his artillery on the Taubenberg hill. Blücher then ordered a general advance, throwing in his reserve cavalry. Brayer retired in good order via Niedercrayn to Kroitisch, but abandoned his wagons and guns. The Allies did not pursue with vigor. Later that afternoon, Souham arrived. He committed his divisions, but once news arrived of the defeat elsewhere, they fell back. Gérard and Lauriston captured Hennemersdorf about 4:00 P.M., but a flanking attack by the Prussians forced them to withdraw. The village was contested until midnight.

The French suffered around 10,000 casualties in this battle, and a similar number deserted. The Allies captured at least 30 cannon and more than 100 wagons and took more than 1,000 prisoners. They lost a similar number of men.

## Keats, John (1795–1821)

English poet who came to personify the Romantic literary movement because of his great talent and early, tragic demise. Like the other Romantics, Keats's poetry emphasizes Classical and medieval themes and influences and does not directly address the Napoleonic Wars or the political turmoil of the age. Instead, his poetry draws upon glorious eras of the past and is in tacit opposition to the ongoing Industrial Revolution in Europe.

Keats was born in London in 1795. Both of his parents died while Keats was young, and the future poet turned to literature for comfort and solace. In 1811 Keats became a surgeon's apprentice, but concurrently he began to write poetry. His first poem, "Lines in Imitation of Spenser," was composed in 1814. The following year Keats completed his medical training, although his main interest remained poetry. He met other Romantic poets, including Percy Bysshe Shelley and the literary editor Leigh Hunt. Hunt edited the journal *The Examiner* and was a prominent liberal thinker. Hunt not only influenced the political sentiments of Keats but also helped the young poet's career, including publishing some of Keats's early poems.

Although Keats began his brief literary career just as the Napoleonic Wars concluded, the battles and political instability of the period were scarcely reflected in his poetry. Instead, major figures of earlier English literature such as Edmund Spenser, John Milton, and William Shakespeare would exert significant influence on the young poet. Keats's initial works were not well received and did not sell well. He also faced substantial literary criticism. However, he refined his work and became increasingly rigorous in his style.

In 1817 Keats traveled to the Isle of Wight, where he completed his first effort at an epic poem, *Endymion*, which ran to 4,000 lines. The following year Keats went on a tour of the Western Isles of Scotland, and his health began to fail. He initially suffered from a severe sore throat, but soon it was clear that he had contracted tuberculosis, to which his brother had recently succumbed. During the tour, Keats met the painter Joseph Severn.

Keats became engaged to Fanny Brawne, although his financial difficulties prevented him from marrying. Despite this frustration, from 1818 to 1819 Keats composed some of his greatest poetry, including, "Ode on a Grecian Urn," "Ode to a Nightingale," "The Eve of St. Agnes," and "To Autumn." He also composed memorable sonnets on such themes as intellectual imagination, emotional longing, and immortality. His poems were noted for their exacting detail and use of imagery and dimension.

His health began to decline rapidly by late 1819, and his last volume of collected poems was published the following year. His doctors advised him to leave England for a more temperate climate, and Keats sailed for Italy in September 1820 to stay with his friend Severn. In spite of the Mediterranean sun, Keats was already in his last illness. He died in Rome on 23 February 1821. Although not greatly popular during his lifetime, Keats was soon memorialized in and given wider recognition through Shelley's elegy *Adonais* (1821), and Keats's poetry and letters would influence later generations of poets, including such luminaries as Alfred, Lord Tennyson and Oscar Wilde.

### **Kellermann, François Etienne Christophe “the Elder” (1735–1820)**

One of the select few of Napoleon’s marshals, Kellermann was not one of history’s great generals. However, what he accomplished on 20 September 1792 at Valmy was one of history’s decisive events.

Descended from a Saxon family that had settled in Alsace, Kellermann was born on 28 May 1735 in Strasbourg, then a Free City in the Holy Roman Empire. Of a modest background, he started his military service in 1752 in the Lowendahl Regiment. He fought in the Seven Years’ War (1756–1763), first as a lieutenant in the Alsatian Volunteers, then in the cavalry. In 1763, he transferred to the Conflans Legion, a mixture of cavalry, infantry, and artillery to be used for special purposes.

He married in 1769, and his son François Etienne, later one of the great cavalry generals of history, was born the next year. Kellermann the Elder settled down, pursuing a military career in peacetime. In 1776, he received command of his own squadron. Three years later, he was promoted to major and a year after that to lieutenant colonel. In 1784, after thirty-five years’ service, he reached the rank of general, commanding his own brigade.

By the eve of the French Revolution, Kellermann had amassed a variety of experiences that would put him in good stead for what was to come. He had commanded volunteers; raised, organized, and led raw irregulars; and commanded a force of mixed arms. Moreover, he knew how to handle inexperienced troops and turn them into good soldiers. He also knew how to make the most of unfavorable social and political conditions to achieve headway. All this knowledge was put to good use.

Kellermann’s day came in the fateful year of 1792. The European powers massed armies on France’s borders to intervene in favor of the threatened Louis XVI. Kellermann was placed in charge of the Division of the Saar, a mixed bag of volunteers and regulars he needed to lick into shape. He set about this task with characteristic energy.

That August, a Prussian army under Charles, Duke of Brunswick, crossed the border into France. General Charles Dumouriez, commander of the Army of the North (Armée du Nord), requested that Kellermann join him, because many of his volunteers had left for home in a panic rather than face the Prussians. Reinforced by Kellermann, Dumouriez drew up his forces to face the Prussians on the field of battle at Valmy on 20 September. The opening bombardment from the Prussians caused several French ammunition wagons to explode. The men panicked, but Kellermann rode up and steadied them. Seeing for once the French were not going to be a pushover, and lacking the resources to press on to Paris, Brunswick disengaged his army. That act saved the Revolution. Ironically, Kellermann, a soldier of the *ancien régime* and a man from a disadvantaged background, did so with an army trained in the methods of the Seven Years’ War.

Kellermann went on to hold several more commands in the Revolutionary Wars before moving on to administrative posts in the army. He was appointed Marshal of the Empire in 1804 in recognition of his services, and four years later was created duc de Valmy.

### **Kellermann, François Etienne “the Younger,” comte (1770–1835)**

General François Etienne Kellermann received his army commission in 1785 and served as aide-de-camp to his father, Marshal François Etienne Christophe Kellermann. In May 1797, after service in Bonaparte’s first Italian campaign, he was given command of a brigade of cavalry. It was during the Battle of Marengo, 14 June 1800, that he brought about the most notable tactical achievement of his career. At a pivotal moment in the battle Kellermann, along

with General Louis-Charles Desaix, launched a well-timed cavalry charge, which broke the Austrian advance and turned the tide in favor of the French.

Following Kellermann’s success at Marengo he was well esteemed among the army as a great cavalry leader. Marshal Auguste de Marmont was of the opinion that “Kellermann was the finest tactician in Napoleon’s cavalry” (Johnson 1999, 131). His recommendations were highly regarded in the cavalry service. When, therefore, Kellermann and Marshal Michel Ney proposed several reforms for the cavalry, including the introduction of steel helmets to the uniform, these recommendations were quickly adopted on Napoleon’s orders.

Kellermann continued leading cavalry forces in battle, being wounded at Austerlitz in 1805. After he recovered from his wounds Kellermann led General Jean Junot’s cavalry in Portugal where he helped negotiate the very advantageous terms of the Convention of Cintra. In November 1809, during the war in Spain, troops led by Kellermann pursued the retreating Spanish forces of the Duque del Parque. Kellermann’s 3,000 cavalry caught up with Parque’s force of 18,000, drawn up along a river near Alba de Tormes. Kellermann worried that the Spanish would withdraw to safety and, ignoring the odds, charged into battle at the head of his forces. The French cavalry broke the Spanish horsemen and smashed the opposing infantry lines. Parque’s mauled forces withdrew in the darkness, having lost 6,000 men, with 3,000 killed or captured, and another 3,000 deserters. One of Kellermann’s officers wrote later: “Rarely can so many corpses have been seen covering so small an area” (Johnson 1999, 88). Alba de Tormes was a notable victory and a prime example of Kellermann’s bravery and superior ability as a commander.

Despite Kellermann’s stature as a noted cavalry commander, his reputation suffered during the campaign in Spain, where he earned notoriety for being a flagrant plunderer. He was considered “the most rapacious general that . . . the Napoleonic Wars produced” (Johnson 1999, 132). He sent a vast quantity of stolen goods and money back to his estates in France. When his conduct was brought to Napoleon’s attention, the Emperor was always inclined to turn a blind eye, in acknowledgment for Kellermann’s charge at Marengo.

Because of poor health, Kellermann was unable to join the Grande Armée for its ill-fated invasion of Russia, though he did serve with distinction during the 1813 campaign in Germany. During the Battle of Bautzen, Kellermann was wounded twice and had five horses shot from under him. He missed the decisive Battle of Leipzig, owing to the wounds sustained at Bautzen and a return of ill health.

After Napoleon’s forced abdication, Kellermann remained in the new Bourbon army and was made Chevalier de St. Louis. Upon Napoleon’s return from exile, Keller-

mann was inspector of the army and had been ordered to intercept Napoleon, but his soldiers, refusing to obey orders, instead joined the Emperor on his march to Paris. Kellermann retired to his estates until Napoleon recalled him to service, placing him in command of III Cavalry Corps, the largest command of his career. During the Battle of Waterloo, Kellermann led his troops with distinction. Befuddled by the illogical commands issued by Ney in the midst of the battle, he charged into the middle of the wild cavalry actions launched against the British center, where he was wounded yet again.

After Napoleon’s defeat, Kellermann was reconciled once more with the Bourbons, and after his father’s death he was made duc de Valmy and gained a seat in the Chamber of Peers. He engaged in a war of words with General Anne Jean Savary, writing two pamphlets refuting Savary’s “biased and misleading account of Kellermann’s charge at Marengo” (Johnson 1999, 131). Kellermann maintained that he never received the credit he was due for his services during the battle.

Kellermann finally retired to his extensive estates in Senlis. In addition to taking part in various alleged corrupt business dealings, he was responsible for some philanthropic acts, most notably the building of a church on his estates, built purportedly with money stolen from Spain. Once when questioned about his Iberian spoils, Kellermann supposedly commented, “What do they suppose I crossed the Pyrenees for? A change of air?” (Johnson 1999, 144). He died in retirement in 1835 and was eulogized as one of the greatest cavalry leaders of the Napoleonic Wars.

### Kjoge, Battle of (2–5 September 1807)

In July 1807 British foreign secretary George Canning received intelligence indicating that some secret articles of the Treaty of Tilsit between Napoleon and Tsar Alexander would not only break up the Fourth Coalition against France but would compel Denmark to close its ports to Britain as part of Napoleon's Continental System. Ultimately this meant that Napoleon could gain possession of the sizable Danish fleet, control the Baltic, and possibly invade England. Canning ordered Crown Prince Frederick of Denmark to renounce his country's neutrality and place his fleet in temporary British custody. He refused.

To counter this danger, Canning devised a plan to employ a British and Hanoverian force to seize the Danish fleet and compel Frederick to renounce Denmark's neutrality. Consequently, on 29 July the Royal Navy's Baltic fleet, commanded by Admiral James Gambier, sailed from Sheerness to Denmark with a total of 380 vessels, including 24 ships of the line, 9 frigates, 22 smaller ships, and troop transports carrying 30,000 men, which were under the command of Major General William, Lord Cathcart. Sir Harry Burrard was second in command, while Sir Arthur Wellesley (the future Duke of Wellington) commanded the Reserve, consisting of five battalions. The heavy artillery included howitzers, guns, mortars, and the new Congreve rockets.

On 3 August the British landed unopposed at Vedbæk. After negotiations failed on 16 August, Wellesley covered the disembarkation of the advance guard that would create a semicircle around Copenhagen, which was besieged on 18 August. Danish general Ernst Peymann was commander in chief of the land forces. He sent a small inexperienced body of regulars and militia—the Zealand, Lolland-Falsterske, and the Mønске—as a relieving force commanded by General J. M. H. Castenschoild, to Kjoge, a small town some 40 kilometers south of Copenhagen, on 26 August, where the Danish had built entrenchments. Wellesley deployed five battalions of infantry, eight squadrons of cavalry, and two batteries of artillery to counter this attack.

The Danish fired one volley during the fighting at Kjoge. The British 92nd Foot charged them to the front, with devastating results. The undisciplined enemy quickly retreated in all directions, much to Wellesley's chagrin, because his flanking column, which would have contained the retreat, failed to arrive at the appointed time. Some men of the 92nd and 95th and some hussar officers were wounded. Wellesley suffered 172 casualties but did not lose any officers. He took 1,500 prisoners, but many Danes were killed or wounded.

Thereafter the Danish gave up trying to lift the siege. The British called on the Danes to surrender on the first and again on 2 September, but they refused. The British bombardment of Copenhagen consequently began at 7:30 PM on the second. Gambier fired on the city almost continuously from the second to the fifth, and inflicted more than 2,000 casualties. The newly invented Congreve rockets destroyed one-third of the buildings in the city. The Danes flew a flag of truce on 5 September. Wellesley helped to negotiate the surrender and draw up the articles of capitulation, which Peymann signed on 7 September. The Danish fleet was to be handed over to the British, and Fort Kastellet and the fleet facilities would be occupied until the British departed. The Danes lost some 18 ships of the line, 10 frigates, 42 smaller warships, plus 243 transport vessels; these sailed to various British ports. The remaining Danish ships were scuttled. In 1808 Wellesley was promoted to lieutenant general and was sent to Portugal, where he commanded the expeditionary force in the ensuing Peninsular War.

### Kléber, Jean-Baptiste (1753–1800)

Born in Strasbourg in Alsace on 9 March 1753, Kléber was one of the ablest of French Republican-era generals, seeing service in the Vendée, with the Armée de Sambre-et-Meuse, and most notably in Egypt, where he succeeded Bonaparte in command. A powerfully built man more than 6 feet 2 inches tall, Kléber was typically described as “Mars in uniform.” Despite some difficulties between Kléber and Bonaparte, the latter said that he regretted the untimely deaths of Kléber and Louis Desaix the most of all his generals.

General Jean-Baptiste Kléber succeeded in command of French forces in Egypt after Napoleon's departure in 1799. Kléber defeated the Turks at Heliopolis but was assassinated the following year. (Drawing by Jean Baptiste Guerin from *Life of Napoleon Bonaparte* by William M. Sloane. New York: Century, 1906, vol. 1)

After finishing grammar school, Kléber joined the Bercheny Hussars, only to have his mother annul the engagement. Instead, Kléber was sent to Paris for two years to work for an architect. He then worked in Besançon until he fought a duel over a girl and was ordered to leave town. Tradition has it that, returning to Strasbourg in 1775, Kléber fought a tavern brawl in defense of two Bavarian nobles who persuaded him to become a soldier. In 1776 he entered the Munich Military Academy before joining the Austrian Kaunitz infantry regiment as a cadet in October 1777, making ensign that November, and second lieutenant in 1779. Growing restless, Kléber resigned from the Austrian Army in June 1783 and returned to Strasbourg, where his stepbrother secured him work as an inspector of public buildings and works.

In July 1789 he was elected captain in the National Guard, then in 1792 he volunteered for the defense of the frontiers. As adjutant major in the volunteer 4th Haut-Rhin battalion, Kléber received his baptism of fire in the defense of Mainz (October 1792–July 1793). The garrison eventually capitulated but was allowed to leave Mainz with

full honors, provided they did not take up arms against the Imperial powers for a year. Therefore the *Mayençais*, as they were known, were transferred to the Vendée to fight against the rebels. Promoted to *général de brigade*, Kléber was revolted by the atrocities being committed by republican efforts to put down the rebellion and by the Jacobins' scorched-earth policy in the region. Nevertheless, with General François Marceau, he scored notable successes, particularly at Cholet (17 October 1793), after which he was promoted *général de division* (18 October).

In May 1794 he was transferred to the eastern frontier and saw action at Fleurus (26 June) before being put in command of the siege of Maastricht (17 September–14 November). In 1796 he commanded the left wing of the army and was victorious at Altenkirchen (4 June), but thereafter began to suffer some reverses, notwithstanding his taking Frankfurt on 16 July. However, after a series of spats with General Jean-Baptiste Jourdan and a certain amount of war-weariness, Kléber resigned his command on grounds of ill health that December.

Kléber returned to Alsace in February 1797 and spent much of the year piloting a dangerous course through shifting political sands. A year later, he was introduced to the young General Napoleon Bonaparte by the engineer General Louis Caffarelli du Falga and, along with Desaix, enthusiastically joined them in planning the expedition to Egypt. Sailing from France on 19 May 1798, Kléber landed under fire at Alexandria (2 July), where he was wounded in the forehead, taking governorship of the city while Bonaparte marched on Cairo. In October Kléber went to Cairo to prepare for the proposed Syrian campaign. From this point on, relations between Kléber and Bonaparte soured, with Kléber protesting about the lack of planning for a desert march and Bonaparte's apparent reliance on "fortune."

During the Syrian campaign he contributed to the capture of Gaza (25 February 1799) and Jaffa (7 March) and distinguished himself at the Battle of Mount Tabor (16 April). Recalled to Acre, Kléber was critical of the siege works constructed under Bonaparte's direction. Kléber's troops took part in a series of prolonged assaults but without any lasting success. With growing casualties and an outbreak of bubonic plague, Bonaparte finally called off the siege (20 May) and fell back on Egypt.

Unsurprisingly, Bonaparte did not include Kléber in his secret plan to return to France on 23 August 1799. Kléber was furious to find himself named commander in chief, with instructions to negotiate with the British a passage home for he and his forces if he had not received news from France by the following May. Kléber's fury at Bonaparte was increased when he realized the full extent of the logistical problems facing the army, which had fallen to half

its original strength and bankrupt. He wrote a stinging report to the Directory, which, fortuitously for Bonaparte, did not arrive until after his Brumaire coup (9–10 November).

By restoring army finances, Kléber remained popular among his soldiers, who expected him to negotiate a safe passage home for them all. Commodore Sir Sidney Smith opened a correspondence with Kléber, offering him safe passage aboard Turkish ships. Kléber agreed to the convention of El Arish (24 January 1800), but the British naval commander in the Mediterranean, Vice Admiral George, Viscount Keith, had separate instructions not to accept anything other than the unconditional surrender of the French. A furious Kléber resumed hostilities and won a stunning victory against the Turks at Heliopolis (20 March 1800) before putting down a revolt in Cairo (27 March), the second since the French occupation had begun.

On 14 June 1800 a young Muslim zealot from Aleppo named Soleyman fatally stabbed Kléber. The assassin was caught and executed, and four accomplices were beheaded. When the French in Cairo capitulated (17 June 1801), Kléber's remains were evacuated back to France and provisionally deposited in the Chateau d'If, where they remained for the duration of Napoleon's rule.

### **Kleist von Nollendorf, Friedrich Heinrich Ferdinand Emil Graf (1762–1823)**

Prussian general; in the Battle of Kulm and Nollendorf (30 August 1813) the flanking attack of II Corps under his command secured the victory for the Allies. He was made *Graf* (Count) Nollendorf on 3 June 1814.

Kleist entered military service on 2 July 1778 with the rank of ensign, rising progressively through the ranks as second lieutenant (April 1783); quartermaster lieutenant in the general staff (May 1790); captain of the army (October 1792, a position without assignment to a unit); major (January 1795); lieutenant colonel (May 1805); colonel (May 1806); major general (November 1808); lieutenant general (November 1812); general of infantry (May 1814); and finally general field marshal (May 1821). He served in the War of the Bavarian Succession (1778–1779); in 1793–1795 on the Rhine; in 1806–1807, in Prussia and Poland; and 1812–1815, in Russia, Germany, France, and Belgium.

Kleist was born on 9 April 1762 in Berlin. His family had close connections to the royal court, and in 1775 he became page to Prince Henry of Prussia, the brother of King Frederick II, “the Great.” In order to take part in the campaigns of 1778–1779, he joined an infantry regiment. After the peace, his regiment being garrisoned in Berlin, he studied at the Académie des nobles (Academy of Noblemen), a kind of officer academy. This enabled him to join the general staff in 1790, serving as an adjutant in the campaigns of 1793–1795. On 9 November 1799 he returned to service in the line as commander of a grenadier battalion.

On 28 April 1803 the king appointed him his adjutant general (a kind of secretary for military affairs). This task he performed until 19 August 1807, when he got leave to restore his poor state of health. From 25 November 1808 he was employed on active service again as commander of the Lower Silesian brigade.

On 12 March 1812 he was appointed commander of the infantry in the auxiliary corps, which played a nominal role during the Russian campaign, when Prussia reluctantly observed its alliance with France. On 26 November the king made Kleist second in command of this corps. An order by the king of 6 January 1813 for Kleist to arrest General Johann von Yorck and take over his command arrived at the front after a very long delay—too late to be executed, for by that time the Prussians had, by the Convention of Tauroggen, joined the Russians in the war against France.

In the campaign in Germany in spring 1813, Kleist commanded a corps assigned to the army under Yorck, but acted quite independently. On 28 May, he took command over the corps hitherto commanded by General Gebhard von Blücher. On 4 June, as Prussian representative, Kleist signed the Armistice of Pleischwitz. On 12 July his command was named II Corps and was assigned to the Allied army under Austrian *Feldmarschall* Karl Philipp Fürst zu Schwarzenberg. After the Battle of Leipzig (16–19 October) Kleist's corps besieged the fortress of Erfurt and was transferred to Blücher's Army of Silesia on 31 December, joining it in northern France in February 1814.

On 31 March of that year Kleist was made chief (by that time, an honorific title without any duties) of the 1st West Prussian infantry regiment. On 10 April he passed command of II Corps to General Wieprecht Graf von Zieten, but on 30 May Kleist assumed overall command of I, II, III Prussian, and III, IV, V Federal German army corps. On 23 October he was given general command in occupied Saxony.

On 10 March 1815 Zieten was appointed commander of the North German Federal army corps and ten days later was given command of the Prussian II Corps as well. However, on 20 June, as a result of severe jaundice, he was granted a leave of absence in order to recover. On 3 October he again became commanding general in Saxony.

Kleist was pensioned for health reasons on 5 May 1821 and died from hepatitis on 17 February 1823.

### **Kleist, Heinrich Wilhelm von (1777–1811)**

Poet, playwright, and novelist Heinrich von Kleist was one of the most important German dramatists associated with the Romantic movement.

Born in Frankfurt an der Oder, Brandenburg, in Prussia, Kleist was from a family having old martial connections. Most of the men on his father's side of the family served as officers in the Prussian Army. Some of them had even risen to the rank of general. Consequently everyone in his family assumed that Kleist would follow the same tradition. At the age of fifteen he entered the army and, a year later, he fought against the French on the Rhine.

In 1799 Kleist left the army as a second lieutenant and enrolled in the University of Frankfurt. He had had enough of military life and decided to attain a degree so that he could become a college professor. For a few semesters, Kleist intensively studied philosophy, mathematics, and political science, but he became disillusioned with his inability to find truth through education and dropped out. The writings of Immanuel Kant, the German metaphysi-

cist, greatly influenced Kleist's view of life. According to Kant, all theoretical attempts to find truth would fail. Unable to find truth through knowledge, Kleist attempted to express his sense of the randomness and uncertainty of human fate through plays, poems, and short novels.

Kleist never married. Wilhelmine von Zenge, his fiancée, broke off the engagement after she determined that he would be unable to support her properly. The breakup affected him deeply. He never again sought a wife and instead devoted his time to writing. Unable to achieve fame as a writer in his own lifetime, however, he became deeply unhappy; indeed, the characters of his works portray his own despair. Contemporary audiences often rejected Kleist's dramas because they found them too dark.

Unable to support himself with his writing, Kleist took a position with the Prussian government in Königsberg. During the French occupation of the area in 1807, Kleist was arrested by the French as a spy and imprisoned for six months at Châlons-sur-Marne. After he was set free, Kleist determined to use his literary skills to oppose the French and to unite the German people against Napoleon. In 1809 he wrote a political drama titled *Die Hermannschlacht* (Herman's Battle), in which he expressed his hatred for the French invaders. In the years that followed, Kleist edited journals that sought to rally German patriotism and continually criticized the French. However, his scheme to precipitate a German uprising through his writings failed.

Having lost all hope, at the age of thirty-four, Kleist made a double suicide pact with Henrietta Vogel, the wife of a friend who suffered from incurable uterine cancer. On 21 November Kleist shot the woman in the chest and then shot himself in the mouth. The bodies were buried side by side at the location of the suicides, just outside of Berlin. As so often happens, the circumstances surrounding his tragic death led to Kleist's immediate fame in Europe and critical interest in his work.

### **Krasnyi, First Battle of (14 August 1812)**

Rearguard action between Russian and French forces during Napoleon's march on Moscow in 1812. As the Russian armies concentrated at Smolensk, a decision was made to

counterattack Napoleon's forces. The Russian counteroffensive began on 7 August, but continuous disagreement between generals Mikhail Barclay de Tolly and Prince Peter Bagration rendered it ineffective and gave Napoleon enough time to adjust his plans.

Napoleon's maneuver at Smolensk was a masterpiece. He ordered Marshal Louis Davout to cross the Dnieper River at Rosasna; General Jean Junot to move to Romanovo; and marshals Joachim Murat and Michel Ney, together with General Eugène de Beauharnais, to march south, screened by cavalry. The Emperor intended to form a formidable *bataillon carré* and launch it as secretly as possible across the river on a 15-mile front through Orsha and Rosasna. There were to be two great columns. The Rosasna column, under Napoleon himself, was to consist of Murat's cavalry, the Imperial Guard, and III and IV Corps. The second column, under Davout, was composed of I, V, and VIII Corps, while cavalry under General Marie-Victor-Nicolas de Fay, comte Latour-Maubourg was to make a diversion southward from the Dnieper. Covered by a heavy cavalry screen, French movements remained unknown to the Russians. During the night of 13–14 August, General Jean-Baptiste Eblé completed pontoon bridges over the Dnieper at Rosasna, and the French crossed the river. By daylight almost the entire Grande Armée was advancing on Smolensk.

By early afternoon on 14 August the French advance guard reached Krasnyi, where the detachment of General Dmitry Neverovsky (10 battalions of infantry, 4 cavalry squadrons, 3 Cossack regiments, and 14 guns, for a total of some 7,200 men) was deployed. Neverovsky's cavalry outposts were stationed at Liady, a few miles west, and by 2:00 P.M. they were driven out by General Emmanuel Grouchy's troops. Facing overwhelming enemy forces, Neverovsky immediately assumed dispositions to cover his retreat. He deployed the 49th *Jägers* at Krasnyi, with two battalions of the 50th and 41st *Jägers* and two guns in support, and arranged the remaining battalions of the 50th *Jägers*, the Kharkov Dragoons, and the Cossacks (Grekov's regiment), behind the town.

The French meanwhile concentrated their forces, as the light cavalry of Ney's corps arrived around 3:00 P.M., followed by the 24th Légère, which occupied Krasnyi after half an hour of fighting. At the same time, Grouchy's cavalry located fords 3 miles to the north of Krasnyi, while the light cavalry of I Corps found crossings to the south as well. General Pierre Déry led the charge of the 9th Polish Uhlans against Russian dragoons but was repulsed. However, General Etienne Bordessoulle captured a Russian battery of seven guns and routed some dragoons and Cossacks.

Neverovsky, recognizing the French superiority, sent his remaining cavalry to the rear and began withdrawing with

his ten infantry battalions in two dense columns on the road to Smolensk via Merlino and Korythnia. The French cavalry rapidly pursued the Russians. Murat directed his massed squadrons against them but failed to break their formation. He then seemed to lose his nerve. Despite Ney's pleas to employ artillery and allow III Corps to engage the Russians, Murat launched more than thirty cavalry charges against them. Neverovsky repulsed each attack, then counterattacked and rallied his troops, forming them into one large square before continuing his retreat toward Smolensk.

At about 8:00 P.M. Neverovsky arrived at Korytnnya, where he rallied his cavalry and rear guard and moved through the darkness to the village of Yasennaia, 12 miles away. He resumed his retreat the following day and was reinforced by the 26th Division under General Ivan Paskevich, whom Bagration had dispatched that night. Neverovsky's division lost some 1,500 men, including 800 prisoners and 8 guns; French losses amounted to some 500 killed and wounded.

Neverovsky's resolute fight at Krasnyi was celebrated in the Russian army, and even French officers praised the Russians' gallantry. Without Neverovsky's staunch resistance at Krasnyi, the French might well have reached Smolensk by the evening of 14 August and assaulted it. As a result of this action, however, Napoleon decided to halt his advance for a day in order to regroup his forces, thus missing his chance to take Smolensk by surprise.

Some Russian contemporaries criticized Neverovsky for his failure to organize a more effective retreat. Later Russian and Soviet historians, however, have glorified the Russian exploits at Krasnyi and exaggerated its importance.

### **Krasnyi, Second Battle of (15–18 November 1812)**

A battle between French and Russian forces near Krasnyi on 15–18 November 1812. During the retreat of the Grande Armée, the Russian army of General Mikhail Kutuzov approached Smolensk from the south and, having bypassed it, made a direct thrust to Krasnyi, threatening to cut the French line of retreat. Napoleon left Smolensk with his Imperial Guard on 14 November and marched toward Krasnyi, followed by the remaining French corps. That same day, General Adam Ozharovsky's detachment briefly occupied Krasnyi before being driven out by the French.

Simultaneously, General Alexander Osterman-Tolstoy (11th Division and 2nd Reserve Cavalry Corps) attacked at Kobyzevich, while General Mikhail Miloradovich (2nd Corps, 7th Corps, and 1st Reserve Cavalry Corps) confronted the French rear near the village of Rzhavka and isolated the corps of marshals Louis Davout and Michel Ney and Viceroy Eugène de Beauharnais. On 16 November Kutuzov reached with his main army the village of Shilovo (3 miles from Krasnyi), but he kept to his plan of avoiding battle and reinforced Miloradovich with the 2nd Reserve Corps. Miloradovich then marched to Merlino, where he awaited the approaching troops under Eugène. The French tried to cut their way through but their attack was repulsed and they suffered from the Russian guns and cavalry. Eugène's predicament stirred Napoleon to action, who seized the initiative by turning his Imperial Guard back toward Smolensk.

The French counterattack surprised Miloradovich, and the Russians had to withdraw their forces and open the road for Eugène's IV Corps. However, nothing could prevent a Russian attack on Davout's I Corps, which suffered heavy casualties and lost its artillery and baggage, including Davout's personal belongings and marshal's baton. Napoleon was soon informed of the Russian movement to the village of Dobroe and, fearing that he might be encircled, he ordered a retreat, even though Ney's corps was still cut off. Ney spent the night near Korytnia and then tried to break through on 18 November; however, his steadfast attacks were all repulsed, and the Russians gathered reinforcements to encircle and destroy him. To gain time, Ney pretended to consider a Russian offer to surrender, and during the night he succeeded in eluding the Russians on his march to the Dnieper River, which the French crossed over thin ice near Syrokorenye.

Krasnyi was not a battle on the scale of Borodino or Maloyaroslavets but rather a series of engagements that inflicted considerable casualties on the French. Napoleon's forces lost some 6,000 killed and more than 20,000 captured, including more than 200 guns and 6 flags. Russian casualties amounted to 2,000 killed and wounded. Russian and Soviet historians tended to exaggerate the importance of the Battle of Krasnyi. Kutuzov, who withheld the main army from the battle, described it as a major encounter in his report to Tsar Alexander and was conferred the title of Prince of Smolensk, and senior Russian commanders were also rewarded. Later historians followed suit describing this engagement as a "decisive battle," brilliantly won by the Russians.

The fact is the Russian troops attacked French corps (Eugène, Davout, Ney) while they were marching from Smolensk to Krasnyi, and although each corps was temporarily cut off and Ney's corps even surrounded, none of them was forced to lay down their arms, and so an opportunity to destroy the French army was missed. Kutuzov's actions at Krasnyi served as a basis for the "golden bridge" or "parallel march" thesis, which argued that Kutuzov refrained from attacking the French in order to preserve his troops and let the winter and hunger take their toll on the enemy.

**Kray, Paul Freiherr von Krajova (1735–1804)**

From a Hungarian military family, Kray was a natural leader of the *Grenz* (Military Frontier) units in *der kleine Krieg* (literally, the little war, or light warfare) and a renowned advance-guard commander with the natural swagger of a hussar. Known to the French as “*le terrible Kray, le fils chéri de victoire*” (the darling child of victory) especially for his triumphs at Verona and Magnano in 1799, he proved to be an able leader of large formations but was unsuccessful as an army commander in Germany in 1800.

Kray was born in Käsmark in Hungary, the son of a *Hauptmann* (captain). Trained in military skills from an early age, he joined Infanterie Regiment 31 as a *Kadett* officer aged eighteen and served through the Seven Years’ War (1756–1763), distinguished by his bravery and stamina. Promoted to major in 1778, he became a noted light infantry commander as *Oberstleutnant* (lieutenant colonel) with the 2nd Szeckler Grenz Regiment, and *Oberst* (commanding colonel) of the 1st Wallach Grenz Regiment in the following years. During Austria’s war with Turkey (1787–1792), he led large long-range raids into enemy territory and secured the Siebenburgen (Transylvania) border passes, for which he won promotion to *Generalmajor* in 1790. At this time he was ennobled, taking his title, Freiherr von Krajova, from his famous raid on Krajova in Romania. At the request of *Feldzeugmeister* Franz Sebastian de Croix Graf von Clerfayt, Kray transferred to Belgium in 1793 as the army advance-guard commander. His victories at Famars, Courtrai, and Menin were followed by his successful defense of Orchies and, on 30 October, the capture of Marchiennes, where five French battalions were taken prisoner. During 1794–1795, he distinguished himself leading his men at Charleroi, Landrecies, and Fleurus. Promoted to *Feldmarschalleutnant* (lieutenant general), he showed himself to be a skilled corps commander under Archduke Charles in Germany in 1796 at the victories of Wetzlar, Amberg, and Würzburg. For a poor performance in Germany in 1797, he was court-martialed with *Feldmarschalleutnant* Franz Freiherr von Werneck but released after two weeks in jail.

Following the death of the Prince of Orange in 1798, Kray became interim Austrian commander in Italy, where he crushed General Barthélemy Schérer at Verona and Magnano in early April 1799. Promoted for his victories to *Feldzeugmeister* (general), he directed the short three-month siege and recapture of Mantua before joining the main Allied army in the victory at Novi in August. In early 1800, he relieved Archduke Charles as commander of the Austrian army in southern Germany, but could not equal the popularity of his predecessor among his men. After de-

feats at Engen and Mösskirch in early May, and aggravated by differences with the *Hofkriegsrat* in Vienna, he signed the Armistice of Parsdorf in July and retired. From 1799 he was *Inhaber* (honorary colonel) of Infanterie Regiment 34.

**Krüdener, Julie Freiherrin von (1764–1824)**

A Russian visionary, author, and spiritual adviser of Alexander I of Russia, Krüdener claimed to have inspired the tsar’s proposal in 1815 of a Treaty of Holy Alliance among the European monarchs. After leaving her diplomat husband in 1801, Krüdener established herself in Paris, where she mingled with the notable literati of the day, including Germaine de Staël, Benjamin Constant, and François-René de Chateaubriand, and wrote a popular sentimental novel, *Valérie* (1804). She converted to Moravian pietism and traveled throughout Europe, prophesying the imminent approach of the Apocalypse.

Krüdener had come to the attention of Alexander through a lady-in-waiting to the empress, Roxane Stourdza, who mentioned Krüdener’s prophecy concerning the return of Napoleon as a political threat, which was fulfilled on 1 March 1815, when Napoleon, having escaped from Elba, began his march to Paris. Alexander became convinced of Krüdener’s prophetic powers after she arranged a meeting with him in Germany in the summer of 1815. For several months after this significant interview, Krüdener became the spiritual counselor and close confidante of the tsar, accompanying him to Paris, where he continued to seek her advice as he negotiated with the diplomats assembled in the French capital.

The crowning moment of Krüdener’s influence over Alexander came on 11 September 1815, during the tsar’s review of his army on the Feast of St. Alexander Nevsky, his patron and protector. Standing by his side, Krüdener witnessed the march of the troops around seven altars—the mystical number of the Apocalypse—while the Russian

Mass was celebrated. Krüdener's prominent role in the proceedings was remarkable, not least because she was an evangelical Protestant and never a member of the Orthodox Church. On 26 September Francis I of Austria and Frederick William III of Prussia joined Alexander in signing his proposed Treaty of the Holy Alliance, in which they pledged to base all their future decisions on the principles of Christianity. Although many contemporaries believed that Krüdener was instrumental in shaping the Holy Alliance, associates of Alexander, including Stourdzka, denied Krüdener's involvement.

Alexander's interest in the female visionary waned considerably after the signing of the treaty. Over the next few years, Krüdener continued her missionary work in Germany and Switzerland, while repeatedly trying to regain the tsar's favor. They met in secret twice more in 1819 and 1821. Finally, in the spring of 1822, Alexander sent Krüdener an eight-page handwritten letter in which he accused her of neglecting her duties as a loyal subject and a Christian, and urged her to leave St. Petersburg. This time Krüdener heeded his advice and left for her home in Latvia. In 1824, during the tsar's illness, Krüdener once again petitioned for a meeting, but Alexander refused and banished her to the Crimea, where she died later that year.

### **Kulm, Battle of (29–30 August 1813)**

The Battle of Kulm took place between a French corps under General Dominique Vandamme and elements of the (largely Austrian) Army of Bohemia that it was pursuing after the Battle of Dresden during the 1813 campaign in Germany. Vandamme managed to become surrounded, and his corps was annihilated. This defeat wiped out what little gains Napoleon now had left after his victory at Dresden on 26–27 August.

After its defeat at Dresden, the Army of Bohemia retreated southward through the mountain passes back into Bohemia. Vandamme pursued, expecting to totally destroy the Allied force, making Dresden the decisive victory of the campaign. Napoleon now believed the matter all but decided and had the Old Guard return to Dresden, while

halting the Young Guard at Pirna, on the river Elbe. He was already aware of Marshal Nicolas Oudinot's defeat at Grossbeeren on 23 August and then of Marshal Jacques Macdonald's on the Katzbach three days later. However, the destruction of the main Allied army in Bohemia would more than make up for these setbacks.

Vandamme attempted to get into a position where he could cut off the Allied line of retreat. He moved down the road from Pirna through Peterswalde (now Petrovice) and Tellnitz (Telnice), but the Allies attempted to stop him. The village of Kulm (Chulmlec) lies in a valley, with the steep sides of the Erzgebirge mountain range to the north and the rolling Striesowitz Heights to the south. A relatively small number of men could hold up advancing troops in this bottleneck.

The Allies staged an improvised defense at the village of Priesten (Prestanov), with artillery to their fore, cavalry on the right, and a line of infantry. The first day's action began with an exchange of artillery fire about 11:00 A.M. A determined defense of the village of Straden followed this, but the French prevailed here. More of Vandamme's men arrived, and from 3:00 P.M. the assault on Priesten began. An hour later, the Russians counterattacked and stormed the burning village.

At 5:00 P.M. French reinforcements arrived, and Vandamme sent them in against the Allied center. The Russian Guard Dragoons chased them off, and more Russian Guard cavalry arrived. The Russian 1st Grenadier Division and 2nd Guard Division were reported to be on their way, along with the Prussian Guards. Shortly after 6:00 P.M. the Allied commander in chief, *Feldmarschall* Karl Philipp Fürst zu Schwarzenberg, also arrived. Vandamme decided not to send in his men piecemeal but to await more reinforcements. Both sides now consolidated their positions. By the end of the first day, the Allies had checked Vandamme and ensured that the remaining passes into Bohemia were not blocked, as they needed to hold the passes open for a further day to complete their withdrawal from Saxony.

Meanwhile, contact with General Friedrich von Kleist's Prussian corps had been lost. Kleist was attempting to fall back but found all the routes through the hills and woods of southern Saxony to be blocked, bar one—the very one that Vandamme had used. He had little choice but to take a great risk and move along behind the pursuing French.

Other than Kleist, Schwarzenberg had his entire army available for the second day of battle. The divisions under *Feldmarschalleutnants* Hieronymous Graf von Colloredo-Mansfeld and Vincenz Freiherr von Bianchi had arrived during the night and were rested. The position around Priesten was reinforced. Vandamme expected the Young Guard would arrive to support him. Other troops had

come up that night, and he started the day with 39,000 infantry, 3,000 cavalry, and 82 guns.

Of the 14,000 Russians that had faced Vandamme the previous day, 6,000 were dead or wounded, but now Schwarzenberg had 41,000 infantry, 10,000 cavalry, and 136 guns at his disposal. His plan was to pin down the French frontally, while Colloredo went around their left flank. News arrived that Kleist was moving on the rear of Vandamme's position, and the battle was to begin once he had reached Tellnitz. The fighting commenced at 7:00 A.M. on the Allied left. An hour later, the leading elements of Bianchi's and Colloredo's divisions arrived at the village of Karbitz, and the flanking maneuver began.

Colloredo moved through the village of Herbitz and deployed on the Striesowitz Heights, threatening the French left and rear. Supported by Bianchi, he commenced his attack about 9:30 A.M. Quiot's brigade was sent to meet Colloredo and for a while held him up. Meanwhile, General Philibert Duhesme withdrew his brigade to the Wappling Heights but was slowly pushed back farther toward Kulm. Schwarzenberg now wanted to press on.

At this point, Kleist appeared in Vandamme's rear, forcing him to detach troops to hold him up. Vandamme was still anticipating the arrival of the Young Guard. Kleist had commenced his march at 5:00 A.M., moving from Fürstenwalde through Rudoldsdorf and Nollendorf. Learning from French prisoners that Vandamme was engaging the Allies at Kulm, he accelerated the pace of his march.

Kleist's artillery opened fire on the French about 10:30 A.M. The Allies at first thought that Vandamme had received reinforcements, but when Kleist's point reached Tellnitz about midday, Vandamme realized that he was encircled. Taking men from his front line, he attacked the Prussians, hoping to brush them out of his way and break out of the trap. Vandamme was prepared to sacrifice his artillery if he could cut his way through the Prussians with his infantry. Along the entire front, the battle now reached its crescendo.

For a time it was touch and go for the Prussians, and their line came close to collapsing. However, they held on and by 2:00 P.M. it was clear that Vandamme's attempt to break out would not succeed. Disorganized groups of men fled into the hills, hoping to find a way out. Thousands were taken prisoner, and Vandamme's corps ceased to exist. He was taken prisoner along with his aide, General François, baron Haxo. In all, the French lost 15,000 to 17,000 men, nearly half as prisoners, 2 eagles, and 82 guns. The Russians lost around 6,000 men, and Kleist's corps was mauled. Victory came at a high price, but now the French were retreating on all fronts.

### **Kulnev, Jacob Petrovich (1763–1812)**

Russian general and cavalry commander. Born to a noble family from the Vitebsk *gubernia* (province), Kulnev studied in the Cadet Corps and was commissioned a lieutenant to the Chernigov Infantry Regiment in March 1785. Late that year he joined the St. Petersburg Dragoon Regiment and participated in the Russo-Turkish War from 1787 to 1792. Kulnev was assigned to the Perejaslavl Horse *Jäger* Regiment on 15 November 1789 and fought in Poland in 1792–1794, distinguishing himself in the actions at Oshmyani, Lida, Kobryn, Brest-Litovsk (promoted to *rotmistr*), and Praga (promoted to major). In 1797–1798 and from 1801 to 1806 he served in the Sumsk Hussar Regiment but did not participate in any military operations. He transferred to the Grodno Hussar Regiment as a lieutenant colonel in late 1806.

Kulnev participated in the 1807 campaign in Poland, fighting at Guttstädt, on the Passarge River, at Heilsberg, and at Friedland, and was promoted to colonel. In 1808 during the Russo-Swedish War, he served under Prince Peter Bagration in Finland and distinguished himself commanding the advance guard. He took part in the actions at Kalaioki, Pihaioki, Sikaioki, Lappo, Kuortane, Salmi, and Oravais. Kulnev became a major general in December 1808. The next year he led his troops to the Aland Islands and was among the first to reach continental Sweden across the frozen Gulf of Bothnia. He was appointed *chef* of the Byelorussia Hussar Regiment in April 1809.

After the war, Kulnev briefly remained in Finland as an assistant to General Nikolay Demidov, who garrisoned the Aland Islands. In 1810 Kulnev accompanied General Nikolay Kamenski to the Danubian Principalities and assumed command of the Russian advance guard during the Russo-Turkish War of 1806–1812. He fought at Ruse, Silistra, Shumla, and Batin. However, he had an argument with General Kamenski during the Battle of Batin and left the army. He became *chef* of the Grodno Hussar Regiment on 29 January 1811. During the 1812 campaign he commanded the advance guard of General Wittgenstein's corps and fought in rearguard actions at Wilkomir and Druya.

He defeated the French at Klyastitsy on 31 July but recklessly attacked French forces near the same location on 1 August; Kulnev was mortally wounded when a French artillery shot carried away both his legs. He was initially buried on the battlefield, but his remains were then transferred to Ilsenberg in the Vitebsk *gubernia* in 1831.

### **Kutaisov (Kutaysov), Alexander Ivanovich, Count (1784–1812)**

Russian general and artillery commander. He enlisted as a vice *vakhmistr* (a noncommissioned officer rank) in the Life Guard Horse Regiment in January 1793 and rose to *vakhmistr* that December. In January 1796 Kutaisov transferred as a sergeant to the Life Guard Preobrazhensk Regiment and on the same day was appointed as captain to the Veliki Lutsk Infantry Regiment. That November he became *ober-provianmeister* (a noncommissioned officer in charge of supply) in the headquarters of General Mikhail Kutuzov's corps on the Finnish border.

In 1798 the fourteen-year-old Kutaisov became general *lieutenant-proviantmeister* with a rank of lieutenant colonel. His actual service began at fifteen, when he was promoted to colonel and appointed to the Life Guard Artillery Battalion in February 1799. He studied artillery science extensively over the next five years and served as adjutant to artillery Inspector General Alexander Rimsky-Korsakov from October 1799 through May 1803. He was transferred to the 2nd Artillery Regiment on 5 July 1803.

Two years later he was dispatched with reinforcements to the main Russian army at Austerlitz but arrived after the battle had ended. Promoted to major general in 1806, Kutaisov served in General Fedor Buxhowden's corps and took part in the Battle of Golymin that December. Kutaisov distinguished himself at the Battle of Eylau, when, commanding the Russian artillery of the right flank, he diverted his batteries to the left flank and halted Marshal Louis Davout's advance.

From May to June 1807 Kutaisov commanded artillery at Lomitten, Heilsberg, and Friedland. He commanded the artillery of General Sergey Golitsyn's corps during the virtually bloodless campaign against Austria in 1809. However, he did not participate in any actions and took a prolonged furlough in 1810. Over the next two years he traveled in Europe, learned six languages (French, German, English, Italian, Turkish, and Arabic), and studied artillery and fortifications in France and Austria. Returning to Russia in the summer of 1811, he served on the Commission on Military Regulations, wrote a treatise on battlefield artillery operations, and contributed articles on the artillery to the *Uchrezhdenie dlia upravleniia bolshoi deistvuiushei armii* (Establishment for the Administration of the Large Active Army). He briefly served as commander of the entire Russian artillery in early 1812 and was appointed commander of the artillery in the 1st Western Army that March.

During the 1812 campaign Kutaisov commanded the rear guard during the initial retreat of the 1st Western Army and was wounded at Kakuviachina, near Vitebsk, in August. He commanded the artillery at Smolensk on 16 August, defending the Malakhov Gates and the Rachenka suburb, and he then took part in the actions at Lubino and Soloveyovo on 19–20 August. At Borodino Kutaisov again commanded the artillery, but he was killed while leading an infantry charge against the French around the Great Redoubt. His body was never recovered and is probably buried in a common grave at Borodino.

### **Kutuzov, Mikhail Golenischev-, Prince (1745–1813)**

Russian military commander whose leadership contributed substantially to the defeat of the Grande Armée during the campaign of 1812.

Mikhail Kutuzov (Mikhail Illarionovich Golenishev-Kutuzov) was born in St Petersburg, the son of a prominent military engineer who had made his career under Peter the Great. In 1757 Kutuzov began his military education, entering the elite Engineer-Artillery School. There he studied civil and military subjects, learned to speak French and German fluently, and later studied Polish, Swedish, and Turkish.

Kutuzov became a corporal in October 1759, a *kaptenarmus* (a noncommissioned officer in charge of ammunition) that November, and a conductor of the 1st class in 1760. He was left at the school as an instructor of arithmetic and geometry, and served as an assistant to officers teaching courses. In January 1761 Kutuzov became an ensign and the following year, upon his request, he was transferred to the Astrakhan Infantry Regiment commanded by the legendary general Alexander Suvorov. Later that year, he became a *flügel-adjutant* to the military governor of Revel and received promotion to captain in September 1762.

In 1764, again at his request, Kutuzov was sent to Poland, where he stayed for three years in Russian efforts to suppress the Polish mutiny. Late in 1769 Kutuzov petitioned for his transfer to the army of Count Peter Rumyantsev and in 1770–1774 he served in the Russo-Turkish War, fighting the Turks at Ryabaia Mogila, Larga, Kaluga (earning promotion to major), and Poneshta (earning promotion to lieutenant colonel). He served as acting senior quartermaster in the corps under Rumyantsev and Suvorov.

In 1774 Kutuzov was badly wounded and lost an eye in combat near the village of Shumy, in the Crimea. Sent abroad for proper medical treatment, Kutuzov visited Prussia, Austria, Britain, and Holland, studying the military tactics and strategy employed by the armies of those nations and learning about new forms of ammunition and military technology. In 1776 he returned to Russia and for six years served under Suvorov's command in different regions of the Crimea. In 1777 Kutuzov was promoted to colonel and made commander of the Lugansk *pikinernii* (lancer) Regiment, and the next year he commanded the Mariupol Light Horse (*legkokonnyi*) Regiment. In 1782 Kutuzov was promoted to brigadier general and in 1784 to major general.

From 1785 Kutuzov served as commander of the Bug *Jäger* Corps, which was organized on his own initiative. In the course of conducting numerous military exercises he practiced new tactics and wrote a manual of military instruction. During the Russo-Turkish War of 1787–1792 he protected the southwestern borders of the Russian Empire; organized the siege of Ochakov, where he was wounded for the second time; and fought at Akkerman, Kaushany (Kauschanan), Bender, and Ismail. For the successful storming of Ismail, Kutuzov was praised by Suvorov, pro-

Field Marshal Mikhail Kutuzov, who held senior command over Russian forces during the French invasion of 1812. His troops fought tenaciously at Borodino, where, having deployed his divisions, Kutuzov did little to influence the slaughter that ensued. (George Dawe [1781–1929]/Hermitage, St. Petersburg, Russia)

moted to lieutenant general, appointed the military commandant of that town, and made commander of the troops located between the Dniester and the Bug.

Kutuzov had by now established himself as one of the most prominent Russian military commanders. He also proved himself a talented diplomat. In 1792, after briefly serving in Poland, Kutuzov became Russian ambassador to the Ottoman Empire, where he successfully settled several territorial disputes and considerably improved relations between the two empires. Returning to Russia, he served as governor general of the Kazan and Vyatka provinces in 1794 before becoming director of the Land Nobility Military School, where he taught tactics, military history, and other subjects. In December 1797 Kutuzov served briefly on a diplomatic mission to Prussia and succeeded in laying the foundation for future military cooperation between Prussia and Russia in their war against France.

For his diplomatic success in Prussia, Kutuzov was promoted to general of infantry and appointed *chef*

(colonel-proprietor) of the Ryazan Musketeer Regiment and head of the Finland Inspectorate in January 1798. In October 1799 he took command of the expeditionary corps sent to Holland but learned of the end of hostilities upon arrival at Hamburg. Returning home, he served as the military governor of Lithuania (November 1799–July 1801) and became *chef* of the Pskov Musketeer Regiment (November 1799). In the summer of 1800 Kutuzov received command of the newly organized Army of Volhynia and participated in grand maneuvers at Gatchina.

He enjoyed close relations with Tsar Paul and dined with him the evening the tsar was assassinated. Tsar Alexander appointed Kutuzov as military governor of St. Petersburg in June 1801 but relieved him of this position in September 1802. He retired to his estate of Goroshki in Volhynia, where he remained for the next two years.

In 1805 Russia formed the Third Coalition with Austria, Britain, and Sweden. Alexander recalled Kutuzov to military duties and appointed him commander of one of two Russian armies active in the campaign. In September and October Kutuzov led his army to join the Austrians, but the latter were defeated by Napoleon at Ulm on 20 October. Facing a numerically superior French army, Kutuzov sought to preserve his forces at any price and conducted a celebrated retreat from Braunau to Olmütz, fighting the French near Lambach and Amstetten and defeating Marshal Adolphe Mortier near Dürnstein (Krems). After safely conducting his army to Olmütz, Kutuzov proposed to withdraw closer to the Russian frontiers and await reinforcements but was ignored by the tsar and his entourage, who forced Kutuzov to move his tired army to Austerlitz in Moravia. There, on 2 December, together with the Austrians, he was decisively defeated, largely blamed for the disaster, and relieved of command.

In September 1806 Kutuzov was appointed military governor of Kiev. In 1808 he was sent to advise Field Marshal Alexander Prozorovsky, commander in chief of the (Russian) Army of Moldavia, but disagreed with him over strategy. As a result, Kutuzov was recalled from active service and appointed military governor of Vilna in July 1809.

In 1811, as the Russo-Turkish War entered its fifth year, Alexander felt obliged to appoint Kutuzov as commander of the Army of Moldavia with the hope of a quick victory over the Turks. In July 1811 he crushed the Turkish army near Rushchuk (now Ruse) and Silistra, where he surrounded and captured some 40,000 enemy troops, so securing Russia's decisive victory over the Ottoman Empire. Despite French and British pressure, Kutuzov succeeded in concluding a treaty at Bucharest on relatively favorable terms for Russia on 28 May 1812. The treaty was important because it secured the southern borders of Russia on the eve of the war against France in June.

At the start of the Russian campaign Kutuzov was in St. Petersburg. While the two main Russian armies were led by generals Mikhail Barclay de Tolly and Prince Peter Bagration, Kutuzov was elected head of the St. Petersburg Militia and then the Moscow Militia. After the surrender of Smolensk to the French, however, Alexander was forced to concede to the pressure both of public opinion and of the military by appointing Kutuzov commander in chief of all Russian armies. Hailed by the populace along his route, Kutuzov joined his forces near Tsarevo-Znaimische on 29 August.

Kutuzov's strategy was to wear down the French by engaging them in incessant minor engagements while retreating and preserving his main army. However, under public pressure and against his better judgment, he decided to stand and fight near Moscow. On 7 September, near the village of Borodino, the main encounter of the campaign took place, when the Russian army of 155,000, including militia, faced Napoleon's army of some 133,000. Kutuzov thwarted all of Napoleon's efforts to inflict a decisive blow against the Russians. Despite enormous losses on both sides, the battle failed to produce a decisive result; the stalemate cost the Russians 44,000 men, while the French suffered at least 33,000 casualties.

Once aware of his immense losses, Kutuzov ordered a withdrawal and, after a council of war in the village of Fili, assumed responsibility for the decision to abandon Moscow to the enemy. By that time, in any event, the Russian army had begun to swell with the arrival of reserves, while in the French rear a partisan war was already under way. By moving his forces to the village of Tarutino, Kutuzov secured the route to Russia's southern provinces where Napoleon might have obtained supplies.

Realizing the gravity of his predicament, Napoleon dispatched his aide-de-camp General Jacques Alexander, comte Lauriston to Russian headquarters to propose peace negotiations. Kutuzov declined the offer, replying that the war had just begun. Napoleon left Moscow on 19 October and moved toward Maloyaroslavets, where Kutuzov had blocked his path. In a bloody battle he forced the French to withdraw along the Smolensk road that had already been wrecked by the armies in the summer.

Shifting to the offensive, the Russian army struck blows against the retreating French at Viazma, Liakhovo, and Krasnyi. Kutuzov did not pursue the French vigorously, however, preferring not to engage them in decisive battles but rather to allow severe weather and lack of supplies to destroy the enemy. Thus, Kutuzov's reluctance to come to grips with the French contributed to Napoleon's successful (though costly) escape across the Berezina River. In January 1813, in his orders of the day, Kutuzov congratulated his forces for expelling the enemy from Russia.

For his skillful leadership of the Russian army in 1812 Kutuzov was awarded the rank of field marshal and the title of Prince of Smolensk. Kutuzov opposed Alexander's decision to continue the war in Germany and wanted to return the Russian troops to their native soil. As the Russian army advanced through the Duchy of Warsaw, Alexander joined the troops and, as entitled by army regulations, assumed overall command. In any event, Kutuzov became seriously ill, his health rapidly deteriorated, and he died on 28 April 1813 at Bunzlau (now Boleslawiec). His body was brought to St. Petersburg and interred in the newly constructed Cathedral of Our Lady of Kazan.

For his active participation in the campaigns of 1805 and 1812, Kutuzov remains the best known of the Russian commanders of the Napoleonic Wars. In addition to his military talents, he proved himself an adept diplomat in his negotiations with the Turks, particularly when he brought hostilities to an end in 1812, thus freeing up Russian troops for service against the French. But while he demonstrated considerable skill at fighting the Turks, Kutuzov enjoyed less success against Napoleon. Keen to attract the favor of the tsar and garner the honors bestowed on those who distinguished themselves on campaign, Kutuzov exceeded even the status of a national hero: He became in the eyes of many a messiah embodying Russian virtue pitted against the scourge of chaos and revolution. Soviet historians, eager to exploit this image of Kutuzov for their own purposes, converted the field marshal into a commander of mythic proportions, when in reality Kutuzov must be seen as highly talented, but by no means the god of war as is portrayed by the more hagiographic texts of the Soviet era.

## La Rothière, Battle of (1 February 1814)

During the Allied invasion of France in 1814 the Prussian general Gebhard von Blücher launched an assault on Napoleon's position around this town on 1 February. He had a great superiority in numbers, and many of the French troops were raw conscripts. The heavy snow allowed Napoleon to fight a successful defensive action for most of the day. However, the arrival of General Karl Freiherr von Wrede and his Russo-Bavarian corps on Napoleon's left flank forced him to withdraw. In the action both sides lost around 6,000 men.

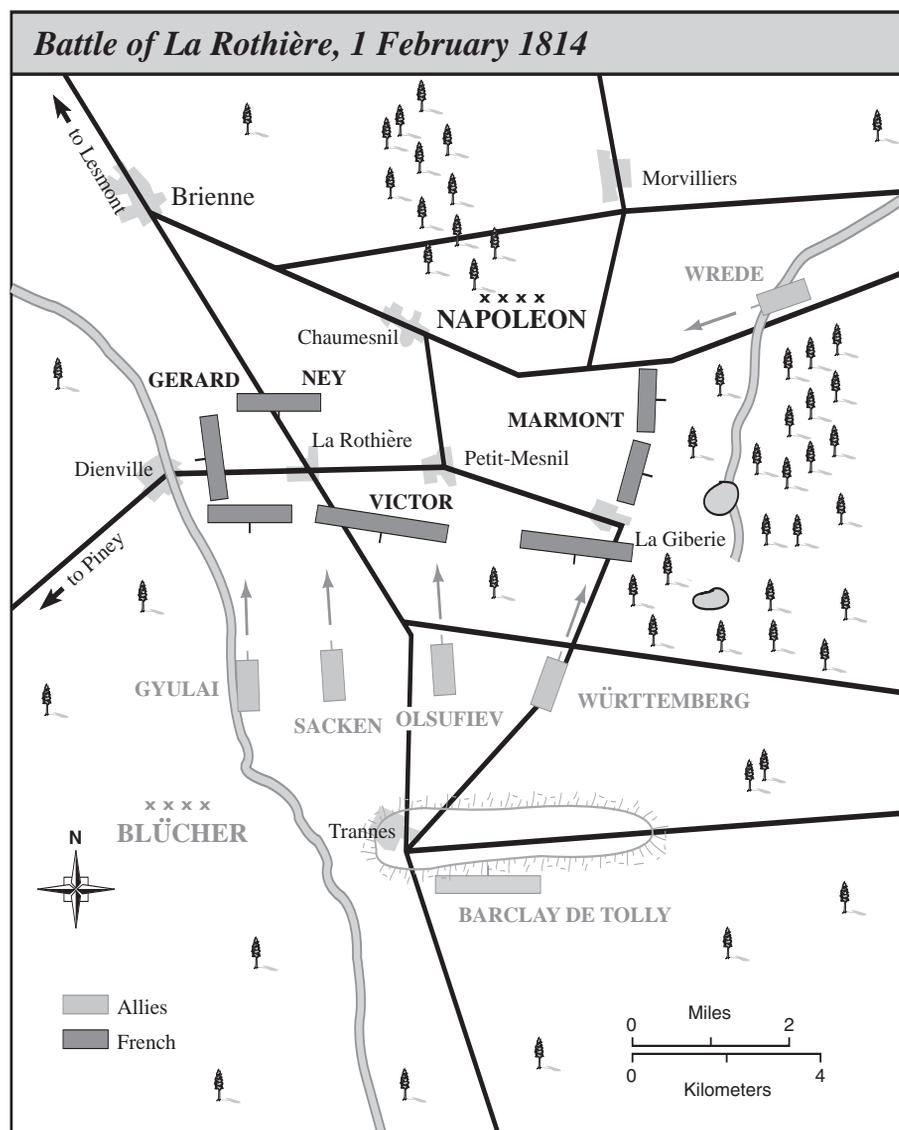

After the Battle of Brienne, Blücher had fallen back to positions north of Trannes, where he had good fields of fire to his front on high ground. During the next two days both sides rested their forces and Napoleon uncharacteristically remained inactive. *Feldmarschall* Karl Philipp Fürst zu Schwarzenberg, the Allied commander in chief, gave Blücher two corps, those of *Feldzeugmeister* Ignaz Gyulai Graf von Maros-Nemeth und Nadaska and Prince Eugen of Württemberg, to strengthen his forces. Meanwhile the Bavarians under Wrede were to operate on the right flank of the Allied force. Blücher planned his attack for the morning of 1 February. Schwarzenberg could have committed more forces to the attack, but political decisions made it inadvisable to allow the Prussian commander enough troops to destroy Napoleon's forces. Gyulai and Württemberg were ordered not to pursue beyond Brienne. The combined strength of the Allied forces was around 80,000, whereas Napoleon had only 45,000 men under his command. The weather was poor, with frigid temperatures and frequent snow squalls.

Blücher planned to attack the four villages of Dienville, La Rothière, Le Petit Mesnil, and La Giberie with the troops of generals Gyulai, Fabian Osten-Sacken, and Württemberg. Württemberg's troops advanced through the woods to their front and attacked La Giberie, which was held by troops under Marshal Auguste de Marmont. This assault pushed the French out of the village. However

the French rallied and counterattacked, retaking La Giberie. In the center, Marshal Claude Victor held La Rothière and was faced by the cavalry of Osten-Sacken and General Zakhar Dmititrievich Olsufiev's Russian troops. Osten-Sacken had problems in bringing up his artillery, owing to the condition of the ground, and the mud had also prevented Württemberg from making full use of his guns. General Etienne Nansouty, commanding the French cavalry in the center, took advantage of this to launch a charge meant to catch Osten-Sacken in the act of fully deploying his artillery. However the cavalry were driven off by some of the guns firing canister.

By now Osten-Sacken had fully deployed his troops, and his guns began to bombard La Rothière. Within a short time the town was ablaze, and he ordered his troops to begin an assault. The French were almost evicted from the village, but were reinforced and assailed once again by Russian troops. In the fighting that followed Osten-Sacken was nearly captured. On either side of La Rothière a cavalry battle raged between the French cavalry under General Emmanuel de Grouchy and Nansouty and Osten-Sacken's dragoons and hussars. In the melee that followed, some of Osten-Sacken's forces managed to overrun four batteries of horse artillery of the Imperial Guard. However, the French still held La Rothière by the end of the battle.

On the right flank of the French position General Maurice Etienne, comte Gérard held Dienville. Gyulai's Austrian troops were given the task of attacking this village. Gyulai wished to capture the bridge here, but Gérard had time to barricade it. Despite the fact that many of his troops were conscripts, he was able to hold his position. By around 4:00 P.M. Wrede with his Bavarian troops were in a position to attack the left flank of Napoleon's army. Marmont was able to turn his forces to face this threat, but could not prevent the Bavarians from taking the woods of Ajou to their front. There was some confusion in this action as some of Württemberg's cavalry mistook Bavarian cavalry for the enemy and charged them. Württemberg quickly became aware of Wrede's advance and requested

Adapted from Fremont-Barnes 2002B, 55.

his assistance in taking the village of Chaumesnil. To do this Wrede would have to turn his forces to the south, and this would prevent them from falling on the rear of the French. Such a move could have crushed the enemy.

Wrede chose to move against Chaumesnil. Napoleon appreciated the importance of holding this village for the safety of his entire force and ordered Marmont to retake it with a division of the Young Guard. Despite the ferocious attack of the French, the Bavarians held on to parts of the village, helped by the poor visibility caused by darkness and the snow. Würtemberg had by now completed the capture of La Giberie and Le Petit Mesnil, but his forces were too exhausted to advance further. At La Rothière, Blücher had been reinforced by a force of Russian grenadiers commanded by General Mikhail Barclay de Tolly. Blücher organized one more assault on the town.

The French had also been reinforced, Marshal Nicolas Oudinot having been ordered by Napoleon to defend the village with further troops drawn from the Young Guard. The clash between these enemy formations was bloody, but eventually the Russians forced the French out. Once more, however, the Allied pursuit was halted, this time by Napoleon deploying a number of guns of the Imperial Guard under the command of General Antoine, comte Drouot.

By the early evening Napoleon had managed to resist all attacks, but he had lost around 6,000 men and a large amount of artillery. Allied forces had lost a similar number. Napoleon, however, knew that if he remained in his position he would be surrounded the next day and crushed. By 9:00 P.M. he had dictated orders for a withdrawal to the north covered by Marmont.

### Lafayette, Marie Joseph Paul Yves Roch Gilbert du Motier, marquis de (1757–1834)

Liberal French soldier and noble statesman, distinguished in the American Revolution as an aide to General George Washington and in the French Revolutionary Wars fighting to defend France from invasion. He was born on 6 September 1757 in Château Chavagnac, Auvergne, to Michel Roche Gilbert du Motier, marquis de Lafayette, and Marie Louise, daughter of Joseph Yves Hyacinthe, marquis de la Rivière. His father was killed at the Battle of Minden in 1759 during the Seven Years' War (1756–1763), and young Lafayette was taken to Paris for his education in 1768 at the College of Louis Le Grand and the Military Academy at Versailles. Upon his mother's death he inherited a fortune in 1770.

He served at court as a page to Queen Marie Leczinska (wife of Louis XV) and received a commission as a lieutenant in the royal musketeers who defended the king. In 1774 he married Anastasie Adrienne de Noailles. After the American colonies declared their independence in 1776, Lafayette determined to aid the cause of liberty and strike a blow against the British, whom he held responsible for the death of his father. Silas Deane, the American minister in Paris, gave him a letter of introduction to Congress, at the time situated at Philadelphia, and he received a major general's commission in the Continental Army in July 1777, attached to George Washington's staff. Lafayette distinguished himself throughout the American Revolutionary War (1775–1783).

Lafayette served in the Assembly of Notables in 1787, discussing reform measures with King Louis XVI, and in 1789 he represented the nobility from Auvergne in demanding a meeting of the Estates-General. When the French Revolution began, he served in the National Assembly, advocating a constitutional monarchy and supporting the Constitution of 1791. He was appointed commander of the National Guard on 15 July 1789—the day after the storming of the Bastille—serving until 18 September 1791. He was charged with protecting the king and Queen Marie Antoinette. Lafayette advocated the end of feudalism and its privileges, religious toleration, penal code reform, and freedom of the press, but his moderate views made him suspect as the Jacobins rose to power in 1793. He had been rapidly promoted, serving as a lieutenant general from 30 June 1791, and after 6 December 1791 he commanded one of three armies guarding the French frontiers.

Following the declaration of war against Austria on 20 April 1792 he was given command of 52,000 troops to defend France between Philippeville and Lauterburg. A coalition had been formed to invade France, restore the king, and end the Revolution, and Lafayette strove to defend his homeland. While encamped at Maubeuge on 16 June 1792 he wrote a letter to the National Assembly denouncing radical Jacobin policies. He came to Paris on 28 June to defend his views. Finding Paris enflamed and radicalized, Lafayette planned to evacuate the royal family from Paris, but the king was charged with conspiring with the enemies of France and imprisoned in August. Lafayette broke with the Assembly, refusing to follow their directives. The Assembly countered by removing Lafayette from command. He then fled to Belgium, was captured by the Austrians, and was turned over to the Prussians, who imprisoned him at Wesel, then at Magdeburg. He was offered his freedom in exchange for his collaboration, but he refused and was placed in prison at Ohnutz, in Austria. In Britain, Charles James Fox, William Wilberforce, and Richard Sheridan worked for his release. In 1795 Lafayette's wife and two daughters, Anastasie and Virginie, joined him in captivity. In September 1797 he was released as a result of Bonaparte's victories and the terms of the Treaty of Campo Formio. Following a brief stay in Holstein and Holland, Lafayette returned to France in March 1800, following the collapse of the Directory, and retired to his castle of La Grange in Brie.

During the Consulate and the Empire, Lafayette refused to become involved in French politics, declining Napoleon's offers of the Cross of the Legion of Honor—which he believed too elitist—a senatorship, and an appointment as ambassador to the United States. He was too much of a constitutionalist to have worked with either the Jacobins or the Bonapartists. So well respected was he in America that President Jefferson offered him the post of

governor of Louisiana in 1805, but Lafayette desired to remain in France. Following Napoleon's escape from Elba and the Waterloo campaign, Joseph Bonaparte sought Lafayette's support, but this was refused.

Following Waterloo, Lafayette worked for Napoleon's abdication, returned to public service as a representative from Seine-et-Marne, attempted but failed to provide Napoleon with an escape to the United States, and from 1818 to 1824 served in the Chamber of Deputies. Visiting the United States in 1824–1825 for fourteen months with his son (named after George Washington) as a guest of President James Monroe, he was received everywhere as a hero who had aided the American Revolution. In honoring him at the White House on his sixty-eighth birthday in 1825, Congress granted him \$200,000 plus 24,000 acres of public lands. Upon his return to France he was elected again to the Chamber of Deputies in 1827–1834. During the revolution in France in 1830 against the Bourbons he supported Louis-Philippe's bid for the throne, believing Louis-Philippe would introduce true constitutional government. Upon Lafayette's death, 20 May 1834, this nobleman of liberal politics was buried in Picpus Cemetery with earth from Bunker Hill sprinkled over his grave.

### La-Fère-Champenoise, Battle of (25 March 1814)

The Battle of La-Fère-Champenoise was fought during the campaign in France in 1814 between the bulk of the Allied forces and the isolated French marshals Auguste de Marmont and Adolphe Mortier. Mortier and Marmont were both trying to meet up with Napoleon in Vitry; on the evening of 24 March, Marmont was at Soudé-St. Croix, and Mortier was marching toward him from Vertus. Other French detachments were scattered at Vertus and Sézanne, and the whole of them were boxed in by Allied corps. The

Allied leaders had ignored Napoleon's attempt to draw them east in the Battle of St. Dizier, and, through the knowledge gained from intercepted imperial messages to Paris, sought instead to gain the capital before Napoleon could return there. Tsar Alexander in particular successfully urged sending the troops to Paris rather than chasing down Napoleon in the east.

The first engagement in the battle occurred in the morning, between Allied cavalry forces and Marmont's troops. Throughout the day, the Allies were able to reinforce their cavalry against the combined might of Marmont and Mortier, whose own cavalry was in disarray. The French forces were saved, albeit temporarily, when the Allied commander, Eugen, Prince of Württemberg, decided to await the arrival of his infantry before continuing the attack. In the meantime, the detached French forces under the command of generals Michel-Marie Pacthod and François Amey were attacked on all sides from several elements of the Allied forces, particularly from cavalry and Russian artillery. By the end of the day, the French forces under Marmont, Mortier, Pacthod, and Amey lost about 10,000 men and 60 guns, while the Allies lost a fifth of that number. Marmont and Mortier were pushed back toward Paris against the weight of Allied forces, which at this point numbered around 180,000 men.

### Laffrey, Incident at (7 March 1815)

The encounter at Laffrey, on 7 March 1815, took place on a field 15 miles south of Grenoble. It was Napoleon's first meeting with royalist troops after his escape from Elba. The battalion of infantry sent to bar Napoleon's way defected and opened the road to Grenoble, which rallied to the former emperor. This was the beginning of his triumphal march to Paris.

Before Napoleon's arrival, the prefect, Joseph Fourier, and the commandant of Grenoble, General Jean-Gabriel Marchand, both decided to remain loyal to the king. Even so, there was little they could do to prevent Napoleon's

progress. Signs of defection had already appeared among the garrison at Grenoble. By way of defense, Marchand sent a company of engineers to blow up the mountain bridge at Ponthaut. Shortly afterward, he dispatched a battalion of infantry, commanded by Colonel Delessart, to support the demolition. Napoleon's troops had already secured the bridge, however, and the engineers tore the white cockades from their shakos to join the invaders. Delessart, finding the bridge in enemy hands, withdrew toward Grenoble and bivouacked for the night.

The following day Napoleon's 1,000 troops moved north and found Delessart and his men protecting the road to Grenoble. The result was the famous encounter at Laffrey. The battalion of the 5th Regiment of the Line formed ranks, blocking passage to Grenoble. Napoleon's grenadiers, their muskets pointing to the ground, marched to within 50 yards. For several hours they faced each other, neither wanting to make the first move, which would lead to bloodshed. Knowing that the first military engagement would spark civil war, Napoleon gambled. He walked out from behind his grenadiers to within pistol range of the royal troops. He threw open his coat and said, "Soldiers of the 5th, you can shoot your Emperor if you dare! Do you not recognize me as your Emperor? Am I not your old general?" (Chandler 1966, 1011). His old soldiers could bear it no longer, threw down their weapons, and ran to his side.

In the city, preparations were being made to repel the invaders, but, now that a battalion of their comrades were among the enemy, it was unlikely that the garrison would fire on them. Before their arrival another regiment defected. To the beat of drums, Colonel Charles de Labédoyère formed his 7th Regiment of the Line and charged out the Bonne Gate, the point of Napoleon's anticipated arrival. It was this regiment that Fourier and Marchand had believed would steady the other troops. By nightfall, soldiers on the ramparts were dropping over the wall to join the Emperor. Upon Napoleon's arrival, a crowd of peasants, some said as many as 2,000, arrived carrying torches, pitchforks, and old muskets. They escorted the troops to the city gate and acclaimed Napoleon with shouts of "*Vive l'Empereur!*" Not a shot was fired; the gates remaining closed only because Marchand had taken the key. Local workmen inside and military engineers outside soon broke the gate down, and Napoleon was carried into town on the shoulders of the inhabitants.

### Lamarck, Jean-Baptiste Pierre Antoine de Monet, chevalier de (1744–1829)

Jean-Baptiste Lamarck was a naturalist and an early champion of the idea that biological species change over time. A younger son of a noble family from southern France, Lamarck joined the French Army in 1760 and retired from it in 1768. He went to Paris where he published a three-volume guide to the plants of France, *French Flora* (1779). Lamarck's great energy and ability won him admission to the Royal Academy of Sciences. He continued to progress through the academy, reaching the highest level of pensionary in 1790, but had to defend his position amid the storm of the French Revolution.

Despite suspicion aroused by his noble ancestry, Lamarck managed the transition from monarchy to republic smoothly, being appointed Professor of Insects and Worms at the inaugural opening of the Museum of Natural History in 1794. The year 1801 saw the fruit of Lamarck's work connected with his professorship, the *System of Invertebrate Animals*. Lamarck strongly believed in the mutability of species, setting him against Georges Cuvier, who believed with equal firmness that species were "fixed," unchanging over time. Cuvier also argued that species frequently went extinct, while Lamarck denied the possibility.

Lamarck's vision of species change (he did not use the word *evolution*) was not random but progressive. Nature drove the creation of a continuous series of ever-more-complex living forms. Lamarck did not regard nature as an autonomous force, nor was he a vitalist who ascribed this drive to complexity to a "life force" not explainable in mechanical terms. Instead he saw the drive to complexity as a function of the circulation of the "subtle fluids," electricity and caloric, the fluid of heat, which combined with the material structure to form living things.

Lamarck is often identified with the idea of inheritance of acquired characteristics, a concept overthrown by modern genetics. This idea was not original to Lamarck, however, and although important was not central to his thought. The concept Lamarck used to explain change was

habit rather than conscious intention. Habit forms channels for the more easy circulation of the subtle fluids along certain paths. The giraffe developed a long neck over generations as the result of the habit of straining to reach the higher branches of trees to eat the leaves. Conversely, lack of use, as in the case of the eyes of the mole, causes the subtle fluids to stop circulating, and eventually the decay of an organ or faculty. Lamarck's theory, for which he provided little evidence, attracted few followers and many opponents. Some opposed the theory's materialism and its denial of the need for a divine designer and creator. Cuvier simply refused to take Lamarck's theory seriously. Despite Cuvier's ridicule, Lamarck's ideas were not forgotten, and they contributed to pre-Darwinian evolutionary theory.

### Landrecies, Battle of (26 April 1794)

The Battle of Landrecies was the opening encounter in General Jean-Charles Pichegru's spring 1794 campaign against the Allied forces in Flanders. Pichegru hoped to relieve the garrison of Landrecies, which had recently come under siege. The battle was badly fought by the French. The Allies also captured Pichegru's plans for the campaign, permitting them to reinforce the sectors that were to be attacked by Pichegru's Armée du Nord (Army of the North), the principal French army in the field against the forces of the First Coalition.

Pichegru had proven his ability in fighting on the Rhine and hoped to repeat his successes against Allied forces in Flanders. He faced an army composed of contingents from various countries. Britain had supplied a number of cavalry and infantry units and had paid for additional units from several small German states. Austrian units comprised the bulk of the army facing Pichegru, under Friedrich Graf Saxe-Coburg-Saalfeld (generally known as Saxe-Coburg). The Allies had thus far enjoyed success against the French, pushing them back toward the French border until the offensive halted on 20 April. Pichegru responded by ordering the divisions of his right wing to relieve Landrecies. The number of French troops under arms had increased greatly, but many were poorly armed and all lacked training in drill and formations. The

divisions were placed under the immediate command of General Antoine François Ferrand. Ferrand began his approach march on 24 April. On the twenty-sixth, he opened the battle.

Pichegru's plan for Landrecies was simple. The major attack was to be carried out by the division under General René-Bernard Chapuis, composed of 25,000 men. These were to make a frontal attack on the Allied lines. Poor maneuvering delayed Chapuis, giving the Allies time to prepare, and in the interim Anglo-German units under the Duke of York counterattacked. Allied cavalry was especially effective against Chapuis's poorly trained troops, who were unable to form squares, the traditional defense against mounted attack. Chapuis's left wing was routed, and the survivors fled back to Cambrai. Chapuis himself was captured, along with a complete set of Pichegru's plans for the campaign.

While Chapuis came to grief, a flanking column of about 10,000 men under General Jacques Ferrand swung round the Allied left to attack Landrecies from the east. They failed to coordinate their attack with Chapuis's column, allowing the Allies to shift reserves to meet each attack in turn. Ferrand's attack was met by stubborn resistance from Austrian troops under Archduke Charles, leaving the French commander to withdraw to his original position. Landrecies surrendered on 30 April.

French losses at Landrecies totaled around 7,000 men and 40 cannon. Allied losses were approximately 2,000.

### Landshut, Battle of (21 April 1809)

The main battle of Landshut took place when a French force under Marshal Jean Lannes was following up the withdrawal of part of the Austrian army under the command of *Feldmarschalleutnant* Johann Freiherr von Hiller. Hiller decided to defend the town of Landshut, but was outflanked by Marshal André Masséna. A determined assault on Landshut forced Hiller to withdraw.

There were in fact two engagements at Landshut. The first occurred on 16 April when Hiller pushed a defending

Bavarian division out of the town. Five days later, after the French victory at Abensberg, the left wing of the Austrian army withdrew on Landshut (this force was once more led by Hiller). Napoleon believed that this was the main Austrian army and ordered Lannes to pursue the enemy. Lannes's troops caught up with Hiller on the twenty-first. Hiller had decided to defend Landshut to allow his baggage train to withdraw. At Landshut the Isar River was spanned by two bridges with a small island in the center. Hiller had positioned cavalry outposts to the north of the town. His main force was deployed in Landshut and to the south on higher ground. Early in the morning Hiller was informed that a French force had crossed the Isar upstream at Moosberg. Masséna led this force.

Hiller realized that he would be unable to hold his position for long. At this point his cavalry were forced back by Lannes's troops and the Austrians were pushed back into Landshut. The French now quickly seized the northern bridge over the river, and the Austrians withdrew into the main part of the town to defend the southern bridge. The Austrians tried to set fire to this second bridge, but owing to the rainfall over the previous days, this was only partially successful. However the Austrians did manage to close the gates at the end of the bridge. The French were now faced with attacking across the smoldering bridge. Napoleon ordered his aide General Georges Mouton (later comte de Lobau) to assume command of the attacking grenadiers of the 17th Line. In the face of heavy Austrian fire from all sides, Mouton ordered his men to attack without firing their muskets. The grenadiers reached the gateway and broke it down, allowing Bavarian troops to quickly reinforce the breach.

The fighting now continued in the streets of Landshut itself. However the French had crossed a bridge immediately to the west of the town and were now entering Landshut from the south. Many of the defenders were captured, but Hiller was able to retreat with the bulk of his force toward Neumarkt. Landshut finally fell to the French just after noon. The Austrian force had suffered around 9,000 casualties, but more importantly they had lost a large number of caissons, a pontoon train, and thousands of supply wagons. The victorious French forces spent much of the afternoon ransacking these supplies.

### **Langeron, Louis Alexander Andrault (1763–1831)**

Russian general and corps commander. He was born Louis Alexander Andrault, chevalier comte de Langéron (to mention but one of many other aristocratic titles) and enlisted at the age of fifteen as a *sous-lieutenant* in the French Guards (*Gardes Français*). He later served at Caracas and St. Domingue in 1782–1783. In 1786 he was promoted to assistant colonel of the regiment of Médoc and then colonel of the Armagnac Regiment in 1788. He accompanied the Prince of Nassau to Russia in 1789 and the next year entered Russian service as a colonel in the Siberia Grenadier Regiment. Langeron distinguished himself in the campaigns against the Swedes, especially at Bjork, and commanded the Russian left wing in the battle at Rochensalmi. In 1790–1791, he fought the Turks at Ismail, where he was wounded, and at Macin.

With Catherine II's permission, Langeron served in the army of *Feldmarschall* Friedrich Graf Saxe-Coburg-Saalfeld (generally known as Saxe-Coburg) against the French in the Austrian Netherlands (now Belgium and Luxembourg), and, on his return to Russia, he was sent as a military observer to the Austrian army in northern France and Flanders in 1793–1794. In August 1795 he transferred to the Malorossiisk (Little Russia) Grenadier Regiment and rose to brigadier in July 1796. He became a major general and *chef* of the Ufa (Ufimsky) Musketeer Regiment in June 1797. Under Tsar Paul, Langeron was conferred the title of Count of the Russian Empire. He was given the rank of lieutenant general in November 1798 and appointed *chef* of the Riga (Ryazhsky) Musketeer Regiment in May 1799. Langeron became the head of the Brest Inspection in August 1800.

Langeron took part in the campaign of 1805 against Napoleon and commanded Russian troops on the Allied left flank at Austerlitz. He was one of the two generals disgraced after the War of the Third Coalition and was sent to Odessa. In 1806–1811, he served in the (Russian) Army of Moldavia against the Ottomans in the Russo-Turkish War. He fought at Giurgiu, Silistra, Frasin, Derekoy, and Ruse. Langeron took command of the 22nd Division in August 1810 and temporarily commanded the Army of Moldavia after General Nikolay Kamenski's death. He participated in the decisive battle at Ruse in 1811 for which he was promoted to general of infantry in September 1811. In 1812 Langeron commanded the 1st Corps of the Army of the Danube and took part in the actions at Brest-Litovsk and on the Berezina.

During the campaign in Germany in 1813, Langeron was in charge of the blockade of Thorn and later commanded a corps, with which he participated in various engagements, major and minor, including Königswarte, Bautzen, Zibeneichen, Lowenberg, Holdberg, the Katzbach, Hartau, Bischofsward, and Leipzig. In 1814 he led his corps at Soissons, Craonne, Laon, Rheims, La-Fère-Champenoise, and Montmartre. In late 1814 Langeron commanded the 4th and 6th Corps in Volhynia and marched toward the French frontier during the Hundred Days. He had reached the Rhine when Napoleon was defeated at Waterloo and therefore turned back for Russia.

After the war, Langeron was appointed military governor of Kherson and Odessa; commander in chief of the Bug and Black Sea Cossack Hosts; and governor of the Ekaterinoslavl, Kherson, and Tavrida *gubernias* (provinces) on 28 November 1815. He fought in numerous actions during the Russo-Turkish War of 1828–1829. He died as a result of the cholera epidemic that struck in St. Petersburg in 1831.

### Lannes, Jean (1769–1809)

The son of a poor family from southwestern France, Lannes had a brilliant military career as a general serving under Napoleon. Short, profane, and ill mannered, the aggressive young officer was in his element on the battlefield. Lannes first distinguished himself as a daring field commander during Napoleon’s Italian campaigns of 1796–1797, then in fighting in Egypt and Syria. From his early years with Napoleon, Lannes made his units the spearhead in the aggressive offensives that characterized the operations of the French army, but he also developed into a skilled practitioner of siege warfare and, at Friedland in

1807, he fought a brilliant defensive battle against overwhelming odds. Napoleon developed a deep personal affection for this valuable subordinate. As a corps commander, Lannes saw action at Austerlitz (1805) and distinguished himself at Jena (1806) as well as at Friedland. Placing himself in the thick of combat in the 1809 campaign against Austria, he personally led the assault on Ratisbon (now Regensburg), only to be killed in action at Aspern-Essling shortly thereafter.

Jean Lannes was born in Lectoure, a small town in Gascony, on 10 April 1769. He came from a modest background, some authorities indicating that his father was a peasant farmer, others suggesting that he had managed to become a poor merchant. In any case, prospects were limited for Jean, the fifth of eight children, and he received only a cursory education. Tutored briefly by an older brother, he soon began his working life as an apprentice to a local dyer. Possibly he served briefly in the pre-1789 army. As France mobilized her young men for war in the spring of 1792, Lannes joined a local battalion of volunteers. Although he lacked formal qualifications, his comrades elected him a lieutenant, and, starting in the spring of 1793 Lannes served in the Army of the Pyrenees against Spain. By December of that year, and only twenty-four years old, he had risen to the rank of colonel.

Following the close of the war against Spain in the spring of 1795, Lannes received orders to join the (French) Army of Italy. He took command of a brigade in November 1795 and the following spring participated in Bonaparte’s campaign against the Austrian and Sardinian forces in the mountains above the Italian Riviera. Napoleon soon came to rely on the aggressive young Gascon to lead rapid and daring offensives such as the march along the southern bank of the river Po to Piacenza. At Piacenza, Lannes was the first French soldier to reach the enemy side of the river. In May 1796, Bonaparte promoted the young man from Gascony to the rank of *général de brigade*. Lannes’s reputation as one of Bonaparte’s reliable commanders grew steadily. He was wounded four times, twice at the Battle of Arcola—he would in fact be wounded ten times during the course of his entire military career—and he took on such dirty but essential tasks as repressing Italian partisans in the rear of the French army as well as putting down French royalist factions back in Marseilles.

A close personal friendship between Bonaparte and Lannes developed in the midst of these military events. Lannes had the notable and rare privilege of addressing Bonaparte using the French familiar form of *tu* rather than the more formal *vous* other senior officers had to use. Bonaparte included Lannes in the expedition to Egypt in 1798, and Lannes was among the small group who accom-

Marshal Lannes commanded a corps in the campaigns of 1805–1807. While serving in Spain in 1809 he captured Saragossa after a horrendous siege. He died later the same year from wounds received during the campaign against Austria. (Drawing by Jean Baptiste Guerin from *Life of Napoleon Bonaparte* by William M. Sloane. New York: Century, 1906, vol. 3)

panied the French commander when he returned to France in August 1799.

The characteristics of Lannes's career evident in Italy were underlined by his service in the Egyptian campaign: displaying daring (even reckless) leadership on the battlefield, suffering but ignoring a new collection of combat wounds, and mounting a pitiless response to revolts by the civilian population. After leading a brigade in the initial advance on Cairo, Lannes brutally suppressed a revolt by the population of the Egyptian capital. His forces led the way during Bonaparte's advance into Syria in February 1799, and Lannes suffered multiple wounds in assaulting the enemy stronghold at Acre. A bullet that passed through his cheeks and teeth left Lannes with a lisp in his speech and a wound in his neck, which forced him to tilt his neck for the remainder of his life.

Lannes supported Bonaparte's coup against the Directory in late 1799. When Bonaparte ousted the existing government and positioned himself to establish a one-man dictatorship, Lannes commanded the crucial troops stationed in Paris. After participating in this dramatic politi-

cal event, Lannes underwent a drastic change in his personal life, suing his wife for divorce on the grounds of adultery. Wed in 1795, the couple had experienced troubles from the start. Lannes had married a young woman from a family with which he boarded during the campaign in the Pyrenees. Her flirtations with his fellow officers soon followed, and when he was transferred to Italy, she in turn accused him of breaking their marriage vows with illicit liaisons. The final blow to the marriage came during the Egyptian campaign when Madame Lannes gave birth to a child more than a year after her husband's departure for the eastern Mediterranean.

During the 1800 campaign against Austrian forces in Italy, Lannes played his customary role at the leading edge of Bonaparte's offensive. He commanded the advance guard that marched over the Great Saint Bernard Pass into northern Italy, secured the key mountain route for the French army, then struck boldly at the Austrians at Montebello. Montebello was the first time Lannes had exercised an independent command, and his victory there was incorporated into the honors that Bonaparte, as the Emperor Napoleon I, would grant him in 1804, making him duc de Montebello. At Marengo, Lannes joined in the final offensive led by General Louis Desaix that turned the tide of the battle late in the day from an Austrian victory into a French triumph.

In the early years of the new century, Lannes saw his career take a new turn as he filled the post of French minister to Portugal. His relations with Bonaparte had taken an ugly turn when Lannes, appointed head of the Consular Guard (the forerunner of the Imperial Guard), quarreled with Bonaparte over the funds Lannes had allegedly squandered in outfitting this elite unit. The rough soldier had little experience with dishonest military contractors, and Bonaparte insisted that Lannes reimburse the government for the exorbitant costs paid for the unit's uniforms. Financial help from General Pierre Augereau, an old comrade in arms in the Italian campaign, helped Lannes out of his difficulty. The entire sordid episode combined with Lannes's rough personal manner to make him unwelcome as the French dictator set up court in Paris and moved toward establishing himself as emperor. Nonetheless, Lannes's rough edge served France well during his years in Portugal. He forced the Portuguese to remove government officials hostile to France and bullied the small country into signing a treaty of neutrality with Napoleon.

On 19 May 1804 Napoleon made Lannes one of the first group of generals raised to the rank of marshal. Lannes took command of a corps at Boulogne in March 1805, in anticipation of a Channel crossing and a French invasion of the British Isles. As usual, Lannes was to command the vanguard of the army. When Napoleon, in the

fall of the year, decided to abandon this effort and to strike eastward against the Austrians and Russians, Lannes's V Corps of the Grande Armée led the advance. The campaign brought him both glowing success and frustration. In a brilliant ruse, Lannes and Marshal Joachim Murat persuaded the Austrian troops guarding the key Tabor bridge at Vienna that hostilities had ended. Instead of destroying the mined structure and thereby delaying the French advance, the confused enemy forces allowed Lannes's men to take the bridge intact.

At Austerlitz on 2 December, Lannes held the northern sector of the French position against Russian assaults. To his discomfort, other leaders such as Marshal Nicolas Soult, who led the climactic French assault on the enemy lines further to the south, received credit for the army's triumph. Angered at the small role credited to him in official reports of the battle, Lannes abruptly left the army in disgust and returned to France.

The following year, the Jena campaign against Prussia gave Lannes an opportunity to shine. He took on his customary role as leader of the French advance. His V Corps, along with Augereau's VII, were assigned the task of driving northward from Schweinfurt toward Coburg to engage the Prussians. Lannes's units outpaced the slower Augereau, defeating the Prussians at Saalfeld before leading the successful attack at Jena. Although his infantry was hard-pressed to keep up with Murat's cavalry, Lannes nonetheless hustled his forces northward all the way to Stettin on the Baltic to pursue and destroy remnants of the defeated Prussians.

In the winter of 1806–1807 Lannes led his corps into Poland. The barren country left Lannes's forces without adequate food supplies, and the general himself fell ill, most likely having contracted typhus. His physical condition worsened when he was wounded fighting against Russian forces at Pultusk, north of Warsaw, and Lannes took no part in the Battle of Eylau.

When the campaign resumed in the spring, Lannes received command of a newly formed Reserve Corps. He led this force with particular distinction at the Battle of Friedland on 14 June 1807. The possibility of a Russian retreat from northwestern Poland impelled Napoleon to send Lannes to block the enemy at the river Alle. With only 16,000 men on the west bank of the river, Lannes tempted the enemy commander, General Levin Bennigsen, to halt his retreat in order to throw his force of 60,000 Russians across the Alle in attacks that continued for eleven hours. The French leader proved himself a master of defensive warfare, using the rugged terrain and timely redeployments to hold his thin line until Napoleon and sizable French reinforcements arrived by early afternoon.

In the aftermath of the French victory, Lannes received lavish rewards, including a Polish principality. Al-

though he never returned to Poland and chose not to take the title of prince, Lannes benefited from the territory's yearly revenue of more than 2 million francs. Such wealth permitted the former Gascon dyer's apprentice to maintain a lavish country estate along with an elegant town house. In May 1808 Napoleon named Lannes the duc de Montebello, the title based on his victory in Italy eight years earlier. A reward of a different kind came in the fall of that year when Lannes received the high honor of escorting Tsar Alexander I of Russia to the diplomatic gathering at Erfurt.

Like the majority of Napoleon's subordinates, Lannes took part in France's effort to conquer the Iberian Peninsula. The young Gascon general warned Napoleon about the dangers of involvement in Spain, but the Emperor refused his advice and ordered Lannes to accompany him for the campaign in northeastern Spain in the fall of 1808.

Lannes was severely injured in a riding accident while crossing the Pyrenees. Although still in pain, he participated in the series of sweeping offensives in late 1808 under Napoleon's direct control. The Emperor hoped to crush Spanish resistance by personally directing operations. Fighting in the northeastern sector, Lannes won a victory over a Spanish force at Tudela in November. But Spanish resistance did not collapse, and in January 1809 Lannes received the grim task of capturing the city of Saragossa. The population in this key center of Spanish resistance numbered 50,000. Alongside troops in uniform, combatants included a large number of armed and determined civilians, especially monks and nuns from Saragossa's numerous religious bodies. The city's defenders had already frustrated the efforts of another French force the previous summer.

After firing two of the generals who had failed to produce speedy results in a second assault on Saragossa, Napoleon gave the task to Lannes, providing him with two army corps. Lannes took the job reluctantly, well aware that his talents were best suited to maneuvering on the battlefield and preferably on the offensive. He quickly found that the Spanish defenses were too strong to succumb to ordinary assault; Lannes therefore took the city through a slow, bloody process of street-by-street, even house-by-house, fighting. Despite Napoleon's constant calls for speed, it required fifty-two days of combat as Lannes's engineers destroyed fortified houses to permit the steady advance of the French army. Although Lannes took no comfort in adding this new achievement to his record, the eventual capture of Saragossa demonstrated his military versatility.

Lannes carried the sour memory of Saragossa with him when he returned to Paris in April 1809. While he was happy to be away from the indecisive campaigns and fanatical opposition that characterized the fighting in Spain, he

was uncharacteristically gloomy about his future military career. Carrying orders to join Napoleon in the forthcoming campaign against Austria, Lannes stopped to pay a courtesy call on Empress Josephine. In conversation with Napoleon's wife, the young general confessed to having bad feelings about the new war. Other acquaintances who met Lannes before his departure from Paris likewise found him pessimistic about his chances of surviving the upcoming campaign. Nonetheless, he hastened to his new assignment in Bavaria, arriving without his staff but just in time to join in the first major fighting of the campaign.

Lannes played a major role in the campaign's opening stages. French forces under Marshal Louis Davout, advancing toward the main Austrian supply center at Landshut, had found themselves perilously outnumbered by the concentrated forces of Archduke Charles's Austrian army. Along with Marshal André Masséna, Lannes received orders to rush northward to rescue Davout. In successful fighting near Eggmühl, in the central Danube valley south of Ratisbon on 22 April, Lannes was shaken by a sudden personal loss. An Austrian roundshot (cannonball) cut down, at Lannes's side, his chief of staff General Jean-Baptiste Cervoni, a close friend who had served with Lannes since 1796.

The following day, Lannes performed one of his most remarkable feats of arms at the walls of Ratisbon. In Napoleon's view, the Austrian retreat into the strongly fortified medieval city required an immediate French assault. Lannes directed several attacks, but all failed with heavy casualties in the face of a deep moat, high walls, and fusillades of Austrian musketry. In an inspired example of battlefield leadership, Lannes himself grabbed a scaling ladder and moved toward the enemy's defenses. His newly motivated troops followed and swarmed over the Austrian defenses. Lannes continued to display aggressive leadership in the subsequent street fighting that led to the capture of the city.

In command of II Corps, Lannes led the pursuit of the Austrians eastward along the south bank of the Danube. On 10 May, his forces were the first units in the Grande Armée to reach Vienna, but by that time the bulk of the Austrian army had concentrated opposite the city along the northern bank of the Danube. The French now faced the difficult dilemma of crossing a major river in the face of massive enemy resistance.

The attempt to establish a French bridgehead on the Danube's north bank cost Lannes his life. On 21 May, one day after Masséna's corps had led the way, Lannes's forces crossed the single bridge linking the two banks of the Danube via the large island of Lobau in the middle of the river. Lannes held the village of Essling when a ferocious Austrian counterattack struck the French lines. The Austri-

ans combined their offensive with a successful blow sabotaging the crucial French bridge. When the fighting continued on the twenty-second, Lannes held his ground tenaciously in the face of overwhelming Austrian numbers. Nonetheless, a shortage of ammunition among the units on the northern bank, combined with another Austrian success in severing the French bridge across the river, led Napoleon to order a withdrawal.

In the midst of the French pullout, Lannes saw another old battle companion struck down by artillery fire. While mourning his lost friend, Lannes too was hit. Both of his legs were broken, and, as the wounds later became infected with gangrene, his life began slipping away. He died on 31 May after nine days of suffering. One of the most distinguished of Napoleon's fighting generals to have become a marshal of France, Lannes was the first of the marshals to perish on the battlefield.

### Laon, Battle of (8–9 March 1814)

Following the Battle of Craonne, Napoleon believed that Marshal Gebhard Blücher von Wahlstatt (generally known simply as Blücher) and his (Russo-Prussian) Army of Silesia were in full retreat. In fact Blücher had ordered the concentration of his forces around the town of Laon. Napoleon assaulted a strong defensive position, primarily with units of the Imperial Guard. He was heavily outnumbered, and the assault failed. On the second day of the battle the Allies could not take advantage of their success of the previous day, due to Blücher's illness. The French were able to withdraw after some desultory fighting, but they could not afford the losses that they had sustained and Napoleon had only delayed the advance of the Prussians.

After the Battle of Craonne, Blücher made the decision to withdraw to the town of Laon and to order all his forces to converge there. He had a fever at that time and decided that he should fight a defensive battle. Laon was a small town on a hill that dominated the river Ardon. The town was walled, and the land around was broken up by swampy ground. Blücher deployed his infantry in the suburbs of Semilly and Ardon, to the south of the town. His batteries covered the roads leading to Rheims and Soissons. The cavalry under the command of the Russian general Ferdinand Winzgorode were positioned to the west of the town. To the east were the forces of Prussian generals Friedrich Graf Kleist von Nollendorf and Johann Graf Yorck von Wartenburg (commonly referred to as Kleist and Yorck, respectively). In reserve were the troops of Russian generals Fabian Osten-Sacken and Louis Langeron.

Blücher was in a strong position with around 90,000 men, but he believed that Napoleon had a roughly comparable force. In this he was very much mistaken, because the French had fewer than 30,000 men. Napoleon, too, was in error in the way in which he approached the forthcoming battle. He believed that after Craonne, Blücher was in headlong retreat and intended to pursue what he believed was only a rear guard.

On the morning of 8 March, Napoleon ordered his Guard to attack down the Soissons road, toward Laon. Marshal Michel Ney was commanding the vanguard and

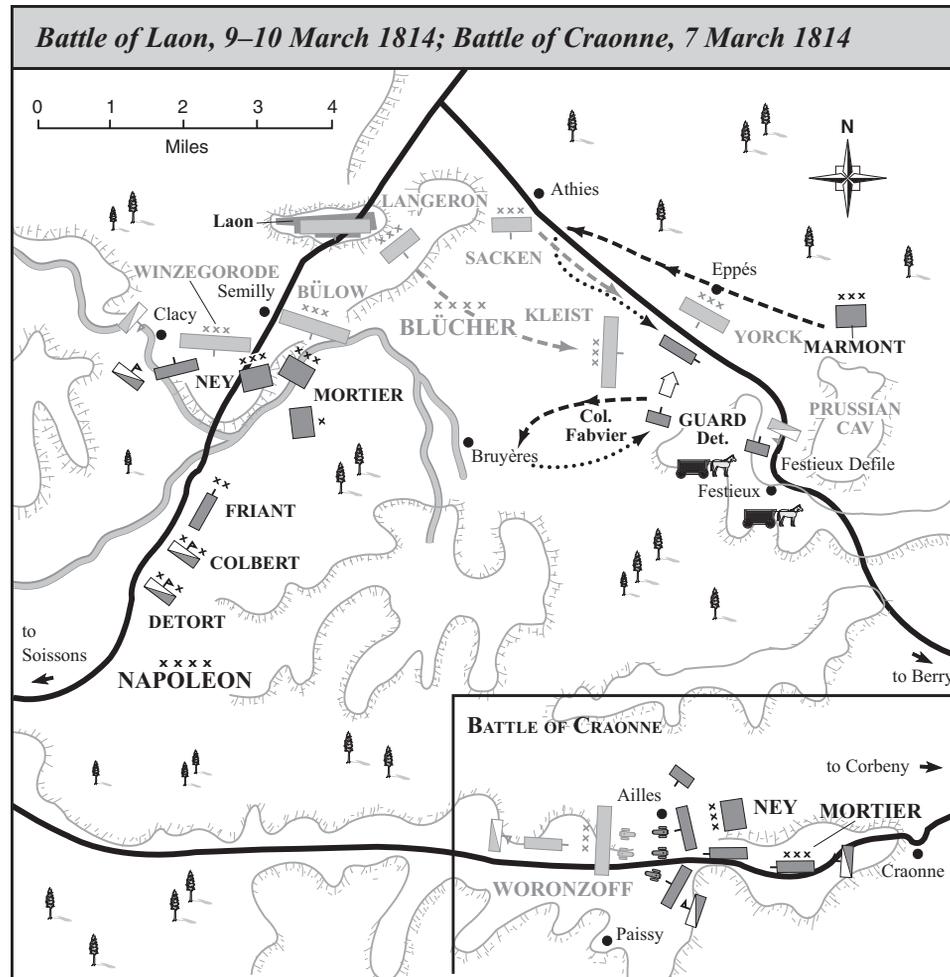

forced away the outlying Cossack patrols. However he could not push beyond Etouvelles. Ney and Napoleon were informed by a French officer who knew the local area that the enemy position at Etouvelles could be turned by making use of a small road leading through a ravine to the west. By early evening a force made up of units of the Guard forced this defile, pushing a number of Russian regiments back as far as Semilly. It was now early morning on the ninth, and in the mist and snow, Ney ordered a general attack toward Laon. The Guard seized Ardon, and at this point Napoleon sent orders to Marshal Auguste de Marmont to advance along the Rheims road, believing that he was about to inflict a further defeat on the Army of Silesia.

Blücher, however, was not to remain inactive for much longer. Fearful that the French had equal numbers to his own army he had maintained a strong reserve at the start of the battle. As the weather began to clear, however, Blücher could discern more of the French dispositions and grew confident enough to launch a counterattack to retake Ardon. The French fought fiercely, and neither side was able to force a conclusion. In addition to this attack, Blücher ordered forces to advance between the two roads that joined at Laon. This move split the French army and prevented communication between the two wings. This was to have important consequences for Marmont's attack along the Rheims road.

Marmont had marched from Berry du Bac, and in the afternoon began to attack the Prussians at Athies, south of Laon. His forces were able to take this village, but could make no further headway toward Laon. By evening Marmont was confident that the fighting on his front was petering out for the day, and he withdrew to spend the night in a local château. He was not able to communicate with Napoleon and had no idea of the position of the French on the western flank of the battlefield.

Blücher on the other hand had now grown in confidence and wanted to maintain contact with the enemy. Therefore between 6:00 and 7:00 P.M. four Allied columns of infantry attacked Marmont's weary corps. The first element of the columns did not open fire, but just advanced at bayonet point. The shock of this assault was too great for Marmont's men, and they broke after only a brief fight. Marmont had more than 3,000 men captured, but more important, he lost 40 guns and 100 ammunition caissons. These supplies were of vital importance to Napoleon.

Next morning Napoleon renewed his attack on the western flank by sending forward Marshal Auguste Mortier to retake Ardon. Ney's troops and the Guard were ordered to support this attack by seizing the village of Clacy. However, the assault had only just begun when news of Marmont's defeat reached Napoleon. He realized that he would not be able to maintain the impetus of the advance and or-

Adapted from Chandler 1966, 987.

dered Ney to hold his position and then cover the withdrawal of the army on Soissons. The Allies should have been able to closely pursue the withdrawing French, but during the night, Blücher's fever had worsened. The Allied commanders were divided in how to proceed. Kleist, believing that General August von Gneisenau, Blücher's chief of staff, was concealing Blücher's death (which in fact had not occurred), resigned his command, and Langeron, the most senior officer after Blücher, refused to contemplate taking over command of the Allied army. As a result the pursuit of Napoleon was very desultory and the campaign in France was prolonged a little further.

#### Larrey, Dominique Jean, baron (1766–1842)

Praised by Napoleon as the most virtuous man he had ever met, Dominique Jean Larrey personified military surgery

during the Napoleonic Wars. He is also credited for his equal attention to treating the wounded on all sides.

Dominique Jean Larrey was born on 8 July 1766 in Baudean, a little village in the French Pyrenees near Bagnères-de-Bigorre. Orphaned at age thirteen, he was raised by his uncle Alexis, who was a surgeon in Toulouse. He studied medicine there for six years and was successful enough in examinations to become an *aide-major* (assistant surgeon) in the town's hospital when he was only twenty years old.

Larrey walked to Paris in 1787, two years before the outbreak of the Revolution. He was successful in a competitive examination and entered the navy in 1788 as a *chirurgien-major* (surgeon) aboard the frigate *Vigilante*, for a campaign in Terra Nueva. Once back in Brest, he left the navy and returned in 1789 to Paris, where he put into practice, during the first riots in the Saint-Antoine boroughs, all he had learned about military surgery from Billard, Desault, and Sabatier. In 1791 he was accepted as an *aide-major* for the care of the veterans in the Invalides.

In 1792 Larrey was designated *chirurgien-major* to the (French) Army of the Rhine, and he participated in the campaign of that year. To help the wounded rapidly, he designed "flying ambulances" (*ambulances volantes*), whose purpose of collecting and carrying fallen soldiers from the battlefield in horse-drawn wagons was derived from the "flying artillery." It appears that Larrey was possibly not the only doctor involved in establishing this method. Jean-François Coste, who had served as physician-general to the French army serving in the American Revolutionary War (1775–1783), in a letter signed on 23 April 1804, claimed a part in the idea: "You were so quick and interested in claiming the creation of the flying ambulances, but in fact it was I who allowed you to put it into practice" (Lemaire 1992, 118).

Larrey married Elisabeth-Charlotte Le Roulx de Laville on 4 March 1794. As chief surgeon to the (French) Army of Corsica, he met General Bonaparte for the first time in Toulon. Some months after, in 1795, he became chief surgeon to the Army of the Pyrenees in Catalonia. He was promoted to professor of surgery to the new Val-de-Grace school of military medicine in 1796 and joined the Army of Italy under Bonaparte's command in 1797. Larrey was the chief surgeon to the Army of the Orient, first during the campaign in the Middle East (1798–1801). During these operations he used camels in place of horse-drawn wagons to carry the wounded. He described his own experience of local diseases, particularly bubonic plague. While serving in Egypt he was made chief surgeon to the Garde des consuls (Consular Guard), the future Imperial Guard, on 2 November 1800. He became an officer in (and the recipient of) a Cross of the Legion d'Honneur on 15 July 1804.

Dominique Larrey, the senior medical officer of the Grande Armée. His tireless efforts to relieve the suffering of the sick and wounded conferred on him an almost legendary status in his own time. (The Art Archive/Musée du Louvre Paris/Dagli Orti )

Larrey accompanied Napoleon as the chief surgeon to the Imperial Guard on all of the Emperor's campaigns. He personally tried to save the life of Marshal Jean Lannes at Essling in 1809, but without success. He was made a baron on 15 August 1809. During the Russian campaign in 1812, Larrey suffered from frostbite and was the first person to describe the condition identified many years later as trench foot. When Napoleon returned to power after his escape from Elba in 1815, Larrey followed him during the Hundred Days. He was captured by the Prussian army in the aftermath of the Battle of Waterloo on 18 June and could have been shot on the spot had he not been identified and spared.

During the Restoration Larrey narrowly escaped being imprisoned and worked in Paris as chief surgeon to the Gros-Caillou hospital for the Royal Guard. He was appointed chief surgeon at the Invalides and general inspector after the Revolution of 1830. Larrey died at the age of seventy-five in Lyons on 25 July 1842 as he was returning with his son Hippolyte from Algeria, where he had been sent on a short mission.

Larrey's skill at amputation was second to none. In 1803, before the outbreak of the Napoleonic Wars, he performed the first hip joint amputation. He claimed to have performed personally around 200 amputations (Larrey 1983–1984, 4:57) within the first 24-hour period following the Battle of Borodino on 7 September 1812. Some of his detractors accused him of abusing this method, but early and quick amputation was thought, with good reason, to prevent infection and to allow easier nursing and evacuation (Larrey 1983–1984, 2:453).

Larrey conceived the system of “triage,” which established priority of care based upon the nature of the injuries without regard to rank or distinction. Because Larrey was in touch with the common soldier, he was loved by the men in the ranks. In his memoirs, he wrote that soldiers helped him to cross the bridge over the Berezina in November 1812, whereas many tens of thousands were left on the enemy bank of the river to die or to be captured.

At the Battle of Bautzen on 20 May 1813, several hundred young conscripts received injuries to their fingers, which were thought by senior officers to be caused by self-mutilation. Napoleon ordered an inquiry, and 2,632 soldiers were medically examined by a commission headed by Larrey. He refused to consider forensic evaluation as evidence of culpability: “The medical doctor must always speak and act as a friend of humanity. He cares for the guilty as well as for the innocent guy and his only concern is the suffering patient. Other considerations are not his business” (Lemaire 1999, 189–196). Larrey's survey provided Napoleon with an explanation of the injuries, based on insufficient drill, as a result of which the executions of the wounded did not take place.

Before his death on the island of St. Helena, Napoleon rewarded his surgeon by leaving him 100,000 francs in his will. The name of Larrey is inscribed on the Arc de Triomphe in Paris. Larrey's statue stands in Val-de-Grace military hospital, and his grave was transferred to the Invalides in 1992.

## Lasalle, Antoine Charles Louis, comte (1775–1809)

Lasalle was undoubtedly one of history's greatest cavalrymen, whose skill, bravery, and panache have become legendary. He distinguished himself in many of Napoleon's most famous campaigns and battles including Rivoli, the Pyramids, Austerlitz, and Medellín, to name but a few. Marshal Auguste de Marmont famously remarked that during the entire period of the French Revolutionary and Napoleonic Wars, only Lasalle and generals Louis-Pierre Montbrun and François Kellermann (the Younger) knew how to deploy and control massed cavalry.

Born into a noble family in Metz in 1775, Lasalle went on to begin his remarkable military career at the tender age of eleven and by 1795 had become aide-de-camp to the renowned General François Kellermann (the Elder), the victor of Valmy.

However, it was with the infamous “Infernal Brigade” that the genius of France's light cavalry gained lasting acclaim. As a *général de brigade* from February 1805, he fought at Austerlitz and, with his elite 5th and 7th Hussars, comprehensively defeated the pride of the Prussian cavalry, obliged Friedrich Fürst zu Hohenlohe-Ingelfingen (commonly known as Prince Hohenlohe) to surrender Prenzlau, and audaciously tricked the heavily armed garrison of Stettin into surrendering with just a small covering force.

Brave to the point of fearlessness, Lasalle inspired a fierce devotion in the men who served under him and expected his troops to meet his own exacting standards of courage. Alongside Napoleon, Lasalle is also said to have possessed the rare gift of “coup d'oeil,” which gave the holder a distinct tactical advantage by enabling them to evaluate terrain instantaneously.

At Golymin in December 1806, for example, he reportedly kept his men under a raging Russian cannonade, despite having two horses killed under him at the front of the brigade. He distinguished himself at Heilsberg in June 1807 and was promoted to *général de division* on 30 December. In 1808 he led a division of light cavalry in Spain, serving at Medina de Río Seco. Leading a single regiment of dragoons at the Battle of Medellín, Lasalle broke a

Spanish square of several thousand men. He was made a Count of the Empire in March 1808. During the campaign of 1809 against Austria, Lasalle fought at Aspern-Essling and at Raab. He was killed in the course of leading a charge at Wagram, a musket ball piercing his forehead.

Despite his intelligence and genteel birth, Lasalle acquired a justified reputation in his younger years for womanizing and rabble-rousing. He was well known for going to extreme lengths to conduct late-night trysts, and in one notorious liaison, he actually infiltrated enemy lines to frolic with the marquise de Sali at Vicenza in 1796. Innkeepers had frequently to be warned to remove mirrors and other breakable items so that the hot-headed cavalry general could not use them as target practice as he entertained his officers.

Lasalle perfectly embodied the romantic image of the hussar as gallant, ostentatious, and ready to fight to the death at any moment. This is encapsulated by his oft-quoted remark that “any French hussar who was not dead by the age of 30 was a blackguard” (Uffindell 2003, 58). He outlived his own maxim by four years, dying at the age of thirty-four. Of Napoleon’s 18,000 casualties at Wagram, Lasalle’s death was arguably the most costly, not only robbing the Emperor of one of his finest commanders but ending the life of one of the most flamboyant and interesting personalities of the period.

### Lauriston, Jacques Alexandre, comte (1768–1828)

Prominent French diplomat and statesman. Lauriston was born to a noble family of Scottish origins in Pondicherry, India, on 1 February 1768. He was the son of General Jacques François Law de Lauriston (1724–1785) and great nephew of John Law, controller general in 1720. Lauriston began service in 1784, later that year serving in the *régiment de Toul* and then under his father for the next several

years. He became aide-de-camp to General Beauvoir in 1791 and served with three different armies in the Rhine theater between 1792 and 1795: Nord; Moselle; and Sambre-et-Meuse. He distinguished himself at the siege of Maastricht and was promoted to *chef de brigade* of the 4e Régiment d’Artillerie à Cheval (4th Regiment of Horse Artillery) on 7 February 1795. Resigning in 1796, he returned to service in 1800 as aide-de-camp to Bonaparte and became *chef de brigade* of the 4e Régiment d’Artillerie à Cheval on 5 March. During the campaign of 1800 against Austria, he distinguished himself at Marengo on 14 June. He served on a special mission to Copenhagen in 1801 and witnessed the British attack on the Danish fleet.

Returning to France, he took part in negotiations with Britain leading to the Peace of Amiens in 1802, and he was selected to convey to England the ratification of the peace. He was promoted to *général de brigade* on 13 September 1802, and served in the Army of Ocean Coasts, which was poised for a descent on the south coast of England. He became the commander of the Legion of Honor in 1804 and the next year rose to the rank of *général de division* (1 February), leading expeditionary forces that embarked with Admiral Pierre de Villeneuve. He briefly served in Martinique, and, returning to Europe, took part in the action off Cape Finisterre on 22 July. He was then appointed governor general of Braunau, east of Munich on the river Inn, during the campaign of 1805. He occupied Ragusa in May 1806 and was made governor-general of Venice in 1807. The following year he was conferred the title of Count of the Empire in May and took part in the negotiations at Erfurt with Tsar Alexander.

He commanded the artillery of the Imperial Guard in Spain in late 1808 and served under Viceroy Eugène de Beauharnais against the Austrians in Italy in 1809. He fought at Raab and distinguished himself commanding the famous massed artillery battery of the Imperial Guard at Wagram. In 1810 he helped negotiate Napoleon’s marriage to Marie Louise and escorted the Austrian princess to France. In February 1811 he was appointed ambassador to Russia and joined Napoleon on campaign at Smolensk in August 1812. After the fall of Moscow, he was sent to negotiate peace with Alexander but was turned away by General Mikhail Kutuzov. During the French retreat, he fought with the rear guard. In 1813, Lauriston commanded the observation corps on the Elbe and led V Corps at Möckern, Bautzen, and Leipzig, where he was captured during the retreat.

Lauriston was held captive until May 1814, after the fall of the Empire, and then declared his loyalty to King Louis XVIII. During the Hundred Days, he refused to join Napoleon and remained faithful to the Bourbons. After the Second Restoration, he was decorated with the Order of St. Louis and given a command in the Royal Guard. In 1817,

he was conferred the title of marquis and presided over the electoral college of the Loire-Inférieure; six years later, Lauriston became a Marshal of France after the death of Marshal Louis Davout. During the war in Spain in 1822–1823, he commanded a corps on the Ebro and captured Pamplona. He died in Paris on 11 June 1828.

### Lawrence, Sir Thomas (1769–1830)

The most accomplished British portrait painter of his day, Sir Thomas Lawrence fixed forever the iconic image of the country's leaders as strong, confident men at the time of the wars against French Revolutionary and Napoleonic France. His portraits of beautiful and exquisitely dressed women have been equally enduring as a representation of the elegance of the Regency period.

Lawrence rose to prominence at an early age, owing mainly to remarkable natural ability, though he was also spurred on by family need and his career was helped by a pleasing manner. His father was the improvident landlord of a coaching inn, and Lawrence himself, despite commanding high prices once he was established, was also a poor financial manager and never out of debt. Having demonstrated a great talent for sketching people, Lawrence became the chief support of his family at the age of ten, when his father became bankrupt. Beginning in the fashionable spa town of Bath, he soon moved to London. By 1790 he was acknowledged as a leading artist when he exhibited twelve portraits, including one of Queen Charlotte, at the Royal Academy. He was patronized by George III and after 1811 by the Prince Regent (George IV from 1820), who knighted him in 1814.

During the victory celebrations in London following Napoleon's first abdication in that year (which also marked

the centenary of the Hanoverian succession to the British throne), Lawrence painted the most famous portrait of the newly created Duke of Wellington. The victor of the Peninsular War is depicted in field marshal's uniform (as he appeared at the Congress of Vienna early in 1815), arms folded, gazing self-assuredly at the viewer. In 1817 the duke commissioned Lawrence to paint a huge life-size portrait of him, a depiction of Wellington astride his famous horse, Copenhagen, signaling the general advance at the end of the Battle of Waterloo, a canvas he gave to the secretary of state for war and the colonies, Lord Bathurst. This portrait was used as a model for the equestrian statue of Wellington that has stood opposite Apsley House in London since the 1883.

Lawrence also painted Klemens Fürst von Metternich, Field Marshal Gebhard Blücher von Wahlsatt, and the Russian general Matvei Platov when the Allied leaders were in London for the 1814 festivities. After Waterloo the Prince Regent sent Lawrence to the Continent four times to paint various Allied sovereigns, diplomats, and soldiers connected with the defeat of Napoleon. These were hung, and still remain, in the Waterloo Gallery at Windsor Castle. Of these portraits the acknowledged masterpiece is that of Pope Pius VII, once much harried by Napoleon but depicted in serene old age with the restored art treasures—seen through an arch in the background—a metaphor for the times.

Lawrence died suddenly in 1830, on the eve of European revolutions, the parliamentary reform bill in Britain, and a more prudish taste in art. He received an impressive funeral and was buried with other heroes in the national pantheon of St. Paul's Cathedral.

### Le Boulou, Battle of (1 May 1794)

The Battle of Le Boulou, fought on the Pyrenean front, resulted in the expulsion of the Spanish army from French

territory. The victor, General Jacques Dugommier, had broken the Allied siege at Toulon the previous year and was a mentor of General Bonaparte. Despite his decisive victory at Le Boulou, Dugommier failed to follow up his success, thus needlessly extending the war with Spain into the following year.

Dugommier had assumed command of the Army of the Eastern Pyrenees in January 1794, a month after capturing Toulon. More than 10,000 veterans from his army joined him at Perpignan. Dugommier's appointment resulted in improvements among the French troops in the eastern Pyrenees. He instituted strict discipline and increased training. The supply situation also improved somewhat, although the French remained short of many necessities. He reorganized the army, gathering many of the more experienced troops into the same units. Weapons were standardized in various units, and private hunting weapons were replaced with military ones.

Dugommier's job was facilitated by a change in the Spanish command. General Don Antonio Ramón Ricardos had commanded the Spanish in a cautious but competent way. He was called to Madrid for consultation, where he died on 13 March 1794. He was replaced by General O'Reilly, but O'Reilly suffered from seizures on his way to the army and died on the twenty-third. Command ultimately fell to the Conde de la Union, a brave and distinguished soldier, but one who was discouraged by the poor state of the Spanish army in the Pyrenees. He refused command three times before acquiescing.

Dugommier prepared for the campaign by launching a series of probing attacks against Spanish defenses. The Committee of Public Safety ordered him to recover French forts along the Mediterranean coast, which had been captured by the Spanish. When the cooperating fleet failed to appear, Dugommier decided to attack the main Spanish position. Ricardos had established a powerful defensive position around Le Boulou. Their camp was behind the river Tech, with mountains at their back. While the Spanish right was anchored on the sea, their left and center were separated by some distance. Dugommier's plan was to draw the Spanish left forward and slip his main body between the center and right. If all went well, he would be able to cut them off from Spanish territory and crush them.

He launched the campaign on 27 March, with about 35,000 men available for service. The Spanish had a slightly smaller number. The French right was commanded by General Pierre Augereau, with the best troops available. He demonstrated against the Spanish at Ceret and enticed them into crossing the Tech. De la Union moved the troops of the Spanish center to support his left, leaving a gap for Dugommier to penetrate. Thus, on the night of 29 April,

French forces under General Catherine Dominique Pérignon crossed the Tech below Boulou. The next day, he captured two forts overlooking the Spanish camp at Boulou. De la Union realized his position had been compromised and immediately ordered a withdrawal from the Pyrenees back into Spain.

On 1 May, the Spanish left and center were attacked from the front and rear. They lost cohesion and were routed. Spanish losses totaled 1,500 killed and wounded and the same number captured—a decisive defeat. Dugommier captured more than 150 cannon and 1,800 horses and mules. In consequence, Spanish forces were only able to establish a new defensive line between Collioure and St. Laurent on 4 May. Dugommier's army had not suffered many casualties, but was exhausted from marching and fighting. He failed to follow up his success and spent most of the summer reducing Spanish forts along the Mediterranean coast.

## **Leclerc, Charles-Victor Emmanuel (1772–1802)**

Charles-Victor Emmanuel Leclerc is best known for marrying Napoleon Bonaparte's sister, Pauline, then leading a disastrous French expedition to St. Domingue (present-day Haiti).

Born on 17 March 1772 to Marie-Jeanne Musquinet and Jean-Paul Leclerc, Leclerc volunteered for the French Army in June 1791. His good social and intellectual background and the dearth of qualified officers immediately catapulted him to the rank of lieutenant in the second battalion of Volunteers of Seine-et-Oise, then as Lieutenant Colonel Jean-François de la Poype's aide-de-camp. Demobilized in September 1792, Leclerc decided to join the 12th Regiment of cavalry as a professional soldier. He first saw combat during the siege of Toulon in 1793, during which he befriended the young Captain Napoleon Bonaparte. After Toulon, he became an adjutant general.

After briefly serving in the Army of the Ardennes, he joined the (French) Army of Italy where he helped halt a

Piedmontese attack in July 1795, then headed the garrison of Marseilles. There, he met Pauline Bonaparte, who was then enamored of Louis Marie Stanislas Fréron. Recruited by Bonaparte during the campaign in Italy in 1796, Leclerc distinguished himself while leading the 10th Chasseurs à Cheval; in 1796, he was promoted to *général de brigade*. He married Pauline Bonaparte near Milan on 14 June 1797 (their son Dermide was born on 20 April 1798).

From 1797 to 1798, Leclerc served as chief of staff of the Army of Italy, then of the Army of England, assembled in Rennes to prepare for a possible invasion of England and to pacify royalist rebels in western France. He was promoted to the rank of *général de division* in 1799 then ordered to reorganize the Army of Italy. During the coup d'état of 18–19 Brumaire Year VIII (9–10 November 1799), Leclerc led the troops that drove out members of the Council of Five Hundred. Despite this key role, Leclerc was General Jean Moreau's subordinate during the Rhine campaign of 1800.

After taking part in the 1801 expedition to enforce the anti-British blockade in Portugal, Leclerc was ordered by Bonaparte to command an expedition to St. Domingue. The West Indian island, France's most valuable colony, was ruled by Toussaint Louverture, a former slave whose loyalty Bonaparte doubted. Napoleon's secret orders instructed Leclerc initially to pledge his commitment to emancipation, then to round up and deport black leaders, and finally to restore the pre-Revolutionary order in St. Domingue. Leaving France on 14 December 1801, the 19,000-strong expeditionary force arrived at Cape Samana on 29 January 1802.

Toussaint Louverture, officially submissive, secretly ordered his subordinates to prepare for a resumption of hostilities. Leclerc had him arrested on 10 June, then shipped him to France, where he died of neglect at the Fort de Joux in April 1803. Initial military operations developed well, with victories at Ravine à Coulevres in February and at Crête à Pierrot in March 1802.

Leclerc's task nevertheless proved difficult. Black rebels continued fighting despite Toussaint Louverture's arrest, and most black generals loyal to France defected in October 1802. Morale among Leclerc's troops was low, and provisions inadequate; St. Domingue produced little except tropical goods, France was very distant, and whatever food and supplies French authorities sent from across the Atlantic were often spoiled and defective. Starting in April 1802, cases of the deadly yellow fever multiplied: over the following eighteen months, during which period large numbers of reinforcements arrived, 45,000 of the 50,000 to 55,000 French deaths were attributable to disease. On 2 November Leclerc himself succumbed to yellow fever in Cap Français. His successor, General Donatien Rocham-

beau, lingered on the island until November 1803, then left with the survivors of this disastrous expedition.

### Lefebvre, François Joseph (1755–1820)

A marshal in the French Army, Lefebvre was born in Alsace in 1755 and brought up from age seven by his uncle, a priest, after his father died. Lefebvre rejected the opportunity to take up a life in the Church and instead joined the Garde Français just prior to his eighteenth birthday. Before the Revolution he had already reached the rank of sergeant. The Garde Français having been disbanded on the fall of the monarchy, Lefebvre joined the National Guard and was rapidly promoted.

In 1792 Lefebvre joined the 13e Légère (13th Light Infantry) and served in the armies of the Center and of the Moselle, fighting at Thionville and Arlon. However, in 1793 the Committee of Public Safety decreed that all former members of royal household units were to be relieved of their commands. Lefebvre was saved by the intervention of one of the people's representatives (a sort of commissar).

At the end of 1793 he was under the command of General Louis Hoche and fought at Kaiserslautern and Weissenburg. In 1794 he fought at Fleurus and particularly distinguished himself by leading the French counterattack. During this period General Nicolas Soult, the future marshal, was his chief of staff. Between 1795 and 1797 Lefebvre was transferred to the Army of the Sambre and Meuse in Flanders. By the end of 1797 Lefebvre was seen as one of the most able commanders in the field. Nevertheless, he was now exhausted by his continuous campaigning and requested the Directory to retire him from active service. This was refused, and he was assigned to the Army of the Danube where he was wounded in the arm at Pfullendorf. While recovering he was given military command of the Paris district. When Bonaparte returned from Egypt, Lefebvre took an active part in the coup d'état of 18–19 Brumaire (9–10 November 1799) by leading troops into the Chamber of the

Council of Five Hundred. The following year he was made a senator.

On 19 May 1804 Lefebvre was made a marshal, and in many ways this should have been an honorary title for the military service he had already performed. However, in 1805 he was ordered to Mainz and in 1806 was given command of the infantry of the Imperial Guard. He fought at Jena and was then entrusted with the siege of Danzig, being given command of X Corps. His troops comprised various nationalities but he managed to inspire them to fight off a relief attempt by the Prussians; as a result the city surrendered after a siege of almost three months. Lefebvre was rewarded by being made duc de Danzig. When Napoleon invaded Spain in 1808 Lefebvre had the command of IV Corps and was to act with Marshal Michel Ney on the right wing of the advancing army. Unfortunately Lefebvre launched his attack too early, and despite winning a series of victories against the Spanish generals Joaquín Blake and the Marqués de la Romana, Napoleon was critical of his conduct in the campaign.

With the imminent outbreak of hostilities with Austria in 1809, Lefebvre was given the command of VII Corps, composed entirely of Bavarian troops. His men bore the brunt of the early fighting, and he fought well at Abensberg and Eggmühl. The Bavarian troops were now sent to the Tyrol to suppress the revolt there, and Lefebvre was successful against the Austrian *Feldmarschalleutnant* Franz Jellacic Freiherr von Buzim, capturing Innsbruck and defeating the rebel leader Andreas Hofer. Lefebvre was present at Wagram but saw little action. He now returned to his estates, though he was recalled in 1812 to serve in the Russian campaign and once again was given command of the infantry of the Old Guard. His troops were present at Borodino but were not fully committed. In the retreat from Moscow, Lefebvre demonstrated his skills in keeping his troops together, but he suffered a personal disaster when his only son was killed. He served in the campaign in Germany in 1813, leading the Imperial Guard infantry at Dresden and Leipzig.

During the campaign of 1814 in France, Lefebvre fought at Champaubert on 10 February, and a week later personally led two battalions in a charge at Montmirail. During the engagement at Montereau, he had his horse shot from under him. Despite the French success at Arcis-sur-Aube, Lefebvre realized that the French had little prospect of ultimate victory. He reluctantly encouraged Napoleon to abdicate but sought to ensure that France was not divided by defeat, and in a meeting with Tsar Alexander urged that Alsace should remain part of France.

Although he supported Napoleon on his return from Elba, Lefebvre did not fight in the Waterloo campaign and as a result was allowed to keep his peerage by the restored

Bourbon monarchy. He was an able soldier who was not involved in many of the squabbles indulged in by the other marshals, and he remained close to his origins. Before his death in 1820 he spent much of his time helping veterans and their families and giving time and money to a variety of charities.

### Lefebvre-Desnouëttes, Charles, comte (1773–1822)

Charles Lefebvre-Desnouëttes served in the French cavalry, rising to the rank of *général de division* by the end of the Napoleonic Wars, at which time he went into exile in the United States to escape a firing squad for treason.

Lefebvre-Desnouëttes's father was a Parisian draper. He ran away from school three times in an effort to join the army. At the start of the French Revolution in 1789 he joined the Parisian National Guard as a cavalry trooper but left after two years of service. In 1791 he reenlisted, this time in the Army of the Alps, and was commissioned as a junior officer in a dragoon unit. He served in several armies on the French frontiers until 1797, when he transferred to Italy. In 1800 Napoleon appointed Lefebvre-Desnouëttes to be one of his aides-de-camp, and he fought

at Marengo later that year. In 1803 he served under Marshal Nicolas Soult and in 1804 returned to Napoleon's staff as an equerry. In 1805 he rejoined the cavalry in time for that year's campaign and fought at Austerlitz with the 4th Dragoon Division under General François Bourcier.

Lefebvre-Desnouëttes was promoted to *général de brigade* in 1806 and became an aide to Jérôme Bonaparte, who commanded VIII Corps. In November 1807 he was promoted to *général de division* in the Westphalian Army and became King Jérôme's Grand Equerry. In 1808 he returned to France and was made a count, after which he left France to serve in Spain.

Upon arriving there, Lefebvre-Desnouëttes's first assignment was as chief of staff to Marshal Jean-Baptiste Bessières. He fought at Tudela and the siege of Saragossa, where he was wounded. He returned to France for a short time to recover, then returned to Spain with Marshal Jean Lannes after having been promoted to *général de division* (in the French service) and was given command of a division of light cavalry of the Imperial Guard. Later in the year he fought at Somosierra under Bessières. In December he was wounded during the pursuit of Lieutenant General Sir John Moore at Benavente, captured, and imprisoned in England until his escape in 1812.

Lefebvre-Desnouëttes was back in France in time to join the Grand Armée for the invasion of Russia. He was again given command of the light cavalry of the Imperial Guard and was wounded at Vinkovo. When Napoleon retreated from Russia, Lefebvre-Desnouëttes accompanied him back to France. In 1813 he fought at Bautzen under Marshal Adolphe Mortier and later in the year saw action at Meresburg, Altenburg, and Hanau. He fought in most of the battles in France in 1814 during which campaign he was twice wounded. He retained command even after Napoleon went into exile on Elba.

When Napoleon returned from exile in 1815 Lefebvre-Desnouëttes tried to rally units to Napoleon but had little success. During the Waterloo campaign he led a light cavalry division as part of Marshal Michel Ney's left wing and was wounded at Waterloo. Following Napoleon's defeat, Lefebvre-Desnouëttes sailed to the United States. Convicting him in absentia for treason, the new Bourbon government under Louis XVIII decreed he be executed were he ever to return. In 1822 Lefebvre-Desnouëttes returned to Europe but perished short of France when the ship he was aboard, the *Albion*, sank off the coast of Ireland on 22 April 1822.

### **Leipzig, Battle of (16–19 October 1813)**

The Battle of Leipzig, also known as the Battle of the Nations, was fought between Napoleon and the three Allied armies that had been approaching the city for several days: the Army of Bohemia (*Feldmarschall* Karl Philipp Fürst zu Schwarzenberg), the Army of Silesia (General Gebhard Lebrecht von Blücher), and the Army of the North (former French marshal Jean-Baptiste-Jules Bernadotte, now Crown Prince of Sweden). Napoleon suffered a major defeat, which decided the campaign in Germany. He then fell back from Saxony to France.

Rainfall had been heavy that autumn, so the river levels were high and the countryside heavy going. A line of hills offering good defensive positions ran to the south and east of Leipzig. The outlying villages consisted of solid buildings that favored the defense. The terrain north of Leipzig was more level and broken up by rivers and marshes. The causeway to Lindenau, west of Leipzig, was Napoleon's line of communication to France. The rectangular city of Leipzig had four main points of access: the Grimma, Peter's, Neustäder, and Halle gates.

Napoleon's intention was to attempt to defeat each of the Allied armies in detail, winning the decisive battle of the campaign. The Allies wanted to bring Napoleon to bay by concentrating their forces and overwhelming him with their superiority in numbers.

Apart from scattered detachments garrisoning various important towns and cities throughout Germany, Napoleon had concentrated nearly all his forces in the Leipzig area. These included the Imperial Guard; II Corps (Marshal Claude Victor); III (General Joseph, comte Souham); IV (General Henri-Gatien, comte Bertrand); V (General Jacques, comte Lauriston); VI (Marshal Auguste de Marmont); VII (General Jean Reynier); VIII (Prince Józef Poniatowski); IX (Marshal Pierre-François-Charles Augereau); XI (Marshal Jacques Macdonald); I Cavalry Corps (General Marie-Victor-Nicolas de Fay Latour-Maubourg); II (General Horace, comte Sébastiani); III (General Jean-

Toussaint Arrighi de Casanova); IV (General François, comte Kellermann); and V (General Claude Pajol). Napoleon had around 190,000 men with 752 guns.

The Army of Bohemia consisted of the wing of the Russian general Peter Ludwig Graf zu Wittgenstein, the Austrian army, and II Prussian Army Corps (General Friedrich von Kleist). Wittgenstein's wing consisted of the 1st (Russian Infantry) Corps (General Prince Andrey Ivanovich Gorchakov); 2nd (Russian Infantry) Corps (General Prince Eugen of Württemberg); 3rd (Grenadier) Corps (General Nikolay Rayevsky); 5th (Guard) Corps (General Aleksey Ermolov); the Russian Guard Cavalry (Prince Dmitry Golitsyn); General Count Peter Petrovich Pahlen's cavalry corps; and two brigades of Cossacks under Ataman Matvei Platov.

The Austrian army consisted of the vanguard (two light divisions); the corps of *Feldzeugmeister* Hieronymus Graf von Colloredo-Mansfeld, *General der Kavallerie* Maximilian Graf von Merveldt, *Feldzeugmeister* Ignaz Gyulai Graf von Maros-Nemeth und Nadaska, and *General der Kavallerie* Johann Graf Klenau; the Reserve under *General der Kavallerie* Friedrich Erbprinz (Hereditary Prince) Hessen-Homburg; and the cuirassier corps under *Feldmarschalleutnant* Johann Graf Nostitz-Rieneck. Schwarzenberg commanded around 180,000 men with 628 guns.

The Army of Silesia consisted of the Prussian I Army Corps (General Johann von Yorck), and the Russian corps of generals Louis Langeron and Fabian Osten-Sacken. It amounted to 65,000 men with 310 guns. The Army of the North consisted of the Swedes under Field Marshal Count Stedingk, a Russian corps under General Ferdinand Winzgorode, and the Prussian III Army Corps of General Friedrich von Bülow: 58,000 men with 242 guns. Moving to join the Allies was the (Russian) Army of Poland led by General Levin Bennigsen: 48,000 men with 134 guns. In all, the Allies had more than 350,000 men at their disposal, along with 1,314 guns.

The preliminary phase of the battle began on 14 October, with the great cavalry action between Marshal Joachim Murat and the vanguard under Wittgenstein at Liebertwolkwitz. Although largely indecisive, this combat committed the Army of Bohemia to the battle.

The battle proper commenced on 16 October, with one action at Wachau and Connewitz to the south of Leipzig and another at Lindenau and Möckern, to its northwest.

In the south, Wittgenstein was deployed along the line from Fuchshain through Grosspösna and Güldengossa to Cröbern. Merveldt and Hessen-Homburg were at Gautzsch, between the rivers Elster and Pleisse. Gyulai was moving against the 3,200 French holding Lindenau, at the western end of the causeway from Leipzig. Blücher was at

Schkeuditz, to the northwest of town. Including Cossacks, more than 200,000 men were available on the sixteenth.

Napoleon had not anticipated Blücher joining the battle that day, so he concentrated his efforts against the Army of Bohemia. The troops at his disposal that day included Lefol's division, Poniatowski, and Kellermann, all deployed south of Leipzig and in echelon along the line from Connewitz through Lössnig and Dölitz to Markkleeberg. Victor and Lauriston were deployed between Wachau and Liebertwolkwitz. Elements of the Imperial Guard were also in reserve here. Augereau was behind Zuckelhausen. Latour-Maubourg and part of the Guard were at Probstheida, while Macdonald and Sébastiani were marching on Holzhausen. Napoleon had 138,000 men and 488 guns deployed against Schwarzenberg.

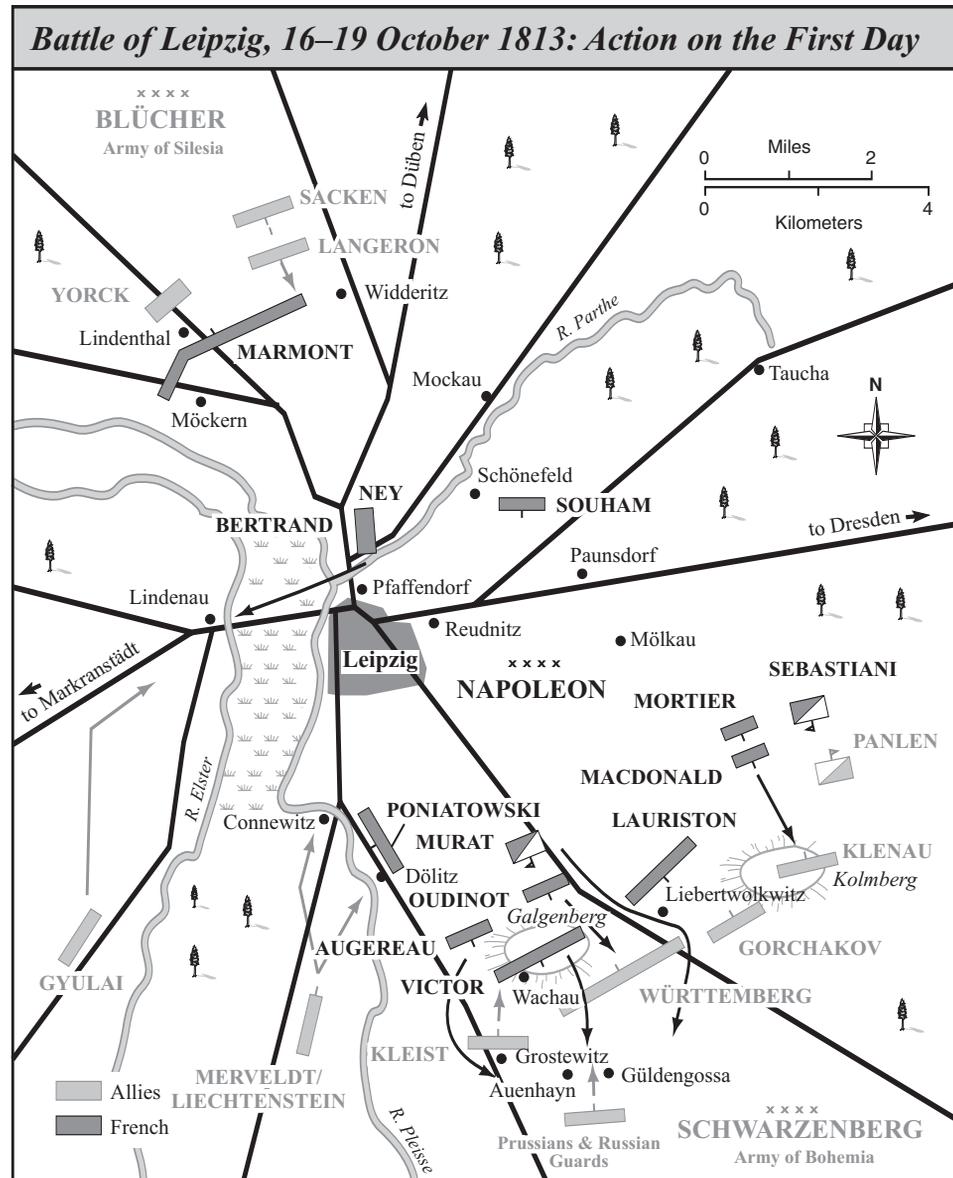

The four columns of Wittgenstein's force moved off on a cold, foggy morning. Klenau was to deploy between Fuchshain and the University Wood and assault Liebertwolkwitz. Gorchakov would support him by advancing between Störmthal and the Wood. Prince Eugen of Württemberg was to attack Wachau from the direction of Güldengossa. Kleist was to move from Cröbern to between Markkleeberg and Wachau, taking both villages and the nearby heights. Pahlen was to support Gorchakov and Eugen. Rayevsky and a brigade of cuirassiers were held in reserve.

The battle opened at 8:00 A.M. with Eugen's advance on Wachau, which he took. However, the French artillery prevented him from breaking out. Victor counterattacked and regained the village by 9:30 A.M. After a firefight, the Allies assaulted the village again at 11:00 A.M. The French counterattacked, driving them out.

Meanwhile, Kleist engaged Poniatowski in Markkleeberg, and by 11:00 A.M., the street fighting had become critical. Gorchakov and Lauriston bombarded each other with their artillery, causing heavy casualties to their infantry. Klenau started his advance to Liebertwolkwitz at 10:00 A.M., moving via the Kolmberg hill to the east. The small French garrison was soon ejected, but a counterattack regained the village.

By 11:00 A.M., the situation on the southern front was critical. The Allies had made little headway, and large French reserves were approaching. Tsar Alexander then committed his last reserves, Rayevsky and the Russian and Prussian Guards. The Austrians were also moving up, but Merveldt was making little progress.

The Allied assault that morning had taken Napoleon by surprise, and he had to commit his reserves prematurely. He sent the artillery of the Young Guard to aid Victor and Lauriston. At 9:30 A.M., Augereau moved to support Poniatowski, and the infantry of the Young Guard and a division of the Old Guard were sent to reinforce Liebert-

Adapted from Fremont-Barnes 2002B, 46.

wolkwitz. Then two divisions of the Young Guard, together with the Guard Cavalry, Latour-Maubourg, and Pajol were sent to support Wachau.

The morning fog lifted. Macdonald took the Kolmberg and moved on Seifertshain on the Allied right, throwing Klenau back in disorder. Only Roeder's timely intervention prevented further pursuit. Liebertwolkwitz now fell to the French, with the Austrians retiring to the Niederholz to its south, where Lauriston attacked them, forcing them to retire further. Gorchakov and Pahlen now fell back so their flank was not exposed. Only Kleist held his positions, but Augereau was sent in against him. Kleist used the last of his reserves in a vain assault on Wachau. He nevertheless held on to Markkleeberg. By

2:00 P.M., the rest of the Allies had been driven back to their initial positions.

Napoleon now prepared to make what he expected to be the final attack. He committed all his artillery to its preparation. The Guard, Victor, and Lauriston massed for the attack, with all the available cavalry in support. Marmont had yet to arrive, as he had been held up at Möckern fighting Blücher. Bertrand had been committed to the defense of Lindenau, and Ney was too far away to intervene. At 2:00 P.M., Napoleon launched his offensive.

A charge by Nostitz saved Kleist from destruction, but he was driven off by Saxon cuirassiers. At 2:30 P.M., General Etienne Tardif de Pommeroux, comte de Bordessoulle's cuirassier division charged through the Allied center, riding

French infantry defend a barricade against a Prussian assault at the Battle of Leipzig, where overwhelming defeat forced Napoleon to abandon his control over Germany. (Print by Valadon, Bousson, Paris, after E. Boutigny from *Life of Napoleon Bonaparte* by William M. Sloane, New York: Century, 1906, vol. 4)

down Eugen's infantry and taking 26 guns before continuing into the Russian Guard Cavalry Division and throwing that back as well. Russian cavalry then took the French cuirassiers in the flank, forcing them to retire. Ten squadrons of Prussian cavalry then followed up, driving Bordesouille back to his initial positions and into the French grand battery.

Despite this setback, the French infantry advanced along the entire front but met with a determined defense. Klenau held on to Seifertshain until nightfall. Bianchi's division took the Young Guard and Lauriston in the flank, forcing them to retire. Markkleeberg was recaptured and the Russians pushed on, forcing Napoleon to commit Souham and part of the Old Guard to shore up his crumbling right. By 5:00 P.M. the tide had turned in favor of the Allies. It was evident to Napoleon that the Allies had more reserves than he did, so he broke off his attack.

The second action of the day took place in and around Lindenau and Möckern. At Lindenau, it was Gyulai's aim to threaten Napoleon's line of retreat along the causeway, drawing off parts of Napoleon's reserves that then could not be used on the southern front. Bertrand had to be used to defend the city of Leipzig, when his intervention at Wachau could have decided the battle in Napoleon's favor. Gyulai commenced his attack at 8:00 A.M., on hearing the artillery fire at Wachau. At first, he was successful, taking several villages around Lindenau, but Bertrand's arrival at 11:00 A.M. halted his advance. Bertrand staged a counterattack at 5:00 P.M. and cleared the area.

Blücher's determined advance that day also drew off forces that could have been used on the southern front. Napoleon did not anticipate the arrival of the Army of Silesia that day and had ordered Marmont to Liebertswolkwitz. However, on hearing of Blücher's approach from Halle, Marmont turned his 20,000 men around and moved to face Blücher at the village of Möckern.

At 8:00 A.M. Blücher received a report from Bernadotte that the Army of the North was not going to arrive that day. The sounds of battle could be heard coming from Lindenau and Wachau, so Blücher decided to attack the French to draw their reserves away from the southern front. His assault commenced at 10:00 A.M., forcing Marmont to withdraw his outposts. Langeron advanced on Wiederitzsch, Yorck on Lindenthal and Möckern. Seeing the strategic importance of Möckern, Yorck stormed it at 2:00 P.M. The village changed hands several times that afternoon, with both sides suffering heavy losses in the bitter street fighting. An equally savage contest for Wiederitzsch took place, but by nightfall the French had abandoned it.

Yorck brought up 88 more guns and bombarded Möckern before sending in a brigade under Prince Charles of Mecklenburg-Strelitz. General Jean Dominique Compans's division took back the village after a counterattack. Yorck committed his last infantry reserve, a brigade under Colonel Karl Friedrich Franziskus von Steinmetz, at 5:00 P.M. Marmont drove it off. All that Yorck had left was his cavalry, so he threw them in. Their charge routed Marmont, capturing 35 cannon, 2 colors, 5 ammunition wagons, and 400 men. Yorck was by now a spent force, and Marmont was able to withdraw unmolested.

Marmont reported his losses at 6,000 to 7,000 men. Yorck suffered nearly 6,000 casualties from the 21,000 troops with which he had started. Langeron's losses were 1,500 men, but he took 1 color, 13 pieces of artillery, a large number of wagons, and hundreds of prisoners.

The day ended with Napoleon holding his line in the south, but not having gained the victory he sought. His reserves had been tied down in the northwest, and he now

had no fresh forces to commit to the battle. His losses had been fearful, with Poniatowski losing around one-third of his men and Augereau almost one-half. The remaining corps had also suffered heavily, and ammunition was running out. The Allies were bringing up their reserves, closing the ring around Leipzig, so Napoleon sent an emissary to the Allies to negotiate an armistice.

The next day, 17 October, Napoleon formed up his men in the pouring rain in anticipation of an attack that did not come. Instead, the Allies took the opportunity of resting and resupplying their front line, while allowing their substantial reserves to move up.

That night, Napoleon shortened his front by means of a withdrawal toward Leipzig. His right wing under Murat ran from Connewitz to Probstheida and consisted of Poniatowski, Augereau, and Victor. In reserve behind the right were the Guard and most of the cavalry. In the center, Macdonald drew up between Holzhausen and Steinberg, with Lauriston and Sébastiani in support. His left wing under Ney consisted of the Saxons, General Pierre François, baron Durutte's division, and Marmont, with Souham and most of Arrighi in support. It deployed in and around Paunsdorf. Dombrowski's division and other troops occupied Leipzig, while two divisions of the Young Guard under Mortier held Lindenau. That day, Napoleon had 160,000 men and 630 guns with which to offer battle.

The decisive day of the battle was 18 October. Schwarzenberg had the Allied forces draw up in six columns. The first, under Hessen-Homburg, consisted of Colloredo, Merveldt, and Nostitz, along with the divisions of *Feldmarschalleutnants* Freiherr von Bianchi and Graf von Weissenwolf. It was ordered to move on Leipzig from Markkleeberg. The second, under the Russian general, Mikhail Barclay de Tolly, consisted of Kleist, Wittgenstein, the Russian and Prussian Guards, and the reserves. It was to advance from Wachau and Liebertwolkwitz on Probstheida. The third, under Bennigsen, consisted of the Polish Reserve Army, Klenau, *Feldmarschalleutnant* Graf von Bubna's division, General Wiewprecht von Zieten's brigade, and Platov's Cossacks. It was ordered to move from Fuchshain and Seifertshain on Zuckelhausen and Holzhausen. The fourth consisted of the Army of the North under Bernadotte, together with Langeron and St. Priest. It was to move via Taucha toward Leipzig from the northeast, in collaboration with the Army of Bohemia. The fifth, consisting of the remainder of the Army of Silesia under Blücher, was to approach Leipzig from the northwest. The sixth, under Gyulai, consisted of his own corps, together with the divisions of *Feldmarschalleutnant* Moritz Fürst Liechtenstein and other detachments. It was to advance on Lindenau. The Allies had around 295,000 men with 1,360 guns that day.

The offensive began at 9:00 A.M. Hessen-Homburg took Dösen and Dölitz, but the Young Guard, Poniatowski, and Augereau recaptured Dölitz. Hessen-Homburg was wounded in the fight, and Colloredo took over command. Rayevsky's grenadiers and a division of Russian cuirassiers recaptured it, but the advance had been delayed.

Barclay moved off at 8:00 A.M. but halted within cannon shot of Probstheida to allow Bennigsen to catch up. The French withdrew with little resistance, and Barclay reached his positions by 10:00 A.M. He then moved on to capture Holzhausen and Zuckelhausen, ejecting General Maurice, comte Gérard's division from the Steinberg. Bubna advanced toward Paunsdorf, but Bennigsen halted again to allow the Army of the North to become effectively engaged. The French held the villages of Zweinaundorf, Mölkau, and Paunsdorf.

To the north of Leipzig, Langeron attacked Marmont, while Blücher moved into the suburbs of Leipzig. Napoleon sent a division of the Young Guard to stabilize this front. Bertrand reopened the road to Weissenfels, to the southwest.

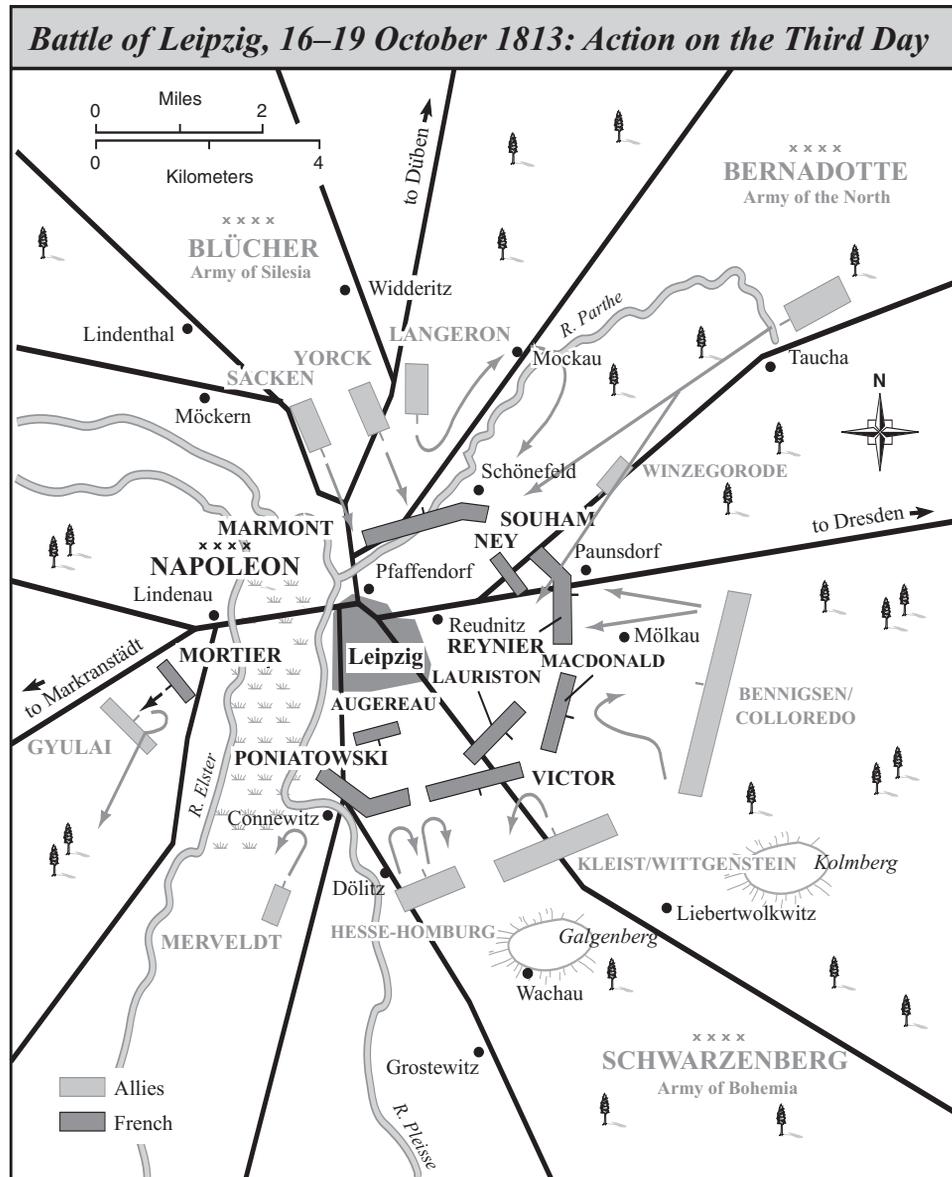

At 2:00 P.M. the day had yet to be decided. The French were far from beaten and still held a strong perimeter around Leipzig. Their line of retreat was still open, and Napoleon had the chance of saving his army from destruction.

Colloredo made no headway that afternoon. Barclay was held up at Probstheida and by nightfall the French had regained it. At Paunsdorf, the Saxon contingent went over to the Allies, as had the Württemberg cavalry earlier that day, but these events had little effect on the overall situation.

Napoleon now decided to withdraw through Leipzig on 19 October. Using the cover of darkness and the morning fog, he pulled back his men into the city. Schwarzenberg formed five columns to storm it. Yorck and Gyulai were to attempt to cut off the French retreat, but they were too weak and exhausted for this. All the Allied reserves had been committed the previous day, and there were no fresh troops left to conduct a pursuit.

The assault on Leipzig commenced at 10:30 A.M. but made little progress as every inch of the city was defended. The Grimma Gate fell to a battalion of East Prussian militia, and a seesaw battle for every street, building, and wall developed. While Napoleon had to defend several entrances to Leipzig, he could only use one for his escape, and this proved to be a great bottleneck. The French baggage trains proved to be a particular hindrance, and many were abandoned. When the bridge across the river Elster was blown up prematurely, part of the French rear guard was cut off. The last men of the garrison tried to swim across the river Pleisse to safety, while others surrendered. Poniatowski drowned while attempting to escape.

News of the victory was brought to the Allied commanders, who then met in the marketplace in the center of

Adapted from Fremont-Barnes 2002B, 50.

the city. The battle was over, but because Napoleon escaped with much of his army, the war would continue. Barring a feeble attempt to stop his retreat at Hanau at the end of the month and a few minor skirmishes, Napoleon reached France unhindered as the Allies were simply too exhausted to do much more.

Losses were horrific. The French are estimated to have lost 15,000 killed and 30,000 wounded, of which 23,000 were abandoned to the Allies, together with 15,000 prisoners. More than 70 generals were killed or wounded; others were taken prisoner. Material losses included 300 guns and 900 ammunition wagons. The Austrians lost 2,000 dead, more than 5,000 wounded, and more than 1,000 prisoners. The Russians lost more than 3,000 dead, nearly 14,000

wounded, and around 2,800 prisoners. The Prussians lost nearly 16,000 dead and wounded, and the Swedes 400. This amounted to more than 46,000 killed, wounded, or missing. The campaign in Germany was now all but over.

## Leoben, Preliminaries of (18 April 1797)

Preliminary peace agreement between Austria and France signed at the château of Ekenwald near Leoben in Styria (now southeastern Austria) as a prelude to formal peace concluded as a result of the Treaty of Campo Formio six months later. General Bonaparte, following his triumphant

campaign in Italy in 1797, crossed the Alps and advanced directly on Vienna. Defeating Austrian forces on the Tagliamento and the Isonzo, he reached Leoben on 13 April. However, the French army was overextended and exposed to possible Austrian counterattack, and Bonaparte was eager to negotiate an armistice. Hence, he had proposed a truce to Archduke Charles, and an armistice of six days was concluded.

Bonaparte, a mere general, had no authority to conduct diplomatic talks, and the Directory, in fact, expected direct negotiations with Vienna and prepared to appoint Henri-Benjamin Constant de Rebecque and Emmanuel Sièyes to negotiate. However, Bonaparte indicated that he would not accept any interference in his designs. Johann Ludwig Graf Cobenzl, an experienced diplomat who hoped to easily outmaneuver his younger opponent, represented the Austrian side. However, negotiations proved complicated, and Bonaparte showed himself a skillful negotiator, who often resorted to threats and faked outbursts of anger to achieve his goals.

In the end, the French obtained the left bank of the Rhine and laid the foundation for the creation of the Cisalpine Republic in northern Italy. To compensate Austrian losses, Bonaparte committed his government to cede to Austria the continental possessions of the Venetian Republic as far as Oglio, with Istria and Dalmatia. The Treaty of Campo Formio confirmed the preliminaries on 27 October 1797.

## Levée en Masse (23 August 1793)

The *levée en masse* of 23 August 1793 constituted the call-up of the entire French population to save the country

from invasion and defeat. It was the product of military emergency as France's armies collapsed in defeat at the hands of the First Coalition, morale disintegrated, noble officers resigned and defected, and other methods of recruitment failed to produce the hundreds of thousands of soldiers required. In particular, resort to the levée was an admission that the voluntary principle—to which the Revolutionaries had turned in 1791 and 1792—had proved a failure, and that some form of compulsion was now required. The Convention's declared aim was to provide France with a mass army of three-quarters of a million men. The *patrie* was declared *en danger*, and the people were called upon to make personal sacrifices for the national cause. No one was to be exempt, other than on medical grounds, and though in practice it was single men and widowers aged between eighteen and forty-five who were called upon to fight in the front line, everyone, regardless of age or gender, had a role to play.

In the words of the decree, the entire population was put in a state of requisition. The young men would go into battle; married men would forge arms and transport provisions; women would make tents and clothes and administer to the sick; children would make lint out of old linen; while “the aged shall betake themselves to the public places in order to arouse the courage of the warriors and preach the hatred of kings and the unity of the Republic” (Kirchberger 1989, 317). The decree—almost unique among the various forms of levy and conscription that were decreed during the Revolution and Empire—made no provision for buying replacements (a system by which a person would take the place of the conscripted party in exchange for a sum of money), nor was there any call for volunteers. Service was to be personal. It was declared to be a function of citizenship, an obligation that fell upon everyone.

The decree was proclaimed in tones of high moral fervor and Revolutionary nationalism, and it left a powerful image of the people in arms, rising spontaneously against tyranny in defense of their country. It would inspire French republicans in the Revolutions of 1830 and 1848 and the militants of the Paris Commune (1870–1871), just as it would inspire future revolutionaries in Russia, Algeria, Vietnam, and much of South America.

But is that image wholly propagandist? It is certainly true that the levée en masse did produce the soldiers the French armies required, and that this measure, together with structural and tactical reforms, allowed the Revolutionaries to turn a defensive war into one of conquest. No further mass recruitment was required until the end of the decade, in 1799. But while thousands of soldiers joined with apparent enthusiasm and quotas were exceeded in many areas—especially in Paris and in the

frontier regions of the north and east—there were other parts of France where the law was met with resentment and widespread resistance. In regions like the southwest and the Massif Central there was little evidence of spontaneity. It would take more than the levée en masse to persuade everyone that military service was a central tenet of citizenship.

### Liebertwolkwitz, Action at (14 October 1813)

The action at Liebertwolkwitz was the largest cavalry engagement of the Napoleonic Wars and marked the preliminary stage of the decisive Battle of Leipzig. Situated south of Leipzig in Saxony, this combat took place among the villages of Markkleeberg, Wachau, Crostewitz, Cröbern, and Guldengossa. The terrain was open, with gentle slopes leading up to flat-topped hills. The Galgenberg hill to the north of Wachau was the highest point.

Marshal Joachim Murat commanded the French forces in this area, which consisted of II (Marshal Claude Victor), V (General Jacques, comte Lauriston), and VIII (Prince Józef Poniatowski) Corps; IV (General François, comte Kellermann) and V (General Claude Pajol) Cavalry Corps; and General Sigismond-Frédéric, baron Berckheim's division from I Cavalry Corps; in all around 35,000 infantry and 8,000 cavalry. Other troops were held in reserve behind this line.

General Peter Graf zu Wittgenstein commanded the vanguard of the (largely Austrian) Army of Bohemia. Count Peter Petrovich Pahlen's cavalry led the left column at Cröbern, followed by General Bogdan Borisovich von Helfreich's 14th Russian Division, then part of the Prussian Reserve Cavalry under General Friedrich Erhard Leopold von Roeder. It was directed toward Liebertwolkwitz via Wachau. The remainder of Roeder's troopers together with some Russian cavalry led the center column, followed by the 2nd (Russian) Infantry Corps (Prince Eugen of Würt-

temberg). It was directed on Liebertwolkwitz via Gülden-gossa. To the right, the 1st (Russian) Infantry Corps (Prince Andrey Ivanovich Gorchakov) moved up through the village of Störmthal, while on the far right the (Austrian) IV Korps (Klenau) was approaching Liebertwolkwitz. The Allies had around 44,000 men available. Reinforcements were moving up.

Victor covered the line from Markkleeberg to Wachau, and Lauriston from the Galgenberg to Liebertwolkwitz. A grand battery was deployed on the Galgenberg.

The fighting commenced around 11:00 A.M. First, two Russian hussar regiments were sent forward but fell back in the face of heavy fire. Then two French cavalry divisions advanced. The Russian Sumy Hussars charged the leading regiment and drove it back. The second regiment forced the Russians to retire but were themselves repulsed. The Prussian Neumark Dragoons pushed back the second regiment, while the Silesian Uhlans moved against the flank of this column. The French withdrew to their starting point, with the Prussians in pursuit. French reserves, observing the pursuit coming to a halt, were therefore not committed to the fray. On the left, the fighting bogged down, with neither side making much progress or effort.

Liebertwolkwitz was the key to the position. If it were to fall, then the French grand battery on the Galgenberg would be threatened and forced to withdraw, leaving the center of their line open to the Allies. Around midday Klenau staged an assault on this village, where the French had a strong position. After two hours of bitter street fighting, it fell to the Austrians, but French artillery prevented them from breaking out of the village.

Next, the French cavalry staged another attack in the center, but the Prussians again gained their flanks and forced them back. At 2:30 P.M., Murat launched his final attack, which suffered a similar fate.

At 4:00 P.M. the French recaptured Liebertwolkwitz, bringing this action to an inconclusive end. The Allies lost just over 2,000 men, while the French may have lost more.

## **Liechtenstein, Johannes Joseph Fürst zu (1760–1836)**

One of the finest cavalry commanders of the era, the prince fought for the Austrians in 132 actions, losing 24 horses shot from under him. Always at the head of his troops, leading with tactical skill but refusing to sacrifice them unnecessarily, he was idolized for more than 20 years by his men, who acclaimed him “Magister equituum” (master of horse). A trusted commander and close friend of Archduke Charles, Liechtenstein negotiated the Treaty of Pressburg in 1805 at the end of the War of the Third Coalition and the Treaty of Schönbrunn in 1809 at the conclusion of the War of the Fifth Coalition.

Enthusiastic about the military from his youth, he joined the Pappenheim Kürassiers as an *Unterleutnant* at age twenty-one and rose to major in the Harrach Dragoons in 1787. Distinguished service in the war with Turkey (1788–1791) brought promotion to *Oberstleutnant* (lieutenant-colonel) of the Kinsky Chevaulégers; he climbed the Cetin fortress wall at the head of his men on 20 July 1790. Fighting in the Austrian Netherlands (now Belgium and Luxembourg) in 1793–1794, this cavalry leader displayed his superior tactical and strategic skill at Avesnes-le-Sec on 20 September 1793. Having halted a French advance for four hours with his advance guard, he led the Kinsky Chevaulégers into a large French square, supported by other cavalry to the sides, and took more than 2,000 prisoners. His successful raid on the French camp at Mauberge in 1794 won him promotion to *Generalmajor*.

In 1796 he served in Germany, where he commanded the rear guard and inflicted several defeats on General Louis Desaix. At Würzburg, Liechtenstein directed the light cavalry in outflanking the French line before leading a decisive heavy cavalry charge. In the following year his brigade destroyed a French light cavalry regiment at Rastatt. Moving to Italy in 1799, he fought at the Trebbia (17–19 June), halting General Jacques Macdonald's attack on the last day, and secured the fortress of Coni. Back in Germany in 1800, he led his cavalry to save the remnants of the army after the defeat at Hohenlinden.

Commander of the Allied fifth column at Austerlitz, Liechtenstein pushed his cavalry forward to support the Russian general, Prince Peter Bagration, in the north and covered the retreat. He then was entrusted with the peace negotiations, which concluded with the Treaty of Pressburg. He had succeeded his brother as sovereign of the Principality of Liechtenstein but abdicated in 1806 rather than serve Napoleon as a prince of the Confederation of the Rhine.

After peacetime *General Kommandant* appointments in the Empire, he commanded I Reserve Korps in 1809 and

took Ratisbon (Regensburg), before covering the retreat from Bavaria. Leading the cavalry at Aspern, he slept among his men on the front line overnight. Directing the consolidated Reserve at Wagram, his attack from the west caught Napoleon by surprise. After the Austrian defeat, however, he signed the Treaty of Schönbrunn, following which he was promoted to *Feldmarschall*; he then retired.

### Ligny, Battle of (16 June 1815)

The Battle of Ligny took place during the Waterloo campaign in the south of the newly established Kingdom of the Netherlands; today, Ligny is in Belgium. The rival armies were led by Napoleon, commanding the (French) Army of the North (*Armée du Nord*), and Field Marshal Gebhard Lebrecht Blücher von Wahlstatt, commanding the (Prussian) Army of the Lower Rhine. The Prussians held on for most of the day, but a final assault on the village of Ligny that evening broke through the center of their position, leaving Napoleon in possession of the battlefield. However, he did not achieve his objective of destroying the Prussian army as an effective fighting force. Blücher's men escaped to fight another day, at Waterloo, turning the tactical defeat at Ligny into a strategic victory.

Napoleon's forces had crossed the Franco-Netherlands border the previous day, taking the city of Charleroi. His strategy was to drive the two Allied armies apart, achieving local superiority and defeating them in detail. The Allied strategy, involving the Anglo-Allied army under the Duke of Wellington as well as Blücher's Prussians, was to unite their forces rapidly once it was clear that Napoleon was making a serious attack, bringing their superiority in numbers into play to defeat him. For political reasons they could not allow Brussels to fall into the hands of the French, so they had to concentrate their forces to its fore, which meant moving forward to meet Napoleon's attack, a

maneuver that was particularly dangerous when facing a commander as mobile as Napoleon.

The (Prussian) I Army Corps (General Wierprecht von Zieten), covering the frontier around Charleroi, fought a rearguard action on 15 June, allowing Blücher to commence the concentration of his army in the Sombrefe area to fight a holding action against Napoleon. Wellington had made various promises to the Prussians to be in a position to support them with 20,000 men immediately, while bringing up the rest of his army for the decisive battle the next day.

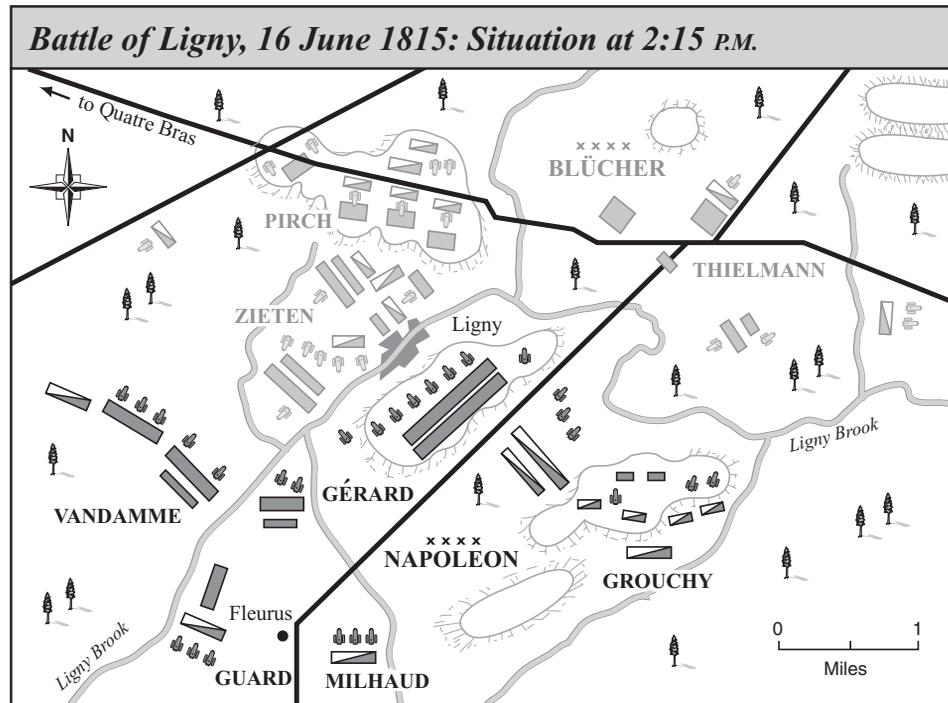

The forces available to Napoleon that day included the Imperial Guard; III Corps (General Dominique Vandamme); IV Corps (General Maurice, comte Gérard); VI Corps (General Georges Mouton, comte Lobau); General Jean-Baptiste, baron Girard's division from II Corps; and the cavalry corps of generals Claude Pajol, Isidore Exelmans, and Edouard Jean Baptiste, comte Milhaud, for a total of around 77,000 men. He also attempted to bring his I Corps (General Jean-Baptiste Drouet, comte d'Erlon) into play (20,000 men), but because of errors in communication, d'Erlon did not arrive. The quality of Napoleon's forces was good, with a solid cadre of experienced troops.

Three of the four of Blücher's corps, around 83,000 men, arrived in time for the battle. Owing to poor staff work, IV Army Corps (General Friedrich Wilhelm Graf Bülow von Dennewitz) was delayed. Two-thirds of Blücher's men were untried militia and suffering from a lack of food, water, clothing, arms, and ammunition.

The Sombrefe area had been selected in May as a suitable position for a defensive battle. The undulating countryside offered much dead ground, and the tall crops provided concealment. The villages of St. Amand, Ligny, Sombrefe, Tongrinne, Boignée, and Balâtre all featured stone buildings that gave cover. The windmill at Bussy and the church spires in the villages made good observation posts.

Blücher's intention was to fight an aggressive defense, holding up the French long enough for Wellington to arrive. He placed his I Corps in the front line, mainly in the villages of Ligny and St. Amand, and held his II Corps (General Georg Dubislav Ludwig von Pirch) in immediate reserve. The III Army Corps (General Johann Adolph Freiherr von Thielmann) covered the Namur road from Tongrenelle to Tongrinne. Bülow was expected to move up along this road. Napoleon deployed Vandamme and Girard against St. Amand and Gérard against Ligny. Exelmans's and Pajol's troopers stood observing Thielmann.

The battle commenced around 2:30 P.M. Vandamme moved against the village of St. Amand, with Girard coming up in support once the village was being stormed. The Prussians held their ground, so Vandamme attempted to

Adapted from Chandler 1999, 250.

outflank their position by throwing in Girard against the farm of St. Amand la Haye. This maneuver was successful, and the Prussians retired, having suffered heavy losses.

About 3:00 P.M. Gérard commenced his attack on Ligny. Here, too, the fight was bitter, with the Prussians contesting every inch of ground. Attack was followed by counterattack. The French attempted to storm the church in the center of the village. When that attack was not successful, they tried to move around Ligny. By about 4:00 P.M. Gérard held most of the village.

Around the same time, the Prussians launched a counteroffensive at St. Amand. This was undertaken by men of both I and II Army Corps, led in person by Blücher. The French were expelled from all but one farmhouse in the village. During a counterattack, Girard was mortally wounded. The French then moved against the Prussian flank at Wagnelée, forcing them to retire.

About 5:00 P.M. the Prussians staged a counterattack against Ligny, clearing much of the village at bayonet point. The hand-to-hand fighting was particularly vicious here, with quarter neither requested nor given.

Napoleon sent a division of the Young Guard into action at St. Amand. The Prussians then staged their second counterattack, and the village was again contested. The village fell to the French when they attacked it from three sides simultaneously.

About 6:00 P.M. the Prussian 6th Brigade was sent in against Ligny. This attack achieved only limited success, as

the French maintained their hold on the south of the village. Each house had to be taken individually. Much of Ligny was now on fire, and every open space was covered with the wounded. Blücher then committed the 8th Brigade to the battle, which made some initial headway. However, counterattacks by the French slowly drove the Prussians back. They were on the point of losing the village.

The Prussians then staged their final assault on St. Amand, taking the village. They were hoping that Wellington would soon arrive to support them, but their scouts reported the approach of d'Erlon's Corps. The Prussians now held St. Amand.

About 8:30 P.M. Napoleon sent in the Imperial Guard against Ligny, and this attack broke the Prussian center. Blücher attempted to stabilize the situation with a cavalry charge, but he was trapped under a fallen horse and control was lost over parts of the Prussian army. Blücher's chief of staff, General August Graf Neidhardt von Gneisenau, attempted to direct the Prussian withdrawal on Tilly, close to Wellington's positions, but the Prussians fell back to Wavre, 10 miles to the north.

Although the Prussians were soundly beaten and suffered 25,000 casualties to the French 11,000, they had not been destroyed, and as the French were unable to pursue them in the immediate aftermath of the battle, the Prussians were able to recover and regroup, with the charismatic and dogged Blücher back in command. The Prussians would see action again at Wavre only two days later when,

much more significantly, they were also in position to detach the bulk of their forces to aid the beleaguered Anglo-Allies only a few miles away at Waterloo on the same day.

## Ligurian Republic (1797–1805)

Prior to the French Revolution the maritime republic of Genoa was dominated by a small oligarchy of patricians, most notably the Doria, Spinola, and Durazzo families. During the War of the First Coalition, Genoa remained neutral. The port of Genoa and the city's wealth were too important for Bonaparte, conducting operations in northern Italy at the time, to ignore. In late May 1797 Genoese democrats rebelled against the government, benefiting from Bonaparte's support in arms and in the French military presence in the region. The old oligarchic government was toppled, and a pro-French Ligurian Republic was proclaimed.

On 6 June Bonaparte imposed a new provisional government, consisting of moderate republicans, fourteen members of the bourgeoisie, and eight nobles. On 2 December 1797 the Ligurian population approved a new constitution, modeled on the 1795 French Constitution. It established a Directory and a bicameral legislature. The republic faced major economic difficulties; aside from a decline of its maritime commerce, it was subject to contribution (expropriation of funds), requisitions, and plundering by the French troops.

While the other Italian "sister" republics collapsed in 1799, the Ligurian Republic survived until June 1800. In early April of that year, the Austrians began an offensive against the Ligurian coast with the help of the (British) Royal Navy and on 19 April laid siege to Genoa. General André Masséna, who led the French forces, was determined to resist the Austrians until Bonaparte reached the Po valley and refused an offer by Austrian general von Melas to capitulate. However, conditions in the city deteriorated rapidly, and when it became clear that Bonaparte would not be able to reach Genoa and lift the siege quickly, Masséna surrendered on 4 June. The Austrians allowed Masséna and thousands of French troops to leave the city. The Austrian occupation of Genoa lasted, however, a mere twelve days. Following his victory at Marengo, on 14 June, Bonaparte regained control over northern Italy, including Genoa.

The Ligurian Republic was quickly restored and a new government, comprising pro-French moderate liberals, was established. On 24 June 1802 the Ligurian Republic proclaimed a new constitution. The executive power belonged to a senate presided over by a doge. However, the Ligurian Republic was independent in name only. Bonaparte selected both the senators and doge. Antonio Salicetti, the French representative in Genoa, largely governed the republic. France imposed fiscal impositions and requisitions to support its troops. Moreover, Liguria was forced to provide soldiers and sailors to Bonaparte. After the Peace of Amiens, Genoa had to close its port to British ships, bringing maritime traffic to an almost complete halt.

Clearly, the Ligurian Republic was an anachronism. On 4 June 1805, upon the "request" of the Ligurian Republic, Napoleon annexed that state into the French Empire and divided its territory into the departments of Genoa, Montenotte, and Apennins. After the fall of Napoleon, Liguria was incorporated into the Kingdom of Piedmont-Sardinia.

## Liverpool, Robert Banks Jenkinson, Second Earl of (1770–1828)

Robert Banks Jenkinson, Baron Hawkesbury (1796), second Earl of Liverpool (1808), held high office in the British government almost continuously through the wars against

Napoleon. His prime ministership (1812 to 1827) encompassed the last phase of the conflict, peacemaking, and the turbulent transition to peace after twenty years of fighting.

The son of one of William Pitt's cabinet ministers, Jenkinson was elected to the House of Commons just before he could take his seat at the age of twenty-one. He soon received minor office and proved himself a good orator. When Pitt resigned in 1801 over the inability to follow Irish union with Catholic emancipation, Hawkesbury was one of those persuaded by the departing leader to continue in Henry Addington's administration. Although he had himself favored continuing the war, he found himself as foreign secretary in a government committed to negotiating peace with the French foreign minister, Charles Maurice de Talleyrand, and Napoleon, and was naturally criticized by those who felt that Britain had surrendered too much in the Treaty of Amiens (1802).

When Pitt returned to office in 1804, after the renewal of war, Hawkesbury was nevertheless merely moved to the chief domestic department as home secretary. Out of office during Lord Grenville's period in office (the so-called Ministry of All the Talents, February 1806–March 1807), he resumed the same post in the Duke of Portland's government. In 1809 when Spencer Perceval became prime minister, Liverpool (as Hawkesbury was now known) became secretary of state for war and the colonies. He was strongly committed to the Peninsular War but warned the future Duke of Wellington not to take military risks that would undermine support at home. Following the assassination of Perceval in 1812, Liverpool was the unanimous choice of his colleagues to be prime minister.

Although he was personally opposed to altering the political restrictions on Catholics, he dealt with the divisive issue by having no official policy and allowing individual ministers to voice their individual views while carefully balancing the cabinet between the two sides. As head of the government he shared the credit for his country's vital contribution in the Peninsular War, the Battle of Waterloo, and the final defeat of Napoleon, but also the blame for the repression of unrest in the five years following the end of wartime prosperity. The social situation was in no way helped by the Corn Laws, which fixed the price of grain at a high rate to discourage cheaper foreign imports, and abolition of the income tax (paid only by the well-to-do) in 1816, which he was virtually forced to accept by the landowners who controlled Parliament.

In 1821–1823 new ministers brought into the cabinet wanted changes in foreign and economic policy. Liverpool sided with the foreign secretary, George Canning, and supported tariff reduction, including those on grain, to the anger of Wellington and some other colleagues. By the middle of the decade the ministry was divided, particularly

on the Corn Laws and Catholic emancipation. Liverpool was on the verge of retirement when he was forced to resign following a crippling stroke in February 1827. His accomplishment in holding together a talented but temperamental combination of ministers of differing political hues for longer than any of his successors became more obvious in the next three years as his party fragmented, paving the way for the major reform of Parliament in 1832.

## Loano, Battle of (23 November 1795)

The main engagement of a series of operations that took place from 22 to 29 November 1795, the Battle of Loano was a victory that consolidated the French position in western Liguria and in the Maritime Alps, forcing the Austro-Piedmontese army on the defensive.

Since 1792 Revolutionary France and the Kingdom of Piedmont-Sardinia had been at war for the possession of Savoy and Nice. After two years of indecisive actions in the Piedmontese Alps, the French strategy turned to Liguria. With the exception of the Piedmontese enclaves of Oneglia and Loano, these rugged territories belonged to the neutral Republic of Genoa. In June 1795, the Piedmontese (Sardinian) army, under Austrian general *Feldmarschalleutnant* Michael Freiherr von Colli, and the (Austrian) Army of Lombardy, under *Feldzeugmeister* Joseph Nikolaus Freiherr De Vins (Allied commander in chief), drove the French back to the line of Borghetto, which stretched for 15 miles from the coast up to the heights dominating Ormea, in the upper Tanaro valley. The Austro-Piedmontese established a position on a roughly parallel line of entrenchments from Loano, on the coast, to Garessio. The Piedmontese were to watch the northern span, from Garessio to the Colle Scravaion. The Austrians held the rest of the line, with strongpoints on Roccabarbena, Toirano, and Loano.

On 21 September, General Barthélemy Schérer replaced General François Kellermann at the head of the Armée d'Italie. He soon received substantial reinforcements in manpower and supplies. Schérer's army could now field 25,000 men, a force strong enough to successfully strike and separate the Allied armies, which on paper numbered 43,000 strong. Strategic consumption had, however, considerably reduced this figure. Bad weather and early snow made life unsustainable in mountain entrenchments, so that several Allied units took shelter in the villages nearby.

The French concentration ended on 22 November, masked by feint movements to winter quarters. The same day a sick De Vins handed over command to General Olivier Graf von Wallis. In the early morning of the twenty-third, the French attack developed along three directions. On the left, Jean Philibert Sérurier led a diversionary action against the Piedmontese in the upper Tanaro valley. Though eventually forced back to his original positions, he succeeded in preventing Colli from detaching troops to the center, where the main blow was to be delivered. In this sector, General André Masséna attacked with 13,000 men. While some Austrian units bravely resisted at Alzabecchi, others panicked and fled back to Bardinetto. For fear of being outflanked, *Generalmajor* Eugène Graf d'Argenteau's troops retreated in disorder, thus exposing the northern flank of the Austrian left wing. The latter faced the attack of General Pierre Augereau's division. With the effective support of gunboats along the coast, and spearheaded by General Jean Lannes, the French made some progress at Toirano and Boissano but could not break the Austrian resistance at Loano. A pouring rain put an end to this indecisive engagement.

Wallis, informed of Argenteau's rout and at risk of being entrapped with his back to the sea, retreated to Finale. On the twenty-fourth, he sent a column with all his guns and wagons up the road to the San Giacomo Pass, only to discover that the defile was already in French hands. Forced to abandon most of their artillery, the Austrians continued their retreat to Acqui along the coast, via Savona. Allied losses at Loano amounted to 50 guns and 5,500 dead, wounded, and prisoners. The French had 1,300 dead and wounded, and 400 prisoners taken by the Piedmontese.

## Lodi, Battle of (10 May 1796)

A relatively minor engagement against the Austrian rear guard defending the bridge over the Adda River in the Italian village of Lodi, this battle was nevertheless instrumental in the development of Bonaparte's self-perception and of his public image as a great commander.

After defeating the Piedmontese in his first Italian campaign, Bonaparte turned his attention to the pursuit of the Austrians under *Feldzeugmeister* Johann Peter Freiherr von Beaulieu. It was necessary to cross the river Adda on a 170-yard-long wooden bridge at Lodi, in defense of which Beaulieu had left a rear guard of some 12,000 men and 14 cannon.

Bonaparte decided to storm the bridge, even though the Austrian guns completely dominated it. He sent a cavalry contingent up the river to cross and then sweep down on the Austrian right flank. He formed his grenadiers into columns in the shelter of the city walls and gave them an inspirational speech. Then, to the cries of “*Vive la République*,” they stormed the bridge. This attack faltered, but generals André Masséna and Louis-Alexandre Berthier soon led another attack across the bridge. In light of the heavy Austrian fusillade on the bridge, many French troops jumped off and opened fire from the shallow part of the river. A counterattack by the Austrians was foiled as French cavalry arrived just as more French infantry attacked the bridge. The cavalry sabered the enemy gun crews and routed the Austrian forces, which left behind their artillery, several hundred dead, and almost 2,000 prisoners.

Bonaparte was a whirlwind of action. Observing from close range and from a church tower, he took personal charge of every detail. He even positioned the cannon along the river, earning for himself the sobriquet “the little corporal” for doing work normally assigned to a soldier of that rank. Bonaparte's strength lay not just in his military skills but in emotional leadership, something that had not been particularly necessary in his previous engagements. He had inspired his men to undertake the rather daunting task of running across a bridge into concentrated Austrian fire.

The Austrian retreat from Lodi opened the road to Milan and gave the French troops new confidence. Lodi was far more important than simply a battle that opened the way to Milan. Beyond its somewhat limited military significance, the battle created a change in Bonaparte's attitude toward his future: He now knew he was a leader. In exile at St. Helena he wrote that it was at Lodi that he first saw himself as able to achieve great things.

Lodi also had an important effect on Bonaparte's troops. It was there that they first observed him in action

The Battle of Lodi, where after seizing the bridge over the Adda, the French defeated the Austrians and proceeded to occupy Milan. (Print by Valadon, Bousson, Paris, after F. de Myrbach from *Life of Napoleon Bonaparte* by William M. Sloane. New York: Century, 1906, vol. 1)

and finally gained complete confidence in him. It was the beginning of the special relationship between Bonaparte and his men; indeed, Lodi marked the beginning of their personal devotion to him that would last some twenty years.

### Lonato, Battles of (31 July and 3 August 1796)

During the frantic week leading up to the decisive Battle of Castiglione (5 August 1796), two minor engagements were fought on 31 July and 3 August at Lonato, a small village on the hills southwest of Lake Garda. Both were French victo-

ries that contributed to the success of Bonaparte's plan to repulse the first Austrian attempt at relieving Mantua.

In July 1796 a reinforced Austrian army of 50,000 men under *Feldmarschall* Dagobert Graf Würmser moved south from the Tyrol in three columns. On 28 July while the main body under Würmser pushed down the Adige valley, and another smaller column under *Feldmarschalleutnant* Johann Meszaros Freiherr von Szoboszio advanced on Verona from the east, the right wing (18,000 under *Feldmarschalleutnant* Peter Vitus Freiherr von Quosdanovich), after a tiring march down the Chiese valley, unexpectedly debouched west of Lake Garda. On 30 July Quosdanovich took the city of Brescia, thus severing Bonaparte's line of communication to Milan. By that time, the bulk of the (French) Armée d'Italie (about 42,500, including the force besieging Mantua) had deployed in a central position just south of Lake Garda on both banks of the Mincio River. The serious threat posed to his rear forced Bonaparte to concentrate against Quosdanovich. He then ordered the abandonment of Verona and the raising of the siege of Mantua.

By early morning on 31 July, most of his divisions (led by generals Hyacinthe François Despinoy, André Masséna,

and Pierre Augereau) were across the Mincio moving westward. On its way to Brescia, the French advance guard under Despinoy (about 4,700 men) ran into one of Quosdanovich's brigades (4,000 troops under *General-major* Peter Ott Freiherr von Bartokez) at Lonato. The French were first repulsed and then pursued by some Austrian cavalry up to the hills east of the village. Very soon, however, General Claude Dallemagne's brigade (and possibly General Antoine Guillaume Rampon's) of Masséna's division joined in the fight with some artillery. Overwhelmed, Ott began an orderly fighting retreat back to Ponte San Marco and Brescia, leaving Lonato in French hands. Despite his later claims, it is not clear whether Bonaparte was in command on the spot.

From 1 to 3 August, while Würmsers was advancing to cross the Mincio to come to Quosdanovich's rescue, a confused sequence of movements and countermovements took place in the broken terrain between Brescia and Lake Garda. On 1 August, the Austrians abandoned Brescia and retreated northeast. Aware of Würmsers's advance across the Mincio, Quosdanovich made an attempt to link up with his commander in chief in the Lonato-Castiglione area. Accordingly, on the second attempt he dispatched *Generalmajor* Joseph Ocksay Freiherr von Ocska's brigade (about 3,600 men) to Desenzano on the southern shore of Lake Garda. The following day at dawn, Ocksay attacked and occupied Lonato, defeating General Jean Joseph Pijon's brigade (1,500 troops) and taking many prisoners, including the commanding general, and three guns.

The rest of Masséna's division (9,000 men), with Bonaparte, soon counterattacked with most units deployed in *colonnes serrés* with supporting cavalry and artillery, forcing by sheer weight of numbers Ocksay out of the village and back to Desenzano. To entrap the discouraged enemy, Bonaparte promptly sent a flying column of cavalry and light infantry under General Jean Junot to block the northern exits from that village. Ocksay consequently had to surrender with most of his men.

The defeat at Lonato definitively frustrated Quosdanovich's attempt at linking with Würmsers and, together with other minor reverses, obliged him to retrace his steps back to the Chiese valley and the western shore of Lake Garda. Free from Quosdanovich's threat, Bonaparte was now ready to fall on Würmsers.

### López Ballesteros, Francisco (1770–1833)

A well-known Spanish general in the Peninsular War, Francisco López Ballesteros was in 1808 a junior officer in the Resguardo, or customs guard, in the province of Asturias in northern Spain. In the aftermath of the Spanish uprising he was appointed by the provincial junta established in Oviedo to the rank of first brigadier and then major general, taking command of a division of the Army of Asturias. Assigned to home defense, he took no part in the campaigns of 1808 and saw no action until May 1809 when the French marched on Oviedo. Bypassed by the invaders, Ballesteros led his 10,000 men in a desperate march to save the city but was unable to arrive in time. Doubling back, he therefore struck eastward and stormed Santander, which had been left almost unprotected by the French, only to be defeated by a relief force that arrived the next day. Ballesteros, however, escaped by boat, while his division was reconstituted in Asturias.

Transferred to join the Army of the Left with his new troops later in the year, the Asturian commander next fought in the campaign of Alba de Tormes, before wintering in the Sierra de Francia with the rest of the Duque Del Parque's forces. Brought still farther south to defend Badajoz, the Army of the Left—and with it Ballesteros—spent 1810 skirmishing on the frontiers of Andalucía (Andalusia) against the troops of Marshal Nicholas Soult. From these actions Ballesteros derived little profit, but in March 1811 his fortunes changed. When Soult marched on Badajoz, he and his division—now a tough veteran fighting force—were cut off in the mountains that divide Extremadura from Andalusia (Andalucía). Showing considerable enterprise, Ballesteros spent most of the next few months launching an incessant series of attacks on the French and also made an appearance at Albuera.

With his reputation boosted by a number of minor victories, in August 1811 he and his men were transferred by sea to a new base at Algeciras, in the far south. Continuing to harass the French, they then took a prominent part in the diversionary operations that helped set up the Earl of Wellington's victory at Salamanca in July 1812. Promoted in the wake of the Allied triumph to the command of the Spanish Fourth Army, Ballesteros set up his headquarters at Granada. Lionized by the liberal press, he now considered himself to be one of the foremost commanders in Spain, and in consequence reacted very badly when he heard that Wellington was being made commander in chief

of the Spanish armies. So angry was he, indeed, that he attempted to lead a military revolt against the government, but he received no support and was placed under arrest and banished to Ceuta.

After 1814 he was at first favored by the restored Ferdinand VII, who made him minister of war, but after a short period he was dismissed, as a result of which he joined the liberal cause when revolution broke out in 1820. A moderate, however, he had little stomach for the radicalism of many of the leading liberals and therefore put up little fight against the French army that intervened to rescue the absolutist cause in 1823, choosing rather to flee into exile. Eventually settling in Paris, he died in 1833.

## Losses (French)

The armies of the Revolution and the Empire were the first ones with several million men to pass through their ranks. Recruitment of younger and younger conscripts compensated for the losses suffered. Losses exceeded one million deaths (from all causes) for the whole period. Any evaluation of French losses is difficult since “the necessary documents do not exist [so] we could give only vague conjectures not founded on official records” (Bodart 1916, 131–132). Karl von Clausewitz himself would go on to say, “Reports on the number of persons killed and wounded are never precise, rarely sincere, and most of the time voluntarily truncated” (Clausewitz 1976, 248–251). Indeed, the *Bulletin de la Grande Armée* includes many examples of forgery; the number of 20,000 drowned Allied soldiers in the ponds of Austerlitz, for example, might be an exaggeration of the true total by a factor of one hundred.

In 1900 a member of the staff at the War Office in Paris named A. Martinien, after establishing tables of officers killed and wounded in the Napoleonic Wars, determined that it was an impossible task to extend his research to include the lower ranks (Lemaire 1999, 15). About 10 percent of superior officers of the Republic were killed in action, while during the Empire the proportion rose to more than 20 percent. The total of French and allied offi-

cers killed or wounded in the armies of Napoleon between 1805 and 1815 has been estimated to be approximately 60,000 (Bodart 1916, 122–124).

In 1892 a study by Dumas and Vedel-Petersen offered very different results. According to them, the data compiled by Fröhlich for total civil and military losses between 1801 and 1815 are strangely precise: 5,295,084 deaths (Dumas and Vedel-Petersen 1923, 33). The maximum figure appearing in studies hostile to Napoleon is 5,256,000 military personnel killed during the Empire, among whom 3,097,720 were actually Frenchmen (Soubiran 1969, 12–14). In fact, a million Frenchmen are thought to have died, among which 471,000 recorded deaths can be attributed to combat and disease, while 530,000 soldiers are believed to have gone missing (Houdaille 1972, 27–50).

According to others, the wars cost France 1,070,000 men (306,000 killed and 764,000 wounded) and 265,000 to its allies (65,000 killed and 200,000 wounded). The disability rate among surviving wounded soldiers was approximately 15–20 percent. To this Bodart asserts the need to add 600,000 deaths resulting from disease, cold, and other causes (Bodart 1916, 131–132). The figure of 1,700,000 deaths, given by Hargenvilliers and adopted by some nineteenth-century historians, is an overestimate because of the uncertainty of the fate of those reported as missing.

Among the 1,285,000 killed and missing soldiers of the Empire were 537,000 prisoners and 280,000 deserters (out of 2,025,000 mobilized). Up to 300,000 of them probably returned, without military authorities being informed of the fact (Houdaille 1972, 27–50). Estimates provided by demographers seem to be the most reliable: “400,000 to 500,000 for the Revolution [1792–1803], or a third of the men who served, and for the Empire [1804–1815] from 800,000 to 900,000, that is, a little more than 40 percent” (Corvisier and Delmas 1992, 328–329).

To consider a specific region, at least 4,067 Héraultais (men from the Languedoc area) died or were killed on campaign during the years 1792–1815, a minimum figure established from the “Etat-Civil” register. The department lost 20–30 percent of its mobilized men from 1803 to 1810. Their survival rate became shorter as periods of campaigning grew successively more protracted: More than 60 percent of deaths occurred in the two years that followed a soldier’s call to the colors. In 1813 nearly half of the conscripts died in the first six months (Fangier 1971; Peschot 1971; Robert 1971).

Typical losses (killed and wounded) in battle have been estimated on average at 15 percent in case of victory and at 20 percent in case of defeat (Bodart 1916, 14–15). The Battle of Valmy (20 September 1792) resulted in small French losses (90 soldiers killed and 210 wounded), but losses at Eylau (7 February 1807) are estimated at 31.4 percent of

forces (Bodart 1916, 16), what Lemaire describes as the first battle of the period to qualify as “a bloodbath” (Lemaire 1999, 140). The Russian campaign was a disaster for the Grande Armée with, according to Bodart, the loss of 340,000 out of 680,000 men (Bodart 1916, 126–128), though his figures for the total size of the invading force is almost certainly exaggerated. In the Medical Service, only 275 surgeons out of 824 survived (a fatality rate of 33 percent), and barely more than 30 doctors out of 113 (26 percent) (Lemaire 1999, 179).

The armies of the Empire lost 15.6 percent of their forces through disease as against 5.6 percent in combat (Corvisier and Delmas 1992, 328–329). Typhus wiped out huge numbers. In 1805 in Brünn, during the Austerlitz campaign, this disease alone accounted for 12,000 deaths in the French army. During the siege of Torgau (1 September 1813–31 January 1814) the garrison lost 13,500 men out of a total of 25,000 to disease (Soubiran 1969, 101–102, 309). Typhus was responsible for 25,000 deaths among the 30,000 prisoners of the Grande Armée detained in Vilna in 1812 (Dumas and Vedel-Petersen 1923, 118).

## Lough Swilly Expedition (August–October 1798)

In the summer of 1798 the French government (known as the Directory) organized a second expedition to Ireland (the first having been two years earlier) to aid the rebellion of the United Irishmen that had broken out in June. Instead of a large single fleet as had sailed in 1796, this expedition was divided into three small parts, each to be conveyed from a different port. There was no coordination between the separate parts of the expedition, with each commander responsible for organizing and launching his own contingent and each to arrive separately in Ireland. Meanwhile, the British intelligence network was well informed about the preparation of this expedition and its general destination. The first group to reach Ireland, General Jean Joseph Humbert’s force of 1,000 men from Rochefort, landed in Killala Bay on 22 August. The main force of 3,000 men under the command of General Jean Hardy, along with a consignment of 40,000 muskets for the Irish insurgents, sailed from Brest on 16 September, aboard a squadron comprising the *Hoche* (74 guns) and eight frigates commanded by *chef de division* Jean-Baptiste-François Bompard. Also on board was Wolfe Tone, the Irish revolutionary leader.

Despite Bompard’s efforts to avoid Royal Navy patrols and conceal his ultimate destination, two British frigates sighted the French squadron on 22 September. While one frigate shadowed the squadron, the other alerted the British squadron stationed off Ireland. While the trailing frigate eventually lost contact because of poor weather on 4 October, Commodore Sir John Warren’s force of three ships of the line and a heavy frigate joined the chase. On 11 October the French squadron arrived in Donegal Bay and sailed toward Lough Swilly to disembark the expeditionary force. However, Warren’s reinforced squadron of three ships of the line and five frigates had already reached Lough Swilly before Bompard. Bompard turned to flee, while Warren ordered a general chase.

During the night a heavy gale toppled the *Hoche*’s main-topmast, tearing the mainsail. Seeing that the *Hoche* would be unable to escape, Bompard requested that Tone flee aboard one of the frigates, but the Irishman refused to leave his cause to be fought by the French. Tone thus chose to remain on board the *Hoche*, commanding one of its batteries. After a two-hour engagement, the *Hoche* was forced

to surrender. The eight French frigates attempted to escape, but three were taken and, over the next week, the British chased down and captured three of the remaining frigates. Once on shore, Tone was recognized and tried by the British as a traitor, despite his commission in the French Army. Sentenced to be hanged, Tone committed suicide.

### Louis XVI, King (1754–1793)

In 1774 Louis-Auguste, duc de Berry became king of France at the age of nineteen, upon the death of his grandfather Louis XV. He inherited the massive debt accumulated from the War of the Austrian Succession (1740–1748) and the Seven Years' War (1756–1763), and found himself ruling uncomfortably in an age influenced by the liberal ideas of the Enlightenment propounded by philosophes such as Montesquieu, Diderot, Voltaire, and Rousseau, whose principles were incompatible with a feudal monarchy. Louis possessed personal virtues, including courage, but few qualities of an inspiring leader. Conscientious and thought by many contemporaries to be genuinely concerned for the welfare of his people, he attempted economic reforms but could not support the efforts of his ministers when faced with intransigent opposition from the nobility and the Church. If Louis XV lost the affection of his people, Louis XVI could not restore it. Despite his goodwill, Louis's equivocal concessions came too late to save the monarchy.

Born on 23 August 1754, Louis as a child was a serious student, of average intelligence, whose favorite subjects included mathematics, history, and geography. He loved books and could read English, Italian, Spanish, and Latin. He held deep Catholic religious convictions with a sense of compassion. An excellent horseman, he kept a diary of his passion for hunting. He also took an interest in mechanical science, fashioning locks and clocks. Louis was neglected until his untimely elevation as the Dauphin and heir. Deeply affected by the death of his parents, and dominated by his two popular brothers, he lacked self-esteem and grew

introspective. Moreover, he was puritanical, repelled by the dominating influences of his grandfather's mistresses on policy. Louis was as wary of his queen, Marie Antoinette, a former archduchess of the Austrian House of Habsburg.

The marriage of Louis and Marie Antoinette in 1770 fortified the defensive alliance between France and Austria arranged by Louis XV and Maria Theresa in 1756 to counter the growing influence of Prussia. The royal couple was guarantor of a policy that neither of their populations fully accepted after two centuries of warfare. In its early years, the marriage was impaired by Louis's awkwardness and ignorance, and his preference for solitude impelled the queen toward capricious diversions, ruinous gambling debts, and extravagant spending on royal residences. Their marriage was consummated in 1773, and the king sired four children, two of whom survived the king and queen, including the heir, Louis-Charles.

His lighthearted queen sought company in close personal relationships with the princess de Lamballe and duchess de Polignac, successive governesses to her children, leading to charges of favoritism and later libels. Personally she was generous and loyal to her friends, dressing fashionably in a role expected of her, with a fondness for diamonds. The queen avoided the stiff formality of the court, offending courtiers, but she nevertheless led an indulgent lifestyle with her intimate circle at a time when France was facing serious economic problems. The queen came to symbolize the abuses of the monarchy, and she suffered deeply from scorn and sexual libels. The scandal of a public trial over the fraudulent purchase of an expensive diamond necklace in her name by the comtesse de la Motte—who took possession of lavishly expensive items of jewelry and then claimed the queen would pay for them—ruined her, notwithstanding her innocence, and thoroughly discredited the monarchy. Yet, as Louis became increasingly debilitated by protracted bouts of depression, the queen grew stronger, increasing her influence on the king's decisions supporting their royal prerogatives. Not political by nature, she was wedded to the monarchy as a patrimony for her children.

Notwithstanding the near state of bankruptcy plaguing France, a popular treaty of alliance with America in 1778 enabled it to intervene in the American Revolutionary War (1775–1783) in order to oppose the hereditary enemy of France, Britain. By its involvement in the conflict, France intended to restore the balance of power lost as a result of the Seven Years' War. But Louis also feared the loss of France's lucrative colonies in the West Indies if Britain succeeded in suppressing the rebellion. The American Revolutionary War became global, stretching from North America and the West Indies to India. Forty thousand French troops were poised to invade England itself.

The comte de Rochambeau commanded a French expeditionary army in America and with Washington's army defeated the British at Yorktown after Admiral François Joseph de Grasse achieved a signal naval victory there. The Treaty of Paris in 1783 ensured political independence for the infant republic, though the commercial advantages sought by France never materialized. The overall cost of the war to the French budget is estimated, in today's terms, at 5 billion euros, which necessitated further borrowing. Louis later credited much of the economic problems on the "exorbitant but honorable war" in America.

The reign of Louis XVI was otherwise marked by a series of economic and political crises stemming from proposals for tax reform initiated by the king and his ministers to address a looming bankruptcy. More than 40 percent of the budget was devoted to servicing the national debt; the expenses of the court alone accounted for nearly 7 percent of the total. The commoners and peasantry shouldered virtually the entire national debt. The nobility and Church, pillars of the monarchy, successfully resisted a succession of liberal-minded finance ministers unable to extend the tax burden to the privileged classes, who countered by calling for restraint in the court's extravagance.

The king's defiant responses to the Assembly of Notables, the parlement of Paris, and finally the Estates-General, all resentful of arbitrary power, converted the issue into a debate on the legitimacy of the king's authority. The troubles were exacerbated by a severe winter followed by eighteen months of poor harvest, causing a shortage of bread that touched ordinary people visibly. The king vacillated when faced with opposition from the nobility and clergy, dismissing his ministers in turn, only to appoint new ones who urged similar reforms. Finally, the Third Estate, a self-styled commons representing the laboring and productive classes in the Estates-General, declaring itself the sole representative of the people, on 17 June 1789 broke with the First and Second estates, the chambers representing the clergy and nobility, to adopt a constitution with legislative powers. Presented with a fait accompli, the king dispatched troops to Paris and Versailles to ensure public order while threatening the newly formed National Assembly with a possible coup d'état.

On 14 July, sizable elements of the Parisian population reacted violently, storming Les Invalides and the great royalist fortress, the Bastille, in search of arms and powder to defend itself, forcing the king to retreat and acknowledge a de facto constitutional monarchy. The Revolution became increasingly violent, as diverse factions competed for influence and brought the movement's most radical elements into ascendancy in an assembly determined to eliminate the last vestiges of feudal absolutism. The palaces of Versailles and then the Tuileries were stormed by mobs that

sought through plunder and occupation to remove any remnant of royal prestige and authority.

In 1792, war was declared against Austria and Prussia to repel an invading army intent on restoring the Bourbon monarchy, though its progress was checked as a consequence of the decisive French victory at the Battle of Valmy. Members of the royal family attempted a furtive flight but were arrested at Varennes, and an atmosphere of anti-royalist hysteria enraging the people finally sank the fortunes of the monarchy. The king was deposed, and a republic established. The king and queen were imprisoned and tried for treason, notably for conspiring with foreign powers to save the monarchy. Louis was guillotined on 21 January 1793, followed by Marie Antoinette on 16 October. The heir to the throne, Louis-Charles, subjected to pitiless abuse and neglect in the Temple Tower, died two years later.

Louis XVI was as much a victim as a king, neither accommodated by the nobility and church to solve the economic and political crises facing the nation, nor accorded the right to do so by the Assembly. Unwittingly sacrificed by the former to preserve their privileges, he was deposed by the latter for their collective folly consonant with the nascent democratic principles of the Age of Reason.

### Louis XVIII, King (1755–1824)

When Bonaparte seized power in 1799, royalists hoped he would pave the way for a restoration of the Bourbon dynasty, in the person of the pretender Louis XVIII. In the event, this younger brother of the unfortunate Louis XVI would only succeed to the throne in 1814, after Napoleon's first abdication. By the time of his belated accession, contrary to the famous jibe that he lived in the past, Louis XVIII had finally learned a little and forgotten something of the old regime. His recent sojourn in Britain had perhaps mellowed him, for under the Revolution there were few hints of any moderation.

One of the first émigrés to leave France, in 1789, the comte de Provence, as he was then known, was a die-hard reactionary who refused to compromise with the principles of *liberté, égalité, et fraternité*. Indeed, on the eve of the Revolution he urged his older brother to yield nothing to the mounting opposition. Not surprisingly, the declaration he issued from his exile in Verona (after having taken the title Louis XVIII on the death of Louis XVI's ten-year-old son, Louis XVII, in 1795) was a traditional defense of throne and altar. Only a return to the absolutist and aristocratic system that had served France so well for almost a thousand years, he argued, could save the country from its dire predicament.

In the wake of the Terror, the moment for restoration appeared ripe. Yet such an unbending appeal to the past disappointed most resurgent royalists, who desired nothing more than a return to the constitutional monarchy of 1791. Though the Republic seemed unworkable, the extremism exhibited by Louis appeared equally unviable. Hence the attraction of Napoleon, who was quick to quash rumors that he might be the French equivalent of General Monck (restorer of Charles II in seventeenth-century England) by stating that Louis would only march to power over thousands of French corpses.

The degree of internal stability that Napoleon achieved and, above all, the reestablishment of the Catholic Church, ensured that Louis remained isolated. The extrajudicial murder in 1804 of the duc d'Enghien—a member of the House of Bourbon—closely followed by the creation of the hereditary Empire, banished all hopes of a monarchical restoration to a post-Napoleonic future, which materialized only with Napoleon's defeat in 1814.

Even then the elderly, and rather portly, Louis had to endure the indignity of scurrying back into exile when Napoleon launched the adventure of the Hundred Days in 1815. It was still more difficult for Louis to shrug off the accusation that he had returned in the baggage train of the victorious Allies, a beneficiary of French defeat. There was also a severe political backlash when Louis was restored for a second time, but he resisted pressure from the so-called ultra-royalists and began to consolidate a liberal parliamentary monarchy. It was the more reactionary policies of his younger brother and successor, Charles X, that brought the Bourbons crashing down for good in 1830.

## Louise, Queen (1776–1810)

Born 10 March 1776, Louise was the daughter of Charles of Mecklenburg-Strelitz and Frederika of Hesse-Darmstadt. On 24 December 1793 she married Crown Prince Frederick William (Friedrich Wilhelm) of Prussia, who inherited the Prussian Crown in 1797, and proved to be an ideal consort, producing nine children and becoming popular with the Prussian Army as well as becoming her husband's closest friend and adviser. Napoleon, hoping to keep Prussia neutral, attempted to win Louise's favor with gifts, including a lace gown ostensibly sent from Josephine, although by 1805 Louise was at the center of a Prussian court faction determined to fight Napoleon, whom she characterized as a "monster." In the process of educating herself to be queen, Louise's reading in history and politics led her to champion educational and military reforms, and she advised her husband to dismiss ministers like Heinrich vom Stein and Karl August Fürst von Hardenberg in favor of progressive and aggressive men.

Queen Louise of Prussia. An enthusiastic advocate for war with France in 1806, she was described by Napoleon as "the only man in Prussia." (Unsigned print from *Life of Napoleon Bonaparte* by William M. Sloane. New York: Century, 1906, vol. 3)

Louise was present on the field at the Battle of Auerstädt on 14 October 1806 and fled Prussia to Memel under the protection of Tsar Alexander I. Louise and Alexander formed a close friendship that aided Prussian-Russian diplomatic and military relations, although Napoleon viciously caricatured them in French propaganda as Horatio Nelson and Lady Emma Hamilton, imputing an adulterous relationship. After taking Berlin, Napoleon also quoted passages of Louise's seized personal correspondence in an army bulletin in an attempt to smear her. Louise appeared during the treaty negotiations at Tilsit, in a failed attempt to secure concessions from Napoleon, although she did win his sympathy with her beauty and regal poise—something of a change from Napoleon's description of her the year before as “the only real man in Prussia” (quoted in Fremont-Barnes 2002, 16).

Louise did not live to see Napoleon's defeat, instead dying of a pulmonary embolism on 19 July 1810 during a visit to her family in Strelitz. In her honor, Frederick William III in 1813 instituted both the Iron Cross for military valor and the *Luisenorde* decoration for Prussian women. In 1870 Louise's son, Wilhelm I, stopped at her tomb to vow revenge on France before deploying for the Franco-Prussian War.

### Louisiana Purchase (3 May 1803)

On 3 May 1803 in Paris, U.S. minister to France Robert R. Livingston, U.S. secretary of state James Monroe, and French foreign minister François Barbé-Marbois signed the Louisiana Purchase treaty (antedated to 30 April), under which France ceded the Louisiana Territory to the United States. Under two additional conventions signed the same day, the United States agreed to pay 60 million

francs in addition to assuming 20 million francs of private claims held against France, for a total of \$15 million.

The Louisiana Territory had first been claimed by René-Robert Cavelier, sieur de La Salle in 1682, then was split at the Treaty of Paris (1763) between East and West Louisiana, with Britain and Spain, respectively, as the new colonial masters. The territory included the whole or parts of present-day Arkansas, Colorado, North Dakota, South Dakota, Iowa, Kansas, Louisiana, Minnesota, Missouri, Montana, Nebraska, Oklahoma, Texas, and Wyoming.

The First Consul of France, Napoleon Bonaparte, had initially seemed eager to reestablish a French presence in North America. At the secret Treaty of San Ildefonso (7 October 1800), Spain agreed to retrocede Louisiana to France; Bonaparte also, and unsuccessfully, demanded that Spain sell the Floridas. In 1801 he sent an expedition to St. Domingue (present-day Haiti) to reassert French authority over a colony that had become effectively independent under the rule of Toussaint Louverture. In 1802 Bonaparte gave the Duke of Parma the Italian province of Etruria, thus fulfilling an essential clause of the Treaty of San Ildefonso. He then ordered 3,000 French troops to assemble in Rotterdam and depart for Louisiana. Owing to difficulties in finding enough transport ships, however, followed by harsh winter weather, the force was not ready to sail until early 1803.

French policy then changed dramatically in the spring of 1803. In March of that year, Bonaparte ordered that plans to occupy Louisiana be put on hold. In April, when Livingston made a proposal to purchase New Orleans, the port of which was essential to the economic well-being of the territory through which the Mississippi passed, Bonaparte offered not only the city but the rest of Louisiana as well. The Louisiana Purchase was negotiated in a few weeks and ratified by the U.S. Senate on 20 October. Exactly a month later, France officially assumed control in New Orleans, only to pass the province over to the United States on 20 December, with a similar ceremony taking place on 9 March 1804 in St. Louis.

Explanations for Bonaparte's decision to sell Louisiana are twofold. First, in January 1802, he received the news that the commander of the French expeditionary force in St. Domingue, General Charles-Victor Emmanuel Leclerc, had died of yellow fever. This confirmed that the French attempt to restore slavery to France's most valuable colony, already plagued by tropical diseases and Haitian resistance, would probably end in failure, thus diminishing the value of France's other New World colonies. Second, deteriorating relations between Britain and France—nominally at peace from the conclusion of the Treaty of Amiens (25 March 1802) to the renewal of war (18 May 1803)—along with costly preparations for a cross-Channel invasion

force, meant that the French Navy would be better employed in home waters rather than in protecting far-flung colonies. The French treasury, moreover, was in dire need of the extra funds, which the sale of Louisiana provided.

## Lowe, Sir Hudson (1769–1844)

British officer who served as governor of St. Helena during most of Napoleon's final exile on that island from 1815 to 1821.

An Irishman who had seen service mostly in the Mediterranean throughout the Napoleonic period, Hudson Lowe had little in his military career to recommend him for any important position, but the British government nevertheless appointed him to the sensitive post of governor of St. Helena, and he arrived there in April 1816. Lowe was somewhat lacking in the social graces but was well meaning; in terms of his assignment, he proved unimaginative, lacking in initiative, and concerned with following instructions precisely, without regard to the circumstances of the moment.

Lowe made some effort to establish good relations with Napoleon, but he was adamant in restricting his captive's freedom of movement. He was obsessed with the fear, perhaps misplaced, that Napoleon might somehow escape the island. Though St. Helena was very remote, and any approaching ship would have been visible for days, Lowe was nevertheless convinced that somehow Napoleon would

find a way to get off the island, and in so doing ruin Lowe's career. Lowe thus placed increasingly severe restrictions on Napoleon's mobility and insisted that he show himself each day to a British officer.

For his part, Napoleon, whose defeat at the Battle of Waterloo in June 1815 had led to his exile, was furious at having to tolerate what he considered to be insulting restrictions on his movements. For a man who had been Emperor of the French and master of much of Europe besides, Lowe's seemingly niggling infringements on his freedom of movement seemed particularly galling to Napoleon. However, the British refused to allow him to be addressed as such, claiming that the only legitimate title he had was that of general. Lowe could have bent or ignored that political decision, but instead he insisted on enforcing it. He even refused to allow delivery of letters or packages addressed to the "Emperor." Over the years, the two men engaged in a trivial and demeaning war of words. Napoleon died a bitter man, some arguing that much of the blame rests with the approach taken by Lowe toward his uniquely important prisoner.

After Napoleon's death, Lowe continued his military service, attaining the rank of colonel in 1844. He was a career military man of some success, but his legacy is that of a petty jailer of one of history's great personalities.

## Luddites

The Luddites, named after legendary leader Ned Ludd, was a secret organization of skilled workers formed to protest the use of machinery in England's textile industries during the early nineteenth century. The organization's efforts were concentrated in the nation's industrial areas (mainly northern and central England) between 1811 and 1816. Supporters of the cause contended that the recent economic downturn, which was characterized by unemployment, low wages, and a general sense of disillusionment,

was attributable to the rise of machines and the demise of skilled labor.

The majority of Luddites were expert craftsmen whose livelihoods were based upon their ability to cut and manipulate woolen cloth. Such expertise had been highly sought and rewarded by mill owners, and as such croppers received top wages. Yet, in an effort to expand their own profits, mill owners soon discovered that even the crudest machine could more swiftly and cheaply produce the needed goods. Unemployment ensued as mills in the north and Midlands turned to mechanized manufacturing. To reverse this seemingly dangerous preference for technology over human skill, workers turned their frustration against the machines that had replaced them, destroying power looms, knitting machines, and shearing machines in protest. These actions angered owners, who saw their investments dwindling.

However, the rise of the machine was not the only factor challenging the industrial barons in the textile industries. Britain's struggles with France, not just in terms of military conflict but also economic competition, as evidenced by Napoleon's Continental System, which sought to place a ban on British goods across Europe, had, in fact, severely compromised the nation's financial health. Exports sharply declined, creating panic and uncertainty; widespread inflation ensued, particularly in the grain market (where prices were already reeling from a series of poor harvests); and wages dropped. Nonetheless, for these workers, most of whom had received the highest wages for their services, a machine in their local mill was a more tangible and real enemy than the schemes of a foreign dictator.

With little recompense for their demands, Luddite demonstrations grew more violent by 1812, as attacks expanded to mill owners and their personal property. The government, fearing further assassinations, property damage, class hostility, and—given what had happened in France—total revolution, responded harshly. Several key leaders were arrested and a few executed through 1813, and devoid of strong leadership, the organization weakened. Luddism had never been a single, coherent movement, possessing a clear political goal. Its supporters championed a variety of causes, including acceptable working conditions, fair wages, an end to food shortages, and quality control. This ambiguity additionally impaired the movement, and the number of incidents declined. By 1816 the movement all but disbanded. Periodic bursts of class unrest, most notably the Peterloo Massacre (1819), would continue in the immediate aftermath of Britain's peace with France, but the recurrent aggression of earlier years was absent.

### **Lundy's Lane, Battle of (25 July 1814)**

One of two principal battles fought in 1814 on the U.S.-Canadian border during the War of 1812.

Seeking to probe British defenses at Fort George in the Niagara theater, the Americans under General Jacob Brown proved unsuccessful in tempting the British garrison of 600 men to venture out and seek battle. Aware, moreover, that British relief forces under Major General Phineas Riall were nearby, Brown chose to withdraw quickly so as to protect his communications. Riall followed close behind, with reinforcements under Lieutenant General Gordon Drummond marching from the west. The Americans spent the night of 24 July camped on the Chippewa battlefield, and early the following morning Riall dispatched a force of 950 infantry to establish a position just north of the Americans along a road known as Lundy's Lane, which passed over a low hill. A church stood atop the hill on the southern side of the road.

In the morning Riall placed his five cannon in the center of the hill with the infantry arrayed in an arc along Lundy's Lane and extending west from the base of the hill. Brown, with 2,600 men, lay 3 miles to the south. Unaware of his numerical superiority, Brown failed to take advantage of this opportunity, and by 4:00 P.M. Drummond was on his way to Riall's position with 500 men, fresh from a raid across the river earlier that day against what he discovered to be the abandoned American camp at Lewiston.

Around 5:00 P.M. the Americans under General Winfield Scott, about 1,100 men in all, began to advance along the Queenston Road. This ran roughly north to meet Lundy's Lane, with the Niagara River and Niagara Falls to its right. Scott's men reached the base of the hill at about 6:00 P.M. Riall, believing himself outnumbered, ordered a withdrawal, but this was countermanded by Drummond who was at that moment arriving with reinforcements. The Americans suddenly faced between 1,600 and 1,800 troops instead of fewer than 1,000, as before. Scott nevertheless carried on with his regulars, striking Riall's center and left, for a brief time hitting the left flank and rear before being repulsed by the reserves. Scott returned to make several determined attacks on Riall's left, driving it back, but the remainder of the line remained firm. The fighting carried on into dusk and then night, making identification difficult for both sides.

Around 9:00 P.M. 1,300 American reinforcements arrived, while 1,200 infantry and some artillery arrived to bolster British strength. By this time the numbers stood at around 2,100 Americans and 3,000 British, but so determined were the American assaults that Drummond thought he faced 5,000 men. About 10:00 P.M. Brown ordered an assault on the British battery of seven cannon. This was captured, while at about the same time the British left was broken and forced back half a mile. A fierce struggle then ensued when the British sought to retake the guns. Both sides fired at one another through the darkness at exceptionally close range. Around midnight both Brown and Scott were seriously wounded and the Americans fled the field in some disorder, abandoning the captured guns. At 9:00 A.M. on the twenty-sixth, the Americans sought to renew the battle with 1,500 men of their total force, but when they reached the British position, about a mile south of the field, they recognized that greatly superior numbers awaited them and withdrew.

Casualties at Lundy's Lane were very high: The Americans lost 171 killed, 572 wounded, and about 100 missing and captured. The British lost 84 killed, 559 wounded, and about 230 missing and captured.

### Lunéville, Treaty of (8 February 1801)

Concluded in 8 February 1801 following Austria's disastrous defeat at Hohenlinden, the Treaty of Lunéville put an end to Austria's part in the War of the Second Coalition. In line with the earlier Treaty of Campo Formio (1797), Austria was again forced to accept France's annexation of the Austrian Netherlands (Belgium and Luxembourg) and the left bank of the Rhine and to recognize the independence of its surviving satellite states: the (Dutch) Batavian Republic, the (Swiss) Helvetic Republic, and the (northern Italian) Cisalpine Republic. But now there were further provisions. Austria had to agree not to alter a number of fortresses on the right bank of the Rhine and to give up the Habsburg-ruled duchies of Modena and Tuscany, together with some of the territory it had acquired from Venice in 1797. Of these territories, Modena and the Venetian lands went to the Cisalpine Republic, while in a gesture intended to conciliate Spain, Tuscany was given to the son of the Duke of Parma—a son-in-law of Charles IV—as the Kingdom of Etruria.

As if all this was not bad enough, meanwhile, the Austrians were also made to agree that the Duke of Tuscany

should receive territorial compensation in Germany, from which it followed that the ecclesiastical states that made up Vienna's chief power base in the Holy Roman Empire should be put up for "secularization," or, to put it in plain language, annexation. In principle, Austria had already agreed to this process at Campo Formio in that it had accepted that the rulers of the territories lost in France's annexation of the left bank of the Rhine should also be compensated with territory from within the Empire, a question which was to be resolved as a result of the Imperial Recess of 1802–1803.

But what Lunéville meant was that the reorganization of Germany was now likely to be wholesale rather than partial, for such was Austria's need for territorial compensation that the Prussians must necessarily be drawn in, too. Add to this the fact that Vienna had failed to impose any clause in the treaty to the effect that the emperor—that is, Francis II—should have a controlling interest in the settlement of the new frontiers, or still less that foreign powers should be excluded from the process, and it will be seen that Austria had suffered a shattering blow. And, in effect, gone, too, was Austrian influence south of the Alps. Naples had been promised that no treaty would be concluded without it, but it was now left with no alternative but to accept the terms and thereafter played a much more cautious game in terms of international politics.

### Lützen, Battle of (2 May 1813)

The Battle of Lützen took place in and around the village of Grossgörschen in Saxony during the 1813 campaign in Germany. Here, a flanking attack by a Prusso-Russian force under the Russian general Peter Graf zu Wittgenstein surprised Napoleon's column of 144,000 men marching on Leipzig. The Allies (88,500 regular troops and 5,000 Cossacks) were hoping to defeat Napoleon's army piecemeal, not allowing him to bring his superiority in numbers to bear. After denying Napoleon the possession of Leipzig,

they hoped to drive him back on the Bohemian border, forcing him to surrender. They were unsuccessful and withdrew from the battlefield that evening.

Early on the morning of 2 May the Allies deployed their troops for the forthcoming battle, intending to strike Marshal Michel Ney's corps (consisting of the divisions of generals Joseph, comte Souham, Antoine-François, comte Brenier de Montmorand, Jean-Baptiste Girard, and Etienne Pierre Sylvestre, baron Ricard; and Jean-Gabriel, comte Marchand and François Kellermann's cavalry) as it slept in the four villages of Grossgörschen, Rahna, Kleingörschen, and Kaja, which formed a rectangle about 1 kilometer square. This area was filled with trees and bushes, marshy in places, and cut by ditches. Outside of the villages, the terrain was relatively open. Their forces consisted of the corps of generals Gebhard Lebrecht von Blücher and Johann von Yorck (Prussians), and Baron Ferdinand Winzendorode and General von Berg (Russians).

At 11:00 A.M. the Allied forces were deployed in three lines. The first, consisting of Blücher's corps, had generals Wieprecht von Zieten and Joseph Friedrich von Klüx's brigades in the first line, Friedrich von Roeder in the second, and the Reserve Cavalry under Colonel von Dolffs 2 kilometers to the left. In the second line, Berg's corps stood on the right flank, Yorck's on the left. The third line consisted of Winzendorode's infantry under General Prince Eugen of Württemberg, with his cavalry on the left flank toward Domsen. The main army was supposed to form up behind the rear center, but was delayed and did not come up until shortly before 4:00 P.M.

The French forces moving up included the corps of Marshal Auguste de Marmont, General Henri-Gatien Bertrand, Marshal Jacques Etienne Macdonald, and General Jacques Alexandre, comte Lauriston, the Imperial Guard, and the cavalry under General Marie-Victor-Nicolas de Fay Latour-Maubourg. On hearing the sound of heavy artillery fire from Kaja, Napoleon ordered Marmont to accelerate his march to Starsiedel and join Ney's right flank. Bertrand was ordered to Söhesten to attack the Allied left. Macdonald and the I Cavalry Corps were to halt and await developments. The Imperial Guard was to remain in reserve at Lützen. Napoleon was hoping to tie down the Allies frontally and defeat them with a flanking maneuver that would achieve a decisive victory.

Blücher led the attack that commenced about 11:30 A.M., and at about noon Blücher's artillery commenced firing. The Allies considered Ney's men to be the vanguard of a force at Lützen. Reports came in of a cloud of dust over the road from Weissenfels to Leipzig, indicating the direction of Napoleon's army. After bombarding the French encampment for 40 minutes, Klüx's brigade from Blücher's corps was sent to storm the quadrangle of villages. Souham

was overwhelmed, and Grossgörschen fell to the first charge. Klüx easily beat off several local counterattacks.

Meanwhile, the Prussian Reserve Cavalry moved toward Starsiedel, where it surprised Girard. The divisions of generals Jean-Dominique, comte Compans and Jean-Pierre François, comte Bonet from Marmont's corps moved up to Starsiedel and deployed their artillery. Souham then counterattacked and recaptured Grossgörschen. Blücher sent in Zieten to take Kleingörschen, which he did by 1:00 P.M. Klüx then recaptured Grossgörschen. Rahna fell to the Prussians, but Brenier and Ricard counterattacked. Ney threw in Souham and Girard, supported by Brenier, against Kleingörschen. Rahna and Kleingörschen were recaptured, but the Prussians held Grossgörschen.

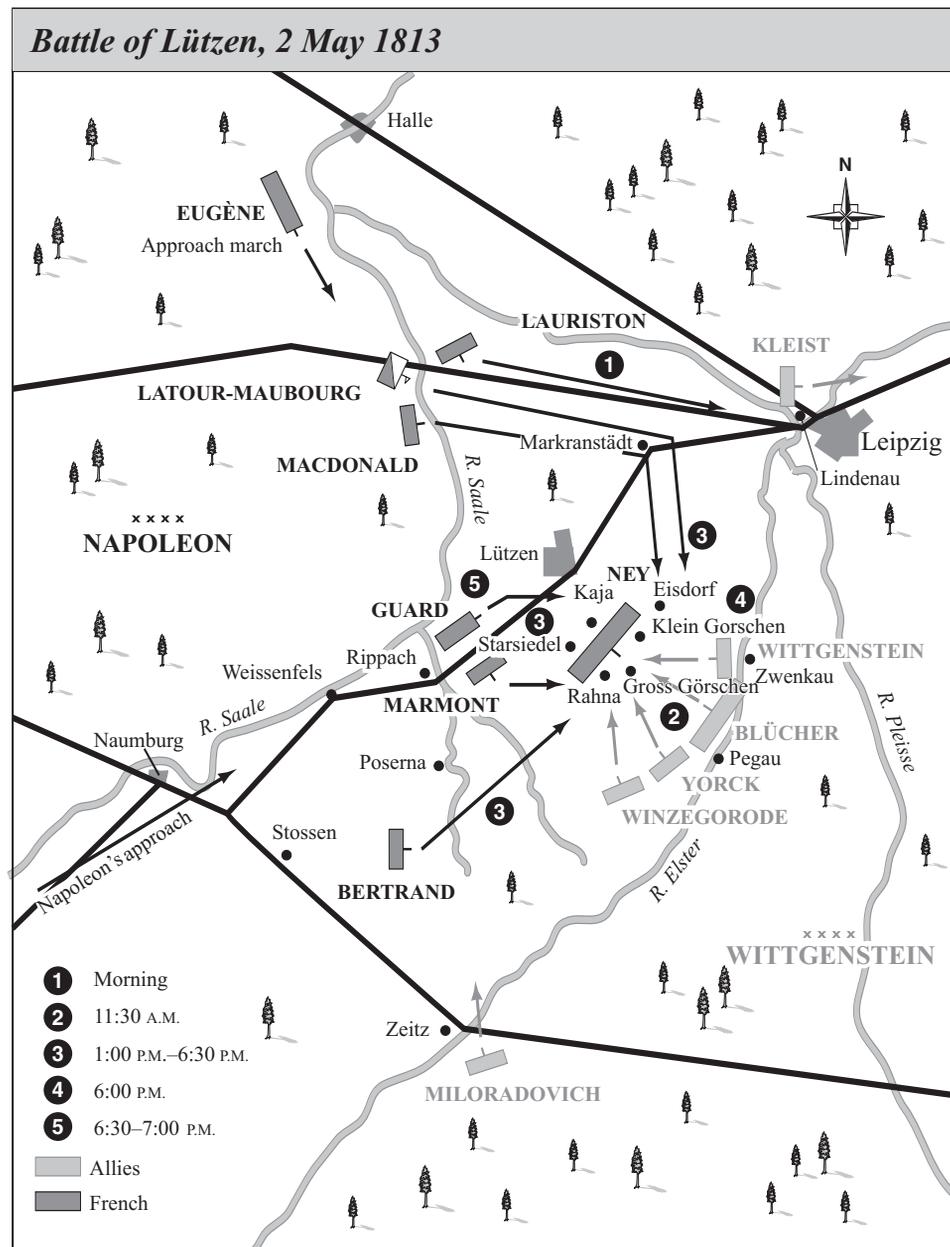

Berg then attacked Starsiedel, his movement coinciding with Ney's counterattack and the loss of Rahna and Kleingörschen to the French. This caused Berg to halt southwest of Rahna, while Blücher's last reserve, Roeder's brigade, moved up, supported by the strong artillery fire. The French abandoned Kleingörschen and Rahna, while the Prussians advanced as far as Kaja.

Shortly after 2:00 P.M. Ney's entire line fell back. Losses were heavy on both sides. One determined charge by the large mass of Allied cavalry might well have settled the issue, but Napoleon now arrived, intending to outflank the Allied position. Because the Emperor's center was in danger of collapse before this maneuver could take effect, Ricard was now sent in and quickly cleared Kaja before moving on Grossgörschen, where his forces took the northern edge of that village before their attack ground to a halt.

On the French right, Marmont, observing 12,000 Russian and Prussian cavalry and Berg's corps, remained largely where he stood. However, his presence was enough to make Wittgenstein delay sending in Yorck and Berg to support Blücher.

Just before 4:00 P.M. the Russian main army arrived and Wittgenstein went over to the offensive, sending in Yorck. General Friedrich Heinrich Freiherr von Hünerbein's brigade moved on Kleingörschen, Colonel Heinrich von Horn's on Rahna, and these fresh troops took Kleingörschen and Rahna for the third time. Close combat took place for about 90 minutes. Ney, Blücher, and General Gerhard von Scharnhorst were wounded, the latter succumbing to an infection from this wound some weeks later. The French regained Kleingörschen and Rahna. The infantry of the 2nd (Russian) Corps under General Prince Eugen of Württemberg then recaptured all four villages, and Ney's corps withdrew beyond Kaja.

Further French forces started to arrive from 5:30 P.M. and moved along the north bank of the Flossgraben, taking positions opposite Kleingörschen. General Charles An-

Adapted from Fremont-Barnes 2002B, 35.

toine, comte Morand's division of Bertrand's corps reached Kölzen. Macdonald's corps moved from Markranstädt toward Eisdorf. Wittgenstein had insufficient men left to oppose them.

About 6:00 P.M. the Young Guard expelled the Allies from Kaja. Napoleon brought up eighty guns, deploying them along the ridge from Kaja to Starsiedel. Macdonald and Latour-Maubourg's cavalry reached Eisdorf. Fressinet's division assaulted that village, while Charpentier's moved on Kitzen. St. Priest's division of the 2nd (Russian) Corps was driven out of Eisdorf. Counterattacks followed, but Gérard regained the village.

Napoleon led the final, decisive attack in the center. Marchand crossed the Flossgraben and took Kleingörschen. Bonnet's division now moved against Rahna, and the Imperial Guard advanced. With Ney's support, four columns under Marshal Adolphe Mortier moved from Grossgörschen on Kaja. The Allies were forced to retreat from the battlefield, although parts of the brigades of Klüx and Zieten disputed Grossgörschen into the night. Blücher's cavalry covered the withdrawal.

Losses were heavy on both sides, the French suffering about 22,000 casualties, 15,000 of which were inflicted on Ney's corps alone. Two generals had been killed, 9 severely

wounded, and 30 regimental commanders' *hors de combat* (out of action). The Allies captured 5 guns and disabled 22 others, losing 2 themselves. The Allies lost about 11,500 men, the Prussians 8,500 of these. Fifty-three Prussian officers were killed, and 244 were wounded.

## Lützow, Adolf (1782–1834)

Adolf Lützow was one of the most famous leaders of the independent volunteer units, known as *Freikorps*, raised during the campaign in Germany in 1813. His fame rested not so much on military successes as on the literary works by members of his command. Lützow became a symbolic leader of German nationalism, and the colors worn by his command became the German national colors.

Lützow was born in Berlin in 1782, and he joined the Prussian Army in 1795. He was a lieutenant by 1806 and was present at the Battle of Auerstädt. Following the Prussian defeat, Lützow was determined to continue the fight against the French invaders. He joined the defenders of Kolberg and came under the command of Major Ferdinand Baptista von Schill. Lützow commanded a squadron of Schill's volunteers and distinguished himself in sorties against the French. Although promoted to major, he resigned from the Prussian Army in 1808, in protest against the Peace of Tilsit.

Lützow rejoined Schill in 1809, when the latter tried to spur an uprising in northern Germany against Napo-

leon. Schill marched his regiment into Westphalia in May 1809 but was disappointed when the population remained passive. Lützow was wounded in fighting at Dodendorf and was left behind when Schill retreated to Stralsund. The wound probably saved Lützow's life, as Schill and most of his command were killed by troops under Jérôme Bonaparte.

In 1811 Lützow was restored to his rank in the Prussian Army. After Napoleon's disaster in Russia, Prussian authorities prepared to resume their war against the French. Chief of staff Gerhard von Scharnhorst authorized Lützow to form a *Freikorps* in February 1813. Lützow quickly organized a group known as the Lützow Corps, or the Black *Jägers*, because of their uniform. The unit was composed of all arms, including five cavalry squadrons, three infantry battalions, and eight guns. Total strength was about 3,000 men. Lützow attracted both Prussians and non-Prussians who were pan-Germans. Unlike other *Freikorps* of the time, up to a third of Lützow's unit were educated young men. Nearly all were from urban and middle-class backgrounds. Several members of the *Freikorps* went on to literary careers, including Theodor Korner, Joseph Eichendorff, and Friedrich Ludwig Jahn.

Lützow's mission was to take his *Freikorps* behind French lines and attack their lines of communication. He hoped to spark nationalist uprisings in the smaller German states, as well as to disrupt French supplies. Lützow accomplished little before an armistice was signed on 2 June and took effect on 14 June. As Lützow was on the French side of the demarcation line, he was to be allowed to return to Prussian territory. However, on 17 June, escorting French troops attacked the *Freikorps*, most of Lützow's command was massacred, and only while he and a few companions escaped.

Lützow's *Freikorps* was reconstituted in time for the resumption of fighting in the fall. The unit assumed a more traditional role and distinguished itself in fighting at Göhrde. After Lützow was wounded, the *Freikorps* was dissolved. The infantry became the 25th Prussian Infantry Regiment, and the cavalry formed the 6th Uhlán (lancer) Cavalry Regiment. When Napoleon returned from Elba, Lützow commanded the 6th Uhlans at Ligny. He was captured but escaped after Waterloo.

Lützow was promoted to major general in 1822 and to lieutenant general when he retired in 1830. He and his *Freikorps* became a symbol of German unity and Romanticism, thanks to a poem written by Korner before his death in 1813. By 1818 German nationalists had adopted the colors of Lützow's Black *Jägers* as the national colors: black from their coats, red from their lapels, and yellow from the unit's buttons. Bands of these colors make up the German national flag to this day.

## Luxembourg

Small, landlocked western European country extending over just 2,500 square kilometers. Located at the junction of the Alzette and Pétrusse rivers, Luxembourg has historically been a place of military significance. The origins of the city are closely associated with the tenth-century castle, a structure that was further fortified in the fourteenth century. The formidable defensive works remained until 1867 when they were dismantled as part of the Treaty of London, an agreement that asserted Luxembourg's territorial and political autonomy. In written history Luxembourg dates from the tenth century, when it was known as Lucil-inburhuc (little fortress). At this time Siegfried, comte des Ardennes, erected a castle (now in Luxembourg city), hence the historical name.

By the start of the sixteenth century Luxembourg was governed by a foreign power, Spain, and from 1506 to 1890, Luxembourg formed part of the territories of numerous European countries: Spain, France, Austria, and the Kingdom of the Netherlands. When the French Revolutionary Wars began Luxembourg formed part of the Austrian Netherlands, but it was occupied by the French during their campaigns in Flanders, formally annexed to the Republic in 1795, and recognized as such by Austria by the terms of the Treaty of Campo Formio in 1797. It was not until 1815 that the process of independence in Luxembourg began, a consequence of the forming of a grand duchy by the Congress of Vienna.

Held between October 1814 and June 1815, the Congress acted as a forum for Europe's powers (principally Britain, Austria, Prussia, France, Russia, Spain, Portugal, Sweden, and German regional representatives) to redraw the Continent's political map following the defeat of Napoleonic France. The primary results of the event, aside from the confirmation of France's loss of those territories it had annexed between 1795 and 1810, included: the enlargements of Prussia and Russia; the reorganization of Germany into a confederation of states; the formation of the Grand Duchy of Luxembourg; and the establishment

of the Netherlands (modern Holland and Belgium joined together) as an independent kingdom. As part of this Europe-wide development, the Duchy of Luxembourg was granted to the Dutch monarch, William (Willem) I.

## Lyons, Siege of (August–October 1793)

Lyons (Lyon) was the second-largest city in France during the Revolution and the scene of a serious counterrevolutionary movement against Jacobin radicalism. A French Revolutionary Army was forced to besiege the city for nine weeks in the fall of 1793 before it overcame locally raised forces. Following the city's surrender, nearly 2,000 inhabitants were executed as rebels.

At the outbreak of the French Revolution, Lyons had approximately 140,000 inhabitants, a population second only to Paris. The city had grown because of the silk trade but suffered from economic stagnation from 1789. Revolutionaries and royalists fought over control of the city, and various political clubs were formed. After the September Massacres of 1792, the Jacobins took control of the city government. Moderates, headed by members of the aristocracy, mobilized their supporters, and on 29 May 1793 they regained control over Lyons. Inspired by counterrevolutionary movements in cities such as Marseilles and Toulon, as well as by the royalist uprising in the Vendée, the city government refused to submit to national control from Paris, whereupon the National Convention ordered the Armée d'Italie and the Armée des Alpes to detach forces to retake Lyons in the name of the Republic.

Lyons mobilized a force of 3,500 to 4,000 men, organized into battalions based in different sections of the city. Because the population of some sections were more radical and could not raise the assigned number of troops, the initial twenty-eight battalions were eventually reduced to only twenty. A number of cannon were also available from the local armory, and crews were recruited to man these guns. The soldiers' pay was raised by means of voluntary contributions, taxes, and confiscations from churches and rebel inhabitants. Those suspected of trying to subvert Lyons's defenses were subject to arrest and imprisonment or execution. A number of émigré aristocrats fought for Lyons against the National Convention, journeying to the

city from exile in Germany and Switzerland. The military commander of Lyons was Louis-François Perrin, comte de Précý.

The leaders of Lyons, realizing they faced attack by troops loyal to the National Convention, tried to stir up support in the surrounding territory. On 9 July 1,500 armed royalists left on an expedition to secure the neighboring towns. They managed to capture Saint-Chamond, Saint-Etienne, and Montbrison, but many peasants resisted them. Captured supplies were sent back to Lyons. The survivors of the expedition returned to the city on 15 September to find the place already under siege.

The National Convention pressed General François Etienne Kellermann to lead most of his Armée des Alpes against Lyons during July. Kellermann was forced to divide his army between defending the Swiss frontier and sending other detachments to Toulon and Marseilles. In late July, he finally massed 8,000 troops near Lyons. Many were untrained peasant levies, and Kellermann was short of siege artillery. He tried to negotiate a peaceful settlement to the dispute, but representatives sent by the Committee of Public Safety forced him to open siege operations against Lyons in the first part of August. Kellermann's operations were limited to periodic bombardments during August and September. The city was not completely surrounded until 17 September. Even so, Kellermann's army increased in numbers, thanks to reinforcements from Paris. However, because he failed to prosecute the siege energetically

Kellermann himself was replaced by General François Amédée Doppet.

Lyons was short of food by the beginning of October, and many buildings had been damaged or destroyed by the bombardment. The population became discouraged by the lack of outside support. On 8 October representatives of the various sections met and agreed to ask for terms from Doppet. During the night of 8–9 October, Précý and 700 followers tried to cut their way out of the city, being harassed by government troops along their way to the Swiss border. Précý and a small number escaped into Switzerland on 10 October. Lyons had surrendered the day before.

The Committee of Public Safety had intended to destroy the homes of wealthy merchants and aristocrats, but little further damage was done to the city. Nearly 2,000 suspected royalists, however, were arrested and executed between October 1793 and March 1794. When the guillotine was unable to keep up with the work, hundreds were executed by grapeshot and musket fire.

## **Maastricht, Siege of (September–November 1794)**

Not to be confused with the first bombardment of Maastricht by General Sebastián Francisco de Miranda in 1793, an attempt to take the city that proved abortive, Maastricht was successfully besieged and captured in 1794 by General Jean-Baptiste Kléber. After their victory at Fleurus on 26 June the French sought to acquire a stronghold, as much to consolidate their victory as to provide winter quarters and a depot for the brave and successful, yet ill-equipped, ill-fed, and ill-clothed republican armies in the north. Maastricht was deemed perfect, and Lazare Carnot, one of the *Directeurs* in the government, intervened to press the issue with Pierre-Mathurin Gillet, the *représentant en mission*, or political officer, accompanying the Army of the Sambre and Meuse. On 25 July the siege was ordered, but the exact date of its commencement is not entirely clear.

In mid-September, probably on the seventeenth, the siege commenced. Kléber, commanding around 40,000 troops, offered terms of surrender to both the governor (the Prince of Hesse-Kassel) and to the board of magistrates, independently of each other, accompanied by a threat to bombard the city—overtures that proved unsuccessful. Kléber had started to acquire sufficient firepower and ammunition, a process that, notwithstanding the efforts of Gillet, took until 23 October. Kléber had already started to bombard the city with the artillery he did have at his disposal. Further preparations lasted until 1 November, when at last all batteries were ready to fire. After a renewed ultimatum a final bombardment commenced that lasted until 4 November, when Maastricht and 8,000 Austrian and Dutch troops surrendered.

## **Macdonald, Jacques Etienne Joseph Alexandre (1765–1840)**

The son of a Scottish immigrant, Macdonald served as an officer in the pre-1789 French army, passed into the Revolutionary armies of the 1790s, and moved on to become a marshal under Napoleon. A quiet and dignified figure, he adapted readily—some historians think too readily—to changes in the political winds. Macdonald's career was marked by political and military missteps as well as by some startling achievements. Although he was eventually elevated to the rank of marshal, his personal ties to military leaders who plotted against Napoleon barred him from holding military commands for several years in the first decade of the nineteenth century.

Moreover, Macdonald's military performance was inconsistent. He sometimes exhibited striking boldness, but he was then unable to respond to enemy countermeasures. He suffered severe defeats: in the Battle of the Trebbia at the hands of the Russian field marshal Alexander Suvorov in 1799 and at the Battle of the Katzbach against General Gebhard von Blücher in 1813. Nonetheless, he reached a peak of success in 1809 at the Battle of Wagram, where Napoleon presented him with a marshal's baton.

Macdonald was an open and vocal critic of Napoleon's military strategy in the 1813–1814 campaign, and in March 1814, along with Marshal Michel Ney, he played a key role in convincing the Emperor the time had come to abdicate. After Waterloo, Macdonald conducted the demobilization of the remnants of Napoleon's army with skill and tact, shielding many officers from the vengeance of France's new political leaders.

Marshal Macdonald. Serving throughout the French Revolutionary and Napoleonic Wars, he led major formations in the 1809 campaign against Austria (1809), in Spain (1810–1811), Russia (1812), Germany (1813), and in France (1814). (Engraving by Paul Girardet after Eugène Charpentier, 19th c. The David Markham Collection)

Macdonald was born in Sedan in the Ardennes on 17 November 1765. His father was an emigrant from Scotland who had fled his homeland after the failure of the Jacobite rebellion in 1745–1746. The elder Macdonald joined the French army and married the daughter of one of its officers. Jacques decided to follow his father's occupation, and at the age of nineteen he became a lieutenant in the army of Louis XVI.

In addition to his professional duties, Macdonald pursued a range of cultural interests, including music and art. But he exhibited no deep political convictions beyond a loyalty to the French government of the time, and he moved smoothly from service in the Royal Army to rapid advancement in the forces defending Revolutionary France. Serving in the French campaigns in the Low Countries from 1792 to 1795, he rose from the rank of lieutenant to become a *général de division* in 1794 at the age of twenty-nine. His service here was exemplified by his skillful performance at the head of an infantry brigade during the Battle of Tournai in May 1793.

The outbreak of the War of the Second Coalition in 1798 found Macdonald in Italy where he commanded the (French) Army of Rome. As Austrian and Russian forces reconquered the territory Bonaparte had won in his campaign of 1796–1797, Macdonald moved his troops northward in the spring of 1799 and struck aggressively at the Austrian forces at Modena. Although he suffered a severe wound to the head in the battle, his victory here halted the advance of the left wing of the Austrian forces moving across northern Italy. Macdonald then adopted an overly bold strategy of advancing northward toward the Po. He hoped to sever the enemy's supply lines and possibly to relieve French forces besieged in Mantua. The plan came to grief near Piacenza at the three-day Battle of the Trebbia (17–19 June) against the Austrian and Russian forces under Suvorov. Macdonald found his bold strategy negated by the tenacious offensive conducted by his opponent. The French army, vigorously pursued by Suvorov's forces, retreated in disarray to the coast at Genoa. The Allies soon moved on to occupy northwestern Italy and much of Switzerland.

Macdonald commanded the troops controlling the key roads connecting Paris to Versailles and St. Cloud in the fall of 1799. Thus, he played an important role in helping Bonaparte seize power during the coup d'état of 18–19 Brumaire (9–10 November). Receiving command of the (French) Army of the Grisons in Switzerland, he expunged memories of his failure at the Trebbia by conducting a successful midwinter passage of the Alps in December 1800. Moving through the snowy Splügen Pass, Macdonald struck at the Austrians in the Adige valley and completed Bonaparte's reconquest of northern Italy.

But Macdonald's political misfortune negated his recent military achievement. His career was blocked by his association with two royalist generals, Jean Victor Moreau and Jean-Charles Pichegru, who conspired to kill or kidnap Bonaparte in 1803. Both Moreau and Pichegru had been Macdonald's superiors in the early stages of his career in the Revolutionary Wars, and they had played an important role in his ascendancy to higher rank. The plot failed, Moreau was forced into exile, and Pichegru was imprisoned and later executed. Macdonald, his guilt unproven, was merely deprived of any command for the next six years. Out of favor with Bonaparte, he spent this period at his country estate, and other leaders played the role he might have done in the great victories of 1805, 1806, and 1807.

The crisis facing Napoleon's forces in the spring of 1809 brought Macdonald back to active service. With campaigns proceeding in Spain, northern Italy, and southern Germany, the Emperor needed every experienced senior commander he could find. Macdonald received orders to serve in the (French) Army of Italy, where he helped Eu-

gène de Beauharnais, the inexperienced French commander on the scene, the viceroy of the Kingdom of Italy, and Napoleon's stepson, to recover from early defeats at the hands of the Austrians. Macdonald pushed the enemy out of northeastern Italy, then pursued them to prevent their juncture with the Austrian army of Archduke Charles, facing Napoleon near Vienna.

When Napoleon ordered Eugène's forces to join him at Vienna, Macdonald's troops reached the Austrian capital on 4 July after a frantic forced march. These reinforcements went into action during the first day of the Battle of Wagram on 5 July. Ordered to attack a key Austrian position late that day, Macdonald objected unsuccessfully to an operation he thought had little prospect of success. He noted that there was little daylight left; moreover, the Austrians were in an elevated, entrenched position. When Napoleon insisted on the advance, Macdonald's troops were repelled, then fell back in apparently hopeless disorder.

Macdonald showed his military skill and determination in rapidly restoring discipline to his units. Then, on the sixth, he led those same troops in a relentless advance against the center of the Austrian line. Macdonald directed his force of 8,000 troops forward in a hollow square formation, designed to maximize his control over these relatively inexperienced and recently defeated men. The attack shook the enemy defenses and helped to make the entire Austrian line untenable.

Macdonald's performance at Wagram was the high-point in his mercurial military career. Napoleon rewarded him with the rank of marshal, the only time the Emperor bestowed such an honor on the battlefield. Moreover, the following month, Macdonald was elevated to the Napoleonic nobility with the title of duc de Tarante.

Like most of Napoleon's other subordinates, Macdonald served for a period in Spain. Arriving in April 1810, he took command of the Army of Catalonia and was soon frustrated by his duties. Unable to bring local guerrilla resistance under control, Macdonald was pleased to be allowed to return to Paris on medical leave in July 1811. The following year brought him a minor role in Napoleon's invasion of Russia. Macdonald's X Corps, composed of a French staff and Prussian, Bavarian, and Polish troops, had the task of securing Tsar Alexander's Baltic provinces and shielding Napoleon's northern flank. During Napoleon's retreat, Macdonald had a preview of the difficulties French forces would experience the following year. General Johann von Yorck, the commander of the Prussian troops in X Corps, made a separate armistice with the Russians at Taugoggen on 28 December 1812. This set the stage for Prussia to break its alliance with Napoleon and to oppose him in 1813.

As the French hold on Germany weakened, Macdonald presented Napoleon with a promising alternative to a

campaign designed to maintain control of central Europe. In Macdonald's view, a sound French strategy called for an early withdrawal—perhaps as far as the Rhine—with the evacuation of French garrisons from vulnerable fortresses like Stettin and Torgau. Napoleon rejected such possibilities and decided to defend all of Germany.

When Macdonald took the field in 1813, his performance recalled the events fourteen years earlier at the Battle of the Trebbia. Ordered to hold the southern sector of the French front against General Gebhard von Blücher's Prussian army, Macdonald launched a bold offensive across the river Katzbach in late August. With 100,000 men under his command, Macdonald failed to keep control of his forces at the ensuing Battle of the Katzbach (26 August). Napoleon later commented that, for all his skills, Macdonald was never able to handle large numbers of troops. On this occasion, the Prussian commander struck Macdonald's scattered columns with devastating force, and the French retreat that followed undermined Napoleon's success at the Battle of Dresden. Macdonald nevertheless regained some of his military reputation at the subsequent Battle of Leipzig. His corps conducted a vigorous defense of the city, and the French commander escaped capture only by swimming across the river Elster.

Living to fight another day, Macdonald participated in Napoleon's 1814 campaign against the Allied armies invading French territory. Napoleon found his performance disappointing. In early February Blücher thrust forward, opening a gap between his forces and his Austrian allies, in a reckless attempt to seize Paris. When Napoleon defeated the Prussians at the Battle of Montmirail on 11 February, Macdonald had an opportunity to seize Château-Thierry, cut off the Prussian retreat, and set the stage to annihilate Blücher. But Macdonald was unable to close the trap.

In March, with enemy troops in control of Paris, Macdonald and Ney confronted Napoleon at Fontainebleau with a successful demand that the Emperor cease hostilities. Macdonald went on to help negotiate the terms of Napoleon's abdication.

With the restoration of the Bourbon monarchy, Macdonald readily shifted his allegiance to the new rulers of France. He remained loyal to King Louis XVIII during Napoleon's brief return to power in 1815. After Waterloo, Macdonald became the commander of the Army of the Loire. His chief task was the delicate business of demobilizing this force, which contained many of the veterans of Napoleon's Grande Armée. Macdonald conducted this sad task with skill and sensitivity. At a time when officers who had supported Napoleon's return in 1815 were the targets of Bourbon retaliation, Macdonald managed to shield such men at this vulnerable moment for them.

In the ensuing years Macdonald returned to private life. He married his third wife in 1821. Three years later, at the age of fifty-nine, he became the father of a son for the first time. In 1825 he took a sentimental journey to Scotland, where he visited his family's ancestral home. The old general died at the age of seventy-five on 25 September 1840 at his château at Courcelles-le-Roi.

### Maciejowice, Battle of (10 October 1794)

A battle between Polish and Russian forces near Maciejowice (in present-day Poland) that decided the outcome

of the Polish uprising and led to the Third Partition of Poland. Following the Second Partition of Poland in 1793 Russo-Polish relations rapidly deteriorated, culminating on 12 March 1794 when General Antoni Madalinski rejected Russian demands to disband the Polish-Lithuanian army. This sparked a general outbreak of anti-Russian riots throughout the country. The uprising quickly spread through the Polish lands and Tadeusz Kościuszko (Thaddeus Kosciuszko), a veteran of the American War of Independence (1775–1783), was invited to lead the insurrection. Kościuszko returned to Poland in late March 1794 and called the Poles to arms.

The Polish army achieved a surprising victory over the numerically and technically superior Russian detachment at Raclawice on 4 April. Simultaneously, residents of Warsaw, inspired by the success of Kościuszko's army, rose up against the Russians on 17 April and seized the city after two days of fighting. However, the strategic situation soon worsened for the Poles. A Prussian army invaded Poland on 10 May and, receiving Russian reinforcements, they defeated Kościuszko at Szczekociny on 6 June and General Józef Zajączek at Chelm on 8 June.

Despite losses, Kościuszko's army managed to retreat to Warsaw, where it regrouped. On 15 June the Prussian army captured Cracow (Kraków), but the Russian forces were halted in a series of skirmishes near Warsaw. Although Russo-Prussian forces besieged the Polish capital on 22 July, the siege was unsuccessful. On 20 August an uprising broke out in Greater Poland at the rear of the besieging armies, forcing the Prussians to divert their forces from Warsaw. Simultaneously, Russian forces under General Ivan Fersen were withdrawn toward the Pilica River.

Throughout the summer of 1794 Kościuszko strengthened the defenses around the capital, while Russia equipped a new corps commanded by General Alexander Suvorov and ordered it to join up with Fersen's corps near Warsaw. The Russians captured Vilna in August and defeated General Karol Józef Sierakowski's detachment at Korschin on 19 September. Faced with two converging Russian corps, Kościuszko acted quickly to prevent them from uniting. Leading some 10,000 men, he left Warsaw for Maciejowice, intending to combine his own force with that of General Adam Poninski. However, the Russians captured Kościuszko's first messenger, and although a second courier did get through and prompted Poninski to move, he was too late. On 10 October Kościuszko engaged Fersen's column near Maciejowice, unaware that Suvorov had crossed the Vistula River and was approaching the battlefield. The Poles were overwhelmed and suffered heavy casualties, including Kościuszko, who was captured, injured in both the head and thigh.

The Polish defeat at Maciejowice effectively ensured the defeat of the uprising. The capture of Kościuszko led to an internal struggle for power in Warsaw and the demoralization of the city's population. The Russian army quickly advanced to Warsaw, which it besieged in November and captured after a bloody assault on the Praga suburb. The Third Partition of Poland in 1795 ended the existence of the country until 1919, when the Treaty of Versailles included provisions for the reestablishment of a sovereign Polish state by plebiscite.

### Mack, Karl Freiherr von Leiberich (1752–1828)

In 1805 *Feldmarschalleutnant* Karl Mack Freiherr von Leiberich lost more than 50,000 Austrian troops in the opening moves of the Austerlitz campaign after having been isolated by the rapid advance of Napoleon's army on Ulm in Bavaria.

Mack enlisted in the Austrian Army as a cavalry trooper in 1770 and, making rapid progress, was offered a commission in 1777. Six years later he received his first staff appointment, and during the war against the Turks in 1789 he was made a baron for his services at the siege of Belgrade. Following a return to regimental duties in 1790 he accepted a position as chief of staff to *Feldmarschall* Friedrich Josias Graf Saxe-Coburg-Saalfeld (generally known as Saxe-Coburg) in 1793 and earned widespread praise for his contribution to the victories at Aldenhoven and Neerwinden. He stepped down after the defeat at Tourcoing the following year but returned to the army in 1796 as chief of staff to the Army of the Interior with the rank of *Feldmarschalleutnant*. In 1798 having accepted command of the Neapolitan army, he led it in a disastrous campaign against French-occupied Rome. As public order broke down he surrendered to the French for his own protection and eventually returned home to semi-retirement in April 1800.

France's defeat of Austria in 1800 led to a period of military reform overseen by Archduke Charles. His view that the army was as-yet unprepared for a return to war angered those who supported the necessity of a Russian alliance to protect Austria from French ambitions. In 1804, to back their argument, the war party resurrected Mack's career and presented him as their military expert. His confident but overoptimistic ideas concerning tactical and logistical reform and plans for a rapid mobilization of the army gained influential support from those frustrated by Charles's more sober views. Appointed chief of the quartermaster general staff, Mack pushed through his program of reforms in the first half of 1805, resulting in a state of confusion in the army on the eve of the war of the Third Coalition.

Nominally under the command of the young Archduke Ferdinand, but in reality led by Mack, an Austrian army advanced into Bavaria, taking up a position centered on Ulm on the Danube, to await Russian support. This support did not arrive before Napoleon was able to surround the Austrian position. Isolated and facing disunity among his officers, Mack accepted that the Russians were too far away to help and surrendered the city on 20 October. The campaign cost the Austrian army more than 50,000 men. Released on parole, Mack returned in disgrace to Vienna, where he was court-martialed, stripped of his rank, and imprisoned for two years. His reputation gained some rehabilitation in the postwar years, but he lived out the rest of his life as a recluse.

### Madrid, Action at (3 December 1808)

Though little more than a skirmish, the action at Madrid played a key role in the Peninsular War. Following the Battle of Bailén in July 1808, the French army of occupation had fallen back to a safe position behind the river Ebro. In the course of the autumn there it was joined by many reinforcements, and at the beginning of November, Napoleon himself. Determined to wipe out the shame of Bailén, the Emperor was bent on the recon-

quest of the Spanish capital. Sweeping aside the armies facing him, he marched on Madrid with 45,000 men. With the city protected only by a scratch force of 12,000 men, most of which was routed on 30 November at Somosierra, by 2 December the French were once again before the city (which lacked even the most rudimentary defenses and had no hope of relief).

Shocked by the invaders' sudden appearance, the populace essayed resistance, barricading the streets and petitioning the authorities for arms. But their efforts at fortification were ineffectual, while the city was gripped by disorders of all sorts. As for the authorities, they were helpless: Possessed of few troops of any sort, all they could do was to stiffen the barricades with cannon and send a small force to occupy the dominating heights occupied by the gardens of the Buen Retiro palace. In short, an easy victory seemed certain, but Napoleon wanted to demonstrate magnanimity, and therefore twice summoned the city to surrender. No response was forthcoming, however, and on 3 December he ordered a partial attack on Madrid's eastern and northern front.

While cannon smashed the defenders' improvised barricades, masses of French troops seized the palace gardens, overran the Buen Retiro itself, and swept across the famous boulevard known as the Paseo del Prado. So rapid was the French progress, indeed, that some troops even captured the barricade at the entrance to the Carrera de San Jerónimo and the adjacent Medinaceli palace. Had they pressed on, the city would have fallen that night, but Napoleon did not want a bloodbath and therefore halted his men. This proved a shrewd move. As he had probably guessed they would, the terrified authorities sued for peace during the night, while the citizens abandoned their arms and fled to their homes. In the early morning of 4 December the invaders entered the city.

However, the war went on; meanwhile, brief as it was, Madrid's resistance proved crucial. Wrongly presaged as the harbinger of a second siege of Saragossa—which had proved a horrendously costly affair—the capital's stand persuaded Sir John Moore to advance into northern Spain rather than to withdraw from Salamanca into Portugal. Because the result of this advance was the campaign of Corunna, it is arguable that the action of 3 December might have changed the course of history.

## Madrid Uprising (2 May 1808)

The uprising that convulsed Madrid on 2 May 1808 was a key moment in the history of the Napoleonic empire. However, while the course of events is clear enough, the nature and significance of the Dos de Mayo is open to debate.

In brief, the revolt was sparked off by the tension caused by Napoleon's decision to summon the entire Spanish royal family to Bayonne. The capital was both alarmed and excited, and in the early morning of 2 May, news spread that the Bourbons' last remaining representatives were about to be sent off to France. Immediately a crowd gathered before the royal palace. Growing more and more agitated, it fell into a frenzy and attacked an aide-de-camp of Marshal Joachim Murat who had appeared to supervise the prince's departure. Undaunted, Murat immediately sent a squad of troops to restore order. Opening fire, they quickly dispersed the crowd from the area around the palace, but the sound of their volleys caused a general panic, with hundreds of the city's inhabitants rushing onto the streets in the belief that they were about to be massacred. The few Frenchmen caught on the streets were quickly killed, while a cavalry patrol sent to reconnoiter the city center was cut to pieces in the Puerta del Sol.

But French control was barely shaken. Most of Murat's forces were encamped outside Madrid, and columns of the invaders were soon pouring into the city from all sides. Faced with overwhelming odds, most resistance quickly came to an end. Indeed, only at the army's chief artillery depot did the French face serious opposition. Here a small group of officers headed by Luis Daoiz and Pedro Velarde took over the cannon and beat off a number of French attacks, but in the end they, too, were overrun. In all perhaps 500 Spaniards were killed or wounded, including 113 prisoners who were executed by firing squad. French casualties, meanwhile, numbered a mere 145.

In the wake of these events Spain rose in revolt, the populace being gripped by the belief, first, that the French were bent on their massacre, and, second, that the authorities (who had counseled obedience and done their best to get the people of Madrid off the streets) intended to betray them to the invaders. So much for the actual fighting, and its effects. However, what is less clear is the nature of the rising. For some historians, it was a spontaneous nationalist revolt; for others, it was a premeditated attempt to precipitate rebellion. Such views, however, are difficult to sustain. In fact, the revolt was little more than a mass panic, although it is true that it was both joined by a handful of army officers who were bent on resistance, and later made much use of as an image both by genuine patriots and by ambitious factions eager to secure their own ends.

### **Magdeburg, Siege of (23 October–11 November 1806)**

Magdeburg was one of the strongest fortifications in Prussia during the War of the Fourth Coalition. After the twin defeats at Jena and Auerstädt on 14 October 1806, around 20,000 troops had withdrawn into the city. The French invested Magdeburg in late October, and Marshal Michel Ney succeeded in forcing the capitulation of the fortress on 11 November.

In the wake of the disasters at Jena and Auerstädt, General Friedrich Ludwig Fürst zu Hohenlohe-Ingelfingen (better known as Prince Hohenlohe) had retreated to the city with the remains of his force. Marshal Joachim Murat called upon Hohenlohe to surrender, but the main Prussian army continued its withdrawal on 21 October, leaving a large garrison behind. Ney was given the task of subduing the fortress and arrived outside the city on 23 October with his own corps and two regiments of dragoons under the command of General Dominique Louis Antoine Klein. His total force amounted to 18,000 men, facing a garrison of almost 25,000. This disparity in numbers was outweighed by two factors. First, the governor of the city was General Friedrich von Kleist, who at the age of seventy-three was worn out by ill health, and there was some doubt about his resolve to hold the city. Second, the residents of Magdeburg were loath to see their homes bombarded when the defeat of Prussia now seemed inevitable.

Ney completed his blockade when he constructed a bridge on the Elbe above the city and dispatched his light cavalry onto the opposite bank. On 1 November, however, Ney lost Klein's command when it was recalled by Napoleon, who also wanted to withdraw one of Ney's divisions. Ney, however, strongly protested and was able to preserve his corps intact. In fact, throughout the siege the French underestimated the strength of the garrison. On 4 November the garrison launched a sortie, which was easily repulsed. The following day Ney requested permission from headquarters to bombard Magdeburg. This was approved, and orders were given for mortars to be sent to him. Ney then informed Kleist that a bombardment of the city was imminent. Before the arrival of the mortars, the French fired a few shells into the city to warn the citizens.

Kleist received news that Hohenlohe had capitulated at Prenzlau on the sixth, together with the last major Prussian field army. Prenzlau was 130 miles to the northeast of Magdeburg, and the news reached Kleist after Ney permitted a captured Prussian officer access to the city. Kleist considered further resistance to be futile and opened negotiations with Ney. By 7 November an armistice had come into force, and on the following day Kleist surrendered. French troops occupied the gates of the city on the tenth, and the following day the garrison was marched to Bernburg as prisoners of war. The fall of Magdeburg left 600 pieces of artillery in French hands as well as a large quantity of supplies. Kleist was later criticized for his lack of determination in having surrendered the city so quickly.

### Magnano, Battle of (2 April 1799)

First Austrian victory of the War of the Second Coalition in Italy. After the indecisive Battle of Verona, French commander General Barthélemy Schérer made a second attempt to take the city but was decisively defeated by Austrian *Feldmarschalleutnant* Paul Kray Freiherr von Krajova, forcing the French to evacuate the Adige area. Kray was promoted to *Feldzeugmeister*; Schérer was relieved of command.

In late March, Kray concentrated his troops in Verona and awaited reinforcement by Austro-Russian troops. Schérer planned an attack across the Adige, downstream

between Verona and Legnano, marching into position on 2 April. Kray anticipated Schérer's plan and decided to attack the French as they crossed the river. Problems at the crossing point prompted Schérer to change his plan, however; thinking the Austrians were deploying over the Adige to the west of Verona, he decided on an attack by two flanking columns on either side of the city. His left, comprising three divisions of 20,000 men, would attack from the west; the French right, with two divisions totaling 14,000 men, would march from the southeast; while one division, 7,000 strong, would cover the center. These 41,000 men were strung out across 16 kilometers of ground broken up by watercourses, hedges, and embanked roads. Kray divided his 43,800 troops into three columns facing their French counterparts, each about 7,000 strong, and two large reserve columns of 10,000 troops, one behind the center and one out to the west.

The French attacked at 6:00 A.M. but the Austrians did not move until 10:00 A.M. Fighting began in the east as *Feldmarschalleutnant* Johann Graf Mercandin's Austrian column encountered the French right (generals Claude Victor and Paul Grenier) at Pozzo, and they were defeated when a French cavalry charge ended the infantry stalemate. The Austrian center under *Feldmarschalleutnant* Konrad Valentin Freiherr von Kaim marched unopposed through Magnano and only encountered the French center under General Antoine-Guillaume Delmas at Buttapietra. Alarmed by this fighting, General Jean Victor Moreau, with part of the French left, reinforced the center, and Kaim was pushed back. The rest of Moreau's two divisions halted the advance of the Austrian right under *Feldmarschalleutnant* Johann Freiherr von Zoph, but General Jean Sérurier, with the other division of the French left, found his left flank under fire from the Austrian reserve column under *Generalmajor* Prinz Friedrich Hohenzollern-Hechingen (generally known as Hohenzollern) around Isolalta. The French counterattacked and reached the embankment in front of the village.

Kray now acted to stabilize his faltering advance. A detachment from Verona deployed to support the broken left wing, while Kray directed part of his central reserve into Grenier's left flank as Mercandin's reformed column attacked its front. The French right broke and fled. Meanwhile, Moreau had driven Zoph back and sent extra reinforcements to Delmas, as the French center was assaulted by the Austrian central reserve. Night fell, and the battle ended in an exchange of artillery fire. Both sides had lost about 4,000 troops, but the French had lost another 4,500 prisoners, forcing them to retreat across the Oglio.

## Maida, Battle of (4 July 1806)

The Battle of Maida was fought as a result of British assistance given to Ferdinand IV, king of Naples, to protect Sicily, his only remaining unoccupied possession, from French invasion and to contain the spread of French influence in the Adriatic region. The defenses of Sicily were in a fragile state, as large numbers of French troops had occupied Ferdinand's mainland possessions, and Napoleon had deposed that monarch in favor of his brother Joseph Bonaparte.

Major General Sir John Stuart was ordered to command a British expeditionary force to Calabria, in southern Italy. This force was conveyed from Messina, in Sicily, by ships under the command of Rear Admiral Sir Sidney Smith, with orders to assist Ferdinand in the defense of his kingdom. A French invasion force under General Jean Reynier had reached Naples on 15 February 1806, and finding Neapolitan resistance virtually nonexistent, had then turned its attention to Calabria. Leaving Naples on 1 March, the French defeated the Neapolitans at Campo Tenese on the ninth, advancing to the Straits of Messina.

Stuart's force consisted of 5,200 men and 10 guns, but no cavalry. Many of his troops were experienced soldiers, having served in Holland (1799) and Egypt (1801) and endured rigorous training on Malta the previous year. Stuart hoped that the Calabrese would give him support, but there was no sign of the local uprising the British had hoped for. Opposing him was a French force under Reynier consisting of 6,440 men and 4 guns, including 4 squadrons of veteran cavalry.

During the night of 30 June, Stuart's British force landed unopposed in the Bay of St. Euphemia on the Italian mainland. On learning of the landing, the French advanced toward the bay and took up a position overlooking the plain of the small village of Maida. On the morning of 4 July the French attacked by marching over the river Amato toward the British, who had left their camp and were marching onto the plain.

This action is often held up to be a triumph of the British line over the French column, but although the French marched across the river in column, they deployed into line to attack the British, who had done the same. The

British beat off their attacks with a combination of artillery fire and disciplined musketry, followed by determined bayonet charges. The French left gave ground, but their right, supported by cavalry, threatened the British left flank. The outcome was uncertain until the British 20th Foot arrived on the French flank, whereupon Reynier's troops retreated, chased by their opponents, whose pursuit was hampered by the lack of cavalry. British casualties were 327 killed and wounded, while the French lost 700 killed, 1,000 wounded, and 1,000 taken prisoner.

## Mainz, Siege of (14 April–23 July 1793)

Following the victory at Valmy on 20 September 1792, the French seized the offensive. General Adam Philippe, comte de Custine's Army of the Vosges captured Speyer, Worms, Mainz, and Frankfurt in barely a month, mainly because his otherwise easily panicked troops faced little opposition. The fortified city of Mainz, which capitulated on 21 October 1792, was a prize whose loss nine months later came to symbolize a tragedy of illusions and missed opportunities as well as valiant efforts. For contemporaries as well as modern historians, the principal significance of the episode was political rather than military, for the fall of the city was accurately thought to have presaged the French occupation of the Rhineland.

French troops—promising liberation to all peoples seeking assistance—along with the new local Jacobin Clubs set about revolutionizing the left bank of the Rhine. Though led by intellectuals and officials, Mainz Jacobinism was a cross-class movement that found resonance among the lower orders but never quite attracted mass support. As the idealism of its leaders collided with the reality of public skepticism or hostility, frustration and French power-political needs led to ever more coercive measures, recapitulating the transition of the Revolution itself from liberalism to authoritarianism. Finally, the new "Rhenish-German National Convention" declared the city and surrounding territories a republic independent of the Holy Roman Empire (18 March) and then sought union with France, whose republican government, heretofore

forswearing any desire for territorial aggrandizement, now resurrected the old Bourbon objective of enlarging the country to include the “natural” frontiers—the Rhine, the Alps, and the Pyrenees.

Threatened by Austrian forces and contingents furnished by the Holy Roman Empire, however, Custine withdrew the bulk of his troops. The Allies encircled Mainz on 30 March 1793, invested it on 14 April, began bombarding it on 18 June, and took it on 23 July. The departing French pledged not to engage the Allies for one year, and many joined the republican armies of the west, where their skill contributed greatly to the crushing of the Vendean revolt. The fate of their German collaborators was less gentle, ranging from harassment to prison terms, exile, and lynching. The most celebrated primary source is the account by Goethe, who accompanied the besiegers but who displayed great empathy for all participants (especially civilians) and a spirit of reconciliation all too rare among the victors.

The fall of Mainz, combined with other blows that summer, precipitated the *levée en masse* and the commencement of the Reign of Terror. Mainz changed hands several times in 1794–1795, but under the Treaties of Campo Formio (1797) and Lunéville (1801) was returned to France and became the Prefecture of the Department of Mont-Tonnerre. In 1814 Mainz was restored to its sovereign status.

Although one should beware of exaggerating the importance of the revolution in Mainz, it was the first modern German democratic movement. The problems it posed—the strengths and limitations of both force and idealism, the challenge of implanting democracy under occupation, and the dilemma arising when the majority will rejects democracy—remain topics for military and political reflection.

## Maison, The

Meaning “the house,” Napoleon’s Imperial Headquarters, which reflected his centralized approach to what in today’s terms is known as command and control.

Like most command organizations, the Imperial Headquarters was flexible and changed over the duration of his rule. However, from 1805 onward it included three main parts: the Maison, the general staff, and the administrative headquarters. The only link between these three parts was the Emperor himself. The Maison was originally the part of the king’s household that accompanied him on campaign.

While the Maison fluctuated in size, in 1806 it consisted of approximately 800 men, including grooms, valets, pages, cooks, and personal bodyguards. Individual positions such as the master of the horse to the empress and the governor of the pages were also included in the Maison. Their function was both ceremonial and practical as they accompanied Napoleon in the field.

The Maison itself was divided into three units, including adjutants general, ordnance officers, and the cabinet. The ordnance officers served as junior aides-de-camp under *chef d’escadron* Gaspard Gourgaud. Generals Géraud-Christophe-Michel Duroc and Armand-Augustin-Louis de Caulaincourt oversaw the organization as a whole, dividing their responsibilities between leadership (Duroc) and travel arrangements (Caulaincourt). Upon Duroc’s death in 1813 Caulaincourt took over both of these roles.

Of the three sections of the Maison, the cabinet was the largest and most powerful and can be seen as the direct heir of royal secretariats of the past. Napoleon’s cabinet divided itself further according to area of responsibility: intelligence, or statistical; topographic; and secretarial.

The intelligence, or statistical branch of the cabinet was focused on strategic enemy intelligence. Collection methods included traditional espionage, open-source analysis of newspapers and other enemy publications, and intercepted messages. The “Black Cabinet” (*cabinet noir*), an organization founded by Jean-Baptiste Colbert during the reign of Louis XIV that specialized in opening the mail of lower-echelon ambassadors, also provided deciphered messages. All products of this strategic intelligence collection, which were extensive even in the pre-conflict phases, were passed to Napoleon through the cabinet. One of Napoleon’s senior adjutant generals normally led the statistical branch, which over the duration of the organization’s existence included Anne Jean Savary, among others.

The topographical bureau was first created by Lazare Carnot, who had served in the Directory and as minister of war during the 1790s, but under Napoleon was run by Gen-

eral Louis Albert Bacler d'Albe. Bacler d'Albe was responsible for organizing and preparing the Emperor's campaign headquarters. Maps, enemy and friendly positions, and easy access to intelligence were all a part of the campaign headquarters formed by the topographical bureau.

The secretariat of the cabinet comprised civilian secretaries, librarians, and archivists who worked in what resembled modern office jobs, providing communications, writing orders, and filing paperwork. Generally chosen for their experience, these bureaucratic functionaries often served long tenures within the Maison. The continuity of service of its members is speculated to be the main reason the Maison functioned so well for Napoleon.

## Malet Conspiracy (October 1812)

Napoleon established the French Empire and married Marie Louise, daughter of the emperor of Austria, to provide for a hereditary heir to his rule. This was largely in response to attempts on his life by conspirators who wanted to reestablish the Bourbon monarchy. Napoleon hoped that an heir would make any effort to kill him futile, because rather than bringing in a king, the French people would turn to his son, perhaps with his wife as regent. The Malet Conspiracy showed Napoleon just how unlikely that scenario was.

General Claude-François Malet had been in and out of trouble, and jail, for much of his career, largely owing to his strong republican views, which led him to oppose an imperial dynasty. Eventually considered mad and fairly harmless, he was allowed to stay in a private Paris asylum for the insane. While there, he became convinced that only he could save France from ruin.

On 23 October 1812 Malet escaped from the asylum and sought out the commander of the 10th National Guard, Colonel Gabriel Soulier. At around 4:00 A.M. Malet informed Soulier that Napoleon had been killed on campaign in Russia and that he, Malet, would be forming a provisional government. Malet had prepared some forged documents that appeared to support his claims, along with his demand that Soulier arrest chief of police Anne Jean Savary, minister of war General Henri Clark, General Jean-Jacques de Cambacérès, and Paris garrison commander General Pierre-Augustin Hulin. Incredibly, Soulier agreed and immediately organized his troops.

Malet led them at once to La Force Prison, where they released generals Victor Lahorie and Emmanuel Maximilien Joseph Guidal. The latter general was sent to arrest Cambacérès and Clark, the former to arrest Savary. The plan began to unravel when Guidal failed to carry out his instructions. Thus the conspirators had taken control of the police leadership, but little else.

Malet went himself to Hulin's headquarters to seize control of the 1st Division, the military unit charged with defending Paris. When Hulin challenged his authority Malet shot him dead, grabbed the seals of the division, and left to take charge.

However, the plan completely failed when Malet was recognized by Colonel Jean Doucet, who knew that Malet had been in an insane asylum and that Napoleon was known to have been alive after the date that Malet said he was killed. Doucet arrested Malet and ordered the troops back to their barracks. The conspiracy was over, and a few days later Malet and many of his co-conspirators were tried for treason and executed.

Napoleon's reign was again secure, but its fragility had been exposed. At no time did anyone even mention turning over the government to Napoleon's son; the hereditary arrangements so carefully made by Napoleon were irrelevant to what was happening. It was a bitter pill for Napoleon to swallow. Told of the episode on 6 November as he was withdrawing from Russia, Napoleon quipped that the French were like women, and one should not leave them alone for too long. Humor aside, Napoleon well understood the ominous message and was determined to get back to Paris as soon as possible. As a result of the conspiracy, Napoleon's bulletins thereafter would frequently end with statements to the effect that "The Emperor's health has never been better."

### Maloyaroslavets, Battle of (24 October 1812)

An important battle between French and Russian forces in October 1812. After spending a fruitless month in Moscow, Napoleon finally commenced his retreat on 19 October. His forces had dwindled to some 100,000 men, accompanied by thousands of noncombatants and an enormous baggage train laden with loot. Napoleon planned to move his forces to the western provinces of Russia, where supply stores had been prepared in advance. However, the route from Moscow to Smolensk, via Gzhatsk, was devastated after the French forces had fought their way to Moscow in August and September. Napoleon therefore decided to advance by the Kaluga route toward the unharmed regions in the southwest.

Initially, Napoleon successfully deceived the Russian forces about his plan; however, heavy rains made the roads almost impassable and considerably delayed the French movements on 21–22 October. During the night of the twenty-third, Russian scouts finally realized that Napoleon was moving his entire army southward. Field Marshal Mikhail Kutuzov immediately dispatched General Dmitry Dokhturov's corps from Tarutino to the little town of Maloyaroslavets, the only point where Kutuzov could join the new Kaluga road and block the French advance. Late in the evening of 23 October, the French advance guard under Eugène de Beauharnais, the Viceroy of Italy, approached Maloyaroslavets, where it launched attacks against the bridge during the night of the twenty-fourth. In fierce fighting, the bridge changed hands several times, and the town of Maloyaroslavets, built entirely of wood, was set ablaze. General Alexis Joseph Delzons, with the 13th Division, initially carried the town, but he was killed in action, and the Russians drove the French back in a counterattack. The French made one last effort and, despite suffering almost 6,000 casualties, regained control of the bridge and the town. Dokhturov withdrew to the heights overlooking Maloyaroslavets.

By the afternoon of 24 October Napoleon brought the rest of his army to Maloyaroslavets, while the main Russian army under Kutuzov appeared in the southern suburbs of the town. General Nikolay Rayevsky with 7th Corps arrived in time to reinforce Dokhturov, while two divisions of Marshal Nicolas Davout's corps supported Eugène. Neither side committed its main forces, however. The fighting was extremely savage, with the town changing hands at

least eight times. Over the course of the day the place was completely destroyed, and the streets were strewn with hundreds of corpses. The fighting ended with the French in control of the burning town, but they failed to secure a bridgehead. On the twenty-fifth, Napoleon conducted a reconnaissance on the southern bank of the Lusha and barely escaped being captured by Cossacks. Although his troops gained a tactical victory, Napoleon realized that he would be unable to break through the Russian army in front of him. After a council of war on the evening of the twenty-fifth, the Emperor began a withdrawal to Smolensk by way of Borodino and Gzhatsk. Remarkably, Kutuzov ordered his army to retreat southward, fearing Napoleon might outflank and defeat him. Thus, both armies simultaneously began retreating in opposite directions.

The Battle of Maloyaroslavets had a crucial impact on Napoleon's campaign in Russia. The French were prevented from reaching the rich provinces in southeastern Russia and were forced to return by a devastated route to Smolensk. The marching and fighting at Maloyaroslavets consumed seven crucial days; a week after the battle the snow began to fall.

### Malta, Operations on (1798–1800)

Malta is a small island in the Mediterranean Sea, strategically situated between Sicily and North Africa. Ruled from the sixteenth century by the Knights of the Order of St. John of Jerusalem, by the time of the French Revolution Malta had come increasingly into contact with European countries. Malta's principal city, Valetta (now Valletta), was a cosmopolitan trading center known especially for its Grand Harbor. That harbor drew Bonaparte to Malta in the summer of 1798.

In 1798 Malta's population of 74,000 supported 2,210 regular troops and a militia force of 10,000. The French invading force of 40,000 arrived on approximately 500 ships. The French were off Malta by early June 1798 and landed on the tenth at three points (St. Paul's Bay, St. Julian's Bay, and Marsa Scirocco), meeting little resistance. Bonaparte

had published a declaration setting forth his grounds for invading Malta, but it was clear to all that the real reason was to facilitate the French invasion of Egypt.

At first many of the Maltese welcomed Bonaparte's invading force. In it they saw potential release from the Knights, whose oppressive measures were hated. Bonaparte knew those sentiments, having sent a spy, Henri Poussieluge, to gather such information. Bonaparte stayed on the island for only six days. He departed for Egypt, leaving Malta under the command of General Claude-Henri Vaubois. For a time it seemed to some Maltese that French occupation was a blessing. Malta's church, legal structure, and education system were overhauled, largely through a legislative commission headed by Maltese. But disenchantment soon followed.

The abolition of Maltese coats of arms was resented by many. So, too, were deteriorating economic conditions, brought on by a shortage of currency as Bonaparte extracted from the country large sums of money. Others resented that Bonaparte freed Malta's slaves, most of whom were Turks and Moors. Others still resented increased rents, feared the possibility of conscription, and begrudged wearing the red cockade. On 2 September resentment gave way to organized revolt.

The Maltese overthrew the French forces at Rabat, and the main French force at Valetta came under siege. The Maltese formed a National Assembly and approached the British for military assistance. The British Mediterranean fleet was recovering from the Battle of the Nile, but Rear Admiral Sir Horatio Nelson sent a Portuguese squadron and, in October, arrived himself. The British instituted a blockade of the French at Valletta. At first the blockade was sporadic. There was almost a complete withdrawal in May 1799 when British ships were needed for the blockade of Brest. However, a tightened blockade thereafter—with land forces under the command of Brigadier General Thomas Graham, those at sea under Captain Alexander Ball, and a continued siege by Maltese forces—proved effective. By August, food supplies for the French were desperately low. On 5 September 1800 Vaubois capitulated under terms that dictated the immediate withdrawal of his troops, who were to return to France.

### Mannheim Offensive (1799)

Two French offensives and an Austrian counterattack in the later months of 1799 sought to control this strategically important area of the central Rhine valley. In late August and November the French attempted to draw Austrian forces north away from strategically important Switzerland, while in between, the Austrians attempted to link up with the Anglo-Russian expedition in Holland. Mannheim, which guarded a key Rhine crossing and the roads in the Neckar River valley, changed hands three times.

The French garrison at Mannheim (6,000 men) under General Baraguey d'Hilliers advanced to drive the Austrians from Heidelberg, which fell on 2 September, and seize the Neckar valley. Faced with the threat of a French advance into central Germany, the Austrian commander, Archduke Charles, was ordered to leave *Feldmarschalleutnant* Johann Freiherr von Hotze's corps at Zürich and march north on 26 August with 35,000 men to join the force (20,000 troops) of *Feldmarschalleutnant* Anton Graf Sztáray von Nagy-Mihaly und Sztara (generally known simply as Sztáray) at Veihingen. The archduke arrived on 8 September and the combined force laid siege to the fortress at Philippsburg. Ten days later, they had forced the French back on Mannheim. On 18 September the Austrians advanced in three columns and at Neckerau defeated d'Hilliers, who had been reinforced by General Michel Ney, inflicting 1,600 casualties and taking 1,800 prisoners, at the cost of 900 casualties to themselves, before successfully storming Mannheim. Vienna had intended that the archduke secure links with and aid the Anglo-Russian expedition bogged down in Holland. However, news of General Alexander Rimsky-Korsakov's defeat at the second Battle of Zürich (25 September) obliged Charles to withdraw with 30,000 men from the Neckar valley to the Upper Danube.

The French promptly renewed their attacks. Troops from their Mainz garrison crossed the Rhine on 13 October at Rüsselsheim. The commander of the Austrian outposts,

*Generalmajor* Karl Philipp Fürst zu Schwarzenberg, tried to mass a small force but was defeated by Ney at Bensheim and pushed back to Weinheim. The French recaptured Mannheim and on 16 October took Heidelberg. Following the Brumaire coup of 18–19 November, French war minister Louis-Alexandre Berthier ordered General Claude Jacques Lecourbe, commander of the Army of the Rhine (62,000 men), to attack the Neckar valley, in order to draw Austrian forces away from both the vital French assembly areas in Switzerland and the line of General Jean Victor Moreau's planned offensive with the Army of the Danube.

On his own initiative the energetic Lecourbe had already crossed the Rhine at Mainz on 16 November. Having taken Frankfurt the French reoccupied Mannheim and drove the Austrians up the Neckar. Lecourbe then laid siege to Philippsburg, but he was attacked on 23 and 26 November by superior Austrian forces under Sztáray, who had been reinforced by Archduke Charles. The Austrians were victorious at Sinzheim on 2 December, forcing Lecourbe to evacuate the right bank of the Rhine, and the Austrians reentered Mannheim on 9 December. A decree of 24 November had already formally consolidated the Armies of the Rhine and of the Danube into one force under Moreau.

### Mantua, Sieges of (1796–1797)

The sieges of Mantua played a key role during the third stage of Bonaparte's campaign in northern Italy in 1796–1797, influencing for eight months (June 1796–February 1797) the development of all military operations. Four times the Austrians failed to relieve Mantua despite a huge expenditure of manpower and equipment that strained their military resources. On the other hand, the constant need to keep a strong blockading force around Mantua prevented Bonaparte from maintaining a sure grasp on northern Italy and prosecuting the war to the

Austrian borders. The fall of Mantua on 2 February 1797 eventually allowed the Armée d'Italie to march to Frioul and sped up the course of events leading to the end of Bonaparte's first Italian campaign and the conclusion of the Treaty of Campo Formio.

Mantua was the southwestern endpoint of a fortress system known as the Quadrilateral that stood between Lake Garda (to the north), and the rivers Po (to the south), Mincio (to the west), and Adige (to the east). A Renaissance city, Mantua lies on the right bank of the Mincio, where the river widens, forming an oblong lake. In 1796 the lake and swampy ground covered the northern, northeastern, and western accesses to the city. To the south and southeast lay another swampy area and a canal. More than anything else, it was this natural protection that made Mantua a formidable stronghold and caused enormous problems to any besieging force, not least the spreading of malarial fevers (the latter, admittedly, plaguing also the besieged).

The city was surrounded by an impressive extension of stone walls, bastions, outworks, and entrenchments, with five main gates. The whole network of fortifications was, however, in poor condition. To the north and the east, two narrow causeways built on dams extended across the lake through drawbridges, leading, respectively, to a Vauban-style citadel and the small suburb of San Giorgio.

The strategic role of Mantua is easy to understand, as it posed a constant threat to the lines of communication of any army conducting operations to the east and the north. In order either to link up with the French armies in Germany or bring war to the Austrian borders, Bonaparte had thus first to dispose of the fortress. On the other hand, Mantua was crucial to any Austrian attempt at retaking Lombardy. In 1796, moreover, the side holding Mantua enjoyed a remarkable political advantage. For those classes still supporting the *ancien régime*, the fall of the fortress to the French would mean the final victory of the Revolution in Italy. For France, the seizing of Mantua would signal the end of Austrian rule over northern Italy to the rest of Europe. The French blockade (and, for a limited period, the sieges) of Mantua took place from 3 June 1796 to the capitulation of the fortress on 2 February 1797, with a short interruption from 1 to 10 August, when *Feldmarschall* Dagobert Graf Würmser succeeded in temporarily relieving the city.

The sieges can be divided into four stages:

1. *3 June–18 July 1796*. After the conquest of Lombardy, on 30 May Bonaparte's Armée d'Italie crossed the Mincio at Borghetto and repulsed *Feldzeugmeister* Johann Peter Freiherr von Beaulieu up to the Tyrol, thus severing any link

between the Austrian field army and Mantua. By then, the fortress garrison under General Joseph Count Canto d'Yrles, had been brought up to 15,000 men (of whom 1,500 were unfit for service), with 315 pieces of artillery. Supplies for the troops and the 25,000 citizens were estimated to last three months. Bonaparte entrusted General Jean Sérurier's division (9,000 men) with the investment of the fortress, which began on 3 June. For forty-five days the French, under the expert guide of General François de Chasseloup-Loubat, the Armée d'Italie's engineer in chief, were busy completing the encirclement of the fortress and preparing earthworks for the siege artillery emplacements. Bonaparte also ordered the assembly of a boat flotilla to patrol the lake. During this period the Austrians attempted limited sorties and only occasional fighting broke out along the siege lines.

2. *18 July–1 August.* On 18 July the blockade became a bona fide siege, as heavy guns and mortars started striking the bastions and the city. During two weeks of bombardment more than 12,000 explosive projectiles (that is, excluding round shots) fell on Mantua.
3. *1 August–15 September.* Over the night of 31 July–1 August, Würmser's advance from the Tyrol forced Bonaparte hastily to lift the siege. The city was resupplied, and the garrison brought within the walls the siege equipment the French had left behind (179 guns and thousands of shot). After Würmser's defeat at Castiglione on 5 August, however, the link between Mantua and the field army was once again severed. Now without siege artillery, French general Jean Joseph Sahuguet, who had temporarily replaced Sérurier in command, could only make dispositions for a blockade that prevented the Austrians from acquiring supplies from the surrounding area. By then, the garrison had risen to 16,500 (of which 12,200 were fit for service). In early September Würmser's second offensive failed miserably. Defeated at Bassano and cut off from the rest of his army, the Austrian commander in chief nevertheless ably eluded the French pursuit and managed to reach Mantua with around 13,000 men. After two days of fighting before the city ramparts, at La Favorita and San Giorgio, on 15 September Würmser was forced to retire within the fortress.
4. *15 September 1796–2 February 1797.* With Würmser's arrival, the garrison strength rose to almost 30,000 men. More troops, however, meant

more mouths to feed. Shortages in supplies began to tell, and Würmser was obliged to organize foraging sorties. Against disease, however, there was nothing he could do, and in the following six weeks 4,000 men died in the hospitals. Aware that Mantua could not resist for much longer, Austrian officials in Vienna prepared a new campaign. *Feldzeugmeister* Joseph Alvinczy Freiherr von Berberek twice failed to relieve Mantua. In November his advance was checked at Arcola. On 14 January 1797, while Bonaparte crushed the main Austrian army at Rivoli, a secondary Austrian Korps under *Generalmajor* Giovanni, Marquis Provera (5,000 men) succeeded in breaking through the French line on the Adige and arrived before Mantua. Bonaparte, however, immediately rushed back from Rivoli, with General André Masséna's and General Claude Victor's divisions. On the sixteenth, Provera tried to make his way to the citadel and join Würmser. Attacked by superior forces at La Favorita, he was forced to surrender his entire command. Alvinczy's second failure sealed the fate of Mantua, where starvation and disease continued to exact a high daily toll. On 2 February, Würmser accepted the French conditions to capitulate.

## Marengo, Battle of (14 June 1800)

Decisive last-minute victory of Napoleon Bonaparte over the Austrian army in Italy under *General der Kavallerie* Michael Freiherr von Melas, which consolidated Bonaparte's

position as First Consul of France in the wake of his coup d'état the previous November.

Surprised by the Austrian advance toward Genoa in mid-April 1800, Bonaparte had hastily led his army over the Alps in mid-May and reached Milan on 2 June. After cutting Melas's line of communications by crossing the river Po and defeating *Feldmarschalleutnant* Karl Peter Freiherr Ott von Bartokez at Montebello on 9 June, the French closed in on the Austrian army, which had massed in Alessandria (80 kilometers north of Genoa and equidistant from Turin and Milan). Deceived by a local double agent, Bonaparte dispatched large forces to the north and south, but the Austrians launched a surprise attack on 14 June against the main French army under General Louis-Alexandre Berthier.

Initially, their two assaults across the Fontanone stream near Marengo village were repelled, and General Jean Lannes reinforced the French right. Bonaparte realized the true position and issued orders at 11:00 A.M. to recall the detachment under General Louis Desaix, while moving his reserve forward. On the Austrian left, Ott's column had taken Castel Ceriolo, and its advance guard moved south to attack Lannes's flank. Despite failing to get the cavalry across on his right flank, Melas renewed the main assault and the Austrians broke the central French position. By 2:30 P.M. the French were withdrawing and Austrian dragoons seized the Marengo farm.

Bonaparte had by then arrived with the reserve, and his right under General Jean-Charles Monnier briefly retook Castel Ceriolo, while Berthier's troops fell back on the main vine belts (grape vines slung among mulberry trees). Knowing Desaix was approaching, Bonaparte was anxious about a column of Ott's troops marching from the north, so he deployed his Consular Guard infantry to delay it. After an initial clash around 4:00 P.M. *Oberst* Johann Maria Frimont's Austrian cavalry destroyed the Guard infantry. The French then withdrew steadily eastward toward San Giuliano as the Austrians formed a column to follow them in line with Ott's advance in the northern sector.

Desaix's arrival around 5:30 P.M. stabilized the French position as the 9<sup>ème</sup> Légère (9th Light Infantry) delayed the Austrian advance down the main road and the rest of the army re-formed north of Cascina Grossa. As the pursuing Austrian troops arrived, a mix of musketry and artillery fire concealed the surprise attack of General François Kellermann's cavalry, which threw the Austrian pursuit into disordered flight. The whole French line chased after them to seal *une victoire politique* (a political victory) that secured Bonaparte's grip on power after the coup. It would be followed by a propaganda campaign, which sought to rewrite the battle three times during Napoleon's rule.

Bonaparte had crossed the Alps with his Army of the Reserve (officially commanded by Berthier) in mid-May 1800 and, abandoning General André Masséna in Genoa, captured Milan on 2 June. Once he had crossed the Po, he secured Stradella and cut the Austrian line of communication eastward. As other French forces closed from the west and south, the Austrian commander, Melas, had withdrawn most of his troops from their positions near Nice and Genoa to Alessandria on the main Turin-Mantua road.

**The Austrian plans.** The Austrians planned to fight their way out eastward but—using a local double agent, usually known by his cover of François Toli—attempted to deceive Bonaparte into thinking they would try to march north, cross the Po, and head for Milan, joined by the remaining troops marching up from Genoa. The spy would advise Bonaparte to march via Sale on the northern side of the plain, so that he could be engaged by the Austrian left wing; meanwhile the main force would move through Marengo village in the center, turn north, and fall into the French left flank. Ott arrived from Montebello on 12 June, increasing the Austrian force to 31,000 fit troops, who faced a French force about a thousand stronger under Bonaparte, which arrived at Sale on 13 June.

**The preliminary French moves.** Following his meeting with the spy, Napoleon weakened his forces by sending Desaix with General Jean Boudet's division (5,400 men) south and General Jean François Cornu de Lapoype (3,500 men) north. His view was confirmed when General Claude Victor, supported by General Joachim Murat's cavalry, swiftly evicted *Feldmarschalleutnant* Andreas Graf von O'Reilly's Austrian brigade from Marengo village that afternoon. Victor then deployed General Gasparde-Amedee Gardanne and General Jacques Antoine de Chambarlhac's brigades along the Fontanone stream. Austrian headquarters debated building a bridge to the north to outflank the French, but the lack of pontoons and time forced the Austrians to cross the river Bormida and then launch a single, direct assault across the Fontanone bridge.

**The surprise Austrian attack.** The Austrian attack broke at 8:00 A.M. on 14 June, led by the right wing, which quickly drove the French from Pedrabona farm, then headed south to tackle the French at La Stortiglione farm. Reaching the Fontanone, *Feldmarschalleutnant* Karl Graf Hadik von Futak's four battalions supported by Frimont's advance guard battery along the stream mounted an assault on General Claude Victor at 8:30 A.M. The remaining Austrian troops followed across the Bormida—a brigade under *Feldmarschalleutnant* Konrad Valentin Freiherr von Kaim, grenadiers, and cavalry. At 9:00 A.M., news reached Melas from Acqui that French troops under General Louis Suchet were advancing from the south. Fatefully, the Austrian commander dispatched two Hussar regiments (2,300

men) and two artillery batteries back over the Bormida bridge to reinforce the position 30 kilometers away, delaying the crossing of the Austrian left wing. Meanwhile, Kellermann's cavalry had reinforced Victor's troopers. Lannes's formation went forward; forced into a funnel by the bad ground and Fontanone stream, Hadik's attack came under fire from two sides and failed. Kaim followed up with his larger brigade but was thwarted by 11:00 A.M.

**Stalemate in the center around Marengo.** Bonaparte now realized the real situation and frantically dispatched orders to his detachments to return before setting off with his Guard and Monnier's division. *Feldmarschalleutnant* Heinrich Graf Bellegarde's part of Kaim's brigade had crossed the Fontanone north of Marengo and occupied La Barbotta farm. Lannes arrived and directed Watrin's infantry to drive Bellegarde back. They briefly crossed the Fontanone before Austrian reserve guns drove the French back. A small part of the 6ème Légère (6th Light Infantry) occupied Castel Ceriolo to the north, until Ott's lead units seized it around 11.30 A.M. Ott could not see any sign of the expected main French advance from Sale (to the northeast), so he sent *Generalmajor* Freidrich Freiherr von Gottesheim's reinforced advance guard to outflank Lannes north of Marengo. Melas, too, realized that the main French force was around Marengo, so at noon, a cavalry brigade under *Generalmajor* Giovanni conte Pilatti della Torre di Mombisaggio attempted to cross the steep-sided Fontanone at its southern end to tackle Victor's right. Kellermann spotted them and moved quickly to defeat their attempt.

**The Austrians break out across the Fontanone.** Toward 12:30 P.M. Lannes moved the rest of his force to face Gottesheim in a hook shape, while Kaim attacked again, but this time against Victor's wings. A *Laufbrücke* (small bridge) was thrown over the Fontanone and supported by reserve artillery. *Generalmajor* Christoph Freiherr von Latterman's grenadiers crossed to engage Rivaud's two demi-brigades defending Marengo village, while Bellegarde and Frimont's four squadrons split Watrin off. Although Rivaud retook the village, O'Reilly had taken Stortiglione by 2:00 P.M., and in the north, Ott prepared to send *Feldmarschalleutnant* Joseph Freiherr von Schellenberg's column to support Gottesheim. After securing the Fontanone bridge, Pilatti's cavalry crossed but were again charged and defeated by Kellermann. However, Victor could no longer hold his positions and withdrew southeast to the main vine belt, Lannes mirroring the move. The Marengo farm garrison was abandoned and at around 2:30 P.M. Melas led two cavalry squadrons to capture them.

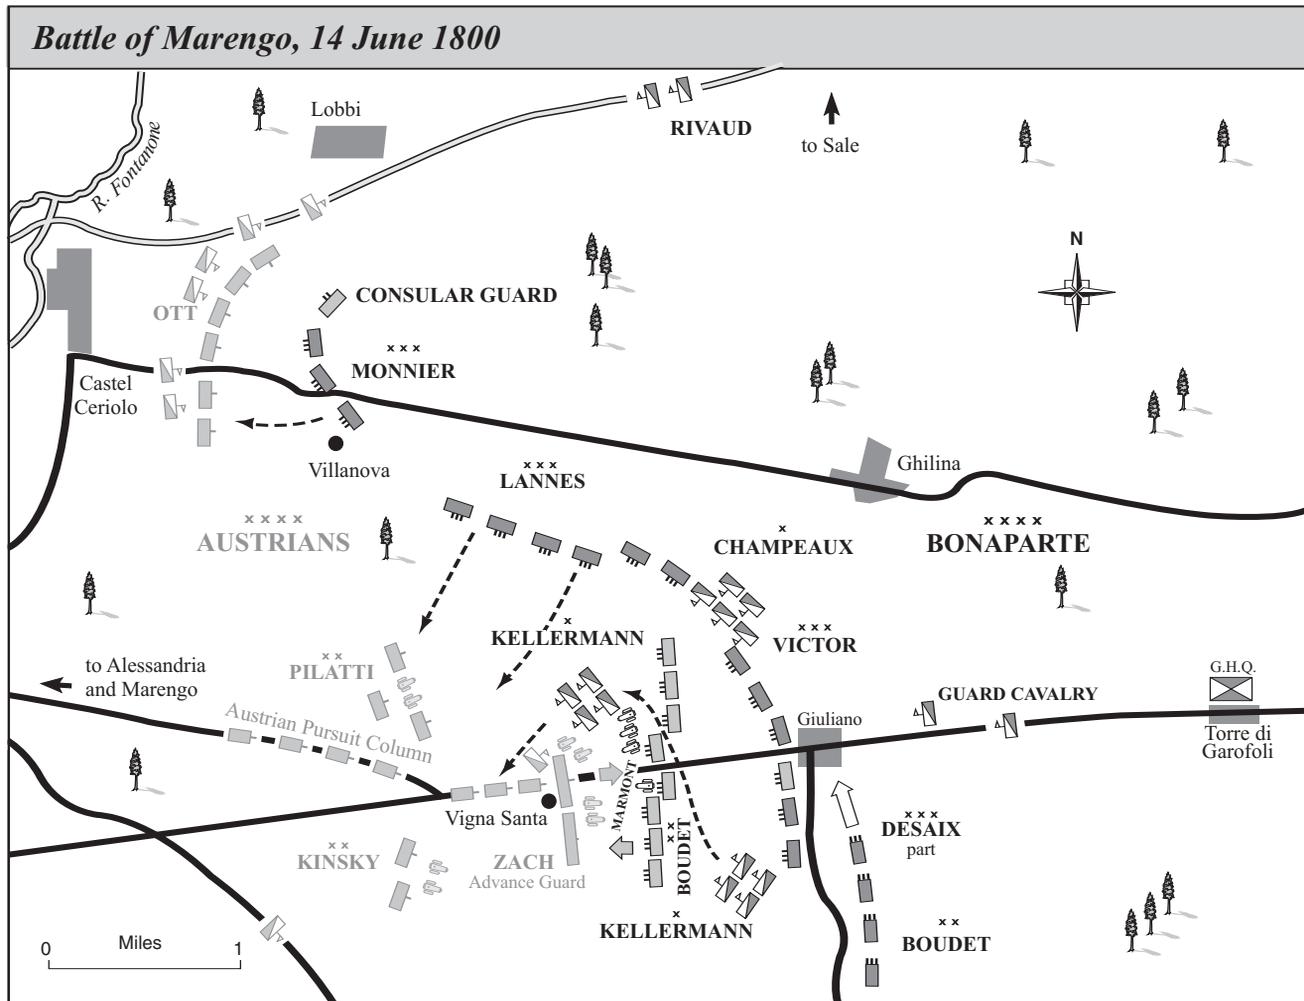

About 20 minutes later, the arrival of Bonaparte reinvigorated his men. Monnier's troops had been sent toward Castel Ceriolo, and after taking the village around 3:00 P.M.

had delayed the advance of Schellenberg's column by attacking its tail before Ott drove them off. As Austrian troops crossed the Fontanone, their guns bombarded the French infantry in the vines. In a bid to delay Schellenberg's advance, Bonaparte committed his main Guard battalion and its artillery, which moved to flank the column. After driving off Austrian dragoons with the aid of General Pierre Clément de Champeaux's remaining cavalry (under Murat), they engaged the head of the column. After a 15-minute firefight around 4:00 P.M. the Guard were surprised and destroyed by Frimont's cavalry.

**The return of Desaix.** A wounded Melas left the field and handed command to Kaim with orders for *Feldmarschalleutnant* Franz Graf St. Julien, in command of the advance guard, to lead a pursuit of the retreating French. The main Austrian pursuit column formed up around Spinetta, southeast of Marengo, and advanced down the New Road, as Ott moved in parallel in the north. However, delays in the center led to the Austrian army forming a crescent shape with a thinly stretched central sector. The arrival of Desaix's aide-de-camp, General Anne Jean Savary, brought Bonaparte the news that reinforcements would arrive around 5:00 P.M., so he withdrew his troops eastward toward San Giuliano but left small contingents in the high corn to unsettle the Austrians.

Desaix had hastened his advance and reached a small road junction north of Cascina Grossa (3 kilometers west of San Giuliano). Boudet and the 9ème Légère were quickly moved on to the exit from the main vine belt, where they surprised the head of *Feldmarschalleutnant* St. Julien's column. As the Austrian infantry deployed on the south side of the road, the 9ème Légère conducted a steady withdrawal for 30 minutes back to Desaix's position. There he had placed General Louis Charles de Guénand's brigade on the north side while most of the remaining French army (Monnier and Lannes) were forming up north from there. The Austrians deployed three artillery batteries on the north side of the road supported by a dragoon regiment while engaged in an artillery duel with Marmont's improvised battery. Desaix prepared his counterattack, including a request to Bonaparte for cavalry support. As the 9ème Légère halted to face the main Austrian advance and General Auguste de Marmont's guns fired a salvo into the Austrian infantry, Kellermann launched his cavalry in a surprise attack into their flank. At the decisive moment of the battle, Desaix was shot from his horse.

Exhausted after fighting all day, many Austrian infantry surrendered, while the dragoons were too slow to support their guns. As panic spread, Pilatti's Austrian cavalry attempted to intervene but were put to flight. In the confusion, chief of staff *Generalmajor* Anton Ritter von Zach was captured and the gun teams fled, pursued by

Adapted from Chandler 1966, 297.

French cavalry, while their whole infantry line advanced westward. Ott with the Austrian left failed to intervene and found his retreat through Castel Ceriolo blocked by French troops advancing northwest from the center. The fleeing Austrian right threw the weak center into disorder, which was exploited by the French cavalry to drive them back toward the Bormida. Only in the south did *Generalmajor* Franz Freiherr von Weidenfeld's grenadiers delay Boudet's advance long enough for O'Reilly's cavalry to return, and together with Frimont, they mounted a last defense around Marengo village as night fell. Ott fought his way through Castel Ceriolo and back to the Bormida bridgehead. Both sides had sustained about 2,100 casualties with another 2,500 Austrians captured.

**The fruits of victory.** Bonaparte needed to depart for Paris urgently and the next morning sent Berthier on a surprise visit to Austrian headquarters, where an armistice was signed at Alessandria, allowing the Austrian army to evacuate northwestern Italy. Although the war would

briefly resume in the autumn, the victory had secured Bonaparte's political power. A last-gasp victory in reality, it was mythologized in an army bulletin, some international propaganda, and three increasingly glamorized "Official Reports" during his rule. The last of these suggested that he had staged a planned withdrawal retaining control of Castel Ceriolo until reinforcements could arrive to complete the victory. Tales were invented about the Guard and the 72<sup>ème</sup> demibrigade, which had been under his direct control throughout. The Emperor's mount at Waterloo was named Marengo.

### Marie Louise, Empress (1791–1847)

Marie Louise was Empress of France from 1810 to 1815, the second wife of Napoleon; she was also daughter of Emperor Francis I of Austria, mother of Napoleon II, and ruler of the duchies of Guastalla, Parma, and Piacenza from 1816 to 1847.

Marie Louise Leopoldine Franziska Theresia Josepha Lucia was born, with the titles of Princess Imperial and Archduchess of Austria and Princess Royal of Hungary and Bohemia, on 12 December 1791 in Vienna. Her father was Holy Roman Emperor Francis II (later Emperor Francis I of Austria), and her mother was Maria Theresa of the Two Sicilies. Marie Louise exhibited a pleasant personality. She was educated by tutors, mastered various languages, German literature, geography, and law, and became a master musician. She was taught to be unquestioningly submissive to her father. She married Napoleon out of political expediency; it ended Austria's wars with France.

The couple was married in several ceremonies, one in Vienna on 11 March 1810 and again on 1 April in Paris. Napoleon treated the sensual, self-centered Marie Louise with great respect and consideration, and for a time the marriage proved successful. During the difficult childbirth of the long-awaited heir, Napoleon was prepared to save her life over that of the infant. Their son, François, was born on 20 March 1811 and designated King of Rome. The heir ensured Napoleon's dynastic ambitions.

Marie Louise was unpopular in France. She served as regent in 1814 during Napoleon's military travails, but her inexperience and naïveté led to grievous errors despite her following the advice of a council. In 1814 Napoleon was forced to abdicate and was exiled to Elba. Marie Louise and François were restricted to Château Blois. Caught between husband and father, she fled to Vienna with her son where they lived as semi-prisoners in Schönbrunn Palace from

1814 to 1816. She was never reunited with Napoleon; their son, whom she largely neglected, was raised by his grandfather, a governess, and tutors, and never succeeded to the title of Napoleon II, as intended by his father.

Eight months after leaving France Marie Louise abandoned discretion and found solace with the love of her life, Adam, Graf von Neipperg, the Austrian officer who had escorted her back to Austria. He was well suited to her personality, but their union was deemed scandalous because she was still married to Napoleon. She secretly had two children with him: Albertine and Wilhelm Albrecht. A third child, Mathilde, died in infancy in 1822. Marie Louise was indifferent to the fate of her first child and held Napoleon responsible for their son's situation.

The Treaty of Fontainebleau, approved by the Congress of Vienna, granted Marie Louise the duchies of Guastalla, Parma, and Piacenza in Italy in her own right. She first set foot in her new country on 19 April 1816. She was well liked by her subjects and introduced numerous liberal reforms.

Upon Napoleon's death she married von Neipperg morganatically on 8 August 1821. Von Neipperg died in 1829, leaving her grief stricken. She married again on 17 February 1834 to her chamberlain, Charles René, comte de Bombelles, who was unpopular.

Marie Louise died at Vienna on 18 December 1847. She was buried at the Capucin church crypt in Vienna at her request, beside her father and her son, François, who was later moved to Paris to rest beside his father at Les Invalides.

### Marines

Marines have traditionally been sea-going infantry, able to fight as well on land as on board ship. During the French Revolutionary and Napoleonic Wars, all navies had a complement of marines on board their vessels, and when there was a shortage of such troops, resorted to using soldiers from the army.

On board ship, marines were associated with helping to maintain discipline and enforce regulations below deck,

suppressing mutinies, and performing guard duties. British marines (they received the title “Royal” in 1802) were to stand guard whenever punishment was inflicted. In the Royal Navy it was normal practice to maintain a social barrier between the marines and seamen, to ensure that the former did not form a bond with the seamen in the event of mutiny. However, this policy did not always succeed, as many marines took part in the mutinies at Spithead and the Nore in 1797.

Marines played an important role in the amphibious warfare that was a notable feature of the era. Small landing parties could consist of a mix of marines and armed seamen, while for specific operations large detachments of marines would be involved. In 1808 a party of 300 marines from all the Royal Navy ships on the Portugal station were brought together and landed at Figueras in support of a local uprising. A Royal Marine battalion was added to Sir Home Popham’s forces on the north coast of Spain in 1812, taking part in many landings, including the capture of Santander.

Apart from amphibious operations, marines were used extensively on land. They formed garrisons in friendly ports, especially when enemy colonies were captured. In Europe, French marines formed the garrisons of many coastal fortifications. French colonial garrisons also included detachments of these men.

In battle at sea, marines had a number of roles to play. Detachments would be used to fire disciplined volleys of musketry at opposing ships when they came into range; individual marines in the rigging would fire onto enemy decks, aiming at officers and gun crews. Boarding parties would consist of both marines and sailors, and the former would help defend against such onslaughts. On the capture of an enemy vessel, marines played a prominent role in securing the prize and guarding prisoners of war.

The employment of artillerymen from the army on board ship often gave rise to disputes over who had authority over such non-naval personnel. In 1804 the British Admiralty formed the Royal Marine Artillery to man the mortars and guns on bomb vessels, and these troops were landed (often with howitzers) in support of naval operations on land in the Iberian Peninsula and in America during the War of 1812. The French had no marine infantry units as such after 1795, but did have units of marine artillery who were trained and equipped as infantry and expected to perform all the duties of marines. After 1803 many French marines found themselves in the armies marching across Europe, especially in the campaigns of 1813 and 1814, as Napoleon sought ever-more troops to bolster his dwindling forces.

**Marmont, Auguste Frédéric Louis Viesse de (1774–1852)**

Auguste de Marmont, duc de Raguse and Marshal of the Empire, is best known for the betrayal of Napoleon, which took place on 5 April 1814. At that time, Marmont’s entire corps of 12,000 men guarding Fontainebleau was taken over to the Allies, with the immediate result that the Emperor abdicated in favor of his son. In consequence, the French verb *raguser*, from Marmont’s title, has entered the language to mean to betray.

Marmont was born into ancient nobility on 20 July 1774. The future marshal’s father was *seigneur* of Sainte-Colombe, near Châtillon-sur-Seine, and a Knight of the Order of Saint-Louis. It seems that Auguste contemplated a military career from an early age, and when he failed to gain entry into the royal artillery he joined a provincial regiment. In 1790 he became a *sous-lieutenant* in the Chartres Regular Army garrison. At about that time, an uncle of Marmont’s who had gone to the military school at Brienne recommended that he seek out a promising young artillery officer named Napoleon Bonaparte. The two would become friends, the wealthy Frenchman helping the impoverished, brash young Corsican through his family’s hard times. Marmont apparently exhibited a bit of the impressed younger sibling’s attitude toward Bonaparte, five years his senior.

In March 1792 Marmont entered the Châlons Artillery School, and upon graduating he became a lieutenant in La Fère Artillery Regiment, Bonaparte’s old unit. He was posted to the Army of the Moselle; then, as a captain, to the armies of the Alps and later the Pyrenees. At Toulon between 14 and 18 December 1793 Marmont attracted Bonaparte’s attention, and he soon was appointed one of General Bonaparte’s two personal aides. In 1794 and 1795 Marmont served in the (French) Army of Italy, and then in March 1795 he was assigned to a new post in the Vendée.

In February 1796 Bonaparte made Marmont his first aide-de-camp, and the two arrived to assume command of

the Army of Italy on 27 March. In Bonaparte's famous victory at Lodi, Marmont distinguished himself by leading a cavalry charge and personally capturing a cannon. In August Marmont's deployment of French artillery was integral to the French victory at Castiglione. Later that year Bonaparte sent Marmont to Paris with the colors captured at Rovereto, Bassano, Saint-George, Primolano, and Cismona. The ruling Directory promoted Marmont to the rank of colonel. At Arcola Marmont saw that his general had fallen into the mud of the dykes and plunged in after him, probably saving his life.

Marmont spent much of 1798 and 1799 in the Levant, where his superior's Egyptian campaign ultimately proved a disaster for French arms. Marmont, however, returned from the Middle East as a brigadier general: He personally had seized the flag of the Knights of Malta, having been one of the first ashore on that island, and this conspicuous bravery captured Bonaparte's eye. In addition Marmont was responsible for severing the Mamelukes' line of retreat at the Battle of the Pyramids on 21 July 1798, which cost the enemy 1,600 casualties and put the remainder to rout.

Bonaparte rewarded Marmont by making him Governor of Alexandria, while the bulk of the French force headed north for Syria. As elsewhere and at other times in his career, Marmont proved an able administrator, but he was still unable to avert the loss of Aboukir, for which Bonaparte criticized him, probably unfairly. At the campaign's conclusion, Marmont was among those select few to join their chief in abandoning the French army in the Middle East on 24 August 1799.

On 9–10 November 1799 Bonaparte and his supporters overthrew the French government in the coup of Brumaire. Marmont commanded the artillery in the army that would soon win renown on the field of Marengo. Since both Bonaparte and Marmont had been trained as artillerymen, they had special faith in the potential of their arm to decide battles—as, indeed, their experience at Castiglione had already borne out. At Marengo Marmont again employed the artillery to telling effect, and Bonaparte's army won a near-run victory. Marmont thus was delegated the task of negotiating the Treaty of Campo Formio, which brought the campaign of 1800 to a successful close via the reestablishment of French control south of the Alps. On returning to France Marmont undertook the standardization of the artillery, which gave France the world's first modern artillery arm.

In 1804 the Empire was proclaimed and the marshalate resuscitated. Marmont, who was younger than any of those named, felt disappointed not to have been among the new Emperor's first marshals; the explanation seems to have been that Marmont had never yet held an indepen-

Marshal Marmont. Despite scoring several minor victories against the Spanish, he was badly defeated by Wellington at Salamanca. He played a prominent part in the campaign of 1814 in France, but as fortunes turned for the worse urged Napoleon to abdicate. (Drawing by Jean Baptiste Guerin from *Life of Napoleon Bonaparte* by William M. Sloane. New York: Century, 1906, vol. 4)

dent command. Still, he was the only non-marshal in command of a *corps d'armée* when Napoleon's new Grande Armée swept eastward in 1805. In the Austerlitz campaign Napoleon decided to use the Imperial Guard and Marmont's corps as his reserve, the significance for Marmont being that it was unlikely he would win his marshal's baton in that episode, either. Marmont's selection to be held in reserve indicates that Napoleon considered his friend to be the corps commander least prepared for combat.

The Austerlitz campaign saw Marmont begin to butt heads with the Imperial Headquarters, specifically chief of staff Marshal Louis-Alexandre Berthier, over the Napoleonic recourse to "living off the land," that is, the army requisitioning supplies locally rather than establishing supply depots or taking with them on campaign thousands of supply wagons. Marmont's corps played a secondary role in the encirclement of *Feldmarschalleutnant* Karl Mack Freiherr von Leiberich at Ulm, then was again assigned a lesser role in the campaign that culminated in the triumph at Austerlitz on 2 December 1805.

Nor would Marmont participate in the other famous battles of Jena (1806) and Friedland (1807). Instead, he was made governor of the new province of Illyria (essentially, Albania and Dalmatia). He arrived at his post, which he would hold for three years, on 7 July 1806. His chief military task there was to make a show of assisting the Turks in one of their perennial conflicts with Russia and thus reduce Russia's contribution to the anti-French coalitions; at one point, he sent 500 artillerymen to assist in manning new shore batteries guarding the Dardanelles, but the Ottoman regime rejected this offer of French assistance. Marmont's 25,000 men were also to stand ready to assist in the defense of the line of the Danube.

In 1806 Russian forces took the Corcyrean harbor of Cattaro, and an Allied force of Montenegrins attacked Ragusa (present-day Dubrovnik). The Russian admiral Dmitry Senyavin refused to credit the French insistence that a treaty between France and Russia had been reached in Paris on 20 July, so Marmont faced the necessity of dealing with the Austrian, Russian, and Montenegrin amphibious force. In September 1806 Marmont successfully repelled the Allied expeditionary force, and French control of Ragusa and all of Dalmatia was preserved.

Marmont's administrative successes in Illyria led Napoleon to bestow on Marmont the title of duc de Raguse. During his time there, Marmont and his men built hundreds of miles of roads—including some that are still in use—and established French-style *lycées*. He might have achieved more, but Napoleon counseled that the imperial forces in Illyria must always be prepared to participate in operations elsewhere in Europe. Still, Marmont's superb performance led the Austrian emperor, Francis I, to comment a decade later, "*Domage qu'il ne soit pas resté plus longtemps*" (Too bad that he did not stay longer) (Driault 1927, 19).

The call for Marmont to head north finally came during the War of the Fifth Coalition in 1809. Both poor disposition of French forces by Berthier and more astute Austrian generalship than that to which the French had become accustomed necessitated the augmentation of Napoleon's force by the 15,000 men Marmont had available. After the Battle of Aspern-Essling, Napoleon told Marmont to hasten to him, and Marmont's alacrity in complying with this order pleased the Emperor.

During the crucial phase of the Battle of Wagram, Marmont's corps joined Marshal Jacques Macdonald's in a massive assault on the exposed Austrian center. Marmont's prior work on the French artillery paid off, as Napoleon massed more than a hundred guns to break Archduke Charles's center.

Since Marmont's men essentially had fought only on the battle's final day, they were assigned the key role in the

pursuit, and their performance turned Wagram into a major victory. On 10 July Marmont attacked two-thirds of the retreating Austrian army at Taya, performing the classic pinning function Napoleon expected of his pursuing corps. Marshal André Masséna's corps joined in mauling the Austrian rear guard at Znaim on 10–11 July, and the Austrians sued for peace. On the twelfth, the day of the armistice, Marmont received a marshal's baton, as did two colleagues. A rhyme popular among the army at the time held that, "*La France a nommé Macdonald. L'armée a nommé Oudinot. L'amitié a nommé Marmont*" (France named Macdonald. The army named Oudinot. Friendship named Marmont). Marmont, far from agreeing, believed that his promotion had come too late. He may have been, at age thirty-five, the youngest of Napoleon's marshals, but that did not satisfy Marmont, who felt insulted by the delay of his promotion. Further, there might have been a financial motive behind Marmont's appointment to the marshalate: The younger man had married into one of the leading banking families in France. Since Napoleon needed cash to fund his expensive military establishment and to offset the effects of his trade policies, amicable relations with the duc de Raguse were essential to Napoleon.

Marmont returned to Illyria. French taxes and conscription in time would be introduced into Illyria, over the governor's objections. Marmont allowed Slovene and Croatian to be spoken in schools and used in documents, and he even allowed the writing of Slovene textbooks. Still, as in much of Napoleon's Empire, transportation and educational improvements were not seen by the locals as offsetting the burdens of foreign taxation and conscription into foreign armies, and Marmont had to deal with periodic flare-ups of local resistance, such as the quashing of a Croatian rebellion before his departure for Spain in 1811. By the time the Napoleonic Code was implemented in Illyria, Marmont had already departed.

Marmont was assigned to take command of VI Corps, a unit of Masséna's (French) Army of Portugal, on 9 April 1811. The position Marmont had been assigned was being vacated by Marshal Michel Ney, who had found it impossible to work with the dissolute, though very able, Masséna. Like Ney, Masséna, and others, Marmont would see his military reputation irretrievably damaged by events in Iberia: Within three days of his arrival in April 1811, he found himself in command of the Army of Portugal, which he would lead to a resounding defeat at the hands of the Earl of (later Duke of) Wellington.

The "Spanish Ulcer" arguably would prove fatal to the Napoleonic Empire, and the command structure in Iberia was hardly conducive to battlefield success. First, Napoleon's older brother Joseph ruled Spain as puppet king, and several French armies—whose commanders each had their

own agenda—were posted about the kingdom. As the commanders rarely cooperated effectively, the Emperor constantly intervened from afar to “clarify” matters. In addition, Napoleon saw Iberia as a theater of secondary importance, so, as Marmont soon had reason to lament, even the most essential items were perpetually in short supply.

Marmont’s record in Illyria and Egypt had given reason to believe that he was capable of managing a major independent command, but this was his first opportunity to do so. The Army of Portugal numbered approximately 40,000 men when Marmont assumed command. The transport system was in shambles, and ongoing guerrilla warfare posed great difficulties. On the other hand, Napoleon gave Marmont total control of the organization of his force, including the discretion to relieve generals with whom he did not believe he could work. Marmont’s assignment was to defend Ciudad Rodrigo against any attempt by the Anglo-Portuguese force under Wellington to take that strategic city, and he was assured that in case Wellington moved against it, Napoleon himself would come to take command of the Army of Portugal.

Marmont began his operations in Iberia with a strategic withdrawal from the Spanish-Portuguese border to Salamanca. He and Marshal Nicolas Soult then succeeded in forcing Wellington to abandon his attempt to capture Badajoz, one of the two so-called keys to Iberia. Marmont favored forcing Wellington to fight at that juncture, but Soult desired only to return to his comfortable sinecure in Seville. Thus was lost the French army’s best opportunity to confront Wellington from a position of marked numerical superiority.

After reluctantly mounting an invasion of Portugal, Marmont realized that Wellington intended to strike into Castile, thus bringing Marmont into a general action. The French forces in Spain had been notably weakened in 1812 by the Emperor’s decision to transfer the most outstanding of his generals and units for the invasion of Russia, but Marmont remained confident.

Marmont performed well in what became a contest of maneuver in Spain. Wellington first advanced to meet Marmont, who then began a prolonged attempt to turn Wellington’s flank and sever the Anglo-Portuguese line of communications, which extended back into Portugal. Wellington, on the other hand, hoped to force Marmont to come to blows. The two armies marched within a stone’s throw of each other for days on end. On 22 July 1812, however, the race came to a conclusion at the Battle of Salamanca.

Marmont, on seeing what he thought was dust rising from the British rear, expected another day of hard marching. As he described it in his largely self-exculpatory memoirs, he therefore sent four divisions along the plateau to

the west of the Greater Arapile, with two divisions abreast in front and the other two to follow. Instead, however, General Antoine Louis Popon, baron de Maucune and his division descended from the plateau, which allowed too great a gap to develop between those leading forces. (The point of Marmont’s account is that the fault lay with Maucune, not with Marmont himself.) Wellington, observing the French maneuver from a distance, instantly told his Spanish counterpart, “*Mon chère Aliva, Marmont est perdu*” (My dear Aliva, Marmont is lost) (Longford 1973, 285). Wellington then sent his finest units to cut off Marmont’s lead divisions and destroy them in succession.

Marmont and Joseph Bonaparte agreed that Marmont might at that point have rectified the situation. Yet Marmont did not witness the rout of his army. No sooner did he realize what was happening than he was struck by shell fragments. He regained consciousness only the next day. His right side had been badly injured in two places; eventually, his right arm would have to be amputated. The defeat at Salamanca reduced the Army of Portugal to 20,000 effectives. Soult had to abandon Andalusia, and Marmont was reposted to central Europe, where the fate of the Napoleonic empire in Germany would be decided in 1813.

Marmont fought bravely and well in the campaign of 1813. His performance at Lützen and Bautzen (where only the shortage of horses plaguing the French army prevented a repetition of 1806), and particularly at Leipzig, went far toward restoring the reputation that had been so seriously sullied at Salamanca.

Marmont was bitterly opposed to Napoleon’s entire plan of operations at Leipzig. Still, his corps fought well on 16–17 October. The day might even have been won had not the Württemberger cavalry associated with Marmont’s corps refused to pursue General Johann von Yorck’s corps when Marmont’s men routed its leading division; two days later, the Württembergers would desert. Still Marmont’s corps had faced down General Gebhard von Blücher’s numerically superior Allied force at Möckern.

On 18 October a force of 10,000 Saxon cavalry deserted Ney’s corps, which necessitated a contraction of the entire French line of battle. The outcome of Leipzig had been determined. All that remained was for the disaster of the nineteenth—the premature destruction of the main bridge into the city of Leipzig, and thus the unintentional destruction by French forces of their main line of retreat—to occur. Marmont’s troops had been virtually annihilated at Leipzig, and he sustained another wound.

Napoleon returned to France to endeavor to raise yet another army. Marmont and three other marshals remained in central Europe to lead the tattered remains of the Grande Armée back to France. Marmont let his departing chief know of his displeasure at the mounting human

cost of the seemingly endless war, especially since Napoleon seemed enthused by the prospect of raising a new army.

Champagne became the theater of a midwinter campaign in 1814. Marmont, long dissatisfied with the French armies' de facto policy of living off the land, repeatedly complained that his men had insufficient food. The quality of the new troops, many young boys and most with little training, posed further difficulties. By the end of the campaign, they would lack basic items of clothing, as well.

As in 1796 Napoleon led his small force brilliantly. He took advantage of his interior lines to rain a succession of blows down upon the heads of his far more numerous enemies. Marmont repeatedly demonstrated great bravery and real leadership ability, as when he put 25,000 Bavarians to rout near Troyes on 2 February.

On the night of 6 March Marmont's exhausted men marched toward Laon, to where Napoleon had given the marshal a direct order to hasten. Marmont's men were exhausted and hungry, and Marmont—without taking proper precautions against night attack—spent the night at a château well to their rear. When Blücher attacked them, they were routed very easily; only the presence of 125 members of the Old Guard averted a complete disaster. Marmont had lost 3,200 of his 9,000 men, plus 37 of 45 guns. Napoleon cited “the crass stupidity of the Duke of Ragusa, who behaved himself like a second lieutenant” (Chandler 1966, 991) as the reason for the failure of his maneuvers to bring Blücher to bay against the main French force.

By the end of March Marmont and Marshal Adolphe Mortier had arrived in Paris. They faced 150,000 enemy troops in three bodies. Marmont would perform heroically in the defense of the capital: A dozen men were killed by bayonet at his side, and his hat was pierced by a musket ball. Finally, however, in accordance with Napoleon's instructions, the city was surrendered rather than defended to the bitter end.

Marmont withdrew to Essonnes, on the city's outskirts. There, he was praised by Napoleon for his heroic defense of the approaches to the city, and the two discussed a plan to fall upon their enemies' lines of communication. Soon enough, however, Marmont decided upon a different course of action: Under the prodding of Tsar Alexander, French foreign minister Charles Maurice de Talleyrand, and others, he took his army over to the enemy on 5 April, five days after he had surrendered the capital.

Marmont thus abandoned his Emperor, his old friend, in the field. Napoleon's abdication quickly followed. During the Hundred Days of 1815, Marmont refused to go to Napoleon's aid, and he was branded a traitor. Although he would remain a marshal during the reigns of Louis XVIII

and Charles X, Marmont was never trusted again. In 1830 he was forced into exile together with the last Bourbon king, and he spent the remainder of his life wandering the scenes of his bygone glory. His death in Venice, on 3 March 1852, was unique among those of Napoleon's marshals in being essentially unlamented.

## Marseillaise, La

The birth of the French national anthem has its origins in April 1792 when, as troops mobilized for war against Austria, Philippe Frédéric, baron de Dietrich, the mayor of Strasbourg, hosted a patriotic dinner. In response to the complaint that popular Revolutionary songs, such as “Ça ira,” were neither dignified nor suited for marching, a young military engineer and amateur composer called Claude Joseph Rouget de Lisle wrote the “War Song of the Army of the Rhine” in just one night. It acquired the name “La Marseillaise” when federated troops from the south transmitted it to Paris shortly before the fall of the monarchy. The dramatic images of family and fatherland in peril (*La Patrie en danger!*) captured the public imagination as they spread around the country—thanks in large part to numerous printed editions of the song, some subsidized by the government.

“La Marseillaise” was part of the new civil religion so central to the Revolution. Like the tricolor flag, it celebrated the whole nation rather than a dynasty, class, or region (just as the French language of the text supplanted both provincial dialects and elite Latin). It featured prominently in ritualized political settings such as civic festivals or meetings of the Jacobin Club but was also sung spontaneously; theaters were required to perform it upon public demand. It was appropriated in medleys and variations and also spawned hundreds of parodies.

The Thermidorians, however, replaced it with the anti-Jacobin “Awakening of the People.” The Convention made “La Marseillaise” the national anthem on 14 July 1795, although the battle with the “Awakening” continued in the streets and theaters into the next year before dissipating. The relevance of the song’s martial themes notwithstanding, Napoleon rejected its Jacobinism, elevating “Watch o’er the Empire” (from 1792) in its place. The fate of “La Marseillaise” fluctuated as regimes came and went, until it again became the national anthem under the Third Republic in 1879.

Rouget de Lisle’s authorship of the music was long a matter of contention—said, for example, to come from an opera by Dalayrac—but is now generally accepted.

François-Joseph Gossec orchestrated the melody, and following the Revolution of 1830, Hector Berlioz dedicated an arrangement to Rouget de Lisle, by then impoverished and forgotten.

Among the artworks that the song inspired is François Rudé’s sculpture on the Arc de Triomphe, *The Departure of the Volunteers* (1833), more popularly known as *The Marseillaise*. The story of the song was popularized in a chapter of Stefan Zweig’s *Tide of Fortune* (1927; English, 1940), and in Jean Renoir’s film, *La Marseillaise* (1938), which both commemorated the one hundred fiftieth anniversary of the Revolution and urged national unity and vigilance in the face of the new threat of fascism.

## Marshalate

Body of twenty-six men endowed with the highest rank bestowed under the French Empire. Just as the aristocracy and their titles were swept away by the Revolution, the ancient dignity of Marshal of France (*Maréchal de France*) was abolished by the Convention in 1793. On the proclamation of Napoleon as Emperor on 18 May 1804, the new Constitution of the Year XII (in deference to the republican calendar) created the dignity of Marshal of the Empire (*Maréchal d'Empire*). In theory the marshalate was a civil dignity, as opposed to a hereditary title or military rank. Nevertheless, only senior military men were eligible, and key military commands invariably went to marshals.

The first promotions to the marshalate were made on 19 May 1804 with fourteen active and four honorary members. They are listed below in order of creation. There was no distinction of seniority among them apart from Louis-Alexandre Berthier who, as chief of staff, acted in the name of the Emperor, and Joachim Murat, Napoleon’s brother-in-law. Napoleon created the marshalate

primarily to consolidate his support within the army, thus defusing potential coups, but also to give prestige to the Empire.

The marshals came from diverse backgrounds socially and politically and from different power groups within the army. The army had a network of personal loyalties among men who had served together, whether in the Pyrenees, on the Rhine frontier, in Italy, in Egypt, or elsewhere. The composition of the marshalate was fairly balanced among the factions and respected the achievements of the Republic, a number of republicans being included.

The marshals were variously rewarded with titles, along with grants of land or money. Many also enriched themselves through speculation. However, the price of fame was heavy: Half were wounded, while marshals Jean Lannes and Jean-Baptiste Bessières were killed in action, and Józef Poniatowski drowned in the river Elster as the army fled from Leipzig on the final day of that battle. After 1815 Michel Ney and Murat were shot by firing squad, Guillaume Brune was killed by a royalist mob, and Berthier died mysteriously after falling from a window.

#### List of Marshals

*Created on 19 May 1804*

**Augereau**, Pierre-François-Charles (1757–1816), duc de Castiglione

**Bernadotte**, Jean-Baptiste-Jules (1763–1844), prince de Ponte-Corvo, roi de Suède (at its invitation)

**Berthier**, Louis-Alexandre (1753–1815), prince souverain de Neuchâtel et de Wagram, duc de Valengin

**Bessières**, Jean-Baptiste (1768–1813), duc d’Istrie

**Brune**, Guillaume-Marie-Anne (1763–1815), comte

**Davout**, Louis Nicolas (1770–1823), duc d’Auerstädt, prince d’Eckmühl

**Jourdan**, Jean-Baptiste (1762–1833), comte

**Kellermann**, François Etienne “the Elder” (1735–1820), duc de Valmy (honorary)

**Lannes**, Jean (1769–1809), duc de Montebello

**Lefebvre**, François Joseph (1755–1820), duc de Danzig

**Masséna**, André (1758–1817), duc de Rivoli, prince d’Essling

**Moncey**, Bon Adrien Jannot de (1754–1842), duc de Conegliano (honorary)

**Mortier**, Adolphe Edouard Casimir Joseph (1768–1835), duc de Trévise

**Murat**, Joachim (1767–1815), grand duc de Clèves et Berg, roi de Naples

**Ney**, Michel (1769–1815), duc d’Elchingen, prince de la Moskowa

**Pérignon**, Dominique-Catherine (1754–1818), marquis de (honorary)

**Sérurier**, Jean Mathieu Philibert (1742–1819), comte (honorary)

**Soult**, Nicolas Jean de Dieu (1769–1851), duc de Dalmatie

*Created on 13 July 1807*

**Victor**, Claude Perrin (1764–1841), duc de Bellune

*Created on 6, 12, 13 July 1809, respectively*

**Macdonald**, Jacques Etienne Joseph Alexandre (1765–1840), duc de Tarente

**Marmont**, Auguste Frédéric Louis Viesse de (1774–1852), duc de Raguse

**Oudinot**, Nicolas Charles (1767–1847), duc de Reggio

*Created on 8 July 1811*

**Suchet**, Louis-Gabriel (1770–1826), duc d’Albufera

*Created on 27 August 1812*

**Gouvion St. Cyr**, Laurent (1764–1830), comte

*Created on 15 October 1813*

**Poniatowski**, Józef Anton (1763–1813), Prince (Polish title, by birth)

*Created on 15 April 1815*

**Grouchy**, Emmanuel (1766–1847), marquis de

#### Martín Díez, Juan, “El Empecinado” (1775–1825)

Originally a peasant and sometime soldier from Castrillo de Duero in the province of Burgos, Juan Martín Díez was a great hero of the Spanish struggle against Napoleon, and, more particularly, one of the leading commanders of the famous Spanish guerrillas.

The true story of how he became a member of a guerrilla band is unknown, but it seems probable that he had to take to the hills after killing a Frenchman in a fight. Be this as it may, by June 1808 he was attacking couriers traveling

along the high road from Madrid to the French frontier at the head of a handful of followers. According to legend he then fought under General Gregorio García de la Cuesta at Cabezón and Medina de Río Seco, but this is by no means certain, it being more likely that he continued to haunt the Madrid high road. Little better than a bandit, following the French evacuation of Old Castile in the wake of Bailén he was thrown in jail at Burgo de Osma.

In November, however, the French occupied the town, and Martín managed to escape in the confusion. Fleeing westward to his home district, he then reunited his followers, who included his three brothers, and, once again according to legend, proceeded to harass the French in an area stretching from Aranda de Duero to Segovia, it being at this point that he acquired the nickname of “El Empeinado” (roughly, “Stick-in-the-Mud”).

Had matters simply continued in this fashion, Martín would beyond doubt in the end have degenerated into a mere brigand (always assuming, that is, that he was ever anything else). However, whatever may have been his motivation—and it seems almost certain that this was not simple patriotism—the guerrilla leader decided that he would do best if he regularized his position with the Patriot authorities. In consequence, he did all that he could to ingratiate himself with them, and in April 1809 the Junta Central duly rewarded him with the rank of lieutenant. At the same time, meanwhile, unlike many of his fellow irregulars, he threw himself wholeheartedly into the struggle against the French, reasoning, perhaps, that his only hope of advancement was military glory.

For some time he continued to operate in Old Castile, but in September 1809 his growing fame led the Patriot authorities in the province of Guadalajara to offer him command of the forces they had been raising to fight the French. This was all the opportunity that Martín needed. A redoubtable character of considerable talent, he quickly scored a number of successes against the enemy and greatly expanded his command, which he had by 1810 transformed into a brigade of regular troops. Basing himself in the mountains that fringed Guadalajara, Martín for the next two years waged a fierce struggle against the invaders. By August 1812 when the Earl of Wellington liberated Madrid, Martín, by then a brigadier, accompanied him in his triumphal entry into the city.

This, however, was to prove the zenith of his career. Though the French recovered Madrid in November, Guadalajara remained largely free of their presence, and Martín and his men appear to have settled down to enjoy the fruits of victory. Such incursions into the area as the French made were resisted, but no attempt was made to seek them out. Increasingly exasperated, the Patriot authorities responded by depriving Martín of his indepen-

dence: Already theoretically a division of the Second Army, he and his men in August 1813 were ordered to join the Spanish forces besieging the garrison, which the retreating French had left in the Catalan town of Tortosa. So ineffectually was the siege conducted, however, that the invaders were still holding out when the war ended.

The story of the years that followed is not much more edifying. Contrary to legend, Martín did not immediately join the fight against absolutism. Showered with honors, he appears to have been on good terms with the regime. Following the Revolution of 1820, however, he went over to the liberals and in 1821 was given the task of suppressing absolutist rebels in the province of Burgos. The guerrilla, then, was now turned counter guerrilla, but in this role he was singularly unsuccessful, while his command was overwhelmed when the French invaded Spain to rescue Ferdinand VII two years later.

With the liberal armies collapsing on all sides Martín appears to have tried to revert to life as a partisan, but on 22 November 1823 he was captured at Olmos. Put on trial for his life, he was finally led out for execution at Roa on 19 August 1825. However, adventurer and opportunist though he may have been, Martín was not lacking in courage. In a last-minute bid for freedom, then, he broke loose from his captors on the very scaffold. There followed a desperate chase through the streets, but in the end the guerrilla leader was cornered, overcome, and brought back to face the noose.

## Martinique

Martinique is an island in the Lesser Antilles group of the West Indies, 40 miles long and 15 miles wide. It was one of France’s main colonies in the Caribbean, having been colonized in 1635, and its principal crops were sugar and bananas. The future Empress Josephine was born there in 1763. It was an important French colony both commercially and in wartime, acting as a base for privateers to harass British maritime interests.

The West Indies was a major theater of the war, as it was an important source of sugar, spices, coffee, cocoa, and cotton. The mercantile interest in Britain was represented by the “West India lobby,” which demanded military and naval action to protect their commercial interests. The capture of French and Spanish colonies in the region would deny goods and revenue to those countries and at the same time open up new markets for British trade. However, the campaigns in the West Indies were costly in human lives, as many thousands of soldiers and seamen succumbed to sickness and disease, notably yellow fever.

In 1791 the French Assembly had granted citizenship to the slaves on the French islands of the West Indies. This had angered the French colonists and provoked them into declaring for the royalist cause and seeking British assistance and protection. Rear Admiral Alan Gardner landed nearly 2,000 British troops and French royalists on Martinique in June 1793, intending to march overland and attack the French forts at St. Pierre. Confusion among the royalist contingent caused them to fire on one another, and this persuaded the entire force to fall back to the landing site, where they were all evacuated, the invasion having failed.

The following year saw a determined attack on the island by a strong naval force under Vice Admiral Sir John Jervis carrying 7,000 troops under Lieutenant General Sir Charles Grey, who arrived off the island on 5 February. The landing was made in three places, and by 16 March the whole island had fallen to the British, apart from forts Bourbon and Royal. On 22 March the French governor in Fort Bourbon, Donatien Marie Joseph, vicomte de Rochambeau (son of the noted French general in the American Revolutionary War), capitulated. Martinique remained in British possession until returned to France under the Treaty of Amiens.

During the summer of 1805 Admiral Pierre de Villeneuve briefly used Martinique as a base for his powerful naval squadron that was pursued by Vice Admiral Horatio, Viscount Nelson across the Atlantic prior to the Battle of Trafalgar. In early 1809 Rear Admiral Alexander Cochrane took a strong naval force plus 10,000 troops under Lieutenant General George Beckwith to attack Martinique again. Opposing them under the command of Vice Admiral Louis Villaret-Joyeuse were 2,400 regular troops and 2,500 militia of dubious quality. The militia put up no resistance, and after a heavy bombardment of Fort Desaix, the garrison of regulars surrendered on 24 February. The island remained British until it was restored to France in 1815.

### Masséna, André (1758–1817)

One of Napoleon's most brilliant and successful subordinates. The two first became acquainted at the siege of Toulon in 1793, and they formed a lasting association during the Italian campaigns of 1796–1797. While Napoleon and his key lieutenant were never personally friendly, Masséna served Napoleon with notable success for more than a decade. During the time Napoleon was in Egypt, Masséna established an independent reputation as a military commander with his brilliant defense of Switzerland against the forces of the Second Coalition in 1799. He added luster to his name the following year when he defended Genoa, pinning down Austrian forces and facilitating Napoleon's victory at Marengo. Another high point in Masséna's career came in the 1809 campaign on the Danube against Austria. When Napoleon sent him to Spain at the close of that year, his arrival was greeted with trepidation by Viscount (later Duke of) Wellington, the British commander. But by then Masséna's best days were behind him. Wellington defeated him decisively, and his career as a battlefield leader came to an end.

Masséna was born on 6 May 1758, in the city of Nice. His birthplace was located in the Italian kingdom of Piedmont, and Masséna grew up in an Italian-speaking environment. His father, a modest merchant, died while André was still a child, and his mother abandoned him. With few prospects in life and virtually no education, the orphaned Masséna went to sea as a cabin boy, and then, at the age of seventeen, joined the French Army. He quickly showed his military gifts, but the pre-Revolutionary army offered only limited opportunities for someone of his background, and he left the service in the summer of 1789 to take up the grocer's trade. Some historians believe this occupation was a cover for Masséna's more compelling occupation as a smuggler.

As an experienced soldier, Masséna rose rapidly in the military forces that emerged after the Revolution of 1789. He served as an instructor to the National Guard at Antibes, and he joined the volunteer army the government raised in early 1791, quickly attaining the rank of lieutenant colonel. Fighting in the Maritime Alps, he became a *général de brigade* in August 1793. A few months later, he took part in the final assault that drove Allied forces from the French port of Toulon. Masséna first met Bonaparte at the siege, and, while the young Corsican's performance here made him a *général de brigade*, Masséna's accomplishments elevated him to the (higher) rank of *général de division*. In future years, Masséna remembered that he had once outranked the young Corsican.

In early 1794 Masséna joined the (French) Army of Italy, and in November 1795 he achieved a major victory in command of two divisions at the Battle of Loano. Although an obvious candidate to become the permanent commander of the Army of Italy, Masséna saw the post go to Bonaparte. The two now began a close collaboration, but their work together was marred by Masséna's open dislike for his new superior and especially for General Louis-Alexandre Berthier, Bonaparte's chief of staff.

The first moves in Bonaparte's Italian campaign in the spring of 1796 relied heavily on Masséna's skills. He pummeled the Austrian army at Montenotte and Dego, while his fellow divisional commander, General Pierre Augereau, struck at the Piedmontese. The two then joined forces to gain a decisive victory over Piedmont at Mondovi, and Masséna's subsequent advance northward pushed the Piedmontese leaders to call for an armistice.

With Piedmont out of the war, Masséna's forces played a key role in Bonaparte's advance to Milan and Verona. During the remainder of 1796 and the early part of 1797, the Austrians launched repeated offensives against the French in northern Italy, and Masséna served Bonaparte brilliantly. The high point of his leadership came in January 1797. Masséna rushed his forces northward from his headquarters at Verona to Rivoli to defeat a dangerous Austrian advance under *Feldzeugmeister* Joseph Alvinczy Freiherr von Berberek, then turned southward to block a second Austrian attack near Mantua. Masséna's troops subsequently led the advance into Austrian territory, stopping only 100 miles short of the enemy capital at Vienna and compelling the Austrians to open peace negotiations.

Masséna's career entered a period of stagnation after these dramatic successes. He remained in Italy, and his reputation was soon stained by word of his rapacious taste for looting. He also failed, as commander of French troops in Rome, to maintain discipline among his troops. Bonaparte did not include him in the small circle of favored subordi-

Marshal Masséna, a long-serving officer of the French Revolutionary and Napoleonic Wars, is best remembered for the period of his service in Spain and Portugal. (Library of Congress)

nates like generals Jean Lannes and Jean Andoche Junot who joined the expedition to Egypt in the spring of 1798. Masséna received the less prestigious assignment of serving under General Jean-Baptiste Jourdan at Mainz, in the Rhine theater.

The threat posed by the Second Coalition gave Masséna a new opportunity to shine. Austrian troops took the offensive in southern Germany and northern Italy, and the danger was heightened by the imminent arrival of Russian forces. Maintaining a French hold on Switzerland became a key factor in the defense of French territory. Named commander of the newly formed (French) Army of Switzerland, Masséna held a large independent command for the first time. At the order of the Directory he reluctantly advanced into eastern Switzerland in March 1799, but the failure of Jourdan's parallel offensive in southern Germany, the defeat of French forces at Verona, and the arrival of Russian troops under Field Marshal Alexander Suvorov gave Masséna the central role in defending France. He was in charge of a 400-mile sector shielding his country's eastern frontier. With an army of 80,000 men, Masséna launched a skillfully planned and executed attack in late September on Austrian and Russian forces at the second Battle of Zürich. His success here disrupted the entire Allied advance and saved France from invasion.

During the closing months of 1799 Masséna returned to Italy to perform brilliantly once again. Bonaparte, who had just seized control of the French government, appointed his former subordinate to pin down the Austrian and Russian forces that had retaken control of northern Italy. He was to defend a line from Genoa to Mount Blanc. At first Bonaparte did not inform Masséna that he intended to cross the Alps and strike France's opponents from the rear.

Pushed back by the Austrians into Genoa in April 1800, Masséna also had to face the power of the Royal Navy, which controlled the seaborne approaches to the city. But the French leader conducted a masterly defense of the city for two months. He ordered sorties against the Austrian forces besieging the city, and when surrender negotiations began he delayed the talks as long as possible. He was forced to capitulate on 4 June only after Genoa's food supply had been completely exhausted. Nonetheless, his efforts had drawn Austrian forces away from the Alpine passes Bonaparte's forces were using. This set the stage for Bonaparte's triumph at Marengo ten days after Masséna's exhausted force of 8,000 men surrendered.

Friction with Bonaparte continued in the aftermath of this success. Bonaparte failed to offer Masséna any credit for his performance at Genoa. Instead, Masséna was relieved of his command and ordered to return to Paris in August 1800. Moreover, Masséna refused to approve of Bonaparte's elevation to the post of Consul for Life in 1802. Thus, it was no surprise when in 1803 Masséna failed to secure a command for the planned invasion of England. The only bright moment during the years following the 1800 campaign came when Napoleon named Masséna one of the first marshals, on 19 May 1804.

In the fall of 1805 Masséna again played a secondary role in one of Napoleon's brilliant offensive campaigns. He returned to Italy to pin down the Austrian forces there while Napoleon conducted the main campaign in Germany and Austria against the Third Coalition. Masséna fought Archduke Charles, the Austrians' most renowned general, to a draw at the Battle of Caldiero, then followed Charles as the Austrian commander moved northward. Masséna's efforts helped prevent Charles from reaching the Austrian and Russian forces facing Napoleon in central Europe. But, once again, Napoleon gave Masséna's role in 1805 no public praise.

In 1806 as Napoleon's Grande Armée won a spectacular victory over the Prussians at the twin battles of Jena and Auerstädt, Masséna remained in Italy. He helped to establish Napoleon's brother Joseph as King of Naples, and he engaged in a brutal campaign of suppression against Italian guerrillas. In the spring of 1807 after repeated requests, Masséna joined the Grande Armée in northern Poland, the main theater of operations. Napoleon appointed him to

command V Corps, replacing Lannes, who returned to France on sick leave. Masséna participated in the Battle of Friedland, and like others at the top of the army command he received a domain in Poland as a reward for his role in the campaign. His stay in Poland had an unwelcome effect on his health, however, burdening him with a chronic lung disease.

In March 1808 when Napoleon created a new aristocracy, Masséna was named duc de Rivoli. The more logical title for someone of Masséna's eminence should have been duc de Zürich—after his great triumph there in 1799—but Napoleon refused to grant laurels for an action that had not taken place under his overall control. Relations between the two suffered another blow when Napoleon accidentally shot Masséna in the face during a hunting party.

Masséna's military career reached new heights in the campaign against Austria in 1809. In command of the newly formed IV Corps of the Grande Armée, Masséna helped defeat Archduke Charles at Landshut and Eggmühl in Bavaria, then led the pursuit of the Austrians down the Danube, fighting at Ebersberg. Masséna helped save the French army in late May 1809, when Napoleon, without having established the location of the main Austrian army, ordered Lannes and Masséna to take their forces to the north bank of the Danube. Charles struck the outnumbered French with a surprise attack at the villages of Aspern and Essling on the afternoon of 21 May. But Masséna, like Lannes, held steady, counterattacked with vigor, then withdrew skillfully to the French-held island of Lobau in the Danube. Masséna was the last French soldier to leave the Danube's northern shore.

Together with Napoleon, Masséna disguised himself as a sergeant in the French army to reconnoiter Austrian defenses in preparation for a second crossing of the Danube. Although injured in a riding accident and forced to travel in a carriage, Masséna led the new operation across the Danube. In the ensuing Battle of Wagram Masséna showed his effectiveness in combat once again. With the French center in danger in the face of an Austrian attack, Masséna moved his forces to fill the gap. His firm defense permitted General Louis Davout on the French right flank to launch the climactic attack that drove the Austrians from the field. With the defeat of Austria, Napoleon handed out new titles and rewards, and Masséna, already the Duke of Rivoli, was elevated to become the Prince of Essling.

Masséna's final tour of combat duty took place in the Iberian Peninsula, where so many French commanders saw their reputations tarnished. Despite France's occupation of Portugal in 1807 and Spain in 1808, resistance continued, conducted by Spanish and Portuguese regulars and guerrillas supported by a British expeditionary force. Deter-

mined to win a decisive victory over the British, Napoleon appointed Masséna to advance into Portugal to destroy the forces of Viscount Wellington. In April 1810 Masséna received command of the (French) Army of Portugal.

After more than a decade of military successes, stretching from Loano to Wagram, Masséna seemed capable of assuming this challenging independent command. But he took the post with great reluctance. His health had been impaired by the strains of recent years, and he had doubts of how well he could operate with formerly independent subordinates like marshals Michel Ney and Jean Andoche Junot. Upon his arrival at the French base at Valladolid in May Masséna, only fifty-two years old, appeared to many observers to be a sick, enfeebled figure.

The campaign of 1810–1811 presented Masséna with insuperable difficulties. His British opponent created a set of impregnable defenses—the Lines of Torres Vedras—that stretched across the width of Portugal. With command of the sea secured by the Royal Navy, Wellesley had the ability to hold out indefinitely against a French assault. Meanwhile, Masséna had to supply his troops and horses from a countryside the British and their Portuguese allies had stripped of all food and fodder.

Masséna had to cope as well with unrealistic orders from Napoleon, which prevented Masséna from advancing rapidly into Portugal in the early summer of 1810. Instead, the Emperor insisted that Masséna besiege and capture the border fortresses of Ciudad Rodrigo and Almeida. Given his choice Masséna would have used covering forces instead of attacking these two cities, and Napoleon's directives led to months of delay in the advance against Lisbon. Moreover, the army had a total strength of only 65,000 men, which made it impossible to secure French links with Masséna's Spanish bases. Thus, the French lost control of Coimbra, a key locale for the French line of communications, as soon as the Army of Portugal moved through it en route to Lisbon.

Other problems were clearly Masséna's fault. He insisted on bringing his mistress on the campaign, and her disguise in the uniform of a French hussar failed to fool anyone. Finding lodgings for the young woman sometimes slowed the army's advance. When the French confronted Wellington's forces at Busaco on 27 September, Masséna suffered a costly rebuff against Anglo-Portuguese forces. Against the advice of his senior subordinates like Ney, he ordered a costly frontal assault. Only after this initial failure did Masséna's cavalry discover a road to the north of Wellington's line. By the time Masséna began to outflank his adversary, the enemy had slipped away to take refuge in Lisbon.

Masséna reached the Anglo-Portuguese defenses at Torres Vedras in early October 1810. He immediately rec-

ognized that a direct assault could not succeed. After probing the lines on one occasion and then camping in front of them for a month, he understood that Wellington would not risk leaving his secure base to fight the French in the open. With no good options available, the French commander pulled his forces back 30 miles to Santarém. Masséna's forces benefited from the unwillingness of the Portuguese government to destroy all subsistence in this part of the country. Nonetheless, as more than three months went by, the French were reduced to starvation. Cut off from secure areas in Spain and without support from other French leaders like Marshal Nicolas Soult in Andalusia, Masséna had no alternative except to retreat.

The French withdrew from Portugal in March 1811. Masséna conducted the retreat with signs of his old military skills, and despite Wellington's efforts the British were unable to strike a decisive blow against the retreating French. Masséna even formulated an ambitious plan to strike at Lisbon from the south after moving his forces through the rugged Estremadura region in western Spain and crossing the river Tagus at Alcántara. But it immediately became evident that his exhausted forces were in no condition for such an ambitious undertaking, and Masséna turned eastward to return to his Spanish base at Salamanca. He made a final thrust into Portugal in May to lift the siege of Almeida, a border fortress that was being blockaded by the British. This led to a last encounter with Wellington at the Battle of Fuentes de Oñoro. Even before Masséna's defeat here Napoleon had decided to relieve him, and the news arrived in an insulting letter from Berthier, Napoleon's chief of staff and Masséna's longstanding personal enemy since the Italian campaign of 1796.

Masséna's failure against the British and Portuguese in 1810–1811 can be seen in retrospect as the turning point in the Peninsular War. The initiative in the fighting here now passed into Wellington's hands. Masséna saw his own life take a new turn as well, since he never held a battlefield command again. Nevertheless, although Napoleon had greeted Masséna brutally upon his return to France—reportedly telling him that the Prince of Essling was “no longer Masséna” (Humble 1974, 218)—he still had work for the old soldier. Masséna spent the last years of Napoleon's reign in charge of the military district at Toulon.

After the Emperor's abdication, Masséna remained at his post under Louis XVIII. When Napoleon returned to power in the spring of 1815, Masséna accepted his old leader as the legitimate ruler of France. He showed no particular enthusiasm, however, for the restoration of the Emperor, and after Waterloo Masséna returned to the service of the Bourbon monarchs. Despite his objections he was required to serve as a member of the court-martial trying

Ney, but even this did not make France's new rulers excuse his long service under Napoleon. On 1 January 1816 he was relieved of his command in Toulon. Masséna died on 4 April 1817.

## Maximilian I, King (1756–1825)

First king of Bavaria, ally and supporter of France for much of the Napoleonic Wars.

Maximilian Graf von Zweibrücken-Birkenfeld, later Maximilian I, or Maximilian I Joseph, was born on 27 May 1756 at Mannheim in the Palatinate as the son of Friedrich Graf von Zweibrücken-Birkenfeld and Marie Franziska of Pfalz-Sulzbach, who were members of the royal House of Wittelsbach. After a prescribed education he entered the French Army as a colonel in 1777. He quickly advanced in rank to major general and was stationed at Strasbourg from 1782 until 1789.

On 30 September 1785 Maximilian married Wilhelmine Auguste, Princess of Hesse-Darmstadt. The couple had five children. After his wife died in 1796, Maximilian, on 9 March 1797, married Friederike Karoline Wilhelmine, Margravine von Baden, with whom he had eight children.

When the French Revolution broke out Maximilian switched his allegiance to Austria. He became Duke of Zweibrücken on 1 April 1795 upon the death of his brother Charles II. Maximilian inherited the Electorate of Bavaria from his cousin Karl Theodore on 16 February 1799 when the Sulzbach line died out, becoming Maximilian IV Joseph. He also became Count Palatinate of the Rhine.

As elector Maximilian believed in following Enlightenment ideals. He never truly trusted Austria's intentions and when the Habsburgs forced him into war against France he signed a separate peace treaty with Napoleon in 1801 which, over the course of the next few years, enabled Bavaria to acquire territories that compensated for those (Jülich, Berg, Zweibrücken, and Electoral Palatinate) Maximilian had been obliged to cede according to the Treaty of Lunéville. Napoleon rewarded him for his loyalty with favorable terms in the Treaty of Pressburg on 26 December 1805; he received not only the kingship of Bavaria but also territorial acquisitions in Franconia and Swabia. On 1 January 1806, emulating Napoleon, he crowned himself the first king of Bavaria. Moreover, by sustaining membership in the Confederation of the Rhine, created that year, he significantly increased Bavarian territory.

With the help of his chief minister, Max Josef Graf von Montgelas, Maximilian endeavored to create a lib-

eral state. This was accomplished with a constitution in 1808. Commerce was promoted, agriculture was fostered, the criminal code was renewed, laws were enacted, and economic privileges were equalized. Religious houses were suppressed, and their revenue was shifted to improve education.

Maximilian's daughter, Augusta, married Eugène de Beauharnais, Napoleon's stepson. However, he changed his allegiance again, joining the Allies by the Convention of Ried on 8 October 1813, which ensured the integrity of Bavaria in exchange for his participation in the war against Napoleon. In 1816 he also exchanged Salzburg and the area around the river Inn for the more lucrative Palatinate on the west bank of the Rhine. In 1818 he created a charter establishing a bicameral parliament. He lost territory in subsequent treaties. The popular and kindly Maximilian, who loved playing the role of father of the country, died on 13 October 1825 in Munich. He was succeeded by his son, Louis I.

## Maya, Battle of (25 July 1813)

The Battle of Maya was a rare French victory during the Battle of the Pyrenees fought from 25 July to 2 August 1813.

Napoleon's plans for Spain were waylaid after his brother King Joseph lost the Battle of Vitoria on 21 June 1813. His 65,000 men were soundly defeated by a combined British, Portuguese, and Spanish force of 79,000. Napoleon appointed Marshal Nicolas Soult to take over command of the 50,000 French troops and the 70,000-strong (French) Army of Spain. His reorganized the armies and developed a strategy involving a counteroffensive in order to delay the planned actions of his opponent, the Marquis of Wellington, with his Allied force of 100,000 men.

In order to relieve the garrison at Pamplona, Soult had to move through the mountainous terrain of the Maya Pass in the Pyrenees, situated near the French border. Meanwhile, some 6,000 Anglo-Portuguese troops were ordered to drive the French out of Spain.

While British forces were foraging for food early on 25 July, they encountered the 6,000 French under Soult and General Jean-Baptiste Drouet, comte d'Erlon. The British 92nd Foot was stationed outside Maya. Severe weather caused by relentless rain damaged tents and supplies, ammunition, and equipment. While foraging for wood on 25 July, the 92nd encountered d'Erlon's corps advancing on the right side of the Maya Pass. A fire was set by the Allies to prevent French passage, but to no avail; the numerically superior French could not be checked. Within 20 minutes, some two-thirds of the 92nd was killed. The French advance was held up because stacks of Allied bodies blocked their way. The 6th Foot and Brunswick infantry arrived to offer relief, and the remnants of the 92nd were ordered back. However, when the regimental song "The Haughs of Cromdale" was played the 92nd spontaneously charged the French, without orders. The ferocity of the onslaught caused d'Erlon to withdraw momentarily. The fighting at Maya continued for nine hours, by the end of which the French had suffered 1,000 casualties.

Meanwhile the Allied forces that had been contained in the Roncesvalles Pass were forced to retreat by troops under General Bertrand Clausel. These constituted the only two French victories of the various battles fought in the Pyrenees. Their casualties amounted to 14,000 while the British lost 7,300. Thereafter the Allies were victorious in the subsequent battles, and the French were forced to return to their own soil. The Allies followed up their successes in the Pyrenees and entered France on 8 October 1813.

## Meaux, Battle of

*See* France, Campaign in

### Medellín, Battle of (29 March 1809)

A heavy Spanish defeat, the Battle of Medellín was one of Marshal Claude Victor's greatest victories. Reinforced by a division of dragoons, in early 1809 Victor's corps of the (French) Army of Spain had been sent to march on Lisbon. On nearing Badajoz, however, he found himself facing the new commander of the (Spanish) Army of Extremadura (Extremadura), General Gregorio García de la Cuesta. A tough and determined soldier, Cuesta was by nature very aggressive, while he also knew that he was feared and distrusted by the Junta Central (the provisional government of Patriot Spain). Having initially fallen back in the face of Victor's troops as they marched southward from the river Tagus, he therefore resolved on an offensive.

On 29 March 1809, then, Victor found himself under attack at the town of Medellín. Although the French commander's troops were much better than those of Cuesta, whose men were mostly raw recruits, his position was not a comfortable one: Caught by surprise, he had the broad river Guadiana at his back, and he was also somewhat outnumbered. Meanwhile, Cuesta had also adopted a sensible battle plan: Deployed in a crescent-shaped formation with their flanks resting on the Guadiana on the one hand and a minor tributary of that river called the Ortiga on the other, his army would be able to launch a concentric attack on the French, and every step that it advanced would thicken its line. To say that there were no faults in this scheme would be foolish: The terrain was open and the initial Spanish line thin, while much would depend on the troops maintaining their alignment as they moved forward. However, if the French were to be attacked at all, it is hard to see what else could have been done.

Initially, indeed, all went well for the Spaniards. Showing much courage, they pressed home their attack and drove back Victor's first line. At this point, however, disaster struck. The exact circumstances are unclear, but some Spanish cavalry suddenly fled and left a gaping hole in the line. Seeing their opportunity, the French pounced: Within moments their dragoons were pouring through the gap and rolling up the Spanish infantry on either side. Caught in flank and rear, the Spaniards broke and ran, suffering appalling casualties in the process: By the end of the day they had lost fully 10,000 men. As for Cuesta himself, he was trampled underfoot by some fugitive cavalry while trying to rally his men (with effects that famously were still to be visible when the British encountered him in the campaign of Talavera four months later). Yet the French profited little from their victory: unable to get Badajoz to surrender, Victor suspended his advance and was eventually forced to withdraw to the Tagus valley for want of supplies.

### Medical Services

Medical advances made during the French Revolutionary and Napoleonic Wars had long-lasting effects that still influence civilian and military medicine today. Through all the surgeries and amputations, surgeons discovered many new techniques and gained a better understanding of the functions of the human body. They made major advancements in the fields of sterilization, vaccination, and treatment of fevers, plagues, diseases, and bacteria. In addition, they developed sanitation codes and procedures for the evacuation of casualties and for surgical methods to deal with wounds.

France led the way in military medicine, enjoying higher amputation survival rates than any other country. French success was probably thanks to Dominique Jean Larrey's newly devised system of ambulance transportation and his emphasis on rapid amputations, coupled with his more advanced medical doctrine and the greater skill of French surgeons. Larrey put great emphasis on mobility and made care readily accessible for the wounded soldier, a principle still used in modern military medicine. The Enlightenment's emphasis on scientific and statistical approaches to medical management encouraged French military surgeons to keep detailed case histories of large groups of soldiers, resulting in new knowledge of the origins and treatment of disease. Because of their battlefield experiences, French army surgeons would become the advocates for future state-run, public health programs.

Military medical services were disorganized and ineffective before the French Revolution. Prior to the development of firearms, individuals usually were able to take care of their own wounds. Muskets, however, produced more serious wounds with greater amounts of tissue damage, while gunpowder increased the chances of infection. Such wounds required immediate and specialized medical treatment, but the system for delivering such services had become tragically inadequate by the end of the eighteenth and the beginning of the nineteenth centuries.

In the French, British, and Prussian armies, the attention and resources given to field medical units depended entirely on the army commander's willingness to provide them. Frederick the Great became more assertive in mili-

tary medical care. Despite his efforts, however, medical treatment for Prussian soldiers remained considerably behind that of other armies at the end of the century. In 1789 there was no formal medical training of any kind in the British Army, which had a medical board but did not require surgeons to provide or maintain specific medical instruments or drugs. Surgeons learned their trade after reporting to their regiments by practicing on the wounded. French soldiers, too, suffered from poorly trained surgeons.

Motivated by the new sense of patriotism, 1,400 French physicians and surgeons volunteered for military service at the outbreak of the War of the First Coalition in 1792. By the end of the French Revolutionary and Napoleonic Wars in 1815, more than 8,000 medical personnel of various types had seen service with the French armies. In the beginning, the press of war and social revolution had near catastrophic effects on the French medical establishment. The National Assembly had closed eighteen medical faculties and fifteen medical schools in France with a single vote in 1792, but in 1794 the state ordered the creation of the *Ecoles de Santé* for the express purpose of providing sufficient medical personnel to the armies. The disruption of the medical establishment drastically lowered the schools' quality of training and allowed anyone who could afford to pay for a license to practice medicine. This caused the quality of military doctors to decline even though their numbers increased. The French maintained this system until Napoleon completely reorganized the military medical establishment in 1804.

Once wounded, a soldier sometimes had to wait a considerable period of time before receiving treatment, after likely having had to carry himself off the battlefield or receive help from a comrade. In some cases there were stretcher-bearers, but in the early stages of the wars this was rare. The French medical system operated like the British system in that the wounded were evacuated to regimental hospitals, which served as hospital clearing stations near the battlefield or front. Standard practice was for the regimental surgeon to treat only the lightly wounded and prepare the more serious cases for shipment 20 or 40 miles to the rear. If the patient survived the trip, surgeons performed major procedures in better-supplied and more-protected hospitals.

However, because medical services were primitive, chances of survival were still small. The only effective means of treating gunshot wounds at the time was to amputate the limb and hope that gangrene or fever would not set in. Amputation itself was primitive in that there was no standardized technique. The surgeon would have the soldier held down and simply remove the limb with a saw or a butcher's cleaver.

Medical services improved rapidly during the French Revolutionary Wars. There are no reliable figures for total casualties suffered during the period 1792–1815, but historians generally agree that more than a million Frenchmen died during the period of the Empire alone (that is, 1804–1814/15, thus excluding losses sustained during the Revolutionary Wars), mostly from disease, though well over 100,000 can be attributed to battlefield fatalities. These enormous casualty rates forced the major countries involved to take military medical services more seriously. They could not afford to lose an estimated 114,000 soldiers a year and still maintain effective fighting forces.

It was the French Revolutionaries' emphasis on equality that provided the motivation to improve medical care for soldiers throughout Europe. French armies were the first true citizen armies of the modern period, and because sacrifice of life was commonly accepted as a cost of military service, it was equally accepted that the state had an obligation to provide medical treatment to all its soldiers. Other European states realized that they could not compete with French military forces without having recourse to national conscription and patriotic appeals themselves. As part of their programs to foster nationalism, they started to improve medical care for their troops. In this sense, the spirit of the French Revolution impelled most of Europe's armies to begin providing what would eventually become the modern system of military medical care. In 1795 Prussia founded its first military medical and surgical school, the Frederick Wilhelms Institute, reproducing the structure of the *Josephinum*, an Austrian medical school, ten years old at the time.

Throughout the French Revolutionary and Napoleonic era, many physicians, surgeons, and scientists helped to advance medical science within both the military and civilian spheres. Pierre-François, baron Percy, a French military surgeon, made the first attempt to organize a specifically trained and continuously formed unit responsible for transporting casualties from the battlefield to treatment centers. Percy introduced a sophisticated casualty transport system, but Larrey's ambulance system was much preferred because of its greater speed in reaching and retrieving the wounded.

Larrey would eventually become Napoleon's chief surgeon and the most experienced and knowledgeable military surgeon of his time. He treated tens of thousands of wounded soldiers, which resulted in a unique opportunity to experiment with new techniques and methods of amputating limbs or performing other common operations. Larrey is best known for his "flying ambulances," which were invented after Percy's version but proved to be more successful. These consisted of covered vehicles with sprung carriages, to accommodate between two and four

stretchers, conveying the wounded much more comfortably than in an ordinary wagon or cart. In addition to his ambulance service Larrey also introduced field hospitals, triage, the “twenty-four-hour principle,” and battlefield first-aid practices.

On the British side John Hunter was viewed as one of the most distinguished scientists of his day. He made many contributions to the medical sciences, such as the study of human teeth and the advancement of dentistry, as well as an extensive study of inflammation, venereal diseases, and gunshot wounds. He was appointed as the British Army’s deputy surgeon in 1786 and was promoted to surgeon general in 1789. The importance of his work convinced the British government to purchase Hunter’s collection of papers and specimens and present it to the Company of Surgeons.

Another notable British surgeon was George Guthrie, the principal medical officer at the Battle of Albuera in 1811. There he and his staff treated more than 3,000 wounded soldiers in one evening. In 1812 he was appointed deputy inspector of hospitals but was later denied this position as being underage; he was only twenty-seven years old. Back in Britain he continued practicing medicine and was among the first to use lithotripsy, a surgical procedure that pulverizes stones in the urinary bladder or urethra so that they can be passed more easily out of the body in the urine. During the Peninsular War, Guthrie’s unrivaled experience in military surgery allowed him to advance the science and practice of surgery more than any other army surgeon since the seventeenth century. When treating gunshot wounds, Hunter preferred minor surgery while, much like Larrey, Guthrie preferred immediate amputation, because of its higher survival rate. Guthrie also used mineral acids to destroy the diseased tissues of patients with gangrene.

Edward Jenner was another famous British doctor of the era, who on 14 May 1796 discovered that people infected with cowpox were immune to smallpox, a lethal disease of the time. With this knowledge Jenner performed an experiment to prove his hypothesis and then created a smallpox vaccine from the cowpox disease. Drawing on this research, Saxon physician Samuel Hahnemann founded homeopathic medicine in 1796. Homeopathic medicine is a system for treating disease based on the administration of minuscule doses of a drug that in massive amounts would produce symptoms similar to those of the disease in a healthy person. Hahnemann also understood that some ailments were contagious and, while working for the Prussian Duke of Anhalt-Köthe, introduced the practice of quarantining.

The well-known Parisian chemist Antoine-Laurent Lavoisier gained a better understanding of respiration and

the exchange of oxygen and carbon dioxide in living animals. Some lesser-known doctors and scientists were René Laënnec, a physician credited with identifying cirrhosis of the liver as a disease, using his invention, the stethoscope. Humphry Davy, a Cornish chemist, discovered the anesthetic properties of nitrous oxide, better known as laughing gas, in 1800. Abraham Colles, an Irish surgeon and anatomist, published several anatomy books, which provided great detail of the human body, and he was the first surgeon to bind the subclavian artery successfully. His first book, published in 1811, was titled *Surgical Anatomy*, and his second, in 1814, the *Edinburgh Medical and Surgical Journal*.

Finally, Sir Astley Paston Cooper, a British surgeon, used Colles’s research to aid in his first successful tying of the abdominal aorta as a means of treating an aneurysm. He performed many such challenging and groundbreaking surgeries, all before the practice of antiseptic surgery. He also tried to tie off the carotid artery in the same way he did the abdominal aorta. Cooper had possibly the leading and most profitable private practice of any British surgeon of his time, and in 1821 received a baronetcy and was appointed surgeon to King George IV.

### Medina de Río Seco, Battle of (14 July 1808)

A considerable French victory, the Battle of Medina de Río Seco set a pattern that was to be followed by many Franco-Spanish actions in the Peninsular War. Thus, an ill-considered and poorly coordinated Spanish thrust at the French forces in central Spain led to an action fought at a hopeless disadvantage on the high plains of the *meseta*, and with it heavy Spanish losses.

Chief responsibility for the campaign lay with the captain general of Old Castile, Gregorio García de la Cuesta. Driven from his capital of Valladolid by defeat at Cabezón (12 June 1808), Cuesta retired to the western part of his dominions with his few regular troops and built up a new army of volunteers and conscripts. Eager to recover Valladolid, he demanded the support of the Patriotic Junta that had been established in neighboring Galicia. Eager to boost its reputation, the Junta of Galicia decided that it ought to heed these calls—aside from anything else, it possessed a large army of regular troops—but at the same time it instructed the commander of its forces, General Joaquín Blake, that he should continue to protect Galicia.

Because Blake was a cautious officer new to independent command, the result was disaster. Whereas the only hope of victory was to strike hard and fast with all the resources at his disposal, he moved forward very slowly and

left many troops to guard his communications with Galicia. Eventually, however, he joined Cuesta at Medina de Río Seco. Together the two Spanish commanders had some 22,000 men, but there were only 600 cavalry, while almost all Cuesta's men were raw levies. Still worse, the French were not, as they assumed, concentrating at Valladolid. Thus, the French commander in the area, Marshal Jean-Baptiste Bessières, had stolen a march on the Spaniards.

Gathering together such troops as Bessières could—a mere 13,500 men—he had marched north to Palencia and on the evening of 13 July set out to take the Spaniards in flank. At Medina de Río Seco, Blake and Cuesta were watching the road from Valladolid. Finding out at the last minute that Bessières was about to fall on them from the northeast, they frantically tried to redeploy along a line of low hills that protected their left flank, but in the darkness and confusion many of their troops lost their way. When the French attacked on the morning of 14 July, they found the Spaniards deployed in three separate groups that were completely out of touch with one another. As a result the outcome of the battle was not in doubt for a moment. In a series of dramatic cavalry charges, the Patriot forces were defeated in succession and driven from the field. Meanwhile, while Spanish casualties amounted to 2,500 men and 13 guns, the French had lost just 400 men.

*See* Italian Campaigns (1792–1797)

### Melas, Michael Friedrich Benedikt Freiherr von (1729–1806)

Veteran Austrian general defeated by Bonaparte at Marengo in 1800. Having joined as a cadet officer, he served in the Seven Years' War (1756–1763) to reach the rank of general. Recalled from retirement, he won several victories in Italy before his final defeat.

Born near Schässburg in Siebenburgen (Transylvania), Melas came from a Saxon family of Lutheran ministers and was raised in a Spartan environment, learning to ride and use weapons at an early age and attending the Schässburg Gymnasium (grammar school). At age seventeen, he joined

the local Infanterie Regiment Schullenberg as a *Kadett* and saw action as a *Leutnant* (lieutenant) in the victory at Kolin (18 June 1757). Promoted to *Hauptmann* (captain), he commanded the grenadier company of Infanterie Regiment Batthnanyi, distinguishing himself in the storming of Schweidnitz on 1 October 1761 before becoming *Feldmarschall* Leopold Graf Daun's adjutant.

Melas married Josepha Lock von Retsky on 11 September 1768. He transferred to the 2nd Karabinier Regiment in May 1778 as *Oberstleutnant* (lieutenant colonel), leading his division (two squadrons) in the War of the Bavarian Succession (1778–1779). Appointed director of the Remount Service, he was later promoted to *Oberst* (commanding colonel) of the Trautmannsdorf Kurassier Regiment. He led the Lobkowitz Chevauléger Regiment in the Turkish War (1788–1791) until promoted to *Generalmajor* on 16 June 1789 with command of a brigade. Promoted to *Feldmarschalleutnant* in June 1794, he commanded a small corps in Germany and repelled Kléber's advance over the Rhine at Zahlbach on 1 December. Transferred to Italy in 1796, he commanded the Army Reserve under *Feldzeugmeister* Johann Peter Freiherr von Beaulieu against Bonaparte's invasion. Briefly a temporary army commander, Melas proved an able deputy to *Feldmarschall* Dagobert Graf Würmser as they endured the later part of the defense of the fortress of Mantua until its surrender in February 1797. When the war concluded, Melas retired to his estates in Gratz, in Bohemia.

Despite suffering with rheumatism and what is now thought to have been Parkinson's disease, he was recalled two years later and made *Inhaber* (honorary colonel) of the 6th Kurassier Regiment. As Austrian commander in Italy in 1799 alongside the Russian field marshal Alexander Suvorov, he defeated the French general Jacques Etienne Macdonald at the Trebbia in mid-June. On 15 August Melas led his troops in a furious bayonet charge at Novi against the French right flank to decide the battle for the Allies. After the Russians left, he led the Austrian troops in defeating the French at Savigliano on 18 September and Genola on 4 November before taking the fortress of Cuneo on 3 December.

Melas's surprise offensive in mid-April 1800 put Genoa under siege, and he reached the French border on the Var, at which point he was forced to return to Turin by Bonaparte's advance. Massing his troops at Alessandria, he was defeated at Marengo on 14 June. He was appointed general commander of Inner Austria in September 1800 and then of Bohemia until 1803, when he retired.

## Melville, Henry Dundas, First Viscount (1742–1811)

Henry Dundas, a Scottish politician, served during the French Revolutionary and Napoleonic era in prominent government posts, including that of treasurer of the Navy (1782–1800), home secretary (1791–1794), secretary of state for war (1794–1801), and first lord of the Admiralty (1804–1805), a position from which he resigned prior to his impeachment in 1806 at the hands of a Whig government. He was ennobled as Viscount Melville in 1802.

Dundas was educated at the Edinburgh High School and Edinburgh University before being admitted as a member of the Faculty of Advocates in 1763. In 1766 at the age of just twenty-four, he was appointed solicitor general for Scotland. He was elected Member of Parliament for Midlothian in 1774, a seat he held until 1790, when he was elected Member of Parliament for Edinburgh, before being elevated to the peerage in 1802.

In Scottish history Dundas is primarily remembered for his management of political and church patronage from 1775 to 1805, earning himself the unofficial title of “Harry the Nineth of Scotland,” or, as Lord Cockburn put it, the “Pharos [Pharaoh] of Scotland” (Cockburn 1852, vol. i, 77). He is also noteworthy in a broader context for his active role in the government of William Pitt, of whom Dundas was a longtime friend.

As home secretary from 1791 through 1794, Dundas was responsible for preserving domestic law and order. That task became increasingly challenging, especially in the wake of the “Church and King” riots in Birmingham in 1791. By 1792 dozens of radical societies—drawing inspiration from the events in France and the writings of Tom Paine—had formed throughout Britain. These groups agitated for political reform, and to better pursue their goals they began to organize into larger units. In 1793 delegates from England, Scotland, and Ireland planned a national convention to be held in Edinburgh.

Dundas saw these developments as seditious, and he reacted to them as internal subversions by having several radical leaders arrested and tried. Some were transported and one, Robert Watt, was executed. In Scotland, Treason and Sedition Bills were passed and civil liberties were sus-

pended, gaining for Dundas a reputation for despotism. Something of Dundas's outlook on the situation in Britain might be gathered from the tone and nature of his opposition to the French Revolution. Writing in 1794, Dundas described the Revolution as "a conspiracy of the most profligate and ignorant people in the nation, against all the principles of society and religion, against all property, landed or commercial" (quoted in Fry 1992, 155).

As secretary of state for war, Dundas's policies centered on control of the seas and commerce. The way to destroy France, he suggested, was to seize all its colonies and to destroy its commerce. That policy was criticized by his contemporaries, who argued for a greater role for British land forces in Europe, a sentiment that has been shared by later historians. A recent study by Michael Fry has aimed to present a more sympathetic assessment of Dundas's policy.

At the turn of the nineteenth century, suspicions arose concerning Dundas's management of funds during his tenure as treasurer of the Navy, in particular over the blind eye he turned to the use of public funds for private speculation by the deputy treasurer, William Trotter. An official investigation was launched in 1802, and three years later charges were brought against Melville in Parliament for the misappropriation of public funds. Acquitted in 1806 but censured, Melville resigned and did not return thereafter to active political life. He died in 1811.

## Menin, Battle of

*See* Flanders, Campaigns in

## Menou, Jacques-François de Boussay, baron (1750–1810)

French general whose spotted career included France's final defeat by British forces in Egypt in 1801.

As a young officer and member of the nobility, Menou rose through the officer ranks in normal and undistin-

guished fashion. In 1789 he was selected as a delegate from the second estate (nobility) to the Estates-General, where he held several positions and was among those nobles that eventually joined with the third estate. This mixed political message haunted him in his early career. He commanded troops in Paris during the storming of Tuileries palace on 10 August 1792 but was accused of tending toward royalist forces. He survived those accusations and in 1793 was appointed *général de division*. His service against the counter-revolutionary forces in the Vendée led to his defeat and serious wounding at the Battle of Saumur.

In 1795 he commanded troops guarding the Convention during the so-called whiff of grapeshot, when General Bonaparte put down public unrest with cannon fire. Menou's actions were considered suspect, and he was accused of conspiring with royalist forces. An inquiry was held and he was found innocent (largely due to the intervention of Bonaparte), but his reputation was once again politically tarnished.

Menou's career took what seemed a turn for the better when he was invited to join Bonaparte's expedition to Egypt. Here Menou provided good service, receiving multiple wounds at Alexandria and later serving as the governor of that city (having also served as governor of Rosetta). After falling in love with a local Egyptian woman, he converted to Islam to marry her. In Bonaparte's final Egyptian battle, at Aboukir on 25 July 1799, Menou was placed in charge of the siege of the castle.

When Bonaparte departed Egypt for France on 23 August, Menou was second in command to General Jean-Baptiste Kléber. When that general was assassinated by a religious zealot on 14 June 1800, Menou took over command. His command was short and unsuccessful, however, as he was defeated at Canope on 21 March 1801 and forced to surrender at Alexandria on 31 August of that year. He negotiated honorable terms for his men, however, and returned safely to France.

His career as a military leader was over, but he still received various military and civilian administrative posts. He was made a Count of the Empire, administrative general of Piedmont, and governor first of Tuscany and then of Venice, where he died in 1810. Although Menou's career was one of extremes, he nevertheless was made a Grand Officer of the Legion of Honor, and his name is among those inscribed on the Arc de Triomphe in Paris.

## Mercantilism

Mercantilism is an economic philosophy that advocates the maintenance of a favorable trade balance with colonies and other countries. If a country exported more goods than it imported, the balance would be received in gold or silver bullion, which emerged as the measurement of a state's wealth. The mother country should acquire colonies from which it would import raw materials that would be turned into manufactured goods and then exported either back to the colonies or to other countries. The mother country provides the security required to protect the colonies from other countries, maintain internal order, and keep the sea-lanes of communication open for commerce.

The world is a zero-sum game to a mercantilist, because the growth of one country occurs at the expense of other states. Thus, each state must aggressively acquire and defend a colonial system, establish laws of commerce and tariff systems to protect home industries and markets, and counter the economic policies of rival countries. The impact of mercantilist philosophy can be seen in military campaigns during the French Revolutionary and Napoleonic Wars as well as in the establishment of the Continental System under Napoleon.

The Royal Navy ensured that Britain remained the leading economic power on the globe by maintaining the sea-lanes of communication between the island nation and her colonies in North America, the Caribbean, India, and elsewhere around the globe. The French Navy proved unable to defeat its British counterpart and interfere with the trade routes protected by the latter. In 1806 Napoleon changed strategy and implemented the Continental System in an attempt to strangle Britain economically through its trade with the European continent. France introduced policies to halt the trade of neutral nations, such as the United States, with Britain. Although British exports did decrease, the French were unsuccessful in their attempt at economic warfare. British and French naval vessels and privateers preyed on each side's merchant vessels. However, the Royal Navy was able to keep the sea-lanes to the Americas and the eastern Mediterranean open for commerce. European merchants and leaders resented the French policies behind the Continental System, which tended to benefit France to the exclusion of everyone else. Tsar Alexander of Russia reluctantly agreed to abide by the Continental System in the Treaty of Tilsit (1807) but withdrew from the system at the end of 1810.

Some military campaigns fought in this period were a result of mercantilist economic policies. Select examples include the British offensives to capture French-held islands in the Caribbean in the mid-1790s: These operations eliminated French naval bases and reduced the raw materials flowing back to France. In 1795 the British captured the Dutch colony at the Cape of Good Hope to ensure the protection of the sea-lanes to India; in 1796 Ceylon (present-day Sri Lanka) fell to British forces; and in 1801 Britain countered Denmark's attempt to restrict British trade in the Baltic by seizing her holdings in the Caribbean. By 1805 the Royal Navy had taken control of St. Lucia, Tobago, Surinam, Demerara, and Essequibo and instituted a naval blockade of the French coast.

The French operated on the same principles: Their invasion of Egypt in 1798 resulted from an attempt to interfere with British communication and trade with India, and Napoleon's decision to invade Spain ten years later was partially motivated by a desire to counter smuggling, in circumvention of Continental System trade restrictions, into the Iberian Peninsula.

## Merino, Jerónimo (1769–1844)

A poorly educated parish priest from a small village near Lerma in Old Castile, Jerónimo Merino emerged as one of the more ferocious commanders of the various guerrillas who fought Napoleon in Spain between 1808 and 1814.

According to tradition, he took up arms in 1808 following an incident when a party of French troops forced him to serve as a porter, but this story is impossible to verify. Indeed, it could be the case that Merino's motives were entirely unconnected with patriotism: It is by no means insignificant that he had a brother who was a bandit, and he also seems to have been a man of somewhat irregular habits—before becoming a priest, indeed, he had deserted from the provincial militia. However, even if Merino was the self-seeking adventurer that all this suggests, there is no doubt that he waged war on the French with great savagery in the remote region in the southeastern corner of Old Castile that became his chief area of operations: Most of the prisoners that he took, for example, appear to have been shot.

Initially a member of the *partida* (band) of the famous “El Empecinado” (Juan Martín Díez), he set up in 1809 on his own. Known initially as the “Band of the Red Cross,” his forces were soon militarized as the Arlanza infantry regiment and the Burgos Hussars, and he won a string of successes against the invaders. On 28 June 1809, for example, Merino massacred the guard of a French convoy at Quintana del Puente, and a week later he captured a fifty-strong foraging party at Peñacoba. Still more dramatic was the action that took place at Lerma, where the garrison was driven into the castle and the town stripped of supplies and a large number of recruits. By 1811 he was cooperating with the substantial guerrilla forces commanded by José Joaquín Durán in the province of Soria, and in 1812 he supported the Earl of Wellington in that commander's efforts to take Burgos, a city in which Merino was installed the following year as military governor following the Battle of Vitoria. Ending the war with the rank of brigadier, he was rewarded for his services with a canonry in the cathedral of Valencia.

However, deeply traditionalist in his political views as he was, Merino's military career was not over. Taking up arms against the liberals in the civil war of 1822–1823, he became a supporter of the so-called *apostólicos* in the latter years of the reign of Ferdinand VII, and from 1833 onward in consequence saw fresh action in the first Carlist War. Forced to flee across the frontier following the rebel defeat in 1839, he took refuge in France, where he died in obscurity in 1844.

## Metternich, Klemens Wenzel Lothar Fürst (1773–1859)

Austrian ambassador to Napoleon's court and the “coachman of Europe,” who through the Congress of Vienna and the European Concert System—and together with Lord Castlereagh, the British foreign secretary—redrew the map of Europe following the conclusion of the Napoleonic Wars.

His family was among the lower nobility in the Rhineland, and he was born on 15 May 1773 in Coblenz (Koblenz), part of Prussia's Rhenish possessions, to Georg Graf von Metternich and Maria Beatrix Gräfin von Metternich (née Gräfin von Kageneck), at a time when his father was serving as Austrian ambassador to Coblenz, in the Rhineland. With his family's political background he became himself Austrian ambassador to the Electorate of Saxony, residing in Dresden in 1801. He took up this post following his studies of philosophy at the University of Strasbourg and of law and international diplomacy at the University of Mainz, as well as travels in England and throughout Europe in preparation for a career in diplomatic service. Metternich had married Maria Eleonora, the granddaughter of Wenzel Anton Fürst von Kaunitz, Empress Maria Theresa's chancellor, in 1795, and they had seven children. His marriage brought him Austrian lands and a high position in Habsburg society.

In 1803, following distinguished service in Dresden, he was appointed ambassador to Prussia, where he combined great powers of observation with impeccable manners. Having honed his diplomatic skills during the French Revolutionary Wars, Metternich was then appointed Austrian ambassador to France in 1806, following Napoleon's dramatic rise as Emperor of France. At a time when Napoleon desired to extend French influence throughout Europe, Metternich placed Austrian interests on a firm footing through bold negotiation. Metternich owed his position to the Austrian Habsburgs and this he never forgot, especially after 1794, when Revolutionary France had seized the Metternich family estates and freed their serfs on the left bank of the Rhine in the name of *liberté, égalité, et fraternité*. His entire life was devoted to stopping the spread of Jacobinism and the liberal tenets of the French Revolution.

In Paris as Austria's ambassador to the court of Napoleon, he was as ever gracious and at one point had even made Caroline, Napoleon's sister, one of his mistresses. In 1809 war resumed between Austria and France, and Vienna

was occupied. Metternich was held captive upon Napoleon's order but was later exchanged for members of the French embassy in Vienna. Militarily the Austrian forces lost ground to Napoleon's onslaught; the Austrian emperor, Francis I, who desired new leadership, appointed Metternich as minister of state in August, and minister of the imperial house and minister of foreign affairs, jointly, in October. Negotiations with Napoleon had produced the Treaty of Schönbrunn (14 October), which saved Francis's throne but had greatly reduced Austria's boundaries, and the Austrian emperor hoped his new minister Metternich would produce better results.

Indeed, Metternich's diplomatic footwork regained a place of prominence for Austria when he arranged the marriage in 1810 between Napoleon and the Princess Marie Louise, daughter of Emperor Francis, following Napoleon's divorce from the Empress Josephine. This marriage became the basis for an alliance concluded in March 1812 between France and Austria against Russia. Following Napoleon's invasion of Russia with his Grande Armée and a token contingent from Austria, the retreat in 1812 ruptured this alliance, for Metternich had no wish to see Austria confront Russia in eastern Europe. Metternich had become the mediator of Europe by the spring of 1813 and arranged an armistice between France and Russia and Prussia. At Dresden in June 1813 Metternich delivered Austria's terms for remaining neutral: Illyria and northern Italy from France, Poland to Russia, and the left bank of the Elbe to Prussia. Metternich also demanded the Confederation of the Rhine be disbanded. Napoleon refused these demands, attempting to negotiate with his enemies individually. But following their meeting at Dresden and the failure to come to a compromise, Metternich refused Napoleon's final request for Austria's neutrality. Napoleon believed correctly that Austria expected him to relinquish significant parts of his empire. To make such a peace was viewed by Napoleon as dishonorable and constituting a betrayal of the French people.

Austria refused to yield, joining Prussia and Russia in the Convention of Reichenbach on 19 July, which stipulated that unless Napoleon agreed to their demands, they would resume the war against France, now including Austria. Still hoping to placate his enemies, Napoleon sent Armand-Augustin-Louis, marquis de Caulaincourt as a special envoy to a meeting of nations in Prague, but Metternich halted every attempt of the French envoy to discuss terms of peace with individual delegates. By the end of the summer Metternich had formed the final coalition that would defeat Napoleon at Leipzig (16–19 October), having brought Austria into the Sixth Coalition of Russia, Britain, and Prussia after Vienna's declaration of war on 12 August 1813. They pledged to defeat Napoleon, who they said was

“ambitious,” and threatened the peace and status quo of Europe. Metternich had elevated his demands to the point where he knew Napoleon could only refuse. His propaganda decried Napoleon as spreading Jacobinism throughout Europe, portraying himself as the protector of the conservative order.

These events had occurred just as French forces were being ejected from Spain. Napoleon had attempted to cede Illyria to Austria and part of Poland to Russia as concessions to preserve the peace, but Metternich had refused to accept these terms, secretly desiring war to bring an end to Napoleonic hegemony. In these negotiations, both Alexander I of Russia and Frederick William III of Prussia had deferred to Metternich, who represented their interests. Metternich had been able to portray Napoleon as someone who would bring the whole of Europe to its knees to preserve French glory.

Napoleon saw himself as bringing the principles of the French Revolution to every country in Europe; it was not that he loved war, he claimed, but desired an honorable peace. Metternich had calculated that Napoleon's pride would not allow him to agree to Austria's terms of compromise and that war was therefore inevitable. Metternich knew the Russians, Prussians, and Austrians all longed for revenge against the French emperor. Following the Battle of Leipzig—Napoleon's decisive defeat in Germany at the hands of the Sixth Coalition—Francis I elevated Metternich to the rank of prince (*Fürst*) for his successful diplomatic and military efforts during the difficult period of the wars with France.

Metternich had made an important contribution to undermining and defeating Napoleon. The French Empire began to break apart after the Battle of Leipzig, with former satellite states—Baden, Bavaria, Berg, Westphalia, Hesse-Darmstadt, Württemberg, and others—abandoning the French alliance, thereby breaking up the Confederation of the Rhine. There also occurred an uprising in Amsterdam against Napoleon's brother Louis. Northern Italy was retaken by the Austrians. Even Napoleon's sister and brother-in-law, Caroline and Joachim Murat, made peace with Metternich to save their positions as rulers of Naples.

Metternich indirectly secured Paris through intelligent bribery and agreement with Prince Charles Maurice de Talleyrand, the French foreign minister, who made peace with the coalition and sidestepped Joseph Bonaparte, who was to have defended France's capital. Through the Treaty of Chaumont, concluded on 1 March 1814, Metternich, together with his British counterpart, Lord Castlereagh, secured agreement among the great European powers to stabilize the Continent and to loosely reorganize Germany. This reorganization particularly affected the former mem-

bers of the Confederation of the Rhine, created by Napoleon but defunct after the French had been driven across the Rhine in the aftermath of Leipzig.

Following Napoleon's downfall, Metternich was in the forefront of those who demanded his abdication; he was also instrumental in denying Marie Louise control of Tuscany so that she could visit her husband in exile on Elba. Metternich made Marie Louise and her son, despite their intentions to go with Napoleon to Elba, rejoin her father Francis I in Austria, denying to Napoleon the comfort of his wife and child. Metternich had also denied any Austrian financial support to Napoleon despite the fact that Napoleon's son, the King of Rome, was half Austrian. Francis allowed Metternich to negotiate these agreements, which included offering Parma instead of Tuscany to Marie Louise; in the end, Metternich brought Francis's daughter and grandson to live in Vienna, where she became enamored with Adam Graf von Neipperg, who acted as a tool of Metternich. Metternich believed that it was in the best interests of Austria to separate Napoleon and Marie Louise and to keep their son in Vienna.

At the Congress of Vienna, which convened after Napoleon's abdication in 1814, Metternich shone brightly as the "coachman of Europe," guiding policies and decisions, though credit for the success of the agreement ultimately hammered out must be shared with Castlereagh. A skilled diplomat, ever charming, and patriotically Austrian, Metternich created a superior place for Austria in relation to both Germany and Italy. Delegates from the victorious powers—Austria, Russia, Prussia, and Britain—had earlier met at Metternich's villa on the Rennweg in September 1814 to begin preliminary discussions concerning postwar Europe and the restoration of legitimate hereditary rulers. This set in motion the conference system that was to preserve peace and mark European politics for decades. As the host of the Congress of Vienna, Metternich restored Austria to its former place of grandeur and preeminence.

Metternich became the leading statesman of Europe, committed to restoring the balance of power and political boundaries based on the principle of legitimacy (that is, hereditary right). He used Austria's multiethnic state as a foundation for his policy of internationalism throughout Europe.

Metternich was once again the architect of the coalition that defeated Napoleon following the Emperor's escape from Elba. Metternich immediately organized forces to oppose him, turned down Napoleon's offer to preserve the French boundaries of 1814, and secured agreement from Tsar Alexander, the Duke of Wellington, and Talleyrand to remove Napoleon from power. Metternich secured the promise of 150,000 troops from each member of

the coalition—Britain, Prussia, Russia, and Austria—with contingents from the first two nations soon defeating Napoleon at Waterloo.

Following further discussions at the (reconvened) Congress of Vienna, Metternich arranged for Emperor Francis to join the Holy Alliance, a conception of Alexander's. This encouraged rulers to use Christian principles in ruling their respective dominions. The Congress of Vienna was followed by additional postwar conferences at Aix-la-Chapelle (1818), Troppau (1820), Laibach (1821), and Verona (1822). Upon the accords reached at these early conferences, Metternich was named Chancellor of Austria by Francis, a position that had been vacant since the death of Fürst von Kaunitz in 1794. Metternich was praised by the emperor for preserving peace and reestablishing the rule of law. He had successfully reigned in radicalism, liberalism, nationalism, and revolution. At Aix-la-Chapelle the European powers restored their pre-Napoleonic relationship with France, admitting it as a member of the Quintuple Alliance.

In 1827 the widowed Metternich married Maria Antonia, Freiherrin von Leykam, and they had a son, Richard Klemens, who later published his father's biography and papers as *Aus Metternich's Nachgelassenen Papieren*. Metternich was remarried in 1831 to Melanie Freiherrin von Zichy, following his second wife's death. They had three children. A devout Catholic, Metternich held religion to be a cornerstone of national stability.

Metternich as minister of foreign affairs was seen as *un rocher d'ordre* (a rock of order) in postwar Europe. Yet fears among those supporting the conservative political status quo arose over radical agitators, especially in Germany; and following the assassination by a radical of the reactionary politician August von Kotzebue in Russia, Metternich cracked down on liberal student demonstrations at universities, issuing, together with German ministers, the Carlsbad Decrees of 1819. Radicals were to be controlled through censorship, government officials in the universities were to monitor students, and liberal representative organizations were to be quelled. While controlling antigovernment uprisings in Germany, Metternich also moved to control liberal-radical movements in the Italian provinces controlled by Austria.

Viewed by most of his contemporaries as a reactionary who preferred the social and political structure of eighteenth-century Europe, Metternich worked for the preservation of Austria's territories and power, thereby perpetuating the Habsburg dynasty. He was the most influential statesman in Europe from 1815 to 1848—a period often called *The Age of Metternich*. Nevertheless, the Quintuple Alliance was impaired after Russia and Austria split over the Greek Revolution in 1830, with Austria willing to

support Turkish claims to Greece while Russia supported Greek independence. Yet the European Concert System, by which the principal continental powers pledged to work together to maintain the balance of power and uphold the principle of legitimacy, continued—albeit not always satisfactorily for all sides—to be maintained and relied upon to settle international disputes.

Francis's successor, Ferdinand I, ascended to the throne of Austria in 1835. Metternich, as state chancellor, shared leadership in the direction of public affairs with the emperor's uncle, the Archduke Ludwig, and court chancellor, Leopold Graf Kolowrat-Krakowsky. Metternich prevailed in foreign affairs, while the others dominated the process of domestic decision making. He carefully pursued peace as a mechanism for preserving liberty and freedom as outlined in his *Political Testament*.

Metternich was forced into political exile during the Revolution of 1848, which led to his resignation, on 13 March, as minister of foreign affairs and chancellor. Given the political upheavals, Metternich went to live successively in Britain, Belgium, and Prussia. He returned to Vienna in August 1851 and led a quiet life in retirement in his palace on the Rennweg, where he died at age eighty-six on 11 June 1859. Metternich's *Mémoires* were published in 1879 and reveal the machinations of European diplomacy in the early nineteenth century.

## Middle East Campaign (1798–1801)

The French campaign in Egypt and Syria (now present-day Israel).

Following his victorious campaigns in Italy in 1796–1797, General Bonaparte had been assigned to command an invasion of England. An inspection of the invasion forces led him to conclude, however, that the French could not properly secure the English Channel, and so the descent had no chance of success. Bonaparte reported his findings to the Directory and looked for other methods of attacking British interests. He soon proposed a grand project of invading Egypt, establishing a French base there and proceeding overland to India, where, in conjunction with the Sultan of Mysore, they would attack British possessions.

The idea of conquering Egypt and the Levant had been circulating in French strategic thinking since the time of Louis XIV. These Ottoman provinces, actually controlled by the Mamelukes, appeared easy to take. Bonaparte, with the help of Charles Maurice de Talleyrand, the foreign minister, persuaded the Directory to cancel the planned invasion of England and let him lead an army into Egypt. The Directory seized upon the Egyptian expedition partly as a way to remove Bonaparte, an extremely popular general, from France. Finally, owing to the embellishments of contemporary travel writers, Egypt had acquired a certain mystical allure that appealed to Bonaparte. In April 1798 the (French) Army of England was officially renamed the Army of the Orient, with Bonaparte appointed as its commander in chief.

With remarkable speed and secrecy, Bonaparte threw himself into the preparations for the expedition. The entire Army of Egypt was ready to depart in two and a half months. Bonaparte had at his disposal a force of some 35,000 men, the majority of them veteran soldiers of the (French) Army of Italy. The fleet gathered to transport the

army was equally large: some 10,000 sailors on 400 ships, including 13 ships of the line under the command of Admiral François Paul, comte de Brueys. Several ports of embarkation—Toulon, Marseilles, Genoa, Ajaccio, and Civita Vecchia—were to be employed for such an enormous operation. A unique feature of this campaign was the large contingent of savants, whom Bonaparte invited to accompany the expedition. Among these scientists were famous French mathematician Gaspard Monge, chemists Jacques Conte and Claude Berthollet, and Mathieu de Lesseps, who would later tell his son Ferdinand about Bonaparte's project of building a canal linking the Mediterranean and the Red Sea.

French activity at Toulon had caught the attention of the British, whose naval squadron under Rear Admiral Sir Horatio Nelson was deployed in the western Mediterranean. It was a stroke of luck for the French that a strong gale had scattered and damaged the British ships in mid-May. By the time they recovered, the French had already departed for Egypt on 19 May. Bonaparte's first objective was Malta, a strategically located island just south of Sicily that was essential for the French presence in the Mediterranean.

Bonaparte arrived at Malta on 9 June and secured the island without facing resistance from the Knights of St. John, who had ruled the island since 1530. Bonaparte reorganized the local government, turned the holdings of the Knights into national lands, abolished slavery and all remnants of feudalism, and established new education and taxation systems; the French also seized the enormous treasury of the Knights, which helped to pay for the costs of the expedition. After resting his troops, Bonaparte sailed for Alexandria on 18 June, narrowly missing interception by Nelson's pursuing ships on the night of 22–23 June. On 1 July, after six weeks at sea, the Army of the Orient arrived off the Egyptian coast and began disembarking a few miles west of Alexandria.

By the late eighteenth century, Egypt had been ruled by the Mamelukes for more than 500 years. They were a warrior caste created from non-Muslim boys who had been kidnapped at an early age, sold at slave markets, converted to Islam, and trained as mounted warriors. The Mamelukes rose to power after overthrowing the Ayyubid dynasty in 1250 and, over the next five centuries, two dynasties ruled Egypt: the Bahriyya (Bahri) Mamelukes (1250–1382), mostly of Turkish origin, and Burji (Burgite) Mamelukes (1382–1517, though they retained a great deal of influence until 1811), mostly Georgians and Circassians.

Although nominal vassals of the Ottoman Empire after 1517, the Mamelukes took advantage of the Ottoman decline in the mid-eighteenth century. After 1769 they achieved a considerable degree of autonomy under the

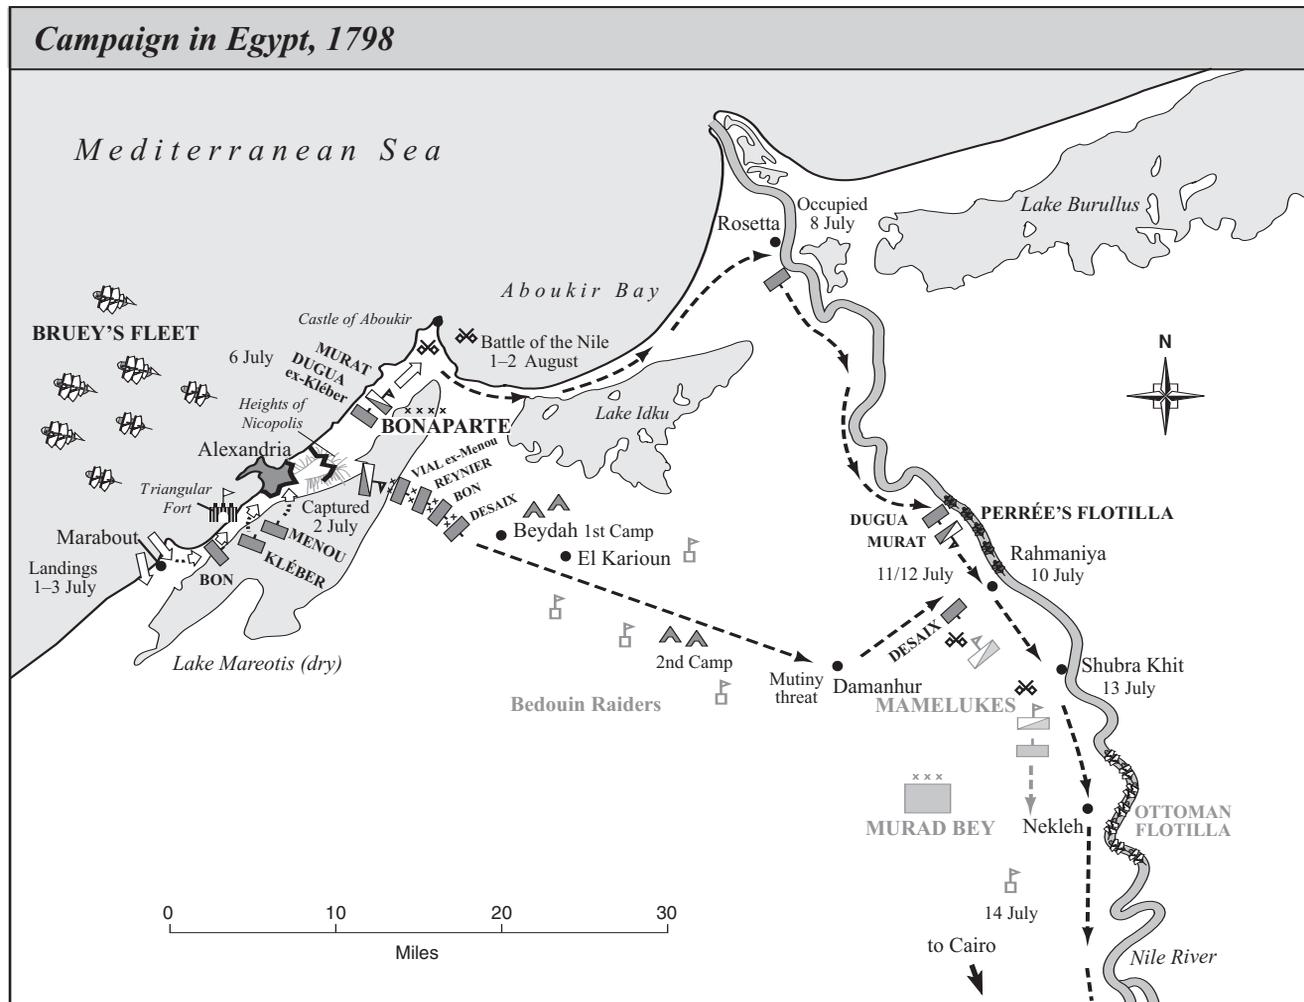

leadership of the provincial governor Ali Bey. Actual power rested with the divan, a council of seven Mameluke beys (governors), which had the power to veto decisions of the Turkish pasha. Executive (and real) power rested in the hands of two Mameluke beys, the Amir al-Bilad (commander of the land), who was responsible for civil order and police powers, and the Amir al-Hajj (commander of the pilgrimage to Mecca), who acted as a political and military counterweight to the Amir al-Bilad. At the time of the French invasion, the Amir al-Bilad was Murad Bey and the Amir al-Hajj was Ibrahim Bey, both from Georgia.

The French army landed at Alexandria on 2 July 1798 and easily overwhelmed the Mameluke cavalry, which was still essentially a medieval fighting force. After capturing Alexandria, Bonaparte engaged the Mamelukes under Murad Bey at Shubra Khit on 13 July and then routed the main Mameluke army in the famous Battle of the Pyramids near the village of Embabeh, just across the Nile River from Cairo, on 21 July. Bonaparte entered Cairo on the twenty-fourth and dispatched General Louis Desaix to pursue the Mamelukes, who had fled into Upper Egypt.

However, the French successes on land were countered by a decisive British triumph at sea. On 1 August, Nelson located the French fleet anchored in line in the shallows of Aboukir Bay near Alexandria. In the ensuing engagement, known as the Battle of the Nile, eleven French ships of the line and most of the frigates were captured or sunk; the French army was stranded in Egypt and the British fleet had thus reasserted its control of the Mediterranean.

Notwithstanding his predicament, Bonaparte set about reorganizing Egyptian society; he revolutionized Egyptian institutions, introducing French-style administrative and judicial systems. Among his many reforms, he abolished feudalism and serfdom and proclaimed freedom of religion and equality before the law. Of great importance was the establishment of the Institute of Egypt in Cairo, which both propagated European culture and ideas in the East and undertook research in Egyptian culture and history, vastly expanding European knowledge of the East. Bonaparte also discussed with Muslim clerics the possibility of converting his army to Islam, but this and other efforts to garner popular support failed to achieve their goal.

Following the Battle of the Nile, Bonaparte found himself in a perilous situation. Although he had defeated the Mamelukes, he had not destroyed them; Ibrahim Bey had withdrawn across the Sinai Peninsula to Palestine, while Murad Bey had retreated southward to Upper Egypt, where he tied down French troops under Desaix. On 9 September the Ottoman Empire declared war on France and began preparing two large armies for the invasion of Egypt. The French also had trouble controlling Cairo,

Adapted from Chandler 1966, 221.

where a revolt against the occupation broke out on 21 October but was brutally suppressed, with approximately 300 French killed and 2,000 Egyptians. In this precarious situation, Bonaparte made a new plan: To defeat the Turks, and force the sultan to make peace and assist him in his march to India, he decided to march on Acre (at the time in the Ottoman province of Syria, now in Israel), where the Turks were raising an army under Djézzar Pasha. He even wrote a letter to Tipu Sultan at Seringapatam in India offering to cooperate against the British.

In late 1798 Bonaparte organized an expeditionary force for the invasion of Syria (not to be confused with modern Syria, which is now farther north), and left Cairo on 10 February 1799. On the twentieth he seized El Arish, where he captured several hundred Turks and Mamelukes, who were later freed on parole. As he continued his advance, Bonaparte entered Gaza on 25 February and stormed Jaffa on 7 March. There followed one of the most repugnant incidents in Bonaparte's career. At Jaffa some

2,500 Turks, many of them former prisoners from El Arish, surrendered on the understanding that their lives would be spared. Bonaparte, believing he could spare neither troops to escort the prisoners to Egypt nor rations to feed them, ordered the massacre of the captives.

While in Jaffa many French troops had contracted bubonic plague, and Bonaparte visited the plague hospital on 11 March, an incident later commemorated in Gros's famous painting. On 17 March Bonaparte reached Haifa and began besieging the stronghold of Acre just across the bay. The odds were against the French, who lacked heavy artillery and many of whom suffered from the plague. A British squadron under Commodore Sir Sidney Smith supported the Turkish garrison under Djézzar, while French émigré officers directed the Turkish artillery.

As the siege of Acre dragged on for weeks, the French faced another danger. The Turkish pasha of Damascus dispatched a large army to attack the French from the rear. Between 8 and 15 April the French defeated the Turkish

detachments near Nazareth, Canaan, and on the Jordan River north of Lake Tiberias. On 16 April General Jean-Baptiste Kléber's 2,000 men engaged a superior Turkish army of 25,000 men at Mount Tabor and resisted for 10 hours, until Bonaparte arrived with reinforcements to rout the Turks. During the next three weeks, the French made repeated assaults on Acre but were repulsed each time. In mid-May, Bonaparte finally decided to abandon the siege and return to Egypt.

The retreat began on 20 May, and the demoralized French forces reached Cairo on 14 June. One month later, another Turkish army of some 20,000 men arrived on the Egyptian coast. The Turks landed near Aboukir on 25 July but were routed by Bonaparte's troops, who drove them into the sea.

Despite his victories, Bonaparte knew that there was little chance he could succeed on this doomed expedition. The British controlled the Mediterranean, preventing the Directory from sending any reinforcements to Egypt. Furthermore, Bonaparte soon learned from European newspapers (sent to him by Sidney Smith) that France was on the defensive against the Second Coalition and had lost virtually all of Italy. He became convinced that he should return to France to save the country. On 22 August with only the handful selected to accompany him, Bonaparte boarded a frigate and abandoned the army in Kléber's hands. After an uneventful voyage of forty-seven days, he landed at St. Raphael in France on 9 October and was given a hero's welcome by French citizens anxious for a turn in their country's fortunes.

Back in Egypt, Kléber, feeling betrayed by Bonaparte, had to negotiate with the British and Turks and agreed to evacuate Egypt by the Convention of El Arish of 24 January 1800. However, after the French surrendered several key fortresses, the British vice admiral Viscount Keith, renounced the convention and the Turkish army seized Cairo. In response, Kléber destroyed Ottoman forces at Heliopolis on 29 March and recaptured Cairo; yet a Muslim zealot assassinated him on 14 June. Kléber was succeeded by General Jacques-François, baron Menou, who was both less capable and unpopular with the troops.

In early 1801 the British prepared an expeditionary force, under Lieutenant General Sir Ralph Abercromby, which landed successfully on the Egyptian coast on 8 March despite fierce French resistance. The British proceeded to inflict a serious blow on their opponents at Alexandria on 20–21 March. The two-day engagement claimed up to 3,000 French and 1,400 British casualties, including Abercromby himself. Their defeat left the French severely demoralized, and disagreements between Menou and his generals only exacerbated the situation. French troops were isolated from each other and confined to the

major cities of Alexandria and Cairo. After months of resistance, General Auguste Belliard surrendered Cairo on 28 July; and Menou, defending Alexandria, followed suit on 2 September. By the terms of capitulation, the British promised to provide the French safe passage home; the survivors of Bonaparte's expedition to the Middle East finally reached France in 1802.

Thus, militarily, the French expedition to Egypt proved to be a failure. Although the French won virtually all the battles, the campaign ultimately ended in disaster. Politically, the expedition was another example of the Directory's aggressive foreign policy and facilitated the formation of the Second Coalition in late 1798. Bonaparte's expedition not only highlighted how aggressive the French government had become; it directly threatened British interests in the region. Moreover, with Bonaparte out of Europe, the Allies could fight without the prospect of having to confront the best commander and the most experienced troops available to France. The expedition showcased Bonaparte's military skills, and the victories at the Pyramids, Mount Tabor, and Aboukir added luster to his name. However, the campaign also revealed Bonaparte's sinister character in the massacre of prisoners at Jaffa, the heavy-handed suppression of the uprising in Cairo, and finally his abandonment of the entire army in Egypt.

The campaign in the Middle East prepared the way for the modernization of Egypt. The Mameluke hold on Egypt was broken and, within a decade, Muhammed Ali Pasha would completely destroy them, laying the foundation for a modernized and strong Egypt that would play an important role in later Middle Eastern history.

Much more important were the lasting cultural and scientific effects of the expedition. The campaign led to a revival of Egyptian motifs in European decorative art styles and architecture. The Institute of Egypt gathered a wealth of documentation on the geography, natural history, contemporary culture, and antiquities of Egypt. The official product of this exploration was the masterful *Description de l'Égypte*, published between 1809 and 1828. With its fourteen large folio volumes of illustrations and ten volumes of text, it attained a new standard of publication and laid the foundation for modern Egyptology. Among the greatest discoveries was the famous Rosetta Stone, which the French scholar Jean-François Champollion used as a key for the decipherment of hieroglyphs in 1822.

## Mikhailovsky-Danilevsky, Alexander Ivanovich (1789–1848)

A distinguished Russian historian, Mikhailovsky-Danilevsky was born to a noble family in St. Petersburg. His father, Ivan Danilevsky, was a prominent figure in contemporary Russian society, having studied widely and received his doctorate in medicine, yet successfully pursuing a banking career and rising to become director of the State Loan Bank. The change of the family name from Danilevsky to Mikhailovsky-Danilevsky was a result of an incident during the reign of Paul I, when Danilevsky was mistakenly accused of treason. During the interrogation, he was found innocent and released. Tsar Paul comforted him by giving him a promotion and adding “Mikhailovsky”—the tsar had just moved to Mikhailovsk palace—to his surname to prevent any future confusion.

Alexander Mikhailovsky-Danilevsky studied at the Petropavlovsk College in St. Petersburg in 1797–1806 and began working as a collegial clerk at his father's bank. He retired after his father's death in 1807 and, after studying at the University of Göttingen, traveled throughout Europe in 1809–1810. Returning to Russia, he briefly worked in the chancellery of the ministry of finance and on 1 August 1812 became an adjutant to General Mikhail Kutuzov, then commander of the St. Petersburg *opolchenye* (virtually untrained militia). After Kutuzov was given command of the Russian army, Mikhailovsky-Danilevsky followed him to Tsarevo-Znaimische and Borodino. He distinguished himself at Borodino, then in October he was wounded at Tarutino and left the army to recover. Mikhailovsky-Danilevsky returned to the army in February 1813 and served as adjutant to Kutuzov. After Kutuzov's death, Tsar Alexander took Mikhailovsky-Danilevsky into his entourage, where he was responsible for foreign correspondence and the journal of military operations, participating in the campaigns of 1813–1814, in Germany and France, respectively.

After the war, Mikhailovsky-Danilevsky joined the newly established General Staff and accompanied Alexander in his travels in 1815–1818. He took part in the negotiations at the Congress of Vienna in 1815. Mikhailovsky-Danilevsky published several works on the campaigns of 1813–1815, including his own wartime diaries, *Zapiski 1814–1815 gg.* (Notes of 1814–1815) and *Zapiski o pokhode 1813 goda* (Notes on the 1813 Campaign). Tsar Nicholas I praised these studies and ordered Mikhailovsky-Danilevsky to write a comprehensive history of the wars of Alexander I. This assignment resulted in a series of fundamental researches on Russia's role in the French Revolutionary and Napoleonic Wars, including the concurrent conflicts with Sweden and Turkey. A prolific writer, Mikhailovsky-Danilevsky worked with remarkable efficiency and had virtually unrestricted access to official diplomatic and military archives.

Mikhailovsky-Danilevsky's works contain narrative histories of the campaigns, without any attempts at critical analyses, which, according to him, was the responsibility of military theorists. The volumes were personally read and edited by Tsar Nicholas I, who often removed entire sections of the works. The author also sometimes omitted the individuals who fell from favor after the Napoleonic Wars. As a result, Mikhailovsky-Danilevsky's histories contained virtually no criticism of Russian actions and catered to Imperial wishes. Nevertheless, they are one of the best sources on the Russian Army, containing many invaluable details.

## Milan Decrees (23 November and 17 December 1807)

One of several extensions of Napoleon's Continental System that resulted in increasingly restrictive measures imposed on maritime commerce. By preventing British goods from reaching continental ports, and in turn denying European traders access to British ports, Napoleon hoped to ruin the economy of his principal adversary, so obliging it to conclude peace on his terms.

As the major commercial and industrial carrier in the world, Britain understood that seaborne commerce was the lifeblood of much of Europe, including France. However, since the French did not have a navy equal to that of Britain, and Britain did not have an army equal to that of France, a military standoff ensued. Napoleon expressed his intentions with the Continental System when he told his brother Louis that his objective was to make himself master of the sea by controlling the coastline of Europe.

As a result of their respective positions of power, Britain issued its Orders in Council on 16 May 1806, declaring restrictions on trade conducted between neutral powers and France or any other enemies. France issued the first Milan Decree on 23 November, which was later modified on 17 December, stating that it should treat neutral ships cooperating with Britain as enemy ships and make them subject to seizure. In November and December 1807 Britain renewed its policy in response to the Milan Decrees. The intention of the Milan Decrees was to reinforce the Berlin Decrees of November 1806, which had authorized French vessels to capture those of neutral powers sailing from Britain, British colonial ports, or countries allied with Britain. In addition, neutral ships that consented to being searched by British vessels could be seized at sea as lawful prizes when captured by the French or their allies.

The Continental System in fact included a host of decrees and legislation enacted over several years, designed to make it impossible for the British to trade with continental Europe. In addition to the Berlin Decrees and the Milan Decrees, these included the Bayonne and Rambouillet Decrees, the Cadore Letter, the Trianon Tariff, and finally the Fontainebleau Decree of 1810. While Britain began the process of changing the interpretation of maritime law, France did not hesitate to mimic its enemy's conduct, and between them both powers ultimately rendered subject to confiscation all neutral vessels at sea.

The origins of French hostility to changes in British maritime policy may date from the signing of the Jay Treaty in 1794 between the United States and Britain, which was intended to settle various problems outstanding from the American Revolutionary War (1775–1783). France viewed the Jay Treaty, whose terms largely favored Britain, as a betrayal of the treaty of 1778 between itself and the young and vulnerable United States. Believing that the United States was allied to Britain, France passed laws that adversely affected American maritime trade from January 1798. France declared her right to stop neutral (including American) vessels trading with Britain, and if a single product of British origin was found within her hold, the entire cargo was considered contraband and seized.

When the United States found itself a victim of both the Orders in Council and the Continental System, President Thomas Jefferson attempted to obtain agreement among the various powers to regulate their maritime policies. Britain, for its part, alleged that there was no need for modifications of the rule of 1756 or other maritime agreements that had been entered into by naval powers since the sixteenth century. Owing to Britain's changing its maritime policies and the rules of war, such as "free ships make free goods," the United States was caught in the middle of a conflict that led to the drastic curtailment of U.S. trade and to consequentially dire effects on the U.S. economy. Beginning in 1806 the separate embargoes laid by France and Britain on American goods, intended for the other's opponent, also began to have adverse political effects on the Democratic-Republican Party, for Jefferson was obliged to institute an embargo that in injuring the growing U.S. economy naturally damaged his party.

### Miloradovich, Mikhail Andreyevitch, Count (1771–1825)

Russian military commander. Born to a prominent noble family of Serbian descent and son of General Andrey Miloradovich, he was enlisted as a young boy as sub-ensign in the Life Guard Izmailovsk Regiment in 1780. Over the next seven years, he studied at the universities of Höttingen and Königsberg as well as at Strasbourg and Metz. He began service as an ensign in the Life Guard Izmailovsk Regiment on 16 April 1787. After participating in the Russo-Swedish War in 1788–1790, he rose to the rank of colonel on 27 September 1797. On 7 August 1798 he became a major general and *chef* of the Apsheron Musketeer Regiment. He participated in Field Marshal Alexander Suvorov's campaigns in Italy and Switzerland, distinguishing himself at Lecco, Cassano, Verderio, on the Trebbia, at Novi, and during the crossing of the Alps. He also became very close to Grand Duke Constantine, the Tsar Alexander's brother.

During the War of the Third Coalition in 1805, Miloradovich led the 2nd Column of the Russian army during the march to Braunau. In October–November, he commanded an independent brigade, distinguishing himself at Amstetten and Dürnstein (Krems), for which he received promotion to lieutenant general on 20 November. At Austerlitz he commanded the Russian division in the center of the Allied positions and made desperate attempts to repulse the French attacks. In 1806, during the War of the Fourth Coalition, he took command of a corps in the (Russian) Army of Moldavia, participating in the opening moves of the Russo-Turkish War of 1806–1812. He distinguished himself at Gladen and Bucharest in 1806, at Turbat and Obilesti in 1807, and at Rassevat and Silistra in 1809. Although promoted to general of infantry on 11 October 1809, Miloradovich had a dispute with the commander in chief, Prince Peter Bagration, who had him recalled from the army later in the year. Between April 1810 and August 1812 he served as military governor of Kiev.

In 1812 Miloradovich organized the Kaluga Reserve Corps and joined the main Russian army at Gzhatsk in August. He distinguished himself commanding the right flank at Borodino. On 9 September he took command of the main rear guard and covered the Russian withdrawal from Moscow. From October through December 1812 Miloradovich commanded the advance guard, fighting at Vyazma, Dorogobouzh, and Krasnyi. During the campaigns

of 1813–1814, he commanded a corps in major battles in Germany and France, including Kulm, Leipzig, Arcis-sur-Aube, Brienne, La-Fère-Champenoise, and Montmartre.

After the war, he commanded the Guard Corps. He became military governor of St. Petersburg and a member of the State Council on 30 August 1818. During the Decembrist Uprising, he urged the insurgents to return to barracks but was mortally wounded by Lieutenant Peter Kakhovsky and died on 25 December 1825. He was buried in the Alexander of Neva Monastery in St. Petersburg.

### Mina y Larrea, Martín Javier (1789–1817)

One of the best known of the Spanish guerrillas, Martín Javier Mina y Larrea (or, as he is more commonly referred

to, simply Javier Mina) was active in Navarre in the period 1809–1810. Given that he never led more than a few hundred men, and further that his career was very short lived, his fame is at first sight somewhat surprising. Yet it can be easily explained: Very young as he was—his usual nickname, indeed, was *el mozo* (the lad)—Mina was an attractive figure, and his opposition to Ferdinand VII after 1814 and tragic death ensured that many Spanish liberals came to regard him as a hero. What is less clear, however, is how Mina, who was the son of a prosperous landowner possessed of a seat in the Navarrese estates, came to take up arms.

Immediately prior to the outbreak of the Peninsular War, he was a student at the University of Saragossa (Zaragoza)—hence his alternative nickname of *el estudiante*—but what happened then is unclear. According to one story, Mina took to the hills after French troops plundered his family home in Otano; according to a second, he was recruited as a secret agent by the Junta Central and eventually given a commission to raise a guerrilla band; and, according to still a third, he was actually expelled from university for misconduct, after which he took up with a gang of bandits. Whatever the truth, Mina seems to have begun his military career with an attack on a small party of French artillerymen who were marching from Saragossa to Pamplona on 7 August 1809. There followed a number of small actions—between 8 and 29 November alone, for example, Mina raided the towns of Tafalla and Tudela and defeated a small French force at Sansol—and it is clear that had matters gone on in this fashion the young commander might have established himself as a champion of the resistance struggle.

However, events turned out otherwise. In the first place, so many men were deployed against his small command that in January 1810 he was forced to suspend his operations, and in the second place, he was soon afterward called away to receive instructions. Returning to Navarre in March, he regrouped his men and launched several attacks on the French, only to have to desist for want of ammunition. Taking shelter in the mountains east of Pamplona, on 28 March Mina was betrayed to the French and captured at the village of Labiano. Sent into captivity in France, he now revealed his true colors by offering his services to Joseph Bonaparte. This offer, however, was not taken up by the French, and it appears to have remained unknown in Spain. In consequence, peace found Mina with his reputation intact, but beyond that he had nothing, Ferdinand VII having little to offer a young irregular who had long since been eclipsed by the more famous, Espoz Ilundaín.

Like many other men in his position, then, Mina drifted into revolutionary politics. Attaching himself to Espoz, he took part in the Navarrese insurrection of Sep-

tember 1814 but managed to escape to France. Seeking fame in the Latin American struggle for independence, he then organized an expedition to Mexico (which was at this point a loyalist bastion). Little support was received from the local populace, however, and on 27 October 1817 he was captured near Guanajuato. Executed by firing squad on 11 November, he became a national hero, and so his remains were eventually transferred to Mexico City, where they lie buried beneath the Independence Column.

### Mincio River, Battle of the (8 February 1814)

The Battle of the Mincio River (or Roverbella, a village some miles north of Mantua) was fought between the Armée d’Italie under Eugène de Beauharnais, Viceroy of the Kingdom of Italy, and an Austrian army under *Feldmarschall* Heinrich Graf Bellegarde. Though tactically a draw (neither party claimed victory in official reports), it was a French victory at the strategic level, as the Austrians failed to force the line of the Mincio.

The 1813–1814 Italian campaigns had begun in September 1813 with the Armée d’Italie defending the Illyrian Provinces (parts of present-day Slovenia and Croatia) and the Drava Valley in Styria (now southern Austria and northern Slovenia). A slow and relatively uncontested retreat followed in the autumn, with bad weather and the lethargic Austrians allowing Eugène to successfully defend the line behind the river Adige for three months. On 4 February 1814, being aware that the King of Naples, Joachim Murat, had recently passed over to the Allied coalition and that his Austro-Neapolitan army threatened the French line of communication on the southern bank of the Po, Eugène ordered a retreat behind the Mincio. The new defensive line, supported on both flanks by the fortresses of Peschiera (to the north) and Mantua (to the south), allowed the Armée d’Italie to shorten its front considerably and maintain a central position between Bellegarde and Murat. Eugène’s plan was to move quickly most of his

army south of the Po and fall on the Neapolitans. To achieve this goal, he had first to paralyze Bellegarde's army, positioned at Villafranca, by delivering an unexpected blow across the Mincio on 8 February. For his part, Bellegarde erroneously believed that Eugène was fleeing to Cremona and decided to set off in pursuit. The Austrian army was to cross the Mincio at Valeggio early in the morning of the same day.

Bellegarde had under his command 35,000 generally well-seasoned troops, with 130 guns. Eugène's was essentially a conscript army of 30,000 men, excluding the troops left in garrison at Mantua and Peschiera, with 90 guns. With morning mist preventing the opposing commanders from detecting each other's positions, the battle developed symmetrically over two distinct areas 5–6 miles apart and separated by the Mincio. While most of Eugène's army (19,000 men) pushed northeast from Goito toward Villafranca, clashing with Bellegarde's reserve, the bulk of the Austrian army crossed to the right bank and ran into a single French division positioned on the hills of Monzambano.

By midmorning, an amazed Eugène realized Austrian intentions and reacted to the unusual situation facing him. Hoping to catch the Austrians off balance and fall on their left flank, he redirected at about 10:00 A.M. three French infantry divisions, with one light cavalry brigade and the cavalry of the Italian Royal Guard, toward Valeggio. His advance, however, was checked by *Generalmajor* Joseph Freiherr von Stutterheim's grenadier brigade (with two dragoon regiments), which stubbornly resisted against greater odds until late afternoon on the heights of the village of Pozzolo, midway between Goito and Valeggio.

On the far bank, General Philibert Fressinet's small French division (5,000) was deployed on higher ground along the Olfino stream and successfully repulsed every enemy effort. Fearing for his rear, Bellegarde eventually ordered a general retreat eastward across the Mincio. Eugène's army encamped for the night somewhere between Pozzolo and Roverbella, and on the following morning withdrew to its original position behind the river. During the battle, two small Italian divisions launched minor and indecisive sorties from Peschiera and Mantua. The Austrians had some 4,000 men killed and wounded, and 2,500 taken prisoner. French losses lay somewhere between the Austrian claim of 6,000 and Eugène's figure of 2,500.

## Minorca

With its key position as the easternmost of the Balearic Islands in the western Mediterranean and with a good harbor at Port Mahon (Maó), Minorca was valuable to Britain, France, and Spain throughout the eighteenth century and was exchanged several times until 1802, when it was restored to Spain.

Minorca passed from Spanish to British control in 1708 when an Anglo-Dutch squadron captured the island during the War of the Spanish Succession (1702–1714). The conquest was confirmed along with Gibraltar in the 1713 Treaty of Utrecht. Minorca remained British until a French force captured it in 1756 during the Seven Years' War (1756–1763). The territory was returned to Britain by the Treaty of Paris in 1763 but was retaken by Spain in 1782 during the American Revolutionary War (1775–1783). The Treaty of Paris in 1783 confirmed Spanish control of Minorca and British control of Gibraltar (seized from Spain in 1704), though King George III declared a preference for Minorca, Spanish Florida, and Guadeloupe over Gibraltar.

Minorca remained important to Britain during the French Revolutionary Wars, and even though the Royal Navy maintained naval bases at Gibraltar, Malta, and in Naples, Commodore John Duckworth and Lieutenant General Sir Charles Stuart, with 2,500 troops from Gibraltar, were ordered to take the island in October 1798. Stuart sailed on 7 November and immediately landed his force with little opposition from the island's 4,000 Spanish defenders. By 9 November Port Mahon surrendered to the British, while Spanish forces continued to fall back behind the walls of Ciudadella on the opposite end of the island. After an exaggerated display of British strength, the Spanish defenders surrendered the island on 15 November in exchange for transporting the garrison to Majorca. The British took the important island without the loss of a single man.

Minorca briefly became the command post of the Mediterranean Fleet from May to July 1799, when the aging Admiral Sir John Jervis, Earl of St. Vincent, commanded the fleet from the island during the pursuit of a massive Franco-Spanish fleet of forty ships of the line led by Vice Admiral Eustache Bruix. In December 1799 Stuart proposed basing at Minorca 20,000 troops who could be called upon to act anywhere on the coast from Toulon to Genoa. The government initially agreed but ultimately

ordered just 5,000 men to the island under Sir Ralph Abercromby. Following the French victory at Marengo in June 1800, Abercromby and the Minorca garrison were ordered to Gibraltar, where they formed the core of the expedition to Egypt. After sailing from Gibraltar, the first group of transports returned to Minorca, where they received extensive repairs at Port Mahon before sailing to Egypt.

Minorca was returned to Spain by the terms of the Treaty of Amiens, concluded in March 1802. Following the Battle of Trafalgar in 1805, British dominance of the sea, an increasing appreciation for the value of Gibraltar as a Mediterranean base, and the Spanish decision to join Britain against Napoleon in 1808 kept Minorca firmly in Spanish hands.

## Möckern, Battle of (5 April 1813)

The Battle of Möckern was one of the first battles of the spring campaign of 1813 in Germany. It was also the first attempt that year by the French to regain possession of Berlin, the capital city of Prussia, and thereby severely disrupt the mobilization of the Prussian army.

Unable to withstand the Russian advance into Germany, Eugène de Beauharnais, commander of the French forces, abandoned the line of the river Oder and withdrew westward to the Elbe, holding the great fortress and river crossing of Magdeburg. Napoleon ordered Eugène to advance from Magdeburg and take up a fortified position farther eastward.

An Allied force under the command of the Russian general Peter Graf zu Wittgenstein was operating in this area. It consisted not only of Wittgenstein's own corps but also that under the Prussian general Johann von Yorck. Moving up in support was the Prussian corps of General Friedrich von Bülow that had recently been joined by troops under the Prussian general Karl Leopold von Borstell. Because these forces were not strong enough to defeat Eugène decisively, their objective was merely to link up with the Prusso-Russian army under General Gebhard von Blücher to the south and observe the line of the Elbe.

At the end of March 1813 the Allied army consisted of a corps under the Prussian general Friedrich Graf Kleist of 5,400 regular troops, 400 Cossacks, and 26 guns, at Marzahna. Kleist had previously commanded Yorck's vanguard. Yorck's corps now consisted of 9,000 men with 44 guns, at Belzig. General von Berg commanded the main body of the Russians, 8,000 regular troops, 250 Cossacks, and 62 guns at Brück. Bülow left General Heinrich von Thümen's brigade covering Spandau and moved 4,500 men and 24 guns to Potsdam. Borstell had 3,800 regulars, 650 Cossacks, and 12 guns at Nedlitz, just east of Magdeburg.

Eugène had four divisions of V Corps at his disposal, 30,500 men with 66 guns, covering the middle reaches of the Elbe. General Horace Sébastiani's cavalry corps, 2,000 sabers strong, with 500 *gendarmes*, was deployed around Magdeburg. Other French forces were in the vicinity and able to move to support him, including elements of the Imperial Guard and I, II, and XI Corps.

On 1 April Yorck received orders from Wittgenstein to move toward Zerbst and Zahna, from where his cavalry was to scout along the Elbe. He moved off the next day. Meanwhile, Wittgenstein built a bridge at Dessau, and Kleist remained at Wittenberg.

On 2 April Eugène took three divisions (16th, 18th, and 19th) of V Corps (General Jacques Alexandre, comte Lauriston) with some cavalry and marched to Neustadt, just to the north. The 16th Division occupied this town, and the Elbe was bridged here. The 16th Division crossed it, marching eastward toward Königsborn, followed by other elements of the corps.

On the morning of 2 April the 16th Division attacked Borstell's outposts at Königsborn, pushing him back on Nedlitz, where Borstell concentrated his corps. The next day, XI Corps and a cavalry corps under General Marie-Victor-Nicolas de Fay Latour-Maubourg's crossed the Elbe and forced Borstell's main body back on Möckern. Bülow's men were too tired to move that day to support him, so Borstell was left in a precarious position. Furthermore, should Eugène decide to continue toward Berlin, Wittgenstein's crossing of the Elbe would not be feasible. Wittgenstein decided to move to support Borstell, concentrating his forces at Senst and Belzig on 3 April. There was growing evidence of Eugène's intention of marching on Berlin, so Wittgenstein instructed Borstell and Bülow to withdraw slowly on Görzke and Ziesar should Eugène bring his superior numbers into play. Wittgenstein was intending to maneuver on his flank.

Eugène planned to beat Borstell's troops in succession on 4 April, but that morning Borstell withdrew, unwittingly avoiding Eugène. Borstell halted between Gloina and Grosslübars, while Bülow's vanguard reached Ziesar. Berg

marched to Lietzo and Yorck to Zerbst, while Kleist remained in Wittenberg. Eugène's men spent the night around Möckern, Gommern, and Dannigkow.

Wittgenstein arrived in Zerbst that evening and decided to go over to the offensive the next day. He now had 23,000 regulars, 500 Cossacks, and 130 guns at his disposal. Although Eugène's 40,000 men outnumbered him, Wittgenstein considered his men better motivated and able to win. However, he delayed his plan for another day, waiting for further forces to come up, intending to use only Bülow and Borstell to keep the French busy. His plan was to tie down Eugène with Bülow and Borstell, while moving on his right flank with Berg and Yorck. Battle was joined on 5 April.

Eugène's positions were as follows: On his right, the 18th Division (General Joseph, comte Lagrange) at Wahlitz, its vanguard at Gommern and Dannigkow, 9,500 men with 16 guns; in the center was XI Corps (temporarily led by General Paul, comte Grenier, in anticipation of the arrival of Marshal Jacques Macdonald) with its three divisions at Karith, Nedlitz, and Büden, 24,000 men with 46 guns; 1st Light Cavalry Division, 800 men, 6 guns at Zeddenick; on his left, the 16th Division (General Nicolas-Joseph Maison) at Woltersdorf, its vanguard moving from Körbelitz toward Burg, 5,000 men, 18 guns. Two more divisions, the 19th and General François, comte Roguet with the Imperial Guard, 11,000 men and 30 guns, were in reserve. The 1st Cavalry Corps covered the muddy banks of the Ehle brook, on the right and into the center.

Yorck's vanguard moved on Dannigkow, making contact with the French at noon. Lagrange's outposts were thrown back, being forced out of Dannigkow at bayonet point. The boggy terrain made it impossible for the cavalry to pursue. Yorck's main body, accompanied by Wittgenstein, reached Leitzkau at 4:00 P.M., from where it attempted to march to the sound of the guns.

Berg's vanguard engaged the French at Vehlitz around the same time, but the terrain made it hard going. Only when Borstell came up at 6:00 P.M. was a serious attack made on Vehlitz, which fell to the Allies after a determined defense.

Bülow's vanguard reached Möckern about 4:00 P.M. General von Oppen's cavalry drove off the 1st Light Cavalry Division. The French troops at Nedlitz then retired. As it was now dark, no attempt was made to pursue.

The Allies held the battlefield, having lost around 500 men. The French lost about 2,200 and one gun.

## Mogilev, Action at (23 July 1812)

A battle fought between the 2nd (Russian) Western Army and Marshal Nicolas Davout's forces in the early phase of Napoleon's advance on Moscow in 1812, Mogilev is also known as the Battle of Saltanovka. As Napoleon's forces invaded Russia, Prince Peter Bagration's 2nd Western Army eluded their enveloping maneuvers and hastily retreated eastward to join General Mikhail Barclay de Tolly's 1st Western Army. Threatened by the forces under Jérôme Bonaparte from the rear and Marshal Louis Davout's corps from the north, Bagration moved by forced marches toward Mogilev, where he intended to cross the Dnieper River and join Barclay de Tolly.

However, Davout beat him to the town, arriving with some 28,000 men on 20 July. The Russians approached Mogilev on the twenty-first, and their advance guard under Colonel Vasily Sysoev engaged Davout's advance troops near the village of Dashkovka, south of Mogilev. Bagration then decided to attack Davout with only the 7th Infantry Corps under General Nikolay Rayevsky: If Mogilev proved to be held only by Davout's advance troops, Rayevsky was strong enough to drive them out, move to Orsha, and cover the route to Smolensk. However, if Davout were there in force, Rayevsky was to fight a delaying action to keep the French on the right bank of the Dnieper, while Bagration crossed the river with the army to the south of Mogilev.

Davout's forces, reduced by fatigue from marching, were still further weakened by the strategic situation. The effective forces at his command to oppose Bagration's army amounted to only 22,000 infantry and some 6,000 cavalry. Taking into account the numerical superiority of the Russians, Davout positioned his troops at Saltanovka. His left was deployed on the marshy bank of the Dnieper and was unassailable. A stream flowing in a difficult ravine, spanned from the village of Saltanovka by a wooden bridge, covered his front. Dense forest surrounded the village, especially on the northern bank of the stream.

Davout reinforced these positions with additional earthworks. His soldiers cut the bridge at Fatova, fortified the buildings on the high road, and established strong batteries there. Davout deployed five battalions of the 108th Line and one battalion of the 85th Line here. Behind them he placed four battalions of the 61st Line in reserve between Fatova and Selets. On the left wing, at Saltanovka, Davout arranged three battalions of the 85th Line and an independent company of *voltigeurs* (light infantry operating as skirmishers). Finally, he deployed battalions of the 85th and 61st Line, respectively, and several cavalry units.

Around 7:00 A.M. on 23 July the advance guard (6th and 42nd *Jägers*) of the Russian 7th Corps led the attack on Davout's left wing at Saltanovka. Pushing the French outposts back, it reached the bridge over the Saltanovka stream at 8:00 A.M. Despite the fierce fire, the *Jägers* under the command of Colonel Andrey Glebov overran the defenders on the bridge and continued their advance. Davout immediately counterattacked with the 85th Line. The Russian advance was halted by heavy artillery fire and musketry, but their infantry then stood stoically for several minutes, allowing themselves to be shot down rather than yield ground. Rayevsky then launched almost simultaneous assaults on the French positions at Saltanovka and Fatova.

The 26th Infantry Division under General Ivan Paskevich was ordered to march on a narrow path through a forest to attack the French; this maneuver would serve as a signal for the main forces of 7th Corps to attack. Paskevich deployed his division in extended column and attacked the village. In fierce fighting the Russians overran the 1st battalion of the 85th Line, forcing its retreat. To support the 85th Line, Davout sent a battalion of the 108th Line with a few guns. Both French battalions took up a position on the heights to the south of Fatova and repulsed the Russian attack. Paskevich rallied his troops on the edge of the forest and, supported by a 12-gun battery, launched another attack that carried the village. However, after passing Fatova, the advancing Russian battalions were suddenly counterattacked by four battalions of the 108th Line, concealed by Davout in the wheat fields behind the village. The French inflicted heavy casualties on the Russians and forced their retreat.

Despite this setback, Paskevich rallied his troops and counterattacked. At first the attack was successful and he captured the village again. Davout, however, moved the 61st Line to strengthen his defenses. The French repulsed the Russian attack and drove them back; on the right flank, two French battalions overwhelmed the Orlov and Nizhniy Novgorod regiments and crossed the brook. Paskevich was compelled to move the Poltava Regiment to contain the

French advance and prevent the Russian right wing from being turned. Meanwhile, the main effort of 7th Corps was focused on Saltanovka. Rayevsky led the Smolensk Infantry Regiment to seize a dam and cover the approach of the main forces. This column was to be supported by the 6th and 42nd *Jäger* regiments and artillery deployed on the heights on both sides of the road. It was agreed that the attack would be launched simultaneously with Paskevich's advance on Fatova.

Yet, Rayevsky did not hear the cannon shots that signaled the advance, and so his attack started too late. Russian units endured devastating artillery fire and suffered heavy casualties. At one point, seeing the confusion in his troops, Rayevsky held the hands of his two sons, Alexander (sixteen) and Nikolay (ten), and, yelling "Hurrah!" led the attack. Notwithstanding this inspiration, the charge was repulsed. Learning from prisoners that Davout had gathered reinforcements, Rayevsky ordered a general retreat and withdrew his troops to Dashkovka.

Following the engagement at Mogilev, the 2nd Western Army completed construction of a bridge at Novy Bikhov and crossed the river toward Smolensk. The Russians acknowledged 2,548 killed and wounded in the battle and claimed the French lost 4,134 dead and wounded. Although Davout admitted to only 900 casualties, the French losses were close to 1,200. Mogilev is often acknowledged as a French victory, though in reality Bagration achieved his goal of eluding the French envelopment and breaking through to Smolensk, where the Russian armies united.

**Moncey, Bon Adrien Jannot de (1754–1842)**

Moncey was a twenty-year veteran of the pre-1789 army who rose to prominence fighting in Spain during the French Revolutionary Wars. Throughout his career, Moncey's most extensive service was in Spain, where he commanded forces first in the 1790s, then in the years after Napoleon invaded in 1808, and in a final, post-Napoleonic campaign in 1823. A humane individual, respected by his military opponents, Moncey deliberately avoided service in areas like the Vendée, where he would be required to fight his fellow Frenchmen. He also accepted imprisonment in 1815 rather than preside over the trial of his fellow Napoleonic marshal, Michel Ney.

Moncey was born on 31 July 1754, at Palise, a town near Besançon. He was the son of a lawyer and estate owner. Commissioned an army officer in 1779, he was only a captain in 1791. The campaign against Spain brought him speedy promotion. Moncey became a *général de brigade* in February 1794 and, six months later, commander of the Army of the Western Pyrenees. But a cloud of suspicion hurt his career in the years following. Moncey

had personal ties to individuals like Lazare Carnot, who in 1797 had been accused of being royalist sympathizers. Declining a command in the rebellious Vendée also led the government to distrust him.

Although Moncey played no active role in Bonaparte's rise to power, he accepted the new order and the opportunities it offered. He led a corps across the Alps through the St. Gotthard Pass against the Austrians in the Marengo campaign of 1800, then served as inspector general of the *gendarmerie* from 1801 to 1807. On 19 May 1804 Napoleon named Moncey one of the marshals of the French army.

In January 1808 Moncey returned to Spain as commander of an army corps. Attacking Valencia that summer, he failed to take the city while suffering heavy losses. At the close of the year, his ineffectual efforts against Saragossa led Napoleon to relieve him and put General Jean Andoche Junot in charge of the siege.

Thereafter, Moncey found himself relegated to rear-area commands in regions like Belgium. But, in March 1814, as commander of the Parisian National Guard, he led his inexperienced citizen soldiers in a temporarily success-

General Moncey commanding National Guard troops in the defense of the Clichy Gate in Paris, 30 March 1814. (Engraving by Aitken after Vernet from *Life of Napoleon Bonaparte* by William M. Sloane, New York: Century, 1906, vol. 4)

ful defense of the crucial Clichy Gate when Allied armies approached the French capital.

Moncey accepted service under Louis XVIII in 1814. Although he did not actively support Napoleon's return the following year, Moncey incurred the Bourbon government's displeasure when he openly rejected service presiding over the court-martial of Michel Ney, one of Napoleon's most distinguished marshals. He paid for this principled action with three months' imprisonment but returned to active duty in 1816.

In April 1823 Moncey led IV Corps of the French army into eastern Spain in a successful campaign in defense of the legitimate Spanish monarch. In 1840, now the governor of Les Invalides, he accepted the return of Napoleon's body. The aged general died on 20 April 1842 and was buried alongside his former commander.

## Mondovi, Battle of (19–21 April 1796)

The strongly contested battle fought from 19 to 21 April 1796 at Mondovi, a small city in southwestern Piedmont, was the last act of the French offensive against the Piedmontese (Sardinian) army during Bonaparte's first Italian campaign. After the retreat from Mondovi, the king of Piedmont-Sardinia, Victor Amadeus III, asked for an armistice, which was signed at Cherasco on 28 April. With Piedmont out of the war and forced to provide France with logistical support, Bonaparte could now plan his offensive against the Austrians in Lombardy.

The French advance from western Liguria had driven the Austrians under *Feldzeugmeister* Johann Peter Freiherr von Beaulieu from the Apennines back to Acqui. The Piedmontese army under *Feldmarschalleutnant* Michael Freiherr von Colli consequently found itself isolated. Suspecting that no Austrian help was to be expected in the near

future, the Court of Turin started considering the prospect of an armistice. Colli's decision of avoiding a decisive clash and conducting a fighting retreat that would allow him to preserve the army could, therefore, be explained on the basis of political, as well as military, considerations.

The retrograde movement began during the night of 16–17 April, when the Piedmontese rear guard—notwithstanding their success on the sixteenth—abandoned the entrenched camp of Ceva. Colli selected a strong new defensive position just southeast of Mondovi. This was a wide salient stretching between the river Tanaro and one of its tributaries, the river Corsaglia. The salient top lay before Lesegno, at the confluence of the two rivers. To the northwest, the swollen Tanaro posed an impassable obstacle, all bridges across the river being cut off. To the southwest, the bridge on the Corsaglia at San Michele was covered by a line of entrenchments that ran along a ridge just behind the stream, with strong points (from north to south) at La Bicocca, Rocchini, and Buon Gesù.

Colli deployed his army as follows: To the left, 4,500 infantry and cavalry under *Generalmajor* Giuseppe Felice, Count Vitali were to cover the line of the Tanaro, from Niella to the bridge on the river Ellero, another tributary of the Tanaro farther downstream; in the center, 2,000 stood on the ridge of La Bicocca; to the right, 2,000 watched the far end of the entrenched camp before Mondovi. Eight hundred grenadiers under Colonel Giovanni Gaspare, Marquis Dichat were detached to garrison the village of San Michele, with ten guns to enfilade the bridge. The rest of the army was back in Mondovi and behind the Ellero. The Piedmontese formation clearly demonstrated that Colli was ready to continue his retreat toward Cuneo or Turin.

Bonaparte spent two days reorganizing the Armée d'Italie. After a week of endless marching and fighting over the mountains, with inadequate logistical support, most French units looked like a starving rabble eager for looting.

The attack on Mondovi was scheduled for 19 April. Bonaparte deployed General Pierre Augereau's division (6,000 men) on the right bank of the Tanaro, from Lesegno to Niella, and General Jean Sérurier's division (6,000) on the Corsaglia, with the cavalry of Henri-Christian-Michel, baron de Stengel in support. Augereau soon realized that the Tanaro could not be crossed and therefore stood idle all day. To the southwest by 10:00 A.M. two columns, under Sérurier and General Pascal Antoine Fiorella, arrived before the bridge at San Michele, where enemy artillery fire easily succeeded in keeping them at bay. Farther to the south, General Jean Joseph Guieu's column made for the hamlet of Torre, where they surprised a Piedmontese outpost on the right bank of the Corsaglia. The latter hurriedly fled across the stream on a small wooden aqueduct, forgetting to destroy it. The French were then able to cross

and established a bridgehead beyond the Corsaglia, thus menacing the right flank of the garrison of San Michele.

Spotting the new threat, Dichat ordered a retreat from the village back to La Bicocca. It was too late: Attacked on their front and flank, hundreds of Piedmontese, Dichat included, were cut off and taken prisoner. Now in control of San Michele, the French troops—as they had done at Dego—once again broke their ranks and went on pillaging and raping. Spearheaded by a company of Swiss grenadiers, the Piedmontese counterattack caught the enemy in disorder. Unable to re-form, Sérurier's men were then pushed back across the Corsaglia, with the exception of those garrisoning the bridgehead at Torre. The first day of the battle ended with a victory for the Piedmontese, who suffered losses of 350 men. The French had 600 dead, wounded, and prisoners.

On 20 April both armies stood on their original positions, with a raging Bonaparte busy restoring order. By then, however, Colli had decided to abandon the entrenched camp along the Corsaglia and withdraw the whole army behind the Ellero, his main goal now being to evacuate the rich magazines of Mondovi. During the night of the twentieth, the Piedmontese began their withdrawal, destroying the bridge at San Michele and leaving burning campfires behind in order to deceive the enemy. On the early morning of the twenty-first, Bonaparte's scouts found a ford over the Corsaglia and Sérurier set off in pursuit. The Piedmontese, encumbered with hundreds of wagons, were still thronging the exits of Mondovi and the bridges over the Ellero. To gain time, Colli ordered a rear-guard action on the Bricchetto, a plateau between Mondovi and Vicoforte. Two thousand Sardinian grenadiers, with four guns, resisted on this spot until 4:00 P.M. Elsewhere, however, other units did not fight as gallantly as their comrades on the Bricchetto, thus opening wide gaps in the Piedmontese line. Meanwhile, General Stengel with about 250 French dragoons and hussars succeeded in fording the Ellero, just northeast of Mondovi, thus posing a serious threat to the enemy columns on the road to Cherasco. The cavalry, however, were charged and repulsed by two squadrons of Piedmontese dragoons, under Colonel Silvestro Giovanni d'Oncieu, baron de Chaffardon. Stengel was killed in this action.

By 6:00 P.M. the battle was over. Fearing bombardment and looting, the citizens of Mondovi convinced the small garrison Colli had left behind in the citadel to surrender. During the fighting of the twenty-first, the French suffered about 1,000 casualties. The Piedmontese had 800 dead and wounded, together with 800 prisoners.

### Moñino, José, Conde de Floridablanca (1728–1808)

An official of the Council of Castile, the then José Moñino first came to the attention of King Charles III of Spain in consequence of his involvement in the expulsion of the Jesuits in 1767. Given the title Conde de Floridablanca in 1773, he was in 1777 elevated to the post of secretary of state (i.e., chief minister), in which capacity he attracted considerable hostility from the so-called Aragonese party surrounding the Conde de Aranda. Still in office when the French Revolution broke out in 1789, he imposed a policy of strict censorship and adopted an attitude of deep hostility toward the new regime across the Pyrenees. Nor was his liking of the Revolution improved when in July 1790 a bankrupt French merchant with a grudge against the Spanish government made an unsuccessful attempt on his life. However, believing that Floridablanca's asperity was endangering the French royal family, Charles IV replaced him in March 1792 with Aranda. Accused of embezzlement by his enemies, Floridablanca was briefly imprisoned but was then exonerated and allowed to retire to his estates in Murcia.

Floridablanca was brought back into public life by the uprising of 1808, which saw him elected president of the junta of Murcia province. Desperate to reconstitute the authority of the Spanish state, he played a leading role in the formation of the provisional government known as the Junta Central, and as its first president, he helped avert the challenges mounted to its authority by such generals as Gregoria García de la Cuesta and José Rebolledo de Palafox. However, increasingly infirm, he fell sick with bronchitis and finally died in the midst of the French counteroffensive of November–December 1808.

## Moniteur, Le

The *Moniteur Universel*, or the *Gazette Nationale*, commonly abbreviated to *Le Moniteur*, was a newspaper created on 24 November 1789 by Charles-Joseph Panckoucke to publish the debates of the Constituent Assembly. Panckoucke had been an established journalist and entrepreneur under the *ancien régime* and had published the *Encyclopédie Méthodique* as well as the newspapers *Mercure de France* and *Gazette de France*, which, alongside the *Journal de Paris*, were the only three political newspapers sanctioned in France prior to the Revolution.

Following the massive expansion in newspaper printing and the relaxation of censorship laws after the storming of the Bastille, Panckoucke sought to launch a newspaper to compete with the daily success of the *Journal de Paris*. *Le Moniteur* was printed in folio (33 × 24 cm), an expensive format copied from English newspapers, which marked it out from its octavo or quarto competition. Indeed, *Le Moniteur* also explicitly emulated the London press in its claimed intent to stimulate public discussion of the legislative reports it contained; to include coverage of literature, science, and the arts, as well as a range of foreign and domestic news; and to provide adequate space for advertising.

The reality was somewhat more cautious, with nonparliamentary news and cultural articles subordinated to the dominant parliamentary proceedings. As a consequence, *Le Moniteur* was aiming for consensus and for the accommodation of the doctrinal differences of successive Revolutionary governments by its emphasis on publishing lengthy transcripts of reports and deliberations with little or no editorial opposition or criticism. Nevertheless, the success of *Le Moniteur* was swift, and it fast became the Revolution's primary source of political documentation, if it never achieved the specific appeal of more partisan journals. Indeed, *Le Moniteur's* reputation as a reliable and accurate record of parliamentary events led to its incorporation of other similar journals, such as Hugues-Bernard Maret's *Bulletin de l'Assemblée Nationale*, in February 1790.

After the coup d'état of 18–19 Brumaire (9–10 November 1799), Bonaparte made *Le Moniteur* the official organ of the French state, and it remained so until 1848. As one of the best-funded and best-staffed newspapers of the period, *Le Moniteur* was available to a wider readership than the majority of its competition, which were largely based in the publishing and bookselling district of Paris in the streets off the Rue St. Jacques and whose readership did not often extend far beyond the region. This made *Le Moniteur* an especially useful resource for the military, who were able to keep abreast of political developments as readily as the populace could maintain a relative awareness of

events at the front. Despite its dispassionate stance, the impartiality of *Le Moniteur* was frequently threatened by legislative demands, particularly during the Terror. This objective quality, although largely based on the desire to stay in business during a period of constant political upheaval, did at least guarantee *Le Moniteur* a permanence in the transitory world of Revolutionary publishing and allowed a critical distance from state-produced accounts of events.

## Montbrun, Louis-Pierre, comte (1770–1812)

Montbrun had a rare and seemingly paradoxical mix of abilities that combined to make him one of the greatest cavalry commanders of the period. Meticulous planning, boldness of maneuver on the battlefield, and tactical brilliance guaranteed his lasting reputation. Alongside generals Antoine Lasalle and François Kellermann “the Younger,” he was one of only three French generals who had the ability to control and deploy massed cavalry effectively, according to no less an authority than Marshal Auguste de Marmont.

Montbrun had an impressive military career, beginning in 1789 when he enlisted in the Chasseurs d'Alsace, which later became the 1er Chasseurs à Cheval. He fought with distinction in scores of battles, including Altendorf, Nidda, Erbach, Kirchberg, Ried, Austerlitz, Breslau, Eggmühl, and Raab. He was also present at a number of key actions in the Peninsular War, such as Almeida, Busaco, Fuentes d'Onoro, and El Bodón.

Furthermore, Montbrun played a key part in a moment that entered the mythology of Napoleon's elite Imperial Guard. In November 1808 at the pass of Somosierra, en route to Madrid, an attack on a large Spanish force by men of the *chevaulégers polonais* (Polish Light Horse) had been repulsed with heavy casualties. Montbrun reassembled the remaining Polish units with squadrons of the Chasseurs à Cheval de la Garde Impériale for a second attack, which was not only successful but led to the *chevaulégers polonais* being raised from Young Guard to Old Guard status for their gallantry.

Although a tremendous equestrian and an accomplished military commander whose sheer imposing presence demanded respect, Montbrun had a temperamental

streak that could even bring him into direct conflict with the Emperor himself. One particular anecdote is worthy of repetition. During the Russian campaign, Montbrun, serving under Marshal Joachim Murat, had been ordered by Napoleon to capture enemy materiel at Vilna. Despite being told of the Emperor's wishes, Murat, being notoriously headstrong and occasionally disobedient, overruled the Emperor and told Montbrun to stand firm. Later, Napoleon took Montbrun to task for ignoring an order and said that he was "not fit for a field command and would be better employed on the lines of communication." In a fit of pique, Montbrun threw away his sword and galloped away, shouting, "You can all go to the Devil!" (Johnson 1978, 102). It is perhaps fitting testament to Montbrun's skills as a soldier that Napoleon allowed him to retain command despite such displays of insubordination. As well as this rebellious side to his character, Montbrun was also reputed to be an "incorrigible looter" (Johnson 1978, 101).

His faults aside, Montbrun's demise was a major blow to Napoleon. It came during the bloodbath of Borodino, where he was horrifically wounded by a cannon shot and died later that evening. As Johnson points out, despite his glorious military career, Montbrun's obituary in the army's *Bulletin* was woefully brief. It read, "We have lost General of Division Count Montbrun, killed by a cannon shot" (Johnson 1978, 105). In the aftermath of Borodino, Napoleon now only had one of his cavalry geniuses left—Kellermann.

### Montebello, Battle of (9 June 1800)

French victory over Austria in a preliminary clash before the Battle of Marengo in Italy. Having crossed the Alps and taken Milan, Bonaparte had cut off the Austrians besieging Genoa from their line of communication with Mantua. Bonaparte's initial plan was to hold a defensive position at Stradella and await the Austrians as they attempted a breakout. However, news that the Austrians had captured

Genoa, from where they could be rescued by a squadron of the Royal Navy, compelled Bonaparte to recapture the initiative. Bonaparte had General Jean Lannes cross the river Po at Belgiojoso on 6 June with 5,500 men and push ahead toward Voghera, supported by General Claude Victor with 6,000 men.

Simultaneously, *Feldmarshalleutnant* Karl Peter Ott Freiherr von Bartokez was marching with two divisions to support *Feldmarshalleutnant* Andreas Graf von O'Reilly, who was retreating on Voghera after having been pushed out of Piacenza by General Joachim Murat on 7 June. On the following day O'Reilly's rear guard clashed with Lannes at Broni. Ignorant of Ott's approach, General Louis-Alexandre Berthier ordered Lannes to push ahead to Casteggio on 9 June.

At 6:00 A.M. the French probed O'Reilly around San Giuletta. O'Reilly fell back to the outskirts of Casteggio, where he made a stand. Around noon Ott's troops began to arrive from Voghera, with Vogelsang's division deploying six battalions on the heights to the south of the town. Against all expectation, Lannes was now heavily engaged against an enemy 17,000 strong—he urgently requested that Victor come up in support. On the Austrian side, *Generalmajor* Anton Ritter von Zach unsuccessfully urged Ott not to get into a full engagement, but Ott refused and brought *Feldmarschalleutnant* Joseph Freiherr von Schellenberg's division into action. Lannes's troops attacked the heights, but were checked by a fierce Austrian counterattack. On the French right, their attempt to outflank Casteggio was stopped by the arrival of Austrian reinforcements.

Fortunately for Lannes, Victor arrived at 2:00 P.M. and sent General Jean Rivaud's brigade to repulse the Austrian right. Lannes launched an assault on Casteggio and the bridges over the Coppa Torrent. Firing soon developed to the north of Casteggio, and as the Austrians began to become stretched Victor launched his reserve in another direct assault on Casteggio. The French broke through, and Ott was forced to withdraw before being overwhelmed. To cover the retreat, Schellenberg ordered his five-battalion reserve to come up as quickly as possible.

By 5:00 P.M. Casteggio had been cleared and the French were in pursuit of the retreating Austrians. Ott ordered Schellenberg to form a rear guard at Montebello, allowing the rest of the army to escape toward Voghera. Approaching 8:00 P.M. a fierce firefight opened up between this rear guard and the French troops arriving in the vicinity. As darkness fell, the rear guard was able to pull out of Montebello, retreating on Voghera, 8 kilometers west down the main road. The action had cost the Austrians about 2,100 casualties, 2,500 prisoners, and 2 guns, with comparable casualties on the French side.

### Montenotte, Battle of (11–12 April 1796)

Fought on the heights crowning the port of Savona in Liguria, and a relatively small engagement, this battle soon acquired a distinctive and perhaps exaggerated fame for having been Bonaparte's first victory during his first campaign in Italy.

After being appointed commander in chief of the Armée d'Italie in March 1796, Bonaparte set to work to complete the reorganization of his poorly supplied troops and prepare a campaign, which—according to minister of war Lazare Carnot's instructions—was to drive the Kingdom of Piedmont-Sardinia out of the First Coalition and expel the Austrians from Italy. The French plan, consequently, aimed first at separating the Piedmontese from the Austrian army, by striking at their weak junction on the Ligurian Apennines, some miles inland from Savona. At the beginning of April the Armée d'Italie could field about 60,000 men scattered along the Ligurian coast from Genoa to Nice, and on the Maritime Alps.

Meanwhile, Austrian commander *Feldzeugmeister* Johann Peter Freiherr von Beaulieu had decided to anticipate enemy movements by descending from the Apennines down to the coast. While a column of 7,500 men under his direct command was to seize Voltri, just west of Genoa, a second column of 9,000 men under *Feldmarschalleutnant* Eugen Graf Argenteau had orders to push from Montenotte toward Savona. The French right wing (General André Masséna's division) would thus remain isolated from the bulk of the Armée d'Italie. According to Beaulieu's plan, the Piedmontese under the Austrian commander *Feldmarschalleutnant* Michael Freiherr von Colli were to remain on the defensive in southwestern Piedmont. Colli's different strategic views went unheard, highlighting another instance of the strained Austro-Piedmontese relations. Those with the British were no better, and Beaulieu's expectation to receive substantial aid from Commodore Horatio Nelson's small squadron was to be disappointed.

On 10 April Beaulieu repulsed the French from Voltri. Argenteau's forces, however, were scattered over the moun-

tains and soon lagged behind schedule. The Montenotte area was an extremely rough and wild terrain, unsuitable for coordinated movements: close valleys dominated by steep wooded slopes, bad roads, and mountain tracks running along narrow and exposed ridges. On the eleventh, Argenteau's late advance was soon checked, as his main column of 4,500 men ran into a chain of enemy outposts entrenched on mounts San Giorgio and Negino, midway between Montenotte Superior and Savona, whence Bonaparte had moved his headquarters. Though outnumbered, the French under *chefs de brigade* Henri-François Fornèsy and Antoine-Guillaume Rampon profited by their strong position and put up a stubborn resistance. In the evening, Bonaparte issued orders for his army's general offensive to begin overnight. Marching in rain and mist, early on the twelfth General Amédée Emmanuel Laharpe's 4,500 men joined the defenders of mounts San Giorgio and Negino and attacked Argenteau from the southeast. Meanwhile, Masséna led the rest of his division (3,500 men) in an outflanking march via Altare and fell on Argenteau's rear from the west. The Austrians fled northeastward toward Montenotte Inferior, with Laharpe in pursuit. Masséna then redirected his troops to Cairo in the Bormida valley so as to support General Pierre Augereau's division descending from the San Giacomo Pass.

At Montenotte the Austrians lost between 1,000 and 1,500 men killed, wounded, and prisoners. French losses are uncertain. Argenteau's retreat opened a wide gap between the Austrian and the Piedmontese armies, thus paving the way for the success of Bonaparte's plan.

### Montereau, Battle of (18 February 1814)

The Battle of Montereau was fought during the 1814 campaign in France between the forces of Napoleon and those of Prince Eugen of Württemberg, in command of the Army of Bohemia, a mixed Allied force, mostly Austrian. Napoleon's victory in this battle enabled him not only to hold Montereau, at which three major roads crossed, but also to force the Army of Bohemia back toward Troyes, with the intent of pushing it out of France

entirely. Napoleon had turned to the south to face *Feldmarschall* Karl Philipp Fürst zu Schwarzenberg after the French victories over General Gebhard von Blücher's (mostly Prussian) Army of Silesia in the Six Days Campaign the previous week.

In the days before the battle, the Allied forces of the Army of Bohemia were spread out in a line stretching along the Seine, holding key positions at Fontainebleau, Bray, Provins, Mormont, and elsewhere. Napoleon, for his part, concentrated his forces at Guignes before sending them forward, and on the morning of 17 February he had gathered about 70,000 troops. Reluctant to face Napoleon directly, and with his forces scattered about the region, Schwarzenberg ordered a general retreat to the southeast toward Troyes. Before all of Schwarzenberg's troops could respond to that order, Napoleon had massed his forces on the road from Guignes to Nangis and broken through the Allied forces, neatly destroying the Allied cavalry under the command of Count Peter Pahlen at Mormant.

With the Austrian lines in general retreat, Napoleon split up his forces and sent his marshals in pursuit of different elements of the enemy to Provins, Bray, and Montereau. The Allied forces retreating to Montereau were under Württemberg's command, and Napoleon sent Marshal Claude Victor in pursuit. Victor's advance was slowed in part by elements of the retreating Allies, and he did not arrive at Montereau before Württemberg had fortified positions north of the town. Napoleon was furious at the delay, and after reprimanding the marshal, replaced Victor with General Maurice Etienne, comte Gérard.

Throughout the morning of the eighteenth, Gérard attacked Württemberg's entrenched position; it was not until the late afternoon that the French were able to overrun the Austrian line and force a retreat. The appearance of Napoleon on the battlefield at the head of his troops helped to turn the advance into a rout of Württemberg's troops past Montereau and south over the river Yonne. By the end of the day the Allies had lost around 6,000 troops, to French losses of about 2,000. Although the Army of Bohemia had been clearly defeated, many of its corps escaped to the east and would be able to regroup against Napoleon in the weeks that followed.

### **Montholon, Charles Tristan, comte de (1783–1853)**

Montholon saw action throughout the Napoleonic period, including service as an aide-de-camp to marshals Louis-Alexandre Berthier, Pierre-François-Charles Augereau, and Jacques Etienne Macdonald, and to General Barthélemy Joubert. He was appointed to the post of imperial chamberlain in 1809, and in 1812 he was a lead diplomat to Würzburg. He lost that position because of his marriage to Albine de Vassal, whom Napoleon considered an unsuitable woman, and fell out of favor with Napoleon. Montholon's claims to wounds and major promotions are unfounded, as there appears to be no supporting documentation. Even so, Montholon rallied to Napoleon's cause during the Hundred Days, and, to the great surprise of many, he and Albine were among the few who accompanied Napoleon to exile in St. Helena in 1815.

While there, Montholon was in charge of the food and drink given to Napoleon. He was unpopular with most of the other members of Napoleon's court in exile, but the Emperor considered him a loyal and important member of his staff. There is considerable speculation that Napoleon seduced Albine, who left the island to give birth. Montholon was executor of Napoleon's will and received a large amount of money from the Emperor. When he left St. Helena he lived the life of a spendthrift, but the Bourbon kings were always willing to see that he was solvent. He helped Louis-Napoleon attempt to gain power in 1840 and was jailed for his effort. He eventually was freed and served in the National Assembly. His memoirs of St. Helena are suspect at best, as they are considered by many to be self-serving, if not outright fraudulent.

Montholon might have been a far larger character than once supposed. There is significant evidence that Napoleon was poisoned while in exile on St. Helena. In his will, Napoleon himself claimed that he had been murdered, though he accused the British of being the culprits. The autopsy was conducted under suspicious circumstances, but for more than a hundred years after Napoleon died it was assumed he succumbed to stomach cancer.

That presumption is being sharply questioned by modern historians. Tests of Napoleon's hair have shown suspicious levels of arsenic, which could have been given to Napoleon in his wine. A growing number of historians believe that Montholon was the likely murderer. His control

of Napoleon's wine, his surprising appearance on St. Helena to begin with, his clear benefit from Napoleon's will, and his ties to the Bourbons—who stood the most to gain from Napoleon's death—render him a prime suspect to many such historians.

### Montmartre, Action at (30 March 1814)

The final engagement in the campaign of 1814, which led directly to Napoleon's first abdication. The unsuccessful defense of Paris against the Allied armies caused the marshals to refuse to fight any longer.

During the campaign of 1814 in France, Napoleon regained his skill at outmaneuvering the Allied armies. Although heavily outnumbered, he was able to keep them at bay for some time. On 20 March he failed to turn back their march on Paris at the Battle of Arcis-sur-Aube. Recognizing that his forces were too weak to face the Allies directly, Napoleon planned to mass his available forces and attack the Allied supply lines. As long as Paris could hold out against the Allies, the strategy could force them to retreat. While he marched east, Napoleon sent marshals Auguste de Marmont and Adolphe Mortier with their weak corps to defend Paris.

Marmont and Mortier were defeated on 25 March by the Allies at La-Fère-Champenoise and retreated directly to Paris. The marshals collected the few men available, many of whom were veterans who were recovering from wounds. Another 6,000 were National Guardsmen who volunteered to join the regulars. Muskets were in short supply, and some Guardsmen were armed only with pikes. Some civilians also joined in, but the total numbered fewer than 25,000. Fewer than 100 guns were also available. Overall command rested upon Joseph Bonaparte, Napoleon's brother. In contrast, the Russian, Austrian, and Prussian forces totaled around 110,000 men. Another 10,000 cavalry had been detached to harass and mislead Napoleon. The Allies made their way

down the river Marne and approached Paris from the north.

The capital's defenses had been allowed to crumble, with Joseph comprehensively failing to restore them to an adequate state. The most important defensive positions were natural formations, especially the knoll at Montmartre. Recognizing this point as the key to the city's defense, Joseph set up his command post there on 30 March.

Fighting broke out along the entire northern side of Paris, but the heaviest fighting was at Montmartre. Defended by Mortier's Young Guard, the knoll was the scene of bloody fighting. The French managed to hold their own, with spirited counterattacks launched to recapture lost positions, but Joseph could see that virtually the entire Allied army was present and outnumbered the French by five or six to one. He left around noon after giving Mortier and Marmont permission to surrender Paris if necessary.

Toward the end of the day, Marmont asked for an armistice to negotiate a capitulation. Russian representatives were conducted to Marmont's house where details were hammered out, and at 2:00 A.M. a surrender agreement was signed. The French forces marched through Paris to Fontainebleau, while the Allies were allowed to enter. Losses for the French totaled 4,000 killed and wounded, with another 1,000 captured. Allied losses numbered 6,700 killed and wounded. Although the defense of Paris had been nearly hopeless, it had been conducted with spirit.

At 11:00 A.M. on 31 March the Allied sovereigns entered Paris, while much of the population celebrated. Prince Talleyrand, the foreign minister, had already contacted the Russian tsar, Alexander I, organized a provisional government, and declared Napoleon deposed as Emperor. Furious at news of the surrender of Paris, Napoleon attempted to rally another army to continue the war, but his marshals refused to renew the fight. Discouraged, Napoleon agreed to abdicate, for the first time, on 6 April.

### Montmirail, Battle of (11 February 1814)

Napoleon's victory at the Battle of Montmirail against the Allied forces of General Johann von Yorck and General Fabian Osten-Sacken proved to be the crowning achievement of the Six Days Campaign, as the odds were stacked greatly against the French. The battle was also a turning point for the overall 1814 campaign: Napoleon and his forces gained a great deal of confidence following the victory, and the Allies had been dealt a serious blow. The Battle of Montmirail followed rapidly from the French victory at Champaubert the day before, as part of Napoleon's intention to systematically destroy Field Marshal Gebhard von Blücher's Army of Silesia before turning to the south to defeat the Army of Bohemia under the command of *Feldmarschall* Karl Philipp Fürst zu Schwarzenberg.

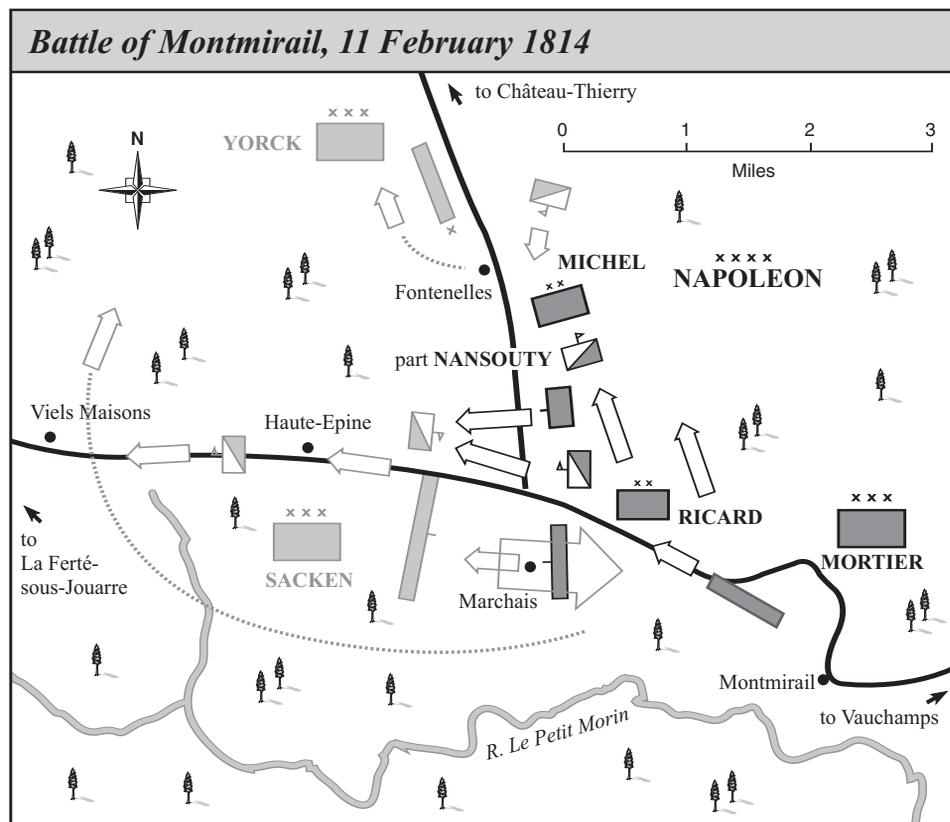

After the defeat of Russian general Zakhar Dmitrievich Olsufiev at Champaubert, the Allied forces were split apart, with Blücher turning east toward Châlons, and generals Yorck and Osten-Sacken in the west near Château-Thierry and Trilport, respectively. Leaving Marshal Auguste de Marmont's troops to hold Blücher, Napoleon took the bulk of his forces and pushed on to Montmirail. He called on Marshal Jacques Macdonald to recapture Château-Thierry (where Yorck was headed) to

prevent the Allies from gaining a bridge over the Marne, and he placed marshals Nicolas Oudinot and Adolphe Mortier at the ready to the south of the main position for additional support.

Instead of following Yorck toward Château-Thierry, Osten-Sacken persisted in advancing east to Montmirail, and by so doing kept the Allied forces separated. At first glance this would not seem to be much of a problem: The Allies outnumbered the French nearly two to one, and Napoleon himself was not certain of victory. On the morning of the eleventh, Osten-Sacken sent his troops in several waves along the main road to Montmirail, trying to break through Napoleon's lines. The French divisions under General Etienne Pierre Ricard defended their position but slowly were forced back toward Montmirail. Both Osten-Sacken and Napoleon were expecting reinforcements on the field: Napoleon had sent part of his troops toward Château-Thierry to observe the arrival of Yorck's troops, even as he hoped that his own reserve from Mortier would arrive first.

Although Yorck's advance guard neared the battlefield well before Mortier's, his cautious approach gave Napoleon the advantage. Of Yorck's 18,000 men, only 3,000 were put in the field, which evened up the numerical disadvantage for the French. Parity of strength increased when Mortier arrived, giving Napoleon the opportunity to turn to the offensive. As Mortier feinted a frontal attack on Osten-Sacken's troops, Napoleon swung his forces around the right flank, effectively cutting off Osten-Sacken's left flank. Although Yorck committed additional troops against Napoleon, they were unable to do more than protect the retreat of Osten-Sacken's forces and prevent a total rout. By the end of the day, the Allies had lost 4,000 troops to French losses of 2,000, and Napoleon's victory seemed certain. The Allies were rapidly retreating toward Château-Thierry, and Blücher ordered a general retreat to Rheims.

French success in this battle changed the tenor of the 1814 campaign. Napoleon regained his confidence both in his forces and his abilities,

Adapted from Chandler 1999, 287.

and in dispatches back to Paris he exaggerated the extent of his success in order to increase morale in the capital. In the wake of the battle Napoleon sent his troops along the road to Château-Thierry, pursuing the retreating Allied forces in an effort to knock them out of the campaign altogether. Although Napoleon was perhaps overconfident when he claimed that he had destroyed the whole of the Army of Silesia, victory at Montmirail was followed by subsequent victories at Château-Thierry, Vauchamps, and Montereau, clearly indicating that he had regained the advantage, if only for a few more weeks. Eventually, however, the total numerical superiority and combined strength of the Allied forces would prove impossible to overcome.

## Moore, Sir John (1761–1809)

A British general and key player in the Peninsular War. As commander of the British forces in Spain, Moore presided over the complex and difficult retreat to Corunna (La Coruña) in 1809. Moore also experimented with light infantry tactics and trained soldiers in their techniques.

Born 13 November 1761 in Glasgow, Moore insisted even as a child that he would become a soldier. Toward this end, the young Moore practiced firing exercises and undertook the study of military strategy and tactics. His efforts were rewarded in 1776 when the Duke of Hamilton helped him obtain an ensigncy. By 1778 Moore was promoted to captain lieutenant and sent to fight in the American Revolutionary War (1775–1783). He remained in America until peace was concluded in 1783, whereupon he returned to Britain.

His regiment having been disbanded upon the conclusion of the war, Moore sought a seat in Parliament in 1784.

Lieutenant General Sir John Moore introduced important reforms for the training of light infantry and later led British forces in Spain in 1808–1809. (Engraving by H. Wolf after Mezzotint from *Life of Napoleon Bonaparte* by William M. Sloane. New York: Century, 1906, vol. 3)

He represented the united Scottish boroughs of Lanark, Selkirk, Peebles, and Linlithgow for three years and earned the respect and admiration of his fellow parliamentarians. Among those who developed a respect for Moore were William Pitt, Edmund Burke, and the king's son, Frederick Augustus, the future Duke of York. In 1787 Moore was reinstated in the army and promoted to major. In 1792 he and his troops set sail for the Mediterranean.

Moore took part in the British-backed conquest of Corsica by Paoli in 1794. He was wounded at the taking of Calvi, where he distinguished himself with his bravery, and was soon promoted to adjutant general and assumed more duties on the island. As he spent time among the patriot leaders, Moore developed a deep respect and admiration for and became close friends with many of them. Moore's superiors felt that this level of intimacy was inappropriate, and Moore was ordered to leave the island. His new assignment was to be in the West Indies.

While on tour in the West Indies, Moore attained the local rank of brigadier general. He quickly became a valued friend and asset to his commander, Lieutenant General Sir Ralph Abercromby. Moore distinguished himself again during the expedition to St. Lucia and in his role in the

captures of the French-held positions at Vigie and Morne Fortuné. So highly was Moore thought of that when Abercromby left the island he appointed Moore as governor and military commander. Yet Moore had not seen the last of Abercromby, for his friend would soon call upon him once again.

Moore remained at his post until 1798, when he was promoted to major general and sent to Ireland to assist Abercromby during the rebellion there. While in command of a large corps, Moore saved Wexford from destruction at the hands of a large Irish force at the Battle of Vinegar Hill. From this moment forward, Moore's abilities were highly sought after. His luck was temporarily set back when he was sent to Holland in 1799. At Egmond aan Zee (known in Britain as Egmont op Zee) on 2 October Moore's brigade suffered a terrible defeat, and he himself was wounded quite seriously. Although he lost, Moore and his troops had performed well. Moore was made colonel of the 52nd Regiment (Oxfordshire Light Infantry), of which he remained for the rest of his life. The 52nd became known as one of the best regiments on the Continent and was praised by both Allied and enemy forces.

Moore next saw service in Egypt in 1801. He himself commanded the reserve forces throughout the expedition. Both he and his troops fought ferociously at the Battle of Alexandria, where Moore's brilliant leadership and tactics were a deciding factor in the British victory there. With the French in Egypt soundly defeated, Moore was given command of the forces at Shorncliffe Camp in Kent. These forces were designed to resist what was thought to be an impending French invasion. Upon his return to Britain he received both a knighthood and a promotion to lieutenant general. Between 1806 and 1808 Moore participated in a series of campaigns.

Moore was given command of British forces in Sicily until 1807, when he was dispatched to the Baltic in order to assist King Gustavus IV of Sweden. Sweden was threatened with numerous attacks from Denmark, France, and Russia. Moore quickly discovered that the Swedish monarch would not allow him a free hand in the command of his troops, was shocked to learn that Gustavus had little interest in purely defensive operations and that he instead wished to embark on various military conquests. Among other things, Gustavus wished Moore to join him in a conquest of Zealand. When Moore explained that this was impossible, the king suggested that the British forces land alone in Finland, where they could confront Russian troops there. Moore explained that this would result in overwhelming odds against his small contingent. Gustavus grew impatient with Moore and had him arrested. Luckily, Moore was able to escape in disguise and return to Britain. Yet even before he could land, Moore was dispatched to

Portugal in order to assist the Spanish in their resistance against the occupying French forces.

When he first arrived in Portugal, Moore was under the command of two senior officers. But when one of these was recalled and the other resigned, Moore was left as commander in chief of the army. Robert Stewart, Lord Castlereagh, the secretary of state for war, officially confirmed this rank on 25 September 1808. Castlereagh's orders stipulated that Moore's army was to consist of no less than 35,000 men and that he was to employ them in the assistance of the Spanish Patriots. An additional 15,000 troops were to rendezvous with Moore's main force by way of Corunna, on the northwest coast of Spain.

Moore found his army in a sorry state, lacking equipment and supplies. In addition to these difficulties, he found the local authorities to be less cooperative than he had expected. Like many British officers, Moore had heard stories of the noble Spanish Patriots who would stop at nothing to defend their homeland from the French invaders. Instead, he discovered that the local merchants and authorities often treated him with contempt and charged him a high price for any goods that his army required. His promissory notes were often refused, the merchants demanding payment in full. Strategic intelligence was also difficult to gather, the locals being of little help in describing the nature of the road networks and terrain. Moore was thus forced to dispatch small groups of his own officers in order to determine where certain roads led and what kind of terrain lay in his path. This logistical nightmare frustrated Moore, who was repeatedly forced to revise his timetables.

When the French army marched toward Madrid, Moore resolved to have all his forces rendezvous at Salamanca. He stationed himself here for almost a month before his troops came together and were organized. Most notably, Moore ordered the absorption of Lieutenant General Sir David Baird's troops, which were situated at Corunna. After many trials, Moore had finally fashioned himself a force capable of taking on the French army.

He did so with initial success. The French had encountered little in the way of Spanish governmental resistance, as local magistrates often stepped aside with the arrival of enemy forces. This frustrated Moore, since these same authorities had often professed their determination to defend their country. The authorities of Toledo, for example, had drafted a declaration of patriotism in which they vowed to defend their city against the invaders. Delighted with the prospect of local support, Moore had his officers develop defensive strategies in conjunction with the local authorities. Yet when the French army arrived, Spanish officials promptly stepped aside, leaving Moore unaided. On 12 December 1808 Moore's forces encountered French forces

in Spain for the first time. A party of the 18th Light Dragoons came upon a group of French cavalry and infantry at Reveda, a small village, where the British killed or captured the entire enemy force.

Upon his arrival at Salamanca Moore was disheartened to learn that Napoleon's forces had defeated the Spanish and were now in Burgos, a destination Moore himself had contemplated. Shortly thereafter, the advancing French were in Madrid and the British army found itself vastly outnumbered. Despite engaging his opponents at Valladolid, Moore realized that a retreat was necessary, and thus his forces began what would prove a horrific retreat to Corunna, where they could be evacuated by a Royal Navy squadron. Napoleon left Marshal Nicolas Soult in pursuit of the British, who engaged the rear guard several times. Indeed, Moore's attempt to hold off the French was skillfully executed, particularly at Benevente and Lugo. His forces finally reached the port of Corunna on 11 January 1809, but the transports were nowhere to be seen. It would be another four days before they arrived. In the meantime Moore was forced to beat back a French attack upon the village of Elvina. The defense was a success, but Moore himself was fatally wounded when a round shot (cannonball) carried away his left shoulder and collarbone. He was taken to the rear and attended to by surgeons, but he did not live through the night. His men buried him on the city ramparts before they embarked for home.

Moore's death caused quite a sensation throughout Britain. Parliament passed a special motion of thanks to his army, and a monument to his memory was constructed in St. Paul's Cathedral. In addition, his native city of Glasgow erected a memorial statue in his honor. Today, much debate surrounds the nature of Moore's true contribution to the war effort—for although he diverted the French from concentrating on the vulnerable Spanish forces during the Corunna campaign, he himself suffered heavy losses and had to evacuate the wreck of his army—but his career undoubtedly encompasses one of the most difficult retreats under hostile conditions ever recorded.

### Moreau, Jean Victor (1763–1813)

For a century following his conviction for treason in 1804, General Jean Victor Moreau was variously vilified or deified. Today, the man once viewed as Bonaparte's chief military and political rival is little known. Although often described as aloof and imperious, Moreau was immensely popular. The French public cheered his victories, his troops adored him for his solicitude, and even his opponents praised his humanity. In 1800 the Tribunate proposed the anniversary of his recent victory at Hohenlinden as a new national holiday. Scant years later, he was humiliated and exiled. His return to Europe in 1813 to fight on the side of the Allies cost him his life and much of his remaining reputation.

Moreau was the exception that embodied the myth of the Revolutionary general officer: an inexperienced provincial civilian, elected to high rank, which he managed to sustain and justify by his performance. Born into a prosperous Breton family, he inclined toward the military but studied law. In 1789 he founded an artillery company in the National Guard, and by 1791 he was a lieutenant colonel of Volunteers. Successful campaigns in the Low Countries led to promotion to *général de division* by 1794, and in 1795 he succeeded General Jean-Charles Pichegru as commander of the Armée du Nord.

Although Moreau managed to serve with distinction under both the Jacobin and Thermidorian regimes (known collectively as the Convention), his performance under the Directory and Consulate propelled him to fame but also confronted him with new political dangers. His major campaigns were fated to unfold in tandem with those of Bonaparte, and whether they proved successful or otherwise they always seemed to detract from the luster of his younger comrade.

In 1796 the main blow against Austria was to occur in the north, while Bonaparte tied down the enemy in Italy. The Armée de Sambre-et-Meuse, under General Jean-Baptiste Jourdan, and that of the Rhin-et-Moselle, under

Moreau (replacing Pichegru) advanced swiftly into Germany, but the brilliant Austrian commander Archduke Charles exploited French errors, defeating Jourdan twice. Moreau thereupon conducted a superb fighting withdrawal through forests and mountains, scoring several victories.

Again in 1797 Moreau drove into Germany, until the preliminary Peace of Leoben halted his advance. His failure to promptly report captured evidence of Pichegru's treason led to his dismissal in September. Recalled to service in 1799 in response to Field Marshal Alexander Suvorov's offensive, he served with mixed results, replacing General Barthélemy Schérer and then General Barthélemy Joubert as commander of the Armée d'Italie. Upon his return to Paris, he proved not to be the "sword" Emmanuel Sieyès, one of the five members of the Directory, was seeking, but he aided Bonaparte's coup d'état of 18–19 Brumaire (9–10 November 1799) by winning the support of other officers and arresting two of the Directors.

In 1800, as in 1796, a decisive blow against Austria depended on close cooperation between the armies in Germany and Italy. Bonaparte blamed Moreau's temporizing for the revision and only partial success of the plan. Once again Bonaparte attracted the attention of the world in Italy as a result of the Battle of Marengo, but Moreau's victory at Hohenlinden won the war, the public's acclaim, and the enduring enmity of the First Consul.

The dislike was mutual. Awarded the Legion of Honor, Moreau responded by publicly decorating his dog and cook. His unconcealed disaffection and the machinations of his ambitious wife allowed rightists to build hopes around the dedicated Republican. Under the pretext of a reconciliation with Pichegru, royalist agents sought Moreau's help in overthrowing Bonaparte and restoring the monarchy in 1804. He rebuffed them but declined to report the incident, and so was indicted along with the conspirators (Joseph Fouché, the minister of police, it now seems, tried to exculpate rather than implicate him). The evidence was thin, the public was sympathetic, and Bonaparte barely managed to force a conviction. When the two-year sentence was converted into banishment for life, Moreau retired to Morrisville, Pennsylvania.

Although he admired American institutions and was offered command of the U.S. Army in 1812, he chose instead to serve as military adviser to Tsar Alexander I, whom he viewed as a reformer. While the two men were inspecting an Allied battery at the Battle of Dresden on 27 August 1813 a French round shot (cannonball) shattered Moreau's left leg; he died on 2 September.

Although Moreau did not invent the corps system, he was among the first to appreciate and effectively employ it. Following Bonaparte, many charge Moreau at least with

excessive caution, whereas contemporaries praised him for his deliberateness and conceptual grasp. Indeed, they likened him to Xenophon, waxing more enthusiastic about his masterful retreat than the advance that preceded it. The only consensus seems to be that Moreau maneuvered far more adeptly on the battlefield than in the corridors of power.

He remains that blank slate upon which partisans inscribe their biases: For Bonapartists, he is the consummate climber whose failings of talent and character serve only to highlight the virtues of their hero. Rightists claim Moreau as the "decent" revolutionary whose switch to the Allied side in fact delegitimizes the Revolution. For some democrats, Moreau represents a nostalgic fantasy: a man of principle who could have plotted a course between revolutionary idealism and caesarism.

Moreau's enigmatic character and tragic fall have inspired a number of sympathetic German literary treatments, including the short prose narratives, "Moreau, Roman eines Soldaten" (1916) by Klabund (pseudonym of Alfred Henschke); "Der Tod des Generals Moreau" (1939), by Willy Bredel; and most recently, the novel *Moreau, ou, La Gloire Perdue* (2002) by Madeleine Lassère.

## Mortier, Adolphe Edouard Casimir Joseph (1768–1835)

The scion of a privileged family, Mortier served in the armies of Revolutionary France and the Napoleonic era in theaters including eastern France, Germany, Switzerland, Spain, and Russia. He was also the only one of Napoleon's marshals to speak and write English. Elevated to the position of marshal in 1804, Mortier was a solid, popular battlefield commander. He was sometimes derided as less intelligent than many of his peers; a pun on his name led some to remark that he was a "big mortar" with "a short range." But Mortier exuded calm in military emergencies, and Napoleon found him a reliable subordinate.

Mortier rallied to Napoleon in the spring of 1815 and temporarily fell afoul of Napoleon's Bourbon successors. Nonetheless, he went on to a distinguished political career in the years between 1816 and 1835. The old general died violently in 1835, the victim of an assassination attempt against King Louis-Philippe.

Mortier was born on 13 February 1768 at Cateau-Cambrésis, in northeastern France. His father was a prosperous merchant, landowner, and prominent member of the community; his mother was an Englishwoman. The young Mortier received a solid education at the English College in Douai, then began a career in a merchant's office at Lille. His family felt the impact of 1789 in several ways. The elder Mortier was elected a delegate to the Estates-General in Paris, and Adolphe joined the National Guard. Chosen in September 1791 by his comrades to be a captain in a locally raised unit of volunteers, Mortier spent the next years campaigning along France's eastern border. He saw action at the most important battles of 1792–1794: Jemappes, Neerwinden, Hondschoote, Wattignies, and Fleurus. The young officer developed a solid reputation for his leadership in combat, and he formed a lasting association with another future marshal, Nicolas Soult. In June 1795 Mortier became a colonel, at the age of twenty-seven. Three years later, after a series of campaigns in Germany, he was elevated to the rank of *général de brigade*.

During General André Masséna's defense of Switzerland in 1799, Mortier served as a division commander under the distinguished French commander, playing an important role in the second Battle of Zürich in late September and October. In May 1803, now a *général de division*, Mortier distinguished himself in Bonaparte's eyes. Upon the outbreak of war following the Peace of Amiens, Mortier skillfully led a French army that eventually numbered 38,000 men to seize the electorate of Hanover, the only British possession on the European continent. A year later, the Emperor rewarded him with the title of marshal,

making Mortier one of the youngest of France's generals to receive this honor.

Mortier's battlefield skills were put to a harsh test in November 1805, as the Grande Armée swept eastward along the Danube toward Vienna. Now commander of a newly organized and widely dispersed army corps, Mortier found himself in a perilous position with only a single division available to him on the northern bank of the river at Dürnstein on 11 November. Neither Marshal Joachim Murat, in charge of the advance eastward, nor Napoleon had taken precautions against an enemy counterattack here. Mortier's mission was to guard the French northern flank and to threaten the Russian line of communications. But the energetic Russian commander, General Mikhail Kutuzov, led his forces northward across the Danube at Krems. With the bulk of the French army south of the Danube, Mortier's small force of 5,000 suddenly confronted eight times their number of Russian troops. A boat was available to take Mortier to safety, but he chose to remain and lead his embattled men. Encircled, the French fought off attacks from all sides, but Mortier's losses numbered more than 60 percent of the troops under his command. Nonetheless, the gallant marshal defended his position from early morning until late afternoon, then led a bayonet charge that enabled his division to fight its way out of the trap.

The following year, in the Jena campaign, Mortier led VIII Corps in western Germany supporting Napoleon's advance farther eastward through the Thuringian Forest. His mission, of a sort Napoleon would give only to a trusted lieutenant, was to protect French territory from attack and to threaten the Prussians with invasion if their king, Frederick William III, chose to enter the war. Mortier's corps struck eastward from Frankfurt. After occupying Hesse-Cassel and Hanover, it marched northward to seize the city of Hamburg and moved on into Mecklenburg.

In the spring of 1807 Mortier's corps assisted in the siege of Danzig (now Gdansk, in Poland), then rushed southward to play a leading role at the Battle of Friedland on 14 June. Mortier arrived in midmorning, just as Russian attacks were threatening to smash the left wing of Marshal Jean Lannes's battle line. With his multinational VIII Corps, including French, Polish, and Dutch troops, Mortier held back superior Russian forces throughout the morning of the battle. Once reinforcements had arrived, Mortier and Lannes stormed the Russian defenses as the French drove the enemy from the field. Rewards came in lavish form. Mortier was soon appointed the governor of Silesia and, the following year, he received the title of duc de Trévise with a generous yearly stipend.

Mortier spent the next years campaigning in Spain, often under the command of his old friend Soult. In a

theater of operations in which most French generals saw their reputations tainted, Mortier became conspicuous as the marshal who never suffered a defeat. He participated in the siege of Saragossa in early 1808 and nearly caught up with Viscount Wellington as Anglo-Portuguese forces retreated westward after the Battle of Talavera in the summer of 1809. In November of that year he fought at Ocaña, where he was slightly wounded by grapeshot in the arm. He also took part in Soult's invasion of Andalusia in January 1810. Although he failed to take the key border fortress of Badajoz the following month, Mortier returned a year later to capture the city in March 1811. Before the siege had brought results, Mortier defeated a powerful Spanish army bent on relieving the city. In the most one-sided battle of the Peninsular campaign, fought on the Gebora River, the advancing Spanish lost 5,000 men, out of a total force 12,400, to Mortier's approximately 400 casualties.

Mortier's success at Badajoz came at a heavy cost. In the muddled command arrangements that characterized French operations in Spain, Masséna, Mortier's old superior officer in Switzerland, had been led to expect crucial help from his former division commander. Moving into Portugal to take Lisbon in the summer of 1810, Masséna had expected Mortier as well as Soult to support his advance with a push farther south. But instructions from Napoleon's chief of staff, Marshal Louis-Alexandre Berthier, had never assigned such tasks clearly and decisively. When Masséna required assistance, Mortier was busy with the less crucial operation at Badajoz.

Mortier grew disgusted with the inconclusive campaign in Spain and requested to be relieved. Returning to France in the summer of 1811, he raised and trained Napoleon's Young Guard. He then led this force of almost 18,000 men into Russia in June 1812 as Napoleon struck eastward across the Niemen River. Once the Grande Armée had reached Moscow on 14 September, Mortier was given the difficult job of governing the city. When Napoleon abandoned the former Russian capital on 19 October, Mortier and some 8,000 men were ordered to remain for another four days.

The veteran marshal reluctantly obeyed Napoleon's command to blow up much of the center of Moscow, including the Kremlin, although wet weather prevented many of the demolition charges from going off, and the overall damage was limited. Mortier then received another difficult task: Napoleon assigned him to guard the rear of the departing army. In the final stage of the retreat, Mortier's Young Guard helped secure the French bridgehead on the western bank of the Berezina River so enabling the remnants of the Grande Armée to escape to safety.

In 1813 Mortier reconstituted the Young Guard, which by late summer reached a strength of 32,000 men organized in four divisions. While still only one division strong

during that spring, the Young Guard under Mortier's direction played a key role in the victories at Lützen and Bautzen. Following the summer armistice, the Young Guard distinguished itself once again at the Battle of Dresden in late August. Mortier's men crushed the Austro-Russian right flank and helped to force the Allies into a hasty withdrawal. With two divisions, Mortier fought at Leipzig in October, and, following the French defeat, led his troops safely all the way back to the Rhine.

Mortier fought with his usual skill and determination in the defense of French territory during the spring of 1814. Driven back to the outskirts of Paris, Mortier with 6,500 men temporarily fought off Russian and Prussian forces that outnumbered them almost five to one. The veteran general offered to go on with the war for Napoleon even after Marshal Auguste de Marmont had surrendered Paris to the enemy. Napoleon himself informed Mortier that the fighting was now at an end.

The restored Bourbon monarchy honored Mortier by naming him a peer of France and giving him command of an army division at Lille. The return of Napoleon in 1815 presented Mortier with a particular dilemma since the Bourbon monarch, Louis XVIII, was escaping France using a route through the commander's area of responsibility. Mortier escorted the fleeing monarch to the Belgian border and delayed declaring for Napoleon until the king had made his escape. He also permitted the members of his staff to choose to support whichever side their consciences dictated.

Mortier seemed destined to play a major role in Napoleon's Waterloo campaign. A few days before the French army moved into Belgium, he was assigned to lead the Imperial Guard cavalry, and Napoleon might have intended to put Mortier into his old position as commander of the Young Guard. However, an attack of sciatica four days before the climactic battle disabled the general so severely that he could not mount a horse. Thus, the battle that decided Napoleon's future took place in his absence.

Supporting the former emperor in March 1815 cost Mortier his title as well as the temporary loss of military command. He soon received his division back, however, and the famous general turned successfully to the world of electoral politics. He was elected to the Chamber of Deputies in the fall of 1816, and his position as an honored member of the Bourbon political world was confirmed by his participation in the coronation ceremonies for King Charles X in 1825.

Mortier's political career included service under King Louis-Philippe as the French ambassador to Russia in the early years of the 1830s, and, in 1834–1835, he served briefly as president of the council and minister of war. A figure of Mortier's eminence could have reasonably expected to retire to a peaceful old age, but instead he fell victim to an act of

political violence. During a military review attended by Louis-Philippe on 28 July 1835, an attempt on the king's life failed, but the volley of gunfire killed Mortier instantly.

## Moscow, Occupation of (15 September–19 October 1812)

After his victory at Borodino on 7 September 1812 Napoleon moved his Grande Armée toward Moscow, in pursuit of the Russian army commanded by General Mikhail Kutuzov. The

Russian army evaded the French by leaving Moscow unprotected. This was a significant prize, so the French moved to take the city, Marshal Joachim Murat's advance guard actually entering Moscow as the Russian rear guard was leaving. Both sides felt that the war was essentially over, so they declined combat. Napoleon, who entered Moscow on 15 September, had expected to be greeted by the city's nobles. Instead, the place was virtually deserted, with only a few thousand inhabitants remaining, including many prostitutes and recently released criminals. The Russian governor of the city, Count Fyodor Vasilievich Rostopchin, had left orders to destroy everything that could be useful to the French.

The entry soon turned into chaos, as hungry French and Allied soldiers attempted to find food and shelter. Napoleon moved into the great fortress known as the Kremlin and began to make plans to properly billet his troops, appointing Marshal Adolphe Mortier governor of the city. That night, however, the Russians put the torch to their own city. Concerns for his safety led Napoleon to temporarily leave the city, and he watched the city burn from a nearby hillside. The fire raged through the night, the Russians having evacuated all firefighting equipment, and though the line between saving things and looting them

Napoleon watching Moscow burn. Almost certainly the deliberate work of Russian incendiaries, the destruction of much of the city added to the mounting travails of the invaders. (Print by W. Wereschtschagin from *Illustrierte Geschichte der Befreiungskriege* by Julius von Pflugk-Harttung, 1913)

was often difficult to discern, in the end the French managed to save about 20 percent of the city.

Napoleon sent messages suggesting that they negotiate a peace settlement to Tsar Alexander, who was in his capital of St. Petersburg, a two-week round trip for couriers. The tsar chose not to respond to any of Napoleon's proposals. Kutuzov also declined to respond to any French overtures.

Napoleon had to decide whether to stay in Moscow for the winter or move back along his lines of communication to a more favorable location, perhaps Smolensk or Poland. The fires had destroyed much of the city, but there were plenty of provisions for the troops, adequate shelter, and the Kremlin was completely untouched. The city was defensible, and the spring would bring with it new opportunities. On the other hand, their supply lines were increasingly vulnerable, and the Emperor's long absence from Paris had potentially serious political risks. Even so, staying was a viable option that was supported by Pierre Bruno, comte Daru, his trusted adviser, and for a while it seemed as though Napoleon might do exactly that. Other advisers argued differently, though, and Napoleon soon began to plan to return to Smolensk, where his lines of communication would be shorter and he could rejoin the soldiers he had left along the way, including the garrison at Smolensk.

In spite of an obvious need to move before the onset of winter, Napoleon continued to delay. When Murat's cavalry, weakened by miserable living conditions outside of Moscow, was beaten in a skirmish on 18 October, Napoleon finally gave the order to move. The next day, the nineteenth, thirty-five days after it entered the city, Napoleon's army began its long march home.

## Mount Tabor, Battle of (16 April 1799)

Battle between French and Ottoman forces near Mount Tabor (present-day northern Israel) during Bonaparte's

campaign in the Middle East. Despite his quick conquest of Egypt, Bonaparte found himself isolated from France following the British triumph at the Battle of the Nile on 1 August 1798. The following month, the Ottoman Empire declared war on France and began preparing two large armies for the invasion of Egypt. In this precarious moment, Bonaparte decided to anticipate Ottoman moves and destroy their armies piecemeal, preventing their joint invasion of Egypt.

In late 1798 Bonaparte organized an expeditionary force for the invasion of Syria (now part of Israel, not modern Syria) and left Cairo on 10 February 1799. After taking Gaza on 25 February and Jaffa on 7 March, Bonaparte reached Haifa on the seventeenth and began besieging the stronghold of St. Jean d'Acre (Acco) just across the bay. As the siege of Acre dragged on for weeks, the French faced another danger. The Turkish pashas of Damascus and Aleppo dispatched a large army to attack the French from the rear. On 5 April General Jean Junot's detachment successfully engaged Turkish forces near Nazareth. Four days later, Bonaparte ordered General Jean-Baptiste Kléber to reinforce Junot. Kléber marched off with part of his division (about 2,000 men), and on 11 April he defeated numerically superior Ottoman troops near Cana. As he continued his advance, Kléber encountered the main Ottoman army bivouacked in the Plain of Esdraelon near Mount Tabor.

The Ottoman army of about 25,000–30,000 men enjoyed a numerical superiority of at least fifteen to one, though many of its troops were untrained and inexperienced. Early on 16 April the Ottoman cavalry observed the French troops and surrounded them. Having deployed his squares, Kléber began a fighting retreat, which the French conducted for the next 10 hours. They were soon running out of ammunition, and desperation was about to overcome the troops. Yet, at that dire moment, Bonaparte arrived with part of General Louis André Bon's division and unexpectedly charged the Turks, who fled the battlefield. The victory at Mount Tabor dispersed the Ottoman army and secured Bonaparte's rear and right flank.

### Murad Bey (17??–1801)

A prominent Mameluke statesman and military commander, Murad Bey was born to a Georgian peasant family near Tbilisi and was kidnapped at an early age. He was raised as a Mameluke of Muhammad Bey Abu l’Dhahab. After the death of the Mameluke leader, Ali Bey, Murad married his widow Nafisa al-Bayda and inherited enormous wealth. Although the Arab chronicles are overly critical of him, Murad Bey did have some accomplishments, including the establishment of the Cairo arsenal, a flotilla on the river Nile, and reconstruction of the Mosque of Amr Ibn al-Aas. A man of music and of letters, Murad was also excessively proud and ruthless to his enemies. He had no military education but possessed instinctive martial talents.

In the 1770s Murad arrogantly attempted to assassinate Ismail Bey, the khushdash and Mameluke of the former Egyptian ruler Ali Bey. In the ensuing civil war, he was defeated and fled to Upper Egypt. He returned to Cairo in 1777, but his intrigues led to a new factional struggle. In 1778–1781, Murad Bey unsuccessfully fought the *Alawiyya* (Mamelukes of Ali Bey) and had to recognize their authority. However, Murad Bey soon succeeded in forcing his co-ruler, Ibrahim Bey, out of Cairo and seizing power in the country in late 1784. Still, he had to reconcile with Ibrahim Bey, whom he restored as *shaykh al-balad* (literally, “chief of the city,” that is, Cairo; but also signifying the leader of all the beys) in February 1785.

In late 1785 Ibrahim and Murad received Ottoman demands for tribute but refused to comply. On 18 July 1786 Murad Bey failed to contain the Ottoman expeditionary force sent against him, as a result of which the Turks set up a new government in Cairo in August 1786. Murad and Ibrahim Bey withdrew to Upper Egypt, where they resisted Ottoman forces for the next six years. Returning to Cairo in July 1791, Murad Bey continued ruling Egypt for seven years, sharing power with Ibrahim Bey. In 1798 he served as *sari askar* (commander in chief) of the Mameluke forces against the French troops under Bonaparte but was decisively defeated at Shubra Khit on 10–13 July and at Embaba (Inbaba) on 21 July. He rejected Bonaparte’s offer to govern the Girga province and withdrew to Upper Egypt, where he tied down considerable numbers of French forces under General Louis Desaix. Demonstrating notable administrative and military skills, he fought the French to a draw at Sediman (El Lahun) on 7 October 1798 but was defeated at Samhud on 22 January 1799. Neverthe-

Murad Bey. Joint ruler of Egypt during the French expedition of 1798, his Mameluke force failed to stem Bonaparte’s advance at Shubra Khit and the Pyramids. (Unsigned lithograph, 19th c.)

less, his guerrillas constantly harassed the French communication and supply lines.

Concerned about his authority, Murad Bey allied himself with the British and Turks against the French in 1800. Yet he realized the potential dangers of this alliance and abandoned the Ottoman troops on the eve of the Battle of Heliopolis, joining forces with French generals Jean Baptiste Kléber and Jacques-François Menou. Murad Bey died of the plague on his way to Cairo in 1801 and was buried at Sohaj.

### Murat, Joachim (1767–1815)

One of Napoleon’s most senior commanders and his most daring cavalry leader, Murat had a complex association with Napoleon over two decades ending in 1815. He played a key role early in Napoleon’s rise to power by delivering the artillery the young general needed to repress a Parisian mob in 1795. Murat added to his list of political deeds in Napoleon’s favor by intervening at a crucial point during the coup of Brumaire (9–10 November 1799), to ensure Napoleon’s success. Moreover, Murat developed a personal tie to the French commander by marrying his sister, Caroline.

Murat began to build his battlefield reputation when he accompanied Napoleon to Italy and Egypt. Napoleon came to rely on Murat’s cavalry to perform the mounted arm’s traditional function of leading the advance of the army and scouting out enemy forces. Murat became the ideal instrument for Napoleon’s aggressive style of warfare. In the aftermath of battles like Jena (14 October 1806), Murat’s troopers hunted down and decimated the remnants of the defeated army. At the Battle of Eylau (14 February 1807), Murat’s charge with the cavalry reserve of the Grande Armée saved the day for the Emperor. Moreover, Murat’s wild courage on the battlefield stood as a hallmark of Napoleon’s operations.

Following his role in bringing French forces into Spain in early 1808, Murat repressed the ensuing Madrid insurgency and departed for Naples, where he replaced Napoleon’s brother Joseph as monarch. He returned to fight under Napoleon in the Russian campaign of 1812 and the campaign in Germany of the next year, but his role as an independent monarch, combined with the influence of his politically ambitious wife, clouded his relationship with the French emperor. As a result of the failed invasion of Russia, Murat had developed doubts about Napoleon’s eventual fate and moved, from the start of 1813, to establish ties with Austria and Britain, the Emperor’s most adamant opponents. As unsophisticated politically as he was courageous on the battlefield, Murat found it impossible to maneuver effectively in this dangerous international environment. Uncertain where to place his loyalties, he betrayed Napoleon in 1814, then rallied to the restored Emperor in 1815. He ended up losing his throne in Naples and dying at the hands of a Neapolitan firing squad.

Joachim Murat was born on 26 March 1767, at La Bastide in Gascony. The son of an innkeeper who also worked as a land agent for a local aristocratic family, Murat found himself pointed by his family toward the priesthood. He showed no inclination to accept this profession, and just before he turned twenty, while studying at a nearby seminary, he enlisted in the army of Louis XVI and served for two years in the cavalry.

After the outbreak of the Revolution, Murat joined the National Guard, then returned to his old regiment. He rose steadily in rank during the years after he received a commission as a lieutenant in 1792. By the fall of 1795 he was a major in a cavalry regiment stationed in Paris. The opportunity to move toward military eminence came by chance. The Directory, the new executive body governing France, faced a popular challenge to its authority. Its efforts to rig France’s constitution to maintain many of its supporters in the French Convention (or legislature) roused mass opposition, and opponents were gathering in the streets of Paris to confront the new government. The young general, Napoleon Bonaparte, was given the task of opposing the mob, but, with only 5,000 troops at his disposal, he knew he needed masses of artillery to be successful. In the early hours of 5 October he sought a cavalry leader to seize the National Guard artillery depot at Sablons in the suburbs of Paris. Murat took the assignment, and, at 6:00 A.M. that morning returned to Bonaparte with forty field pieces. These were the weapons that Bonaparte employed to disperse the mob with the famous “whiff of grapeshot,” in which an estimated 300 Parisians were killed or wounded.

A grateful Bonaparte permitted Murat to assume a position on his staff when the young general was ordered to command the (French) Army of Italy in the spring of 1796. Now promoted to the rank of colonel with the position of aide-de-camp to Bonaparte, Murat had his first great opportunity to shine on the battlefield. At Dego, on 14 April, Murat led the first of the cavalry charges that made him famous. In numerous encounters, sometimes leading cavalry units, sometimes at the head of infantry, he demonstrated his courage and élan. After the defeat of Piedmont, Murat had the honor of bringing the captured enemy banners and armistice terms to the Directory back in Paris. With the close of the campaign in early 1797, Murat had reached the rank of *général de brigade*.

Another reward for Murat’s performance in Italy was an invitation to join the inner circle of Bonaparte’s officers who accompanied the ambitious young general to Egypt in the spring of 1798. Here Murat’s exploits featured his battlefield triumph at Aboukir in July 1799. Confronting a Turkish army that had just landed on the Egyptian coast, Murat recognized that the Turks had dangerously weakened the center of their line. He led his cavalry in a charge,

Marshal Murat, the most famous of many daring and charismatic French cavalry commanders of the era, leads a charge at the Battle of Jena, 14 October 1806. (Print by Bousson, Valadon, Paris, after H. Chartier, 1895 from *Life of Napoleon Bonaparte* by William M. Sloane. New York: Century, 1906, vol. 2)

crushing one set of Turkish defenses after another. He capped this success with an improbable but amply recorded exploit: the defeat in single combat and then the capture of the commander of the Turkish army. Bonaparte rewarded him with promotion to *général de division*.

Murat received another sign of Bonaparte's regard for his talents when the latter included him in the small party that accompanied the French general home in the fall of 1799. The daring young cavalry officer again proved his value to Bonaparte by his service during the coup d'état that elevated Bonaparte to the senior position of the French government—First Consul. Murat had been placed in command of the cavalry forces around Paris, and he accompanied Bonaparte to Saint-Cloud to force approval of the coup from France's legislators. When Bonaparte seemed to falter in a fatal manner in confronting the Council of Five Hundred, Murat called in soldiers who dispersed the assembled representatives and saved the day for the future emperor.

By now Murat had a growing personal tie to Bonaparte as his relationship with the First Consul's sister Caroline moved toward a betrothal. The two were married in

January 1800. Soon afterward, Murat again displayed his battlefield panache in leading cavalry units across the Alps and into the north Italian plain. On 14 June he took a significant role in the closing moments of the Battle of Marengo, reversing the earlier success of Bonaparte's adversaries and winning the day for the French.

Murat was designated a marshal on 19 May 1804, in the first list of eminent French soldiers to receive the honor. He also had the distinction of commanding the Paris garrison. But his relationship with Napoleon was frequently stormy. He saw other members of Napoleon's family receive lavish rewards in the form of territory and titles that exceeded what the newly crowned Emperor gave him. When asked to follow Napoleon's orders to arrange a rigged trial for the duc d'Enghien, after the young member of the French royal family had been kidnapped from Baden in western Germany, Murat saw the whole affair as a stain on his honor. He at first refused, then consented only under intense pressure from the Emperor.

But Napoleon continued to rely heavily on Murat's military qualities. In August 1805, in preparation for the

campaign against Austria, Napoleon dispatched Murat in disguise to scout the regions of central and southern Germany where the campaign would be fought. Murat's cavalry then led the way for the Grande Armée as it wheeled eastward from bases on the Rhine to encircle the Austrians under *Feldmarschalleutnant* Karl Mack Freiherr von Leiberich at Ulm. But Murat's enthusiastic advance on the south bank of the Danube left General Pierre Dupont's division dangerously isolated on the other side of the river. It was not the only occasion when Murat displayed more daring than judgment. After the success at Ulm, he raced toward Vienna along the southern bank of the Danube, neglecting to cover the army corps of Marshal Adolphe Mortier on the river's northern side. As a result, Mortier came close to disaster when a large portion of the Russian army turned on him.

Along with Marshal Jean Lannes, Murat participated in a brilliant ruse after the French entry into Vienna. Pretending that an armistice had been declared, the two French commanders seized control of a vital and heavily defended bridge across the Danube. But Murat found his triumph here clouded by an example of political ineptitude. Following the fall of Vienna, the cavalry commander was ordered to pursue the fleeing Russians northward. When he encountered the enemy, Murat allowed himself to be ensnared in an armistice—and then to be drawn into full-fledged peace negotiations with the enemy. By the time Napoleon expressed his outrage at Murat's acts in excess of authority, the Russians had made their escape.

Nonetheless, the remaining period of operations against the Third Coalition and successive Napoleonic campaigns gave Murat an opportunity to burnish his reputation as a peerless combat commander. In November and early December 1805 he led the advance guard to Austerlitz. He had an even more spectacular success in the Jena campaign of 1806 against Prussia. Once again, his troopers led the army into enemy territory, but Murat's great achievement was his devastating pursuit and destruction of the vanquished Prussian forces. His cavalry spread throughout northern Germany, and he tracked down and captured Friedrich Ludwig Fürst zu Hohenlohe-Ingelfingen (usually abbreviated to Hohenlohe), who commanded the last large remnant of the Prussian army. He then chased down and captured General Gebhard von Blücher, the most energetic leader on the Prussian side and his counterpart as senior cavalry commander.

In the 1807 campaign in Poland, Murat's battlefield aggressiveness appeared at its best. At the Battle of Eylau on 8 February, he led one of history's greatest cavalry charges. As the two armies struggled with each other, the center of the French battle line began to crumble. Murat

led eighty squadrons of cavalry in a ferocious assault that halted the advancing Russians and saved the day.

In late 1807 Murat was appointed the commander of French forces in Spain. Over the course of the next several months, his troops occupied the major cities of northeastern and central Spain as Napoleon pressured the Spanish royal family to abandon their titles and responsibilities. Although Murat sought the position of King of Spain, the role went to Napoleon's brother Joseph. News of the French takeover led to a dramatic uprising of the Madrid population. Murat suppressed the insurgency with efficient brutality, but opposition to the French presence nonetheless spread throughout the country. Murat was fortunate that Napoleon named him to become King of Naples to fill the position formerly held by Joseph. Unlike most other senior figures in the French army, the great cavalry commander was thus able to avoid the frustrations and defeats that came during service in Spain from 1808 through 1813.

Murat took up his duties as the King of Naples in July 1808. He had already been honored with territory and a title when Napoleon named him grand duc de Clèves et de Berg in 1806. But the Kingdom of Naples offered a wider stage than had the small dukedom in northwestern Germany. The new king reformed the Neapolitan military system, recaptured the island of Capri from a British-led force, and planned to reconstitute the old Kingdom of the Two Sicilies by seizing the island of Sicily and joining it to his territory in the south of the Italian mainland. Murat soon discovered that, while he saw himself as an independent crowned head, Napoleon viewed him as little more than a regional governor helping to preserve French hegemony in Europe. Thus, Murat could not acquire French troops to aid his Neapolitans in an expedition against Sicily.

The Russian campaign brought Murat back to Napoleon's side as the leader in a great military undertaking. Once again Murat's cavalry led the way for the Grande Armée and, at Napoleon's direction, they set a murderous pace for the units behind them. Moving rapidly through a desolate part of Europe devoid of forage, Murat's cavalry began to disintegrate, with horses dying from the strain. Other arms of the French force likewise suffered during the advance on Moscow.

When a desperate Napoleon ordered a retreat westward in mid-October, Murat urged Napoleon to take a southerly route back to Smolensk. Napoleon rejected this advice after Russian forces blocked the French at Maloyaroslavets, and, despite Murat's objections, the French retraced their steps over the barren region through which they had invaded. In early December Murat received an unwelcome promotion to de facto commander of the remainder of the Grande Armée. Napoleon had decided to

leave the army at Smorgoni in order to return rapidly to Paris.

The Russian campaign and the accompanying destruction of the Grande Armée convinced Murat that Napoleon's defeat was almost inescapable. Thus, after leading the surviving French forces from Smorgoni westward, Murat shook off his responsibilities and handed over command to Eugène de Beauharnais, Napoleon's stepson. Returning to Naples in early 1813, he took the crucial step of opening negotiations with the enemy. Talks with the Austrians and, more indirectly, with the British, continued throughout the year.

Murat's last military service to Napoleon came in the fall of 1813. Napoleon called on the King of Naples to join him in Germany. The Emperor needed experienced senior leaders for his campaign against the potent enemy coalition (the sixth) led by the Austrians, Prussians, and Russians. Moreover, rumors of Murat's possible change of sides had circulated widely, and Napoleon preferred to have the courageous but unpredictable cavalry leader under the imperial eye. From Murat's perspective, Napoleon's victories at Lützen and Bautzen in the spring of 1813 indicated that the Emperor might survive after all, and Murat clearly felt ambivalent about placing himself alongside the enemies of France.

Murat returned to the ranks of the Grande Armée in August 1813, and he fought for Napoleon with his customary skill and enthusiasm throughout the fall campaign at Dresden, Liebertwolkwitz, Leipzig, and elsewhere. After the decisive French defeat at Leipzig, however, Murat became more determined than ever to break with the French emperor. Napoleon's prospects seemed less than promising, and the French leader's determination to go on fighting at all costs threatened disaster for all associated with him. Murat returned to Naples convinced that an agreement with Napoleon's opponents was essential in order for him to maintain his throne in southern Italy. He also developed a wider ambition. Contacts with proponents of Italian unification, as well as the enthusiasm with which he was greeted by throngs of Italians while on his travels, suggested to Murat that he might become the ruler of a new, unified Italian kingdom.

By February 1814 Murat was formally aligned with Napoleon's enemies. As Napoleon fought desperately to defend eastern France, his stepson, Eugène, faced an equally severe challenge in holding northern Italy. While Austrian forces pushed against Eugène from the east, Murat led a Neapolitan army of 30,000 men northward to threaten the French commander from the south. Nonetheless, Murat continued to maneuver recklessly in international affairs. Holding his forces back from combat, the cavalryman-turned-Neapolitan monarch contacted Napo-

leon and thereby brought the wrath of the British government on his head. Napoleon's abdication helped momentarily to restore Murat's position in the Allied coalition. But, as the delegates gathered for the Congress of Vienna, Murat's hold on the throne of Naples was visibly shaky, and his representatives to the Congress were refused a seat at the gathering. Although Austria had been willing to see the Bourbons deposed in Naples in order to win Murat as an ally, the British had never fully accepted such a change.

The final act in the great drama of Murat's career began with Napoleon's return from exile in the spring of 1815. Murat led his forces northward against the Austrians, proclaiming his desire to unite all of Italy. He won an initial victory at the Battle of the Panaro River in early April, then suffered an irretrievable reverse at the subsequent Battle of Tolentino at the start of May. Fleeing to France, Murat was rebuffed when he asked Napoleon for a military command. Although Napoleon would have found good use for a leader like Murat during the Waterloo campaign, the Emperor decided against employing his talents.

Following Napoleon's final defeat, Murat rejected the offer of asylum for himself and his family from the Austrian government. Instead, with a scratch force of 250 men he had raised in Corsica, he hoped to land in southern Italy and regain his throne. A storm scattered his small flotilla, and Murat found himself and a few dozen followers stranded at the small port of Pizzo. Now in the hands of the restored Bourbon rulers of Naples, Murat was quickly condemned by a court-martial. Napoleon's brother-in-law and most daring battlefield lieutenant was executed by firing squad on 13 October 1815.

## Musket

During the French Revolutionary and Napoleonic Wars, from 1792 to 1815, the majority of infantry was armed with smoothbore muskets. This weapon was first invented in the fifteenth century, but it reached the height of its efficiency (such as it was) in the eighteenth and early nineteenth centuries. It was a powder-and-ball weapon that was relatively easy to load and fire, but was plagued by inaccuracy, owing to the fact that the musket ball was ill-fitting and there was no rifling to impart spin to the projectile in flight. To ensure that the ball was a reasonably close fit in the barrel, it was loaded wrapped in a patch soaked in fat or grease, or, in extremis, in the paper in which the cartridge was supplied. All muskets could accommodate a bayonet, which generally measured approximately fifteen inches long, fastened around the muzzle with a socket so as not to interfere with firing.

The majority of muskets until 1807 (and all military muskets until after the Napoleonic Wars) were fired by flintlock mechanisms, a system that had been developed after the matchlock, wheel-lock, and snaphance systems had been superseded. These earlier methods of firing muskets had served their purpose well, but the flintlock was a great improvement on them. The musket was loaded via the muzzle, for breech loading was still restricted to rare military weapons, such as that tested (though never issued) by Major Patrick Ferguson in 1776. Firing with a flintlock required the powder propellant charge to be poured into the barrel and then for the ball to be rammed down the barrel until it was seated on top of the charge. Ramming was done with an iron rod.

The flintlock mechanism was operated by the trigger, and the hammer was actuated by a spring. So, to load the musket a cartridge had to be torn open. Cartridges at the time were paper wrappers holding one charge of powder and one musket ball. First the powder was poured into the muzzle, and this fell into the chamber by gravity, thus requiring the musket to be loaded in the standing position. Then the ball, perhaps still wrapped in the paper it came in, was forced by the ramrod down the barrel until it came to rest on top of the powder in the chamber. Next the cock was moved to the firing position with the thumb, and the striker plate, or frizen, was pushed forward, exposing the pan. Into the pan was poured a small amount of powder. Pulling the striker plate back covered the pan; the musket was now ready to fire.

The musket had two positions for the hammer, of which one was the firing position, the other half-cock in which the weapon could not be fired. To keep loaded weapons safe on the move, the cock was put in the half-cock position and pulled to the full-cock position when needed. This safety mechanism was of great value, but could also lead to men loading their weapons a second time, forgetting that they had a load already in the barrel. On pulling the trigger with the cock in the firing position the cock was forced forward and the flint it held scraped on the striker, causing sparks that were directed onto the powder in the pan. The flash of this powder was transmitted to the main charge via a small hole between the pan and the chamber. The main charge was fired and the ball forced through the barrel and out of the muzzle.

Musket barrels were made by various gunsmiths, all of whom had their own standards. This meant that infantry weapons, and particularly their calibers, were never standardized, leading to quite large variations in the actual caliber of weapons issued to troops. Bullet molds were issued to troops so that they could make their own ball, and these were all made so that the ball was always smaller than the caliber of the weapon for which it was intended. The ball it-

self was made of lead, and this did have the advantage that it could be relatively easily squeezed into a tight barrel, and in a wider barrel the ramrod could flatten it somewhat to fit at the breach. This meant of course that many such balls were deformed. The result was that accuracy was seriously affected. In short, a perfect round lead ball has few ballistic characteristics, and a deformed one has even fewer.

Infantry of the line used weapons that fired a bullet that was erratic in flight and extremely inaccurate at any but the closest ranges. British tests of accuracy proved that an individual infantryman would be very lucky to hit anything at more than 80 yards, and at 200 yards only mass fire had any hope of being effective. Faced with the problem that individual soldiers could not hope to hit their target with any regularity, the armies at the time decided to continue deploying their troops in line, and firing their muskets en masse. Normally in battle the infantry formed up as a continuous line facing the enemy, the line consisting of two or three ranks, each of which would fire in succession, while those that had fired were reloading.

The British Army, thanks to superior weapon training and drill, formed in only two ranks, with the front rank kneeling. Firing was by company most of the time, to ensure that a heavy weight of fire was directed at the enemy.

Rarely did the whole front rank fire, because of the delay caused by reloading. Every army rehearsed loading and reloading muskets as much as it could afford, and it seems reasonable to conclude that the British Army had spent more time at practice than many of the other European armies. Certainly their rate of fire was higher than other armies, and this, added to their steadfastness in battle, was to their benefit in virtually every battle in which the British fought.

## **Nansouty, Etienne Marie Antoine Champion, comte de (1768–1815)**

Nansouty was one of Napoleon's foremost heavy cavalry leaders. He served in most of the Emperor's battles and earned respect for his deliberate and devastating charges. Although Nansouty was considered by many to be overly cautious, he was a commander who prided himself on taking care of his men.

Nansouty was born in Bordeaux on 30 May 1768 into a noble family. He was sent to the military academy at Brienne in 1782, along with other members of the nobility. He graduated in 1785 and was commissioned as a second lieutenant in the Burgundy cavalry regiment. Despite Nansouty's aristocratic background, the French Revolution opened many opportunities for him. While many other nobles fled the country or were executed, Nansouty advanced rapidly in rank in the expanding French Army. In 1792 he became lieutenant colonel of the 2nd Chasseurs à Cheval. Over the next decade, Nansouty served in the Army of the Rhine. In 1799 he was promoted to *général de brigade* and saw action at Stockach and Memmingen.

Nansouty's career advanced rapidly under Napoleon's rule. In March 1803 he became *général de division*. That year he served under General Adolphe Mortier in the conquest of Hanover. Nansouty then became part of the army at the camp of Boulogne, awaiting the right conditions for an invasion of England. In August 1805 he took command of the newly formed 1st Cuirassier Division, part of Marshal Joachim Murat's cavalry corps. Nansouty's division was an integral part of the striking power of the Grande Armée. During the 1805 campaign Nansouty was present at the battles of Wertingen, Ulm, and Austerlitz, and he gained the reputation of being a cautious commander, even to the point of being slow. In part, the care with which Nansouty deployed his troops was a result of his fatherly attitude toward them. He also regarded Murat as headstrong and overly zealous, viewing himself as a counterbalance.

During 1806 Nansouty fought in the campaign in East Prussia and Poland. His cuirassiers played important roles in the Battle of Golymin in late 1806 and at Eylau and Friedland in 1807. Napoleon noted Nansouty's performance, and in 1808 he named the cavalry commander as his First Equerry, as well as Count of the Empire. Nansouty accompanied Napoleon during his 1808 campaign in Spain and then back to Paris to prepare for war against the Austrians. In 1809 Nansouty headed the 1st Cuirassier Division under Marshal Jean-Baptiste Bessières and participated in the battles along the Danube, including Aspern-Essling and Wagram.

During the invasion of Russia in 1812, Nansouty commanded I Cavalry Corps in the Cavalry Reserve. He fought in the battles of Ostrovno and Borodino. He was wounded in the latter battle and missed the remainder of the campaign, in the course of which the cavalry was decimated by the sufferings of the retreat. The replacements that Nansouty trained and commanded during the 1813 campaign in Germany were inferior in many ways. He commanded the cavalry of the Imperial Guard in fighting at Dresden, Leipzig, and Hanau, at the last of which he was again wounded. Nansouty recovered to fight in the 1814 campaign in France.

Despite the rewards Nansouty received from Napoleon, including being named First Chamberlain to Empress Josephine, he was no Bonapartist and quickly swore allegiance to Louis XVIII upon Napoleon's exile to Elba. He was named aide to the comte d'Artois and captain lieutenant of the Mousquetaires Gris (Gray Musketeers). Nansouty died in Paris on 12 February 1815, before Napoleon's return from Elba.

## Naples

The Napoleonic age brought remarkable changes in the political and social life of the Kingdom of Naples. Ever averse to neutrality, Bourbon king Ferdinand IV joined the First, Second, and Third Coalitions against France. During these wars, Naples fell twice into French hands: in 1799 (with the ephemeral experience of the Jacobin Parthenopean Republic) and, after seven years of Bourbon restoration, again in 1806. From 1806 to 1814 the Kingdom of Naples was a French satellite, ruled for two years by Joseph Bonaparte (Napoleon's brother), and from 1808 onward by Joachim Murat, who introduced a more autonomous system of politics, with the vigorous encouragement of his wife, Caroline (Napoleon's sister). Their attempt at keeping the throne led Naples to join the coalition against Napoleon in 1814, and in 1815, to a new war with Austria, the outcome of which resulted in Murat's overthrow and the restoration of the Bourbons. Under Joseph and Murat, Naples enjoyed a period of social, economic, and institutional reform, which greatly contributed to its modernization.

At the end of the eighteenth century, the Kingdom of Naples included the whole of continental southern Italy and Sicily, and consequently bore as its official name, the Kingdom of the Two Sicilies. Relatively underdeveloped, it had a social and economic structure based mainly on large land estates and feudal privileges. Naples was, however, one of the most important and lively cities in Europe. The House of Bourbon, often at odds with the noble landowners (particularly in Sicily), enjoyed the faithful support of the Naples populace (the *lazzari*) and the peasantry. From the very beginning, Ferdinand IV, strongly influenced by his Austrian wife, Maria Carolina, and politically guided by his British minister Sir John Acton, showed a totally hostile attitude toward Revolutionary France. His participation in the First Coalition was sealed in July 1793 by a treaty with Britain, which was particularly interested in the Neapolitan naval bases in the Mediterranean.

In October 1796, however, Bonaparte's victories in Italy forced Ferdinand to conclude peace with France. This treaty was broken in 1798, as Naples joined the Second Coalition and undertook a campaign against the French in the Papal States. Upon its defeat, the court sailed to Sicily, thus paving the way for the French occupation of the mainland possessions of Naples and the rise of the Jacobin-inspired Parthenopean Republic, proclaimed on 23 January 1799. Internally sapped by lack of political realism, the Republic was not to last long, as the course of the war in northern Italy forced the French to leave Naples. Popular masses faithful to the Bourbons and imbued with religious fanaticism (the Army of the Holy Faith) rose up under Cardinal Fabrizio Ruffo, seizing the city in June. The return of Ferdinand from Palermo the following month was followed by a period of bloody repression. By the Treaty of Florence (28 March 1801) the king went so far as to make peace with France and ally himself to that Republic, ceding Elba and the port of Taranto, the latter's French garrison, to be supported at Neapolitan expense, and agreeing to close Neapolitan ports to British commerce. The following years put a strain on Franco-Neapolitan relations and in 1805, despite a formal commitment to neutrality, Naples joined the Third Coalition.

After Austerlitz and the Peace of Pressburg, the Bourbons were once again forced to flee to Sicily under British protection, the authorities left behind concluding an armistice with the French on 4 February 1806. By Napoleon's decree, Joseph Bonaparte became King of Naples on 30 March. He soon started reforming the state along French patterns (centralization of administration, new civil and penal codes, expropriation of Church properties). Murat, appointed King of Naples by Napoleon on 1 August 1808, and reaching the capital on 6 September, carried on such reforms with passion and energy, trying to eradicate feudal privileges and building important infrastructures throughout the kingdom. The Napoleonic Code was formally introduced to the kingdom on 1 January 1810. Personal lifestyle, together with his sympathetic concern for the Neapolitan people, gained Murat the favor of his subjects. Over these years, the Neapolitan Army contributed to the Napoleonic campaigns in Europe, albeit with a poor record of service.

Foreseeing Napoleon's fall, in January 1814 Murat, whose relationship with the Emperor had long since deteriorated, changed sides so as to retain his throne. During the Congress of Vienna, however, Austria and Britain endorsed the Bourbon restoration. Murat then declared war on Austria, presenting himself as the champion of Italian independence. Defeated at Tolentino, he abdicated in May 1815 and fled to France, Neapolitan generals concluding peace with Austria on 23 May. A month later, Ferdinand

was back on the throne of Naples, and when Murat returned for an attempt to recover his kingdom, he was captured and met his end at the hands of a Neapolitan firing squad. At the Congress of Vienna, Ferdinand IV reasserted his right as the legitimate monarch of the Kingdom of the Two Sicilies proceeding to abolish the existing constitution and wage a campaign of violence and vengeance on republicans and those who had collaborated under French rule.

## Napoleon I, Emperor

*See* Bonaparte, Napoleon

## Napoleon II, King of Rome (1811–1832)

Napoleon François Joseph Charles Bonaparte was the only legitimate child of the Emperor Napoleon I of France and his second wife, Marie Louise. As Napoleon's long-awaited heir, his birth ensured the succession of the powerful but embryonic Bonaparte dynasty. As Napoleon II he was the

uncrowned Emperor of the French from 22 June to 7 July 1815.

François was born on 20 March 1811 in the Tuileries palace in Paris at the height of Napoleon's power. He received the sobriquet of *L'Aiglon* (eaglet). Napoleon had married Princess Marie Louise of Austria for political expediency to procreate. At François's birth, Napoleon proclaimed him the King of Rome. According to the custom of the times, François was accorded his own household and raised by the kindly Louise-Charlotte-Françoise Le Tellier de Courtanvaux, comtesse de Montesquiou-Fezensac until the age of four, although he was doted on by his father. He was known as “le petit monsieur,” and was a precocious, happy, much-loved child, although he never developed a strong relationship with his mother.

Napoleon abdicated for the first time on 6 April 1814, and, by the terms of the Treaty of Fontainebleau, also renounced the throne for his heir before he went into exile to Elba. Marie Louise was manipulated by the victors, used as a mere bargaining tool, and remained behind with her young son in Château Blois. After Napoleon's ultimate defeat at Waterloo in 1815 he abdicated again, assured (falsely) that his son would succeed him. In 1815 mother and son were moved to the Schönbrunn palace in Vienna, his mother's ancestral home and the residence of his grandfather, Emperor Francis I of Austria, who had joined the Sixth Coalition against his son-in-law in 1813. François was virtually a prisoner within the comfort of gilded walls.

Using the name of Napoleon was forbidden, and he became known as Franz. Everything French was removed from his life. His French governess was replaced on his fourth birthday by the stern Maurice Graf von Dietrichstein, who was assisted by two minor tutors. He was taught to be an exemplary Austrian and learned to speak Italian and German. Franz, however, was his father's son. He was enthralled by the romantic Napoleonic era. He possessed strong willpower and a strength of character that refused to acquiesce to the Germanization of his life; he was often physically punished for his defiance. As he matured, the sickly boy became cultivated, highly intelligent, and diplomatic. Franz endeavored to enter the military on his own merit, but this proved impossible, owing to his precarious state of health.

The second Treaty of Paris (1815) excluded Napoleon II from inheriting his mother's newly granted duchies, although he was known as the Prince of Parma for a time. As recompense for the loss of his father's empire, Franz was named Francis Charles (Franz Karl), Duke of Reichstadt, in 1818; no estate was attached to this vacant courtesy title. Franz reconciled with the mother who had abandoned him to his fate. Marie Louise was present when he died of tuberculosis on 22 July 1832 at Schönbrunn Palace.

Napoleon II died as an obscure figure known to history as the Duke of Reichstadt. His remains were moved to rest at his father's side at Les Invalides in Paris in 1940.

## Napoleonic Code

*See* Civil Code

## National Guard (French)

The National Guard consisted of units of volunteer militia raised provincially and municipally early in the French Revolution. The initial purpose of the National Guard lay in replacing the old royally controlled militia, or *Milice*. The National Guard comprised a markedly different force from the one it replaced both in its social composition and methods of recruiting. Likewise, it often held a role in shaping the political developments of the Revolution, until its suppression in 1795 under the Directory. Later, under Napoleon, the National Guard reemerged, but it resembled the earlier institution in name only.

As the National Assembly legislated it into existence in 1789, the Guard was to function as defender of Paris against the royal troops Louis XVI had concentrated outside the city. The first units were raised in Paris, beginning on 13 July 1789. From its inception, the Guard played an important role in shaping political developments in France. For instance, the search for weapons with which to arm civilians and National Guardsmen in Paris led to the attack on the Bastille the following day.

Shortly after the storming of the Bastille, the Paris National Guard adopted the cockade, composed of red and blue for the city of Paris, separated by white, the color of the monarchy. The cockade, in turn, became the emblem of the National Guard throughout the country and later inspired

the Republican flag. At first, the command of these Paris units was entrusted to the marquis de Lafayette, the hero of the American Revolutionary War (1775–1783). In the weeks that followed the birth of the National Guard in Paris, like groups were formed in provinces and municipalities throughout France. The widespread peasant unrest in the rural provinces of France, commonly referred to as the Great Fear, is usually seen as the main reason behind the popularity of forming Guard units. Often, National Guard units from neighboring municipalities banded together, or federated, for mutual support, and were thus known as *fédérés*. In these early stages of its existence, membership in the National Guard was restricted to the middle class.

Initially, membership in the Guard was restricted to active citizens, or those who could pay the equivalent of three days' labor in taxes. This constraint on membership was altered in the wake of the storming of the Tuileries on 10 August 1792, after which passive citizens were allowed to serve in the Guard as well. The age range for members was between eighteen and sixty years old. The units themselves enjoyed both higher pay and a better social perception than the troops of the old Royal Army. The combination of these factors proved a strong lure to men in the ranks of the regular army units, who often deserted in order to join the Guard. By their contemporaries, the men of the National Guard were perceived as patriots selflessly contributing to the defense and preservation of the Revolution. In its civil role, that of protecting citizens and property, the Guard could be quite effective.

Paradoxically, while the National Guard was very useful as an internal security force, its record as a military force was not so bright. In fact, it often resisted assignments to actual military duty. Service in the Guard was not seen in the same light as service in the regular army. Many of those who joined the National Guard early on saw this action as constituting their service to the Revolution and refused to trade it for more dangerous and less comfortable assignments at the front. Still, some did, and many of the Volunteers of 1791 hailed from National Guard units. Likewise, when France was invaded in 1792, the call on the Guard for additional troops to defend *la patrie* met with excellent responses.

The perception of the Guard as a force purely intended for internal security persisted, nevertheless, although this conception led to recurrent problems as the French Revolutionary Wars continued and men were needed at the front. In fact, Guard troops often exhibited an unwillingness to serve in front-line units. In 1793 therefore, with the call up of the *levée en masse*, many National Guard units were disarmed in order to provide weapons for front-line troops.

Even after it lost its weapons, the National Guard continued to play an important role in the politics of Revolutionary

France. The Guard continued as a political force until it supported a counterrevolutionary uprising in Paris in October 1795. General Napoleon Bonaparte, who had achieved fame two years earlier at the siege of Toulon, brutally put down this attempt to overthrow the Directory with the so-called whiff of grapeshot. After these events, the National Guard was suppressed both in Paris and in the provinces.

The National Guard received a new lease on life in 1805, as Napoleon prepared to go to war with Austria and Russia, the principal members of the Third Coalition. The Emperor needed a force that could secure his rear areas in France. Thus the National Guard was reinvented on a more imperial model. The Guard served this same purpose during the Russian campaign in 1812, and units were mobilized for the defense of France in 1814, though these were not considered very effective by the regular army. Desertion rates were high, and the troops were often less than dependable.

A brief attempt was made to revive the National Guard yet again during the Hundred Days in 1815. Little came of this venture. The few units that were assembled were not trusted to do any actual service, even in rear echelon duties.

## Naval Warfare

Naval warfare during the French Revolutionary and Napoleonic Wars was the most important factor behind

the ultimate victory of Great Britain and its allies. Without a powerful navy, Britain could never have taken the war abroad, and indeed, could never have supported the successful campaign in the Iberian Peninsula. Conversely, lack of a powerful and effective navy meant that French ambitions were confined to land campaigns on the Continent, with the notable exception of Bonaparte's expedition to Egypt in 1798. Lack of such a navy also prevented France from successfully countering practically any British naval operations.

The reasons for possessing a naval force during the eighteenth and nineteenth centuries were many. Nations such as Britain, France, Spain, and Holland required navies to protect their overseas possessions, at the same time affording them the means to attack enemy colonies in time of war. Upon the capture of enemy territory overseas, a navy was necessary to protect and supply that colony. Another role was the protection of commerce, at the same time attacking enemy mercantile interests and denying the enemy its overseas markets, thus reducing its fiscal capacity to wage war. A major function of any navy was to bring an enemy fleet to battle and, if not destroy it, at least prevent such a force from doing harm.

For an island nation such as Britain, a powerful navy was essential if it was to take the war abroad, while France required sufficient naval forces to be able to attack Britain on its own shores. The campaigns of the Duke of Wellington in Spain and Portugal could not have succeeded without the Royal Navy supplying the British army and its allies with supplies, weapons, and reinforcements.

While many European nations possessed navies of various sizes and strengths, some countries concentrated on land warfare. Prussia and Austria did not have significant naval forces. In Scandinavia, both Sweden and Denmark had powerful navies in 1792 but confined their interests to the Baltic theater. However, the Danish fleet was still considered of importance to both France and Britain in 1807. To the former, it was a force that could be added to its plans for an invasion of England, while to the latter, it was a navy that could not be allowed to fall into French hands.

Russia was emerging as a major maritime power in the Baltic and the Black Sea, while its longstanding foe, the Ottoman Empire, was in decline, with a navy composed of obsolete ships. Portugal, Naples, and Venice had small navies, but they were not as significant as they had once been. The Netherlands, Spain, and France had developed powerful fleets during the eighteenth century to protect their overseas empires. The Dutch were still considered a threat by Britain until, first, the French conquest of Holland in 1795, and second, the defeat of the Dutch fleet at Camperdown in 1797. Thereafter the Dutch fleet went into

decline. While the Spanish Navy was still a large and powerful force, it was seriously affected by lack of government funding. The French Navy was the second most powerful in the world, but the Revolution undermined its command structure and imposed financial neglect. This left Britain's Royal Navy as the world's largest and most efficient maritime force. Outside Europe, the United States had a small but powerful fleet of frigates and smaller vessels, but no ships of the line.

Such navies required an immense investment of time and matériel in their construction and maintenance. An accessible and regular supply of timber was important if new ships were to be constructed. A 74-gun ship required about 80 acres of trees for its construction, while HMS *Victory*, a first rate (that is, carrying at least 100 guns) used more than 2,000 tons of wood (mainly oak) in her construction—about 3,000 trees in total. Navies stockpiled quantities of wood for use in shipbuilding during wartime, and ships were built both in dockyards owned by the state and in private yards. Masts were often made of fir, especially in the Royal Navy, and this plus hemp and flax came mainly from the Baltic States, a factor that exercised considerable influence over Britain's policies during the wars. Napoleon recognized the importance of this trade, which played a part in his decision to invade Russia in 1812. Aside from the large quantity of wood required, a ship of the line also required nearly 40 miles of rope for the rigging, gun tackles, and anchors, while a first rate had sails that comprised an area of more than two acres of canvas.

Ships were armed with smoothbore muzzle-loading cannon (usually referred to as “guns”), ranging in size from 3-pounder to 42-pounder, the classification deriving from the weight of the round shot (cannonball) fired. By 1793 the 32-pounder was the heaviest gun on board most ships of the line, with 12-pounders or 18-pounders on the main decks. The U.S. Navy used 24-pounders on board its

frigates during the War of 1812 to great effect. In all navies the heaviest guns were employed on the lowest gun decks, with the lighter cannon on the upper decks. The carronade, mounted only on the upper decks, was a British invention exclusive to the Royal Navy and the U.S. Navy, designed for close range to sweep an enemy deck with canister shot—a tin containing up to 500 musket balls—or to destroy enemy rigging with grapeshot. Carronades varied in size from 12- up to 68-pounders, two of which were carried by HMS *Victory* on her bow.

Ships were classified in rates, reflecting the size of the vessel. (See Table N.1, below.)

Navies of the period had many other vessels for a variety of purposes. These included sloops, cutters, bomb ships, gun brigs, and gun boats. Old ship hulls (hulks) were used as receiving ships for seamen, hospital vessels, and prisons.

Navies required vast amounts of manpower to operate. Casualties sustained in action accounted for only a small proportion of losses among crews. The Royal Navy lost 1,875 men killed in action during the main battles of the period, while 72,000 were lost through disease or accident and 13,600 in ships lost by accident or the weather. Naval authorities resorted to a variety of expedients to obtain men. Many did volunteer, but a large number of men were conscripted against their will. In Britain the actions of the infamous press gangs—men authorized by the Admiralty to comb the streets of port towns and forcibly detain sailors from the merchant service for transfer to warships—accounted for large numbers of suitable, if unwilling, men, while in France the *inscription maritime* produced a continuous supply of seamen. There was much evasion of naval service, due in part to the conditions on board ship, but also to the indefinite nature of service, particularly in Britain. By contrast, officers in the Royal Navy saw the service as a career, with the possibility of social and

Table N.1 The Rates of Ships

Rate	Function	Number of Guns	Gun Type (pounder)	Crew
1st Rate	Line of battle, flagships	100–120	32, 24, 12	850–900
2nd Rate	Line of battle, flagships	90–98	32, 18, 12	750
3rd Rate	Main type in line of battle	64–84	32, 24, 18 and/or 12	550–700
4th Rate	Convoy escort	44–60	24, 12, 6	350–425
5th Rate	Heavy frigate, reconnaissance, convoy escort	32–44	32, 24, 12	250
6th Rate	Smaller frigate, reconnaissance, convoy escort	20–28	9	160–200

professional advancement, with the bonus of prize money. The French Navy lost many of its professional and experienced officers with the Revolution, which had a serious impact upon its effectiveness.

Most large warships had a complement of marines on board, both to assist in maintaining discipline and to provide troops for amphibious operations. In battle they would fire their muskets at the enemy crew and could assist with manning the guns. On many occasions, navies resorted to placing soldiers from the army on board to act in the capacity of marines.

The crews lived in very cramped conditions, living, eating, and sleeping on the gun decks. Ships cruising near land could acquire fresh food and water, which was known to help in preventing disease, especially scurvy. Ships on long voyages fed their crews bread, meat, and vegetables that had been packed in barrels many months (if not years) before. Often the bread (or biscuit known as hardtack) was infested with weevils. Officers often supplied their own food, with many ships having livestock on board. Water was brought on board and stored in wooden barrels, becoming rancid after a few weeks at sea. The Royal Navy introduced lime juice to the daily rations to prevent scurvy, hence the American term referring to British seamen as *limeys*. Alcohol was issued in the form of rum, brandy, or wine, to make the water more palatable.

Medicine at sea was rudimentary, each ship having a surgeon who had first learned his trade ashore. He was responsible for the health of the crew, treating wounds caused by action or accident, amputating limbs without anesthesia, and playing an important role in disease prevention. Infection was the greatest killer aboard, either through infection of wounds (many caused by musket balls or wood splinters) or epidemic disease such as typhus, dysentery, yellow fever, and malaria.

Navies were used for many purposes. Blockading of enemy ports to neutralize an enemy fleet was a strategy employed by the British against both the French and Spanish navies, rendering both ineffective, although it was always hoped that the enemy would try to force the blockade and be brought to battle in open sea. Navies were also used to protect trade, and because the Royal Navy was the predominant naval force, Britain's maritime commerce had the protection it needed to thrive, thus providing the finances to prosecute the conflict. Warships were used to escort merchant convoys and protect them from the enemy, especially privateers.

For a country with overseas possessions, the ability to convey troops abroad was important not only to maintain garrisons but also to take the war to enemy colonies. The Royal Navy was instrumental in conducting amphibious

operations that captured most French, Spanish, and Dutch colonies, along with key naval bases at Minorca and Malta.

Yet the British also conducted numerous operations on a far smaller scale. Cutting out expeditions, for instance, entailed the boats of a warship capturing, or "cutting out," an enemy vessel that was sheltering close inshore or in harbor. This was often performed under the guns of enemy shore batteries and was regarded as one of the most dangerous forms of naval warfare, often with great loss of life. Boarding an enemy vessel could occur during these expeditions and also during the final stages of battle at sea. British commanders such as Horatio Nelson and Thomas Cochrane promoted this tactic, which could influence the outcome of a fight. At the Battle of St. Vincent, Nelson successfully led a boarding party to take first the Spanish 80-gun *San Nicolas*, crossing her deck to take the 112-gun *San Josef* in the same manner. Boarding parties consisted of marines plus seamen armed with cutlasses and pistols.

Fleet battles were considered the most important feature of naval warfare, and the Royal Navy successfully defeated the French, Dutch, Danish, and Spanish in the six great fleet actions of the era (Glorious First of June; Camperdown; St. Vincent; the Nile; Copenhagen; and Trafalgar). The basic tactic was to form a line of battle, so that the guns of a ship did not mask those of another, and thus as many guns as possible could be brought to bear on the enemy. Ideally, the attacking fleet would have the weather gauge, that is, be on the windward side of the enemy. This meant that such a force would have more control of the battle, deciding when and where to attack, and being able to launch attacks by fire ships toward the enemy. The advantage of being downwind, or on the lee side, was that it facilitated easy retreat. During this period, however, commanders such as Nelson achieved victory by breaking the enemy line or concentrating his force on a part of it. This had the advantage that British superiority in gunnery and seamanship would prevail over a part of the enemy force.

Admiral Richard, Earl Howe won the first naval victory of the war at the Glorious First of June (1794), when he defeated a French fleet escorting an important grain convoy. The early years of the Revolutionary Wars saw British naval success in the Mediterranean, with the capture of Corsica. The Royal Navy defeated a large Spanish force off Cape St. Vincent in early 1797, and despite serious mutinies in the fleet that spring, decisively defeated the Dutch at Camperdown in October. The French, meanwhile, dispatched invasion fleets in 1798, one to Ireland and another, under Vice Admiral François Paul, comte de Brueys, to Egypt. The Royal Navy, coupled with a lack of effective popular support among the Irish, defeated the former at Bantry Bay, and Nelson dealt the Egyptian venture a severe blow by

decisively defeating the French fleet at anchor in Aboukir Bay at the Battle of the Nile, thus isolating Bonaparte's army in Egypt.

British control of the Mediterranean did not mean that the war always went in favor of the Royal Navy. Lack of cooperation between senior naval officers allowed a French fleet under Vice Admiral Eustache Bruix to escape from Brest and head for open sea. The year 1801 saw the Royal Navy successfully conduct an amphibious operation to land a British army in Egypt and defeat the remaining French army there. That same year, the League of Armed Neutrality in the Baltic threatened Britain's supplies of timber, tar, and naval stores from that region. The Battle of Copenhagen resulted in Nelson's defeat of the Danish fleet and the collapse of the League.

While the main protagonists were the European naval powers, the new republic of the United States conducted a quasi-war with France from 1798 to 1801 to protect U.S. merchant vessels from French privateers. The war drifted to a close in 1801, but not before the United States had formed a small but highly effective navy.

The short-lived Peace of Amiens gave way to renewed conflict in 1803. The Royal Navy quickly mobilized the fleet for war, but the next two years were spent protecting the English coastline from the expected French invasion. This included blockading the main French ports of Toulon and Brest and harassing French coastal shipping in the Channel, especially invasion craft being moved along the Dutch and northern French coastlines to the main invasion assembly port of Boulogne. French plans were given a boost when Spain declared war on Britain after British frigates captured its homecoming treasure fleet on 5 October 1804.

Napoleon realized that he could not invade while the British held naval supremacy, so he devised a plan to lure Nelson and his fleet away to the West Indies. Vice Admiral Pierre de Villeneuve sailed from Toulon in March 1805, leading Nelson to the West Indies. This campaign of maneuver saw the French sail back to Europe, closely followed by the British. Villeneuve combined his force with a Spanish fleet in Cádiz, posing a serious threat to British commercial interests in the West Indies, Atlantic, and Mediterranean. Nelson was sent to blockade this fleet, which came out and was decisively beaten at Cape Trafalgar on 21 October. This battle saw the death of Nelson, Britain's foremost naval hero, but confirmed Britain's naval supremacy.

While this naval dominance kept enemy fleets blockaded in their ports, it did not prevent privateers attacking British merchant ships, and the Royal Navy was kept occupied protecting the sea-lanes from such commerce raiders. Napoleon's Continental System closed European ports to British trade, to which Britain replied by blockading the

ports that supported this decree. This economic blockade stretched the Royal Navy, and resulted in many neutral vessels being stopped and searched on the high seas before being allowed to resume their journey to Europe. The principal neutral nation was the United States, which also objected to many of its citizens being impressed from its ships into the Royal Navy. The result of this was war with the United States in 1812, in which the British lost numerous vessels in frigate actions with the small but effective U.S. Navy.

Much of the naval war after 1805 was confined to blockade, because, while Trafalgar ensured the dominance of Britain's navy, the fleets of France and her allies could never be discounted, since they had access to the ship-building resources of Europe. The Danish fleet was neutralized in 1807 by an attack on Copenhagen to prevent its use by Napoleon, resulting in a war (mainly in the Baltic) with Denmark, which used small gunboats with considerable success. In 1809 the expedition to Walcheren, on the Dutch coast, was a failure, while that same year, an attack on Basque Roads on the western coast of France was not the decisive affair the British had hoped it would be. Apart from these few large-scale operations in the post-Trafalgar era, protection of mercantile interests and the support of land campaigns was an important part of the naval conflict from 1806 to 1815.

During the Napoleonic Wars, much of the naval activity centered on colonial interests, with Britain taking many colonies from France and Holland, such as in the West Indies and southern Africa. Support of military activity abroad became crucially important with the success of the British army in the Iberian Peninsula. Such a campaign would not have succeeded if the Royal Navy had not supplied the army and protected the sea-lanes to that theater. In turn, the Peninsular War played a vital part in the eventual downfall of Napoleonic France.

## Neapolitan Army

Universally regarded as one of the worst armed forces in Europe, the army of the Kingdom of Naples suffered from rampant indiscipline, high rates of desertion, and a poor record of combat. Its troops regularly fled the field of battle and were regularly condemned—not always fairly—for misconduct and cowardice by senior French commanders, including Napoleon.

The Neapolitan Army was originally deployed against the French, but from 1806 Naples fell under long-term French control under successive kings Joseph Bonaparte and Joachim Murat. Neapolitan troops participated in most Napoleonic campaigns but generally performed poorly. It is said that Napoleon refused to allow the troops to carry the imperial eagle, and after large numbers of them deserted in Spain, he refused to allow any more Neapolitan soldiers to serve in the Peninsula.

Before 1806 Naples formed the mainland part of the Kingdom of the Two Sicilies (often shortened to “Kingdom of Naples”), the army taking part in the early coalitions against the French. In 1798 the Austrian commander *Feldmarschalleutnant* Karl Mack Freiherr von Leiberich was in command of 60,000 Neapolitan troops. However, Naples was occupied, and the Parthenopean Republic was briefly established in January 1799 before French troops were withdrawn to face the forces of the Second Coalition in northern Italy. The Bourbon monarchy under Ferdinand IV returned to power in July and retained control until it joined the Third Coalition in late 1805, prompting a second French invasion. When Joseph was made King of Naples in March 1806, Napoleon encouraged him to build up the army. Owing to the fact that there were few volunteers, many recruits were taken from the prisons. The regiments were equipped from French arsenals, and as a result there was a wide variety of uniforms and equipment. When Murat succeeded Joseph as king two years later, he further expanded the army. He also redesigned many of the uniforms, making them some of the most colorful of the whole period.

Neapolitan troops fought respectably during the siege of Gaeta in 1806, and formed part of the occupying force of the Papal States in 1808. In 1809 the army also contributed to the corps led by Eugène de Beauharnais, the viceroy of Italy, that was engaged in the north of Italy, and some cavalry forces were used to defend against the attacks of rebels from the Tyrol. In Spain, Neapolitan troops were under the command of General Francesco Pignatelli.

During the invasion of Russia, units from Naples formed part of General Louis Loison's division in IX Corps, under the command of Marshal Pierre Augereau. They were initially stationed in Germany, but in November moved up to Vilna. Loison's Neapolitans now proved very valuable in the retreat, acting as part of the rear guard together with the Bavarians of General Karl Freiherr von Wrede. They suffered very badly because of their lack of winter clothing. Elements of the Neapolitan guard acted as a bodyguard for Napoleon during the retreat.

The Neapolitans were one of the few contingents complete enough to be able to protect the crossing of the Niemen under Marshal Michel Ney's command. Small numbers of troops fought in Germany in 1813; however, when Murat defected to the Allies in 1814 the army saw little more action.

In 1815 Murat reversed himself and again declared his support for Napoleon, and in an attempt to retain his kingdom, he declared war on Austria. Murat advanced as far north as Bologna with his forces, but then began a retreat back toward Naples. In May the Neapolitan army fought the two-day Battle of Tolentino against a pursuing Austrian force led by *Feldmarschalleutnant* Vincenz Freiherr von Bianchi. The Austrians were heavily outnumbered but easily defeated their opponents when Murat attacked the Austrian defensive position. In the retreat following the battle Murat's army ceased to exist until reconstituted under the restored monarchy.

## Neapolitan Campaign (1798–1799)

In November 1798 the Neapolitan army under King Ferdinand IV and the Austrian general Karl Mack Freiherr von Leiberich opened a campaign to free the Papal States from French control and terminate the satellite Roman Republic. Although at an early stage the Neapolitans succeeded in seizing Rome, a counteroffensive under General Jean-Etienne Championnet soon led to the French occupation of Naples in January 1799, thus paving the way for the establishment of the satellite Parthenopean Republic.

After the occupation of Rome by General Louis-Alexandre Berthier and the formation of the Roman Republic in February 1798, diplomatic relations with Naples rapidly deteriorated. In the summer two treaties were signed whereby Naples opened the Sicilian harbors to the British Fleet and arranged mutual military support with Austria. Meanwhile, peasant uprisings broke out in the Roman countryside, putting considerable military pressure on the French and the local Jacobins. Ferdinand resorted to compulsory conscription to strengthen his army, which at the outbreak of the war could field around 60,000. The average quality, however, was poor, and several officers proved unfaithful.

*Feldmarschalleutnant* Karl Mack Freiherr von Leiberich, on secondment, was appointed field commander. Two strong columns (more than 30,000 men) were to approach Rome by moving up the Tyrrhenian coast and the Liri valley. A third weaker column was detached to operate on the Adriatic slope of the Apennines. Rough, mountainous terrain, with narrow valleys and flooded rivers, hampered coordinated movement. Finally, on 21 November a division under General Diego Naselli embarked at Gaeta and sailed to Leghorn (Livorno) in Tuscany, this expedition resulting in a complete failure.

To face the Neapolitan threat, the Armée de Rome was formed on 31 October. Championnet was to lead 32,000 worn-to-rags French, Polish, and Cisalpine troops (24,000 ready for campaign). From the very beginning, Championnet renounced the defense of Rome and selected a defensive line farther north, in the Tiber valley between Terni and Civita Castellana.

Mack's advance began on 22 November. Three days later the Neapolitans entered Rome without opposition, and Ferdinand established a new provisional government. On the twenty-seventh, a Neapolitan flank column suffered at Terni the first of a long sequel of reverses. Mack then tried to break through the French line by advancing along both banks of the Tiber. His left wing, however, was defeated by General Jacques Etienne Macdonald at Civita Castellana on 4 December. In the days that followed, Championnet outmaneuvered *Generalmajor* Graf Khevenhüller-

Metsch's right wing at Cantalupo and Magliano Sabina. Several Neapolitan units dissolved without a fight. On the Adriatic shore, General Antoni Micheroux did not fare better, his hesitant advance being soon checked.

At this point, a discouraged Mack recommended that King Ferdinand leave Rome and ordered his army to retreat within the kingdom borders on the river Volturno. On 23 December Ferdinand and his court sailed to Sicily aboard Rear Admiral Sir Horatio Nelson's flagship. With Neapolitan Jacobins pleading for French occupation, popular riots broke out in the city. With his rear menaced by local guerrilla raids and lacking specific instructions from his government, Championnet remained idle until 19 January 1799, before ordering the investment of Naples. As the French resumed their advance, fierce fighting raged for three days in the city streets, the Neapolitan populace (the *lazzari*) stubbornly opposing the invaders. By the twenty-third, however, Naples was under French control and the Parthenopean Republic began its ephemeral life (January–June 1799).

### Neerwinden, Battle of (18 March 1793)

Decisive Austrian victory fought approximately 35 kilometers west of Liège, which briefly recovered the Austrian Netherlands from Revolutionary France, as Austrian artillery destroyed the advancing French columns.

After King Louis XVI was executed on 21 January 1793, followed by France's declaration of war on Great Britain and Holland on 1 February, the Convention decreed a new call-up of 300,000 men and invaded Holland. The Austrian army under *Feldmarschall* Friedrich Josias Graf Saxe-Coburg-Saalfeld (generally known as Saxe-Coburg) attacked the French-occupied Austrian Netherlands from the west and engaged the French forces under General Charles François Dumouriez along the Brussels-Liège road. After an Austrian victory at Aldenhoven on 1 March, the armies fought the Battle of Neerwinden across the Kleine Geete River, east of Tirlemont. In a three-pronged attack, the French made progress in the center and right, but their left wing was decisively defeated along the main road. The French retreated to Louvain, where

they were defeated on 22 March, and the Austrians retook Brussels on 25 March.

Dumouriez tried to lead his men to Paris, planning to restore the monarchy, but they refused to follow, and he fled into exile. French generals would thereafter have to fight under the shadow of the guillotine, as the Terror took hold inside France.

After his victory at Jemappes (6 November 1792), Dumouriez had marched north into Holland with 23,000 troops, weakening his links with French forces in the Rhineland, while the Armée du Nord besieged Maastricht. The new Austrian commander, Saxe-Coburg, opted for an aggressive strategy and decided to attack the weak link in the French lines by advancing on Brussels (capital of Austrian Netherlands) from Liège with 30,000 infantry and 9,000 cavalry. After crossing the Roer, he defeated the French right wing at Aldenhoven on 1 March. Dumouriez hastily left his army in Holland and reached Louvain on 11 March, where he collected together 40,000 infantry and 4,500 cavalry from the three French armies (Nord, the Ardennes, and Belgique, all reduced to division size). After a clash around Tirlemont on 17 March, Saxe-Coburg withdrew across the Kleine Geete River and deployed his light troops around the villages of Overwinden and Neerwinden, his main force on the hills above and his right wing anchored on the Brussels road. He intended to attack the French on 19 March, but Dumouriez preempted him.

With many volunteer battalions among the French, Dumouriez gambled on an assault on 18 March. Attempting a repeat of the victory at Jemappes, he planned an initial attack on the Austrian left and center to draw troops from their right. The French left, under General Francisco de Miranda, would then march down the main road to encircle the Austrian right. The broken ground forced Dumouriez to use eight columns (three on the right under the comte de Valence; two in the center under the duc de Chartres; and three under Miranda) to attack the Austrian positions. The swampy ground of the river valley would prevent the French from deploying into their two-company-wide attack columns. Their artillery would remain spread out across the entire front, while the cavalry would be unable to repel the Austrian mass attacks.

At 7:00 A.M. the French commenced their surprise attack by crossing the river. By noon, Miranda's troops had taken Orsmael village by the main road bridge, forcing Saxe-Coburg to move his second *Treffen* (battle line) and most of his reserve artillery to support the right wing under Archduke Charles, which blocked the road. The rest of the Austrian reserve was moved south to protect the left flank around Racour. Although the French quickly drove back Austrian outposts, it was noon before Valence made any real progress with the French right toward the Mittelwinde

hill, where he was to set up a heavy artillery battery and outflank the Austrian left. However, he realigned his attack toward Overwinden, intending to split the Austrian left and center, while his third column supported Chartres in the main assault on Neerwinden, where the left flank of the Austrian center was anchored.

The villages were fiercely contested. By 2:00 P.M. the French had taken Overwinden and the Mittelwinde hill, but this proved too small to accommodate a battery. Neerwinden had been taken by Valence's third column, which had by then been evicted by the Austrian first *Treffen* under *Feldzeugmeister* Franz Graf von Colloredo, before Chartres retook the village. Coburg then moved his reserve to aid Colloredo in retaking Overwinden, but in the fierce fighting ammunition ran low, prompting Saxe-Coburg to launch a mass cavalry charge of twelve squadrons. Racour was retaken, and the first deployed French line was smashed, though the second held out until night fell.

As ordered, Miranda had started his attack across the bridge and down the main road around noon. By 4:00 P.M. comte Miaczynski's column had advanced 4 kilometers and taken Dorsmael. Three times the Austrians assaulted the village before retaking it and putting Miaczynski's column to flight. The second French column from Miranda's wing under General Ruault de la Bonnière turned to engage Archduke Charles's troops on the higher ground south of the road. *Oberleutnant* Josef Smola moved his artillery forward to halt Ruault's column and to allow Charles time to realign his infantry. When Austrian infantry advanced from Dormael and fell into Ruault's left flank, the volunteer units in the French column broke up and fled back over the bridge. The last French column, attempting a wide outflanking movement, headed for Leau around 2:30 P.M. but was repelled by the right wing of the Austrian second battle line.

As night fell, the French left disintegrated and withdrew on Tirlemont. After sustaining 4,000 losses, Dumouriez attempted to renew the attack next morning around Orsmael to cover his retreat but was engaged by Smola's expanded battery at 200 meters' range and forced to withdraw. The Austrians, whose chief of staff, Mack, was hailed as the architect of victory, lost about 2,000 men.

## Nelson, Horatio, First Viscount (1758–1805)

The greatest sailor of his day and perhaps of any era, Vice Admiral Horatio Nelson was born in Burnham Thorpe, Norfolk, on 29 September 1758, the fifth of eleven children to the Reverend Edmund Nelson and his wife, Catherine. He entered the Royal Navy at the age of twelve through the patronage provided by his maternal uncle, Captain Maurice Suckling, who became comptroller of the navy shortly after Nelson joined the service. Young Nelson went aboard the *Raisonné* in 1771, being sent to the West Indies in a merchant vessel. He returned to England after a year to join the *Triumph* before, in 1773, being chosen to assist in an expedition to the Arctic. On his return later the same year he was sent in the *Seahorse* to the East Indies for a short time before being invalided home in 1776 and transferred to the *Worcester* as acting lieutenant. After six months his rank was confirmed, and he returned to the West Indies aboard the frigate *Lowestoffe*.

Through family connections Nelson received command of the brigantine *Badger* in December 1778 and was ordered to protect British trade along the Mosquito Coast (Honduras) from American privateers. In June 1779 he was promoted to post captain of the *Hinchinbrooke* before, at the beginning of the following year, serving in the expedition against Fort San Juan, from which he was withdrawn after falling dangerously ill from fever. He was evacuated to Jamaica and placed in command of the *Janus*, though his sickness prevented him from carrying out his duties, and he was invalided home.

After convalescing at Bath, Nelson went aboard the *Albermarle* and sailed to Canada, arriving in July 1782. From Halifax he sailed to the West Indies in May 1783 under Admiral Viscount Hood (Sir Samuel Hood, not to be confused with his brother, Alexander, also a naval officer), before being sent home for six months. In March 1784, in command of the *Boreas*, Nelson sailed to the West Indies where he tried to put a stop to the illegal trade conducted by American merchants selling goods to British colonies. While on the island of Nevis he met Frances Nisbet, a widow, whom he married in March 1787. The couple returned to England where Nelson went on half pay for the next five years.

In January 1793, just as war broke out with France, Nelson was given command of the *Agamemnon* (64 guns) and

directed to sail to the Mediterranean to join Lord Hood's fleet. Nelson fought on Corsica, where he lost the sight of his right eye at Calvi in July 1794, and became a commodore in April 1796. He came into prominence ten months later when he fought with distinction against the Spanish at the Battle of St. Vincent on 14 February 1797. He was knighted and promoted to rear admiral. In July 1797 he led an unsuccessful attack on Santa Cruz, Tenerife, in which he was severely wounded in the right arm by grapeshot. Nelson's arm was amputated, and he was sent home, where he had an audience with George III and received a pension. Despite his fear that his incapacity would prevent him from further service, Nelson was given command of the *Vanguard* (74) in April 1798, and he rejoined the Mediterranean fleet.

Although his principal mission was to watch the Toulon fleet, a gale blew him off station, and when he was finally able to make repairs the French had left port. Using intelligence that suggested that Bonaparte was bound for Egypt, Nelson went in pursuit, reaching Alexandria in June. The French were nowhere to be seen, but upon returning to the Egyptian coast after stopping for provisions at Syracuse, Nelson discovered Admiral François, comte de Brueys's fleet anchored in Aboukir Bay on 1 August. He surprised the enemy that evening, taking thirteen enemy vessels and thus ruining Bonaparte's plans to conquer Egypt permanently and to march overland to India.

On reaching Naples after the battle he was given a hero's welcome and heaped with honors and rewards, including a peerage as Baron Nelson of the Nile and Burnham Thorpe. In the course of his stay in Naples, at the house of the British ambassador, Sir William Hamilton, Nelson met Emma, Lady Hamilton, with whom a romance developed. Nelson was soon recalled, partly because of the embarrassment being caused by his affair with Lady Hamilton, but also as a result of the revolutionary movement then brewing in the Kingdom of Naples, which had forced the king and queen to transfer their court to Sicily.

Nelson returned home in 1800 and separated from his wife. In the same year he was promoted to vice admiral and sent to Yarmouth, where he joined the fleet under Admiral Sir Hyde Parker as second in command of an expedition to the Baltic. Russia, Sweden, Denmark, and Prussia had formed the League of Armed Neutrality in order to oppose trade restrictions Britain had imposed on these neutral states. Nelson led the attack against the anchored Danish fleet at Copenhagen on 2 April 1801, destroying much of it and forcing Denmark out of the League. He was made a viscount and succeeded Parker as commander in chief in the Baltic. Returning to Yarmouth, Nelson was then appointed to command a flotilla designed to defend the south coast of England from French invasion. In this capacity he took part in an abortive attack against the harbor at Boulogne, where

Vice Admiral Lord Nelson. The greatest naval commander in history, he inflicted three decisive defeats on his opponents at the Nile (1798), Copenhagen (1801), and Trafalgar (1805), so confirming British naval supremacy for the next 100 years. (Engraving by T. W. Harland after Lemuel Abbot from *History of Europe from the Commencement of the French Revolution to the Restoration of the Bourbons in MDCCCXV* by Archibald Alison. Edinburgh & London: William Blackwood, 1860, vol. 6)

on 15 August he failed to destroy enemy troop transports concentrated for a planned descent on the coast of Kent.

When peace was restored with France by the Treaty of Amiens in March 1802, Nelson returned home, purchased a house at Merton in Surrey, and moved in, though he spent considerable time at the Hamiltons' home in London, carrying on his affair with Emma. On Sir William's death in April, however, Nelson and Emma lived scandalously together at Merton, unmarried. Peace with France lasted little more than a year, however, and when war resumed in May 1803 Nelson was given command of the Mediterranean fleet, his purpose to observe the enemy naval force at Toulon and engage it if it emerged from port. A chance to confront it finally arrived in the spring of 1805 when Admiral Pierre de Villeneuve escaped from Toulon, in accordance with Napoleon's plan to unite his various squadrons in a bid to gain control of the English Channel and allow his invasion flotilla to cross.

Nelson's dramatic passing is practically the stuff of legend. While pacing the quarterdeck of the *Victory* at the

Battle of Trafalgar on 21 October 1805, the admiral was hit by a sharpshooter's musket ball and fell to the deck. Carried below, Nelson survived in great pain for just under three hours, proclaiming his love for Emma Hamilton and requesting that the nation look after her in his absence. Shortly after learning that he had emerged victorious over the combined Franco-Spanish fleet, he died. The nation gave its fallen hero a spectacular state funeral, which ended with the lowering of Nelson's coffin into the crypt of St. Paul's Cathedral in London.

## Neoclassicism

An artistic style that developed during the eighteenth century and involved principally painting, sculpture, and architecture but also the theatrical arts, furniture, tapestry, and even jewelry. It was inspired by the revival of a tremendous interest in Classical antiquity that swept through Europe at this time. Neoclassicism was contemporaneous with and supported by the thought of the Enlightenment. Neoclassicists advocated a return to nature and sought to portray reason and morality in art.

Neoclassicism involved a repudiation of the earlier art forms of Rococo and Baroque, which were characterized by lavish, emotional, frivolous, sensuous, and ornamental expression. Rococo art had been the predominant style while Madame de Pompadour presided over the court at Versailles; however, in the years just before her death in 1764, the Neoclassical style arose—a style she encouraged. Art historians associate Rococo style with the *ancien régime*, and although it began mid-century, Neoclassicism was integral to the French Revolutionary and Napoleonic era. This new style was restrained and austere, almost mathematical in structure and form. The artists, architects, and craftsmen of the time designated what we now call Neoclassicism variously as the “true style” or a *Risorgimento*, or renaissance, in the arts (Sweetman 1998, 21). The movement reached its zenith in the late 1780s and 1790s and was succeeded by Romanticism at the turn of the century.

The origins of Neoclassicism lay in the discoveries of archaeological sites at Herculaneum and Pompeii. Excavations began in 1737 and 1748, respectively. Johann Joachim Winckelmann, a German art historian, librarian, and secretary to art patron Cardinal Alessandro Albani, is credited with having initiated the movement. Although Winckelmann never journeyed to Greece, he studied and wrote about its culture, suggesting that in order for humankind

to be great it should imitate the ancients. He traveled to Italy in 1758 to supervise the Herculaneum and Pompeii excavations and was the first scholar to study systematically ancient Greek and Roman art. In 1755 he published “Reflections on the Painting and Sculpture of the Greeks,” which glorified nature and attacked the Rococo style. Winckelmann’s pamphlet has been recognized as a manifesto for the Classical ideal. He popularized the ideals of “noble simplicity” and “calm grandeur,” which he believed were present in Greek art. He exhorted artists to emulate Greek art as a means to reaching a universal form in their own works. Winckelmann’s most famous work, *History of the Art of Antiquity* (1764), which was dedicated to the German Neoclassical artist Anton Raphael Mengs, provided a history of ancient art for the first time.

Winckelmann was not the only writer to contribute to an understanding of Neoclassicism. German writer Gotthold Ephraim Lessing was also important to the theoretical side of Neoclassicism. His *Laocoön, or Concerning the Limits of Painting and Poetry* (1766) was greatly influenced by Winckelmann’s understanding of the meaning of the Laocoön, a famous sculpture dating from the first century B.C.E. that portrays the priest Laocoön and his sons beleaguered by serpents.

Winckelmann’s program underwent some important changes in France. What accounts for this? Works by French philosophes such as Denis Diderot and Jean-Jacques Rousseau were largely responsible for the move away from what was known as the *Classical program*. Rather than merely focusing on the ancients, the humanist Diderot also stressed the use of the arts to foster ethical improvement. Attention to pattern, form, and geometry still remained important. Another characteristic was the stress on the rational and intellectual response of the audience.

Primarily known for having edited the multivolume *Encyclopédie*, Diderot was the author of several works of art criticism such as *Le Salon* (1759, 1761, 1763, and 1765), his examinations of the biennial art show in Paris; and *Essais sur la peinture* (Essays on Painting), written in 1766 and published in 1795. Diderot believed in the primacy of the artist’s freedom rather than the artist’s duty to following a system or set of rules. He advocated a return to the style of the French artists Nicolas Poussin, Eustache Le Sueur, and Charles Le Brun. In common with Winckelmann, Diderot was devoted to the Classical world and to the idea of morality expressed in art.

Jean-Jacques Rousseau also figures in the context of those who contributed to theories of Neoclassicism. Dedicated to a return to the natural, a common theme in Neoclassical art, Rousseau also looked to the ancient Greeks and advocated the simplicity, severity, and minimalism of Sparta as opposed to the luxury of Athens. These themes

are present in Rousseau’s “A Discourse on the Moral Effects of the Arts and the Sciences” (1750). Both Diderot and Rousseau had a tremendous impact on the leading Neoclassical artist of the age, Jacques-Louis David.

David’s forerunners included the first Neoclassical painters, a group active from the 1750s to the 1770s. They included Joseph-Marie Vien, Anton Raphael Mengs, Pompeo Batoni, Angelica Kauffman, and Gavin Hamilton. The German painter Mengs has traditionally been credited with the founding of Neoclassicism, perhaps because of his close association with Winckelmann. It is perhaps more accurate to state that he was the leader of the early Neoclassicist movement. His paintings reflected Enlightenment views of humanity and the ideals of purity and clarity. He studied painting in Rome, where he later settled. His most important work was his fresco *Parnassus at the Villa Albani* (1761). It helped to establish the rise of Neoclassicism.

A disciple of Mengs, Angelica Kauffman is the only female Neoclassical artist of any fame. Born in Switzerland and a founding member of Britain’s Royal Academy, Kauffman painted portraits but preferred landscapes depicting Classical history and mythology. Her paintings were often narrative, such as *Cornelia Pointing to Her Children as Her Treasures* (1758), portraying the Classical female virtues of dedication to one’s children. The major themes found in Neoclassicism often revolved around narratives from antiquity showcasing heroic male deeds. There was a clear delineation between the roles and expectations of men and women. Men dominated the public sphere and were represented as heroic and stoic. By contrast, women and femininity generally, as portrayed in Kauffman’s paintings, were confined to the private and domestic realms and represented as modest and nurturing.

Batoni was an Italian painter of the Roman school who specialized in historical subjects and portraits. Hamilton was a Scottish Neoclassical painter whose work was influenced by his interest in archaeology. In common with other painters of the school, he spent time in Rome, settling there in the 1740s, and his paintings, such as *The Oath of Brutus* (1767), dealt with Classical themes.

Joseph-Marie Vien provides an example of an early Neoclassical artist whose work reflected Winckelmann’s philosophy. He won the coveted Prix de Rome at age twenty-seven and became the director of the French Academy of Rome in 1778. He painted Homeric subjects until the 1780s. His aim was to return the French school to the “faithful imitation of nature” (Brookner 1980, 41). Vien is remembered today more for having been David’s teacher than for his own works.

David learned his craft in Rome under his master Vien between the years 1775 and 1781, when he returned to his native France. During the years before the Revolution

David produced the bulk of his Neoclassical paintings. He was primarily interested in portrait paintings rather than the allegory and grace found in Mengs's paintings. Stoic Roman values gleaned from the writings of Rousseau, particularly *The Social Contract* (1762), are a central feature of David's paintings from the 1780s into the French Revolution. The public interest takes precedence over the private; the individual will is sacrificed for the general will, or the will of the community. Rousseau's stress on Spartan austerity is also present in David's paintings from the 1780s.

David's *Death of Socrates* (1787) was his attempt to put Diderot's *Traité de la Poésie dramatique* (1785), which dealt with the hero Socrates and his high standard of morality, to the canvas. Here an individual sacrificed his life for a higher ideal. *The Oath of the Horatii* (1785) and *The Lictors Bringing Brutus the Bodies of His Sons* (1789) portray the Classical virtue of a citizen's obligation to the state, which took precedence over that to his family. *The Oath of the Horatii*, exhibited at the 1785 salon, is considered by some critics to be his greatest painting. According to one it "ingested the neoclassical movement, naturalized it into French, harnessed it to the approved 17th century models, and thus brought to fruition the disparate efforts of the preceding half century" (Brookner 1980, 68). David's Neoclassical paintings not only represent values of antiquity; they also reflect the impact of Rousseau's thinking. This was David's last work before the Revolution.

During the Revolution, David painted works commemorating major turning points, such as the unfinished canvas *The Oath of the Tennis Court* (1791), which would immortalize the deputies' oath never to separate until they had written a constitution for France. His sketch of *Marie Antoinette on the Way to the Guillotine* (1793) demonstrates his use of realism. Marie Antoinette is portrayed as an old woman, yet she is only thirty-seven. Perhaps his greatest Neoclassical painting is *The Death of Marat* (1793), in which the Revolutionary hero Jean-Paul Marat, stabbed to death in his bathtub by Charlotte Corday, is made to resemble the Christ of the *Pietà* tradition.

David's paintings after the Revolution, those glorifying Bonaparte, leave Neoclassicism behind for Romanticism. These propaganda pieces were painted to the dictum of Napoleon rather than David. The Spartan austerity of earlier works had been replaced by grandeur and the exaltation of one man.

Neoclassicism was also reflected in the sculpture and architecture of the later eighteenth century. The influence of Winckelmann is clear in the work of leading sculptors of the era, the Italian Antonio Canova and the Dane Bertel Thorvaldsen. These men specialized in the celebration and exaltation of the male body as inspired by the Greek gods. Their technique, known as the *beau idéal*, took inspiration

from both live models and ancient statues. The finest examples of their work are Canova's *Theseus and the Centaur* (1804–1819) and Thorvaldsen's *Jason* (1802–1803).

In architecture the Neoclassical style is characterized by a rational and geometric austerity. Neoclassical architects wanted to cleanse buildings of the excesses of Rococo. The revival in Greek and Roman styles began in Britain in the 1720s with the Palladian revival. Richard Boyle, Lord Burlington, a wealthy patron, sponsored such Palladian buildings as Chiswick House, near London. The term is after Renaissance architect Andrea Palladio, one of the many illustrious architects of the period who imitated Classical forms. Robert Adam, one of the greatest architects in the style, began in the Palladian idiom but eventually developed his own, using fine lines and geometric proportions. Born in Scotland, Adam spent time in Rome before working in England, where he designed Lansdowne House and the façades of the Admiralty in Whitehall, Seton Castle, and Syon House on Roman models.

In France one of the greatest of Neoclassical structures is the Panthéon in Paris (Saint Geneviève Church) designed by Jacques-Germain Soufflot. Plans for the church were drafted in 1757, but the building was not completed until 1800. The exterior portico is modeled on the Roman Pantheon, with ornate sculpture and twenty-two columns. Intended as a church, it was converted into a monument to the great departed heroes of the Republic.

## Neresheim, Battle of (11 August 1796)

Indecisive battle north of Ulm between General Jean Victor Moreau's French army and Archduke Charles's main

Austrian army. After fighting around Rastatt, the Austrians withdrew east toward the Danube, followed by Moreau's Army of the Rhine and Moselle; in the north *Feldzeugmeister* Graf Wartensleben's smaller Austrian force and General Jean-Baptiste Jourdan's Army of the Sambre and Meuse moved in parallel. Pressured by his government, Charles reluctantly engaged Moreau in a delaying action around Neresheim near the Danube on 11 August. Despite significant casualties, the battle allowed Charles to break contact and advance north to join Wartensleben near Amberg.

After the Battle of Rastatt and the loss of the contingents furnished by the Holy Roman Empire, Charles's army was reduced to 35,000 troops (with another 20,000 covering the southern flank) facing Moreau with 68,000 men. On 12 July the Austrian command finalized its campaign plan: to withdraw steadily without fighting a major action and take the earliest opportunity to join with Wartensleben's 45,000 in a concentrated attack on one of the French armies. The archduke's army reached Heidenheim on 1 August, two days ahead of Moreau, and spread out to cover the Danube approaches from Gunzburg through Neresheim and southwest to Nordlingen, creating the impression that they would cross the river and, after destroying the bridges, continue withdrawing eastward. However, Jourdan had taken Würzburg and in Italy *Feldmarschall* Dagobert Graf Würmser had been defeated by Bonaparte at Castiglione, so Emperor Francis and Johann Freiherr von Thugut, the foreign minister, demanded that Charles counterattack whatever the cost.

Joined by *Feldmarschalleutnant* Michael Freiherr von Fröhlich, the archduke on 11 August massed 43,000 men against Moreau's 45,000 southeast of Neresheim across hilly ground and boggy defiles, which made coordination difficult. The Austrian center struck first, surprising General Laurent Gouvion St. Cyr with the French center around Eglingen at dawn and drove him to Dunstelingen. Charles was anxious about being separated from Wartensleben and had massed his troops on his right (northern) wing, which marched in several columns against the French left between Kossingen and Bopfingen.

In the difficult terrain, the Austrians could not concentrate their attack and were repelled. To the south, the Austrian left advanced toward Heidenheim, destroying a French division as they threatened to envelop the French right. Unable to make progress in the center, Charles dispatched 9,000 men to reinforce his left, just as French reinforcements reached St. Cyr. Having slowed Moreau's pursuit, the archduke canceled further attacks, and the battle died away by 1:00 P.M. amidst a torrential thunderstorm. The next morning, the Austrians withdrew on Donauwörth, rightly confident that Moreau would follow them cautiously and not head north to join Jourdan.

Wartensleben had reached Amberg on 12 August, 130 kilometers to the northeast. Leaving *Feldmarschalleutnant* Graf Baillet von Latour with 35,000 to face Moreau, Charles re-crossed the Danube at Ingolstadt with 28,000 men on 16 August and headed north in the decisive move of the campaign.

## Netherlands, Campaign in the (1813–1814)

In 1813 the French faced a Sixth Coalition, organized by the British but with military contingents largely dependent on the sizable field armies furnished by the Russians, Prussians, and, later in the year, the Austrians. The British, for their part, instituted a plan to expel the French from the Low Countries. Although the Netherlands campaign of 1813–1814 was a mere sideshow in military terms, Britain acted with post-Napoleonic strategic objectives in mind. The British policy of maintaining the balance of power on the continent of Europe meant that a defeated France should not be replaced by a new threat, especially one capable of threatening the Low Countries, such as Prussia. An important piece of this strategic goal was therefore to ensure that the Netherlands (Holland) ended the war as an independent country—but not strong enough to close the ports of the Low Countries to British trade.

On 4 November 1813 Prince William of Orange-Nassau (Willem Frederik van Oranje-Nassau), the hereditary prince of Holland, met with Lord Castlereagh, the British foreign secretary. The prince was informed that the Allies would reinstall his House in a new united kingdom of the Low Countries after the war. Five days later Castlereagh presented a plan of the territories to be included in the restored Kingdom of the Netherlands.

The campaign opened on 9 November, when Cossacks under General Alexander Benckendorf entered Holland

from Germany as the advance guard of General Ferdinand Winzegorode's Russian corps. Working with Prince Pavel Gavrilovich Gagarin and Prince Alexander Ivanovich Chernishev, Benckendorf and his Cossacks began to assist the Dutch in expelling the French, capturing the town of Groningen on the fifteenth, while a riot in Amsterdam soon drove out the French from that city. Dutch leaders of the resistance then organized a provisional government to recognize Prince William. On 23 November Leiden, which had joined the provisional government, sent 250 Dutch troops commanded by General de Jonge to occupy the small town of Woerden about 15 kilometers from Utrecht. General Gabriel Jean Joseph, comte Molitor, commanding French forces at Utrecht, attacked Woerden the next day with 1,600 troops, forcing the Dutch to surrender after two hours of hard fighting.

Other Dutch towns, siding with the provisional government, called for urgent military assistance from the Allies. On 23 November General Friedrich von Bülow, commanding Prussian troops, took the towns of Doesburg and Zutphen. Two days later Cossacks took Den Haag (The Hague), and on the twenty-eighth, they were reinforced by 200 British marines. On 30 November Prussian troops captured Arnhem after a hard fight. That same day Prince William landed on the beach at Scheveningen, from which he had fled eighteen years earlier. By December 1813 French troops had evacuated the area north of the River Maas (Meuse), except for Gorinchem, Deventer, Den Helder (a naval port), Coevorden, Naarden, and Delfzijl.

The Allies captured Antwerp and Gorinchem in February 1814. Lieutenant General Sir Thomas Graham's forces took Bergen-op-Zoom on 8 March and by the end of March 1814, when the Allies occupied Paris, only a few Dutch towns still contained French garrisons.

## Netherlands, The

### The Dutch Republic (to 1795)

Known at the time of the French Revolutionary Wars as the United Provinces of the Netherlands, and encompassing the approximate dimensions of the Netherlands of today, it should not be confused with the Austrian possession immediately to the south known as the Austrian Netherlands, which constituted what is today Belgium and Luxembourg. The Netherlands were a federated republic, administered by a States-General, with the ruling prince holding the title of *Stadtholder*, an elected position yet hereditary within the House of Orange.

By 1789 the Dutch Republic was only a shadow of its former glory. It had waged three major naval wars against England (from 1707, Britain) in the seventeenth century (1652–1654, 1665–1667, and 1672–1674), and after the fourth Anglo-Dutch war (1780–1784), it had lost its already-dwindling naval hegemony to the British. Internally it was in economic crisis and socially was strongly divided. The formerly relatively open merchant elite had developed into a closed oligarchy, the Regents, who were at odds with both the population and with the stadtholderate. The princes of Orange, the Stadtholders, traditionally the champions of the army, the fleet, and the people, had become semimonarchical and vied for establishing an absolute monarchy.

A new factor in the republic were the Patriots, a more or less democratically inclined group who wanted to reform the archaic and inefficient federal state and break the power of the Regents. The Patriots looked to the Stadtholder, William (Willem) V, for support, but this conservative and incompetent man preferred to make common cause with the Regents than to lead the people into reform, which would inevitably have led to limitations on his own power. Growing Patriot unrest was quickly crushed in 1787, however, by troops sent by Frederick William II of Prussia, the prince's brother-in-law.

Many Patriots fled south to the Austrian Netherlands and France, and when the French Revolution broke out they saw their chance. A Batavian Legion (*Légion Batave*) was formed in French service, containing roughly 2,500 men under the leadership of Pieter Willem Daendels, a man who would remain very influential, both militarily and politically, during the entire period of French suzerainty and occupation (1795–1814). The Legion saw action in the *Armée du Nord* (Army of the North) and would be present during the French invasion of Holland in 1794.

In 1793 the Dutch Republic became a member of the First Coalition, whose principal members included Austria, Prussia, Britain, and Spain. Dutch troops saw action mainly

in defense of the Austrian Netherlands and the Dutch Republic, taking Landrecies (30 April 1794), raising the siege of Charleroi (3 June), driving General Jean-Baptiste Jourdan over the Sambre (16 June), and preventing the French from crossing the Meuse (in Holland known as the Maas), Waal, and Rhine in December, until the rivers froze tight, which allowed the French to cross unhindered. The Batavian Legion fought first under General Charles François Dumouriez and later General Jean Charles Pichegru during the campaigns in Flanders and Holland.

### **The Batavian Republic (1795–1806)**

In 1795 the Dutch Republic was finally overrun by the French, an event strongly facilitated by extreme frost, rendering Dutch defenses, which mainly relied on a line of inundated areas surrounding the principal province of Holland, useless. The Stadtholder fled and the government was taken over by French sympathizers, among whom were many former Patriots, and the Batavian Republic was created. In the event, the result was not entirely what the Patriots had in mind. The French proved overbearing and treated the Dutch as vassals rather than as allies. One of the reasons for that was purely geopolitical, given that the French needed tight control over their allies to withstand the coalition. But there was more to it.

In France there was little sympathy for the Dutch. Not only had the exiled Patriots initially sought help from the French king, proving them rather opportunistic in the eyes of the Revolutionaries, but the Batavian Legions were embarrassed by being closely associated with Dumouriez, who went over to the Austrians after his defeat at Neerwinden. Moreover, the French wanted compensation for helping to overthrow the Dutch regime. As the former Dutch Republic had a (largely obsolete) reputation of being fabulously rich, the French exploited that reputation to the full.

In 1795 the Peace of The Hague was signed, in which the Batavian Republic, in addition to ceding some strategically valuable territory, was obliged to pay the enormous amount of one million guilders in tribute and further, to offer a large loan at a negligible rate of interest. Apart from providing troops as a very junior partner in an alliance with Revolutionary France, the Batavian Republic was expected to provide for a French force of 25,000 troops that would remain on Dutch soil.

Because the Dutch colonies and trade were by this time largely blockaded or disrupted by the British, the burden was prohibitively heavy. Used to diplomacy and negotiation, Dutch diplomats were reduced to continually harassing the French to relinquish them from part of their obligations. Forced, moreover, by shortages and impossibilities, many politicians did everything they could to

negate or delay payments or the execution of burdensome measures, further enhancing French indignation.

On a political level as well, the Batavian Republic was a hard nut to crack. Loyal to their republican past and to their strong federalist traditions, the Dutch defied the French call for a centralized state. The struggle between those who supported the centralist cause and those who were used to their old privileges and rights delayed the forming of a constitution until 1801, this in its turn delaying the creation of an efficient centralized state with a tax system, which for the French would be a far easier means of exercising extortion. Even this constitution would not last long, as Napoleon introduced another after making his brother Louis King of Holland in 1806. However, the Batavian Republic probably proved still more lucrative as a satellite state than it would have through outright annexation, which, by making the Netherlands part of the French nation, would entitle it to corresponding rights.

Militarily, the Batavian Republic was not a very important part of the French sphere of influence. The fleet, small, obsolete, in bad repair, and suffering from the Orangist tendencies of the crew, was decimated at Camperdown (Kamperduin) in 1797, and the feats of the Batavian Army were limited. Together with the French they fought against the British and Russians who invaded North Holland in 1799 and were defeated at Bergen under General Guillaume Brune. Later they marched to the Rhineland to join General Jean-Baptiste Dumonceau at the river Main in 1800–1801 and participated in the Ulm-Austerlitz campaign in 1805.

### **The Kingdom of Holland (1806–1810)**

Under Napoleon the French Empire became increasingly dependent on foreign manpower and matériel. The Emperor, being far less “republican” in his outlook than the republicans he replaced, was more inclined to mold his vassal states to his wishes. As the Batavian Republic remained recalcitrant and uncooperative and, with mounting injury upon insult was reluctant to supply sufficient troops for the French war effort, Napoleon disbanded the Republic and put his brother Louis Bonaparte on the throne of a newly formed Kingdom of Holland on 5 June 1806. Napoleon’s hopes were quickly destroyed. Louis was not to be a mere vassal who slavishly executed his brother’s orders but proved to be a responsible ruler who on occasion actively defied his brother’s wishes, up to the point of acting contrary to his interests.

The increasingly popular Louis quickly became fond of the Dutch and their small country, and he enjoyed his duties and hard work. Acting in the very manner of the Batavian Republic—often advised by the very same men who had administered it—he protested and delayed the

supply of troops and measures that damaged trade or standards of living. One of his major feats was his continuing refusal to introduce general conscription, which temporarily saved the Dutch male population from being decimated for the further glory of the French Empire. Moreover, Louis nakedly defied the Continental System and openly tolerated the smuggling of British goods. A boon for the Dutch, it was to his own detriment: On 1 July 1810 he was forced to abdicate, and he fled, finally leaving the country open to annexation by France.

Because its army was small and notoriously under-strength, the Kingdom of Holland played only a minor military role in the wars. From 1807 to 1809 Dutch troops served mainly in northern Germany and Belgium. They were in Westphalia and Hanover in the campaigns of 1806–1807, and in Mecklenburg and Pomerania from 1807 to 1809. A Dutch brigade served admirably in Spain from 1808 to 1810 under the command of General David Hendrik Chassé, who later would command a Dutch brigade at Waterloo. Within their own borders, Dutch troops served at Walcheren against the British expedition to that island in 1809.

#### **French Annexation (1810–1813)**

Wishing to tighten French control over its subject northern neighbor, Napoleon ordered French troops to occupy the southern provinces of the Republic in January 1810. On 4 February troops were ordered to occupy towns south of the Maas and Waal rivers. On 16 March Louis Bonaparte was forced to conclude a treaty with France ceding his southern provinces to the Empire, though French troops continued to expand their occupation of Holland. After Louis abdicated on 1 July the Netherlands became an integrated part of France, effective from the thirteenth. Well, almost so: Some regulations remained in place designed for further exploitation of the country. The regiments of the Dutch kingdom—with some changes—were redesignated as regiments of the French Army; the Dutch Guard Grenadiers became the 2nd (later 3rd) Grenadiers of the Imperial Guard, and the regiment of Horse Guards became the 2nd Guard Lancers. Most regiments, although forming an integrated part of the French Army, remained fully Dutch, with Dutch recruitment, officers, and staff.

Conscription was introduced on 3 February 1811, a move that led to a series of public demonstrations and clashes with troops, not least when large numbers of men were called upon to serve in the Russian campaign in 1812. Indeed, Dutch troops served in the Peninsula; in Russia, fighting at Borodino and at the crossing of the Berezina; and in the campaign of 1813 at Lützen, Bautzen, and Leipzig. Sadly, like many other foreign troops, Dutch troops were often treated harshly and wantonly by their French generals.

The Netherlands itself became a theater of operations when British and Russian troops invaded the country in November, precipitating uprisings against the French in Amsterdam and at The Hague on the fifteenth and seventeenth, respectively. The hereditary Prince of Orange, William VI (son of the former Stadtholder, William V, who had died on 9 April 1806), landed at Scheveningen on 30 November 1813 and was proclaimed Prince Sovereign of the Netherlands on 2 December, taking the title of William I. Although there still was some military resistance to the return of the Oranges, by the time the prince returned after 18 years in exile, this largely consisted of stubborn French troops or personal admirers of the Emperor. Most Patriot resistance had ebbed away in the twenty years in between and most Dutch hailed the prince, hoping for peace and better times. The armies of both parts were amalgamated, a process that was not fully completed when the Waterloo campaign began.

#### **The Kingdom of the Netherlands (1814–1815)**

William adopted a new constitution favoring a central over a federal system. After the fall of Napoleon in May 1814, the Netherlands was evacuated by the French, and William was inaugurated as King William I of the Kingdom of the Netherlands, to which shortly afterward the former Austrian Netherlands (roughly present-day Belgium and Luxembourg) was added by an agreement reached on 14 June by the Allied powers in the Treaty of London.

When Napoleon returned in the spring of 1815, the Dutch took part in the Waterloo campaign, in which some 30,000 Dutch and Belgians fought initially under the command of the Prince of Orange, the son of the new king, but later under the command of the Duke of Wellington. The Dutch troops suffered notoriously bad press, especially from the British, a reputation only partially deserved. Indeed, especially in the higher echelons, command was often of high quality, because many commanders in the Dutch contingents were career officers—as was common in continental European armies, several were not Dutch natives—who had been in foreign service, be it French, British, or Austrian. The above-mentioned General Chassé commanded a brigade; the Prince of Saxe-Weimar commanded the brigade that, contrary to Wellington's orders, held Quatre Bras; and Orange's chief of staff, Baron de Constant Rebecque, decided to reinforce the town; all were actions that proved of major importance in achieving victory at Waterloo.

## Neuwied, Battle of

See Rhine Campaigns (1792–1797)

## Neverovsky, Dmitry Petrovich (1771–1813)

Russian general and corps commander. Neverovsky was born to a petty noble family in the Poltava *gubernia* (province). He enlisted as a private in the Life Guard Semeyonovsk Regiment in 1786 and became a sergeant in early 1787. During the Russo-Turkish War of 1787–1792, he transferred as a lieutenant to the *Malorosiisk* (Little Russia) Grenadier Regiment in October 1787 and fought at Salchea and Bender. In Poland in 1792–1794, Neverovsky participated in the actions at Derevitse, Gorodische (promoted to captain), Maciejowice, and Praga. Promoted to colonel, he took command of the 1st Marine Regiment in October 1803. The following year he rose to major general and *chef* of the 3rd Marine Regiment at Revel.

In 1805 Neverovsky served under General Peter Tolstoy in the expedition to Hanover. He returned to Revel in early 1806 and became *chef* of the Pavlograd Grenadier Regiment in November 1807. In late 1811 he organized the

27th Infantry Division, which was later assigned to the 2nd Western Army. During the 1812 campaign Neverovsky joined Prince Peter Bagration on the Russian retreat eastward and on 14 August distinguished himself at Krasnyi, where he halted the French army and allowed Russian forces to defend Smolensk. He then took part in the battles of Smolensk, Borodino (where he was wounded), and Maloyaroslavets. For his actions at Borodino he was promoted to lieutenant general in November 1812.

In 1813 Neverovsky served in General Fabian Osten-Sacken's corps of the Army of Silesia under the Prussian general Gebhard von Blücher and fought at the Katzbach. He was mortally wounded at Leipzig when a musket ball shattered his leg. He died of gangrene in the hospital at Halle on 2 November and was buried in a local cemetery. His remains were transferred to the Borodino battlefield on 20 July 1912. For his actions at Leipzig, Neverovsky was nominated for honors but died before receiving them.

## New Orleans, Battle of (8 January 1815)

The last land battle of the War of 1812, fought, unbeknown to the combatants, after a treaty of peace had been signed by their respective nations 3,000 miles away at Ghent (at the time part of the newly formed Kingdom of the Netherlands, though Ghent is now in Belgium).

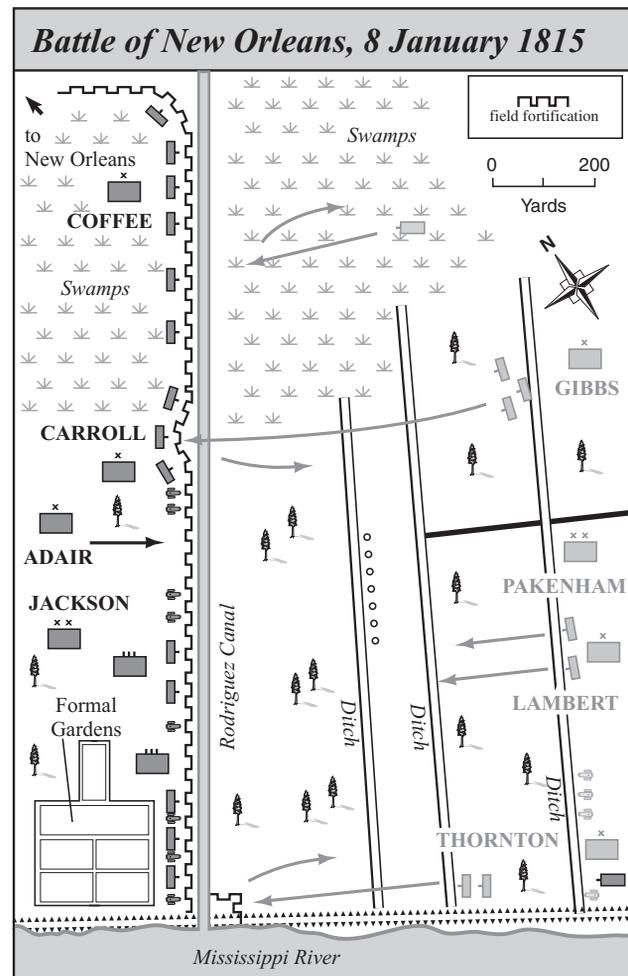

Seeking to capture the important trading center of New Orleans on the Mississippi River, Major General Sir Edward Pakenham, a veteran commander of the Peninsular War, landed his army in the delta in December 1814 and proceeded upriver, encountering American resistance on 31 December. American artillery silenced Pakenham's guns and obliged him to retire and await the opportunity for a second attempt on the city. On 1 January 1815, 1,600 reinforcements arrived, whereupon Pakenham, with about 5,800 men, decided to assault the main American position of about 4,300 men under General Andrew Jackson, whose forces lay camped on Chalmette Plain, on the left bank of

the river. Pakenham planned the attack for the morning of 8 January, which was to begin with a flanking movement launched against the weaker American position on the right bank. A shallow canal connected to the river, together with the American defense of Fort St. Philip downriver, prevented Pakenham from bringing up enough boats to enable the 1,200 men under Lieutenant Colonel William Thornton to cross to the right bank. The shortage of boats therefore held up the crossing, and because Pakenham intended to open the battle on the right bank, this threw his plans off schedule.

The main assault was to be made on the left bank, where the Americans were deployed behind a ditch four feet deep and a line of entrenchments fashioned from earth, bales of cotton, and boxes of provisions. The American left was anchored on a thick swamp and its right on the Mississippi. Major General Samuel Gibbs would lead one column of 2,100 forward about 200 yards from the swamp. The leading regiment was to carry fascines to be hurled into the ditch, while those behind would carry the ladders needed to scale the enemy earthwork. Strict orders were issued that no one was to fire until he had made it to the ditch. A second column of 1,200, under Major General John Keane, was to storm the American position closer to the river in the event that Thornton had taken the enemy guns on the right flank. If, however, Gibbs succeeded in penetrating the American line, Keane was to exploit that success by pushing his men through the gap thus created. A smaller, third column of four companies from various regiments under Lieutenant Colonel Robert Rennie was to proceed along the road that hugged the river. A reserve of 1,400 men under Major General John Lambert was kept farther to the rear.

Pakenham had given instructions that action was to open with the attack on the right bank, but when dawn arrived, accompanied by heavy fog, nothing could be seen or heard across the river. He consequently decided to proceed with the main thrust on the left bank. The three columns advanced, covered by skirmishers, but Gibbs's column stopped when it was discovered that someone had bungled and forgotten the fascines and ladders. Soon the fog dissipated, and with the British infantry clearly in sight, the Americans opened fire with their artillery, including guns on the right bank that began to enfilade Keane's men. At about the same time the Kentucky and Tennessee riflemen opened their own fire.

Keane, now aware that Thornton had failed to capture or drive off the enemy guns on the right bank, marched his column obliquely in Gibbs's direction, thus leaving Rennie's small force alone by the river. Rennie nevertheless managed to enter a redoubt separate from the main entrenchments, but this left him exposed to a terrible enemy

Adapted from Chandler 1999, 313.

fire. Rennie and large numbers of his men were easily shot down in their exposed position, while Keane suffered such intense fire in front of the main position that in less than half an hour his column was in confusion and his men began to lie down to seek protection. When the fascines and ladders arrived Gibbs proceeded, but despite his entreaties his men halted and began to fire. Again they became easy targets and were shot down in large numbers, causing them once again to cling to the earth. A small number, having crossed the ditch, reached the parapet, but these were left to be killed or captured by the refusal of their compatriots to advance under the withering fire.

Gibbs, ordering his men to leave their heavy packs on the ground, rode ahead in an effort to stop the pointless carnage and advance on the American position. A few men tried to rise, but most remained prone, while Gibbs was unhorsed and mortally wounded by a rifle ball, followed by Keane, who was carried away unconscious. Lambert now brought forward the reserve, but it, too, halted once exposed to the combination of accurate rifle and artillery

fire. Pakenham then intervened, and while in the midst of reproving his men, was thrown from his horse, which had been shot. Though badly injured in the fall, Pakenham mounted another horse and attempted to re-form his men before being hit again and killed 300 yards from the enemy line. Command devolved on Lambert, who called a halt to the assault on the left bank and sent Lieutenant Colonel Alexander Dickson, the officer in command of the artillery, to make inquiries about progress on the right.

Thornton and his approximately 1,200 men were to have been transported across the river before dawn, but during the early hours of the morning he realized that without sufficient numbers of boats this was impossible. This left him with only 450 men, which he landed, much later than originally intended, a mile downstream from the Kentuckians, who were positioned in makeshift entrenchments under General Daniel Morgan. This delay had led Pakenham to commence his advance without waiting for Thornton, who was originally supposed to issue the signal for attack.

Morgan had only a scratch force of 250 backwoodsmen, recently arrived and exhausted from their night march through the mud. These Thornton forced back to Morgan's main line, which was undermanned and overextended in a position stretching 500 yards, with its left flank on the river and its right flank exposed. In this position some of the Americans remained for a brief time before running off. Only one of the American batteries was trained on these attackers, the remainder having been sighted to enfilade the assault on the left bank. With Thornton's advance, the Americans spiked their guns and general panic set in, causing the entire force of Kentuckians to flee until finally rallying far to the rear at Boisgervais.

With insufficient numbers to seize the new American position, Thornton halted in expectation of new orders and reinforcements. Dickson now arrived from across the river and, having assessed the situation, reported to Lambert that Thornton should withdraw. Lambert agreed, despite opposition from some of his officers, including the chief engineer, Lieutenant Colonel John Fox Burgoyne, who maintained that with reinforcements Thornton could penetrate the new line at Boisgervais and proceed along the riverbank to a point facing New Orleans. From there they could bombard the city and destroy it with fire or force its surrender on the threat of such destruction. Thornton, was, however, duly withdrawn to the left side of the river, and an armistice was agreed on between the two sides to allow burial of the dead.

Had Lambert prosecuted the offensive on the right bank, he would almost certainly have broken through, thus circumventing the apparently impenetrable American posi-

tion of Jackson's main line. The British withdrew to their ships, and shortly thereafter, news arrived of the conclusion of peace between the two countries. Losses in the battle were extremely unevenly distributed and demonstrated the growing power of the defense by well-armed men firing from cover who had not been subject to a preliminary bombardment. The British lost 192 killed and a staggering 1,265 wounded to the Americans' 13 killed and the same number wounded. In addition, 484 British and 19 Americans went missing. Total losses were 1,941 and 45, respectively.

## Ney, Michel (1769–1815)

Possessing exceptional leadership qualities and bravery, Ney was more than one of Napoleon's most famous marshals, but ranks among the foremost French commanders of the Napoleonic Wars.

Michel Ney was born on 10 January 1769 in Saarlouis, Alsace, to Pierre Ney, a master barrel cooper and blacksmith, and his wife, Margarete Graffin. He apprenticed first as a cooper and then to a local notary lawyer, after which he worked as a mine administrator for three years. However, realizing his interests lay elsewhere and his innate intelligence for the military, he joined the 5th Hussars in February 1787 at Metz. Ney soon excelled in horsemanship and fencing, became a first-class swordsman, and proved to be a brave soldier. His temperamental, impetuous, warmhearted character, accompanied by a generous personal gallantry and flair, were balanced with a commanding voice, a cool, calm, professional demeanor, and boundless energy.

The iron-willed Ney was promoted up the ranks in a short period, becoming *maréchal des logis* (sergeant) in February 1792. As the war began in April, Ney joined the Army of the North and initially served as an aide-de-camp to General François Joseph Lamarche. Promoted to lieutenant on 5 November 1792, he fought at Neerwinden on 18 March 1793 and was promoted to captain in April 1794. Later that year, he transferred to the Army of the Sambre and Meuse, attracted the notice of General Jean-Baptiste Kléber, and rose to *adjutant général chef d'escadrons* in September. Distinguishing himself at Aldenhoven in October, he became *adjutant général chef de brigade* later that month. In November Ney served in the Rhine theater in the sieges of Maastricht and Mainz, where he was wounded.

Over the next three years, he participated in numerous engagements, defeating the Austrians at Loano in 1795 but also fighting at Opladen, Lahn, Friedberg, Dierdorf, Montabaur, Altenkirchen, Forchheim, Würzburg, Neuwied, and Kirchberg; and earned a reputation of veritable fire-eater and the nickname *Le Rougeaud* (The Ruddy). He was promoted to *général de brigade* on 1 August 1796. In the Italian campaigns of 1796–1797, Ney commanded or otherwise played a leading role in the battles of Montenotte, Dego, Mondovi, Lonato, Castiglione, Arcola, and Rivoli. After being captured by the Austrians near Giessen on 21

Michel Ney. Known as “The bravest of the brave,” and arguably Napoleon's greatest marshal, Ney displayed great courage in action, above all during the retreat from Moscow, when he was reputed to have been the last Frenchman to leave Russian soil. (Engraving by Gaildrau and Leguay, 19th c. The David Markham Collection)

April 1797, he was exchanged on 27 May. He went on to command cavalry units in the Army of Mainz that same year, in the Army of England in 1798, and in the Army of the Lower Rhine in 1799. He distinguished himself at Mannheim in 1799 and was promoted to *général de division* on 28 March.

In May 1799 Ney was transferred to command the light cavalry of the Army of the Danube and Switzerland under General André Masséna. In action at Winterthur on 27 May he sustained several injuries and left the army to recuperate. Upon his recovery, Ney was transferred to the Rhine and fought at Hohenlinden under General Jean Victor Moreau in December 1800.

Ney met Napoleon Bonaparte, the First Consul, at a Tuileries function in May 1801. The courtlike atmosphere

annoyed Ney, who abhorred public life and never felt comfortable in what he considered an artificial social environment. Bonaparte was leery of Ney, who had worked closely with his rival, Moreau; on the other hand, Bonaparte's wife, Josephine, was impressed by him. Ney had bought a farm in Lorraine following the disbanding of the Army of the North and looked forward to some rest.

Bonaparte and Josephine arranged his marriage to the kindhearted, lively, and attractive Aglaé Auguié, a close friend of Hortense de Beauharnais, which took place on 5 August 1802 in the chapel of the Auguié château at Grignan, near Versailles. Aglaé had been one of the ladies attending Josephine. Her father was Pierre Cesar Auguié, and her mother, Adelaide Genet, had been a trusted lady-in-waiting to Queen Marie Antoinette. Aglaé thus was of a higher social background than Ney. The well-suited, happy couple had four sons by 1807. Aglaé effectively raised the children herself, for Ney seldom received extensive leave. This absence caused some marital problems, but the marriage survived. In 1808 Ney bought the Château des Coudreaux.

In 1802 Ney was appointed to command the French troops in Switzerland and served as Bonaparte's diplomatic representative to this country. The following year, he was recalled to France and given commands of the camps of Compiègne and Montreuil that trained troops for the planned invasion of England. As Bonaparte began reorganizing his armies, he conferred on Ney the newly created title of Marshal of the Empire on 19 May 1804 and made him a member of the Légion d'Honneur on 2 February 1805. Ney also received command of VI Corps of the newly created Grande Armée.

As the political reality quickly changed in Europe and France was pitted against the Third Coalition in 1805, Ney led his corps against Austrian forces. On 14 October, Ney prevented the Austrian army from breaking out of an encirclement at Ulm by leading a charge across the bridge at Elchingen, a few miles southeast of Ulm. This victory led to the surrender of *Feldmarschalleutnant* Karl Mack Freiherr von Leiberich's entire army and earned for Ney the title of duc d'Elchingen in 1808. He was then sent to conquer the Tyrol—thus his absence from the decisive Battle of Austerlitz—where he seized Innsbruck from Archduke John in November 1805.

In 1806 Ney participated in the campaign against Prussia and fought—rather recklessly—at Jena on 14 October. However, he distinguished himself in the subsequent pursuit of the Prussian army, when his troops captured Erfurt (together with its 100 guns and garrison of 14,000 men) and Magdeburg (with its 800 guns and some 23,000 troops). After a short rest in Berlin, Ney found himself in the midst of another campaign, this time against the Russians. He served at Thorn and Soldau in December 1806

before arriving in time to save the day at Eylau (8 February 1807), though the battle proved to be a bloody stalemate, with Ney famously noting, “*Quel massacre! Et sans resultat*” (What a massacre! And without result.) (Montesquiou-Fezensac 1863, 149). In June Ney demonstrated his tactical skills once again as he successfully escaped with his troops from the attacks of numerically superior Russian forces near Guttstadt (9 June) and then fought with distinction at Friedland (14 June).

In 1808 Ney's VI Corps was transferred to Spain, where he fought in several small actions in Galicia and Asturias. In 1810 he served under Marshal André Masséna during the invasion of Portugal. He took Ciudad Rodrigo and Almeida in July–August 1810 but suffered heavy casualties during the French retreat from the Lines of Torres Vedras and the subsequent defeat at the Battle of Busaco on 27 September. The rather unorthodox Ney blatantly quarreled with his commanding officer, Masséna, and was charged with insubordination and sent back to France in disgrace in March 1811. Over the next year, Ney commanded a camp in Boulogne before being appointed commander of III Corps of the Grande Armée on the eve of the invasion of Russia.

During the Russian campaign in 1812, Ney served in the first action at Krasnyi; at the Battle of Smolensk, where he was wounded in the neck; at Valutina Gora (Lubino) in August; and at Borodino on 7 September, where he distinguished himself in valiantly leading attacks against the fortified Russian left flank.

Ney is probably best remembered for the exceptional personal bravery he displayed while commanding the vulnerable French rear guard during Napoleon's retreat from Moscow in November and December, during which time his troops not only had to endure the bitter cold but also faced continuous Cossack attacks. After being cut off from the main army at Krasnyi, he managed to fight his way through the Russian lines after a Herculean effort that left most of his soldiers dead. Given the new nickname “The Bravest of the Brave,” Ney participated in the bloodbath on the banks of the Berezina in late November and then gallantly defended the bridge at Kovno in December, where he was reputedly the last Frenchman to leave Russian soil. For his heroic service, Napoleon made him prince de la Moskova in March 1813.

The Russian campaign had a profound effect on Ney, who was deeply moved by the continuous loss of his men. Having watched his frostbitten, starving, exhausted soldiers collapse to their deaths during the retreat, Ney began to grow weary of war. Nevertheless, he remained in command and went on to fight in the campaign of 1813 in Germany. On 29 April, he fought successfully at Weissenfels before being wounded in the leg at the Battle of

Lützen on 2 May. He later commanded the left wing at Bautzen on 20–21 May, when his delay and paucity of cavalry prevented Napoleon from completing his planned envelopment and destruction of the Allied armies. Later that spring, Ney led his corps into Silesia and served at Breslau in June and Dresden in August. He was then sent to restore French control of Berlin but suffered defeat at Dennewitz on 6 September. This setback convinced Napoleon to concentrate his forces near Leipzig, where Ney participated in the decisive battle in and around that city between 16 and 19 October, when he received another wound.

In 1814, as the Allied armies invaded France, Ney took command of the 1st Division of Voltigeurs of the Young Guard in January and fought at most of the principal battles of February and March, including St. Dizier, Brienne, La Rothière, Champaubert, Montmirail, Château-Thierry, Craonne, Laon, Rheims, and Arcis-sur-Aube. In early April, at Fontainebleau, he became the spokesman for the marshals, negotiated with the Allies, and persuaded Napoleon to abdicate. In a heated exchange, Napoleon, still not cognizant that defeat was inevitable, argued that the army would follow his orders, to which Ney famously replied that the men would follow their generals.

During the Restoration, Ney pledged an oath of allegiance to King Louis XVIII and, despite his service over the previous decade, he stood in high favor at court. One month after Napoleon's abdication, Ney was appointed to the Council of War and made commander in chief of the cavalry and commander of the 6th Military District at Besançon. The king also rewarded him with the title of chevalier of the Order of St. Louis (1 June) and peer of France (4 June). However, Ney's seemingly successful career was interrupted by the return from exile of his old master, Napoleon, in March 1815. Despite his infamous promise to deliver Napoleon in an iron cage, Ney recognized the unpopularity of the Bourbon monarchy and rallied to the Emperor's side at Auxerre on 18 March. Napoleon, probably less trusting of his old marshal, appointed him inspector of the northern frontiers near Lille and Landau. On the eve of his final campaign—against the seventh coalition formed against France since 1792—Napoleon recalled Ney and gave him command of the left wing of the Army of the North.

On 16 June, Ney fought field marshal the Duke of Wellington at Quatre Bras, where Ney's sluggishness and relative tameness enabled the Anglo-Allied forces to defend that strategic junction, averting the imminent destruction of the Prussian forces at Ligny. At Waterloo, on 18 June, Ney served as de facto field commander because of Napoleon's poor health.

Ney has been frequently accused of having mishandled the cavalry and infantry charges whose failure con-

tributed so much to the catastrophic French defeat. Specifically, Ney's impetuous unleashing of most of the French cavalry against Wellington's squares atop the ridge of Mont St. Jean is often cited as one of the deciding factors in the outcome of the battle. To his credit, Ney fought valiantly in this battle, having had four horses shot from under him and having attempted—but failed—to rally the fleeing masses of troops in the wake of the repulse of the Imperial Guard, famously shouting, "*Venez voir comment meurt un maréchal de France!*" (Come and see how a Marshal of France dies!) (Chandler 1987, 373).

After Waterloo, Ney decided against emigrating from France and hoped to be allowed to retire. Awaiting the verdict at his residence at Château de la Bessonie, near Aurillac, he was arrested on 3 August and was initially presented to the Council of War to be court-martialed for treason by his fellow marshals. However, they refused to try him and the case was passed to the Upper Chamber of the House of Peers on 4 December. Ney attempted to justify his actions but his arguments proved futile, and no one came to his defense. He was found guilty and sentenced to death on 6 December. The following day, Ney—refusing to wear a blindfold—was led before a firing squad at the Jardins du Luxembourg. "Soldiers," he declared, "when I give the command to fire, fire straight at the heart. Wait for the order. It will be my last to you. I protest against my condemnation. I have fought a hundred battles for France, and not one against her" (Chandler 1987, 374). An eyewitness on the day noted that one of the soldiers of Ney's firing squad deliberately aimed at the wall.

Although initially buried in an unmarked grave, Ney was eventually reburied at Père-Lachaise Cemetery in Paris. His heroic death made him a French military icon, and in 1851 he was finally exonerated. A statue in his honor was unveiled at Carrefour Observatory on 7 December 1853, his aged wife and sons present to witness the ceremony.

## **Nile, Battle of the (1–2 August 1798)**

Decisive British naval victory. In the spring of 1798 the French prepared a strong naval armament at the great Mediterranean naval port at Toulon. The destination of this force, which was to convey thousands of troops under Bonaparte on an expedition to Egypt, was a closely guarded secret, prompting the Admiralty in London to dispatch a fleet commanded by Rear Admiral Sir Horatio Nelson to engage and destroy the French fleet, commanded by Vice Admiral François, comte de Brueys.

By the time Nelson reached Toulon the French fleet, consisting of 400 transports carrying 35,000 troops and escorted by 13 ships of the line and four frigates, had already sailed for parts unknown, though the British had their theories as to its purpose and destination: either an attack on Naples or Sicily; for the conveyance of an army to Spain,

ultimately destined for Portugal; or to pass the Straits of Gibraltar en route to Ireland. According to his instructions, Nelson could follow the French anywhere in the Mediterranean or the Black Sea, if necessary. As for Egypt, no mention was specifically made, and there is no evidence that the Admiralty ever imagined it to be Bonaparte's destination. Thus, Nelson had the entire Mediterranean to search, knowing as he did only that Brueys had left Toulon with a northwest wind.

Nelson made first for Corsica and reached Cap Corse on 12 June. Sailing down the coast of Tuscany he anchored in the Bay of Naples on the seventeenth, having received no intelligence from Civita Vecchia (the principal port serving Rome, now Civitavecchia) and a false report of the French at Syracuse as related by a North African vessel. At Naples Sir William Hamilton, the British ambassador, informed Nelson that the French had gone to Malta, and on the strength of this impression he sailed for the Strait of Messina, which he reached on the twentieth. From the British consul at Messina he discovered that in fact both Malta and Gozo had been taken and that the French were still in the vicinity of the latter island. Nelson proceeded through the strait, but on the twenty-second, when off Cape Passaro, he received news that the French had left Malta on the eighteenth with a northwest wind. Alexandria therefore appeared the likely destination, and so Nelson made for the southeast under full sail. No further intelligence was received during the journey to the Egyptian coast and when, on the twenty-eighth, the *Mutine* (16 guns) entered the harbor at Alexandria in search of the French fleet, her crew found no sign of the French or evidence that they had in fact reached Egypt at all.

Thus frustrated in his search, Nelson adopted a new course on the twenty-ninth, sailing northeast until he reached the coast of Anatolia on 4 July. After several days of adverse weather preceding more than a week of favorable winds, Nelson managed to anchor at Syracuse on the nineteenth in order to procure supplies and water. The fleet weighed again on the twenty-fourth. Quite convinced that the French were not to be found at or near Corfu, Nelson decided to investigate the harbor of Alexandria for a second time. First, however, he made for the Morea (the contemporary name for the southern Greek peninsula now known as the Peloponnese), where, off Cape Gallo on the twenty-eighth, he learned from the governor of Corfu that the French had been sighted about a month before off the coast of Candia (Crete), proceeding on a southeast course.

Nelson naturally headed in the same direction, and at 10:00 A.M. on 1 August he caught sight of Alexandria. This time, however, the place was clearly under French possession. The tricolor could be seen flying, and the harbor was filled with vessels. Yet it did not contain the ships of the line

that Nelson had sought for so long. The two ships sent in to reconnoiter discovered only transports and merchant vessels. Only eight ships of war, all insignificant, lay at anchor.

The question remained how the French had arrived undetected by Nelson's fleet. Having left 4,000 troops to garrison Malta, Brueys had sailed east, reaching the coast of Candia at Cape Durazzo on 30 June. From there he made for the African coast, and on reaching a point 70 miles west of Alexandria, followed the shore east and reached the city on 1 July. Troops were immediately sent ashore, and on the following day, after brushing aside light resistance, the city was taken by Bonaparte's troops. However, as Alexandria was not deemed suitable for the ships of the line and the frigates, on the eighth Brueys took his warships to Aboukir Bay, about 15 miles to the northeast.

The frustration among Nelson and the fleet at failing to discover the French fleet was, however, short-lived. Around 1:00 P.M. on 1 August the *Zealous* (74 guns) discovered seventeen warships, of which thirteen or fourteen lay in line of battle, anchored in Aboukir Bay. After receiving the signal, Nelson immediately hauled up and proceeded east with a strong breeze. After a long game of cat and mouse the rival fleets were finally to confront one another.

Aboukir Bay features a semicircular opening to the north about 16 miles across, with Aboukir Point on the west and the Rosetta mouth of the Nile to the east. Access to all but the smallest of vessels was, however, restricted by a chain of shoals and rocks extending to the north from Aboukir Point. The largest of these rocks, Aboukir Island, lies almost 2 miles from shore, and the French occupied and fortified both this place and the town of Aboukir, which lay at Aboukir Point. None of Nelson's ships could negotiate through the shoals and rocks making up this chain, and at the time of the battle the shoal stretched to the northeast for almost a mile beyond Aboukir Island. Thus, for Nelson's fleet, the entrance to the bay measured about 13 miles, and both its mouth and interior were completely uncharted by the British.

Brueys's ships stood at anchor in line, stretching to the southeast, toward the shore, with the leading vessel about 2,400 yards southeast of Aboukir Island. Toward its middle the line took on a slightly convex shape, extending slightly to seaward. At the northwestern end of the line lay the *Guerrier* (74), situated about 1,000 yards from the edge of the shoal that circled the island. About 160 yards separated the anchored ships, making the whole line about 2,850 yards. Between this line and the shore lay a shoal, though the distance between the two was not so great that ships could not pass between them. Here lay the essence of Brueys's faulty dispositions. About halfway between the shoal and his line Brueys placed his four frigates, all parallel with the ships of the line. His smallest vessels—bomb

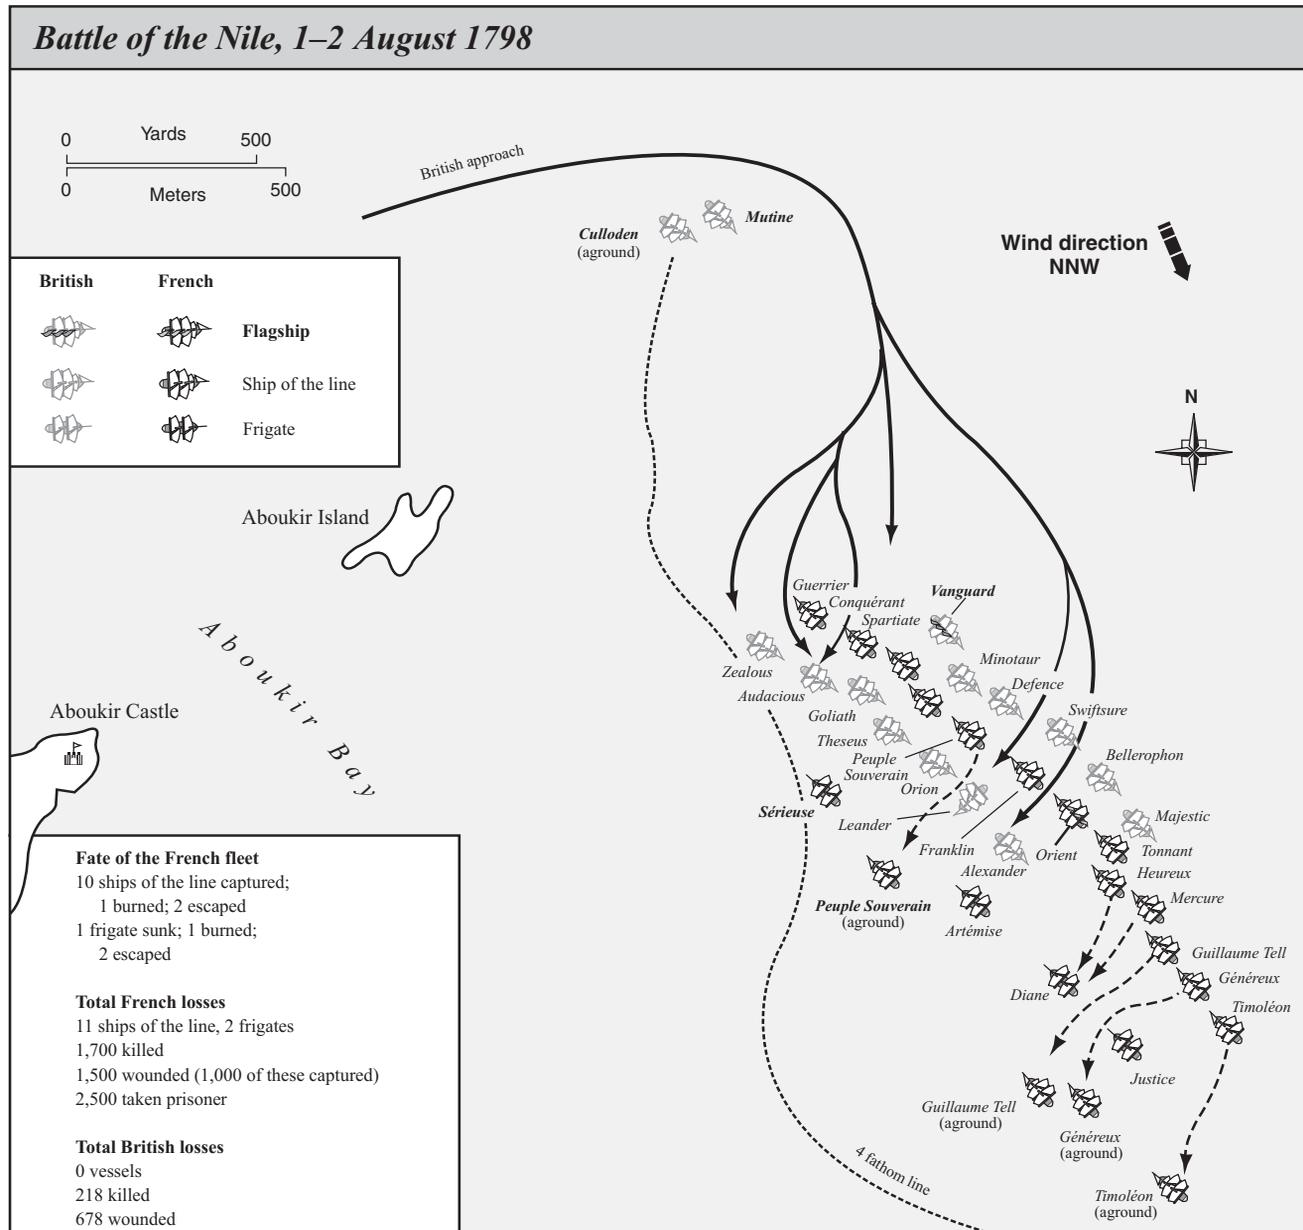

ships and gunboats—he placed closer to shore, near Aboukir Point. On Aboukir Island the French had four 12-pounders, two 13-inch mortars, and some other ordnance of still smaller caliber.

The first of Nelson's force came into view at 2:00 P.M., when the *Heureux* (74) signaled the approach of twelve ships of the line from the northwest. Brueys did not expect to fight, as was abundantly evident by the fact that a large number of men were on shore collecting water. The French commander immediately recalled as many as he could and transferred part of the frigate crews to his larger ships. At 3:00 P.M. he issued the signal to prepare for battle and sent two brigs, the *Railleur* and *Alerte*, to try to attract the attacking force on to the shoals. An hour later he discovered that in fact the British had a force of fourteen—not twelve—ships of the line, for the *Alexander* (74) and *Swiftsure* (74) had now come up with Nelson's fleet. As such, Brueys initially sought to weigh anchor, though when he realized that Nelson would not attack until the next day, he decided to remain in place.

Nelson issued the signal to prepare for battle at 3:00 P.M., and an hour later, with *Orient* (120), the French flagship, bearing southeast by south about 9 miles away, Nelson signaled for his fleet to prepare to anchor from the stern. Having issued this order, he indicated his intention to attack the French van and center. Having already briefed his subordinates with his plans should they find the French arrayed as they were in the end discovered, Nelson could now trust with confidence that his captains would carry out his intentions.

As the British approached, the *Railleur* and *Alerte* proved unable to distract Nelson's van, which ignored them entirely. At 5:30 P.M., as he approached the shoal off Aboukir Island, Nelson gave the signal for line of battle ahead and for his ships to position themselves astern of his flagship, the *Vanguard* (74), as his vessels found it possible to maneuver among the rocks. A short time later he called to the captain of the *Zealous*, asking whether he thought the ships could clear the shoal. A differing account relates that Nelson actually inquired about whether the depth of water would permit his ships to approach between the anchored French and the shore, rather than merely safely negotiating the shoal. If true, this would identify Nelson as the architect of the tactics actually employed in the battle. Nelson had no reliable chart of Aboukir Bay, and no captain present knew it firsthand—hence the investigation.

Nelson ordered Captain Samuel Hood, in the *Zealous*, to bear up and take a careful sounding, in order to guide the fleet safely into the bay. *Zealous* passed the head of the shoal with the *Goliath* (74) on her port bow, and the column arranged itself in order by signal: *Goliath*, *Zealous*, *Orion* (74), *Audacious* (74), *Theseus* (74), *Vanguard*, *Mino-*

Adapted from Fremont-Barnes 2001, 47.

taur (74), *Defiance* (74), *Bellerophon* (74), *Majestic* (74), and *Leander* (50). Far to the north stood the *Culloden* (74), and from a considerable distance to the west came *Alexander* and *Swiftsure*.

Battle commenced at 6:20 P.M., when the *Conquerant* (74), and then the *Guerrier*, fired on the *Goliath* and *Zealous*, and the battery on the island began ineffective shell fire. Ten minutes later the *Goliath* passed and raked the *Guerrier* before attempting to anchor on her port bow. Delay in lowering the anchor meant that instead the *Goliath* came to rest abreast of the *Conquerant's* port quarter. The *Sérieuse* (36) stood on *Goliath's* starboard bow, and against both vessels Captain Thomas Foley opened a brisk fire.

The *Zealous* also passed the head of the French line on the landward side and, in only five fathoms, brought up abreast the *Guerrier's* port bow. The sun now began to set, and British crews gave a cheer as the foremast of the *Guerrier* came down under the *Zealous's* fire.

The *Orion*, next in line, rounded the *Zealous*, passing her and the *Goliath*, firing her starboard broadside against the tiny *Sérieuse*, which had foolishly fired on the *Goliath*. The small ship suffered terribly for it, for the *Orion's* shot brought down her mast, cut her cable, and generally left her a sinking wreck. The *Goliath* then proceeded to anchor opposite the *Peuple Souverain* (74), though farther from that vessel than Captain Sir James

Saumarez originally intended—a consequence of having to alter course slightly to engage the *Sérieuse*, and so as to avoid running foul of the *Theseus*, which stood anchored dead ahead of him.

At the same time the *Audacious*, passing between the *Guerrier* and the *Conquérant*, anchored to within 50 yards of the latter's port bow. The *Theseus*, meanwhile, sailed around the lead vessel in the French line and proceeded on a course between it and the *Zealous* and *Goliath*, which were already anchored. The *Theseus* then laid anchor by her stern, about 300 yards abreast of the *Spartiate* (74).

Nelson, meanwhile, in the *Vanguard*, chose not to cut through the French line, instead anchoring at 6:40 P.M. about 80 yards off the *Spartiate*'s starboard beam. Next in line, the *Minotaur*, passed the *Vanguard* and anchored abreast of the *Aquilon* (74) at 6:45. Following her came the *Defence*, which passed the *Minotaur* and at 7:00 bore up on the beam of the *Peuple Souverain*.

The situation as of 7:00 P.M. therefore stood thus: The first five ships in the French van were opposed to eight British, five on their port, or landward side, and three on their starboard, or seaward side. As darkness was well underway, about this time British vessels began to hoist lights in their rigging according to the directions laid out by Nelson before the action in order to facilitate recognition.

Around the same time the *Bellerophon* anchored abreast the starboard side of *Orient*, and a short time later the *Majestic* maneuvered herself into the same position with respect to the *Tonnant* (80).

As for the *Culloden*, at about 6:40 P.M., while attempting to negotiate the head of the shoal, she had run aground, preventing her from taking part in the fighting. This event held up the progress of the *Leander* for a while, but she soon worked around the *Culloden* and made for the French line. The ship's company aboard *Culloden*, together with her extremely agitated captain, Thomas Troubridge, tried every means to refloat her, but to no avail. The *Mutine* anchored nearby to assist, but the *Culloden* was unable to clear herself of the shoal until 2:00 A.M. on the following morning, by which time she had lost her rudder and sprung a serious leak, which brought in seven feet of water an hour. Nevertheless, Troubridge had had the sense to warn the *Alexander* and *Swiftsure* as they approached so as to prevent a collision, and they managed to clear the shoal without incident.

The *Swiftsure* reached the center of the French line shortly after 8:00 P.M., but by that time she had been dismantled and was drifting without lights or her colors. Captain Benjamin Hallowell, in the *Swiftsure*, on falling in with an unidentified vessel, hailed her and was told she was the *Bellerophon*, now disabled and withdrawing from the action. In the darkness and smoke of battle Hallowell could

not be certain of his position, but knowing that he was in close proximity to the French line, he immediately bore up and passed the *Franklin* (80), anchoring a cable's distance on the starboard bow of the *Orient*.

A short time earlier the *Peuple Souverain* had lost her cable and left the line of battle. In the meantime the *Leander*, positioning herself in the gap left by the *Peuple Souverain*, had anchored athwart the *Franklin*'s bow, thus enabling her to rake the *Franklin*, and those vessels astern of her, with her port side guns. At the same time she could also rake the *Aquilon*. In the meantime the *Alexander* had cut through the French line astern of the *Orient* and had anchored by the bow of the flagship's port quarter.

The *Guerrier* took a tremendous pounding from several British vessels, in the course of which she was completely dismantled. The *Zealous*, anchored on her port bow, raked the *Guerrier*, as did the *Orion*, *Theseus*, *Audacious*, and *Goliath* as they passed her to take up their appointed positions. Notwithstanding this punishment, the *Guerrier* fought on valiantly until past 9:00 P.M., when she hauled down her colors to the *Zealous*. The next in line, the *Conquérant*, first fought the *Goliath* before being raked by the *Audacious*. Once both British ships applied steady fire in unison the *Conquérant* could not continue the fight for more than 10 minutes, and by the time she surrendered her fore mizzenmasts had come down, leaving her dead in the water. The *Spartiate*, which fought first the *Theseus*, joined soon after by the *Vanguard*, also took long-range fire from the *Minotaur* and later the *Audacious*. *Spartiate* received some support from her next astern, the *Aquilon*, which offered fire from her port side against the bows of the *Vanguard*. Nevertheless, eventually the *Spartiate* lost all her masts, and shortly after 9:00 P.M. she surrendered.

The *Aquilon* fought principally with the *Minotaur* and, to a lesser extent, the *Theseus*, which stood somewhat farther away than her consort. At 9:25, having taken great punishment, including the loss of all her masts, the *Aquilon* struck. Meanwhile, the *Peuple Souverain*, heavily engaged with the *Defence* and *Orion*, was quickly deprived of her fore- and mainmasts, and had her cable shot away. As a result the *Peuple Souverain* fell abreast of the *Orient*, dropped anchor, and ceased firing.

For some time the *Franklin* had no contender nearby but was distantly engaged with the *Orion*. Later, however, the *Leander* found a position in which to rake her successfully, to be joined by the *Swiftsure*, who could fire from her starboard quarter and stern. These were joined by the *Defence* and then—after finishing with the *Aquilon*—the *Minotaur*, which could direct fire at the *Franklin*'s starboard bow and beam.

Turning now to Brueys's flagship, the *Orient*, she first became engaged with the *Bellerophon*, which lay anchor

The decisive British victory at the Battle of the Nile left Bonaparte's army stranded in Egypt and reestablished the Royal Navy's dominance in the Mediterranean. (Engraving by J. Le Petit after J. Arnold from *The Life and Services of Horatio, Viscount Nelson . . . from his Lordship's Manuscripts* by James Stanier Clarke and John McArthur. London: Fisher, Son, 1840)

next to that vessel. However, *Orient's* greater number of guns began to tell, and by 7:50 P.M. the *Bellerophon* was without her mizzenmast. Her mainmast fell over the starboard bow soon thereafter and fire broke out in a number of places. By 8:20 she was completely disabled. Finding the *Bellerophon* could no longer sustain the fight, Captain Henry d'Esterre Derby set the spritsail, cut the ship's stern cable, and moved off.

However, when the fore-topsail was set, the heavily damaged foremast collapsed. The *Tonnant* then directed her fire on the disabled *Bellerophon*. But the attack on the *Orient* was not abandoned, for the *Swiftsure* and *Alexander* soon joined the action, and by 9:00 P.M. the *Orient* had caught fire. By this time Brueys had already been injured twice, and around 8:00 P.M. he was mortally wounded by a round shot. Refusing to be taken below, he declared that he must die on his quarterdeck. By the time the flagship had caught fire the admiral was dead. Shortly thereafter the flag captain fell, severely wounded as the ship was reduced to a floating wreck.

The fire could not be brought under control, and from the deck the flames spread to the rigging. The crews of the

vessels nearby, knowing the end was near, steered their ships clear or took other precautions: clearing the decks of ammunition and preparing teams of men carrying buckets of water. Finally, around 10:00 P.M., when the flames reached her magazine, the *Orient* went up in a tremendous explosion, causing severe damage to the ships nearby and sending burning wreckage high into the air, much of which rained down on the *Swiftsure*, *Alexander*, and *Franklin*. These last two were set alight as a result, but their respective crews had no trouble extinguishing the fires.

The shock of the explosion brought a complete lull in the fighting for several minutes. The heavily damaged *Franklin* was the first to resume firing, but her resistance collapsed when, having lost her main- and mizzenmasts to the fire of the *Defence* and *Swiftsure*, she struck her flag. Thus, by midnight every French ship ahead of the *Tonnant* had either surrendered or been destroyed. The *Tonnant*, however, heroically carried on the fight. Thus far she had been chiefly occupied in opposing the *Majestic*, who had in the course of this lost her main- and mizzenmasts. Farther away, the *Swiftsure* and *Alexander* also directed their fire at her.

Eventually her assailants deprived *Tonnant* of her masts, the debris of which rendered firing impossible. Undeterred, she let out her cable, so shifting into a new position from which she earned a temporary respite from the action. On board, her captain, Aristide Aubert Depetit-Thouars, had shown unparalleled bravery. Despite having lost both arms and a leg to three different round shots, he refused to be taken to the cockpit for treatment, instead having himself deposited in a barrel filled with bran. From there he gallantly carried on directing his vessel until massive blood loss rendered him incapable of further command. He had not lost the opportunity, however, of ordering that the crew nail the tricolor to the mast and go down with the ship rather than surrender her.

With the French van captured or destroyed, the *Tonnant* found herself the leading vessel in what amounted to a new line, which now extended leeward of the former one. Of these vessels, all remained fresh and untouched except for the *Tonnant*. They joined the engagement around 4:00 A.M. on the second and, as dawn approached, they exchanged long-range fire with the *Alexander* and the *Majestic*. Meanwhile the *Theseus* and *Goliath* proceeded southeast and anchored on the starboard side of the frigate *Artémis* (40), which fired only one broadside, at the *Theseus*, and then surrendered. Possession was only temporary, however, for she was on fire and was eventually destroyed in the inevitable explosion. Elsewhere, the French rear and the last two frigates had shifted considerably to leeward, placing them virtually out of range. In the cases of the *Heureux* and *Mercure* (74), these vessels succeeded in the desperate expedient of running themselves ashore to escape destruction.

At 6:00 A.M. the *Zealous*, *Goliath*, and *Theseus* weighed anchor. The *Zealous* then went in pursuit of the frigate *Justice* (40), which was proceeding toward the crippled *Bellerophon* with the intention of obliging her to strike. But the *Zealous* foiled this plan and remained to protect the *Bellerophon*.

Meanwhile, the *Alexander* and *Leander* pursued the *Heureux* and *Mercure*, which, after a brief exchange of fire, they obliged to surrender. While this accounts for the activities of the *Zealous*, *Goliath*, *Theseus*, *Alexander*, and *Leander*, this left a number of French vessels virtually or, in some cases entirely, unengaged: the *Guillaume Tell* (80), *Généreux* (74), *Timoléon* (74), *Tonnant*, *Diane* (40), and, eventually, the *Justice*, which it will be recalled, had to abandon her attempt to menace the *Bellerophon*.

The *Tonnant*, completely dismasted, sat dead in the water. The *Timoléon* had managed to get herself among the shoals to leeward, and in the course of trying to make sail on the port tack, inadvertently beached herself on shore. Brueys's other ships, however, had room for maneuver and

duly took advantage of the fact by hauling close on the port tack and making their best efforts to escape. On seeing this, the *Zealous* gave chase, and within a few minutes found herself singlehandedly taking on the four fresh ships and trying to block the path of the rearmost frigate. The possible results cannot now be known, for Nelson recalled her, in consequence of which Brueys's successor, Rear Admiral Pierre de Villeneuve, escaped with the *Guillaume Tell*, *Généreux*, *Diane*, and *Justice*. Every other vessel in the French fleet became a British prize or was destroyed either on the day of battle or shortly thereafter.

On the morning of the third, the *Theseus* and *Leander* confronted the *Tonnant* and compelled her to surrender, while later that day the crew of the *Timoléon*, having been grounded, set her ablaze and abandoned her to eventual explosion. The fates of the remaining vessels were thus: The *Généreux* was captured on 18 February 1799, followed by the *Guillaume Tell* on 30 March, and the *Diane* two years after the Nile, on 24 August 1800. Finally, the *Justice* fell into British hands on the French surrender of Alexandria on 2 September 1801.

Almost without exception, Nelson's ships suffered damage aloft, with the *Bellerophon* losing all three masts, and the *Majestic* losing her main- and mizzenmasts. No other vessels lost lower masts, and damage to topmasts was generally minor. A few vessels, including the *Bellerophon*, *Majestic*, and *Vanguard* received serious damage to their hulls. Total British casualties were 218 killed and 678 wounded. Among the wounded was Nelson himself, struck in the forehead by a splinter early in the fighting, which had brought down a piece of skin over his eye, but which appeared to be minor. Later however, at Naples, his sometimes erratic behavior and severe headaches may have been the result of this otherwise apparently superficial head wound.

Those French ships that bore the brunt of the fighting, that is, the van and center, naturally suffered severe damage. Five of these lost all three masts and endured such appalling punishment to their hulls that they could barely remain afloat. Two other vessels possessed a single mast each, but their hulls were riddled with shot. French losses are not known with any certainty but are estimated at approximately 1,700 killed, 1,500 wounded (of whom approximately 1,000 were captured), and 2,500 taken prisoner. Brueys, it will be recalled, was among the dead, together with four captains.

The Nile ranks as one of Britain's greatest naval triumphs and certainly was the most complete victory at sea during the eighteenth century. Even without counting the guns of the *Culloden*, which, it will be recalled, was grounded and consequently took no part in the battle, Nelson was inferior to Brueys in both tonnage and, by a nar-

row margin, guns. True, Nelson had fourteen ships to Brueys's thirteen, but while the former's ships carried 1,012 guns, the French had 1,026, not counting the frigates. The French mounted, moreover, in general, heavier caliber guns and thus fired heavier broadsides from larger ships.

By way of comparison, Nelson's largest vessel was the *Minotaur*, of 1,718 tons, yet the *Spartiate* weighed 1,949, the *Franklin* 2,257, and the *Tonnant* 2,281 tons. Several other French ships, including the *Orient* and the *Guillaume Tell*, were also superior in size to any other ship available to Nelson. The British labored under still further disadvantages: the *Culloden* took no part in the action, and Nelson had no frigates, while the French had four, mounting 152 guns in all, in addition to a battery on shore.

By any standards, therefore, it was a brilliant victory for the British: Both sides fought with dogged determination and by dawn on the second Nelson had more than defeated a numerically superior opponent—he had all but annihilated his fleet. That Nelson actually ruined Bonaparte's plans for the conquest and rule of Egypt may be an exaggeration, but clearly Bonaparte thereafter could not look to reinforcement and the Mediterranean could no longer be regarded as the preserve of the French.

Victory can be attributed to a number of factors, above all to Nelson's immediate determination to engage Brueys with imaginative tactics, as well as to the superiority of the British crews' morale and training. By isolating a portion of the French line by striking its van and center from both sides, Nelson attained a temporary superiority in ships and guns to which Brueys could offer no effective answer. This underlines the negative, not simply the positive, factors responsible for British victory. Although personally brave, Brueys demonstrated extremely poor judgment in disposing his ships. Formed into an angle, at the apex of which sat the *Orient*, they were incapable of mutual support. Against the advice of his officers Brueys chose to remain at anchor, thereby passing the initiative to Nelson. Moreover, he refused to the last moment to believe that the British would—even were they to discover his position—attack him at his apparently secure anchorage.

If this were not folly enough, Brueys failed to ensure that, if he were wrong and the British did wish to engage, he was in a position to know this well in advance. In short, though Brueys possessed many frigates and other small, swift vessels, both with him at Aboukir Bay as well as at Alexandria, he had failed to dispatch any patrols to watch for signs of British naval activity, and thus had absolutely no intelligence on the approach or strength of Nelson's fleet when it eventually surprised him.

Nor did Brueys even bother to take soundings of the waters of Aboukir Bay or the passage through which, if the British were to appear, they might pass between the head of

the French line and Aboukir Island, so enabling them to attack from landward as well as seaward. Proper consideration of his situation would have led a more competent commander to at least assume an enemy could maneuver around the head of his line. With such knowledge he could shift his ships toward shore, maneuver them so as to block passage round their head, or, at the very least, clear for action both to starboard and port. Brueys took none of these simple, yet crucial, precautions in improving his defense.

Further evidence of the wholly inadequate manner in which the flagship itself prepared for action may be gleaned from the fact that no efforts were made to remove the cabin partitions that had been specially erected to accommodate military and civilian passengers accompanying the fleet. Nor did Brueys's subordinates commanding the rear (six) ships of the line and the frigates assume any initiative to support their consorts in the center and van. Disaster might have been averted had the rear got underway, stood out from the bay, and opposed the five or six British vessels that had yet to join the engagement. In so doing they would doubtless have taken the *Culloden*, marooned as she was on the shoal, and denied passage of the *Alexander* and *Swiftsure* into the bay. Until about 7:00 P.M. the six ships of the French rear might yet have changed the whole course of the battle by taking advantage of the wind as it then blew, to leave the bay, tack when the wind shifted north as it eventually did, and operate as the new French van.

Of the nine vessels taken as prizes, three of them—the *Guerrier*, *Heureux*, and *Mercure*—were so severely damaged as to fit them only to be burned by their captors. The *Peuple Souverain* was renamed *Guerrier* and left at Gibraltar as a guardship. The other five ships reached Plymouth and were added to British service: The *Franklin* was altered to *Canopus*, the *Aquilon* changed to *Aboukir*, and the other three preserved their original names. On 5 August Nelson sent dispatches on the outcome of the battle to the commander in chief of the Mediterranean fleet, Lord St. Vincent, care of Captain Edward Berry of the *Vanguard*, who while proceeding in the *Leander* was captured en route to Cádiz by the *Généreux*. However, Thomas Bladen Capell, a lieutenant from the *Vanguard*, sailed for Naples by sloop on the thirteenth with duplicates and eventually reached London overland. On the following day, the bulk of the fleet, under Sir James Saumarez, including those prizes deemed worthy of retention, weighed, and on the fifteenth they headed west. Four days later Nelson, in the *Vanguard*, accompanied by the *Culloden* and *Alexander*, steered for Naples, leaving at Alexandria the *Zealous*, *Goliath*, *Swiftsure*, *Seahorse* (28), *Emerald* (36), *Alcmène* (32), and *Bonne Citoyenne* (20), all under the senior officer among them, Captain Samuel Hood.

## Nive, Battle of the (9–13 December 1813)

Fought in southwestern France between Anglo-Portuguese and French forces during the final months of the Peninsular War.

At the end of the Battle of the Nivelle, Marshal Nicolas Soult withdrew his forces to the area immediately around the strongly defended town of Bayonne, in southwestern France close to the Spanish border. Throughout the Peninsular War Bayonne had been the main depot for the French army and was fiercely loyal to Napoleon. The town's defenses were based on the sound principles laid down by the great French engineer Sébastien le Prestre, seigneur de Vauban. To the west of the town lay the Atlantic and to the east the river Adour. On the northern bank of the Adour lay a strong citadel that commanded the town, while the ground to the south of Bayonne was bisected by streams, woods, and enclosures, the ground itself being very muddy and soft after several days of hard rain.

The Marquis of (later Duke of) Wellington planned to approach the town from both the south and east, an advance from this latter direction being intended to threaten Soult's communications with the interior of the country. In deciding upon this course of action Wellington was taking a calculated gamble, because he would have to divide his army in two, part of it advancing along the Atlantic coast from the south, while the remainder would cross the river Nive—which flows southeast from Bayonne—and approach from the east.

Soult himself had established a defensive line running southeast from Bayonne along the right bank of the Nive as far as Cambo. The line was defended in strength,

and a flotilla of boats on the Adour enabled troops to be ferried from one bank of the Nive to the other without any trouble.

The Allied army was reduced in numbers at this stage of the war following Wellington's decision to send all the Spanish troops, except General Pablo Morillo's, back to Spain. This was as a result of numerous unsavory incidents involving the Spaniards who sought revenge after years of French persecution. Disorder was rife among them, something which Wellington could ill afford. He could not risk the possibility of a resistance movement similar to that which had dogged the occupying French in Spain and so ordered them home. Nevertheless, Wellington still had 63,500 men at his disposal, slightly fewer than Soult, but had a distinct numerical advantage in cavalry, 8,000 against Soult's 600. Unfortunately, there was little scope for effective use of cavalry over the ground around Bayonne.

The operations against Bayonne were hampered by bad weather, and it was not to be until 9 December that the operation to cross the river Nive got under way, when Sir Rowland Hill, with the 2nd Division, and General Carlos Le Cor's Portuguese division, crossed at fords close to Cambo, while Sir William Beresford, with the 3rd and 6th Divisions, was to cross the Nive by pontoon bridge at Ustaritz.

Having seen Wellington divide his army, Soult was quick to seize his opportunity, and on the evening of 9 December, amid heavy rain, some 50,000 troops under General Jean-Baptiste Drouet, comte d'Erlon began to move silently forward from Bayonne ready for the attack the next day. Shortly after dawn on the gloomy, misty morning of 10 December Sir John Hope's 1st and 5th Divisions, some 30,000 troops, were attacked and driven from Anglet by d'Erlon, who then advanced as far as Barouillet. On Hope's right the Light Division was attacked and driven back 2 miles to the village of Arcangues, where it held on grimly throughout the rest of the day in what was one of the most peculiar duels of the Peninsular War.

The church at Arcangues was quickly crowded with men of the 1st battalion 43rd Foot (1/43rd) who were soon engaged in a duel with some French artillery. The Light Division had been pushed back by four French divisions before finally drawing itself up on a position on a ridge astride the village of Arcangues. The French guns were situated on some ground about 400 yards from the church and presented a nice target to the highly trained and experienced veterans of the 43rd. The old church's interior galleries were quickly manned, the 43rd smashing in the windows to open fire, while others threw themselves into firing positions in the churchyard. Although the church was hit about eight times by round shot that smacked into the walls, the 43rd's marksmen wrested the initiative from the exposed French gunners, forcing them to withdraw, leav-

ing the British as victors and having left behind them twelve guns.

Throughout the next two days, heavy fighting raged across the area as Soult attempted to throw back that part of Wellington's force that remained on the left bank of the Nive. The attempt failed, however, and so Soult turned his attention to Hill's force, numbering about 14,000 men, which was still on the right bank of the river. The British force here had been severely reduced when Wellington ordered Beresford to re-cross to the left bank following Soult's attack on the tenth. To meet the impending threat against Hill, Wellington again ordered Beresford to return to the right bank, but the pontoon bridge connecting the two halves of the Allied army was swept away on the night of the twelfth, after heavy rain had caused the river to swell. This left Hill isolated with a relatively small force, which was now attacked by 35,000 French troops who had come forward from their positions in and around Bayonne.

The ensuing battle, although officially part of the Battle of the Nive, is often called the Battle of St. Pierre by the British, the French choosing to call it Mouguerre, after a small village above which now stands an obelisk to the memory of Marshal Soult.

The Battle of St. Pierre was a bloody and, for Hill, a close one, which swayed one way and then the next, as troops on both sides were thrown helter-skelter into the action. Ground lost by the Allies was regained at bayonet point, until by noon Hill was throwing in the last of his reserves. However, with the pontoon bridge at Villefranque having been repaired, two British divisions, the 4th and 3rd, were thrown across, the 6th coming up from Ustaritz, and by the time Wellington arrived Hill was assured of victory. Wellington's arrival heralded the start of a general advance that forced Soult back into Bayonne. It was a close call—Sir William Napier, the great historian of the war, called it the most desperate of the whole conflict—and losses were high: 1,500 on the Allied side and about 3,500 on the French.

When Soult returned to Bayonne, he no doubt reflected on his failure to defeat Wellington, having attacked half of the Allied force with the whole of his own on two occasions. His attack had failed, however, and the morale of his troops sank even further. In order to avoid being cut off in Bayonne, he withdrew the bulk of his force east along the Adour after leaving about 10,000 troops under General Pierre Thouvenot to defend Bayonne.

The Battle of the Nive brought an end to the year's campaigning, and the Allied troops settled into camps to the south and east of Bayonne as the cold winter weather set in. The crossing of the Adour would mark the resumption of Wellington's operations in 1814.

### **Nivelle, Battle of the (10 November 1813)**

Fought between Anglo-Portuguese and French forces along the river Nivelle, in southwestern France, during the final months of the Peninsular War.

On the very day that San Sebastian fell to the Allies Marshal Nicolas Soult made one last desperate attempt to relieve the place. The attempt ended in failure, however, and the relieving troops were ordered to withdraw. Consequently, 10,000 French troops under General Lublin Martin Vandermaesen pulled back toward Vera and the fords there across the river Bidassoa, which they had crossed that morning. Unfortunately for them, the level of the river had risen dramatically and the only way across it was via the bridge that spanned the Bidassoa at Vera.

However, as they approached it they found their way blocked by Captain Daniel Cadoux of the 95th Rifles. The French were left with little choice but to attack Cadoux and his small party of men whom the French thought would take little brushing aside. In the event, Cadoux held on for two hours, inflicting 231 casualties on the French, including Vandermaesen himself, who was killed. While the fighting was in progress Cadoux sent repeated requests to General John Skerrett, who was acting commander of the Light Division and aware of the action, but he did nothing; otherwise the whole of the French division might have been forced to surrender. No support was given to Cadoux, and finally the 95th were forced to give way. Cadoux was killed,

along with sixteen of his men, while three other officers and forty-three men were wounded. With the withdrawal of the 95th the French were able to gain the safety of the opposite side of the river.

There was no let-up in the Allied operations following the fall of San Sebastian. The winter rains were due, and the Marquis of (later Duke of) Wellington was anxious that his army get as far into France as was possible before the condition of the roads became too poor. At dawn on 7 October Wellington's army crossed the Bidassoa, the first of a series of rivers that had to be negotiated by Wellington's army before he could push on into the heart of France. Waiting to guide the British troops across were some local shrimpers who led the men out across the river, which, in spite of its wide estuary, came up only as far as the men's waists at most. The audacious crossing caught the French by surprise all the way along the river, and as Wellington's men scrambled on to the opposite bank the French troops made good their escape, only in a few places remaining to dispute the crossing. By the end of the day the operation to cross the Bidassoa had been a complete success with just 1,200 Allied casualties against 1,700 French.

Once across the Bidassoa and having established his army in France, Wellington's next objective was to clear away the French from their positions in front of the river Nivelle. Soult's lines stretched from the shores of the Atlantic on the French right flank to the snow-covered pass of Roncesvalles on the left, while the 16 miles between the pass of Maya and the sea roughly followed the line of the Nivelle, thus giving the battle its name.

The line was marked by a series of hills, upon the summits of which the French had constructed strong redoubts, some containing artillery. These redoubts ran from Finodetta on the extreme left flank of the French position, to Fort Socoa, on the coast opposite St. Jean de Luz. Although Soult's overall position grew in strength as he fell back on his base at Bayonne, he did not have enough men to man the lines in depth and was severely overstretched, the 20 miles of front being defended by just 63,000 men. Wellington's force, on the other hand, numbered 80,000, although 20,000 of these were Spanish troops, many of whom were as yet untried in battle.

Wellington planned to advance along the whole length of Soult's line but would concentrate his attack on the center in particular. Any breakthrough here, or on the French left flank, would enable his men to swing north and cut off the French right flank. On the Allied left, Lieutenant General Sir John Hope would advance with the 1st and 5th Divisions and Major General Manuel Freire's Spaniards. Marshal Sir William Beresford would lead the main Allied attack against the French center with the 3rd, 4th, 7th, and Light Divisions, while on the Allied right Sir Rowland Hill would attack with

the 2nd and 6th Divisions, supported by General Pablo Morillo's Spaniards and Lieutenant General John Hamilton's Portuguese. All preparations for the attack having been made, Wellington decided to attack on 10 November.

The French defensive line was dominated by the Greater Rhune, a gorse-covered, craggy mountain some 2,800 feet high. The mountain is fairly accessible to anyone on foot, the rocky spurs only becoming impassable toward the top and on the eastern side. Separated from the Greater Rhune by a ravine, some 700 yards below it, is the Lesser Rhune, along the precipitous crest of which the French had constructed three defensive positions. If the French defenses on La Rhune could be taken, Soult's position would become very precarious as his lines would then be open to Allied attacks from different directions.

The summit of the Greater Rhune was occupied by French troops but, following the crossing of the Bidassoa and the subsequent clearing of the French from their positions along the Bayonet Ridge above Vera, they evacuated it, fearing an outflanking movement that would leave them cut off from their own forces. Before he could consider attacking the redoubts Soult first had to turn his attention to the French defenders along the crest of the Lesser Rhune. This position was a strong one, as the southern face of it could not be assaulted, owing to the precipitous slopes that led to the summit. It was possible, however, to attack the three fortified positions by moving down into the ravine before turning to the left, which would enable the attacking force to take the French in their flank and sweep them from the crest. Wellington chose the Light Division for the task.

Shortly before dawn on 10 November the division carefully picked its way down from the top of the Greater Rhune and into the ravine in front of the Lesser Rhune. Once this had been done the men were ordered to lie down and wait for the order to attack; then suddenly, British guns fired from the top of the nearby Mount Atchubia as the signal for the attack to begin. The men of the 43rd, 52nd, and 95th—with the 17th Portuguese Caçadores in support—swept forward up the steep slopes to assault the French positions that ran along the crest to flush the defenders from their rocky redoubts. The men were exhausted by their efforts, but the surprise and boldness of their attack won the day and soon those defenders who had not been killed or taken were tumbling down the Rhune toward the redoubts atop the hills below.

While the 43rd and 95th were going about their business, there still remained one very strong star-shaped fort down below on the Mouiz plateau, which reached out toward the coast. This was attacked by Sir John Colborne's 52nd Light Infantry, supported by riflemen from the 95th. Once again, surprise was the key to their success, and as they sprang up from their positions in front of the fort the

startled French defenders, in danger of being cut off, quickly fled, leaving Colborne in possession of the fort and other trenches. It had been accomplished with hardly a single casualty.

Following this, Wellington's main assault began as nine Allied divisions advanced on a front of 5 miles, French opposition melting away before them; when the bridge at Amotz fell to the 3rd Division—it was the only lateral communication between the left and right halves of the French army—Soul's position fell with it. This meant that Soul's army was effectively cut in two. By 2:00 P.M. the French were defeated and were in full retreat across the Nivelle, having lost 4,351 men to Wellington's 2,450.

Wellington might have pursued the defeated French even farther, and there was a very real chance that he might cut off the French right flank. However, darkness was falling and, never one to risk the perils of a night attack, he called a halt to the day's proceedings, and his men camped that night upon the ground they had won during the day.

## Nore, Mutiny at the (12 May–14 June 1797)

The Royal Navy experienced two serious mutinies in 1797. On 15 April the Channel Fleet at Spithead refused to put to

sea, the men demanding an increase in pay, improved food, better treatment of the sick, and an entitlement to shore leave. By 17 May most of the seamen's demands had been met, in principle at least, including a King's Pardon for all the mutineers. However, the mutiny at the Nore, beginning on 12 May, had political undertones.

The Nore anchorage was situated in the Thames Estuary, just off the entrance to the river Medway. Ships sailing down the Thames from Deptford and Woolwich would assemble here alongside ships from Chatham. It was the main assembly point for the squadrons blockading the Dutch coast, and protecting the Straits of Dover.

While the mutiny at Spithead was concerned with conditions in the navy, the mutiny at the Nore was more serious and more violent, and was influenced by radicalism. It has been asserted that some men had joined the navy on board these ships with the express intention of fomenting disturbance and revolution. There were certainly a number of "sea-lawyers" among the lower decks, including Richard Parker, who was elected as the overall leader. Parker was a man of some education and had been a naval officer, but had been reduced in rank because of disobedience.

Despite the Spithead mutineers having achieved redress for their grievances, the Nore mutineers added demands of their own. They wanted shore leave, punctual pay, pardon of former deserters who had reenlisted, and more equal distribution of prize money. The mutiny soon spread to the North Sea Fleet, based at Yarmouth, leaving the blockade of the Dutch coast to only two ships, the *Venerable* (74 guns) and *Adamant* (50 guns), under Admiral Adam Duncan.

The Admiralty rejected all the demands and put pressure on the mutinous ships by depriving the vessels of provisions and refusing to receive the sick for treatment ashore. On shore, General Sir Charles Grey concentrated troops and artillery. Other ships were brought to the area to counter the mutineers. This prompted the mutineers to blockade the Thames to disrupt trade, which caused the value of government stock to fall dramatically.

The Admiralty stood firm, and public opinion was against the mutineers. The seamen sensed that they would not have an easy victory, and by 10 June several ships returned to their duties. The leading ship in the mutiny, the *Sandwich*, surrendered on 14 June, along with Richard Parker.

Thirty-five men, including Parker, were hanged, nine flogged, and twenty-nine imprisoned, and the mutineers gained no concessions from the Admiralty. While the mutinies at Spithead and the Nore seriously incapacitated the fleet, Britain's enemies failed to exploit the situation quickly enough, and many of the ships involved in the

mutiny fought and won the Battle of Camperdown later that year.

### North Holland, Campaign in (1799)

In 1799 the Second Coalition was formed and hostilities on the Continent resumed for the first time since April 1797. With war already raging in Switzerland and Italy, the coalition decided to put pressure on the French from the north as well, resulting in a joint Anglo-Russian invasion of North Holland.

The French had conquered the Dutch Republic in 1795. Renamed the Batavian Republic, it had been a vassal state since, and the Allies assumed that the population would be eager to return to the status quo ante and would welcome the restoration of the stadtholderate. The expeditionary force consisted of 12,000 men under the command of Lieutenant General Sir Ralph Abercromby, supported by a fleet of 26 ships of the line and some 150 smaller vessels and gunboats under the command of Vice Admiral Andrew Mitchell. The invasion commenced on 27 August when 2,500 troops disembarked on a stretch of coastline between the Helder and Callandsog, covered by a barrage of naval fire.

The invading British troops stormed the dunes, which were defended by a few battalions of Batavian *Jägers* and line infantry. There was hardly any space to maneuver, as this part of North Holland was in those days hardly more than a narrow corridor of beach, dunes, and a road on a dyke leading from Callandsog to the Helder, bordering the Koegras to the east, a swampy area descending into the Zuiderzee. The Batavians were forced to retreat into the Koegras. The British continued to disembark and, now organized sufficiently, forced further Batavian forces that blocked their way to the south toward Callandsog. The Helder was evacuated as it was deemed impossible to hold—tactically perhaps a viable decision, but a severe blow to morale. After the invasion the Batavians had initially taken position in the Zijpe-

polder, but that line was abandoned shortly after for a line between Alkmaar and Avenhorn more to the south. The British thereupon took up a position at the river Zijpe and took the Helder. Shortly after, the Batavian fleet surrendered at de Vlieter in the Zuiderzee as the crew mutinied after Mitchell flew the Orange banner (representing the former, independent government).

In the course of the following days both sides were continually reinforced, the British by fresh troops from overseas (the Russians did not yet take part, with the exception of a token force of marines), the Dutch by further Batavian troops on the right flank and by French troops on the left. Abercromby now had around 18,000 troops and General Guillaume Brune, Supreme Commander of the Franco-Batavian forces in the Batavian Republic, 25,000. The latter decided to take advantage of his numerical superiority and attack on 10 September. However, the marshy polders, broken up by brooks and gullies, were very difficult to negotiate, and Brune was forced to divide his troops in three narrow columns to make adequate use of roads and dykes. Through bad communication, inadequate intelligence, and general confusion this attack led to nothing.

Two days later 17,500 Russians disembarked, doubling Allied numbers to around 35,000 and leaving Brune outnumbered. On the thirteenth the Duke of York arrived and assumed supreme command. He decided to make use of this numerical superiority, and on the nineteenth he attacked, like Brune, dividing his army into columns. The brunt of the assault would be sent along the North Sea coast and would consist of 2,500 British troops and 9,000 Russians under the Russian general Ivan Hermann. Two columns in the middle would attack and pin Brune's troops in the center while a column on the extreme left under Abercromby would march along the Zuiderzee to outflank the Batavians on the right. The attack had about as much success as Brune's. Hermann's troops became confused, and although he reached Bergen, he there lost control over them and, surprised by fresh Franco-Batavian troops while sacking the town, the Allies were swept back to a position along the Zijpe. The center columns were beaten back and Abercromby, who had taken Hoorn, retreated to prevent his being cut off from the main body.

As a result of its resistance the Batavian command won valuable time to regroup and reinforce, and part of north Holland was inundated to hinder even more an attack farther inland. In addition, the Anglo-Russian forces in the swampy north started to suffer from disease, creating an even less enviable situation. On 2 October York attacked again, now concentrating the bulk of his forces on the coastline, a second column making an attack to pin the Batavian troops on the right flank. York surprised the French, who held this part of the defensive line on their own and broke

through to Egmond aan Zee, forcing the French back to Wijk aan Zee and threatening Brune's main force at Alkmaar, which was abandoned for positions farther to the south. York's victory proved indecisive, however. The Franco-Batavian forces had retreated on safer positions, while the Anglo-Russians were stretching their lines of supply, the surrounding countryside having been plundered bare and the army increasingly depleted by disease.

York decided to push on, and on 6 October he attempted to take three Franco-Batavian positions at Bakkum, Limmen, and Akersloot, a maneuver resulting in the Battle of Castricum. After Russian troops had taken Castricum, Brune counterattacked, and after several hours of fighting in the surrounding sand dunes the Russians had to abandon the town again. Then Abercromby arrived and retook Castricum later in the day, but when the Batavian cavalry charged their British counterparts in the flank Abercromby's troops panicked and abandoned the town. Once again an attack had led to nothing but substantial losses.

After the Battle of Castricum it was clear that, although initially the invasion had been successful and a significant bridgehead had been formed, the Anglo-Russian army would not be able to attain further results. Not only were the troops locked in an enclosed and unhealthy peninsula, the Allies had also severely overestimated anti-French sentiments, which were hardly enhanced by the misbehavior of the Anglo-Russian troops. Orangist loyalty was insignificant and insubstantial, except in the fleet, which after the surrender at the Vlieter served loyally under the British flag. York retreated to the Zijpe and opened negotiations, resulting in the release of prisoners of war, the formal handover of the Batavian fleet to the British, and the evacuation of the Anglo-Russian forces. On 20 November 1799 the last troops embarked from the Helder.

## Norway

A nation on the western edge of the Scandinavian peninsula whose ties first to Denmark and then to Sweden reflected the fluid geopolitics of the Napoleonic era.

At the commencement of the nineteenth century, Norway had long been a part of the Danish kingdom, though the Norwegian people were increasingly interested in independence. Denmark and Norway were allied to Napoleonic France during the short period of the League of Armed Neutrality (1800–1801), an effort largely designed to counter the British policy of boarding neutral ships. This brought Norway into conflict with Britain, which instituted a generally successful naval blockade, the result of which was Norway's increasing isolation from Denmark. This isolation actually increased the Norwegian interest in independence, partially satisfied by the grant of an independent administration in 1807. Unfortunately, it also led to great economic hardship and even famine.

In 1810, the former French marshal, Jean-Baptiste-Jules Bernadotte, became the Crown Prince of Sweden and assumed all real control over foreign policy. Though he had been one of Napoleon's senior commanders, he soon turned against his former Emperor. Sweden had lost control of Finland to Russia, but rather than try to recover it, Bernadotte chose instead to join in the Anglo-Russian coalition against Napoleon, with an eye to gaining control of Norway. At the Battle of Leipzig in 1813, Swedish forces were among the victorious Allies that defeated Napoleon. Military and political pressure on Denmark led to the Treaty of Kiel on 14 January 1814 between Britain, Sweden, and Denmark, by which Denmark left the war, ceding Heligoland to Britain and Norway to Sweden.

The Norwegians resented this cession, and turned to the Danish governor, Prince Christian Frederick, electing him their king on 17 May 1814 with the understanding that he would lead them in their fight against Sweden. On the same day, the Norwegian assembly, with the support of their new king, adopted a constitution. That day is now celebrated as Norwegian Independence Day, or *Syttende Mai*.

Bernadotte responded at the end of July by invading Norway, whose resistance lasted little more than two weeks. An agreement was reached at Moss on 14 August, which bound the two countries together. But Norway was allowed to maintain her recently adopted constitution and operate with a reasonable degree of freedom and independence under the rule of the Swedish king. Though Norway was now a part of Sweden, the events of 1814 are celebrated as the first major steps toward her ultimate independence, which came in 1905.

### **Novi, Battle of (15 August 1799)**

A major battle between French and Austro-Russian armies near the town of Novi in the Italian Piedmont. As the Allies liberated Lombardy and Piedmont, the French Directory made a new effort to turn the tide of the war by appointing a new commander in chief, the young and energetic General Barthélemy Joubert, to the Armée d'Italie. The French advanced in early August from Genoa, and by 15 August they approached the Allied position at Novi. Joubert was surprised to find that he faced superior Allied forces, as Field Marshal Alexander Suvorov massed more than 50,000 men on the battlefield against 35,000 French and enjoyed a great superiority in cavalry. The French command spent the night vacillating, and, as a result, the French troops had no clear orders for the coming battle. On the Allied side, Suvorov was impatient to attack. At 8:00 P.M. on 14 August, he ordered Austrian *Feldzeugmeister* Paul Kray Freiherr von Krajova to begin movement during the night so that the troops could attack at dawn.

The Austrians (27,000 men) launched an assault on the French left flank at 5:00 A.M. Hearing the exchange of small arms fire, Joubert rode to observe the action and was instantly killed by a musket ball. His death was kept secret from the army, and General Jean Moreau assumed command in his place. An experienced commander, Moreau realized the dangers and kept his troops on the defensive. Meanwhile, as Kray continued his attack on the French left, generals Peter Bagration and Mikhail Miloradovich attacked the French positions in the center. For the next several hours, the Russians launched desperate charges on the town of Novi, where the French had established strong positions and expertly arranged their batteries on three levels. After seven hours of fighting, the Allies failed to break through the French positions but, around 3:00 P.M., Suvorov launched a flanking attack with *General der Kavallerie* Michael Freiherr von Melas's troops, while Bagration attacked Novi and Kray assaulted the left flank.

Despite their stubborn defense, the French right flank was swept away, allowing Bagration to capture Novi and pierce the central positions of the French. The Allies now threatened to encircle the French left wing, which hurriedly withdrew toward Pasturano. The retreating French packed the narrow streets of the village, while Allied troops opened fire on them from the nearby heights. Moreau's men fled in confusion, leaving their artillery and supplies. Generals Emmanuel, marquis de Grouchy and Catherine Dominique Pérignon tried to organize some sort of resistance, but both were wounded and captured. *Feldmarschalleutnant* Michael Freiherr von Colli was surrounded and forced to surrender with 2,000 men and 21 guns. Only General Laurent Gouvion St. Cyr's troops retreated in good order and covered the rest of the army. The exhausted Allied troops did not pursue the French and bivouacked on the battlefield.

The next morning, Suvorov intended to resume the pursuit, but his troops were still exhausted and could not move. Moreau exploited the Allied inactivity and successfully extricated the remaining troops to the Riviera. The Battle at Novi was a decisive Allied victory. The French army was shattered, having lost almost 6,500 killed and wounded, 4,600 captured, including 4 generals, 84 officers, 4 flags, and most of the artillery. The Russians lost 1,900 killed and wounded, while Austrian casualties amounted to 5,800 men.

# O

## **Ocaña, Battle of (19 November 1809)**

The biggest battle of the Peninsular War of 1807–1814, Ocaña was a major disaster for the Allied cause that had profound consequences for the history of Spain.

Beset by internal enemies, in the autumn of 1809 the Junta Central (the provisional government that had ruled Spain since 1808) was desperate for a victory. Against British advice, it therefore resolved on a concentric advance on Madrid. Of the three forces involved, the largest was the 60,000-strong Army of the Center under General Juan Carlos Areizaga, which was posted in the mountains that divide New Castile from La Mancha. The one hope that this force had of success was to hurl itself on the French so as to take them by surprise: With winter coming on they had gone into cantonments and were not expecting an attack. However, after a rapid initial march that took him to within a few miles of the capital, Areizaga failed to press home his advantage, and after some indecisive maneuvering, fell back to the small town of Ocaña.

Commanded by Marshal Nicolas Soult, the French attacked on 19 November with 33,000 men. Deployed in an open plain, unable to maneuver, and possessed of a commander who was by now paralyzed by fear and indecision—far from attempting to encourage his men, Areizaga spent the battle watching the fighting from the safety of one of the town's church towers—the Spaniards had no chance. While the French infantry pinned down their front line, a division of dragoons crushed the cavalry that protected their right wing and then rolled the entire army up from the flank. Some formations fought well enough and eventually got off the field in some sort of order, but by the end of the day, Areizaga had lost a third of his army along with sixty guns, while many other troops deserted in the days that followed. At fewer than 2,000 men, meanwhile, Soult's casualties had been minimal.

For the Allied cause, all this represented an unparalleled disaster. With few troops left to protect it, Andalusia

(Andalucía) was open to invasion and with it Patriot Spain's chief repository of the sinews of war (with the exception of Cádiz, the whole region was duly overrun in January 1810). As for the history of Spain, Ocaña brought in its train the downfall of the Junta Central, which was in January 1810 replaced by a Council of Regency, and at the same time helped ensure that the new parliament, which had in any case been scheduled for election in 1810, fell into the hands of Spain's small faction of committed liberals, the result being the revolution that produced the famous Constitution of 1812.

## **O'Donnell, Enrique (1776–1834)**

The descendent of an Irish Jacobite exile, Enrique O'Donnell was a prominent Spanish commander in the Peninsular War.

As an officer of the Ultonia Regiment in 1808, O'Donnell helped defend Gerona against repeated French assaults and continued to fight in Catalonia throughout 1809, eventually attaining the command of a division. Daring and ambitious, he was early in 1810 appointed to head all the Spanish forces in Catalonia, having made a name for himself in the fighting that accompanied the final siege of Gerona. Launching attack after attack on the French, on 20 February 1810 O'Donnell came very close to securing a major victory at Vich, about 40 miles from Barcelona. A risky attempt to relieve the besieged fortress of Lérida led to defeat at Margalef, but this affair

was balanced by a brilliant raid that resulted in the capture of an entire enemy brigade near Gerona. Rewarded for this feat with the title Conde del Abisbal, he was in December 1810 nevertheless forced to relinquish command of his army on account of an infected wound.

Once fully recovered, in January 1812 he became a member of the third Council of Regency, and in this capacity angered Viscount Wellington by trying to subject his operations to the control of the Spanish government. Resigning in August 1812 on account of the criticism provoked by the recent defeat of his brother, José, at Castalla, he was given the newly formed Army of Reserve of Andalusia (Andalucía), and in this capacity supported Wellington in the campaigns of 1813. However, supply problems prevented him from getting his men into the field in time for Vitoria, with the result that he was left with no other role than the blockade of Pamplona. Frustrated and angry, O'Donnell pushed hard for all the Spanish forces in the Pyrenees to be concentrated into a single independent army under his own command, but Wellington quashed this plan with the crushing rejoinder that independent Spanish armies never failed to be defeated.

Angrier than ever, O'Donnell now feigned sickness and did not return to his headquarters until December 1813. Denied any further part in operations, he gave vent to his ire by supporting the military coup that restored absolutism in May 1814. Made captain general of Andalusia in recompense, he then for some time played a double game that aimed to keep open his links with liberals and absolutists alike. Forced by the outbreak of the revolution of 1820 to join the former, he served the new regime as captain general of New Castile. Out of sympathy with the radicals who had taken control in Madrid, he went over to the absolutists as soon as the French intervened (1823) to overthrow the liberals, but Ferdinand VII had him arrested anyway. Spirited out of the country, he died in Montpelier in 1834.

## O'Meara, Barry Edward (1782–1836)

Irish by birth, O'Meara's medical career began in the British Army, but he was discharged as a punishment for having participated as a second in a duel. He then joined the Royal Navy and was a surgeon aboard the *Bellerophon* when that ship carried Napoleon into exile on St. Helena. Napoleon had designated a French doctor to join him in exile, but when he balked at that remote post the British offered the job to O'Meara. Though he was concerned about the obvious conflict inherent in serving both Napoleon and Sir Hudson Lowe, O'Meara accepted the position.

O'Meara's concern proved prophetic. Napoleon expected his doctor to serve as *l'homme de l'Empereur* (the Emperor's man), and O'Meara, no doubt under the powerful sway of Napoleon's personality, began to fill that role. Lowe soon began to believe, with some justification, that O'Meara was more sympathetic to Napoleon than to British interests. In July 1818 Lowe removed O'Meara as Napoleon's doctor and sent him back to Britain, where he was soon drummed out of military service.

During his years as Napoleon's doctor, O'Meara kept careful and extensive notes. After his retirement, he published several works, most notably *A Voice from St. Helena*. While his critics argue that the book is too favorable to Napoleon, it nonetheless serves as a significant source of information on Napoleon's time on St. Helena. A later edition of the work, *Napoleon at St. Helena*, contained numerous corrections.

## Oporto, Battle of (12 May 1809)

Oporto, the second largest city in Portugal, was an important location both strategically and symbolically. Early in the Peninsular War, Napoleon ordered Marshal Nicolas Soult to move his army south from the Galician city of Corunna to Oporto. From there, Soult was to plan an attack on the British stronghold at Lisbon. At the same time, by capturing Oporto, the French would control access to the river Douro. What should have been a rapid advance and easy victory was made more difficult by the very poor roads between Corunna and Oporto. Likewise, Portuguese guerrilla forces and scattered peasant armies made an ef-

fective defensive force. Several months behind Napoleon's schedule, on 29 March 1809, Soult finally captured the city. However, his worn-out army was unable to continue toward Lisbon.

The French army's communications with other units were severely limited by the activities of Portuguese guerrilla forces. Rather than risk further movements, Soult decided to adopt a defensive posture within the city. He ordered the only bridge crossing the Douro to be burned and began to fortify positions overlooking the river.

Lieutenant General Sir Arthur Wellesley had reached Lisbon on 22 April and found that the French controlled large amounts of territory not only to the north around Oporto, but also in southern Portugal and southwestern Spain. Fearing that movement to the south would provoke French armies there to unite, Wellington decided to focus his attention on Soult's forces in Oporto. He set out on 8 May with an army consisting of 16,000 British and 2,400 Portuguese troops. Estimates of Soult's strength vary wildly, but a conservative figure places his force at about 12,000 men. The journey north from Lisbon was made relatively quickly, and the Anglo-Portuguese forces reached the southern bank of the Douro on the morning of 12 May.

In preparation for battle, Soult had ordered all boats on the Douro moved to his side to block the British advance. Wellesley recruited several civilian wine barges to ferry a brigade of troops across the river upstream. Upon arrival, the soldiers secured a bridgehead where the now-destroyed bridge once stood and Wellesley ordered additional troops across the river. At first, the French were unaware of the British movements, but soon, Soult rushed reinforcements from the waterfront to the site of the bridgehead.

As French troops redeployed, a civilian fleet leapt into action along the undefended riverbanks. Dozens of small boats began to ferry British soldiers across the river to the banks of the city. French forces began to fall back from the river into the city, pursued by the British. As his position worsened, Soult began preparations for a withdrawal. The rapidly deteriorating situation made formal precautions impossible, and the French quickly abandoned Oporto and moved to the surrounding countryside.

Soult found the most convenient escape routes blocked either by British forces commanded by Marshal William Beresford or by hostile Portuguese civilians. Forced to leave most of his heavy equipment behind and fight a rearguard action for much of the journey, Soult withdrew his army through the mountains along the Spanish border and back into Galicia. French troops abandoned personal belongings all along their route away from Oporto and even left behind their sick and the force's

treasury. By the time Soult reached the relative safety of the city of Ourense, his original force of 23,000 had been reduced to 6,000 healthy men: his army was in a shambles.

What could have been a total victory for Wellesley and his Anglo-Portuguese army was limited by the inability of this recently amalgamated allied force to prevent Soult's withdrawal. Wellesley's troops were low on supplies, and his orders prohibited him from crossing into Spain. Thus, Soult was able to escape with his army to northern Spain, so enabling Wellesley to turn his full attention to French forces in southern Portugal and Spain.

## Orange, William, Prince of (1792–1849)

Prince William of Orange (or Willem Frederik George Lodewijk of Orange-Nassau) born on 6 September 1792 in The Hague as the grandson of William V "Batavus," Stadtholder of the seven provinces of the Dutch Republic, did not remain in the country of his birth for long, for in 1795 the Stadtholder fled with his family to Britain to avoid capture by Patriot rebels or invading French troops. Almost immediately the hereditary prince, Prince William's father, left for Germany, where the boy grew up and received a Prussian education at the Prussian Cadet School and the Military Academy in Berlin.

In 1811 the nineteen-year-old William was assigned the rank of lieutenant colonel in the British Army, and until 1813 he served as aide-de-camp to the Marquis of (later the Duke of) Wellington, serving with distinction at the sieges of Ciudad Rodrigo and Badajoz, among others, and at the Battle of Salamanca. Wellington liked this charming and brave if slightly naive young man who threw himself into battle with the same audaciousness as he enjoyed the feasts of victory and the balls of the Spanish court. In 1813, however, when the Peninsular War was at its height, Wellington sent him to Britain to report to the government, and during his stay in the country he took a degree at Oxford.

In 1813 William's father became sovereign of roughly the territory of the old Dutch Republic (it having become the French-controlled Kingdom of Holland in 1806), and in 1814 he was inaugurated as William I of the United Netherlands. Shortly after he became governor-general of the former Austrian Netherlands (Belgium and Luxembourg), and soon after Waterloo the two territories would be amalgamated into the Kingdom of the Netherlands. With his father now sovereign, Crown Prince William was now formally assigned the title Prince of Orange-Nassau, and on grounds of status, he commanded during the Waterloo campaign the Dutch contingent until shortly before the battle, only reluctantly passing command to Wellington.

In older Dutch literature Prince William is remembered as a hero of Waterloo and Quatre Bras, an image at odds with most British accounts. His personal bravery was not in question, and the prince was shot in the arm during the battle; however, the inexperienced William, just twenty-two, was hardly fit for his command of the 1st Division of the Anglo-Allied army. He committed serious mistakes that in such a position could have been detrimental to the success of the battle. The decision to remain at Quatre Bras, which proved to be very important in securing ultimate victory in the campaign, is traditionally attributed to him but was probably the initiative of his subordinates, the Prince of Saxe-Weimar, a brigade commander who actually held the position against Wellington's orders, and Constant de Rebecque, William's chief of staff.

After the Napoleonic Wars the prince, who loved the army and military life, had few chances to prove his military merits, the only occasion being in the abortive Belgian campaign in 1830 when Belgium had declared itself independent. There he briefly commanded an army until a French force occupying Brussels rendered further operations unnecessary.

In 1816 Prince William married Anna Paulowna, daughter of Tsar Alexander of Russia, who bore him five children. He seems to have been a loving father, yet not a faithful husband. Nevertheless, the marriage seems to have been good, Anna correcting her husband in matters of etiquette and diplomacy and repeatedly acting as intermediary between William and his father. On a political level he tended to compromise himself as well, moving in circles sympathetic to the principles of the French Revolution and to Napoleonic France—not the sort of notions normally associated with the hereditary rulers of Europe—and he was repeatedly associated with intrigues, among others the assault on Wellington in Paris in 1818. Although such rumors remain unproven, they were a source of gossip and were damaging to his reputation.

In 1840 the king abdicated and the prince could finally ascend the throne, only to rule as king for a mere nine years until his death in Tilburg on 17 March 1849. His rule is mainly remembered in connection with the revolutionary year 1848, when under public pressure the monarch quickly changed his conservative and authoritarian style of rule to that of a constitutional monarch exercising only limited powers. However opportunistic, this move might not only have been responsible for preserving his House, which survives until this day, but might also have saved the Netherlands from the upheaval that convulsed many European states in that year.

## Oranges, War of the (1801)

A minor episode of the Napoleonic Wars, the “War of the Oranges” was a skirmish between Spain and Portugal that earned its name from a basket of oranges that were gathered under fire from the ramparts of the fortress of Elvas and sent to the Spanish queen, María Luisa, as a trophy (her comment on this gesture was that they were “very nice”). Nor was the conflict a much more serious affair than this suggests. Eager to save the garrison of Egypt, at the beginning of 1801 Bonaparte, as First Consul, was determined to force Britain to make peace, and to further this aim he decided to eliminate Portugal, which was then her last ally in mainland Europe. To this end King Charles IV of Spain was induced to mobilize an army, while 15,000 French troops were marched across the Pyrenees in support. For a variety of reasons, however, these troops were delayed, and in the end the actual fighting was left to the Spaniards.

Crossing the Extremaduran (Estramaduran) frontier on 20 May under the command of the royal favorite, Manuel de Godoy, 30,000 men attacked the fortresses of Elvas and Campo Mayor and routed an enemy force at Aronches. Thoroughly cowed, the Portuguese sued for peace, and on 8 June a hastily arranged peace treaty brought the fighting to an end at the cost to Portugal of a substantial indemnity, the frontier district of Olivenza, and

the promise of closing its ports to British ships. This settlement greatly displeased Bonaparte, who had wanted both a more impressive demonstration of the military might available to him and a much harsher peace settlement, but on the advice of Godoy, Charles stood firm and ignored the First Consul's demands for a resumption of hostilities.

In the end the French ruler backed down, and for a moment it had looked as if Spain and France might actually go to war. Ultimately the matter was taken no further, but the Spanish monarch was nevertheless frightened into granting Godoy *carte blanche* to reform the army (which had experienced many problems in the course of its mobilization), to which end he awarded him special powers and the unprecedented rank of *generalissimo*.

## Orders in Council

Policy dictates from King George III known as Orders in Council were used by the British during the Napoleonic Wars to provide the legal framework for the blockade of European ports by the Royal Navy. The resultant restrictive British blockade led to retaliation by the French and increased tensions with neutral powers such as the United States. This economic strife would emerge as one of the principal causes of the War of 1812.

Orders in Council are official statements of policy from the monarch that carry the weight of law and are issued with the support of the Privy Council. They are based on royal prerogative and are not subject to prior review by Parliament. Traditionally, they are used during times of national emergency when the normal parliamentary procedures to enact legislation are judged to be too burdensome.

The British had traditionally attempted to restrict maritime trade as a means of weakening their continental enemies. When war broke out in 1793, the British insisted on the enforcement of the "Rule of 1756," which restricted neutral trade with belligerents. In 1793 Orders in Council were issued that declared that foodstuffs could be defined as contraband and that placed French colonies in the Caribbean under a blockade from neutral shipping. As the war progressed, British Orders in Council became even more restrictive, and in 1799 the blockade was extended to include Holland.

The failure of the Peace of Amiens led to a restoration of the British blockade. In May 1806, new Orders in Coun-

cil were issued in order to redouble the efforts to cut off maritime trade with continental Europe. The orders placed some 800 miles of coastline under blockade. The new regulations allowed British ships to seize merchant vessels bound for Europe just 3 miles from the coast of the United States. They also forbade the practice by which belligerent vessels offloaded goods bound for Europe and reloaded them on neutral ships. In response to these orders, Napoleon issued the Berlin Decrees, and the later Milan Decrees placed Britain under blockade as part of what became known as the Continental System. The United States also enacted retaliatory trade measures, including increased tariffs and embargoes on certain British goods.

As the war progressed, the British government used Orders in Council not only to blockade the Continent but also to try to force neutral powers to trade only with them. Subsequent Orders in Council further restricted trade through measures that forbade neutrals from even trading in ports in which the British were banned, unless the neutral ship docked at a British port and received a special license. Negotiations between Britain and the United States in 1812 failed after a new Order in Council was promulgated in April, which insisted on the French renunciation of the Berlin and Milan Decrees. As a result of this failure, the United States declared war on Britain on 18 June only to learn that the British had already in fact rescinded the offensive Orders in Council a week earlier.

## Orthez, Battle of (27 February 1814)

One of the last battles of the Peninsular War, fought between the French under Marshal Nicolas Soult and the Anglo-Allies under the Marquis of Wellington.

On the morning of 23 February 1814 the left wing of the Allied army under Lieutenant General Sir John Hope began its daring but hazardous crossing of the Adour to the west of Orthez. The Coldstream and 3rd Foot Guards, supported by riflemen of the 5/60th (5th battalion, 60th Regiment), crossed the river in small groups, each party being ferried across the river in small rafts. By the end of the day a bridgehead had been established, and even a French counterattack failed to stop the operation when a

battery of rockets was scattered among them, sending the startled Frenchmen running for cover. By the afternoon of 26 February a bridge of boats had been constructed across the river, which enabled Hope to get some 8,000 men across to the north bank. Bayonne was now completely surrounded, and the blockade of the town began.

The day after Hope's blockade began, Wellington, with the main Allied field army, fought a major battle at Orthez, some 35 miles away to the east. On 26 February Beresford had crossed the Gave de Pau with the 4th and 7th Divisions near Peyrehorade, pushing Soult back toward Orthez. The 3rd Division forded the river at Berenx, while Wellington himself brought up the 6th and Light Division, plus a force of cavalry, across on a pontoon bridge that had been thrown across the Gave, also at Berenx. Lieutenant General Sir Rowland Hill, meanwhile, with the 2nd Division and Carlos Le Cor's Portuguese division, marched to the south of Orthez, passing to the east of the town but remaining on the south bank of the Gave.

On the morning of 27 February Wellington had with him on the northern bank of the Gave some 38,000 infantry and 3,300 cavalry, as well as 54 guns. Soult's army, about 7,000 fewer with 48 guns, occupied a strong position along a ridge that ran north from Orthez for about a mile before running west for 3 miles from the bend in the main Bayonne-Orthez road, which ran along the ridge, to the small village of St. Boes, upon which Soult rested his right flank. Soult's troops occupied the whole length of this ridge from which three very prominent spurs extended south toward the Gave. The spur on the extreme western edge of the ridge does not actually connect with the ridge itself, being separated by a few hundred yards. The remains of an old Roman camp were situated on the forward edge of the spur and would feature prominently in the battle.

The battle opened shortly after 8:30 A.M. on the cold, frosty morning of 27 February, when a battalion of French infantry was driven from the church and churchyard of St. Boes by the 1/7th, 1/20th, and 1/23rd, who made up Major General Robert Ross's brigade of the 4th Division. The brigade advanced east along the ridge to clear the rest of the village, but it came under fire from French artillery and could go no farther. French troops under General Eloi, baron Taupin were then sent to recover the village, and St. Boes became the scene of bloody house-to-house fighting as both sides struggled for its possession.

While the fight for St. Boes flickered and flared, Lieutenant General Sir Thomas Picton's 3rd Division entered the fray, attacking Soult's center. His troops advanced up the two center spurs but were held up by French artillery that swept the crests of the spurs, inflicting heavy casualties. The attack here was only intended to be a demonstration, however, and he pulled his troops back, leaving just

his strong skirmishing line of light troops and riflemen to prod and probe the French line, which they continued to do for the next two hours.

Meanwhile, the fighting in St. Boes intensified until at about 11:30 A.M. Wellington gave orders for an assault along the whole length of his line, leaving part of the Light Division only in reserve at the Roman camp, from where Wellington watched the progress of the fight.

On the Allied left, Major General Thomas Brisbane's brigade of the 3rd Division began to push its way up the easternmost spur, with the 6th Division following behind. At St. Boes the 4th Division was replaced by the 7th Division, while the 1/52nd advanced from the Roman camp to deliver an attack on the French brigade on the right flank of the advancing 7th Division.

These attacks were pressed home vigorously, but French resistance was stiff, and it was to take the advancing British columns about two hours of hard fighting to drive the French from the spurs. This was not accomplished without loss, particularly to the 1/88th, three companies of which suffered heavy casualties when a squadron of French cavalry, the 21st Chasseurs, charged and overran them after catching them in line. The French cavalry suffered similarly when they received return fire from Picton's men, half of their number being killed or wounded.

The French troops along the ridge were being severely pushed by Wellington's attacking columns, but it was the advance by the 1/52nd, under Lieutenant General Sir John Colborne, that decided the day. This battalion entered the fight in support of Walker's 7th Division just at the moment when this division, along with Major General George Anson's brigade of the 4th Division, was finally driving the French from the body-choked village of St. Boes. The 52nd advanced almost knee-deep in mud in places, but when it reached the crest of the spur it took Taupin's division in its left flank. Taupin's men were driven back by Colborne's determined charge and fell in with those retreating from St. Boes. In so doing, they precipitated a degree of panic, which caused the collapse of the entire French right. It was now about 2:30 P.M., and with Wellington's triumphant troops pouring along the main road on top of the ridge the day was as good as won.

At first, Soult's army began to fall back in an orderly manner with the divisions of generals Eugene Casimir Villatte, comte Villatte, and Jean-Isidore Harispe, comte Harispe drawn up on his left flank to cover the withdrawal. However, Hill's corps had crossed the Gave to the east of Orthez and fell upon Harispe's division, driving it back upon Villatte. The controlled retreat soon became a panic-stricken flight, which spread along the whole of the French line, Soult's men discarding great loads of equipment to facilitate their retreat to the northeast toward Toulouse.

The Battle of Orthez cost Wellington 2,164 casualties, while Soult's losses were estimated at around 4,000, including 1,350 prisoners, a number that would have been far greater had not Wellington been slightly wounded toward the end of the battle. This had caused him to halt and incapacitated him during the next few days. The wound was his third of the war, but at least he could rest that night with the satisfaction of knowing that there was little now standing between himself and final victory over the French.

### **Osten-Sacken, Fabian Vilgelmovich, Prince (Fabian Gotlieb von der Osten-Sacken) (1752–1837)**

Prominent Russian military commander, whose surname is often shortened by historians to "Sacken." Born in Revel (now Tallinn, Estonia) on 31 October 1752 to a family of German barons in Courland (a constituent part of the Russian Empire on the Baltic), he enlisted as a sub-ensign in the Koporsk Infantry Regiment on 29 October 1766. He participated in the Russo-Turkish War in 1769–1770, fought at Khotin, and transferred as an ensign to the Nasheburg Infantry Regiment. In 1771–1773, Osten-Sacken served in Poland. By 1785 he was a captain in the Infantry Cadet Corps, transferring as a lieutenant colonel to the Moscow Grenadier Regiment in November 1786.

He joined the Rostov Musketeer Regiment in July 1789 and took part in the Russo-Turkish War of 1787–1792. Promoted to colonel in August 1792, Osten-Sacken transferred to the Chernigov Musketeer Regiment in 1793. He served against the Poles in 1794. In October 1797 he became a major general and *chef* (colonel-proprietor) of the Ekaterinoslavl Grenadier Regiment; two months later, he became *chef* of the Pskov Grenadier Regiment. In 1799 Osten-Sacken served in the Russian corps in Switzerland and fought at Zürich, where he helped to cover the Russian retreat before being wounded in the head and captured by the French. Released in 1800, he became *chef* of the St. Petersburg Grenadier Regiment in January 1801.

In 1805 Osten-Sacken commanded a corps in the Grodno and Vladimir *gubernias* (provinces). In 1806–1807 he led one of the columns in General Levin Bennigsen's army and fought at Pultusk, Jankovo, Eylau, and Launau. During the operations around Guttstadt in June 1807, his column moved very slowly and allowed Marshal Michel Ney's corps to escape. Some contemporaries believed that Osten-Sacken, who had strained relations with Bennigsen, intentionally delayed the advance to undermine the entire operation and precipitate Bennigsen's removal from the army. Bennigsen himself accused Osten-Sacken of insubordination and held him responsible for the failure of the maneuver at Guttstadt. The military court found him guilty and relieved him of command on 10 June 1807.

Osten-Sacken spent the next five years in St. Petersburg before taking over as commander of the Reserve Corps in the 3rd Reserve Army of Observation in early 1812. In October he covered the advance of General Paul Chichagov's army to the Berezina and fought at Slonim and Volkovysk. In 1813 he commanded a corps in the (Russo-Prussian) Army of Silesia and fought at Leignitz, Kaizerwalde, Bunzlau, and the Katzbach. He was promoted to general of infantry in September 1813 and distinguished himself at Leipzig that October. In 1814 during the campaign in France he participated in the battles at La Rothière, Craonne, and Montmartre. He was appointed governor-general of Paris for the month that followed the Allied occupation, which began on 31 March 1814. He served in various military and administrative posts after the Napoleonic Wars and became a field marshal in 1826. He died in Kiev on 19 April 1837.

**Osterman-Tolstoy, Alexander Ivanovich, Count (1771–1857)**

Russian military commander, born to one of the wealthiest and most prominent Russian noble families, the Tolstoy. While only three, in 1774, his name was put down for future service in the Life Guard Preobrazhensk Regiment and he rose to the rank of ensign in 1788 at the age of seventeen. During the Russo-Turkish War of 1787–1792, Tolstoy volunteered to serve in the army, earning promotion to lieutenant of the Guard, and fought at Ismail and Macin. He transferred as a lieutenant colonel to the 2nd Battalion of the Bug *Jäger* Corps on in 1793. Promoted to colonel in November 1796, he was allowed to add the name and title of his childless grandfather, Count Osterman, to his last name. Osterman-Tolstoy became a major general and *chef* (colonel-proprietor) of the Schlüsseburg Musketeer Regiment in February 1798. Two months later, he was transferred to the civil service with a rank of civil counselor.

Osterman-Tolstoy returned to military service in 1801 and took command of an infantry division. In 1805 he served under Count Peter Tolstoy in Pomerania and rose to the rank of lieutenant general on 27 June 1806. During the 1806–1807 campaign in Poland he led the 2nd Division fighting at Czarnow and Pultusk. In 1807 Osterman-Tolstoy took part in the retreat from Jankovo and commanded the left flank of the Russian army at Eylau. He was seriously wounded at Guttstadt in June 1807 and left the army to recuperate. He bitterly opposed the Tilsit peace treaty with France and led the anti-French faction in St. Petersburg. He retired because of poor health on 4 November 1810.

During the 1812 campaign Osterman-Tolstoy joined the 1st Corps as a volunteer and fought at Wilkomir. On 13 July he became commander of the 4th Corps of the 1st Western Army and distinguished himself at Ostrovno and Valutino. He was seriously bruised at Borodino and, at the council of war at Fili, he urged the abandonment of Moscow. In October–November 1812, he fought at Tarutino and the second Battle of Krasnyi, but had to leave the army because of poor health in December.

Osterman-Tolstoy returned to the army in early 1813 and was seriously wounded later that spring at Bautzen.

After recuperating, he was given command of the Guard Corps in August. He distinguished himself at Kulm, where he was seriously wounded when a round shot (cannonball) cut off his left hand, and he took a furlough to recuperate. He was appointed an adjutant general in March 1814 and *chef* of the Life Guard Pavlovsk Regiment in December 1815. Osterman-Tolstoy took command of the Grenadier Corps in 1816 and rose to general of infantry the next year. He was relieved of his position in 1826 and served as military adviser to Ibrahim Pasha of Egypt in 1831. After returning to Russia, Osterman-Tolstoy had an argument with Tsar Nicholas I and had to leave the country in 1834. He spent the rest of his life in Switzerland and died in Geneva in early 1857.

**Ostrach, Battle of (21 March 1799)**

Opening Austrian victory in Germany during the War of the Second Coalition. The French commander, General Jean-Baptiste Jourdan, established a defensive position at Ostrach, 30 kilometers north of Lake Constance. The Austrian commander, Archduke Charles, marched west from the Lech, and on 21 March his advance guard under *Feldmarschalleutnant* Friedrich Graf Nauendorff attacked Jourdan, leading three columns across the river Ostrach to break the French position. Following his victory, Charles advanced to the key road junction at Stockach, where he defeated Jourdan four days later.

On 1 March, Jourdan crossed the Rhine with his Army of the Danube (40,000) to support General André Masséna in Switzerland, as the Austrians under Archduke Charles assembled 80,000 men on the Lech and marched west to contest the roads into central Switzerland. On 20 March Jourdan halted on the river Ostrach, protected by marshy ground in front, while Charles massed his army a few kilometers east of Saulgau. Unaware of the close proximity of the Austrian army, Jourdan arranged his army with General François Lefebvre's division in the

center, covering Ostrach village, which controlled the main river crossing from the west bank; General Joseph Souham's division and General Jean d'Hautpoul's cavalry were in reserve at Pfullendorf, while in the north, General Laurent Gouvion St. Cyr's division guarded Mengen. To the south, Pierre Ferino's division moved toward Markdorf near Lake Constance.

The next morning, the Austrian attack developed in three columns to seize the crossings over the Ostrach. At 2:00 A.M. Nauendorff led the advance guard along the road toward Ostrach village, followed by the central column under Archduke Charles. Despite Souham dispatching reinforcements, Lefebvre was pushed back through the wooded hills to Ostrach as his right flank came under simultaneous attack by the Austrian left wing column under *Feldzeugmeister* Olivier Graf Wallis. To the north, *Feldmarschalleutnant* Karl Fürst von Fürstenberg's column headed for the crossings at Mengen and Einhardt.

Around 7:00 A.M., without seeking orders from Charles, Nauendorff began his assault on Ostrach, just as Jourdan established his headquarters there. The French held the bridge for three hours. Around 8:00 A.M. St. Cyr attempted to aid Lefebvre with a counterattack on the Austrian right wing, but allowed Fürstenberg to outflank his open left wing, and the French left was soon retreating toward the river. St. Cyr clung on until part of Fürstenberg's column crossed the Ostrach at Einhardt around 11:00 A.M., threatening his right.

At 10:00 A.M. Nauendorff had stormed Ostrach village, supported by the two main columns. Within an hour, Lefebvre's resistance was broken as Charles advanced the center column. As *Generalmajor* Ignaz Graf Gyulai's brigade crossed the river to the north and Fürstenberg drove St. Cyr back across it, Jourdan ordered Lefebvre to withdraw at noon. French sappers blew several bridges and d'Hautpoul's reserve cavalry slowed the Austrian pursuit, but St. Cyr had to withdraw on Mösskirch, and Ferino retreated toward the lake. Both sides had lost about 2,200 men.

## Ostrovno, Battle of (25 July 1812)

A rearguard action fought during the campaign of 1812 between Russian and French forces near the village of Ostrovno, 12 miles west of Vitebsk. As Napoleon's Grande Armée invaded Russia in June, the 1st Western Army under General Mikhail Barclay de Tolly quickly retreated to the east. On 23 July it approached Vitebsk, where Barclay de Tolly planned to wait for the 2nd Western Army under General Prince Peter Bagration, who was marching to join him via Mogilev. Receiving intelligence on the French advance, Barclay de Tolly decided to delay the enemy until the arrival of Bagration. On 24 July he designated General Alexander Osterman-Tolstoy's 4th Corps as a rear guard and reinforced it with the Ingermanland and Nezhinsk Dragoon, Life Guard Dragoon, Sumsk Hussar, and Life Guard Hussar Regiments, and a company of horse artillery.

The French advanced along both banks of the Western Dvina River and encountered Osterman-Tolstoy's troops near Ostrovno, where Russian cavalry initially overwhelmed the advance elements of General Etienne, comte de Nansouty's 1st Cavalry Corps. On 25 July Marshal Joachim Murat arrived with his advance guard (1st Light Cavalry Division) under General Jean Pierre Bruyères; the 1st Heavy Cavalry Division under General Antoine Louis Decrest de Saint Germain; and two battalions of the 8th Légère from the 13th Division, under General Alexis Joseph Delzons. On the morning of the twenty-fifth, as the French approached Ostrovno, the 2nd Brigade of the 1st Light Cavalry Division routed two squadrons of the Life Guard Hussars and captured six horse artillery guns. Both sides threw in reinforcements, and the battle began.

General Saint Germain's cavalry division was deployed on the French left flank, the 8th Légère and sixteen squadrons of Bruyères's cavalry division were in the center, and the remaining squadrons of Bruyères's division were on the right flank. Delzons's division was still en route. Russian troops were deployed on both sides of the main road to Vitebsk, protected by dense forest and swamps on the flanks. Osterman-Tolstoy moved the Ingermanland Dragoon Regiment to observe the French right flank. He then deployed the 11th Division under General Nikolay Bakhmetyev and the remaining artillery in the first line, with the 23rd Division under General Aleksey Bakhmetyev in the second line, supported by the Sumsk Hussars.

The initial artillery bombardment was followed by a charge of the Ingermanland Dragoon Regiment against the French right flank. However, the Russian attack proved disastrous as the French cavalry counterattacked and routed the Ingermanland Dragoons, capturing some 200 of them. In the center, Russian troops suffered considerable casualties

from the fire of French *tirailleurs* (light infantry skirmishers), and Osterman-Tolstoy ordered a bayonet attack to drive them back. Yet, as the Russians advanced, the French cavalry charged their exposed flank and inflicted heavy casualties.

Notwithstanding these successes, the French could not make any real headway because the Russians took up positions in a wood. Murat then brought his artillery closer and opened canister fire against the opposing infantry, which though suffering heavy casualties continued to hold their ground. When he was told about the losses and asked for instructions, Osterman-Tolstoy famously responded, "Just hold ground and die." The Russians managed to rally their troops, while Osterman-Tolstoy led infantry attacks against both French flanks, which were repulsed. Delzons's division, meanwhile, arrived on the battlefield and threatened the Russian right flank. Osterman-Tolstoy had no alternative but to withdraw to more favorable positions, and the fighting soon ended because of darkness.

During the night, Barclay de Tolly reinforced Osterman-Tolstoy with the 1st Reserve Cavalry Corps under General Fedor Uvarov and the 3rd Division under General Peter Konovnitsyn. The French also received reinforcements, drawn from the main forces of the Grand Armée, which gradually reached the scene of the fighting. At dawn on 26 July Osterman-Tolstoy began an orderly retreat toward the village of Kakuvyachino, 3 miles east of Ostrovno. The battle resumed that morning, with the Russians holding back the French advance. Despite initial French success (capturing three guns) when Murat personally led cavalry charges, the Russians repulsed all enemy attacks. The fighting continued until late evening, when the Russians finally retreated to Vitebsk. The Russians suffered heavy casualties, losing more than 3,700 men, including 834 killed and 1,855 wounded, and the remainder captured or missing.

## Ottoman Army

By the late eighteenth century, the Ottomans controlled one of the largest dominions in the world, which provided them

with enormous military potential. However, a combination of cumbersome administrative and financial organization, and political division into virtually autonomous provinces led by pashas, prevented the sultan from successfully exploiting his resources. The Ottoman Army was composed of regulars on pay (*kapikulu*, including Janissaries) and irregular troops, with the latter branch also including regional irregulars (*toprakli*), short-term levies (*miri-askeris*), troops raised by provincial governors (*siratku*), local militias (*yerli neferats*) used for town defense, and tribal irregulars (*gönüllüyan*). The irregular troops had no training, and anyone able to wield a weapon was considered a soldier and could enlist. Renowned for their courage and weapon handling, the Ottoman troops nevertheless lacked in discipline and tactical maneuverability. The Ottoman ranking system also represented a complex hierarchy, with ranks varying depending on the branch.

The regular infantry, or *kapikulu*, was established under the premise of the sultan's right to a fifth of the war booty, which he interpreted to include captives taken in battle. The captive slaves were converted to Islam and trained in the sultan's personal service. The most famous branch of the *kapikulu* was the Janissary corps, but there were also several other troop types such as *baltaçis* (halberdier corps); *bostancis*, who were deployed as elite reserves around Constantinople and Edirne; and *solaks*, who defended the royal palace. A series of garrisons along the Straits of the Bosphorus were each commanded by a *dizdar* (warden) under the general supervision of a *bogaz naziri* (superintendent). Since the fourteenth century, a system of conscription had been in place in the Ottoman military requiring every town and village to present a quota of fully equipped conscripts at the recruiting depot. A newer force of irregular infantrymen was called *azaps*, which were organized into garrison *azaps* and naval *azaps*; they transported the supplies to the front line, dug roads, and built bridges. One branch of the *azaps*, the *başıbozuk*, specialized in close combat, sometimes on mounts.

The Janissary corps constituted a major force in the empire and was organized through a *devshirme* system, which conscripted Christian youths from the Balkan and Caucasian provinces, converted them to Islam, and rigorously trained them in martial arts. Janissaries were organized into *ortas* (regiments) and *odas* (barracks) and enjoyed certain privileges and duties such as policing the harbor, acting as members of fire brigades, or guarding foreign embassies. By the late sixteenth century, the Janissaries had become a powerful force within the empire, as the sultan grew dependent on them to counter other internal factions. As a result, Janissaries were frequently involved in palace coups and stubbornly resisted any reforms that might undermine their status. The opposition be-

tween the sultan and the Janissaries was particularly evident under Selim III, who attempted to modernize the army by launching a series of reforms called *nizam-i cedit* (new system). This reform agenda led to a rebellion of the Janissaries and the deposition of Selim in 1807. Such resistance prevented the introduction of much-needed reforms at a crucial time when the Ottoman Empire was struggling to fend off the attacks of the European powers, especially the Russian Empire. The Janissary corps was not to be destroyed until well after the end of the Napoleonic Wars, when Sultan Mahmud II disbanded the corps in the so-called Auspicious Incident in 1826.

The Ottomans also had a well-developed system of raising troops from the subject nations. Local militias (*serhat kulis*) served throughout the Balkans, and their composition and strength varied from province to province. Provincial governors often raised their own cavalry (*deli*), infantry (*seğban*), and light infantry (*panduks*). Christian nations of the Balkan peninsula also had their own forces, among them Serbian *hayduk* units, Wallachian *dorobanti*, Moldavian *slujitori*, Albanian light infantry (*arnauts*), and Bosnian troops (*pandurs* and *eflaks*). In the eastern provinces, the local forces included Kurds, mainly re-

cruited as *tüfenkçis* (musketeers), as well as irregular tribal troops. Ottoman provinces in Syria and Palestine had diverse forces that included *tüfenkçis*, *deli* (mostly Arabic cavalry), *levant* (mounted infantry, mostly Kurdish), *seğbans* (mostly Turkish cavalry), and others. In Egypt, Mameluke slave warriors from the Caucasus had ruled the country since 1250 but had been nominally under Ottoman rule since 1517.

An important part of the Ottoman Army was the six cavalry branches (*altı bölük*), a mounted elite force. The most important of them were *Spahis*, who served as an escort and mounted bodyguard to the sultan and, in times of peace, were responsible for collecting taxes. They gradually became the mounted counterpart to the Janissaries, and the two factions often clashed over influence at court. *Spahis* later played an important role in the destruction of the Janissary corps in 1826. *Spahis* are often confused with *timariots*, an irregular cavalry that provided military service in return for land (*timar*), much like the system of fiefs in medieval Europe. The *timariots* usually assembled after a call for troops but then returned to their land in times of peace. They were organized into regiments (*alays*) commanded by *alay beys*. Above them,

Mamelukes. An elite body of cavalry whom the French encountered during their campaign in Egypt in 1798, the Mamelukes could trace their lineage of service to the Ottomans back to the mid-thirteenth century. (Print by F. de Myrbach from *Life of Napoleon Bonaparte* by William M. Sloane, New York: Century, 1906, vol. 2)

*sançak beys* commanded districts and were elected by the landowners. A special Tatar courier corps (*posta tatar*) was in charge of communications.

Although the Ottomans understood early on the power of artillery, they failed to keep up with Western modernization. The Ottoman *topçu ocağı* (field artillery corps) and *humbaracı ocağı* (siege artillery corps) lacked professional officers and modern artillery pieces. In the late eighteenth century, European officers were regularly invited to train this branch. A special artillery corps (*süratçi ocağı*), armed with modern artillery pieces, was established in the 1770s, and after reorganization this corps consisted of several 10-gun batteries, which included old guns (*balyemez and şahi*), new light caliber guns (*abus*), and heavy pieces (*sürat*). Each gun was manned by a *bölük* of ten men led by *top ustası*. The artillery had an auxiliary corps (*top arabacı ocağı*) of five regiments to provide ammunition and technical support. Other auxiliary corps included military bands (*mehterhane*), which used doubled kettle-drums (*nekkare*), cymbals (*zil*), two-sided drums (*davul*), bass drums (*kös*), trumpets (*kurenay, boru*), and two kinds of seven-hole clarinets (the low pitched *kaba zurna* and the higher pitched *zurna*).

In the 1790s Selim III launched a series of reforms to modernize the army and train new units in the European manner. To secure new sources of revenue, Selim established the *irad-i cedid* (new revenue) system financed from taxes imposed on previously untaxed sources and the confiscation of *timars* whose holders were not fulfilling their duties to the state. Technical and military books were translated into Turkish from Western languages; recruits were trained based on French military manuals; soldiers were armed with modern weapons; and graduates from new military schools were assigned to these units. The regiments were divided into battalions (*taburs*, led by *ağas*), companies (*bölük*, led by *bölükbaşı*), and platoons under *onbasi*. Regimental officers included a *binbaşı* (colonel) and two *ağas*—*ağa-i yemin* and *ağa-i yesar*—who commanded flank battalions. Finally, an attempt was made to introduce discipline into the decadent Janissary corps. However, the creation of new regular army units and growing French influence led to open rebellion of the Janissaries and conservative elements in society. In 1807 the Janissaries organized a coup d'état against Selim, who was imprisoned and then assassinated. By this action the modernization of the Ottoman Army was considerably delayed.

The eighteenth century saw the Ottoman Army engaged in a series of wars against Russia and Austria. The Ottomans fought with varying degrees of success, achieving certain tactical victories but often losing campaigns. The Janissaries refused to adopt any Western tactics or weaponry and objected to serving with the *nizam-i cedid*

troops. These forces thus took virtually no part in the fighting against the Russians, leaving it to the relatively ineffective Janissaries and irregular troops. The conflicts of the late eighteenth century demonstrated that long periods of neglect and decay had left the Ottoman forces far inferior to their European rivals.

The Russo-Turkish War of 1768–1774 ended the undisputed Ottoman control of the Black Sea and gave Russia the right to navigate freely through the Straits. In 1783–1784, the Ottomans failed to defend their interests in the Crimea and Georgia, where the Russians then effectively established their authority. Selim engaged Austria and Russia in 1787–1792, but following Ottoman defeats at the hands of the legendary Russian general Alexander Suvorov he was forced to accept the Treaty of Jassy (1792), which extended the Russian frontier to the Dniester River. In 1798 the Ottoman Army faced a new enemy: the French expeditionary force under Bonaparte in Egypt and Syria. Although the sultan organized two large armies of almost 60,000 men, both were decisively defeated by smaller and more effective French forces at Nazareth, Mount Tabor, and Lake Tiberias in April 1799, and later at Aboukir in July 1799. After Bonaparte's departure Ottoman forces failed to defeat the isolated French troops in Egypt and ultimately succeeded only with British help in 1801.

The early nineteenth century saw the rise of nationalism among Ottoman subject peoples in the Balkans, where a Serbian uprising began in 1803, soon followed by revolts in Bosnia, Wallachia, and Bulgaria. Ottoman forces were effective in suppressing local rebellions but failed to subdue the Serbs, who appealed for help from Russia. A new Russo-Turkish War began in 1806 and continued for the next six years. The Ottoman Army itself was in disarray after Selim's attempts to modernize it led to conflict with the Janissaries and others adversely affected by the reforms.

The new sultan, Mahmud II, faced a desperate situation both internally and externally. His authority was greatly diminished within the empire because of the opposition of the Janissaries and conservative elements. Muhammad Ali, viceroy of Egypt, became virtually independent; Ali Pasha of Janina led an open revolt in southern Albania; and various local governors in Syria and Arabia also disregarded the central authorities. In early 1807 the British attempted to seize the Dardanelles with a naval squadron but were repulsed by Turkish defenses directed by French officers.

Still, the Ottomans suffered a series of reverses against Russian forces in the Danubian Principalities (now Romania). By late 1809 the Ottomans were driven across the river Danube and lost all of Serbia and Greater and Lesser Wallachia. Two years later an Ottoman army under Ahmed Pasha was surrounded near Ruse on the Danube and

starved into submission. Unable to continue the war, Mahmud finally signed a peace treaty at Bucharest on 28 May 1812, relinquishing his claims to Bessarabia and Georgia but restoring his authority in Moldavia, Wallachia, and Serbia. For the next fifteen years, the Ottoman Army avoided wars with major powers and made continuous attempts to modernize.

## Ottoman Empire

For centuries the Ottoman Empire was one of the greatest and most powerful states in Eurasia. As late as 1683 Ottoman armies threatened the European mainland and besieged Vienna. Yet by the late eighteenth century the empire was in decline, presenting only a shadow of its former glory, and it was reluctant to take part in European affairs, largely owing to its internal difficulties. Weak central authority led to the loss of control of many provinces to the local notables (*ayan* or *derebeyi* in Anatolia, *klephts* or *hayduks* in European possessions), who gradually increased their power, exercised virtually unlimited authority, collected taxes, and sent nominal payments to the central authorities.

The central government maintained its position when it could by manipulating local rulers against each other. The Ottoman ruling elites saw the necessity of reforms but failed to implement them, because many of them benefited financially from the anarchy and the sultan's weakness. More significant was the Ottoman sense of superiority over anything other societies could possibly produce and offer. As a result, solutions to financial, social, and political problems were sought within the Ottoman experience and European advances were largely ignored. Major reforms

were attempted in the army and navy under the leadership of the Grand Admiral Gazi Hasan Pasha and Grand Vizier Halil Hamid Pasha, but even these met with considerable resistance.

The eighteenth century saw the Ottomans engaged in a series of wars with the rising Russian Empire for the control of the Black Sea and the Danubian Principalities (Bessarabia, Moldavia, and Wallachia—mostly modern Romania). The Russo-Turkish War of 1768–1774 concluded with the peace treaty of Küçük Kaynarca, which ended undisputed Ottoman control of the Black Sea. The Ottomans had to acknowledge an independent khanate in the Crimea and ceded certain territories on the Black Sea coastline to Russia. The treaty gave Russia the right to navigate freely through the Straits of the Bosphorus and the Dardanelles (also known as the Black Sea Straits) and the privilege of representing Greek Orthodox Christians within the Ottoman Empire, a basis for future Russian interventions in the internal affairs of the Ottoman Empire.

Ten years later, relations between the two empires worsened again, and in 1783–1784 the Ottomans witnessed the Russian annexation of the Crimea and advancement into the Caucasus, where Georgian kingdoms acknowledged Russian sovereignty. Furthermore, in 1787 another Russo-Turkish War began as Russia and Austria sought to extend their influence into the Danubian Principalities. In 1789, as France experienced the upheaval of revolution, Sultan Abdul Hamid had been succeeded by his son Selim III, who actively continued the war against Austria and Russia. However, the war proved to be less successful to the Ottomans. The Treaty of Jassy, signed on 9 January 1792, did restore Bessarabia, Moldavia, and Wallachia to the Ottomans but it also secured Russian dominance in the Black Sea and confirmed the earlier Treaty of Küçük Kaynarca, extending the Russian frontier to the Dniester River, including Ochakov in the Crimea. More importantly, the war consumed enormous resources and prevented Selim from implementing military reforms.

After the Treaty of Jassy, the sultan, realizing the importance of modernization, embarked on creating a new army called the *nizam-i cedit* (new order) using modern weapons and tactics developed in Europe. To fund his reforms and increase state revenue, Selim established the *irad-i cedit* (new revenue) financed from taxes imposed on previously untaxed sources and the confiscation of *timars* (lands) whose holders were not fulfilling their duties to the state. However, his reforms faced bitter resistance from various internal factions, including the powerful *ulama* (religious leaders) and the Janissaries, who felt threatened by the sultan's changes.

In addition to internal strife, the Ottoman Empire faced a French invasion of Egypt, an Ottoman province, in

1798. In May 1798 Bonaparte led an expedition to Egypt to establish a base for an attack on Britain's trade and possessions in India. Though nominally under Ottoman sovereignty, Egypt was in fact under the control of the Mamelukes, and while the French attempted to portray the invasion as a move to restore the position of the Ottoman sultan they failed to achieve this goal; in 1798 Selim joined the anti-French coalition. In December of that year, Russia and the Ottoman Empire signed an eight-year military alliance that would play an important role in subsequent relations between the two empires. This alliance gave the Russian fleet unlimited access to the Straits of the Dardanelles and placed the Russian Black Sea squadron in the Mediterranean, where it supported the Ottomans against the French in 1799.

The Turks, meanwhile, fielded two large armies against the French, but both were decisively defeated by Bonaparte in battles at Nazareth, Mount Tabor, and Lake Tiberias in April 1799, and later at Aboukir in July 1799. Eventually the Ottomans succeeded, largely with British help, in driving the French out of Egypt and reestablishing their control over the province by 1801. The Ottoman hold over Egypt proved to be fleeting as the sultan's appointee, Muhammed Ali Pasha, who was appointed as the viceroy of Egypt in 1805, became increasingly independent and later even challenged the sultan for supremacy in the Levant.

By the early nineteenth century, the Ottoman Empire also faced the rise of nationalism among its subject peoples, especially in the Balkans, where a Serbian uprising began in 1803 and a Greek independence movement flourished in the 1810s. Russo-Turkish relations also became strained, particularly after Napoleon approached Selim with a proposal of alliance. The possibility of the French domination of the Balkans and the Black Sea Straits concerned Russia. In addition, Russian monarchs sympathized with the Slavic peoples under Ottoman domination; when the Serbs revolted in 1803, they turned to Russia for protection and received substantial diplomatic and financial support. Furthermore, when the sultan expressed his interest in renewing the alliance of 1799, the Russian tsar, Alexander I, proposed to expand it to satisfy Russian interests in the region, which were reflected in a new treaty signed on 23 September 1805. However, two months later, a decisive French victory at Austerlitz had changed the European balance of power as Napoleon destroyed the Third Coalition (Austria, Russia, Britain, and Sweden).

After the defeat of the Allies, Selim decided to join the victorious side, hoping to recover lost territories from Russia. He acknowledged Napoleon's imperial title and began negotiations for an alliance with France. Trusting in new relations with Napoleon, the sultan declared his intention

to close the Straits of the Bosphorus and Dardanelles to Russian vessels and replaced the current pro-Russian *hospodars* (princes) of Moldavia and Wallachia. Both of these decisions had a profound effect on Russo-Turkish relations since they violated the articles of the Treaty of Jassy—which had required Russia's consent to dismiss or appoint the *hospodars*—and threatened Russian strategic interests in the Balkans and the eastern Mediterranean. In response, Alexander ordered the invasion and occupation of Bessarabia, Moldavia, and Wallachia in late 1806.

Selim's military reorganization and the increasing influence of France evoked a strong reaction from the conservative coalition of the Janissaries, the *ulamas*, and others adversely affected by the reforms. The sultan, on the other hand, lacked the determination to enforce the measures. The Janissaries soon mutinied in Edirne (Adrianople) and were joined by the local notables. Selim halted the process of reorganization and dismissed his reformist advisers, but it was too late. Discontented with the sultan's reforms, the *yamaks* (auxiliary levies) rebelled in 1807 and imprisoned him. The new sultan, Mustafa IV, ended the reforms, and most of the reformers were persecuted and massacred. However, Mustafa Beyraktar, pasha of Silistra, supported Selim's reform policy, and after the sultan's deposition, he rallied forces at Edirne in 1808. He marched with Grand Vizier Celebi Mustafa Pasha on Constantinople, where they dictated their terms to Sultan Mustafa IV. On 26 July 1808, Mustafa Pasha was appointed commander in chief of the Ottoman Army, and two days later he attempted a coup d'état to restore Selim to power. However, Selim was assassinated on the orders of Mustafa IV, who was himself immediately deposed by Mustafa Beyraktar.

Under the new sultan, Mahmud II, Mustafa Beyraktar became a grand vizier. He continued the reform policy of Selim and summoned a great imperial conference at Constantinople, where the highest-ranking officials were invited to adopt an extensive program of reforms. His actions alienated the conservatives and the Janissaries, who rebelled on 14 November 1808. Mustafa's residence was surrounded and set on fire. He hid himself in a tower of his palace, where his body was found three days later, once the fire was quenched.

Mahmud faced a daunting task of reviving the empire despite internal and external threats. His authority was greatly diminished in the wake of civil unrest and the Janissary revolts as well as the Russian invasion of the Danubian Principalities. Egypt, led by Muhammad Ali Pasha, was only under nominal control, and the central authority struggled to contain local governors in Tunisia, Eastern Anatolia, and Arabia. The situation in the Balkans was most pressing. Greek provinces were in turmoil, Ali Pasha of Janina was in open revolt in southern Albania, as

was Serbia under the leadership of George Petrovic (Karageorge).

The region was also appealing to the interests of European powers; while Austria vied for a slice of territory and exerted great influence in Serbia, Russia was already at war with the Ottoman Empire and its armies occupied Bessarabia and Wallachia. In 1805 Selim hoped to receive French support to recover lost territories but French promises soon proved to be illusive, if not outright detrimental to Ottoman interests. The sultan's pro-French policy led to discord with Britain; in early 1807, Britain attempted to seize the Dardanelles with a naval squadron, but it was repulsed by artillery mounted in coastal fortifications and directed by French officers.

Meanwhile, Napoleon and Tsar Alexander negotiated peace agreements at Tilsit (July 1807) and Erfurt (October 1808), ending the war between France and Russia. Seeking Russia's cooperation in the Continental System and neutrality in regard to his efforts in Spain, Napoleon was willing to agree to Russian requests that were disadvantageous to his Turkish ally. France agreed to abandon its alliance with the Turks and help to mediate a peace between the Ottoman and Russian empires. One of the secret provisions further stipulated that if Russo-Turkish negotiations were to fail, Napoleon would join Alexander in making arrangements to partition the Ottoman Empire. Abandoned by France, Mahmud had to continue the war against Britain and Russia alone. He was able to take advantage of Franco-Russian rapprochement to negotiate a treaty of peace with Britain in January 1809. Implicitly directed against Russia, the Treaty of Çanak guaranteed that no warships of any power would pass through the Black Sea Straits and reaffirmed Britain's capitulatory rights (trading and consular privileges) in the Ottoman Empire; the secret provisions provided for British assistance to the Ottomans in case of a war against France.

The war with Russia continued for another three years and drained Ottoman resources. By late 1809, the Russian army had secured all of Greater and Lesser Wallachia and forced the Grand Vizier, Yussuf, to halt his invasion of Serbia. Two years later, General Mikhail Kutuzov destroyed the Turkish army under Ahmed Pasha near Ruse on the river Danube, forcing Mahmud to open negotiations in October 1811. The Turks prolonged the process, hoping France's impending conflict with Russia would change the political situation. Yet, under pressure from Britain and Russia, the Turks finally had to sign a peace treaty at Bucharest on 28 May 1812. The new agreement was not excessively harsh for the Ottomans since Russia, on the eve of invasion by Napoleon, was seeking ways to secure its southern borders and disentangle its army. Although the Treaty of Bucharest required the sultan to surrender

Bessarabia and Georgia, it also restored his authority in Moldavia, Wallachia, and Serbia, which the Russians had spent more than four years to secure.

Ottoman hopes of French success in Russia in 1812 and any subsequent settling of scores with Russia proved futile. Over the next three years, the sultan watched his archenemy, Russia, become the arbiter of the European balance of power. The Ottomans participated in the Congress of Vienna but did not sign the Final Act of the conference. By that time, the internal situation remained precarious and civil strife continued in various provinces. Serbia was virtually autonomous by 1815, and a Greek independence movement, already gaining support from European powers, would eventually lead to a Greco-Turkish war in 1821 and independence in 1830. Relations between Russia and the Ottoman Empire remained strained despite the Treaty of Bucharest and would result in another war in 1828–1829.

## Ottoman Navy

The Turkish, or Ottoman, Navy played a limited role in the French Revolutionary and Napoleonic Wars. Its operations were largely confined to the waters around Greece, the Dardanelles, and the Black Sea. Although their equipment was comparable in quantity and quality to that of other

countries, the Turks suffered from an archaic organization and a lack of vision, experience, and modern tactics. The navy suffered a series of defeats as the Ottoman government regularly changed alliances in an attempt to regain lost territory.

After a disastrous defeat at Chesme in 1770, the Turkish Navy instituted a massive shipbuilding program. By 1790 Ottoman naval forces numbered thirty ships of the line and fifty frigates, built to modern European designs. Contemporary observers commented that Turkish ships had greater headroom between decks, a characteristic they attributed to the Turks' custom of wearing elaborate headgear. The resulting greater freeboard of Turkish ships made them less navigable in heavy weather. Turkish vessels were also highly decorated and were regarded as the most beautiful in Europe. The fleet included around a hundred galleys, especially effective in coastal waters.

Sultan Selim III (ruled 1789–1806) initiated further naval reforms. Frenchman Jacques Balthazard Le Brun was hired to develop a modern naval establishment. The naval arsenal at Constantinople (Istanbul) was enlarged, and a school to train officers at Haskoy was modernized. Modern shipbuilding facilities were established at Sinope and Rhodes, as well as at the capital. Selim appointed a boyhood friend, Kucuk Huseyin Pasha, as the kaptain pasha, or grand admiral, of the navy. Kucuk Huseyin Pasha retained this position until the end of Selim's rule, giving the navy an unprecedented stability. He instituted regulations to reduce corruption and ensure promotion of talented officers. The reinstatement of conscription in the maritime provinces provided a supply of mostly Greek sailors with seafaring backgrounds. Selim organized a naval medical service based on Western experience, improving the general health of the navy. Standard uniforms remained unknown in the Turkish Navy, and officers' ranks were distinguished by the color of their boots. Marines were provided by the 31st Ortah of the Janissary Corps and had anchors tattooed on their forearms to distinguish them.

The Turks were regarded as brave and tenacious fighters and could handle their ships competently, but their knowledge of naval tactics was primitive compared with that of Europeans. The Ottoman government failed to use its navy to project its power, the navy's role during the French Revolutionary and Napoleonic Wars being limited mostly to conveying troops and defending Constantinople.

The Ottoman Empire remained neutral until Bonaparte invaded Egypt on 1 July 1798. After Rear Admiral Sir Horatio Nelson won control of the Mediterranean at the Battle of the Nile, the Turkish navy conveyed an army to Egypt in June 1799. The navy also cooperated with the Russian Black Sea fleet in 1798–1799 to capture French possessions in the Adriatic. Following the Peace of Amiens

in 1802, the Turkish Navy was allowed to deteriorate. During the peace, relations with France grew closer, while those with the traditional enemy, Russia, became strained. Russian forces invaded Moldavia in December 1806, resulting in war. To assist their ally, a British squadron under Vice Admiral Sir John Duckworth forced its way through the Dardanelles in February 1807 and anchored at Constantinople. Their goal was to force the Turkish to adopt a policy of neutrality. Selim refused to negotiate and ordered ships manned. Duckworth, recognizing that his mission was hopeless, retreated back down the Dardanelles.

In the Russo-Turkish War of 1806–1812, the Turkish navy's main opponent was a Russian Mediterranean squadron under Vice Admiral Dmitry Senyavin. Senyavin seized several Turkish islands in the Aegean and used them as bait to draw the Turkish fleet out of the Dardanelles. Senyavin cornered the Turks at Lemnos where, though the Ottoman fleet was superior in numbers, it anchored in a defensive formation. Senyavin attacked on 19 June 1807, capturing one ship of the line and destroying two others. The surviving Turkish ships fled back to the Dardanelles and did not challenge the Russians again.

The war with Russia dragged on until 1812. The Turkish navy maintained a squadron in the Black Sea but limited its activities to supporting land forces and raiding Russian commerce.

### **Oudinot, Nicolas Charles (1767–1847)**

A ferocious and often wounded battlefield commander, Nicolas Oudinot began his military career in the armies of Revolutionary France in the 1790s. After numerous fights against the Austrians, he rose to general's rank in 1794 at the age of twenty-seven. Oudinot began his association with Napoleon Bonaparte only in 1800, and had to overcome suspicions of being linked with the young dictator's political opponents. He quickly began to distinguish himself in four years of campaigning in the Grande Armée, starting with the conflict against Austria in 1805. Rewarded with the governorship of Holland in 1810, Oudinot displayed a surprising talent for ruling a volatile civilian population.

Oudinot returned to combat as a corps commander in Russia in 1812, and he displayed his talents for aggressive leadership in helping to secure the bridgehead over the Berezina River during the retreat of the Grande Armée. But he showed his limits as an independent commander when he tried to lead four corps against Berlin in 1813. He became timid and hesitant in unrestricted command over large numbers. Fighting against the forces invading France in 1814, Oudinot decided firmly that Napoleon had no chance of winning. He approved of the Emperor's abdication, rallied to King Louis XVIII, and refused to support Napoleon's bid to return to power in 1815. He held various military commands under the restored Bourbon dynasty and then under King Louis-Philippe until his death, at the age of eighty, in 1847.

Oudinot was born at Bar-le-duc on 25 April 1767. From an early age, this son of a prosperous brewer exhibited distaste for the quiet life of a businessman. He ran away from home at the age of seventeen to enlist in the Royal Army. He served for three years until his parents arranged for his release. In 1789, he abandoned a course of study in bookkeeping to join the National Guard. Two years later, when National Guard units were being mobilized for duty with the army, he volunteered for active service.

The young man's leadership qualities became evident from the start. His fellow members of the National Guard chose him as their captain, and comrades in his unit of volunteers in 1791 elevated him to the position of lieutenant colonel. Starting with his first experience of combat in the Moselle valley in June 1793, Oudinot received rapid promotion while defending France's eastern frontiers against the Austrians. By November he was a full colonel. In June 1794, still only twenty-seven, he was promoted a brigadier general (*général de brigade*). By the time he reached this rank, Oudinot had already suffered numerous wounds on the battlefield. In one encounter, in which he was captured, the daring young commander was wounded five times by enemy saber cuts.

Oudinot's career took a crucial turn in late 1798, when he left campaigning in Germany in order to serve in Switzerland under General André Masséna, his first great military mentor. He distinguished himself the next spring leading a brigade, as French forces advanced eastward across Switzerland. Masséna rewarded his young subordinate with a promotion to major general (*général de division*) and assignment as the army's chief of staff. In the autumn of 1799, when Masséna's army found itself pushed back to Zürich, Oudinot played a key role in the new French offensive. As usual, his presence in combat brought him a new set of injuries at the hands of the enemy. By this point, Russian troops had replaced the Austrians facing the French army. In command of one of Masséna's attacking

columns, Oudinot led a decisive envelopment of the Russians near Zürich, then pushed ahead to capture Constance. There, he showed a human touch in permitting the escape of émigré Frenchmen who had fought on the side of the enemy. The close tie between Oudinot and Masséna continued during the siege of Genoa in 1800. At one point during the campaign, Oudinot passed through the blockading British squadron in a small boat to contact French forces outside the city.

During the first years of the new century, Oudinot found his glowing military talents overshadowed by his links to individuals accused of plotting against Bonaparte. Fighting along the Rhine in Germany in the previous decade had brought him close personal ties to known opponents of Bonaparte such as General Jean Moreau. Apparently, in the years just after Bonaparte took power in 1799, Oudinot was present at discussions among disgruntled generals seeking to overthrow the young dictator. But Oudinot was able to overcome Bonaparte's distrust, and he soon found himself placed in responsible positions of command.

In 1803, as Bonaparte prepared for an invasion of England, Oudinot received command of a division in the corps led by General Louis Davout. At the start of 1805 Oudinot was given the signal honor of commanding the Grenadier Division, an elite infantry formation. He led this formation in the series of victorious French campaigns that began that year. In August 1805, Oudinot's troops, now part of Marshal Jean Lannes's V corps, advanced rapidly into western Germany to help surround the Austrian army at Ulm. In the subsequent advance toward Vienna, Oudinot encountered the bulk of the Russian army at Amstetten on the southern bank of the Danube. His ferocious assault against this numerically superior force compelled the enemy to abandon its defensive position, opening the way for a French occupation of the Austrian capital shortly thereafter.

Upon reaching Vienna, the Grande Armée was confronted with the problem of seizing the heavily defended Tabor Bridge across the Danube. In a daring ruse, Lannes and Marshal Joachim Murat approached the Austrians guarding the bridge, pretending that an armistice had ended open fighting. While his superiors occupied enemy officers with their conversation, Oudinot led a force of French troops to capture the span.

Kept mainly in reserve at the battles of Austerlitz (1805) and Jena (1806), Oudinot returned to the thick of action in the 1807 campaign against the Russians. At Ostrolenka in February of that year, he fended off a surprise Russian attack that threatened to crack the right flank of Napoleon's army. A few months later, serving as a divisional commander under Lannes at the Battle of Friedland, he helped to pin down superior numbers of Russian troops

until Napoleon could bring up reinforcements and win the day. On this occasion, Oudinot's coat was riddled with musket balls and a round shot (cannonball) nearly killed him, taking the life of his aide-de-camp beside him instead.

Oudinot displayed his daring and aggressiveness to good effect in the campaign of 1809 against Austria, when for a time he served again under Masséna. Oudinot's troops led the French advance from southern Germany to Vienna, and, on 13 May, he entered the enemy's capital city. During Napoleon's first effort to cross to the northern bank of the Danube, Oudinot fought heroically at Aspern-Essling. Upon the death of Lannes at the close of the battle, Oudinot took command of II Corps. Six weeks later, in early July, he led the second crossing of the Danube. Oudinot's performance at the subsequent Battle of Wagram—in which he made an unauthorized but successful assault on the key Austrian-held village of Baumersdorf—led Napoleon to make him a marshal. Oudinot also received the title of duc de Reggio on 13 July.

Oudinot took a new role in the years following, that of military governor of Holland. He led French troops into that kingdom in February 1810 and completed the occupation of the country two months later with his entry into Amsterdam. Oudinot then presided over Holland's formal annexation by France in July 1810. After Holland became fully incorporated into Napoleon's Empire, Oudinot proved to be a firm but tactful administrator. Under his control the Dutch accepted their new status without resorting to violence.

Leading II Corps into Russia in the summer of 1812, Oudinot and his force of 33,000 men occupied a position on the northern flank of the Grande Armée. He now commanded a larger force than at any time in his career, though he enjoyed only mixed success. In an extended summer battle against the Russians at Polotsk, Oudinot was uncharacteristically timid, hesitating to advance against the enemy for fear of being outnumbered. Nonetheless, he redeemed himself with his heroism in late November. At that time, his troops helped to hold off numerically superior Russian forces on the west bank of the Berezina River, maintaining a bridgehead that allowed the rest of the Grande Armée to cross to safety. As always, Oudinot's service was accompanied by battle wounds. These new injuries were sufficiently severe that they may have affected his subsequent military leadership.

Oudinot's difficulty in commanding large numbers of troops became evident in 1813. Although he contributed to the French victory at Bautzen in May, Oudinot was unsuccessful when Napoleon ordered him to advance on Berlin. Capturing the important capital was a key element in Napoleon's campaign plan, since the French emperor anticipated that it would drive the Prussians out of the opposing coalition. But Oudinot could not produce the results Napo-

leon needed. Defeated by the Prussians at Luckau in early June, he led a second attempt to take the Prussian capital in late August. Oudinot's hesitant advance in command of four corps was followed by a hasty withdrawal after being rebuffed at Grossbeeren. He suffered the humiliation of being demoted to command of a single corps and placed under the orders of Marshal Michel Ney. Despite the shift in leadership, the French were decisively defeated by the Prussians at Dennewitz on 6 September. Annoyed at his demotion, Oudinot contributed directly to the failure: He insisted on following Ney's battlefield orders to the letter, even though he knew they would produce a French defeat.

Oudinot led an army corps during the 1814 campaign on French soil, receiving wounds to both legs at Brienne. At Arcis-sur-Aube he was hit in the chest by a musket ball which, however, on striking his Legion of Honor decoration, was deflected. Early in the fighting Oudinot became convinced that the campaign could not succeed in the face of such superior numbers of the enemy. Although he did not take the lead in calling for the abdication of the Emperor, Oudinot readily agreed to Napoleon's departure from power, and he rallied without hesitation to the newly restored monarchy of Louis XVIII. He was rewarded with an important military post, commander of the garrison at Metz.

When Napoleon returned from exile on Elba in the spring of 1815, Oudinot tried unsuccessfully to keep the troops at Metz from rallying to their old leader. Nonetheless, he refused to support Napoleon's brief return to power himself. Following Waterloo, Oudinot received a variety of new positions under Louis XVIII and his successors. He had been fortunate not to have served in Spain during Napoleon's futile effort to conquer the Peninsula, but, in 1823, he led a corps of the French army across the Pyrenees in a successful campaign to help the reigning Spanish monarch. He received a final appointment, as governor of the Invalides, in 1842, and the old warrior died in Paris on 13 September 1847.

**Owen, Robert (1771–1858)**

Welsh industrialist, labor reformer, and Utopian socialist who pioneered the formation of cooperative societies with his experiments at New Lanark, Scotland, and New Harmony, Indiana. Influenced by the ideals of the French Revolution, he authored numerous books, including *The Formation of Character* (1813), *A New View of Society* (1814), and *Lectures on an Entire New State of Society* (1830). Such works discussed the need for factory reform, suggested new codes of morality, and promoted the virtues of cooperative living.

Owen was born in Newton, Montgomeryshire, Wales, in May 1771. The youngest son of an ironmonger, he began as an apprentice in a firm of drapers in Stamford, Lincolnshire. By age sixteen, he was working in the textile industry in Manchester. While there, Owen was exposed

to the latest developments in mechanized manufacturing, in particular, Richard Arkwright's flying shuttle. His intense interest in the newest technology, coupled with his drive and intellect, fostered his involvement in several investment and business opportunities during the early 1790s. In 1792 Owen became manager of industrialist Peter Drinkwater's spinning mill. Impressed with his new assistant, Drinkwater introduced Owen to several other prominent industrialists, including David Dale, proprietor of Britain's largest cotton-spinning business, the Chorton Twist Company of New Lanark, in Scotland. Dale and Owen quickly developed a solid friendship, and in 1799 Owen purchased Dale's company and later married his daughter, Anne Caroline.

Owen now enjoyed both personal and professional success, yet he remained unfulfilled. The exploitative nature of capitalism troubled the young entrepreneur. Profiteering at the worker's expense disheartened Owen and countered the concepts of social justice he championed. He was a devotee of the socialist notions that originated with the French Revolution, and, once in control of New Lanark, he embarked upon a program of reform that conformed to such ideals. New Lanark was set up as a model factory community where both profit and people were paramount. Free education, medical care, and the like were provided for the community's benefit, and Owen's program became a great success, generating international recognition.

He planned to expand his notions of social change even further with the establishment of another model community, New Harmony, Indiana, in 1825. Citizens of New Harmony would live communally, working, worshipping, learning, and recreating for the mutual benefit of all. However, disorganization, incessant infighting among the inhabitants, and lack of dedication to the Utopian ideal ended the experiment by 1828.

The failure of New Harmony led Owen back to Britain the following year. He became involved in the trade union movement, promoting the formation of the Grand National Consolidated Trades Union of Great Britain and Ireland, and an eight-hour workday, during the 1830s. He joined other crusades by the 1840s, particularly those dealing with religious reform, but he never completely abandoned his cooperative dream, continuing to pursue such objectives until the end of his life. Owen died in November 1858 in his hometown.

## **Paget, Sir Edward (1775–1849)**

Potentially one of the best subordinate commanders to serve under the Duke of Wellington in the Peninsular campaigns, but dogged by ill fortune.

Major General Sir Edward Paget commanded a brigade during Sir John Moore's campaign in 1808, serving with distinction and valor as the commander of the rear guard during the retreat to Corunna and commander of a brigade at the battle of that name in January 1809. He later commanded a division under Wellington, losing his right arm in 1809 at Oporto, during the successful seizure and defense of the convent at the crossing of the Douro on 12 May. He convalesced until he returned to Spain in the fall of 1812, when he was named as second in command to Wellington. He was captured on 17 November 1812.

Prior to his campaigns in Spain and Portugal, Paget had served in Flanders, as a senior marine officer at the Battle of St. Vincent in 1797, and at the capture of Minorca in November 1798. In 1801 he fought in Egypt where he was wounded at the Battle of Alexandria, and later served in Hanover and in Sicily before joining Lieutenant General Sir John Moore's forces in the Peninsula.

Born on 3 November 1775, Edward Paget was the brother of Henry Paget, second Earl of Uxbridge, the latter of whom was despised by Wellington for having eloped with his sister. Henry Paget commanded the cavalry in Moore's campaigns but was not employed by Wellington until he was forced to accept appointment as the commander of the cavalry during the Waterloo campaign in 1815. Wellington's antipathy toward the Earl of Uxbridge does not seem to have extended to Sir Edward.

After the Napoleonic Wars Sir Edward served as the colonel in chief of the 28th Foot (the Gloucestershire Regiment) and as commander in chief of British forces in India during the First Burma War in 1822–1825. There he was involved in the suppression of the Barrackpur Mutiny in November 1824, which resulted in the trial and sentencing of forty-one, and the actual execution of twelve, sepoy of

the 47th Bengal Foot. Sir Edward gained notoriety by the severity of his actions during this incident, notwithstanding that he was not disciplined or replaced as a result of it. He died in England on 13 May 1849 at the age of seventy-three while governor of Chelsea Hospital.

## **Paine, Tom (1737–1809)**

Idealist author of the revolutionary pamphlet *Common Sense*, Paine was born on 29 January 1737 in Thetford, Norfolk, England, to Joseph Paine, a Quaker, and Frances Cocke Paine, a practicing Anglican. He received a basic education after which he attempted a variety of options to obtain a career. After a short stint working for his father as a corset apprentice he tried to be a sailor, a supernumary officer, a teacher, a preacher, a servant, and then an excise

officer, an entirely unsuitable profession for one with Paine's mentality; he did not know his niche in life.

A chance meeting with Benjamin Franklin in London led to letters of introduction supporting Paine's subsequent immigration to America, where he settled in Philadelphia in 1774. Paine was married twice; his first wife died within a year of their marriage, and he separated from his second wife after a stormy three-year marriage that ended in 1774. During this time he developed liberal views, radical for the time, on natural justice, public education, and social security.

Paine became an author and publicist. His 1774 publication, *African Slavery*, characterized the inhumanity of slavery. He also coedited the *Pennsylvania Magazine*. His intuition and sense of anxiety led to his sympathy for the American rebels, especially after the initial clashes at Lexington and Concord in April 1775. He reasoned that no one should pay taxes without parliamentary representation. He abhorred the abuse of power that was officially sanctioned by Parliament; he postulated that governments should be elected frequently and regulate affairs, nothing more. Paine was further emboldened to suggest independence; he argued that the colonists ultimately had a right to independence from a government that had lost touch with its people.

This radical idea was published in his pamphlet *Common Sense* on 10 January 1776. He wrote that "Society in every state is a blessing, but Government, even in its best state, is a necessary evil; in its worst state, an intolerable one." The pamphlet sold 500,000 copies, largely because Paine was determined to keep the price reasonable, thus foregoing hefty profits. *Common Sense* inspired the general public toward accepting independence and directly influenced the authors of the Declaration of Independence of 4 July 1776.

Paine inspired the Continental Army, in which he volunteered, with the influential sixteen patriotic *American Crisis* papers published from 1776 to 1783, which further encouraged revolutionary thought. Paine was forced to resign his position as secretary of the Committee of Foreign Affairs in Congress because of his disclosure of secret documents. He then obtained a position as clerk and continued publishing. Meanwhile he turned to inventing and received a patent for his single-span iron bridge. Paine had become a republican as well as a deist with great disdain for organized religion.

Paine returned to England, and from March 1791 to February 1792 he wrote the *Rights of Man*, which postulated democracy for all men. This response to Edmund Burke's *Reflections on the Revolution in France* (1790) necessitated Paine's escape to France, where he supported the Revolution. As an elected official to the National Assembly he voted against Louis XVI's execution and abhorred the subsequent Terror. Maximilien Robespierre tried to have

Paine guillotined for voting against his wishes. Paine was imprisoned from January 1793 to November 1794 and due to be executed, but a chance event prevented this. His executioners, failing to dispatch him on the day appointed, were prevented from carrying out the sentence amid the chaos that ensued after the fall of Robespierre a few days later. Then in 1796 he published *Agrarian Justice*. Thereafter he wrote the inflammatory work *The Age of Reason*, which attacked organized religion; this controversial work alienated him from his former supporters. By 1802 Paine was invited back to the United States by Thomas Jefferson.

Paine was gradually abandoned except by a few friends from his small social circle. He died penniless and in obscurity in New York City on 8 June 1809. Despite his public derision, his ideas had a strong influence on such august figures as Thomas Jefferson, George Washington, and Abraham Lincoln.

Annette E. Richardson

### Pajol, Claude Pierre (1772–1844)

French general who enjoyed a long and distinguished military career. Wounded many times, Pajol was staunchly opposed to the Bourbons, serving in the French Army during the First Republic, the First Empire, and the July Monarchy.

Born in Besançon on 3 February 1772, Pajol studied law as a young man. Before completing his studies, he joined the National Guard in August 1789. By 1791 he was a sergeant major, and he became a lieutenant in the 82nd Line Infantry Regiment in 1792. Lieutenant Pajol was twice wounded on 30 September 1792 while leading a company of grenadiers in an assault on the town of Speyer. He was made captain and became an aide to General Jean-Baptiste Kléber in 1794. Wounded again at Esneaux, 11 September 1794, Pajol was afterward given the honor of escorting thirty-six captured enemy flags to Paris. Fighting in September 1795, he was hit by a musket ball in the leg. He was promoted to *chef de bataillon* (major) and distinguished himself at Friedberg on 10 July 1796.

Pajol transferred to the 4th Hussars and with two hundred troopers captured two battalions of Austrians in March 1799. Promoted to colonel, he took command of the 6th Hussars. Pajol led this regiment in a successful charge at Neuburg on 27 June 1800. He participated in Napoleon's Ulm campaign in 1805 and then performed garrison duty in Italy. In 1807 Pajol became a general and led a cavalry brigade at Königsberg. In 1809 he fought gallantly at the Battle of Wagram and personally captured an Austrian colonel.

During the invasion of Russia in 1812, Pajol commanded a cavalry division. He captured Kovno and Vilna, and he fought at Borodino. Escaping injury at that bloody battle, he was badly wounded two days later, while pursuing the retreating Russians. Recovered by the following summer, Pajol fought at the Battle of Dresden in August 1813. Two months later, at Wachau, an enemy shell killed his horse, and in the resulting fall the general broke his left arm and several other bones. Barely recovered from his injuries, Pajol fought against the Allied invasion of France in 1814. He led a victorious charge of raw cavalry conscripts at the Battle of Montereau and was again wounded.

When the exiled Napoleon returned to France during the Hundred Days in 1815, he gave Pajol command of a cavalry corps. The general fought at the battles of Ligny and Wavre and helped cover the French retreat from Waterloo. Pajol left the army during the Bourbon Restoration, attempting life as a businessman. He participated in the Revolution of 1830, which overthrew the Bourbons. The new king, Louis-Philippe, returned Pajol to his military duties. Pajol only retired from active duty in 1842, at the age of seventy, and died two years later, on 20 March 1844.

## **Pakenham, Sir Edward (1778–1815)**

A general in the British Army, he led forces through the French Revolutionary and Napoleonic Wars, most notably

in the Iberian Peninsula and at the Battle of New Orleans during the War of 1812 against the United States.

He was born a member of the Anglo-Irish aristocracy to Edward Michael Pakenham, second Baron Longford, and Catherine Rowley Pakenham. The young Pakenham was educated in the finest military schools and rose quickly through the ranks, becoming a major in the Ulster Light Dragoons when he was sixteen. During the French Revolutionary Wars he was part of the expedition that captured St. Lucia in 1803. Politically and militarily well connected, Pakenham became brother-in-law of Sir Arthur Wellesley, later the Duke of Wellington, when Wellesley married his sister in 1806. From 1810 Pakenham served under Wellington in the Peninsular War, and he was promoted to major general by the following year. Pakenham was well respected among the British troops, and he was the epitome of a gentleman-soldier. He distinguished himself at the battles of Salamanca in 1812 and the Pyrenees in 1813, receiving a knighthood (Knight Commander of the Bath) in 1813 for his military achievements.

In 1814 Pakenham was sent to the United States to replace Major General Robert Ross, who was killed near Baltimore. Pakenham's expedition was directed against New Orleans, where General Andrew Jackson held command. Pakenham had been opposed to war with the United States but nevertheless fulfilled his duty. Arriving in Jamaica, he found that part of his intended forces had earlier left for the Gulf Coast. By Christmas 1814 Pakenham linked up with Vice Admiral Sir Alexander Cochrane, coordinating plans with him for an attack from the British advance camp at the Villeré Plantation, close to New Orleans. His supply lines were overextended, the weather was foul, and his forces lacked accurate intelligence on American strength. Nonetheless, artillery was disembarked from his ships and emplaced so as to strike the Americans' defensive position established along both sides of the Mississippi River east of the town.

On 8 January 1815 Pakenham attacked Jackson's forces without first capturing American gun emplacements on the river's west bank, which continued to rain fire down upon the advancing British troops. Encountering a storm of musket and rifle fire from the American entrenchments to their front, Pakenham's men began first to hesitate and then to retreat, whereupon Pakenham rode to the front of his lines to encourage them forward. Hit first by a round shot (cannonball) and then by two musket balls, he died courageously after being carried to the back of the fray. His last order, that his reserves be sent forward under Major General John Lambert, failed to produce victory. Pakenham died knowing he had lost the Battle of New Orleans, an action that, ironically but unbeknownst to him, was fought after the Treaty of Ghent (24 December 1814) had

ended the war between Britain and the United States. Pak-enham's service was commemorated with a life-sized statue in St. Paul's Cathedral in London.

## Palm, Johann Philipp (1766–1806)

Publisher later seen as a martyr to the German nationalist cause. Born in Schorndorf, near Stuttgart, on 18 December 1766, Palm became an apprentice bookseller with a relative, who was established within the book trade. After several appointments with major German-language editors of the time, Palm settled in Nuremberg and bought the Steinische Buchhandlung, a bookshop and publishing house, in 1796. He was especially engaged in printing and distributing books on natural sciences and theology and offered almost nothing concerning political issues. After the victory of Napoleon over Austria in 1805, the old Holy Roman Empire collapsed and finally vanished in August 1806. In the month preceding this collapse large parts of southern Germany were still under French occupation as a result of the 1805 campaign, and the first signs of nationalist German resistance were emerging. After Austria's defeat Prussia remained the only major German state not controlled by Napoleon until it, too, was vanquished, in October 1806, at the twin battles of Jena and Auerstädt.

Yet in the spring and early summer of 1806 these events were not foreseen. Instead German nationalists were confronted with a political situation transformed by the French: remodeled southwestern German states, a defeated Austria still claiming the German Imperial crown, and Prussia preparing for war, though still hesitating. This political turmoil caused economic problems, especially in

those regions where French forces of occupation had to be fed and housed.

The printing of the sharply anti-French and, specifically, anti-Napoleonic pamphlet, *Deutschland in seiner tiefsten Erniedrigung* (Germany in Its Deepest Humiliation) by Palm was probably the product of the prevailing political and economic crisis: Palm was certainly a German nationalist opposing foreign occupation, but he also hoped for good business with such an agitating publication despite the economic gloom, which had affected the bookselling business. The risk involved in such an undertaking was obvious, as occupying authorities were likely to regard even such a somewhat naive call for resistance as tantamount to a full-scale uprising. Palm therefore took precautions to organize a clandestine distribution of his pamphlet.

In spite of this he was arrested on 14 August 1806, and executed on the twenty-sixth. While the trial was certainly fixed before it started, it is important to note that harsh penalties for agitation against occupying forces were not solely the preserve of the French, but an established custom in war. Palm did not name the author of the booklet during his trial; today Philipp Christian Gottlieb Yelin is regarded as the author. Owing to the lack of archival evidence, many details of Palm's motivation and the extent of his clandestine propaganda campaign still remain unclear. Palm became a martyr for the emerging cause of German nationalism and was celebrated as a hero well into the twentieth century, by which time the lack of historical evidence had transformed the story of Palm's life into the realm of fairy tales.

## Pamplona, Siege of (25 June–31 October 1813)

After the French defeat at Vitoria in June 1813, their presence in Spain was reduced to garrisons at Pamplona and San Sebastian. As long as the French controlled these cities, the army of the Marquis of Wellington would be limited in its ability to invade France itself. The Spanish and Anglo-Portuguese forces decided to starve Pamplona into sub-

mission, a process that took five months. Efforts by Marshal Nicolas Soult to relieve the city were unsuccessful.

The total defeat of French forces in Spain at Vitoria on 21 June 1813 resulted in a rout of the surviving troops over the Pyrenees into France. French garrisons were maintained only in San Sebastian, on the Biscayne coast, and Pamplona, a major city located nearly 50 miles inland. Some survivors of Vitoria took refuge in Pamplona, joining the existing garrison of 3,000 troops from General Bertrand Clausel's corps, who were backed by 80 heavy guns and secure fortifications around the city. The commander was General Louis Pierre Cassan, who was determined to hold Pamplona as long as possible. He recognized that the city commanded one of the major routes between France and Spain, and that as long as the French remained in control of the city, the Allies would be unable to undertake major operations in southern France.

Wellington was unwilling to rush into an invasion of France. He feared that Napoleon might sign a peace treaty with Prussia and Russia, allowing large French forces to return to Spain. As his army had only one siege train, Wellington decided to attack San Sebastian first. The French could resupply that port city, and Pamplona could be completely cut off. Therefore, by 25 June, a Spanish division of 11,000 men under General Henry O'Donnell invested Pamplona. The siege was punctuated only by periodic forays by the French to gather more food.

Soult quickly reorganized the defeated French forces. One of his most important goals was to break the Allied siege of Pamplona. He realized that the city would eventually fall from lack of food, so he quickly moved to relieve it. While his reserve division on 25 July demonstrated on the Bidassoa River to hold Wellington's attention, Soult moved most of his forces over the Pyrenees directly toward Pamplona. Despite stubborn resistance at the Roncesvalles Pass, the British under generals Sir Galbraith Lowry Cole and Sir Thomas Picton were forced to retreat almost as far as Pamplona by 27 July.

When Cassan saw French campfires around Sorauren, the general ordered a sortie to break the siege on 27 July. O'Donnell, fearing his division would be caught between Soult and Cassan, ordered that the siege be lifted. The arrival of another Spanish division under General Carlos d'España, however, caused O'Donnell to cancel his orders. Cassan's sortie was unsuccessful, and the garrison awaited Soult. The marshal, however, was defeated at Sorauren by Wellington and forced to retreat. Although the French in Pamplona had lost hope of relief, Cassan was determined to hold on as long as possible, hoping that Soult would be able to mount another relief effort. Events prevented that from happening, but the siege dragged on. Much to Wellington's surprise and disappointment, Pamplona held

out until October. The defenders had used up all their food and exhausted all other resources by the end of the month; even the rats and dogs had been eaten. Cassan planned to surrender after destroying the key fortifications. He was only dissuaded when he learned that Wellington promised to have him, his officers, and one-tenth of his men shot if the fortifications were destroyed. On 31 October, Pamplona surrendered.

## Papal States

As it had been for more than a millennium, during the French Revolution the papacy was involved in many significant political and religious events, influencing affairs beyond the borders of its own territories, known as the Papal States. Prior to Napoleon Bonapartes's arrival, the Papal States had consisted of various territories situated in central Italy, specifically Lazio, Umbria, Marche, Romagna, and part of Emilia. It also included cities, like Pontecorvo and Benevento, that were situated far from Rome, the capital. The territory was divided into seven provinces, each governed by a legate chosen by the pope.

In 1793 the French republican government decided to expand its dominance beyond the French borders, and fighting spread into the Low Countries, the Rhineland, and northern Italy. Relations between France and the Papal States became hostile when in 1796 the young General Bonaparte was put in command of the (French) Army of Italy. Officially, the purpose of the campaign was to avenge the murder in February 1793 of a French diplomat, Ugo Bassville. On that pretext, on 19 June 1796 Bonaparte invaded Bologna and then, having defeated the Papal army at Fort Urban on 23 June, reached Rome. After the French occupation of central Italy in early 1797 and the defeat of Papal forces at the Senio on 5 February, Pope Pius VI was forced to sign a truce on 17 February, followed by the Treaty of Tolentino two days later. By this agreement Pius was obliged to pass to French control the cities of Bologna

and Ferrara, and also the nearby territories of Romagna, Ancona, and the enclave of Avignon. Avignon had in reality already been annexed to France in 1791 but prior to that time had been controlled by the Papacy. Pius now renounced all claims to the territory, disbanded the Papal army, and paid an indemnity in exchange for the departure of French troops.

Numerous riots in Rome led by local patriots resulted in the death of French general Léonard Duphot in December 1797 and the occupation of the city by a French army under General Louis-Alexandre Berthier. There followed the deposition of the pope and the establishment of the Roman Republic, a French satellite, on 15 February 1798. The French army pillaged the city, and by an agreement between the rebels and the army, Pius was imprisoned in Siena, followed by his deportation to Valence, in France, where he died in August 1799. In November 1798, taking advantage of the chaotic atmosphere in the former Papal States, Austrian general Karl Mack Freiherr von Leiberich led a Neapolitan force and liberated Rome, though by the following month French forces had retaken the capital. In September of the same year, the Roman Republic collapsed when Neapolitan troops again entered the capital, at that time no longer under French occupation.

As these events unfolded Bonaparte proclaimed himself First Consul and in 1801 sent troops to reoccupy Rome and the territory of the former Roman Republic. The new pope, Pius VII, elected in Venice in March 1800 and desiring amicable relations with France, signed a concordat in July 1801. He took part in Napoleon's coronation on 2 December 1804, though the Emperor took the crown from Pius's hands and dramatically crowned himself.

Napoleon returned the former Papal territories to Pius, with the exception of Romagna and Marche. Yet tensions increased when the pope showed reluctance to annul the marriage of Joseph Bonaparte. In 1808, after Pius had refused to join the Continental System, Napoleon broke the treaty and annexed the Papal States and the region of Umbria to France, forming the departments of Tiber and Trasimeno. The pope thereupon excommunicated Napoleon, but at the cost of the former's freedom: Pius was arrested and imprisoned first in Savona and later in Fontainebleau. Thereafter the Papal States were administered as an autonomous region of France.

When Napoleon was forced to abdicate in April 1814, the pope returned to power in Rome the following month. The Congress of Vienna restored the territory of the Papal States as they had existed in 1792. However, Pius permitted a number of social and political reforms introduced by the French to remain in force.

## Paris

In 1789, Paris was by far the largest city in France and one of the most important urban areas in all of Europe. The crowded city's 700,000 inhabitants relied on the brisk commerce along the river Seine for grain supply, manufactured products, and luxury goods. Paris represented the political center of France, with the palaces of the Louvre and Tuileries providing residences for the royal family when visiting the city. The monarchy's judicial, legal, and municipal officials worked in the courts and offices on and around the Ile de la Cité and the Hôtel de Ville. King Louis XIV had built the palace of Versailles and the administrative offices of the monarchy only a few miles southwest of Paris, allowing the city and palace together to form a fixed capital.

When the Estates-General met at Versailles in May 1789 to address the problem of the king's debts, its close proximity to Paris was immediately felt. Louis XVI quickly became frustrated by the assembly's failure to concentrate on his personal agenda and attempted to disband the Estates-General in June. Thus sent out of the chambers, many of the deputies claiming to represent the entire nation convened outdoors to take the Oath of the Tennis Court, vowing not to disband until they had drawn up a constitution. The deputies published newspapers reporting on the dramatic events and circulating their ideas throughout the capital.

A large, literate public followed the development of the fledgling French Revolution very closely from Paris. The city, then as now, was France's cultural capital, teeming with hundreds of cafés and theaters where its residents could meet and discuss politics. The vibrant cultural milieu also included *salons* in nobles' urban homes, especially in the Marais quarter. Probably no other place in the capital could rival the Palais-Royal for news of the debates in the National Assembly as the Revolution developed. One visitor to the Palais-Royal remarked at the time, "Just picture a beautiful square palace; and beneath it arcades, where in countless shops glitter treasures from all the

world. . . . Here you see, too, the finest coffeehouses in Paris, also crammed with people. Here they read newspapers and magazines aloud, they shout, argue, make speeches, and so on” (quoted in Karamzin 2002, 106).

Paris was also a vital military center during the French Revolution. The fortifications (the best known being the Bastille), Arsenal, and Invalides soldiers’ hospital built by the monarchy continued to house garrisons, artillery, weapons, and munitions. As the crisis of 1789 deepened, Louis XVI ordered troops from throughout France to concentrate on Paris; many of them camped at the Champ de Mars on the outskirts of the city. Parisians’ fears that these troops would be used to suppress the National Assembly led Revolutionary artisans and members of the new National Guard to storm the Bastille, which held a large cache of arms as well as political prisoners, on 14 July.

Throughout the French Revolution, Paris would remain the key site of political change and transformation. Each of the successive French legislative bodies sat in Paris, and political clubs, forerunners of modern political parties, proliferated in the capital city. The artisans and skilled workers of Paris became known as the *sans-culottes*, perhaps the most important pressure group among the French Revolutionaries because of their ability to organize and demonstrate in the capital city. Parisian women from *sans-culottes* households took the lead in forcing the king and his ministers to leave the palace of Versailles and come to Paris during the October Days. From that point on, the monarch was embroiled in Revolutionary urban politics and unable to act without being closely observed by all groups within the capital.

Successive Revolutionary governments had to negotiate the frequent political plots and popular demonstrations within the city. After the initial chaos of Revolutionary war in 1792, Parisian crowds broke into the city’s prisons to kill “traitors” during the September Massacres. Parisian National Guardsmen stormed the Tuileries palace on 10 August 1792, leading to the deposition of the royal family and the creation of a republican government. Throughout the war and the Terror, the bread supply for Paris remained a key concern for the government.

Napoleon attempted to transform Paris into a Neoclassical capital but also kept the city under close surveillance through his police and officials. Paris remained a volatile focal point for radical politics throughout the French Revolutionary and Napoleonic Wars. It surrendered to the Allies on 31 March 1814 following the action at Montmartre, and again after Waterloo, in June 1815.

### **Paris, First Treaty of (30 May 1814)**

The first Peace of Paris was signed on 30 May 1814 between France and the victorious Allies: Austria, Prussia, Russia, and Britain. It was intended by the signatories to provide a durable and just peace for Europe, at war for more than twenty years, and there is broad scholarly consensus that its remarkable leniency was designed specifically to ease the return of the newly restored Bourbon dynasty in France. A reordering of the map of Europe was needed because of the territorial changes caused by Napoleonic expansion, but the discussion of this issue was postponed for a later conference, ultimately held at Vienna. Yet the peace was of short duration, for with Napoleon’s return from Elba on 1 March 1815, war again broke out and made a new, revised settlement necessary—the second Peace of Paris.

The immediate origins of the peace treaty can be traced to the Treaty of Chaumont, which on 19 March 1814 reaffirmed the cooperation of the Allies against France and prepared their final advance on Paris from the east and Bordeaux from the south. Paris was reached by 30 March, and on 2 April the French Senate demanded Napoleon’s abdication. Formal abdication took place on 13 April by the terms of the Treaty of Fontainebleau. While Napoleon had attempted to offer peace based on discussions with the Allies, held previously at Châtillon between 5 February and 19 March, Tsar Alexander I had insisted on abdication. Now that the Emperor had been defeated, the Allies were divided on his treatment and that of France. Prussia demanded severe terms after the humiliation of 1806, when France had treated it in a harshly punitive fashion, and German public opinion was to be outraged by the final mild terms. Britain and Austria, however, promoted moderate terms, aiming to stabilize Europe quickly. A major problem was also the choice of government for France. In the end, following the principle of legitimacy, the Allies restored the Bourbon dynasty to the throne, in the person of Louis XVIII, older brother of the beheaded Louis XVI.

Negotiations began on 9 May 1814. France was represented by Prince Charles Maurice de Talleyrand; Emperor

Francis I of Austria by Klemens Fürst Metternich and Johann Philipp Graf Stadion; King Frederick William III of Prussia by Karl August Fürst von Hardenberg and Wilhelm von Humboldt; Tsar Alexander I of Russia by Prince Andrey Razumovsky and Count Karl Nesselrode; and King George III of Britain by Viscount Castlereagh, Lord Aberdeen, Earl Cathcart, and Charles Stuart, the British minister *ad interim* to France. Spain acceded to the treaty belatedly, on 20 July. The treaty was written in French and composed of thirty-three articles and five additional articles, one of which was secret. Four identical copies were made and exchanged between France and each of the Allies. Proclaiming perpetual peace and friendship between France and the contracting parties, the treaty called upon all signatories to ensure, to the best of their abilities, the maintenance of that peace, which was to be based on a true balance of power in Europe, still to be determined.

According to the territorial terms of the document, France was reduced to its borders of 1 January 1792, as had been previously agreed with the comte d'Artois, Louis XVIII's younger brother. Still, it was allowed the minor territorial acquisition of some 150 square miles at the expense of Belgium and Savoy. France was also required to return the part of Santo Domingo (the eastern portion of the island of Hispaniola) to Spain that it had acquired in 1795. In return, Spain retroceded to France Guadeloupe and French Guyana. Britain, for its part, acquired the strategic Mediterranean island of Malta and from France received the islands of Tobago, St. Lucia, Ile de France, Rodriguez, and the Seychelles (these last three in the Indian Ocean). Thus the most substantial and lucrative West Indian territories that France had possessed on 1 January 1792 were restored to it. Inhabitants in territories that had changed hands, it was further agreed, were not to be politically persecuted on account of their previous allegiance or political persuasion. Indeed, anyone living in such territories was free to emigrate within six years.

Other stipulations further demonstrated the treaty's moderate and pragmatic character. In a show of good faith toward France, the Allies declined any claims for reparations. They even left France the works of art captured as booty of war except the *Quadriga* (four-horse chariot) of the Brandenburg Gate, which was returned to Prussia. Antwerp, previously a naval port, was demilitarized. The navigation of the Rhine was to be free, while specific provisions regarding the collection of duties along that river were to be regulated at a future congress, which would also examine the possible extension of the principle to other rivers flowing through more than one state.

The additional articles voided the French-imposed Treaties of Pressburg (1805) and Schönbrunn (1809) with Austria, and for Prussia expressly declared the Treaties of

Basle (1795) and Tilsit (1807) null and void. France agreed to the acquisition of Genoa by Sardinia. Under intense pressure from Britain—whose negotiators were themselves under pressure from the British abolitionist lobby—France agreed to abolish its slave trade after a grace period of five years and collaborate with the British at the upcoming congress in a push for a general abolition of the trade by all powers.

As for the complex question of the territorial reorganization of Europe, finally, it was decided that all belligerents were to convene in Vienna within two months to complete the more basic provisions of the treaty with a general European settlement, especially regarding the future of Holland, Germany, and Italy—which as yet were still undetermined, though the broad lines of the framework had emerged during the negotiations. Holland, it was decided, was to be enlarged under the sovereignty of the House of Orange, by the acquisition of Belgium; the Scheldt River opened to navigation; the various German states (apart from Austria and Prussia) given a federal structure; and Italy composed of independent states—with the exception of the Italian territories to be ceded to Austria.

### Paris, Second Treaty of (20 November 1815)

The second Peace of Paris was signed on 20 November 1815 between France and the victorious Allies: Austria,

Prussia, Russia, and Britain, and put a final end to the Napoleonic Wars. After the Emperor's return from Elba, the Hundred Days, and Waterloo, it was felt by the Allies that a more severe peace was needed to prevent yet another renewal of French adventurism. Terms therefore included a significant loss of territory, the payment of a high indemnity, and occupation for up to five years. Still, in their view, it was by any standard a moderate settlement, balancing territorial and pecuniary terms without prejudice to France in any of its essential interests.

Soon after Waterloo (18 June 1815), in a climate of reduced willingness for clemency, the ministerial council of the Allies began discussions for a new peace treaty. The negotiations were largely determined by Britain and Prussia, who, led by the Duke of Wellington and Field Marshal Gebhard Lebrecht Fürst Blücher von Wahlstatt (generally shortened to Blücher), had mounted the final assault against Napoleon. The Prussian general staff demanded extremely harsh terms for France, including the loss of the remainder of Savoy and of Alsace-Lorraine (which they wanted lumped together with Burgundy into an artificial state to be headed by the Austrian Archduke Charles), as well as the payment of substantial reparations. But Robert Stewart, Viscount Castlereagh, the British foreign secretary, worked against this, believing that moderation was still in order to ensure a stable peace.

France's interests were defended by the duc de Richelieu, an able émigré. Prince Charles Maurice de Talleyrand (who had represented France during the negotiations leading to the first Peace of Paris) had resigned, having seen the writing on the wall of the harsher terms of the second Peace, and predicted its unpopularity in France. Richelieu bargained well and succeeded in having not only the amount of lost territory but also the price of reparations and length of occupation reduced. It was again decided to re-restore Louis XVIII to the French throne, since he was considered a lesser evil than a Bonapartist or Orleanist candidate—or an unknown entity perhaps chosen by the French National Assembly. In the end, Castlereagh and Wellington, whose position appears to have been strengthened by Tsar Alexander I, were responsible for a relatively moderate settlement through a combination of “idealism” and a “sense of practical realities,” though they were also influenced by “Alexander's [Christian] ideals” (Schroeder 1994, 557–558).

The signatories were Richelieu for France; Klemens Wenzel Fürst Metternich for Austria; Karl August Fürst von Hardenberg and Wilhelm von Humboldt for Prussia; Count Karl Nesselrode, Prince Andrey Razumovsky, and Count Giovanni Capo d'Istria for Russia; and Wellington and Castlereagh for Britain. The treaty was in French and consisted of twelve main articles, three additional articles,

three conventions, a tariff, and a protocol. These annexes dealt with the slave trade; manner of reparations payment; distribution, administration, and provisioning of the occupying force; treatment of deserters from the occupying army; liquidation of claims of British subjects against France; and the distribution of the French indemnity among the Allies. Four identical copies were made for France and each of the Allies.

The Hundred Days and the widespread French enthusiasm at Napoleon's return resulted in somewhat harsher terms than those of the first Peace of Paris, though on balance they were still relatively lenient, since a compromise had been worked out between the tough Prussian and moderate British positions.

Territorially, France was reduced to the borders of 1790. This meant the loss of Philippeville and Marienburg to the Netherlands; Saarlouis and Saarbrücken to Prussia; the remainder of Savoy to Sardinia; and Landau to Austria (who passed it on to Bavaria). All inhabitants (regardless of nationality) of territories having changed hands were allowed, for a period of six years, to freely liquidate property and move elsewhere, if they so desired.

France was required to pay more than 700 million francs in reparations. It was to be occupied by 150,000 troops, stationed primarily in the border fortresses, for a period of no more than five years. The occupation could be terminated after as little as three years, if all conditions had been met satisfactorily. France was required to bear the cost of its own occupation. All other troops were to leave the country within five weeks.

The indemnities were to be distributed as follows: to the countries bordering on France, for the purpose of building and maintaining fortifications on her frontier, 187.5 million francs, the bulk of which went to the Netherlands and Prussia; 25 million each went to Prussia and Britain, as leaders in the final campaign; a further 100 million each were given to Prussia, Austria, Russia, and Britain; 100 million were distributed, on a pro rata basis according to the number of troops supplied to the common effort, to other middling powers (mainly Bavaria, the Netherlands, Württemberg, Baden, and Saxony). Of the remainder, minor sums went to Spain, Portugal, Denmark, and Switzerland, since their war effort had been negligible. The terms of the first Peace of Paris and the Final Act of the Congress of Vienna were expressly confirmed, except when modified by the present treaty. The treaty, finally, foresaw joint action of the signatories to work for the abolition of the slave trade, referring to its formal denunciation in the declaration made at Vienna on 4 February 1815.

The Quadruple Alliance was signed on the same day as the second Peace of Paris. In it the sovereigns of Britain, Austria, Prussia, and Russia promised to uphold the terms

of the peace, prevent Napoleon's return, and consult regularly in support of the general status quo. This instituted what came to be known as the Congress System or Concert of Europe. In spite of Allied efforts at moderation, however, the treaty was considered harsh in France. Opposition to its terms were to determine Restoration politics, marked by territorial revisionism and a desire to break out of isolation, especially under François Guizot, the prime minister from 1847 to 1848.

## Paul I, Tsar (1754–1801)

Tsar of Russia between 1796 and 1801. Paul was the son of Catherine II and Peter III; however, his paternity is still disputed and is often ascribed to Count Sergey Saltykov. During his infancy, Paul was taken from Catherine by Tsarina Elizabeth and tutored by Nikita Panin, a prominent statesman and diplomat, and Sergey Poroshin, a prominent mathematician. Relations between Paul and Catherine eventually grew distant, particularly after Catherine seized the throne in a coup against Peter III.

In 1773 Paul married Princess Wilhelmina of Hesse-Darmstadt, who was renamed Natalia Alekseevna. After his first marriage he began to engage in court intrigues

and suspected his mother of intending to kill him. When his wife died in childbirth in 1776, Catherine arranged another marriage with Sophia Dorothea of Württemberg, who took the Russian name of Maria Feodorovna. On the birth of his first child in 1777, Paul received an estate in Pavlovsk, where he established his residence. In 1781–1782, Paul traveled through western Europe and, returning to Russia, established his residence at Gatchina, where he maintained Prussian-style military barracks.

In November 1796 Paul ascended the throne after Catherine the Great suddenly sickened and died. He immediately reversed his mother's policies and made changes to the Russian royal succession, excluding females from any role in it. He introduced Prussian-style regulations to the Russian Army, which alienated many in the military. Strict social rules and an austere atmosphere in the capital also contributed to the dislike the Russian upper class felt toward Paul. He ignored the Charter of the Nobility of 1785 and subjected the nobles to taxation and severe punishments. At the same time, he purged the officer corps and closed its ranks to nonnobles. In foreign affairs, Paul joined the anti-French Second Coalition and dispatched Russian armies to Holland and Italy, while a Russian fleet operated in the Mediterranean and enforced a new policy of naval conduct in the Baltic as part of the League of Armed Neutrality.

Following a disagreement with Austria and Britain, Paul suddenly reversed his foreign policy and concluded peace with Bonaparte in late 1799. However, Paul's policies, both domestic and foreign, were extremely unpopular with the nobility, many of whom believed him to be mentally unbalanced. A conspiracy was organized and led by counts Peter Pahlen and Nikita Panin. On the night of 23 March 1801, with Crown Prince Alexander's tacit approval, Paul was murdered in his bedroom in the St. Michael palace by a group of officers headed by General Levin Bennigsen.

### Peninsular War (1807–1814)

A bloodbath that might have cost the lives of a million people, the Peninsular War was the fruit of overconfidence, *folie de grandeur*, and miscalculation. In October 1807 with the permission and assistance of the Spanish government, Napoleon sent French troops to occupy Portugal in order to close it off to British trade. The royal family escaped to Brazil, but resistance was nonexistent, and there seems little reason to believe that the French would have experienced more than minor local difficulties in the ordinary course of events. However, impelled by little more than opportunism, as autumn turned to winter Napoleon resolved on intervention in the complicated politics of the Spanish court, his aim being to make Spain a more effective ally.

This proved a disastrous mistake. In March 1808 a palace coup had replaced King Charles IV with the heir to the throne, Ferdinand VII. Thanks to the propaganda of powerful elements of the Church and aristocracy bent on opposing (Spanish) Bourbon reformism, who had seized on the vacuous and malleable Ferdinand as a useful tool, the new king had come to be seen as a “Prince Charming,” who would put all Spain’s many ills to rights. French intervention, and, more specifically, the invitation of the entire royal family to a “conference” with Napoleon in Bayonne, therefore provoked unrest: There was, for example, a serious uprising in Madrid on 2 May. In consequence, news that Ferdinand had been forced to abdicate in favor of Napoleon’s brother, Joseph, was the catalyst for a series of revolts in the many parts of the country that had remained unoccupied by the French, a similar wave of rebellion soon gripping Portugal.

The nature of this revolt has been widely misunderstood. The subject is a complex one, but in short it was not the unanimous uprising for God, king, and fatherland of legend. Popular concern was not for the Bourbons or the Braganças, but rather land, bread, and revenge on the propertied classes, while the leaders of the insurrection entertained a variety of conflicting interests, which they sought to pursue at the same time as channeling the people’s energies into fighting the French. In consequence, the political history of the war is one of great complexity—its chief feature is the elaboration of a liberal constitution in Spain in 1812—while the background to the struggle was everywhere one of desertion, banditry, agrarian unrest, and resistance to conscription. In those areas actually occupied by the French, the invaders were inconvenienced by much irregular resistance, but close analysis of this phe-

nomenon has suggested that in most cases it bore little resemblance to the legend so beloved of the traditional historiography.

On close inspection, indeed, much of the “little war” proves to have been the work of forces of regular troops or local militias raised and controlled by representatives of the Patriot government operating in the king’s absence. At the same time, such irregular bands as were formed were drawn in large part from men who had either already been bandits in 1808 or had been drawn into banditry since the start of the war (a prime example here is constituted by the many men who fled to the hills to avoid conscription to the Spanish Army, or who had deserted after being called up). With other men brought in by impressment of one sort or another, it is therefore hard to see how the Spanish struggle against Napoleon can really merit the description of a “people’s war.” All the more is this the case, given the fact that those guerrilla bands that were not militarized in the style of such forces commanded by Juan Martín Díez and Francisco Espoz y Mina did not follow the French as they evacuated their areas of operation in the latter part of the war, but rather batted upon the civilian inhabitants and the baggage trains of the Allied armies.

Militarily speaking, the history of the war is much simpler. Initially, the French armies were roughly handled, the forces sent to Portugal being expelled by a British expeditionary force under Lieutenant General Sir Arthur Wellesley (later Duke of Wellington) after the Battle of Vimeiro (21 August 1808) and another contingent forced to surrender at Bailén by the Spaniards. Other forces, meanwhile, were repulsed from Valencia and Gerona, while Saragossa (Zaragoza) beat off a full-scale siege despite the fact that it was devoid of regular fortifications. Forced to draw back beyond the river Ebro, the invaders then received major reinforcements, while Napoleon himself came to Spain to take charge of operations.

There followed a whirlwind campaign, which saw the Spaniards suffer major defeats at Espinosa de los Monteros (10 November), Gamonal (10 November), Tudela (23 November), and Somosierra (29–30 November). With the Spanish armies in tatters, on 4 December the Emperor recaptured Madrid. Meanwhile, the position had also been restored in Catalonia, where the French army of occupation had for the last few months been bottled up in Barcelona, the Spaniards having been routed by fresh forces dispatched from France at Cardedeu (16 December) and Molins de Rei (21 December). With matters in this situation, it seemed entirely possible that the French would go on to overrun the entire Peninsula and end the war at a stroke.

All possibility of this, however, was precluded by a last-minute intervention in the campaign on the part of

Adapted from Fremont-Barnes 2002A, 10.

the British. Having cleared the French from Portugal, the British expeditionary force had advanced into Spain under the command of Lieutenant General Sir John Moore. For various reasons it had taken a long time for it to prepare for action, and for a while it looked as if Moore would have no option but to withdraw into Portugal. Eventually, however, Moore resolved on an offensive against the French communications in Old Castile. As this brought the full weight of the French armies in northern Spain against his 20,000 men, he was soon forced to retreat to the coast of Galicia in search of rescue by the Royal Navy, but so many troops were sent after him that the French had effectively to abandon their plans for the immediate conquest of southern Spain. As for Moore and his army, almost all the troops were rescued after a rearguard action at Corunna (La Coruña) on 16 January 1809, but their commander was mortally wounded by a cannonball at the moment of victory.

The campaign of November 1808–January 1809 set the pattern of operations for the whole of the next year. In brief, the French controlled most of central and northern

Spain, together with a separate area around Barcelona, while Spanish armies held southern Catalonia, the Levante, Andalusia (Andalucía), and Extremadura. As for Portugal, it, too, was in Allied hands with a British garrison in Lisbon and such few troops as the Portuguese themselves could muster deployed to protect Elvas, Almeida, and Oporto. Called away from Spain by growing fears of a new war with Austria in 1809, Napoleon had left instructions for the various commanders he had left in Spain—most notably, marshals Nicolas Soult, Michel Ney, and Claude Perrin Victor—to crush Allied resistance by a series of powerful offensives, but this plan quickly foundered: The Spanish armies defending Andalusia proved unexpectedly aggressive; the British reinforced their presence in Portugal and, now commanded once again by Wellesley, repelled a French invasion; the province of Galicia rose in revolt; and the cities of Saragossa and Gerona both put up desperate resistance (Gerona, indeed, did not fall until December).

By the summer, then, the initiative had passed to the Allies, the rest of the year being dominated by two major attempts to recover Madrid. Of these, the first—an Anglo-

Spanish offensive from the west and south—led merely to a stalemate. Thus, a major triumph at Talavera (27–29 July) was deprived of all effect, first by the arrival of massive French reinforcements released by the fortuitous evacuation of Galicia one month earlier, and second by serious divisions in the Allied command. The second offensive, however, was a far more serious affair. In the wake of Talavera, Wellesley—now Viscount Wellington—refused to engage in any further operations with the Spaniards and pulled his men back to the Portuguese frontier. In consequence, the offensive was the work of the Spaniards alone. Operating on exterior lines from the northwest, the west, and the south, in terrain that greatly favored the vastly superior French cavalry, however, they had no chance and were routed at the battles of Ocaña (19 November) and Alba de Tormes (28 November) with terrible losses.

The defeat of the main Spanish field armies and the British decision to concentrate on the defense of Portugal opened a new phase in the conflict. So serious had been the Spanish losses in the campaigns of 1809 that there was little left to put into the line. Nor could these losses be made up: Though generous, British supplies of arms and uniforms were insufficient to the task of equipping whole new armies from scratch, while resistance to conscription among the populace was greater than ever. Meanwhile, with the new Austrian war fought and won, Napoleon was pouring large numbers of fresh troops into Spain, the result being that the initiative passed back to the French. With the Spaniards further emasculated by the outbreak of revolution in Latin America—by now their chief source of revenue—over the next two years the picture is one of constant French advances. City after city fell into the invaders' hands while the Spaniards lost more and more of such troops and sinews of war as remained to them. First to fall were Seville, Granada, Córdoba, Málaga, and Jaén, all of which were overrun by a massive French offensive in January 1810, and these were followed by Oviedo, Astorga, Ciudad Rodrigo, Lérida, Tortosa, Badajoz, and Tarragona. By late 1811 all that was left of Patriot Spain was Galicia, the Levante, and the blockaded island city of Cádiz, which had in 1810 become the new capital.

Penned up inside Portugal, the British, meanwhile, could do nothing to arrest the march of French conquest, and much the same was true of the Spanish guerrillas, who at the same time were coming under more and more pressure. In the end, indeed, it is clear that Napoleon's commanders could have crushed resistance in Spain and then marched against Portugal in such overwhelming force that even Wellington could not have overcome them. All that was needed was for the French armies in the Peninsula to receive a constant stream of replacements and reinforcements. Thanks to the impending invasion of Russia, how-

ever, in 1812 the supply of men dried up, the Armée d'Espagne even being stripped of a number of troops. As was only to be expected, the result was that the French forces suddenly found themselves badly overextended, and all the more so as Napoleon insisted that they continue with the offensive against Valencia, which they had begun in the autumn of 1811.

What saved the Allied cause in the Peninsula was therefore not Wellington's genius but rather Napoleon's errors. This, however, is not to decry the British commander's very real contribution to the Allied cause. Particular attention should be paid here to his defense of Portugal in 1810–1811. In accordance with France's resumption of the offensive in the Peninsula in 1810, the summer of that year saw some 65,000 men under Marshal André Masséna move across the Portuguese frontier and besiege the fortress of Almeida. This fell very rapidly, thanks to the chance explosion of its main powder magazine and the consequent destruction of much of the town, and the French moved on toward Lisbon.

Wellington, however, had anticipated such a move and put together a comprehensive plan for the defense of Portugal. From the beginning the countryside in the path of the invaders would be devastated—livestock slaughtered or driven off, crops burned, supplies removed or destroyed, and villages abandoned—and the French forces harassed by the irregular home guard known as the *ordenança*. If possible, the French would then be brought to battle and forced to retreat, to which end the Portuguese Army had been completely rebuilt under the direction of Sir William Beresford and the main routes toward Lisbon blocked by field works at a number of obvious defensive positions. Failing that, however, the countryside would continue to be devastated, while the Anglo-Portuguese army would continue to fall back on Lisbon, along, or so it was hoped, with the bulk of the civilian population.

Waiting for the French would be probably the greatest single engineering feat in the entire Napoleonic era, in the form of the so-called Lines of Torres Vedras—an impenetrable belt of fortifications stretching from one side of the peninsula on which Lisbon was built to the other. Whether this plan would have sufficed to hold off the French had they ever unleashed the sort of massive offensive that would have followed the final conquest of Spain is unclear—Wellington, for one, certainly had his doubts—but against the 65,000 men brought by Masséna, it was more than adequate. Despite achieving complete success on the battlefield itself, an attempt to turn the French back at Busaco (Buçaco) on 27 September 1810 failed because of the marshal's discovery of an unguarded track around Wellington's northern front, but when the French reached the Lines of Torres Vedras they found that they could go no

British infantry deployed in line on the ridge at Busaco during the Peninsular War. Successive campaigns in the Iberian Peninsula led to a continuous drain on French manpower. (Print after Major Thomas S. St. Clair, engraved by C. Turner from *Wellington and Waterloo* by Major Arthur Griffiths. London: George Newnes, 1898)

farther. In this situation Masséna did his best, but, deprived of adequate supplies, he could not continue to blockade the lines forever, and in March 1811 he abandoned his headquarters at Santarem and fell back on the Spanish frontier.

However, clearing Masséna from Portugal was one thing, and invading Spain quite another. For the whole of 1811, indeed, the situation on the Portuguese frontier was a stalemate. Authorized by the British government to enter Spain once more, Wellington soon found that this was easier said than done. The crucial border fortresses of Ciudad Rodrigo and Badajoz had been greatly strengthened by the French, while every attempt to besiege them was met by massive French counteroffensives, as at Albuera (16 May) and Fuentes de Oñoro (3–5 May). Repelled though these were, they cost Wellington heavy losses and dissuaded him from marching too far into Spain, and progress was in any case rendered still more difficult by the fact that the Anglo-Portuguese army lacked an adequate siege train. Of course, the French were in no better state: Twice, indeed, they refused battle rather than attack him in powerful defensive

positions inside Portugal, and an attempt on Elvas or Almeida (now back in Allied hands again) would have been out of the question. But that is not the point. What matters is the simple fact that for the whole of 1811 the British remained able to exert only the most marginal influence on the situation in Spain.

In the autumn of 1811, however, the situation changed dramatically. In the first place, Wellington took delivery of a powerful siege train. And in the second the effect of Napoleon insisting that the French commanders in Spain should continue to expand the territory under their control—and, in particular, to continue with the offensive they had launched against Valencia—at the very time that he was pulling men out of Spain and cutting the supply of reinforcements, completely destabilized the position on the Portuguese frontier: In brief, the French no longer had the men they needed to contain Wellington. What followed was all too predictable. Seeing his chance, Wellington struck across the border and was quickly able to capture the fortresses of Ciudad Rodrigo (20 January 1812) and Badajoz (7 April), win a major victory at Salamanca, and liberate

Madrid. Thanks to a variety of problems, of which by far the greatest was the de facto collapse of government and society in Spain, in November 1812 Wellington was again forced to retreat to Portugal, but the French were never fully able to recover and were further weakened by the withdrawal of still more troops in the early months of 1813.

Aided by the continued attempts of the French to hold more territory than they could garrison, in May 1813 Wellington was therefore able to launch a fresh offensive that led to the defeat of King Joseph's main field forces at Vitoria on 21 June, after which, Catalonia and a few scattered garrisons aside, most of what remained of his domains had to be evacuated. Bitter fighting continued in the Pyrenees, with the French vainly trying to relieve the besieged fortresses of San Sebastian and Pamplona, but they were repelled at Sorauren (28–30 July) and San Marcial (31 August), while in October 1813 Wellington invaded France and, after several fierce battles, established himself in an unassailable position south of Bayonne. Though French troops stayed in part of Catalonia until the end of hostilities in April of the following year, to all intents and purposes the Peninsular War was over, the battles that Wellington went on to fight at Orthez (27 February) and Toulouse (10 April) really belonging more to the campaign of 1814.

The significance of the Peninsular War was considerable. British historians have, for obvious reasons, been inclined to emphasize the part that their country played in the downfall of Napoleon, while the Emperor also assigned it much importance, famously calling it his “Spanish ulcer.” But in this respect its effects have probably been exaggerated. Although it inspired many German nationalists, for example, it did not inspire much popular participation in the campaigns of 1813 and 1814, nor still less persuade the people of Germany to heed the various attempts to spur them to rise against Napoleon that were made in the course of 1809. Nor did it do much to erode the Emperor's war-making capacity: It is hard, for instance, to see how the forces caught up in the Peninsular War would have made much difference in Russia in 1812. Nevertheless, the continued struggle in the Peninsula undoubtedly strengthened the credibility of British diplomacy in the period 1812–1814, while the heavy losses suffered in Spain and Portugal certainly played their part in eroding support for the French ruler in the final crisis of the Empire. In Spain and Portugal, by contrast, no one can doubt the war's importance. In both countries it was the key to liberal revolution, loss of empire, and a series of civil wars, while in Spain in particular it gave birth to a long tradition of military intervention in politics that culminated in the bloody conflict of 1936–1939 and the eventual dictatorship of General Francisco Franco.

### Perceval, Spencer (1762–1812)

Spencer Perceval is best remembered as the only British prime minister to be assassinated. But both in his own short ministry from 1809 to 1812 and before, he played an important part in the war against Napoleon.

A younger son of the second Earl of Egmont and a barrister who wrote against the French Revolution and helped to prosecute radical sympathizers on behalf of the government, Perceval entered the House of Commons in 1796. He was a committed supporter of the war against France and an outstanding orator. A zealously evangelical Anglican, he was opposed to both slavery and Catholic emancipation. When William Pitt resigned over the latter in 1801, Perceval joined the government of the more Protestant Henry Addington as solicitor general; he was promoted to attorney general and continued in that post when Pitt returned as prime minister in 1804.

Out of office during the so-called Ministry of All the Talents (1806–1807), Perceval became chancellor of the exchequer and leader of the House of Commons in the Duke of Portland's administration. His main task was to supply the money to fight Napoleon without antagonizing the landed interest, which controlled Parliament, by raising taxes. This he did by government economies and Orders in Council regulating shipping into Napoleonic Europe, which provided substantial revenue from duties and licenses as well as giving Britain control of maritime trade. When Portland resigned in 1809 following Foreign Secretary George Canning's intrigue forcing out Robert Stewart, Viscount Castlereagh, secretary of state for war and the colonies, the cabinet, knowing that Canning refused to serve under him, decided on Perceval as prime minister.

In the aftermath of Austria's failed war of 1809 against the French and the British army's disastrous Walcheren expedition, and with the Peninsular War far from living up to the high expectations that followed the Spanish and Portuguese uprisings in 1808, the prospect of decisively defeating Napoleon seemed at best a very distant one. Perceval and his colleagues nevertheless kept doggedly at it, sending the army in the Peninsula all the resources they could muster, while warning the commander, Lieutenant General Sir Arthur Wellesley, the future Duke of Wellington, not to take undue chances in what seemed a highly risky and politically controversial enterprise. This was not

bold enough for the foreign secretary, Wellington's imperious brother Richard, Marquis Wellesley, who demanded far more money and troops. When Wellesley resigned early in 1812, Castlereagh took his place.

At home Perceval was widely criticized for the Orders in Council during the economic distress of 1811–1812. Conceding an investigation, he was hurrying to a meeting to consider repeal on 11 May 1812 when he was shot dead in the lobby of the House of Commons by John Bellingham, who had decided to assassinate the prime minister for the British government's refusal to intervene when he had been imprisoned for debt in Russia. Bellingham was tried and hanged a week later. Perceval at his family's request was buried privately, but a monument was erected to him in Westminster Abbey.

### Pérignon, Dominique-Catherine (1754–1818)

Generally regarded as the least known of Napoleon's marshals, Pérignon made his reputation more as a politician, diplomat, and administrator than as a soldier. He acted throughout his career with uniform fairness and during his brief period of active service sought to bring a degree of civility to war. Pérignon descended from a prominent landowning family from southwestern France. He was commissioned into the Royal Army in 1780, became a lieutenant colonel in the National Guard in July 1789, and was elected deputy to the Legislative Assembly in September 1791. He resigned this post in May 1792 and joined the Legion of the Pyrenees, rising to lieutenant colonel within four months. He then played an active part in operations against the Spanish in the Army of the Eastern Pyrenees, in which he was promoted to *général de brigade* on 18 September 1793, the day he received a bayonet wound to his

thigh during the fighting around Truillas. Even in a period of rapid promotion for those who showed exceptional merit—and often the guillotine for those perceived to have failed—Pérignon's rise within three months to the rank of *général de division* was nothing less than extraordinary.

On 30 April 1794, at the Battle of Le Boulou, Pérignon's division seized the fieldworks before the town of Bellegarde, and the Spanish were soon driven from French soil. Pérignon then laid siege to the 20,000 Spanish in Bellegarde itself, where the garrison eventually surrendered, together with large quantities of artillery and ammunition. Pérignon also served in an independent capacity on 7 June at La Junquera, where he drove back the Spanish center. When his superior, General Jacques Dugommier, was killed at Muga on 17 November, command of the Army of the Eastern Pyrenees immediately devolved to Pérignon. He reorganized the army, drove the Spanish before him, and invested the formidable fortress at Figueras, which, after laying down siege works, he managed to take without a shot on 27 November through bluff, intimidation, and promises of good treatment for the prisoners.

The fall of Figueras proved a considerable success for Pérignon, for the garrison still possessed six months' supplies, and might have drawn out the campaign accordingly, with Pérignon forced to conduct full-scale siege operations amid appalling freezing conditions. Instead, he moved on to the fortified city of Rosas, capturing its outer defenses on 31 January 1795, creating a breach in its walls, and finally occupying the place after the garrison evacuated it on the night of 2–3 February. Pérignon proceeded to fight various actions along the Fluvià, but having failed to cross that river, he was replaced by General Barthélemy Schérer on 30 May, though the Pyrenean front soon became inactive when the belligerents concluded peace at Basle on 22 July.

Promoted to commander in chief of the Army of Brittany on 15 September, Pérignon nevertheless turned to politics after his election on 16 October to the Council of Five Hundred as deputy for Haute-Garonne, the region from which his family hailed. On 23 October his responsibility for coastal forces expanded further, though he did not assume formal command, instead becoming ambassador to Spain on 26 November. He played a prominent part in the negotiations that resulted in the Treaty of San Ildefonso (19 April 1796) by which Spain and France became allies and thus partners in the latter's war against Britain, which was obliged to evacuate Corsica and withdraw its fleet from the Mediterranean. At the Court of Madrid, Pérignon's position as a former successful commander on the Pyrenean front lent him a degree of prestige, and this, combined with his aristocratic background and refined ed-

ucation, made him well liked by Charles IV and his minister, Manuel de Godoy.

Pérignon was replaced in December 1797 and went into quiet retirement until 4 October 1798, when he was sent to the (French) Army of Italy. The following year he was placed in command of starving and ill-equipped French troops in Liguria. In 1799 he commanded the left wing of General Barthélemy Joubert's army facing a greatly numerically superior Russo-Austrian force led by the distinguished Allied commander, Field Marshal Alexander Suvorov. At Novi, on 15 August, the French were severely defeated and Joubert killed, leaving Pérignon and his subordinates to cover the retreat, in the course of which Pérignon was captured after receiving multiple wounds.

After his release from captivity in 1800, Pérignon was made commander of the 10th Military Division in Toulouse on 5 January 1801. He turned again to politics, however, being elected a senator on 12 April. He retired again on 18 November, though he took up the diplomatic post, from 11 September 1802, of commissioner-extraordinary, responsible for establishing the definitive boundary between France and Spain in the Pyrenees. On 27 October he became vice president of the Senate.

On the establishment of the marshalate by Napoleon on 19 May 1804, Pérignon was chosen in recognition for the important part he had played in the Pyrenean campaigns of 1793–1795, and for his subsequent diplomatic services. Yet, unusual among the marshalate, Pérignon would perform no further active service in the army. Instead, he was destined to continue a career in politics and diplomacy. On 18 September 1806 he was made governor-general of the minor Italian states of Parma and Placentia. On 23 July 1808, after being created a Count of the Empire, he moved south to take up the appointment of governor of Naples, where he succeeded General Jean-Baptiste Jourdan as commander of the French troops in the Kingdom of Naples, whose sovereign, Joachim Murat, was a distinguished fellow marshal. After disagreements with Murat in 1811, Pérignon was dismissed, though he was soon returned to his post at Napoleon's behest. Pérignon retired on 27 March 1813 and returned to France, where he remained loyal to the Emperor until Napoleon abdicated in April 1814. Nevertheless, since his retirement, Pérignon's royalist sympathies had become increasingly apparent.

On the Bourbon Restoration, Pérignon readily consented to serve the new regime, and was made commissioner-extraordinary in the 1st Military Division on 22 April 1814. He became a peer of France later that year and briefly served as commander of the 10th Military Division in Toulouse in 1815. When Napoleon returned from Elba in the spring of that year, Pérignon refused to serve under him, as a result of which his name was struck

from the list of marshals. After the return of Louis XVIII in the wake of Napoleon's final defeat at Waterloo, Pérignon served on the Court of Peers that tried and condemned Michel Ney, his former fellow Napoleonic marshal. Pérignon was restored to the (newly created Bourbon) marshalate on 14 July 1816. Created a marquis on 31 August, Pérignon served as governor of the 1st Military Division and died in Paris on 25 December 1818.

### Perpignan, Battle of (17 July 1793)

The Battle of Perpignan was the first major action in the Pyrenean campaign of 1793–1794. French forces successfully defended the frontier town of Perpignan against a Spanish army, allowing the French to build up their forces and prevent the Spanish from overrunning southern France.

After the French government declared war on Spain on 7 March 1793, the Spanish army in the eastern Pyrenees slowly prepared to cross into France. Its commander was Don Antonio Ramon Ricardós. Ricardós was an able soldier of the old school, moving only when his preparations were complete. He crossed the border on 17 April with approximately 15,000 men and systematically began to clear French garrisons from the Pyrenees. On 20 April he routed a French force at Ceret on the river Tech. The survivors fled to the frontier city of Perpignan. The French Army of the Eastern Pyrenees consisted of about 12,000 men around

Perpignan, but only three-quarters were armed. Most were volunteers and were poorly trained. Ricardós refused to move farther until he received 8,000 reinforcements and additional artillery. Finally, on 19 May, the Spanish moved on Perpignan from Ceret. A French blocking force at Mas Deu was routed and fled to the safety of the fortifications at Perpignan. Once again, Ricardós spent his time clearing his lines of communications instead of attacking his disorganized enemy.

Bringing reinforcements, General Charles de Flers arrived at Perpignan on 14 May to take command of the Army of the Eastern Pyrenees. He established the fortified Camp de l'Union and immediately concentrated on drilling and training his raw soldiers. When Ricardós launched probing attacks against Perpignan's outer defenses during 13–16 July, Flers was able to repel them. Ricardós finally opened his assault on Perpignan itself on the seventeenth, deploying 15,000 troops in five separate columns, supported by more than 100 guns. Flers was able to steady his troops by keeping most of them behind fortifications. His own artillery was competently served by former coastal gunners. All but one of the Spanish columns lost their way during the approach to Perpignan. The sole column, which assaulted the defenses, was thrown back by a counterattack against its flank.

By the end of the day, the Spanish had lost approximately 1,000 men. Ricardós decided to establish a series of fortified camps, nearly encircling Perpignan, and await reinforcements before launching any further attacks. Many of the best troops of the Army of the Eastern Pyrenees were drawn off for service elsewhere, such as at the French Mediterranean port of Toulon. The war in the eastern Pyrenees thus settled into a stalemate.

### Pfuel, Karl Ludwig August von (1757–1826)

Pfuel, often spelled “Phull,” was born to a prominent Württemberg noble family. He began service in the Württemberg Army in 1774 and transferred as a lieutenant in the Prussian Army in 1779. Beginning in 1781, Pfuel served on the Prussian general staff and participated in the cam-

paigns against France. After the Prussian debacle in 1806, he entered Russian service on 8 January 1807, receiving the rank of major general.

Promoted to lieutenant general on 11 September 1809, he served at the main Russian headquarters in 1810–1811 and prepared a strategic plan of the defense of Russia in case of French invasion, known as the Drissa Plan. This plan required the 1st Western Army to retreat to a fortified camp and pin down the French forces there, while the 2nd Western Army was to operate against the enemy flanks and rear. Despite major flaws in this strategy, Tsar Alexander, who completely trusted Pfuel, ordered construction of the fortified camp at Drissa, despite opposition from many senior Russian officers. At the start of the campaign in 1812, Alexander realized the potential dangers of deploying his army at Drissa and allowed General Mikhail Barclay de Tolly to withdraw farther into Russia. Pfuel was recalled to St. Petersburg and did not participate in any military decision making during the campaigns of 1813–1814. After the war, he was appointed Russian envoy to Holland, where he served before retiring in May 1821. He died on 25 April 1826.

### Phélypeaux, Antoine le Picard de (1768–1799)

An aristocrat, Antoine le Picard de Phélypeaux tried to start a royalist revolt in 1795 but failed and was captured, managing to escape to England where he was given a commission in the British Army as a colonel fighting in the Levant. He died of the plague there in 1799.

Phélypeaux attended the Ecole Militaire (military academy) in Paris, where Napoleon Bonaparte was one of his classmates, although the two cadets did not get along with each other. Phélypeaux also graduated higher in the class than did Bonaparte. Initially serving with the artillery, Phélypeaux was commissioned a captain in 1789. In 1791 he emigrated and then joined the Armée de Condé, fighting on the Rhine. He returned to France in 1795 to help the comte de Rochecotte and others foment a royalist revolt in the province of Berry. The revolt was crushed in 1796. Phélypeaux eventually left France again in 1797. He was not gone long before he returned to help rescue Sir Sidney Smith, a captain in the Royal Navy, from the Temple prison in Paris. The rescue was successful, and

Smith used his influence to gain Phélypeaux a colonelcy in the British Army.

In 1798 Phélypeaux went to Acre, on the Syrian coast, with Smith. Here Phélypeaux was able to use his training in military engineering to improve the defense of the city and help thwart Bonaparte's attempts to capture it. Phélypeaux's triumph over his old classmate was short lived; shortly after the siege ended Phélypeaux died from the plague.

### Pichegru, Jean-Charles (1761–1804)

In an era in which battlefield failure often qualified as treason, Pichegru was both a skilled commander and a genuine traitor, who went from peasant farm to the pinnacle of military and political power to prison. First patronized by Robespierrists and then paid by royalists, the man who had tutored Bonaparte at Brienne committed suicide after failing to overthrow his former student.

Like most Revolutionary generals, he was a commoner with military experience, though younger and of humbler origin than most. The former gunner in the American Revolutionary War became a lieutenant colonel of volunteers and captain in the regular army (1793), rising to *général de division* in half a year. Following the debacle at Weissenburg, the Committee of Public Safety turned to Pichegru and General Louis Lazare Hoche, who reconquered Alsace by the end of 1793. Pichegru attained the height of his success in 1794–1795, when in collaboration with General Jean-Baptiste Jourdan his Armée du Nord (Army of the North) drove the Allies from the Low Countries.

The “Savior of the Fatherland” demonstrated his devotion to order, if not the Republic, by crushing the Germinal uprising (April 1795). The autumn campaign, in which Pichegru commanded the Armée de Rhin-et-Moselle (Army of the Rhine and Moselle), was disastrous, for, having lost Mannheim and all strategic advantage, he concluded an armistice. Debate continues over the military consequences as well as motivations of his treason (beginning in early 1794), generally ascribed to a desire for advancement and wealth as much as political change. Indecisive and cautious by nature, Pichegru has been called dilatory even as a traitor, though he deliberately sinned by

General Jean-Charles Pichegru. A distinguished French general of the Revolutionary Wars, he overran Belgium and Holland before fighting on the Rhine front. His subsequent involvement in a royalist conspiracy to remove Napoleon from power led to his arrest and death. (Engraving by H. B. Hall after John Hoppner from *History of Europe from the Commencement of the French Revolution to the Restoration of the Bourbons in MDCCCXV* by Archibald Alison. Edinburgh & London: William Blackwood, 1860, vol. 4)

omission. Enough of a patriot or politician to favor a restoration of the monarchy based on public opinion rather than Austrian bayonets, he apparently sought, by eroding preparedness and morale, to undermine faith in the new republican regime.

Although aware of Pichegru's indiscretions, the Directory hesitated to challenge the popular figure and accepted his resignation in 1796, after which he worked with British and émigré agents to advance the royalist cause in the 1797 elections. As president of the Council of Five Hundred, he failed to vanquish the left and was caught unawares when the coup of Fructidor (September) purged the conservative directors and legislators. Evidence of Pichegru's treason, revealed belatedly by his successor, General Jean Victor Moreau, led to his deportation to Guiana (Guyane). In 1798 Pichegru escaped to England. In January 1804 he joined Chouan leader Georges Cadoudal in France in a plot against Bonaparte—who had seized power as First Consul in November 1799—but they were arrested along

with Moreau, whom they had failed to recruit. Persistent rumors of Bonapartist foul play notwithstanding, Pichegru evidently committed suicide in detention.

### Picton, Sir Thomas (1758–1815)

This lifelong soldier, considered rough and uncouth, was known as the Duke of Wellington's "Welsh General." Although never entrusted by Wellington with independent command, he was considered by many to be one of the best senior British officers to serve in the Peninsular War.

Picton was born in Pembrokeshire, Wales, to a family with a strong military tradition. He joined his uncle's regiment as an ensign at age thirteen, but he spent his first two years of service at a military academy. Picton's early years of military service were uneventful, and at the end of the American War of Independence (1775–1783), his regiment was disbanded. He retired a captain and spent the next eleven years at home on half pay.

In 1794, a year after the war broke out with France, Picton sailed to the West Indies to serve as deputy quartermaster general. He acquitted himself well at the capture of St. Lucia (after which he was promoted to lieutenant colonel), St. Vincent, and Trinidad. Picton was appointed governor of Trinidad, and owing to his efficient administration, local inhabitants petitioned against returning the island to Spanish rule.

In 1809 Picton, now a major general, took part in the attack on Walcheren Island off the Dutch coast. The "Grand Expedition" into the Low Countries to assist the Austrians was one of Britain's biggest debacles during the Napoleonic Wars. Picton served honorably but was one of thousands of British soldiers to contract malaria (known to contemporaries as Walcheren fever).

After the British withdrawal, Wellington, who was campaigning in the Iberian Peninsula against the French,

Lieutenant General Sir Thomas Picton. He commanded the 3rd Division of Wellington's army in the Peninsula, where he was wounded at the storming of Badajoz. He was later killed at Waterloo. (Library of Congress)

summoned Picton to serve there. Picton was placed in charge of the 3rd Division and played an important role at the battles of the Coa (July 1810) and Busaco (September 1810). After earning admiration for his courage and leadership at the Battle of Fuentes de Oñoro (5 May 1811) and the third siege of Badajoz (16 March–6 April 1812), Picton returned to Wales to spend the summer recuperating from a recurrence of malaria. While back home Picton was elected as a Member of Parliament for Pembroke, in Wales, taking his seat in November 1813. While in Britain, Picton was knighted and promoted to lieutenant general. He continued to serve effectively in the Peninsular War, fighting at Vitoria, in engagements in the Pyrenees, and at Toulouse. Upon Napoleon's abdication in April 1814, Picton's division was disbanded, and he returned home.

When Napoleon escaped from Elba, Wellington recalled his Peninsular veteran and gave Picton a senior command in the Anglo-Allied army. On 16 June, during the Battle of Quatre Bras, Picton was severely wounded in the chest (a wound that would have killed him regardless of subsequent events) while playing a decisive role in the battle. He went to great lengths to conceal his injury in order to retain command of his troops. Two days later, at Waterloo, Picton led his men in a counterattack late in the day against superior numbers of French troops, in the course

of which action he was shot through the head with a musket ball and killed.

## Pillnitz, Declaration of (27 August 1791)

A document representing the first international attempt at condemning the French Revolution, issued by the emperor of Austria (and Holy Roman Emperor) Leopold II and the king of Prussia, Frederick William II.

Individuals opposed to the French Revolution continued to stream out of France as late as 1791. The comte d'Artois, the youngest brother of King Louis XVI, proved to be the most vocal of the émigrés and sought international assistance to restore the French royal family to the throne. Most European monarchs, however, were reluctant to become actively involved in military intervention in France. Artois met with Leopold in May 1791 in an effort to persuade him to intervene in France, though the emperor refused to act, citing the danger it could pose to the lives of the French royal family.

Artois left Italy and settled near Coblenz in the Rhineland. Within days Louis attempted to flee France but was caught at Varennes, near Verdun. However, the king's other brother, the comte de Provence, did manage to escape. Continued pressure from the émigrés as well as other European nobility finally prompted Leopold to dispatch a circular letter in July to the governments of Britain, Prussia, Russia, Sardinia, and Spain, asking each leader to develop a common policy calling for the release of the French royal family. However, Leopold still wished to avoid military intervention.

In August, Leopold met with Frederick William II in the city of Pillnitz, the product of which was a declaration stating

that the safety of the French royal family was the mutual concern of all European leaders. More ominously, it asserted that they should be united in their support for Louis's attempts to reestablish full monarchical rule in France. The two sovereigns also announced that they were placing their armies in a condition of readiness for action. This last expression proved to be vague and open to interpretation.

Leopold intended for the Declaration of Pillnitz to be vague and counted upon the reluctance of the other European leaders to intervene in France. For Leopold, the declaration offered a formal sign of support for the French royal family without requiring him to become entangled directly in French political troubles. At the same time the declaration was meant to send a message to the new French government and to help placate the demands for action of the comte d'Artois and other émigrés. Above all, although vague, the declaration did represent the first formal European position on the French Revolution.

The Declaration of Pillnitz produced unintended results. The émigrés viewed the document as a serious declaration of the intention of the principal European courts to support the French royal family and, as such, expressed their glee at what they believed would be a war to restore the *ancien régime*. The French Revolutionaries noted the excitement of the émigrés and perceived the declaration as a general European threat to their existence. Enlistments in the French Army soared, and the country prepared itself for the war it believed was inevitable as a consequence of the statement. The Pillnitz Declaration can be seen as partially responsible for the French declaration of war against Austria and Prussia on 20 April 1792.

### Pirna, Battle of (26 August 1813)

Fought near a small Saxon town, located just over 6 miles southeast of Dresden, between French forces under the command of General Dominique Vandamme and Allied forces under the command of Prince Eugen of Württemberg. Vandamme's forces successfully prevented the Allies from reaching Dresden in time to counter a French victory. Indeed, the Battle of Pirna's primary importance to the fall

campaign in Germany was its role in helping ensure Napoleon's victory at Dresden.

On 25 August 1813 Napoleon discovered that the Allies were successfully encroaching on his position at Dresden. He immediately ordered marshals Auguste de Marmont and Claude Victor to redeploy their forces to the city. Napoleon himself arrived in Dresden on the morning of the twenty-sixth, only to discover that *Feldmarschall* Karl Philipp Fürst zu Schwarzenberg's forces had encircled the city.

Fortunately for Napoleon, French forces still held all of Dresden's walls and the north bank bridgeheads. These bridgeheads would enable General Marie-Victor Latour-Maubourg, Marmont, and Victor's forces to successfully reinforce the French forces by almost 50,000 men. Unfortunately for Napoleon, Austrian reinforcements were also on the way from the east.

Russian general Peter Graf zu Wittgenstein's reinforcements might have given him an advantage over the French at Dresden. Indeed, by that time the Allies had almost total control over the outskirts of Pirna, and their advance on Dresden seemed well planned. Unfortunately for the Allies, Schwarzenberg delayed his offensive and gave the French a chance to mount a powerful strike. Meanwhile, Vandamme, one of the heroes of Austerlitz, engaged Wittgenstein's reinforcements near Pirna, the former's force of 40,000 men successfully preventing the reinforcements from joining the Allies via the Pirna gateway and so helping to secure Napoleon's last major victory of the campaign in Germany.

Vandamme's forces pursued the Allies but were defeated on 30 August at the Battle of Kulm, where Vandamme himself was taken prisoner. The Battle of Pirna thus represents a link in the chain chronicling the course from initial French victory to ultimate defeat at Leipzig.

Gordon Stienburg

### Pitt, William (1759–1806)

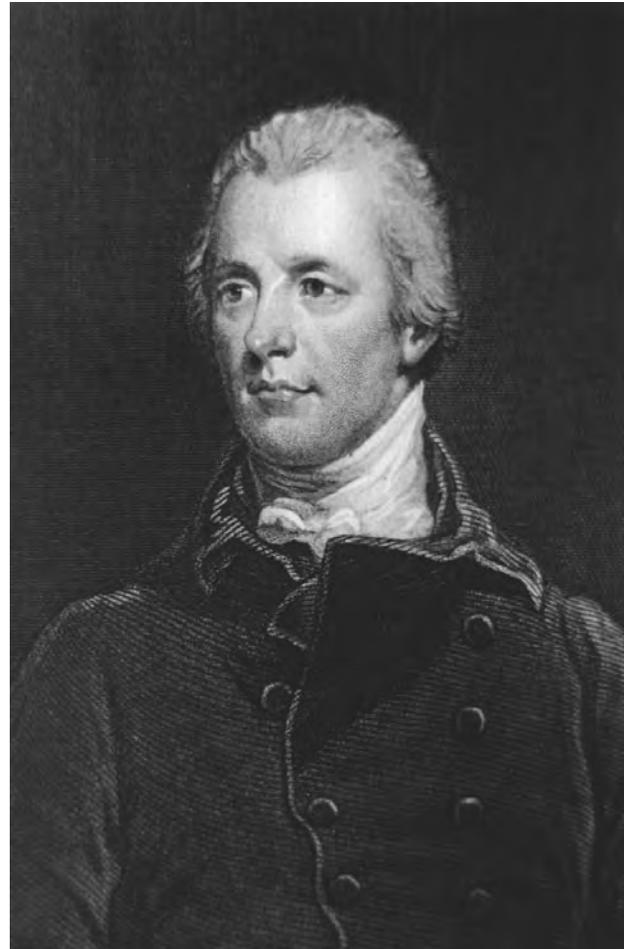

Prime minister of the United Kingdom from 1783 to 1801 and from 1804 to 1806. The fourth child of William Pitt

(the Elder), later first Earl of Chatham, who had served as prime minister during the Seven Years' War (1756–1763), Pitt was commonly referred to as “the Younger,” so as to distinguish him from his august father. His mother, Lady Hester Grenville, was the sister of George Grenville, prime minister between 1763 and 1765. Pitt became the youngest prime minister in British history and presided over a critical period during the long reign of George III. Six years into Pitt's premiership France was engulfed by revolution; the war that resulted was to occupy Britain for more than twenty years, much of that period during Pitt's tenure in office.

Born on 28 May 1759 in Hayes, Kent, Pitt was a sickly and weak child who, instead of being sent to boarding school like most sons of the elite, was tutored at home, by the Reverend Edward Wilson. Pitt was intelligent and possessed a fine grasp of Latin and Greek, and freely translated between those languages and English with great facility. In 1773, at the age of fourteen, he attended Pembroke Hall (now Pembroke College), at Cambridge University, where, under his tutor, George Pretyman, he studied history, political philosophy, and the classics, at all of which he proved adept. He was also particularly skilled at mathematics. At Cambridge he befriended several fellow students, who in later years were to number among his political allies in Parliament and would serve in his cabinet. When his father died in 1778, Pitt, being a younger son, received only a small inheritance. Thus, after leaving Cambridge, he went to London to study law at Lincoln's Inn and was called to the bar in 1780.

In September of that year he contested but failed to gain one of the two parliamentary seats for Cambridge University. He did not despair, however, and through his friendship with the Duke of Rutland secured the patronage of Sir James Lowther, who controlled the pocket borough of Appleby, to which constituency Pitt was elected in a by-election at the age of only twenty-one in January 1781. His maiden speech in the House of Commons, delivered the following month, demonstrated his exceptional mastery of language and his skills as a debater. Pitt initially aligned himself with prominent Whigs, including Charles James Fox, with whom he opposed Lord North's policy of pursuing the war against the rebellious American colonists. He also argued forcefully for reductions in government spending and on what he regarded as the Crown's excessive powers of patronage. Finally, Pitt advocated the introduction of parliamentary reforms meant to sweep away the very corrupt practices that, ironically, had so recently secured his own seat in Parliament.

When Lord North resigned in March 1782, Lord Rockingham, his successor, offered Pitt the minor post of vice treasurer of Ireland, yet with a breathtaking sense of self-assurance—some thought arrogance—he declined it,

William Pitt. Prime Minister of Great Britain (1783–1801, 1804–1806), he was one of Napoleon's most implacable enemies. (Engraving by H. B. Hall after John Hoppner from *History of Europe from the Commencement of the French Revolution to the Restoration of the Bourbons in MDCCCXV* by Archibald Alison. Edinburgh and London: William Blackwood, 1860, vol. 4)

refusing to join the government without a seat in the cabinet. In Parliament he proceeded to denounce the system of rotten boroughs—marked by such abuses, among others, as bribing the electorate for their support—and called for reforms to establish a more equitable system of constituency representation.

After only three months in power, Rockingham died in July 1782 and was succeeded by Shelburne, who appointed Pitt, at the age of twenty-three, chancellor of the exchequer. When Fox refused to serve in the new government and joined a coalition with North, Fox and Pitt fell out, beginning a lifelong political rivalry that was to play itself out on the floor of the House of Commons for the next twenty-three years. When the Opposition brought down Shelburne's ministry in February 1783, King George III—who strongly opposed, but did not prevent, the inclusion of Fox in government—offered Pitt the opportunity

to become prime minister. Pitt, however, declined it, aware that his youth and inexperience were unlikely to secure for him the parliamentary support needed to make his administration viable. Fox and North duly formed a coalition, while Pitt, stepping down as chancellor of the exchequer, joined the Opposition.

As before, he made several appeals for parliamentary reform, particularly on the questions of bribery and rotten boroughs. While he failed to achieve his aims, he did manage to attract a following of reformers from the Foxite camp, increasing his personal standing in Parliament. After the Fox-North coalition collapsed in December 1783 over the question of the reform of the (British) East India Company, the king appointed Pitt, still only twenty-four, prime minister. Despite being criticized for his youth, he was to serve as premier for the next seventeen years.

Pitt came under immediate and regular attack from the Opposition, and notwithstanding a vote of no confidence in January 1784, he refused to resign, retaining as he did the support of both the king and the House of Lords. Not only did he survive in office, but in forthcoming years he gradually increased his majority in Parliament. Although he would never enjoy substantial public popularity, Pitt came to be regarded as an honest figure not subject to the corruption and dishonesty associated with his predecessors. This image, after Parliament was dissolved in March 1784 and a general election called, helped return him to Parliament, this time in possession of one of the two seats representing his coveted Cambridge University.

Armed with a substantial majority in the House of Commons, Pitt now sought to pursue his long-held aims. By his India Act in 1784, Pitt reorganized the East India Company, created a new Board of Control to manage it from London, and limited the powers of the governors of Bombay and Madras in favor of the governor-general of India, who thereafter was to exercise supreme control over British affairs on the subcontinent. On the domestic scene, Pitt pursued his interest in parliamentary reform, introducing in 1785 a bill to abolish representation in thirty-six rotten boroughs, and to extend the franchise to a larger proportion of property owners already enjoying the vote. He, however, failed to gain the requisite parliamentary support required to carry these measures, and this was to become, owing to a profound change in attitude about reform in consequence of the Revolution in France a few years later, the last occasion on which he would publicly raise the question.

Pitt also sought to tackle the nation's massive debt, which had accumulated rapidly as a result of the American Revolutionary War to £250 million—an extraordinary amount for its time. He sought to reduce this debt using

various means: the imposition of new taxes, cracking down on fraud by improving the system of auditing, tackling smuggling by reducing the high duties on imported goods that allowed smuggling to flourish, and simplifying customs and excise duties. Most notably, his Sinking Fund, introduced in 1786, constituted an original scheme to reduce the national debt by setting aside each year £1 million from the surplus revenue derived from new taxes. This sum would be allowed to accumulate compound interest over twenty-eight years, by which time the income so derived would have reached £4 million a year. In the prosperous years of peace that followed, when an annual surplus of revenue was indeed created, this method was found to function fairly well, and by this imaginative method the national debt might eventually—albeit over a long period—have been paid off. However, after war began with France in February 1793 the government was inevitably forced to redeem some of the debt through new borrowing at a higher rate of interest than that fixed to the loans arranged during the war in America.

Pitt faced a severe challenge to his administration when in 1788 the king became mentally ill and the nation found itself without laws to provide for such a contingency. Parliament spent months debating how a regency, barring the king's recovery, could be established, but since it was clear to all that the only realistic candidate for regent was the Prince of Wales—a man openly and staunchly supportive of Fox—it was universally assumed that his appointment as regent would inevitably lead to Pitt's dismissal. Pitt and his adherents in the Commons therefore worked feverishly to oppose measures that were certain to spell political suicide. Crisis was averted for Pitt when the king recovered in February 1789, just as the House of Commons passed the Regency Bill.

On the international scene, even before the French Revolution transformed France into a greater threat to British interests than ever before, Pitt sought to restrict French power by establishing alliances on the Continent. After forming the Triple Alliance with Prussia and the Netherlands in 1788, he made use of Prussia's diplomatic support during the Nootka Sound crisis in 1790 to force Spain to abandon its claim of a monopoly on trade and settlement along the western coastline of North America. But if war had thus been averted in the Pacific Northwest, in the Ochakov crisis Pitt nearly embroiled his country in a conflict with Catherine the Great over his attempts to check the expansion of Russian power in the Black Sea. In March 1791 the prime minister demanded that the tsarina restore to Turkey all recent Russian conquests, apart from the Crimean peninsula. Yet without sufficient backing from the cabinet, and with virtually no public support for the prosecution of hostilities in so distant a place and for

so little apparent gain, Pitt was forced to back down when Catherine refused to comply.

Pitt, like many of his contemporaries, did not initially view the French Revolution with dismay; indeed, in a speech delivered to Parliament in February 1792 he quite misguidedly predicted fifteen years of peace between Britain and France, owing to his perception that internal political and social turmoil would paralyze France, thus enabling Britain to pursue unhindered her commercial and colonial interests. In time, however, he came to share the opinion of such contemporaries as Edmund Burke, who looked with increasing horror on the excesses of the Revolution, even before the Reign of Terror convulsed France in 1793–1794. A crisis in Anglo-French relations did not in fact develop until the closing months of 1792—after the Revolution had already been years in the making—and after war had already broken out between France on the one hand, and Austria and Prussia on the other.

Yet Anglo-French relations deteriorated rapidly from that point. Most significantly for Pitt, the French had invaded the Austrian Netherlands (modern Belgium and Luxembourg), violated the internationally agreed neutral status of the Scheldt, and issued a decree that invited Europeans to overthrow their own monarchs and allow French troops to “liberate” them. In the face of such overt threats to the social and political order of Europe, including Britain, the prime minister viewed confrontation with Revolutionary France as inevitable. The execution of Louis XVI in January 1793 did not in itself precipitate war, but it confirmed in Pitt’s mind what he regarded as the ruthlessness and volatility of the Revolutionary government in Paris. Nor could he have escaped confrontation if he had been so inclined; on 1 February, France declared war on Britain.

The conflict had immediate domestic implications for Pitt. Many reformers, encouraged by the outpouring of democratic ideas and writings from France—by no means all of which could be considered radical or preaching violence against monarchy—renewed the call for parliamentary reform, the issue that Pitt had himself championed up until 1785 when his reform bill had been defeated. Moderate British reformers, failing to appreciate the tense political atmosphere and the prevailing fear of revolution, found themselves, often unjustifiably, cast as revolutionary sympathizers or, worse, traitors, their ideas discredited by the increasing violence within France and the triumphant march of its armies across the Low Countries, the Rhineland, and northern Italy.

Pitt had grave reservations about rising Revolutionary opinion. Fearing the influence of what he regarded as seditious publications, Pitt enacted repressive legislation in May 1792 to prevent the dissemination of such writings and to prosecute and imprison their authors. Two years

later he suspended habeas corpus. Pitt later placed restrictions on the right of individuals to assemble in public and on the establishment of societies or organizations seeking to introduce political reforms. These were no mere temporary measures but remained in force until 1801. At the same time, in an effort to quash internal dissent and to deny radicals a platform from which to espouse revolutionary ideas, Pitt ceased to raise in Parliament the issue of political reform.

Throughout the 1790s the mainstays of his cabinet included his cousin William Grenville, as foreign secretary, and Henry Dundas, as home secretary (1791–1794) and later as secretary of state for war and the colonies (1794–1801). With such men at his disposal, Pitt led a competent government, though as he himself lacked the strategic vision necessary to confront Revolutionary France with much prospect of success, he was in consequence singularly unsuccessful in his prosecution of the war against it.

Pitt proved instrumental in expanding the First Coalition (1792–1797, Britain joining in 1793), including Austria, Britain, Prussia, Sardinia, Spain, and the United Provinces (Holland); yet Britain’s contribution was limited to naval efforts and minor amphibious operations on the Continent, which, apart from in Flanders, did little but divert small enemy forces from the main theaters of operations in the Rhineland and Italy. Indeed, these series of minor, far-flung expeditions, although eventually resulting in the capture of most of the French possessions in the West Indies, failed to prevent France from making substantial territorial conquests on the European continent and appeared to Britain’s allies as merely a means to acquire more colonies while leaving the bulk of the heavy fighting on land to others. The First Coalition, from which in 1795 Prussia and Spain withdrew, was duly defeated in 1797 when Austria was knocked out of the war, leaving Britain the only principal power still opposed to France.

Pitt was instrumental, through a concerted diplomatic offensive, in raising the Second Coalition (1798–1802), consisting of Britain, Austria, Russia, and the Ottoman Empire (Turkey); but this alliance, too, owing largely to poor Allied coordination and mutual suspicion, crumbled in defeat, as its forces, though initially successful, eventually succumbed to French Revolutionary armies in Germany, Switzerland, and Italy. Again Pitt dissipated British resources, though his provision of substantial financial payments to Austria, Russia, and various other continental allies played an important role in maintaining resistance. Nor can one dismiss the significance of Britain’s several notable victories at sea, or its triumph over the French in Egypt. At the same time, Pitt was successful in financing the war by means of the country’s first income tax, an innovation not only meant to generate additional funds to

pay for military and naval operations and the expansion of the armed forces, but also to offset the loss of funds collected through indirect taxation, now reduced by the decline in trade. Although he also introduced property tax schemes, the enormous cost of the war obliged Pitt to have recourse to heavy borrowing.

Pitt not only regarded France as a barrier to imperial expansion and a menace to British markets overseas, but also as a genuine and immediate threat to his country's national existence. Although French invasion plans were thwarted in 1797, in the same year a financial crisis at home and the mutinies of the British fleets off Spithead and the Nore cast an air of gloom over Pitt's administration. Reluctantly prepared to negotiate peace with France, he failed to appreciate the overwhelming desire of the public for an end to the war and all its painful consequences—the heavy burden of taxation, the loss of markets on the Continent, the military failures, and the toll in human terms. Yet, in spite of all of these misfortunes and setbacks, Pitt continued his unassailable hold over the premiership, a hold maintained almost entirely as a consequence of the continuing loyalty of the king, who cast Pitt not only as the defender of conservative principles and the institution of monarchy but as the nation's implacable enemy of Revolutionary France. In 1794 Pitt bolstered this enviable position by inviting leading members of the opposition to join his government, which they did with the Duke of Portland. The various arguments offered by those still opposed to him—most notably Charles James Fox—consistently failed to put the Foxite Whigs back in office.

Personally, Pitt struck most contemporaries as austere, hostile to his critics, and extremely dedicated to his responsibilities as prime minister. He worked exceptionally long hours at Downing Street, seldom entertained, and rarely traveled much beyond London. He never visited Scotland or Ireland and went abroad only once—to France for a few months. His loyal followers in the House of Commons were great in number, but he had few close friends and never married, reluctantly declining to do so on one occasion owing to his woeful financial circumstances. Indeed, personal debt, which had begun to mount soon after Pitt left Cambridge, was to plague him for the rest of his life, a situation less the consequence of extravagance than of the dishonesty of his household staff, of his complete indifference to personal financial matters, and of his extreme—perhaps obsessive—devotion to work at the expense of every other matter. Ironically, the financial welfare of the nation was paramount to him; his own was of no consequence.

By the end of 1800, after seventeen years in office, Pitt was worn out and low. The Austrians were decisively defeated at Marengo and Hohenlinden in June and December,

respectively, while at home, matters in Ireland had been worsened by the rising demands of Irish nationalists, who two years before had staged a rebellion with the forlorn hope of receiving substantial French military assistance. The revolt had been suppressed, but Pitt believed that he could only assuage Irish demands for independence by creating a union between Great Britain and Ireland. This he accomplished in 1800, partly through the bribery of Irish MPs and other corrupt practices. By the Act of Union the Irish Parliament in Dublin was closed and all power centralized in Westminster, effective 1 January 1801.

Pitt also wished to present supplementary proposals before the House of Commons in order to ease existing restrictions on Roman Catholics. Various concessions were to be offered such as the right to hold a seat in Parliament, a government post, or a commission in the army or in the civil or diplomatic service. Pitt also wished to bring forward state provision for Catholic and Dissenting (non-Anglican) clergy. The king violently opposed Catholic emancipation on the basis that his coronation oath, by which he had promised to protect the established Church of England, forbade him as sovereign from granting the extension of additional rights to Catholics. On failing to persuade the king to reconsider, Pitt resigned from office, together with most of his principal political adherents, on 3 February 1801, to be succeeded by Henry Addington. During the crisis the king suffered from another bout of insanity—now thought to have been induced by porphyria. When within a month the king recovered, he attributed his illness to Pitt's plans for Catholic emancipation, whereupon Pitt promised never again to propose such legislation in the king's lifetime.

From February 1801 to May 1804 Pitt lived quietly at Walmer Castle in Kent, gardening, trying to recover his health—which had seriously declined as a combination of overwork and heavy drinking—and drilling the local militia in anticipation of a much-feared French landing. He continued to attend sessions of Parliament on an irregular basis; he was absent altogether for a period of several months. When by the terms of the Treaty of Amiens Britain made peace with France in March 1802, Pitt supported the government, albeit unenthusiastically; and although Addington invited him to join the cabinet, Pitt declined. When after a brief hiatus war resumed with France in May 1803, Pitt stepped up his opposition to the government, denouncing in particular its conduct of the war, its measures for the defense of the nation against invasion, and its financial policies.

In time he joined with his Whig opponents to topple Addington's government and put himself back in Downing Street. His second ministry, however, was marred from the beginning, for when Grenville refused to join the cabinet

without Fox—and the king refused to have Fox in any government capacity—Pitt was obliged to do without the services of both, not to mention other talented politicians, including many former supporters. Indeed, many MPs who had once stood in support of Pitt, but now sat in Addington's camp, joined the Opposition. Pitt's government therefore began office on a weak footing, with much of the available talent absent. Nevertheless, such was the prime minister's standing as a paragon of resistance to French aggrandizement and the defender of conservative ideas that, despite his reduced majority in Parliament, Pitt continued to secure much of the legislation he brought forward and regained much of the public popularity that he had lost by the time he had left office in 1801.

Through intense diplomatic activity and the drafting of a lengthy state paper (19 January 1805) outlining plans for the political reconstruction of Europe after the defeat of France, Pitt was instrumental in inspiring and eventually establishing the Third Coalition, which consisted of Britain, Russia, Austria, and Sweden. Notwithstanding Britain's very substantial naval commitment to the war against Napoleon, Pitt clearly recognized that the fate of the Continent largely rested on the fortunes of the Allied armies then receiving large subsidies from his government. Although the Allies were crushed at Austerlitz on 2 December 1805, the decisive British victory at Trafalgar six weeks earlier owed something to Pitt's appointment of Lord Barham (Sir Charles Middleton) as First Lord of the Admiralty, whose formulation of naval strategy, together with Vice Admiral Horatio, Viscount Nelson's tactics and leadership on the day, secured Britain's protection from invasion for the remainder of the Napoleonic Wars.

News of Trafalgar and his almost-unquenchable optimism led Pitt to spend much of November and December 1805 persuaded that his diplomatic efforts to woo Prussia into the Allied camp would bear fruit and thus bring into the field forces sufficient to turn the tide of the campaign. However, tidings of an Austrian armistice, the withdrawal of the Russian army eastward, news that Prussia had decided to remain neutral, and a combination of physical exhaustion and the cumulative effects of many years' heavy consumption of port, finally overcame him; Pitt died despondently on 23 January 1806.

He left behind debts amounting to £40,000, all of which were paid off by a grant unanimously voted by a grateful Parliament, which also provided a public funeral and a place for his remains in Westminster Abbey, where he was buried on 22 February.

Pitt left a political vacuum behind, which his colleagues, mostly Tories, could not immediately fill. His loss to the nation was felt even by his staunchest political opponents, but Pitt's allies, unable to sustain themselves in the

face of the collapse of yet another coalition formed against France, had no choice but to leave office. In their wake, Grenville formed a government representing a broad political spectrum, which now included the talented Fox but lasted little more than a year. Pitt's legacy had clearly not been eclipsed; subsequent British governments during the Napoleonic Wars—those of the Duke of Portland, Spencer Perceval, and the Earl of Liverpool—were all largely Pittite in character, and when Viscount Castlereagh, as foreign secretary, went to the Continent in 1813–1814 to negotiate a new anti-French coalition to include all the Great Powers, he used Pitt's plan of January 1805 as the basis for Britain's immediate war aims as well as for the postwar political settlement reached by the victorious Allies at the Congress of Vienna in 1814–1815.

During his long tenure Pitt had shown himself astute in the management of government affairs. In sharp contrast to the utter disregard he paid to his personal finances, he pursued sound fiscal policies that helped the nation recover from the economic hardship resulting from the war in America. This achievement was somewhat blighted by the subsequent struggle with Revolutionary and Napoleonic France, which was to force Pitt to adopt new measures to generate revenue on a scale hitherto unknown, particularly through his system of income tax. Pitt's legacy is evident in other realms of his public life. He took a wide view of Britain's role in the world, regarding it as an imperial, as well as a European, power. He maintained the support of the king in consequence of the conservative principles he embraced and for the particular measures in domestic and foreign policy that he pursued, but he was not a reactionary and showed himself ready to accept new ideas and to reach compromises with members of his own, and opposing, factions when necessity dictated it.

Pitt was not successful as a war leader like his father; the three coalitions that Britain helped to form, and which the Treasury generously funded with unprecedented levels of subsidies, all failed to check French expansion. Yet Pitt never wavered in the struggle against France, remaining an inveterate opponent of radicalism and, later, Napoleonic imperialism. In later years he came to symbolize not only resistance to foreign tyranny but also economic prosperity, sound financial policy, and internal political stability, in an era when revolutionary principles and armies threatened to jeopardize the traditional social and political structure of a nation embracing broad (for its time) democratic values and the principle of constitutional monarchy. On the other hand, he never managed to put into being some of the important measures he had advocated over the years, including parliamentary reform, Catholic emancipation, or the abolition of the slave trade.

After a total of nineteen years in office, Pitt established the premiership as one in which the prime minister played a greater role than ever in overseeing and coordinating the work of the various departments of government. In so doing he set a precedent for future prime ministers, whose overall authority to manage state affairs came to be the unquestioned norm in government.

## Pius VI, Pope (1717–1799)

Pope between 15 February 1775 and 29 August 1799. Born 17 December 1717 at Cesena, Giovanni Angelico Braschi was the scion of an ennobled but penurious family from the northern area of the Papal States. He was educated by

Jesuits at Cesena and attended the University of Ferrara for legal training before becoming a favorite of Pope Benedict XIV, who supplied him with a steady stream of appointments, including papal secretary. Although not as popular with the next two pontiffs, Clement XIII and Clement XIV, he was created a cardinal in 1773 and was serving as the abbot of Subiaco in 1775 when Clement XIV died. In the papal election, the monarchies of France, Spain, Austria, and Portugal intervened to attempt to achieve the selection of another pope opposed to the Jesuit order, which Clement XIV had dissolved. Instead, after five acrimonious months, Braschi was elected as Pope Pius VI.

Pius VI proved an able administrator in the Papal States, adding a sacristy to St. Peter’s, draining the Pontine Marshes, building a substantial scholarly library, and patronizing archeological digs as part of his fascination with antiquity. Unable to reverse the bull against the Jesuits, he nonetheless gave many of them refuge and freed their governor-general from imprisonment. In an ironic diplomatic situation, he halfheartedly insisted the Jesuits in Prussia and Russia be banned, but was refused by Frederick II and Catherine II, respectively, both non-Catholic rulers who wanted to retain Jesuit institutions of learning. In 1784, challenged by the Emperor Joseph II of Austria who was dissolving monasteries and usurping papal authority, Pius VI bought a fragile truce with the emperor by allowing him to name bishops in Milan and Mantua.

Although embarrassed by the participation of Cardinal de Rohan in the “affair of the necklace,” Pius VI was a supporter and longtime correspondent of Louis XVI of France. The pope did not excommunicate supporters of the Civil Constitution of the Clergy, but he did rebuke church officials who took the oath under it and refused to recognize the French Republic in 1792. As a result, the Revolutionary government seized Avignon. Pius said public masses for Louis XVI after his execution and attempted to save the life of Marie Antoinette through the intervention of the Spanish.

On 19 February 1797 Pius, who had not committed papal troops to the coalition armies, was forced to accept French hegemony through the Treaty of Tolentino after Bologna surrendered to the French. The Vatican was plundered of its reserves and art collection to pay a 21-million-lire indemnity, but Pius VI refused to retract his condemnation of the Reign of Terror or the French Republic. With the French acting provocatively in Rome, Pius was unable to control an incident in which papal dragoons killed General Mathurin-Léonard Duphot in the street during a violent confrontation outside the Corsini Palace. In reprisal, the French kidnapped the pope while declaring Rome a republic on 10 February 1798.

In ill health, Pius was taken under guard through northern Italy to Valence, where he outlined a method by

which the cardinals were to select a new pope without a formal conclave upon his death. Pius died under French house arrest on 29 August 1799, and was returned for burial in St. Peter's in 1802.

### **Pius VII, Pope (1740–1823)**

Pope between 14 March 1800 and 20 August 1823. He was born Giorgio Barnaba Luigi Chiaramonti on 14 August 1740 to an Italian noble family at Cesena. He received his early education in the college for nobles at Ravenna. At the age of sixteen he entered the Benedictine monastery of Santa Maria del Monte, near Cesena, and after the completion of his studies served as professor of various colleges in Parma and Rome. Pope Pius VI was a close friend of his family and helped Chiaramonti move through the ranks: first appointed abbot of San Callisto monastery in 1776, then conferred the bishoprics of Tivoli and Imola, and finally made cardinal in February 1785. After the death of Pius VI in August 1799, the conclave was convened in Venice and considered several candidates for the papacy. Following several months of stalemate, Chiaramonti was elected as a compromise candidate and proclaimed Pope Pius VII on 21 March 1800. One of his first appointments was the elevation of Ercole Consalvi to the College of Cardinals and the office of secretary of state in August 1800. Consalvi, a prominent figure at the Vatican, opposed French policies in Italy between 1796 and 1798, and played an important role in Pius's election. He later negotiated the concordat with Bonaparte, was instrumental in reforming the Vatican administration, and convinced the Allies at the Congress of Vienna to reestablish the Papal States in their entirety.

In 1801 Pius overcame opposition in the church to open negotiations with First Consul Bonaparte and was able to conclude the historic Concordat of 1801, which restored the Catholic Church in France and governed the relations of the French church with Rome for more than a century. However, relations between the pope and Bonaparte soon deteriorated. In 1802–1803, Pius opposed Bonaparte's plans to compensate German princes with land belonging to the Catholic Church and the subsequent

ecclesiastical reorganization of Germany, known as the Imperial Recess. Despite tense relations, Pius traveled to Paris in order to crown Bonaparte as Emperor Napoleon I. As it happened, during the investiture on 2 December 1804, Bonaparte took the crown from Pius's hands and crowned himself. The pope opposed the Organic Articles, which effectively established Napoleon's control over the Catholic Church; he also rebuffed Napoleon's demands to annul the marriage of Joseph Bonaparte. In 1806 Pius refused to apply the restrictions of the Continental System to his domains. In response, Napoleon occupied Rome and the Papal States in 1808–1809. Although he excommunicated Napoleon, Pius was arrested and confined first in Genoa, then at Savona, before final captivity at Fontainebleau. He was forced to concede a new concordat in January 1813 but later disavowed it. After Napoleon's downfall, Pius succeeded in securing the restoration of the Papal States at the Congress of Vienna. He advocated the restoration of the ecclesiastical system of organization that had previously existed in Germany and negotiated with each German state separately, beginning with the first concordat with Bavaria in 1817. He revived the Society of Jesus (Jesuit order) in 1814, promoted educational reform, and helped the establishment of Rome as a cultural center. In 1820–1821, he opposed the revolutions in Italy and Spain and cooperated with the counterrevolutionaries. Despite mistreatment by Napoleon, Pius treated the fallen emperor's family with benevolence, gave them haven at Rome, and even interceded with the British to alleviate Napoleon's treatment on St. Helena. He died on 20 August 1823.
